Running title: Transcriptome of cultured astrocytes from 3xTg-AD mice.

Keywords: whole-genome microarray, 3xTg-AD mice, cultured astroglia, cross-platform normalization, early Alzheimer’s disease, FAD mutations.

Abstract

Background: It is well known that alterations in astrocytes occur in Alzheimer's Disease and reactive astrogliosis is one of the hallmarks of the disease. Recently, data has emerged that suggests that alterations in astrocytes may also occur early in the pathogenesis of the disease.

Objective: The aim of present work was to characterize the transcriptional alterations occurring in cultured astrocytes from 3xTg-AD mouse pups compared to control non-transgenic mice. Furthermore, we also compared these changes to those reported by others in astrocytes from symptomatic AD mice.

Method: We conducted a whole-genome microarray study on primary cultured astrocytes from the hippocampus of 3xTg-AD and non-transgenic mouse newborn pups. We used cross-platform normalization and an unsupervised hierarchical clustering algorithm to compare our results with other datasets of cultured or freshly isolated astrocytes, including those isolated from plaque-stage APPswe/PS1dE9 AD mice.

Results: We found a set of 993 genes differentially expressed in 3xTg-AD as compared with non-Tg astrocytes. Over-represented gene ontology terms were related to calcium, cell-cell communication, mitochondria, transcription, nucleotide binding and phosphorylation. Of note, no genes related to inflammation were found in cultured 3xTg-AD astrocytes. Comparison with astrocytes isolated from plaque stage APPswe/PS1dE9 showed that 882 out of 993 genes were selectively changed in primary 3xTg-AD astrocytes while 50 genes were co-regulated and 61 were anti-regulated (regulated in the opposite direction in the datasets).

Conclusion: Our data show that in cultured astrocytes from an AD mouse model, transcriptional changes occur and are different from those reported in models mimicking later stages of the disease.

3 **1. INTRODUCTION**
4

5 Alzheimer’s disease (AD) is the most common dementia in the elderly. AD begins with a loss of episodic
6 memory and progresses to cognitive decline and dementia. At the cellular level, AD is characterized by
7 dysfunction of synaptic connectivity and neuronal death [1] and it is established that reactive astrogliosis
8 accompanies the late stages of AD [2].
9

10
11 **Astrocytes are a heterogeneous group of cells in the nervous system responsible for housekeeping and**
12 **homeostatic functions. Implicated in pathogenesis of many neurodegenerative diseases [3], astrocytes** may
13 be important determinants of synaptic dysfunction in incipient AD [4; 5]. For example, recent investigations
14 on mice bearing mutations associated with familial forms of AD (FAD) have demonstrated that, during the
15 disease, astrocytes do not merely become activated, but undergo complex biphasic changes. Thus in 3xTg-
16 AD mice, at three months of age astrocytes are found to be atrophic, but, after the burden of amyloid-β (Aβ)
17 deposits, turn to hypertrophic in the areas proximal to amyloid plaques [5; 6].
18

19
20 Transcriptome studies on whole-brain tissues and on fluorescence-activated cell sorting (FACS)-isolated
21 astrocytes from human AD postmortem brains as well as from a symptomatic AD mouse model have shown
22 that at the late AD stages astrocytes exhibit strong inflammatory phenotypes concomitantly with Aβ plaque
23 development [7]. However, much less is known about gene expression alterations and astroglial remodeling
24 in pre-symptomatic AD. Previously, we have shown that, in primary astroglial cultures, Aβ deregulates the
25 expression of genes involved in Ca²⁺ signaling through the activation of Ca²⁺-dependent gene transcription
26 which determines increased response to a group I glutamate receptor agonist DHPG [8-10]. Deregulation of
27 Ca²⁺ signaling has been found also in astrocytes from the hippocampus of 3xTg-AD mice, in which ATP, but
28 not DHPG-induced Ca²⁺ signals were potentiated in a region-specific manner [11].
29

30
31 In the present study we used primary cultures of purified hippocampal astrocytes from 3xTg-AD mouse pups
32 to explore the effects of FAD-related mutations on gene expression. Using whole-genome microarray and
33 gene ontology (GO) analysis we show that FAD mutations alter expression of a distinct set of genes related
34 to calcium, phosphorylation, mitochondria, gene expression and cell-cell communication.

2. MATERIALS AND METHODS

2.1. Animal handling

The 3xTg-AD mice were obtained from Alexej Verkhatsky (Manchester University, UK; [12], 3xTg-AD mice develop both senile plaques and neurofibrillary tangles [12]). 3xTg-AD and non-transgenic (non-Tg) control mice were housed in the animal facility of the Università del Piemonte Orientale, were kept at three to four per cage, and had unlimited access to water and food. Animals were managed in accordance with European directive 2010/63/UE and with Italian law D.l. 26/2014. The procedures were approved by the local animal-health and ethical committee (Università del Piemonte Orientale) and were authorized by the national authority (Istituto Superiore di Sanità; authorization number N. 22/2013). All efforts were made to reduce the number of animals by following the 3R's rule.

2.2. Astroglial cultures

Primary astroglial cultures were from postnatal day 0-3 (P0-P3) non-Tg and 3xTg-AD mouse pups. Hippocampi were dissected from brains, washed twice in cold HBSS (Sigma, Cat. H6648), minced with a scalpel and incubated in 1x Trypsin (Sigma) for 25 min (5 ml of Trypsin for each 6-8 pups). After neutralization with complete culture medium (DMEM (Sigma, Cat. D5671) supplemented with 2 mM glutamine and 1% penicillin/streptomycin (P/S, both from Sigma)), the tissues were centrifuged (250 xg 3 min) and resuspended in HBSS supplemented with 10 % fetal bovine serum (FBS, Gibco, Cat. 10270), 20 u/ml DNase and MgSO₄. Hippocampal tissues were disaggregated with 30 strokes of 1000 µl automatic pipette. 5 ml of HBSS were added and tissue residues were allowed to sediment. Cellular suspension was transferred in a fresh falcon and, after centrifugation (200 xg, 5 min), pellet was resuspended in complete culture medium and cells were plated in 25 mm² flasks (Falcon, Corning, USA). When confluent, astrocytes were detached with trypsin and contaminating microglial cells were eliminated by negative selection using anti-CD11b-conjugated magnetic-activated cell sorting (MACS) beads (Miltenyi Biotech, Cat. 130-093-634). MACS was performed according to manufacturer's instructions. At the end of the separation purified astrocytes were resuspended in complete culture medium and plated for experiments. Immunocytochemical examination using anti-GFAP and anti-Iba1 antibody showed absence of microglial cells present in cultures.

2.3. RNA isolation and whole-genome microarray

Gene expression profiling was evaluated from 5 samples from non-Tg control mice and 5 samples from 3xTg-AD mice. For each sample 0.5x10⁶ of MACS-purified astrocytes were plated in 65 mm Petri dishes in 4 ml of complete culture medium. At 80% confluence the medium was changed to 4 ml DMEM/F12 (Gibco, Cat. 21041-025, supplemented with 2 mM glutamine and 1% P/S). After 24 hours astrocytes were washed with PBS and lysed in 700 µl QIAzol (Qiagen, Milan, Italy). Total RNA was extracted using Absolutely RNA miRNA kit (Agilent) according to manufacturer's instructions. The samples were subject to one-color gene expression profiling with SurePrint G3 mouse GE 8x60K microarrays (Agilent Technologies, Santa

Clara, CA). Slides were scanned with an Agilent C dual-laser microarray scanner and images analyzed with Agilent Feature Extraction software. Raw data were normalized through the quantile between-array normalization algorithm and the empirical Bayes method (LIMMA/Bioconductor package) was used to compute a moderated *t*-statistics for two-class comparison analysis [13]. *P*-values were adjusted for multiple testing by using Benjamini-Hochberg (BH) false discovery rate (FDR) correction [14]. Because of the high degree of correlation between the genewise variance and the average expression ($\rho = 0.9$), no intensity filtering procedure was applied to not alter the variance distribution. On the contrary, LIMMA was applied to the whole unfiltered dataset to preserve full statistical power and then the expression values of the genes called as significantly regulated have been checked *a posteriori* [15]. Functional annotation was performed using the DAVID Bioinformatics Resources v. 6.7 (<https://david.ncifcrf.gov/>) [16]. False discovery rate (FDR) correction was applied to overrepresented GO terms and cutoff was set to $p < 0.1$ (10%).

2.4. Real-time PCR

Validation of the microarray results by real-time PCR was performed on 4 non-Tg and 4 3xTg-AD astroglial cultures. Total RNA extraction was performed as described above. 0.5-1 µg of total RNA was retrotranscribed using random hexamers and ImProm-II RT system (Promega, Milan, Italy). Real-time PCR was performed using iTaq qPCR master mix according to manufacturer’s instructions (Bio-Rad, Segrate, Italy) on a SFX96 Real-time system (Bio-Rad). To normalize raw real-time PCR data, three housekeeping genes were tested: i) β-actin (Actin), ii) S18 ribosomal subunit and iii) polymerase (RNA) II (DNA directed) polypeptide A (RP2a). S18 showed highest stability across the samples and was used for normalization of raw data in all real-time PCR experiments. Sequences of oligonucleotide primers are provided in Supplementary Materials. The real-time PCR data are expressed as delta-C(t) of gene of interest to S18 allowing appreciation of the expression level of a single gene.

2.5. Comparison with the transcriptome database of acutely isolated purified CNS cellular models

To assess the relationship existing among our astrocyte cultures and the samples belonging to the transcriptome framework of acutely isolated purified central nervous system (CNS) cell types as provided by Cahoy et al. [17], GSE9566 series was downloaded from Gene Expression Omnibus (GEO) database (<https://www.ncbi.nlm.nih.gov/geo/>). It consisted in a transcriptome database made up of 48 independent murine samples measuring the expression levels of more than 20,000 genes. Three main CNS cell types, astrocytes, neurons and oligodendrocytes, are profiled at various postnatal ages, allowing for the identification of those enrichment patterns specifically characterizing each cell type. In particular, for this study, Affymetrix Mouse Genome 430 2.0 Array platform was used, featuring 45,037 oligonucleotide probes (representing 20,832 unique genes) per array. Text matrix file available from GEO database contained log₂ expression values that were already between-array normalized. In order to relate our expression data with those provided by Cahoy and colleagues an “early integration” approach was needed which allowed the data to merge before analysis [18]. To this purpose, the cross-platform normalization (XPN) algorithm was used

as described by Shabalin et al. in [19] to produce a single unified dataset. More in detail, Ensembl BioMart on-line application (<https://www.ensembl.org>) was used to match probes from different platforms (namely Agilent and Affymetrix) and just those 20,932 probes (12,416 unique genes) identified by Cahoy as significantly and consistently expressed in at least one CNS cell type (Supplemental Table S3 in [17]) were used to assemble the common probe-set. This procedure led to a final list of 18,135 cross-platform corresponding probes, representing 11,589 different genes (93.3% of Cahoy's filtering selection). Moreover, only the samples corresponding to one of the groups of interest were retained for XPN procedure and downstream comparison with our dataset, namely acutely isolated P17 astrocytes (n=5), cultured astroglia (n=4) and acutely isolated P16 neurons (n=3). Prior to XPN merging, expression values from each platform were column standardized (zero mean and unitary standard deviation). To reliably evaluate the distance of our samples compared to those from Cahoy's dataset—that includes many different experimental groups—non-Tg $\log_2$ expression values were separately integrated into Cahoy's dataset through XPN algorithm. This precaution allowed indeed to maximally reduce batch effect and helped to rule out possible confounding factors reflecting the inner structure of the two datasets. Specifically, the common experimental conditions adopted for tissue dissociation and cell culturing were likely to put in contact our two cellular models when clustering samples, thus possibly distorting their individual relation to Cahoy's models. Unsupervised hierarchical clustering for sample positioning assessment was performed using Euclidean metric and average linkage criterion. All dendrograms presented in the text reflect this particular choice even if other different metrics would have led to analogous results from a qualitative point of view (not shown). The analysis then proceeded as described in the Results section, searching for those particular genes that were enriched in (or shared by) non-Tg astrocytes cultures compared to the cellular models of interest present in Cahoy's dataset. All these ranked lists of differentially expressed genes were produced through a two-class unpaired rank product (RP) algorithm [20], conducted on $\log_2$ expression values as returned by XPN procedure, controlling FDR at 0.005 level as detailed in Results section. Just for the gene list-associated heatmaps, a further gene/row-wise normalization step (log-mean subtraction) was performed in order to represent the expression values of each gene in terms of $\log_2$ fold-enrichment over their mean value across all samples.

2.6. Comparison with APPswe/PS1dE9 dataset and normally aged mice

To compare our microarray dataset with the AD dataset from the APPswe/PS1dE9 double-transgenic mouse model [7], GSE74615 series was downloaded from Gene Expression Omnibus (GEO) database (<https://www.ncbi.nlm.nih.gov/geo/>). It consisted in a text matrix file containing $\log_2$ intensity values from 22 samples of cortical microglia and astrocytes isolated from 15- to 18-month-old AD and wild-type (WT) mice. RNA samples were hybridized onto Mouse GE 4x44k v2 microarrays (Agilent). In particular, each array featured 39,429 different probes, the 1% of which (399 probes) being within-array replicates, for a total of 43,020 probes per array. Downloaded data were already normalized through quantile between-array algorithm. Thanks to the presence of an internal control (WT mice), we could address this comparison avoiding the introduction of additional confounding factors by a “late integration” (or meta-analysis)

approach [18]. A cross-platform normalization between Orre’s and our dataset was indeed not suitable being the two studies representative of two different healthy and AD pathological models. Therefore, unlike what we did for integrating our dataset into the transcriptome framework provided by Cahoy and colleagues, in this case the individual microarray studies were separately processed to obtain two lists of differentially expressed genes (ranked on the basis of their *p*-values) which have been then combined in the final step of the analysis. In particular, for both dataset, differential expression of all genes among groups was tested for significance through an empirical Bayes moderated *t*-test (LIMMA/Bioconductor package). *P*-values were adjusted for multiple comparisons by using BH FDR correction and genes featuring an $\text{adj.p.val} \leq 0.05$ were marked as significant. APPswe/PS1dE9 whole dataset was employed for the empirical Bayes test, but replicate probes were finally collapsed by mean and microglia data were discarded to retain only the contrast of interest (AD astrocytes vs. WT astrocytes) for downstream comparison with our dataset (4 samples for AD and 4 samples for WT; 2,578 differentially expressed unique genes out of 39,429 different probes). Sharing the same technological platform (i.e. Agilent), the gene-matching procedure between the two datasets was straightforward. All of our 993 significant genes found a correspondence into the APPswe/PS1dE9 dataset: some of them were co- or anti-regulated genes while others genes resulted significantly regulated only in our model. The analysis of the transcriptome intersections between the two datasets then proceeded as described in the *Results*, while its statistical background is detailed in *Appendix: Common significant gene analysis*. To compare the changes in cultured 3xTg-AD astrocytes with those in young-versus-old mice reported by [21], as there is no available original dataset for young mice in GEO database, a list of 926 significantly regulated genes in aged compared to young cortical astrocytes was directly used for comparison (see Supplementary Table 3 in [21]). Official gene symbols were used for gene matching and the whole array (Agilent, Mouse GE 4x44k v2 microarray) has been used as reference for the subsequent analysis. The significance of the transcriptome intersections was assessed through the same approach already mentioned and described in *Appendix*.

2.7. Comparison with human AD dataset

The human AD reference dataset used for comparing our microarray output was made available by Berchtold et al. [22] through the publicly accessible GEO database: series accession number GSE48350. This dataset consisted of 253 samples from 4 brain regions (hippocampus, entorhinal cortex, superior frontal cortex and post-central gyrus), from both normal controls and AD patients. RNA samples were hybridized onto Affymetrix Human HgU133 plus 2.0 microarrays. In particular, each array featured 54,675 different probes and no within-array replicates. Downloaded data were already between-array normalized (GC-Robust Multi-array background adjustment and quantile normalization). Also in this case, thanks to the presence of an internal control (normal non-AD subjects), we could address this comparison between different models through the same “late integration” approach [18] already used for the comparison with APPswe/PS1dE9 double-transgenic mouse dataset. Again, individual microarray studies were separately processed to identify two lists of differentially expressed genes (ranked on the base of their *p*-values) which have been then

combined in the final step. In particular, data from Berchtold's dataset were then log₂-transformed and differential expression of all genes among the groups of interest (69- to 99-year-aged control hippocampus, n=24; 74- to 95-year-aged AD hippocampus, n=18) was tested for significance through an empirical Bayes moderated *t*-test (LIMMA/Bioconductor package). *P*-values were adjusted for multiple comparisons by using BH FDR correction and genes with an adj.p.val ≤ 0.05 were marked as significant. This procedure led to the identification of 746 differentially expressed genes. Ensembl BioMart on-line application (<https://www.ensembl.org>) was then used to find human-mouse orthologous genes and to match probes from different platforms (Agilent and Affymetrix respectively). A virtual set of 21,213 one-to-one orthologous genes was obtained (96.4% of which featuring a "high human orthology confidence"), but just 495 out of the 993 genes that were significant into our murine dataset found an orthologous correspondence within the human dataset provided by Berchtold et al. (329 genes did not featured any human orthology while 169 were not present in Berchtold's dataset). As for the previous comparison with APPswe/PS1dE9 samples, we found co-regulated genes, anti-regulated genes and genes significantly regulated only in our model. The subsequent analysis of the transcriptome intersections between the two datasets is described in the Results section while its statistical background is detailed in the Appendix *Common significant gene analysis*.

2.8. Software used for microarray analysis

Quantile normalizations and empirical Bayes moderated *t*-tests were conducted in R (using LIMMA/Bioconductor package). XPN algorithm was run in MATLAB environment using the code as provided by the author [19]. RP procedures for gene selection and unsupervised hierarchical clustering, such as unsupervised hierarchical clustering and related dendrograms were performed using MeV 4.9.0 (Multi Experiment Viewer, TM4 Software Suite) [23]. The same software was used also to draw dendrograms and heatmaps from expression data. Common significant gene analysis was performed as detailed in *Appendix* through homemade code.

3. RESULTS

3.1. 993 genes are differentially expressed in 3xTg-AD vs non-Tg cultured hippocampal astrocytes

Nine independent cultures were prepared from non-Tg or 3xTg-AD mice. Before plating, astroglial cultures were depleted of microglial cells to avoid contaminations. This resulted in virtually no microglial cells detected by anti-Iba1 immunocytochemical analysis (Fig. 1A). Five non-Tg and five 3xTg-AD cultures were processed for microarray analysis while the remaining cultures were used for validation using real-time PCR. A total of 55,681 Agilent mouse probes were analyzed. Based on our previous experience, we expected overall low changes in gene expression [9; 10]. We therefore did not apply any cut-off for fold change and considered all genes which passed BH FDR correction for multiple comparisons (Adjusted p-value, Adj.p.val) with $p \leq 0.05$. Probes representing long intergenic non-coding RNAs (lincRNA), as well as probes with no gene symbol, no gene name and no description were excluded from the selection. Such an approach yielded 993 differentially expressed genes in 3xTg-AD vs non-Tg samples (Fig. 1B). 536 genes were up-regulated and 457 genes were down-regulated. The full list of differentially expressed genes may be found in Supplementary Table 1, while the top 40 of up- and 40 down regulated genes are listed in Table 1. In total, 33 genes were used for validation by real-time PCR on 4 independent cultures. Of these, 27 genes passed validation and are listed in Supplementary Table 2. Figure 2A demonstrates the high degree of correlation between differential expression obtained in microarray and real-time PCR, while real-time PCR results of a set of 14 genes is shown in Figure 2B, demonstrating the reliability of the microarray results.

3.2. Gene Ontology analysis does not detect inflammation but impairment of cell-cell communication and transcription.

The possible biological significance of the differentially expressed genes was analyzed using DAVID online GO tool v. 6.7 (<https://david.ncifcrf.gov/>). In the up-regulated genes, the most general over-represented GO terms were *phosphoprotein*, *cytoplasm*, *alternative splicing*, *acetylation*, *transferase* and *nucleotide binding*. More specific GO terms included *mitochondrion*, *ATP binding*, *cell projection*, *Zinc finger*, *C2H2-like* and *Krueppel-associated box*, *compositionally biased region:Poly-Arg* and *vesicle* (Table 2). The down-regulated genes were specifically enriched in the following general GO terms: *phosphoprotein*, *cytoplasm*, *alternative splicing*, *cytoplasm* and *transport*. More specific over-represented GO terms were *nucleolus*, *cell projection* and *cell junction*, *calcium*, *apoptotic process*, *synapse* and *dendritic spine*, and *extrinsic apoptotic signaling pathway*. The most enriched GO terms among down-regulated genes were *EH domain*, *positive regulation of T cell mediated cytotoxicity*, *triglyceride catabolic process* and *extrinsic apoptotic signaling pathway* (Table 2). Previously, we reported that astroglial Ca^{2+} signaling is deregulated in A β -treated astrocytes [8-10] as well as in astrocytes from 3xTg-AD mice [11]. Therefore Ca^{2+} -related genes were of special interest. However, overrepresented Ca^{2+} -related genes in down-regulated hits did not contain genes of the classical “ Ca^{2+} signaling toolkit” but almost all coded for Ca^{2+} -regulated proteins involved in cell adhesion, exocytosis but mostly in formation of extracellular matrix (Table 3). Validation of these genes by real-time PCR is

shown in Figure 2. Taken together, GO analysis suggests that Ca^{2+} -regulated cell adhesion and cell-cell communication, mitochondria and transcription may be specifically deregulated in 3xTg-AD cultured astrocytes.

3.3. Comparison with cultured and freshly FACS-isolated astrocytes.

To our knowledge, there are no published reports on the transcriptional profile of cultured astrocytes from the hippocampus. Therefore, it was interesting to compare the transcriptional profile of our cultured non-Tg astrocytes with that of cultured cortical astrocytes, freshly FACS-isolated forebrain astrocytes P17 pups, or freshly isolated neurons from P16 pups provided by Cahoy and colleagues [17]. We used the Ensembl BioMart on-line application (<https://www.ensembl.org>) for matching genes between different platforms, namely Agilent Mouse GE 4x44k v2 and Affymetrix Mouse Genome 430 2.0 Arrays. This procedure led to a set of 18,135 common probes, where only those probes filtered by Cahoy as corresponding to “genes with significant expression in the CNS” (Supplemental Table S3 in [17]) were taken into account. After the two datasets were properly integrated and renormalized through XPN algorithm (see Materials and Methods), they were merged into one single dataset. Since XPN algorithm succeeded in removing the batch effect without altering the original clusterization among samples from Cahoy’s dataset (not shown), we could proceed performing an unsupervised hierarchical clustering (Euclidean distance metric and average linkage criterion) to inspect the positioning of our non-Tg astrocytes compared to the groups profiled by Cahoy et al. Figure 3A shows that our cultured astrocytes resulted more similar to the cultured and freshly isolated astroglia than in respect to any other cell type in Cahoy’s dataset. Secondly, both cultured cellular models were more similar to acutely isolated astrocytes than to neurons. Incidentally, the fact that our samples could penetrate Cahoy’s dataset, clustering with its cultured astroglia, is a good evidence that the batch effect was efficiently removed. Afterwards, we took advantage of the merged dataset to search for the most up- and down-regulated genes in our non-Tg astrocyte cultures compared to acutely isolated astrocytes. We used the rank product method (two class, unpaired) as described in [20] controlling FDR at the strict level of 0.005 to get a basic ranked list of genes representing the most enriched expression patterns in both the groups. Results are shown in Figure 3B,C respectively. In particular, we found 130 up-regulated genes in non-Tg compared to acutely isolated astrocytes (Supplementary Table 3) and 230 down-regulated genes in non-Tg compared to acutely isolated astrocytes (Supplementary Table 4). Notably, even if the statistical test was conducted only by comparing non-Tg against acutely isolated astrocytes, heatmaps clearly showed that Cahoy’s cultured astrocytes closely followed our non-Tg culture expression profiles. This is another evidence of the high degree of similarity between our cultured model and Cahoy’s, restricted in particular to those genes that are the most specific for cultured astrocytes. More in detail, 70.0% of genes enriched in our non-Tg cultures could also be found in Cahoy’s list “Genes statistically enriched in cultured astroglia compared to *in vivo* astrocytes” (Supplemental Table S21 in [17]), while 76.5% of genes down-regulated in non-Tg could also be found in Cahoy’s list “Genes statistically enriched in *in vivo* astrocytes compared to cultured astroglia” (Supplemental Table S20 in [17]). Taken together, these two percentages give an estimate of the technical

reproducibility and the biological variability of *in vitro* astrocyte cell cultures. On the other hand, a complementary list of the most up- and down-regulated genes in our non-Tg cultures compared to Cahoy’s cultured astroglia (two class unpaired rank product, FDR=0.005) is provided as supplementary material (Supplementary Tables 5 and 6). As a final qualitative remark, the expression profile of acutely isolated neurons (right side of the heatmaps, Figure 3B,C) also shows how most of the genes that are differentially expressed in non-Tg cultures compared to acutely isolated astrocytes can be indeed ascribable to a neuronal phenotype.

3.4. Comparison with isolated astrocytes from symptomatic AD or normally aged mice

Notably, in cultures from 3xTg-AD, genes involved in immune responses were largely unchanged. This is in sharp contrast with changes occurring in aged plaque stage (15 mo of age) APPswe/PS1dE9 AD mice [7] in which the most prominent change was the up-regulation of a large list of genes related to different aspects of inflammation. We therefore compared our genes with the publicly available dataset by [7] (GEO database accession number: GSE74615). To this purpose, APPswe/PS1dE9 dataset was downloaded and the empirical Bayes method (LIMMA) was used to assess the significance of differential expression of all genes among groups. After *p*-values were adjusted through BH procedure, genes with an adj.p.val ≤ 0.05 were marked as significant. While the original APPswe/PS1dE9 dataset included both cortical astrocyte and microglia samples, only the astrocyte data were retained for use in the following meta-analysis (see *Materials and Methods*).

Each one of the 993 genes we found to be significantly regulated in our model had a direct correspondence within Orre’s dataset. In particular the comparison between 3xTg-AD significant genes and APPswe/PS1dE9 dataset allowed to define 6 distinct categories of genes corresponding to 3 relationships between the datasets (see heatmaps and table in Figure 5 for a graphical summary): 1) significantly co-regulated genes (total 50, upward 23, downward 27); 2) significantly changed only in 3xTg-AD astrocytes (total 882; up-regulated 486, down-regulated 396); and 3) genes oppositely regulated in 3xTg-AD and APPswePS1dE9 astrocytes (total 61, up-to-down 27, down-to-up 34). Notably, this kind of analysis could have been alternatively addressed through a K-means algorithm, but in that case the resulting 6 clusters would have been based merely on log₂FC expression values, and all the information related to the *p*-values of the second dataset (APPswe/PS1dE9) would have been ignored. Conversely, to find the common and the specific gene signature of the two pathological models compared, we preferred clustering genes using the more rigorous criterion of the statistical significance compared their own whole dataset. Although a number of methods for the meta-analysis of combined lists of *p*-values from two or more studies exist [18; 24], some of them (e.g. Fisher’s, Stouffer’s, minP) are too liberal for our purpose—since genes having small *p*-values in just one study are likely to be detected as globally significant—while others (such as maxP) are conservative but too naïve, not addressing the problem of distinguishing concordant and discordant expression fold changes [18], nor the problem of randomly shared genes. In fact, it should be considered that when two datasets are compared in terms of shared significant genes, a certain number of co-/anti-regulated genes is expected to

arise just by chance. For this reason, here we propose a novel method for the meta-analysis of p -valued lists of genes drawn from two different studies. The procedure makes use of a simple randomized null model based on the binomial distribution to determine which (if any) of the 6 relational categories of genes was significantly enriched (see *Common significant gene analysis* in Appendix). Overall, this method is useful to compare differentially regulated genes between two studies in order to find their “log₂FC-signed” intersections and their statistical significance according to quite conservative criteria.

With reference to the table in Figure 4, the central column contains all genes we found significantly changed only in 3xTg-AD astrocytes (Up-Zero and Down-Zero). All these 882 genes can be considered, as a whole, specific for cultured 3xTg-AD astrocytes, possibly representing early FAD-related alterations. They can also be used for further analysis (such as biological validation through GO analysis, see below) regardless of their categorical p -value. However, the smaller the p -value, the more likely that the two AD models compared have a substantial overlap, because the number of significant non-shared genes is too low if compared to the null model. In other words, the number of common genes differentially expressed is too high compared to a random expression pattern, such as that resulting from comparing two completely independent disease models. In our case the very low p -value assigned to the category of genes significantly downregulated only in 3xTg-AD suggests that at least one of the two other categories of co-regulated and anti-regulated genes (left and right column respectively) were enriched. This allowed us to search for those processes that are in common for both models of early and late AD. In particular, we found 27 common genes significantly down-regulated in both the dataset (Down-Down, expected value=14.9; categorical p -value = 0.003) and 34 genes significantly down-regulated in 3xTg-AD and significantly up-regulated in APPswe/PS1dE9 astrocytes (Down-Up, expected value=22.6; categorical p -value = 0.013).

To analyze the biological significance of genes specific for primary astrocytes from 3xTgAD mice we first fed to DAVID GO tool a list of 882 genes that were not changed in APPswe/PS1dE9 astrocytes (Supplementary Table 7) regardless they were up or down-regulated. These genes constitute the major part (89%) of all differentially expressed genes of our dataset, therefore, expectedly, enriched GO terms (Supplementary Table 8) overlapped significantly with those found during the initial analysis (Table 2). This suggests that in the 3xTg-AD cultured astrocytes the altered astroglial functions differ substantially from those altered later on, when deposition of A β aggregates is fully expressed. These alterations comprise genes and functions described by GO terms *phosphoproteins*, *cytoplasm*, *alternative splicing*, *nucleotide* and *ATP binding*, *transferase activity*, *mitochondrion*, *cell projection*, *apoptotic process*, *magnesium*, *Kruppel associated box* and *KRAB*.

Next, we analyzed GO significance of two small categories (co-regulated and anti-regulated) in which the number of common genes significantly differed from expected values (Figure 5). In the list of co-down-regulated genes (Down-Down, Figure 5) GO analysis failed to find significantly enriched GO terms. However, in the list of 34 anti-regulated genes (down 3xTg-AD and up in APPswe/PS1dE9 astrocytes, Down-Up) there were 5 GO terms with significantly enriched genes: *membrane*, *nucleolus*, *ribosomal*

protein, structural constituent of ribosome, and ribonucleoprotein (Supplementary Table 8), suggesting that ribosomes may be altered in both, pre-plaque and plaque AD stages, but the direction of these alterations is somewhat opposed.

In parallel with APPswe/PS1dE9 dataset it was interesting to explore if cultured 3xTg-AD astrocytes may have common/divergent features with astrocytes from mice subjected to normal ageing from 2.5 to 18 months [21]. The comparison between 3xTg-AD and Orre’s dataset of young-versus-old mice led to the detection of 38 common genes, but none of the 6 previously defined relational categories resulted in a significant enrichment compared to random configuration (see Supplementary Table 9). The absence of significant overlap between our AD model and the physiological aging picture provided by Orre and colleagues [21], suggests that the alterations detected in cultures of 3xTg-AD astrocytes may be specific for AD. It is worth noting that, unlike the previous case, for this comparison a list of differentially expressed genes was used as reported by the authors (see *Materials and Methods*). To build the statistical null model we could refer only to the full dimension of the array used by Orre in his study (Agilent, Mouse GE 4x44k v2 microarrays, $n_y=39,429$ different probes), which has likely led to an overestimation of the size of the dataset, and, as a consequence, to an overestimation of all the enrichment scores (see *Appendix*). Therefore, though no significant overlap have been ultimately detected after correction of p-values for multiple comparisons (as described in *Appendix*), this comparison should be considered merely as an exploratory analysis.

3.5. Comparison with human AD microarray

A this point it was interesting to explore if the changes found in cultured 3xTg-AD astrocytes may have had common/divergent features with the changes observed in postmortem biopsies from symptomatic AD patients. The hypothesis was that this was unlikely to occur, as cultures possibly represent early changes. For this, we downloaded from GEO database the dataset contributed by Berchtold et al. [22] (series accession number: GSE48350). This dataset featured samples from normal controls (young and aged) and AD cases, from 4 brain regions (hippocampus, entorhinal cortex, superior frontal cortex, post-central gyrus). After the assessment of the differential expression (LIMMA/empirical Bayes) and *p*-values adjustment for multiple comparisons (BH procedure), genes with an $\text{adj.p.val} \leq 0.05$ were marked as significant. Then we restricted our analysis to the groups of interest, retaining just hippocampal samples from both aged control subjects ($n=24$) and aged AD patients ($n=18$). During the gene-matching procedure (see *Materials and Methods* for details) we searched for those genes that met the following requirements: i) belonged to the subset of the genes significantly regulated in our mouse dataset; ii) featured at least one human orthologous gene iii) were present (as orthologous gene) within the Berchtold’s human dataset. Because of these necessary prerequisites, the pool of significant genes available for comparison with the human dataset decreased from 993 to 495.

Starting from this set of selected genes, the analysis proceeded according to the same methods already described in the previous section and following the same statistical approach. Contrary to what emerged from the comparison with the APPswe/PS1dE9 model, in this case we were not able to find any particular type of enrichment in any of the 6 relational categories previously described. In other words, the empirical configuration of the common significant genes was precisely predicted by the null model, thus suggesting a substantial independence of the two datasets (Supplementary Table 10). While, on the one hand, this negative result can be an indication of the large number of different biological parameters distinguishing the two models compared (mouse vs. human, astrocytes vs. whole-tissue samples, young vs. aged, familial AD vs. sporadic AD), it may also confirm the transcriptional specificity of early astroglial changes compared to the late astroglial changes. Moreover, the near-perfect agreement between empirical and expected values demonstrates the high predictive power of our null model in the case of uncorrelated datasets, and hence the substantial validity of this statistical approach.

4. DISCUSSION

In the present report we have investigated transcriptional alterations in purified cultures of hippocampal astrocytes of 3xTg-AD mice. An obvious limitation of this work is the use of astrocytes in culture, which raises concerns on (i) to which extent the changes in gene expression in cultures reflect the changes occurring in astrocytes *in vivo*, and (ii) to which extent the cultured astrocytes from FAD mice models represent AD. With regard to the first point, while it has been reported that in defined growing conditions gene profiles of cultured astrocytes in different aspects reliably replicate those of freshly isolated astrocytes ([25] and refs therein), our first objective was not to replicate gene expression of astrocytes *in vivo*, but to find the early FAD-related transcriptional signature specific to astrocytes in the hippocampal region as compared with non-Tg astrocytes. With this aim the purity of astrocytes in culture was our first concern because small contaminations of astrocytes with microglial cells would result in the emergence of transcripts related to inflammation. This was successfully achieved by eliminating microglia with anti-CD11b beads. Regarding the second point, we reasoned that astroglial cultures prepared from newborn mouse pups may represent a proxy model for early, pre-plaque, AD because the changes (if any) would have been due to the FAD-related mutations but not due to the burden of A β species. Of the three mutations present in 3xTg-AD mice, PS1_{M146V} mutation has been introduced by knock-in of a point mutation of in the PS1 gene and is ubiquitous as it is under the control of the endogenous PS1 promoter [26]. The other mutations, APPswe and Tau_{P301L} have been added later as overexpressing human transgenes under the control of Thy-1.2 promoter, which is considered to be neuronal [12]. Therefore, *in vivo* the effect of the PS1_{M146V} mutation should have direct consequences on astroglial biology, while the effects of APP and Tau mutations should be indirect. In cultured astrocytes, the changes (if any) should be a consequence of PS1 mutation, while the effects of APP and Tau mutations appear to be less probable or indirect, driven by priming before explant.

In contrast to works reporting proinflammatory phenotypes in cultured astrocytes from FAD mouse models [27] as well as in A β -exposed astrocytes [28], in our highly purified astroglial cultures from 3xTg-AD hippocampi we found substantially no changes in inflammatory genes with down-regulation of a few genes related to positive regulation of T cell mediated cytotoxicity. Recently, however, we have found that transforming growth factor β (TGF- β) is released by cultured hippocampal astrocytes [29]. Now this observation is corroborated by the finding that TGF- β 2 and TGF- β 3 are expressed at high levels in hippocampal astrocytes and TGF- β 3 is significantly up-regulated in 3xTg-AD with regard to non-Tg astrocytes.

Among highly up-regulated genes in 3xTg-Ad astrocytes the only gene relative to the immune system was C-C motif chemokine ligand 27a (Ccl27a), a member of the β -chemokine family of proinflammatory mediators [30]. However, a closer examination of the 3 probes in the Agilent array for this cytokine, all of which were up-regulated, shows that two probes detected a splice variant of Ccl27a in which the signal peptide was replaced with an alternative stretch of amino acids that allows for nuclear targeting of this isoform. This nucleus-targeted Ccl27a variant, which is called PESKY [30] is the most expressed isoform in primary astrocytes and is able to modulate gene transcription [31]. This finding corroborates the hypothesis that transcriptional reprogramming occurs in 3xTg-AD astrocytes as well as the absence of inflammation. Our results suggest that hippocampal astrocytes from a mouse FAD model are unable to mount a pro-inflammatory phenotype in a cell-autonomous manner. The setup of inflammation likely requires participation of microglial cells which, together with astrocytes, upon exposure to activating stimuli, like A β , undergo cascading reactions which result in activation of both microglial and astroglial cells [32]. Such a scenario may be illustrated by a recent report by Balducci et al. [33] in which acute *in vivo* intraventricular delivery of oligomeric A β induced rapid and long-lasting inflammatory reactions with astroglial expression of pro-inflammatory cytokines. Such an observation also highlights that the strength of our model, i.e. purified astrocytes, on the other hand limits the possibility to evaluate the relationship between cell types in early AD. In this regard it is interesting to note that in late stages AD pathology patients with APOE ϵ 4 allele astrocytes exhibited alterations in genes related to cell adhesion and signaling pathways including calcium signaling and insulin signaling, while changes in expression of inflammatory genes were not reported [34].

Previously, we have suggested that astroglial degeneration, occurring in the very early AD stages, may be linked to deregulated astroglial Ca²⁺ signaling [5; 35]. Reasonably, astroglial degeneration is likely to be associated with the absence or the repression of inflammatory processes, while it would be hardly reconcilable with inflammation. Instead, at later AD stages, in which the inflammatory phenotype is fully expressed [7], astrocytes are found to be reactive and hypertrophic [2].

GO analysis of our dataset suggests that physiological processes and functions which are likely to be altered in 3xTg-AD astrocytes are: phosphorylation, transcription, mitochondrial structure and function, calcium-regulated cell adhesion and cell-cell communication. A survey of the literature suggests that alterations in all these functions occur in symptomatic AD [36; 37]. Considering astroglial cultures from new-born pups a

proxy model for the early developing pre-plaque AD, our analysis suggests that phosphorylation, mitochondria, cell adhesion and cell-cell communication are among the first to be altered in astrocytes. In particular, alterations in phosphorylation cascades and in autophagy which are controlled by mammalian target of rapamycin complex 1 (mTORC1) are emerging as possible causes of metabolic dysregulation in neurodegenerative diseases including AD [36; 38; 39]. In this regard, of note is one of the most down-regulated genes in 3xTg-AD astrocytes, Sterile alpha motif domain containing protein 4 (Samd4). Samd4 is a mammalian homolog of *Drosophila* Smaug gene coding for a protein able to bind RNA and repress translation [40]. While the function of Samd4 in mammalian cells, including astrocytes, is largely unknown, it has recently been reported that mice with missense mutation of Samd4 were exceptionally thin and had severe deficiency in metabolic homeostasis and mTORC1 signaling [41]. Our finding that a protein required for the mTORC1 signaling is strongly downregulated in FAD-expressing astrocytes suggests that such a deregulation may initiate early in AD pathogenesis.

One important feature of late AD, as it has been shown on FACS-isolated astrocytes, is the down-regulation of genes involved in cellular communication and neuronal support [7]. In our dataset, in contrast to genes coding for inflammatory mediators, we found that many gene which code for proteins involved in exocytosis, formation of processes and extracellular matrix, which generally may be involved in communication with surrounding cells and support to neurons, are massively down-regulated in 3xTg-AD astrocytes. This suggests that the impairment of communication between astrocytes and other cells in the brain may begin very early in AD. In line with this observation, Stenovec et al [42] reported impaired vesicle dynamics and reduced evoked secretion of a neuroactive peptide atrial natriuretic peptide in 3xTg-AD cultured astrocytes. These alterations were attributed to mutations in PS1. The impairment of cell-cell communication, in concomitance with compromised housekeeping functions may be at the basis of early astroglial pathology that, in turn, accelerates the impairment in synaptic transmission [43].

Comparison of the dataset presented in this work with the dataset obtained from astrocytes isolated from plaque-stage symptomatic APP^{swe}/PS1^{dE9} AD mice [7] shows that most altered genes (89%) were specific for cultured astrocytes and were not changed in APP^{swe}/PS1^{dE9} mice. This suggests that (1) in cultured 3xTg-AD astrocytes as a proxy for early AD, FAD-mutations produce a unique signature of transcriptional remodeling which may be related to changes occurring early in AD; and (2) dynamics of astroglial remodeling are likely to change significantly during AD progression. Alongside the AD-related changes, astrocytes are involved in ageing. Transcriptional changes in AD, however, differ from those related to ageing by exacerbated inflammatory response and increased dysfunction [7; 21]. Our attempt to compare alterations in cultured 3xTg-AD astrocytes with the aged-vs-young changes in mice suggests that FAD-mutations in cultured astrocytes produce changes which are more related to AD pathology than to normal ageing. Considering that in different brain areas the dynamics of AD-related pathology are brain region-specific [5; 11], it is interesting to note that in humans, astrocytic genes, which are mostly expressed during ageing tend to lose their region specificity undergoing global up-regulation [44].

While in AD neuropathological changes are not always followed by cognitive deficit, and cognitively normal subjects may have deposition of amyloid plaques and development of neurofibrillary tangles, it appears important to correlate cognitive damage with astroglial gene expression profile. Such an attempt has been recently made by Barbash and colleagues [45]. In contrast to neuronal and oligodendrocytic genes, which were up-regulated and down-regulated, respectively, in non-demented patients with AD neuropathology, astroglial and microglial genes were up-regulated in both demented and non-demented AD patients as compared with healthy subjects. These results may be interpreted as there is no correlation in astroglial overall transcriptome changes and cognitive damage, but only with neuropathology [45]. However, more detailed examination of functional significance of changed genes is necessary for further understanding of their relation cognitive damage in AD. In this report we analyze the alterations in primary astroglial cultures of FAD-expressing mouse pups, which likely reflect the early stages of AD and may determine or even delay development of both neuropathological and cognitive alterations.

Conclusion

Astrocytes, which are the principal housekeeping and homeostatic cells in the brain, are intimately involved in the pathogenesis of neurodegenerative diseases including AD. The spatio-temporal pattern of astroglial alterations in AD is likely to be complex and in the early, pre-symptomatic disease stages include astrodegeneration and atrophy [5]. In this work we used cultured hippocampal astrocytes from 3xTg-AD mice as a proxy model of early astrocyte involvement in FAD to investigate transcriptional alterations that may characterize early AD using whole-genome microarray technology and subsequent bioinformatics approaches. Our results indicate that, in astrocytes, FAD mutations produce a pattern of alterations which is distinct from that reported in astrocytes at later stages, although a number of genes appear to be common in the two mouse models. Our data reinforce and provide new details to the hypothesis of the early involvement of astrocytes in AD pathogenesis and emphasize the importance of its further investigation.

Appendix

Common significant gene analysis

Given a statistical criterion for significance assessment and a dataset X featuring x_s significantly regulated genes, one might be interested in comparing it with another dataset Y (containing at least each of the x_s genes) in order to find out how many of those x_s genes are also significantly regulated in Y and how much this overlap is likely to be random, rather than representative of a meaningful common transcriptional pattern.

We say:

- x_{up} and x_{down} the number of genes significantly up- and down-regulated in the dataset X, being $x_s = x_{up} + x_{down}$ the total number of genes that passed the test for significance assessment within dataset X;
- y_{up} and y_{down} the number of genes significantly up- and down-regulated in the dataset Y, being $y_s = y_{up} + y_{down}$ the total number of genes that passed the test for significance assessment within dataset Y;
- n_y the total number of genes present in Y dataset; it will be necessarily $n_y \geq y_s$, even if typically is $n_y \gg y_s$; moreover, since Y contains each of the x_s genes by hypothesis, it will also be $n_y \geq x_s$;
- $E[z]$ the expectation value of the discrete random variable z.

In this problem we can have basically 6 categories of genes:

UU	$U0$	UD
DD	$D0$	DU

- UU = experimental number of genes that are significantly up-regulated in X and significantly up-regulated in Y (upward co-regulation);
- DD = experimental number of genes that are significantly down-regulated in X and significantly down-regulated in Y (downward co-regulation);
- $U0$ = experimental number of genes that are significantly up-regulated in X but are not significant in Y (“up-to-zero”);
- $D0$ = experimental number of genes that are significantly down-regulated in X but are not significant in Y (“down-to-zero”);
- UD = experimental number of genes that are significantly up-regulated in X and significantly down-regulated in Y (“up-to-down” anti-regulation);
- DU = experimental number of genes that are significantly down-regulated in X and significantly up-regulated in Y (“down-to-up” anti-regulation).

Notice that the problem we are addressing is not fully symmetrical in that we are not interested in those genes that are not significant in X (typically X is the dataset to be studied, while Y is an auxiliary dataset used as a reference, comparison or control). Also notice that x_s does not necessarily have to be the full set of significantly regulated genes in X, but just the largest subset suitable for the comparison (i.e.: {significant genes in X} $\cap$ Y).

If X and Y are independent (e.g. they describe the transcriptome of two completely unrelated pathologies) there should not be any correlation between them, that is to say that significant genes are randomly distributed in the two datasets (at least mutually). Using the previous notations, assuming that X and Y are independent and that both X and Y provide a uniform (even though incomplete) coverage of the transcriptome, starting from the experimental occurrences of the genes called as significant, we can easily

predict how many genes we should expect to find by chance in each one of the 6 categories (lower case is used to indicate a discrete random variable):

$\mathbf{E}[uu] = x_{up} \frac{y_{up}}{n_y}$	$\mathbf{E}[u0] = x_{up} \left(1 - \frac{y_s}{n_y}\right)$	$\mathbf{E}[ud] = x_{up} \frac{y_{down}}{n_y}$
$\mathbf{E}[dd] = x_{down} \frac{y_{down}}{n_y}$	$\mathbf{E}[d0] = x_{down} \left(1 - \frac{y_s}{n_y}\right)$	$\mathbf{E}[du] = x_{down} \frac{y_{up}}{n_y}$

By this way we can define a randomized null model based on the empirical proportions of significant genes in X and Y, the only assumption being the mutually independence of X and Y. In order to compare empirical data $\{UU, U0, UD, DD, D0, DU\}$ to the expected values predicted by the null model, we also need a statistical model describing how the 6 random variables $\{uu, u0, ud, dd, d0, du\}$ distribute around their expected values. Binomial distribution can be used to this purpose: $Pr(k) = \binom{n}{k} p^k (1-p)^{n-k}$, where $\binom{n}{k} = \frac{n!}{k!(n-k)!}$ is the binomial coefficient, represents the probability mass function describing the probability of getting exactly k successes in n trials, p being the probability of a single success in a single trial. In our case a success is intended to be one of the 6 possible gene combinations, n is x_{up} or x_{down} , while p is equal to y_{up}/n_y rather than y_{down}/n_y , depending on the particular combination of interest. So we have:

$$Pr(uu = k) = \binom{x_{up}}{k} \left(\frac{y_{up}}{n_y}\right)^k \left(1 - \frac{y_{up}}{n_y}\right)^{x_{up}-k},$$

$$Pr(u0 = k) = \binom{x_{up}}{k} \left(1 - \frac{y_s}{n_y}\right)^k \left(\frac{y_s}{n_y}\right)^{x_{up}-k},$$

$$Pr(ud = k) = \binom{x_{up}}{k} \left(\frac{y_{down}}{n_y}\right)^k \left(1 - \frac{y_{down}}{n_y}\right)^{x_{up}-k},$$

$$Pr(dd = k) = \binom{x_{down}}{k} \left(\frac{y_{down}}{n_y}\right)^k \left(1 - \frac{y_{down}}{n_y}\right)^{x_{down}-k},$$

$$Pr(d0 = k) = \binom{x_{down}}{k} \left(1 - \frac{y_s}{n_y}\right)^k \left(\frac{y_s}{n_y}\right)^{x_{down}-k},$$

$$Pr(du = k) = \binom{x_{down}}{k} \left(\frac{y_{up}}{n_y}\right)^k \left(1 - \frac{y_{up}}{n_y}\right)^{x_{down}-k}.$$

Notice that, being $\mathbf{E}[k] = np$ the mean of a binomially distributed random variable, these probability mass functions are consistent with the expectation values already showed in table.

Actually, in order to estimate the probability of see a particular experimental configuration $\{UU, U0, UD, DD, D0, DU\}$ under the null hypothesis that X and Y are independent, we are more interested in the cumulative distribution functions, rather than probability mass functions. In particular, for the first combination UU , we have:

$$Pr(uu \geq UU) = \sum_{k=UU}^{x_{up}} \binom{x_{up}}{k} \left(\frac{y_{up}}{n_y}\right)^k \left(1 - \frac{y_{up}}{n_y}\right)^{x_{up}-k}.$$

Notably, $Pr(uu \geq UU)$ can be regarded as a p -value concerning the enrichment of the entire category containing those genes that are significantly up-regulated in both X and Y (upward co-regulation). We call it “categorical p -value” (to distinguish it from ordinary p -values referred to individual genes) since it answers

the question: “How likely is it to have UU (or more) genes upwardly co-regulated, under the hypothesis that significant genes are randomly distributed in the two datasets?”

While the same can be said for the other “lateral” categories of genes (UD , DD and DU), the interest in the two “central” categories (those featuring genes that are significantly regulated only in X) concerns their possible “impoverishment” rather than enrichment. In this case, the statistical significance (categorical p -value) can be calculated as follow:

$$Pr(u0 \leq U0) = \sum_{k=0}^{U0} \binom{x_{up}}{k} \left(1 - \frac{y_s}{n_y}\right)^k \left(\frac{y_s}{n_y}\right)^{x_{up}-k}, \text{ and analogously for } D0.$$

Notice that, in this kind of problem, the 6 categories of interest are not mutually independent. In particular, because of the 2 constraints $x_{up} = uu + ud + u0$ and $x_{down} = dd + du + d0$ only 4 categories out of 6 are actually independent, and the same applies to the enrichment hypothesis tests. Thus, since each comparative analysis of two datasets implies 4 independent hypothesis tests, we can adjust categorical p -values for multiple comparisons according to the usual correction techniques: $\text{Adj.p.val} = 4 \cdot p\text{-value}$ (Bonferroni), $\text{Adj.p.val} = 1 - (1 - p\text{-value})^4$ (Dunn–Šidák), etc.

Incidentally, because of the same two constraints cited above, the expectation values of the central categories could be alternatively computed as:

$$E[u0] = x_{up} - E[uu] - E[ud],$$

$$E[d0] = x_{down} - E[dd] - E[du].$$

Even if the two categories $U0$ and $D0$ can be further explored and biologically validated regardless of their categorical p -values (simply because they are in any case the containers of the specific gene signature, namely those genes specific for the condition studied by X respect to Y), a significant impoverishment of one of them is suggestive of some kind of correlation between X and Y (and hence between the pathologies or treatments they represent). On the contrary, the p -values assigned to the lateral categories allow to precisely locate any possible (and statistically significant) overlap of the two dataset (common gene signature), and further investigations should not be justified in the absence of a sufficiently low categorical p -value.

Legends

Figure 1. Microarray setup. **A**, Immunofluorescence photographs showing astrocytes marked with GFAP (green) and microglial cells marked with Iba1 (red) antibody. Note the absence of microglia after MACS using anti-CD11b-conjugated beads. Bar, 40 μm . **B**, a scheme of the microarray setup.

Figure 2. Real-time PCR validation of microarray results. **A**, real-time PCR validation of genes emerged in microarray was performed on four independent astrocyte cultures. X-axis shows microarray $\log_2$ fold change ($\log\text{FC}$) of 3xTg-AD vs non-Tg astrocytes, while y-axis shows $\log\text{FC}$ of real-time PCR, $n = 23$ genes. **B**, scatterplots of 14 genes exemplifying the results of real-time PCR validation. Data are expressed as mean $\pm$ SD $\Delta C_{(t)}$ of 4 samples each run in triplicate.

Figure 3. Comparison with acutely isolated CNS cellular models. **(A)** Dendrogram showing the positioning of non-Tg astrocyte cultures compared to the other cellular models present the transcriptome database provided by Cahoy et al. (Astros = acutely isolated astrocytes; Neurons = acutely isolated neurons). Dendrograms were obtained through unsupervised hierarchical clustering (Euclidean metric, average linkage). Cahoy's cellular model are labeled in blue. **(B)** Heatmaps of the 130 most upregulated genes in non-Tg compared to acutely isolated astrocytes (Astros). See Supplementary Table 3 for "Genes enriched in non-Tg compared to acutely isolated astrocytes". **(C)** Heatmaps of the 230 most downregulated genes in non-Tg compared to acutely isolated astrocytes (Astros). See Supplementary Table 4 for "Genes enriched in acutely isolated astrocytes compared to non-Tg". Notice the high degree of similarity between our cultured model and Cahoy's cultured astroglia. Both heatmaps (and the corresponding gene lists) were obtained through a RP procedure ($\text{FDR} \leq 0.005$, two class, unpaired). Expression data were lastly gene-wise normalized (log-mean subtraction) to represent the expression values of each gene in terms of $\log_2$ fold-enrichment over their mean value across all samples.

Figure 4. Comparison with isolated astrocytes from symptomatic APP^{swe}/PS1^{dE9} AD mice. The results of the statistical comparison between present microarray dataset and the dataset provided by Orre et al. (2014) are reported in table, according to the 6-category template, the conventional notation and the null model introduced in *Materials and Methods* section and detailed in *Appendix (Common significant gene analysis)*. In particular, in each box of the table are, from top to bottom, the actual (experimental) number of genes belonging to that particular category, the expectation value according to the null model and the related categorical p -value. Above and below the table are the $\log_2\text{FC}$ color-coded heatmaps of the top-20 regulated genes for each category ($X = 3\text{xTg-AD vs non-Tg dataset}$; $Y = \text{APP}^{\text{swe}}/\text{PS1}^{\text{dE9}} \text{ AD vs WT dataset}$). At the bottom of the Figure, as an example for the first category (Up-Up = upward co-regulated genes) provided the complete procedure for the calculation of the expectation value and the categorical p -value from the null model is shown. Following the arrow: **(1)** the binomial probability mass function representing the null model for the set of upward co-regulated genes (as given in *Appendix: Common significant gene analysis*); **(2)** the numerical values for the constants x_{up} , y_{up} and n_y (see *Materials and Methods*, section *Comparison with*

1.2. Common significant gene analysis

Given a statistical criterion for significance assessment and a dataset X featuring x_s significantly regulated genes, one might be interest in comparing it with another dataset Y (containing at least each of the x_s genes) in order to find out how many of those x_s genes are also significantly regulated in Y and how much this overlap is likely to be random, rather than representative of a meaningful common transcriptional pattern.

We say:

- x_{up} and x_{down} the number of genes significantly up- and down-regulated in the dataset X, being $x_s = x_{up} + x_{down}$ the total number of genes that passed the test for significance assessment within dataset X;
- y_{up} and y_{down} the number of genes significantly up- and down-regulated in the dataset Y, being $y_s = y_{up} + y_{down}$ the total number of genes that passed the test for significance assessment within dataset Y;
- n_y the total number of genes present in Y dataset; it will be necessarily $n_y \geq y_s$, even if typically is $n_y \gg y_s$;
- $E[z]$ the expectation value of the discrete random variable z .

In this problem we can have basically 6 categories of genes:

UU	$U0$	UD
DD	$D0$	DU

- UU = experimental number of genes that are significantly up-regulated in X and significantly up-regulated in Y (upward co-regulation);
- DD = experimental number of genes that are significantly down-regulated in X and significantly down-regulated in Y (downward co-regulation);
- $U0$ = experimental number of genes that are significantly up-regulated in X but are not significant in Y (“up-to-zero”);
- $D0$ = experimental number of genes that are significantly down-regulated in X but are not significant in Y (“down-to-zero”);
- UD = experimental number of genes that are significantly up-regulated in X and significantly down-regulated in Y (“up-to-down” anti-regulation);
- DU = experimental number of genes that are significantly down-regulated in X and significantly up-regulated in Y (“down-to-up” anti-regulation).

Notice that the problem we are addressing is not fully symmetrical in that we are not interested in those genes that are not significant in X (typically X is the dataset to be studied, while Y is an auxiliary dataset used as reference/comparison/control).

If X and Y are independent (e.g. they describe the transcriptome of two completely unrelated pathologies) there should not be any correlation between them, that is to say that significant genes are randomly distributed in the two datasets (at least mutually). Using the previous notations, assuming that X and Y are independent and given the experimental occurrences of significant genes present in the two dataset, we can easily predict how many genes we should expect to find by chance in each one of the 6 categories (lower case is used to indicate a discrete random variable):

$E[uu] = x_{up} \frac{y_{up}}{n_y}$	$E[u0] = x_{up} \left(1 - \frac{y_s}{n_y}\right)$	$E[ud] = x_{up} \frac{y_{down}}{n_y}$
$E[dd] = x_{down} \frac{y_{down}}{n_y}$	$E[d0] = x_{down} \left(1 - \frac{y_s}{n_y}\right)$	$E[du] = x_{down} \frac{y_{up}}{n_y}$

By this way we can define a randomized null model based on the empirical proportions of significant genes in X and Y, the only assumption being the mutually independence of X and Y. In order to compare empirical data $\{UU, U0, UD, DD, D0, DU\}$ to the expected values predicted by the null model, we also need a statistical model describing how the 6 random variables $\{uu, u0, ud, dd, d0, du\}$ distribute around their expected values. Binomial distribution can be used to this purpose: $Pr(k) = \binom{n}{k} p^k (1-p)^{n-k}$, where $\binom{n}{k} = \frac{n!}{k!(n-k)!}$ is the binomial coefficient, represents the probability mass function describing the probability of getting exactly k successes in n trials, p being the probability of a single success in a single trial. In our case a success is intended to be one of the 6 possible gene combination, n is x_{up} or x_{down} , while p is equal to y_{up}/n_y rather than y_{down}/n_y , depending on the particular combination of interest. So we have:

$$Pr(uu = k) = \binom{x_{up}}{k} \left(\frac{y_{up}}{n_y}\right)^k \left(1 - \frac{y_{up}}{n_y}\right)^{x_{up}-k},$$

$$Pr(u0 = k) = \binom{x_{up}}{k} \left(1 - \frac{y_s}{n_y}\right)^k \left(\frac{y_s}{n_y}\right)^{x_{up}-k},$$

$$Pr(ud = k) = \binom{x_{up}}{k} \left(\frac{y_{down}}{n_y}\right)^k \left(1 - \frac{y_{down}}{n_y}\right)^{x_{up}-k},$$

$$Pr(dd = k) = \binom{x_{down}}{k} \left(\frac{y_{down}}{n_y}\right)^k \left(1 - \frac{y_{down}}{n_y}\right)^{x_{down}-k},$$

$$Pr(d0 = k) = \binom{x_{down}}{k} \left(1 - \frac{y_s}{n_y}\right)^k \left(\frac{y_s}{n_y}\right)^{x_{down}-k},$$

$$Pr(du = k) = \binom{x_{down}}{k} \left(\frac{y_{up}}{n_y}\right)^k \left(1 - \frac{y_{up}}{n_y}\right)^{x_{down}-k}.$$

Notice that, being $E[k] = np$ the mean of a binomially distributed random variable, these probability mass functions are consistent with the expectation values already showed in table.

Actually, in order to estimate the probability of see a particular experimental configuration $\{UU, U0, UD, DD, D0, DU\}$ under the null hypothesis that X and Y are independent, we are more interested in the cumulative distribution functions, rather than probability mass functions. In particular, for the first combination UU , we have:

$$Pr(uu \geq UU) = \sum_{k=UU}^{x_{up}} \binom{x_{up}}{k} \left(\frac{y_{up}}{n_y}\right)^k \left(1 - \frac{y_{up}}{n_y}\right)^{x_{up}-k}.$$

Notably, $Pr(uu \geq UU)$ can be regarded as a p -value concerning the enrichment of the entire category containing those genes that are significantly up-regulated in both X and Y (upward co-regulation). We call it “categorical p -value” (to distinguish it from ordinary p -values referred to individual genes) since it answer the question: “How likely is it to have UU (or more) genes upwardly co-regulated, under the hypothesis that significant genes are randomly distributed in the two datasets?”

While the same can be said for the other “lateral” categories of genes (UD , DD and DU), the interest in the “central” categories (those featuring genes that are significantly regulated only in X) concerns their possible impoverishment rather than enrichment. In this case, the statistical significance (categorical p -value) can be calculated as follow:

$$Pr(u0 \leq U0) = \sum_{k=0}^{U0} \binom{x_{up}}{k} \left(1 - \frac{y_s}{n_y}\right)^k \left(\frac{y_s}{n_y}\right)^{x_{up}-k}, \text{ and analogously for } D0.$$

Notice that, in this kind of problem, the 6 categories of interest are not mutually independent. In particular, because of the 2 constraints $x_{up} = uu + ud + u0$ and $x_{down} = dd + du + d0$ only 4 categories out of 6 are actually independent, and the same applies to the enrichment hypothesis tests. Since each comparative analysis of two datasets implies 4 independent hypothesis tests, we can adjust categorical p -values for multiple comparisons according to the usual correction techniques: Adj.p.val = $4 \cdot p$ -value (Bonferroni), Adj.p.val = $1 - (1 - p\text{-value})^4$ (Dunn–Šidák), etc.

Incidentally, because of the same two constraints cited above, the expectation values of the central categories could be alternatively computed as:

$$E[u0] = x_{up} - E[uu] - E[ud],$$

$$E[d0] = x_{down} - E[dd] - E[du].$$

Even if the two categories $U0$ and $D0$ can be further explored and biologically validated regardless of their categorical p -values (simply because they are in any case the container of all those genes specific for the condition studied by X respect to Y), a significant impoverishment of one of them is suggestive of some kind of correlation between X and Y (and hence between the pathologies or treatments they represent). On the contrary, the p -values assigned to the lateral categories allow to precisely locate any possible (and statistically significant) overlapping of the two dataset, and further investigations are not justified in the absence of a sufficiently low categorical p -value.

g and 3xTg-AD primary hippocampal astrocytes

Description

Mus musculus tripartite motif-containing 12A (Trim12a), mRNA [NM_023835]
 Mus musculus 13 days embryo male testis cDNA, RIKEN full-length enriched library, clone:6030400B02 pr
 Mus musculus chemokine (C-C motif) ligand 27A (Ccl27a), transcript variant 1, mRNA [NM_001048179]
 Mus musculus RIKEN cDNA 2610507I01 gene (2610507I01Rik), long non-coding RNA [NR_037964]
 Mus musculus tripartite motif-containing 12A (Trim12a), mRNA [NM_023835]
 Mus musculus 16 days embryo head cDNA, RIKEN full-length enriched library, clone:C130078N14 product
 Mus musculus predicted gene, 20878 (Gm20878), mRNA [NM_001270431]
 Mus musculus microtubule-associated protein 1B (Map1b), mRNA [NM_008634]
 Mus musculus predicted gene, 20878 (Gm20878), mRNA [NM_001270431]
 Mus musculus carbonic anhydrase 9 (Car9), mRNA [NM_139305]
 Mus musculus vomeronasal 2, receptor 123 (Vmn2r123), mRNA [NM_009485]
 Mus musculus angiogenin, ribonuclease A family, member 2 (Ang2), mRNA [NM_007449]
 Mus musculus zinc finger protein 933 (Zfp933), mRNA [NM_198619]
 Mus musculus bisphosphate 3'-nucleotidase 1 (Bpnt1), mRNA [NM_011794]
 Mus musculus jumonji domain containing 7 (Jmjd7), mRNA [NM_001114637]
 Mus musculus zinc finger protein 963 (Zfp963), mRNA [NM_001200023]
 Mus musculus kallikrein 1-related peptidase b22 (Klk1b22), mRNA [NM_010114]
 Mus musculus cDNA sequence BC049715 (BC049715), mRNA [NM_178776]
 Mus musculus patched domain containing 2 (Ptchd2), mRNA [NM_001083342]
 Mus musculus carbohydrate (N-acetylgalactosamine 4-O) sulfotransferase 8 (Chst8), mRNA [NM_175140]
 Mus musculus cDNA sequence BC049715 (BC049715), mRNA [NM_178776]
 Mus musculus solute carrier family 2 (facilitated glucose transporter), member 4 (Slc2a4), mRNA [NM_009:
 Mus musculus serine/threonine kinase 3 (Stk3), mRNA [NM_019635]
 Mus musculus occludin/ELL domain containing 1 (Ocl1), mRNA [NM_029865]
 Mus musculus RIKEN cDNA 4930427A07 gene (4930427A07Rik), mRNA [NM_134041]
 Mus musculus tripartite motif-containing 34A (Trim34a), mRNA [NM_030684]
 Mus musculus angiogenin, ribonuclease A family, member 3 (Ang3), mRNA [NM_001123394]
 PREDICTED: Mus musculus tropomyosin alpha-4 chain-like (LOC102633627), misc_RNA [XR_385459]
 Mus musculus major facilitator superfamily domain containing 7B (Mfsd7b), mRNA [NM_001081259]
 Mus musculus secreted phosphoprotein 1 (Spp1), transcript variant 5, mRNA [NM_001204233]
 Mus musculus bone morphogenetic protein 4 (Bmp4), mRNA [NM_007554]
 Mus musculus kallikrein 1-related peptidase b3 (Klk1b3), mRNA [NM_008693]
 Mus musculus ST6 (alpha-N-acetyl-neuraminy-2,3-beta-galactosyl-1,3)-N-acetylgalactosaminide alpha-2,6
 Mus musculus 2-deoxyribose-5-phosphate aldolase homolog (C. elegans) (Dera), mRNA [NM_172733]
 Mus musculus coiled-coil domain containing 65 (Ccdc65), mRNA [NM_153518]
 Mus musculus phorbol-12-myristate-13-acetate-induced protein 1 (Pmaip1), mRNA [NM_021451]
 Mus musculus potassium voltage-gated channel, shaker-related subfamily, beta member 1 (Kcnab1), trans
 Mus musculus adult male tongue cDNA, RIKEN full-length enriched library, clone:2310058N22 product:unc
 Mus musculus RIKEN cDNA 9030025P20 gene (9030025P20Rik), mRNA [NM_001123370]
 Mus musculus mutL homolog 1 (E. coli) (Mlh1), mRNA [NM_026810]
 Mus musculus CD59a antigen (Cd59a), transcript variant 2, mRNA [NM_007652]
 Mus musculus leucine zipper protein 2 (Luzp2), mRNA [NM_178705]
 Mus musculus zinc finger protein 236 (Zfp236), mRNA [NM_177832]
 Mus musculus cortixin 3 (Ctxn3), mRNA [NM_001134697]
 Mus musculus chemokine (C-C motif) ligand 27A (Ccl27a), transcript variant 2 (and 1), mRNA [NM_011336]
 Mus musculus MAM domain containing 2 (Mamdc2), mRNA [NM_174857]
 Mus musculus chemokine (C-C motif) ligand 27A (Ccl27a), transcript variant 1, mRNA [NM_001048179]
 Mus musculus zinc finger protein 961 (Zfp961), mRNA [NM_001164581]
 Mus musculus podoplanin (Pdpn), transcript variant 1, mRNA [NM_010329]
 Mus musculus LanC lantibiotic synthetase component C-like 3 (bacterial) (Lancl3), mRNA [NM_173414]
 Mus musculus microtubule associated serine/threonine kinase family member 4 (Mast4), mRNA [NM_1751
 Mus musculus RIKEN cDNA 1500011B03 gene (1500011B03Rik), transcript variant 2, long non-coding RN
 Mus musculus ER membrane associated RNA degradation (Ermard), transcript variant 1, mRNA [NM_0010
 Mus musculus transmembrane protein 88 (Tmem88), mRNA [NM_025915]
 Mus musculus ER membrane associated RNA degradation (Ermard), transcript variant 1, mRNA [NM_0010
 Mus musculus myosin VIIA (Myo7a), transcript variant 2, mRNA [NM_008663]

Mus musculus tetratricopeptide repeat domain 8 (Ttc8), transcript variant 1, mRNA [NM_029553]
 Mus musculus lung RCB-0558 LLC cDNA, RIKEN full-length enriched library, clone:G730014H17 product:
 Mus musculus matrix-remodelling associated 7 (Mxra7), mRNA [NM_026280]
 PREDICTED: Mus musculus tumor necrosis factor (ligand) superfamily, member 13, opposite strand (Tnfsf
 Mus musculus centrosomal protein 76 (Cep76), mRNA [NM_001081073]
 sorting nexin 29 [Source:MGI Symbol;Acc:MGI:1921728] [ENSMUST00000134941]
 GAG_IPMAE (P31790) Retrovirus-related Gag polyprotein, partial (43%) [TC1705975]
 Mus musculus cDNA sequence BC006965 (BC006965), long non-coding RNA [NR_024085]
 Mus musculus ATPase, class V, type 10D (Atp10d), mRNA [NM_153389]
 Mus musculus angiogenin, ribonuclease A family, member 3 (Ang3), mRNA [NM_001123394]
 Mus musculus predicted gene 13152 (Gm13152), mRNA [NM_001039209]
 Mus musculus cerebral endothelial cell adhesion molecule (Cercam), mRNA [NM_207298]
 coiled-coil domain containing 32 [Source:MGI Symbol;Acc:MGI:2685477] [ENSMUST00000110834]
 Mus musculus cAMP responsive element binding protein 3 (Creb3), mRNA [NM_013497]
 Mus musculus RIKEN cDNA 1190007I07 gene (1190007I07Rik), transcript variant 1, mRNA [NM_0011355]
 Mus musculus purinergic receptor P2Y, G-protein coupled 2 (P2ry2), mRNA [NM_008773]
 Mus musculus 6 days neonate head cDNA, RIKEN full-length enriched library, clone:5430416G10 product:
 Mus musculus phosphatidylserine decarboxylase, pseudogene 3 (Pisd-ps3), non-coding RNA [NR_003518]
 Mus musculus diacylglycerol O-acyltransferase 2 (Dgat2), mRNA [NM_026384]
 Mus musculus family with sequence similarity 32, member A (Fam32a), mRNA [NM_026455]
 Mus musculus histidyl-tRNA synthetase (Hars), mRNA [NM_008214]
 Mus musculus acetyl-Coenzyme A carboxylase beta (Acacb), mRNA [NM_133904]
 Mus musculus predicted gene 3448 (Gm3448), mRNA [NM_001123367]
 Mus musculus branched chain aminotransferase 2, mitochondrial (Bcat2), transcript variant 2, mRNA [NM_
 Mus musculus carbonic anhydrase 11 (Car11), mRNA [NM_009800]
 Mus musculus immunity-related GTPase family M member 2 (Irgm2), mRNA [NM_019440]
 Mus musculus predicted gene, EG633640, mRNA (cDNA clone MGC:118117 IMAGE:6309338), complete
 Mus musculus La ribonucleoprotein domain family, member 1 (Larp1), mRNA [NM_028451]
 Mus musculus BCL2-like 15 (Bcl2l15), transcript variant 1, mRNA [NM_001142959]
 Mus musculus nuclear receptor co-repressor 2 (Ncor2), transcript variant 1, mRNA [NM_011424]
 Mus musculus adult male spinal cord cDNA, RIKEN full-length enriched library, clone:A330057J19 product:
 docking protein 7 [Source:MGI Symbol;Acc:MGI:3584043] [ENSMUST00000114270]
 Mus musculus F-box protein 44 (Fbxo44), transcript variant 1, mRNA [NM_173401]
 Mus musculus purine rich element binding protein B (Purb), mRNA [NM_011221]
 Mus musculus expressed sequence AI593442 (AI593442), transcript variant 1, mRNA [NM_001286641]
 Mus musculus DNA-damage-inducible transcript 4-like (Ddit4l), mRNA [NM_030143]
 Mus musculus wingless-related MMTV integration site 2 (Wnt2), mRNA [NM_023653]
 Mus musculus annexin A3 (Anxa3), mRNA [NM_013470]
 eukaryotic translation initiation factor 2 alpha kinase 4 [Source:MGI Symbol;Acc:MGI:1353427] [ENSMUST
 Mus musculus family with sequence similarity 154, member B (Fam154b), mRNA [NM_177894]
 Mus musculus zinc finger protein 386 (Krueppel-like) (Zfp386), transcript variant 1, mRNA [NM_001004066]
 Mus musculus ribonuclease, RNase A family 4 (Rnase4), transcript variant 1, mRNA [NM_021472]
 Mus musculus mitogen-activated protein kinase kinase 7 (Map2k7), transcript variant 1, mRNA [NM_00104
 Mus musculus zinc finger protein 672 (Zfp672), transcript variant 2, non-coding RNA [NR_028331]
 Mus musculus patched domain containing 2 (Ptchd2), mRNA [NM_001083342]
 Mus musculus small integral membrane protein 5 (Smim5), mRNA [NM_183259]
 Mus musculus dynein light chain Tctex-type 1F (Dylnl1f), transcript variant 2, mRNA [NM_001199948]
 Mus musculus solute carrier family 30 (zinc transporter), member 7 (Slc30a7), mRNA [NM_023214]
 Mus musculus tRNA nucleotidyl transferase, CCA-adding, 1 (Trnt1), transcript variant 1, mRNA [NM_00124
 Mus musculus tyrosine 3-monooxygenase/tryptophan 5-monooxygenase activation protein, zeta polypeptid
 Mus musculus RIKEN cDNA 4930444P10 gene (4930444P10Rik), mRNA [NM_001243238]
 Mus musculus START domain containing 10 (Stard10), mRNA [NM_019990]
 Mus musculus serine/threonine kinase 38 like (Stk38l), mRNA [NM_172734]
 Mus musculus RIKEN cDNA 1700001C19 gene (1700001C19Rik), transcript variant 1, mRNA [NM_029296]
 Mus musculus predicted gene 13298 (Gm13298), mRNA [NM_001085530]
 Mus musculus peptidase D (Pepd), mRNA [NM_008820]
 Mus musculus polyadenylate binding protein-interacting protein 1 (Paip1), transcript variant 1, mRNA [NM_
 Mus musculus Smith-Magenis syndrome chromosome region, candidate 8 homolog (human) (Smcr8), tran:
 PREDICTED: Mus musculus pregnancy specific glycoprotein 16 (Psg16), transcript variant X2, mRNA [XM

Mus musculus growth factor receptor bound protein 14 (Grb14), mRNA [NM_016719]
 Mus musculus predicted gene 10845 (Gm10845), long non-coding RNA [NR_033535]
 Mus musculus ribosomal protein L15 (Rpl15), mRNA [NM_025586]
 Mus musculus cDNA clone IMAGE:5065404. [BC029971]
 Mus musculus dedicator of cytokinesis 4 (Dock4), mRNA [NM_172803]
 Mus musculus retinal degeneration 3 (Rd3), transcript variant 1, mRNA [NM_023727]
 Mus musculus vimentin-type intermediate filament associated coiled-coil protein (Vmac), transcript variant
 Mus musculus predicted gene, 547127, mRNA (cDNA clone IMAGE:577088), complete cds. [BC096660]
 Mus musculus predicted gene 3448 (Gm3448), mRNA [NM_001123367]
 Mus musculus adult male olfactory brain cDNA, RIKEN full-length enriched library, clone:6430517C21 prod
 Mus musculus four and a half LIM domains 2 (Fhl2), transcript variant 1, mRNA [NM_010212]
 Mus musculus fibronectin type III domain containing 1 (Fndc1), mRNA [NM_001081416]
 Mus musculus zinc finger, B-box domain containing (Zbbx), mRNA [NM_172515]
 Mus musculus predicted gene 13157 (Gm13157), mRNA [NM_001127189]
 Mus musculus ribosomal protein L31 (Rpl31), transcript variant 3, mRNA [NM_053257]
 Mus musculus ring finger protein 41 (Rnf41), transcript variant 1, mRNA [NM_001164237]
 Mus musculus adult male aorta and vein cDNA, RIKEN full-length enriched library, clone:A530041D01 proc
 Mus musculus galactosidase, beta 1 (Glb1), transcript variant 1, mRNA [NM_009752]
 Mus musculus zinc finger protein 420 (Zfp420), mRNA [NM_172740]
 Mus musculus ribosomal protein S13 (Rps13), mRNA [NM_026533]
 Mus musculus maestro (Mro), mRNA [NM_027741]
 Mus musculus myocilin (Myoc), mRNA [NM_010865]
 Mus musculus peptidylprolyl isomerase domain and WD repeat containing 1 (Ppwd1), mRNA [NM_172807]
 Mus musculus tubulin tyrosine ligase-like family, member 2 (Ttl2), mRNA [NM_001098267]
 Mus musculus WD repeat domain 60 (Wdr60), mRNA [NM_146039]
 Mus musculus OCIA domain containing 1 (Ociad1), transcript variant 1, mRNA [NM_023429]
 Mus musculus SPEG complex locus (Speg), transcript variant 3, mRNA [NM_001085371]
 Mus musculus actin-binding LIM protein 1 (Ablim1), transcript variant 1, mRNA [NM_178688]
 Mus musculus autophagy related 16-like 2 (S. cerevisiae) (Atg16l2), mRNA [NM_001111111]
 Mus musculus 4 days neonate thymus cDNA, RIKEN full-length enriched library, clone:B630008G01 produ
 Mus musculus autophagy related 16-like 2 (S. cerevisiae) (Atg16l2), mRNA [NM_001111111]
 Mus musculus tripartite motif-containing 16 (Trim16), mRNA [NM_053169]
 Mus musculus coiled-coil domain containing 65 (Ccdc65), mRNA [NM_153518]
 Mus musculus solute carrier family 9 (sodium/hydrogen exchanger), member 3 regulator 1 (Slc9a3r1), mRN
 Mus musculus period circadian clock 1 (Per1), transcript variant 1, mRNA [NM_011065]
 Mus musculus protein kinase, cAMP dependent regulatory, type II alpha (Prkar2a), mRNA [NM_008924]
 Mus musculus predicted gene 10516 (Gm10516), long non-coding RNA [NR_033536]
 Mus musculus vomeronasal 2, receptor 121 (Vmn2r121), mRNA [NM_001100616]
 Mus musculus ets variant gene 3 (Etv3), transcript variant 1, mRNA [NM_001286844]
 Mus musculus nuclear receptor 2C2-associated protein (Nr2c2ap), transcript variant 1, mRNA [NM_001025
 Mus musculus hormonally upregulated Neu-associated kinase (Hunk), mRNA [NM_015755]
 Mus musculus asunder, spermatogenesis regulator (Asun), mRNA [NM_138757]
 Mus musculus potassium voltage-gated channel, subfamily H (eag-related), member 5 (Kcnh5), mRNA [NM
 Mus musculus chemokine (C-X-C motif) ligand 14 (Cxcl14), mRNA [NM_019568]
 Mus musculus insulin-like growth factor binding protein 3 (Igfbp3), mRNA [NM_008343]
 Mus musculus serine/threonine kinase 38 like (Stk38l), mRNA [NM_172734]
 Mus musculus epidermal growth factor receptor pathway substrate 8 (Eps8), transcript variant 1, mRNA [NI
 PREDICTED: Mus musculus uncharacterized LOC102639358 (LOC102639358), transcript variant X1, ncR
 Mus musculus signal peptidase complex subunit 3 homolog (S. cerevisiae) (Spcs3), mRNA [NM_029701]
 Mus musculus distal-less homeobox 2 (Dlx2), mRNA [NM_010054]
 Mus musculus docking protein 7 (Dok7), mRNA [NM_172708]
 Mus musculus musashi RNA-binding protein 1 (Msi1), mRNA [NM_008629]
 Mus musculus zinc finger protein 386 (Krueppel-like) (Zfp386), transcript variant 1, mRNA [NM_001004066]
 Mus musculus ATPase, class V, type 10A (Atp10a), mRNA [NM_009728]
 Mus musculus matrix-remodelling associated 7 (Mxra7), mRNA [NM_026280]
 Mus musculus dynein, axonemal, heavy chain 7A (Dnah7a), mRNA [NM_001252070]
 Mus musculus frizzled homolog 6 (Drosophila) (Fzd6), transcript variant 1, mRNA [NM_008056]
 Mus musculus serine/threonine kinase 36 (Stk36), mRNA [NM_175031]
 Mus musculus Parkinson disease (autosomal recessive, juvenile) 2, parkin (Park2), mRNA [NM_016694]

Mus musculus 2 cells egg cDNA, RIKEN full-length enriched library, clone:B020040A10 product:unclassified
 PREDICTED: Mus musculus RIKEN cDNA C230072F16 gene (C230072F16Rik), transcript variant X3, ncF
 Mus musculus dual adaptor for phosphotyrosine and 3-phosphoinositides 1 (Dapp1), mRNA [NM_011932]
 Mus musculus LYR motif containing 5 (Lyrm5), transcript variant 1, mRNA [NM_001163628]
 Mus musculus serine/threonine kinase 38 like (Stk38l), mRNA [NM_172734]
 Mus musculus DNA segment, Chr 7, ERATO Doi 143, expressed (D7Ertd143e), long non-coding RNA [NR_001166630]
 Mus musculus RIKEN cDNA 5830444B04 gene (5830444B04Rik), transcript variant 1, long non-coding RNA
 Mus musculus dynein light chain Tctex-type 1C (Dyntl1c), mRNA [NM_001166630]
 Mus musculus CDGSH iron sulfur domain 2 (Cisd2), mRNA [NM_025902]
 Mus musculus camello-like 5 (Cml5), mRNA [NM_023493]
 BB001409 RIKEN full-length enriched, 13 days embryo head Mus musculus cDNA clone 3110026C13 3'. [F0110026C13]
 Mus musculus ATP-binding cassette, sub-family D (ALD), member 1 (Abcd1), mRNA [NM_007435]
 Mus musculus phosphatidylserine decarboxylase (Pisd), mRNA [NM_177298]
 Mus musculus cat eye syndrome chromosome region, candidate 5 (Cecr5), mRNA [NM_144815]
 Mus musculus NFkB inhibitor interacting Ras-like protein 1 (Nkiras1), mRNA [NM_023526]
 Mus musculus FH2 domain containing 1 (Fhdc1), transcript variant 1, mRNA [NM_001205355]
 Mus musculus zinc finger protein 14 (Zfp14), transcript variant 1, mRNA [NM_011748]
 Mus musculus predicted gene 13298 (Gm13298), mRNA [NM_001085530]
 Mus musculus Yip1 domain family, member 4 (Yipf4), mRNA [NM_026417]
 Mus musculus kelch-like 26 (Klhl26), transcript variant 2, mRNA [NM_178771]
 Mus musculus Williams-Beuren syndrome chromosome region 17 homolog (human) (Wbscr17), mRNA [NM_001166630]
 Mus musculus sperm associated antigen 1 (Spag1), mRNA [NM_012031]
 Mus musculus cytochrome c oxidase assembly protein 18 (Cox18), transcript variant 1, mRNA [NM_001166630]
 Mus musculus DAZ interacting protein 1 (Dzip1), mRNA [NM_025943]
 Mus musculus trinucleotide repeat containing 18 (Tnrc18), transcript variant A, mRNA [NM_001122730]
 Mus musculus NLR family, pyrin domain containing 5 (Nlrp5), transcript variant 1, mRNA [NM_011860]
 Mus musculus septin 9 (Sept9), transcript variant 2, mRNA [NM_001113487]
 Mus musculus nicotinamide nucleotide transhydrogenase (Nnt), transcript variant 1, mRNA [NM_008710]
 Mus musculus 16 days neonate thymus cDNA, RIKEN full-length enriched library, clone:A130026C10 product:unclassified
 Mus musculus transmembrane protein 242 (Tmem242), mRNA [NM_027457]
 Mus musculus transmembrane protein 242 (Tmem242), mRNA [NM_027457]
 Mus musculus 16 days neonate thymus cDNA, RIKEN full-length enriched library, clone:A130009K03 product:unclassified
 Mus musculus biregional cell adhesion molecule-related/down-regulated by oncogenes (Cdon) binding protein 1 (Cdonb1), mRNA [NM_001166630]
 Mus musculus predicted gene, OTTMUSG00000016609 (OTTMUSG00000016609), mRNA [NM_0011004]
 Mus musculus dual specificity phosphatase 8 (Dusp8), mRNA [NM_008748]
 Mus musculus purine rich element binding protein B (Purb), mRNA [NM_011221]
 Mus musculus tumor necrosis factor receptor superfamily, member 11b (osteoprotegerin) (Tnfrsf11b), mRNA [NM_001166630]
 Mus musculus 2 days neonate thymus thymic cells cDNA, RIKEN full-length enriched library, clone:E4300C
 Mus musculus phosphatidylserine decarboxylase, pseudogene 1 (Pisd-ps1), non-coding RNA [NR_003517]
 Mus musculus mitochondrial ribosomal protein S7 (Mrps7), mRNA [NM_025305]
 Mus musculus polymerase (DNA directed), delta 2, regulatory subunit (Pold2), mRNA [NM_008894]
 Mus musculus trans-golgi network vesicle protein 23A (Tvp23a), mRNA [NM_001013778]
 Mus musculus F-box protein 44 (Fbxo44), transcript variant 1, mRNA [NM_173401]
 Mus musculus expressed sequence A1661453 (A1661453), mRNA [NM_145489]
 Mus musculus purine rich element binding protein B (Purb), mRNA [NM_011221]
 Mus musculus coxsackie virus and adenovirus receptor (Cxadr), transcript variant 1, mRNA [NM_0010251]
 Mus musculus a disintegrin-like and metalloproteinase (reprolysin type) with thrombospondin type 1 motif, 5
 Mus musculus INO80 homolog (S. cerevisiae) (Ino80), mRNA [NM_026574]
 Mus musculus insulin receptor (Insr), mRNA [NM_010568]
 Mus musculus 10 days embryo whole body cDNA, RIKEN full-length enriched library, clone:2600006K01 product:unclassified
 BC009829 Sin3A associated protein p30-like {Homo sapiens} (exp=-1; wgp=0; cg=0), complete [TC161034]
 Mus musculus SPEG complex locus (Speg), transcript variant 2, mRNA [NM_001085370]
 Mus musculus nicotinamide nucleotide transhydrogenase (Nnt), transcript variant 1, mRNA [NM_008710]
 Mus musculus exostoses (multiple)-like 2 (Extl2), transcript variant 1, mRNA [NM_021388]
 Mus musculus striatin, calmodulin binding protein (Strn), mRNA [NM_011500]
 Mus musculus armadillo repeat containing 6 (Armrc6), mRNA [NM_133972]
 Mus musculus glutaminyl-peptide cyclotransferase (glutaminyl cyclase) (Qpct), mRNA [NM_027455]
 Mus musculus aryl hydrocarbon receptor nuclear translocator 2 (Arnt2), mRNA [NM_007488]
 PREDICTED: Mus musculus uncharacterized LOC102633020 (LOC102633020), ncRNA [XR_382000]

1 Mus musculus dispatched homolog 2 (*Drosophila*) (*Disp2*), mRNA [NM_170593]
2 Mus musculus 0 day neonate eyeball cDNA, RIKEN full-length enriched library, clone:E130101M22 produc
3 Mus musculus NME/NM23 nucleoside diphosphate kinase 6 (*Nme6*), mRNA [NM_018757]
4 PREDICTED: Mus musculus RIKEN cDNA 3830406C13 gene (3830406C13Rik), transcript variant X1, mR
5 Mus musculus prolylcarboxypeptidase (angiotensinase C) (*Prpc*), mRNA [NM_028243]
6 Mus musculus DNA segment, Chr 16, ERATO Doi 472, expressed (D16Ert472e), transcript variant 2, mR
7 coiled-coil domain containing 107 [Source:MGI Symbol;Acc:MGI:1913423] [ENSMUST00000107922]
8 Mus musculus ribonuclease, RNase K (*Rnasek*), mRNA [NM_173742]
9 Mus musculus vacuolar protein sorting 4a (yeast) (*Vps4a*), mRNA [NM_126165]
10 Mus musculus STT3, subunit of the oligosaccharyltransferase complex, homolog B (*S. cerevisiae*) (*Stt3b*),
11 Mus musculus solute carrier family 4, sodium bicarbonate cotransporter, member 7 (*Slc4a7*), mRNA [NM_0
12 Mus musculus ezrin (*Ezr*), mRNA [NM_009510]
13 Mus musculus predicted gene 14326 (*Gm14326*), transcript variant 2, mRNA [NM_001282028]
14 Mus musculus 12 days embryo male wolffian duct includes surrounding region cDNA, RIKEN full-length en
15 predicted gene 9949 [Source:MGI Symbol;Acc:MGI:3647947] [ENSMUST00000067743]
16 Mus musculus caspase 7 (*Casp7*), mRNA [NM_007611]
17 Mus musculus post-GPI attachment to proteins 2 (*Pgap2*), transcript variant 1, mRNA [NM_001291358]
18 Mus musculus StAR-related lipid transfer (START) domain containing 6 (*Stard6*), transcript variant 1, mRN
19 Mus musculus zinc finger protein 74 (*Zfp74*), mRNA [NM_178384]
20 Mus musculus dual adaptor for phosphotyrosine and 3-phosphoinositides 1 (*Dapp1*), mRNA [NM_011932]
21 Mus musculus zinc finger protein 868 (*Zfp868*), transcript variant 1, mRNA [NM_172754]
22 Mus musculus zyg-II family member B, cell cycle regulator (*Zyg11b*), mRNA [NM_001033634]
23 Mus musculus regulatory factor X-associated ankyrin-containing protein (*Rfxank*), transcript variant 1, mRN
24 Mus musculus cysteine-serine-rich nuclear protein 1 (*Csrnp1*), mRNA [NM_153287]
25 Mus musculus KDEL (Lys-Asp-Glu-Leu) containing 1 (*Kdelc1*), mRNA [NM_023645]
26 Mus musculus vacuolar protein sorting 33A (yeast) (*Vps33a*), mRNA [NM_029929]
27 Mus musculus coiled-coil domain containing 144B (*Ccdc144b*), mRNA [NM_178418]
28 Mus musculus alpha tubulin acetyltransferase 1 (*Atat1*), transcript variant 1, mRNA [NM_001142744]
29 Mus musculus 3-oxoacyl-ACP synthase, mitochondrial (*Oxsm*), mRNA [NM_027695]
30 Mus musculus glycerol kinase (*Gyk*), transcript variant 1, mRNA [NM_008194]
31 Mus musculus D17Mia10e clone c7 mRNA, partial sequence. [U49252]
32 Mus musculus neuroepithelial cell transforming gene 1 (*Net1*), transcript variant 1, mRNA [NM_019671]
33 Mus musculus DNA segment, Chr 16, ERATO Doi 472, expressed (D16Ert472e), transcript variant 1, mR
34 Mus musculus potassium channel, subfamily K, member 2 (*Kcnk2*), transcript variant 2, mRNA [NM_01060
35 Mus musculus regulator of microtubule dynamics 3 (*Rmdn3*), mRNA [NM_001033136]
36 Mus musculus galanin receptor 2 (*Galr2*), mRNA [NM_010254]
37 Mus musculus N(alpha)-acetyltransferase 30, NatC catalytic subunit (*Naa30*), mRNA [NM_001081430]
38 Mus musculus Rho guanine nucleotide exchange factor (GEF) 39 (*Arhgef39*), mRNA [NM_001013377]
39 Mus musculus src homology three (SH3) and cysteine rich domain (*Stac*), mRNA [NM_016853]
40 Mus musculus prostate stem cell antigen (*Psca*), mRNA [NM_028216]
41 Mus musculus testis expressed 33 (*Tex33*), transcript variant 1, mRNA [NM_001163612]
42 Mus musculus adult male testis cDNA, RIKEN full-length enriched library, clone:4930439M07 product:uncl
43 Mus musculus FERM domain containing 4A (*Frmd4a*), transcript variant 2, mRNA [NM_001177843]
44 Mus musculus tubulin, delta 1 (*Tubd1*), transcript variant 1, mRNA [NM_001199045]
45 Mus musculus ribokinase (*Rbks*), mRNA [NM_153196]
46 Mus musculus suppressor of Ty 16 (*Supt16*), mRNA [NM_033618]
47 Mus musculus zinc finger protein 882 (*Zfp882*), mRNA [NM_001166645]
48 Mus musculus netrin G1 (*Ntng1*), transcript variant a, mRNA [NM_030699]
49 Mus musculus dehydrogenase/reductase (SDR family) X chromosome (*Dhrsx*), mRNA [NM_001033326]
50 Mus musculus 0 day neonate head cDNA, RIKEN full-length enriched library, clone:4833419G08 product:u
51 Mus musculus tripartite motif-containing 16 (*Trim16*), mRNA [NM_053169]
52 Mus musculus Emx2 opposite strand/antisense transcript (non-protein coding) (*Emx2os*), long non-coding l
53 Mus musculus antizyme inhibitor 1 (*Azin1*), transcript variant 2, mRNA [NM_018745]
54 tripartite motif-containing 5 [Source:MGI Symbol;Acc:MGI:3646853] [ENSMUST00000138557]
55 Mus musculus ADAMTS-like 2 (*Adamtsl2*), mRNA [NM_029981]
56 Mus musculus WD repeat domain 52 (*Wdr52*), mRNA [NM_001033247]
57 Mus musculus amyloid beta (A4) precursor protein-binding, family B, member 2 (*Apbb2*), transcript variant
58 Mus musculus zinc finger protein 931 (*Zfp931*), mRNA [NM_001162922]
59 Mus musculus predicted gene 14326 (*Gm14326*), transcript variant 1, mRNA [NM_001190302]
60

1 Mus musculus platelet-derived growth factor, C polypeptide (Pdgfc), mRNA [NM_019971]
2 PREDICTED: Mus musculus predicted gene 7967 (Gm7967), misc_RNA [XR_387291]
3 Mus musculus triosephosphate isomerase 1 (Tpi1), mRNA [NM_009415]
4 Mus musculus ubiquitin specific peptidase 36 (Usp36), mRNA [NM_001033528]
5 Mus musculus transforming growth factor, beta receptor associated protein 1 (Tgfbrap1), mRNA [NM_0010
6 Mus musculus hormonally upregulated Neu-associated kinase (Hunk), mRNA [NM_015755]
7 Mus musculus MLX interacting protein (Mlxip), transcript variant 2, mRNA [NM_133917]
8 Mus musculus tropomyosin 1, alpha (Tpm1), transcript variant 1, mRNA [NM_001164248]
9 Mus musculus mannosidase, beta A, lysosomal (Manba), mRNA [NM_027288]
10 Mus musculus insulin receptor (Insr), mRNA [NM_010568]
11 Mus musculus MIF4G domain containing (Mif4gd), transcript variant 3, mRNA [NM_001243586]
12 Mus musculus potassium voltage gated channel, Shaw-related subfamily, member 1 (Kcnc1), transcript var
13 Mus musculus cDNA sequence BC100451 (BC100451), mRNA [NM_021440]
14 Mus musculus coiled-coil domain containing 65 (Ccdc65), mRNA [NM_153518]
15 Mus musculus OTU domain containing 7A (Otud7a), mRNA [NM_130880]
16 Mus musculus cleavage stimulation factor, 3' pre-RNA, subunit 3 (Cstf3), transcript variant 1, mRNA [NM_1
17 Mus musculus 2-oxoglutarate and iron-dependent oxygenase domain containing 1 (Ogfod1), transcript vari
18 Mus musculus RIKEN cDNA 2610305D13 gene (2610305D13Rik), mRNA [NM_145078]
19 Mus musculus F-box protein 3 (Fbxo3), transcript variant 2, mRNA [NM_020593]
20 Mus musculus SMAD family member 7 (Smad7), mRNA [NM_001042660]
21 Mus musculus collagen, type XII, alpha 1 (Col12a1), mRNA [NM_001290308]
22 insulin-like growth factor binding protein 3 [Source:MGI Symbol;Acc:MGI:96438] [ENSMUST00000135887]
23 Mus musculus migration and invasion inhibitory protein (Miip), mRNA [NM_001025365]
24 Mus musculus family with sequence similarity 45, member A (Fam45a), transcript variant 1, mRNA [NM_02
25 Mus musculus p21 protein (Cdc42/Rac)-activated kinase 6 (Pak6), transcript variant 1, mRNA [NM_001033
26 Mus musculus tumor necrosis factor receptor superfamily, member 1b (Tnfrsf1b), mRNA [NM_011610]
27 Mus musculus RIKEN cDNA 2010107G23 gene (2010107G23Rik), mRNA [NM_027251]
28 Mus musculus predicted pseudogene 5523 (Gm5523), non-coding RNA [NR_004447]
29 Mus musculus asparagine-linked glycosylation 8 (alpha-1,3-glucosyltransferase) (Alg8), mRNA [NM_19903
30 Mus musculus single stranded DNA binding protein 4 (Ssbp4), mRNA [NM_133772]
31 Mus musculus RIKEN cDNA 1500015A07 gene (1500015A07Rik), long non-coding RNA [NR_029432]
32 Mus musculus transforming growth factor, beta 3 (Tgfb3), mRNA [NM_009368]
33 Mus musculus transmembrane protein 62 (Tmem62), mRNA [NM_175285]
34 Mus musculus UDP-Gal:betaGlcNAc beta 1,4-galactosyltransferase, polypeptide 4 (B4galt4), transcript var
35 Mus musculus RAB4A, member RAS oncogene family (Rab4a), mRNA [NM_009003]
36 Mus musculus predicted gene 14325 (Gm14325), mRNA [NM_001024849]
37 Mus musculus myocyte enhancer factor 2D (Mef2d), mRNA [NM_133665]
38 Mus musculus transcription elongation factor A (SII) N-terminal and central domain containing 2 (Tceanc2),
39 Mus musculus amylo-1,6-glucosidase, 4-alpha-glucanotransferase (Agl), mRNA [NM_001081326]
40 Mus musculus fragile X mental retardation, autosomal homolog 2 (Fxr2), mRNA [NM_011814]
41 Y box protein 2 [Source:MGI Symbol;Acc:MGI:1096372] [ENSMUST00000018698]
42 Mus musculus inhibitor of DNA binding 1 (Id1), mRNA [NM_010495]
43 Mus musculus 11 days pregnant adult female ovary and uterus cDNA, RIKEN full-length enriched library, c
44 Mus musculus rcd1 (required for cell differentiation) homolog 1 (S. pombe) (Rqcd1), mRNA [NM_021383]
45 Mus musculus family with sequence similarity 129, member C (Fam129c), mRNA [NM_001166213]
46 Mus musculus RNA polymerase II associated protein 1 (Rpap1), transcript variant 1, mRNA [NM_177294]
47 Mus musculus activated spleen cDNA, RIKEN full-length enriched library, clone:F830223B06 product:hypo
48 Mus musculus mitogen-activated protein kinase 1 interacting protein 1-like (Mapk1ip1l), mRNA [NM_17868
49 Mus musculus integrator complex subunit 10 (Ints10), mRNA [NM_027590]
50 Mus musculus mitogen-activated protein kinase 8 (Mapk8), mRNA [NM_016700]
51 Mus musculus ankyrin repeat and LEM domain containing 1 (Ankle1), mRNA [NM_172756]
52 Mus musculus ADAMTS-like 4 (Adamtsl4), mRNA [NM_144899]
53 Mus musculus jerky (Jrk), mRNA [NM_008415]
54 Mus musculus vacuolar protein sorting 13B (yeast) (Vps13b), mRNA [NM_177151]
55 PREDICTED: Mus musculus predicted gene 6410 (Gm6410), misc_RNA [XR_378684]
56 Mus musculus predicted gene 14305 (Gm14305), mRNA [NM_001099327]
57 Mus musculus insulin receptor (Insr), mRNA [NM_010568]
58 Mus musculus trafficking protein particle complex 5 (Trappc5), mRNA [NM_025701]
59 Mus musculus tropomyosin 1, alpha (Tpm1), transcript variant 1, mRNA [NM_001164248]
60

Mus musculus neuroepithelial cell transforming gene 1 (Net1), transcript variant 1, mRNA [NM_019671]
 Mus musculus asparaginyl-tRNA synthetase (Nars), transcript variant 2, mRNA [NM_027350]
 Mus musculus protein O-fucosyltransferase 2 (Pofut2), mRNA [NM_030262]
 Mus musculus mediator complex subunit 29 (Med29), mRNA [NM_026042]
 Mus musculus 0 day neonate eyeball cDNA, RIKEN full-length enriched library, clone:E130203P04 product
 Mus musculus RIKEN cDNA 4930539J05 gene (4930539J05Rik), long non-coding RNA [NR_030689]
 Mus musculus STT3, subunit of the oligosaccharyltransferase complex, homolog B (S. cerevisiae) (Stt3b),
 Mus musculus gap junction protein, gamma 2 (Gjc2), transcript variant 2, mRNA [NM_175452]
 Mus musculus NME/NM23 nucleoside diphosphate kinase 6 (Nme6), mRNA [NM_018757]
 Mus musculus MAD2 mitotic arrest deficient-like 2 (Mad2l2), mRNA [NM_027985]
 Mus musculus Kell blood group precursor (McLeod phenotype) homolog (Xk), mRNA [NM_023500]
 Mus musculus predicted gene 3893 (Gm3893), long non-coding RNA [NR_033506]
 Mus musculus vomeronasal 2, receptor 121 (Vmn2r121), mRNA [NM_001100616]
 Mus musculus sine oculis-related homeobox 4 (Six4), mRNA [NM_011382]
 Mus musculus mechanistic target of rapamycin (serine/threonine kinase) (Mtor), mRNA [NM_020009]
 Mus musculus PET112 homolog (S. cerevisiae) (Pet112), mRNA [NM_144896]
 Mus musculus predicted gene 14484 (Gm14484), mRNA [NM_001025260]
 Mus musculus vomeronasal 2, receptor 88 (Vmn2r88), mRNA [NM_011686]
 Mus musculus RIKEN cDNA 6030419C18 gene (6030419C18Rik), mRNA [NM_176921]
 Mus musculus NudC domain containing 3 (Nudcd3), mRNA [NM_173748]
 Mus musculus STAR-related lipid transfer (START) domain containing 6 (Stard6), transcript variant 1, mRNA
 Mus musculus RIKEN cDNA 2410141K09 gene (2410141K09Rik), transcript variant 1, mRNA [NM_001296]
 Mus musculus haloacid dehalogenase-like hydrolase domain containing 2 (Hdhd2), transcript variant 3, mRNA
 Mus musculus cysteinyl leukotriene receptor 1 (Cysltr1), transcript variant 1, mRNA [NM_021476]
 Mus musculus nuclear factor of kappa light polypeptide gene enhancer in B cells inhibitor, beta (Nfkbib), mRNA
 myosin XVIIIa [Source:MGI Symbol;Acc:MGI:2667185] [ENSMUST00000100795]
 Mus musculus predicted gene 10825 (Gm10825), long non-coding RNA [NR_028580]
 Mus musculus NADH dehydrogenase (ubiquinone) 1 alpha subcomplex assembly factor 7 (Ndufaf7), mRNA
 Mus musculus epidermal growth factor receptor pathway substrate 8 (Eps8), transcript variant 1, mRNA [NM_012962]
 PREDICTED: Mus musculus anoctamin 3 (Ano3), transcript variant X3, mRNA [XM_006499262]
 Mus musculus CREB/ATF bZIP transcription factor (Crebzf), transcript variant 1, mRNA [NM_145151]
 Mus musculus tubulin, gamma complex associated protein 4 (Tubgcp4), transcript variant 1, mRNA [NM_012962]
 Mus musculus transmembrane protein 181A (Tmem181a), mRNA [NM_001033178]
 Mus musculus activated spleen cDNA, RIKEN full-length enriched library, clone:F830048I15 product:hypot
 Mus musculus RAB4A, member RAS oncogene family (Rab4a), mRNA [NM_009003]
 Mus musculus kin of IRRE like (Drosophila) (Kirrel), transcript variant 1, mRNA [NM_001170985]
 Mus musculus EF-hand calcium binding domain 11 (Efcab11), mRNA [NM_030172]
 Mus musculus ceramide synthase 2 (Cers2), mRNA [NM_029789]
 family with sequence similarity 227, member A [Source:MGI Symbol;Acc:MGI:1922979] [ENSMUST00000100795]
 Mus musculus spermine synthase (Sms), mRNA [NM_009214]
 Mus musculus eukaryotic translation initiation factor 3, subunit J1 (Eif3j1), mRNA [NM_144545]
 Mus musculus small nuclear ribonucleoprotein N (Snrpn), transcript variant 3, mRNA [NM_001082962]
 Mus musculus IQ motif containing GTPase activating protein 2 (Iqgap2), mRNA [NM_027711]
 Mus musculus transmembrane protein 62 (Tmem62), mRNA [NM_175285]
 Mus musculus ferrochelatase (Fech), mRNA [NM_007998]
 Mus musculus 3 days neonate thymus cDNA, RIKEN full-length enriched library, clone:A630006J12 product
 Mus musculus L-2-hydroxyglutarate dehydrogenase (L2hgdh), mRNA [NM_145443]
 Mus musculus sulfatase modifying factor 2 (Sumf2), mRNA [NM_026445]
 Mus musculus RIKEN cDNA 1700104L18 gene (1700104L18Rik), long non-coding RNA [NR_108033]
 Mus musculus staufer (RNA binding protein) homolog 1 (Drosophila) (Stau1), transcript variant 3, mRNA [NM_012962]
 Mus musculus contactin 6 (Cntn6), mRNA [NM_017383]
 Mus musculus synaptic vesicle glycoprotein 2c (Sv2c), mRNA [NM_029210]
 Mus musculus valosin containing protein (Vcp), mRNA [NM_009503]
 Mus musculus 13 days embryo stomach cDNA, RIKEN full-length enriched library, clone:D530006I24 product
 Mus musculus biogenesis of lysosomal organelles complex-1, subunit 6, pallidin (Bloc1s6), mRNA [NM_012962]
 Mus musculus transmembrane and coiled-coil domains 6 (Tmco6), mRNA [NM_028036]
 Mus musculus RIKEN cDNA 4933406C10 gene (4933406C10Rik), long non-coding RNA [NR_044986]
 Mus musculus glucosaminyl (N-acetyl) transferase 2, l-branching enzyme (Gcnt2), transcript variant 3, mRNA
 Mus musculus fibroblast growth factor receptor 2 (Fgfr2), transcript variant 1, mRNA [NM_010207]

Mus musculus cDNA sequence BC026513, mRNA (cDNA clone IMAGE:4909841), partial cds. [BC039787]
 Mus musculus 13 days embryo head cDNA, RIKEN full-length enriched library, clone:3110040I23 product:F
 Mus musculus WW, C2 and coiled-coil domain containing 1 (Wwc1), mRNA [NM_170779]
 Mus musculus ataxin 2 (Atxn2), mRNA [NM_009125]
 Mus musculus RAB8A, member RAS oncogene family (Rab8a), mRNA [NM_023126]
 PREDICTED: Mus musculus RIKEN cDNA G630016G05 gene (G630016G05Rik), transcript variant X2, mi
 Mus musculus zinc finger protein 868 (Zfp868), transcript variant 1, mRNA [NM_172754]
 Mus musculus coenzyme Q5 homolog, methyltransferase (yeast) (Coq5), mRNA [NM_026504]
 leucine zipper, putative tumor suppressor 1 [Source:MGI Symbol;Acc:MGI:2684762] [ENSMUST00000185]
 Mus musculus C-type lectin domain family 2, member f (Clec2f), mRNA [NM_001277202]
 eukaryotic translation initiation factor 2 alpha kinase 4 [Source:MGI Symbol;Acc:MGI:1353427] [ENSMUST
 Mus musculus coenzyme Q5 homolog, methyltransferase (yeast) (Coq5), mRNA [NM_026504]
 sideroflexin 5 [Source:MGI Symbol;Acc:MGI:2137681] [ENSMUST00000138489]
 Mus musculus apolipoprotein O (Apoo), transcript variant 2, mRNA [NM_001199337]
 Mus musculus cathepsin O (Ctso), mRNA [NM_177662]
 Mus musculus MAX gene associated (Mga), transcript variant 1, mRNA [NM_013720]
 Mus musculus nicotinamide riboside kinase 1 (Nmrk1), mRNA [NM_145497]
 Mus musculus 2 days neonate sympathetic ganglion cDNA, RIKEN full-length enriched library, clone:71204
 PREDICTED: Mus musculus predicted gene 5785 (Gm5785), mRNA [XM_974939]
 Mus musculus RIKEN cDNA 2900026A02 gene (2900026A02Rik), mRNA [NM_172884]
 Mus musculus adipogenesis associated Mth938 domain containing (Aamdc), transcript variant 1, mRNA [N
 Mus musculus lysocardiolipin acyltransferase 1 (Lclat1), transcript variant 1, mRNA [NM_001081071]
 Mus musculus adult male tongue cDNA, RIKEN full-length enriched library, clone:2310007J06 product:uncl
 Mus musculus predicted gene 14325 (Gm14325), mRNA [NM_001024849]
 Mus musculus transmembrane protein 18 (Tmem18), mRNA [NM_172049]
 Mus musculus leucine carboxyl methyltransferase 2 (Lcmt2), mRNA [NM_177846]
 Mus musculus transcription elongation factor A (SII) N-terminal and central domain containing 2 (Tceanc2),
 Mus musculus churchill domain containing 1 (Churc1), mRNA [NM_206534]
 Mus musculus lysine (K)-specific demethylase 4C (Kdm4c), transcript variant 1, mRNA [NM_144787]
 Mus musculus adult inner ear cDNA, RIKEN full-length enriched library, clone:F930115A20 product:hypoth
 Mus musculus excision repaiross-complementing rodent repair deficiency, complementation group 8 (Erccf
 Mus musculus 10 days embryo whole body cDNA, RIKEN full-length enriched library, clone:2610312K03 pi
 immunoglobulin kappa variable 16-104 [Source:MGI Symbol;Acc:MGI:2685913] [ENSMUST00000103323]
 Q8BSH3_MOUSE (Q8BSH3) 12 days embryo male wolffian duct includes surrounding region cDNA, RIKEI
 Mus musculus solute carrier organic anion transporter family, member 5A1 (Slco5a1), mRNA [NM_172841]
 Mus musculus solute carrier family 30 (zinc transporter), member 7 (Slc30a7), mRNA [NM_023214]
 Mus musculus serine/threonine kinase 38 (Stk38), mRNA [NM_134115]
 T cell receptor alpha variable 13N-3 [Source:MGI Symbol;Acc:MGI:3645598] [ENSMUST00000179580]
 Mus musculus asparagine-linked glycosylation 2 (alpha-1,3-mannosyltransferase) (Alg2), mRNA [NM_0195
 Mus musculus RCB-1283 B16 melanoma cDNA, RIKEN full-length enriched library, clone:G430107107 pro
 Mus musculus dynein, axonemal, heavy chain 7A (Dnah7a), mRNA [NM_001252070]
 Mus musculus acetyl-Coenzyme A carboxylase beta (Acacb), mRNA [NM_133904]
 Mus musculus adult male bone cDNA, RIKEN full-length enriched library, clone:9830143P17 product:uncla
 Mus musculus coiled-coil domain containing 88C (Ccdc88c), mRNA [NM_026681]
 Mus musculus predicted gene 14499 (Gm14499), mRNA [NM_001277184]
 Mus musculus zinc finger and BTB domain containing 34 (Zbtb34), transcript variant 1, mRNA [NM_001085
 Mus musculus myosin, light chain 12A, regulatory, non-sarcomeric (My12a), mRNA [NM_026064]
 REM2 and RAB-like small GTPase 1 [Source:MGI Symbol;Acc:MGI:1923416] [ENSMUST00000097813]
 Mus musculus vomeronasal 2, receptor 86 (Vmn2r86), mRNA [NM_001103365]
 Mus musculus vomeronasal 2, receptor 10 (Vmn2r10), mRNA [NM_009491]
 Mus musculus predicted gene 5132 (Gm5132), mRNA [NM_001085517]
 osteopetrosis associated transmembrane protein 1 [Source:MGI Symbol;Acc:MGI:2655574] [ENSMUST00
 Mus musculus Emx2 opposite strand/antisense transcript (non-protein coding) (Emx2os), long non-coding l
 Mus musculus zinc fingers and homeoboxes 2 (Zhx2), mRNA [NM_199449]
 Mus musculus patched domain containing 2 (Ptchd2), mRNA [NM_001083342]
 Mus musculus Fas apoptotic inhibitory molecule 2 (Faim2), transcript variant 1, mRNA [NM_028224]
 Mus musculus cyclin B1 interacting protein 1 (Ccnb1ip1), mRNA [NM_001111119]
 Mus musculus adenosine deaminase-like (Adal), transcript variant 1, mRNA [NM_029475]
 Mus musculus TBC1 domain family, member 5 (Tbc1d5), transcript variant 1, mRNA [NM_001285991]

Mus musculus lung RCB-0558 LLC cDNA, RIKEN full-length enriched library, clone:G730040L14 product:h
 Mus musculus 15 days embryo head cDNA, RIKEN full-length enriched library, clone:4022436C10 product:
 Mus musculus citrate lyase beta like (Clybl), mRNA [NM_029556]
 Mus musculus predicted gene 13298 (Gm13298), mRNA [NM_001085530]
 Mus musculus CD84 antigen (Cd84), transcript variant 1, mRNA [NM_013489]
 Mus musculus glutamate receptor, ionotropic, NMDA2B (epsilon 2) (Grin2b), mRNA [NM_008171]
 Mus musculus ankyrin repeat and IBR domain containing 1 (Ankib1), transcript variant 2, mRNA [NM_0010
 Mus musculus DEAD (Asp-Glu-Ala-Asp) box polypeptide 51 (Ddx51), mRNA [NM_027156]
 PREDICTED: Mus musculus RIKEN cDNA 2810407A14 gene (2810407A14Rik), transcript variant X1, mis
 Mus musculus congenital dyserythropoietic anemia, type I (human) (Cdan1), mRNA [NM_026891]
 Mus musculus angiopoietin-like 7 (Angptl7), mRNA [NM_001039554]
 Mus musculus zinc finger protein 72 (Zfp72), mRNA [NM_001081680]
 Mus musculus mesoderm development candidate 1 (Mesdc1), mRNA [NM_030705]
 Mus musculus nucleus accumbens associated 2, BEN and BTB (POZ) domain containing (Nacc2), transcri
 Mus musculus Rho guanine nucleotide exchange factor (GEF) 26 (Arhgef26), mRNA [NM_001081295]
 Mus musculus ethanol induced 1 (Etoh1), transcript variant 1, mRNA [NM_001177399]
 Mus musculus calpain 15 (Capn15), mRNA [NM_015830]
 Mus musculus mitofusin 2 (Mfn2), transcript variant 2, mRNA [NM_133201]
 Mus musculus solute carrier family 25, member 37 (Slc25a37), mRNA [NM_026331]
 Mus musculus glucose phosphate isomerase 1 (Gpi1), mRNA [NM_008155]
 Mus musculus cyclin L2 (Ccnl2), mRNA [NM_207678]
 Mus musculus glucose phosphate isomerase 1 (Gpi1), mRNA [NM_008155]
 Mus musculus kinesin light chain 2 (Klc2), transcript variant 1, mRNA [NM_008451]
 Mus musculus homeobox D8 (Hoxd8), transcript variant 1, mRNA [NM_008276]
 Mus musculus CREB/ATF bZIP transcription factor (Crebzf), transcript variant 1, mRNA [NM_145151]
 Mus musculus 4-nitrophenylphosphatase domain and non-neuronal SNAP25-like protein homolog 1 (C. ele
 Mus musculus membrane associated guanylate kinase, WW and PDZ domain containing 1 (Magi1), transcr
 Mus musculus PHD finger protein 13 (Phf13), mRNA [NM_172705]
 Mus musculus ribonuclease P 14 subunit (Rpp14), mRNA [NM_025938]
 Mus musculus importin 11 (Ipo11), mRNA [NM_029665]
 Mus musculus LanC lantibiotic synthetase component C-like 3 (bacterial) (Lancl3), mRNA [NM_173414]
 Mus musculus potassium voltage-gated channel, subfamily Q, member 5 (Kcnq5), transcript variant 1, mRN
 Mus musculus mRNA for mKIAA0996 protein. [AK129256]
 Mus musculus RAB37, member RAS oncogene family (Rab37), transcript variant 2, mRNA [NM_00116375]
 Mus musculus predicted gene 5382 (Gm5382), mRNA [NM_001034100]
 Mus musculus microfilament-associated protein 3 (Mfap3), transcript variant 1, mRNA [NM_145426]
 Mus musculus predicted gene 14137 (Gm14137), mRNA [NM_001039223]
 Mus musculus heat shock factor binding protein 1-like 1 (Hsbp11), mRNA [NM_001136181]
 Mus musculus desumoylating isopeptidase 1 (Desi1), mRNA [NM_134095]
 Mus musculus toll-like receptor 1 (Tlr1), transcript variant 1, mRNA [NM_030682]
 Mus musculus adult male diencephalon cDNA, RIKEN full-length enriched library, clone:9330167E06 prod
 Mus musculus Rho guanine nucleotide exchange factor (GEF) 38 (Arhgef38), mRNA [NM_029953]
 Mus musculus adult male olfactory brain cDNA, RIKEN full-length enriched library, clone:6430528A12 prod
 Mus musculus ubiquitin-conjugating enzyme E2E 1 (Ube2e1), mRNA [NM_009455]
 Mus musculus SR-related CTD-associated factor 8 (Scaf8), mRNA [NM_134123]
 Mus musculus adenylate cyclase 6 (Adcy6), mRNA [NM_007405]
 Mus musculus expressed sequence AI593442 (AI593442), transcript variant 1, mRNA [NM_001286641]
 Mus musculus phosphatidic acid phosphatase type 2A (Ppap2a), transcript variant 1, mRNA [NM_008247]
 Mus musculus nuclear fragile X mental retardation protein interacting protein 1 (Nufip1), mRNA [NM_01374
 Mus musculus transmembrane protein 135 (Tmem135), mRNA [NM_028343]
 Mus musculus RIKEN cDNA 1700012L04 gene (1700012L04Rik), mRNA [NM_029588]
 Mus musculus SEC63-like (S. cerevisiae) (Sec63), mRNA [NM_153055]
 Mus musculus RAS-like, estrogen-regulated, growth-inhibitor (Rerg), transcript variant 1, mRNA [NM_0011
 Mus musculus USO1 vesicle docking factor (Uso1), mRNA [NM_019490]
 Mus musculus guanosine diphosphate (GDP) dissociation inhibitor 2 (Gdi2), mRNA [NM_008112]
 Mus musculus vomeronasal 2, receptor 16 (Vmn2r16), mRNA [NM_001104627]
 Mus musculus NADH dehydrogenase (ubiquinone) 1, subcomplex unknown, 2 (Ndufc2), mRNA [NM_0242
 Mus musculus RAD23b homolog (S. cerevisiae) (Rad23b), mRNA [NM_009011]
 UI-M-GI0-cek-h-17-0-UI.r1 NIH_BMAP_GI0 Mus musculus cDNA clone IMAGE: 6840738 5', mRNA sequer

Mus musculus ATP synthase, H⁺ transporting mitochondrial F1 complex, beta subunit (Atp5b), mRNA [NM_023418]
 Mus musculus phosphoglycerate mutase 1 (Pgsm1), mRNA [NM_023418]
 Mus musculus adult male testis cDNA, RIKEN full-length enriched library, clone:4921515G04 product:uncle
 Mus musculus UDP-N-acetyl-alpha-D-galactosamine:polypeptide N-acetylgalactosaminyltransferase 9 (Ga
 Mus musculus Kell blood group precursor (McLeod phenotype) homolog (Xk), mRNA [NM_023500]
 Mus musculus RAB37, member RAS oncogene family (Rab37), transcript variant 2, mRNA [NM_00116375
 Mus musculus jagunal homolog 1 (Drosophila) (Jagn1), transcript variant 1, mRNA [NM_026365]
 Mus musculus natriuretic peptide type A (Nppa), mRNA [NM_008725]
 Mus musculus mitochondrial ribosomal protein L34 (Mrpl34), mRNA [NM_053162]
 PREDICTED: Mus musculus predicted gene, 20764 (Gm20764), mRNA [XM_003688790]
 Mus musculus multivesicular body subunit 12A (Mvb12a), mRNA [NM_028617]
 Mus musculus family with sequence similarity 114, member A2 (Fam114a2), transcript variant 2, mRNA [NI
 PREDICTED: Mus musculus predicted gene 3693 (Gm3693), transcript variant X2, misc_RNA [XR_381755]
 Mus musculus superkiller viralicidic activity 2-like 2 (S. cerevisiae) (Skiv2l2), mRNA [NM_028151]
 Mus musculus protein phosphatase 1, regulatory (inhibitor) subunit 3E (Ppp1r3e), mRNA [NM_001167908]
 Mus musculus TNFRSF1A-associated via death domain (Tradd), mRNA [NM_001033161]
 Mus musculus ankyrin repeat and sterile alpha motif domain containing 1B (Anks1b), transcript variant 4, m
 Mus musculus abhydrolase domain containing 5 (Abhd5), mRNA [NM_026179]
 Mus musculus ribosomal protein L36 (Rpl36), mRNA [NM_018730]
 Mus musculus trafficking protein particle complex 5 (Trappc5), mRNA [NM_025701]
 Mus musculus RIKEN cDNA 2810408A11 gene (2810408A11Rik), mRNA [NM_027419]
 Mus musculus G protein-coupled receptor 158 (Gpr158), mRNA [NM_001004761]
 Mus musculus spastic paraplegia 11 (Spg11), mRNA [NM_145531]
 Mus musculus ribosomal protein L36 (Rpl36), mRNA [NM_018730]
 PREDICTED: Mus musculus predicted gene 6404 (Gm6404), mRNA [XM_006517804]
 Mus musculus RAB3 GTPase activating protein subunit 2 (Rab3gap2), mRNA [NM_001163754]
 Mus musculus THO complex 7 homolog (Drosophila) (Thoc7), transcript variant 3, mRNA [NM_001285780]
 Mus musculus piggyBac transposable element derived 5 (Pgbd5), mRNA [NM_171824]
 Mus musculus bone morphogenetic protein 8a (Bmp8a), transcript variant 1, mRNA [NM_001256019]
 Mus musculus ribosomal protein L13A (Rpl13a), mRNA [NM_009438]
 Mus musculus ubiquitin specific peptidase 37 (Usp37), mRNA [NM_176972]
 Mus musculus SHC (Src homology 2 domain containing) transforming protein 2 (Shc2), mRNA [NM_00102
 Mus musculus DNA cross-link repair 1C, PSO2 homolog (S. cerevisiae) (Dclre1c), transcript variant 2, mR
 Mus musculus neuroguidin, EIF4E binding protein (Ngdn), mRNA [NM_026890]
 Mus musculus folliculin (Flcn), transcript variant 2, mRNA [NM_146018]
 PREDICTED: Mus musculus zinc finger protein 74 (Zfp74), transcript variant X1, mRNA [XM_006540384]
 Mus musculus caspase 3 (Casp3), transcript variant 2, mRNA [NM_009810]
 Mus musculus protocadherin beta 7 (Pcdhb7), mRNA [NM_053132]
 Mus musculus EFR3 homolog B (S. cerevisiae) (Efr3b), mRNA [NM_001082483]
 Mus musculus Ras interacting protein 1 (Rasip1), mRNA [NM_028544]
 Mus musculus tubulin, beta 6 class V (Tubb6), mRNA [NM_026473]
 Mus musculus G protein-coupled receptor 135 (Gpr135), mRNA [NM_181752]
 Mus musculus REC8 meiotic recombination protein (Rec8), mRNA [NM_020002]
 Mus musculus SAP30-like (Sap30l), mRNA [NM_001081168]
 Mus musculus nucleotide binding protein-like (Nubpl), mRNA [NM_029760]
 Mus musculus chemokine (C-C motif) ligand 28 (Ccl28), mRNA [NM_020279]
 Mus musculus SLIT and NTRK-like family, member 3 (Slitrk3), mRNA [NM_198864]
 Mus musculus unconventional SNARE in the ER 1 homolog (S. cerevisiae) (Use1), transcript variant 3, mR
 Mus musculus G patch domain containing 1 (Gpatch1), mRNA [NM_026181]
 Mus musculus F-box and leucine-rich repeat protein 21 (Fbxl21), mRNA [NM_178674]
 Mus musculus SIVA1, apoptosis-inducing factor (Siva1), transcript variant 1, mRNA [NM_013929]
 Mus musculus small G protein signaling modulator 1 (Sgsm1), transcript variant 3, mRNA [NM_001162965]
 Mus musculus RIKEN cDNA 1700049G17 gene (1700049G17Rik), mRNA [NM_028538]
 Mus musculus family with sequence similarity 160, member B1 (Fam160b1), mRNA [NM_145505]
 Mus musculus mitogen-activated protein kinase kinase kinase 1 (Map4k1), mRNA [NM_008279]
 Mus musculus RIKEN cDNA 6330416G13 gene (6330416G13Rik), mRNA [NM_144905]
 Mus musculus coiled-coil domain containing 71 (Ccdc71), mRNA [NM_133744]
 Mus musculus monoglyceride lipase (Mgl1), transcript variant 1, mRNA [NM_001166251]
 leucine-rich and death domain containing [Source:MGI Symbol;Acc:MGI:1889507] [ENSMUST0000013806

Mus musculus phosphopantothienoylcysteine decarboxylase (Ppcdc), mRNA [NM_176831]
 Mus musculus RIKEN cDNA D130040H23 gene (D130040H23Rik), mRNA [NM_172491]
 Mus musculus small integral membrane protein 7 (Smim7), mRNA [NM_172396]
 Mus musculus thioredoxin-like 4A (Txnl4a), transcript variant 1, mRNA [NM_025299]
 synaptosomal-associated protein 23 [Source:MGI Symbol;Acc:MGI:109356] [ENSMUST00000110711]
 Mus musculus N-acetyltransferase 9 (GCN5-related, putative) (Nat9), mRNA [NM_025400]
 Mus musculus pleckstrin homology domain containing, family A member 7 (Plekha7), mRNA [NM_172743]
 Mus musculus RIKEN cDNA 4930563E22 gene (4930563E22Rik), mRNA [NM_001163728]
 Mus musculus myelin basic protein (Mbp), transcript variant 7, mRNA [NM_010777]
 Mus musculus prion protein (Prnp), transcript variant 2, mRNA [NM_001278256]
 Mus musculus mutS homolog 3 (E. coli) (Msh3), mRNA [NM_010829]
 Mus musculus TBC1 domain family, member 2 (Tbc1d2), mRNA [NM_198664]
 Mus musculus 6 days neonate head cDNA, RIKEN full-length enriched library, clone:5430410E06 product: zinc finger protein 81 [Source:MGI Symbol;Acc:MGI:1890752] [ENSMUST00000054072]
 Mus musculus slingshot homolog 1 (Drosophila) (Ssh1), mRNA [NM_198109]
 Mus musculus Sh3 domain YSC-like 1 (Sh3yl1), transcript variant 1, mRNA [NM_013709]
 Mus musculus spastin (Spast), transcript variant 2, mRNA [NM_016962]
 Mus musculus RAB26, member RAS oncogene family (Rab26), mRNA [NM_177375]
 Mus musculus F-box protein 6 (Fbxo6), transcript variant 1, mRNA [NM_015797]
 Mus musculus MEF2 activating motif and SAP domain containing transcriptional regulator (Mamstr), mRNA
 Mus musculus patatin-like phospholipase domain containing 3 (Pnpla3), mRNA [NM_054088]
 Mus musculus serine hydroxymethyltransferase 1 (soluble) (Shmt1), mRNA [NM_009171]
 PREDICTED: Mus musculus predicted pseudogene 7241 (Gm7241), mRNA [XM_006543539]
 Mus musculus solute carrier organic anion transporter family, member 2b1 (Slco2b1), transcript variant 1, n
 Mus musculus 12 days embryo spinal ganglion cDNA, RIKEN full-length enriched library, clone:D130094KC
 Mus musculus RIKEN cDNA 4930570G19 gene (4930570G19Rik), transcript variant 2, long non-coding RN
 Mus musculus wingless-type MMTV integration site 9A (Wnt9a), mRNA [NM_139298]
 Mus musculus transmembrane protein 192 (Tmem192), transcript variant 1, mRNA [NM_028427]
 Mus musculus leucine rich repeat containing 73 (Lrrc73), mRNA [NM_001111142]
 Mus musculus serine peptidase inhibitor, Kazal type 2 (Spink2), transcript variant 2, mRNA [NM_183284]
 Mus musculus oxytocin receptor (Oxtr), mRNA [NM_001081147]
 Mus musculus transmembrane emp24 protein transport domain containing 4 (Tmed4), mRNA [NM_13402C
 Mus musculus cytochrome c oxidase assembly factor 4 (Coa4), mRNA [NM_183270]
 Mus musculus glutathione S-transferase kappa 1 (Gstk1), mRNA [NM_029555]
 Mus musculus tripartite motif-containing 12C (Trim12c), transcript variant 1, mRNA [NM_001146007]
 Mus musculus CDP-diacylglycerol synthase 1 (Cds1), mRNA [NM_173370]
 Mus musculus fibroblast activation protein (Fap), mRNA [NM_007986]
 Mus musculus nodal modulator 1 (Nomo1), mRNA [NM_153057]
 Mus musculus adult male urinary bladder cDNA, RIKEN full-length enriched library, clone:9530073P05 pro
 Mus musculus T cell activation GTPase activating protein 1 (Tagap1), mRNA [NM_147155]
 Mus musculus BCL2-like 12 (proline rich) (Bcl2l12), mRNA [NM_029410]
 Mus musculus immunoglobulin superfamily, member 10 (Igsf10), mRNA [NM_001162884]
 Mus musculus high mobility group box transcription factor 1 (Hbp1), transcript variant 2, mRNA [NM_1779C
 Mus musculus NEL-like 1 (Nell1), mRNA [NM_001037906]
 Mus musculus synergin, gamma (Synrg), mRNA [NM_194341]
 Mus musculus protein phosphatase 2 (formerly 2A), regulatory subunit B", delta (Ppp2r3d), transcript varia
 Mus musculus putative homeodomain transcription factor 1 (Phtf1), transcript variant 1, mRNA [NM_01362
 Mus musculus progesterone and adipoQ receptor family member VI (Paqr6), mRNA [NM_198410]
 Mus musculus tRNA splicing endonuclease 54 homolog (S. cerevisiae) (Tsen54), mRNA [NM_029557]
 PREDICTED: Mus musculus predicted gene 6306 (Gm6306), mRNA [XM_006500499]
 PREDICTED: Mus musculus predicted gene 5093 (Gm5093), mRNA [XM_006543383]
 Mus musculus RAS-like, family 10, member A (Rasl10a), mRNA [NM_145216]
 Mus musculus SURP and G patch domain containing 1 (Sugp1), mRNA [NM_027481]
 Mus musculus DEAD (Asp-Glu-Ala-Asp) box polypeptide 55 (Ddx55), transcript variant 1, mRNA [NM_026
 Mus musculus ubiquitin specific peptidase 53 (Usp53), mRNA [NM_133857]
 Mus musculus adult male testis cDNA, RIKEN full-length enriched library, clone:4930522L14 product:simile
 Mus musculus coiled-coil domain containing 91 (Ccdc91), mRNA [NM_025911]
 Mus musculus oligonucleotide/oligosaccharide-binding fold containing 1 (Obfc1), mRNA [NM_175360]
 Mus musculus cytokine receptor-like factor 2 (Crfl2), transcript variant 1, mRNA [NM_001164735]

Mus musculus centromere protein K (Cenpk), transcript variant 1, mRNA [NM_021790]
 Mus musculus zinc finger protein 608 (Zfp608), mRNA [NM_175751]
 Mus musculus 3 days neonate thymus cDNA, RIKEN full-length enriched library, clone:A630055C05 produ
 Mus musculus solute carrier family 10 (sodium/bile acid cotransporter family), member 3 (Slc10a3), transcr
 Mus musculus Holliday junction recognition protein (Hjrp), mRNA [NM_198652]
 Mus musculus D-tyrosyl-tRNA deacylase 2 (Dtd2), mRNA [NM_029545]
 Mus musculus progesterone and adiponectin receptor family member VI (Paqr6), mRNA [NM_198410]
 Mus musculus palmdelphin (Palmd), mRNA [NM_023245]
 Mus musculus ferritin light chain 1 (Ftl1), mRNA [NM_010240]
 Mus musculus THAP domain containing 6 (Thap6), non-coding RNA [NR_028429]
 PREDICTED: Mus musculus uncharacterized LOC102634598 (LOC102634598), misc_RNA [XR_386205]
 Mus musculus monoglyceride lipase (Mgll), transcript variant 1, mRNA [NM_001166251]
 Mus musculus RIKEN cDNA 1810009N02 gene (1810009N02Rik), mRNA [NM_026939]
 Mus musculus solute carrier family 25, member 41 (Slc25a41), mRNA [NM_175333]
 Mus musculus aldo-keto reductase family 1, member C19 (Akr1c19), mRNA [NM_001013785]
 Mus musculus transmembrane protein 173 (Tmem173), transcript variant 1, mRNA [NM_028261]
 Mus musculus ubiquitin C (Ubc), mRNA [NM_019639]
 predicted gene 10654 [Source:MGI Symbol;Acc:MGI:3643366] [ENSMUST00000098653]
 Mus musculus histocompatibility 2, M region locus 3 (H2-M3), mRNA [NM_013819]
 Mus musculus NIM1 serine/threonine protein kinase (Nim1k), mRNA [NM_175538]
 Mus musculus beaded filament structural protein 2, phakinin (Bfsp2), mRNA [NM_001002896]
 Mus musculus alkB, alkylation repair homolog 6 (E. coli) (Alkbh6), mRNA [NM_198027]
 Mus musculus CaM kinase-like vesicle-associated (Camkv), mRNA [NM_145621]
 Mus musculus polymerase (DNA directed), iota (Poli), transcript variant 2, mRNA [NM_011972]
 Mus musculus zinc finger protein 566 (Zfp566), mRNA [NM_152814]
 Mus musculus retinol binding protein 7, cellular (Rbp7), mRNA [NM_022020]
 PREDICTED: Mus musculus predicted gene 8013 (Gm8013), transcript variant X4, ncRNA [XR_389350]
 Mus musculus synaptogyrin 2 (Syngr2), mRNA [NM_009304]
 Mus musculus LSM4 homolog, U6 small nuclear RNA associated (S. cerevisiae) (Lsm4), mRNA [NM_0158]
 Mus musculus FXYD domain-containing ion transport regulator 6 (Fxyd6), mRNA [NM_022004]
 Mus musculus solute carrier family 2 (facilitated glucose transporter), member 9 (Slc2a9), transcript variant
 Mus musculus SERTA domain containing 3 (Sertad3), mRNA [NM_133210]
 Mus musculus acyl-CoA synthetase long-chain family member 5 (Acsl5), mRNA [NM_027976]
 Mus musculus SLIT and NTRK-like family, member 5 (Slitrk5), mRNA [NM_198865]
 cut-like homeobox 2 [Source:MGI Symbol;Acc:MGI:107321] [ENSMUST00000111752]
 BEN domain containing 7 [Source:MGI Symbol;Acc:MGI:2443100] [ENSMUST00000115022]
 Mus musculus ES cells cDNA, RIKEN full-length enriched library, clone:C330018M05 product:similar to ZF
 Mus musculus myosin, light polypeptide 2, regulatory, cardiac, slow (Myl2), mRNA [NM_010861]
 Mus musculus telomeric repeat binding factor 1 (Terf1), transcript variant 1, mRNA [NM_009352]
 Mus musculus predicted gene 13247 (Gm13247), transcript variant 1, mRNA [NM_001243138]
 Mus musculus polymerase (DNA directed), epsilon (Pole), mRNA [NM_011132]
 Mus musculus Holliday junction recognition protein (Hjrp), mRNA [NM_198652]
 Mus musculus coiled-coil domain containing 91 (Ccdc91), mRNA [NM_025911]
 Mus musculus G2/M-phase specific E3 ubiquitin ligase (G2e3), transcript variant 2, mRNA [NM_00116796]
 Mus musculus PTPRF interacting protein, binding protein 2 (liprin beta 2) (Ppfibp2), transcript variant 1, mF
 Mus musculus methyltransferase like 3 (Mettl3), mRNA [NM_019721]
 Mus musculus thyroid hormone responsive (Thrsp), mRNA [NM_009381]
 Mus musculus 9.5 days embryo parthenogenote cDNA, RIKEN full-length enriched library, clone:B130019E
 Mus musculus 16 days neonate thymus cDNA, RIKEN full-length enriched library, clone:A130072N09 prod
 Mus musculus CD1d2 antigen (Cd1d2), transcript variant 1, mRNA [NM_007640]
 Mus musculus phosphatidylinositol glycan anchor biosynthesis, class P (Pigp), transcript variant 5, mRNA [NM_0010353]
 Mus musculus germ cell-specific gene 2 (Gsg2), mRNA [NM_010353]
 Mus musculus huntingtin interacting protein K (Hypk), mRNA [NM_026318]
 Mus musculus apolipoprotein L 7b (Apol7b), mRNA [NM_001024848]
 Mus musculus apoptotic chromatin condensation inducer 1 (Acin1), transcript variant 2, mRNA [NM_02319]
 Mus musculus methyltransferase like 17 (Mettl17), mRNA [NM_001029990]
 Mus musculus Friend virus susceptibility 1 (Fv1), mRNA [NM_010244]
 Mus musculus churchill domain containing 1 (Churc1), mRNA [NM_206534]
 Mus musculus predicted gene 15698 (Gm15698), non-coding RNA [NR_003564]

Mus musculus microsomal triglyceride transfer protein (Mttp), transcript variant 1, mRNA [NM_001163457]
 Mus musculus adrenergic receptor kinase, beta 2 (Adrbk2), transcript variant 1, mRNA [NM_177078]
 Mus musculus RIKEN cDNA 4930515G01 gene (4930515G01Rik), long non-coding RNA [NR_027872]
 ribosomal protein S3A3 [Source:MGI Symbol;Acc:MGI:3643406] [ENSMUST00000074680]
 Mus musculus Ca²⁺-dependent secretion activator (Cadps), transcript variant 1, mRNA [NM_012061]
 Mus musculus RIKEN cDNA 2410006H16 gene (2410006H16Rik), long non-coding RNA [NR_030738]
 Mus musculus RWD domain containing 3 (Rwdd3), transcript variant 2, mRNA [NM_028456]
 Mus musculus cortistatin (Cort), mRNA [NM_007745]
 Mus musculus kinesin light chain 4 (Klc4), mRNA [NM_029091]
 Mus musculus G2/M-phase specific E3 ubiquitin ligase (G2e3), transcript variant 3, mRNA [NM_001167964]
 Mus musculus 4HAUS augmin-like complex, subunit 8 (Haus8), transcript variant 1, mRNA [NM_00116304]
 Mus musculus EH-domain containing 4 (Ehd4), mRNA [NM_133838]
 Mus musculus interleukin 17 receptor D (Il17rd), mRNA [NM_134437]
 regulating synaptic membrane exocytosis 3 [Source:MGI Symbol;Acc:MGI:2443331] [ENSMUST00000071]
 Mus musculus RAB19, member RAS oncogene family (Rab19), mRNA [NM_011226]
 Mus musculus FXYD domain-containing ion transport regulator 2 (Fxyd2), transcript variant b, mRNA [NM_001167964]
 Mus musculus creatine kinase, mitochondrial 1, ubiquitous (Ckmt1), mRNA [NM_009897]
 Mus musculus dehydrogenase/reductase (SDR family) member 7 (Dhrs7), mRNA [NM_025522]
 Mus musculus zinc finger protein 286 (Zfp286), mRNA [NM_138949]
 Mus musculus polymerase (DNA directed), kappa (Polk), mRNA [NM_012048]
 Mus musculus cysteine-rich PDZ-binding protein (Cript), mRNA [NM_019936]
 mp78f05.y1 Soares_thymus_2NbMT Mus musculus cDNA clone IMAGE:575361 5'. [AI530666]
 Mus musculus G protein-coupled receptor 180 (Gpr180), mRNA [NM_021434]
 Mus musculus 11 days pregnant adult female ovary and uterus cDNA, RIKEN full-length enriched library, clone:4930532K22 product:hypoxanthine phosphotransferase II
 Mus musculus neuron-glia-CAM-related cell adhesion molecule (Nrcam), transcript variant 1, mRNA [NM_001167964]
 Mus musculus RIKEN cDNA 2810459M11 gene (2810459M11Rik), transcript variant 1, mRNA [NM_001167964]
 Mus musculus asparaginase homolog (S. cerevisiae) (Aspg), mRNA [NM_001081169]
 Mus musculus uncharacterized LOC100862268 (LOC100862268), transcript variant 1, long non-coding RNA [NR_027872]
 Mus musculus DEAD (Asp-Glu-Ala-Asp) box polypeptide 4 (Ddx4), transcript variant 2, mRNA [NM_010026]
 Mus musculus ATPase, class I, type 8B, member 5 (Atp8b5), mRNA [NM_177195]
 Mus musculus dynein, axonemal, intermediate chain 2 (Dnaic2), mRNA [NM_001034878]
 Mus musculus kelch repeat and BTB (POZ) domain containing 11 (Kbtbd11), mRNA [NM_029116]
 Mus musculus nudix (nucleoside diphosphate linked moiety X)-type motif 7 (Nudt7), transcript variant 4, mRNA [NM_001167964]
 Mus musculus predicted gene 7120 (Gm7120), transcript variant 2, mRNA [NM_001177666]
 Mus musculus adult male medulla oblongata cDNA, RIKEN full-length enriched library, clone:6330442E02
 Mus musculus Iroquois related homeobox 1 (Drosophila) (Irx1), mRNA [NM_010573]
 Mus musculus ribosomal protein L34, pseudogene 1 (Rpl34-ps1), mRNA [NM_001199350]
 Mus musculus doublecortin domain containing 2a (Dcdc2a), transcript variant 1, mRNA [NM_177577]
 Mus musculus parathyroid hormone 1 receptor (Pth1r), transcript variant 1, mRNA [NM_011199]
 Mus musculus synaptotagmin IX (Syt9), mRNA [NM_021889]
 Mus musculus glutathione S-transferase, mu 6 (Gstm6), mRNA [NM_008184]
 Mus musculus gem (nuclear organelle) associated protein 5 (Gemin5), transcript variant 1, mRNA [NM_001167964]
 Mus musculus RUN and FYVE domain containing 3 (Rufy3), transcript variant 3, mRNA [NM_001289776]
 Q8NFW1_HUMAN (Q8NFW1) Alpha 1 type XXII collagen, partial (33%) [TC1681647]
 Mus musculus protein tyrosine phosphatase, receptor type, R (Ptprr), transcript variant 1, mRNA [NM_011226]
 Mus musculus microtubule-associated protein 1S (Map1s), mRNA [NM_173013]
 Mus musculus cDNA sequence BC005764 (BC005764), transcript variant 1, mRNA [NM_181681]
 Mus musculus zinc finger protein 536 (Zfp536), mRNA [NM_172385]
 Mus musculus RALBP1 associated Eps domain containing protein 2 (Reps2), transcript variant 1, mRNA [NM_001167964]
 Mus musculus family with sequence similarity 83, member G (Fam83g), mRNA [NM_178618]
 Mus musculus guanine nucleotide binding protein, alpha 14 (Gna14), mRNA [NM_008137]
 Mus musculus teashirt zinc finger family member 1 (Tshz1), mRNA [NM_001081300]
 Mus musculus adult male testis cDNA, RIKEN full-length enriched library, clone:4930532K22 product:hypoxanthine phosphotransferase II
 Mus musculus RIKEN cDNA 4930515G01 gene (4930515G01Rik), long non-coding RNA [NR_027872]
 Mus musculus oxysterol binding protein-like 10 (Osbp10), mRNA [NM_148958]
 Mus musculus periaxin (Prx), transcript variant 2, mRNA [NM_019412]
 Mus musculus Rap guanine nucleotide exchange factor (GEF) 3 (Rapgef3), transcript variant 2, mRNA [NM_001167964]
 Mus musculus Rho GTPase activating protein 22 (Arhgap22), mRNA [NM_153800]
 Mus musculus RIKEN cDNA 2010109A12 gene (2010109A12Rik), mRNA [NM_029363]

Mus musculus carbonyl reductase 3 (Cbr3), mRNA [NM_173047]
 BB713741 RIKEN full-length enriched, 2 cells egg Mus musculus cDNA clone B020049A06 3', mRNA sequ
 predicted gene 6816 [Source:MGI Symbol;Acc:MGI:3648347] [ENSMUST00000059737]
 Mus musculus transmembrane protein 65 (Tmem65), mRNA [NM_175212]
 Mus musculus pleckstrin homology domain containing, family B (evectins) member 1 (Plekhhb1), transcript v
 Mus musculus histamine receptor H1 (Hrh1), transcript variant 1, mRNA [NM_001252643]
 PREDICTED: Mus musculus ADP-ribosylation factor 1-like (LOC102632770), misc_RNA [XR_399117]
 Mus musculus M-phase phosphoprotein 10 (U3 small nucleolar ribonucleoprotein) (Mphosph10), mRNA [N
 Mus musculus activated spleen cDNA, RIKEN full-length enriched library, clone:F830106C12 product:hypo
 Mus musculus centromere protein K (Cenpk), transcript variant 1, mRNA [NM_021790]
 histone cluster 3, H2ba [Source:MGI Symbol;Acc:MGI:1925553] [ENSMUST00000078267]
 Mus musculus cation channel, sperm associated 2 (Catsper2), mRNA [NM_153075]
 Mus musculus microtubule-associated protein 1 A (Map1a), transcript variant 1, mRNA [NM_032393]
 Mus musculus TRAF-interacting protein (Traip), mRNA [NM_011634]
 Mus musculus protein tyrosine phosphatase, non-receptor type 5 (Ptpn5), transcript variant 1, mRNA [NM_
 Mus musculus seven in absentia homolog 3 (Drosophila) (Siah3), mRNA [NM_001128093]
 Mus musculus heparanase (Hpse), mRNA [NM_152803]
 Mus musculus iduronidase, alpha-L- (Idua), transcript variant 1, mRNA [NM_008325]
 Mus musculus predicted gene 2696 (Gm2696), mRNA [NM_001205009]
 Mus musculus mannan-binding lectin serine peptidase 2 (Masp2), transcript variant 2, mRNA [NM_010767]
 Mus musculus ferritin light chain 1 (Ftl1), mRNA [NM_010240]
 Mus musculus bisphosphate 3'-nucleotidase 1 (Bpnt1), mRNA [NM_011794]
 Mus musculus synaptoporin (Synpr), transcript variant 2, mRNA [NM_001163032]
 Mus musculus synuclein, gamma (Snca), mRNA [NM_011430]
 PREDICTED: Mus musculus uncharacterized LOC102634215 (LOC102634215), ncRNA [XR_386425]
 Mus musculus H2A histone family, member J (H2afj), mRNA [NM_177688]
 Mus musculus coiled-coil domain containing 184 (Ccadc184), mRNA [NM_177716]
 Mus musculus transmembrane emp24 protein transport domain containing 5 (Tmed5), mRNA [NM_028876]
 Mus musculus solute carrier family 6 (neurotransmitter transporter), member 17 (Slc6a17), mRNA [NM_17
 Mus musculus carbohydrate (N-acetylgalactosamine 4-O) sulfotransferase 14 (Chst14), mRNA [NM_02811
 Mus musculus C-type lectin domain family 16, member A (Clec16a), transcript variant 1, mRNA [NM_17756
 Mus musculus GATA zinc finger domain containing 2A (Gata2a), transcript variant 1, mRNA [NM_145596]
 Mus musculus inositol 1,4,5-trisphosphate 3-kinase A (Itpka), mRNA [NM_146125]
 Mus musculus synaptotagmin 2 (Synj2), transcript variant 1, mRNA [NM_001113353]
 Mus musculus RIKEN cDNA 2310045N01 gene (2310045N01Rik), mRNA [NM_001145552]
 Mus musculus L-3-hydroxyproline dehydratase (trans-) (L3hpdh), mRNA [NM_026038]
 Mus musculus UbiA prenyltransferase domain containing 1 (Ubiad1), mRNA [NM_027873]
 Mus musculus integrin beta 4 (Itgb4), transcript variant 1, mRNA [NM_001005608]
 v-erb-a erythroblastic leukemia viral oncogene homolog 4 (avian) [Source:MGI Symbol;Acc:MGI:104771] [E
 Mus musculus solute carrier family 27 (fatty acid transporter), member 3 (Slc27a3), mRNA [NM_011988]
 Mus musculus HscB iron-sulfur cluster co-chaperone homolog (E. coli) (Hscb), mRNA [NM_153571]
 Mus musculus solute carrier family 48 (heme transporter), member 1 (Slc48a1), mRNA [NM_026353]
 Mus musculus meiotic nuclear divisions 1 homolog (S. cerevisiae) (Mnd1), mRNA [NM_029797]
 Mus musculus alcohol dehydrogenase, iron containing, 1 (Adhfe1), transcript variant 1, mRNA [NM_175231]
 Mus musculus solute carrier family 35, member E1 (Slc35e1), mRNA [NM_177766]
 Mus musculus late endosomal/lysosomal adaptor, MAPK and MTOR activator 3 (Lamtor3), mRNA [NM_01
 Mus musculus a disintegrin-like and metallopeptidase (repolysin type) with thrombospondin type 1 motif, 1
 Mus musculus Holliday junction recognition protein (Hjrp), mRNA [NM_198652]
 Mus musculus fatty acid binding protein 5, epidermal (Fabp5), transcript variant 2, mRNA [NM_001272097]
 Mus musculus calmodulin binding transcription activator 1 (Camta1), transcript variant 1, mRNA [NM_0010
 Mus musculus RIKEN cDNA E330013P04 gene (E330013P04Rik), long non-coding RNA [NR_026942]
 Mus musculus ChaC, cation transport regulator 1 (Chac1), mRNA [NM_026929]
 Mus musculus selenium binding protein 1 (Selenbp1), mRNA [NM_009150]
 Mus musculus protocadherin beta 4 (Pcdhb4), mRNA [NM_053129]
 Mus musculus solute carrier family 13 (sodium-dependent citrate transporter), member 5 (Slc13a5), mRNA
 Mus musculus 10, 11 days embryo whole body cDNA, RIKEN full-length enriched library, clone:2810451K1
 Mus musculus acid phosphatase 1, soluble (Acp1), transcript variant 1, mRNA [NM_001110239]
 Mus musculus predicted gene 7120 (Gm7120), transcript variant 2, mRNA [NM_001177666]
 Mus musculus islet cell autoantigen 1-like (Ica1l), mRNA [NM_027407]

Mus musculus ribonuclease T2A (Rnaset2a), mRNA [NM_001083938]
 Mus musculus RIKEN cDNA 1700010I14 gene (1700010I14Rik), mRNA [NM_025851]
 Mus musculus predicted gene 13157 (Gm13157), mRNA [NM_001127189]
 Mus musculus intraflagellar transport 27 (Ift27), mRNA [NM_025931]
 Mus musculus RIKEN cDNA 3110070M22 gene (3110070M22Rik), long non-coding RNA [NR_027974]
 Mus musculus CD1d1 antigen (Cd1d1), mRNA [NM_007639]
 Mus musculus synaptotagmin XV (Syt15), transcript variant a, mRNA [NM_181529]
 Mus musculus pannexin 1 (Pannx1), mRNA [NM_019482]
 Mus musculus small nuclear RNA activating complex, polypeptide 1 (Snapc1), mRNA [NM_178392]
 Mus musculus 2 days pregnant adult female ovary cDNA, RIKEN full-length enriched library, clone:E33002
 Mus musculus protein kinase, cAMP dependent regulatory, type II beta (Prkar2b), mRNA [NM_011158]
 Mus musculus EF-hand calcium binding domain 12 (Efca12), mRNA [NM_001110506]
 Mus musculus olfactomedin-like 3 (Olfml3), mRNA [NM_133859]
 Mus musculus lectin, galactose-binding, soluble 2 (Lgals2), mRNA [NM_025622]
 Mus musculus cysteine-rich protein 1 (intestinal) (Crip1), mRNA [NM_007763]
 Mus musculus Ly6/neurotoxin 1 (Lynx1), mRNA [NM_011838]
 Mus musculus transmembrane protein 140 (Tmem140), mRNA [NM_197986]
 Mus musculus RIKEN cDNA 4932415M13 gene (4932415M13Rik), long non-coding RNA [NR_073205]
 Mus musculus microfilament-associated protein 1A (Mfap1a), mRNA [NM_026220]
 Mus musculus eukaryotic translation initiation factor 2-alpha kinase 2 (Eif2ak2), mRNA [NM_011163]
 Mus musculus RIKEN cDNA 6720483E21 gene (6720483E21Rik), long non-coding RNA [NR_040492]
 Mus musculus leukocyte specific transcript 1 (Lst1), mRNA [NM_010734]
 Mus musculus malic enzyme 3, NADP(+)-dependent, mitochondrial (Me3), mRNA [NM_181407]
 Mus musculus calmodulin binding transcription activator 1 (Camta1), transcript variant 1, mRNA [NM_0010]
 Mus musculus guanine nucleotide binding protein (G protein), beta 4 (Gnb4), mRNA [NM_013531]
 Mus musculus ribosomal protein S4-like (Rps4l), non-coding RNA [NR_003634]
 Mus musculus transmembrane protein 132B (Tmem132b), mRNA [NM_001190352]
 Mus musculus a disintegrin-like and metallopeptidase (reprolysin type) with thrombospondin type 1 motif, 1
 Mus musculus ATP-binding cassette, sub-family C (CFTR/MRP), member 4 (Abcc4), transcript variant 1, m
 Mus musculus malic enzyme 3, NADP(+)-dependent, mitochondrial (Me3), mRNA [NM_181407]
 Mus musculus apoptotic chromatin condensation inducer 1 (Acin1), transcript variant 2, mRNA [NM_02319]
 Mus musculus calcium channel, voltage-dependent, alpha2/delta subunit 3 (Cacna2d3), mRNA [NM_00978]
 Mus musculus proteasome (prosome, macropain) subunit, beta type 9 (large multifunctional peptidase 2) (F
 Mus musculus minichromosome maintenance deficient 3 (S. cerevisiae) (Mcm3), mRNA [NM_008563]
 Mus musculus solute carrier family 26 (sulfate transporter), member 1 (Slc26a1), mRNA [NM_174870]
 Mus musculus solute carrier family 13 (sodium-dependent citrate transporter), member 5 (Slc13a5), mRNA
 Mus musculus ring finger protein 43 (Rnf43), mRNA [NM_172448]
 Mus musculus zinc finger protein 930 (Zfp930), mRNA [NM_001013379]
 Mus musculus solute carrier family 29 (nucleoside transporters), member 4 (Slc29a4), mRNA [NM_146257]
 Mus musculus ataxia telangiectasia mutated homolog (human) (Atm), mRNA [NM_007499]
 Mus musculus purinergic receptor P2X, ligand-gated ion channel, 7 (P2rx7), transcript variant 2, mRNA [NM
 Mus musculus strain ICR clone Li(i)01 endogenous retrovirus U3 region, partial sequence. [FJ654066]
 Mus musculus meiotic nuclear divisions 1 homolog (S. cerevisiae) (Mnd1), mRNA [NM_029797]
 Mus musculus zinc finger homeobox 3 (Zfhx3), mRNA [NM_007496]
 Mus musculus 15 days embryo head cDNA, RIKEN full-length enriched library, clone:D930032C08 product
 Mus musculus RIKEN cDNA 6330403K07 gene (6330403K07Rik), mRNA [NM_134022]
 Mus musculus DNA cross-link repair 1C, PSO2 homolog (S. cerevisiae) (Dclre1c), transcript variant 2, mRN
 Mus musculus RNA polymerase II associated protein 2 (Rpap2), transcript variant 3, mRNA [NM_0011634]
 Mus musculus inhibitor of four 1 (Mif1) mRNA, complete cds. [DQ459435]
 Mus musculus RIKEN cDNA 2010315B03 gene (2010315B03Rik), transcript variant 1, mRNA [NM_001243]
 Mus musculus zinc finger protein 619 (Zfp619), mRNA [NM_001004139]
 Mus musculus olfactomedin-like 1 (Olfml1), mRNA [NM_172907]
 Mus musculus RIKEN cDNA A730008H23 gene (A730008H23Rik), mRNA [NM_172505]
 Mus musculus dynein regulatory complex subunit 1 (Drc1), mRNA [NM_001033460]
 Mus musculus RIKEN cDNA 1600014C10 gene (1600014C10Rik), transcript variant 1, mRNA [NM_001083]
 Mus musculus chordin-like 1 (Chrdl1), transcript variant 1, mRNA [NM_001114385]
 Mus musculus NLR family, CARD domain containing 5 (Nlr5), mRNA [NM_001033207]
 Mus musculus hydroxyprostaglandin dehydrogenase 15 (NAD) (Hpgd), mRNA [NM_008278]
 Mus musculus T cell activation Rho GTPase activating protein (Tagap), mRNA [NM_145968]

1 Mus musculus immunoglobulin superfamily, member 21 (Igsf21), mRNA [NM_198610]
2 Mus musculus growth differentiation factor 15 (Gdf15), mRNA [NM_011819]
3 Mus musculus potassium large conductance calcium-activated channel, subfamily M, beta member 4 (Kcnr
4 Mus musculus BH3 interacting domain death agonist (Bid), mRNA [NM_007544]
5 Mus musculus chloride channel Kb (Clcnkb), mRNA [NM_019701]
6 Mus musculus fibulin 2 (Fbln2), transcript variant 1, mRNA [NM_007992]
7 Mus musculus LIM domain and actin binding 1 (Lima1), transcript variant a, mRNA [NM_001113545]
8 Mus musculus lung RCB-0558 LLC cDNA, RIKEN full-length enriched library, clone:G730026111 product:ui
9 Mus musculus 12 days embryo male wolffian duct includes surrounding region cDNA, RIKEN full-length en
10 Mus musculus cDNA clone IMAGE:40090117. [BC128469]
11 Mus musculus 2 days pregnant adult female ovary cDNA, RIKEN full-length enriched library, clone:E33003
12 Mus musculus tubulin, beta 3 class III (Tubb3), mRNA [NM_023279]
13 Mus musculus potassium voltage-gated channel, Shal-related family, member 2 (Kcnd2), mRNA [NM_0196
14 Mus musculus adult male cecum cDNA, RIKEN full-length enriched library, clone:9130022E09 product:hyp
15 Mus musculus CDC42 effector protein (Rho GTPase binding) 1 (Cdc42ep1), mRNA [NM_027219]
16 Mus musculus myosin, heavy polypeptide 1, skeletal muscle, adult (Myh1), mRNA [NM_030679]
17 PREDICTED: Mus musculus predicted gene, 20746 (Gm20746), mRNA [XM_006542883]
18 Mus musculus small nucleolar RNA host gene 6 (Snhg6), long non-coding RNA [NR_024067]
19 Mus musculus ring finger protein 41 (Rnf41), transcript variant 2, mRNA [NM_026259]
20 Mus musculus A kinase (PRKA) anchor protein 5 (Akap5), mRNA [NM_001101471]
21 Mus musculus membrane-associated ring finger (C3HC4) 8 (March8), mRNA [NM_027920]
22 Mus musculus RNA polymerase II associated protein 3 (Rpap3), mRNA [NM_028003]
23 Mus musculus UDP-N-acetyl-alpha-D-galactosamine:polypeptide N-acetylgalactosaminyltransferase 15 (G
24 Mus musculus N-myristoyltransferase 2 (Nmt2), transcript variant 1, mRNA [NM_008708]
25 Mus musculus 13 days embryo whole body cDNA, RIKEN full-length enriched library, clone:3930401B19 pi
26 Mus musculus 2-phosphoxylase phosphatase 1 (Pxylp1), transcript variant 1, mRNA [NM_001289645]
27 Mus musculus mitochondrial ribosomal protein S12 (Mrps12), mRNA [NM_011885]
28 Mus musculus transmembrane protein 254a (Tmem254a), transcript variant 1, mRNA [NM_026679]
29 Mus musculus adult male urinary bladder cDNA, RIKEN full-length enriched library, clone:9530030H05 pro
30 Mus musculus 4 days neonate male adipose cDNA, RIKEN full-length enriched library, clone:B430105A11
31 Mus musculus dynein light chain LC8-type 1 (Dylnl1), mRNA [NM_019682]
32 Mus musculus chemokine (C-C motif) ligand 25 (Ccl25), transcript variant 2, long non-coding RNA [NR_03:
33 Mus musculus transmembrane protein 178 (Tmem178), mRNA [NM_026516]
34 Mus musculus cell adhesion molecule with homology to L1CAM (Chl1), mRNA [NM_007697]
35 Mus musculus transmembrane protein 254c (Tmem254c), transcript variant 1, mRNA [NM_001270498]
36 Mus musculus lipoma HMGIC fusion partner-like 3 (Lhfp13), transcript variant 2, mRNA [NM_001081231]
37 Mus musculus adult male hippocampus cDNA, RIKEN full-length enriched library, clone:2900019G23 prod
38 Mus musculus adult male hippocampus cDNA, RIKEN full-length enriched library, clone:2900019G23 prod
39 Mus musculus BMP2 inducible kinase (Bmp2k), mRNA [NM_080708]
40 Mus musculus leucine rich repeat and sterile alpha motif containing 1 (Lrsam1), mRNA [NM_199302]
41 Mus musculus collagen, type IV, alpha 6 (Col4a6), mRNA [NM_053185]
42 Mus musculus serine/threonine kinase receptor associated protein (Strap), mRNA [NM_011499]
43 Mus musculus purine-nucleoside phosphorylase 2 (Pnp2), mRNA [NM_001123371]
44 Mus musculus dehydrogenase/reductase (SDR family) member 7C (Dhrs7c), mRNA [NM_001013013]
45 Mus musculus RIKEN cDNA A930005H10 gene (A930005H10Rik), transcript variant 2, long non-coding R
46 Mus musculus pituitary tumor-transforming gene 1 (Pttg1), transcript variant 2, mRNA [NM_013917]
47 Mus musculus anaphase-promoting complex subunit 5 (Anapc5), transcript variant 1, mRNA [NM_021505]
48 PREDICTED: Mus musculus RIKEN cDNA A030001D20 gene (A030001D20Rik), misc_RNA [XR_105107]
49 Mus musculus stathmin-like 3 (Stmn3), mRNA [NM_009133]
50 Mus musculus S100 calcium binding protein, zeta (S100z), mRNA [NM_001081159]
51 Mus musculus LIM domain only 1 (Lmo1), mRNA [NM_057173]
52 Mus musculus tissue inhibitor of metalloproteinase 4 (Timp4), mRNA [NM_080639]
53 Mus musculus integrin alpha 9 (Itga9), transcript variant 1, mRNA [NM_133721]
54 Mus musculus complement component 2 (within H-2S) (C2), mRNA [NM_013484]
55 Mus musculus EH-domain containing 3 (Ehd3), mRNA [NM_020578]
56 Mus musculus potassium intermediate/small conductance calcium-activated channel, subfamily N, member
57 Mus musculus double homeobox B-like 2 (Duxbl2), mRNA [NM_001177538]
58 Mus musculus lectin, galactose binding, soluble 4 (Lgals4), mRNA [NM_010706]
59 Mus musculus lectin, galactose binding, soluble 4 (Lgals4), mRNA [NM_010706]
60

1 Mus musculus GATA zinc finger domain containing 2A (Gatad2a), transcript variant 1, mRNA [NM_145596]
2 Mus musculus nuclear receptor subfamily 1, group D, member 2, mRNA (cDNA clone MGC:106146 IMAGE
3 Mus musculus F-box protein 17 (Fbxo17), mRNA [NM_015796]
4 Mus musculus glutamate receptor, metabotropic 5 (Grm5), transcript variant b, mRNA [NM_001143834]
5 Mus musculus ribosomal protein S3A1 (Rps3a1), mRNA [NM_016959]
6 Mus musculus endothelial cell-specific molecule 1 (Esm1), mRNA [NM_023612]
7 Mus musculus RIKEN cDNA 4833420G17 gene (4833420G17Rik), transcript variant 1, mRNA [NM_02612]
8 Mus musculus nicotinamide nucleotide adenyltransferase 3 (Nmnat3), mRNA [NM_144533]
9 Mus musculus exonuclease 3'-5' domain containing 1 (Exd1), mRNA [NM_172857]
10 Q3J0L9_RHOS4 (Q3J0L9) Hydrogenase maturation factor F, partial (3%) [TC1616199]
11 Mus musculus cell adhesion molecule with homology to L1CAM (Chl1), mRNA [NM_007697]
12 Mus musculus protein arginine N-methyltransferase 8 (Prmt8), mRNA [NM_201371]
13 Mus musculus KN motif and ankyrin repeat domains 1 (Kank1), mRNA [NM_181404]
14 Mus musculus hydroxyprostaglandin dehydrogenase 15 (NAD) (Hpgd), mRNA [NM_008278]
15 Mus musculus leucine rich repeat and sterile alpha motif containing 1 (Lrsam1), mRNA [NM_199302]
16 Mus musculus collagen, type II, alpha 1 (Col2a1), transcript variant 2, mRNA [NM_001113515]
17 Mus musculus growth associated protein 43 (Gap43), mRNA [NM_008083]
18 Mus musculus translocase of outer mitochondrial membrane 22 homolog (yeast) (Tomm22), mRNA [NM_1
19 Mus musculus adult male bone cDNA, RIKEN full-length enriched library, clone:9830138L07 product:uncla:
20 Mus musculus histocompatibility 2, Q region locus 5 (H2-Q5), non-coding RNA [NR_051981]
21 Mus musculus pyruvate dehydrogenase (lipoamide) beta (Pdhb), mRNA [NM_024221]
22 Mus musculus amyloid beta (A4) precursor protein-binding, family A, member 2 (Apba2), transcript variant
23 Mus musculus stathmin-like 4 (Stmn4), mRNA [NM_019675]
24 Mus musculus Ly6/neurotoxin 1 (Lynx1), mRNA [NM_011838]
25 Mus musculus butyrylcholinesterase (Bche), mRNA [NM_009738]
26 Mus musculus SH3-domain GRB2-like 3 (Sh3gl3), transcript variant 1, mRNA [NM_017400]
27 Mus musculus uncoupling protein 3 (mitochondrial, proton carrier) (Ucp3), mRNA [NM_009464]
28 Mus musculus stathmin-like 4 (Stmn4), mRNA [NM_019675]
29 Mus musculus peptidyl arginine deiminase, type II (Padi2), mRNA [NM_008812]
30 Mus musculus G protein-coupled receptor, family C, group 5, member A (Gprc5a), mRNA [NM_181444]
31 Mus musculus lipoprotein lipase (Lpl), mRNA [NM_008509]
32 Mus musculus lipoprotein lipase (Lpl), mRNA [NM_008509]
33 Mus musculus peptidyl arginine deiminase, type II (Padi2), mRNA [NM_008812]
34 Mus musculus uncoupling protein 2 (mitochondrial, proton carrier) (Ucp2), mRNA [NM_011671]
35 Mus musculus abhydrolase domain containing 1 (Abhd1), mRNA [NM_021304]
36 Mus musculus RIKEN cDNA 4833420G17 gene (4833420G17Rik), transcript variant 1, mRNA [NM_02612]
37 Mus musculus serine (or cysteine) peptidase inhibitor, clade A, member 3N (Serpina3n), mRNA [NM_0092
38 Mus musculus complement component factor i (Cfi), mRNA [NM_007686]
39 UDP-N-acetyl-alpha-D-galactosamine:polypeptide N-acetylgalactosaminyltransferase 15 [Source:MGI Sym
40 Mus musculus purinergic receptor P2X, ligand-gated ion channel, 7 (P2rx7), transcript variant 1, mRNA [NM
41 Mus musculus phosphatidylethanolamine binding protein 2 (Pbp2), mRNA [NM_029595]
42 Mus musculus olfactory receptor 224 (Olfr224), mRNA [NM_207695]
43 Mus musculus processing of precursor 4, ribonuclease P/MRP family, (S. cerevisiae) (Pop4), mRNA [NM_(
44 Mus musculus POU domain, class 6, transcription factor 1 (Pou6f1), mRNA [NM_010127]
45 Mus musculus protocadherin 17 (Pcdh17), mRNA [NM_001013753]
46 Mus musculus family with sequence similarity 183, member B (Fam183b), transcript variant 1, mRNA [NM_
47 Mus musculus RIKEN cDNA 1810037I17 gene (1810037I17Rik), mRNA [NM_024461]
48 Mus musculus RIKEN cDNA 1810037I17 gene (1810037I17Rik), mRNA [NM_024461]
49 Mus musculus sterile alpha motif domain containing 4 (Samd4), transcript variant 1, mRNA [NM_00103722
50 Mus musculus serine (or cysteine) peptidase inhibitor, clade A, member 3I (Serpina3i), mRNA [NM_001195
51 Mus musculus collagen, type IV, alpha 6 (Col4a6), mRNA [NM_053185]
52 Mus musculus XIAP associated factor 1 (Xaf1), transcript variant 1, mRNA [NM_001037713]

Supplimentary Table 2. List of genes validated by real-time PCR.

Gene Symbol	Gene Name	FC uArr	Ave Expr	Adj.p.value	FC pcr	p.value
Trim12a	tripartite motif-containing 12A	40.13	7.97	1.5E-21	20.31	0.0002
Ccl27a	chemokine (C-C motif) ligand 27A	8.94	8.53	2.5E-15	4.30	0.0107
Ccl27a (Pesky)	chemokine (C-C motif) ligand 27A Pesky	2.83	10.15	1.1E-03	4.30	0.0001
Car9	carbonic anhydrase 9	4.68	11.43	1.1E-02	3.83	0.0119
Ptchd2	patched domain containing 2	4.00	7.33	1.7E-13	7.33	0.0000
Slc2a4	solute carrier family 2 (facilitated glucose transporter), member 4	3.91	8.57	8.5E-09	5.25	0.0009
Bmp4	bone morphogenetic protein 4	3.31	12.83	2.0E-03	3.11	0.0002
Kcnab1	potassium voltage-gated channel, shaker-related subfamily, beta member 1	3.14	9.03	2.5E-04	1.72	0.0223
P2ry2	purinergic receptor P2Y, G-protein coupled 2	2.29	10.79	4.0E-04	3.45	0.0000
Tnrc18	trinucleotide repeat containing 18	1.70	11.77	2.5E-03	1.79	0.0126
TGFB3	transforming growth factor, beta 3	1.46	14.82	4.5E-02	1.80	0.0122
Vcp	valosin containing protein	1.37	15.31	9.0E-04	1.50	0.0012
Ankib1	ankyrin repeat and IBR domain containing 1	1.28	11.36	2.7E-02	1.41	0.0115
Panx1	pannexin 1	-1.8657	10.51056	2.4E-02	-4.48	0.032
Cacna2d3	calcium channel, voltage-dependent, alpha2/delta subunit 3	-1.94831	8.02254	2.1E-02	-1.90	0.040
Fbln2	fibulin 2	-2.13	12.94	3.5E-02	-2.17	0.016
Grm5	glutamate receptor, metabotropic 5	-2.72	7.75	3.0E-02	-4.64	0.023
Chl1	cell adhesion molecule with homology to L1CAM	-2.90	10.44	1.7E-03	-2.13	0.0410
Col2a1	collagen, type II, alpha 1	-3.03	10.26	3.0E-02	-2.83	0.068
Gap43	growth associated protein 43	-3.05	10.06	2.3E-03	-3.03	0.0497
Lynx1	Ly6/neurotoxin 1	-3.29	11.50	8.9E-07	-4.62	0.0050
Lpl	lipoprotein lipase	-3.89	10.54	2.1E-03	-5.57	0.0141
Padi2	peptidyl arginine deiminase, type II	-3.94	13.12	2.9E-06	-2.54	0.025
P2rx7	purinergic receptor P2X, ligand-gated ion channel, 7	-5.92	9.92	1.6E-05	-2.45	0.0004
Pcdh17	protocadherin 17	-8.55	9.29	4.6E-09	-3.64	0.0058
Samd4	sterile alpha motif domain containing 4	-10.42	9.71	3.5E-12	-24.32	0.0000
Col4a6	collagen, type IV, alpha 6	-20.09	11.49	1.7E-16	-24.89	0.0003
