Abstract

The European Commission requested the EFSA Panel on Plant Health to prepare and deliver risk assessments for commodities listed in Commission Implementing Regulation (EU) 2018/2019 as 'High-risk plants, plant products and other objects'. This Scientific Opinion covers plant health risks posed by bare root plants of *Malus domestica* grafted on rootstocks of either *Malus domestica* or *Malus sylvestris* imported from Bosnia and Herzegovina (BIH), taking into account the available scientific information, including the technical information provided by Bosnia and Herzegovina. All pests associated with the commodities were evaluated against specific criteria for their relevance for this opinion. One protected zone quarantine pest, *Erwinia amylovora*, fulfilled all relevant criteria and was selected for further evaluation. For *E. amylovora*, special requirements are specified in Commission Implementing Regulation (EU) 2019/2072. Based on the information provided in the Dossier, these specific requirements for *E. amylovora* are not met.

1. Introduction

1.1. Background and Terms of Reference as provided by European Commission

1.1.1. Background

The new Plant Health Regulation (EU) 2016/2031¹, on the protective measures against pests of plants, has been applied from December 2019. Provisions within the above Regulation are in place for the listing of 'high risk plants, plant products and other objects' (Article 42) on the basis of a preliminary assessment, and to be followed by a commodity risk assessment. A list of 'high risk plants, plant products and other objects' has been published in Regulation (EU) 2018/2019². Scientific opinions are therefore needed to support the European Commission and the Member States in the work connected to Article 42 of Regulation (EU) 2016/2031, as stipulated in the terms of reference.

1.1.2. Terms of Reference

In view of the above and in accordance with Article 29 of Regulation (EC) No 178/2002³, the Commission asks EFSA to provide scientific opinions in the field of plant health.

In particular, EFSA is expected to prepare and deliver risk assessments for commodities listed in the relevant Implementing Act as "High risk plants, plant products and other objects". Article 42, paragraphs 4 and 5, establishes that a risk assessment is needed as a follow-up to evaluate whether the commodities will remain prohibited, removed from the list and additional measures will be applied or removed from the list without any additional measures. This task is expected to be on-going, with a regular flow of dossiers being sent by the applicant required for the risk assessment.

Therefore, to facilitate the correct handling of the dossiers and the acquisition of the required data for the commodity risk assessment, a format for the submission of the required data for each dossier is needed.

Furthermore, a standard methodology for the performance of "commodity risk assessment" based on the work already done by Member States and other international organizations needs to be set.

In view of the above and in accordance with Article 29 of Regulation (EC) No 178/2002, the Commission asks EFSA to provide scientific opinion in the field of plant health for *Malus domestica* from Bosnia and Herzegovina taking into account the available scientific information, including the technical dossier provided by Bosnia and Herzegovina.

1.2. Interpretation of the Terms of Reference

The EFSA Panel on Plant Health (hereafter referred to as 'the Panel') was requested to conduct a commodity risk assessment of *M. domestica* from Bosnia and Herzegovina following the Guidance on commodity risk assessment for the evaluation of high-risk plant dossiers (EFSA PLH Panel, 2019).

The EU quarantine pests that are regulated as a group in the Commission Implementing Regulation (EU) 2019/2072 were considered and evaluated separately at species level.

Annex II of Implementing Regulation (EU) 2019/2072 lists certain pests as non-European populations or isolates or species. These pests are regulated quarantine pests. Consequently, the respective European populations, or isolates, or species are non-regulated pests.

Annex VII of the same Regulation, in certain cases (e.g. point 32) makes reference to the following countries that are excluded from the obligation to comply with specific import requirements for those non-European populations, or isolates, or species: Albania, Andorra, Armenia, Azerbaijan, Belarus, Bosnia and Herzegovina, Canary Islands, Faeroe Islands, Georgia, Iceland, Liechtenstein, Moldova,

¹ Regulation (EU) 2016/2031 of the European Parliament of the Council of 26 October 2016 on protective measures against pests of plants, amending Regulations (EU) 228/2013, (EU) 652/2014 and (EU) 1143/2014 of the European Parliament and of the Council and repealing Council Directives 69/464/EEC, 74/647/EEC, 93/85/EEC, 98/57/EC, 2000/29/EC, 2006/91/EC and 2007/33/EC. OJ L 317, 23.11.2016, pp. 4–104.

² Commission Implementing Regulation (EU) 2018/2019 of 18 December 2018 establishing a provisional list of high risk plants, plant products or other objects, within the meaning of Article 42 of Regulation (EU) 2016/2031 and a list of plants for which phytosanitary certificates are not required for introduction into the Union, within the meaning of Article 73 of that Regulation C/2018/8877. OJ L 323, 19.12.2018, pp. 10–15.

³ Regulation (EC) No 178/2002 of the European Parliament and of the Council of 28 January 2002 laying down the general principles and requirements of food law, establishing the European Food Safety Authority and laying down procedures in matters of food safety. OJ L 31, 1.2.2002, pp. 1–24.

Monaco, Montenegro, North Macedonia, Norway, Russia (only the following parts: Central Federal District (Tsentrally federalny okrug), Northwestern Federal District (Severo Zapadny federalny okrug), Southern Federal District (Yuzhny federalny okrug), North Caucasian Federal District (Severo-Kavkazsky federalny okrug) and Volga Federal District (Privolzhsky federalny okrug), San Marino, Serbia, Switzerland, Türkiye, Ukraine and the United Kingdom (except Northern Ireland⁴). Most of those countries are historically linked to the reference to 'non-European countries' existing in the previous legal framework, Directive 2000/29/EC.

Consequently, for those countries,

- i) any pests identified, which are listed as non-European species in Annex II of Implementing Regulation (EU) 2019/2072 should be investigated as any other non-regulated pest.
- ii) any pest found in a European country that belongs to the same denomination as the pests listed as non-European populations or isolates in Annex II of Implementing Regulation (EU) 2019/2072, should be considered as European populations or isolates and should not be considered in the assessment of those countries.

Pests listed as 'Regulated Non-Quarantine Pest' (RNQP) in Annex IV of the Commission Implementing Regulation (EU) 2019/2072, and deregulated pests (i.e. pests which were listed as quarantine pests in the Council Directive 2000/29/EC and were deregulated by Commission Implementing Regulation (EU) 2019/2072) were not considered for further evaluation.

In its evaluation the Panel:

- Checked whether the information provided by the applicant (Administration Bosnia and Herzegovina for Plant Health Protection, Ministry of Foreign Trade and Economic Relations) in the technical dossier (hereafter referred to as 'the Dossier') was sufficient to conduct a commodity risk assessment. When necessary, additional information was requested.
- Selected the relevant union EU-regulated quarantine pests and protected zone quarantine pests (as specified in Commission Implementing Regulation (EU) 2019/2072⁵, hereafter referred to as 'EU quarantine pests') and other relevant pests present in Bosnia and Herzegovina and associated with the commodity.
- Assessed whether the applicant country implements specific measures for Union quarantine pests for which specific measures are in place for the import of the commodity from the specific country in the relevant legislative texts for emergency measures (https://ec.europa.eu/food/plant/plant_health_biosecurity/legislation/emergency_measures_en); the assessment was restricted to whether or not the applicant country applies those measures. The effectiveness of those measures was not assessed.
- Assessed whether the applicant country implements the special requirements specified in Annex VII (points 1–101) and Annex X of the Commission Implementing Regulation (EU) 2019/2072 targeting Union quarantine pests for the commodity in question from the specific country.
- Assessed the effectiveness of the measures described in the dossier for those Union quarantine pests for which no specific measures are in place for the import of the commodity from the specific applicant country and other relevant pests present in applicant country and associated with the commodity.

Risk management decisions are not within EFSA's remit. Therefore, the Panel provided a rating based on expert judgement regarding the likelihood of pest freedom for each relevant pest given the risk mitigation measures claimed to be implemented by the Administration Bosnia and Herzegovina for Plant Health Protection, Ministry of Foreign Trade and Economic Relations.

⁴ In accordance with the Agreement on the withdrawal of the United Kingdom of Great Britain and Northern Ireland from the European Union and the European Atomic Energy Community, and in particular Article 5(4) of the Protocol on Ireland/Northern Ireland in conjunction with Annex 2 to that Protocol, for the purposes of this Annex, references to Member States include the United Kingdom in respect of Northern Ireland.

⁵ Commission Implementing Regulation (EU) 2019/2072 of 28 November 2019 establishing uniform conditions for the implementation of Regulation (EU) 2016/2031 of the European Parliament and the Council, as regards protective measures against pests of plants, and repealing Commission Regulation (EC) No 690/2008 and amending Commission Implementing Regulation (EU) 2018/2019, OJ L 319, 10.12.2019, p. 1–279.

2. Data and methodologies

2.1. Data provided by the Administration Bosnia and Herzegovina for Plant Health Protection, Ministry of Foreign Trade and Economic Relations

The Panel considered all the data and information (hereafter called 'the Dossier') provided by the Ministry of Foreign Trade and Economic Relations, Administration Bosnia and Herzegovina for Plant Health Protection in February 2022, including the additional information provided by the Ministry of Foreign Trade and Economic Relations, Administration Bosnia and Herzegovina for Plant Health Protection in July 2023 after EFSA's request. The Dossier is managed by EFSA.

The structure and overview of the Dossier is shown in Table 1. The number of the relevant section is indicated in the opinion when referring to a specific part of the Dossier.

Table 1: Structure and overview of the Dossier

Dossier section	Overview of contents	Filename
1.0	Technical dossier	Dossier_Malus_Bosnia_ARES-241276-Annexe.docx Production_and_control_of_Apple_seedlings_ARES-241276-Lettre.docx
2.0	Pest list	Dossier_Malus_Bosnia_ARES-241276-Annexe.docx
3.0	Additional information provided by Bosnia and Herzegovina in August 2023	Bosnia Malus domestica reply

The data and supporting information provided by the Administration Bosnia and Herzegovina for Plant Health Protection formed the basis of the commodity risk assessment.

2.2. Literature searches performed by EFSA

Literature searches in different databases were undertaken by EFSA to complete a list of pests potentially associated with *M. domestica* and *M. sylvestris*. The following searches were combined: (i) a general search to identify pests of *M. domestica* and *M. sylvestris* in different databases and (ii) a tailored search to identify whether these pests are present or not in Bosnia and Herzegovina and the EU. The searches were run between 13 January 2023 and 27 March 2023. No language, date or document type restrictions were applied in the search strategy.

The search strategy and search syntax were adapted to each of the databases listed in Table 2, according to the options and functionalities of the different databases and CABI keyword thesaurus.

As for Web of Science, the literature search was performed using a specific, ad hoc established search string (see Appendix B). The string was run in 'All Databases' with no range limits for time or language filters. This is further explained in Section 2.3.2.

Additional searches, limited to retrieve documents, were run when developing the opinion. The available scientific information, including previous EFSA opinions on the relevant pests and diseases (see pest data sheets in Appendix A) and the relevant literature and legislation (e.g. Regulation (EU) 2016/2031; Commission Implementing Regulations (EU) 2018/2019; (EU) 2018/2018 and (EU) 2019/2072) were taken into account.

2.3. Methodology

When developing the opinion, the Panel followed the EFSA Guidance on commodity risk assessment for the evaluation of high-risk plant dossiers (EFSA PLH Panel, 2019).

In the first step, pests potentially associated with the commodity in the country of origin (EU-quarantine pests and other pests) that may require risk mitigation measures were identified. The EU non-quarantine pests not known to occur in the EU were selected based on evidence of their potential impact in the EU. After the first step, all the relevant pests that may need risk mitigation measures were identified.

In the second step, the proposed risk mitigation measures for each relevant pest were evaluated in terms of efficacy or compliance with EU requirements as explained in Section 1.2.

A conclusion on the likelihood of the commodity being free from each of the relevant pest was determined and uncertainties identified using expert judgements.

2.3.1. Commodity data

Based on the information provided by Bosnia and Herzegovina, the characteristics of the commodity were summarised.

2.3.2. Identification of pests potentially associated with the commodity

To evaluate the pest risk associated with the importation of *M. domestica* from Bosnia and Herzegovina a pest list was compiled. The pest list is a compilation of all identified plant pests associated with *M. domestica*, *M. pumila* and *M. sylvestris* based on (1) information provided in the technical Dossier, (2) additional information provided by Administration Bosnia and Herzegovina for Plant Health Protection, (3) as well as on searches performed by the Panel. The search strategy and search syntax were adapted to each of the databases listed in Table 4, according to the options and functionalities of the different databases and CABI keyword thesaurus.

The scientific name of the host plants (*M. domestica* (synonym *M. pumila*) and *M. sylvestris*) was used when searching in the EPPO Global database and CABI Crop Protection Compendium. The same strategy was applied to the other databases excluding EUROPHYT and Web of Science.

EUROPHYT was consulted by searching for the interceptions associated to commodities imported from Bosnia and Herzegovina, at species level, from 1998 to May 2020 and TRACES for interceptions

from June 2020 to June 2023. For the pests selected for further evaluation a search in the EUROPHYT and/or TRACES was performed for the interceptions from the whole world, at species level.

The search strategy used for Web of Science Databases was designed combining common names for pests and diseases, terms describing symptoms of plant diseases and the scientific and common names of the commodity. All the pests already retrieved using the other databases were removed from the search terms in order to be able to reduce the number of records to be screened.

The established search string is detailed in Appendix A and was run on 3 to 7 July 2023.

The titles and abstracts of the scientific papers retrieved were screened and the pests associated with *M. domestica* and *M. sylvestris* were included in the pest list. The pest list was eventually further compiled with other relevant information (e.g. EPPO code per pest, taxonomic information, categorisation, distribution) useful for the selection of the pests relevant for the purposes of this opinion.

The compiled pest list (see Microsoft Excel® file in Appendix B) includes all identified pests that use *M. domestica* or *M. sylvestris* as host. According to the Interpretation of Terms of Reference.

The evaluation of the compiled pest list was done in two steps: first, the relevance of the EU-quarantine pests was evaluated (Section 4.1); second, the relevance of any other plant pest was evaluated (Section 4.2).

2.3.3. Listing and evaluation of risk mitigation measures

Since the Panel did not identify any relevant pest for this Opinion (see Sections 4.1 and 4.2), the proposed risk mitigation measures were listed without undergoing subsequent evaluation. Likewise, due to the absence of pests an expert knowledge elicitation on pest freedom was not performed.

3. Commodity data

3.1. Description of the commodity

According to the Dossier the commodities considered to be imported into EU from Bosnia and Herzegovina are:

- Single bare root plants, 1 or 2 year old (after grafting and/or budding), of *M. domestica* (Figure 1).
- Bundles of 10 bare root plants, 1 or 2 year old (after grafting and/or budding), of *M. domestica*.

The two commodities can be grafted on rootstocks of *M. domestica* or *M. sylvestris*.

As presented in the Dossier 1 year old plants destined for export must have three well-developed roots with a minimum length of 25 cm, a minimum height of 1 m, the minimum diameter of the lower part of the plant of 10 mm and the cross-sectional area of the scion must be at least 40% of the rootstock cross-sectional area. Two year old plants must have at least 3–4 properly formed primary branches, straight and smooth stem, well-developed root system and the minimum cross-sectional area of the scion is 80%.

Plants are transported in dormant stage without fruits or leaves.

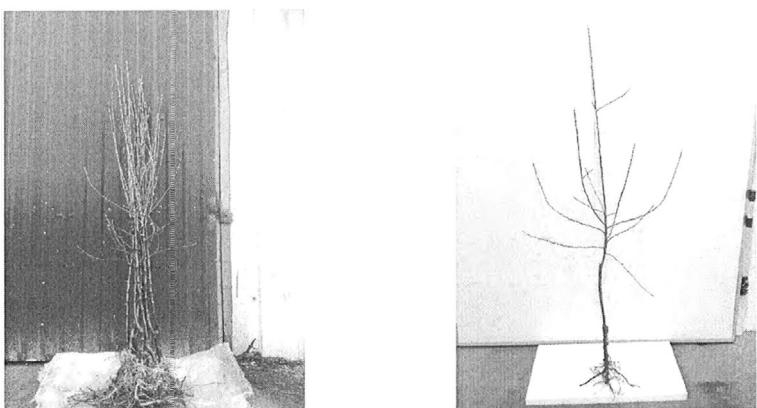

Figure 1: Pictures of the commodity as provided by Bosnia and Herzegovina; Left – bundle of 1 year old apple plants (T1) in dormant stage, right – 2 year old apple plant (T3) in dormant stage (see Section 3.3.3 for details). © Administration Bosnia and Herzegovina for Plant Health Protection, Ministry of Foreign Trade and Economic Relations

3.2. Description of the production areas

According to the Dossier and additional information provided, in Bosnia and Herzegovina there are two main planting material production regions (Figure 2): northern part (Ljevče polje and Posavina) and southern part of the country (Neretva valley and Popovo polje). There are 46 registered nurseries in Bosnia and Herzegovina (38 in Republika Srpska (RS) and eight in Federation of Bosnia and Herzegovina (FBiH)). Currently, only three registered nurseries have exported to EU and non-EU countries in the last 3 years (all from RS), and 17 potential exporting nurseries have continuous yearly production of planting material.

The three mentioned nurseries (location 1, 2 and 3, Figure 2) are located within a radius of about 20 km, and the dominant crop in the surrounding areas and in the entire region is cereals.

Nurseries that produce apple plants in Bosnia and Herzegovina have a mixed structure of production. Other than apples, the most common species are pear and plum, and other species (cherry, sour cherry, peach, apricot, quince, hazelnut, walnut, chestnut, raspberry, strawberry, blackberry, chokeberry, currant, blueberry) are produced in small quantities. No other information about the plants growing outside and within the nurseries was provided.

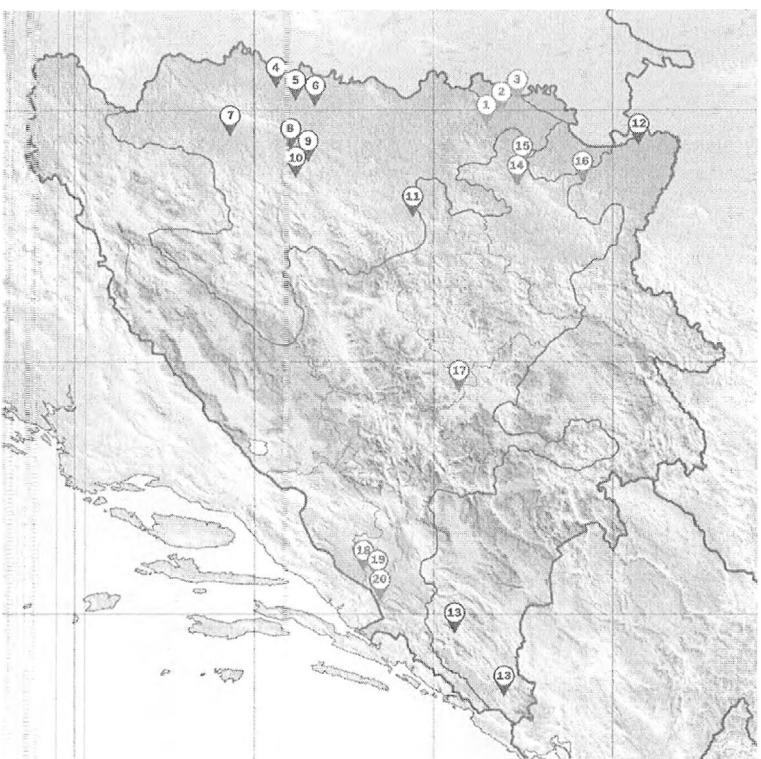

Figure 2: Map of Bosnia and Herzegovina and location of current and potential exporting nurseries (picture provided by Bosnia and Herzegovina). © Administration Bosnia and Herzegovina for Plant Health Protection, Ministry of Foreign Trade and Economic Relations

Disclaimer: The designations employed and the presentation of material on this map do not imply the expression of any opinion whatsoever on the part of the European Food Safety Authority concerning the legal status of any country, territory, city or area or of its authorities or concerning the delimitation of its frontiers or boundaries.

3.3. Production and handling processes

3.3.1. Growing conditions

As provided in the submitted Dossier, plants are grown in open fields. Plants are grafted on site or moved indoors for grafting and after are replanted in the field. The growing medium used for the production is soil (according to the ISPM 40, FAO, 2017).

The soil tests are the obligatory prerequisite for establishment of the nursery production in Bosnia and Herzegovina.

3.3.2. Source of planting material

According to the Dossier, propagation materials are supplied from the mother plants in Bosnia and Herzegovina as some nurseries have their own mother plants. Additionally, mother plants are supplied from nurseries from the EU.

3.3.3. Production cycle

The production cycle as described in the Dossier is as follow:

'The apple planting material considered to be imported in the EU from BIH (1 or 2 year old bare root plants) is ready for selling in late autumn. Production process for planting differs on the following:

- 1) The grafting / budding methods – Whip-and-Tongue Graft is the most used grafting method; T and Chip budding is used equally,
- 2) The grafting site – The grafting on site or grafting indoors and then planting in the field,
- 3) One or two-three years of production: 1 year plants spend 1 or 2 years in the field; kneipping the grafted plants after first year in the field to produce 2-year plants and
- 4) Source of scions and 'rootstocks' – imported from EU, region or nursery's own mother plantation.

There are three prevailing technologies of fruit plant production performed in BIH, with the production cycle of one or two seasons (Table 3):

- 1) T1 – 1-year-old budded fruit plants (two seasons in the field during three or two calendar years),
- 2) T2 – 1-year-old grafted fruit plants (1 year in the field) and
- 3) T3 – 2-year-old grafted 'Knip-baum' fruit plants (2 year in the field during three or two calendar years').

Table 3: An example of the production cycle in Bosnia and Herzegovina as provided in the Dossier

T3 – 2-year-old grafted fruit plants production process (branched 'Knip-baum' plants)

Year before	August–December	Plot selection, soil analysis, soil precultivation. Crop rotation is a must (the plots already used for nursery production are not used now). For each establishment the plot history should be provided -for at least 4 years before the production, and there should not be any orchards in the same plot.
1st growing season	February	Grafting. Storage in cold until planting.
	March–April	Irrigation system installation. Planting the grafted rootstocks. Fertigation, pest control and protection.
	May–September	Maintaining of the site and plants (irrigation, soil cultivation, fertigation, pest control and protection); stripping tape removal; tying of plants to bamboo or wire. First official control by authorised institution and inspection (June).
	September/October	Second official control by authorised institution and inspection. Plot selection, soil analysis, soil precultivation (plot for 2nd season)
	October/December	Taking out the plants from soil, classifying and replanting the 1st class of plants on the new plot for the 2nd season.
2nd growing season	January/February	Shortening of plants on 70 cm above ground level.
	April–September	Tying of plants to bamboo or wire. Maintaining of the site and plants (irrigation, soil cultivation, fertigation, pest control and protection). 1st official control by authorised institution and inspection (June).

T3 – 2-year-old grafted fruit plants production process (branched 'Knip-baum' plants)

September/October	2nd official control by authorised institution and inspection. Defoliation treatments. Labelling.
October to December	Taking out the young plants from soil, shaking the soil from roots, ranking for storage or delivering, washing, packaging, transportation.

3.3.4. Pest monitoring during production

According to the Dossier regular control of production in nurseries is carried out twice a year based on the Law on Planting Material and Plant Health Law.

The first official supervision of plants, rootstocks and mother trees is performed during the vegetation from mid-June to the end of July.

The second official supervision is performed before the uprooting of plants and rootstocks (autumn–early winter), and for mother trees before removing the scions.

Plant health inspections of propagating material are carried out during the growing season to determine the presence of disease and pests at a time when the symptoms can be observed and recorded.

Additionally, when establishing new nurseries, the inspection of the site is carried out regarding the spatial isolation conditions and soil analysis for the presence of harmful nematodes that may cause economic loss.

All plants are produced only in registered nurseries under official inspections.

The sanitary status of the fruit plants is controlled by the producers, by the authorised institutions, as well as via official inspection controls.

The whole production process is under official control and there are official records of the production surveillance. The procedures and protocols for the commodity – Apple planting material are in line with EPPO Standards PM 4/27 (1) – certification scheme on pathogen-tested material of *Malus*, *Pyrus* and *Cydonia*; PM 3/76 (1) Trees of *Malus*, *Pyrus*, *Cydonia* and *Prunus* spp. – inspection of places of production and PM 3/72 (1) – Elements common to inspection of places of production, area-wide surveillance, inspection of consignments and lot identification.

The authorised person must, on the basis of a visual inspection, check that the propagating material is free from harmful organisms and diseases that affect quality and whether there are signs or symptoms of such organisms and diseases that reduce the use value of propagating material and fruit plants.

The authorised person carefully walks between the rows of plants and looks for the symptoms of harmful organisms and diseases, then records the number of plants on which the symptoms of harmful organisms and diseases have been noticed.

3.3.5. Post-harvest processes and export procedure

The post-harvest and export procedure usually takes place between October and December, when young plants are taken out from the field. Soil is removed from roots by shaking, plants are ranked for storage or delivering, washed and packed.

The planting material during transport and in the store is kept in conditions (rack, refrigeration, etc.) to preserve its quality and protect from damage. Planting material intended for export is packed either individually or in bundles of 10 pieces, and the root of each bundle is protected with plastic film. Seedlings for export are transported in closed trunks.

4. Identification of pests potentially associated with the commodity

The search for potential pests associated to *M. domestica* (old name *M. pumila*) and *M. sylvestris* rendered 1,996 species (see Microsoft Excel® file in Appendix B).

4.1. Selection of relevant EU-quarantine pests associated with the commodity

The EU listing of union quarantine pests and protected zone quarantine pests (Commission Implementing Regulation (EU) 2019/2072) is based on assessments concluding that the pests can enter, establish, spread and have potential impact in the EU.

A total of 56 EU-quarantine species that are reported to use *M. domestica* and/or *M. sylvestris* as host plants were evaluated (Table 4) for their relevance of being included in this opinion.

The relevance of an EU-quarantine pest for this opinion was based on evidence that:

- a) the pest is present in Bosnia and Herzegovina.
- b) *M. domestica* and/or *M. sylvestris* is a host of the pest.
- c) one or more life stages of the pest can be associated with the specified commodity.

Pests that fulfilled all criteria were selected for further evaluation.

Table 4 presents an overview of the evaluation of the 56 EU-quarantine pest species that are reported to use *M. domestica* and/or *M. sylvestris* as a host; they were included in the Dossier submitted by Ministry of Foreign Trade and Economic Relations, Administration of Bosnia and Herzegovina for Plant Health Protection in regards of their relevance for this Opinion.

One species (*Erwinia amylovora*) known to use *M. domestica* as host, associated with the commodity and present in Bosnia and Herzegovina, was selected for further evaluation.

Since special requirements or emergency measures are specified for *M. domestica* with regards to *E. amylovora*, in Appendix X, item 9 of Commission Implementing Regulation (EU) 2019/2072 the evaluation for this pest consisted of checking whether or not the exporting country applies these measures.

Table 4: Overview of the evaluation of the 56 EU-quarantine pest species known to use *M. domestica* and/or *M. sylvestris* as a host plant for their relevance for this opinion

(a): Commission Implementing Regulation (EU) 2019/2072.

(b): NA – Not assessed.

4.2. Selection of other relevant pests (non-regulated in the EU) associated with the commodity

The information provided by Bosnia and Herzegovina, integrated with the search EFSA performed, was evaluated in order to assess whether there are other potentially relevant pests of *M. domestica* present in the country of export. For these potential pests that are non-regulated in the EU, pest risk assessment information on the probability of entry, establishment, spread and impact is usually lacking. Therefore, these pests were also evaluated to determine their relevance for this opinion based on evidence that:

- a) the pest is present in Bosnia and Herzegovina;
- b) the pest is (i) absent or (ii) has a limited distribution in the EU;
- c) *M. domestica* and/or *M. sylvestris* is a host of the pest;
- d) one or more life stages of the pest can be associated with the specified commodity;
- e) the pest may have an impact in the EU.

Pest species were excluded from further evaluation when at least one of the conditions listed above (a–e) was not met. Details can be found in Appendix B (Microsoft Excel® file).

There were no pests that fulfilled the above listed criteria and consequently no pests were selected for further evaluation.

Based on the information collected, 1,942 potential pests (non-EU quarantine) known to be associated with the species commodity were evaluated for their relevance to this Opinion. The species were excluded from further evaluation when at least one of the conditions listed above (a–e) was not met. Details can be found in Appendix B (Microsoft Excel® file). None of the evaluated EU non-quarantine pests was selected for further evaluation.

4.3. Overview of interceptions

Data on the interception of harmful organisms on plants of *M. domestica* can provide information on some of the organisms that can be present on *M. domestica* despite the current measures taken. According to EUROPHYT, online (accessed on 20 April 2023) and TRACES, online (accessed on 28 July 2023) there were no interceptions of plants for planting of *M. domestica* from Bosnia and Herzegovina destined to the EU Member States due to presence of harmful organisms between the years 1998 and the 2023 (July).

5. Risk mitigation measures

Since the Panel did not identify any relevant pest associated with the evaluated commodity, the proposed risk mitigation measures were not further evaluated. However, an overview of the risk mitigation measures, as described in the Dossier, is reported in the following section.

5.1. Risk mitigation measures applied in Bosnia and Herzegovina

With the Dossier and additional information provided by Bosnia and Herzegovina, the Panel summarised the risk mitigation measures (see Table 5) that are proposed in the production nurseries.

Table 5: Overview of proposed risk mitigation measures for *Malus domestica* plants designated for export to the EU from Bosnia and Herzegovina

No.	Risk mitigation measure (name)	Implementation in Bosnia and Herzegovina
1	Certified material	Apple planting material can be produced only by a legal entity or entrepreneur. Producers keep all records of production and marketing for 5 years. If the propagating material meets the prescribed requirements the certificates on varieties purity and quality and plant health condition followed by Certificate on propagating material production are issued. In the case of planting material, it must be confirmed that the genus or type of material is correct and that the identity and purity are in accordance with the variety. Since it is difficult to determine this visually, the emphasis is on checking of the documentation on the origin of the material for reproduction.

No.	Risk mitigation measure (name)	Implementation in Bosnia and Herzegovina
2	Phytosanitary certificates	<p>The origin, quality and health status of plants and the origin and quantity of reproductive material used for plant production are controlled by field inspection (twice in the vegetation) and control of documentation in the nursery.</p> <p>Planting material may be placed on the market if it meets the requirements in terms of quality, prescribed category, health status (in accordance with the regulations on plant health); packaging and labelling. The producer is obliged to:</p> <ul style="list-style-type: none"> – ensure that the planting material meets the prescribed requirements, – constantly monitor the production of planting material in accordance with the plan, – implement measures to ensure compliance of planting material with the prescribed requirements (especially with regard to maintenance of nursery areas and protection against harmful organisms), – keep records of supervision and implemented measures, – enable official or inspection control, allow sampling and inform the phytosanitary inspector on the occurrence or suspicion of the occurrence of quarantine harmful organisms at the place of production.
3	Cleaning and disinfection of facilities, tools and machinery	No specific information on this measure is provided in the Dossier
4	Rouging and pruning	No specific information on this measure is provided in the Dossier
5	Pesticide application, biological and mechanical control	Pesticides are applied when needed according to regulations in BiH. Regular agro-technical measures, including the application of pesticides, are mandatory in the nurseries.
6	Surveillance and monitoring	<p>Apple planting material is under permanent surveillance and monitoring in all nurseries. The whole production process is under official control and there are official records of the production surveillance. The procedures and protocols for the commodity – Apple planting material are in line with EPPO Standards PM 4/27 (1) certification scheme on pathogen-tested material of <i>Malus</i>, <i>Pyrus</i> and <i>Cydonia</i>; PM 3/76 (1) Trees of <i>Malus</i>, <i>Pyrus</i>, <i>Cydonia</i> and <i>Prunus</i> spp. – inspection of places of production, and PM 3/72 (1) – Elements common to inspection of places of production, area-wide surveillance, inspection of consignments and lot identification.</p> <p>Two official controls are performed on apple planting material, both by authorised institution and phytosanitary inspection. The first official supervision of plants, rootstocks and mother trees is performed during the vegetation from mid-June to the end of July. The second official supervision is performed before the uprooting of plants and rootstocks (autumn-early winter), and for mother trees before removing the scions from the mother trees. Plant health inspections of propagating material are carried out during the growing season to determine the presence of disease and pests at time when the symptoms can be observed and recorded.</p> <p>The first official inspection checks the documentation on the origin of the material used for the declared production, and the visual inspection and assessment checks the declared quantity with the actual situation in the field, as well as the general condition of the planting material in the field.</p> <p>During the last official control, the quantity of planting material by species, varieties, clones (if necessary), rootstocks and categories that meet the conditions for placing on the market is determined by counting, either the whole quantity or a certain percentage determined by the principle of a representative sample, and these data are entered in the record.</p>

No.	Risk mitigation measure (name)	Implementation in Bosnia and Herzegovina
7	Sampling and laboratory testing	<p>Authorised phytosanitary laboratories perform sampling and laboratory testing for the presence of harmful organisms in accordance with the general need and special monitoring programs. Regular reporting on performed activities is carried out within the time limits prescribed by the annual programmes, and extraordinary reporting in case of detection of the presence of a harmful organism is performed in accordance with the rulebook, after which the Ministry and phytosanitary inspection are notified.</p> <p>Harmful organisms are monitored by:</p> <ul style="list-style-type: none"> – visual inspection of plants during field visits; – using traps; – laboratory observations; – using computer forecasting models. <p>Alerts on the presence of observed harmful organisms are disseminated through the website of the Department.</p> <p>After finishing the laboratory testing, the laboratory issues a Report on laboratory analysis with a specific unique number and date and submits the Report to the competent inspector or authorised person who signed the Order.</p> <p>For certain harmful organisms, in case of suspicion of their presence, the authorised Laboratory issues an Emergency Report on suspected occurrence and submits the Report to the competent Inspector. A copy of this Report is urgently sent to the Ministry, which is responsible to inform the BIH Administration.</p> <p>After completion of the confirmation test, the Laboratory issues a final Report on confirmation test and submits it to the competent inspector, and additionally a final Report on confirmation test, with photos and a description of methodology, is sent to responsible Ministry.</p> <p>Authorised laboratories also co-operate in the preparation and implementation of surveys of harmful organisms.</p>
8	Root washing	After uprooting
9	Refrigeration and temperature control	After grafting in February plants are placed in cold storage until planting in March–April
10	Pre-consignment inspection	The authorised person must, on the basis of a visual inspection, check that the propagating material of fruit and fruit seedlings is free from harmful organisms and diseases that affect quality, and whether there are signs or symptoms of such organisms and diseases.

5.2. Evaluation of the application of specific measures in Bosnia and Herzegovina

Annex X of the Commission Implementing Regulation (EU) 2019/2072 specifies a list of plants, plant products and other objects, originating from third countries, along with the corresponding special requirements for their introduction into the Union's territory or Protected Zones.

According to the above mentioned Annex special measures are required for the import of the commodity from Bosnia and Herzegovina related to *E. amylovora*. As presented in the Dossier, including the supplementary information, the Panel concludes that the exporting country does not fully meet the specific requirements for a certificate regarding *E. amylovora*. At least two inspections are mentioned, and the timing could be interpreted as the 'most appropriate time', though not in full agreement with the timeframes mentioned in the legislation.

Details of the buffer zone were uncertain, and it remains unclear whether it was officially designated, and if it fulfils the minimum size requirement of 50 km². Additionally, information regarding testing for latent infections was lacking.

Given the fact that *E. amylovora* is present in BIH and there are no pest free areas in BIH the Panel assumes that the exported material has to fulfil option (d) of Annex X point 9:

(d) the plants have been produced, or, if moved into a 'buffer zone', kept and maintained for a period of at least 7 months, including the period from 1 April to 31 October of the last complete cycle of vegetation, on a field:

(i) located at least 1 km inside the border of an officially designated 'buffer zone' of at least 50 km², where host plants are subject to an officially approved and supervised control regime established at the latest before the beginning of the complete cycle of vegetation, preceding the last complete cycle of vegetation, with the object of minimising the risk of *E. amylovora* (Burr.) Winsl. et al. being spread from the plants grown there;

(ii) which has been officially approved, as well as the 'buffer zone', before the beginning of the complete cycle of vegetation preceding the last complete cycle of vegetation, for the cultivation of plants under the requirements laid down in this point;

(iii) which, as well as the surrounding zone of a width of at least 500 m, has been found free from *E. amylovora* (Burr.) Winsl. et al. since the beginning of the last complete cycle of vegetation, at official inspection carried out at least: – twice in the field at the most appropriate time, i.e. once in the period from June to August and once from August to November; and – once in the said surrounding zone at the most appropriate time, i.e. from August to November and

(iv) from which plants were officially tested for latent infections in accordance with an appropriate laboratory method on samples officially drawn at the most appropriate period.

In the dossier details on the implementation of the buffer zone are not provided and it remains unclear whether it was officially designated, and if it fulfils the minimum size requirement of 50 km² (as required in point d(i)).

In the dossier it is stated that at least two inspections are carried out. It is uncertain if these inspections are carried out at the 'most appropriate time', as specified in point d iii of the legislation. Additionally, information regarding testing for latent infections was lacking (point d iv).

As presented in the Dossier, including the supplementary information, the Panel concludes that the exporting country does not fully meet the specific requirements as specified in Annex X point 9 regarding *E. amylovora*.

6. Conclusions

After a thorough analysis of the Dossier on *M. domestica*, the Panel concludes that one pest is identified to be present in Bosnia and Herzegovina and considered to be potentially associated with single or bundled bare root plants of *M. domestica* imported from Bosnia and Herzegovina and relevant for the EU.

The Panel concludes that for *E. amylovora*, the exporting country does not meet the specific requirements for a certificate regarding this pest.

Glossary

Control (of a pest)	Suppression, containment or eradication of a pest population (FAO, 1995, 2023).
Entry (of a pest)	Movement of a pest into an area where it is not yet present, or present but not widely distributed and being officially controlled (FAO, 2023).
Establishment (of a pest)	Perpetuation, for the foreseeable future, of a pest within an area after entry (FAO, 2023).
Impact (of a pest)	The impact of the pest on the crop output and quality and on the environment in the occupied spatial units.
Introduction (of a pest) Measures	The entry of a pest resulting in its establishment (FAO, 2023). Control (of a pest) is defined in ISPM 5 (FAO 2023) as 'Suppression, containment or eradication of a pest population' (FAO, 1995). Control measures are measures that have a direct effect on pest abundance. Supporting measures are organisational measures or procedures supporting the choice of appropriate risk mitigation measures that do not directly affect pest abundance.
Pathway	Any means that allows the entry or spread of a pest (FAO, 2023).
Phytosanitary measures	Any legislation, regulation or official procedure having the purpose to prevent the introduction or spread of quarantine pests or to limit the economic impact of regulated non-quarantine pests (FAO, 2023).
Protected zone	A Protected zone is an area recognised at EU level to be free from a harmful organism, which is established in one or more other parts of the Union.
Quarantine pest	A pest of potential economic importance to the area endangered thereby and not yet present there, or present but not widely distributed and being officially controlled (FAO, 2023).
Regulated non-quarantine pest	A non-quarantine pest whose presence in plants for planting affects the intended use of those plants with an economically unacceptable impact and which is therefore regulated within the territory of the importing contracting party (FAO, 2023).
Risk mitigation measure	A measure acting on pest introduction and/or pest spread and/or the magnitude of the biological impact of the pest should the pest be present. A risk mitigation measure may become a phytosanitary measure, action or procedure according to the decision of the risk manager.
Spread (of a pest)	Expansion of the geographical distribution of a pest within an area (FAO, 2023).

Appendix A – Web of Science All Databases Search String

In the table below the search string used in Web of Science is reported. In total, 412 papers were retrieved. Titles and abstracts were screened, and 17 pests were added to the list of pests (see Appendix B).

Web of Science All databases	<p>TOPIC:</p> <p>#1 ("Malus domestica" OR "M.
