About 43% caregivers said that they and/or the patients had paid OOP for medications during the last half-year of the patient's life. Most (73%) oncologists who suggested an OOP medication hardly asked or did not ask about financial ability and took little or no interest in ability to afford it, 43% hardly explained or did not explain the advantages of an OOP medication, and 52% hardly explained or did not explain any treatment alternatives. A linear regression analysis reveals that older age and female gender are related to less communication about an OOP medication and that better education, greater affluence, and having private health insurance are related to more communication. About 56% of caregivers say that OOP payment for medications inflicted a very heavy or heavy financial burden on patients and their households. A regression analysis revealed that physicians' interest in their financial ability and in the explanation they gave decreased their burden.

Conclusions:

Discussing and explaining the meaning of OOP payment alleviates the financial burden that families experience. It is crucial to develop and invest in improving oncologists' education and skills to communicate costs more openly.

Key messages:

- Few oncologists took much interest in patients' ability to afford medications, while most caregivers found OOP payment for medications burdensome.
- Oncologists' explanations and interest in patients' means lightened the burden. Oncologists need to be better educated in speaking about costs.

Temporal dynamics of socioeconomic inequalities in COVID-19 – a scoping review

Florian Beese

F Beese[1], *L Wollgast*[1], *J Waldhauer*[1], *J Hoebel*[1], *B Wachtler*[1]
[1]Division for Social Determinants of Health, Robert Koch-Institute, Berlin, Germany
Contact: beesef@rki.de

Background:
International evidence shows a socially unequal burden of SARS-CoV-2 infections and COVID-19 outcomes across different socioeconomic groups. However, less is known about the temporal dynamics of socioeconomic inequalities in COVID-19 throughout the pandemic. We conducted a scoping review to systematically map and synthesize the available evidence.
Methods:
We conducted a systematic literature search in Embase and Scopus with pre-defined eligibility criteria, including empirical research from 1 January 2020 to 24 August 2021. Additionally, several journals and the reference lists of all included articles were hand-searched to identify relevant studies. We used a standardized charting approach to extract relevant content and narratively synthesized the included evidence. The study follows the PRISMA guidelines for scoping reviews.
Results:
From 8,011 identified records, we finally included 46 articles in the analysis. 50.0% of all included studies were conducted in the United States. The majority of all studies analyzed surveillance data (n = 44) and used area-based socioeconomic indicators on an ecological level (92.5%). The study results show temporal dynamics in COVID-19 inequalities, frequently initiated through higher outcome rates in more affluent populations and subsequent crossover dynamics to higher rates in more deprived populations (41.9%). Furthermore, 91.4% of the analyses show maintaining or worsening social inequalities in health with ongoing pandemic progression, which hit the most deprived populations the hardest.
Conclusions:
The results show worsening social inequalities in COVID-19 over the course of the pandemic, with the most disadvantaged populations most affected during its progression. Targeted prevention and interventions, such as low-threshold testing and vaccination programs, infection protection for precarious jobs or living conditions, and targeted information are crucial to face socioeconomic inequalities throughout pandemics.
Key messages:
- Socioeconomic inequalities in COVID-19 show temporal dynamics over the course of the pandemic.
- Socioeconomically deprived populations had higher burdens of COVID-19 outcomes, especially in more advanced stages of the pandemic.

Contact: ellymertens@itg.be

Background:
Accumulated evidence on risk factors for adverse COVID-19 outcomes revealed that old age and male sex are main associates, next to pre-existing comorbidities, as analysed from scattered single cohorts of hospitalised COVID-19 patients of accessible electronic medical records. Hence, evidence from federated analyses is called for to provide a more comprehensive and robust analyses of risk factors.
Methods:
Using the unCoVer network, i.e., a research platform of 29 partners for the expert use of patient data as routinely gathered

in real-world healthcare settings, present analyses restricted to available data of four hospitals from Spain, Slovakia, Romania and Bosnia and Herzegovina covering 8,287 hospitalised COVID-19 patients. In-hospital death after COVID-19 diagnosis was examined in relation to common pre-existing comorbidities using virtual pooling of logistic regression models adjusted for age and sex.

Results:

Patients were on average 60.1 (± 20.9) years, 50.7% were male, almost half (43.3%) had at least one pre-existing comorbidity (17.4% having obesity, 21.9% hypertension, 18.0% diabetes and 13.7% cardiovascular diseases (CVD)), and 12.6% died during hospitalisation. Patients with comorbidities had a higher risk of mortality that was increasing with the number of comorbidities: from a virtual pooled odds ratio of 1.16 (95%CI: 0.96, 1.40) for one vs none to 1.30 (1.04, 1.64) and 2.14 (1.64, 2.79) for two and three or more comorbidities, respectively. Of the comorbidities, highest risk was seen for CVD (1.68; 1.40, 2.01), followed by hypertension (1.40; 1.19, 1.64) and diabetes (1.27; 1.07, 1.50), and the lowest for obesity (1.13; 0.94, 1.37).

Conclusions:

By federated analyses, this study confirmed that the number of comorbidities was a strong risk factor for in-hospital death after COVID-19, in particular CVD. The unCoVer platform pursues using scattered data sources by innovative computational resources and integrated information for enhanced impact.

Key messages:

- Federated analyses, capable of streamlining ethical and legal aspects, provide unique opportunities for robust results to inform public health.
- Higher COVID-19 in-hospital mortality risk with increasing number of comorbidities.

Abstract citation ID: ckac130.016
Evaluating the pandemic's impact on surgical site infections after abdominal surgery in Italy

Heba Safwat Mhmoued Abdo Elhadidy

HSMA Elhadidy[1], *G Paladini*[1], *E Ugliono*[2], *AR Cornio*[1], *V Bordino*[1], *C Vicentini*[1], *CM Zotti*[1]
[1]Department of Public Health Sciences, Università degli Studi di Torino, Turin, Italy
[2]Department of Surgical Sciences, Università degli Studi di Torino, Turin, Italy
Contact: h.elhadidy@unito.it

Background:

The COVID-19 pandemic led to important disruptions in surgical activity. The aim of this study was to evaluate the impact of COVID-19 on abdominal surgery outcomes in the region of Piedmont, in northern Italy.

Methods:

Data were gathered from 42 hospitals participating in the regional surveillance network from 2018 to 2020. SSI, overall mortality and case fatality rates (CFR) were calculated, comparing 2020 to mean 2018-19 data. Chi-squared tests were used to assess both the differences among the proportion of urgent and oncological procedures (based on ICD-9-CM codes) and rates between the two periods. Subgroup analyses on 2020 data were carried out comparing urgent vs. elective and oncological vs. non-oncological procedures using chi-squared tests. Analyses were performed using SPSS v. 28.0.1.0.

Results:

5407 procedures were recorded in 2018-19; 310 SSIs and 120 deaths were observed. The mean proportions of urgent and oncological operations were, respectively, 21.90% and 43.24%. In 2020, 1057 procedures were recorded, along with 44 SSIs and 29 deaths. 34.44% of procedures were urgent and 39.74% oncological. The mean 2018-2019 SSI rate was 5.73%, with an overall mortality of 2.22% and a CFR of 7.42%. The SSI rate in 2020 was 4.16%, with an overall mortality of 2.74% and a CFR of 9.09%. The proportion of urgent procedures significantly differed between the two periods ($p < 0.001$), as did the proportion of oncological procedures and SSI rates (both $p = 0.05$). Considering 2020, significant differences were found comparing overall mortality between urgent vs. elective procedures (4.95% vs. 1.59%, $p = 0.002$) and comparing SSI rates between oncological vs. non-oncological patients (3.57% vs. 2.20%, $p = 0.02$).

Conclusions:

During the pandemic, patients undergoing surgical procedures significantly differed, reflecting public health decisions. Even though these differences did not reach statistical significance, overall mortality and CFR increased in 2020.

Key messages:

- Results of this study suggest the COVID-19 pandemic had a negative impact on outcomes after abdominal surgery.
- Further longer-term studies are needed to assess the impact of policies implemented during the pandemic, to help inform future pandemic plans.

[4]Universidad Carlos III, Madrid, Spain
[5]UNED, Madrid, Spain
Contact: crodb@isciii.es

Background:

The COVID-19 pandemic has severely impacted older people. The disease and the measures to combat it have had a differential impact according to gender, with higher mortality rates in men and worse psychological and social consequences in women. The objective of this work is to analyze the changes in perceived health of older people in Europe during the first months of the pandemic and to assess the combined role of age and gender.

Methods:

Wave 8 data of SHARE-corona (Survey of Health, Aging and Retirement in Europe) ($n = 51{,}695$, aged$\geq$50) collected between Jun-Aug 2020 were used. Perceived health status was explored with a question on whether there has been a change compared with the health status before the COVID-19 outbreak (response options: worse, the same and better). Two-way ANOVA with interaction and Student's t-test with Bonferroni correction were used to compare the effects of gender and age group (50-59 years, 60-69 years, 70-79 years, and $\geq$80) in changes in perceived health.

Results:

Differences in perceived health were observed by age, as well as by gender in participants aged $\geq$70 years ($F = 91.94$; $p < 0.001$). These differences were significant both by gender ($F = 19.39$; $p < 0.001$) and age ($F = 191.79$; $p < 0.001$). No interaction was detected between both factors ($p = 0.170$), which allowed their effect to be studied individually. Among the people who reported a worsening in their perceived health, women aged 70 to 79 years predominated (11.1%), followed by men aged 80 and over (15.3%) and women of the same age group (16.4%).

Conclusions:

The results suggest an association between the change in perceived health during the pandemic and age. Women have a slightly worse health status than men in all age groups. Therefore, gender can be considered as an influential factor in perceived health in old age, which in turn can have a potential impact in the quality of life of older people.

Funding:
Projects Ref. H2019/HUM-5698 and Ref. 202010E158.

Key messages:

- Older people have been severely impacted by COVID-19 pandemic.
- The combined effect of age and gender on the change in perceived health status during the pandemic have been analyzed.

Abstract citation ID: ckac130.018
Psychosocial wellbeing of Berlin school children during the COVID-19 pandemic, June 2020-March 2021

Stefanie Theuring

[4]Institute of Public Health, Charité- Universitätsmedizin, Berlin, Germany
Contact: stefanie.theuring@charite.de

Background:
The COVID-19 pandemic and related restrictions have affected the wellbeing of school children worldwide. Specific problems evolving during the pandemic, their extent and duration havent́ been sufficiently explored yet. We aimed at describing school childrenś psychosocial and behavioral parameters and associated factors during the COVID-19 pandemic in Berlin, Germany.

Methods:
Our longitudinal study included students from 24 randomly selected Berlin primary and secondary schools, assessing psychosocial wellbeing and behaviors at four time points between June 2020 and March 2021. We analyzed temporal changes in the proportions of anxiety, fear of infection, reduced health-related quality of life (HRQoL), physical activity and social contacts, as well as sociodemographic and economic factors associated with anxiety, fear of infection and HRQoL.

Results:
Of initially 384 recruited students, 324 still participated in the fourth study round after nine months. During the observation period, presence of anxiety symptoms increased from 26.2% (96/367) to 34.6% (62/179), and fear of infection from 28.6% (108/377) to 40.6% (73/180). The proportion of children with limited social contacts (<1/week) increased from 16.4% (61/373) to 23.5% (42/179). Low physical activity (<3 times sports/week) was consistent over time. Low HRQoL was observed among 44% (77/174). Factors associated with anxiety were female sex, increasing age, secondary school attendance, lower household income, and presence of adults with anxiety symptoms in the student's household. Fear of infection and low HRQoL were associated with anxiety.

Conclusions:
A substantial proportion of school children experienced unfavorable psychosocial conditions during the COVID-19 pandemic in 2020/2021. In particular, students from households with limited social and financial resilience require special attention.

Key messages:

- Berlin school childreńs anxiety increased significantly during the pandemic months between June 2020 and March 2021 and was associated with anxiety in the family and lower household income.
- Almost half of the schoolchildren in our study reported low health-related quality of life after the second pandemic lockdown in March 2021.

[6]Department of Social Sciences, University of Siegen, Siegen, Germany
Contact: jannis.truemmler@med.uni-duesseldorf.de

Introduction:
Vaccination behaviour is influenced by various determinants. Evidence indicates a higher COVID-19 vaccine hesitancy among university students due to their age and a lower risk of complications compared to the general population in Germany. However, little is known about other COVID-19-related determinants for the population of German university students. This study aimed to investigate determinants of vaccination behaviour among German university students.

Methods:
The cross-sectional COVID-19 German Student Well-being Study was conducted at five German universities at the end of 2021 via an online survey (n = 7.267). Multiple logistic regressions were calculated to examine associations of vaccination behaviour (not vaccinated vs. fully vaccinated) and attitudes towards vaccination (5Cs: confidence in the safety of the vaccine, complacency - not perceiving diseases as high risk, constraints - structural and psychological barriers, calculation - engagement in information seeking, collective responsibility - willingness to protect others), health literacy in a pandemic (CHL-P), and additional determinants.

Results:
All 5Cs were associated with the vaccination status 'fully vaccinated', except for complacency. Regarding CHL-P, we found that students who felt that the current scientific knowledge about COVID-19 in terms of the policy decisions on pandemic measures was very complex had a higher odds for being vaccinated (OR = 3.02; 95% CI: 2.26-4.04). Regarding additional determinants, the analysis revealed that students who had been previously infected had in all regressions a lower odds for being vaccinated compared to students with no previous infection.

Conclusions:
Due to the strong association of the attitudes towards vaccination and vaccination behaviour among university students, we recommend that the different components of the 5Cs should be considered in future COVID-19 vaccination campaigns in the university context.

Key messages:

- Attitudes towards vaccinations impact on vaccination behaviour among university students.
- Perceiving the current scientific knowledge on COVID-19 as very complex increased the odds for vaccination.

Contact: jbosdriesz@ggd.amsterdam.nl

Background:

Testing and Contact Tracing (TCT) was a core strategy in the fight against the spread of SARS-CoV-2. However, little is known about the real-world effectiveness of TCT for COVID-19. Because time is an important conditional factor, we aim to study timeliness of TCT in the Netherlands, and its determinants.

Methods:

We used routine COVID-19 TCT registry data from all individuals who tested positive for SARS-CoV-2 at 8 Dutch regional public health services from 1-6-2020 to 28-2-2021 (N = 338,066). We calculated median time intervals of TCT stages. Factors associated with the time between test result and completion of TCT, categorised as ≤ 3 days and >3 days, were assessed using logistic regression adjusting for region, testing site, and laboratory. Potential determinants were: gender, age, country of birth, number of close contacts, working in healthcare or education, TCT manpower, and the Oxford Covid-19 Government Response Tracker (OxCGRT).

Results:

The median time from symptom onset to TCT completion was 6 days (IQR:3-10). Median times between TCT stages were 1 day (IQR:0-3) for symptom onset to test request, 1 day, (IQR:0-1) for test request to sample collection, 1 day, (IQR:1-1) for sample collection to test result, and 2 days (IQR:1-5) for test result to TCT completion. In 31.7% of tests, time between test result and TCT completion was >3 days. This delay was associated with being older (65+), whereas being younger (0-14), a higher OxCGRT, scaling down TCT, and a higher number of TCT employees were associated with a shorter interval.

Conclusions:

Over fifty percent of interval times from symptom onset to TCT completion exceeded the median SARS-CoV-2 incubation period of 5 days. There seems to be little room for improvement on the side of the index case, but there are some implications for logistics such as increasing TCT manpower, and better integration of digital systems.

Key messages:

- Testing and contact tracing were key elements of fighting the spread of COVID-19, but the potential impact was reduced because >50% of interval times exceed the median SARS-CoV-2 incubation period.
- The influence of contextual factors shows that stricter government policies, and increasing TCT manpower could help speed up the process of TCT for COVID-19.

[4]San Gerardo Hospital, Hospital, Monza, Italy
[5]University of Milano-Bicocca, University, Milan, Italy
[6]Fondazione PU Agostino Gemelli, IRCCS, Rome, Italy
Contact: agodia@unict.it

Background:

Evaluating COVID-19 vaccine coverage and risk factors is useful to develop public health strategies against COVID-19 pandemic. In the framework of two studies commissioned by the European Centre for Disease Prevention and Control (ECDC) and coordinated by Epiconcept, France, we reported findings about incidence and seroprevalence among healthcare workers (HCWs) enrolled from three Italian hospitals.

Methods:

From July 2021 to date, the AOUP "G. Rodolico-San Marco" (Catania), the San Gerardo Hospital (Monza) and the Policlinico Gemelli (Rome) participated in the ECDC study to measure COVID-19 vaccine effectiveness. Catania and Rome also participated to the ECDC study of nosocomial transmission. HCWs were asked to complete a weekly questionnaire to report changes in health status and professional/personal exposures. At recruitment, a nasopharyngeal swab for RT-PCR and a blood sample for serology test were collected. Moreover, HCWs were followed-up with a weekly or bimonthly nasopharyngeal or saliva swabs. Blood samples were collected every one or two months.

Results:

A total of 226 HCWs was enrolled from Catania, 330 from Rome and 132 from Monza in the COVID-19 vaccine effectiveness study. As of February 2022, PCR tests performed were 2270 in Catania, 5475 in Rome and 891 in Monza sites. Moreover, the serological tests performed were 845 in Catania, 760 in Rome and 395 in Monza sites. A total of 6 SARS-CoV-2 infections were identified in Catania, 34 in Rome and 4 in Monza sites. Interestingly, the study of nosocomial transmission reported the highest incidence rate in Catania (4 per 10,000 person-day), while 0.7 per 10,000 person-day in Rome. During the study period seroprevalence declined by 17% among HWCs enrolled in Catania.

Conclusions:

Our findings revealed low number of COVID-19 infections, with high COVID-19 vaccine coverage among HCWs. However, further analyses are needed to provide more robust estimates of vaccine effectiveness.

Key messages:

- Monitoring risk factors is useful to understand the pandemic scenario among high-risk groups.
- A larger sample size and follow-up will improve public health vaccination strategies against COVID-19.

Abstract citation ID: ckac130.022
Increasing role of Public Health Rapid Response Teams in infectious disease outbreaks

Samuel Tweed

S Tweed[1], DE Stewart[2], E Hornsey[2,3], W Graham[3]
[1]Institute of Global Health, University College London, London, UK
[2]Public Health Rapid Support Team, UK Health Security Agency, London, UK
[3]Department of Infectious Disease Epidemiology, LSHTM, London, UK
Contact: samuel.tweed@nhs.net

Background:

Following the Ebola crisis (2013-2016), the WHO, Global Health Security Agenda and other international actors advocated for the development of Public Health Rapid Response Teams (RRTs) to strengthen outbreak response. Despite significant investment, evidence on the uptake, composition and effectiveness of such teams remains lacking.

Methods:

Qualitative review of published and grey literature including from governmental and multilateral agencies, with semi-structured interviews of key informants. Thematic content analysis was completed and evidence synthesised to inform future policy recommendations.

Results:

RRTs have been adopted globally providing surge capacity in outbreak settings. RRTs typically include microbiologists and field epidemiologists but can be more efficacious when broadly multidisciplinary with the inclusion of social scientists, risk communicators and infection prevention and control professionals. The organisation of RRTs must be responsive to district and national contexts so existing systems are not undermined, with regional collaboration beneficial where skill gaps exist. Literature and interviewees agreed that RRTs should not be uniformly defined by narrow technical capabilities, but rather regional standards and evaluation of deployments used to assess operational readiness.

Conclusions:

Public Health RRTs should be multiprofessional in nature and evaluated against regional standards to be effective. Future research should seek to assess the experience of countries before and after RRT implementation including detailed economic assessment.

Key messages:

- Public Health Rapid Response Teams (RRTs) are increasingly adopted globally to strengthen outbreak response.
- RRTs should be truly multidisciplinary and rigorously evaluated against regional standards to maintain effectiveness.

[3]Department of Public Health, Semey Medical University, Semey, Kazakhstan
[4]Health Research Institute, Al-Farabi Kazakh National University, Almaty, Kazakhstan
Contact: glushkovanatalyae@gmail.com

Background:

After cessation of initial quarantine in Kazakhstan, the COVID-19 outbreak peaked in July 2020, imposing dramatic stress on the country's healthcare system. This study was focused on calculation of updated epidemiological characteristics, on evaluation of available medical workforce and infrastructure and the impact of workforce density on infected and dead individuals via ArcGIS platform.

Methods:

The national and local incidence rate (IR), mortality (M) and case-fatality rates (CFR) were calculated along with the population-weighted densities of beds, physicians, general practitioners, resuscitators, nurses and healthcare budget. Associations between the density of different health workers, infected and dead individuals were investigated using Poisson regression. Finally, we constructed vector maps of country regions clustered by IR and CFR to depict the density of beds and those health workers that were significantly associated with infection and death rates.

Results:

There is much heterogeneity between the country regions in terms of CFR (range from 0.28 to 2.57) and IR (range from 1.62 to 12.04), while density of beds was characterized by a relatively greater stability (range from 3.47 to 6.66) and so did density of physicians (range from 0.79 to 2.76) and density of nurses (range from 5.73 to 8.26). Densities of beds, physicians, general practitioners, resuscitators, and nurses have been linked significantly with infection and death rates.

Conclusions:

As COVID-19 epidemic is still far from ending, findings of this study could be of interest for policy makers to formulate an appropriate action plan in the view of possible repeated outbreaks.

Key messages:

- Available medical workforce and infrastructure were insufficient during the pandemic time in Kazakhstan.
- Densities of beds, physicians, general practitioners, resuscitators, and nurses are significantly associated with infection and death rates.

Absence among National Health Service workers during the COVID-19 pandemic in Portugal

Joana Alves

J Alves[1,2], C Nunes[1,3]
[1]Public Health Research Centre, NOVA National School of Public Health, Lisbon, Portugal
[2]Comprehensive Health Research Centre, NOVA National School of Public Health, Lisbon, Portugal
[3]Directorate-General of Health, Lisbon, Portugal
Contact: joana.alves@ensp.unl.pt

Background:

By March 2020, the first Covid-19 cases were detected in Portugal. While the National Health Service (NHS) faced an increased demand for health care, anecdotal evidence showed that the NHS absenteeism rose. This might be explained by outbreaks in healthcare units, COVID-19 infection due to close contact with patients, self-isolation and quarantines, and family challenges originated by lockdowns. The present work aimed to quantify the absenteeism among NHS workers during the COVID-19 pandemic in Portugal.

Methods:

This study used data for the number of NHS workers and absence days (2015-2021), from the Portuguese NHS Transparency Portal and the Strategy and Planning Office. Absenteeism was compared, before and after the pandemic onset, in absolute terms, and as absence rates (number of absent days as a percentage of potential workforce days). Additionally, we performed an interrupted time series analysis, by fitting a Poisson regression model with level change. We controlled for data seasonality using Fourier terms (pairs of sine and cosine functions).

Results:

From 2015 until March 2020, the average monthly absence rate was of 12.2, rising to 14.4 in the remaining period. This represented an increase of 18% in the absence rate. The interrupted time series showed an increase of 10.8% in the NHS absenteeism after the pandemic onset [Relative risk $=1.10$; 95% confidence interval (CI) 1.10-1.11; $p<0.01$]. When accounting for seasonality in the data, the model showed an increase of 11.0% in the NHS absenteeism [Relative risk $=1.11$; 95% CI 1.01-1.22; $p<0.05$].

Conclusions:

These results highlight the excess of absence days among the NHS workers during the COVID-19 pandemic. In future healthcare crises, health professionals should be protected, by assuring a safe workplace and making protective equipment available. Only then will be possible to reduce constraints in healthcare assistance, guarantee the adequate response, and contain the absence costs.

Key messages:

- During the COVID-19 pandemic in Portugal, the NHS absenteeism increased by 11% ($p<0.05$).
- The absence rates might have threatened healthcare assistance, and increased the healthcare costs.

COVID-19 and religion: evidence and implications for future public health challenges

Leuconoe Grazia Sisti

LG Sisti[1,2], D Buonsenso[1,3], U Moscato[1,3], W Malorni[1]
[1]Center for Global Health Research and Studies, Università Cattolica del Sacro Cuore, Rome, Italy
[2]National Institute for Health, Migration and Poverty, Rome, Italy
[3]Department of Woman, Child and Public Health, Fondazione Policlinico Universitario A. Gemelli IRCCS, Rome, Italy
Contact: leuconoe.sisti@gmail.com

Background:
Religious and cultural beliefs strongly influence people's attitudes and behaviors that, in turn, may positively or negatively affect both individual and public health. In this regard, we aimed to collect and analyze evidence on the impact of religion in the current COVID-19 pandemic.
Methods:
We performed a scoping review investigating both scientific and grey literature available on the topic from the onset of the pandemic to September 2021. Pubmed, Web of Science and Google Scholar were investigated and a hand-search on Google was also performed. Studies dealing with religion and COVID-19 were included and narratively summarized according to topics.
Results:
46 articles were included in the review. Predominant topics emerged were 1) religious pilgrimages and rituals worldwide being relevant to COVID-19 outbreaks, especially in the first pandemic wave 2) difficulties to engage the Closed Religious Communities (e.g. Haredi, Amish, etc.) in which community way of life, restrictions in using media and resistance to comply to preventive measures were identified as significant COVID-19 risk 3) COVID-19 unofficial treatments and vaccine hesitancy also supported by concerns on the religious acceptability of vaccine composition or firm interpretation of the Ramadan fasting 4) a fuel of religious discrimination 5) religious communities and leaders strongly trusted in conveying COVID-19 information.
Conclusions:
Our findings highlighted how religion has represented both a risk for the spreading of the virus and a precious opportunity to convey evidence-based and culturally-sensitive COVID-19 information engaging people in fighting the pandemic. To be prepared for similar future challenges, scientists, politicians and health professionals need to acknowledge the role that culture and religion have in influencing people's lives to design specific health policies and strategies to ensure that all people are effectively engaged in health production and protection.
Key messages:

- Religion has represented both a risk factor for COVID-19 outbreaks and a resource to convey evidence-based information and overcome resistance to implementing COVID-19 preventive measures.
- Health policy should become more sensitive to religious and cultural issues acknowledging the role played by religion in facing complex global health challenges.

Using R programming to inform and improve case notification procedures in a local public health unit

Henrique Barrilaro Ruas

H Barrilaro Ruas[1], R Capucho[1], V Melo Ferreira[1]
[1]USP, ACES Alto-Tâmega e Barroso, Chaves, Portugal
Contact: henriqueruasmoreira@gmail.com

Issue/Problem:
COVID-19 was declared a pandemic in March 2020. Information systems, particularly those related to laboratory testing notification, became extremely important as a mechanism of fast identification of cases. In Portugal, any test performed in a professional setting is of mandatory notification.
For a local public health unit in northern Portugal, much like in other regions worldwide, challenges related to lack of human and material resources were felt over the course of the pandemic.
Description of the problem:
In 2021, an intensive surveillance strategy was implemented using up to date notification database analysis through R programming, focusing on simplified data availability for contact tracing team members and accuracy of notifications submitted by laboratories, including verification of individual identifying information.
Results:
Some laboratories were identified has having lower data completion rate, which had negative effects on contact tracing timeliness, while others failed to notify tests conducted. Public Health workers warned partners of these failures and worked with them to develop solutions. Interventions included facilitation of access to technologies to notify test results, as well as revision of internal processes to ensure correct patient identification. During the intervention, successful notification rates were increased, and new informal and formal partnerships were developed, leading to faster identification of clusters.
Lessons:
Establishing partnerships with stakeholders and developing support systems is beneficial towards epidemiological surveillance efforts. Adequate analysis of notification procedures was an important step towards standardization and correctness of information required for epidemiological surveillance.
Key messages:

- Resilient information systems are important for surveillance, especially during a pandemic.
- Partnerships with community stakeholders are essential to timely and adequate epidemiological response.

2.R. Achieving universal health coverage

Health equity of displaced Syrians in Lebanon

Riwa Khalifeh

R Khalifeh[1], W D'Hoore[1], M Dauvrin[1], C Saliba[2]
[1]Public Health, UCLouvain, Brussels, Belgium
[2]Public Health, Lebanese University, Beirut, Lebanon
Contact: riwakh@hotmail.com

Lebanese government data indicates that the country hosts 1.5 million displaced Syrians (DS). Providing care for DS is a challenge, especially when barriers and discrimination issues arise in accessing the Lebanese health system. This study therefore aimed to understand the causes of biases, their mechanisms, their forms and their consequences on access and quality of care for DS in Lebanon. A qualitative study using in-depth semi-structured interviews was utilized. In 2021, 28 semi-structured interviews were conducted with doctors (n = 12) and nurses (n = 16). Six group interviews were conducted with DS (n = 22) in different Lebanese healthcare facilities. The recruitment of participants was based on reasoned and targeted sampling. The interviews were recorded and transcribed for later narrative content analysis. Thematic analysis was performed to identify common themes in participants' experiences of DS in accessing Lebanese healthcare. The results showed a barrier of access to care related to transportation and financial issues. Discrimination emerged as an underlying mechanism that drives health inequity. Several factors contributed to the presence of biases in the Lebanese healthcare system. Healthcare services provided to the Syrian population may not be the best due to inequity to access the health system attributable to the discriminatory behavior of healthcare providers. The underlying causes of discrimination are due to the fragility of the Lebanese healthcare system facing a humanitarian crisis with a collapsed infrastructure torn by previous wars and current socio-political and financial problems. Global initiatives can provide the help needed for the equitable provision of health services by providing the resources necessary to address this problem. The findings of this study highlight the changes that should be performed at the micro (cultural skills) and macro (equitable distribution of resources) levels to grant quality of healthcare services for DS.

Key messages:

- The health equity of DS in Lebanon is influenced by the lack of resources and the socio-political situation.
- Measures should be examined to deliver equally health services for both Lebanese and Syrians.

Abstract citation ID: ckac130.028

Impact of COVID-19 pandemic on inequalities in mortality: an analysis in Piedmont and Emilia-Romagna

Elena Strippoli

E Strippoli[1], N Zengarini[1], C Di Girolamo[2], L Bartolini[3], C Aversa[1], G Costa[1]
[1]Epidemiology Unit, ASL TO3 Piedmont Region, Grugliasco, Turin, Italy
[2]Health and Social Care Agency, Emilia-Romagna Region, Bologna, Italy
[3]Epidemiology Unit, Azienda USL-IRCCS di Reggio Emilia, Reggio Emilia, Italy
Contact: elena.strippoli@epi.piemonte.it

Background:

Italy was heavily hit by the COVID-19 pandemic. According to official statistics, during 2020 there were more than 75,000 excess deaths compared to the average expected mortality in 2015-2019. General mortality (GM) is a good measure of both the direct and indirect effects of the pandemic because it's exempt from potential bias due to misclassification of events. Evidence shows a greater burden of disease and mortality attributable to COVID-19 among disadvantaged populations, with the risk of an exacerbation of existing health inequalities. We aim to analyse the trend of social inequalities in mortality during the first pandemic year in two Italian regions (Piedmont and Emilia-Romagna) using data from Administrative Population Registries (APR) and statistical databases.

Methods:

Data on deaths occurred between Jan 2015 and Jan 2021 in subjects ≥ 65, stratified by educational level, were obtained from Regional APR and the Census. Using a time series approach, we computed Standardized Mortality Rates (SMR), Relative Index of Inequalities (RII) and Slope Index of Inequalities (SII), adjusted by age, gender, month and region. SMR, RII and SII from March 2020 were forecasted using Holt-Winters method and compared to the observed values in the same period.

Results:

SMRs were higher than expected during the two 2020 epidemic waves (Mar-Apr, Oct-Dec) in both regions. RII didn't increase significantly. Absolute inequalities instead rose in Piedmont during both pandemic waves, mostly among women, and in Emilia-Romagna in March among men.

Conclusions:

The impact of the pandemic on inequalities in GM has been at least of the same size of the impact of other mechanisms of unequal mortality. APR coupled with sociodemographic data are a quick and reliable source for assessing the unequal impact of the COVID-19 pandemic on health. Further research is needed to explore mechanisms underlying these effects e.g. inequalities in cause-specific mortality and access to health services.

Key messages:

- The unequal impact of the pandemic on mortality was confirmed.
- Administrative data linked with Census and health data are efficient and reliable sources for a timely monitoring of health inequalities.

Abstract citation ID: ckac130.029

Covid-19 Vaccination and the issue of insurance status

Daniel Schröpfer

D Schröpfer[1], R Fortunato[1], N Devaud[1], R Koppensteiner[1]
[1]Sozial-Gesundheitliche Dienste, City Zuerich, Zurich, Switzerland
Contact: daniel.schroepfer@zuerich.ch

Issue:

It is estimated, that 11000 - 14000 people that live in Zurich do not have health insurance (~3% of pop.). Covid-19 vaccination in Switzerland required an online registration ('Vacme') with name, address and health insurance number. Health insurance in Switzerland is only accessible to people with registered residence in the country. This systematically excluded people without right of residence, health insurance or internet access.

Description:

To address this issue the health service of the city Zurich organized a vaccination site for the uninsured from 14.06.2021 onward. To achieve this a simplified registration procedure was established, which allowed us to offer Vaccination to everybody, independent of their insurance status. Instead of the health insurance number, on site personal used a dummy number and the address of our site to register those patients. To remove language and technological barriers. In order to lower, the inhibition threshold for people without legal residence the Police department was informed and agreed not to circulate the area of the vaccination site on vaccination days.

Results:

Between 14.06.2021 and 19.02.2022, 880 people came for vaccination of which 603 (69%) were clearly identifiable as individuals from non-insured populations. (See Graph)

Lessons:

It is therefore critical not to forget these people when organizing public health measures, especially when addressing a pandemic or other infectious diseases (HIV, Hepatitis). A group specific information approach is of paramount importance to reach such subpopulations. Non-insurance is a known barrier for universal access to care.

Acknowledgements: We would like to thank the involved departments of the city Zurich, chief medical officer canton zurich, our collaboration partners and the staff of our vaccination site.

Key messages:

- When fighting a pandemic it is of utmost importance to reach as many people as possible with given interventions including vaccination.
- Non-insurance is a known barrier for universal access to care.

Gateways not gatekeepers – reaching seldom-heard groups to gather public health community insights

Mabel Lie

M Lie[1], *S Visram*[1], *M Cheetham*[2], *A Christie*[3], *P Hodgson*[2], *J Jasperse*[3], *M Logan*[3]
[1]Population Health Sciences Institute, Newcastle University, Newcastle upon Tyne, UK
[2]Department of Nursing, Midwifery and Health, Northumbria University, Newcastle upon Tyne, UK
[3]Public Health, South Tyneside Council, South Shields, UK
Contact: mabel.lie@ncl.ac.uk

Background:

Each local authority in England must develop a Health and Wellbeing Strategy (HWS) in collaboration with NHS partners to plan and support delivery of local improvements in health and wellbeing. HWSs often draw on diverse sources but few are informed by consultative exercises involving citizens. South Tyneside Council in Northern England sought to ensure their new HWS was community-informed, specifically including seldom-heard groups and individuals. Specific objectives of this community insights research were to:

1.Target sampling and recruitment activities at typically marginalized, vulnerable or otherwise underrepresented groups

2.Explore the health and wellbeing-related views and priorities of these groups to address health inequalities

Methods:

A mapping exercise was undertaken to identify organisations who might act as gatekeepers to accessing participants from underrepresented groups. Focus groups were held in settings-based venues where members would be comfortable and known to one another. Representatives of voluntary and community sector (VCS) organisations often helped to co-facilitate the discussions.

Results:

119 participants took part in 16 group discussions. Three were held online, two were outdoors, while 11 involved community venues where the groups regularly met. We reached older and younger people, minority ethnic groups, and vulnerable men and women, including residents who had experienced homelessness, mental health issues, substance misuse, offending, domestic violence and learning disabilities. Participants were largely concerned with the wider determinants of health (such as poverty, employment, and leisure spaces), shifting the narrative away from individual lifestyle factors that tend to be the focus of much public health discourse.

Conclusions:

Gatekeepers from the VCS were essentially gateways, enabling us to include underrepresented voices in local consultation processes and generate new insights to inform the South Tyneside HWS.

Key messages:

- Public health strategy development can address health inequalities through community-informed consultative exercises involving seldom heard members of vulnerable communities.
- Community consultations seeking to reach typically under-represented groups require gatekeepers acting as gateways, and meeting participants where they are comfortably located at community venues.

Schistosomiasis control in adults: a call for action towards the goal of universal health coverage

Sarah Gruninger

S Gruninger[1,2], *T Rasamoelina*[3], *R Rakotoarivelo*[4], *C Oumar Doumbia*[1,2,5], *E Lorenz*[1,2], *GJ van Dam*[6], *NG Schwarz*[1,2], *J May*[1,2], *R Rakotozandrindrainy*[7], *D Fusco*[1,2]
[1]Department of Infectious Disease Epidemiology, Bernhard Nocht Institute for Tropical Medicine, Hamburg, Germany
[2]German Center for Infection Research, Hamburg-Borstel-Lübeck-Riems, Germany
[3]Centre d'Infectiologie Charles Mérieux, University of Antananarivo, Antananarivo, Madagascar
[4]Department of Infectious Diseases, University of Fianarantsoa Andrainjato, Fianarantsoa, Madagascar
[5]University Clinical Research Center, University of Sciences Technics and Technologies of Bamako, Bamako, Mali
[6]Department of Parasitology, Leiden University Medical Center, Leiden, Netherlands
[7]Department of Microbiology and Parasitology, University of Antananarivo, Antananarivo, Madagascar
Contact: sarah.gruninger@bnitm.de

Background:

Schistosomiasis is a high-burden parasitic disease and endemic in tropical climates, such as Madagascar. Recently it is emerging in Europe. Chronic infections lead to disabilities including loss in work productivity. Current control strategies focus on school-aged children, thereby systematically excluding adults. The goal to eliminate the disease as a public health problem is aligned with the Sustainable Development Goals agenda, including Universal Health Coverage (UHC). We aim at assessing the distribution of schistosomiasis among adults in Madagascar, in order to promote more targeted public health initiatives against the disease.

Methods:

In a cross-sectional study, 1477 blood samples were collected at three primary health-care centers in Madagascar from 03.21 to 01.22. A semi quantitative PCR assay was used to assess the presence of Schistosoma. Positivity rates with 95% Confidence Intervals (CI) were reported by gender and age groups.

Results:

Our study population had a balanced gender distribution with 54.2% [CI: 51.7;56.8] of females and a median age of 37 years (IQR: 24-48). Preliminary results show an overall Schistosome positivity rate of 59.5% [CI: 57.0;62.0]. Positivity was higher in males 62.4% [CI: 58.7;66.1], than in females 57.1% [CI: 53.5;60.5]. Highest positivity was seen in the 18-34 year age group with 66.2% [CI: 62.7;69.6]. Lowest positivity of 46.2% [CI: 39.2;53.2] was observed in adults aged over 55 years.

Conclusions:

Our preliminary results provide evidence of high positivity rates of schistosomiasis among adults in a highly endemic country. Differently from many studies, males seem more affected than females. The youngest age group, representing the more active workforce of a population, shows a higher positivity rate. Our data suggests that, in the logic of UHC and health as a human right, public health strategies for schistosomiasis need to be re-addressed towards a universal coverage of affected individuals.

Key messages:

- Inequalities in current control strategies to fight the tropical disease schistosomiasis might hinder the achievement of disease elimination and universal health coverage goals.
- Further systematically assessment and re-addressing of public health strategies towards universal coverage of affected individuals might help to close gaps in health care and reach the set goals.

Abstract citation ID: ckac130.032
Health status of people with intellectual disabilities: A systematic literature review

Ursula Griebler

U Griebler[1,2], *R Griebler*[3], *G Weber*[4]
[1]Department for Evidence-based Medicine and Evaluation, University for Continuing Education Krems, Vienna, Austria
[2]Cochrane Austria, University for Continuing Education Krems, Vienna, Austria
[3]Competence Centre for Health Promotion and Health Care, Austrian National Public Health Institute, Vienna, Austria
[4]Faculty of Psychology, University of Vienna, Vienna, Austria
Contact: ursula.griebler@donau-uni.ac.at

Background:

People with intellectual disabilities (ID) have a right to the highest level of health and to non-discrimination in health care. There are an estimated 89,000 people with ID living in Austria. Little is known about their health status and about their health care. We carried out a systematic review with the aim to provide an overview of comparative studies on the health status and health behaviour of people with and without ID.

Methods:

The systematic literature search was conducted in 3 electronic databases for the search period 2008 to March 2020, supplemented by a reference list check and a search of relevant websites. Abstracts and full texts were dually screened, data extraction was performed by one person and checked by a second. Bias risk was assessed by two people using the AXIS tool for cross-sectional studies. Results were summarised narratively.

Results:

A total of 73 publications were included. The literature review reveals a very clear picture: people with ID have a shorter life expectancy, are more affected by illness and health problems, are more likely to have health-related limitations in daily living and are more likely to die from potentially preventable causes of death that could be avoided either through preventive measures or by high-quality medical care.

Conclusions:

To better assess the health situation of people with ID in Austria, Austria-specific data is needed. Furthermore, systematic initiatives in the areas of prevention, health promotion and health care are necessary. People with ID should therefore be systematically considered in all strategies and processes in the health sector. In terms of health literacy, a stronger information policy towards people with ID and towards their relatives and health care professions would be indicated.

Key messages:

- People with ID have a shorter life expectancy, more illness and health problems, health-related limitations in daily life and are more likely to die from preventable causes of death.
- Health data for people with ID is missing in Austria and systematic initiatives in the areas of prevention, health promotion and health care are strongly needed.

Abstract citation ID: ckac130.033
Older German adults' health-related quality of life and associated social factors

Lina Spagert

C Geigl[1,2], *L Spagert*[3], *J Loss*[4], *M Leitzmann*[2], *C Janssen*[1]
[1]Department of Applied Social Sciences, Munich University of Applied Sciences, Munich, Germany
[2]Department of Epidemiology and Preventive Medicine, University of Regensburg, Regensburg, Germany
[3]Department of Engineering and Management, Munich University of Applied Sciences, Munich, Germany
[4]Department of Epidemiology and Health Monitoring, Robert Koch Institute, Berlin, Germany
Contact: spagert@hm.edu

Background:

A differentiated analysis of the structural relationships between social factors and health-related quality of life (HRQOL) in older German adults has not yet been conducted. In this analysis, we aimed to examine the relationships between sociodemographic, socioeconomic, psychosocial, and behavioural factors and both physical and mental HRQOL in older German adults.

Methods:

A community-based postal survey was used to collect cross-sectional data from German adults aged 65 and older ($n = 1687$, 33% response proportion, 52% female). Physical and mental dimensions of HRQOL were assessed using Short Form 36, version 2. Multiple linear regression models were used to analyse the associations between social factors and both physical and mental HRQOL.

Results:

Health locus of control, physical activity, and income were positively associated with both physical HRQOL (Adj. $R2 = 0.34$, $p < 0.001$) and mental HRQOL (Adj. $R2 = 0.22$, $p < 0.001$), whereas age was negatively associated with both. Alcohol use was positively associated with physical HRQOL, and social support was positively associated with mental HRQOL.

Conclusions:

A differentiated understanding of the relationships between social factors and HRQOL assists in group-specific targeting of health interventions. Demand-oriented interventions should consider underlying social factors to reduce socially determined inequities in HRQOL among older German adults. Depending on the focus of the intervention, it may be helpful to take specific social conditions into account. The results may be transferable to municipalities in high-income European countries.

Key messages:

- Sociodemographic, socioeconomic, psychosocial, and behavioural factors are associated with physical and mental health-related quality of life in older German adults.
- Social conditions should be considered when targeting group-specific interventions to reduce socially determined inequities in health-related quality of life among older adults.

Abstract citation ID: ckac130.034
Tobacco product menthol and flavour bans: their utility for LMIC and lessons from the EU ban

Rosemary Hiscock

R Hiscock[1,2], *K Silver*[3,2]
[1]Tobacco Control Research Group, University of Bath, Bath, UK
[2]STOP Project, University of Bath, Bath, UK
[3]Tobacco Tactics, University of Bath, Bath, UK
Contact: r.hiscock@bath.ac.uk

Background:

Flavoured tobacco products increase smoking uptake and create dependence. By June 2020 all cigarettes with a characterising flavour, including menthol were banned across the EU, UK and Moldova but many low and middle income countries (LMIC) are yet to develop and implement bans despite high smoking prevalence. This paper has two objectives: to establish whether (1) flavoured tobacco products are present and marketed in LMIC and (2) the experience of bans in Europe can guide development of legislation elsewhere.

Methods:

Research involved analysis of menthol/flavour market data, review of academic and commercial literature and online media.

Results:

The median menthol/capsule market share of the cigarette market grew significantly in middle income countries ($p < 0.05$) between 2005 and 2019, both in lower and upper middle-income countries [lower: 2.5% (IQR: 0.5-4.0) to 6.5% (IQR: 3.6-15.9); and upper: 4.0% (IQR: 0.8-9.8) to 12.3% (IQR: 3.5-24.3)]. No market data were available on low-income countries, but the academic literature suggested high prevalence of menthol use in Zambia. Tobacco industry strategies underpinning growth of menthol/flavoured tobacco use in LMICs included in-store marketing and display, colourful packs and non-conventional flavour names. Tobacco industry attempts to circumvent the EU ban included introducing new flavoured tobacco products and accessories not included in the ban and exploiting the ban on characterising flavour (as opposed to an ingredient ban) by introducing cigarettes with lower levels of menthol.

Conclusions:

Banning flavoured and menthol cigarettes in LMIC would impact a growing proportion of smokers in these countries.

From the European experience, menthol and flavour bans that include all tobacco products and accessories and ban flavour as an ingredient rather than a characterising flavour is recommended. Currently, lack of marketing bans and standardised packaging in LMICs exacerbate the impact of flavours.

Key messages:

- Flavoured and menthol tobacco products are a growing problem in LMICs.
- Bans should include all tobacco products and accessories and ban flavour as an ingredient.

Abstract citation ID: ckac130.035
Barriers to HIV testing among transgender women and men who have sex with men in sub-Saharan Africa

Subash Thapa

OT Tewogbola[1], *S Thapa*[2]
[1]Department of Public Health, University of Southern Denmark, Odense, Denmark
[2]Research Unit of General Practice, University of Southern Denmark, Odense, Denmark
Contact: soobesh@gmail.com

Background:

Accessing HIV testing services is a challenge for transgender women and men who have sex with men (MSM) in sub-Saharan Africa. Only a little about this issue has been understood and discussed. No systematic review exists that discusses barriers to HIV testing among transgender women and MSM on the regional level.

Methods:

We systematically searched databases namely MEDLINE, CINAHL, and Google Scholar to identify qualitative studies that reported decision-making and/or experiences with HIV testing uptake among transgender women or MSM and that were conducted in sub-Saharan Africa between January 2005 and March 2020. Two independent authors performed the selection, extraction, and thematic analysis of data.

Results:

Twelve out of 794 studies were found eligible and included for synthesis. The synthesis led to the development of a framework illustrating multi-level, inter-related barriers to HIV testing. Couple-based HIV testing policies, criminalizing same-sex behaviors, and (health) governance being influenced by traditional religious (Islamic or Christianity) belief systems were the barriers at the regional level. Discriminatory practices in the communities and health institutions were the community-specific barriers. Interpersonal barriers included interactions with healthcare providers leading to forced disclosure and/or discrimination, and individual level barriers included fears and depressive thoughts, and poor healthcare access.

Conclusions:

We identified policies and practices at the regional and country levels that hindered HIV testing practices among transgender women and MSM, which should be reconsidered while providing HIV prevention services to people of gender-minority backgrounds. We also think that countries from the global west do have a responsibility to question the sovereignty of some African countries for their inability to provide optimal health care to gender minority populations.

Key messages:

- Policies/practices that hinder access to HIV testing for transgender women and MSM in African countries should be discussed on the regional and global levels.
- Countries from the global west do have a responsibility to enforce African countries to provide optimal health care to gender minority populations.

Associations between biomass fuel use and child health: a community-based study in Bhaktapur, Nepal

Catherine Schwinger

C Schwinger[1,7], *I Kvestad*[2,3], *RK Chandyo*[4], *M Hysing*[5], *M Ulak*[1,6], *M Shrestha*[6], *S Ranjitkar*[6], *L Shrestha*[6], *TA Strand*[1,3]
[1]Centre for International Health, University of Bergen, Bergen, Norway
[2]NORCE, Bergen, Norway
[3]Department of Research, Innlandet Hospital Trust, Lillehammer, Norway
[4]Department of Community Medicine, Kathmandu Medical College, Kathmandu, Nepal
[5]Department of Psychosocial Science, University of Bergen, Bergen, Norway
[6]Department of Child Health, Tribhuvan University, Kathmandu, Nepal
[7]Centre for Disease Burden, Norwegian Institute of Public Health, Bergen, Norway
Contact: c.schwinger@uib.no

Background:

Biomass fuel use for cooking is widespread in low- and middle-income countries. Previous studies have mainly focused on adverse health outcomes in adults or specific diseases. In a cohort among young children living in Bhaktapur, Nepal, we aimed to describe the association between the use of biomass cooking fuels in families with child health using measures of linear growth, cognition and chronic illness.

Methods:

Caregivers of 600 marginally stunted children aged 6-11 months were interviewed about their primary source of cooking fuel at enrolment into a randomized controlled trial. Children's body length (n = 572) was measured at age 18-23 months. At the same time, blood samples (n = 497) were taken, and we measured leukocyte telomere length (LTL) as a marker of chronic disease risk. We chose LTL expressed as z-scores as a measure of chronic disease. Cognitive abilities were measured by the Wechsler Preschool and Primary Scale of Intelligence, 4th edition (WPPSI-IV) and NEPSY-II subtests when the children were 4 years old (n = 531). Associations were estimated in multiple regression models.

Results:

About 18% of all families used biomass as primary cooking fuel. Children from families using biomass fuel were on average slightly shorter (mean difference 0.14 Z-scores, 95% CI: 0.28, 0.00), had lower IQ scores (mean difference 2.2 (95% CI: 0.5, 3.9), and shorter LTL (mean difference: 0.09 (95% CI: 0.05 to 0.13) compared to those not using biomass fuel. The observed associations were unaltered after adjusting for relevant confounders.

Conclusions:

In children from households in poor, urban neighborhoods in Nepal, biomass fuel use for cooking was associated with health indicators for child growth and cognition as well as longevity and chronic illnesses reflected in shortening of telomeres. As this was an observational study, residual confounding cannot be excluded. Our findings support the ongoing effort to reduce exposure to biomass fuel in low-resource settings.

Key messages:

- Biomass fuel use was associated with diverse child health indicators in young Nepalese children.
- A better understanding of mechanisms leading to adverse health outcomes early in life is needed.

Abstract citation ID: ckac130.037
Youth HIV services in the context of COVID-19 pandemic in Sofala Province, Mozambique

Virginia Casigliani

V Casigliani[1,2], *N Ronzoni*[2], *A Merolle*[2], *F Chenene*[2], *V Cinturao*[2], *G Putoto*[2]
[1]Translational Research and New Technologies in Medicine and Surgery, University of Pisa, Pisa, Italy
[2]Medici con l'Africa CUAMM, Padua, Italy
Contact: v.casigliani7@gmail.com

Background:

After the first COVID-19 case in Mozambique, the government established a state of emergency in period April - September 2020. To reduce exposure for people living with HIV (PLWHIV), the Ministry of Health modified service delivery guidance, interrupting community activities, and revising patient flow within health facilities. The study aimed to measure the impact of the COVID-19 pandemic on HIV testing and treatment services in Sofala Province, Mozambique.

Methods:

The study analysed the activities in 9 youth HIV services called SAAJs (Serviço amigo do adolescente e jovem) supported by Doctors with Africa CUAMM in 2020 and 2021. The following data were gathered and analysed: number of counselling sessions, number of HIV tests performed, number of people who tested positive and therefore started the antiretroviral treatment (ART), number of PLHIV on ART. Data were disaggregated by sex and age.

Results:

In 2020 and 2021 85466 and 141844 counselling sessions were performed, respectively. A decrease of 41% was observed in the second trimester of 2020 compared with the previous one. The number of counselling sessions came back at pre-pandemic levels in the 2nd trimester of 2021. People aged 20-24 accessed more in 2020, while those aged 15-19 in 2021. In 2020 people tested for HIV were 22753, while the number was twice in 2021: the increase was higher among males($p<.05$). In 2020 females were more likely to be tested, while in 2021 it was the opposite($p<.05$). The positivity rate was 2.5% and 1.5%, respectively; in both years males were more likely to be tested positive($p<.05$). In 2020 86.1% of people tested positive started the ART, in 2021 98%. Males were more at risk of not starting the ART($p<.05$). The number of PLWHIV on ART did not decrease over time.

Conclusions:

ART provision was generally maintained during the COVID-19 pandemic, while other services were heavily impacted. The difference observed among sex was significant and may inform future interventions.

Key messages:

- The pandemic impacted severely HIV services in 2020, especially counselling and testing activities.
- It is relevant to assess how the population responded to services' restoration.

Abstract citation ID: ckac130.038
Evaluation of interventions for essential newborn care practices at home-based delivery in India

Jihyun Moon

J Moon[1], *G Usmanova*[2], *J van der Schans*[3,4], *JW Noh*[5], *R Biesma*[6]
[1]Graduate School of Medical Sciences, University of Groningen, Groningen, Netherlands

Contact: jihyun.moon123@gmail.com

India has the largest share of neonatal mortality, accounting for 21.7 per 1,000 in 2019, while the global goal is at least 12 per 1,000 by 2030. More than 20% of deliveries still occur at home in India for various reasons. Several national interventions were designed to ensure essential practices even at home by engaging skilled birth attendants (SBAs), antenatal care (ANC), and community health workers (CHWs). This study evaluates the effectiveness of these interventions on essential newborn care practices (EP); clean cord care, thermal care, and breastfeeding. Using data from the 2015-2016 India Demographic and Health Survey (n = 9,273), this study employs structural equation modeling to confirm the relationship between SBA, ANC, CHWs̀ counseling, and EP, including indirect effects of ANC and CHWs and moderating effects of women's empowerment. The results show that SBA and ANC have significant direct effects (standardised coefficient = 0.105 and 0.056, respectively) on EP, and ANC and CHWs have significant indirect effects (0.015 and 0.004) in the well-fitted model (CFI = 0.938, TLI = 0.920, RMSEA (upper 90% CI) = 0.028 (0.029), SRMR = 0.044). The empowerment-related factors which had a significant positive moderating effect on the paths from SBA to EP and from ANC to EP are decision-making power (0.007, 0.003), allowed mobility (0.002, 0.001), and education (0.009, 0.004). More than 90% of EP variance is not associated with the factors in this model (standardised coefficient = 0.958). SBA demonstrated the most considerable effectiveness for EP, while ANCs and CHW indirectly impacted EP. Improving women's empowerment can be an effective strategy to enhance EP. Previous literature said that the other factors explaining EP could be quality of care, other interventions for a safe birth, and cultural characteristics. Policymakers are recommended to consider comprehensive factors to address barriers to safe home birth and design CHW's intervention to persuade SBA.

Key messages:

- To optimize the effects of skilled birth attendants, quality of care need to be improved.
- Improving women's empowerment can be an effective strategy to enhance essential practices.

Abstract citation ID: ckac130.039
Early adolescents' sexual and reproductive health literacy in Lao PDR

Hyeonkyeong Lee

HK Lee[1], *YS Yang*[2], *SK Kim*[3], *V Vongxay*[4], *YM Lee*[5]
[1]Nursing, Yonsei University, Seoul, South Korea
[2]Regional Office, Korea International Cooperation Agency, Vientiane, Laos
[3]Nursing, Soonchunhyang, Cheonan, South Korea
[4]Public Health, University of Health Sciences, Vientiane, Laos
[5]Nursing, DePaul University, Chicago, USA
Contact: hlee39@yuhs.ac

Background:

Sexual and reproductive health literacy (SRHL) refers to the ability to access, understand, appraise, and apply information for decision-making related to sexual and reproductive health. The low level of SRHL in adolescents increases their sexually risky behaviors and endangers sexual health. Although early adolescence is a critical development period for forming initial views on sexuality and is often a time for attempting risky behaviors, studies on SRHL for early adolescents are fairly limited in Las PDR. As an initial step for the development of a global health project between Lao PDR and South Korea, this study assessed the level of SRHL and the differences in gender among early adolescents in Lao PDR.

Methods:

Participants were 235 students conveniently recruited from one junior high school each in two provinces in Lao PDR. SRHL was measured using the 39-item Teen Pregnancy Health Literacy scale consisting of 4 subscales of finding, understanding, appraisal, and application. The scores were classified into inadequate, problematic, sufficient, and excellent using the SRHL index formula. The mean differences in gender were compared using t-test.

Results:

The mean of the SRHL scores of the participants was 19.07 (±10.57). The mean score was significantly lower for girls, at 17.67 (±11.22) than for boys, at 21.37 (±9.05) ($p = .006$). Significant differences were further identified in all four subdomains of SRHL: finding ($p = .025$), understanding ($p = .005$), appraisal ($p = .041$), and application ($p = .029$). The majority of participants (91.7%) were categorized as having an 'inadequate' or 'problematic' level of SRHL.

Conclusions:

The level of SRHL among most early adolescents was found to be inadequate. The level of SRHL among girls was much lower than that among boys. The findings suggest a gender-specific approach to developing health education programs to improve SRHL among early adolescents and prevent future sexually risky behaviors in Lao PDR.

Key messages:

- Most of the early adolescents who participated in this study were categorized as having an inadequate or problematic level of SRHL.
- This study suggests a gender-specific approach to develop and implement interventions to improve adolescents' SRHL, particularly in lower-middle-income countries, to ultimately enhance sexual health.

Quantifying the burden of Hypercholesterolemia among Adolescents in India

Kirti Kirti

K Kirti[1], *SK Singh*[1]
[1]Department of Biostatitics and Demography, International Institute for Population Sciences, Mumbai, India
Contact: kirti070197@gmail.com

Hypercholesterolemia is a kind of hyperlipidemia in which an individual's blood contains excessive non-high-density lipoprotein (non-HDL) cholesterol and low-density lipoprotein (LDL) cholesterol, which has emerged as a significant covariate of coronary heart disease. Descriptive, bivariate and multivariable regression analyses were used to unearth the current hypercholesterolemia levels, probable risk factors, and its impact on other metabolic diseases among adolescents using data on 35,830 adolescents aged 10-19 years from the Comprehensive National Nutrition Survey, India, 2016-18. Findings suggest that the mean lipid levels for total cholesterol, LDL, HDL, and triglycerides were 140.6, 84.1, 47.3, and 95.3, respectively, with females bearing the higher burden. The study further identified early adolescents, urban residents, and overweight individuals at a higher risk of having elevated non-HDL. Western and Eastern regions bore higher LDL levels. Further, for a unit increase in TSFT risk of having high LDL increased by 2.55 times. Zinc deficits are at 2.13 times higher risk compared to zinc sufficient. Adolescents consuming unhealthy diets were at higher risk of elevated LDL. The study contends that it is essential to prevent the increasing levels of lipid profiles among Indian adolescents. Vitamin and mineral deficiencies and unhealthy dietary habits are significantly associated with high LDL and non-HDL levels. In the longer run, this might cause the early onset of complex cardiometabolic disorders, which would disrupt the individual's social and economic well-being. Hence, appropriate interventions are needed to curtail these early onsets by primarily focusing on adolescents.

Key messages:

- Present study is primarily focussed upon the cholesterol levels among adolescents in India.
- How this imbalance in cholesterol levels among adolescents would affect the chronic conditions among adolescents in India.

Abstract citation ID: ckac130.041

Does neighbourhood crime mediate the relationship between neighbourhood SES and birth outcomes?

Lizbeth Burgos Ochoa

L Burgos Ochoa[1], *MJ Bijlsma*[2], *EAP Steegers*[1], *JV Been*[1,3,4], *LCM Bertens*[1]
[1]Obstetrics and Gyneacology, Erasmus MC, Rotterdam, Netherlands
[2]Pharmacotherapy, Epidemiology and Economics, University of Groningen, Groningen, Netherlands
[3]Division of Neonatology, Paediatrics, Erasmus MC, Rotterdam, Netherlands
[4]Department of Public Health, Erasmus MC, Rotterdam, Netherlands
Contact: l.burgosochoa@erasmusmc.nl

Background:

Previous studies have consistently found that women living in low socioeconomic status (SES) neighbourhoods are at higher risk of experiencing adverse birth outcomes compared to women from high SES areas. However, the mechanisms through which neighbourhood SES might influence health at birth remain poorly understood. One of the proposed pathways is the exposure to higher crime rates. The aim of this study is to investigate whether neighbourhood crime mediates the relationship between neighbourhood SES and birth outcomes.

Methods:

A retrospective cohort study including over 1.3 million singleton births occurred in the Netherlands between 2010 and 2017. Individual-level data from the Dutch perinatal registry was linked to quintiles of neighbourhood SES scores and neighbourhood-level crime rates. Using the mediational g-formula, we estimated the total effect, natural direct effect, and natural indirect effect of neighbourhood SES on birth outcomes: small-for-gestational-age (SGA), low birth weight, and preterm birth. The neighbourhood SES intervention settings correspond with a hypothetical improvement in neighbourhood SES from the lowest to the highest quintile.

Results:

The hypothetical improvement in neighbourhood SES resulted in a 6.6% (CI = 5.6%; 7.5%) relative reduction in the proportion of SGA births, an 8.9% (CI = 7.6%; 10.3%) reduction in the proportion of low birth weight, and a 5.1% (CI = 4.0%; 6.1%) decrease of preterm birth. Neighbourhood crime accounted for 29.0% (CI = 25.1%; 32.8%) of the total effect of neighbourhood SES on SGA, and for 8.6% (CI = 5.1%; 11.6%) of the total effect on low birth weight. For preterm birth, we found no evidence of mediation by neighbourhood crime.

Conclusions:

Neighbourhood crime mediates the association between neighbourhood SES and key adverse birth outcomes. Interventions targeted at lowering neighbourhood crime rates could improve birth outcomes in disadvantaged areas.

Key messages:

- Neighbourhood crime mediates the association between neighbourhood SES and adverse birth outcomes in the Netherlands.
- Results from this study can provide guidance to neighbourhood-level strategies aiming at improving health at birth and reducing health inequalities.

Abstract citation ID: ckac130.042

Do fathers have sufficient knowledge to administer medicine to children correctly?

Natsuyo Yanagi

N Yanagi[1], *H Satoh*[1], *Y Sawada*[1]
[1]Graduate School of Pharmaceutical Sciences, University of Tokyo, Tokyo, Japan

Contact: ntyanagi@gmail.com

Background:

Recently, the father's involvement in childcare is increasing in Japan. Inappropriate use of medication for children at home has been reported worldwide, however, the most responsible person was likely to be the mother. We aimed to compare the knowledge related to administering medication to children between fathers and mothers among Japanese parents.

Methods:

An online survey regarding medication administration to children was conducted in March 2022. Parents living with preschool children were recruited and categorized by four factors: sex (fathers and mothers), age of children, regular medication, and the difficulty level in giving medicine to their own children. The cross-sectional data were collected for each category. The knowledge related to administering medication to children was measured using ten statements such as "Children can be given a reduced dose of adult medicine" using a 5-point Likert scale. The answer "disagree" was defined as correct understanding and was compared between fathers and mothers (Chi-square test).

Results:

The participants were 145 fathers and 128 mothers. The percentage of fathers who answered all questions correctly or all questions incorrectly was 9.0% (mothers = 13.3%) and 25.5% (mothers = 13.3%) respectively. Each statement was answered correctly by fathers 20.0-57.9% and by mothers 25.8-71.9% and fathers were less likely to have the correct knowledge than mothers (6 items, $p < 0.05$). The biggest difference between those two groups was the statement of "Children should be given more than the proper dose for rapid effect". Furthermore, the fathers having some difficulties in giving medicine had lower awareness about appropriate medication use than fathers having no difficulties.

Conclusions:

Fathers were more likely to have lower knowledge related to administering medication to children than mothers. Medical professionals like pharmacists will need to support fathers.

Key messages:

- Fathers were more likely to have lower knowledge related to administering medication to children than mothers among Japanese parents living with preschool children.
- To improve fathers' knowledge related to administering medication to children, support by medical professionals like pharmacists will be needed.

Abstract citation ID: ckac130.043
The design of a user-centred m-health application for caregivers of children undergoing ORL surgery

Raffaella Dobrina

R Dobrina[1], A Cassone[1], L Brunelli[2], S Zanchiello[3], C DeVita[3], A Starec[3], L Bicego[1]
[1]Healthcare Professions Department, Institute for Maternal and Child Health IRCCS Burlo Garofolo, Trieste, Italy
[2]Department of Medical, Surgical and Health Science, University of Trieste, Trieste, Italy
[3]Innovation and Complex Systems Department, Area Science Park, Trieste, Italy
Contact: raffaella.dobrina@burlo.trieste.it

Background:

In the context of common surgical procedures in pediatric otorhinolaryngology (ORL) patients, providing for education to families for hospitalization, surgery, and postoperative home management has been shown to improve peri-operative outcomes. In this regard, the use of Mobile Health Applications (MHA) is increasing. However, for these tools to be needs-appropriate and effective, their development requires a user-centred approach.

Methods:

Our study aimed to explore the informational needs and preferences - in terms of features and functionalities - of health care providers and ORL patients' caregivers (end-users) to inform the development of an MHA supporting ORL peri-operative process effectively. The study was conducted at a 136-bed maternal and child health hospital in Trieste. A user-centred participatory study design was employed, and the methodology steps were informed by the 3 cycles of the Information System Research Framework (Schnall et al., 2016).

Results:

The Relevance cycle was performed to better understand the environment as well as end users' (64 participants) informational needs and desired features for the MHA. Five critical information/education moments of the ORL perioperative period were identified. In the Rigour cycle a literature review was performed to identify further key topics relevant to understanding ORL end-users' needs and relevant features for the MHA. In the Design cycle the final contents were defined to be displayed on the MHA spread across the 5 identified moments. A randomized controlled trial will then be conducted to evaluate the effectiveness of the MHA compared to standard care.

Conclusions:

Triangulation of data sources collected by experts, ORL patients' caregivers, and healthcare professionals ensured the rigour of the methodology adopted in the study. Moreover, such a MHA user-centred developed MHA favours end-users positive health outcomes and organizational benefits of health services.

Key messages:

- Contextualizing, and responding to the health informational needs and intent to use by end users is a critical foundation for the design and adoption of MHA in a maternal and child health hospital.
- To implement MHA quality in the process of children ORL health management and family consumer satisfaction, user-centred design methods are needed and feasible.

Abstract citation ID: ckac130.044
Impact of socioeconomic position on childhood obesity in Finland based on register data from 2018

Laura Paalanen

L Paalanen[1], E Levälahti[1], P Mäki[1], H Tolonen[1], T Laatikainen[1,2]
[1]Department of Public Health and Welfare, Finnish Institute for Health and Welfare, Helsinki, Finland
[2]Institute of Public Health and Clinical Nutrition, University of Eastern Finland, Kuopio, Finland
Contact: laura.paalanen@thl.fi

Background:

Obesity is a globally growing public health challenge among children. In developed countries, the risk of obesity is commonly higher among lower socioeconomic groups. Measuring socioeconomic position (SEP), especially income, is challenging in surveys as self-reported information may suffer from reporting, awareness, recall and non-response bias. Our aim is to utilize official register data on several SEP indicators and measured height and weight of children, to identify the strongest predictors of SEP of the parents on the risk of obesity among the whole 2-17-year-old child population in Finland.

Methods:

Data for all children who had visited child health clinic or school health care in 2018 were extracted from the National Outpatient Register on Primary Health Care Services (n = 387623, coverage 40% in 2018). Obesity was defined according to the WHO criteria. SEP indicators were obtained from Statistics Finland for both parents living in the same household with a child. Boosted regression model was used to analyze the contribution of SEP to obesity using training dataset on 155479 non-related children.

Results:

The area under the curve for the final model in training dataset was 0.736 and 0.718 in validation dataset. Mother's educational level (12.6% of the total explained variation) and household's disposable income (12.6%) were the SEP indicators that most strongly predicted childhood obesity, whereas the impact of educational level of the father was somewhat smaller (8.1%). The influence of the age of a child was even bigger (39.2%), the prevalence of obesity being highest at 11 and 9 years of age among boys and girls, respectively.

Conclusions:

Our results based on official register data from Finland, a Nordic high-income country, endorse earlier findings on higher obesity risk among children with low socio-economic family background. Identification of the SEP related risk factors and support to families are essential in the prevention of childhood obesity.

Key messages:

- Several family socio-economic factors are reflected in the risk of childhood obesity.
- Utilizing objective register data offers a way to tackle many challenges related to self-reported survey data.

Abstract citation ID: ckac130.045
Maternal respectful care and Post-Traumatic Stress Disorder among postpartum mothers in Israel

Sirat Abu-Hamad

S Abu-Hamad[1], *N Daoud*[1]
[1]School of Public Health, Ben Gurion University of the Negev, Beer Sheva, Israel
Contact: sirat.ah@gmail.com

Background:

Maternal Respectful Care (MRC) approach was recommended by the WHO for improving maternal birth experience and mental health. We examined the association between MRC and Post-Traumatic Stress Disorder (PTSD) among postpartum women.

Methods:

A cross-sectional study took place between November 2020 and October 2021. 817 postpartum women (Jewish- 444 Arab-373) were interviewed via Zoom due to Covid-19 limitations. MRC was measured by 26 statements from disrespectful/abusive care during childbirth in facilities (DACF); 4 statements from the Mother on Respect questionnaire (MOR-feeling mistreatment based on ethno-national background, level of command of the Hebrew language and disagreement with the staff); and 4 statements regarding abuse of the NorVold Abuse Questionnaire (NorAQ). PTSD was measured by Solomon et al.'s tool, and dichotomized into 12 score cutoff. (Yes /No PTSD).

Results:

PTSD prevalence was 14.3%, significantly higher among Palestinian-Arab compared to Jewish women (22.0%,7.9%, respectively), and it was higher in women who had lower MRC scores: did not receive postpartum education (19.9%,11.9 % respectively) received; received midwife support 11.7%,18.4% didn't receive; reported racism 26.1%,11.4% not; Felt humiliated at healthcare services vs. not (16.8% , 10.6%, respectively); women who reported mistreatment based on national/cultural background, compared to others (MOR) (36.6%,13.1%, respectively). In the multivariate analysis after adjusting to different independent variables, Palestinian-Arab women were 6.04 times at risk for PTSD (OR = 6.04,95% CI = 3.38-10.78),Women who reported racism are 2.14 times more likely to PTSD (OR = 2.14, 95% CI = 1.30-3.54). Women who reported feeling humiliated visiting the health care system are 2.08 times more likely to PTSD (OR = 2.08,95% CI = 1.23-3.52).

Conclusions:

MRC is an important factor for maternal PTSD among postpartum women and it should be considered specifically among minority women.

Key messages:

- MRC can contribute to quality care, improving birthing mothers experience and reducing negative health outcomes such as PTSD, and it should be improved for women.
- The health care services need to run a program to overcome racism and reduce unrespectful care for postpartum women.

Abstract citation ID: ckac130.046
Regulation and financing of prenatal screening and diagnostic tests for fetal anomalies in Europe

Inanna Reinsperger

I Reinsperger[1], *I Zechmeister-Koss*[1]
[1]Austrian Institute for HTA, Vienna, Austria
Contact: inanna.reinsperger@aihta.at

Background:

Pregnant women frequently use prenatal screening and diagnostic tests to detect fetal structural and chromosomal anomalies; however, the regulation and financing of these examinations differ substantially across countries. In this paper we focus on the provision, financing and setting of the following tests in selected European countries: First Trimester Screening (FTS)/Combined Test (CT), Non-invasive Prenatal Test (NIPT), second-trimester ultrasound screening for fetal anomalies, amniocentesis/chorionic villus sampling.

Methods:

We chose 6 European countries that differ in various criteria (e.g., health/insurance system, geographical location) to illustrate the range of possible regulations and forms of funding: Germany, Switzerland, Netherlands, United Kingdom, Norway, Italy. We conducted a comprehensive hand search and consulted experts from the 6 countries using a questionnaire.

Results:

The results are based on 11 completed expert questionnaires and 22 published sources. The heterogeneity of the provision, regulation and financing of the tests concerns in particular the choice of the first-line screening test for fetal trisomies (FTS/CT, NIPT or the identification of risk factors), the implementation of the NIPT, the reimbursement of the tests, the uptake of the examinations, but also the professional groups responsible for antenatal care (midwives, gynaecologists). There are some similarities between countries, e.g., concerning the provision and financing of invasive tests and of the ultrasound screening for fetal anomalies in the second trimester.

Conclusions:

The results highlight the significant heterogeneity between European countries regarding prenatal screening and diagnostic testing for fetal anomalies. Due to the many ethical aspects of the topic, a broad societal discourse with the relevant interest groups and stakeholders seems to be necessary. Decision-makers should pay particular attention to high-quality and non-directive counselling.

Key messages:

- European countries take different approaches to offer and fund prenatal screening and diagnostic tests for fetal anomalies.
- The implementation of screening strategies should focus in particular on the importance of high-quality counselling to enable informed decision-making.

3.R. Chronic diseases

Abstract citation ID: ckac130.047
Overview of national strategies for the prevention and management of non-communicable diseases

Inanna Reinsperger

I Reinsperger[1], *L Gassner*[1], *I Zechmeister-Koss*[1]
[1]Austrian Institute for HTA, Vienna, Austria
Contact: inanna.reinsperger@aihta.at

Background:

Several countries have developed national strategies or policies for preventing and managing non-communicable diseases (NCDs) which are the leading cause of death worldwide. We aim to provide an overview of these strategies from selected countries and their implementation, focusing on chronic respiratory and cardiovascular diseases, diabetes and depression.

Methods:

Using a comprehensive structured hand search, strategies from 8 countries (Germany, Switzerland, Netherlands, Finland, Ireland, United Kingdom, Canada, Australia) were identified and information on the main characteristics and implementation process of the strategies was extracted.

Results:

A total of 18 strategies were included. Most of the strategies formulate rather broad overarching aims or visions (e.g., ''stay healthy'' or ''living healthier lives'') as well as more specific targets that differ across strategies, e.g. focusing on improving quality of life and health literacy, reducing health inequalities or strengthening integrated care. The level of detail of information on implementation, monitoring and evaluation processes as well as financing is very heterogeneous. All strategies provide information on activities to achieve their aims, e.g. in the areas of health promotion/primary prevention, self-management, screening, integrated care, measures for specific risk groups or activities outside the health sector. Only a few strategies mention specific, already implemented (and evaluated) interventions, such as prevention or disease management programmes.

Conclusions:

The included NCD strategies differ considerably in terms of level of detail, structure and implementation. We focused on interventions within the health sector and on adults as a target group. However, for the prevention and management of NCDs, it is important to start in early childhood and to adequately address the social determinants of health with a 'Health in All Policies' approach.

Key messages:

- Many countries have developed and implemented strategies to strengthen and coordinate action to tackle NCDs which are a growing problem worldwide due to their high mortality and morbidity.
- A structured approach from the macro to the micro level seems crucial for a comprehensive, coordinated overall policy for preventing and managing NCDs.

Abstract citation ID: ckac130.048
A systematic review of multimorbidity patterns: social determinants and classification methods

Begoña Ramos-Fiol

B Ramos-Fiol[1,2], *ME Ortega-Martin*[1], *J Carretero-Bravo*[1], *V Suarez-Lledo*[1], *J Alvarez-Galvez*[1]
[1]Biomedicine, Biotechnology and Public Health, University of Cadiz, Jerez de la Frontera, Spain
[2]Clinical Medicine and Public Health, University of Granada, Granada, Spain
Contact: begona.ramos@gm.uca.es

Background:

Governments and healthcare systems are facing multimorbidity (MM) as a major challenge due to the difficulties related to its proper identification and clinical management. Despite growing research on MM, its epidemiology is poorly understood due to the great complexity of underlying patterns of chronicity. The present review aims to identify the most frequent MM profiles and their social determinants.

Methods:

A systematic review following the PRISMA statement was conducted. The search strategy was performed by combining three sets of keywords (MM, inequalities and patterns) that were searched in Pubmed, Scopus, Web of Science, OVID, CINAHL Complete, and PsycINFO. Primary studies analysing MM patterns and their relationship with social determinants were included. The quality of the studies was assessed using the Axis tool quality assessment.

Results:

After the review process, 96 studies were selected from the 46,726 identified. The main methods used to identify MM patterns fell into five categories: latent class analysis (38.54%), cluster techniques (23.96%), factor analysis (19.79%), and machine learning (10.42%), and expert knowledge (7.29%). Latent class analysis was widely used, although in recent years the use of techniques based on machine learning has increased. The main patterns were cardiometabolic, cardiovascular, mental, musculoskeletal, complex MM, and respiratory diseases. Some MM profiles were more prevalent among lower-SES groups. In particular, patterns of mental multimorbidity were more prevalent among women and complex patterns were associated with low income.

Conclusions:

Results show different disease combinations among disparate social determinants such as gender, age, education, and socioeconomic status. Our results suggest that more and better designed studies are needed to improve clinical practice and health policies with the aim of enhancing the quality of patients with MM and their relationship to health system use and care.

Key messages:

- Patterns of mental multimorbidity and complex multimorbidity were more prevalent among women and men of low socioeconomic status, respectively.
- An increasing number of studies are using a network-based approach to classify multimorbidity.

[8]Veterinary Public Health and Food Safety, Ghent University, Ghent, Belgium
Contact: vanessa.gorasso@sciensano.be

Background:

Within the European Union, musculoskeletal (MSK) disorders represent the most prevalent and costly work-related health problems affecting about 45 million workers. Since middle-aged people during their formative and peak income-earning years are predominantly affected, MSK disorders are the major contributors to the loss of productive life years in the workforce compared with other non-communicable diseases. This study aimed to summarize the average yearly economic impact of low back pain (LBP), neck pain (NKP), osteoarthritis (OST) and rheumatoid arthritis (RHE) in Belgium from 2013 to 2017.

Methods:

Direct costs, measured by reimbursed expenditures for medical services and medications, were derived by the national health insurer. Indirect costs were computed by multiplying the mean number of days absent from work (derived by the Belgian health interview survey, as prevalence data) with the average gross daily wage. Multivariate regression models were used to explore the extent to which average yearly costs were associated with MSK disorders. The method of recycled predictions allowed to estimate the marginal effect of each MSK disorder on costs.

Results:

25% of Belgian adults were affected by at least one MSK disorder that incurred on average to 1,524€ per capita. LBP was the most costly disorder (2,405€ per capita) followed by NKP (2,260€ per capita). In the working population, 15% had at least one MSK disorder with an average indirect cost of 3,083€ per capita. People with LBP were the only showing a significantly higher indirect cost compared to a population without LBP, with an adjusted cost per capita of 5,875€.

Conclusions:

The adult Belgian population is largely affected by MSK disorders. Every year the total adjusted healthcare cost amounted to more than 3 billion Euros. Additionally, on average every year Belgium spends around 2 billion Euros for work absenteeism related to one of the MSK disorders.

Key messages:

- MSK disorders have a great societal cost in Belgium.
- Intervening on the working population that is largely affected can help reducing absenteeism costs.

Contact: lotta.vikstrom@umu.se

Background:

While diseases in contemporary and past populations are thoroughly studied, the knowledge about disability and the risks of getting it is poor. Like diseases, disabilities increase with growing age affecting primarily elderly groups. Whether this notion holds historically and for other groups at risk for disability and differences over time is not known. This study estimates the disability risks in Swedish populations c. 1800-1959 by age, sex and disability type (sensory, physical, mental).

Methods:

We use data on two historical populations in the 1800s (N = 36,500; 550 with disability) and 1900-1959 (N = 194,500; 4,700 with disability) drawn from digitized parish registers reporting socio-economic and demographic characteristics over lifetime and on disabilities. Cox proportional regressions estimate disability risks across time by group (age, sex, disability type).

Results:

Our preliminary results based on unadjusted estimates from 1900-1959 suggest that the disability risks doubled or more. In the 1950s, women had 2.6 times higher risk than 50 years before, while it was 2.0 for men. The major rise started in the 1930s (Men 1.51; Women: 1.67), and grew in the 1940s (Men 1.80; Women: 2.14). Next, we will assess these risks by group and in the 1800s.

Conclusions:

From 1900-1959, Swedish populations experienced consistently higher disability risks, which doubled for men and almost tripled for women. These risks increased while improvements in public health and economic growth would subsequently make Sweden internationally known as a modern welfare state. That health improvements did not reduce the disability risks but the reverse, was possibly due to higher recognition or labeling of disabilities.

Key messages:

- Our study is unique in providing long-term results on populations at risk for disability while public health improved.
- Public concerns to confine disabled people for treatment in the early welfare era increased the disability risks beside longer life expectancy.

Abstract citation ID: ckac130.051
Development and internal validation of a new life expectancy estimator for multimorbid older adults

Viktoria Gastens

V Gastens[1,2], A Chiolero[1,2,3], D Anker[2], M Feller[1,4], D Bauer[5], N Rodondi[1,4], C Del Giovane[1,2]

[4]Department of General Internal Medicine, Bern University Hospital, Bern, Switzerland
[5]Departments of Medicine and Epidemiology, University of California, San Francisco, USA
Contact: viktoria.gastens@biham.unibe.ch

Background:

Multimorbidity is highly prevalent among older adults and associated with a shorter life expectancy. Many guidelines recommend tailoring preventive care of multimorbid people according to life expectancy. Indeed, patients with a relatively short life expectancy might not have the time to benefit from a preventive care intervention. Our objective was therefore to develop and internally validate a life expectancy estimator for older multimorbid adults.

Methods:

We analysed data of the OPERAM (OPtimising thERapy to prevent Avoidable hospital admissions in Multimorbid older people) cohort study in Bern, Switzerland. 822 hospitalized participants aged 70 years old or more, with multimorbidity (3 or more chronic medical conditions), and polypharmacy (use of 5 drugs or more for >30 days) were included. Our main outcome was time to all-cause mortality assessed during 3 years of follow-up. Candidate predictors included demographic variables (age, sex), clinical characteristics (Charlson-Comorbidity-Index, number of drugs, body mass index, weight loss), smoking, functional status variables (Barthel-Index, falls, nursing home residence), and hospitalization. We internally validated and optimism corrected the model using bootstrapping techniques. We transformed the 3-year mortality prognostic index into a life expectancy estimator using the Gompertz survival function.

Results:

At baseline, the participants (58% men) had a median age of 79 years (min: 70; max: 99). They took daily a median of 10 chronic medications (min: 5; max 38). During 3 years of follow-up, 292 participants (36%) died. The analysis is ongoing and results will be presented at the congress.

Conclusions:

A life expectancy estimator eventually helps personalising care to prevent under- and overuse of preventive care in the growing older population.

Key messages:

- We provide the first life expectancy estimator for older multimorbid adults.

- A life expectancy estimator eventually helps personalising care to prevent under- and overuse of preventive care in the growing older population.

Changing epidemiology and trends in incidence of kidney cancer in England, 1985-2019

Anjum Memon

Y Salari[1], P Bannister[1], A Memon[1]
[1]Brighton and Sussex Medical School, Department of Primary Care and Public Health, Brighton, UK
Contact: a.memon@bsms.ac.uk

Background:
Kidney cancer is the 7th most common cancer in the UK, accounting for 4% of all new cancer cases. The risk factors for kidney cancer include obesity, smoking, hypertension, and exposure to certain environmental and occupational carcinogens. We conducted a retrospective population-based cohort study to examine whether there have been changes in the incidence of kidney cancer in England during the past four decades.

Methods:
Individual level data for patients diagnosed with kidney cancer in England during 1985-2019 were obtained from the Office for National Statistics/Public Health England. Average annual incidence rates were calculated by two age categories (0-49, 50+ years) and all ages combined during the seven five-year time periods (1985-89 to 2015-19). The percentage change in incidence was calculated as change in the average annual incidence rate from the first (1985-89) to the last time period (2015-19).

Results:
During the 35-year study period, a total of 197,819 new cases of kidney cancer were registered in England (62.4% males, 37.6% females). In young people aged 0-49 years, the average annual incidence rates increased by 164% in males and 144% in females (from 1.4/100,000 in 1985-89 to 3.7/100,000 in 2015-19 in males and from 0.9/100,000 in 1985-89 to 2.2/100,000 in 2015-19 in females). In older people aged 50+ years, the rates increased by 129% in males and 147% in females (from 24.5/100,000 in 1985-89 to 56.0/100,000 in 2015-19 in males and from 11.9/100,000 in 1985-89 to 29.4/100,000 in 2015-19 in females).

Conclusions:
There has been a steady and significant increase in the incidence of kidney cancer in England over the past four decades. The largest increase (164%) was observed in young males aged 0-49 years, which was unexpected. Considering the risk factors for kidney cancer, further research is needed to understand the role of environmental/occupational exposures in causing kidney cancer.

Key messages:
- About 24% of kidney cancers in the UK are attributed to obesity and 13% to smoking. This research highlights the benefits of reducing the prevalence of obesity and smoking in the general population.
- The unexpected significant increase in the incidence of kidney cancer in young people aged 0-49 years needs further investigation.

Abstract citation ID: ckac130.053
Changing epidemiology and trends in incidence of thyroid cancer in England, 1985-2019

Anjum Memon

R Stonell[1], P Bannister[1], A Memon[1]
[1]Brighton and Sussex Medical School, Department of Primary Care and Public Health, Brighton, UK
Contact: a.memon@bsms.ac.uk

Background:
Thyroid cancer is 2-3 times more common in females and is currently the fastest growing cancer worldwide. Exposure to ionizing radiation is the only established risk factor for thyroid cancer. Other factors include obesity, history of benign thyroid conditions, and family history. We conducted a retrospective population-based cohort study to examine whether there have been changes in the incidence of thyroid cancer in England during the past four decades.

Methods:
Individual level data for patients diagnosed with thyroid cancer in England during 1985-2019 were obtained from the Office for National Statistics/Public Health England. Average annual incidence rates were calculated by two age categories (0-49, 50+ years) and all ages combined during the seven five-year time periods (1985-89 to 2015-19). The percentage change in incidence was calculated as change in the average annual incidence rate from the first (1985-89) to the last time period (2015-19).

Results:
During the 35-year study period, a total of 58,710 new cases of thyroid cancer were registered in England (27.3% males, 72.7% females). In young people aged 0-49 years, the average annual incidence rates increased by 375% in males and 438% in females (from 0.4/100,000 in 1985-89 to 1.9/100,000 in 2015-19 in males and from 1.3/100,000 in 1985-89 to 7.0/100,000 in 2015-19 in females). In older people aged 50+ years, the rates increased by 146% in males and 171% in females (from 2.4/100,000 in 1985-89 to 5.9/100,000 in 2015-19 in males and from 4.1/100,000 in 1985-89 to 11.1/100,000 in 2015-19 in females).

Conclusions:
There has been a steady and substantial increase in the incidence of thyroid cancer in England over the past four decades. The largest increase in incidence was observed in young people aged 0-49 years. Some of this increase is due to enhanced surveillance and sensitive diagnostic methods, but other factors (e.g., obesity and history of benign thyroid conditions) need to be considered.

Key messages:
- The unexpected substantial increase in the incidence of thyroid cancer in young people aged 0-49 years needs further investigation.
- It is important to determine what proportion of the cases are due to enhanced surveillance and what proportion are due to environmental exposures.

[6]Recetox, Masaryk University, Brno, Czechia
[7]Research, Innovation and Teaching Unit, Parc Sanitari Sant Joan de Déu, Sant Boi de Llobregat, Spain
Contact: m.kozela@uj.edu.pl

Background:
A novel tool to measure healthy ageing was developed by the ATHLOS consortium (Ageing Trajectories of Health-Longitudinal Opportunities and Synergies). ATHLOS Healthy Ageing Scale, constructed using harmonized data from 16 independent ageing cohorts, was designed to contribute to

worldwide research on healthy ageing. The aim of the analysis was to assess the relation between ATHLOS Healthy Ageing Scale and all-cause mortality in Central European populations.

Methods:

Participants of the Polish and Czech HAPIEE cohorts (baseline age 45-69 years) were followed for 14 years. ATHLOS Healthy Ageing Scale was based on over 40 health indicators related to intrinsic capacity and functional ability. Cox proportional hazards models were used to determine the relationship between the ATHLOS Healthy Ageing Scale scores and all-cause mortality.

Results:

As many as 9,922 Polish and 8,518 Czech participants had non-missing data on the ATHLOS Healthy Ageing Scale score and mortality (1828 and 1700 deaths, respectively). After adjustment for age, dose-response associations with mortality in both genders and countries were found (HR for lowest vs. highest quintile of the ATHLOS Healthy Ageing Scale: 2.98 and 1.96 in Czech and Polish women and 2.83 and 2.66 in Czech and Polish men, respectively). Only modest attenuation was observed when additionally adjusted for education, economic activity, smoking and self-rated health.

Conclusions:

The ATHLOS Healthy Ageing Scale was found to be a good predictor of all-cause mortality in urban populations of Poland and Czechia. This composite indicator seems to be an important contributor to a better assessment of healthy ageing.

Key messages:

- Independent inverse associations between ATHLOS Healthy Ageing Scale and all-cause mortality were found in both men and women in urban population samples from Central and Eastern Europe.
- Given its predictive validity for all-cause mortality, this novel tool may substantially contribute to a better assessment of healthy ageing.

Abstract citation ID: ckac130.055
Dual task test: Screening procedure for early detection of cognitive impairment among healthy adults

Helmut Simi

H Simi[1], B Guggenberger[2,5], P Holler[1], M Christova[2,4], R Pilz[3], W Staubmann[3]
[1]Sport Science Laboratory, FH JOANNEUM, University of Applied Sciences, Bad Gleichenberg, Austria
[2]Institute of Physiotherapy, FH JOANNEUM, University of Applied Sciences, Graz, Austria
[3]Institute of Dietetics & Nutrition, FH JOANNEUM, University of Applied Sciences, Graz, Austria
[4]Section of Physiology, Otto Loewi Resarch Centre, Medical University of Graz, Graz, Austria
[5]Department of Orthopaedics & Trauma, Medical University of Graz, Graz, Austria
Contact: helmut.simi@fh-joanneum.at

Background:

Early detection of cognitive impairment can slow progression to dementia when using appropriate therapy. For early detection of dementia dual task combining cognitive tasks and walking might be suitable, since individuals with cognitive impairment have shown greater changes in gait specific parameters on dual task test (DT) compared to single task test (ST). This study investigates whether these changes correlate with poorer cognitive function in healthy older adults.

Methods:

In a cross-sectional study 174 healthy adults (66,48±4,26years; 40%female) completed the Cognitive Functions Dementia Test (CFD), with a lower CFD index indicating lower cognitive function. Participants performed ST (walking 20m) and DT (walking 20m & counting backwards), in which step frequency, stride length and gait speed were monitored by Pablo sensors. Cognitive cost (CC) was determined for each gait variable. CC represents a change score between SD & DT and quantifies cognitive demands, with higher CC indicating poorer cognitive function. Pearson correlations and stepwise linear regression adjusted for age and gender were applied to analyze the association between CFD Index (dependent variable) and CC gate variables (predictors) ($\alpha = 5\%$).

Results:

Significant correlations were observed between CFD Index and CC step frequency ($p = .014$, $r = -.187$), CC stride length ($p = .037$, $r = -.160$) and CC gait speed ($p = .002$, $r = -.232$). Since gait variables were intercorrelated (multicollinearity), only gait speed was significant predictor for CFD Index ($ß = -.243$, $p < .001$, $R^2 = .053$) in a stepwise adjusted regression model.

Conclusions:

Changes in gait speed might be sensitive enough to indicate differences of cognitive performance among older individuals. Therefore, DT could be included in screening procedures as alert for potential cognitive decline.

Key messages:

- Changes in gait speed might be sensitive enough to indicate differences of cognitive performance among older individuals.
- DT is sensitive to distinguish different cognitive performance in healthy elderly with potential for early detection of mild cognitive impairments.

Assessing the state of Web-based communication for public health: a systematic review

Francesca Cappellini

E Ceretti[1], L Covolo[1], F Cappellini[1], A Nanni[2], S Sorosina[2], M Taranto[3], A Gasparini[3], P De Castro[3], S Brusaferro[3], U Gelatti[1]
[1]Department of Medicine, Università degli Studi di Brescia, Brescia, Italy
[2]Post-graduate School of Public Health, Università degli Studi di Brescia, Brescia, Italy
[3]Italian National Institute of Health, Rome, Italy
Contact: francesca.cappellini@unibs.it

Background:

Communicating strategically is a key issue for health organisations and, over the past decade, healthcare communication via social media and websites has generated a great deal of studies. As for systematic reviews, there is, however, fragmentary evidence on this type of communication. The aim of this research was to summarise the evidence on Web institutional health communication for public health authorities to evaluate aim-specific key points based on existing studies.

Methods:

Guided by the PRISMA statement, we conducted a comprehensive review across two electronic databases (PubMed and Web of Science) from 2011 until 7 October 2021, searching for studies investigating institutional health communication. Two independent researchers reviewed the articles for inclusion, and assessment of methodological quality was based on the Kmet appraisal checklist.

Results:

78 articles were selected. Most of the studies targeted health promotion/disease prevention (n = 35), followed by crisis communication (n = 24), general health (n = 13), and misinformation correction/health promotion (n = 6). Engagement and message framing were the most analysed aspects. Few studies focused on campaign effectiveness. Only 18 studies had an experimental design. Kmet evaluation was used to distinguish studies presenting a solid structure from lacking studies. In particular, considering the 0·75-point threshold, out of 74 studies, 28 were excluded (37·8% of the total). Studies above this threshold were used to identify a series of aim-specific and medium-specific suggestions, as communication strategies employed differ quite greatly.

Conclusions:

Overall, findings suggest that no single strategy works best in the case of Web-based healthcare communication. The extreme variability of outcomes and the lack of a unitary measure for assessing the end-points of a specific campaign or study leads us to reconsider the tools we use to evaluate the efficacy of Web-based health communication.

Key messages:

- This systematic review provides an overview on Web-based health communication. Results suggest that no single strategy works best and the need to reassess its evaluation tools.
- Communicating strategically is key for health organisations. This systematic review analyses a corpus of texts, in an effort to summarise and analyse existing, albeit fragmentary, evidence.

Disruptive e-prevention from 2019: dummy online drug selling sites to reach new consumers

Michel Mau

M Mau[1], *C Bouchet-Mayer*[3,2], *S Bost*[2], *M Shelly*[4,2], *D Trauchessec*[1]
[1]e-prevention, PlaySafe, Paris, France
[2]Hospital ''Outside the Walls'', Aremedia, Paris, France
[3]Santésih, Research Center in Sociology, University of Montpellier, Montpellier, France
[4]Fernand Widal Hospital, Assistance Publique–Hôpitaux de Paris, Paris, France
Contact: michel@playsafe.fr

Background:

The last three decades have seen the development of chemsex, the diversification of substances through New Psychoactive Substances (NPS), and new technologies allowing people to buy online and find peers to consume on applications while remaining in private spheres (Trend, Cadet-Taillou, 2020). The latter has made it more difficult to reach users, so as to document their uses and the population, and to design public health schemes aimed at users, except through targeting metapopulations known to consume more than the general population (Léobon et al., 2018; Talley et al., 2011).

Methods:

The PlaySafe association designed two dummy websites, one selling GBL, the other NPS. These websites use the same graphics and syntactic codes as the main websites of the field, except for: 1) a fake drug named ''love machine''; 2) an automatic redirection to a health promotion page instead of payment finalization. The information collected is: delivery region, birth year, gender, perceived usefulness of the health promotion messages, whether people would recommend to friends, the contents and quantities of the shopping cart, the time spent on each page, and data gathered via Google Analytics.

Results:

On both websites 21,459 order attempts have been placed. This pathfinder research project has allowed to reach 6,203 people on the GBL website in 30 months and 7,927 people in 12 months on the NPS website, with people spending on average 1 min 35 s on the first website's prevention page and 1 min 27 s on the second. Around 85% of people consider the content useful, among whom 75% would recommend the website to friends. This communication also aims to present the characteristics of the reached population.

Conclusions:

This innovative approach has allowed to precisely target a population escaping public health research and prevention schemes. It appears interesting to explore online prevention, especially since most of the respondents consider the experience helpful and recommendable.

Key messages:

- NTIC can serve research and actions in public health in order to reach online drug buyers.
- Monitoring the online drug market can be used to design actions by stakeholders.

Abstract citation ID: ckac130.058
COVID-19 contact tracing apps in Europe, technological feat or failure?

Juan Rachadell

A Santos[4], *J Rachadell*[1,2,5], *R Vareda*[3,5]
[1]Public Health Unit, ACES Lisboa Ocidental e Oeiras, Oeiras, Portugal
[2]EUPHA-DH
[3]Public Health Unit, ACES Lisboa Norte, Lisbon, Portugal
[4]Public Health Unit, ACES Almada-Seixal, Almada, Portugal
[5]Institute for Evidence Based Health, Lisbon, Portugal
Contact: juan.rachadell@campus.ul.pt

Background:

In the context of infectious disease control (IDC), public health services (PHS) have been under great pressure during the COVID-19 pandemic, especially with the burden of contact tracing. Most European Union countries have developed contact tracing apps for smartphones (CTA) with the goal of aiding PHS in IDC. CTAs generally use proximity data from mobile devices to determine a user's risk of exposure to SARS-CoV-2, thus providing testing and isolation recommendations. This review aimed to study the acceptance and adoption of CTAs in Europe.

Methods:

5 European countries were selected: Germany, Spain, France, Ireland, Italy. A literature review was carried out and official sources of information from each country were consulted in order to compare the adoption of each national CTA. Criterias included number of downloads, rating in the app stores, costo of development, proportion of positive tests registered. Potential factors influencing population adherence to CTAs were also investigated.

Results:

In proportion to their population, the number of downloads varied significantly in each country (18 % in Spain, 67% in France, 75% in Ireland). Except for Spain, all countries integrated additional functions into the CTA to increase its uptake, such as access to the vaccination certificate. App stores ratings ranged from 3.0 (Spain) to 3.9 (France and Ireland). The proportion of tests added in the apps varied significantly (1% in Italy and Spain, 4% in Ireland, 10% in France and 17% in Germany). Concerns that lead to the non-use of CTAs were related to data protection, smartphone battery drainage and app bugs.

Conclusions:

CTAs as a way to identify contacts from a positive case had a low impact in the analyzed countries, with low population adherence being an important factor. Adding more features within the apps, minimizing bugs, and increasing public confidence in data privacy seem essential to increase uptake in the future.

Key messages:

- Although conceptually attractive, CTAs have not proven to be effective in the context of the COVID-19 pandemic.
- There is a need for research and evaluation of the use of CTA, including cost effectiveness metrics, to inform future implementation similar technologies.

Abstract citation ID: ckac130.059
The "grey" digital divide in older adults during COVID-19 in Germany: Who is most at risk?

Núria Pedrós Barnils

N Pedrós Barnils[1,2], *B Schüz*[1,2]
[1]Prevention and Health Promotion, Bremen University, Bremen, Germany
[2]Digital Public Health, Leibniz Science Campus, Bremen, Germany
Contact: nupedros@uni-bremen.de

Background:

During the COVID-19 pandemic, physical distancing was a recommended public health measure. For some older adults, distancing has not only been physical but also social due to a lack of access to the internet - either due to consciously opting out or lack of resources. This study aims to assess who is most at risk of not having access to the internet and the associated negative mental and physical health outcomes.

Methods:

Participants were drawn from the 2020 German Ageing Survey (DEAS) in June and July 2020, and include community-dwelling adults above 45 years old (N = 4,823; 56.5% response rate). Two complementary analytic approaches were used to identify lack of access: logistic regression (LR) and Classification and Regression Tree (CART) analysis, using social indicators as predictors. LR provides information about main effects of the predictors; CART, through an exploratory, non-parametric procedure, illustrates the mathematical relationship of the variables.

Results:

CART analysis revealed that the strongest discriminating factor for internet access was being over or under 75 years old (n = 3,131 Pr = 0.075 vs n = 1,545 Pr = 0.385). Moreover, for older individuals high education was a protective factor (n = 739 Pr = 0.260 vs n = 805 Pr = 0.499), while for younger individuals a monthly income of 2,000€ set the internet access cut-off point (n = 2520 Pr = 0.0504 vs n = 611 Pr = 0.177). Logistic regression revealed that gender (OR = 1.50; pv < 0.001), education (OR = 0.36; pv < 0.001), monthly income (0.93; pv < 0.001) and region in Germany (West-East) (OR = 2.42; pv < 0.001) explain 29.40% of internet access' variance. Results are preliminary.

Conclusions:

In times of forced physical distancing, the "grey" digital divide increases the vulnerability of disadvantaged groups. CART analysis helped identify groups at higher risk of not having access to the internet and yields the ground for tailored public health interventions.

Key messages:

- The strongest discriminating factor for internet access in Germany during the COVID-19 pandemic was being over or under 75 years old. For younger individuals a monthly income of 2k € set the threshold.
- The "grey" digital divide affects individuals over 75 years old with middle or low education the most, increasing the risk of associated negative mental and physical health outcomes.

Abstract citation ID: ckac130.060
Research ethics with real-world data (RWD) on COVID-19 infections: the unCoVer study

Silvia Riva

S Riva[1], *Z Kabir*[2], *N Biscoe*[1], *G O'Sullivan*[2], *G Soriano*[3], *J Penalvo*[3]
[1]St. Mary's University, Twickenham, London, UK
[2]University College of Cork, Cork, Ireland
[3]Institute of Tropical Medicine, Antwerp, Belgium
Contact: silvia.riva@stmarys.ac.uk

Issue:

The aim of the Horizon 2020 unCoVer project (Unravelling Data for Rapid Evidence-Based Response to COVID-19) is to coordinate research expertise in utilising Real World Data (RWD) to investigate the underlying risk factors for COVID-19 infection and severity, the effectiveness of treatments and the impact on health systems. RWD is particularly useful in a dynamic health context as it is relevant, timely, and more ecologically valid. Pooling clinical databases and integrating epidemiological principles and powerful biostatistical tools optimises resources and fully exploits routinely-collected data.

Description of the problem:

RWD sharing poses new practical and ethical challenges to research. The unCoVer network has developed a federated data platform to access diverse databases for advanced analytics. This data access process entails GDPR, and regulatory and ethical nuances. The use of large-scale data from heterogeneous sources across multiple jurisdictions for research purposes presents a complex systems challenge.

Effects & Lessons:

A dedicated team of unCoVer network members is responsible for addressing these challenges. Here, we describe the ethical and regulatory aspects of RWD sources, the role of the Data Protection Authorities and the Data Protection External Authority Board (DP-EAB) of the Uncover project, and the documentation involved, including a data processing agreement and a data transfer agreement. We provide an overview of the main principles for sharing RWD whilst maintaining integrity and security and how this translates into procedures to protect the rights, security, and well-being of human research participants. This represents a practical framework for researchers.

Key messages:

- Sharing RWDs presents new practical and ethical challenges for research where large-scale datasets from heterogeneous sources across multiple jurisdictions must be arranged in a structured manner.
- Using the Uncover project framework, heterogeneous data can be shared and harmonized in a standard manner. This framework can be used in future RWD projects to generate real-world evidence.

Abstract citation ID: ckac130.061
Applicability of European legislation for the protection of data while using tracing applications

Petra Mullerova

P Mullerova[1]
[1]Faculty of Law, Lund University, Lund, Sweden
Contact: petra.mullerova@jur.lu.se

Background:

Since the beginning of the COVID pandemic, Member States have started using tracing applications. The European Commission immediately confirmed the possibility of collecting personal data without the obligation to obtain the citizens' consent. Aware of the threat of data breach, the Commission has tried to remedy the situation and has given up the recommendation followed by a guide on how to use the tracing applications.

Methods:

In order to achieve the determination of the applicable European legislation, we used the doctrinal method in combination with the quantitative empirical research in the area of comparison of individual tracing applications.

Results:

The geolocal applications are regulated by GDPR. Based on Article 6 (1) GDPR, Commission confirmed the possibility to restrict the citizens' privacy. The Commission drew the attention to the collection of personal data based on the exception of "public interest" without necessity of the citizens' consent. In combination with Article 23, the Member states may restrict the lawful processing of data by legislative measure for protection of "public health". The applications using Bluetooth exposure notification system (ENS) do not operate with personal data. Thus, these are in general out of scope GDPR and regulated by the Directive on privacy and electronic communications. Article 15 of the Directive allows processing of communication without citizens' consent for the reasons listed in paragraph 1, which did not include "public health", therefore the applications cannot be use without citizen's consent.

Conclusions:

The use of applications with geolocation allows Member states to process personal data without guarantees in order to protect public health. This approach is unacceptable in relation to the right to privacy. If a situation like the covid pandemic occurs again, exclusively applications with ENS should be used. The use of these applications, even in times of pandemic, is conditioned by the citizens' consent.

Key messages:

- The project is expected to define applicable European legislation for using tracing applications and thus contributing to their safe use in the future with the least impact on citizens' rights.
- The use of geolocal applications without legal proceeding of sensitive data contributed in 2020 to an increase of data breach up to 68%, thus it is necessary to adhere to the principles set by GDPR.

Contact: feyzamuz@gmail.com

Background:

Being ignored, one of the most common problems among young people, can occur not only in face-to-face communication but also through social media communication tools over the internet and is called cyberostracism (CO). The effects of cyberostracism on people are at least as effective as in real social life and can cause a wide variety of affective disorders. It is thought that the family, environmental factors and the individual's own personality traits effectively control such negative emotions. This study aims to evaluate the CO level and personality types of students who have just started university in Turkey.

Methods:

This cross-sectional study was conducted in 2021 spring semester and 3148 students in the first year of their university in Turkey constituted the study group. To evaluate the CO levels of the students, CO Scale (min-max score 14-70) and to evaluate the personality type, Ten Item-Personality Inventory (TIPI) was used. The questionnaire prepared in accordance with literature was filled out online by the students. Mann Whitney U, Kruskal Wallis analyses and Multiple Linear Regression was used.

Results:

In the study, 1847 (62.5%) were female and the mean age was 19.9±1.8 years. The mean score obtained from the CO scale was 21.1±8.1; 41.8% of the participants had the Agreeableness personality type. Male gender, extended family, not good at face-to-face communication with friends, creating a membership by hiding their identity in social media and being ignored in social media were predictive for CO (F: 69.176, R2: 0.172, $p < 0.001$) was shown in multiple linear regression.

Conclusions:

Distance education programs during the pandemic period have limited the face-to-face communication of young people, causing them to spend more time in cyberspace. Personality type has been an important factor affecting the level of cyberostracism by determining our behaviour when exposed to difficult life events.

Key messages:

- Young people exposed to cyberostracism, may enter dangerous environments and groups that they think will be easily accepted in their real lives.
- It is thought that young people should be guided to use social media more consciously in the future in order to prevent cyberostracism.

Abstract citation ID: ckac130.063
Digital Health Literacy and Infodemic: the impact on Italian medical students between 2019-2020

Valentina Moretti

V Moretti[1], *L Arnoldo*[1,2], *G Valdi*[1], *A Conte*[3], *M Masoni*[4], *MR Guelfi*[4], *F Anelli*[5], *L Brunelli*[1,2]
[1]Department of Medicine, University of Udine, Udine, Italy
[2]Quality and Risk Management Unit, Friuli Centrale Healthcare and University Trust, Udine, Italy
[3]Medical Directorate, Friuli Centrale Healthcare and University Trust, Udine, Italy
[4]Department of Medicine, University of Firenze, Firenze, Italy
[5]FNOMCEO, Italian Federation of Medical Professional Associations, Rome, Italy
Contact: moretti.valentina001@spes.uniud.it

Background:

The COVID-19 infodemic is putting pressure on public health systems to control the pandemic. With the internet and social media playing a key role in emergency communication, digital health literacy (DHL) can be considered a determinant of health. This study aims to assess the impact of infodemic on the skills of medical students, for whom low levels of DHL may affect the ability to identify the best available medical evidence.

Methods:

A cross-sectional web-based survey was conducted at the University of Florence (Italy) in Apr-May 2019 (pre-pandemic period) and in Nov-Dec 2020 (pandemic period) to investigate DHL skills. Two different cohorts of students, both in their first year of medical school, participated in the survey. The 8-item self-assessment tool (IT-eHEALS) with a 5-point Likert scale was used to examine DHL. The change in perception of ability between the two cohorts was examined using the Wilcoxon test.

Results:

A total of 329 students participated in the survey in 2019 (F: 58.1%; mean age 20.6±2.1) and 341 in 2020 (F:61.9%; mean age 19.8±2.0). In 2019, participants' DHL level was moderate with a IT-eHEALS overall mean score (MS) of 28.4±5.8. Students had a good idea of how to find helpful health information (MS 3.9±0.8) and how to use the web for this purpose (MS 3.8±0.9), but they were less confident about the usefulness of the information they received (MS 2.9±1.1). In 2020, the medical students' DHL level deteriorated as the overall MS of IT-eHEALS decreased to 23.4±7.2 ($p < 0.01$). The scores of the IT-eHEALS items were significantly lower and students indicated that they found it difficult to assess the information they found (MS 2.4±1.1; $p < 0.01$).

Conclusions:

DHL can contrast infodemic, but the latter in turn may have a negative impact on perceived DHL skills if personal knowledge base is not well structured. Training programmes for medical students as future health care providers should be reinforces to guide their practise.

Key messages:

- Assessing digital health literacy is the first step in directing public efforts towards empowering educational programmes to improve health literacy.
- Medical students, as future health professionals, should be able to use the best evidence to help their patients identify healthy beliefs and behaviours to manage in health emergencies.

Abstract citation ID: ckac130.064
Evaluation of Telemedicine awareness, knowledge, attitude, skill levels of physicians and students

Aysegul Mutlu

A Mutlu[1], A Kilinc[1], L Ozcan[1], M Tepetas[1], S Metintas[1], MF Onsuz[1]
[1]Department of Public Health, Osmangazi University Faculty of Medicine, Eskisehir, Turkey
Contact: ayse0gul090@gmail.com

Background:
The increase in the use of information and communication technologies around the world brings about developments and changes in the provision of health services. It is accepted that telemedicine applications will facilitate health services for patients and health personnel. This study aimed to evaluate the telemedicine awareness, knowledge, attitude and skill levels of physicians and medical school students.

Methods:
This cross-sectional study was conducted between July and August 2021. A questionnaire form was prepared using the relevant literature then filled online by the participants. Telemedicine Awareness, Knowledge, Attitudes and Skills Questionnaire was used in the research. The universe of the research consisted of medical faculty students and physicians across Turkey. In the study, 933 people were reached by using the purposeful snowball sampling method, one of the non-probability sampling methods. Mann Whitney-U test, Kruskal Wallis test, Spearman correlation analysis and Multiple Linear Regression analysis were used.

Results:
Of the participants, 442 (47.4%) were female, 497 (53.3%) were medical students, and 436 (46.7%) were physicians. Their ages ranged from 18 to 59, with a mean of 28.0±8.8 years. The median (min-max) scores obtained from the Telemedicine Awareness (TA) sub-section were 18(0-24), 51.3% of them had scores above the median score. TA sub-section had a moderate positive correlation ($r = 0.559$, $p < 0.001$) with knowledge sub-section and a weak positive correlation ($r = 0.208$, $p < 0.001$) with skill level sub-section. TA scores were higher among men, physicians and those who want to participate in a telemedicine training program. TA increased as the level of computer and internet knowledge increased ($F = 29.171$, $R2 = 0.197$, $p < 0.001$).

Conclusions:
It can be said that TA is at a moderate level among medical students and physicians in Turkey. TA increased as the level of computer and internet knowledge, telemedicine knowledge and skills increased.

Key messages:
- It may be beneficial to add telemedicine education to the medical school curriculum.
- For physicians in working life, it is recommended to include telemedicine applications in the scope of continuing medical education.

Remote patient monitoring at home using ambient sensors: a systematic review

Ahmed Alboksmaty

A Alboksmaty[1,2,3], N Solomons[2], S Gul[2], AL Neves[2,3], P Aylin[1,2,3]
[1]Department of Primary Care and Public Health, Imperial College London, London, UK
[2]School of Public Health, Imperial College London, London, UK
[3]PSTRC, Imperial College London, London, UK
Contact: ama1716@ic.ac.uk

Background:
The world population is ageing, and their health needs imply substantial demands on health systems. Remote Patient Monitoring (RPM) may help elderly patients live independently in their homes for longer. The essence of RPM is the continuity of use, which is challenging for wearable devices and patient-led technologies. Unobtrusive (ambient) sensors could be an innovative solution, such as motion detectors and similar technologies. This study aims to review the evidence on the effect of ambient sensors on healthcare use by the elderly.

Methods:
This is a systematic review for narrative synthesis, searching five databases, Medline, Embase, CINHAL, Scopus and Web of Science, on 21 Feb 2022 without setting a lower time limit. No restrictions on the design of studies were applied. A meta-analysis was not feasible due to the heterogenicity of the studies.

Results:
Out of 5,653 search results, 180 studies were subjected to full-text review, of which 6 studies were included in the final synthesis. All the included studies were conducted in the USA. Four studies assessed the technology's cost-efficiency, while only one reported significant cost savings. One study reported a significant reduction in hospital days and visits to a physician among the users. Using ambient sensors was associated with an increased length of stay in facilities where the elderly can live independently, including at home. The impact on the number of hospitalisations or emergency room visits was unclear.

Conclusions:
Our review identified limited evidence on the effect of ambient sensors on healthcare use by the elderly. The potential has been demonstrated for ambient sensor technologies to result in cost savings; however, further research is needed to assess the impact on health outcomes.

Key messages:
- Ambient sensors can be effectively used to remotely monitor the health of eldelry people at home.
- Further research is needed to assess the cost effectiveness of using ambient sensor technologies in remote patient monitoring.

[3]Respiratory Physiology Laboratory, University of Cyprus Medical School, Nicosia, Cyprus
[4]Department of Epidemiology, School of Public Health, Harvard University, Boston, MA, USA
[5]Department of Nursing, Cyprus University of Technology, Limassol, Cyprus
[6]Department of Environmental Health, School of Public Health, Harvard University, Boston, MA, USA
Contact: achilleos.s@unic.ac.cy

Background:
Desert dust storms (DDS) impact the Mediterranean basin heavily, particularly in the context of climate change, reduced

precipitation and increasing desertification. There is a pressing need to develop policies protecting EU citizens' health from DDS. While Public Health authorities in affected regions commonly issue warnings, the effectiveness of recommendations to reduce exposure has not been documented.

Methods:

This work is part of the wider "MEDEA" intervention studies, co-funded by LIFE 2016 Programme. Among other outcomes, the studies examined the effectiveness of an indoor exposure-reduction intervention (i.e., decrease home ventilation and use of air cleaners) across homes of asthmatic schoolchildren and individuals with atrial fibrillation in Cyprus. Participants were randomized to either a control or indoor intervention group. The assessment took place in a sample of participants' homes, during 2019 and 2021, with the collection of indoor and outdoor PM10 and PM2.5 samples, which were analyzed for mass and elemental concentrations.

Results:

Indoor PM2.5 and PM10 mass and elements concentrations were significantly lower in the indoor intervention group compared to the control group, both during days with no dust (e.g., 55% and 48% reduction for PM2.5 and PM10, respectively) and days with desert dust (PM2.5: 47% and PM10: 40% reduction). In addition, the infiltration of PM2.5 and PM10 particles from the outdoor to the indoor air was significantly lower in the intervention vs. the control group (PM2.5: -55%, 95% CI: -42%, -65%; PM10: -41%, 95% CI: -61%, -12%).

Conclusions:

The study assessed a realistic exposure-reduction strategy and provided first-time evidence that closing doors and windows along with air cleaners can reduce indoor exposure to DDS particles. This evidence can further inform decision-making and strategic planning for population-level mitigation of DDS health effects in Mediterranean Europe.

Key messages:

- Decreasing home ventilation and use of air cleaners during DDS can reduce indoor particle mass concentrations by up to 50%, and infiltration of particles from outdoor environments by up to 60%.
- Demonstration of the effectiveness of a sustainable exposure-reduction intervention can contribute towards the adaptation of the population to the effects of climate change.

Abstract citation ID: ckac130.067
The impact on ambient air pollution and asthma-related admissions of COVID-19 transport restrictions

Caitriona Kelly

C Kelly[1], P Kenny[2], M O'Dwyer[2], KI Quintyne[1,3]
[1]Department of Public Health, North East, HSE, Kells, Ireland
[2]National Ambient Air Quality Unit, EPA, Dublin, Ireland
[3]School of Public Health, UCC, Cork, Ireland
Contact: caitriona.kelly@ucdconnect.ie

Exposure to air pollution is a known risk factor for asthma exacerbations, emergency attendances and hospitalisations. In Europe, the main source of air pollution is the transport industry, and so the COVID-19 transport restrictions provided an opportunity to examine if reduction in traffic had a demonstrable impact on ambient air quality and asthma-related admissions. Routinely collected data was used to conduct a retrospective population cohort study. The Environmental Protection Agency provided daily nitrogen dioxide (NO2) and particulate matter (PM) concentrations for Dublin, and all asthma-related admissions were collected from the Hospital In-Patient Enquiry system. The two years prior to the pandemic were compared with the period of transport restrictions (from March 2020). During the period of restrictions, there was a significant reduction in the mean number of daily asthma admissions (2.8 v 4.5 admissions $p < 0.001$). There was also a significant decrease in mean daily concentrations in two pollutants: NO2 (16.7 v 24.0µg/m3 $p < 0.001$) and PM2.5 (7.8 v 8.9µg/m3 $p = 0.002$). Only NO2 had a statistically significant correlation with asthma admissions ($r = 0.132$ $p < 0.001$). Transport restrictions introduced to mitigate against COVID-19 led to improvements in air quality, as seen by the reductions in pollutant concentrations. Previously described associations between pollutants and asthma, would suggest that these improvements in air quality contributed to the reduction in asthma admissions. Whereas the primary source of NO2 is transport emissions, PM is made up of particles from multiple sources, which likely explains the lack of correlation between asthma admissions and PM. Public Health need to advocate for transport policies which can improve air quality, and as a result, public health.

Key messages:

- Poor air quality poses a significant health challenge requiring public health input and advocacy.
- Reducing vehicle traffic can improve air quality which would have a positive impact on public health.

Abstract citation ID: ckac130.068
Medical studentś needs for an integration of climate change into the medical curriculum

Leonie Rybol

L Rybol[1], D Amelung[1], J Nieder[1], H Hachad[2], A Depoux[3], R Sauerborn[1], A Herrmann[1]
[1]Medical Faculty, Heidelberg Institute of Global Health, Heidelberg, Germany
[2]Medical Faculty, Sorbonne University, Paris, France
[3]Centre Virchow-Villermé of Public Health, University of Paris Cité, Paris, France
Contact: leonie.rybol@gmx.net

Background:

The impacts of climate change (CC) on health comprise increased human morbidity and mortality. Consequently, physicians need to be systematically trained to address CC in their professional life. Due to lacking research on educational needs of medical students, we developed a survey instrument to assess studentś attitudinal and knowledge-based needs for the integration of CC into medical curricula and their readiness to learn.

Methods:

Our survey was administered online to 788 students at the Medical Faculty of Heidelberg University between 06/2021 and 02/2022. Data analyses included descriptive statistics, reliability analyses as well as regression modeling with regard to readiness to learn.

Results:

214 students participated in the survey, 170 fully completed datasets were included in the analysis. A majority of students (72.35%) (strongly) agreed that doctors carry a responsibility to address CC in their work setting, while only 4.71% (strongly) agreed, that their current medical training had imparted them with enough skill to do so. Students showed both considerable knowledge and interest in the area of CC, its health impacts, vulnerabilities and clinical adaptation (70.09% correct answers). Knowledge gaps were identified in the areas of health co-benefits and sustainable healthcare (55.53% and 16.71% of correct answers). 79.42% of students want to learn about CC through the integration into existing mandatory courses.

Conclusions:

Results encourage the integration of CC topics with a focus on knowledge and professional role development into existing mandatory courses of the medical curriculum. Specifically, they also pinpoint health impacts and adaptation as greatest areas of interest for students and at health co-benefits and sustainable healthcare as areas with least prior knowledge.

Key messages:

- Heidelberg medical students want to learn about CC in their curricula.
- They have decent knowledge about CC and health but knowledge deficits in the topic areas of health co-benefits and green health sector.

Abstract citation ID: ckac130.069
Climate-sensitive health counselling: a quantitative survey on addressing climate change

Nicola Krippl

N Krippl[1], NCS Mezger[2], H Fischer[3], J Schildmann[4], R Mikolajczyk[2], I Danquah[1], EJ Kantelhardt[2], A Herrmann[1]
[1]Institute for Global Health, University of Heidelberg, Heidelberg, Germany
[2]IMEBI, University of Halle-Wittenberg, Haale (Saale), Germany
[3]Perception and Action lab, Leibniz-Institut für Wissensmedien, Tübingen, Germany
[4]Institute for History and Ethics of Medicine, University of Halle-Wittenberg, Haale (Saale), Germany
Contact: krippl@stud.uni-heidelberg.de

Background:
Climate change and its mitigation have significant health implications. Hence, medical associations call on physicians to inform the population about health risks of climate change and possible health co-benefits of climate action. However, so far it is unclear what preferences the general public has about climate-sensitive health counselling (CSHC). Therefore, we developed a survey tool to a) characterize experiences of CSHC, b) identify preferences about communication methods and themes, and c) determine associations of socioeconomic characteristics and climate change attitudes with CSHC preferences.

Methods:
The tool development for this cross-sectional online-based survey was embedded in a bigger research project on the conceptualization of CSHC, which follows an exploratory mixed-methods design. Results of preceding qualitative interviews about CSHC were integrated into the tool development. After two pilot tests, the tool was administered from April to June 2022 through the population-based HeReCa panel (Health Related Beliefs and Health Care Experiences in Germany), comprising 3200 participants from 5 federal states. Sociodemographic data is available for all participants.

Results:
The final tool entails 46 items, sorted into 7 sections. Two sections serve as dependent variables for the association analysis: 13 items about the acceptability of different communicative approaches of CSHC and 18 items on preferences for themes in CSHC. Three sections serve as independent variables for the analysis: attitudes on climate change, level of engagement, and sociodemographic data. Two sections assess experiences with CSHC and preferred information channels to serve as descriptive results.

Conclusions:
A rigorous methodology proved helpful for survey development within a mixed methods study. In triangulation with qualitative data, results of the survey will help physicians to deliver CSHC tailored to the preferences of different sociodemographic groups.

Key messages:

- We developed a survey tool to measure the general public's preferences regarding climate-sensitive health counselling (CSHC) of physicians.
- Our study will provide guidance for physicians on how to offer CSHC to specific patient subgroups based on socioeconomic characteristics and attitudes towards climate change.

Abstract citation ID: ckac130.070
The role of public health services in implementing heat health action plans in Germany

Karin Geffert

K Geffert[1,2,3], E Rehfuess[1,2], B Rechel[3]
[1]Public Health and Health Services Research, Ludwig-Maximilians-Universität, Munich, Germany
[2]Pettenkofer School of Public Health, Ludwig-Maximilians-Universität, Munich, Germany
[3]European Observatory, LSHTM, London, UK
Contact: karin.geffert@gmail.com

Background:
The rise in extreme heat periods is a major public health challenge of climate change and the World Health Organization therefore recommends the implementation of heat health action plans (HHAPs). In Germany, HHAPs are not implemented in a comprehensive manner nor nationwide. Public health authorities have been identified as key actors with regards to heat and health. This study aims at assessing the role of public health services in the implementation of HHAPs in Germany.

Methods:
First, a review of the scientific and grey literature on the role of public health services in heat adaptation in Europe was conducted. Second, a policy document analysis of the legislation of Germany's federal states for public health services and their potential role in the implementation of HHAPs was carried out. Finally, semi-structured interviews with selected experts from multiple sectors at the local, federal and national level on their perception of the role of public health services in the implementation of HHAPs in Germany were undertaken.

Results:
Preliminary findings show that the legal framework for public health services in the different federal states addresses environmental health and civil protection to varying extents, but that climate change-specific health risks are barely mentioned. The expert interviews revealed perceived barriers for the public health services to implement HHAPs, notably with regards to personnel (e.g. competencies, time), organizational structures (e.g. financial resources, administrative structures, legal mandates) and competing other tasks (e.g. COVID-19 response). Facilitators included motivated individuals, funding opportunities for cross-sectoral collaboration and political support.

Conclusions:
The role of public health services in HHAP implementation in Germany varies widely between the different geographic settings and is influenced by several factors at the individual, organizational and political level.

Key messages:

- Public health services can play an important role in heat adaptation, for example through coordinating the implementation of heat health action plans.
- Strong legal frameworks, sufficient organizational structures and well-trained personnel are important preconditions for an effective response by public health services to climate change challenges.

Abstract citation ID: ckac130.071
CO2 production in waste management during the COVID pandemic in an Italian hospital

Mattia Di Russo

M Di Russo[1,2], A Heidar Alizadeh[1,2], G Santoli[1,2], C Castagna[1,2], M Nurchis[1,2,4], A Rosano[3], C Cadeddu[1,2]

[2]Italian Institute for Planetary Health, Rome, Italy
[3]National Institute for Public Policy Analysis, Rome, Italy
[4]Department of Woman and Child Health and Public Health, Catholic University of Sacred Heart, Rome, Italy
Contact: mattia.dirusso88@gmail.com

Background:

Personal protection equipment (PPE) use in hospitals has consistently increased due to the Sars-Cov-2 outbreak, in wards repurposed for Covid-19 patients and wards that kept their usual activity. This increase influenced an environmental emergency in terms of health waste (HW) disposal. This study aims to assess the economic and environmental impact of the increase in HW generated before and during the pandemic in an Italian Hospital.

Methods:

Data from 2016 to 2019 and 2020 to 2021 was retrieved from Risk Management department. Per capita and per days-of-stay waste quantity were calculated for the hospital inpatient wards and medical service areas (anatomical pathology, laboratories, radiology, nuclear medicine). Linear regression models assessed the epidemiological impact of COVID, and LOESS analysis modeled the relationship between infectious HW generation and the percentage of COVID-related inpatient days. Average weight of HW per patient was used to estimate the monetary value of CO2 produced.

Results:

Preliminary results show that the inpatient days related to COVID nonlinearly influenced the infectious HW generated by wards. PPE usage increased in every context, and the proportion of COVID-related bed-days ranged from 2% to 12% in low-incidence months to 17% to 31% during acute phases. Pre-COVID CO2 production weighted 487 kg per patient and cost 1705€ per-capita, whereas during the pandemic it amounted to 768 kg per patient and cost 2688€ per capita which resulted in a significant increase of 983€ per patient.

Conclusions:

In light of the results, HW disposal is an urgent issue that should be addressed by policy makers when implementing new monitoring systems for hospitals. A more adequate disposal of HW could substantially contribute in reducing air pollution and concurrently reduce the economic impact health systems due to the coronavirus pandemic.

Key messages:

- The COVID-19 pandemic has brought an increase in hospital waste generation.
- The improvement of HW disposal monitoring system should be considered to avoid reaching critical levels in the near future.

Abstract citation ID: ckac130.072
Burned area mapping using satellite data – a tool for monitoring effects on environment

Monica Laura Cara

ML Cara[1], A Becheru[2,3], L Nicola[3], C Cara[3], IM Prejbeanu[4]
[1]Public Health, University of Medicine and Pharmacy, Craiova, Romania
[2]Computers & Information Technolgy, University of Craiova, Craiova, Romania
[3]Software Solutions for Applied Science, CS GROUP - ROMANIA, Craiova, Romania
[4]Department of Hygiene, University of Medicine and Pharmacy, Craiova, Romania
Contact: daimoniquelle@yahoo.com

Background:

Significant crop residue burning not only negatively affects local communities but is becoming an important public health issue for global climate change mitigation efforts. This practice is linked with air quality impairment, water contamination, soil degradation, fauna destruction. Chronic exposure to a high level of air pollution may cause permanent health injuries such as the development of lung diseases. The intentional burning of crop residues is a well-known practice across Romania even it is restricted by law.

Methods:

We propose a generic software model capable of detecting burned areas based on a time series of multi-spectral optical images together with a multi-step algorithm that uses a pre-trained Gaussian Naive-Bayes classifier to map burned crop fields, named BCMA (Burned Crop Mapping Algorithm), using Copernicus Sentinel-2 acquisitions. BCMA can be trained and extended to recognize other user-defined burned areas and it can be used to produce burned crop fields maps at a global scale in near-real-time at high resolution. We focused on two restrained geographical areas where burned areas were signalized in local press as massive burning vegetation events.

Results:

We provide burned area maps generated with an implementation of BCMA over two sites in Romania: Ostroveni - Dolj county and Domogled - Mehedinti county, based on acquisitions from July 2020.

Conclusions:

This model provides a fast and reliable tool for detection of burned areas regardless of the landscape and vegetation that could help stakeholders to react and make a proper intervention. Our study highlights the meaningful implications of using this tool to track crop fields burning and to organize large scale awareness campaigns around sustainable crop residues management with positive impact on environment, human health, and agriculture. Further government agencies' positions regarding using satellite monitoring of burning vegetables might be crucial.

Key messages:

- Satellite imagery is a valuable source of information for environment monitoring.
- More strategies are need to bring health and environment sustainability to the center of the climate change and to deliver information to the policy makers.

Abstract citation ID: ckac130.073
Scientific clues on global food (in)security and climate change relationship as drivers of health

Dilek Aslan

D Aslan[1]
[1]Department of Public Health, Hacettepe University Faculty of Medicine, Sihhiye-Ankara, Turkey
Contact: diaslan.dr@gmail.com

Issue:

Food insecurity is in close relationship with the determinants of health. Global crisis including climate change (CC), natural disasters, poverty can deepen the burden, and all are linked with the economic, social, commercial, structural determinants of health. Defining such connections may help in proposing practical solutions.

Description of the problem:

COVID-19 pandemic made the food security (FS) problem more visible. Food security considers basically the affordability, availability, and the quality of food. Food insecurity (FiS), violation of the right to healthy food, influences disease patterns and causes communicable and non-communicable diseases (NCDs). Globally, 71% of deaths are attributed to NCDs. Analyzing the relationship between FiS and other determinants of health like CC may be helpful for sustainable solutions in such a world where we are talking on "our planet, our health" motto. Example given in this study is the relationship between the country values/rankings of the "Global Food Security Index (GFSI)" and the "Climate Change Performance Index (CCPI)". GFSI defines the FS situation and CCPI defines countries' response to CC.

Results:

Countries' CCPI and GFSI values do not show a linear relationship. For example, Norway, as a country at the top of the Human Development Index (HDI) ranking list has both high CCPI and GFSI values. On the other hand, although USA and Canada have low CCPI, both have good GFSI values. Sub dimensions of the indicators may also vary across countries.

Crisis like COVID-19, conflicts, poverty emphasize the need on improving the indicators in a transdisciplinary approach.

Lessons:

Investigating indicators taking the determinants of health into account is helpful. However, different characteristics of the countries make it difficult to propose a standard approach to overcome the problems. Developing ''new'' indicators with transdisciplinary work might be useful in this sense.

Key messages:

- Food (in)security and climate change have ''complex'' interactions.
- Transdisciplinary approach may facilitate proposing realistic solutions.

Abstract citation ID: ckac130.074

Environmental Health Literacy: an index to study its relations with pro-environmental behaviors

Annalaura Carducci

A Carducci[1], M Fiore[2], C Lorini[3], I Federigi[1], M Verani[1], M Ferrante[2], G Bonaccorsi[3]
[1]Department of Biology, University of Pisa, Pisa, Italy
[2]Department of Medical, Surgical Sciences and Advanced Technologies ''G., University of Catania, Catania, Italy
[3]Department of Health Sciences, University of Florence, Florence, Italy
Contact: annalaura.carducci@unipi.it

The citizen' awareness about environmental health risks has been identified as an important determinant of citizens' choices for the adoption of pro-environmental behaviors, but for its study simple measures to be applied in population studies are still lacking. The Environmental Health Literacy (EHL), is a recent sub-cathegory of health literacy, including functional, critical and interactive dimensions, that can be applied in surveys on environmental health risk perception and behaviors. The aim of our study was to elaborate and validate an EHL Index (ELHI) using data from a large multicenter survey carried out among 4778 students of different disciplines in 15 Italian Universities, with a self-administered anonymous questionnaire investigating risk perceptions, attitudes and behaviors towards environmental health risks and including a simple Functional Health Literacy test (FHL). From the original questionnaire of 56 items three sets of questions were selected to represent the three dimensions of health literacy (Functional, Critical or Interactive) and their outcomes were compared with the answers about FHL test and pro-environmental behaviors. The Principal Component Analysis was used to select the most representative questions that were then grouped in the EHLI. The index was significantly associated with both FHL test and behaviors questions. The ROC curve indicated a satisfying accuracy and was used to identify the best cut-off for ELHI. In conclusion the constructed ELHI can be considered reliable and useful for further population surveys in similar target people to plan communication interventions about environmental health risks and their prevention through individual choices.

Key messages:

- An Environmental Health Literacy Index is proposed as simple measure to be used in population surveys.
- This measure resulted associated with behaviors and can be considered accurate and reliable.

Abstract citation ID: ckac130.075

Results of a Qualitative Study on Disaster Nursing in a Coastal Region of Lower Saxony/Germany

Frauke Koppelin

The increase in heavy rainfall in recent years shows the need to consider disaster preparedness also for persons in need of assistance and care who are cared for at home or in old people's and nursing homes. Evacuation concepts in the event of a heavy rainfall event lasting several days with simultaneous power failure are hardly available for the vulnerable group so far. As part of the LifeGRID project funded by the Federal Ministry of Education and Research, the question is being investigated as to what regional challenges and requirements arise in the event of flooding and a prolonged power blackout in the Wesermarsch district. In addition, the question will be addressed as to how the current care situation of patients referred to electricity presents itself in such a situation. Within the framework of a qualitative design, expert interviews were conducted with care service managers in winter 2022. The four guided interviews were transcribed and their content analysed. In coping with the assumed catastrophic events, the interviewees see problem areas in the organisation, communication, form of care and target group, in addition to the regional characteristics. It became clear that there are not only unanswered questions regarding responsibilities in the event of a crisis, but also that the diversity of forms of care (e.g. private households) poses a particular challenge. The interviewees do not see any viable alternatives to secure communication in the event of a power failure and also see that respiratory patients, for example, have a special need for care (e.g. due to the limited battery life of the respiratory equipment). The results also show that the nursing experts have different views on how they should prepare for such a scenario. These range from passivity to proactivity. A clear need for action becomes visible for cooperation and networking of the relevant actors, promotion of disaster literacy as well as the necessity to adapt the training curricula.

Key messages:

- Climate change is exacerbating the demands for concepts that sustainably contribute to increasing disaster literacy. The results of the study underline this.
- Patients receiving outpatient care and residents of nursing homes for the elderly who depend on a continuous power supply have not yet been the focus of disaster management.

4.S. Epidemiology: socioeconomic risk factors

Trends of socioeconomic inequalities in overweight and obesity in children and adolescents in Germany

Jens Hoebel

J Hoebel[1], J Waldhauer[1], M Blume[1], A Schienkiewitz[2]
[1]Unit of Social Determinants of Health, Robert Koch Institute, Berlin, Germany
[2]Unit of Health Behaviour, Robert Koch Institute, Berlin, Germany
Contact: j.hoebel@rki.de

Background:

Overweight and obesity in early life are risk factors for chronic health conditions in the later life course. Children and adolescents from socioeconomically disadvantaged families are more likely to be overweight or obese than their better-off peers. This study examined post-millennial trends of socioeconomic inequalities in the prevalence of overweight and obesity among young people in Germany.

Methods:
Repeated cross-sectional data were used from the German health interview and examination survey for children and adolescents (KiGGS). Overweight and obesity were assessed by body mass index, based on measured height and weight of 3- to 17-year-old participants in KiGGS baseline (2003-06) and KiGGS wave 2 (2014-17). Socioeconomic position (SEP) was measured using a composite index of parental education, occupation and income. The regression-based slope index of inequality (SII) and relative index of inequality (RII) were calculated to estimate the extent of absolute and relative inequalities in the prevalence of overweight and obesity.

Results:
The overall prevalence of overweight and obesity among 3- to 17-year-olds in Germany did not change over time and was recently 15.4% and 5.9%, respectively. In both survey waves, overweight and obesity were more prevalent in lower SEP-groups. From 2003-06 to 2014-17, overweight increased in the low-SES group, whereas it tended to decrease in those with higher SES. This trend was concomitant with increasing socioeconomic inequalities in overweight over the observation period (SII from 0.11 to 0.19, $p = 0.054$; RII from 2.1 to 3.7, $p = 0.021$). No such trend was found for obesity.

Conclusions:
Socioeconomic inequalities in overweight have widened among the young in Germany since the early 2000s. Structural interventions that are effective in preventing and reducing overweight in young people from socially disadvantaged backgrounds are still needed.

Key messages:

- Overweight increased among young people from socioeconomically disadvantaged families.
- Socioeconomic inequalities in overweight increased among children and adolescents.

Area-level socioeconomic deprivation, non-national residency, and Covid-19 incidence

Sven Rohleder

S Rohleder[1,2]*, D Costa*[1]*, K Bozorgmehr*[1,2]
[1]Department of General Practice and HSR, University Hospital Heidelberg, Heidelberg, Germany
[2]Department of Population Medicine and HSR, Bielefeld University, Bielefeld, Germany
Contact: sven.rohleder@med.uni-heidelberg.de

Introduction:
Socioeconomic conditions affect the dynamics of the COVID-19 pandemic. We analysed the association between area-level socioeconomic deprivation, proportion of non-nationals, and Covid-19 incidence in Germany.

Methods:
Using nationally representative data at the level of 401 German districts from three waves of infection (January-2020 to May-2021), we fitted Bayesian spatiotemporal models to assess the association between socioeconomic deprivation, proportion of non-nationals, and Covid-19 incidence, controlling for age, sex, vaccination coverage, settlement structure, spatial and temporal effects. We estimated risk ratios (RR) and corresponding 95% credible intervals (95%-CrI) for deprivation quintiles. We further examined the deprivation domains (education, income, occupation), interactions between deprivation, sex and the proportion of non-nationals, and explored potential pathways from deprivation to Covid-19 incidence.

Results:
Covid-19 incidence risk was 15% higher (RR = 1.15, 95%-CrI = 1.06-1.24) in areas with the highest deprivation quintile (Q5) compared to the least deprived areas (Q1). Medium-low (Q2), medium (Q3), and medium-high (Q4) deprived districts showed 5% (1.05, 0.98-1.13), 8% (1.08, 1.01-1.15), and 6% (1.00, 1.00-1.12) higher risk, respectively, compared to the least deprived. Districts with higher proportion of non-nationals showed higher risk compared to districts with lowest proportion, but the association weakened across the three waves. During the first wave, an inverse association was observed with highest risk in least deprived areas (Q1). Deprivation interacted with sex, but not credibly with the proportion of non-nationals.

Conclusions:
Socioeconomic deprivation and proportion of non-nationals are independently associated with Covid-19 incidence. Regional planning of non-pharmaceutical interventions and vaccination strategies would benefit from consideration of area-level deprivation and non-national residency.

Key messages:

- Area-level socioeconomic deprivation and proportion of non-nationals are independently associated with higher risk of Covid-19 incidence across 401 German districts.
- Tailored non-pharmaceutical interventions and immunisation strategies are needed, which properly consider area-level socioeconomic deprivation and non-national residents.

[5]Ontario Institute for Cancer Research, Toronto, Canada
[6]Psychology and Neuroscience, King's College London, London, UK
[7]SPECTRUM, London, UK
Contact: valerie.lohner@uk-koeln.de

Background:
Electronic cigarettes (e-cigarettes) are often advertised as a healthier option to combustible cigarettes and as smoking cessation aid. However, e-cigarettes are a growing health concern and their addictive potential remains to be fully understood. Within the EValuation of the Addictive Potential of E-cigarettes (EVAPE) project, we studied subjective and objective measures of addiction in relation to e-cigarette use.

Methods:
This cross-sectional analysis was based on 832 participants of the first wave (2016) of England from the ITC Four Country Smoking and Vaping (4CV) Survey, who were using e-cigarettes daily or weekly for at least four months. Perceived addiction to e-cigarettes was categorised as very vs. not/somewhat addicted, and perceived addictiveness of e-cigarettes relative to combustible cigarettes as equally/more addictive vs. less addictive. Objective measures of addiction included urge to vape, time to first vape after waking, frequency of use, and used nicotine strength. We examined associations between these objective and subjective measures of addiction using multivariate logistic regression, adjusted for age, gender, education, and cigarette smoking.

Results:
17.8% of participants reported feeling very addicted to e-cigarettes and 42.3% considered e-cigarettes equally/more addictive than combustible cigarettes. Those who felt very addicted had higher odds of regarding e-cigarettes as more addictive (OR 3.43 (95%-CI 2.29-5.19)). All objective measures of addiction were associated with higher perceived addiction, whereas only a shorter time to first vape was associated with perceived product addictiveness.

Conclusions:
Subjective measures of addiction to e-cigarettes, in particular perceived addiction, correspond with objective measures. Understanding the addictive potential of e-cigarettes is the

cornerstone for developing new strategies for prevention and treatment, and ultimately understanding their role from a public health perspective.

Key messages:

- Despite being promoted as healthier alternative to combustible cigarettes, electronic cigarettes are a growing health concern, also given their potential addictiveness.
- We found both subjective and objective indicators of addiction to be prevalent in a relevant proportion of electronic cigarette users, suggesting an addictive potential of electronic cigarettes.

Abstract citation ID: ckac130.079
Differences in labour market marginalisation among young immigrant groups and Swedish-born youth

Muhammad Ridwanul Amin

R Amin[1], G Geirsdottir[1], E Mittendorfer-Rutz[1], E Björkenstam[1], L Chen[1], T Dorner[1,2]
[1]Department of Clinical Neuroscience, Karolinska Institutet, Stockholm, Sweden
[2]Karl-Landsteiner Institute, Health Promotion Research, Vienna, Austria
Contact: ridwanul.amin@ki.se

Background:

There is a knowledge gap regarding the risk for labour market marginalisation among younger cohorts of refugees and non-refugee immigrants. We investigated if the risk of long-term unemployment (LTU) and disability pension (DP) differs between young refugees and non-refuge immigrants compared to the Swedish-born. The role of age at arrival, duration of residency and morbidity in this association was also investigated.

Methods:

All 19- to 25-year-olds residing in Sweden on 31 December 2004 (1691 refugees who were unaccompanied by a parent at arrival, 24,697 accompanied refugees, 18,762 non-refugee immigrants and 621,455 Swedish-born individuals) were followed from 2005 to 2016 regarding LTU (>180 days annually) and DP using nationwide register data. Cox regression models were used to estimate crude and multivariate-adjusted (adjusted for several socio-demographic, labour market and health-related covariates) hazard ratios (aHRs) with 95% confidence intervals.

Results:

Compared to the Swedish-born, all migrant groups had around a 1.8-fold higher risk of LTU (range aHR = 1.71-1.83) and around a 30% lower risk of DP (range aHR = 0.66-0.76). Older age at arrival was associated with a higher risk of LTU only for non-refugee immigrants. Both older age at arrival and a shorter duration of residency were associated with a lower risk of DP for all migrant groups. Psychiatric morbidity had the strongest effect on subsequent DP, with no significant differences between migrant groups and the Swedish-born (range aHR = 5.1-6.1).

Conclusions:

Young immigrants had a higher risk of LTU and a lower risk of DP than their Swedish-born peers. No differences between the different immigrant groups were found. Age at arrival, psychiatric morbidity and duration of residency are strong determinants of being granted DP.

Key messages:

- Young refugees and non-refugee immigrants both had a similar higher risk of long-term unemployment and a similar lower risk of disability pension than their Swedish-born peers.
- Age at arrival, psychiatric morbidity and duration of residency are strong determinants of being granted disability pension for young refugees and non-refugee immigrants in Sweden.

Abstract citation ID: ckac130.080
Effect of socio-economic deprivation on refugee health: a natural experiment study in Germany

Louise Biddle

L Biddle[1], K Bozorgmehr[1,2]
[1]Population Medicine and Health Services Research, University Bielefeld, Bielefeld, Germany
[2]Section Health Equity Studies & Migration, University Hospital Heidelberg, Heidelberg, Germany
Contact: louise.biddle@uni-bielefeld.de

Background:

Characteristics of the place of residence have been proposed as a key determinant of physical and mental health, but so far, little experimental evidence exists. The quasi-random dispersal of refugees in Germany serves as a natural experiment to study the causal relationship between socio-economic deprivation and health as well as the impact of the social context on this relationship.

Methods:

Refugees subject to dispersal policy (n = 1723) were selected from the nation-wide German IAB-SOEP-BAMF Panel from 2016 to 2018. The effect of German Index of Socioeconomic Deprivation quintiles (Q1-Q5) on change between baseline (t0) and follow-up (t1) in mental (mcs) and physical (pcs) health component scales of SF-12 were analysed using multi-level linear regression. Social context variables were included in a mediation analysis.

Results:

Across quintiles, mental health improves (Δmcs = 0.5) and physical health declines (Δpcs = -0.8) between t0 and t1. Fully adjusted models show a negative, dose-responsive relationship between deprivation and physical health, which is statistically significant for Q4 (coef. Q4vsQ1: -1.84, 95%CI: -3.50;-0.17). Models for mental health show an improvement in Q5 (coef. Q5vsQ1: 6.00, 95%CI: 1.70;10.31). Social context variables have no effect on physical health but slightly diminish the effect on mental health (coef. Q5vsQ1: 4.78, 95%CI: 0.65;8.90).

Conclusions:

The quasi-random dispersal of refugees in Germany acts as a natural experiment to disentangle selection effects from the relationship between deprivation and health. Results suggest a negative effect of deprivation on physical health and a potential positive effect on mental health which can be partially explained by the social context. Limitations are the small sample sizes in deprived quintiles and short follow-up periods. This analysis can act as a magnifying glass for similar effects among other population groups, but causal paths need to be investigated further.

Key messages:

- The quasi-random dispersal of refugees in Germany acts as a natural experiment to disentangle selection effects from the relationship between deprivation and health.
- Results from a natural experiment suggest a negative effect of deprivation on physical health and a potential positive effect on mental health which can be partially explained by the social context.

Risk behaviors among migrant adolescents in Italy

Emanuele Koumantakis

E Koumantakis[1,2], M Bersia[1,2], P Berchialla[3], L Charrier[1], RI Comoretto[1], A Borraccino[1], P Lemma[1], P Nardone[4], A Vieno[5], P Dalmasso[1]
[1]Department of Public Health and Pediatrics, University of Torino, Turin, Italy
[2]Post Graduate School of Medical Statistics, University of Torino, Turin, Italy
[3]Department of Clinical and Biological Science, University of Torino, Orbassano, Italy
[4]CNaPPS, Italian National Institute of Health, Rome, Italy
[5]Department of Developmental Social Psychology, University of Padova, Padua, Italy
Contact: emanuele.koumantakis@unito.it

Background:

Over the last decade, the student population migrated to Italy has quadrupled, but studies on their potentially harmful behaviors such as substance use are still scarce. The aim of this research is to monitor risk behaviors among migrant adolescents in Italy and provide appropriate indications for the definition of targeted policies and interventions.

Methods:

A representative sample of 15 year-old adolescents was drawn from the 2018 Italian Health Behavior in School-aged Children (HBSC) survey data. Smoking habits, alcohol consumption and drunkenness were investigated and differences with Italian peers were assessed.

Findings:

Results were based on more than 18,500 students, of which 16% were migrants: 32.7% from Western countries (We), 32.5% from Eastern European countries (Ee), and 34.8% from non-Western/non-European countries (nW). Compared with natives, students from nW countries showed a lower risk of smoking habits (OR: 0.72, 95%CI: 0.58-0.89) and weekly alcohol consumption (OR:0.57, 95%CI:0.43-0.75), whereas drunkenness was more prevalent among Ee migrants (OR: 1.42, 95%CI: 1.10-1.83). Overall, both migrant and Italian girls showed a lower risk of unhealthy behaviors than boys.

Conclusions:

Compared to the native counterparts, migrant adolescents showed differences in substance use according to their ethnic background. We observed two different immigration patterns: the Western immigrants, who came from countries with higher affluence and share similar risk behaviors with native peers, and non-Western immigrants, who came from less affluent countries and seemed to maintain the risk behaviors of their culture of origin.

Key messages:

- More in-depth studies that include specific information on migrant culture are needed to explain the observed differences in risk behaviors among young migrants.
- Our findings suggest that interventions aiming at smoking and/or drinking reduction should focus mainly on the male migrant adolescents.

Abstract citation ID: ckac130.082
Interaction between APOE ε4 genotype and education on mild cognitive impairment

Mirjam Frank

M Frank[1]*, J Hensel*[1]*, L Baak*[1]*, N Dragano*[2]*, C Weimar*[1,3]*, M Jokisch*[4]*, B Schmidt*[1]
[1]Institute for Medical Informatics, Biometry and Epidemiology, University of Duisburg-Essen, Essen, Germany
[2]Institute of Medical Sociology, University of Düsseldorf, Düsseldorf, Germany
[3]Center for NeuroRehabilitation, BDH-Clinic Elzach, Elzach, Germany
[4]Department of Neurology, University Hospital Essen, Essen, Germany
Contact: Mirjam.Frank@uk-essen.de

Introduction:

Studies have identified the apolipoprotein E (APOE) ε4 genotype to be a genetic risk factor for mild cognitive impairment (MCI) with environmental factors, such as education, modifying this genetic effect. The aim of this study was to investigate possible interaction of APOE ε4 status and educational attainment on MCI.

Methods:

Information on education, MCI and APOE status was available for 3,829 participants from the Heinz Nixdorf Recall study. Logistic regression models were fitted to estimate sex- and age-adjusted odds ratios (OR) and 95% confidence intervals (95%-CI) for education (<14 years vs. ≥14 years of education), APOE status (carrier vs. noncarrier) and the interaction between APOExeducation on multiplicative scale with MCI. To consider interaction on additive scale, the relative excess risk due to interaction (RERI) was calculated. The effect of APOE on MCI was additionally stratified by educational groups.

Results:

A higher chance of MCI was observed for reporting <14 years of education (OR: 1.37 [95%-CI: 1.11, 1.69]) and having a positive APOE ε4 status (OR: 1.27 [95%-CI: 1.04, 1.55]). Stratified analysis showed a stronger genetic effect of APOE ε4 status on MCI in participants with low education (OR: 1.42 [95%-CI: 1.12, 1.79)], compared to participants with higher education (OR: 1.00 [95%-CI: 0.67, 1.45)]. An indication for positive interaction between education and APOE ε4 status on MCI was found on additive scale (RERI: 0.52 [95%-CI: 0.01, 1.03]), no interaction on the multiplicative scale was observed.

Conclusions:

Results gave indication for positive interaction on the additive scale of APOE ε4 status and education, showing stronger genetic effects on MCI in groups of low education. Socioeconomically disadvantaged environments and health behaviors related to low educational attainment may be responsible for an altered APOE ε4 expression. Higher educated groups seem to be better equipped to reduce their genetic susceptibility for MCI.

Key messages:

- Gene-environment interaction seems to be present on the additive scale between education and APOE ε4 status on MCI .
- Socioeconomically disadvantaged environments and health behaviors related to low educational attainment may be responsible for an altered APOE ε4 expression on MCI.

Abstract citation ID: ckac130.083
Time period effects in work disability due to common mental disorders among young employees

Muhammad Ridwanul Amin

M Amin[1]*, E Mittendorfer-Rutz*[1]*, E Björkenstam*[1]*, M Virtanen*[1,2]*, M Helgesson*[1]*, N Gustafsson*[1]*, S Rahman*[1]
[1]Department of Clinical Neuroscience, Karolinska Institutet, Stockholm, Sweden
[2]School of Educational Sciences and Psychology, University of Eastern Finland, Joensuu, Finland
Contact: ridwanul.amin@ki.se

Background:

Previous research on period effects in risk for work disability due to common mental disorders across employment sectors and occupational classes in young employees is lacking. Temporal changes in the healthcare system or social insurance policies or other structural/organisational changes could contribute to such time period effects. We aimed to investigate time period effects in the risk of work disability, defined as long-term sickness absence (LTSA) and disability pension (DP) due to common mental disorders (CMDs), among young employees according to their employment sector (private/public) and occupational class (non-manual/manual).

Methods:

Three cohorts, including all employed individuals with complete information on employment sector and occupational class, aged 19-29 years and resident in Sweden on the 31-Dec-2004, 2009 and 2014 (n = 573,516, 665,138 and 600,889 individuals in cohort 2004, 2009 and 2014, respectively) were followed for four years. Crude and multivariate-adjusted hazard ratios (HRs and aHRs, respectively) with 95% confidence intervals (CIs) were estimated regarding the risk of LTSA and DP due to CMDs using Cox regression analyses.

Results:

In cohort 2004, public sector employees had a higher relative risk for LTSA due to CMDs than private sector employees (aHR, (95%CI): 1.24, 1.16-1.34 and 1.18, 1.11-1.26 among non-manual and manual workers). These associations were similar in the later cohorts. Compared to cohort 2004, the rate of DP due to CMDs was considerably lower in the later cohorts leading to uncertainties in the risk estimates limiting the comparability for time period effects regarding the risk of DP due to CMDs across employment sectors and occupational classes.

Conclusions:

Stricter regulation changes regarding the receipt of DP in Sweden, rather than other time period events, may have differentially affected the risk of work disability among young non-manual and manual employees working in the private and public sectors.

Key messages:

- Time period effects did not seem to influence the association of long-term sickness absence due to common mental disorders across employment sectors and occupational classes.
- The risk of disability pension due to common mental disorders by sector of employment and occupational class varied, to some extent, across the different time period cohorts.

Abstract citation ID: ckac130.084
Untangling the influence of depression on clinical risks: role of leukocytes and somatic symptoms

Alessandro Gialluisi

A Gialluisi[1,2], F Bracone[2], S Costanzo[2], A Di Castelnuovo[3], S Orlandi[2], A De Curtis[2], C Cerletti[2], MB Donati[2], G de Gaetano[2], L Iacoviello[1,2]
[1]Department of Medicine and Surgery, University of Insubria, Varese, Italy
[2]Department of Epidemiology and Prevention, IRCCS NEUROMED, Pozzilli, Italy
[3]Mediterranea Cardiocentro, Naples, Italy
Contact: alessandro.gialluisi@uninsubria.it

Background:

Depression has been associated with increased hospitalization and mortality risk, especially for cardiovascular causes. We previously found a composite circulating inflammation score (INFLA-score) to explain part of this link, although the role of its component and of depressive symptoms domains in this relationship is unexplored.

Methods:

In an Italian population cohort (N = 13,191; age$\geq$35 years; 51.7 % women; 4,856 hospitalizations and 471 deaths, median follow-up 7.28/8.24 years), we estimated the proportion of association explained by C-reactive protein levels (CRP), platelet count, granulocyte-to-lymphocyte ratio (GLR) and white blood cell counts (WBC), in multivariable Cox regressions modelling first hospitalization/mortality for all and cardiovascular (CVD), ischemic heart (IHD) and cerebrovascular disease (CeVD) causes vs depression severity based on an alternative validated version of PHQ-9. We also estimated the proportion of association explained by INFLA-score in the associations of polychoric factors tagging somatic and cognitive depressive symptoms with clinical risks.

Results:

In models adjusted for age, sex and education, significant proportions of the positive influence of depression on clinical risks were explained by CRP (4.8% on IHD hospitalizations), GLR (11% on all-cause mortality) and WBC (24% on IHD/CeVD hospitalizations). Stable associations of somatic but not of cognitive depressive symptoms were observed with increased hospitalization risk (+16% for all causes, +14% for CVD causes), with INFLA-score again explaining small but significant proportions of these associations (2.5% for all causes, 8.6% for IHD causes).

Conclusions:

These findings suggest a prominent explanatory role of leukocytes in the link between depression and clinical (especially CVD) risks, and highlight the importance of inflammation in the influence of somatic depressive symptoms. Therefore, acting on these factors may reduce clinical risks associated with depression.

Key messages:

- Inflammation – in particular leukocytes - plays a role in the link between depression and clinical risks.
- This effect is more pronounced for cardiovascular events and for somatic depressive symptoms.

Abstract citation ID: ckac130.085
Associations between early life transitions and depressed mood over time: A 27-year study

Magnus Jørgensen

M Jørgensen[1], ORF Smith[2,3], B Wold[1], E Haug[1]
[1]Department of Health Promotion and Development, University of Bergen, Bergen, Norway
[2]Department of Health Promotion, Norwegian Institute of Public Health, Bergen, Norway
[3]Department of Psychosocial Science, University of Bergen, Bergen, Norway
Contact: Magnus.Jorgensen@uib.no

Background:

Few studies have looked at how life transitions influence depressed mood from adolescence to adulthood and if parental socioeconomic status (SES) moderates these effects.

Study questions:

- Are early life transitions (leaving education, leaving the parental home, attaining employment, and beginning cohabitation) associated with the development of depressed mood?
- Does SES affect the exposure to depressed mood and moderate the impact of life transitions?

Methods:

We used latent growth modelling to analyze depressed mood in a Norwegian sample (n = 1257) surveyed at age 13, 14, 15, 16, 18, 19, 21, 23, 30 and 40 (1990-2017). The effects of life transitions were modelled as time-varying predictors. At age 30 and 40, attaining employment and beginning cohabitation were used as covariates while parenthood was controlled for from age 19. Time-invariant covariates were gender and SES.

Results:

Depressed mood peaked at age 15 and 18, but decreased over time - following a polynomic curve with a linear (B = -.38, 95% CI = [-.49, -.28], $p < .001$) and quadratic slope (B = .05, 95% CI = [.013, .086], $p < .001$). Leaving the parental home (B = -.166, 95% CI = [-.250, -.083], $p < .001$) and beginning cohabitation (B = -.130, 95% CI = [-.231, -.029], $p < .05$) led to decreases in depressed mood regardless of age of transition. Higher SES was associated with lower depressed mood at intercept compared to mid-SES (B = -.106, 95% CI = [-.295, -.030], $p < .05$) and low SES (B = -.202, 95% CI = [-.343, -.062], $p < .05$). Girls also reported a higher intercept level of depressed mood (B = .274, 95% CI = [.165, .383], $p < .001$). Life transitions were not moderated by SES.

Conclusions:

The study demonstrated that leaving the parental home and beginning cohabitation were associated with depressed mood, and SES showed no moderation. Public health initiatives should therefore pay attention to life transitions when aiming to lessen depressive symptoms from adolescent years to adulthood.

Key messages:

- Including life transitions can help better identify critical periods in developing depressed mood in the transition to adulthood.
- The often reported gender gap and social disparity in mental health was supported by the current study.

Abstract citation ID: ckac130.086
Mediation of behavioural and socioeconomic risk factors associated with malaria in children in Ghana

Theresa Habermann

T Habermann[1], E Lorenz[1,2,3], DI Puradiredja[1]
[1]Infectious Disease Epidemiology Department, Bernhard-Nocht-Institute for Tropical Medicine, Hamburg, Germany
[2]German Center for Infection Research, Hamburg-Borstel-Lübeck-Riems, Germany
[3]IMBEI, University Medical Centre of the JGU Mainz, Mainz, Germany
Contact: theresa.habermann@bnitm.de

Background and objectives:

Malaria remains a major global public health concern and a leading cause of morbidity and mortality especially among children <5 years in Ghana. While an association between poverty and malaria has long been recognised, evidence on the causal pathways between socioeconomic position (SEP) and malaria is scarce. Our study contributes to addressing this gap by investigating the association whilst taking mediation through potential behavioural and socioeconomic factors into account. This can help to identify more specific targets for interventions on a structural level.

Methods:

Using data of 3,004 children from the Malaria Indicator Survey of the Demographic and Health Surveys Program conducted in Ghana in 2019, a household wealth index (quintiles) was derived using principal component analysis based on household assets. Causal multiple mediation analyses investigated mediating effects of treatment-seeking, bed net (LLIN) use, educational attainment, and housing conditions on the association between socioeconomic position and children's malaria fever events.

Results:

Higher maternal educational attainment and housing conditions jointly mediate 18% of the association between socioeconomic position and malaria fever events (OR = 0.98; 95%CI = 0.96-0.99). Maternal educational attainment and seeking formal prenatal health care jointly mediate 20% of the total effect (OR = 0.98; 95%CI = 0.95-1.00), in presence of a lower socioeconomic position. No strong mediation was found for educational attainment jointly with the use of LLINs between malaria and socioeconomic position in this study (OR = 0.99; 95%CI = 0.97-1.01).

Conclusions:

As shown by the proportions mediated between malaria and socioeconomic position, findings suggest that current malaria control efforts could be strengthened by investments at the structural levels, such as increased (female) education, targeted improvements in housing, and stronger integration of informal health care.

Key messages:

- Mediation analysis highlights possible targets for structural malaria interventions, as educational improvements, housing and health care provider mediate up to 20% between SEP and malaria.
- Structural interventions should include improving housing conditions, quality education for women and the inclusion of informal health care provider for preventive actions against malaria.

Abstract citation ID: ckac130.087
Maternal care experience and postpartum depressive symptoms among migrant and native in Portugal

Cristina Teixeira

Background:

Migration is a risk factor for both, poor maternal experience with healthcare services (MEHCS) and postpartum depressive symptoms (PPDS), a matter of concern due to their adverse consequences. We aimed to assess the association between MEHCS and PPDS taking into account the migration status.

Methods:

This is part of a population-based study (baMBINO project), enrolling native (PT; n = 1568), permanent migrant (PM; n = 676) and temporary migrant (TM; n = 757) women recruited at delivery (2017-2019) in 32 Portuguese public hospitals. MEHCS was assessed based on 39 items of the Migrant Friendly Maternal Care Questionnaire asking about how women have experienced maternal care during pregnancy, during delivery and after birth. Items were grouped into 9 components each one assessing a different issue of MEHCS. For each component women were classified as having "good" or "less than good" experience. PPDS were assessed using the Edinburgh Postnatal Depression Scale (cut-off$\geq$12). Multivariate logistic regression model was fitted to estimate the association between MEHCS and PPDS. Adjusted odds ratio (aOR) and respective 95% confidence interval were obtained.

Results:

PPDS were reported by 3.8%, 5.8% and 8.2% of PT, PM and TM women, respectively ($p < 0.001$). After adjustment, 4 out 9 components of MEHCS appeared related with PPDS, such that women reporting less than good experience with "understanding information" (aOR = 1.72 95%CI:1.14-2.60), "decisions according to maternal wishes" (aOR = 1.56 95% CI:1.04-2.34), "time waiting for healthcare" (aOR = 1.50 95%CI:1.04-2.18) and "healthcare provider's attitudes during pregnancy" (aOR = 1.58 95%CI:1.01-2.47) showed higher odds of PPDS than women reporting good experience.

Conclusions:

Further than the migration status, poor experience with some issues of maternal care seems play a role in the risk of PPDS

Key messages:

- Awareness should be given to maternal care experience.
- Public health strategies should address factors underlying a positive maternal experience.

Contact: paula.diaz@udea.edu.co

Background:

Different socioeconomic aspects have been related to mortality from COVID-19. For this reason, the objective of this study was to analyze the association between the Multidimensional

Poverty Measure at the municipal level (MPM) and the clinical outcome of mortality in the resident population of Colombia with a diagnosis of COVID-19.

Methods:

Observational, non-concurrent cohort study of confirmed cases of COVID-19 reported in Colombia by August 2021. The main outcome variable was mortality from COVID-19, and the main exposure variable was MPM. The covariates included in the analysis were patient's sex, age, and municipality of residence. Unadjusted and adjusted logistic models were used using balanced random samples of deaths and recovered patients, calculating odds ratios (OR) and 95% confidence interval ranges (CI).

Results:

In total, 4,194,538 cases of COVID-19 were included in the analysis, of which approximately 3% died. According to the adjusted multivariate analysis, it was found that patients who live in municipalities with an MPM between 20 to 40%, 41 to 60%, 61 to 80% and more than 80% had an OR of 1.6 (95% CI 1.4 to 1.8), 1.6 (95% CI 1.3 to 1.9), 1.7 (95% CI 1.2 to 2.5), and 2.2 (95% CI 0.7 to 7.8), respectively, for mortality from COVID-19 compared with an MPM of less than 20%. When analyzing the data according to sex for the MPM from 20 to 40%, 41 to 60%, 61 to 80% and more than 80%, an OR for women of 1.7 (95% CI 1.5 to 2.0), 1.8 (95% CI % 1.5 to 2.1), 1.9 (95% CI 1.3 to 2.6) and 2.8 (CI 0.9 to 10.1) respectively. For men an OR of 1.5 (95% CI 1.3 to 1.7), 1.4 (95% CI 1.2 to 1.7), 1.6 (95% CI 1.1 to 2.3) and 1.9 (95% CI 0.6 to 6.0) respectively compared to a MPM less than 20%.

Conclusions:

The risk of mortality from COVID-19 in Colombia is increased in populations with higher MPM. Social determinants of health have an important effect on the outcomes of COVID-19.

Key messages:

- Only a few studies exist in South America on social determinants in health and COVID-19. This study provides evidence to understand the impact of poverty measures on mortality in COVID-19 patients.
- Multidimensional poverty measure at the municipal level was associated with increased COVID-19 mortality in a large cohort of patients from the Colombian population.

Abstract citation ID: ckac130.089
Histopathological Findings of Lung Cancer in Black Coal Miners in the Czech Republic

Hana Tomaskova

H Tomaskova[1,2,3], J Horacek[4], H Slachtova[1,3], A Splichalova[2], P Riedlova[1,3], A Dalecka[1,3], Z Jirak[1], R Madar[1]

[4]Institute of Molecular and Clinical Pathology, Faculty of Medicine, University of Ostrava, Ostrava, Czechia
Contact: hana.tomaskova@osu.cz

Background:

Coal miners with coal workers' pneumoconiosis (CWP, J60 according to ICD-10) were previously found to have a significantly higher risk of lung carcinoma compared to the general male population. The presented study aimed to analyze the incidence of lung carcinoma in miners, histopathological findings in cohorts with and without CWP, and effect of smoking cessation on the histopathological profile.

Methods:

Analysed cohorts consisted of miners with (n = 3476) and without (n = 6687) CWP. Data on personal and working history obtained from the medical records were combined with information on lung cancer from the Czech Oncological Register and histopathological findings. Statistical analysis was performed using non-parametric tests and the incidence risk ratio (significance level of 5%).

Results:

In 1992-2015, 180 miners (2.7%) without CWP and 169 (4.9%) with CWP, respectively, were diagnosed with lung carcinoma. The risk of lung cancer in miners with CWP was 1.82 (95% CI: 1.48-2.25) times higher than in those without CWP. Squamous cell carcinoma (37%) was the most common histopathological type, followed by adenocarcinoma (22%) and small cell carcinoma (21%). A statistically significant difference between the cohorts (p = 0.003) was found in the histopathological subtypes, with the incidence of small cell carcinoma being 2 times higher in miners without CWP than in those with CWP. Only a few individuals with lung carcinoma were non-smokers. The incidence of small cell carcinoma, which is strongly associated with smoking, is significantly higher in miners without CWP.

Conclusions:

Smoking constitutes the most important risk factor for developing lung carcinoma even in that cohort. However, CWP remains a very important risk factor.

This work was supported by grant of Research Support Foundation, Vaduz. Markus R. Tödtli Consulting and project Healthy Aging in the Industrial Environment CZ.02.1.01/0.0/0.0/16_019/0000798 (HAIE).

Key messages:

- The risk of lung cancer in black coal miners with coal workers' pneumoconiosis (CWP) was 1.82 (95% CI: 1.48–2.25) times higher than in those without CWP.
- The incidence of small cell carcinoma was 2 times higher in black coal miners without CWP than in those with CWP.

Contact: a.bellicha@eren.smbh.univ-paris13.fr

Background:

Acrylamide is classified as a probable human carcinogen by the IARC but epidemiological evidence on the carcinogenicity of acrylamide from dietary sources is limited. This study aimed to investigate the associations between dietary acrylamide and breast cancer risk in the NutriNet-Santé cohort.

Methods:

This prospective cohort study included 80,597 French women (mean [SD] age at baseline: 40.8 [14] years) during a mean (SD) follow-up of 8.8 (2.3) years. Acrylamide intake was evaluated using repeated 24h dietary records (n = 5.5 [SD 3.0]), linked to a comprehensive food composition database. Associations between acrylamide intake and breast cancer risk (overall, premenopausal and post-menopausal) were assessed by Cox hazard models adjusted for known risk factors.

Results:

The mean (SD) dietary acrylamide intake was 30.1 (21.9) µg/d (main contributors: coffee, potato fries and chips, pastries and cakes, and bread). During follow-up, 1016 first incident breast cancer cases were diagnosed (431 premenopausal, 585 post-menopausal). A borderline significant positive association was observed between acrylamide intake and breast cancer risk overall (HRQ4 vs Q1 = 1.21 [95% CI: 1.00-1.47]) and a positive association was observed with premenopausal cancer

(HRQ4 vs Q1= 1.40 [95% CI: 1.04-1.88]). Restricted cubic spline analyses suggested evidence for non-linearity of these associations, with higher HR for intermediate (Q2) and high (Q4) exposures. Receptor-specific analyses revealed a positive association with estrogen receptor-positive breast cancer, which represented 86% of total cancer cases. Acrylamide intake was not associated with post-menopausal breast cancer.

Conclusions:

Results from this large prospective cohort study suggest the potential deleterious role of dietary acrylamide in breast cancer etiology, especially in premenopausal women, and provide new insights that should encourage further mitigation strategies to reduce the content of acrylamide in food.

Key messages:

- Results from this large prospective cohort study suggest that dietary acrylamide exposure is associated with an increased risk of breast cancer, especially in premenopausal women.
- These epidemiological findings are in line with experimental data that conducted IARC, EFSA and other public health institutions worldwide to classify acrylamide as a probable carcinogen for humans.

Elevated risk of depression and anxiety disorder by „high strain“ occupations: a systematic review

Andreas Seidler

A Seidler[1], A Freiberg[1], S Drössler[1], FS Hussenoeder[2], I Conrad[2], S Riedel-Heller[2], K Romero Starke[1], M Schubert[1]
[1]TU Dresden, Faculty of Medicine, Institute of Occupational and Social Medicine, Dresden, Germany
[2]University of Leipzig, Institute of Social Medicine, Occupational Occupational Medicine and Public Health, Leipzig, Germany
Contact: andreas.seidler@tu-dresden.de

Background:

Poor working conditions might lead to mental illness.

Methods:

We performed a systematic review with meta-analyses as an update of a review published in 2013. We registered the study protocol with PROSPERO (registration number: CRD42020170032) and searched for epidemiological studies in MEDLINE, PsycINFO, and Embase. Two reviewers carried out independently all review steps including title-abstract screening, full-text screening, risk-of-bias assessment and data extraction. Discordances were solved by consensus. We determined the certainty of evidence using the GRADE-approach.

Results:

Ten cohort studies with acceptable study quality examined the relationship between high job strain and the incidence of depression. In the “classic” demand-control-model, ‘high strain’ (combination of high demands and low control) is compared with ‘low strain’ (combination of low demands and high job control). For high strain, the risk of depression was elevated by 73%, the pooled effect estimate for the risk of depression was 1.73 (95% CI 1.32-2.27. In a dichotomous analysis (without dividing job strain into the four dimensions mentioned above), there was a doubled risk of depression with high job strain (pooled effect estimate = 1.99, 95% CI 1.68-2.35). We found comparable risk estimates for men and women. The GRADE assessment revealed a high certainty of evidence of the association between job strain and depression. We also found a considerably increased risk of anxiety disorder among individuals prone to high job strain.

Conclusions:

This systematic review finds a clear association between high job strain (high demands in combination with low control) and depression as well as anxiety disorders.

Acknowledgment: This study was financially supported by SUVA (Schweizerische Unfallversicherungsanstalt).

Key messages:

- High job strain (high demands, low control) is clearly associated with depression and anxiety disorders.
- The GRADE assessment revealed a high certainty of evidence of the association between job strain and depression.

Trajectories of part-time work and sickness absence among shift working healthcare employees

Annina Ropponen

A Ropponen[1,2], J Ervasti[1], M Härmä[1]
[1]Finnish Institute of Occupational Health, Työterveyslaitos, Finland
[2]Division of Insurance Medicine, Karolinska Institutet, Stockholm, Sweden
Contact: annina.ropponen@ttl.fi

Background:

Healthcare systems are facing major challenges due to population ageing, increased need for care, and economic challenges combined with staff shortage. The existing need for longer work careers combined with increasing turnover rates in healthcare highlights the need to understand working hours in association with work capacity and sustainable work careers. We aimed to investigate the concurrent changes in part-time work and sickness absence (SA) among healthcare employees without any SA spell >14 days at baseline.

Methods:

Annual working hour and SA data from 23 hospital districts and cities in Finland for 2008-2019 (172 922 employees with at least one work shift in any year). The sample was restricted to 20274 employees with ≤31 work shifts/year in 3 consequent years during the follow-up and without any SA spell >14 days at baseline in 2008. Part-time work/year (yes/no), SA months/year, and nightwork/year (% of nightwork of all shifts) as time varying covariate were used in the group-based trajectory models examining the concurrent changes. Models for age groups (in 2008 and categorized into < 25 years of age, ≥25 and <40 years, ≥40 and <55 years, and >55 years) will be considered later.

Results:

A five-trajectory solution identified groups for “stable full-time work without SA” (56.8%), “increasing part-time work and stable very low SA” (13.5%), “slight increase both in part-time work and SA” (16.5%), “steep increase in part-time work and reversed low U-shape in SA months” (5.0%), and “stable part-time work and low SA” (8.2%) across 2009-2019.

Conclusions:

These initial findings indicate that while most employees work full-time without SA, those who transfer from working full-time to part-time during follow-up from 2009 to 2019 seem to have low SA. Thus, part-time work may promote work capacity, and accompanied by part-time work disability benefits, offer a tool for employers to support sustainable working life and to keep older employees at work.

Key messages:

- Part-time work may provide possibility to maintain work participation.
- An important public health message is to provide possibilities for part-time work accompanied with partial work disability benefits to support sustainable working life.

Abstract citation ID: ckac130.093
Risk of first musculoskeletal disorder in Danish occupational fishermen – a register-based study

Line Remmen

LN Remmen[1], DH Christiansen[2,3], K Herttua[4], G Berg-Beckhoff[1]
[1]Research Unit for Health Promotion, University of Southern Denmark, Esbjerg, Denmark
[2]Department of Occupational Medicine, Regional Hospital West Jutland, Herning, Denmark
[3]Department of Clinical Medicine, Aarhus University, Aarhus N, Denmark
[4]Center for Maritime Health and Society, University of Southern Demark, Esbejrg, Denmark
Contact: lremmen@health.sdu.dk

Background:

Occupational fishery increase risk of musculoskeletal disorders due to a combination of heavy workloads and strenuous settings. Scarce and inconsistent knowledge exists on work-related risk factors despite high prevalence is evident. The aim was to determine work-related risk factors for the first diagnosis of musculoskeletal disorders in Danish occupational fishermen.

Methods:

This study was a register-based cohort study. We extracted data the from Nationwide Danish registers on work affiliation and health data for all persons registered as occupational fishermen between 1994 and 2017. Job titles were retrieved from the Danish Occupational Cohort with eXposure (DOC*X). Time-to-event analysis using cox regression with age as timescale was applied.

Results:

Among 15.739 fishermen, forty percent (n = 6.218 cases) experienced first musculoskeletal disorder during 82.2 million person-years of follow-up. Adjusted gender-stratified analysis showed that male fishermen, who worked less than 5 years and more than 15 years had the highest significant risks of MSD (HR 2.40 (95%CI: 2.06, 2.80), HR: 2.40 (95%CI: 1.76, 2.35)) respectively, compared to working more than 20 years. In males, more years in workforce, a captain education and working part time significantly protected against first MSD, while shifting trades above three times increased risk. Women had estimates with greater uncertainties due to their small numbers in the industry.

Conclusions:

A high incidence of musculoskeletal disorders was found in Danish occupational fishermen between 1994-2017. Findings suggest a bimodal relationship between occupational fishermen seniority level and their risk of musculoskeletal disorder, where highest risk was seen at five years in trade, afterwards from lower estimate slowly increasing with accumulating years until highest occupational seniority, compared to more than twenty years in trade. Continued development actions of preventive measures are suggested.

Key messages:

- Persons who are working large proportions of their work-life within occupational fishery significantly increase the risk of experiencing first musculoskeletal disorder.
- High incidence of musculoskeletal disorder cases within Danish occupational fishery was shown, therefor further preventive actions towards work-related risk factors is necessary.

Abstract citation ID: ckac130.094
The causal effect of switching from precarious to standard employment on mortality in Sweden

Nuria Matilla-Santander

N Matilla-Santander[1], AA Matthews[2], V Gunn[1,3,4], C Muntaner[5], B Kreshpaj[1], DH Wegman[6], J Jonsson[1], T Bodin[1,7], PPWR Consortium[1]

[2]Unit of Epidemiology, Karolinska Institutet, Stockholm, Sweden
[3]Lawrence S. Bloomberg Faculty of Nursing, University of Toronto, Toronto, Canada
[4]MAP Centre for Urban Health Solutions, Li Ka Shing Knowledge Institute, Toronto, Canada
[5]Division of Social and Behavioral Sciences, University of Toronto, Toronto, Canada
[6]University of Massachusetts Lowell, Lowell, USA
[7]Centre for Occupational and Environmental Medicine, Stockholm Region, Stockholm, Sweden
Contact: nuria.matilla.santander@ki.se

Background:

Precarious employment (PE) is a well-known social determinant of health and health inequalities, yet the effect of PE on mortality has not been explored sufficiently and high-quality longitudinal studies are lacking. When studying this effect, several methodological factors must be considered, one of them being the immortal time bias or prevalent user bias. A framework that helps us overcome these biases is the target trial. Therefore, the aim of this study is to estimate the causal effect of switching from precarious to standard employment (SE) on the 12-year risk of all-cause mortality among precariously employed workers aged 20-55 in Sweden.

Methods:

We emulated the target trial as a series of 11 target trials (starting at any year between 2005 and 2016), such that each individual may participate in multiple trials using Swedish register data (N = 251274). We classified individuals as: a) workers that at baseline (start) move from PE to SE and then followed while in SE or b) continuation of PE over follow-up. All-cause mortality was measured from 2006 to 2017. We pooled data for all 11 emulated trials and used pooled logistic regression to estimate intention-to-treat effects via hazard ratios and standardized survival curves.

Results:

The following results are preliminary. Individuals that continued on PE were 185,480 and those that initiated SE were 65,794. Over the 12-year follow-up, 1553 individuals died. The estimated observational analogue of the intention-to-treat 12-year survival difference for all cause-mortality between workers that continued on PE and those that initiated SE was of -0.2%, and the HR:0.82, 95%CI:0.72-0.94.

Conclusions:

The following conclusions are preliminary. According to our results, we find indication that shifting from PE to SE decreased the risk of death. Our study highlights the crucial role of decent employment conditions for health.

Key messages:

- Changing from precarious to more decent employment conditions decreases the risk of death by any cause in a cohort of Swedish workers.
- This study provides evidence that precarious employment has also an effect on any cause mortality.

Abstract citation ID: ckac130.095
Social Disparities in Cardiometabolic Health in Czechia and Venezuela Using the Allostatic Load Model

Anna Polcrova

A Polcrova[1,2], R Nieto-Martinez[3,4,5], JI Mechanick[6], GA Maranhao Neto[2], MM Infante-Garcia[2,3], H Pikhart[1,7], M Bobak[1,7], JR Medina-Inojosa[8], JP Gonzalez-Rivas[2,3,4]

[8]Division of Preventive Cardiology, Mayo Clinic, Rochester, USA
Contact: anna.polcrova@recetox.muni.cz

Background:

Subjects with lower socioeconomic status (SES) are exposed to higher levels of environmental stressors. The cumulative effects of chronic stressors on cardiometabolic health can be evaluated using the allostatic load (AL) score. Despite the accepted social gradient, clear relationships between social determinants and cardiometabolic health in populations with different socio-cultural contexts have been rarely explored. This study aimed to compare the relationships of social determinants with AL in different socioeconomic contexts: unstable Venezuela (VE) and stable Czechia (CZ).

Methods:

25-64 years old subjects from two cross-sectional population-based samples from CZ (2013-2014, n = 1579, 56% females) and VE (2014-2017, n = 1652, 70% females). The AL score (scaled 0-8) was calculated using 8 cardiometabolic biomarkers (BMI, waist circumference, systolic and diastolic blood pressure, total and HDL-cholesterol, triglycerides). Social characteristics included education in both countries, household income in CZ, and composite measure of SES based on source of income, household head's profession, mothers education, and housing conditions in VE. Ordinal regression was performed separately in men and women.

Results:

In CZ, men and women with low education and women with low income were more likely to have higher score of AL compared to those with high education and income (OR 1.45, 2.29 and 1.69). In VE, women with low education and low SES were more likely to have higher AL (OR 1.47 and 1.51), while men with low education and low SES were less likely to have higher AL (OR 0.64 and 0.61), compared to those with high education and high SES. Independently of age, sex, and socioeconomic characteristics, Venezuelans were more likely to have higher AL than Czechs.

Conclusions:

Associations of social position indices and cardiometabolic health (proxied by AL) differed between CZ and VE, most likely reflecting differences in social environment between the countries.

Key messages:

- Social gradients in cardiometabolic health differ among social environments.
- Social gradients in cardiometabolic health differ among sexes.

Abstract citation ID: ckac130.096
Estimating the magnitude of surveillance bias in COVID-19

Stefano Tancredi

S Tancredi[1], *S Cullati*[1,2], *A Chiolero*[1,3,4]
[1]Population Health Laboratory, University of Fribourg, Fribourg, Switzerland
[2]Department of Readaptation and Geriatrics, University of Geneva, Geneva, Switzerland
[3]Institute of Primary Health Care, University of Bern, Bern, Switzerland
[4]School of Population and Global Health, McGill University, Montreal, Canada
Contact: stefanotancredi@gmail.com

Background:

Most European countries implemented COVID-19 surveillance systems based notably on the number of diagnosed infections. Using this number as an indicator of epidemic severity is however problematic since it is influenced by testing modality. Indeed, differences in the frequency of infections are partly due to differences in detection rates rather than to changes in the risk of infection, leading to a ''surveillance bias''. Our goal was to estimate the magnitude of this bias in one region of Switzerland, using population-based seroprevalence as the best marker of epidemic severity.

Methods:

We used data from serosurveys carried out on random samples of the adult population after the 1st (Jul-Oct 2020) and the 2nd wave of the pandemic (Nov 2020-Feb 2021), before the start of the vaccination campaign. To assess the scale of surveillance bias, we assessed the burden of COVID-19 between 2 waves comparing seroprevalence with the number of diagnosed cases (positive PCR or antigen tests).

Results:

Out of 867 participants (46% men), 8% (IC 95%:4%-12%) and 19% (IC:15%-23%) had anti-SARS-CoV-2 IgG after the 1st and 2nd wave respectively, that is, a 11% increase between waves. The cumulative number of SARS-CoV-2 diagnosed cases was 2'355 after the 1st wave and 23'321 after the 2nd, that is, an increase of 20'966 cases between waves. Based on the number of diagnosed cases, the epidemic severity of the 2nd wave was 8-9 times higher compared with the 1st wave (20'966 vs 2'355 cases). Based on seroprevalence estimates, epidemic severity of the 2nd wave was less than 1.5 times higher compared to the 1st wave (11% vs 8%).

Conclusions:

Due to changes in testing modalities, the number of cases is problematic to assess the burden of COVID-19 in different phases of the pandemic. Accounting for surveillance bias is necessary for accurate public health surveillance.

Key messages:

- Accounting for surveillance bias and critically interpreting surveillance data is essential for an accurate public health monitoring activity.
- The number of diagnosed cases cannot be used alone to assess the burden of COVID-19.

Abstract citation ID: ckac130.097
Reporting guidelines for burden of disease studies: why and how?

Periklis Charalampous

B Devleesschauwer[1], *JA Haagsma*[1], *P Charalampous*[1], *R Assunção*[1], *C Di Bari*[1], *V Gorasso*[1], *I Grant*[1], *H Hilderink*[1], *J Idavain*[1], *T Lesnik*[1], *M Majdan*[1], *M Santric-Milicevic*[1], *E Pallari*[1], *SM Pires*[1], *D Plass*[1], *GMA Wyper*[1], *E Von der Lippe*[1]
[1]European Burden of Disease Network, COST Action CA18218
Contact: p.charalampous@erasmusmc.nl

Background:

The Disability Adjusted Life Year (DALY) is a frequently used metric to assess burden of disease (BoD). Many independent BoD studies have been performed across Europe, showing wide variations and inconsistencies in the application and reporting of DALY specific methods. The European Burden of Disease Network (burden-eu) aims to develop guidelines for reporting DALY calculation studies which may enhance transparency and comparability of BoD estimates across Europe and beyond.

Methods:

A burden-eu working group of experts generated a list of potential reporting items based on existing literature, guidance for developing guidelines and consultations with BoD experts. To pilot the drafted product, we asked BoD experts and non-experts to apply it to existing BoD studies. We received feedback and we revised the guidelines accordingly.

Results:

The guide for DALY calculation studies comprises about 25 items that should be reported in BoD studies. We included information about the study setting, data input sources including methods for data corrections, DALY-specific methods (e.g., YLL life table, YLD approach, disability weights etc), data analyses, and data limitations. We also included information on how users can compare their new estimates with previously available BoD estimates.

Conclusions:

We introduced a reporting instrument for DALY calculations that can be used to document input data and methodological design choices in BoD studies. The application of such guidelines will enhance usability of BoD estimates for decision-makers as well as global, regional, and national health experts.

Key messages:

- Application of reporting guidelines will increase consistency and transparency in reporting of BoD studies, thus enhancing usability of BoD estimates.
- Reporting guidelines for BoD studies will serve as an educational tool for better understanding the complexity of DALY methodological design approaches.

[1]Centre for Infectious Disease Control, RIVM, Bilthoven, Netherlands
Contact: milou.ohm@rivm.nl

Background:

A rise in serogroup C invasive meningococcal disease (IMD-C) led to introduction of MenC vaccination in 2002 in the Netherlands at 14 months of age, accompanied by a mass-campaign for all children between 1 and 18 years (coverage 94%). Due to an IMD-W outbreak in 2016-17, the MenC vaccine was replaced by a MenACWY vaccine and an adolescent booster at 14 years was introduced next to a mass campaign for 14-18 year-olds in 2018.

Aim/methods:

We explored meningococcal antibody status in the Netherlands across the population in 2006-07, 2016-17 and 2020 in consecutive cross-sectional serosurveillance studies. Furthermore, we assessed the vaccine impact and effectiveness of the recent MenACWY vaccination campaign. We determined long-term protection in both adolescents and adults after a MenACWY vaccination and investigated sex-related differences in the vaccine response in adolescents.

Results:

MenC antibody levels were low in 2016-17, except in recently vaccinated toddlers and individuals who were vaccinated as teenagers in 2002. We demonstrated waning of MenC immunity 15 years after the mass campaign and highlighted the lack of meningococcal AWY immunity across the population, which underlined the importance of the recently introduced MenACWY (booster) vaccination. The MenACWY vaccination program was effective in preventing IMD-W in the target population. Long-term protection was achieved for MenC, MenW, and MenY in 94-96% of adolescents five years postvaccination, but in adults only in 32%, 65% and 71% for MenC, W and Y. Adolescent antibody responses were higher in girls than in boys for all serogroups at most timepoints after MenACWY vaccination. The differences in average titers were however small and the percentage of participants with protective titers was very high for both sexes.

Conclusions:

The current meningococcal vaccination policy in the Netherlands provides protection across the population against IMD-ACWY and seems sufficient on the long-term.

Key messages:

- The current meningococcal vaccination policy in the Netherlands provides protection across the population against IMD-ACWY and seems sufficient on the long-term.
- The current meningococcal vaccination policy in the Netherlands provides protection across the population against IMD-ACWY and seems sufficient on the long-term.

5.S. Food, nutrition and diet

Motivations and strategies underlying the adoption of the front-of-pack labelling scheme Nutri-Score

Barthelemy Sarda

B Sarda[1], *M Fialon*[1], *P Ducrot*[3], *AJ Serry*[3], *P Galan*[1], *E Kesse-Guyot*[1], *S Hercberg*[1,2], *M Touvier*[1], *C Julia*[1,2]

Contact: b.sarda@eren.smbh.univ-paris13.fr

Front-of-pack nutrition labellings (FoPL) have gained traction in the European Union as tools to tackle the burden of nutrition-related chronic diseases. Multiple FoPL have been implemented by both governments and private actors. Under the European food labelling regulation, any FoPL is optional to display, although the legal framework is being revised for a harmonized FoPL to emerge. Since the implementation of the Nutri-Score in France in 2017, little data is available to understand the motivations and strategies underlying the adoption of the FoPL from a food business' perspective. A cross-sectional study was conducted in March 2021 on food businesses having adopted the Nutri-Score in France through an online questionnaire. In total, 121 businesses completed the questionnaire, representing 32% of companies adopting the scheme and covering a variety of company types. Engaged businesses had a rather healthier portfolio of products according to the Nutri-Score (on average, 69% of engaged products were A or B and 12% were D or E), with disparities between retailers and national brands. Businesses mostly reported their engagement was motivated by a will to be transparent (76%) and to simplify nutritional information (67%) but still 19% reported that they engaged following external pressures. External pressures were more likely to play a role in the engagement if the company engaged in 2020 compared to those engaged before 2018 ($P = 0.032$), if the company was larger ($P = 0.044$) and if the scope of engagement included D or E products (poorer nutritional quality) ($P = 0.033$). Our study showed that the Nutri-Score, as an optional measure, is mainly used by businesses, especially national brands, as a tool to promote rather healthier products, while companies with products of lower nutritional quality are more likely to engage following external pressure. This highlights the relevance of enforcing a mandatory FoPL system, in line with the Farm to Fork strategy.

Key messages:

- Nutri-Score led to a selective use of the measure by food businesses, especially national brands, to promote rather healthier products.
- The relatively low engagement of companies with low nutritional value products highlights the relevance of enforcing a mandatory FoPL system, in line with the Farm to Fork strategy.

Assessment of the impact of the Belgian and French food industry on obesity and population nutrition

Iris Van Dam

I Van Dam[1,2], *O Allais*[2], *S Vandevijvere*[1]
[1]Lifestyle and Chronic Diseases, Sciensano, Anderlecht, Belgium
[2]Université Paris-Saclay, INRAE, UR ALISS, Ivry-sur-Seine, France
Contact: iris.vandam@sciensano.be

Major food industry players make commitments to improve food environments, but it remains unclear how well these commitments translate into practice. This study set out to quantitatively assess the nutrition-related commitments and practices, as well as the correlation between both, of major food companies in Belgium and France. The 'Business Impact

Assessment' (BIA-Obesity) was applied to evaluate nutrition-related commitments and practices regarding product formulation, labelling, promotion and accessibility. Publicly available commitments were collected and companies given the opportunity to complete the information (2019-2020). Practices were evaluated applying following performance metrics: the proportion of products with Nutri-Score A or B, the percentage of products not-permitted to be marketed to children (World Health Organisation) and the proportion of ultra-processed food products (NOVA). Correlations between commitments and practices were calculated applying the Spearman's rank correlation coefficient. Overall BIA-Obesity scores for commitments were lower in France (median: 28%) than in Belgium (35%). Response rates in France (39%) were lower than in Belgium (56%). Median product portfolios in France contained less ultra-processed products (63%) and contained a higher proportion of products with a Nutri-Score A or B (38%) compared to Belgium (75% and 29%, respectively). In both countries a similar proportion of products was not-permitted to be marketed to children (81% in Belgium and 84% in France). Stronger company commitments did not translate into better performance metrics. Belgian food companies obtained a higher score for their nutrition-related commitments. French companies performed slightly better according to the performance metrics. In both countries there was ample room to improve commitments and practices. To improve food environments it is crucial to ensure that commitments are strengthened and translate into improved company practices.

Key messages:

- Food industry players make a range of nutrition and health related commitments, but these don't necessarily result into better practices.
- The BIA-Obesity clearly identifies areas where food industry players can improve the comprehensiveness, specificity and transparency of their nutrition-related commitments and associated practices.

Abstract citation ID: ckac130.101
An exploratory study of the level of folic acid in food staples in Ireland in 2021

Mary Rose Sweeney

D McMenemy[1], *MR Sweeney*[1]
[1]School of Nursing, Psychotherapy, and Community Health, Dublin City University, Donabate, Ireland
Contact: maryrose.sweeney@dcu.ie

Background:

Ireland previously had widespread voluntary fortification but there has been a major decline in the number of food staples fortified with folic acid in Irish supermarkets in the past 15 years. In this research we set out to examine the level of folic acid in food staples in supermarkets with the leading market share in the Republic of Ireland.

Methods:

The food labels of food staples (breads, spreads, milk, cereals, cereal bars, yoghurt/yoghurt drinks) were photographed in supermarkets with the leading market share in the Republic of Ireland (Tesco's, Dunnes, SuperValu, Lidl, Aldi, and M&S) between 2017 and 2021.The data was extracted and collated in an excel spreadsheet. The data was analysed to examine the level of folic acid in each product. We compared the levels captured at the current times with the levels previously captured in 2017.

Results:

Preliminary analysis suggests that folic acid level in food staples in Ireland continues to decline. Folic acid was not found in any breads (except a number of gluten free breads), milks, spreads but was found in several cereals marketed mainly at children.

Conclusions:

This study reports on the declining levels of folic acid in the food chain in Ireland. The number of food staples fortified with folic acid continues to decline demonstrating that voluntary fortification in Ireland is no longer an effective measure for passively augmenting the folic acid levels of consumers. This is of concern due to the incidence of neural tube defects in Ireland largely preventable by folic acid.

Key messages:

- This study reports on the declining levels of folic acid in the food chain in Ireland.
- The number of food staples fortified with folic acid continues to decline.

Abstract citation ID: ckac130.102
Assessment of maternal dietary patterns and their relationship with c-reactive protein in pregnancy

Paige van der Pligt

P van der Pligt[1], *SJ McNaughton*[1], *K Kuswara*[2], *G Abbott*[1], *S Islam*[1], *S Ebrahimi*[2,3], *S Ellery*[3,4]
[1]Institute for Physical Activity and Nutrition, Deakin University, Geelong, Australia
[2]School of Exercise and Nutrition Sciences, Deakin University, Burwood, Australia
[3]The Ritchie Centre, Hudson Institute of Medical Research, Clayton, Australia
[4]Department of Obstetrics and Gynaecology, Monash University, Clayton, Australia
Contact: p.vanderpligt@deakin.edu.au

Background:

Inflammation during pregnancy including elevated C-reactive protein (CRP) is associated with adverse pregnancy outcomes. Understanding relationships between CRP and modifiable factors such as dietary patterns is key to identifying opportunities for pregnancy intervention. This study assessed change in adherence to the Dietary Approaches to Stop Hypertension (DASH) and Mediterranean diet (MED-diet) from early to late-pregnancy and the relationship between adherence to both dietary patterns at early-pregnancy with plasma CRP at early and late-pregnancy.

Methods:

Women (n = 215) attending antenatal clinics at Monash Health, Melbourne were recruited at 10-20 weeks gestation. Medical history and blood samples were collected at 5 antenatal visits. Adapted DASH and MED-diet scores were calculated from Food Frequency Questionnaires completed at early ([mean±SD] 15±3 weeks) and late (36±1 week) pregnancy. CRP was measured in maternal plasma samples collected at early and late-pregnancy. Adjusted linear regression assessed associations of early-pregnancy DASH and MED-diet scores with early and late-pregnancy plasma CRP.

Results:

DASH score at early (23.5±4.8) and late (23.5±5.2) pregnancy was not significantly different (p = 0.971). There was no statistically significant change in MED-diet score from early (3.99±1.6) to late-pregnancy (4.08±1.8) (p = 0.408), however, MED-diet adherence and plasma CRP at early pregnancy were significantly and inversely associated (β = -0.14 [95%CI = -0.27, -0.01], p = 0.039).

Conclusions:

Adherence to the MED-diet in early pregnancy may be beneficial in reducing inflammatory markers and assisting optimal pregnancy outcomes. Assessment of dietary patterns is important to assist identifying modifiable factors which impact maternal and child health.

Key messages:

- Adherence to the MED-diet during pregnancy may be important in reducing inflammation.
- Assessment of maternal dietary patterns can assist informing early pregnancy intervention.

Abstract citation ID: ckac130.103
Preventing food contamination: preliminary results of a cross-sectional study among food handlers

Enrico Antonio Errico

EA Errico[1], F Licata[1], R Maruca[1], N Costantino[1], G Di Giuseppe[2], F Napolitano[2], CP Pelullo[3], G Della Polla[4], S Angelillo[1], A Bianco[1]

[3]Department of Movement Sciences and Wellbeing, University of Naples, Naples, Italy
[4]Health Direction, Teaching Hospital, University of Campania ''Luigi Vanvitelli'', Naples, Italy
Contact: enrico.ee93@gmail.com

Background:
More than 600 million people around the world get sick every year due to eating contaminated food, which is impressive considering that all foodborne diseases (FDs) are preventable. Contamination during food preparation by food handlers (FHs) is one of the main causes of FDs. The aim of this study is to assess the knowledge and behaviors of FHs related to FDs.

Methods:
The cross-sectional study was conducted in two regions (i.e. Calabria and Sicily) of Southern Italy. Data was collected through an anonymous self-administered questionnaire designed to retrieve sociodemographic information, knowledge about food safety, and food-handling behaviors among a randomly selected sample of FHs $\geq$ 18 years of age.

Results:
Findings refer to a sample of 171 respondents with a mean age of 40 years (SD $\pm$ 12.7). A vast majority (63.7%) of FHs did not know the correct procedure for hand washing according to Food & Drug Administration (FDA) guidelines and 28.4% of subjects did not wash their hands after touching raw food, which constitutes a major risk of food cross-contamination. One-third of FHs were unknowledgeable that cross-contamination (e.g. using the same utensils for cooked and raw foods) could lead to FDs. Multiple logistic regression analysis showed a positive correlation ($p < 0.001$) among good knowledge and proper food-handling practices, such as using separate kitchen utensils to prepare cooked and raw foods and storing them in separate areas or fridges. Less than half of the sample (42.1%) reported the need for more information about FDs.

Conclusions:
Preliminary results highlight a lack of knowledge about simple rules to avoid food cross-contamination that could negatively impact on food safety and food-handling behaviors. This study add evidence about areas where intervention are needed to reduce the occurrence of FDs.

Key messages:
- Incorporating knowledge and behavioral-based food safety training programs could be effective to control the risk of FDs.
- Further research is needed on strategies to improve behavior change.

Abstract citation ID: ckac130.104
Individual and food environment factors associated with the diet of disadvantaged adults in Flanders

Yasemin Inac

Y Inac[1,3,4], E de Clerq[2], N Van de Weghe[3], S Dury[4], S D'Hooghe[1,4], S Vandevijvere[1], D van Dyck[5], B Deforche[5,6], K De Ridder[1]

[5]Department of Movement and Sports Sciences, Ghent University, Ghent, Belgium
[6]Department of Public Health and Primary Care, Ghent University, Ghent, Belgium
Contact: yasemin.inac@sciensano.be

Background:
Health inequalities partially remain due to differences in diet between socioeconomic groups. Examining the association between socio-ecological factors and the diet of socioeconomically disadvantaged (SED) individuals can enhance the development of interventions to decrease health inequalities.

Methods:
In total, 278 SED adults residing in two Flemish municipalities completed a survey addressing sociodemographics, diet, health and their perceptions of the food environment. The objective food environment was examined by assessing food retailer information in street network-based buffers of 500m and 1000m around participants' addresses. Linear regression was used to test assumptions.

Results:
Individual factors such as poor subjective health (OR0.58;CI 0.34-0.97), food insecurity (OR0.60;CI 0.38-0.94) and living alone (OR0.86;CI 0.75-0.98) were negatively associated with healthy dietary habits such as daily fruit and vegetable (FV) consumption. Positive perceptions on the availability of FV were positively associated (OR1.09;CI 1.02-1.17) with daily FV consumption. Objective food environmental factors showed a stronger association with unhealthy dietary habits. A greater amount of retailers within 1000m walking distance was negatively associated with fast-food (OR0.96;CI 0.94-0.99) and sugar-sweetened beverages (SSB) consumption (OR0.93; CI 0.88-0.98). More supermarkets within 500m distance was negatively associated (OR0.77;CI 0.58-0.97) with SSB consumption, while more convenience stores within a 1000m distance was positively associated (OR1.48;CI 1.17-1.88) with SSB consumption.

Conclusions:
Our findings suggest that factors associated with the diet of SED adults differ according to food and drink items. Interventions focused on this population should take these differences into account.

Key messages:
- Individual and food environmental factors are both associated with the diet of socioeconomically disadvantaged adults but differ according to food and drink items.
- Individual factors and perceptions of the food environment more likely associated with a healthy diet. Objective factors of the food environment were more likely associated with an unhealthy diet.

Abstract citation ID: ckac130.105
Fed up: a qualitative investigation on the influencing factors of food insecurity in the Azores

Robyn Freiheit

R Freiheit[1], T Leão[1]
[1]University of Porto, Institute of Public Health, Porto, Portugal
Contact: rmfreiheit@gmail.com

Background:
In 2019, over 1 billion people experienced food insecurity. In the Azores, a 9-island archipelago in the Atlantic Ocean, 13.4% of its population perceived food insecurity, the highest regional rate in Portugal (10.1%). These geographical limitations paired with high unemployment and low education rates, may challenge their access to nutritious food. It is still unclear how these (and other) contextual factors may affect access and availability to food in this remote area, and how they interact with individual determinants.

Methods:
Data collection was conducted in early 2022 with 13, in-depth, 1:1 semi-structured interviews regarding topics of food consumption and supply in the Azores. Non-probability sampling was used, with use of purposive and snowball

sampling. We included key-stakeholders currently living in the islands or working in a role related to the islands (i.e., in healthcare, supply chain, agriculture, etc.). We performed a thematic analysis with an inductive-deductive iterative analysis.

Results:

Participants identified several challenges related to access and availability of food. Vegetables, fruit and fish can be scarce and are subject to seasonal variation. There are clear regional disparities in access to food, with more isolated islands having less variety, quality and quantity of healthy foods available. Its topography and weather limit agricultural practices and transportation, but education, culture, and policies subsidizing the production of meat and dairy were also identified as important barriers to local production of fruits and vegetables.

Conclusions:

Food insecurity is a public health concern in this outermost EU region. If topography and geography limit the production and access of nutritious foods, economic and agricultural policies are a leading theme of concern to highlight. The solution for food insecurity thus demands an interdisciplinary dialogue to better adjust future policies in the Azores and in similar regions.

Key messages:

- Food insecurity is a public health issue in the Azores, a European outermost region. Access to nutritious foods is unstable due to contextual variables such as geography, weather and policy.
- A possible solution to address food insecurity in the Azores islands demands interdisciplinary dialogue to better adjust future policies in this region and within similar contexts.

Abstract citation ID: ckac130.106

Understanding the relationships between dietary risk behaviour and social factors in older adults

Lina Spagert

C Geigl[1,2], *L Spagert*[3], *J Loss*[4], *M Leitzmann*[2], *C Janssen*[1]
[1]Department of Applied Social Sciences, Munich University of Applied Sciences, Munich, Germany
[2]Department of Epidemiology and Preventive Medicine, University of Regensburg, Regensburg, Germany
[3]Department of Engineering and Management, Munich University of Applied Sciences, Munich, Germany
[4]Department of Epidemiology and Health Monitoring, Robert Koch Institute, Berlin, Germany
Contact: spagert@hm.edu

Background:

The relationships between social factors and dietary risk behaviour in older adults have not yet been thoroughly investigated. In this analysis, we aimed to develop a brief index of dietary risk behaviour and examine its associations with sociodemographic, socioeconomic, psychosocial, and behavioural factors.

Methods:

A community-based postal survey was conducted to collect cross-sectional data from German adults aged 65 and older ($n = 1687$; 33% response proportion; 52% female). Using principal component analysis, we developed a 3-item dietary risk behaviour index (DRB), including the food groups vegetables/fruit, whole grains, and dairy products. Dietary risk behaviour was defined as food group consumption frequencies below national dietary recommendations. Multiple linear regression was used to analyse associations between dietary risk behaviour and social factors.

Results:

Physical activity, female gender, education level, and social support were negatively associated with dietary risk behaviour, while alcohol consumption and smoking were positively associated (Adj. $R2 = 0.16$, $p < 0.001$). The brief DRB based on vegetables/fruit, whole grains, and dairy products has proven to be appropriate in analysing dietary behaviour among older adults.

Conclusions:

A better understanding of the relationships between social factors and dietary risk behaviour among older adults can assist in group-specific targeting of dietary-related interventions. Demand-oriented dietary interventions should address underlying social factors to reduce inequities in dietary risk behaviour among older adults. The results may be transferable to municipalities in high-income European countries.

Key messages:

- Dietary risk behaviour among older German adults is associated with sociodemographic, socioeconomic, psychosocial, and behavioural factors.
- Social conditions should be considered when targeting group-specific interventions to reduce socially determined inequities in dietary risk behaviour among older adults.

Abstract citation ID: ckac130.107

Actions to support local charitable organizations in countering the spread of food insecurity

Giulio Barocco

G Barocco[1], *E Croci*[1], *T Longo*[1], *A Calabretti*[2], *P Bogoni*[3], *J Sepe*[1], *A Marsi*[1]
[1]Servizio Igiene Alimenti e Nutrizione, Azienda Sanitaria Universitaria Giuliano Isontina, Trieste, Italy
[2]Department of Chemical and Pharmaceutical, Trieste University, Trieste, Italy
[3]Department of Economics, Business, Mathematics and Statistics, Trieste University, Trieste, Italy
Contact: giuliobarocco@gmail.com

Background:

According to the Italian Statistic Institute data, in Italy between 2007 - 2020 individual absolute poverty (AP) grew from 4.1 to 9.4%. In 2020 13.5% of minors lived in AP, furthermore in 2017 22.3% of Italians lived in conditions of food poverty or food insecurity (FI), between 2018 - 2019 1 in 7 minors lived in conditions of FI. The scientific literature underlines how inadequate food access is one of the risk factors for the onset of chronic non-communicable diseases. The aims of the project were to evaluate in the 3 main local charitable organizations (LCOs) the qualitative - quantitative profile of the food basket and the content of protective components present in fruits and vegetables (FV) available for socially disadvantaged communities (SDCs); determine the main nutritional critical points (NCPs); and identify possible corrective actions (CAs).

Methods:

The average composition of the food baskets available in 2021 for 1600 users by the 3 LCOs was compared with national nutritional recommendations. In February 2022, 23 samples of FV were collected from the LCOs for chemical analyses by the University of Trieste (UT). The outcomes were compared with the food composition database of the UT.

Results:

The food baskets at the LCOs were characterized by: daily average availability of 50 to 145 g of FV (8 to 22% of the recommended requirement); weekly average availability from 26 to 200g of cheeses, from 0 to 132g of meat. The quantitative profile of the protective molecules present in FV samples was reduced by 11 to 40 % compared to the UT database. The main NCPs were lack of nutrition guidelines on targeted food programmes and of monitor systems to evaluate the food basket balance for SDCs. CAs have been planned to integrate food safety and food security in public health programs to support LCOs.

Conclusions:

The results of the project can significantly support LCOs towards integrated actions in the food and nutritional policies at local and regional level.

Key messages:

- The rapid spread of food insecurity among the population, especially in families with minors, requires new tools to plan rapid and effective actions of food and nutrition policies.
- The analysis of nutritional critical points in the flux of donating food to socially disadvantaged communities is crucial for identifying corrective actions and to support charitable organizations.

6.R. Health care services and systems

Abstract citation ID: ckac130.108
Healthcare accessibility since and during Covid-19 pandemic among older individuals in Europe

Madara Mikelsone

M Mikelsone[1], *I Reine*[1]
[1]Statistics Unit, Riga Stradiņš University, Rīga, Latvia
Contact: madara.mikelsone@rsu.lv

Ensuring access to healthcare is critical to prevent illnesses and maintain health and functional abilities for older individuals. The Covid-19 pandemic is a major global public health threat that challenges healthcare availability and accessibility. The objective of the study was to compare healthcare accessibility for older individuals since and during Covid-19 pandemic. The study was based on a sample of individuals from wave 8 Covid-19 add-on and wave 9 Covid-19-add-on of the Survey of Health, Ageing and Retirement in Europe (SHARE) in the period from 2020 till 2021. The sample size was 44043 respondents from 26 European countries. Descriptive statistics, Chi-square and McNemar test was performed. Overall, in 2021 there is a statistically significant decrease in proportion of respondents who forwent medical treatment (from 12% to 8%, in Latvia from 14,6% to 7%), postponed medical appointment due to Covid-19 (from 27% to 13%, in Latvia from 14,6% to 3,2%) and to whom appointment was denied by healthcare facility due to Covid-19 (from 5,3% to 4,5%, in Latvia from 6.9% to 3,3%) ($p < 0.001$). More often forwent medical appointment in 2021 was reported from females as well as respondents younger than 75 years, with good or very good self-rated health status and with less or no limitations due to health. Forwent medical treatment was reported more often from respondents with diabetes and hypertension. Results indicate that remote consultations are used more often than in 2020 (number of remote consultations varied between 1 and more than 100) and more often were reported by younger respondents (50-74 years). No significant association was found in self-rated health changes since and during Covid-19 pandemic for respondents who reported healthcare accessibility issues. As those issues were reported also by individuals with poor or fair self-rated health status and serious health conditions it can lead to a more rapid decline in health and functional abilities in the future.

Key messages:

- The situation with access to health care has improved during Covid-19, however further research is necessary to analyze how healthcare accessibility has affected health changes of older individuals.
- Telemedicine serves as a viable tool for maintaining patient care and lowering the risk of Covid-19 exposure to patients, however actions to improve digital skills for older individuals are needed.

Abstract citation ID: ckac130.109
Professionals' roles in the hospital discharge of older adults in 3 Nordic cities: a vignette study

Ann Liljas

AEM Liljas[1], *J Pulkki*[2], *NK Jensen*[3], *B Burström*[1], *I Keskimäki*[2], *I Andersen*[3], *E Jämsen*[2], *J Agerholm*[1]
[1]Global Public Health, Karolinska Institutet, Stockholm, Sweden
[2]Faculty of Social Sciences, Tampere University, Tampere, Finland
[3]Department of Public Health, Copenhagen University, Copenhagen, Denmark
Contact: ann.liljas@ki.se

Background:

The hospital discharge process of older adults in need of both medical and social care post hospitalisation requires extensive care coordination. Cooperation and continuity between involved care providers are essential, however, existing care systems including the Nordic care systems, are poorly designed to provide health and social care to patients with complex health and social care needs which increases the risk of certain groups not receiving optimal care.

Aim and methods:

This study aims to examine and compare what roles, responsibility and actions nurses take in the hospital discharge process of older adults with complex care needs in three Nordic cities: Copenhagen (Denmark), Stockholm (Sweden) and Tampere (Finland). A vignette study consisting of three fictive cases was conducted face-to-face with nurses in Copenhagen (n = 11), Stockholm (n = 16) and Tampere (n = 8). Participants were identified through the researchers' networks and snowball sampling. The vignettes represent older patients with age-related medical conditions of which one also has cognitive loss and one looks after their partner with dementia. The cases further include differences in the home help received by their children, physical obstacles in their homes and unwillingness of becoming a burden to the system. A thematic approach is used for the data analysis.

Results and conclusions:

Preliminary results suggest that the informants' roles and engagement in the coordination and collaboration may differ both within and between the systems studied, and that they take responsibility beyond their job roles particularly if the patient has no close relatives. The study is of public health importance as it identifies gaps in how the care is organised in the three welfare states targeted. It also sheds light on the complexities of providing universal care in ageing societies where a growing proportion of older adults have both medical and social care needs.

Key messages:

- This study reveals similarities and differences in how the hospital discharge process is organised in 3 Nordic cities.
- Gaps in the care system are partly filled by nurses who do work beyond their job roles.

Abstract citation ID: ckac130.110
The situation of older Emergency Department patients. Results from a participatory observation study

Johannes Deutschbein

J Deutschbein[1], *A Wagenknecht*[1], *A Schneider*[1], *M Moeckel*[2], *L Schenk*[1]
[1]Institute of Medical Sociology and Rehabilitation Science, Charité - Universitätsmedizin Berlin, Berlin, Germany
[2]Departments of Emergency Medicine, Charité - Universitätsmedizin Berlin, Berlin, Germany
Contact: johannes.deutschbein@charite.de

Background:

Elderly patients make up a substantial share of Emergency Department (ED) populations which will increase steadily in the coming decades. This poses a challenge for EDs that are not designed to care for multimorbid, frail, and care-dependent older patients. However, too little is known about the current situation of older ED patients and their specific needs. This study seeks to explore ED stays of older and geriatric patients from a patient-centered perspective.

Methods:

Participatory observations of older patients' ED stays were conducted in five different EDs in a central district of Berlin. This included the passive company of ED patients aged 65 years and older, as possible from admission to discharge or referral. The sampling strategy followed the logic of theoretical sampling. Observation notes were captured in a semi-structured protocol and subjected to systematic, comparative analysis based on the Grounded Theory approach.

Results:

N = 71 cases of older ED patients were included. Patients' mean age was 80 years and 52% were female. The total observation time amounted to 332 hours, the mean observation time was 4 hours and 40 minutes. Long waiting hours and uncertainty about the further course turned out to be burdensome for the patients. Other problems were the dependency of patients in their ability to satisfy basic needs such as toileting and hydration. Personnel mostly tried to address these needs but did not always have the capacities.

Conclusions:

Like most health care institutions, EDs need to prepare for the consequences of aging societies. Older patients are more vulnerable to stressful situations such as ED stays and depend on more attention and nursing support. ED staff often lack the resources for this. Strategies are needed to adjust ED structures and processes to the specific needs of older patients. This includes the prevention of ED stays.

Key messages:

- ED stays can be particularly burdensome for elderly patients. There is a need for strategies to develop patient-centered and age-sensitive ED structures.
- Participatory observation is a productive method for patient-centered health research. Its methodological potential and challenges should be further analyzed and discussed.

[7]Università degli Studi di Torino, Turin, Italy
Contact: riccardo.calsolaro01@universitadipavia.it

Background:

Despite its effectiveness, compliance to colorectal cancer (CRC) screening remains low. Different strategies to improve the adherence were identified, such as the involvement of new stakeholders as the community pharmacists. In Italy a recent national project fuelled the development of this strategy, scaling-up the collaboration between screening programmes and pharmacies formerly at the local level up to the national level.

Methods:

The regional representatives of the CRC screening programmes provided to the National Screening Monitoring Centre the agreements arranged between the Regions/Autonomous provinces and their respective pharmacy owners representatives. The agreement decrees were analysed describing the fecal occult blood test pathway (e.g. kit supply and delivery) and supplementary activities provided by the pharmacies together with the CRC screening kit delivery, such as health promotion ones.

Results:

Information was received from 18 Regions and Autonomous provinces (86% of the total). Regarding the economic compensation, the amount of money paid for each kit varies a lot, with a range from 0 to 18 EUR. The number of process phases covered by the agreements ranged from a maximum of 16 (out of 18) to a minimum of 0. The processes that were included most often were the supply of the kit, the delivery of the kit, and education/awareness of CRC screening (68.8%), followed by sample transfer to the laboratory, test tube tracing and counselling (62.5%). Among the processes less covered there were the warehouse management and awareness of other healthcare initiatives (12.5%), and only in one case a supplementary agreement on delivery of preparation for intestinal cleansing was included.

Conclusions:

The arrangements between pharmacies and CRC screening programmes in Italy are very diverse and unique model is missing. Collaboration between programs and pharmacies is promising and quality standards of the service should be set at international level.

Key messages:

- Collaboration between organized colorectal cancer screening programmes and community pharmacies can improve the quality of the service and adherence to screening.
- Quality standards of the pharmacy service in colorectal cancer screening should be set at international level.

Abstract citation ID: ckac130.112
Quality of life and social contacts in old age

Kerstin Loeffler

K Loeffler[1], L Weidinger[1], M Bohnstingl[1], C Pammer[2], J Goldgruber[1]
[1]Albert Schweitzer Institute for Geriatric Medicine, Geriatric Health Care Centers, Graz, Austria
[2]Sozialarbeit, Medius Zentrum für Gesundheit, Graz, Austria
Contact: kerstin.loeffler@stadt.graz.at

Background:

Changes in lifestyle, housing and social relationships have a verifiable impact on aging. Older adults of today have different ideas about housing and residential mobility than previous generations. Consequently, the importance of innovative types of housing for senior citizens, which allow largely independent housekeeping and provide integration into preexisting social structures, is increasingly in the focus of public health debates.

Methods:

Face-to-face interviews with 32 tenants of Wohnoase Robert Stolz in Graz were conducted between July 2018 and December 2020. The subjects were interviewed twice (T1: at move-in, T2: 6-12 months after moving-in). WHOQOL-BREF and WHOQOL-Old were used to assess health-related quality of life. Furthermore, the ego-centered social network map and a questionnaire to assess subjective sense of safety at home were applied.

Results:

Tenants' health-related quality of life improved by an average of 11% after 6-12 months in the area of environmental conditions for health promotion ((T1: 3.83; T2: 4.25). Residential satisfaction (T1: 3.44; T2: 4.3; +25%) as well as subjective feeling of safety in their own homes (T1: 4.19; T2: 4.81; +14.8%) rose significantly. Tenants on average had about 6 more social contacts than before moving in (52.2%). In contrast, no significant changes were evident in tenants' self-assessment of their physical, mental, and social health.

Conclusions:

Results indicate that moving into assisted living can lead to psychosocial stabilization and an increased sense of security. Over time, deteriorations in physical health can be observed, which can most likely be attributed to advanced ageing. Conducting an evaluation study with a higher number of participants and a control group is recommended.

Key messages:

- Moving into an assisted living facility led to psychological stabilization and a heightened sense of security among the participants.
- Further, the amount of social contacts increased over time.

Abstract citation ID: ckac130.113
Social capital and STIs testing among young men in Stockholm, Sweden: A cross-sectional study

Ana Canabarro

APF Canabarro[1]*, M Eriksson*[2]*, A Nielsen*[1]*, M Salazar*[1]
[1]Department of Global Public Health, Karolinska Institutet, Stockholm, Sweden
[2]Department of Social Work, Umeå University, Umeå, Sweden
Contact: ana.paula.finatto.canabarro@ki.se

Background:

Testing for sexually transmitted infections (STIs) is highly accessible in Sweden, but young men's testing rate is considerably lower than young women's. Social capital (SC) might shape people's STIs testing patterns. However, such association has not been studied among young men before. This study assessed the prevalence of different forms of SC and if they increase STIs testing among young men in Stockholm, Sweden.

Methods:

This population-based cross-sectional study was conducted in 2018 and included 523 men aged 20-29 years living in Stockholm. Bonding SC (having helped someone; having received help; having someone to share inner feelings with), institutionalized trust SC (in school; healthcare; media) and STIs testing behavior (never tested, tested only in the last 12 months, only more than 12 months ago, or both before and after the last 12 months) were assessed. Weighted adjusted multinomial logistic regression tested the associations between SC and STIs testing.

Results:

High levels of bonding SC (range: 86.5 - 95.5%), as well as trust in healthcare (76.7%) and school (64.8%) were reported. Having helped someone (aRRR 6.1, 95% CI 1.7 - 21.6), having received help (aRRR 8.1, 95% CI 2.6 - 24.7) and having someone to share feelings (aRRR 4.0, 95% CI 1.7 - 9.2) were associated with being tested for STIs more than 12 months ago. Trust in media was the only institutional trust significantly associated with STIs testing (tested in the last 12 months: aRRR 2.5, 95% CI 1.1 - 5.4; both before and after: aRRR 3.8, 95% CI 1.6 - 8.9).

Conclusions:

Peer-to-peer interventions using bonding SC should be used to promote STIs testing. More studies are needed to understand how trust in media increases testing for STIs. Although trust in healthcare and school were not statistically associated with testing, the high overall trust in these institutions reported in our study could be harnessed to implement sexual education programs promoting STIs testing among young men.

Key messages:

- Higher level of bonding social capital, as well as trusting in media, were positively associated with being tested for STIs among young men in Stockholm.
- The participants' reported high institutional trust in healthcare and media could be harnessed to implement sexual education programs promoting STIs testing among young men.

Abstract citation ID: ckac130.114
Influence of occupation on the subjective health of forced migrant doctors-a qualitative study

Verena Locher

V Locher[1]*, A Krämer*[1]
[1]School of Public Health, Bielefeld University, Bielefeld, Germany
Contact: verena.locher@uni-bielefeld.de

Background:

With the refugee movement in 2015, also forced migrated female and male medical professionals have arrived in Germany. The effect of occupation on the subjective health status of these physicians working in the German health care system was investigated on the basis of Antonovsky's sense of coherence (SOC) and the occupational science models of Siegrist and Karasek&Theorell.

Methods:

Using a semi-structured interview guide, nine forced migrated physicians were interviewed before and nine forced migrated physicians were interviewed during their professional medical activity. Both interview groups had an Arabic cultural background. The transcribed interviews were analyzed according to Kuckartz's content structuring qualitative content analysis using the MAXQDA 2020 software tool.

Results:

The SOC of migrated physicians is favorably influenced by meaningful occupational activity and the newly gained manageability of life. Positive influences are seen in professional appreciation and collegial support at all hierarchical levels. Negative effects are perceived in experiences of discrimination, insecurity and experienced injustice in the recognition of foreign qualifications. Physical stress results from occupational overload, unfamiliar work and time pressure.

Conclusions:

The salutogenic effect of the work, the recognition in the profession and the collegial support are essential contributions to the promotion of especially mental health among forced migrated doctors. This speaks in favor of rapid and stringent integration into professional life. However, organizational barriers inherent in the German health care system should not be disregarded, which is why both legal and structural improvements should be made to the existing integration procedure before and during professional activity.

Key messages:

- Expediting the integration of migrant doctors back into their professions is of salutogenic importance.
- Therefore, coordinated and corrective measures should be taken to this end by those responsible for this process.

[7]Fundación Avedis Donabedian, Barcelona, Spain
[8]King's College, London, UK
[9]Universidad de León, León, Spain
Contact: mgbarbag@aspb.cat

Background:

Guiding the decision-making process in mental health investments is advisable. The objective of the study is to develop a framework for evaluating the quality of integrated health and social care in Mental Health and Drug Addiction (MH&DA)

Methods:

A literature review helped to establish a definition of integrated care specific to MH&DA and to identify potential indicators for its evaluation. The quality of integrated care was assessed through focus groups (FGs) and interviews (INs) with three different profiles: professionals (2FGs & 2 INs), patients (3 FGs & 2 INs) and families/carers (2FGs & 2 INs). Additional indicators were also obtained from them.

Results:

Out of 2,226 publications identified, 87 (4%) were reviewed in full. According to the literature, integrated care in MH&DA is based on four main components: case management, comprehensive assessment, individualised care plan and care coordination among different providers. Based on these components, an operational definition of integrated care was developed and validated in the FGs and INs. Positive aspects identified were a respectful approach and positive experiences of coordination between social and community network. Regarding indicators about 400 were identified, after screening were reduced to 60: 25% corresponded to accessibility, 20% person-centred care, 16% each to care coordination and to effectiveness. In general, the main threats to the quality of care, identified in FGs and INs, matched the dimensions with the highest proportion of indicators (i.e., limited care resources, poor coordination and communication among professionals and services, and barriers in accessing specialized treatment).

Conclusions:

According to literature, integrated care in MH&DA seems to be mainly evaluated in terms of accessibility and person-centred care. In a following phase, a large group of experts will be key to select the most relevant dimensions and indicators for the evaluation in a Delphi study.

Key messages:

- A quality integration of Health and Social Care is paramount for people with mental disorders and/or drug addictions.
- A framework for assessing the quality of integrated Health and Social Care in Mental Health and Addictions would help guide necessary investments in mental health.

Abstract citation ID: ckac130.116
Caregiver burden in professionals working in different settings for persons with dementia

Zuzana Katreniakova

Z Katreniakova[1], M Nemcikova[1], I Nagyova[1]
[1]Department of Social and Behavioural Medicine, PJ Safarik University in Kosice, Faculty of Medicine & SAVEZ, Kosice, Slovakia
Contact: zuzana.katreniakova@upjs.sk

Introduction:

Professionals caring for persons with dementia (PwD) have to meet demands from various sides. Considering today's high standards put on institutional care with respect to ‘‘person centred care’’ and the skills related to specific needs of PwD, caring for care staff is one of the major challenges.

Objectives:

The aim of this study was to investigate the caregiver burden in professional dementia care and its work related differences.

Methods:

The study was carried out from September 2021 to February 2022 among 105 professionals working in different settings for PwD in Slovakia including home care and day care centres. The Professional Care Team Burden scale (PCTB) and the Zarit Burden Interview (ZBI-12) were chosen to measure caregiver burden. Length of work in the organisation (< 3, 3 to 6, > 6 years), job position (domiciliary and other care worker), and current dementia care intensity (≤ 8, 9 to 39, > 40 hours/week) were also measured. Independent samples T-tests and ANOVA were used to analyse the differences (IBM SPSS 27).

Results:

87.6% of professionals were women (mean age 48.6±9.8 years). 52.5% worked more than 6 years in the organisation, 53.3% were in the job position of domiciliary care workers, and for 52.1% the current dementia care intensity was 9 to 39 hours/week. Caregiver burden mean scores achieved were 26.7±4.0 (PCTB) and 9.7±6.2 (ZBI-12). The significant difference was found in the PCTB by job position with the higher burden in domiciliary care workers (mean score 26.0 + 4.2, $p < 0.05$). No significant differences were observed in the PCTB and the ZBI-12 by the length of work in the organisation and current dementia care intensity.

Conclusions:

Specific scales for assessing professionals' caregiver burden are useful to uncover areas for intervention. Structuring the interventions by taking the care staff subjective feelings of burden into account is important for future improvements in institutional care. (Grant support: VEGA no. 1/0372/20).

Key messages:

- Caring for professionals is one of the major challenges to improve health and social services for persons with dementia.
- Structuring the tailored interventions should take the caregiver burden into account.

Abstract citation ID: ckac130.117
The impact of depression on satisfaction with prenatal care in Kazakhstan during COVID-19 pandemic

Raushan Alibekova

G Kossybakova[1], R Alibekova[1], B Crape[1], A Kuntuganova[1]
[1]Department of Medicine, Nazarbayev University School of Medicine, Nur-Sultan, Kazakhstan
Contact: raushan.alibekova@nu.edu.kz

Background:

Depression and anxiety are common during perinatal periods, representing a considerable public health concern during global pandemic. Only few studies have examined the influence of emotional disturbances on satisfaction with maternity care. This study aimed to assess the prevalence of satisfaction with prenatal care and to examine its association with depression and anxiety among pregnant women in Kazakhstan.

Methods:

Participants were recruited to this online cross-sectional survey in the outpatient clinic in Novoshamalgan, Almaty region (n = 174) in December-January, 2022. A single-item measure of satisfaction was used by asking a question ‘‘How satisfied are you with health services?’’, scored on a 5-point Likert scale. A simplified 2-item Edinburgh Postpartum Depression Scale and 2-item Generalized Anxiety Disorder scale were used to measure depressive and anxiety symptoms.

Results:

Majority of women were very satisfied or satisfied (n = 128; 74%), while less than a third of the sample (n = 46; 26%) were dissatisfied with the received care. The prevalence of depression in the total sample was higher, compared to the prevalence of anxiety (34% versus 18%). Multivariable logistic regression showed that dissatisfaction with prenatal care was associated with older age, not attending check-ups regularly, and being employee of private company or student. Depression increased the odds of being dissatisfied by 2.6 times (95% CI 1.19∼5.79); while obstetric issues and anxiety were not associated with satisfaction. Perception of women about inadequate solution of the problem of antenatal depression was a significant predictor of dissatisfaction (AOR 6.87; 95% CI 1.81∼26.12).

Conclusions:

Depressed women in our study were less satisfied with prenatal care. Further investigation of the perception of women about specific aspects of perinatal health services is suggested. Providing a quality, patient-centered care is needed to support pregnant women during the current pandemic.

Key messages:

- To improve the quality of prenatal care, health providers should address not only physical concerns, but also psychosocial issues and symptoms of depression of pregnant women during current pandemic.
- Although prenatal care is accessible to all pregnant women in Kazakhstan, development of patient-centered perinatal care is needed, focusing on communication skills and quality of interaction.

Abstract citation ID: ckac130.118
A questionnaire to measure the impact of ICT-based coordination mechanisms on clinical coordination

M Luisa Vázquez Navarrete

D Campaz[1], I Vargas[1], P Plaja[2], M Sanclemente[3], M Paino[4], MT Madrid[4], ML Vázquez[1]
[1]Health Policy Research Unit, Consortium for Health Care and Social Services of Catalonia, Barcelona, Spain
[2]Fundació Salut Empodà, Figueres, Spain
[3]Son Espases University Hospital, Palma de Mallorca, Spain
[4]General Directorate, Department of Health, Basque Country, Spain
Contact: mlvazquez@consorci.org

Background:

In national health systems based on primary care, cross-level clinical coordination (CC) is a priority, as it may improve quality of care. Evidence on the impact of information and communication technology (ICT)-based coordination mechanisms on CC is inconclusive. The implementation of those mechanisms increased during the pandemic. The aim is to adapt the validated COORDENA-CAT questionnaire, for measuring CC, to analyse the implementation of ICT-based coordination mechanisms and its impact on CC in three regions of Spain.

Methods:

The COORDENA-CAT questionnaire underwent a two-stage adaptation process:1) contents revision based on literature review, expert discussions, and pretest to adapt the contents and language and produce a version for each region; and 2) piloting the adapted version by self-administration of the questionnaire to primary and secondary care doctors in the health systems of two of the participating regions.

Results:

The adapted version (COORDENA-TICs) kept most of the original contents. Main changes were on coordination mechanisms section. Pretest showed an adequate level of comprehensiveness, comprehension, sequence of themes and questions, and length. A low non-response rate was observed, with little variability or unexpected responses. The question on any difficulties encountered in answering the questionnaire revealed no relevant difficulties. The Shared Electronic Medical Record of each region was the most frequently used ICT-based coordination mechanism. Limited access to information and technical issues related to its use were the most common difficulties encountered. Suggestions for improving its use were receiving specific training on its use.

Conclusions:

COORDENA-TICs questionnaire is a useful tool to assess utilization of ICT-based coordination mechanisms and its impact on CC from the perspective of primary and secondary care doctors. It will allow comparisons across areas, regions and to evaluate changes over time

Key messages:

- Evidence on the impact of ICT-based coordination mechanisms on clinical coordination is inconclusive.
- COORDENA-TICs questionnaire could be useful to measure the impact of ICT-based coordination mechanisms on clinical coordination.

Abstract citation ID: ckac130.119
Analysing hospital travel times in central Athens using Google Maps services

Nikolaos Christos Xifaras

NC Xifaras[1], E Roubou[1], P Altsitzioglou[2]
[1]Department of Medicine, National and Kapodistrian University of Athens, Athens, Greece
[2]Department of Orthopedics, Attikon University Hospital, Athens, Greece
Contact: nixifaras@gmail.com

Introduction:

The importance of timely care is well documented for numerous emergency conditions, including STEMI and ischemic stroke, where low symptom-to-balloon/symptom-to-needle times are crucial for mortality and disability. The study of all potential delays helps us understand the constraints we have to work under. Here, we use Google Maps services to map the travel times from central Athens areas to on-duty hospitals

Methods:

We built our code in the Python programming language, using the Google Maps Distance Matrix API to perform real-time trip duration calculations based on real-life data. As reference points, we used a set of Athens neighbourhoods provided by the Municipality as open data; we considered only public secondary and tertiary health facilities as valid destinations, and based our calculations based on the available daily duty schedules.

Results:

Our algorithm collected 43,200 data points in total over two weeks, using 144 starting points. The average trip durations to reach an on-duty department formed a right-skewed distribution (-0.424), with a mean of 19.55 minutes and a median of 19.95 minutes. The maximum average time was 26.78 minutes, and the overall maximum was 44 minutes. Average travel times to cardiology, general surgery, neurology and internal medicine ERs, which experience a heavy patient load, were higher than the total mean (20.60/22.06/21.31/20.51 mins respectively). We found no correlation between the average travel time and average distance from a hospital or the geographical location, but we were able to create a map with hotspots of high/low travel times.

Conclusions:

Our approach to collecting accurate trip data has shown the impact of time-of-day and location on trips to hospitals, even for patients within the same larger area. As acute care can be time-sensitive, similar wide-scale modelling could be used to create systemic solutions, e.g. data-guided spatial distribution of facilities or transportation.

Key messages:

- Public APIs can be used to gather useful data about the context around our health systems.
- In Athens, a difference in position can mean up to 100% longer travel times to a hospital.

Abstract citation ID: ckac130.120
Fostering mental health and chronic diseases self-management among professional truck drivers

Jalila Jbilou

D Desrosier[2], ME Carrière[2], S Chartrand[2], MV Gaudet[2], J Jbilou[1,2]
[1]Psychology, Université de Moncton, Moncton, Canada
[2]School of Medicine, Université de Sherbrooke, Moncton, Canada
Contact: jalila.jbilou@umoncton.ca

Most passengers and goods in Canada travel by road. The trucking industry is the backbone of the tangible goods economy. However, the health and well-being of this aging workforce is in jeopardy. Recent data reveals that 86% of the truckers' community are 50 years old and over, 4% are female and 5% are immigrants. Moreover, 75% of the male truckers self-reported one or more health condition (54% obesity, 19% hyperlipidemia, 18 % high blood pressure, 11 % type II diabetes). Despite, the high prevalence of risk factors (e.g. stress, depression/anxiety, lower level of education, social isolation and financial challenges) and preventable chronic diseases among truckers, in New Brunswick and elsewhere in Canada, there is a lack of on-the-road accessible lifestyle change programs. Therefore, tailored interventions are needed to appropriately support them adopt healthy behaviors. Using the Re-AIM Framework, we carried out 23 semi-structured interviews to inform the development of tailored educational material. The aims were: to describe the needs and challenges and to design a truckers-sensitive educational intervention. The theoretical foundation of this qualitative study is articulated around concepts extracted from cognitive and behavioural theories (transtheoretical model of behaviour change). Qualitative analysis of verbatims identified four major themes: Lifestyle challenges, Social and individual representation of healthy behaviors, Health education strategies and communication and Motivational and engagement strategies. Drawing upon these findings we developed tailored educational material and pre-validated them with a small group of professional truck drivers. Our findings informed the development of an educational intervention to support truckers manage and improve their mental health and self-management of chronic diseases. The next step is to implement a randomized clinical trial to test and assess acceptability, feasibility, and effectiveness of our intervention.

Key messages:

- Improving mental health of professional truck drivers is an urgent public health issue.
- Format and content of mental health and chronic disease self-management need to be adapted at the cognitive (health liercy) and capacity (resources, time) level.

Abstract citation ID: ckac130.121
The economic value of informal long-term care

Tessa Huis in 't Veld

T Huis in 't Veld[1], D Korver[1], R Orhan[1], L Berenschot[1]
[1]Ecorys, Rotterdam, Netherlands
Contact: Tessa.HuisintVeld@ecorys.com

Informal care makes up a significant share of long-term care (LTC) and is likely to become even more important in the near future because of the ageing population, rising numbers of chronic patients and shortages of formal carers. At the same time, informal care is under pressure because of societal developments (shrinking family sizes, increased participation of women on the labour market, rising retirement age and geographical dispersion of families). These developments may further enhance the effect of informal care in terms of individuals' quality of life and opportunity costs caused by work absence and productivity losses. Against this background, Ecorys has performed studies, to empirically estimate the social value of informal LTC and increase the awareness on its importance. The results of the study, commissioned by the European Commission, demonstrate that informal caregivers represent about 80% of all caregivers (measured in FTE). If paid for, these hours would cost between 2.4 and 2.7% of EU GDP. Currently, these costs are not paid and the actual costs of informal care are estimated at 1.05% of EU GDP, mostly in lost tax revenues. European countries vary greatly in the extent to which informal carers are supported by public policies. Only some countries have cash benefit schemes to compensate for the loss of income from employment. Specific benefits and leave entitlements to support informal caregivers are often insufficient or lacking. In several studies in the Netherlands, Ecorys found that total social costs of informal care are estimated at 2.54% of NL GDP (€22 billion/year) and informal caregivers perceive increasing economic and psychological burden and are at higher risk of depression and burn out. Government policies are developed to better support informal caregivers.

Key messages:

- Throughout the EU, most long-term care is provided by informal caregivers. Social costs of informal care represent 2.4 – 2.7% of EU GDP, actual financial costs are 1.05%.
- Informal caregivers suffer negative effects in terms of income and quality of life. Public policies to support informal caregivers vary widely throughout the EU.

Abstract citation ID: ckac130.122
Determinants of Homelessness (SODH) in North West England in 2020

Mzwandile Mabhala

M Mabhala[1]
[1]University of Chester, Chester, UK
Contact: a.mabhala@chester.ac.uk

Background:

Poverty creates social conditions that increase the likelihood of homelessness. These include exposure to traumatic life experiences; social disadvantages such as poor educational experiences; being raised in a broken family, care homes or foster care; physical, emotional, and sexual abuse; and neglect at an early age. These conditions reduce people's ability to negotiate through life challenges.

Methods:

This cross-sectional study documents the clustering and frequency of adverse social conditions among 152 homeless people from four cities in North West England between January and August 2020.

Results:

Two-step cluster analysis showed that having parents with a criminal record, care history, and child neglect/abuse history was predictive of homelessness. The cluster of indicator variables among homeless people included sexual abuse ($\chi2$ (N = 152) = 220.684, $p < 0.001$, Cramer's V = 0.7), inappropriate sexual behaviour ($\chi2$ (N = 152) = 207.737, $p < 0.001$, Cramer's V = 0.7), emotional neglect ($\chi2$ (N = 152) = 181.671, $p < 0.001$, Cramer's V = 0.7), physical abuse by step-parent ($\chi2$ (N = 152) = 195.882, $p < 0.001$, Cramer's V = 0.8), and physical neglect ($\chi2$ (N = 152) = 205.632, $p < 0.001$, Cramer's V = 0.8).

Conclusions:

Poverty and homelessness are intertwined because of the high prevalence of poverty among the homeless. Poverty sets up a chain of interactions between social conditions that increase the likelihood of unfavourable outcomes: homelessness is at the end of the interaction chain. Interventions supporting families to rise out of poverty may also reduce entry into homelessness.

Key messages:

- Being poor is associated with so many childhood adversities that it may be considered an ACE in itself.
- Reducing poverty might be one strategy to reduce both ACEs and homelessness.

Abstract citation ID: ckac130.123
Sickness absence and disability pension in white-collar workers in the trade and retail industry

Kristin Farrants

K Farrants[1], *K Alexanderson*[1]
[1]Division of Insurance Medicine, Department of Clinical Neuroscience, Karolinska Institutet, Stockholm, Sweden
Contact: kristin.farrants@ki.se

Background:

Very little is known about sickness absence among white-collars workers in the trade and retail industry, despite being a large and important group on the labour market. The aim was to investigate future sickness absence (SA) and disability pension (DP) in a cohort of privately employed white-collar employees in the trade and retail industry.

Methods:

A prospective population-based cohort study of all 192,077 such white-collar workers (44% women) in Sweden in 2012, using linked microdata from three nationwide registers covering 2012-2016. Prevalence and mean number of SA and/or DP net days/year in general and by diagnoses categories were calculated for all and also stratified by sex. Logistic regression was used to calculate odds ratios (OR) and 95% confidence intervals (CI) between sociodemographic and work-related factors and future SA/DP.

Results:

The proportion who had SA and/or DP was higher in women (10-13%, depending on year) than men (4-6%) each year. Each studied year, women had more mean SA/DP net days than men in the entire cohort, however, among those who had SA and/or DP, there were no gender differences regarding the mean number of net days. The mean number of SA/DP net days increased for both women and men each year, especially SA due to mental diagnoses. SA in 2012 was the strongest factor associated with SA/DP in 2016 (OR women 3.28, 95% CI 3.09-3.47; men 4.10, 95% CI 3.76-4.48). Work-related factors were only weakly or insignificantly associated with future SA/DP. The ORs for most factors were stronger for men than for women.

Conclusions:

More knowledge about the mechanisms behind these results are needed. Some SA/DP measures showed large sex-differences, others not - it is important to use different measures to show the complexity of these phenomena. Several factors were more strongly associated with SA/DP among men than among women, indicating that there are other factors of importance for women.

Key messages:

- Most white-collar workers in the trade and retail industry had no SA/DP in any of the six studied years. SA due to mental diagnoses was the largest and fastest-growing SA/DP diagnostic group.
- Sickness absence in 2012, female sex, and low education were associated with future SA/DP. Most other socio-demographic and job-related factors were not, or only weakly, associated with future SA/DP.

Hustle: Experiences of making work 'work' for non-standard and precariously employed workers in NYC

Isabel Cuervo

I Cuervo[1], *EQ Ahonen*[2], *EF Vignola*[3], *L Davis*[4], *S Baron*[1]

[4]Boston, USA
Contact: icuervo@qc.cuny.edu

Background:

Precarious and non-standard employment (NSE) has negative implications for workers' health. As part of a six-country comparative mixed methods case study, this research explores US-based workers' experiences in NSE and its influences on their health and well-being in a context of weak labor regulations and social welfare programs.

Methods:

To understand US policy context, we analyzed country-level labor regulatory and social protection frameworks using 2019 Organization for Economic Cooperation and Development data. To understand workers' experiences, we conducted in-depth interviews with NSE workers in various occupations in New York City (N = 40) between January and May 2021. We recruited and screened eligibility via Facebook advertisements and an online questionnaire, respectively. We used deductive and inductive thematic analysis for interview data.

Results:

With heavy reliance on market competition in the US, minimal state regulation and flexible labor markets create less secure employment along with limited government-funded social supports. Workers' experiences center on the Hustle, i.e., figuring out how to make NSE work for them and their families. They lack healthcare coverage and have low expectations of other supportive employment and social protections (e.g., paid leave). While NSE payoffs (e.g., perceived flexibility) were common for most, almost all experience NSE tradeoffs (e.g., job insecurity and instability) that create stress and overwork, negatively implicating overall health and well-being. These impacts differ by access to resources associated with social location (e.g., immigration status). COVID-19 exacerbated these experiences.

Discussion:

Low expectations of supportive policies of US workers in NSE are linked to the individualized hustle, as they attempt to counter NSE tradeoffs often relying on family to fill those gaps. Over-reliance on privatization for social supports such as healthcare coverage can be detrimental to workers' health.

Key messages:

- US workers in NSE experience stress and overwork with low expectations of support from the state.
- We caution against increasingly market-based policies in Europe, which may jeopardize public health.

Managers' sick-leave recommendations - a video vignette study on common mental disorders

Gunnel Hensing

G Hensing[1], *J Hultquist*[1,2], *M Bertilsson*[1]
[1]School of Public Health and Community Medicine, University of Gothenburg, Göteborg, Sweden
[2]Department of Health and Rehabilitation, University of Gothenburg, Göteborg, Sweden
Contact: gunnel.hensing@socmed.gu.se

Background:

Sick leave due to common mental disorders (CMD) in Sweden is higher among women than men. Since the Swedish labor market is highly sex segregated a contributing factor might be managers' attitudes towards CMD and sick leave. This video vignette study tests three hypotheses on managerś sex and recommendation for sick leave. The hypotheses are: (1) there is an association between negative attitudes towards CMDs and recommending sick leave, and (2) there is an association between educational level and recommending sick leave, and (3) there is an association between workplace factors and managerś recommendation of sick leave.

Methods:

The study sample consisted of 2703 Swedish managers, female (34%) and male (66%). The online survey included a randomized female and male video vignette played by actors and specifically designed for the study. Associations were investigated by means of logistic regression. The covariates were attitudes towards depression, educational level, labor sector, size of company, proportion of women/men at the workplace, and sex of the person in the video vignette.

Results:

The bi-variate crude analysis showed an OR of 1.28 (95% C.I. 1.08-1.51) for female vs. male managers' recommendation of employee sick leave to the video vignette. Negative attitudes towards CMD did not add to the model, whereas educational level did, OR 1.34 (95% C.I. 1.13-1.59). The final, fully adjusted model showed an OR of 1.39 (95% C.I. 1.16-1.66) for female vs. male managers' recommendation of employee sick leave.

Conclusions:

The likelihood of a manager recommending sick leave after watching a CMD-labelled video vignette was slightly higher for female managers compared to male, and it remained in the final adjusted model. The results resonate with the registered sick leave and the sex segregation among managers and industries in the Swedish labor market.

Key messages:

- Female managers were slightly more likely to recommend sick leave to a video vignette case compared to male managers.
- Negative attitudes towards CMD were not associated with recommending sick leave.

Contact: emilia.vignola45@login.cuny.edu

Background:

Over the last decades, the prevalence of non-standard employment (NSE) has increased in many countries, with negative implications for worker health and well-being. Research at the micro level, mostly quantitative, has linked NSE with poor health through insecurity. Macro-level studies investigating whether political economic factors buffer the harms of NSE have generated mixed results. This study describes how various types of insecurity are experienced by workers in NSE, in general and during COVID-19, and how this influences their health and well-being, in six countries with different welfare states: Belgium, Canada, Chile, Spain, Sweden and the United States.

Methods:

In-depth interviews with 250 workers in NSE were analysed using a multiple-case study approach and using the welfare state typology as a macro-level framework.

Results:

Despite differences in welfare states, workers in all six countries experienced multiple forms of insecurity as well as relational tension with employers or clients, with clear negative effects on their well-being, in ways that were shaped by broader social inequalities (e.g., related to gender, age, and access to family support). Simultaneously, differences in welfare states were reflected in the level of workers' exclusion from social protections, the temporality of difficulties they faced in planning their lives (e.g., threats to daily survival or to longer-term life planning), and their ability to derive control from NSE despite the insecurity it created. Workers in less generous welfare states experienced heightened insecurity and greater stress from the COVID-19, but the severity of the health and economic crisis was felt by workers in all study countries.

Conclusions:

This study sheds light on the ways that welfare regimes can support - or fail to support - workers in NSE, and suggests the need in all six countries for stronger state responses to NSE, a pressing social determinant of health.

Key messages:

- Employment insecurity is a central dimension of the experience of non-standard employment across the six countries.
- Differences in state approaches to labour market regulation and social welfare influence how non-standard workers experience insecurities.

[7]Centre for Occupational and Environmental Medicine, Stockholm Region, Stockholm, Sweden
Contact: julio.hernando@ki.se

Background:

Mental health disorders have become one of the leading diagnoses causing sickness absence. Previous studies have examined the impact of single employment characteristics or working conditions on sickness absence. However, few studies have investigated the effect of a multidimensional construct of precarious employment on sickness absence. Therefore, this study aims to describe sickness absence due to common mental disorders (CMD) as a proxy for access to social security benefits among precarious and non-precarious workers with mental health problems.

Methods:

Cohort register-based study of the total Swedish population aged 27 to 61 years residing in Sweden in 2016 and having mental health problems defined as being prescribed Selective Serotonin Reuptake Inhibitors (SSRI) in 2017 (N = 19,691). Individuals were classified as precariously employed or not based on a precarious employment score measured multi-dimensionally in 2016 (i.e., employment insecurity, income inadequacy, and lack of social protection). The outcome was the incidence of the first sickness absence episode due to CMD co-occurring with SSRI treatment in 2017. Logistic regression models will be performed.

Results:

The following results are preliminary. Precariously employed treated with SSRI were 8,68% in 2017. The distribution of a first sickness absence episode due to common mental disorders was similar in precarious and non-precarious workers (12.35% and 12.42%, respectively). Individuals directly employed (12.20%), with multiple jobs holding (14.62%), and low-medium income levels (14%) had higher sickness absence incidence due to common mental disorders. There were slight differences by gender.

Conclusions:

In these preliminary results, no differences were found between precarious and non-precarious workers with mental health problems in the distribution of sickness absence due to CMD. Further analysis will be conducted to investigate whether precarious employment is associated with sickness absences.

Key messages:

- Sickness absence due to common mental disorders is similarly distributed among precarious and non-precarious workers.
- Individuals with multiple jobs, low-income levels, and directly employed show higher sickness absence incidence due to common mental disorders.

Abstract citation ID: ckac130.128
Prior sick leave with mental or somatic diagnoses and being in work in ages 66–71; a Swedish cohort

Aleksiina Martikainen

A Martikainen[1], *A Svensson Alavi*[1], *K Alexanderson*[1], *K Farrants*[1]
[1]Division of Insurance Medicine, Karolinska Institutet, Stockholm, Sweden
Contact: aleksiina.martikainen@gmail.com

Background:

As longevity and retirement ages are increasing, knowledge is needed on factors hindering extended working lives. The aim of this study was to explore how sickness absence (SA) and disability pension (DP) due to mental and/or somatic diagnoses before age 65 were associated with being in paid work when aged 66-71.

Methods:

A 6-year prospective population-based cohort study of all 98,551 people (48% women) in Sweden who turned 65 years in 2010 (baseline year) and had been in paid work at any point when aged 60-64. Microdata from nationwide registers were used. Exposure variables were SA (spells >14 days) and/or DP in 2005-2009, and the outcome variable was paid work at any point in 2011-2016. Logistic regression was used to calculate odds ratios (OR) with 95% confidence intervals (CI) for associations between exposures and outcome, controlling for sociodemographic factors in 2010, stratified by sex.

Results:

Most women (56.0%) and men (66.3%) had no SA or DP when aged 60-64. Of the women, 42.7% and of the men 53.3% were in paid work after the age of 65. Those with SA due to mental diagnoses had lower OR of being in paid work (women 0.76; 95% CI: 0.69-0.84; men 0.74; 0.65-0.84). This association was weaker for SA due to somatic diagnoses (women 0.87; 0.84-0.91; men 0.92; 0.89-0.96). Having had SA due to both mental and somatic diagnoses was associated with lower OR for men (0.77; 0.65-0.91) but not women (0.98; 0.88-1.09). Full- or part-time DP had the strongest association with not being in paid work regardless of diagnosis group and sex (e.g., women mental DP 0.39; 0.34-0.45; women somatic DP 0.38; 0.35-0.41; men mental DP 0.36; 0.29-0.43; men somatic DP 0.35; 0.32-0.38).

Conclusions:

SA due to mental diagnoses had a stronger association with not being in paid work after age 65 than SA due to somatic diagnoses. The results highlight the importance of identifying factors that hinder older workers with mental disorders to extend their working lives.

Key messages:

- Many were in paid work after age 65, also among those with previous SA. However, this was less likely among those who had been on SA due to mental diagnoses compared to somatic diagnoses.
- More knowledge is needed on how older people with different types of mental and somatic morbidities can extend their working lives, what hinders and what promotes this in different European countries.

Abstract citation ID: ckac130.129
Employment at the onset of partial disability retirement and four years later

Anu Polvinen

A Polvinen[1]
[1]The Finnish Centre for Pensions, Helsinki, Finland
Contact: anu.polvinen@etk.fi

Background:

Increasing the labour market participation of people with a reduced ability to work is a big labour market challenge in many countries. In Finland, one third of all new disability pensions are granted as partial pensions. It is also known that most partial disability pensioners continue working while receiving a pension. There is only limited research about the length of employment of partial disability pensioners and the factors associated with employment in retirement. The aim of this study was to examine the employment at the onset of partial disability retirement and four years after retirement, and to examine how age, gender, educational level, employment sector, diagnosis and type of pension are associated with employment after partial disability retirement.

Methods:

Our Finnish register data comprised 7,617 partial disability pensioners aged 20-58 who retired in 2013 or 2014. Logistic and multinomial logistic regression analysis were used to estimate OR:s and 95 percent CI:s for employment at the onset of partial disability retirement and four years after retirement.

Results:

81 percent of partial disability pensioners were employed when retiring on a partial disability pension. Four years later, 50 percent were still drawing a partial disability pension, of whom 77 percent were working. 11 percent were employed but no longer drawing a partial disability pension. The partial disability pensioners who were more often employed were younger, female, more highly educated, working in the public sector and receiving a temporary disability pension.

Conclusions:

Many sociodemographic factors are associated with employment at the onset of partial disability retirement and with continued working while drawing a partial disability pension.

Key messages:

- Employment after partial disability retirement is common and relatively stable. After four years of retirement, more than 70 percent of partial disability pensioners were still working.
- Many sociodemographic factors are associated with employment after partial disability retirement.

Abstract citation ID: ckac130.130
Impact of COVID-19 on psychosocial work factors and emotional exhaustion among healthcare workers

Fleur van Elk

F van Elk[1], *SJW Robroek*[1], *A Burdorf*[1], *KM Oude Hengel*[2]
[1]Public Health, Erasmus University Medical Center, Rotterdam, Netherlands
[2]Work Health Technology, TNO, Leiden, Netherlands
Contact: f.vanelk@erasmusmc.nl

Background:

Healthcare workers are at risk to develop mental health problems and to experience adverse psychosocial working conditions during the COVID-19 pandemic. This study aims to investigate across subgroups of healthcare workers i) differences in psychosocial working conditions and emotional exhaustion, ii) changes in psychosocial working conditions and emotional exhaustion during the pandemic compared to the situation before, and iii) impact of different stages of the COVID-19 pandemic in terms of hospital pressure on psychosocial working conditions and emotional exhaustion.

Methods:

Data on psychosocial working conditions and emotional exhaustion of five measurements from 1,915 healthcare workers participating in the longitudinal study 'the Netherlands Working Conditions Survey- COVID-19' were used. Three subgroups were defined: working with COVID-19 patients, working with other patients, and not working with patients. For each measurement, hospital pressure was determined. Linear mixed models were fitted to analyze the differences across subgroups of healthcare workers.

Results:

Healthcare workers working with patients, in particular COVID-19 patients, had more unfavorable psychosocial working conditions than those not working with patients. Psychosocial working conditions deteriorated among those working with patients compared to pre-COVID-19, but no changes were found for emotional exhaustion. An increasing hospital pressure resulted in improved job autonomy and emotional demands among healthcare workers working with COVID-19 patients, but did not result in differences in other working conditions and emotional exhaustion.

Conclusions:

Psychosocial working conditions deteriorated for healthcare workers working with (COVID-19) patients during the pandemic compared to the situation before the pandemic, while emotional exhaustion did not change in these subgroups. This shows the importance of interventions to improve working conditions of healthcare workers.

Key messages:

- Healthcare workers working with (COVID-19) patients experience unfavorable psychosocial working conditions, which deteriorated during COVID-19. No changes were found for emotional exhaustion.
- An increase in hospital pressure did not further deteriorate psychosocial working conditions.

Abstract citation ID: ckac130.131
Cardiovascular risk in young healthcare workers: results from a cross-sectional study

Valentin Imeshtari

V Imeshtari[1], *A Imeshtari*[1], *G La Torre*[1]
[1]Department of Public Health and Infectious Diseases, Sapienza University of Rome, Rome, Italy
Contact: valentin.imeshtari@uniroma1.it

Background:

Cardiovascular diseases represent the main cause of mortality worldwide. While cardiovascular risk (CVR) has decreased in grown adults and elderly in the last years due to innovative therapies and prevention, it seems to be rising among young adults. The aim of our study was to map the 10-year CVR in healthcare workers (HCWs) at the teaching hospital Policlinico Umberto I of Rome and identify possible determinants in order to design and implement preventive strategies.

Methods:

A cross-sectional study was carried out between January 2019 and July 2020. 525 HCWs aged 20-40 years were recruited. All participants underwent, after informed consent, medical history collection, physical examination and blood tests. CVR was measured using Framingham Risk Score (FRS) and CUORE score (CVR score developed by the Italian National Institute of Health). Univariate, bivariate and multivariate analysis were performed.

Results:

CVR evaluated with FRS correlated positively with age ($\beta = 0.104$, $p < 0.001$), being a shift worker ($\beta = 0.06$, $p = 0.037$), and negatively with female gender ($\beta = -0.757$, $p < 0.001$). No differences were found between being a doctor or a nurse. CVR evaluated with CUORE score correlated positively with age ($\beta = 0.698$, $p < 0.001$), and negatively with female gender ($\beta = -0.332$, $p < 0.001$) and being a doctor ($\beta = -0.220$, $p < 0.001$). Inferential analysis showed low correlation between FRS and CUORE Score ($R2 = 0.340$).

Conclusions:

Our study demonstrates that females have a lower CVR among HCWs. On the contrary, 15% of male HCWs show a CVR above the average. FRS and CUORE score indicate that advancing age determines an increase in CVR. There is a low correlation between the scores used, in fact CUORE score underestimates the CVR of shift workers while it is known that this particular category is at higher risk.

Key messages:

- Some of the HCWs have higher risk of cardiovascular events despite their young age. Further research is needed in order to design appropriate prevention strategies.
- FRS is more accurate in the prediction of CVR among HCWs compared to CUORE score.

Abstract citation ID: ckac130.132
Occupational hazards and early retirement: German National Cohort (NAKO) baseline distributions

Janice Hegewald

J Hegewald[1,2], *K Romero Starke*[2], *U Latza*[3], *A Seidler*[2]
[1]Unit 3.1 Prevention of Work-related Diseases, Federal Institute for Occupational Safety and Health, Berlin, Germany
[2]IPAS, TU Dresden, Dresden, Germany
[3]Division 3 Work and Health, Federal Institute for Occupational Safety and Health, Berlin, Germany
Contact: hegewald.janice@baua.bund.de

Background:

Despite measures to ensure occupational safety, harmful workplace conditions that negatively impact worker health persist. The baseline assessment of the German National Cohort (NAKO) provides a basis for determining the prevalence of occupational hazards and early retirement (due to health reasons).

Methods:

From 2014 to 2017, the NAKO examined 205,141 participants aged 20-69 years at 18 study centers across Germany. Working participants were asked about exposure to airborne particulates, occupational noise, evening and night work, sick days, presenteeism, and personal safety equipment use (respiratory masks, hearing protection). The assessment also included questions on retirement. We examined the distributions descriptively.

Results:

A total of 84.2% (n = 172,766) participants were ever employed. Of these participants, 7.9% reported ever working in a job with dust or air particulate exposure where a respiratory mask was required for at least one year. However, nearly one-third (31.6%) of the particulate-exposed workers reported not having worn a mask. 11.4% worked at least a year in a job that required hearing protection, but 27.2% of noise-exposed workers did not comply with this safety measure. Over half of the workers sometimes worked between 6 and 10 pm, and 18.7% sometimes worked at night (11 pm to 6 am) in the last three months. On average, participants used 10.5 sick days in the previous year, and the 12-month prevalence of going to work sick at least one day (presenteeism) was 64.9%. Nearly one-fourth (24.4%; n = 9043) of retirees reported early retirement due to health reasons.

Conclusions:
Hazardous working conditions were common, and there was only partial compliance with the use of available personal safety equipment and measures. The NAKO provides a basis for examining the distribution of occupational exposures in Germany, and future prospective data will permit an evaluation of the effectiveness of preventative regulations.

Key messages:
- The NAKO cohort provides essential information on the prevalence of hazardous working conditions in Germany.
- In the future, trend observations from the prospective data can help evaluate the efficacy of preventive regulations.

Psychometric Properties of the Turkish Version of the Coronavirus-Related Health Literacy Scale

Pinar Soylar

P Soylar[1], *F Öztürk*[2], *S Sönmez*[3]
[1]Health Science Faculty, Firat University, Elazig, Turkey
[2]Nursing Faculty, Ankara University, Ankara, Turkey
[3]Faculty of Education, Ege University, İzmir, Turkey
Contact: psoylar@gmail.com

Background:
This study aims to assess the validity and reliability of the Coronavirus-Related Health Literacy Questionnaire adapted to Turkey and examine the levels of coronavirus-related health literacy among the adults.
Methods:
This cross-sectional study was carried out in Turkey. The tools were applied to a total sample population of 452 people. Exploratory Factor Analysis (EFA) and Confirmatory Factor Analysis (CFA) were calculated to determine the construct validity of the questionnaire with the IBM SPSS Amos program version 24.0.
Results:
The validity and reliability analyses of the Coronavirus-Related Health Literacy (HLS-COVID-Q22) questionnaire were adapted to Turkish. Internal consistency was very high ($\alpha = 0{,}963$) and construct validity suggests a sufficient model fit, making HLS-COVID-Q19 a feasible tool for assessing coronavirus-related health literacy in population surveys. The findings show that the questionnaire is a valid and reliable tool consisting of 19 items and 3 subdivisions. The mean coronavirus-related health literacy score of the participants was found to be 2.92 (±0.51), meaning that it was on average. The coronavirus-related health literacy level of 18.8% of the participants was found to be 'inadequate' while 37.8% had 'problematic' and 43.4% 'sufficient' health literacy. The HLS-COVID-Q19-TR scores of those in the young age group (18-29 years old), married, employed, university graduates, and vaccinated against COVID-19 were found to be higher, and a statistically significant difference was found ($p = 0.049$, $p = 0.009$, $p = 0.029$, $p = 0.012$ and $p = 0.051$, respectively).
Conclusions:
The results of the research reveal that the HLS-COVID-Q19-TR is a valid and reliable tool. In this study, more than half of the participants were found to have "inadequate" or "problematic" coronavirus-related health literacy levels. For this reason, studies aimed at improving society's coronavirus-related health literacy should be conducted.
Key messages:
- There is now a valid tool to assess the Covid 19 health literacy level of individuals in Turkey. It will contribute to the determination of Covid 19 health literacy level in Turkey.
- An adequate level of health literacy helps people make informed decisions by combating misinformation about COVID-19 and supporting individuals' self-management.

Abstract citation ID: ckac130.135 Coronavirus-related Health Literacy in elderly and adult population during COVID pandemic in Italy

Luigi Palmieri

L Palmieri[1], A Rosano[2], C Lorini[3], C Cadeddu[4], G Bonaccorsi[3], B Unim[1], P De Castro[5], D Galeone[6], G Onder[1], C Donfrancesco[1]

[5]Scientific Communication Unit, Istituto Superiore di Sanità, Rome, Italy
[6]Ministry of Health, Rome, Italy
Contact: luigi.palmieri@iss.it

Background:

The COVID-19 pandemic caused an overabundance of valid and invalid information rapidly spread via traditional media, by internet and digital communication. Health Literacy (HL), as the ability to access, understand, appraise, apply health information, is fundamental for finding, interpreting, correctly using COVID-19 information.

Methods:

In 2021, in the framework of the participation to the WHO M-POHL (Measuring Population and Organizational Health Literacy) network, a survey was conducted in a representative sample of the Italian general population aged 18+ years (N = 3,500). The validated HL questionnaire included coronavirus-related HL (HL-COVID, 16-items), general HL, sociodemographic characteristics, risk factors, lifestyles sections. For the HL-items, a 4-point Likert scale was applied: very easy, easy, difficult, very difficult. HL-COVID levels were defined as Good: very easy+easy>81.3% (more than 12 of 16 answers); Sufficient: 50.0%<very easy+easy < = 81.3% (9-12 of 16 answers); Limited: very easy+easy < = 50.0% (fewer than 9 of 16 answers). Elderly were responders aged 65+ years, the remaining ones were defined as adults. Ordinal Logistic Regression analysis was performed to assess the association of HL-COVID with sociodemographic characteristics (sex, age-group, educational level, financial deprivation).

Results:

Good HL-COVID prevalence was lower in elderly than in adults (44.8% vs. 51.0%, p-value = 0.001); the opposite for both sufficient (22.8% vs. 19.9%) and limited (32.5% vs. 29.1%) levels, but not statistically significant. The odds of a low HL-COVID (sufficient/limited) increased by 31% in the elderly and by 50%, 92%, and almost triple in persons with a low, considerable, and severe financial deprivation level, respectively.

Conclusions:

The COVID-19 pandemic highlighted the need to improve HL and to prepare the general population for future emergency and non-emergency situations, confirming that HL can be considered a social vaccine.

Key messages:

- Low coronavirus-related HL level is mostly associated to elderly and to increasing deprivation level.
- The COVID-19 pandemic confirmed that Health Literacy can be considered a social vaccine.

Abstract citation ID: ckac130.136 Participation in prevention measures during the corona pandemic in Germany in 2020/21

Susanne Jordan

S Jordan[1], R Kuhnert[1], N Schmid-Küpke[2], A Starker[1]
[1]Department of Epidemiology and Health Monitoring, Robert Koch Institute, Berlin, Germany
[2]Department of Infectious Disease Epidemiology, Robert Koch Institute, Berlin, Germany
Contact: jordans@rki.de

Background:

The availability and use of preventive measures such as diet courses, sports groups, and counselling services were hindered by containment measures set by the German government and local authorities to reduce the spread of the COVID-19 pandemic. Regulations on contact restriction, closure of sport and leisure facilities made it difficult to use prevention programs in 2020 and 2021. So far, no information is available to what extent the participation of the population in prevention programs has changed as a result of the pandemic and whether there are group differences regarding socio-demographic characteristics.

Methods:

We used standardized telephone interviews of the adult German-speaking population to ask for changes in the participation in prevention measures in the last 12 months as a result of the corona pandemic. The data were collected between 17.3.2021 and 18.08.2021 in four cross-sectional surveys and is representative of the population aged 18 years and older in Germany. Analyses of the weighted and pooled data were conducted for n = 3,998 individuals by gender, age and education.

Results:

Almost one third of the respondents reported a lower use of programs (28.3%). An unchanged use of the programs was stated by 6.5%, a higher use by 2.1%. 63.2% said they did not use such programs. More women (33.6%) than men (22.7%) reported reduced pandemic-related use ($p < 0.0001$). For women, we observed a difference between age and education groups, but not for men: Lower participation was reported by a higher proportion of older than younger women ($p < 0.0001$). More women with high education reported an increased use than ones with low education ($p = 0.003$) (preliminary results).

Conclusions:

The observed differences indicate to different barriers to use prevention measures during the pandemic, especially for women. To promote equal opportunities, resilient structures of prevention and health promotion should be built for future crises in advance.

Key messages:

- The use of prevention measures was seriously reduced by the corona pandemic.
- To be prepared for further crises, concrete barriers to use prevention programs under crisis conditions should be identified and addressed through public health actions.

Abstract citation ID: ckac130.137 Predictors of physical activity and smoking among German teachers during the SARS-CoV-2 pandemic

Viktoria Eggert

V Eggert[1], C Koestner[1], T Beutel[2], K Kalo[3], T Dicks[1], C Zaehme[1], S Letzel[1,2], P Dietz[1]
[1]Research Group Public Health and Social Medicine, University Medical Center of the University of Mainz, Mainz, Germany
[2]Institute for Teachers' Health, University Medical Center of the University of Mainz, Mainz, Germany
[3]Department of Sports Medicine, Disease Prevention and Rehabilitation, Johannes Gutenberg University Mainz, Mainz, Germany
Contact: vieggert@uni-mainz.de

Background:

The SARS-CoV-2 pandemic has influenced the social and health-related behavior due to significant changes and constraints in the professional and private life. Especially in the school context, there were considerable changes, which may have promoted positive and negative health behaviors. Therefore, the aim of our study was to identify the predictors of physical activity and smoking of teachers during the SARS-CoV-2 pandemic.

Methods:

In March 2021, a nation-wide online survey was conducted among teachers in Germany. A total number of 31,089 participants entered analysis. Data on smoking and physical activity as well as sociodemographic, workplace-related, psychological, SARS-CoV-2-related, and health-related items were collected using established instruments and if necessary self-developed items. Two binary logistic regressions with block wise inclusion of the different variable groups were performed to predict physical activity and smoking.

Results:

Among all surveyed teachers, 70.1% did not comply with the WHO recommendation of being physically active for at least 150 minutes per week and 13.9% reported to smoke. The regression analyses revealed significant predictors for physical activity (e.g., time requirement) and smoking (e.g., work schedule).

Conclusions:

Recommendations to improve teachers' health can be derived from the predictors for physical activity and smoking that were identified in our study. Given the alarming result that more than two thirds of the teachers did not comply with the WHO recommendations, a special focus should be placed on improving physical activity, as this is a crucial factor for somatic and mental health.

Key messages:

- Teachers in Germany showed alarmingly low compliance regarding the WHO recommendations on physical activity during the pandemic.
- To improve teachers' health, it is important to take into account significant predictors of health behavior when planning interventions.

Abstract citation ID: ckac130.138
Domestic violence in indian women: status of husbands' alcohol consumption as a determinant factor

Joana Sofia da Silva Maia

J da Silva Maia[1], *J Félix China*[2], *JP Teixeira*[3]
[1]Public Health Unit, Primary Healthcare Cluster Estuário do Tejo, Lisbon, Portugal
[2]Public Health Unit, Primary Healthcare Cluster Arrábida, Setúbal, Portugal
[3]Public Health Unit, Primary Healthcare Cluster Sintra, Lisbon, Portugal
Contact: joanamaia93@gmail.com

Background:

Domestic violence continues to be a major public health issue that affects millions of individuals worldwide. According to the 2015-2016 India National Family Health Survey, 33% of married women had been victims of spousal physical, sexual, or emotional violence. It was also revealed that spousal abuse differs depending on the level of the husband's alcohol consumption. In this case, determining the link between this consumption and domestic violence is critical.

Methods:

The effects of husbands' alcohol use on the occurrence of domestic violence and associated risk factors were investigated using data from the 2015-2016 India Individual Record Database (DHS) A binomial logistic regression model was used for the analysis.

Results:

62554 married women aged 15 to 49 were chosen for this study, of which 31.2% have experienced some form of marital violence. Women with husbands who drink alcohol account for 31% of the sample, with 49.5% of those committing domestic violence against their wives. In a multivariate analysis, women whose spouses drink have a 3.11 times higher chance ($p < 0.01$; adjOR = 3.11, 95%CI 3-3.23) of experiencing domestic violence than women whose husbands don't drink.

Conclusions:

The effect of the husband's alcohol use on the occurrence of domestic violence can be used to guide evidence-based targeted intervention.

Key messages:

- Domestic violence is a public health issue with potential for targeted intervention.
- Targeted interventions in husbands' alcohol consumption of women who suffer domestic violence might guide useful interventions to address this problem.

Influencing behavioral patterns through primary prevention, possibly addressing more risk factors at a time, is the most effective means to tackle cardiovascular diseases. Many interdisciplinary prevention activities have been coordinated by community nurses outside of specialist centers, resulting in a more effective control of risk factors. Our study aims at describing the impact of an 18-month prevention and promotion, interdisciplinary intervention on lifestyle habits and cardiovascular risk. From December 2018 to May 2020, patients were recruited by 4 General Practitioners (GPs) in the Roman neighborhood of Torresina and received nutritional, physical and psychological counselling to learn healthy lifestyles. Until May 2020 patients had to self-manage their new healthy habits, but during this phase the SARS-CoV-2 pandemic broke out. Patients were assessed at baseline, 6, 12 and 18 months by a nutritionist, a physiotherapist, a psychologist, the 4 GPs and community nurses, and the cardiovascular risk score (CRS) was estimated at every examination. 76 patients were included, with a mean age of 54,6 years. Mean CRS showed a significant reduction between baseline and 12 months (from 4.9 to 3.8, $p < 0.001$), but this trend was not maintained at 18 months. As for variables included in the calculation of the cardiovascular risk score, both total cholesterol and systolic blood pressure significantly decreased at 6 months of follow up (respectively, from 211.1 to 192 ($p < 0.001$) and from 133.1 to 123.1($p < 0.001$)). Nontheless, the reduction was maintained in the remaining points in time only for systolic blood pressure. Our interdisciplinary educational intervention in a primary care setting resulted in a CRS improvement at 12 months, but this changes where not maintained at 18 months. Community nurses were facilitators in improving health outcomes and patient's satisfaction in the described primary care setting.

Key messages:

- Our interdisciplinary educational intervention in a primary care setting resulted in a CRS improvement at 12 months, but this changes where not maintained at 18 months.
- Community nurses are facilitators in improving health outcomes and patient's satisfaction in the described primary care setting.

Background:

Health literacy (HL) concerns the knowledge and competences of people to meet the complex demands of health in modern society. It is essential for health promotion, disease prevention and healthcare. Young adults can perform a very important role in taking a more active role in managing and protect their health, so this study aimed to identify the HL levels in the population of higher education students, according to the European Health Literacy Survey (HLS-EU-PT) and to evaluate its association with social and academic determinants.

Methods:

A quantitative, observational, and cross-sectional study was carried out based on an online survey disseminated in Portuguese universities. Data were analysed using binary logistic regression, adjusted for age, income, parents' education, gender, and chronic disease report.

Results:

In total, 4801 students were surveyed, 76% female. Of those, 44% revealed a problematic or inadequate level of HL. Those students with higher income levels (OR (95% CI), OR = 4.5 (3.4; 5.9) and whose parents had higher education levels (OR = 1.3(1.1; 1.5) had higher odds of achieving sufficient or excellent levels of HL, even after adjusting for confounders. In what concerns academic determinants, data revealed that HL tends to be sufficient or excellent among those students from health-related courses (OR = 2.0 (1.6; 2.5). In the subgroup of students from non-health-related courses, it was found that HL levels do not differ in 1st year and last year's students. However, in students from health-related courses, data revealed that a last yeaŕs students had higher odds of having sufficient or excellent HL levels compared to a 1st-year student (OR = 1.7 (1.4; 2.2).

Conclusions:

This study reveals low HL levels and addresses that socio-economic and familiar context are determinants of HL in higher education students. Future intervention studies are needed, focused on these determinants so that adequate levels of HL are achieved in higher education students.

Key messages:

- Almost half of the higher education students had inadequate or problematic levels of health literacy.
- Both socioeconomic, familiar, and academic contexts are significantly associated with health literacy levels among higher education students.

Abstract citation ID: ckac130.141
A qualitative study on newly settled migrants' perceptions of civic and health orientation in Sweden

Maissa Al-Adhami

M Al-Adhami[1,2], *K Hjelm*[3], *J Wångdahl*[2], *E Larsson*[4]
[1]SWEDESD, Department of Women's and Children's Health, Uppsala, Sweden
[2]CHAP, Department of Public Health & Nursing Science, Uppsala, Sweden
[3]Caring Sciences, Department of Public Health & Nursing Science, Uppsala, Sweden
[4]GloSH, Department of Global Public Health, Stockholm, Sweden
Contact: maissa.aladhami@kbh.uu.se

Background:

Migrants face structural, socio-political barriers in their resettlement processes that affect their health. Migration also impacts resources such as social capital and health literacy that are of importance for health and integration in society. Hence, there is a need for health promotion in the post-migration phase. The aim of the study was to explore participants' perceptions and experiences of civic orientation with added health communication.

Methods:

Six focus group discussions were performed with 32 men and women. Two were held in Arabic, two in Farsi and two in Somali, with native speaking moderators. Participants were recruited from civic orientation classes in the county of Stockholm. An interview guide with semi-structured questions was used. The data were analysed using a method for content analysis of focus group discussions.

Results:

Three main categories were identified: 'The course gives valuable information but its delivery needs adjustments', which includes that the civic and health orientation is valuable and needed earlier, during asylum phase, and that planning and course content need adjustments. 'The health communication inspired participants to focus on their health', includes that the health communication was useful and inspired uptake of healthier habits. 'Participation in the course promoted independence and self-confidence', which includes that the course gave insights into society and values in Sweden and promoted independence and new social contacts.

Conclusions:

This study adds knowledge of the users' perspectives on the potential of civic orientation to promote health and integration of newly settled migrants, describing ways in which civic orientation with added health communication prompted health and empowerment. However, the content and delivery of the course needs adjustment to better fit the migrants' life situations and varying pre-existing knowledge.

Key messages:

- The civic and health information is needed early in the resettlement phase.
- Participation in the course promoted health awareness, independence and self-confidence.

[5]Center for Media and Health, Gouda, Netherlands
[6]Athena Institute, VU University Amsterdam, Amsterdam, Netherlands
[7]Program Prevention and Care, Pharos, Utrecht, Netherlands
Contact: nora.hamdiui@rivm.nl

Background:

In the Netherlands, especially Turkish- and Moroccan-Dutch women show low cervical cancer screening participation and limited informed decision-making in this regard. To meet the needs of these women, a culturally sensitive educational video was developed. The objective was to evaluate the effect of the video on informed decision-making regarding cervical cancer screening participation among Turkish and Moroccan women aged 30-60 years in the Netherlands.

Methods:

Initial respondents were recruited via several social media platforms and invited to complete an online questionnaire. Following respondent-driven sampling, respondents were asked to recruit a number of peers from their social network to complete the same questionnaire. Respondents were randomly assigned to the control condition (current information brochure) or intervention condition (brochure and video). We evaluated the added effect of the video on knowledge, attitude, intention, and informed decision-making using intention-to-treat analyses.

Results:

The final sample included 686 Turkish- and 878 Moroccan-Dutch women. Of this sample, 793 were randomised to the control group (350 Turkish and 443 Moroccan) and 771 to the intervention group (336 Turkish and 435 Moroccan). Among Turkish-Dutch women, 33.1% of the control respondents and 40.5% of the intervention respondents consulted the brochure (not statistically significant). Among Moroccan-Dutch women, these percentages were 28.2% and 37.9%, respectively (P = 0.003). Of all intervention respondents, 96.1% (Turkish) and 84.4% (Moroccan) consulted the video. The video resulted in more positive screening attitudes among Moroccan-Dutch women, in comparison to the brochure (74.3% versus 68.4%, P = 0.07).

Conclusions:

Our short, easily implementable video resulted in more positive screening attitudes in Turkish- and Moroccan-Dutch women and can thus contribute to informed cervical cancer screening decisions.

Key messages:

- Audio-visual interventions lead to a greater reach and impact in informed decision-making among immigrant women, compared to the currently implemented textual information materials.
- Culturally sensitive educational videos, tailored to the needs of vulnerable populations, contribute to informed decision-making and participation in European preventive healthcare programmes.

Abstract citation ID: ckac130.143

A systematic review of the effectiveness of community interventions to improve parent health literacy

Samantha Belfrage

M Husted[1], *S Fraser*[2], *S Patel*[3], *J Faulkner*[1]
[1]Faculty of Health & Well-being, University of Winchester, Winchester, UK
[2]Primary Care, Population Sciences and Medical Education, University of Southampton, Southampton, UK
[3]Department of Paediatric Infectious Diseases, Southampton Children's Hospital, Southampton, UK
Contact: s.belfrage.20@unimail.winchester.ac.uk

Background:

Many community-based interventions have been developed to increase parent/caregiver health literacy, yet no systematic review of their effectiveness has been published. Therefore, the aim of this systematic review was to examine the effectiveness of community-based health literacy interventions in improving the health literacy of parents/caregivers.

Methods:

A systematic review of six databases; MEDLINE, PsycINFO, CINAHL, Cochrane Library, Embase, and Education Source were conducted to identify relevant articles. Risk of bias were assessed using version two of the Cochrane risk of bias tool for randomised controlled trials or the Cochrane Collaboration Risk of Bias in Non-Randomised Studies of Interventions. The study findings were grouped and synthesised following the Synthesis Without Meta-analysis framework.

Results:

Eleven community-based health literacy interventions for parents/caregivers were identified. Study design included randomised controlled trials (n = 4), non-randomised studies with comparison group (n = 4), and non-randomised studies without a comparison group (n = 3). Interventions were delivered digitally, in person or a combination of the two. The main findings of the studies showed some potential for both in person and digital interventions to increase parental health literacy. The risk of bias was high in over half the studies (n = 7) Studies were heterogeneous preventing a meta-analysis.

Discussion:

Although no definitive conclusion of the effectiveness of community-based interventions can be drawn there are suggestions of improvement in many of the studies included in this review. The review has brought into question whether the health literacy measurement tools used met the needs of assessing the interventions outcomes. When comparing the cost and resources needed for digital with in person interventions, the findings of this review have implications for both practise and research.

Key messages:

- Methodologically stronger primary research, informed by theory, is needed to capture the components of effective health literacy intervention for parents.
- Researchers in the field of health literacy need to consider the suitability of using screening tools to measure change in health literacy post intervention.

7.S. Health workforce

Abstract citation ID: ckac130.144

"Laboratorium Repository": a training tool for the Healthcare Workforce

Guglielmo Arzilli

GP Privitera[1], *G Arzilli*[2], *C Di Benedetto*[3], *F Di Serafino*[2], *E Morassi*[3], *N Zotti*[2], *M Luzi*[3], *F Papini*[2], *V Casigliani*[2], *S Brusaferro*[4]
[1]Training Office, National Institute of Health, Rome, Italy
[2]Department of Translational Research and and of New Surgical and Medical Technologies, University of Pisa, Pisa, Italy
[3]Information Technology, National Institute of Health, Rome, Italy
[4]National Institute of Health, Rome, Italy
Contact: guglielmo.arzilli@gmail.com

Background:

The COVID-19 pandemic highlighted the need to redefine the healthcare workforce (HCW) competencies to face future emergencies linked to emerging infectious diseases, environmental, climate and social crises. As recently stated by WHO, there is a need to identify standards for education and competencies training for HCW in emergency and preparedness (E&P). The Italian National Institute of Health, in agreement with the deliberation of the G20 Health Ministers under the Italian Presidency, is developing an educational program named "Laboratorium" which includes a free access digital repository aimed to share selected documents and tools at the International Public HCW (PHCW) to increase the competencies in E&P response.

Objectives:

A range of web domains selected according to their reliability was monitored using a keyword search tool for any relevant material published from February 14th up to April 28th, 2022. We included any publications, training materials, epidemiological data, initiatives, and communication items that addressed the topic of interest. Each item was submitted for approval by a scientific board and, if appropriate, classified by typology, language, topic, and country before publication.

Results:

To date, out of 6197 items, 418 fulfilled the inclusion criteria. For the type of content, we included guidelines/recommendations (75), epidemiological data (58), websites (34), online courses (15) and books (16). PHCW was the most representative target group (361), followed by other stakeholders (127), hospital practitioners (90), primary care (87). The most represented topic was infectious diseases/SARS-CoV-2 (277) followed by vaccines (88), emergency interventions (34), emerging diseases (17), policies (26), public health preparedness (32).

Conclusions:

Future training for PHCW should be designed with a modular approach with different levels of usability. The Laboratorium Repository provides a core of items for learning according to one's training needs

Key messages:

- The Laboratorium repository offers to PHCW a tool for updating their emergency and preparedness competencies.
- This repository has a user-friendly interface, accessible also through mobile devices.

Abstract citation ID: ckac130.145
Mental well-being of healthcare workers in two hospital districts with differing COVID-19 incidence

Noora Rantanen

N Rantanen[1,2], J Lieslehto[3], L-MAH Oksanen[1,4], SA Oksanen[5], V-J Anttila[1,6], L Lehtonen[1,7], A Geneid[1,4], E Sanmark[1,4]
[1]Faculty of Medicine, University of Helsinki, Helsingin yliopisto, Finland
[2]Clinical Research Institute HUCH, Helsinki University Hospital, Helsinki, Finland
[3]Niuvanniemi Hospital, University of Eastern Finland, Kuopio, Finland
[4]Department of Otorhinolaryngology and Phoniatrics, Helsinki University Hospital, Helsinki, Finland
[5]BeeHealthy, Helsinki, Finland
[6]HUS Inflammation Center, Helsinki University Hospital, Helsinki, Finland
[7]HUS Diagnostic Center, HUSLAB, Helsinki University Hospital, Helsinki, Finland
Contact: ext-noora.rantanen@hus.fi

Objectives:

Healthcare systems and healthcare workers have been under considerable strain during the COVID-19 pandemic in many countries. Our study aimed to assess the mental well-being of Finnish healthcare workers from two hospital districts with differing COVID-19 incidence rates (HUS, Hospital district of Helsinki and Uusimaa/Helsinki University Hospital; and Kymsote, Social and Health services in Kymenlaakso region) during the first wave of the COVID-19 pandemic in spring 2020.

Material and methods:

The data of this prospective survey study was collected during summer 2020, and a total of 996 healthcare workers (HUS N = 862, Kymsote N = 134) participated. Mental health symptoms were self-reported, and symptom criteria followed ICD-10 classification, excluding duration criteria. We divided participants into symptom categories "often/sometimes" (those who met the diagnostic criteria), and "rarely/never" (those not meeting the diagnostic criteria), and compared these groups to sociodemographic factors and factors related to work, workload, and well-being.

Results:

Despite differences in COVID-19 incidence, the degree of mental health symptoms did not differ between HUS and Kymsote districts ($p = 1$). A significant relationship was found between self-reported diagnostic mental health symptoms and experiences of insufficient instructions for protection against COVID-19 (in HUS cohort, $p < 0.001$), insufficient recovery from work ($p < 0.001$), and subjective increased workload ($p < 0.001$).

Conclusions:

These findings show the importance of sufficient, well-designed instructions for protection from SARS-CoV-2 for healthcare workers, indicating their need to feel safe and protected at work. The workload of healthcare workers should be carefully monitored to keep it moderate and ensure their adequate recovery from work. Sufficient control of the epidemic to keep the burden of the healthcare system as low as possible is essential for healthcare workers' well-being.

Key messages:

- Workload of healthcare workers should be carefully monitored during a pandemic to keep it moderate and ensure adequate recovery in all regions, regardless of the local disease burden.
- The importance of sufficient, well-designed instructions for healthcare workers and their need to feel safe and protected at work.

Abstract citation ID: ckac130.146
Interprofessional collaboration in Austrian primary care: an analysis of requirements and challenges

Melanie Roth

A Atalaia[1], CJ Schnegg[1], B Grabner[1], M Roth[1]
[1]Department of Health Sciences, Salzburg University of Applied Sciences, Puch/Salzburg, Austria
Contact: melanie.roth@fh-salzburg.ac.at

Background:

Primary health care (PHC) is built on interprofessional collaboration (IPC) between health and social professions. According to international frameworks, interprofessional communication, client-centred care, collaborative leadership, role clarification, team functioning and interprofessional conflict resolution are essential for IPC. As of April 2022, 36 PHC units were registered in Austria. This study aims to explore the perspectives of health care professionals on IPC in PHC in Austria.

Methods:

Between October 2021 and March 2022, 15 guided group interviews were conducted with a total of 57 representatives of the professional groups biomedical analytics, dietetics, medical training therapy, medicine, midwifery, nursing, occupational therapy, office assistance, orthoptics, pharmacy, physiotherapy, psychotherapy, radiology technology, social work and speech therapy. The data was analysed using qualitative content analysis according to Mayring.

Results:

Interdisciplinary counselling and prevention services, monitoring, acute interventions and treatment of chronic diseases are seen as fields of action for increased IPC in PHC. Interprofessional relationships are established during joint home visits and weekly multiprofessional meetings, when communication is collegial. Challenges mentioned for the IPC in PHC were i.e. role ambiguity, lack of time for networking or unclear legal regulations. Taking over responsibility as well as the ability to delegate and to deal with conflict, a sense of justice and willingness to accept criticism are core competences required for IPC in PHC.

Conclusions:

The interviewees aim to get more involved in PHC, but not all feel optimally prepared for the necessary collaboration in this setting. In their view, specific training content, focusing on the unique structure of PHC, the roles of all the involved professional groups and conflict management, is necessary to successfully shape IPC in the interest of the clients.

Key messages:

- Austrian health care professionals desire specific training content for interprofessional collaboration in primary health care.

- Austrian health care professionals see opportunities but also challenges for their professional group in primary health care.

Abstract citation ID: ckac130.147
Dealing with staff diversity in German hospitals: A comparative analysis of doctors and nurses

Lisa Peppler

L Peppler[1], *K Molzberger*[2,1], *P Beck*[3], *D Matusiewicz*[3], *L Schenk*[1]
[1]Institute of Medical Sociology and Rehabilitation Science, Charité University Medicine, Berlin, Germany
[2]Center for Diversity Research in Teaching, Universität Bonn, Bonn, Germany
[3]Institute for Health & Social Sciences, FOM University of Applied Sciences gGmbH, Essen, Germany
Contact: lisa.peppler@charite.de

Background:
Germany is increasingly recruiting foreign healthcare staff due to the shortage of skilled workers. This diversity of professional and cultural backgrounds poses a challenge to everyday life in inpatient care. Previous studies have focused on the renegotiation of professional identities and competencies in nursing or medicine. In contrast, this study sheds light on group-specific mechanisms through a comparative analysis: How do doctors and nurses deal with diversity in the workplace? Where do profession-specific differences emerge and what does this mean for future interventions?
Methods:
Eight group discussions (June 2019 to October 2020) were conducted with groups of doctors and nurses with and without a migration background in four hospitals in two federal states in Germany; including 22 nurses and 10 doctors (n = 32). The data were analysed using the documentary method to examine professional meaning-making processes. The results were validated intersubjectively.
Results:
The respective handling of diversity in the workplace is influenced by different professional group identities. The situation is precarious for nurses with a migration background - especially for those with an academic degree, as nursing is still an apprenticeship profession in Germany. In the medical profession, on the other hand, diversity does not lead to significant controversies, even if cultural differences are discussed.
Conclusions:
Dealing with diversity is negotiated within professional groups. As nursing or medical 'communities of practice' (E. Wenger), these have a mediating role through which they can mitigate institutional and individual barriers to the integration of migrants in the workplace.
Key messages:
- Physicians and nurses need more specific, iterative cross-occupational and cross-cultural education.
- Management should support in accommodating different expectations and abilities.

Abstract citation ID: ckac130.148
Diversity Competence in Healthcare: A minimal definition

Sandra Ziegler

S Ziegler[1], *J Sørensen*[2], *C Michaëlis*[2], *A Krasnik*[2], *K Bozorgmehr*[1]
[1]Department for General Practice, Heidelberg University Hospital, Heidelberg, Germany
[2]Department of Public Health, University of Copenhagen, Copenhagen, Denmark
Contact: sandra.ziegler@med.uni-heidelberg.de

Background:
Health professionals face a variety of professional challenges in today's plural societies. Sciences propose a specific skill set can help to meet those challenges. Various terms and sometimes extensive concepts are provided for diversity competence. The related learning processes are time-consuming and demanding to implement in hectic clinical realities, so that a basic, easy to deplore training package of essential skills would be desirable in order to enable health professionals to take equally good care of all patients including migrants and minorities.
Methods:
A two-round Delphi study was conducted to prioritise teaching objectives; 31 clinical and academic migrant health experts from 13 European countries participated. A round of open questions was followed by a standardised rating round of 65 items. Data was descriptively analysed (m, M, SD) and consensus defined as 80% of experts assigning high importance to a competence.
Results:
The process identified essential competences as well as high priority cognitive, affective and pragmatic competences, leading to a minimal definition of diversity competence for health professionals which includes respectfulness, empathy, diversity awareness and reflection, knowledge on social determinants as well as ethics and human rights; Further skills are: being able to listen, observe and communicate understandably, including professional usage of interpreters, shared decision-making and individual, need-based care.
Conclusions:
The panel reached consensus on many of the competences. In general, attitudes and practical skills were considered essential. Basic trainings that meet the needs of professionals and help them cope with everyday challenges can be designed on the grounds of these findings.
We provide a working definition of 'diversity competence of health professionals' for scientific exchange and investigation and propose the conscious use of a 'diversity' instead of 'intercultural'' terminology.
Key messages:
- In the light of various diversity and cultural competence definitions, we need to specify essential competences for health workers to meet the needs of diverse patient populations.
- Experts' prioritisations of key diversity competences can be used to prioritise teaching objectives to train health professionals to take equally good care of all patients.

Abstract citation ID: ckac130.149
General paediatrics: motives and concerns of medical students on the career pathway

Lenka Šlegerová

L Šlegerová[1], *P Michenka*[2], *M Kočí*[3]
[1]Institute of Economic Studies, Charles University, Faculty of Social Sciences, Prague, Czechia
[2]Charles University, Third Faculty of Medicine, Prague, Czechia
[3]Charles University, Second Faculty of Medicine, Prague, Czechia
Contact: lenka.slegerova@fsv.cuni.cz

Child public health is dependent on preventive care provided by primary care physicians for children and adolescents. Nevertheless, their accessibility in Czechia is exceedingly endangered by their ageing (the average increased by 1.5 years to 57.5 in eight years). This study aims to (1) identify medical students who opt for paediatric residency and explore the effect of undergraduate training on their decision, (2) detect factors that would persuade them to become practitioners, and (3) factors influencing their choice of a medical facility. The analysis builds on our survey's unique data exploring students' views on training and occupational preferences. Students in the fourth to the sixth year of all medical faculties in Czechia were addressed in two waves (2020 and 2021) of this cross-sectional study, resulting in 2,283 complete questionnaires (response and coverage rate of

25.3%). Out of these, 306 respondents have already decided on or shortlisted paediatrics as a residency speciality, with a strong over-representation of women (85.3%). The evaluation of undergraduate paediatric training's quality (in terms of its organisation, number of students and teachers' feedback) is mildly correlated with considering the paediatric residency (Cramer's V < 0.1). Fewer administrative obligations represent the most frequent factor necessary to lean towards primary care, reported by 54% of respondents preferring hospital paediatrics (or yet undecided); a financial entry bonus is less convincing (only 27% of them). To attract graduates, medical facilities need to provide favourable conditions for residency (good supervisor, employer's support in the training); financial offers might not be an adequate decoy in less-attractive areas. This survey sheds light on medical students' views and decision-making processes, which are essential to consider in the public discussion on the future accessibility of primary care for children and adolescents.

Key messages:

- To captivate graduates, medical facilities need to provide favourable conditions for residency (good supervisor, employer's support in the training); financial offers might not be sufficient.
- Fewer administrative obligations laid upon primary care physicians are necessary to attract medical students to general paediatrics to reverse the ageing trend of practitioners in Czechia.

Nurse understaffing and short work experience as predictors of healthcare-associated infections

Laura Peutere

L Peutere[1,4], K Terho[2], J Pentti[3], A Ropponen[4,5], M Kivimäki[4,6,7], M Härmä[4], O Krutova[4], J Ervasti[4], A Koskinen[4], M Virtanen[1,5]

[7]Department of Epidemiology and Public Health, University College London, London, UK
Contact: laura.peutere@uef.fi

Background:

Healthcare-associated infections (HAIs) are a serious risk factor for hospital patients leading to more than 90 000 deaths each year in European countries. It has been evaluated that 7% of patients in European acute care hospitals acquire an HAI, and that a large part of cases could be prevented. Good hand hygiene is central in preventing HAIs, which may be compromised under high work pressure. The aim of this study was to analyse the associations between nurse understaffing and short work experience with the risk of HAIs at patient-level. Prior evidence on this topic remains inconclusive due to a reliance on imprecise measurement of these exposures.

Methods:

We utilized administrative data on employees' working hours and patient records from one hospital district in Finland from years 2013-2019. The data included in total 281,672 inpatient periods. We used mixed-effects survival analyses to predict the overall risk of HAIs, and four types of HAIs: bloodstream, Clostridium difficile, surgical-site and pneumonia. To consider the incubation time, exposure to nurse understaffing and short work experience were measured in preceding days in moving time windows when the patients were in the hospital.

Results:

Preliminary results showed that exposure to nurse understaffing within two days, measured as low nursing hours relative to planned hours, was associated with increased risk of HAIs (hazard ratio was 1.23, 95% CI 1.05-1.45). Additional analyses showed that this risk was especially pronounced in surgical-site infections, which were also carefully monitored in the hospital district. We did not find associations between exposure to short work experience among nurses and HAI risk.

Conclusions:

This study showed that nurse staffing below planned levels was associated with an increased overall risk of HAIs, particularly surgical-site infections, among patients. Adequate levels of nursing staff in hospitals may be important for preventing HAIs.

Key messages:

- Nurse understaffing may increase particularly the risk of surgical-site infections among patients.
- Nurse understaffing can be approximated based on nursing hours relative to planned hours.

Abstract citation ID: ckac130.151
Training needs assessment of European healthcare workers on vaccinology and vaccine acceptance

Andrea Paladini

A Paladini[1], TE Lanza[1], V Gianfredi[2], L Blandi[3], W Ricciardi[1], G Damiani[1], C Signorelli[2], A Odone[3], C Cadeddu[1]
[1]Life Sciences and Public Health, Università Cattolica del Sacro Cuore, Rome, Italy
[2]School of Medicine, Vita-Salute San Raffaele University, Milan, Italy
[3]Public Health, University of Pavia, Pavia, Italy
Contact: apmed1994@gmail.com

Background:

Healthcare workers (HCWs) are at the frontline of interaction with those that are taking decisions around vaccination. They need adequate training. The general aim of this systematic review is to assess HCWs' training needs on vaccinology and vaccine acceptance. This work was performed for the European Centre for Disease Control (ECDC) under the specific contract No 1ECD.12108 ID.12922 implementing the framework contract number ECDC/2021/005.

Methods:

The search was performed using MEDLINE, Scopus and Google Scholar databases in February 2022. The following inclusion criteria were used: date (from 01/01/2011 to 24/02/2022); language (English, Italian, Portuguese, Spanish, French and Romanian); geographic location of the study (Europe). Appraisal tool for Cross-Sectional Studies (AXIS checklist) was used to assess the methodological quality of the included papers.

Results:

The scientific literature search retrieved 640 results on PubMed, 556 on Scopus and 15 on Google Scholar. In total, 1211 records were identified. After the duplicate removal and the title/abstract assessment, 132 publications were assessed for eligibility. Finally, after the full-text assessment, only 25 articles were included. As regards for the quality assessment, all studies were judged of moderate-good quality. The majority of studies stressed the need to deepen general knowledge of vaccine preventable diseases, vaccine efficacy, vaccination schedule and adverse effects of vaccines.

Conclusions:

Considering their role in the community, especially as source of information and trust for vaccine acceptance, educational initiatives in vaccinology and vaccine hesitancy should be prioritized for HCWs, aimed at increasing their knowledge, awareness, and attitudes. An important heterogeneity of educational backgrounds, activities performed and training needs of the HCWs involved in vaccination at European level was one of the main critical issue to be addressed for future actions.

Key messages:

- HCWs need appropriate training and constant updates on immunization.
- General knowledge of vaccine preventable diseases, vaccine efficacy, vaccination schedule and safety are main HCWs' learning needs.

The role of 'satellite crash training' in capacity building for migration health out of Europe

István Szilárd

I Szilárd[1], L Emődy[2], L Hárdy[3], E Marek[1], Z Katz[1], C Jaksa[1], I Kiss[4]
[1]Chair of Migration Health, University of Pécs Medical School, Pécs, Hungary
[2]Institute of Medical Microbiology, University of Pécs Clinical Centre, Pécs, Hungary
[3]Management of the Foundation, Cordelia Foundation, Budapest, Hungary
[4]Institute of Public Health Medicine, University of Pécs Medical School, Pécs, Hungary
Contact: istvan.szilard@aok.pte.hu

Background:

In spite of the significant shortage of migration health professionals in and out of Europe, higher education institutions are not really likely to accept WHO repeated calls for developing/ strengthening 'migrant sensitive' health care. Following the Syrian crisis in 2015/16, and now in Ukraine, millions of refugees have left their home country.

Objectives:

University of Pécs Medical School (UPMS) - based on its broad experience in migration health training -, has developed a 'crash training' package, easy to implement in other higher education institututions.

Results:

Within the frame of the program of the Hungarian Ministry of Foreign Affairs aiming to increase the migration health capacity in the Jordanian Kingdom, UPMS has established a bilateral cooperation with the Jordanian University in Amman and has offered to implement and monitor a seven-day satellite crash training on migration health.

- The program was developed in a form of 'problem-based learning', aiming to strengthen the self-activity of the students, while solving the task: how to establish a refugee camp addressing the challenge of high and rapid influx of migrants from the region.

- The necessary theoretical background provided by the expert team was set up around the territories as follows: international guidelines and experiences, epidemiological and public health challenges, the role of cultural competence, mental health aspects including the need for 'helping the helpers' as well.

Conclusions:

The program included a pre- and post-test component, aiming to monitor the change in knowledge, attitude, and commitment. Detailed results will be introduced during the presentation.

Key messages:

- Health assistance of migrants is a key public health as well as economnical interest.
- Experience of institutions on the field of migration health shoulod be utilzed globally.

Abstract citation ID: ckac130.153
Racism-critical self-reflection of professors of public health in Germany

Hürrem Tezcan-Güntekin

H Tezcan-Güntekin[1,2], J Simke[2], T Nassal[2], R Karls[3], L Löhning[3], T Döring[3]
[1]Alice Salomon University of Applied Science, Department of Health and Education, Berlin, Germany
[2]Charité Berlin, Berlin School of Public Health, Berlin, Germany
[3]Universität Bielefeld, Fakultät für Soziologie, Bielefeld, Germany
Contact: tezcan@ash-berlin.eu

Background:

In public discourse, universities are rarely understood as places of institutionalized discrimination, but rather as places of enlightenment and intercultural cosmopolitanism (Nghi Ha 2016). Existing studies focus on students' perspectives on institutionalized discrimination. In this context, the critical self-reflection on racism is particularly relevant for people who are in positions of power, as their attitudes and actions have a direct impact on many other people, such as in the case of professors on students, academic and non-academic staff. The study reconstructs to what extent conscious or unconscious attitudes in terms of critical whiteness manifest themselves in the attitudes and, in the actions of professors in health sciences and co-constitute the realities of staff and students.

Methods:

Based on the critical whiteness concept according to Dietze (2009) a reconstructive, qualitative-empirical analysis (Bohnsack 2000) of eight episodic interviews (Flick 2011) with public health professors in Germany was conducted. Attitudes of professors are examined with regard to the critical reflection of their own power position in dealing with employees and students.

Results:

Interviewees have heterogeneous reflective skills and few structurally anchored opportunities for racism-critical self-reflection in their professional environment. The spaces are demanded by students or staff or initiated by themselves, expecting resistance from colleagues. Unconscious racism is sometimes present even with a high degree of reflexivity.

Conclusions:

Criticism of racism must be systematically addressed in schools of public health in order to create spaces for reflection where staff can reflect on and identify their racisms and develop collective action for racism-sensitive teaching and workplace.

Key messages:

- Universities need to address and work on structural racism in their institution. Structures must be the responsibility of the management level and developed participatively with staff and students.
- Spaces of reflection for university staff must be created to enable a continuous confrontation with own (often unconscious) racist actions to develop a racism-sensitive place for work/study.

8.R. Health promotion: innovative approaches

Physical activity change across retirement by device measured work-related and commuting activity

Sanna Pasanen

S Pasanen[1,2], JI Halonen[3], K Suorsa[1,2], T Leskinen[1,2], Y Kestens[4], B Thierry[4], J Pentti[1,2,5], J Vahtera[1,2], S Stenholm[1,2]
[1]Public Health, University of Turku, Turku University Hospital, Turku, Finland
[2]Centre for Population Health Research, University of Turku, Turku University Hospital, Turku, Finland
[3]Department of Health Security, Finnish Institute for Health and Welfare, Helsinki, Finland
[4]Centre de Recherche en Santé Publique, Montreal, Canada
[5]Clinicum, University of Helsinki, Helsinki, Finland
Contact: sanna.pasanen@utu.fi

Background:

Work-related and commuting physical activity before retirement may contribute to changes in physical activity and sedentary time after retirement, and the aim of this study was to examine these associations.

Methods:

Study population consisted of participants of the Finnish Retirement and Aging study (n = 119). Activity behaviour was measured with GPS and accelerometer devices. The participants provided 637 measurement days before and 557 days after retirement. Work-related physical activity was defined as physical activity accumulated at workplace. Commuting activity was dichotomised based on the speed of trips between home and workplace to active (<20 km/h) and passive (≥20 km/h) commute. Participants were divided into four groups: non-active workers and commuters, non-active workers but active commuters, active workers but non-active commuters, and active workers and commuters. Linear regression analysis with generalized estimating equations were used for statistical analysis.

Results:

The change in physical activity during retirement transition markedly varied by the activity group. Lower work-related activity was associated with an increase in light physical activity and a decrease in sedentary time. Conversely, higher work-related activity was associated with a decrease in light physical activity and an increase in sedentary time, except among those active workers who were active commuters. Particularly the active workers but non-active commuters increased their sedentary time (48 min, 95% Cl 20 to 76) and decreased their light physical activity (54 min, 95% Cl -80 to -29). No statistically significant changes in moderate-to-vigorous physical activity were observed.

Conclusions:

Our results suggest that work-related physical activity is associated with changes in physical activity behavior when retiring. Special attention should be targeted to active workers who are non-active commuters to maintain physical activity and decrease sedentary time after retirement.

Key messages:

- Lower work-related physical activity before retirement was associated with an increase in light physical activity and a decrease in sedentary time after retirement.
- Active workers but non-active commuters showed an increase in sedentary time and a decline in light physical activity after retirement, and might be a suitable group for physical activity promotion.

Contact: anka.tyranska@gumed.edu.pl

Identifying predictors of e-cigarette use initiation is important for preventing young persons from becoming smokers. Because of the addictiveness, harmful effects but on the other hand attractiveness and fashion for e-cigarettes among young people, teen use of tobacco related products is a significant public health concern. This study evaluated the determinants of susceptibility to e-cigarette use to both e-cigarettes use and traditional cigarettes in secondary school students in Poland. This study examined a sample of Polish youths aged 13-19 (n = 19241) attending 192 schools, 12 on average in each voivodship. Logistic regression and multi-variable logistic regression models were used to calculate crude and adjusted odds ratios. The profile of susceptibility to e-cigarettes use among never e-cigarette users included: pocket money available per month (more than 150 PLN) (OR = 1.7; p = 0.001), 16-17 years old (OR = 1.9; p = 0.001), parental tobacco smoking and e-cigarette usage (OR = 2.0; p = 0.01 and OR = 1.7; p = 0.001 respectively), maternal secondary education (OR = 1.1; p = 0.04) and living in big cities >500 thou. inhabitants (OR = 1.4; p = 0.04). E-cigarette susceptible persons among ever users were similar to never cigarette users in their opinion that e-cigarettes use are less harmful than conventional smoking (OR = 1.6; p = 0.0012) and living with both parents smoking cigarettes (OR = 1.3; p = 0.02). Additionally, the determinants were: female gender (OR = 1.5; p = 0.009) in the age group less than 15 years of age (OR = 1.3; p = 0.007). The results revealed that such basic predictors as: parental smoking and opinion of lower harmfulness of e-cigarettes use are the most important determinants of smoking susceptibility among never or ever e-cigarette users. The intervention should be focused on educating the young people and their parents on the addictiveness and harmful effects of e-cigarette use and smoking.

Key messages:

- Such basic predictors as: parental smoking and opinion of lower harmfulness of e-cigarettes use are the most important determinants of smoking susceptibility among never or ever e-cigarette users.
- The intervention should be focused on educating the young people and their parents on the addictiveness and harmful effects of e-cigarette use and smoking.

Abstract citation ID: ckac130.156
Trust in societal factors and vaccine hesitancy in Western Balkans

Sanja Matovic Miljanovic

S Matovic-Miljanovic[1], S Cvjetkovic[3], V Jeremic-Stojkovic[3], S Mandic-Rajcevic[2], V Bjegovic-Mikanovic[2], M Gross[1]
[1]Public Health, Euro Health Group, Copenhagen, Denmark
[2]Institute for Social Medicine, School of Medicine, University of Belgrade, Belgrade, Serbia
[3]Department of Humanities, School of Medicine, University of Belgrade, Belgrade, Serbia
Contact: smatovic@ehg.dk

Background:

Countries in the Western Balkans are facing vaccine hesitancy, trying to bring vaccine acceptance and ways to improve it into the focus. Trust in science and institutions, namely political trust, plays an important role and can significantly affects vaccine acceptance.

Methods:

Cross-sectional research was carried out from July to September 2021 in five countries of the Western Balkans (Albania, Bosnia and Herzegovina, North Macedonia, Montenegro and Serbia) and included adult population aged 18 and older (1605 individuals). Convenience sampling was applied using anonymised online questionnaires and Likert scales, shared through online social media, and asking, among others, for trust in societal factors.

Results:

In all countries people had more confidence in health authorities than in political officials. There are no gender differences found in showing trust in societal factors, except in Serbia where women compared to men showed greater trust in health authorities (50.6% vs. 34.4%), as well as in political officials (42.8% vs. 28.2%). The lowest trust in pharmaceutical companies was found in Albania where 34,9% respondents believe that vaccination against COVID-19 is largely promoted by pharmaceutical companies due to financial profits. People who put more trust in societal factors were vaccinated to a greater extent. In Serbia and Albania, the older respondents in general put more trust in societal factors. People who assessed themselves as more religious in Serbia and North Macedonia demonstrated less trust towards societal factors.

Conclusions:

The study demonstrated moderate trust in societal factors in all countries, with greatest trust in health authorities. This implies that health authorities should have a pivotal role, together with physicians in primary health, in promoting vaccination and educating the general public in the Western Balkans.

Key messages:

- Vaccine hesitancy is identified as one of the crucial contributors to the decline in vaccine coverage in the Western Balkans.
- Vaccine hesitancy is associated with the global crisis of trust in science and institutions.

Abstract citation ID: ckac130.157
Development and early results of a comprehensive sexuality education experience in Italian schools

Alice Chinelli

A Chinelli[1], *E Torri*[1], *D Martinelli*[2], *M Farinella*[3], *L Rancilio*[4], *R Galipò*[5], *P Meli*[6], *M Ubbiali*[7], *B Suligoi*[8], *L Tavoschi*[1]

[6]CICA, Bergamo, Italy
[7]Human Sciences, University of Verona, Verona, Italy
[8]Infectious Diseases, Italian National Institute of Health, Rome, Italy
Contact: alice.chinelli@gmail.com

Background:

Comprehensive sexuality education (CSE) is an integrated approach to sexual health and wellbeing promotion, especially effective when performed in school settings, but it is not included in Italian school curricula. This study describes the creation and early results of a pilot experience targeting students attending 20 lower secondary schools (LSS) in 4 Italian regions within EduForIST project, funded by the Ministry of Health.

Methods:

A literature review and a national survey were used to collect guidelines and best practices in the field of sexuality education (SE), along with focus groups and multisectorial expert consultations. The results informed the development of 4 modules of 2 hours each, addressing: changes in adolescence; emotions and relationships; sexual identities and diversity; sexual consent, pregnancy and sexually transmitted infection (STI) prevention, sexual health services. A final session was dedicated to evaluation.

Results:

The pre-test results referred to 14 classrooms of 5 schools within 2 Regions, for a total of 266 students. A high level of uncertainty was reported, regarding the topics of personal identity development (37,4%), experiencing intense emotions during adolescence (18,1%), the definitions of gender identity, sexual orientation and stereotype (42,1%), STI symptoms (58,7%) and prevention (43,4%). The post-test results were available for 153 students. Pre/post analysis showed an increase of correct answers ($p<.05$) for 12/15 items investigated. A total of 102 students responded to the satisfaction questionnaire, with positive results.

Conclusions:

Preliminary results revealed knowledge gaps and high levels of uncertainty among LSS students. Early pre/post evaluation suggested that the pilot activity was effective in enhancing knowledge and decreasing uncertainty in all domains. Evidence collected through this study will foster awareness among policy makers on the value and urgency of introducing CSE in Italian school curricula.

Key messages:

- School-based CSE is the most effective way to positively impact on young people's behaviour and attitudes towards sexuality. However, it is not yet included in Italian school curricula.
- EduForIST pilot activity represents a first step towards the implementation of an evidence-based approach to sexuality education, to be promoted and implemented equally across Italian schools.

Abstract citation ID: ckac130.158
Health literacy and gender differences in colorectal cancer screening

Patrizio Zanobini

P Zanobini[1], *C Lorini*[1], *M Giusti*[2], *V Minardi*[3], *V Possenti*[3], *M Masocco*[3], *G Mereu*[4], *R Cecconi*[4], *G Bonaccorsi*[1]

[2]Department of Experimental and Clinic Medicine, University of Florence, Florence, Italy
[3]Centro Nazionale per la Prevenzione delle Mal, Istituto Superiore di Sanità, Rome, Italy
[4]Department of Prevention, Azienda Unità Sanitaria Locale Toscana Centro, Florence, Italy
Contact: patrizio.zanobini@unifi.it

Introduction:

Colorectal cancer (CRC) is one of the major causes of death worldwide. Previous research reported differences in screening adherence both by gender and socioeconomic determinants. However, little is known about the extent to which Health Literacy (HL) may affect gender differences in CRC screening rates. Here, we aimed to assess HL levels in both genders and their relations with CRC screening adherence.

Methods:

The study was performed within the Tuscan population sample selected in the Italian Behavioral Risk Factor Surveillance System (PASSI - Progress by local health units toward a healthier Italy) in 2017-2019. Socioeconomic status was measured by education level, occupation, financial status, and nationality, while HL by the Italian version of the 6-items European Health Literacy Survey Questionnaire (HLS-EU-Q6). Multivariate analysis was performed to investigate associations between CRC screening rates, social determinants, and HL.

Results:

Among 4,268 people aged 50-69 years included in PASSI, 64% undergo to CRC screening in the 2 years preceding the interview. No statistically significant differences in screening adherence were found by gender. In the multivariate analysis, the odds of adherence to CRC screening increased in both genders for being aged 60-69 years (Males: OR 1.43, 95% CI 1.12-1.82; Females: OR 1.72, 95% CI 1.37-2.14) and high education level (Males: OR 1.34, 95% CI 1.08-1.66; Females: OR 1.30, 95% CI 1.05-1.60). Males with a poor financial status and females with a low HL level were less likely to undergo CRC screening (OR 0.71, 95% CI 0.57-0.88 and OR 0.68 95% CI 0.49-0.95 respectively).

Conclusions:

Our findings suggest that adherence to CRC screening is associated with HL in females only, while it depends on financial status in males. Therefore, gender specific interventions, tailored on different factors, are needed to increase the CRC screening rates.

Key messages:

- The association between Health Literacy and colorectal cancer screening adherence differs according to gender.
- Gender specific interventions are needed to increase the colorectal cancer screening rates.

Implementation, home mediators and children's sugary drink consumption - results from DAGIS study

Reetta Lehto

R Lehto[1], *H Vepsäläinen*[2], *A-V Lehtimäki*[1], *E Lehto*[3], *MH Leppänen*[1,4], *E Skaffari*[2], *A Abdollahi*[2], *E Roos*[5,1], *M Erkkola*[2], *C Ray*[1]
[1]Folkhälsan Research Center, Helsinki, Finland
[2]Department of Food and Nutrition, University of Helsinki, Helsinki, Finland
[3]Department of Sociology, University of Helsinki, Helsinki, Finland
[4]Faculty of Medicine, University of Helsinki, Helsinki, Finland
[5]Department of Food Studies, Nutrition and Dietetics, Uppsala University, Uppsala, Sweden
Contact: reetta.lehto@folkhalsan.fi

Background and objectives:

The effectiveness of a health behavior intervention can depend on the extent to which the intervention is implemented; higher degree of implementation (DOI) might associate with larger intervention effects. This study examined whether the parental DOI of an health behavior intervention had an effect on children's consumption of sugar-sweetened beverages (SSB) and was the effect mediated by home factors.

Methods:

the DAGIS preschool intervention was conducted in 2017-2018 in Finland among 3-6-year-olds with valid data from 476 children. At baseline and follow-up parents reported 1) children's SSB consumption in a semi-quantified food frequency questionnaire, 2) availability of SSB at home, parental role modelling of drinking SSB, and norm (parental view on the suitable amount of SSB for children), and 3) DOI: a dichotomized sum variable on several aspects of parental program implementation. In the analyses, high and low DOI were compared to control group. Mediation analysis of the effect of DOI on the change in children's SSB consumption via change in availability, role modelling and norm was conducted with R statistical software.

Results:

High DOI was associated with reduced consumption of SSB (B -27.71, 95% CI -49.05, -4.80). No mediated effects were found. All studied mediators impacted the change in SSB consumption, but the DOI had no effect on the change in mediators.

Conclusions:

Intervention effect on the consumption of SSB was only found in the high DOI group, which supports the importance of assessing intervention implementation. Since the found effect was not mediated by the studied mediators, other possible mediators should be examined, as understanding intervention mediators is crucial in developing successful interventions.

Key messages:

- The consumption of SSB reduced only among children whose parents implemented the intervention to a large degree.
- The effect was not mediated by availability of SSB, parental role modelling, or norm.

Health literacy of organisations – a cornerstone for fair health outcome

Maria Magnusson

M Magnusson[1]
[1]SV Hospital Group, Angered Hospital, Angered, Sweden
Contact: maria.b.magnusson@vgregion.se

Unhealthy food habits are included in the factors behind several severe health conditions. Their unequal distribution in the population has a complex background. Putting the problem "How can we make our resources more reachable?" instead of "How can we reach these groups?" changes focus from individual to organisational health literacy which opens windows of opportunity. A public health unit with commission to contribute to close health gaps identified a need to systematically develop its own health literacy. Critical examining was conducted by the quan/qual tool Health equlibrium methodology. Reflections on accessability and acceptability of resources offered by the unit were documented and used for methodolocigal development. Aims were to develop professional judgment on how to contribute to fair health outcome and to improve support for healthy habits. Data used were collected 2019-2021.What hinders people from healthier food habits? How can we adjust our practice? Documentation included organised breakfast-talks, food-talk with cultural interpreters, lectures with sports-club health ambassadors, health groups with people of different maternal language, meetings with parents at open pre-school, staff in health promotion commissions and elderly. Problems identified were high costs on healthy food and on travels to vending points, traditional large sugar-intake, marketing of unhealthy food to children, failure to understand information from Swedish Food Agency (except the Keyhole food labelling which was much appreciated). A model for shop-walks with cultural interpreters, more accessible versions of leaflet-materials and dialogue-meetings about food in different settings were developed. Reflections on the unit's communication lead to change of settings for meetings and refined ways to talk about parenthood, women's role and aspects of ethnicity. Systematic self-reflection strenghtens organisational health literacy and may contribute to fair health outcomes

Key messages:

- Organisational health literacy need to be developed purposedly.
- Scarcity is a barrier for a healthy diet also in a welfare state like Sweden.

Abstract citation ID: ckac130.161
Health sciences students' Covid-19 digital health literacy – information reliability evaluation

Nikoleta Leventi

N Leventi[1], *A Vodenicharova*[1]
[1]Faculty of Public Health, Medical University - Sofia, Sofia, Bulgaria
Contact: n.leventi@foz.mu-sofia.bg

Background:

In the Shanghai Declaration on promoting health in the 2030 Agenda of the UNs for Sustainable Development highlighted the importance of health literacy (HL) to empower individual citizens and enable their engagement in collective health promotion action. The aim of this study was to demonstrate the COVID-19 digital HL and the information-seeking behavior among students in Medical University - Sofia.

Methods:

For the purpose of the study a web-based questionnaire was distributed among medical students from the Faculty of Medicine, and health sciences students from the Faculty of Public Health and the Medical College-Sofia, all from Medical University - Sofia in Bulgaria. The study was conducted between February and April 2022. In total 239 respondents participated, all anonymously and voluntarily. In data analysis established statistical methods were used.

Results:

Data collected show that when students searched the Internet for information on the coronavirus or related topics, nearly two thirds (66%) of the respondents could either easy or very easy decide whether the information is reliable or not, and (81%) could easy or very easy decide whether the information is written with commercial interests. In addition among the respondents 82% find easy or very easy to check different websites to see whether they provide the same information.

Conclusions:

From the presented analysis the following conclusion can be made: when navigate the social media platforms and forums, it is significant for health sciences students to obtain the appropriate searching skills, in order to be confident to identify the validity of the information and make informed decisions, as well as decide whether commercial interests are in focus of the provided information. Furthermore it is important to emphasize that searching competencies help to cross check the provided information.

Key messages:

- In emergency situations like the global COVID-19 pandemic, digital health literacy is an important factor when search and use reliable and crosschecked information in daily clinical practice.
- Health sciences students should be educated aiming to maximize their digital literacy, to acquire the competencies and skills and to be confident when search, and use digitally provided information.

Supporting patient involvement in health service research: development of a methodological guidance

Marie Dauvrin

M Dauvrin[1]*, L Kohn*[1]*, I Cleemput*[1]
[1]Belgian Health Care Knowledge Centre, Brussels, Belgium
Contact: marie.dauvrin@kce.fgov.be

Background:

The Belgian Health Care Knowledge Centre (KCE) issued a Position Paper in 2019 regarding the Patient Involvement (PI) in its researches as stakeholders. After previously investigating the organizational culture of the KCE, a key element for a successful implementation of PI was providing methodological guidance to the researchers.

Objectives:

The objective of this study was to develop a methodological guidance for implementing PI into the practices of researchers at KCE.

Methods:

In order to build a practical and effective process note, reflecting the needs and points of attention of all involved participants, different methods were combined: a literature review, workshops with the umbrellas of patient associations, patients and patient representatives, Delphi survey and a pilot project involving patients as research partners.

Results:

The resulting guidance identified 5 prerequisites and conditions for implementation of patient involvement at the organisational level. The guidance also focused on how to involve patients (which patients, how, when, what for) and included general recommendations to researchers during the collaboration (communication, relational aspects, animation techniques, specific needs of patients). Recommendations for the reporting and evaluation of PI were also formulated. Alongside the guidance for researchers, supports for patients were also developed and validated by the patient associations.

Conclusions:

The KCE guidance for PI in research could inspire other agencies willing to implement PI in their practices. Implementation will therefore require additional human and financial resources.

Key messages:

- Patient involvement into resarch needs methodological guidance to be successful.
- Cocreated guidance for patient involvement could help other researchers.

The use of digital tools to promote health in children: A systematic review of intervention studies

Giacomo Pietro Vigezzi

G Dallagiacoma[1]*, P Ferrara*[1]*, F Alberti*[1]*, R Vecchio*[1]*, GP Vigezzi*[1,2]*, A Odone*[1]
[1]Department of Public Health, University of Pavia, Pavia, Italy
[2]Ca' della Paglia College, Ghislieri Foundation, Pavia, Italy
Contact: gvigezzi@hotmail.com

Background:

Early childhood health interventions and educational programs are key to keeping children healthy and preventing disease during adulthood. Since several preventive strategies and campaigns targeting children have been proposed, the aim of this systematic review is to evaluate the effectiveness of digital-based interventions (e.g., cartoons, videos, video games, mobile apps, etc.) in promoting healthy behaviours in primary school-aged children.

Methods:

Following PRISMA guidelines, we searched three electronic databases (Medline, Embase, and Scopus) up to April 11, 2022. We included randomized and non-randomized experimental studies quantifying the effectiveness of digital or audio-visual-based health promotion interventions in childhood (up to 12 years of age).

Results:

The search strategy yielded a total of 1640 articles. Retrieved studies covered a wide range of health interventions - including a healthy diet, physical activity promotion, oral hygiene, skin cancer prevention, and different educational approaches (such as cartoons, interactive video games, etc.), mainly implemented in a school setting and comparing digital interventions to teacher-led interventions or no intervention at all. Data pooling suggests that digital and audio-visual-based health promotion interventions targeting children are effective in improving health literacy and healthy behaviours.

Conclusions:

This systematic review adds to the body of knowledge on health promotion in children and provides actionable measures to implement straightforward educational approaches in this specific population, empowering them to adopt preventive behaviours, and ultimately promoting health at the household and societal level.

Key messages:

- Health promotion has to be delivered during childhood and evidence is needed to identify effective interventions in this population.
- Digital and audio-visual tools have great potential to convey effective health promotion interventions in children and adults to be.

Abstract citation ID: ckac130.164
Recreational walking and the perceived local environment among socioeconomic disadvantaged adults

Suzannah D'Hooghe

S D'Hooghe[1,2,5]*, B Deforche*[2,6]*, D van Dyck*[3]*, K De Ridder*[1]*, S Vandevijvere*[1]*, N van de Weghe*[4]*, S Dury*[5]
[1]Department of Epidemiology and Public Health, Sciensano, Elsene, Belgium
[2]Department of Public Health and Primary Care, Ghent University, Ghent, Belgium
[3]Department of Movement and Sport Sciences, Ghent University, Ghent, Belgium
[4]Department of Geography, Ghent University, Ghent, Belgium
[5]Department of Educational Sciences, Vrije Universiteit Brussel, Brussels, Belgium
[6]Department of Movement and Sport Sciences, Vrije Universiteit Brussel, Brussels, Belgium
Contact: Suzannah.DHooghe@Sciensano.be

Background:

Insufficient physical activity (PA) is a risk factor for obesity and non-communicable diseases and seems more prevalent among socioeconomically disadvantaged (SED) adults. Recreational walking (RW) is an important type of leisure time PA which can be done for free and without specific equipment or facilities. Environmental factors influencing PA may be particularly important for SED adults who are more reliant on their direct environment. The objectively measured environment is not always congruent with the perception of residents, and this may differ by socioeconomic group. This study aims to identify the local environmental factors important for RW as perceived by SED adults.

Methods:

This study is part of the CIVISANO project. Purposeful convenience sampling was used to recruit 38 SED adults (25-65 y/o) in two Flemish semi-urban municipalities. Individual walk-along interviews have been performed in the participants' neighborhood. 20 participants joined the focus group discussion (n = 4) that were intended for member checking, to categorize identified environmental factors and to identify local actions to promote recreational walking. MaxQDA was used for content analysis.

Results:

The way the environment is perceived by SED adults plays an important role in their RW behavior. Results demonstrate the interrelation of different environmental types (physical, sociocultural, economic, political and information) and sizes (micro, meso, macro). Improving communication and knowledge transfer, stimulation of physical, sociocultural, and economic accessibility, and promotion of physical and social safety are identified most important action points for the local government to facilitate RW.

Conclusions:

Our findings indicate that the perceived local environment can play an important role in promoting RW among SED adults. Future studies should investigate if changes in these environments and in residents' perception lead to changes in RW behavior of SED adults.

Key messages:

- The way the environment is perceived by socioeconomic disadvantaged adults plays an important role in their recreational walking behavior.
- Participation of community members allows to integrate novel and community-sourced ideas for practical intervention planning with high external validity.

Abstract citation ID: ckac130.165
Implementation gaps of the Portuguese National Health Plan: a stakeholders' perception analysis

Alexandra Costa

A Costa[1,2], A Rosa[3], L Costa[1,4], R Mexia[3], CM Dias[3], T Caldas de Almeida[1]

[1]Department of Health Promotion and NCD Prevention, National Institute of Health Doutor Ricardo Jorge, Lisbon, Portugal

[2]Institute of Social and Political Sciences, University of Lisbon, Lisbon, Portugal

[3]Department of Epidemiology, National Institute of Health Doutor Ricardo Jorge, Lisbon, Portugal

[4]BioISI-Biosystems & Integrative Sciences Institute, Faculty of Sciences, University of Lisbon, Lisbon, Portugal

Contact: alexandra.costa@insa.min-saude.pt

Background:

The Portuguese National Health Plan (PNS) 2012-2016, extended to 2020, was the strategic health document shaping the direction of intervention within the Health System. The National Institute of Health Doutor Ricardo Jorge (INSA) is the institution responsible for carrying out its final evaluation. To underpin PNS final evaluation a multistep process was designed.

Methods:

A mixed methods study using a convenience sample was implemented to assess stakeholders' perception about five PNS dimensions: dissemination, communication, implementation, impact, and evaluation. For this purpose, two different tools were used. Semi-structured interviews with former health policy managers were conducted. In addition, an online survey was designed and widely distributed to additional stakeholders. From October 2019 to February 2020, data was collected using two separate instruments. Integral transcriptions of the interviews were made. Qualitative content analysis and quantitative descriptive analysis were used.

Results:

A total of 12 interviews and 179 valid surveys were obtained. Regarding stakeholders' perception about PNS implementation process, there was an overall positive recognition about the strategic and operational relevance of the PNS, as a common dialogue platform and a tool for health improvements both for health status and health system function in Portugal. Among pointed implementation barriers, management was mentioned as the major constraint, mainly due to shortage of human and financial resources to carry out the recommended interventions within the PNS timeline.

Conclusions:

As part of the evaluation process the research team found relevant gain knowledge of the wider context in which PNS was developed and implemented, based on stakeholders' perception. Their considerations are important not only to support the definition of the questions and criteria for PNS final evaluation, but also to highlight key issues for the future policy cycle.

Key messages:

- Gain knowledge about the wider context in which the Portuguese National Health Plan (PNS) was developed and implemented was considered a crucial step towards its final evaluation.
- Stakeholders' perception about PNS can inform about implementation gaps, key enablers and barriers and further support the definition of the questions and criteria for PNS final evaluation.

Exploring barriers to vaccine delivery in adult migrants: a qualitative study in primary care

Sally Hargreaves

S Hargreaves[1], J Carter[1], A Mehrotra[1], F Knights[1], A Deal[1], AF Crawshaw[1], F Wurie[2], Y Ciftci[3], A Majeed[4]

[1]Institute for Infection and Immunity, St George's University of London, London, UK

[2]Office for Improvements and Disparities, UK Health Security Agency London, London, UK

[3]Doctors of the World UK, London, UK

[4]Department of Primary Care and Public Health, Imperial College London, London, UK

Contact: s.hargreaves@sgul.ac.uk

Background:

The COVID-19 pandemic has highlighted shortfalls in the delivery of vaccine programmes to older migrant groups. Guidelines exist, however, little is known around care pathways and engagement of these older cohorts in routine vaccinations in primary care, including catch-up programmes. We explored the views of primary care professionals around barriers and facilitators to catch-up vaccination in adult migrants (defined as foreign born; 18+ years) with incomplete or uncertain vaccination status.

Methods:

We did a qualitative interview study with purposive sampling and thematic analysis in UK primary care (50 practices included nationally; 1 hour qualitative interviews) with 64 primary care professionals (PCPs): 48 clinical staff including GPs, Practice Nurses and healthcare assistants (HCAs); 16 administrative staff including practice managers and receptionists (mean age 45 years; 84.4% female; a range of ethnicities).

Results:

Participants highlighted direct and indirect barriers to catch-up vaccines in adult migrants who may have missed vaccines as children, missed boosters, and not be aligned with the UK's vaccine schedule, from both a personal and service-delivery level, with themes including: lack of training and knowledge of guidance around catch-up vaccination among staff; unclear or incomplete vaccine records; and lack of incentivization (including financial reimbursement) and dedicated time and care pathways. Adult migrants were reported as being excluded from many vaccination initiatives, most of which focus exclusively on children. PCPs noted that migrants expressed to them a range of views around vaccines, from positivity to uncertainty, to refusal.

Conclusions:

Vaccine uptake in adult migrants could be improved through implementing new financial incentives, strengthening care pathways and training, and working directly with local community groups to improve understanding around the benefits of vaccination at all ages.

Key messages:

- There are direct and indirect barriers to catch-up vaccines in adult migrants who may have missed vaccines as children, missed boosters, and not be aligned with the UK's vaccine schedule.
- Primary care teams have a key role to play in implementing WHO's new Immunization Agenda and to better consider catch-up vaccination to under-immunised groups across the life-course.

Abstract citation ID: ckac130.167
The Italian Roma, Sinti and Travellers Health Project for equity in access to care

Alessandra Diodati

A Diodati[1], *MC Proietti*[1], *E Eugeni*[1], *R del Gaudio*[1], *LG Sisti*[1], *F Curtale*[1]
[1]INMP, Rome, Italy
Contact: alessandra.diodati@inmp.it

Issue:

In 2015, Italy approved the National Action Plan for Health for and with Roma, Sinti and Travellers (RSC); however, it is still not fully applied at a local level. The INMP (funded by the National Operational Programme for Social Inclusion), implemented the "Health Project - Promotion of strategies and tools for equity in access to health care for RSC", aimed to support the implementation of the Plan by Local Health Authorities (ASL).

Description:

The project lasted from March 2019 to December 2021. INMP worked with 7 ASL to design interventions and develop tools to address RSC health needs. The SODA (Strategic Options Development and Analysis) method as a participatory process aimed at identifying strategies and models for the execution of the Plan among relevant stakeholders was used. Moreover, RSC communities' engagement strategies and a community-based Proximity Public Health (PPS) approach were adopted in designing and developing health promotion interventions.

Results:

INMP performed 38 interviews with ASL health operators highlighting barriers and strategies in the local implementation of the Plan. Tools orienting to social and health services and health education materials for hard-to-reach groups were produced. A training course for 14 RSC facilitators and 5 training courses attended by over 200 NHS operators have been organized. ASL were supported in developing health promotion initiatives, based on the engagement of both local RSC communities and third sector entities.

Lessons:

The project has enabled the ASL to develop local protocols for the implementation of the Action Plan. In line with this capacity-building activity, the project trained both health operators and RSC facilitators fostering the dissemination of the PPS culture in designing and providing care for hard-to-reach groups. Given the positive results obtained, INMP is still collaborating with both ASL and the Third Sector on additional activities related to the Project in 2022.

Key messages:

- The project has strongly promoted the Proximity Public Health (PPS) approach and the enrollment of RSC communities in designing equity-oriented health interventions.
- The SODA methodology and the training of operators have resulted effective in capacitating ASL in the implementation of the Plan.

Abstract citation ID: ckac130.168
The vulnerability of migrants living in large urban areas to COVID-19: Exacerbators and mitigators

Lisa Hitch

L Hitch[1], *K Cravero*[1], *D Masoud*[1], *M Moujabber*[1], *LA Hobbs*[1]
[1]Center for Immigrant, Refugee & Global Health, CUNY Graduate School of Public Health, New York, USA
Contact: lisa.hitch@sph.cuny.edu

Background:

Even though large urban areas have been researched in the context of COVID-19, evidence on how COVID-19 impacted migrants -a particularly vulnerable group- in these settings is still limited.

Objective: To explore exacerbating and mitigating factors of large urban areas on migrants' vulnerabilities during the COVID-19 pandemic.

Methods:

We conducted a systematic review of peer-reviewed literature published between 2020-2022 and focused on migrants (foreign-born individuals who have not been naturalized in the host country, regardless of immigration status) in urban areas with a population >500.000. After screening 880 studies, 29 studies were included and categorized within the following thematic framework: 1) Underlying structural inequities, 2) governance and economic structure, 3) urban design, and 4) engagement of civil society organizations (CSO).

Results:

Exacerbating factors include pre-existing inequities (e.g., unemployment, financial precarity, and barriers to healthcare access), exclusionary government responses (e.g., relief funds or unemployment benefits), and residential segregation. Mitigating factors include the engagement of CSOs and the implementation of innovative governance strategies such as e-governance and use of teleservices. Recommendations: We recommend increased attention to pre-existing social inequities faced by migrants, inclusive governance strategies, and partnerships between government and CSOs to improve the design and delivery of services to migrants in large urban areas. More research is needed on how urban design can be utilized to mitigate the COVID-19 impacts on migrant communities.

Conclusions:

The factors identified in this systematic review should be considered as part of migrant-inclusive emergency preparedness to address the disproportionate impact of similar public health crises on migrant communities.

Key messages:

- Pre-existing inequities, exclusionary governance strategies, and residential segregation led to a disproportionate impact of COVID-19 on migrants living in large urban areas.

- Mitigators of cities on the COVID-19 impacts among migrants include the engagement of civil society, implementation of innovative governance strategies, and use of teleservices in these settings.

Abstract citation ID: ckac130.169
(Un)safety of LGBT+ asylum seekers in asylum accommodations in Germany

Franziska Gartner

F Gartner[1], *M Giacomozzi*[2], *A Helberg-Proctor*[3]
[1]Faculty of Health, Medicine and Life Sciences, Maastricht University, Maastricht, Netherlands
[2]Treat it Queer Foundation, Maastricht, Netherlands
[3]Life Sciences & Society Lab, KU Leuven, Leuven, Belgium
Contact: franziska.gartner@alumni.maastrichtuniversity.nl

LGBT+ asylum seekers face multiple challenges in their countries of origin as well as in their host countries. Violence and structural discrimination against this community are common and affect their whole asylum process. Violence and structural discrimination based on sexual orientation and gender identity stress the needs of LGBT+ asylum seekers in particular in regards to reception accommodations. In this study we investigated factors that contribute to the (un)safety of reception accommodations for LGBT+ asylum seekers in Germany. Qualitative semi-structured interviews were conducted with 11 participants from two groups, namely, professionals, and former and current LGBT+ asylum seekers. Thematic analysis was used to analyze the data and revealed multiple factors influencing the safety of LGBT+ asylum seekers in accommodations. These were clustered according to the used frameworks in the categories individual level, physical and social environment, and policies. The factors for (un) safety included amongst others interpersonal violence based on sexual orientation and gender identity, gender-neutral sanitary areas or lockable rooms, community support, and policies that govern where asylum seekers are accommodated, and which protection measures are set up in accommodations. Applying an intersectional lens, transgender asylum seekers were described as more vulnerable than other LGBT+ individuals. The analysis concluded that binding policies are necessary to guarantee safer accommodations for LGBT+ asylum seekers in Germany. Besides, the social cisheteronormative structures that manifest in discrimination of LGBT+ asylum seekers must be structurally deconstructed by, among others, training staff on LGBT+ needs and increase inclusivity among the asylum seeker community and in the host country.

Key messages:

- In Germany, the European country with the highest number of refugees, LGBT+ asylum seekers face many challenges related to their sexual orientation and gender identity.
- Several factors interplay in the (un)safety of accommodations for LGBT+ asylum seekers.

Abstract citation ID: ckac130.170
Social support and poverty alleviation among asylum-seekers and refugees in Wales

Mike Wells

M Wells[1], *H Seage*[1]
[1]Psychology, Cardiff Metropolitan University, Cardiff, UK
Contact: wellsm90@yahoo.co.uk

Background:

Wales is working toward being a Nation of Sanctuary for asylum-seekers and refugees and has resettled between 6,000 and 10,000 refugees since 2001. Uprooted social support networks during the period of asylum-seeking process predispose this population to poverty. The aim of this research was to explore the role of social support among asylum-seekers and refugees in alleviating poverty and its adverse impact on their health and wellbeing. Understanding the importance of social support in promoting the health and wellbeing of asylum-seekers and refugees is a critical factor for informing public health interventions and policies to improve outcomes for tackling poverty among this population in Wales.

Methods:

A qualitative research method, based on social support framework, was adopted. Semi-structured interviews were utilised to collect data from a purposive sample of 8 participants. All the participants were recruited through a refugee support organisation in Cardiff, Wales and were interviewed in the community hub of this organisation. The interviews were digitally recorded, transcribed and analysed using Interpretative Phenomenological Analysis (IPA).

Results:

Results show two formal (government, charities) and three informal (family, friends, and peers) sources of social support as the potential pathways that alleviate the impact of poverty on the health and wellbeing of asylum-seekers and refugees. These sources provide access to language courses, education, employment, housing, food, and sense of belonging in the new communities of resettlement.

Conclusions:

Enhancing access to formal and informal sources of social support is of vital importance to tackling the pernicious impact of poverty on the health and wellbeing of asylum-seekers and refugees. Providing social support for this population should be given uttermost consideration for public health interventions and policy decisions in an effort to protect and promote their health and wellbeing.

Key messages:

- Public health interventions and policies should consider access to social support resources by asylum-seekers and refugees.
- Access to, and quality of, social support resources will alleviate the impact of poverty and improve the health and wellbeing of asylum-seekers and refugees in the host country.

Abstract citation ID: ckac130.171
Do newly arrived migrants represent a COVID-19 burden? Data from the Italian information flow

Leuconoe Grazia Sisti

LG Sisti[1], *A Di Napoli*[1], *A Petrelli*[1], *A Diodati*[1], *A Cavani*[1], *C Mirisola*[1], *G Costanzo*[1]
[1]National Institute for Health, Migration and Poverty, Rome, Italy
Contact: leuconoe.sisti@gmail.com

Background:

Migrants who reach host countries irregularly are often perceived as increasing the COVID-19 burden. Italy is a transit and destination country for migrants who cross the Central Mediterranean route. During the pandemic, all migrants who disembarked on the Italian shores have been COVID-19 tested and quarantined. To investigate the incidence of SARS-CoV-2 infection in this population, the INMP, together with the Italian Ministry of the Interior, set a specific information flow collecting data about the infection and possible outcomes.

Methods:

The observation period was from January 2021 to January 2022. COVID-19 tests used were molecular and antigenic. Positive cases detected both at the arrival and during the quarantine period, have been registered on an ad hoc INMP online platform. Migrants' SARS-CoV-2 incidence rate (per 1,000) - with 95% CI - was therefore calculated. The Incidence Ratio (IR) was used to compare the migrants' incidence rate with that of the resident population in Italy, in the same period and corresponding age group.

Results:

Among 70,512 migrants (91% males and 9% females, all <60years old) who landed in Italy during the observation period, 2,861 tested positive, with an incidence rate of 40.6 (39.1-42.1) cases per 1,000. In the same period, an incidence rate of 177.6 (177.5-177.8) has been recorded in the resident population, with an IR of 0.22 (0.22-0.23). 89.9% of cases were males and almost half (49.6%) belonged to the age group 25-39years old. 99% of cases reported no symptoms, no relevant comorbidity has been reported and no cases have been hospitalized.

Conclusions:

Our findings clearly highlight the low rate of SARS-CoV-2 infection in migrants reaching Italy by sea with an incidence rate that is roughly a quarter of that of the resident population, encouraging the opportunity to investigate the reasons for such an observation. Moreover, our study confirms the ''healthy migrant effect'' in migrants reaching Italy by sea.

Key messages:

- Irregular migrants arriving in Italy did not increase the COVID-19 burden in the country, thus alarmism is not justified.
- Further studies are needed to investigate the reasons for the lower incidence observed.

Abstract citation ID: ckac130.172
Assessment of mental health and psychosocial support in Ukrainian refugee minors resettled in Norway

Cecilie Dangmann

C Dangmann[1], *M Leonhard*[2], *AL Kleppang*[1], *L Lien*[1]
[1]Faculty of Social and Health Sciences, Inland Norway University of Applied Sciences, Elverum, Norway
[2]Advisory Unit Substance Abuse, Mental Health, Innlandet Hospital Trust, Brumunddal, Norway
Contact: cecilie.dangmann@inn.no

Background:

The recent invasion of Ukraine has forced millions of civilians, especially women and children, to leave their country. Although the European Union offers guidance on individual health assessment of refugees fleeing the war in Ukraine, assessment practice varies across host countries and even on national basis. Thus, the aim of this project was to identify and prioritize procedures for mental health assessment of Ukrainian refugee minors in Norway.

Methods:

This project applied a modified three-round-Delphi method. In a first step, the leading public health nurse and community physician in 40 municipalities across Norway were contacted via e-mail and asked to state who is in charge of health assessment, what is current assessing practice and what are the problems and needs. Answers were analysed and condensed and will be presented for rating in a second and third round.

Results:

Preliminary results from the first round suggest that most municipalities are currently in a planning phase with uncertainties surrounding who and how future assessments will be done. Public health nurses or general practitioners are often in charge of health assessments, but it is unclear if this includes age-adjusted mental health assessments.

Conclusions:

Preliminary results show that current practice in assessing mental health and psychosocial support for Ukranian refugee minors in Norway is very diverse. There is a need to evaluate and prioritize current procedures to assure an equal and age-adjusted procedures for all refugee minors, regardless of where they have resettled.

Key messages:

- Current practice in assessing mental health and psychosocial support among Ukrainian refugee minors is very diverse.
- Assessment of mental health in Ukrainian refugees depends on infrastructure and local municipal resources.

Abstract citation ID: ckac130.173
Knowledge of HIV prevention biomedical tools among African immigrants in France: the Makasi project

Karna Coulibaly

K Coulibaly[1,2], *A Gosselin*[3,2,1], *S Carillon*[1], *A Ravalihasy*[1,2], *M Bousmah*[1,2], *C Taeron*[4], *R Mbiribindi*[5], *A Desgrées du Loû*[1,2]
[1]Ceped, Université Paris Cité, IRD, Inserm, France
[2]CNRS, French Collaborative Institute on Migrations, Aubervilliers, France
[3]Ined, National Institute for Demographic Studies, Aubervilliers, France
[4]Arcat, Paris, France
[5]Afrique Avenir, Paris, France
Contact: ckbakary@outlook.com

Background:

In France, post-exposure prophylaxis (PEP) and pre-exposure prophylaxis (PrEP) have been available for several years. However, there is still no evidence on the level of knowledge of these HIV prevention tools among immigrants from sub-Saharan Africa living in precarious situations, a population particularly affected by HIV. The aim of this study is to describe the knowledge of these tools in this population and analyse the factors associated with this knowledge.

Methods:

The data mobilized are from the Makasi interventional research that was conducted between 2018 and 2020 among immigrants from sub-Saharan Africa in precarious situations in the greater Paris area. Using data collected from 601 participants, we described levels of knowledge of HIV treatment effectiveness, treatment as prevention (TasP), post-exposure prophylaxis (PEP), and pre-exposure prophylaxis (PrEP), by sex with a chi2 test. We investigated factors associated with their knowledge with logistic regressions adjusted for sociodemographic characteristics, living conditions and sexual behaviors ($p \leq 0.2$).

Results:

The population surveyed was predominantly men (76%), from West Africa (61%) and in a precarious situation: 69% were unemployed, 74% were undocumented, 46% had no health coverage and 13% were homeless. In this population, knowledge of antiretroviral treatments for HIV prevention was heterogeneous: the effectiveness of HIV treatment was well known (84%), but only half of the respondents (46%) were aware of TasP and very few knew about PEP and PrEP: 6% and 5% respectively. Multivariable-adjusted models showed that these tools was better known by educated people, those who had a social network in France, those who have had access to the health system and those who were exposed to sexual risks.

Conclusions:

While sub-Saharan African immigrants know the effectiveness of HIV treatment and use certain prevention tools such as HIV testing, they are not aware of PEP and PrEP.

Key messages:

- PEP and PrEP are two HIV prevention tools that are not well known by sub-Saharan African immigrants.
- There is an urgent need to disseminate information about these prevention tools to immigrants.

Abstract citation ID: ckac130.174
Breast cancer screening adhesion among migrants: a matter of communication strategy?

Stefania Banzola

S Banzola[1], *A Corsaro*[2], *S Capitani*[3], *S Vesco*[4], *L Dodi*[5], *O Serra*[6], *N Piazza*[6], *S Onesti*[6], *MA Salvati*[7], *A Musolino*[6]
[1]Migrant Health Unit, Spazio Salute Immigrati, Local Health Unit, Parma, Italy

[4]Social Health Unit, Center for Immigration Asylum and Cooperation, CIAC Onlus, Parma, Italy
[5]Healthcare Management Direction, Local Health Unit, Parma, Italy
[6]Breast Unit, University Hospital and Local Health Unit, Parma, Italy
[7]Cervical Screening Center, UOC Salute Donna, Local Health Unit, Parma, Italy
Contact: sbanzola@ausl.pr.it

Background:
Migrants' engagement to cancer screening programs is a relevant issue for universalistic health systems. To increase breast cancer screening coverage among migrant women, a public-private partnership involving a multidisciplinary team of Primary Care, Public Health, Hospital and private social workers has been built up in a district in Italy. The team worked in two steps, planning health promotion (HP) meetings addressing women in refugees' reception programs and a web-based workshop involving intercultural mediators (IMs) and community health promoters.

Objectives:
The workshop, involving 10 professionals among IMs and community health promoters, realized in 3 online meetings during March '22, aimed at identifying communication tools to enable migrants' participation to breast cancer screening and increasing health literacy (HL) and cultural competence (CC) among the team. A participatory approach, supported by learning methods, such as storytelling and role-play, has been adopted to identify the major barriers to access to screening and public health messages. Participants worked on critical words and concepts, highlighted during HP meetings, accounting for HL, literacy, language skills, communication techniques and different perspectives about health and prevention.

Results:
Several barriers, such as lack of knowledge on preventive initiatives and different approaches to health, decrease the perception of cancer risk. Others, like family and work duties, influence the adhesion. Fear or shame about the exam and linguistic issues are further hampering factors. Participants pointed out text, audio and video messages, in Italian and native plain language, as useful tools to explain the screening procedure and give relevant and practical information supported by simple and clear illustrations to diffuse via WhatsApp.

Conclusions:
The intervention enabled the team to improve HL and CC defining suitable communication strategies for cancer screening programs.

Key messages:
- Within the team building process, professionals, from health and private sectors, improved communication skills and awareness of the role played by HL and CC in reducing health disparities.
- Active learning methods, such as role-play and storytelling, resulted to be strategic for the participatory approach and to achieve the objectives.

Occupational role and Covid-19 among foreign-born healthcare workers: a registry-based study

Chioma Nwaru

C Nwaru[1], H Li[1], C Bonander[1], A Santosa[1], S Franzén[1], M Rosvall[1,2], F Nyberg[1]
[1]School of Public Health and Community Medicine, Institute of Medicine, Sahlgrenska Academy, University of Gothenburg, Gothenburg, Sweden
[2]Primary Heath Care, Regionhälsan, Region Västra Götaland, Gothenburg, Sweden
Contact: chioma.nwaru@gu.se

Background:
Studies have shown an elevated risk of Covid-19 among foreign-born healthcare workers (HCWs), but data on the distribution of the risk in different occupational roles are lacking. Such data are needed for the effective control of Covid-19 risk among HCWs. Here, we examined the risk of Covid-19 infection and hospitalization in foreign-born HCWs in different occupational roles in Sweden.

Methods:
We prospectively linked occupational data (2018-2019) of 783950 employed foreign-born (20-65 years) workers to Covid-19 data registered between 1 January 2020 and 30 September 2021. We used Cox proportional hazards regression to estimate the risk of Covid-19 infection and hospitalization in foreign-born HCWs in eight different occupational groups compared to non-HCWs, and to assess whether the associations varied by region of birth. The analyses were adjusted for sociodemographic and socioeconomic factors, comorbidities, and Covid-19 vaccination.

Results:
All HCWs had a higher risk of Covid-19 outcomes than non-HCWs, but the risk differed by occupational role. Assistant nurses had the highest risk both for Covid-19 infection (HR 1.80; 95%CI 1.74-1.87) and hospitalization (HR 1.85; 95%CI 1.57-2.18); other allied HCWs had the lowest risk (infection: HR 1.23; 95%CI 1.11-1.36; hospitalization: HR 1.02; 95%CI 0.63-1.67)). In some healthcare occupations, the relative risk of Covid-19 varied by region of birth. For example, physicians and dental nurses/hygienists of African and Asian origin had a higher risk of Covid-19 infection than European-born in the same occupation. In contrast, European-born assistant nurses had a greater risk of both outcomes than non-European-born in the same occupation.

Conclusions:
The risk of Covid-19 among foreign-born HCWs varied by occupational role and region of birth. Public health efforts that target occupational exposures as well as incorporate culturally responsive measures may help to reduce Covid-19 risk among foreign-born HCWs.

Key messages:
- Risk of Covid-19 among foreign-born healthcare workers varied by occupational role and region of birth.
- Multiple approaches are needed to protect this population group against Covid-19.

Abstract citation ID: ckac130.176
Health Status and Self-Perception of Health in Czech Roma Community

Ekaterina Volevach

E Volevach[1,2], M Ely[1], H Maršálková[1], L Gulová[3,4], R Mikulik[1,2]
[1]The International Clinical Research Center, St. Anne's University Hospital Brno, Brno, Czechia
[2]Faculty of Medicine, Masaryk University, Brno, Czechia
[3]Faculty of Education, Masaryk University, Brno, Czechia
[4]Faculty of Humanities, Tomas Bata University, Zlin, Czechia
Contact: ekaterina.volevach@fnusa.cz

Background:
The Roma population is reported to have a lower life expectancy in several European countries. The reasons for this are not well described, which limits the development of effective health promotion programs. This report investigates some possible reasons: self-perception of health risks and discrimination in a sample of Czech Roma. The study is a part of a complex health awareness program.

Methods:
This is a pilot descriptive, cross-sectional survey conducted in Brno, Czech Republic in March 2022. Respondents were identified by community gatekeepers using quotas of gender and education. Data on disease incidence, lifestyle, attitudes to health care and risk perception were collected.

Results:
In the sample of 30 participants, 60% were female, average age 42±5, 60% primary education. 57% daily smokers, with an average 17 cigarettes daily during 18 years. 35% had 1 chronic disease, another 38% had 2 and more. The most prevalent diseases were hypertension (43%) and obesity (41%). 60% of

respondents with hypertension as compared to 23% without hypertension considered their stroke risk as medium. 43% smokers as compared to 21% non-smokers consider their risk of COPD as medium (for lung cancer 41% vs. 0%). Roma report not visiting a doctor due to a lack of time (33%), expecting the problem to resolve itself (33%), long waiting time (33%), but not discrimination (0%).

Conclusions:

The Roma with risk factors correctly identify their risk of stroke, COPD, lung cancer as higher. None of them feel discriminated from physicians, but they limit contact with them due to other reasons. It appears that the prevalence of risk factors is higher in the Roma when compared to Caucasians based on the European Health Interview Survey (16% female, 31% male hypertension; 14% female, 29% male obesity). Self-perception of health and feeling of discrimination in Roma communities should be taken into account when designing health interventions.

Key messages:

- Roma people evaluate their risk of diseases adequately to their health status.
- The reasons for not using healthcare are not connected to discrimination.

The use of social media platforms by migrant populations during the COVID-19 pandemic

Sally Hargreaves

S Hargreaves[1], *LP Goldsmith*[1], *M Rowland-Pomp*[1], *K Hanson*[2], *A Deal*[1], *AF Crawshaw*[1], *A Ahmad*[3], *M Razai*[3], *T Vandrevala*[2]
[1]Institute for Infection and Immunity, St George's University of London, London, UK
[2]Faculty of Health, Social Care and Education, Kingston University & St George's, London, UK
[3]Population Health Research Institute, St George's University of London, London, UK
Contact: s.hargreaves@sgul.ac.uk

Background:

The rapid expansion of internet and social media use has meant that both useful and potentially harmful health information can spread rapidly. Groups experiencing barriers to health systems may be more reliant on social media as a source of health information. We did a systematic review to determine the extent and nature of social media use in migrant and ethnic minority communities for COVID-19 information, and implications for preventative health measures including vaccination intent and uptake.

Methods:

We reviewed published and grey literature following PRISMA guidelines (PROSPERO registered CRD42021259190). Global research was included that reported on the use of social media by migrants and/or ethnic minority groups in relation to COVID-19.

Results:

1849 unique records were screened, and 21 data sources included in our analysis involving studies from the UK, US, China, Jordan, Qatar, and Turkey. We found evidence of consistent use of a range of social media platforms for COVID-19 information in some migrant and ethnic minority populations (including WeChat, Facebook, WhatsApp, Instagram, Twitter, YouTube), which may stem from difficulty in accessing COVID-19 information in their native languages or from trusted sources. There were positive and negative associations with social media use reported, with some evidence suggesting circulating misinformation and social media use may be associated with lower participation in preventative health measures, including vaccine intent and uptake, findings of which are likely relevant to multiple population groups.

Conclusions:

Urgent actions and further research are now needed to better understand the use of social media platforms for accessing health information by groups who may be marginalised from health systems, effective approaches to tackling circulating misinformation, and to seize on opportunities to make better use of social media platforms to support public health communication.

Key messages:

- We found evidence of consistent use of a range of social media platforms for COVID-19 information in some migrant and ethnic minority populations.
- Further research is needed to better understand the use of social media platforms for accessing health information by groups who may be marginalised from health systems.

Abstract citation ID: ckac130.178
Navigating to support: experiences of forced migrant survivors of sexual and gender-based violence

Anna Perez Aronsson

A Perez Aronsson[1], *H Bradby*[2], *A Sarkadi*[1], *S Akyuz*[3], *G Warner*[1]
[1]Department of Public Health and Caring Sciences, Uppsala University, Uppsala, Sweden
[2]Department of Sociology, Uppsala University, Uppsala, Sweden
[3]Department of Political Science and International Relations, TED University, Ankara, Turkey
Contact: anna.perez.aronsson@pubcare.uu.se

Background:

Sexual and gender-based violence (SGBV) is a severe human rights violation as well as a widespread global health problem with several negative consequences for emotional-psychological, sexual-reproductive and physical health. People who have experienced forced migration have a heightened exposure to SGBV, yet face several challenges to access support. Increased understanding of the help seeking processes of forced migrants who have experienced SGBV can help improve access to adequate support.

Methods:

Interviews with thirty forced migrants in Sweden who have experienced SGBV have been analyzed using thematic analysis to generate an understanding of their help-seeking processes. The participants were recruited through a broad range of service providers, nongovernmental organizations and community sites.

Results:

The disempowerment experienced after arrival to Sweden exacerbated health needs, increased the risk of violence, and prevented help seeking. Increased independency and more stable circumstances ameliorated the anticipated risks of seeking help and improved well-being. Activities and places providing a platform for social interactions as well as opportunities to acquire needed knowledge, such as language, were highlighted as valuable and could become a pathway to specialized services through a process of increased trust.

Conclusions:

Help-seeking processes for SGBV can be promoted by early access to support services and social networks, as well as language classes and information about the society. Access to support can be facilitated by increased collaboration between non-violence-related service providers working close to forced migrants, such as language schools, and specialized services. The societal factors influencing help seeking processes are being further explored in an ongoing analysis of interviews with 29 service providers. The findings will inform the co-development of a new service model.

Key messages:

- Forced migrants describe that current services are not meeting their need of support for SGBV.
- There is a need to co-develop an enhanced service model involving both service users and providers.

Abstract citation ID: ckac130.179
Depression among survivors of 1988 Spitak earthquake in Armenia: a prospective cohort study

Anahit Demirchyan

A Demirchyan[1]
[1]Gerald and Patricia Turpanjian College of Health Sciences, Yerevan, Armenia
Contact: ademirch@aua.am

Background:

Mental health-related consequences of disasters can be very long lasting. Depression is one of the most prevalent psychopathologies among disaster survivors. Yet, compared to PTSD, it is studied much less among disaster victims. Studies of depression decades after the exposure are extremely rare. This study evaluated the prevalence and predictors of depression in a prospective cohort of Spitak earthquake survivors 23 years after the event.

Methods:

A geographically stratified urban sub-sample of 1785 individuals underwent all three baseline waves of the cohort study during 1990-1992 and provided detailed sociodemographic, earthquake exposure and physical and mental health-related information. In 2012, 83.3% (n = 1487) of this subsample was traced and 40.6% (n = 725) interviewed. Depression status was measured via validated and adapted Armenian-language CES-D scale. A fitted linear regression model identified predictors of depression score in 2012.

Results:

Twenty-three years after the exposure, the rate of depression in this cohort was 25.4%. Depression was highly comorbid with anxiety (62.0%) and PTSD (36.8%). Factors positively associated with depression score included number of stressful life events (95% CI 0.33, 1.20), poor self-rated health (95% CI 2.45, 5.40), earthquake-related deaths in the family (95% CI 0.12, 3.80), and strong phobia and fear at baseline (95% CI 0.51, 2.96). Age (95% CI -0.15, -0.06), social support score (95% CI -0.83, -0.55), quality of life score (95% CI -15.83, -10.77), and being married (95% CI -2.61, -0.35) were protective for depression. The fitted model explained 46.6% of the variance in the depression score.

Conclusions:

This study found an increased prevalence of depression among earthquake survivors over two decades after the exposure. The identified potentially modifiable predictors of long-term depression create prerequisites for planning better targeted mental health recovery interventions among disaster survivors.

Key messages:

- Traumatic deaths in the core family, strong emotional response to the event, and lack of social support predicted depression over two decades after the disaster.
- A considerable proportion of survivors reported long-term depressive symptoms highly comorbid with anxiety and PTSD, underscoring the need for screening of all three traits and intervening early-on.

Change in the financial situation of students during COVID-19 and its impact on depressive symptoms

Sarah Negash

S Negash[1], *J Horn*[1], *E Heumann*[2], *SM Helmer*[3], *H Busse*[3], *K Heinrichs*[2], *CR Pischke*[4], *J Trümmler*[4], *J Niephaus*[5], *R Mikolajczyk*[1]

[4]Institute of Medical Sociology, Heinrich Heine University Duesseldorf, Duesseldorf, Germany
[5]Department of Social Sciences, University of Siegen, Siegen, Germany
Contact: sarah.negash@uk-halle.de

Background:

Students faced unique challenges during the COVID-19 pandemic that may have affected their financial situation as well as their mental health. This study sought to examine whether changes in financial situation before and during the COVID-19 pandemic were associated with depressive symptoms among German university students.

Methods:

The cross-sectional COVID-19 German Student Well-being Study (C19 GSWS; N = 7,267) was implemented at five German universities between 27.10. and 14.11.2021. Students were asked if they had had sufficient financial resources to cover monthly expenses before the pandemic, as well as during the first and third waves of the pandemic. Depressive symptoms were assessed using the CES-D 8 (score ranges 0-24) and the PHQ-2 (0-6); higher scores indicating more severe depressive symptoms. Linear regression models were used to examine associations between variables.

Results:

A worsened financial situation between the first and the third wave of the pandemic was associated with a one point (0.95) increase on the CES-D 8 scale (95% CI: 0.61, 1.29) and an improved financial situation with a decrease by 0.81 points (95% CI: -1.20, -0.42). A worsened financial situation was associated with a 0.26-point increase in PHQ-2 (95% CI: 0.14, 0.37) and an improved financial situation with a -0.12-point decrease (95% CI: -0.25, 0.01). Similarly, worsened financial situation in the third wave compared to prior to the pandemic, was also associated with an increase in CES-D 8 score and PHQ-2 and an improved financial situation with a decrease in CES-D 8 and PHQ-2.

Conclusions:

Our findings suggest associations between students' financial situation during the COVID-19 pandemic and their mental health. Due to their instable financial situation, students are a vulnerable group in need of mental and financial support during pandemic crises.

Key messages:

- This study revealed associations between students' financial situation and depressive symptoms.
- A comprehensive approach in efforts to address mental health, including financial support is required.

[8]National Centre on Addiction and Doping, Italian National Institute of Health, Rome, Italy
[9]Department of Brain and Behavioral Sciences, University of Pavia, Pavia, Italy
Contact: gvigezzi@hotmail.com

Background:

Benefits of the stay-at-home order imposed in Italy to prevent SARS-CoV-2 transmission need to be weighed against its impact on citizens' health. In a country with a solid familial culture and where welfare relies on households, confinement drastically decreased support provided by elder relatives, which may have worsened mental health.

Methods:

A web-based cross-sectional study (LOST in Italy) was conducted on a representative sample of Italian adults during lockdown (27th of April-3rd of May 2020). We asked 3156 subjects to report on reduced help in housework and childcare from retired parents to assess confinement impact on mental health through validated scales before and during the lockdown.

Results:

Overall, 1484 (47.0%) subjects reported reduced housework help from parents, and 769 (64.0%, of the 1202 subjects with children) diminished babysitting support. Subjects reporting reduced housework help had worsened sleep quality (multivariate odds ratio, OR 1.74, 95% confidence interval, CI 1.49-2.03) and quantity (OR 1.50, 95%CI 1.28-1.76), depressive (OR 1.32, 95% CI 1.14-1.53) and anxiety symptoms (OR 1.53, 95%CI 1.32-1.78), compared to those reporting unreduced help. Worsening in sleep quality (OR 2.32, 95%CI 1.76-3.05) and quantity (OR 1.80, 95%CI 1.36-2.37), depressive (OR 1.79, 95%CI 1.39-2.31) and anxiety symptoms (OR 1.90, 95%CI 1.48-2.46) was also associated with reduced babysitting help. In subjects with poorer housing and teleworking, mental health outcomes were worse.

Conclusions:

Confinement came along with reduced familial support from parents, negatively impacting mental health. Social networks and support within families provided by older relatives act as a resilience factor and a potential vulnerability that affects mental health outcomes. Health and social services response should be designed to address mental health needs and mitigate long-term health costs caused by the pandemic's unprecedented stressfulness and unknown duration.

Key messages:

- National lockdown measures came along with reduced housework help supply for a large proportion of adult parents who presented increased mental health symptoms with unsatisfactory quality of life.
- A global, multi-level socioeconomic interdisciplinary approach is needed to inform evidence-based family and welfare policies and prevention strategies centred on population wellbeing.

Abstract citation ID: ckac130.182

Country-level determinants of gender differences in major depression and alcohol use disorder

Daniel Hagen

D Hagen[1], *E Goldmann*[1], *DC Ompad*[1,2], *C Bambra*[3]
[1]Department of Epidemiology, New York University School of Global Public Health, New York City, USA
[2]Center for Drug Use and HIV, HCV Research, New York University, New York City, USA
[3]Population Health Sciences Institute, Newcastle University, Newcastle-upon-Tyne, UK
Contact: daniel.hagen@mailbox.org

Background:

Major depressive disorder (MDD) and alcohol use disorder (AUD) are leading causes of disease burden in Europe, with MDD disproportionately affecting women and AUD being more prevalent among men. However, it is unclear how country-level political and socio-cultural characteristics contribute to gender differences in these conditions.

Methods:

Data for 30,416 participants from 16 countries were obtained from the 2014 European Social Survey. Depressive symptoms were ascertained using the 8-item CES-D scale, and alcohol use was assessed with items on past-year alcohol use frequency and quantity, as well as frequency of heavy episodic drinking. Country-level data for attitudes to gender equality, needs-adjusted public social expenditure, and other covariates came from the 2012 International Social Survey Programme and the OECD. Modified Poisson and linear regression with log link examined additive and multiplicative interactions of country-level characteristics with gender for MDD, AUD, and their specific symptoms/dimensions.

Results:

Public social expenditure was not associated with gender differences in MDD (CES-D>10), but with greater differences in the prevalence of the loneliness and sadness symptoms; support for gender equality was associated with smaller differences in loneliness ($p < 0.05$). For AUD, there was evidence of increased alcohol use frequency and quantity among women, and decreased frequency and quantity among men associated with support for gender equality, resulting in lower gender differences in predicted probabilities (from 23% to 5% across exposure levels; $p < 0.001$). Heavy episodic drinking was strongly positively associated with support for gender equality among women ($p < 0.001$), but not among men.

Conclusions:

Country-level characteristics appear to exert differential impact on the prevalence of AUD and certain psychological symptoms of MDD among men and women in Europe. Pending replication, future research should examine underlying mechanisms.

Key messages:

- Country-level characteristics appear to influence the magnitude of gender differences in prevalent alcohol use disorder and certain psychological symptoms of major depression across Europe.
- Favourable country-level attitudes towards gender equality appear to be associated with lower overall prevalence of alcohol use disorder, but higher prevalence among women.

Abstract citation ID: ckac130.183

An analysis of hospital-treated attempted hanging and drowning in Ireland, 2007-2019

Philippa White

P White[1], *P Corcoran*[2], *E Griffin*[2], *E Arensman*[2], *P Barrett*[1]
[1]Department of Public Health, HSE-South, Cork, Ireland
[2]National Suicide Research Foundation, Cork, Ireland
Contact: philippa.fjwhite@gmail.com

Background:

Highly lethal of methods of self-harm, such as attempted hanging and drowning, are a major public health concern due to their high associated risk of completed suicide. This study aims to describe hospital presentations for attempted hanging and drowning in Ireland and explore the factors associated with self-harm and repeat self-harm by these methods.

Methods:

Data on all self-harm presentations to Irish hospitals (2007-2019) were obtained from the National Self-Harm Registry Ireland, a national surveillance system of hospital-treated self-harm. Multivariable logistic regression was used to explore factors associated with any presentation for attempted hanging and drowning and factors associated with repetition of attempted hanging and drowning.

Results:

There were 9,719 and 4,637 attempted hanging and drowning hospital presentations, respectively, in Ireland in 2007-2019. The odds of presentations being due to hanging, rather than due to any other self-harm method, were highest for males (aOR 2.88, 95% CI: 2.76-3.02), children aged <15 (aOR 1.32, 1.17-1.48) and in summer (aOR 1.09, 1.02-1.14). The odds of presentations being due to drowning, rather than due to any other self-harm method, were highest for those aged ≥ 55 (aOR 1.60, 1.43-1.78), homeless individuals (aOR 2.59, 2.32-2.89) and in autumn (aOR 1.15, 1.06-1.25). Repetition of attempted hanging was positively associated with homelessness (aOR 2.47, 2.02-3.04) and acute alcohol ingestion (aOR 1.12, 1.02-1.23). Similar associations were observed for repetition of attempted drowning.

Conclusions:

This study identifies key population groups for whom the risk of self-harm, or repeat self-harm, by hanging and drowning is greatest. Universal, targeted and indicated interventions are needed to address the determinants of highly lethal methods of self-harm. Biopsychosocial assessments of those presenting after attempted hanging and drowning are essential, in view of their high risk of repeat self-harm and suicide.

Key messages:

- Compared with other self-harm methods, the risk of self-harm by hanging and drowning may be highest among males and children aged <15 years and adults aged ≥55 and homeless individuals, respectively.
- A combination of interventions are needed to address self-harm by highly lethal methods.

Abstract citation ID: ckac130.184

Risk factors for internet addiction among Croatian university students during the COVID-19 pandemic

Maja Miskulin

M Miskulin[1], N Pavlovic[1], I Miskulin[1], J Kovacevic[1], D Laslo[1], I Vukoja[1]
[1]Department of Public Health, Faculty of Medicine Osijek, University of Osijek, Osijek, Croatia
Contact: maja.miskulin@mefos.hr

Background:

Following the increased internet use due to the COVID-19 pandemic there have been concerns regarding an elevated risk of developing internet addiction (IA). University students are especially prone to develop IA and risk factors for its development in this population during pandemics are not fully investigated nor understood. This study aimed to identify possible risk factors of IA in the studied population during the ongoing pandemic and to compare it with risk factors in pre-pandemic time.

Methods:

In April 2016 and April 2022 a validated, anonymous questionnaire that contained questions regarding demographic data, as well as Young's Internet Addiction Test, was self-administered to a cross-faculty representative student sample of the University of Osijek, Croatia.

Results:

The study included 1602 university students median age of 21 years (interquartile range 20-22), 34.5% males, and 65.5% females. There was no statistically significant difference in the median age between the two student samples ($p = 0.234$). The main reason for internet use (social networking and entertainment and online gaming) was considered the significant risk factor for IA in a studied population in pre-pandemic time (the year 2016) and pandemic time (the year 2022) ($p < 0.001$). In pre-pandemic time the IA was more frequent in males ($p = 0.046$) while the difference in IA prevalence between sexes did not exist during pandemics ($p = 0.160$). During pandemics, the students who did not work during their study had higher proportions of IA ($p = 0.021$) while there was no difference in IA prevalence among students regarding their working status during the study in pre-pandemic time ($p = 0.251$).

Conclusions:

During the COVID-19 pandemic working status of students has been recognized as the new risk factor for IA in the Croatian university students population. Further studies are needed to identify other possible risk factors for IA in the studied population during pandemics.

Key messages:

- The COVID-19 pandemic has changed the set of risk factors for IA among Croatian university students.
- Better understanding of risk factors for IA among university students during the COVID-19 pandemic will enable the development of successful preventive programs for this behavioral addiction.

Abstract citation ID: ckac130.185

Preoperative anxiety and health literacy in patients applying to the anesthesia outpatient clinic

Mehmet Mutlu

M Mutlu[1], A Mutlu[2], D Oktar[2], B Yelken[1], D Arslantas[2], A Unsal[2]
[1]Anesthesiology and Reanimation, Osmangazi University Faculty of Medicine, Eskisehir, Turkey
[2]Public Health, Osmangazi University Faculty of Medicine, Eskisehir, Turkey
Contact: dr.mehmetmutlu.33@gmail.com

Background:

Evaluation of preoperative anxiety and health literacy is important for healthcare professionals to understand the needs and expectations of patients and provide them with the necessary support. The study aimed to evaluate the preoperative anxiety levels of patients who applied to the anesthesia outpatient clinic and its relationship with health literacy.

Methods:

A cross-sectional study was conducted on patients who applied to the anesthesia outpatient clinic of Eskişehir Osmangazi University Medical Faculty Hospital in March 2022. The questionnaire form, which was prepared by making use of the literature, was filled in by face-to-face interview method after obtaining the participants' verbal consent. The 6 item Amsterdam Preoperative Anxiety and Information Scale (APAIS) in which the scores that can be taken range from 6 to 30 and higher score means higher anxiety was used to assess the level of anxiety, and the 16 item European Health Literacy Scale Short Form was used to assess health literacy. Descriptive statistics, Chi-Square test and Logistic Regression analysis were used to analyze the data.

Results:

In the study group, 197 (50.3%) were female. Their ages ranged from 18 to 86, with a mean of 45.7 ± 17.2 years. The median (min-max) APAIS score was 15 (6-30). There was a moderate negative correlation between the scores obtained from the APAIS and the European Health Literacy Scale Short Form ($r = -0.50$, $p < 0.01$). According to the logistic regression analysis, preoperative anxiety was found to be 1.53 (%95 CI; 1.01-2.30) times higher in women, 3.49 (%95 CI; 1.23-9.94) times higher in those with low family income, and 1.61 (%95 CI; 1.07-2.42) times higher in those with type A personality.

Conclusions:

More than half of the patients had preoperative anxiety. The level of preoperative anxiety decreased as the health literacy level increased.

Key messages:

- Necessary support should be given for the preoperative anxiety of the patients.
- Public health policies should be developed in order to increase health literacy.

Abstract citation ID: ckac130.186

The association of loneliness and social isolation with healthcare utilization in Denmark

Julie Christiansen

J Christensen[1,2], SS Pedersen[1,3], CM Andersen[1,7], P Qualter[4], R Lund[5,6], M Lasgaard[2]
[1]Department of Psychology, University of Southern Denmark, Odense, Denmark
[2]Public Health and Health Services Research, Defactum, Central Denmark Region, Aarhus, Denmark
[3]Department of Cardiology, Odense University Hospital, Odense, Denmark
[4]Manchester Institute of Education, University of Manchester, Manchester, UK
[5]Department of Public Health, University of Copenhagen, Copenhagen, Denmark
[6]Center for Healthy Aging, University of Copenhagen, Copenhagen, Denmark
[7]Steno Diabetes Center Odense, Odense University Hospital, Odense, Denmark
Contact: Julie.Christiansen@stab.rm.dk

Objectives:

The present prospective cohort study investigated the association of loneliness and social isolation (SI) with healthcare utilization (HCU) in the general population over time.

Methods:

Data from the 2013 Danish "How are you?' survey (n = 29,472) were combined with individual-level register data from the National Danish Patient Registry and the Danish National Health Service Registry over a 6-year follow-up period (2013-2018). Negative binomial regression analyses were performed while adjusting for baseline demographics and chronic disease.

Results:

Loneliness measured at baseline was significantly associated with more GP contacts (incident-rate ratio (IRR) = 1.03, 95% confidence interval (CI) [1.02, 1.04]), more emergency treatments (IRR = 1.06, 95% CI [1.03, 1.10]), more emergency admissions (IRR = 1.06, 95% CI [1.03, 1.06]), and hospital admission days (IRR = 1.05, 95% CI [1.00, 1.11]) across the 6-year follow-up period. No significant associations were found between social isolation and HCU with one minor exception, in which SI was associated with fewer planned outpatient treatments (IRR = .97, 95% CI [.94, .99]).

Conclusions:

Our findings suggest that loneliness is a risk factor for certain types of HCU, independent of social isolation, baseline demographics, and chronic disease.

Key messages:

- The findings suggest that lonely individuals are slightly overrepresented within the healthcare system. In contrast, social isolation does not affect the use of health care services.
- The association between loneliness and health care utilization is complex and there is a need for future studies to investigate the mechanisms underlying the association.

Abstract citation ID: ckac130.187
Care obligations, employment and mental health

Uwe Rose

U Rose[1], *H Burr*[1]
[1]Work & Health, Federal Institute for Occupational Safety and Health, Berlin, Germany
Contact: rose.uwe@baua.bund.de

Background:

The presentation is dedicated to employees who care for others in addition to their work. The starting point is the representative cohort study on mental health at work (S-MGA), which covered both care at home and care outside the home in the second wave of the survey. In this regard, cross sectional associations with exhaustion and work-life balance as indicators of mental health were examined taking into account full-time and part-time employment.

Methods:

The sampling frame consisted of all German employees being subject to social security contributions and born between 1951 and 1980. The baseline sample consisted of 4511 survey participants of whom 1279 males and 1358 females were asked for informal care at the follow-up interview. Employment conditions as well as work-life balance were obtained by personal interview; exhaustion was obtained in a paper and pencil questionnaire. Statistical analysis was conducted descriptively and in linear and logistic regressions stratified by gender and controlled for age.

Results:

Informal care at home was reported by n = 74 individuals (2.8%) and care outside of their home by n = 236 (8.9%). The association between both types of care with exhaustion was below the level for significance. There was an increase of work-life-imbalance for females caring at home but not for those who were caring outside. For males there were no effects of both types of care. Including the part-time/full-time distinction indicator within the regression models showed that women who cared at home had lower exhaustion scores and lower work-life imbalance when they were employed part-time.

Conclusions:

The results show that caring at home for females leads to work-life imbalance and that part-time employment mitigates the negative effects on work-life imbalance and exhaustion. However, there are strong limitations by the sample size and the number of observations at the second wave of assessment.

Key messages:

- The results show that caring at home among females seems to lead to work-life imbalance.
- Part-time employment seems to mitigate the negative effects on work-life imbalance and exhaustion.

Abstract citation ID: ckac130.188
Risk factors associated with depression among French university students during covid-19 lockdown

Thibaut Sabatier

T Sabatier[1], *C Godefroy*[1], *MP Tavolacci*[1], *J Ladner*[1]
[1]INSERM UMR 1073, Rouen University, Rouen, France
Contact: thibaut.sabatier1@gmail.com

Background:

During the COVID-19 pandemic students' lives changed drastically, especially regarding their mental health. Social isolation, induced by lockdown, could be the cause of the development of mental disorders in this population. Therefore, the aim of this study was to identify factors associated with depression during French first Covid-19 lockdown among university students.

Methods:

This cross-sectional study, which is a part of the COVID-19 International Student Well-Being Study (ISWS consortium), used the validated CES-D 8 score (Center for Epidemiologic Studies - Depression Scale) to measure depression levels. Data on socio-demographics, curriculum, living condition, academic environment and social interactions were collected few days after the first lockdown in France, from 13 to 31 May 2020. The potential impact of risk factors on depression was studied by multinomial logistic regression.

Results:

A total of 3593 students were included. The CES-D 8 mean score was 8.65 (SD = 5.08). Literature students had the highest average CES-D 8 score (9.47, SD = 5.16). Independent factors associated with the higher scores of depressions included having limited financial resources (AOR = 2.49, 95% CI = 1.84-3.38) having academic concerns, including students worried about not completing the academic year (AOR = 2.93, AOR = 2.37-3.64) and stressed with changes in teaching methods (AOR = 3.55, 95% CI = 2.82-4.46). Otherwise, living with parents during lockdown and being in a relationship were significant protective factors against depression.

Conclusions:

This study highlights the impact of changing social network, living conditions, and academic environment on depression among university students. Preserving students from social isolation must be a critical priority for universities. Future universities' policy strategy could combine on-site teaching with online courses and consider the role of students' social contacts, with a particular emphasis on mental health.

Key messages:

- Social isolation is an important risk factor of depression in students.
- Implications for policy makers demonstrating the need for effective mental health programs and guidance as a public health strategy in universities.

Burden of Depressive disorders in Balkan countries

Aleksandar Stevanović

J Todorovic[1], M Santric-Milicevic[1], A Stevanovic[1], Z Terzic-Supic[1], Z Stamenkovic[1], T Albreht[2], S Stoisavljevic[3,4], N Terzic[5], L Scepanovic[5]
[1]Institute of Social Medicine, Medical Faculty, University of Belgrade, Belgrade, Serbia
[2]Institute of Public Health of Slovenia, Ljubljana, Slovenia
[3]Institute of Public Health of Republika Srpska, Banja Luka, Bosnia and Herzegovina
[4]Faculty of Medicine, Banja Luka, Bosnia and Herzegovina
[5]Institute of Public Health of Montenegro, Podgorica, Montenegro
Contact: aleksandar.stevanovic@med.bg.ac.rs

Background:

Depressive disorders are one of the leading causes of disability and are significant contributor to total Global Burden of Disease (GBD). Globally, according to the 2019 GBD study, the 1.85% of all Disability adjusted life years (DALYs) was associated with depression. The aim of this study was to describe the age-standardized DALYs in ten Balkan countries and the changes observed between 1990 and 2019.

Methods:

The study included the data on age-standardized DALY rate per 100,000 for depressive disorders in the period between 1990 and 2019 for ten Balkan countries (Albania, Bosnia and Herzegovina, Bulgaria, Croatia, Greece, Montenegro, North Macedonia, Romania, Serbia and Slovenia) from the Institute of Health Metrics and Evaluation. We acknowledge the support from the COST Action 18218 - European Burden of Disease Network.

Results:

The highest age-standardized DALY rate/ 100,000 throughout the observed period was in Greece in the 1990- 914.48 (95% CI: 620.19-1287.16) and 927.75 (95% CI: 626.5-1295.7) in 2019, while the lowest age-standardized DALY rate per 100,000 was in Albania in the entire observed period (1990- 369.032, 95% CI: 253.52-518.04 and 2019- 386.42, 95% CI: 266.46-536.31). Greece and Albania are only two countries in the Balkans in which the age-standardized DALY rate per 100,000 increased in the period between 1990 and 2019, in all other countries there was a slight decrease in age-standardized DALY rates in the period between 1990 and 2019.

Conclusions:

Age-standardized DALY rates per 100,000 decreased in eight out of ten countries in the Balkan region. However, age-standardized DALY rate per 100,000 increased in the country with the highest burden of depressive disorders in the region-Greece. In the period between 1990 and 2019 the lowest burden of depressive disorders measured in age-standardized DALY rate /100,000 was in Albania, but Albania also recorded the increase in burden.

Key messages:

- Burden of depressive disorders in Balkan countries is significant.
- Key public health stakeholders in Greece should address the increasing trend of DALY and its association with economic crisis.

Abstract citation ID: ckac130.190
Burden of alcohol use disorder in Balkan countries

Aleksandar Stevanović

J Todorovic[1], M Santric- Milicevic[1], Z Terzic-Supic[1], A Stevanovic[1], Z Stamenkovic[1], N Terzic[2], L Scepanovic[2], T Albreht[3], S Stoisavljevic[4]
[1]Institute of Social Medicine, Medical Faculty, University of Belgrade, Belgrade, Serbia
[2]Institute of Public Health of Montenegro, Podgorica, Montenegro
[3]National Institute of Public Health of Slovenia, Ljubljana, Slovenia
[4]Institute of Public Health of Republika Srpska, Banja Luka, Bosnia and Herzegovina
Contact: aleksandar.stevanovic@med.bg.ac.rs

Background:

Alcohol use is recognized as an important risk factor for more than 200 different diseases and injuries. In the Diagnostic statistic Manual- 5 (DSM-5) it is defined as 'impaired control over alcohol consumption with chronic, heavy and often escalating pattern of alcohol use despite significant detrimental consequences to their overall health, the lives of their family members and friends and society in general'. The aim of this study was to describe the disability adjusted life years (DALY) associated with the alcohol use disorder in the Balkan countries in the period between 1990 and 2019.

Methods:

The study included the data on age-standardized DALY rate per 100,000 for alcohol use disorder in the period between 1990 and 2019 for ten Balkan countries (Albania, Bosnia and Herzegovina, Bulgaria, Croatia, Greece, Montenegro, North Macedonia, Romania, Serbia and Slovenia) from the Institute of Health Metrics and Evaluation. We acknowledge the support from the COST Action 18218 - European Burden of Disease Network.

Results:

The highest age-standardized DALY rate in 1990 was in Romania 484.03 per 100,000 (95% CI: 394.68-594.99), while the highest age-standardized DALY rate per 100,000 in 2019 was in Slovenia 427.75 (95% CI: 332.28-543.83). Along with Slovenia, only country that recorded the increase in the age-standardized DALY rates in the period between 1990 and 2019 was Albania, but the increase was only marginal (DALY per 100,000 increased from 174.24, 95% CI: 115.07-244.76 to 187.92, 95% CI: 127.26-262.41). The lowest burden measured in age-standardized DALY rates per 100,000 in 1990 was in Albania, and in 2019 was in Greece- 174.68, 95% CI: 113.66-251.34.

Conclusions:

In the majority of the Balkan countries the age-standardized DALY rates per 100,000 for alcohol use disorder decreased in the observed period. The increase is observed for Slovenia and Albania, with the more apparent increase in Slovenia.

Key messages:

- The age-standardized DALY rates for alcohol use disorder decreased in the majority of Balkan countries between 1990 and 2019.
- The age-standardized DALY rate increased in Slovenia and Albania between 1990 and 2019.

9.S. Public health monitoring and reporting

Sexual and Contraceptive Behaviour of Adolescents and Young Adults in Germany

Sara Scharmanski

S Scharmanski[1], AH Hessling[1]
[1]Sexuality Education, Contraception and Family, Federal Centre for Health Education, Köln, Germany
Contact: sara.scharmanski@bzga.de

Background:

For 40 years the Federal Centre for Health Education in Germany has been analysing the contraception behaviour of young people. The current Survey is the ninth iteration, carried out in 2019. This continuous monitoring generates insights on the sexual and reproductive health of young people in Germany. The survey provides an important basis for the development of sexuality education and family planning measures.

Methods:

A total of N = 6032 adolescents and young adults participated in the survey. Date collection was conducted by computer-assisted personal interviewing (CAPI). The current sexual and contraceptive behaviour of adolescents and young adults will be summarized using descriptive results. In addition, the association between contraception non-use and sociodemographic factors, characteristics of sexuality education and situated factors of first sexual intercourse is analysed by multivariate logistic regressions.

Results:

A key finding of this iteration is that with regards to the age of the first sexual intercourse, the proportion of adolescents younger than 17 years has been declining for several years. For contraception, adolescents most frequently used condoms, and use of the pill has decreased. 9% of the participants reported non-contraception use at first sexual intercourse. This is significantly associated ($p < .01$) with unexpected and only unilaterally desired sexual intercourse and the absence of sexuality education in School. In addition, the younger the adolescence were at first sexual intercourse the greater the risk for contraception non-use.

Conclusions:

The data from the current iteration indicate safe and responsible contraceptive behaviour among young people in Germany. It is important to maintain the commitment in the field of sexual health promotion and expand prevention measures for young people. This is the only way to ensure the sexual and reproductive health also in the next generation.

Key messages:

- Data from Youth Sexuality Study indicate safe and responsible contraceptive behaviour among young people in Germany.
- Commitment in the field of sexual health promotion needs to be continued.

Abstract citation ID: ckac130.192
Temporal trends in adolescent sport participation in the south-east of France from 2001 to 2019

Maxime Luiggi

M Luiggi[1], M Travert[2], C Gatouillat[2], J Griffet[2]
[1]ADEF, Aix-Marseille University, Marseille, France
[2]ISM, CNRS, Aix-Marseille University, Marseille, France
Contact: maxime.luiggi@univ-amu.fr

Background:

Adolescents playing sport are more likely to reach the recommended levels of physical activity. In 2001, 2006, 2011 and 2019, four successive French national plans were launched to "develop physical and sports activity and limit sedentary living". Monitoring sport participation rates (SPR) is one of the essential components to evaluate these plans. To date, information on temporal trends in SPR has mainly come from the national population. However, due to sample size, it was impossible to measure trends among adolescents on the territory level. Given the various economic and geographical disparities between territories, it is likely that territory specific trends exist. The main objective of this study was to measure temporal trends in adolescent SPR in the third biggest French department (South-East of France).

Methods:

Four retrospective studies were conducted in high-schools between March and April 2001, 2008, 2015 and 2019 (n = 4367). A quota sampling design was used to obtain geographically and socially representative samples. They were invited to report their sex, their socioeconomic status (SES) and their sport participation. A sports player was defined as an adolescent playing sport for at least one hour a week. SPR were calculated by sex and SES with 95% confidence interval (95% CI).

Results:

A decline in SPR, from 79.0% (95% CI = 76.4-81.7) to 64.5% (95% CI = 61.7-67.3), accompanied with a growth of social inequalities, were observed. SPR of low-SES adolescents declined from 67.7% (95% CI = 61.1-74.3) to 42.6% (95% CI = 36.7-48.4). SPR also declined from 72.5% (95% CI = 66.2-78.8) to 69.9% (95% CI = 64.5-75.3) for high-SES girls, from 87.2% (95% CI = 82.5-92.0) to 65.2% (95% CI = 59.6-70.9) for low-SES boys and from 91.0% (95% CI = 87.0-95.0) to 83.0% (95% CI = 78.5-87.4) for high-SES boys.

Conclusions:

Temporal trends in adolescent SPR in this territory are in decline since 2001. Governmental plans to improve SPR seems to have had a limited success in this territory.

Key messages:

- Weekly sport participation is declining among adolescents in the South-East of France.
- Social inequality in weekly sport participation are increasing over time.

Abstract citation ID: ckac130.193
Trends and serotype distribution of human Salmonella strains in central Italy (2015-2021)

Valeria Russini

V Russini[1], C Lucarelli[2], MG Marrocco[1], S Owczarek[2], L Villa[2], ML De Marchis[1], S Bilei[1]
[1]Food Microbiology Unit, Istituto Zooprofilattico Sperimentale del Lazio e Toscana, Rome, Italy
[2]Department of Infectious Diseases, Istituto Superiore di Sanità, Rome, Italy
Contact: valeria.russini@gmail.com

Introduction:

Salmonella enterica (S.) is one of the most common agents of foodborne infections and a risk for children, elder people and immunocompromised patients. S. is the first cause of foodborne outbreaks in the EU, the majority being caused by S. Enteritidis. We report S. serovars prevalence and trends in clinical isolates in central Italy from 2015 to 2021.

Methods:

S. strains of patients from Lazio and Tuscany regions isolated by hospitals and private laboratories were sent to the Regional Reference Centre for Pathogenic Enterobacteria (CREP) at IZSLT (Rome) for serotyping. All metadata and a selection of isolates were shared with ISS according to the National Surveillance Enter-Net Italia program.

Results:

A total of 2395 strains were collected from 2015 to 2021, with a mean value of 342 strains per year. Notably, reported cases did not decrease during the pandemic in 2020. A total of 116 different serovars were identified. The most common ones were S. Typhimurium var. monophasic, which increased from 2015 to 2021, S. Enteritidis, which peaked in 2018 doubling its average, and S. Typhimurium with a reverse trend compared to the monophasic variant, followed by S. Infantis, S. Napoli and S. Derby. Afterwards, S. Brandenburg showed a constant increase (from 2 cases in 2015 to 18 cases in 2021). S. Strathcona showed a significant peak during 2019 with 23 cases, correlated to a European reported outbreak. The average age of patients was stable (mean 28.5, median 12.8), except for an increase in 2021 (mean 35.2, median 27).

Conclusions:

The results show a substantial agreement between data collected in central Italy and national trends. The occurrence of cases per year is stable. The serovars prevalence does not agree with the prevalence found in EU, in particular concerning S. Typhimurium var. monophasic frequency. Further investigations are needed to explain the significant increment of patients' mean age in 2021.

Key messages:

- This kind of studies provide a detailed picture of the S. serotypes actually relevant to human health and could be used to improve and update food safety regulations and monitoring programs.
- Surveillance and digital reporting, even retrospective, are pivotal tool for long-term monitoring, outbreaks investigation and research.

Abstract citation ID: ckac130.194
The impact of the COVID-19 pandemic on tuberculosis case reporting in Kazakhstan

Mukhtar Kulimbet

M Kulimbet[1], A Yergasen[3], N Glushkova[1,3], M Adenov[2], K Davletov[1]
[1]Health Research Institute, Al-Farabi Kazakh National University, Almaty, Kazakhstan
[2]National Scientific Center of Phthisiopulmonology, Almaty, Kazakhstan
[3]Department of Epidemiology, Biostatistics and Evidence-Based Medicine, Al-Farabi Kazakh National University, Almaty, Kazakhstan
Contact: mkbkul@gmail.com

Background:

The COVID-19 pandemic had a significant impact on economic development, lifestyles and health systems in all countries. Due to the lack of medical interventions, many countries adopted restrictive measures to slow the spread of the virus and reduce the burden on the healthcare system. Quarantine measures have had an impact on the transmission of SARS-CoV-2. However, the unintended consequences of such drastic measures were inevitable. In developing countries, there have been adverse effects of disruptions in health services, including the provision of timely medical services in detecting cases of tuberculosis in the population. The aim of this study was to study the influence of COVID-19 pandemic on the tuberculosis incidence in the Republic of Kazakhstan.

Methods:

We analyzed national data on the reported tuberculosis cases and screening results of tuberculosis in Kazakhstan for 2019-2020. The primary data were collected from regular reporting of cases through surveillance.

Results:

The number of registered patients identified during screening activities in 2020 were 2,854 cases compared to 4,288 cases in 2019 before COVID-19 era. The proportion of cases with antibiotic-resistant (poly, multi, super) forms of tuberculosis increased up to 6.7% in 2020 in comparison with 2019.

Conclusions:

There is a need to conduct an analysis of the reasons for the increase in cases of multidrug-resistant and extensively drug-resistant tuberculosis. The working process should be adapted to epidemics and emergencies to ensure the availability of medical services, as well as to improve the system of preventive examinations and screening for the early detection of TB cases. The abstract was submitted under the 'CATINCA - Capacities and infrastructures for health policy development' project which is coordinated/led by Robert Koch Institute and supported by the WHO Regional Office for Europe.

Key messages:

- The detection of tuberculosis during preventive examinations and screenings significantly decreased in 2020 compared to 2019.
- In recent years, there has been a significant increase in the number of cases with poly-, multi- and superantibiotic-resistant forms of tuberculosis.

Abstract citation ID: ckac130.195
Major economic burden of musculoskeletal and connective tissue diseases in Slovenia

Marjetka Jelenc

M Jelenc[1,2], S Sedlak[1], S Simonović[1]
[1]Center for Health Care, National Institute of Public Health, Ljubljana, Slovenia
[2]Faculty of Health Sciences, University of Maribor, Maribor, Slovenia
Contact: marjetka.jelenc@nijz.si

Background:

Musculoskeletal and connective tissue diseases represent a growing public health problem, a great burden on health systems and place a heavy burden on society as a whole. Patients with musculoskeletal and connective tissue diseases often retire early, and any early retirement that could be prevented represents a loss of human capital, which means great social and economic damage to society. The present study was conducted in order to calculate for the first time in Slovenia the costs of the six most common diseases of the musculoskeletal and connective tissue diseases for the period from 2016-2018.

Methods:

The calculated burden of musculoskeletal and connective tissue diseases was based on the calculation of various direct and indirect costs cross-sectionally at the level of one year. The methodology of National Transfer Accounts (NTA) was used for the calculation of indirect costs. Six major diagnoses based on the International Classification of Diseases and Related Health Problems for statistical purposes were selected for calculation. Data were obtained from different national routine databases.

Results:

Calculations of the economic burden of musculoskeletal and connective tissue diseases in Slovenia showed that the economic costs of six selected diagnoses in the period 2016-2018 averaged about 5% of total health expenditure or 0.4% of gross domestic product in this period. The highest direct costs were hospitalizations, followed by costs for medicines, first curative visits at the primary level and visits to the outpatient clinic at the secondary level.

Conclusions:

The results of the first calculation of the burden of musculoskeletal and connective tissue diseases in Slovenia showed a high economic burden of these diseases in the period from 2016 to 2018. The economic burden is underestimated and would be significantly higher considering all diagnoses from this group of diseases.

Key messages:

- Reducing the burden of musculoskeletal and connective tissue diseases is absolutely necessary in view of the aging population and in the light of the sustainability of health systems.
- The preparation of strategic documents for the promotion of musculoskeletal health and the consistent implementation of their contents has become urgent in Slovenia.

To achieve the goal of sustainable employment, considering the profile of the Portuguese working population (PWP), is needed a range of strategies to ensure long, productive, and sustainable careers allied with a better quality of working life, health, and wellbeing, but also with public health policies grounded on scientifically validated and reliable data. This is possible through a comprehensive working system approach that ensures workers will be mentally and physically able to remain at work by the balance between work demands and individual resources allied with public health policies transfer into the workplaces by organizations' leadership and policy makers. The Portuguese Observatory on Occupational Factors (Popsy@Work) aims at addressing this global challenge by: i) digitally collecting psychosocial data on the PWP; ii) implementing and strengthening of a psychosocial occupational health surveillance digital system; iii) providing reference values for the PWP concerning Psychosocial Health; iv) Transferring to society knowledge and best practices; v) Raising awareness on the importance of psychosocial management in occupational settings based on science. Popsy@work is a digital platform that collects and aggregates psychosocial data analytically and creates a visualization hub adding value to data on the PWP and giving science back to society in a usable way, empowering workers, strengthening organizations and grounding public policies. Pospy@Work considers the development of strategic intelligence on levels and inequalities of psychosocial health and well-being in occupational settings by robust metrics and reference data. Creating opportunities for national policy dialogue on inequalities, including the psychosocial health of the PWP through collaboration with diverse sectors identifying and mapping subgroups of populations whose unmet needs require specific outreach measures.

Key messages:

- Popsy@work allows psychosocial health monitoring, reporting and foresight, promoting the provision of robust metrics and reference values for the Portuguese working population.
- Popsy@work allows psychosocial health on occupational settings to be digitally monitored in a continuous way and sustain public health policies.

Changing life expectancy in Europe 1990-2019: Global Burden of Disease Study 2019

Nicholas Steel

N Steel[1], C BauerStaeb[2], J Ford[3], T Gillam[1], J Schmidt[2], AS Hughes[2]
[1]University of East Anglia, Norwich Medical School, Norwich, UK
[2]Office for Health Improvement and Disparaties, Department of Health and Social Care, London, UK
[3]Primary Care Unit, University of Cambridge, Cambridge, UK
Contact: n.steel@uea.ac.uk

Improvements in life expectancy have slowed in high income countries, with uncertain causes. We assessed the contribution of different causes of death to changes in life expectancy, and changes in population exposure to major risk factors in 16 European Economic Area countries plus the 4 nations of the United Kingdom from 1990-2013 and 2013-2019, using the Global Burden of Disease Study. After decades of steady improvements in life expectancy, all countries experienced smaller annual improvements after 2013. Norway experienced the smallest mean annual rate of change in improvement from pre 2013 to post 2013 of 0.03 years, and Northern Ireland (followed closely by Scotland and England) experienced the largest annual reduction from pre to post 2013 of 0.25 years. The cause of death responsible for the largest reductions in life expectancy improvements after 2013 was cardiovascular disease, followed by neoplasms. The largest reductions in deaths from cardiovascular disease were attributable to seven major risk factors: high LDL cholesterol, tobacco, dietary risks, high fasting plasma glucose, high systolic blood pressure, high body mass index, and low physical activity. The risk factors for deaths from neoplasm were similar. Exposure to tobacco remains a high risk but exposure declined steadily. Exposure to the other risks generally worsened after 2013, particularly for BMI and high fasting plasma glucose. The European countries that had better maintained reductions in deaths from cardiovascular disease and neoplasms also experienced larger improvements in life expectancy. These changes were underpinned by changing exposure to major risks. Policy responses to the slowdown in life expectancy improvements should include reducing population exposure to major risks, including the broader risks from diet and low physical activity, through prevention and addressing the broad social and commercial determinants of health as well as adequate funding for health services.

Key messages:

- Reductions in European life expectancy improvements have been driven by changes in deaths from cardiovascular disease and neoplasms.
- Policy responses to the slowdown in life expectancy improvements should include reducing population exposure to major risks, including the broader risks from diet and low physical activity.

Abstract citation ID: ckac130.198
Causes of death in Germany: A time series analysis of official statistics from 1990 to 2020

Diego Montano

D Montano[1]
[1]Department of Population-Based Medicine, University of Tübingen, Tübingen, Germany
Contact: diego.montano@uni-tuebingen.de

Background:

The analysis of the temporal patterns of causes of death is one of the most important tasks in population health monitoring and forecasts. In the present study, a detailed time series analysis of official statistics is performed in order to identify major temporal trends in the distribution of health risks in the German population.

Methods:

Official statistics on causes of death from 1990 to 2020 are utilised. The causes of death are classified according to the International Classification of Diseases (10th Revision). Temporal trends of death cases per 100,000 population and ten-year forecasts are estimated with integrated autoregressive moving average models (ARIMA).

Results:

Cardiovascular diseases, neoplasms and cerebrovascular diseases have accounted for more than 70% of all deaths between 1990-2020. In contrast, urogenital, infectious and muscular-related diseases have been reported for less than 2% of deaths during the same period. Annual deaths per 100,000 population due to cardiovascular and cerebrovascular diseases largely decreased between 1990-2020 (-11.07 95% CI [-15.17; -6.97] and -4.02 95% CI [-6.85; -1.20], respectively). Concerning other causes of deaths, no temporal trends were observed, with the exception of diseases of the nervous and digestive system (0.83 95% CI [0.08; 1.58]). The forecasts for the decade 2020-2030 suggest that cardiovascular diseases and neoplasms are expected to remain the most frequent causes of death in Germany and could account for about 67% of all deaths.

Conclusions:
The results indicate that non-communicable diseases, in particular the group of cardiovascular diseases and neoplasms, will remain the major driver of mortality in Germany over the next decade.

Key messages:
- Cardiovascular health has greatly improved over the last decades in Germany.
- Non-communicable diseases are likely to remain the main drivers of morbidity and mortality over the next decade.

Social inequalities in multimorbidity patterns in southern Spain: findings from the DEMMOCAD survey

Jesús Carretero-Bravo

J Carretero-Bravo[1]*, ME Ortega-Martín*[1]*, B Ramos-Fiol*[1,2]*, V Suárez-Lledó*[1]*, J Álvarez-Gálvez*[1]
[1]Biomedicine, Biotechnology and Public Health, University of Cadiz, Cadiz, Spain
[2]Clinical Medicine and Public Health, University of Granada, Granada, Spain
Contact: jesus.carretero@uca.es

Background:
Multimorbidity (MM) is associated with lower quality of life, greater disability, and higher use of health services. It is a complex problem that is difficult to capture due to the broad spectrum of concurrent chronic diseases involved. There is a need to identify and characterize patterns of chronic conditions in the local context of specific population groups. The DEMMOCAD project aims to respond to this knowledge gap by detecting patterns of MM and their inequalities in the province of Cadiz (Spain).

Methods:
A cross-sectional study was carried out by means of telephone interviews with people over 50 years of age. The final sample was 1592 individuals with MM. A latent class analysis was carried out to identify patterns of MM from 31 chronic conditions. First, the appropriate number of classes was established, considering model fit indices, class size, and clinical interpretability. Subsequently, covariates were introduced into the model using the three-step approach, a technique that minimizes biases in the multinomial regression model.

Results:
Preliminary analyses of the goodness-of-fit indices of the model derived five MM patterns (entropy = 0.727): (C1) mild MM; (C2) cardiovascular; (C3) musculoskeletal; (C4) musculoskeletal plus mental; and (C5) complex MM. Compared with class C1, persons in class C5 were significantly older and less educated, class C4 had a lower income, class C3 was smokers and disabled, and class C2 was characteristic among older males. All four classes also showed lower scores on mental and physical dimensions of the SF12 scale compared to class C1.

Conclusions:
In addition to providing an adjusted characterization of the population of the area analyzed, these initial findings highlight the existence of social inequalities in multimorbidity at the local level that should be addressed by implementing policies targeting the most vulnerable groups in Cadiz (low socio-economic status groups, people with disabilities, and the elderly).

Key messages:
- Five patterns of multimorbidity were identified in the province of Cadiz (Spain).
- Tailored policies are needed to reduce social inequalities in multimorbidity among vulnerable groups in this local area.

Strategies to recruit people with selected nationalities for the interview survey GEDA Fokus

Carmen Koschollek

C Koschollek[1]*, J Geerlings*[1]*, M Bug*[1]*, M Blume*[1]*, K Kajikhina*[1,2]*, C Hövener*[1]
[1]Department Epidemiology and Health Monitoring, Robert Koch Institute, Berlin, Germany
[2]Department Infectious Disease Epidemiology, Robert Koch Institute, Berlin, Germany
Contact: KoschollekC@rki.de

Background:
People with migration history (PMH) are underrepresented within health monitoring at Robert Koch Institute (RKI). To better describe the health status of PHM, the RKI is currently conducting the health interview survey GEDA Fokus with different migrant groups. Aim of this contribution is to present which sub-groups in this sequential mixed-mode survey design are reached by which mode.

Methods:
People aged 18-70 years with Croatian (hr), Italian (it), Polish (pl), Syrian (sy) or Turkish (tr) nationality were drawn out of 99 residents' registration offices all over Germany (N = 33,436). Study persons were invited sequentially to participate online (saq-web), paper-based(saq-paper) and in person (CAPI) or by telephone (CATI) in Arabic, Croatian, German, Italian, Polish or Turkish. Saq-web was available in German only or bilingual. Data collection took place from November 2021 to April 2022. Per nationality, 1,200 participants were recruited.

Results:
As of 25th of April, 6,197 people took part, most often per saq-web (49%), which was less often used among participants aged $\geq$ 50 years (35% vs. 56%). Pl participants used saq-web most often in German only (55%), sy participants most often used the bilingual version (77%). Saq-paper was more often used by participants aged $\geq$ 50 years (41% vs. 22%) and less often by tr (21%) and sy (24%) participants. Participants with it nationality most often took part on their own initiative (saq) (92%), while tr (33%) and pl (28%) participants were recruited via personal contact (CAPI/ CATI) more often.

Conclusions:
Preliminary results show that offering multiple modes of administration helps to reach different sub-groups. Personal contact contributes to reach those not directly taking part on their own initiative. The opportunity to utilize the bilingual version of the questionnaire was well accepted, especially among those with presumably shorter duration of residence in Germany.

Key messages:
- Offering different modes of survey administration, including personal contact increases survey participation.
- In order to reach people with migration history in their heterogeneity the utilization of multilingual questionnaires is crucial.

The impact of perceived discrimination on subjective health among adolescents

Katja Kajikhina

K Kajikhina[1,2]*, C Koschollek*[1]*, C Hövener*[1]
[1]Social Determinants of Health, Rober Koch Institute, Berlin, Germany
[2]Crisis Management, Outbreak Investigations and Training Programmes, Rober Koch Institute, Berlin, Germany
Contact: KajikhinaK@rki.de

Background:
Interpersonal discrimination (disc.) plays an important role for physical and mental health, througoutthe life-course and in particular during adolescence. People can experience disc., e.g. due to their physical appearance or language preferences

independently of having a migration background (mb, official statistical category in Germany). Aim of this contribution is to analyse the impact of perceived disc. on subjective health and its relation to mb.

Methods:

Using data from from German Health Interview and Examination Survey for Children and Adolescents (KiGGS) wave 2 (2014 - 2017), we analysed by logistic regression the impact of a) overall perceived disc. ($\geq$ one indication of "sometimes" across eight dimensions), b) perceived disc. related to origin, skin colour, accent, language, dialect and c) one- and two-sided mb (one or both parents with own mb) on subjective health among adolescents aged 14 to 17 years.

Results:

Among 3,558 adolescents, 21% perceived disc. in at least one of overall eight dimensions, 11% reported disc. related to their origin, skin colour or language. A one-sided mb was measured for 8,4% of participants, a two-sided mb for 20%. Perceiving overall disc. (OR = 3.29) and disc. related to origin, skin colour or language (OR = 1.91) was associated with reporting a (very) bad subjective health. Mb had no impact. Effects remain after controlling for gender, age and socioeconomic position of parents (overall disc. aOR = 2.99; disc. related to origin, skin colour or language aOR = 1.65).

Conclusions:

Perceived disc. is associated with worse subjective health among adolescents, whereas no association with mb is observed. Epidemiological analyses solely focussing on one statistical category such as mb are insufficient as they do not consider those affected by discrimination but are not captured by mb. Differentiated analyses are necessary to elucidate explanatory mechanisms and protective factors.

Key messages:

- Discrimination has negative effects on self-rated subjective health.
- Differentiated analyses based on more than "origin" or "migration background" is required to describe public health.

Abstract citation ID: ckac130.202
An analysis of RMNCH data quality on technological applications and methods to improve it

Harhini Harhini

H Harhini[1], *P Nath Sidh*[1]
[1]Sahaj Sansthan, Jodhpur, India
Contact: harhini@sahajsansthan.org

Background:

Health information management systems (HIMS) are used by most countries to record data on the coverage of reproductive, maternal, newborn and child health services (RMNCH). The HIMS in India manually collects data from primary health care facilities. Low and middle income countries (LMIC) are shifting to technological applications (apps) to improve reporting and real time tracking of RMNCH services. This study found high disparity of data between different sources. Yet governments and other stakeholders continue to use poorly reported data for daily monitoring, review and decision making. This study shares insight on the high degree of data variation, and proposes process and policy changes to improve it.

Methods:

To quantify the extent of data variation, critical RMNCH indicators from apps and HIMS are compared for a given geography and time period. Workshops with the primary health workers and their supervisors were conducted to understand the challenges in reporting, based on which solutions to improve the efficiency of apps are proposed.

Results:

Preliminary analysis in the state of Madhya Pradesh shows, in the year 2020-2021 live births, neonatal deaths and Infant deaths were 93%, 91% and 71% less respectively on apps as compared to HIMS. Major challenges of reporting on technological applications by primary health workers

- low internet penetration at 31% in Madhya Pradesh
- Lack of mechanisms to ensure user friendly and glitch-free apps
- Poor capacity to understand public health indicators and application generated reports

Conclusions:

Online data quality must be governed by policies that focus on implementing mechanisms to analyze and validate data from different sources and remove blockages to quality reporting. Online public health reports need to be demystified by building capacities of primary health workers and their supervisors to use data to reflect on their performance and plan for improvement.

Key messages:

- Poor online data will impact real time action to ensure coverage and accountability for low performance.
- Investing in user friendly efficient technology for RMNCH services with strong quality control mechanisms, is the priority for good decision making.

Abstract citation ID: ckac130.203
Trends in working years lost due to different types of work disability and unemployment

Taina Leinonen

T Leinonen[1], *E Viikari-Juntura*[1], *S Solovieva*[1]
[1]Finnish Institute of Occupational Health, Helsinki, Finland
Contact: taina.leinonen@ttl.fi

Background:

Little is known about working years lost (WYL) due to work disability and unemployment by industrial sector. This information would help in directing interventions promoting healthy working careers, knowing that the sectors have been differently affected by economic fluctuations and other changes in the labour market. We examined trends in WYL in the general Finnish population and by industrial sector in the period after the 2008 financial crisis with a particular focus on different types of work disability.

Methods:

Utilising register data on the Finnish working-age population and the Sullivan method, we calculated expected WYL due to sickness absence, other temporary work disability, partial disability retirement, full disability retirement, unemployment and other reasons in years 2010, 2013 and 2016 for the general male and female populations and by industrial sector.

Results:

In 2010, a 30-year-old person was expected to have around two-and-a-half to three WYL due to full disability retirement and unemployment until reaching age 65, depending on gender and the reason. By 2016, WYL due to full disability retirement decreased to less than two years and that due to unemployment increased to around four years among both genders. WYL due to sickness absence, other temporary work disability, partial disability retirement and other reasons remained relatively stable. The total WYL increased between 2010 and 2016 particularly among women. The differences by industrial sector in WYL were attributable more to unemployment than to the different work disability statuses.

Conclusions:

After the financial crisis unemployment appears to have replaced disability retirement as the most important reason for WYL. Furthermore, as individuals with a defined industrial sector are initially employed, sectoral differences in WYL are not largely attributable to disability retirement, disability pensioners typically having been outside the labour market for a long time.

Key messages:

- During economic downturns work disability may be increasingly disguised as unemployment, which should be considered when tackling problems of health and work ability of the labour force.

- Partly due to healthy worker effect, differences in working years lost by industrial sector are attributable to long-term work disability to a much smaller extent than to unemployment.

A German study on the impact of stress on interparental relationship strain after preterm birth

Alinda Reimer

A Reimer[1], *L Mause*[1], *J Hoffmann*[1], *A Hagemeier*[2], *N Scholten*[1]
[1]IMVR, University Hospital Cologne, Cologne, Germany
[2]IMSB, University of Cologne, Cologne, Germany
Contact: alinda.reimer@uk-koeln.de

Background:
Relationship satisfaction is an important predictor of well-being. Few studies address the effects of stress on interparental relationships of parents with preterm infants. However, the experience of a preterm birth represents an extreme, stressful event and therefore may place a strain on a relationship. Our aim is to examine the impact of postnatal stress on maternal and paternal perceptions of relationship strain.

Methods:
As part of the Neo-CamCare project, a retrospective cross-sectional study was conducted targeting parents with infants with a birth weight below 1,500 g. Linear regression was used to analyse the influence of stress on relationship strain.

Results:
437 mothers and 301 fathers participated. Data indicate that interparental relationship strain experienced by fathers (M = 2.61, SD = 1.46) is lower than strain experienced by mothers (M = 3.43, SD = 1.7). The stress level due to the infant's behaviour and appearance is lower in fathers (M = 2.53, SD = 0.95) than in mothers (M = 2.98, SD = 1.05). Stress due to parental role change is higher in mothers (M = 3.37, p = 1.04) than in fathers (M = 2.49, SD = 0.99). Regression analyses show that stress due to behaviour and appearance, as well as parental role change, can be associated with relationship strain in mothers. For fathers, only stress experienced due to the behaviour and appearance can be associated with relationship strain, whereas parental role change is not significant.

Conclusions:
Our data illustrate that relationship strain can result from stress in mothers and fathers, indicating the need for stress prevention measures for both. Only mothers show relationship strain due to stress in their parental role. Although it is unclear what mechanisms underlie these findings, we assume that the maternal role is still primarily associated with child care. One way to relieve maternal stress could be to increase psychological support and the promotion paternal involvement in the postnatal period.

Key messages:
- Understanding the extent to which stress affects relationships helps to address mothers and father equally.
- Based on the findings, parent-centred interventions can be developed to manage relationship strains.

Abstract citation ID: ckac130.205
Perceived discrimination and mental health among adolescents in Germany

Miriam Blume

M Blume[1], *C Koschollek*[1], *K Kajikhina*[1], *J Waldhauer*[1], *C Hövener*[1]
[1]Epidemiology and Health Monitoring, Robert Koch-Institut, Berlin, Germany
Contact: blumemi@rki.de

Background:
The association between perceived discrimination and mental health in adolescents has been widely documented. Aim of this contribution is to show how the relationship between mental health and perceived discrimination at school, work or job training differs depending on socio-economic or migration-related determinants.

Methods:
The present analyses was conducted with data from German Health Interview and Examination Survey for Children and Adolescents (KiGGS) wave 2 (2014 - 2017). Weighted linear regression analyses were conducted to explore the association between perceived discrimination at school, work or job training and behavioral problems in adolescents (14-17 years). Also, we examined the extent to which the association is moderated by the parents' income, education as well as the language spoken at home.

Results:
Of all young people, 25.5 % reported perceived discrimination at school, work or job training. Behavioral problems were reported more frequently in adolescents with discrimination experience (12.5 % vs. 3.23 %). Multivariate analyses showed that the coefficients of the association between perceived discrimination and behavioral problems differed by parents' level of education (low 4.07 (2.39-5.74)/high 2.47 (1.29-3.65)), income (low 3.61 (2.06-5.16)/high 0.35 (-1.81-2.51)), or language spoken at home (German 2.02 (0.33-3.70)/ Other 3.48 (-0.27-7.23)).

Conclusions:
A large proportion of adolescents experienced discrimination, with this being reported more frequently among young people with behavioral problems. Parents' income and education as well as the language spoken at home are relevant for this context. To ensure that health inequalities are not exacerbated by discrimination, targeted prevention measures are needed in these settings. These should address not only the individual needs of young people, but also the underlying conditions and thus aim to promote health equity in the long term, especially in already disadvantaged groups.

Key messages:
- Perceived discrimination is important when considering mental health, whereby these associations may vary between socioeconomic and migration-related determinants.
- Prevention programs regarding discrimination are needed, which address individual needs and underlying conditions of adolescents, especially in already disadvantaged groups.

Abstract citation ID: ckac130.206
Normalisation of mental health problems: Adolescents' views on mental health problems and stigma

Veronica Hermann

V Hermann[1], *N Durbeej*[1], *A-C Karlsson*[1], *A Sarkadi*[1]
[1]Department of Public Health and Caring Sciences, Uppsala University, Uppsala, Sweden
Contact: veronica.hermann@pubcare.uu.se

Background:
It is essential to listen to adolescents' views on mental health issues since these problems are common among young people.

Exposure to stigmatization is an additional burden, causing increased suffering. This qualitative descriptive study aimed to explore adolescents' views on the prevalence of mental health problems and public stigma related to mental health problems.

Methods:

Semi-structured individual interviews and focus group interviews were conducted with a total of 32 adolescents, aged 15-18 years. The interviews were held on Gotland, Sweden's largest island, between October and December 2020. Systematic text condensation was used to analyse the data.

Results:

Three themes were identified: Having mental health problems is the new normal; What others think of us affects us a lot; If others lack experience and knowledge, they don't respond in a good way. The adolescents perceived mental health problems as a common phenomenon. Increased mental health problems in young people were linked to pressure related to school performance, social media and improved openness about mental health problems. Stereotypic gender norms, rumours and prejudice were perceived as important causal risk factors of mental health problems. Lack of knowledge was suggested as a source of prejudice against people suffering from mental health problems.

Conclusions:

The adolescents recognised mental health problems as an increasing public health issue, but also as a normal phenomenon due to current living conditions for young people.. They perceived stereotypic gender norms, taboo and prejudice against mental health problems as factors contributing to and increasing mental health problems and wished for a society without such factors. The results suggest that the tri-folded description of stigma involving stereotypes, prejudice and discrimination can be applicable to adolescents.

Key messages:

- The results suggest that adolescents recognise mental health problems as an increasing public health issue but also as a normal phenomenon due to current living conditions for young people.
- Increased knowledge of mental health problems alongside reduction of prejudice and stereotypic gender norms was requested by the adolescents to improve young peoples' mental health.

Abstract citation ID: ckac130.207
Multi-method analysis of gender differences in psychological distress among the elderly during COVID

Ieva Reine

C Queen[1,2], *R Pasupathy*[1], *I Reine*[2,3]
[1]Department of Public Health, Texas Tech University Health Sciences Center, Abilene, USA
[2]Institute of Public Health, Riga Stradins University, Riga, Latvia
[3]Department of Public Health and Caring Sciences, Uppsala University, Uppsala, Sweden
Contact: Ieva.reine@rsu.lv

As COVID swept through Europe, and the world, with high rates of illness and death, so did symptoms of anxiety, depression, post-traumatic stress disorder, stress, and psychological distress. This study examines the relationship between gender and psychological distress among Latvians over 50 years old within the first 6 months of the COVID-19 pandemic. Data from Wave 8 COVID-19 data of the Survey of Health, Aging, and Retirement in Europe (SHARE) as an early data version of the SHARE Corona survey conducted between June and August 2020. It features the data collected by telephone (CATI) on topics related to COVID-19 for a large sub-sample of SHARE panel respondents. This study examined a sample of 980 adults over 50 years old in Latvia. Bivariate analysis were performed utilizing the Pearson chi-square test for association to examine differences in symptoms of psychological distress by gender during the first six months of the COVID-19 pandemic. Level of significance was determined by the p-value test statistic. Alpha level was established at .05. A chi-square test for association shows that there were statistically relationships between gender and feeling nervous (X2 (2, N = 976) = 22.11, p < .001), feeling depressed (X2 (3, N = 976) = 10.95, p < .01), and trouble sleeping (X2 (2, N = 976) = 20.40, p < .001). This study rejects the null hypothesis that no differences exist between the genders, as women reported greater psychological distress during the first 6 months of the COVID-19 pandemic. Additional multi-method analysis is consistent with these findings and concludes that this is due to the greater concern women report for family, and the burden which placed limitations on meeting their children and grandchildren.

Key messages:

- Gender differences exist in experiences of psychological distress during the early COVID-19 pandemic among the aging population in Latvia.
- With the high rates of illness and death associated with the COVID-19 pandemic, so were symptoms of anxiety, depression, post-traumatic stress disorder, stress, and psychological distress.

Abstract citation ID: ckac130.208
Enhancing the understanding of parental burnout from an empirical and psychometric perspective

Katharina Prandstetter

K Prandstetter[1], *H Murphy*[1], *S Olderbak*[2], *H Foran*[1]
[1]Department for Psychology, University of Klagenfurt, Klagenfurt, Austria
[2]Department for Diagnostic and Epidemiology, Institute for Therapy Research, Munich, Germany
Contact: katharina.prandstetter@aau.at

Background:

Parental burnout (PB) is a relatively new syndrome resulting from chronic parenting stress. Besides efforts to enhance scientific and public understanding of PB, little is known about its link to intimate partner violence (IPV), and the psychometrics of German measures for PB remain an under-researched topic. This study aims to address these gaps by 1) testing the interplay of PB, parenting, couple satisfaction, and IPV, 2) examining the psychometrics of the German version of the Parental Burnout Assessment (PBA).

Methods:

Data were collected online as part of an international PB study including Austrian parents aged 18 or older with at least one child at home (0-18). Overall, N = 121 mothers from a community sample reported on family functioning, PB, couple quality and gender roles. Structural equation modeling was applied to assess the fit of the theoretical model. Furthermore, data from N = 220 Austrian and German parents on PB and familial variables during the Covid-19 pandemic were collected to analyze the psychometrics of the German PBA. Confirmatory factor analyses were performed to test the validity of the PBA.

Results:

SEM indicated a good model fit, $\chi\circ2(37) = 35.51$, $p = .54$; CFI = 1.00; RMSEA = .00, (95% CI = .00 -.06). Furthermore, an indirect effect of couple satisfaction on the link between IPV to PB and IPV to parenting was found.

Conclusions:

This study provides preliminary evidence for the importance of couples' relationship satisfaction in understanding links between IPV and PB as well as parenting in German-speaking mothers. On the basis of these findings, future public health efforts may be organized to focus on preventing PB indirectly or directly by targeting couples' relationship. Additionally, psychometric results of this study can inform researchers and practitioners about the applicability of the German PBA, improving screening of at-risk parents, and offering support for parents at early stages.

Key messages:

- Our findings underscore the importance of couples' relationships for understanding parental burnout in German-speaking parents.
- Valid and reliable assessment of parental burnout can support the screening of at-risk parents at early stages.

[9]School of Medicine, University of Nottingham, Nottingham, UK
Contact: holly.blake@nottingham.ac.uk

Background:

Mental ill health is the leading cause of sickness absence with high economic burden. Workplace interventions aimed at supporting employers with prevention of mental ill-health in the workforce are urgently required. Managing Minds at Work (MMW) is a digital intervention targeting support for line managers in any work setting to promote better mental health at work through a preventative approach.

Objectives:

To describe the design and development of the MMW digital training programme, prior to feasibility testing. We adopted a collaborative participatory design involving co-design (users as partners) and principles of user-centred design (pilot and usability testing). Agile methodology was used to co-create intervention content with a stakeholder community of practice. Development processes were mapped to core elements of the Medical Research Council (MRC) framework for developing and evaluating complex interventions.

Results:

The program covers five broad areas: (i) promoting self-care techniques among line managers; (ii) designing work to prevent work-related stress; (iii) management competencies to prevent and reduce stress; (iv) having conversations with employees about mental health; (v) building a psychologically safe work environment. Pilot and usability testing (n = 37 surveys) aligned with the Technology Acceptance Model (TAM) demonstrated that MMW was perceived to be useful, relevant, and easy to use by managers across sectors, organization types and sizes. We identified positive impacts on manager attitudes and behavioural intentions related to preventing mental ill-health and promoting good mental well-being at work.

Conclusions:

MMW is a digital training programme for line managers that has been co-created using rigorous development processes and aims to support employers with primary prevention in mental health. The next step is to explore the feasibility and acceptability of this intervention with line managers in diverse employment settings.

Key messages:

- We used co-creation and participatory design to create Managing Minds at Work - a new digital intervention to support line managers in preventing mental ill-health at work.
- The next step is to explore the feasibility and acceptability of this intervention with line managers in diverse employment settings.

Abstract citation ID: ckac130.210
Exploring ethical issues arising from a problem-solving intervention in the Swedish Primary Care

Ida Karlsson

I Karlsson[1], L Sandman[2], I Axén[1], G Bergström[3,1], L Kwak[1], E Sernbo[4], E Björk Brämberg[1]
[1]Department of Environmental Medicine, Karolinska Institutet, Stockholm, Sweden
[2]Division of Society and Health, Linköping University, Linköping, Sweden
[3]Department of Occupational Health Sciences, University of Gävle, Gävle, Sweden
[4]Department of Social Work, Gothenburg University, Gothenburg, Sweden
Contact: ida.karlsson.1@ki.se

Background:

Common mental disorders count for a large percentage of sick leave cases in Europe and in Sweden. Problem-solving with workplace involvement have shown promising results in reducing the number of sick leave days for employees on sick leave for these conditions. Engaging the workplace by for example including the first-line manager in the return-to-work process changes the usual role of the primary care. Hence, this study aims to explore ethical issues that potentially arise when introducing workplace involvement as part of a problem-solving intervention.

Methods:

A qualitative study in the Swedish Primary Care using data from semi-structured interviews with rehabilitation coordinators (n = 6), employees on sick leave for common mental disorders (n = 13), and their first-line managers (n = 8). A theoretical framework for systematic identification of ethical aspects of healthcare technologies was used to guide the interviews and reporting of results. Content analysis was used to code the data, searching for latent content. Ethical issues related to the ethical values privacy, identity, autonomy, professional values, third party, equality and justice were identified and described. The analysis was concluded by a normative discussion.

Results:

Ethical issues were identified such as difficulties for the employees to control personal information. A need to create an integrated role of a patient and an employee and for coordinators to act neutral instead of as a patient advocate. Managers needed to balance the needs of the organization with the needs of the employee. A pre-requisite for participation was agreeing to manager involvement which may affect the equality of the intervention.

Conclusions:

A conversation about sharing of information, roles, responsibilities and expectations during the rehabilitation should be initiated early and be continuous. Managers need support in learning the "how to" when having an employee on sick leave due to a common mental disorder.

Key messages:

- The problem-solving intervention imposed ethical issues in regard to control over personal information and role shifting, which can be handled through discussions and awareness.
- By analysing ethical aspects and norms and values connected to the intervention, adaptations and solutions can be discussed and handled before full scale implementation.

Abstract citation ID: ckac130.211
Effect, economic and process evaluation of a mental health return to work intervention: study design

Fiona Starke

F Starke[1,2], *A de Rijk*[2], *U Wegewitz*[1]
[1]Division 3 Work and Health, Federal Institute for Occupational Health & Safety, Berlin, Germany
[2]Department of Social Medicine, Maastricht University, Maastricht, Netherlands
Contact: f.starke@maastrichtuniversity.nl

Background:

In Germany, the sickness absence duration for mental disorders lasts on average more than twice as long as for all other diseases. Interventions that link medical-therapeutic approaches with organisation-directed methods to improve a sustainable return to work (RTW) have hardly been evaluated. The aim is to present the study design, which evaluates the (cost-)effectiveness and feasibility of an 18-month intensified RTW aftercare delivered by German psychiatric outpatient clinics to employees with mental disorders.

Methods:

A two-arm multicentre randomised controlled study is carried out. Sick-listed employees with mental disorders are recruited within psychiatric hospitals (n = 506). Besides care as usual, the intervention group receives a multimodal treatment consisting of individual RTW-support, RTW-aftercare groups, and web-based aftercare. At five time points over a 24-month observation period, quantitative effectiveness and health economic evaluation data from a societal perspective will be obtained. Intervention fidelity, reach, context, satisfaction and dose delivered will be examined in a multi-method process evaluation. A qualitative evaluation using pre-and post-interviews from a sub-sample (n = 30) will complement the effectiveness and process evaluation findings.

Results:

Recruitment is currently ongoing. The intervention is expected to improve the employeés achievement of a sustainable RTW, defined as the 12-month remain and participation at work without having sickness absence periods of > 6 weeks (after RTW). It is hypothesized that the intervention is preferable in terms of costs compared to care as usual. The interviews allow for a better understanding of subjective experiences with the intervention.

Discussion:

This study evaluates the (cost-)effectiveness and implementation process of an intensified RTW aftercare. If successfully implemented and evaluated, it might be adopted as standard care for employees with mental disorders in Germany.

Key messages:

- A comprehensive evaluation of a RTW-intervention is needed.
- The proposed design includes an effectiveness, process and health economic evaluation. It has a unique scope and follow-up length.

Abstract citation ID: ckac130.212
Mental health care in the post-partum: differences between Danish-born, migrants and descendants

Paula Santia

P Santia[1], *CJ de Montgomery*[2], *M Marti-Castañer*[2]
[1]Epidemiology, Hospital del Mar, Barcelona, Spain
[2]Public Health, University of Copenhagen, Copenhagen, Denmark
Contact: palisantia@gmail.com

Background:

Research suggest migrants are at higher risk of mental health (MH) disorders in the post-partum (PP), while they have less access to care. However, MH need and care have been studied separately, descendants have been, mostly, excluded and migrants, studied as a homogeneous group. We aim to assess differences in MH care use between Danish-born, migrants and descendants in the PP after a MH need is identified; and to characterize migrants at lowest risk of accessing MH care.

Methods:

This retrospective cohort study includes 45571 women who gave birth from 2002 to 2018 in Denmark and had a MH need identified by a nurse in the PP program. MH care use, from delivery to two years PP, was retrieved from national registries and includes contacts with the general practitioner, psychologist, psychiatrist, emergency room, hospitalization, and medication expedition. Cox regression models estimated time to MH care use, by migrant status and migrant characteristics, adjusted by history of MH, sociodemographic and birth variables. Results are shown as hazard ratios (aHR [95% CI]).

Results:

Final sample consisted of 75.7% Danish, 19.7% migrants and 4.7% descendants. Median time to treatment was 4 months for Danish and 6 months for migrants and descendants. Risk of accessing MH care was lower for migrants (aHR 0.75 [0.70; 0.79]) and descendants (aHR 0.77 [0.70; 0.86]) than for Danish-born. Among migrants, refugees showed higher risk of accessing MH care (1.22 [1.04; 1.42]) than non-refugees; recently arrived showed lower risk (<5 years, 0.85 [0.74; 0.97]) than those living in Denmark for ≥10 years; and migrants from East Africa showed the lowest risk of accessing MH care (0.47 [0.33; 0.66]) compared to migrants from North Europe.

Conclusions:

There is a gap in PP MH care between Danish-born women, who show higher and earlier access to care, and migrants and descendants. Refugee background, length of residency and origin impact migrant's MH care use and should be considered.

Key messages:

- Unmet need for MH care is higher for migrants and descendants than for Danish-born in the postpartum.
- MH care use differ among migrants and tailored strategies of care provision could be beneficial.

Abstract citation ID: ckac130.213
Having mental health problems but not sickness absent: factors of importance among privately employed

Jurgita Narusyte

J Narusyte[1,2], *I Alaie*[1], *A Ropponen*[1,3], *P Svedberg*[1]
[1]Division of Insurance, Karolinska Institutet, Stockholm, Sweden
[2]Centre for Epidemiology and Community Medicine, Stockholm, Sweden
[3]Finnish Institute of Occupational Health, Helsinki, Finland
Contact: jurgita.narusyte@ki.se

Background:

Knowledge is scarce on individuals who are experiencing mental health problems but who have low or no sickness absence (SA). The aim of this study was to identify individual-level characteristics, including sociodemographic factors, morbidity, and lifestyle, among privately employed individuals with previous depression/anxiety but no SA during follow-up.

Methods:

This prospective cohort study included 750 twin individuals born in Sweden in 1959-1986, employed in the private sector and with a history of depression/anxiety. Depending on the birth year, the twins were invited to participate in two different health-screening surveys in 2005, when study participants were aged 19-20 or 20-30, respectively. Survey data were used to evaluate depression and anxiety, self-rated health, stressful life events, emotional neglect, level of physical activity, and alcohol use. Study participants were prospectively followed regarding SA occurrence between 2006 and 2018. Data on SA, sociodemographic factors, outpatient healthcare use, and use of prescribed antidepressants were obtained from the Swedish national registries. Descriptive statistics will be reported with further analyses for the presentation.

Results:
Preliminary results showed that despite previous depression or anxiety, 35% of women and 52% of men were not on SA during the follow-up period. Those who had no SA during follow-up were more likely to have higher education >12 years (49%), experienced fewer stressful life events (43%) and emotional neglect (56%), had better self-rated health (95%), along with a lower use of antidepressants (11%) and outpatient healthcare (88%), as compared with those on SA (33%, 65%, 66%, 90%, 17%, and 98%, respectively).

Conclusions:
Higher education, being male, fewer life adversities, good self-rated health and low use of antidepressants and outpatient healthcare were individual-level factors of importance for those with previous depression or anxiety and no incident SA during follow-up.

Key messages:

- Individuals with previous depression/anxiety, but not sickness absent, were more likely to have higher education, be male, and have lower morbidity, as compared to individuals on sickness absence.
- Identification of factors that prevent sickness absence among those with mental health problems may potentially be used to improve sickness absence prevention strategies.

Job resources do not mitigate the impact of job demands for workers with depression

Patricia Ots

P Ots[1], AC Keller[2], E Altrock[2], SKR van Zon[1], S Brouwer[1]
[1]Department of Health Sciences, University Medical Center Groningen, Groningen, Netherlands
[2]Department of Psychology, University of Groningen, Groningen, Netherlands
Contact: p.ots@umcg.nl

Introduction:
Jobs characterized by low to moderate job demands and high job resources are associated with better work outcomes among healthy workers, yet it remains unclear whether this is the case for workers with depression. This study examined whether depression moderates the relationship between job demands, job resources, and maintaining employment.

Methods:
Data from the longitudinal population-based Lifelines cohort study were matched with register data on employment status from Statistics Netherlands (n = 55,950). The two-way interaction between job demands and depression and the three-way interaction between job demands, job resources and depression were examined in a zero-inflated Poisson regression model with path 1 including a binary employment outcome and path 2 a count variable including months out of employment.

Results:
The interaction effect of job demands and depression on being employed was significant (b = -0.22, 95% CI: -0.44; 0.01), showing that workers without depression were more likely to be employed whereas workers with depression were less likely to be employed if they had high job demands. The three-way interaction between job demands, job resources, and depression was significant for months out of employment (b = 0.15, 95% CI: 0.01; 0.29), indicating that workers with depression had more months out of employment when reporting high job demands and high job resources compared to workers without depression.

Discussion:
Although increasing resources to prevent negative work outcomes may be beneficial for workers without depression, this approach might be limited for the vulnerable subgroup of workers with depression.

Key messages:

- While job demands are associated with a higher likelihood of employment during follow-up for workers without depression, this is not the case for workers with depression.
- Job resources do not help workers with depression who face high job demands.

Abstract citation ID: ckac130.215
Co-locating public mental health services in communities: a realist evaluation

Shamini Gnani

C Baskin[1], F Duncan[2], E Oliver[2], G Samuel[3], A Adams[4], S Gnani[1]
[1]Department of Primary Care and Public Health, Imperial College London, London, UK
[2]Department of Sport and Exercise Sciences, Durham University, Durham, UK
[3]McPin Foundation, London, UK
[4]Population Health Sciences Institute, Newcastle University, Newcastle, UK
Contact: s.gnani@imperial.ac.uk

Background:
Public mental health (PMH) services address social determinants of mental health, such as poverty, poor housing, and job insecurity. Austerity and welfare reform in the UK has led to cuts to social and welfare support, increasing poor mental health and widening inequalities, exacerbated by COVID-19. State health services lack capacity to tackle social issues that contribute to a large proportion of expressed mental health need. Co-locating PMH services within community spaces is a potential solution to increase early access and improve quality of services. Using a realist evaluation, we sought to develop the theory on how community co-location affects PMH outcomes, who this works best for, and how this is impacted by the context of delivery.

Methods:
We collected data from service-users and service-providers at six case study sites across England, UK, using interviews (n = 62), four focus groups (n = 40) and two stakeholder workshops (n = 19).

Results:
We identified four overarching theories. First, community providers do not operate under the same limits as state services allowing them the flexibility and time to build trust and ongoing relationships with service users. Second, the ethos and culture of services is to empower users to access help and be independent. Third, accessing support from a shared local space allows a coordinated and holistic response reducing barriers such as distance, cost, and anxiety. Four, as they are recreational services and spaces for access by all with no predefined/required level of need they are better at promoting wellbeing and primary prevention.

Conclusions:
Community co-location of PMH services can strengthen the overall mental health system by widening reach to people vulnerable to poor mental health and enabling earlier intervention on associated social determinants. This has potential to reduce mental health inequalities and demand on the state health system.

Key messages:

- Community co-location of PMH services can provide early and holistic support for complex social issues.
- There is potential to support the state health system by alleviating demand for help with ‘non-health’ issues.

Abstract citation ID: ckac130.216
Transformation of the long-term care system in Poland in the light of the maps of health needs

Jan Olminski

J Olminski[1]*, M Koziol-Rostkowska*[1]*, A Smiglewska*[1]*, M Strozyk-Kaczynska*[1]
[1]Department of Analyses and Strategies, Ministry of Health, Warsaw, Poland
Contact: j.olminski@mz.gov.pl

As the inevitable ageing of the population progresses, the pressure on the public health system increases. The predicted rise in the share of people aged 65 and more from 19% in 2020 to 33% in 2050 jeopardises the capacity of the long term care in Poland. It demands immediate actions in public policies to strengthen the system and to provide the silver generation with the proper and adjusted services. That topic is one of the main issues for the map of health needs, developed by the Ministry of Health in Poland. The analyses investigate the current and future state of this part of the system, e.g. the number of visits, average length of stay, types of services, care-giver support ratio. Conclusions drawn from the data allowed to formulate a number of challenges, which include:

1. levelling up the access to the services,
2. increasing the number of outpatient services, provided at home or close to the place of residence,
3. implementation of the eHealth solutions,
4. support for the informal care-givers.In line with these information, the actions and strategic frameworks have been established at the national level and included:

1. strategic approach for deinstitutionalisation, in order to bring the long term care closer to the patients' environment, to provide them with an optimal level of comfort and to make them self-reliant for as long as possible,
2. enhancement of the inpatient care through transformation of less occupied wards into long term wards in district hospitals.

Key messages:

- The Maps of Health Needs help to create national public policies and strategic frameworks aimed at coping with the foreseen challenges of aging society pressuring the healthcare system.
- The main challenge for the long term care in the future is to channel the available resources in the appropriate way.

Abstract citation ID: ckac130.217
The frequency of UTIs in people who undertake intermittent catheterization: A systematic review

Floriana D'Ambrosio

F D'Ambrosio[1]*, F Orsini*[2]*, A Scardigno*[1]*, C Pappalardo*[1]*, R Ricciardi*[3]*, GE Calabrò*[1,3]
[1]Section of Hygiene, University Department of Public Health, Università Cattolica del Sacro Cuore, Rome, Italy
[2]Graduate School of Health Economics and Management, Università Cattolica del Sacro Cuore, Rome, Italy
[3]VIHTALI, Spin-Off of Università Cattolica del Sacro Cuore, Rome, Italy
Contact: florianadambrosio@libero.it

Background:

Intermittent Catheterization (IC) is a common procedure used for the management of incomplete bladder emptying in various diseases such as spinal cord injury, multiple sclerosis and benign prostatic hypertrophy. Catheterization is associated with several complications and particularly with an increased risk of developing urinary tract infections (UTIs) responsible for high morbidity worldwide and significant costs to health systems and society.Today, this health problem is still underestimated. Therefore, the aim of this study was to summarize the available evidence on the clinical and epidemiological burden of UTIs among patients performing IC.

Methods:

A systematic literature review was performed querying two online database (PubMed,Web of Science) from January 2012 to January 2022. All studies in English language and focused on the clinical-epidemiological burden of UTIs related to IC in the adult population were included.

Results:

Overall, 43 studies were considered. It was described a range of UTIs from 26% to 63%, with an increased number of hospital admissions and length of stay. UTIs were more common in patients with spinal cord injuries (about 40%) and with multiple sclerosis (24-34%).The main risk factors associated with UTIs were catheter reuse, type of catheter and catheterization procedure adopted.

Conclusions:

Data on IC-associated UTIs are still limited. Estimating the UTIs load in patients with IC could support healthcare professionals to identify the most appropriate type of catheter to reduce the risk of this important complication. Proper management of catheterization could improve patients' quality of life and also reduce the impact of diseases associated with this procedure on health systems and society.

Key messages:

- Catheterization is associated with an increased risk of UTIs causing morbidity and relevant costs to health systems and society.
- Knowing the burden of IC-associated UTIs could support better patients management in terms of suitable procedures to apply and more appropriate catheters to use.

Abstract citation ID: ckac130.218
Anticipating & assessing adverse consequences of public health interventions - CONSEQUENT framework

Jan Stratil

J Stratil[1]*, RL Biallas*[1]*, A Movsisyan*[1]*, K Oliver*[2]*, EA Rehfuess*[1]
[1]LMU Munich, IBE, Munich, Germany
[2]Faculty of Public Health and Policy, LSHTM, London, UK
Contact: stratil@posteo.net

Introduction:

Despite the best intentions, public health (PH) interventions can have adverse and other unintended consequences (AUCs). AUCs may arise in novel PH interventions, as well as from known and tested PH interventions implemented in a new context. Despite their importance, this topic has been largely overlooked. Therefore, we used a structured value-guided as well as evidence-based approach, to develop a framework to support researchers, practitioners, and policy-makers in anticipating and assessing AUCs of PH interventions.

Methods:

We employed the 'best-fit' synthesis approach starting with an a priori framework and iteratively revising this based on systematically identified evidence. The a priori framework was derived from both the WHO-INTEGRATE framework and the Behaviour Change Wheel, to root the framework in global health norms and values, established mechanisms of PH interventions, and a complexity perspective. The a priori framework was advanced based on theoretical and conceptual publications and systematic reviews on the topic of AUCs in PH. Thematic analysis was used to revise the framework and identify new themes. To validate the framework, it was coded against four selected systematic reviews of AUCs of PH interventions.

Results:

The CONSEQUENT framework includes two components: the first focuses on AUCs and serves to categorise them; the second component highlights the mechanisms through which AUCs may arise. The first component comprises eight domains of consequences - health-related, health system, human and fundamental rights, acceptability- and adherence-related, equality- and equity-related, social and institutional, economic and resource-related, and environmental.

Conclusions:

Both over- and underestimation of AUCs of PH intervention poses risks. The CONSEQUENT framework may facilitate classification and conceptualization of AUCs of PH interventions during their development or evaluation to support evidence-informed decision-making.

Key messages:

- Despite their importance for evidence-informed decision making adverse and unintended consequences of public health interventions are often overlooked within public health research and practice.
- The CONSEQUENT framework can support decision-makers in anticipating, assessing, and accounting for adverse and other unintended consquences, as well as the machanisms leading to them.

Abstract citation ID: ckac130.219
Tobacco outlet availability in Dutch rural and urban areas

Tessa van Deelen

T van Deelen[1], *S Belmonte*[1], *B van denPutte*[2], *AE Kunst*[1], *MAG Kuipers*[1]
[1]Public and Occupational Health, Amsterdam UMC Location University of Amsterdam, Amsterdam, Netherlands
[2]Amsterdam School of Communication Research, University of Amsterdam, Amsterdam, Netherlands
Contact: t.r.d.vandeelen@amsterdamumc.nl

Background:

The Netherlands aims to reduce the availability of tobacco outlets by implementing a sales ban for vending machines (2022) and supermarkets (2024). The government intends to further phase out tobacco sales by petrol stations and small outlets after 2030. This study aims to understand its impact on tobacco outlet availability in the Netherlands, with particular attention to rural areas.

Methods:

An audit of tobacco retailers was held between Sept 2019-June 2020 in four cities (Amsterdam, Eindhoven, Haarlem, and Zwolle) and between March-Apr 2022 in seven rural municipalities (Aa en Hunze, Ermelo, Dinkelland, Montferland, Simpelveld, Veere, and Waadhoeke). Each identified retailer was visited and mapped using Global Positioning System (GPS). Tobacco outlet availability was calculated in terms of density per population and km2, and residents' proximity to the nearest outlet.

Results:

In the rural areas, we found a total of 98 tobacco outlets, of which supermarkets (n = 57), petrol stations (26), small outlets (13) and tobacco specialist shops (2). In the four cities, we found a total of 870 outlets. Tobacco outlet density was much lower in rural areas than the four cities: 0.09 vs. 2.2 per km2 and 5.05 vs. 6.2 per 10,000 capita. The average shortest distance from an address to a tobacco outlet was much higher in rural areas (1.23km) compared to cities (0.31km). After implementation of all sales bans, tobacco outlet availability will reduce to 2 outlets in rural areas and 61 in urban areas which represents 0.1 and 0.4 per 10,000 capita, respectively. The distance will increase in cities (to 1.42km), but particularly in rural areas (to 5.28km) where 5 of the 7 municipalities did no longer include a tobacco outlet.

Conclusions:

The proposed restrictions on tobacco sales will strongly decrease tobacco outlet availability, and might even disappear in some rural areas. These results call into question how the tobacco industry would respond to the proposed restriction.

Key messages:

- This study is the first ex-ante policy evaluation to assess the impact of current and future tobacco control policies at the POS on tobacco outlet availability in the Netherlands.
- The proposed restrictions on tobacco sales will strongly decrease tobacco outlet availability, and might even disappear in some rural areas.

Abstract citation ID: ckac130.220
Public perceptions uncovered: engaging in decision-making regarding non-pharmaceutical interventions

Sophie Kemper

S Kemper[1,2], *MEJ Bongers*[1], *JFH Kupper*[2], *M De Vries*[1], *A Timen*[1,2]
[1]Centre for Communicable Disease Control, RIVM, Bilthoven, Netherlands
[2]Athena Institute, VU University Amsterdam, Amsterdam, Netherlands
Contact: sophie.kemper@rivm.nl

Background:

To control the COVID-19 pandemic, non-pharmaceutical interventions (NPIs) were implemented worldwide, that heavily impacted the daily lives of citizens. Occasionally, the public expressed discontent about NPIs, as NPIs did not always corresponded with their preferences. The question is if and how public engagement (PE) could aid in development and implementation of NPIs, in order to improve legitimacy, quality and compliance.

Methods:

An online survey was conducted from 27 October to 9 November 2021, with a representative sample of the public in the Netherlands on gender, age, education, place of residency and migration background. In total 4981 respondents participated. Perceptions and preferences about PE in decision-making on NPIs to control COVID-19 was collected. Four NPIs were used: Nightly curfew (NC); Digital Covid Certificate (DCC); Closure of schools and daycares (CSD); and 1.5meter social distance.

Results:

Around 25% of respondents expressed a desire to engage in decision-making, as it would increase understanding and quality of NPIs, and their trust in the government. Especially for the NPIs DCC and NC, respondents found it valuable to engage, by providing their perspective on certain trade-offs in values in decision-making (e.g. opening up society vs division in society by vaccination status). The public could play a role by giving feedback on bottlenecks during decision-making, however overall responsibility should stay with experts and policy-makers. Desire for engagement was lowest for CSD. Around 50% of the respondents did not want to engage, as they felt they were not knowledgeable enough to do so and did not perceive a need to engage. The other 25% had a neutral disposition.

Conclusions:

Engagement was not self-evident for most respondents, yet the ones willing to engage revealed important possibilities for future outbreaks. Next, a deliberative process for PE in decision-making could be executed, in order to implement our findings in practice.

Key messages:

- Although engagement was not self-evident, respondents who were willing to engage revealed important possibilities to shape future public engagement practices in decision-making in COVID-19 control.
- Respondents were mostly willing to engage in NPIs with no consensus in the trade-offs of relevant values in decision-making, such as the Nightly Curfew and the Digital Covid Certificate.

Abstract citation ID: ckac130.221
Determinants influencing municipal decision-makers in Germany regarding community health promotion

Lisa Paulsen

L Paulsen[1], *L Benz*[1], *C Müller*[2], *B Wallmann-Sperlich*[2], *J Bucksch*[1]
[1]Prevention and Health Promotion, Heidelberg University of Education, Heidelberg, Germany
[2]Institute for Sport Sciences, University of Würzburg, Würzburg, Germany
Contact: paulsen@ph-heidelberg.de

Background:

Community health promotion should be based on theoretical behavioural and environmental approaches. Especially changes in the physical environment require administrative and political decisions. This study aims to identify determinants that influence decision-makers from local politics and administrations on decisions so that health promotion can be placed on the agenda of communities as a prerequisite of intervention implementation.

Methods:

We used the methods of qualitative guided interviews and a quantitative survey. First, decision-makers from local politics and administrations in both urban and rural areas in Germany were interviewed in the period from July to November 2020. The interviews were analysed using qualitative content analysis according to Kuckartz and MAXQDA. Second, a nationwide online survey was conducted using Limesurvey. We used descriptive analyses. In both surveys, decision-makers reported the determinants for decision-making processes and their decision-making behaviour.

Results:

22 interviews were conducted (women n = 7), and 415 participants (women n = 118) responded to the online survey. The decision-making behaviour of local decision-makers can be differentiated on different levels, following socio-ecological models: individual, socio-cultural, institutional, municipal and political. Each of these levels comprises a multitude of determinants that are essential for successful persuasion toward community health promotion. At the individual level, we identified determinants like attitudes, outcome expectations or emotions towards a topic.

Conclusions:

The identification and understanding of determinants for local decision-making are essential for a tailored and theory-based intervention approach to place health promotion on the agenda of communities and to implement interventions. Further research is needed to replicate the importance of potential determinants and to develop effective intervention methods and techniques.

Key messages:

- Regarding to a theory-based implementation of community health, determinants of local decision-makers should be taken into account.
- The determinants are nested on different levels (e.g. individual, socio-cultural, institutional) of a socio-ecological approach.

Abstract citation ID: ckac130.222
Swedish local and regional politicians' views on their role in health promotion

Sara Svanholm

S Svanholm[1], *H Carlerby*[1], *E Viitasara*[1]
[1]Department of Health Sciences, Mid Sweden University, Sundsvall, Sweden
Contact: sara.svanholm@miun.se

Background:

The political context is an important determinant of health. Politicians in municipalities and regions in Sweden are responsible for many of the determinants of health, and their role is therefore important when considering health promotion. The aim of the study was to explore how politicians describe their role in health promotion.

Methods:

An electronic questionnaire focused on politicians' role, responsibility, and possibility to promote health was sent to all politicians in municipalities and regions in the north of Sweden. A total of 667 politicians answered the questionnaire, and out of them, 361 politicians answered the free text question ''as a politician I consider my role in health promotion to be ...''. The answers were analyzed using thematic analysis. The four themes discovered were used to sort politicians into groups. All politicians were sorted into the group that was most similar to their answer. Group sizes were shown in percentage of how large part of the politicians belonged to the respective groups.

Results:

Preliminary results show that the politicians could be divided into four different groups: 1) No political role, only personal aspects described (such as being a good role model) (25,3%), 2) Promote individuals to take care of their health (for example through information) (19,5%), 3) Support other parts of the organization (municipality or region) to promote health, mainly through financial support and agenda-setting (29,8%), 4) Most (if not all) political decision-making affect health (25,4%).

Conclusions:

There is a large variety in how politicians describe their role in promoting health. Only approximately half of the politicians see that their political decision-making can directly affect the health of the population. With the political context being an important determinant of health, this could be considered a missed opportunity for structural health promotion work.

Key messages:

- Approximately half of the politicians did not describe political means of affecting population health.
- Not recognizing the political determinants of health risk making politicians miss the opportunity for structural health promotion work.

Abstract citation ID: ckac130.223
Preparing for the unexpected: Comparing plans for post-terror health response in Norway and France

Lisa Govasli Nilsen

L Nilsen[1,2], *LE Stene*[1]
[1]Section for Trauma, Catastrophes and Forced Migration - Children and Youths, Norwegian Center for Violence and Traumatic Stress, Oslo, Norway
[2]Department of Sociology and Political Science, Norwegian University of Science and Technology, Trondheim, Norway
Contact: l.g.nilsen@nkvts.no

Background:

How healthcare systems should respond to health and psychosocial needs in the population after terrorism is debated. Still, there has been recent interest for more coordinated health threat governance in Europe. Studies comparing approaches to health emergency contingency in different countries are thus needed. This poster will present a comparative study of how France and Norway planned for disaster follow-up prior to four major terrorist attacks, and how differences in the approaches can be understood.

Methods:

National plans and guidelines from France and Norway, planning the response to mass casualty incidents relevant to four terrorist attacks in 2011, 2015 and 2016 were analyzed, by document analysis. Walt and Gilson's health policy model, focused on context, process, content and actors guided the analysis.

Results:

The countries' approaches were similar regarding identified target groups of prescribed measures and contents of some measures, however historical and systemic differences shaped approaches to post-terror needs. The countries deviated particularly on who the actors responsible for providing care were, and also the content of some measures. For instance, in

France specialized mental health care were more involved in early psychosocial care than in Norway, where primary care approaches were more salient.

Conclusions:

Contextual factors appear to affect how healthcare contingency is planned, and finding one approach applicable in all national contexts appears challenging. Still, the presentation will discuss the potential for identifying core elements for psychosocial and healthcare follow-up that can be relevant in different contexts.

Key messages:

- There is variation in how countries approach the task of protecting the population's health and psychosocial well-being following terrorism.
- There is a need to continue mapping existing practices in different countries to identify core elements for psychosocial follow-up that could be used internationally.

Abstract citation ID: ckac130.224
Impact of the kidney transplantation moratorium in France because of the COVID-19 pandemic

Vincent Bonnemains

V Bonnemains[1], F Le Borgne[1,2], E Savoye[3], C Legeai[3], M Pastural[3], S Bayat-Maokei[4], R Lenain[1,5], K Leffondré[6], C Couchoud[3,7], Y Foucher[1,8]

[6]Université de Bordeaux, INSERM, UMR1219, Bordeaux, France
[7]Université de Lyon I, CNRS, UMR 5558, Villeurbanne, France
[8]Centre Hospitalier Universitaire de Nantes, Nantes, France
Contact: vincent.bonnemains@univ-nantes.fr

Background:

The COVID-19 pandemic has resulted in worldwide kidney transplantation (KT) moratoriums. The impacts of these moratoriums on the life expectancy of KT candidates remain unclear.

Methods:

We simulated the evolution of several French candidate populations for KT using a multistate semi-Markovian approach and according to moratorium durations ranging from 0 to 24 months. The transition rates were modeled from the 63,927 French patients who began dialysis or were registered on the waiting list for KT between 2011 and 2019.

Results:

Among the 8,350 patients active on the waiting list at the time of the French KT moratorium decided on March 16, 2020, for 2.5-months, we predicted 4.0 additional months [CI: 2.8, 5.0] on the waiting list and 42 additional deaths [CI: -70, 150] up to March 16, 2030. In this population, we reported a significant impact for a 9-month moratorium duration: 135 attributable deaths [CI: 31, 257] up to March 16, 2030. Patients who became active on the list after March 2020 were less impacted.

Interpretation:

The temporary moratorium of KT during a COVID-19 peak in order to free up hospitals' resources doesn't impact patients' 10-year survival if the moratorium does not exceed a prolonged period.

Funding. French National Research Agency (ANR-20-COV8-0002-01).

Key messages:

- The French 2020 KT moratorium didn't impair patients' 10-years survival.
- 9-month or longer moratoriums may impair patients' 10-years survival.

Abstract citation ID: ckac130.225
Public Health Guideline to prevent and control SARS-CoV-2 in schools: development and evaluation

Lisa Maria Pfadenhauer

L Pfadenhauer[1,2], M Rueb[1,2], B Strahwald[1,2], KJ Wabnitz[1,2], M Nothacker[3], EA Rehfuess[1,2]
[1]IBE, Ludwig-Maximilians University, Munich, Germany
[2]Pettenkofer School of Public Health, Ludwig-Maximilians University, Munich, Germany
[3]AWMF e.V., Arbeitsgemeinschaft der Wissenschaftlichen Medizinischen Fachgesellsch, Berlin, Germany
Contact: pfadenhauer@ibe.med.uni-muenchen.de

Issue/problem:

In times of high demand for scientific evidence for decision-making on COVID-19 mitigation measures, guidelines can be useful for translating scientific evidence into policy and practice. While guidelines are widely used in medical decision-making, they are novel to public health in Germany.

Description of the problem:

Since December 2020, a guideline group has been working on a living, evidence- and consensus-based public health guideline on preventing and controlling SARS-CoV-2 transmission in schools. The group includes scientists across multiple disciplines as well as a broad range of stakeholders, including from the school family. Key features in the development of recommendations included a Cochrane rapid review and the WHO-INTEGRATE evidence-to-decision framework. The development and usefulness of the guideline for decision-making are being evaluated using a multi-method approach.

Results:

The first version of the guideline containing nine recommendations was published in February 2021. The WHO-INTEGRATE framework facilitated the consideration of factors such as health benefits and harms, feasibility, acceptability and financial constraints. Preliminary findings of the evaluation suggest that under time pressure, developing few essential, consensus-based recommendations while assessing their societal implications is warranted. A shared understanding of evidence and of the purpose and limitations of guidelines is critical. To remain relevant, continuous integration of new evidence and updating of the guideline is necessary.

Key messages:

- Purpose and limitation of guidelines needs to be clear to ensure engagement and utilization.
- To remain useful for decision-making, guidelines and the underlying evidence need to be continuously updated.

Abstract citation ID: ckac130.226
The role of socioeconomic status and political attitudes in the spread of Covid-19 in Austria

Anja Stradner

A Stradner[1,2]
[1]International Affairs and Consulting, The Austrian National Public Health Institute, Vienna, Austria
[2]Socioeconomics Department, Vienna University of Economics and Business, Vienna, Austria
Contact: anja.stradner@goeg.at

This study investigates the role of socioeconomic status (SES) and political attitudes marked by populism and libertarianism in the spread of Covid-19 infections across Austria. A spatial regression approach is adopted based on official registry data on Covid-19 cases at the municipality level, granted by the Austrian National Public Health Institute. This allows the consideration of spatial dependencies between observations in close geographic proximity. Moreover, to uncover potential temporal (in)stabilities in the effects, the associations are examined over two pandemic phases, namely the second (06/20 to 02/21) and third wave (02/21 to 07/21) of infections. The analysis shows that low educational attainment and income led to higher infection rates during both periods under investigation. In contrast, unemployment was negatively related to the Covid-19 incidence. While the findings for income and education were more pronounced during the third wave of infections, unemployment had a more significant impact during the second wave. Contrary to what was expected, the findings report that populist attitudes were associated with lower case numbers during the second wave. This association reversed and became positive in the third wave but was no longer significant. A positive yet non-significant relationship was detected between libertarian attitudes and Covid-19 cases for both periods studied. The findings suggest that low-income and less-educated groups carry a higher Covid-19 disease burden in Austria. This provides vital information for policymakers to develop targeted public health strategies to protect vulnerable groups and achieve a more equitable distribution of health in society. Only limited evidence was provided regarding the impact of populist and libertarian sentiments on the spread of Covid-19. As polarisation has increased throughout the pandemic, further research on attitudes characterized by skepticism towards state intervention and science is needed.

Key messages:

- This study shows that income, education, and unemployment had a significant impact on municipality-level Covid-19 infection rates in Austria during the second and third waves of the pandemic.
- While populist and libertarian attitudes were positively associated with the Covid-19 incidence during the third wave, the effects were not significant.

11.R. The impact of the COVID-19 pandemic

Flu and Covid-19: is there adherence to vaccination in target groups?

Domitilla Marconi

D Marconi[1], *L Botarelli*[1], *M Gennari*[1], *A Cartocci*[2], *N Vigiani*[3], *N Nante*[1,4], *G Messina*[1,4]
[1]Post Graduate School of Public Health, University of Siena, Siena, Italy

[4]Department of Molecular and Developmental Medicine, University of Siena, Siena, Italy
Contact: d.marconi2@student.unisi.it

Background:

In Italy, the flu vaccine is recommended and free for target groups (adults≥60 years old, fragile people, healthcare workers, pregnant women). During the 2020/2021 flu season, an increased vaccination coverage (+6,9%) was observed compared to the previous season, also due to the Covid-19 pandemic. We aimed to investigate how strong the adherence to the flu vaccine was by the vulnerable groups and assess if the Covid-19 vaccination campaign may have influenced the rate of flu vaccines.

Methods:

At the beginning of autumn 2021 we conducted an online survey among the population of Tuscany. We collected data on demographics, health status (pregnancy, vulnerable), flu and COVID-19 vaccinations coverage and health information sources. In addition, we performed a descriptive and a risk factors analysis to assess correlation between our variables with R v 4.0.0. Significance level was set at $p < 0.05$.

Results:

Among 408 participants, 248 (61%) belong to a vulnerable group and are recommended to receive the flu vaccine, 229 (56%) usually get the flu vaccine, 386 (95%) got the Covid-19 vaccine, 267 (65%) choose and trust the general practitioner (GP) as their health information source. There is a statistically significant association between being part of a vulnerable group and getting the seasonal flu vaccine (OR 6.63 95% CI 4.26-10.3 $p < 0.001$). In addition, getting the Covid-19 vaccine increases the likelihood of receiving the flu vaccine (2.90 95% CI 1.16-7.28 $p = 0.018$). Moreover, participants who trust their GP as their health information source (OR 1.63 CI 1.08-2.46 $p = 0.019$) are more likely to receive the flu vaccine; other information sources (TV, newspaper, social media) are not associated with the flu vaccine.

Conclusions:

Our research shows that vulnerable groups get vaccinated against the flu. The increase in flu vaccine coverage may be due to the COVID-19 vaccines campaign. GPs play a crucial role in the health promotion, prevention and health literacy of patients.

Key messages:

- GP plays a crucial role in the prevention and health literacy of patients.
- COVID-19 vaccines campaign may have positively influenced the flu vaccination campaign. However, we must continue to maintain the coverage we have managed to achieve in the future.

[4]4Centre for Health Research, Faculty of Medicine, University of Ostrava, Ostrava, Czechia
Contact: hana.tomaskova@osu.cz

Background and Aims:

Elderly, especially those with chronic diseases, are a population at high risk of a severe course of the SARS-CoV-2 infection. The study aimed to investigate the complex immune response after vaccination in nursing home residents older than 65 years depending on the previous COVID-19 status and vaccine brand.

Methods:

375 participants participated in the study in September-October 2021. IgG antibodies against spike protein and nucleocapsid protein, the titer of virus neutralization antibodies, and cellular immunity (interferon-gamma release assay) were tested in elderly nursing home residents vaccinated with Pfizer, Moderna 30-31 weeks after the completion of vaccination and in those vaccinated with AstraZeneca 23 weeks before sampling. The prevalence with 95% confidence intervals (CI) was evaluated in Stata version 17.

Results:

In total, 95.2% (95% CI: 92.5%-97.1%) of samples had positive results of anti-S IgG, 92.8% (95% CI: 89.7%-95.2%) were positive in virus neutralization assay and 89.0% (95% CI: 84.5%-92.5%) in the interferon-gamma-releasing assay (indicator of cellular immunity). Even though the immune response to the Pfizer and Moderna vaccines were evaluated after a longer period than AstraZeneca, the immune response in residents vaccinated with these vaccines were superior. All immune parameters in vaccinated individuals were significantly higher in convalescent residents than in those who had not been infected with COVID. No case of COVID-19 occurred during the vaccination-to-test period.

Conclusions:

High immune response was found in elderly nursing homes residents (65 years and older) after 5-7 months after vaccination against SARS-CoV-2. In particular, vaccinated convalescents showed high immune responses. It appears that such residents are much better protected from COVID-19 than those who are only vaccinated.

Key messages:

- In a random sample of elderly nursing homes residents, high immune responses were found 5-7 months after the completion of vaccination against SARS-CoV-2 in the Czech Republic.
- During the vaccination-to-test period (5-7 months) no case of COVID-19 occurred in the samples of Elderly Nursing Homes Residents in the Czech Republic.

Attitudes towards mandatory vaccinations during the COVID-19 pandemic in Bulgaria

Stanislava Hadzhieva

S Hadzhieva[1], R Chamova[1], E Ivanova[1], N Radeva[2], M Rohova[3], NL Mihaylov[3], Ts Paunov[1], M Kolarova[1], R Pancheva[1]
[1]Department of Hygiene and Epidemiology, Faculty of Public Health, Medical University, Varna, Bulgaria
[2]Department of Disaster Medicine and Maritime Medicine, Faculty of Public Health, Medical University, Varna, Bulgaria
[3]Department of Economics and Health Care Management, Faculty of Public Health, Medical University, Varna, Bulgaria
Contact: slava79@abv.bg

Background:

Vaccinations are an essential public health strategy to control preventable diseases. A much-discussed approach to increase coverage is mandatory vaccination; however, its legitimacy and effectiveness were put to question during the COVID-19 pandemic. As of March 1,2022, Bulgaria had one of Europe's lowest immunization coverage rates against COVID-19. Only 29.3% of Bulgarians had completed COVID-19 vaccination, compared to 71% in the EU and EEA, and the country ranked last in number of booster doses (9.9% vs 51.4 %). This study aims to investigate the public's attitudes toward proposed mandatory COVID-19 vaccination and toward the long-standing mandatory child immunization schedule in the context of the COVID-19 pandemic.

Methods:

An online cross-sectional survey was conducted in April 2022 using a self-administered anonymous questionnaire to collect information on sociodemographic characteristics, vaccination status and attitudes toward mandatory vaccination to COVID-19 and the mandatory childhood immunization schedule.

Results:

Out of 1433 reached respondents, 1200(84%) completed the survey. The largest relative share of respondents is between 35-44y-33.3%; 72.7% were women; mainly highly educated (50.8%), and vaccinated participants (59.3%). There is a significant and large difference between vaccinated and unvaccinated regarding the full support of mandatory COVID vaccinations (46.1% vs 1.8%), and regarding mandatory child vaccinations (77.9% vs 50.4%). Mandatory childhood vaccination schedules are supported by 88.7% of those in favor of obligatory COVID-19 vaccinations and 56% of those who oppose them ($p < 0.001$). Significance is preserved after adjustment for vaccination status.

Conclusions:

Public health authorities need to develop well-organized vaccination campaigns in which accurate evidence-based information is adequately disseminated with respect to individuals' autonomy. More research on the determinants of vaccination attitudes in Bulgaria is necessary.

Key messages:

- Mandatory vaccination programs should be proceeded by investigation of the social readiness for acceptance.
- Exploration of cultural specificities to influence vaccination decision is needed.

Abstract citation ID: ckac130.230
Fear of infection or fear of protection – driving factors of COVID-19 vaccine uptake in Bulgaria

Stanislava Hadzhieva

M Rohova[1], R Pancheva[2], NL Mihaylov[1], N Radeva[3], E Ivanova[2], R Chamova[2], Ts Paunov[2], M Kolarova[2], S Hadzhieva[2]
[1]Department of Economics and Health Care Management, Faculty of Public Health, Medical University, Varna, Bulgaria
[2]Department of Hygiene and Epidemiology, Faculty of Public Health, Medical University, Varna, Bulgaria
[3]Department of Disaster Medicine and Maritime Medicine, Faculty of Public Health, Medical University, Varna, Bulgaria
Contact: slava79@abv.bg

Background:

Bulgaria faced significant COVID-19 morbidity and mortality rates, but many people underestimated the risk of transmission and severity of infection. Rising vaccine-related fear and misinformation exacerbated existing hesitancy and mass vaccination remained a challenge. This study aims to investigate the factors influencing COVID-19 vaccination uptake in Bulgaria.

Methods:

A cross-sectional study was conducted in April 2022 in a sample of 1,200 respondents. Data were collected via an online self-administered questionnaire, measuring perceived risk of COVID-19, vaccine attitudes, trust in health system, and sociodemographics. Results were analyzed using bivariate and multivariate statistical methods.

Results:

Bivariate analyses showed that the majority of vaccinated respondents (81.9%) expressed concern about infection, compared to 47.1% of non-vaccinated. Significant differences were related to perceived risk of COVID-19 vaccine: 61.0% of vaccinated assessed risk as small versus 7.4% of refusers. Non-vaccinated participants demonstrated distrust in vaccine benefits and lack of trust in health system, science and pharmaceutical companies. The multivariable regression revealed associations between age, income, vaccine perception, and vaccination uptake. The 45-54 and 55-64 age groups were less likely to refuse vaccination compared to the youngest age group ($OR = 0.34$, $p = 0.009$ and $OR = 0.38$, $p = 0.036$). Odds of refusing the COVID-19 vaccine decreased as income increased ($OR = 0.33$, $p = 0.036$). A high perceived risk of adverse effects increased the odds of vaccine refusal by 7.02 ($p<.001$).

Conclusions:

The lack of confidence in the vaccine safety and effectiveness, coupled with an underestimation of the coronavirus disease, formed a critical barrier to the vaccine uptake. The misinformation fueled vaccination fear. Public health campaigns should address vaccine-related concerns and promote vaccination adherence in more consistent manner targeting also the spread of fake news.

Key messages:

- The lack of confidence became a crucial barrier for vaccination coverage in Bulgaria.
- Understanding driving factors for vaccine uptake is of utmost importance to design effective vaccination programs.

Abstract citation ID: ckac130.231
Hand hygiene and HAI transmission in Piedmont, Italy: an observational study, 2017-2019

Antonino Russotto

A Russotto[1], C Vicentini[1], CM Zotti[1]
[1]Department of Public Health and Paediatrics, University of Turin, Turin, Italy
Contact: antonino.russotto@unito.it

Background:

Hand hygiene (HH) is one of the most important measures to prevent healthcare-associated infections (HAIs). Several indicators have been proposed to measure HH practices, including alcohol-based handrub consumption (AHC). The objective of this study was to evaluate whether AHC is associated with HAI transmission.

Methods:

All 25 public hospitals/trusts of Piedmont, in Northern Italy, are required to provide data each year concerning HAIs and infection prevention and control (IPC) activities, as part of a mandatory regional indicator system. Data on AHC and HAIs were extracted from reports provided concerning the years 2017-2019. The mean annual AHC for each facility was expressed as liters per patient-day. The rate of hospital-wide Methicillin-resistant Staphylococcus aureus (MRSA) and carbapenem-resistant Enterobacteriaceae (CRE) infections was calculated per 1000 patient-days (pd). Mean ventilation-associated infections (VAP) for 1000 days of ventilation (vd) and mean catheter-related bloodstream infections (CR-BSI) for 1000 days of catheterization (cd) were calculated for intensive care units (ICUs). Spearman's correlational analysis was conducted between AHC and HAIs: hospital-level, ICU-level.

Results:

Hospital-level: mean AHC was 15.4 liters/pd; mean HAI rate was 39.6/1000 pd (MRSA) and 18.5/1000 pd (CRE). No significant correlation was found. ICU-level: mean AHC was 39.6 liters/pd; mean HAI rate was 1.7/1000 cd (CR-BSI) and 8.2/1000 vd (VAP). A moderate correlation was found between AHC and CR-BSI rate (Spearman's ρ -0.55, p 0.022). Concerning AHC and VAP, higher AHC was reported from facilities with lower VAP rates, however no significant correlation was found (Spearman's ρ -0.203, p 0.451).

Conclusions:

Results of this study support the validity of AHC as an indicator of IPC practices in ICUs. The hospital-level analysis could have been affected by important differences in AHC among ward types.

Key messages:

- Results of this study support the association between higher AHC and reduced HAI transmission in intensive care units.
- Stratifying data by ward type could provide further insight in the association between AHC and HAI rates.

Abstract citation ID: ckac130.232
Vaccination policy strategies before and during the COVID-19 pandemic: an overview

Jacopo Garlasco

J Garlasco[1], L Charrier[1], R Thomas[2], P Gardois[3], M Bo[4], CM Zotti[1]
[1]Department of Public Health Sciences, University of Turin, Turin, Italy
[2]Northern Metropolitan Department Direction, Local Health Authority Turin 3, Venaria Reale, Italy
[3]Biblioteca Federata di Medicina F. Rossi, University of Turin, Turin, Italy
[4]Hospital Medical Direction, Local Health Authority Turin 5, Chieri, Italy
Contact: jacopo.garlasco@unito.it

Background:

The debate on vaccination strategies has been periodically involving researchers, policymakers, and also the population. Interest waves have occurred both after a revival of childhood infectious diseases in 2016-2017, due to low vaccine coverages, and during the recent Coronavirus outbreak. This study aimed at overviewing vaccination strategies (and corresponding vaccine coverages) for childhood vaccinations and SARS-CoV-2.

Methods:

Measles was chosen as a childhood vaccination indicator. Policy data were retrieved from health institutions (either European or national/regional) and, for COVID-19, also from press agencies and newspaper websites. Vaccine coverage data were retrieved from the World Bank, World Health Organisation, and UNICEF databases (for childhood vaccines), and from the "Our World in Data" platform for SARS-CoV-2. A qualitative comparison was performed between the two contexts.

Results:

Unlike childhood vaccinations, few countries (and only Austria in Europe) imposed generalised COVID-19 mandates, most countries preferring targeted mandates for higher-risk groups. Many countries confirmed their traditional voluntary vaccination approach also for COVID-19, while countries historically relying on compulsory vaccination strategies, such as Slovenia and Hungary, surprisingly opted for voluntary SARS-CoV-2 vaccination, with unsatisfactory results. However, no tangible crude association was generally found between vaccination policies and achieved coverages, although factors such as cultural background, education, and religion appeared to influence the impact of vaccination policies.

Conclusions:

The COVID-19 experience has enriched pre-existent vaccination strategy debates by adding interesting elements concerning attitudes toward vaccines in a novel context. Reading the available results in the frame of vaccine hesitancy determinants can help to understand the relationship between policies and actual coverages.

Key messages:

- Few countries have imposed generalised mandates for COVID-19, while many preferred targeted obligations for high-risk groups and some countries surprisingly opted for a voluntary approach.
- Accurately considering social and cultural determinants allows understanding the chance of success of vaccination strategies, ahead of fostering the right policymaking approach for each population.

Abstract citation ID: ckac130.233
Using default opt-out strategies to undercover the unknown HCV infections: a scoping review

Gianluca Paparatto

L Ceccarelli[1], G Paparatto[2], L Tavoschi[1]
[1]Department of Translational Research in Medicine, University of Pisa, Pisa, Italy
[2]Management and Healthcare Laboratory, Sant'Anna School of Advanced Studies, Pisa, Italy
Contact: gianlu.papa.96.gp@gmail.com

Background:

Following the advent of directly acting antivirals (DAAs) a global effort is underway to eliminate viral hepatitis C (HCV) by 2030. Yet identification of infected individuals and access to dedicated services may pose a challenge to the achievement elimination targets. A scoping review to synthesize studies that explored the efficacy of opt-out strategies to improve HCV testing capacity was conducted.

Methods:

We searched PubMed and Scopus (from 2015 to March 2022) for all English original articles and systematic reviews addressing opt-out strategies for HCV testing in different settings, published in the WHO's European Region Countries. We excluded articles that focused on other testing implementation strategies.

Results:

A total of 136 articles were screened at the title and abstract level, of which 41 were also assessed at full text for eligibility after deduplication. In the end, 30 articles met the inclusion criteria. Studies originated from 19 different countries of the WHO's European Region, with the most prevalent being France (26.9%, 11/41). The 43.3% of the articles addressed opt-out testing strategies in emergency departments (EDs), 36.6% into prisons, 13.3% in primary care, and 6.6% among people who use drugs. Opt-out default testing was found to be effective in EDs and prisons, whereas only 2 articles tested the efficacy of opt-out strategies for HCV testing in primary care settings.

Conclusions:

Opt-out strategies resulted in increased testing rates and higher cost-effectiveness in different settings, especially EDs and prisons. However, to identify individuals with undiagnosed infections, birth cohorts screening in the general population may be needed. Further research is needed to assess the utility of an opt-out default testing strategy in primary care settings.

Key messages:

- Opt-out strategies resulted in increased testing rates and higher cost-effectiveness in different settings.
- OpT-out strategies should be implemented in primary care settings to undercover the unknown infections.

Abstract citation ID: ckac130.234
Impact of lockdown on football players' injuries

Vittorio Falcone

V Falcone[1], *D Romani*[2], *N Nante*[1,3], *F Cocchi*[4], *G Messina*[1,3]
[1]Post Graduate School of Public Health, University of Siena, Siena, Italy
[2]UOC Hygiene and Public Health-Sud Area, Azienda USL Toscana Sud-Est, Grosseto, Italy
[3]Department of Molecular and Developmental Medicine, University of Siena, Siena, Italy
[4]Training and Skills Unit, ASL 1 Roma, Rome, Italy
Contact: v.falcone1@student.unisi.it

Background:

The global outbreak of COVID-19 has resulted in the closure of stadiums and the interruption of Serie A for three months. Many studies have evaluated the effects of COVID on population health, but few have evaluated the effects of containment measures on the health of football players. With this study, we evaluated the impact of this break on Serie A football players.

Methods:

This cross-sectional study was conducted considering a timespan of three Serie A seasons (2018-19; 2019-20; 2020-21). The information was obtained from the German website Transfermarkt. All the players who had played at least one match during each of the Serie A season were identified. For each of the players, data concerning the number of days lost due to injury, both before and after the stop in the championship due to Covid, were collected. Statistical analysis was performed using Stata 17 Software.

Results:

According to the selection criteria, 264 players were selected. This group was subsequently skimmed to 256 players after eliminating all players who did not suffer physical injuries over the timespan considered (non-purely orthopedic surgery; COVID; Intestinal problems; Infections). 256 players were analysed, 228 had skipped at least one day for pre-lockdown due to physical injury (median = 37,5), while 227 missed a day for post-lockdown (median = 27). Wilcoxon signed-rank test between days lost due to injuries before and after lockdown highlighted significant differences ($p < 0.05$).

Conclusions:

Comparing pre-lockdown and post-lockdown periods, we noticed that there were fewer days skipped due to physical injury post lockdown. Statistical evidence suggests that the same players were more susceptible to suffer physical injuries in the pre-lockdown period. This is probably because some players have worked with home coaching by spending more time in the gym and less time on the field. Also tapis roulant and cyclettes were often delivered to football players' homes.

Key messages:

- In this phase of coexistence with COVID-19 it is of fundamental importance to understand the impact that public health measures have on the population.
- Although, with vaccination, there has been a reduction in the number of cases, it is critical to strengthen preparedness against all possible epidemic scenarios.

Dietary factors and risk of SARS-CoV-2 infection in the Moli-sani Study Cohort

Marialaura Bonaccio

M Bonaccio[1], *A Di Castelnuovo*[2], *S Costanzo*[1], *M Persichillo*[1], *A De Curtis*[1], *F Gianfagna*[2,3], *MB Donati*[1], *G de Gaetano*[1], *C Cerletti*[1], *L Iacoviello*[1,3]
[1]Department of Epidemiology and Prevention, IRCCS NEUROMED, Pozzilli, Italy
[2]Cardiocentro, Clinica Mediterranea, Naples, Italy
[3]Department of Medicine and Surgery, University of Insubria, Varese, Italy
Contact: marialaura.bonaccio@neuromed.it

Background:

A healthy diet plays a major role in supporting the immune system which is critical to protect the host from pathogenic organisms. To date, evidence on the relationship between dietary habits and the risk of SARS-CoV-2 infection is still scarce.

Methods:

Analyses on 1,096 participants from the Moli-sani Study (2005-2010) who were re-examined in 2017-2020, and in January-September 2021. Food intake was assessed in 2017-2020 using a 188-item FFQ. Adherence to Mediterranean diet (MD) was evaluated using the Mediterranean Diet Score (MDS) ranging from 0 to 9. Multivariable logistic regression models were used to estimate odds ratios (OR) and 95% confidence intervals (95%CI) for incident SARS-CoV-2 infection in association with dietary factors.

Results:

Out of 1,096 participants, 90 either reported to have tested positive for COVID-19 or were positive for anti-SARS-CoV-2 antibodies before receiving any COVID-19 vaccine. In a multivariable-adjusted model controlled for known risk factors, a 1-point increase in MDS was associated, though not significantly, with lower risk of SARS-CoV-2 infection (OR = 0.90; 95%CI 0.78-1.04). Among individual dietary components, a high consumption of vegetables or fruits and nuts was associated with lower odds of SARS-CoV-2 infection (OR = 0.57; 0.34-0.96 and OR = 0.61; 0.37-1.00, respectively). High fish intake was otherwise linked to increased risk of infection (OR = 2.05; 1.25-3.36). Nutritional factors associated with reduced risk of infection were dietary fibre (OR = 0.50; 0.27-0.93 for 10 g/d increase), vegetable proteins (OR = 0.56; 0.33-0.94 for 10 g/d increase) and vitamin C (OR = 0.94; 0.89-0.99 for 10 g/d increase).

Conclusions:

Adherence to MD was suggestive of a lower risk of SARS-CoV-2 infection. In particular, large amounts of fruit and vegetables were associated with reduced odds of being infected, as well as diets rich in fibre, vegetable proteins and Vitamin C.

Key messages:

- Diets rich in vegetables, fruits, Vitamin C and fibre were independently associated with lower risk of SARS-CoV-2 infection.
- Nutrition could represent an effective strategy at the population level to contribute to the protection against SARS-CoV-2 infection.

Abstract citation ID: ckac130.236
Parental perception about the pandemic impact on mental health of children: a cross-sectional study

Sonia Pinto

S Pinto[1], *G Lo Moro*[1], *F Bert*[1], *E Rolfini*[1], *G Scaioli*[1], *R Siliquini*[1,2]
[1]Department of Public Health Sciences, Università degli Studi di Torino, Turin, Italy
[2]A.O.U. City of Health and Science of Turin, Università degli Studi di Torino, Turin, Italy
Contact: sonia.pinto@unito.it

Background:
The pandemic may increase mental issues among children. This study aimed to explore parental perceptions on the pandemic impact on the health status of their children, with a focus on mental health.
Methods:
An online nationwide cross-sectional study has been conducted amongst Italian parents (from April 2022-ongoing). The survey included: Strength and Difficulties Questionnaire (SDQ), Kessler-6 (K6) for parent's psychological distress, and pandemic-related items. The outcomes were: child's SDQ above the clinical cut-off and perceived child's worsening of sleep, appetite, physical and mental health during the pandemic. Multivariable regressions were run ($p < 0.05$ as significant).
Results:
Up to date, participants were 333 (88% female). Mean age was 40.7 years (SD = 6.7). Considering their children, 52.9% were female and mean age was 6.62 (SD = 4.3). A total of 12.6% of children passed the SDQ cut-off. Having parents who are healthcare workers (adjOR = 4.1), having parents positive for K6 (adjOR = 4.0) and having a poor economic situation (adjOR = 3.9) were significantly associated with a higher probability of passing the cut-off. Considering the pandemic, 15.4% declared their child had worse sleep, 12.2% lower appetite, 6.6% more physical issues, and 22.9% more mental issues. Using electronic devices more than before the pandemic was significantly associated with worsening of sleep (adjOR = 2.9) and appetite (adjOR = 6.9). Having parents who are healthcare workers was significantly associated with worsening of sleep (adjOR = 2.3) and mental health (adjOR = 2.4). Having parents positive for K6 was significantly associated with worsening of mental health (adjOR = 5.3).
Conclusions:
This study suggested a perceived substantial worsening of children's health, especially considering mental health. Exploring how parents recognize their children's health and how the COVID-19 has changed daily habits should be considered as a public health priority in Europe.
Key messages:
- Children having parents who are healthcare workers, having parents positive for K6 and having a poor economic situation had a higher risk to pass the clinical cut-off of SDQ.
- According to parents' perceptions, the impact of the pandemic was relevant on children's health, especially on mental health.

Abstract citation ID: ckac130.237
Participatory development of inclusive health communication on COVID-19 with homeless people

Anabell Specht

A Specht[1], *N Sarma*[2], *T Hellmund*[1], *T Linzbach*[1], *M Hörig*[1], *M Wintel*[1], *FP Mockenhaupt*[1], *J Seybold*[3], *AK Lindner*[1]
[1]Institute of Tropical Medicine and International Health, Charité - Universitätsmedizin Berlin, Berlin, Germany
[2]Department of Infectious Disease Epidemiology, Robert Koch Institute, Berlin, Germany
[3]Medical Directorate, Charité - Universitätsmedizin Berlin, Berlin, Germany
Contact: anabell.specht@charite.de

Background:
The COVID-19 pandemic demonstrates the important role of providing people with easy to access up-to-date health information in digital formats. People experiencing homelessness have limited access to health information and were hardly ever directly addressed through communication channels in Germany. Lack of digitalization within shelters and social services, as well as technical and socio-economic barriers in purchasing and maintaining a smartphone are further barriers to information.
Methods:
The Charité-COVID-19-project for and with homeless people has created digital health information videos and posters, with an interdisciplinary team and in a participatory approach. Two videos on general information and testing of COVID-19 were launched in 5 languages in February 2021. Vaccination posters in two language versions including 9 languages are available since April 2021.
Results:
We will present the collaboration of research, practice and community, the production process, the distribution and the acceptance of the formats. The web link refers to the videos, posters and further information:
https://tropeninstitut.charite.de/forschung/charite_covid_19_projekt_fuer_und_mit_obdachlosen_menschen/
Conclusions:
Exclusion from (digital) information is an increasingly important part of the structural marginalization of homeless people. This, as well as the inadequate consideration of this population in health communication and the pandemic response have to be addressed. Tackling the digital gap allows improved access to health information for homeless people and promotes health-seeking behaviour. Empowerment of the community through participation and a network between community, service providers, politics and research are also crucial for improvement of homeless people's health in the future.
Key messages:
- Exclusion from (digital) information is an increasingly important part of the structural marginalization of homeless people that has to be addressed.
- Bridging the gap between research, practice and community was a key factor for the realisation of inclusive digital health communication with homeless people in this project.

11.S. Prenatal and maternal health

Community Perceptions of Facilitators and Barriers to Post Natal Care access in Rural Laos

Monika Christofori-Khadka

JC Mayangitan[1], *B Poudel*[1], *H Gulliver*[1], *C Stephenson*[1]
[1]Swiss Red Cross, Luang Prabang, Laos
Contact: Monika.Christofori-Khadka@redcross.ch

Background:
The quality of Maternal, Neonatal and Child Health (MNCH) services delivered varies widely in Lao People Democratic Republic. Swiss Red Cross (SRC) provides support to the country to improve the quality of reproductive health services, enhance access, and positively change health behavior through the MNCH2 project. This implementation research was then undertaken aiming to identify factors affecting decision-

making of women relative to accessing postnatal care (PNC) and explore opportunities for improving SRC programming.

Methods:

From August 2020 to January 2021, 33 in-depth interviews and 6 focus group discussion (FGD) with 54 women were conducted. Women who had given birth in the last six months were purposively selected from several ethnic groups residing in Chomphet and Phonexay Districts in Luang Prabang province. Socio-cultural and behavioral factors affecting women's decision to access PNC were assessed during the interviews and FGD. Additional perceptions were gathered though interviews with the partners, health service providers, village heads, and external project stakeholders.

Results:

Traditional practices such as smoking ritual, strict practice of keeping the baby in the house within the first three days, and the treatment and disposal of placenta were identified as the main barrier for women to access PNC. Perceived importance of these traditional practices, however, are affected by family hierarchy especially with older family members insisting on its practice. Economic, road conditions, and transport challenges were also identified as significant barriers.

Conclusions:

Traditional practices and family hierarchy, together with physical and economic access limit women's capacity to engage with facility-based postnatal care. Thus, quality outreach with home visits are critical. Gender inclusive health education given not only to pregnant women but to all family members was also identified as critical and is recommended to improve PNC access.

Key messages:

- Post natal care remains the most neglected phase in the provision of quality maternal and newborn care.
- Understanding what influences decision making around health care seeking optimised the goal to continue to increase the numbers of women who access a health facility for post natal care in Laos.

Abstract citation ID: ckac130.239
Using Intervention Mapping to develop an intervention to promote healthy child weight development

Camilla Thørring Bonnesen

CT Bonnesen[1], RR Carlsson[1], LAS Brautsch[1], L Kierkegaard[1]
[1]National Institute of Public Health, Copenhagen, Denmark
Contact: catb@sdu.dk

Background:

Clear documentation of the understanding of the problem, development process, and content of interventions is essential to understand why interventions succeed or fail. Transparent reporting will enable future researchers to build on previous evidence and replicate or adapt interventions for new contexts. This paper describes the theory- and evidence-based systematic development of the Bloom Trial - a home-based intervention to promote healthy weight development among infants and children in Denmark.

Methods:

Development of the intervention is guided by the six-step planning tool the Intervention Mapping protocol. Step 1: Needs assessment including identification of risk factors in infancy and existing interventions, interviews with parents, and an organizational capacity assessment. Step 2: Development of program theory and matrices. Step 3: Selection of theoretical methods and practical applications for modifying personal and environmental determinants. Step 4: Development of intervention tools. Step 5: Planning of program adoption, implementation, and sustainability. Step 6: Generation of an evaluation plan.

Results:

The Bloom intervention is universal but with a strong focus on families with low socio-economic position and non-Danish ethnic background. It is aimed at first-time parents and addresses early risk factors for child overweight such as parental skills and healthy habits related to food and meals, movement, screen time and sleep, and introduce a new theme: sense of security in the family. It will be integrated in existing services delivered by community health nurses supplemented with extra elements such as telephone consultations, family groups and a video library.

Conclusions:

The transparency of the developmental process and theoretical, empirical, and contextual foundation of the Bloom Trial may enable future studies to build on our findings and accumulate knowledge to promote healthy weight development among infants and children.

Key messages:

- The development process resulted in a complex intervention addressing known risk factors for child overweight e.g., meals, movement, screentime and sleep, and introduce a new theme: sense of security.
- Transparency of the developmental process may enable future intervention studies to build on our findings and accumulate knowledge to promote healthy weight development among infants and children.

Interaction between MTNR1B polymorphisms and lifestyle intervention on pregnancy outcomes

Mireille van Poppel

M van Poppel[1], R Corcoy[2], D Simmons[3], G Desoye[4], L Mendizabal[5], M Zulueta[5]
[1]Institute of Human Movement Science, Sport and Health, University of Graz, Graz, Austria
[2]Institut de Recerca de ĺHospital de la Santa Creu, Barcelona, Spain
[3]Western Sydney University, Campbelltown, Australia
[4]Department of Obstetrics and Gynecology, Medical Universit, Graz, Austria
[5]Patia Europe, San Sebastian, Spain
Contact: mireille.van-poppel@uni-graz.at

Background:

Interactions between polymorphisms of the melatonin receptor 1B gene (MTNR1B) and lifestyle intervention for gestational diabetes have been described. Whether these are specific for physical activity or healthy eating intervention is unknown.

Objectives:

To assess the interaction between MTNR1B rs10830962 and rs10830963 polymorphisms and lifestyle interventions during pregnancy.

Methods:

Women with a BMI of ≥ 29 kg/m2 (n = 436) received counseling on healthy eating (HE), physical activity (PA) or both. The control group received usual care. The analysis had a factorial design with comparison of HE versus no HE and PA versus no PA. Maternal outcomes at 24-28 weeks were gestational weight gain (GWG), maternal fasting glucose, insulin, insulin resistance (HOMA-IR), and development of GDM. Interaction between receiving either HE or PA intervention and genotypes of both rs10830962 and rs10830963 was assessed using multilevel regression analysis.

Results:

GDM risk was increased in women homozygous for the G allele of rs10830962 or rs10830963 (OR 2.60 [95% CI 1.34, 5.06] and 2.83 [1.24, 6.47], respectively). Significant interactions between rs10830962 and interventions were found: In women homozygous for the G allele, but not in the other genotypes, the PA intervention reduced maternal fasting insulin (beta -0.16 [95%CI -0.33, 0.02], p = 0.08) and HOMA-IR (-0.17 [-0.35, 0.01], p = 0.06). In heterozygous women, HE intervention had no effect, whereas in women homozygous for the C allele, HE intervention reduced GWG (-1.6 kg [-2.4, -0.8]).

Discussion:

In women homozygous for the risk allele of MTNR1B rs10830962, GDM risk was increased and PA intervention might be more beneficial than HE intervention for reducing maternal insulin resistance.

Key messages:

- In women homozygous for the risk allele of MTNR1B rs10830962, risk of gestational diabetes was increased.
- For these women, PA intervention might be more beneficial than HE intervention for reducing maternal insulin resistance.

[3]The Riga Maternity Hospital, Riga, Latvia
[4]Riga East University Hospital, Riga, Latvia
Contact: irisazile@inbox.lv

Introduction:

Coronavirus disease (COVID-19) has affected many pregnant women worldwide. Pregnant women with COVID-19 infection belong to a vulnerable group with concerns about the effect of the disease on maternal and neonatal health.

Objectives:

To assess association of COVID-19 on maternal and neonatal outcomes in Latvia.

Methods:

Data source was Medical Birth Register. A total of 17206 birth data for 2021 were included in the data analysis.

Results:

2.1% (n = 358) women with COVID-19 (U07.1; U07.2) during pregnancy or delivery. COVID-19 infection was related to the following conditions during pregnancy - gestation diabetes (10.6% to 4.6%; $p < 0.001$); placental abruption (1.7% to 0.6%; $p < 0.05$). Birth outcomes for COVID-19 infected women showed that infection has led to the increased caesarean section (27.7% to 22.0%; $p < 0.01$), preterm birth (12.8% to 5.3%; $p < 0.001$); low birth weight $\leq$2499g rate (10.1% to 3.9%; $p < 0.001$); stillbirths (2.8% to 0.4%; $p < 0.001$) and newborn infections specific to the perinatal period (P35-P39) (9.5% to 5.2%; $p < 0.05$). Increased BMI (8.9% to 6.8%), fetal distress (3.9% to 2.4%); preeclampsia, eclampsia (3.2% to 2.1%), hypertension (2.8% to 2.0%), gestational hypertension (5.0% to 3.8%) more frequently were observed among COVID-19 infected patients but the difference was not statistically significant. COVID-19 associated with higher odds (adjusted by mother age, multiple births, gestational age, mode of delivery) of gestational diabetes (ORadj 2.3; 95%CI 1.7-3.4; $p < 0.001$), newborn infections specific to the perinatal period (ORadj 1.7; 95%CI 1.2-2.4; $p < 0.01$) and stillbirth (ORadj 4.0; 95%CI 1.9-8.2; $p < 0.001$).

Conclusions:

COVID- 19 during pregnancy is associated with higher risk of adverse maternal and perinatal outcomes. The study results of short-term pregnancy outcomes show importance of implementation of all recommended COVID-19 prophylactic measures by public health specialists and clinicians during antenatal care.

Key messages:

- COVID- 19 during pregnancy is associated with higher risk of adverse maternal and perinatal outcomes.
- Study results of short-term pregnancy outcomes show importance of implementation of all recommended COVID-19 prophylactic measures by public health specialists and clinicians during antenatal care.

Abstract citation ID: ckac130.242
Dietary habits of pregnant women in Bulgaria

Rositsa Chamova

R Chamova[1], *M Panteleeva*[2]
[1]Department of Hygiene and Epidemiology, Medical University of Varna, Varna, Bulgaria
[2]Department of Disaster Medicine and Maritime Medicine, Medical University of Varna, Varna, Bulgaria
Contact: rchamova72@gmail.com

Background:

The optimal nutritional status of the mother is one of the most influential non-genetic factors for the healthy development of the fetus. In recent years, more and more scientific evidence has been accumulating that her dietary habits and nutritional status determine the fetal development and the health of the offspring.

Methods:

A cross - sectional study of pregnant women's dietary habits was conducted online. A questionnaire is attached, including questions about the diet, the frequency of consumption of certain food groups, application of alternative eating patterns and more. The analysis of the results is done with a software statistical package Jamovi ver. 2.3.0.

Results:

The servey is conducted among 117 women with a mean age of 30.4 ± 4.88 years. The majority of them have changed their dietary habits after registering a pregnancy (72.6%). Among all respondents, 18.8% haven't got a fixed diet. 67% of the respondents eat 3 - 4 times a day, and 5.1% - less than three times a day. The relative share of pregnant women who consume milk and dairy products every day is 41% and 47%, respectively. None of the respondents restrains from consuming dairy products. Only 5.1% of the respondents do not consume milk. Six of the surveyed women (5.1%) do not eat meat and 14 (12%) do not eat fish. The relative share of women who eat fish 1 - 2 times a week is 29.9%. The majority of women (88.9%) doesn't consume alcohol during pregnancy. The relative share of vegetarians is 6%. There are no vegans among the women surveyed.

Conclusions:

The majority of pregnant women surveyed follow the recommendations for healthy eating. There are women at risk of developing nutritional deficiencies among the respondents - macro - and micronutrients, which is a threat for maternal health, the course of pregnancy, as well as the growth and development of offspring.

Key messages:

- The key to a normal pregnancy and primary prevention of complications is to establish healthy dietary habits.
- Malnutrition, overfeeding and unbalanced nutrition during pregnancy can adversely affect the offspring health at all stages of its live.

Late antenatal care initiation and neonatal outcomes in an ethnically diverse maternal cohort

Shuby Puthussery

S Puthussery[1], *Pc Tseng*[1], *E Sharma*[1], *A Harden*[2], *L Leah*[3]
[1]Maternal and Child Health Research Centre, University of Bedfordshire, Luton, UK
[2]School of Health Sciences, City University of London, London, UK
[3]Great Ormond Street Institute of Child Health, University College London, London, UK
Contact: shuby.puthussery@beds.ac.uk

Background:

Ethnic minority status and maternal socio-economic deprivation are linked to delayed access to health care during pregnancy. The link between late antenatal care initiation and neonatal outcomes in settings with high ethnic diversity and social disadvantage is seldom explored. This study examined associations between late antenatal care initiation (first antenatal appointment >12 weeks gestation) and neonatal outcomes of preterm birth (<37 weeks gestation) and low birth weight (<2500 g) in an ethnically diverse socially disadvantaged maternal cohort.

Methods:

A retrospective cross sectional study using routinely collected anonymous data of singleton births between April 2007 - March 2016 from a large UK National Health Service maternity unit in an ethnically diverse, socially disadvantaged area. Univariate and multivariate logistic regression models were used to examine the associations between late antenatal care initiation and prevalence of preterm birth and low birth weight.

Results:

Of the 46,307 singleton births recorded, more than one third (34.8%) were to mothers from Black African, Black Caribbean, Indian, Pakistani, and Bangladeshi mothers. Gestational week at first antenatal appointment was available for 99.31% births among which 79.2% had their first appointment at $\leq$ 12 weeks, 12% at 13-20 weeks, and 8.8% at $>$ 20 weeks. Mothers who booked at 13+ weeks were significantly more likely to have a preterm and/or low birth weight baby. Compared to mothers who booked at $\leq$ 12 weeks, those booking at $>$ 20 weeks were 4.08 times (95% CI: 3.29,5.07) as likely to have an extremely preterm baby (<28 weeks of gestation) and 3.12 (CI 2.66, 3.67) times as likely to have a baby born with extremely low birthweight (<1500g).

Conclusions:

Mothers in ethnically diverse socially deprived areas who started antenatal care late were at increased risk of adverse neonatal outcomes. Targeted intervention programmes and services are needed to support these mothers.

Key messages:

- Mothers who start antenatal care late are more likely to have a preterm and/or low birth weight baby in ethnically diverse socially disadvantaged areas.
- There is a need for targeted programmes and services to support mothers in ethnically diverse socially disadvantaged areas to start antenatal care on time.

Health professionals' communication and Italian pregnant women's attitudes to the Covid-19 vaccine

Carlotta Fiammenghi

C Fiammenghi[1], *NA Mbaye*[2], *D Pelleri*[2], *U Gelatti*[1], *L Covolo*[1]
[1]Unit of Hygiene, Epidemiology, Public Health, University of Brescia, Brescia, Italy
[2]Degree Course in Health Assistance, University of Brescia, Brescia, Italy
Contact: carlotta.fiammenghi@unibs.it

Background:

Pregnancy is a risk condition for hospitalization and severe illness from Covid-19, with an increased risk of maternal mortality and serious neonatal complications. The study examines Italian pregnant women's attitudes about the Covid-19 vaccine, the role of healthcare professionals' (HP) communication, the reasons and potential predictors for non-adherence to vaccination.

Methods:

An online survey was developed by LimeSurvey software and spread through social media between August 2021 and January 2022 to pregnant women of age living in Italy. Participants were asked to indicate their sources of information and to rate the support received from their HP; their health literacy (HL) was assessed using the HLS-EU-Q6 tool. Multivariate linear regression analysis was performed. Open-ended questions were analysed using MaxQDA 2022.

Results:

1594 total survey responses were obtained (median age 31.5±4.94); 48% of the participants had a university degree. Only 17% of women had sufficient HL. Most (52%) of them refused to be vaccinated against Covid-19 while pregnant, 27% were unsure and 26% disagreed about the safety of the vaccine during pregnancy. Most of them did not deem the information received by HP complete (56%), clear (52%), and reliable (46%); 49% of them did not feel supported in their decision to vaccinate. This variable was the main predictor of vaccine hesitancy in addition to concern about vaccine safety in the multivariate model. Among women who felt unsatisfied 57% had an inadequate HL compared to 40% of those who had sufficient HL (p<.0001). The analysis of the open-ended questions also revealed a pervasive feeling of uncertainty.

Conclusions:

The study highlights how the lack of adequate communication and support by HP had a strong impact in the adherence to Covid-19 vaccination among pregnant women.

Key messages:

- The lack of an effective communication by healthcare professionals contributed to the feeling of uncertainty and concern of pregnant women about Covid-19 vaccination.
- There is a need to put effort on training for HP to improve their communication skills to support pregnant women's health decisions and improve their literacy in such a delicate phase of their life.

Abstract citation ID: ckac130.245
Knowledge, beliefs and experience of adopting healthy habits in pregnancy: a mixed methods study

Ourania Kolokotroni

O Kolokotroni[1,2], *M Economou*[2], *A Koutrouba*[1], *M Prokou*[2], *A Derlagen*[2], *P Enayati Zadeh*[2], *E Philippou*[3], *D Hileti*[3], *A Quattrocchi*[2], *MC Mosquera*[2]
[1]School of Health Sciences, Cyprus University of Technology, Limassol, Cyprus
[2]Medical School, University of Nicosia, Nicosia, Cyprus
[3]Department of Life and Health Sciences, University of Nicosia, Nicosia, Cyprus
Contact: o.kolokotroni@cut.ac.cy

Background:

Early life exposures affect a child's obesity risk. The EARLY START uses participatory action research to develop an intervention for reducing early life obesogenic exposures. The initial phase uses a mixed methods approach to investigate pregnant mothers' knowledge, beliefs, and experience of adopting healthy dietary and physical activity (PA) habits.

Methods:

Cypriot pregnant women in 2021 completed a web-based questionnaire on: a) Adherence to Mediterranean diet (MD) (MEDAS tool); b) knowledge, beliefs on diet and PA. A subgroup participated in a structured focus group discussion of their experience/needs in adopting healthy habits. Data were analyzed using Descriptive and Thematic Content methods.

Results:

Ninety-seven women participated, 73% <35 y.o., 49% primigravida, 92% with tertiary education. Adherence to MD was moderate (median 6/14, IQR 2.5), 90% were eating <3 portions of fruit/vegetables daily, 50% believed their diet was healthy and did not change habits in pregnancy. Most had access to information (94%), internet was the commonest source (74%), and the doctor the most trusted (47%). Mild and moderate-intensity PA were considered appropriate by many (60%) for the first and second half of pregnancy, respectively. Most (90%) were aware of the risks of excessive weight gain in pregnancy. Qualitative analysis showed that women value diet as "the main driver to holistically achieving a healthy pregnancy". The main barrier was the "struggle between the will and ability". PA was considered a "therapy" but the challenge was "to achieve the right balance". Internet was described as "accessible but unreliable information source". Women believed that needs can be met by "early, holistic recommendation-based interventions run by professionals".

Conclusions:

A huge gap exists between knowledge, beliefs, and practice of healthy behaviours in pregnancy. New interventions should meet gaps and needs using contextualized, timely, holistic, and reliable approaches.

Key messages:

- Exploring knowledge and experience of healthy habits in pregnancy as part of participatory action research in shaping an obesity prevention intervention revealed important gaps and unmet needs.
- Future interventions should holistically address knowledge gaps and behavioral change needs using contextualized, timely, holistic and reliable information and methods.

Abstract citation ID: ckac130.246
Breastfeeding and allergic disease at age nine in Ireland: An Irish prospective cohort study

Ellen Cosgrave

E Cosgrave[1,2], *P Fitzpatrick*[2]
[1]Department of Public Health HSE South East, Health Service Executive, Kilkenny, Ireland
[2]School of Public Health, University College Dublin, Dublin, Ireland
Contact: cosgraej@tcd.ie

Background:

Despite well-recognised benefits, Irish breastfeeding rates remain suboptimal. Although associations between breastfeeding and allergic disease are well-researched in younger children, evidence for continued effect in older children is sparse. This Irish prospective cohort study investigated associations between breastfeeding and allergic disease at age nine.

Methods:

The study sample included all nine-year-old children enrolled in the Growing Up in Ireland Infant Cohort Study whose mothers had participated in both Wave 1 and Wave 5. Mothers self-reported infant feeding practices at nine months and allergic diseases at nine years. Multiple logistic regression was used to generate adjusted odds ratios (aOR) for associations between breastfeeding and allergic diseases; re-weighting was applied to enhance generalisability.

Results:

Response rate was 72% (N = 8,006). Most mothers (53%) had ever-breastfed their child; younger mothers, smokers and those of lower socioeconomic status were significantly less likely to have ever-breastfed. Compared to never-breastfeeding, ever-breastfeeding was protective against asthma (aOR 0.74, 95%CI 0.62-0.87) and eczema (aOR 0.72, 95%CI 0.55-0.93) at age nine. Ever-breastfeeding increased the risk of atopic rhinitis (aOR 1.44, 95%CI 1.07-1.94); the association with food allergy was inconclusive (aOR 1.17, 95%CI 0.83-1.64). Breastfeeding $\geq$6 months was protective against asthma (aOR 0.57, 95%CI 0.39-0.82) and any allergic disease (aOR 0.72, 95%CI 0.55-0.96). Exclusive breastfeeding (3-5 months) was protective against asthma (aOR 0.67, 95%CI 0.50-0.89) and eczema (aOR 0.54, 95%CI 0.34-0.86).

Conclusions:

This study provides new evidence suggesting breastfeeding may be protective against asthma and eczema but may increase the risk of atopic rhinitis in older Irish children. Results must be considered in light of high Irish allergic disease prevalence and action in support of breastfeeding prior to and following birth prioritised accordingly.

Key messages:

- Findings lend support to a protective association between breastfeeding and asthma and eczema in later childhood and indicate breastfeeding may play a role in allergic disease prevention.
- Breastfeeding may reduce the risk of asthma and eczema in Irish children: findings should be used to drive impactful breastfeeding promotion and reorientate cultural norms in favour of breastfeeding.

Assessment of maternal and newborn services in Uganda based on the Effective Coverage framework

Marco Fonzo

C Bertoncello[1], *P Bordin*[1], *M Fonzo*[1], *G Dall'Oglio*[2], *P Lochoro*[2], *G Putoto*[3], *F Tognon*[3]
[1]Hygiene and Public Health Unit, DCTVSP, University, Padua, Italy
[2]Doctors with Africa CUAMM, Uganda, Uganda
[3]Doctors with Africa CUAMM, Padua, Italy
Contact: marco.fonzo@unipd.it

Background:

The implementation of a health service does not necessarily equate to a health gain. Effective Coverage (EC) aims to capture the potential benefits of a health intervention by adjusting the crude coverage for quality. The aim of this study was to assess the EC of Antenatal Care (ANC), Institutional deliveries and Postnatal Care (PNC) in Oyam district, Uganda, considering the input (drugs and equipment) and the process dimension (components of care provided).

Methods:

The study involved 19 Health Centers (HC), 12 type II, 6 type III and 1 type IV, having a catchment area of 15.603 expected deliveries per year. The analysis covered the period between April and September 2021. Data on crude coverage were retrieved from the District Health Information Software-2. Data used to assess quality domains were extracted from checklists compiled during Supportive Supervisions and were summarized by readiness and likelihood of quality care indices. The crude coverage of the interventions was adjusted to calculate the input-adjusted and the quality-adjusted coverage.

Results:

The readiness index was 0.81 for ANC, 0.82 for institutional delivery and 0.88 for PNC, while the likelihood of quality of care was 0.73, 0.88 and 0.89 respectively. In all three areas, the loss of coverage was mainly due to lack of materials and equipment; HCs II showed lower quality indexes than HCs III, particularly for ANC (P = 0.007). Compared to the target population, EC was 40% for ANC4 visits, 48% for institutional deliveries and 77% for PNC visits. The gap between crude and EC was higher for ANC4 (-30%) compared with the one for institutional deliveries (-18%) and PNC (-23%).

Conclusions:

EC is a useful indicator for monitoring maternal and neonatal services in low-resource countries, bringing gaps in crude coverage to the surface. Supportive Supervision provides an opportunity to assess EC at the facility level without additional resources and to support health authorities in setting priorities.

Key messages:

- The application of EC framework can be adapted both at district and facility level, either to a single service or healthcare pathways, and guide public health intervention.
- Integration of Supportive Supervision data in the EC is an innovative approach and permit to include the quality of care dimension in the routine data collection.

Birth defects and associated antenatal care factors related with 1st trimester of pregnancy

Irisa Zile-Velika

I Zile-Velika[1,2], *I Ebela*[2], *I Rumba-Rozenfelde*[2]
[1]Centre for Disease Prevention and Control of Latvia, Rīga, Latvia
[2]Faculty of Medicine, University of Latvia, Riga, Latvia
Contact: irisazile@inbox.lv

Background:

Ultrasound (US) can help monitor normal fetal development and screen for any potential problems. The prenatal detection of fetal anomalies allows for optimal perinatal management.

Aim:

The aim was to assess congenital anomalies at births and their associated antenatal care factors.

Methods:

Data source - Health Care Monitoring Datalink (HCMD), including two data sources: Medical Birth Register and ambulatory care data provided by public and private health care providers about US. Screening was detected by specific manipulation code: 50694 - routine US screening in the 1st trimester of pregnancy. All singleton birth in 2018 (n = 12955) were included in the data analysis. OR (odds ratio) were calculated. Multiple regression model was adjusted for mother age, gestational age, living area and antenatal care factors.

Results:

The mean mother age was 30.3 (SD 5.4) and gestational age 39.3 (SD 1.8). The use of ICD-10 code O28 - abnormal findings on antenatal screening of mother - was observed in a small number of cases. 2.4% (n = 305) abnormal findings on antenatal screening of mother were detected at ambulatory care visits. From these cases 7.5% (n = 23) were diagnosed congenital anomalies at birth. Totally 2.8% (n = 362) of births were registered congenital anomalies. Congenital anomalies at birth have higher and statistically significant odds of invasive diagnostic methods in pregnancy (OR = 2.0; 95%CI 1.2-3.6; $p < 0.01$) and abnormal findings on US screening (OR = 2.6; 95%CI 1.7-4.2; $p < 0.001$). Slightly higher frequency of congenital anomalies at birth but not statistically significant ($p > 0.05$) were observed for 1st trimester genetic screening (OR = 1.5), preterm deliveries (OR = 1.4) and living in urban area (OR = 1.3).

Conclusions:

Pregnancy outcome as congenital anomalies at birth related with higher maternal screening examinations prenatally. Further studies are needed to analyze the efficiency of US examinations for early prenatal detection of congenital anomalies.

Key messages:

- Pregnancy outcome as congenital anomalies at birth related with higher maternal screening examinations prenatally. There is not enough information of US screening results in existing data bases.
- Further studies are needed to analyze the efficiency of US examinations for early prenatal detection of congenital anomalies.

Contact: adrien.aubert@inserm.fr

Background:

Motor disorders resulting from extremely preterm birth (EPT; <28 weeks' gestation) can limit daily activities, schooling and social relationships. Cerebral palsy (CP) affects about 10% of children and non-CP movement difficulties (MD) are highly prevalent, although they tend to be under-diagnosed, especially in children without other developmental difficulties. We investigated the association between motor disorders and health-related quality of life (HRQoL) among five-year-old children born EPT.

Methods:

We included children at age five from a population-based EPT birth cohort born in 2011-2012 in 11 European countries (N = 1,021). Children without CP were classified using the Movement Assessment Battery for Children - 2nd edition as having significant MD (≤5th percentile of standardised norms) or being at risk of MD (6th-15th percentile). Parents reported on CP diagnoses and HRQoL using the Pediatric Quality of Life InventoryTM. We used linear regression to compare HRQoL scores by motor status adjusting for social characteristics.

Results:

Children born EPT with CP, significant MD and at risk of MD had lower adjusted HRQoL total scores [95% confidence intervals] than those without MD: -26.1 [-31.0; -21.2], -9.1 [-12.0; -6.1] and -5.0 [-7.7; -2.3]. Decreases were greater for physical scores: -35.3 [-42.7; -27.9], -11.9 [-16.1; -7.8] and -5.4 [-9.1; -1.6] than psychosocial scores: -20.6 [-25.2; -16.0], -7.4 [-10.3; -4.5] and -4.9 [-7.6; -2.1]. These differences persisted after exclusion of children with other developmental difficulties.

Conclusions:

Motor disorders among 5-year-old children born EPT were associated with lower HRQoL, even among children with less severe motor difficulties and without other developmental difficulties.

Key messages:

- Among five-year-old children born extremely preterm, severity level of motor disorders was associated with reductions of their health-related quality of life.
- Differences persisted after exclusion of children with other developmental difficulties and among children not receiving motor-related health care services had lower health-related quality of life.

Providers' Experience with Artificial Intelligence-Based System During the COVID-19 Pandemic

Joe Lintz

J Lintz[1]
[1]Health Information Management, Parker University, Dallas, Texas, USA
Contact: cclintz@hotmail.com

Background:
As the pandemic continues to spread worldwide, many of healthcare facilities are exploring new methods to keep their patients safe from potential hospital-acquired infections (HAIs) during the pandemic. This study explored the attitudes about artificial intelligence (AI) among providers who utilized AI-based hand hygiene monitoring system (HHMS) at a rural medical center during the pandemic.
Methods:
A self-administered questionnaire was mailed to 48 healthcare providers at a rural medical center in north Texas, with a 75% percent response rate (n = 36). The survey collected information on providers attitudes about AI-based HHMS use. In addition, the study also examined the relationship between provider's well-being and the level of satisfaction with the AI-based HHMS use. The lessons learned from this study will be used to determine important factors to consider when attempting to advance and expand AI technologies in rural healthcare settings.
Results:
Results revealed that the integration of AI technology within the existing electronic health record (EHR) system remains a challenge for many providers. Plus, the lack of user-centered design approaches to incorporate the AI tool into existing workflows has reduced providers satisfaction about the new technology.
Conclusions:
The findings suggested that although AI technology has great promise to reduce the number of hospital-acquired infections (HAIs), successfully implement of an AI-based tool that meets the expectations of users requires significant levels of consolidation to ensure that it fits within the existing workflows and is accepted by users.
Key messages:

- AI application indirectly affects the well-being of providers, particularly in rural healthcare settings.
- A better AI application interface design that meets the expectations of providers is needed.

Abstract citation ID: ckac131.002
Colorectal Cancer Prevention in Eastern European (EaP) Countries: A Policy Analysis

Tina Beruchashvili

M Nonikashvili[1], *M Kereselidze*[1], *T Beruchashvili*[1]
[1]Public Health and Healthcare Management, School of Health Sciences, University of Georgia, Tbilisi, Georgia
Contact: t.beruchashvili@ug.edu.ge

Background:
Colorectal cancer (CRC) is a critical public health issue in Central and Eastern European Countries, where it is the second leading cause of female cancer deaths. In this study, we aimed to identify the presence of CRC policies in EaP Countries and analyze the content of CRC policies for comprehensiveness.
Methods:
We conducted a scoping review based on the methodological framework suggested by Arksey and O'Malley. We searched for publicly-available policy documents from Armenia, Azerbaijan, Belarus, Georgia, Moldova and Ukraine. We outline each country's prevention approaches and activities based on World Health Organization (WHO) guidelines for CRC screening.
Results:
Most countries had at least one policy addressing some aspect of colorectal cancer prevention. Primary and secondary prevention were most commonly addressed, and certain details such as healthy lifestyle campaigns, target age and screening method (gFOBT, FIT or colonoscopy) were frequently mentioned in these policies. Policies to implement or pilot population-based CRC screening program have been adopted only by Georgia. Our analysis revealed the urgent need to improve the availability and use of colorectal cancer screening among those countries.
Conclusions:
These country experiences suggest that while prevention approaches can promote the best strategies to carry out screening programs, there is no standardized approach to screening for CRC.
Key messages:

- Further research is urgently needed to better understand CRC screening needs of adults in EaP.
- Necessity of CRC screening irrespective of need will help make shift from curative to preventive cancer care.

Abstract citation ID: ckac131.003
Person-centred care to prevent hospitalisation - a focus group study with primary care providers

Cecilie Nørby Lyhne

C Nørby Lyhne[1], *M Bjerrum*[1,3], *M Johansson Jørgensen*[2]
[1]Department of Public Health, Aarhus University, Aarhus C, Denmark
[2]Research Unit, Horsens Regional Hospital, Horsens, Denmark
[3]Center for Clinical Guidelines, Aalborg University, Aalborg, Denmark
Contact: cnth@ph.au.dk

Background:
The primary healthcare sector comprises various health services, including disease prevention at local level. Research shows that targeted primary healthcare services can prevent the development of acute complications and reduce the risk of hospitalisations. While interdisciplinary collaboration has been suggested as a means to improve the quality and responsiveness of personal care needs in preventive services, effective implementation remains a challenge. The aim was to investigate perceptions of preventive care among primary healthcare providers by examining their views on what constitutes a need for hospitalisation, and which strategies are found useful to prevent hospitalisation. Further, to explain how interdisciplinary collaboration can be supported with a view to providing person-centred care.
Methods:
Five focus group interviews were conducted with 27 primary healthcare providers. Interviews were transcribed, and analysed with qualitative content analysis.

Results:

Three categories emerged: 1) Mental and social conditions influence physical functioning and hospitalisation need, 2) Well-established primary healthcare services are important to provide person-centred care through interdisciplinary collaboration and 3) Interdisciplinary collaboration in primary healthcare services is predominantly focussed on handling acute physical conditions.

Conclusions:

By focusing on the whole person, it could be possible to provide more person-centred care through interdisciplinary collaboration and ultimately prevent some hospitalisations. The findings have clear implications for person-centred care and health system quality, and they highlight the need for involving stakeholders at all levels and for informing about the relevance of social and mental conditions, as they may influence the general health state and the risk of hospitalisation. The study supplements existing knowledge by providing valuable insight into the views of key primary healthcare providers.

Key messages:

- Healthcare providers are attentive towards the influence of mental, social and physical conditions on the risk of hospitalisation highlighting the importance of care that considers the whole person.
- The development and sustainable implementation of person-centred care in local primary care settings may be supported by evidence-based practices and co-production trajectories.

Abstract citation ID: ckac131.004
Knowledge and use of antibiotics among health care users in Institute of public health of Belgrade

Gordana Belamaric

G Belamaric[1], D Matijevic[1], D Vukovic[2], Z Bukumiric[3], S Mladenovic Jankovic[1], G Markovic[4], G Tamburkovski[1], K Vojvodic[1], M Jakovljevic[1]
[1]Institute of Public Health of Belgrade, Belgrade, Serbia
[2]Institut of Social Medicine, Faculty of Medicine, Belgrade, Serbia
[3]Institute for Medical Statistics and Informatics, Faculty of Medicine University of Belgrade, Belgrade, Serbia
[4]Primary Health Center Zemun, Belgrade, Serbia
Contact: belamaric.gordana@gmail.com

Background:

Antimicrobial resistance (AMR) is one of the major global public health threats that may lead to severe illness, hospital admissions, treatment failure and increasing of the health care costs. In order to address those challenges, the aims of this study were to examine the antibiotics consumption among the population of health care consumers in the Institute of Public Health of Belgrade, and their knowledge and attitudes regarding antibiotics compared to the inhabitants of EU and Japan.

Methods:

A cross-sectional study was conducted on a sample of 321 respondents who visited the Institute of Public Health of Belgrade in July 2021. The basic survey instrument was a Eurobarometer questionnaire (with the permission of the Directorate General for Communication European Commission). The obtained data were analyzed by methods of descriptive statistics, which included frequency distribution with percentages. In addition, the Chi-square test was used to examine the difference in frequencies.

Results:

More than half of all respondents used antibiotics in the previous 12 months (56.6%), majority of them with a doctor's prescription and 57.1% did some pre-testing (blood or urine test, swab) before or at the same time as using antibiotics. They used antibiotics most often for urinary infections (9,3%) and common cold (8,1%). We discovered that the knowledge of our respondents is somewhere in between comparing to the knowledge of the people from EU and Japan. 37.4% of our respondents knew that antibiotics are ineffective against cold and flu; 68.9% knew that unnecessary use of antibiotics makes them ineffective; 55.9% knew that taking antibiotics often leads to side effects such as diarrhea and 50.7% knew that antibiotics don't kill viruses.

Conclusions:

Knowledge about the antibiotics is insufficient and interventions of education, better informing and awareness of general public are necessary to encourage rational use of antibiotics.

Key messages:

- It is important to take evidence based interventions to reduce unnecessary use of antibiotics.
- This is the first study about antibiotics in Serbia which used the Eurobarometer model of research.

Abstract citation ID: ckac131.005
International Horizon Scanning the impact of Covid-19 on increasing the health gap and vulnerability

Liz Green

A Instone[1], A Stielke[1], J Allen[1], A Cotter-Roberts[1], B Bainham[1,2], L Couzens[1], C Beynon[1], M Dyakova[1], L Green[1]
[1]WHO Collaborating Center on Investment for Health and Well-being, Public Health Wales, Cardiff, UK
[2]Health Improvement, Public Health Wales, Cardiff, UK
Contact: liz.green@wales.nhs.uk

The COVID-19 pandemic has caused unprecedented challenges for populations, health systems and governments worldwide, which have resulted in lasting economic, social and health impacts. The results of such have been felt disproportionately throughout society and existing vulnerabilities have been highlighted and heightened. A clear understanding of the extent of these vulnerabilities is needed in order to fully address the problem. The World Health Organization Collaborating Centre on Investment for Health and Well-being (WHOCC), Public Health Wales has developed a summary report focusing on the existing and emerging inequalities resulting from the pandemic, as identified through international evidence and learning from the International Horizon Scanning Reports. These reports, undertaken between May 2020 - August 2021, are based upon rapid evidence synthesis reviews of international literature. The summary report focuses on global learning and best practices in order to better understand and address the unequal impacts of the pandemic. The information has been categorised according to the five essential conditions required to enable a healthy life as presented within the WHO health equity conditions framework. The report provides evidence on groups most vulnerable to both direct and indirect impacts of the pandemic as well as promising practice to address the resulting inequity. Inequalities and related factors explored within the report include but are not limited to, level of deprivation and education. Taking a global perspective, this report summarises international evidence to support inclusive, sustainable, and equitable solutions, such as protecting economic well-being and taking an intergenerational lens in both response and recovery. To address and mitigate the impact of the pandemic upon vulnerable groups, collating and sharing international evidence and best practice has proven to support equitable long-term socio-economic and environmental recovery.

Key messages:

- International learning provides vital insights to support recovery in Wales and beyond.
- Responses to the pandemic should address the needs of the vulnerable to reduce existing health gaps.

Personal budget: integration of social and health resources of frail elderly in supported discharge

Martina Giusti

M Giusti[1], *S Simoni*[1], *N Persiani*[1]
[1]Experimental and Clinic Medicine, Università di Firenze, Florence, Italy
Contact: martina.giusti@unifi.it

During COVID-19 pandemic, health and social condition of frail elderly got worse at worldwide level. This aggravation was due both to isolation and higher mortality rate for COVID-19, influenced by the widespread condition of comorbidity in this segment of population. The progressive change of needs in this target weren't matched with a prompt and adequate response, which could guarantee the taking charge of frail elderly. Personal budget is a tool for integrating public health, social assistance and family efforts on the international scene. In the Italian context, it is emerging as means to program and coordinate economic and professional, institutional, and personal resources, finalising them to provide a personalised pathway. Research aims to value the contribution of personal budget association to effectiveness and efficacy of personalised pathway for frail elderlies in early supported discharges. A research-intervention approach was done. Personal budget was applied to a significant sample of cases of personalised pathways for frail elderly in supported discharge in the Local Health District of Teramo. The study compared used resources and obtained health outcomes between the sample and a control group. The application of the personal budget permits the immediate maximisation of resources use and the quantification of the deviation between the available and the needed resources for provision of personalised pathway. Moreover, this tool supported the planning of services, the integration of health and social actions, the monitoring of adherence to planned programmes and the application of corrective mechanisms, if these are necessary, improving the health outcomes. Personal budget contributes to increase the integrated and continued taking charge of frail elderly in supported discharges in the short-medium term. Globally, this tool could be an organisational and economic answer for responding in a sustainable way to international increasing of life expectancy.

Key messages:

- Personal budget manages and controls both health and social activities and resources.
- Personal budget supports the establishment of an integrated and continuous taking charge system of the frail elderly.

Abstract citation ID: ckac131.008
Does community HIV combination prevention (HPTN 071 (PopART)) impact healthcare inequity?

Christa Hansen

C Hansen[1], *M Miraldo*[1], *K Hauck*[2]
[1]Business School, Imperial College London, London, UK
[2]School of Public Health, Imperial College London, London, UK
Contact: c.hansen14@imperial.ac.uk

Background:

This research explores the impact of the HIV Prevention Trials Network (HPTN) 071 combination prevention (PopART) trial on horizontal inequity in Zambia and South Africa. Evidence suggests there is often inequality in healthcare utilisation in relation to socioeconomic characteristics, such as wealth. This paper is the first to address such distributional outcomes and inequities in a randomised trial setting.

Methods:

We utilise horizontal inequity as a key performance metric to make value judgements with regards to the distribution of healthcare utilisation in a health system. Additionally, we supplement this index by estimating the impact of PopART on inequality in healthcare utilisation and HIV prevalence, estimating concentration curves and indices.

Results:

We find a pro-rich inequity in healthcare utilisation, as ranked by wealth, before and after the trial is implemented. Pro-rich implies, for example, the 20% poorest make up less than 20% of healthcare utilisation. This suggests the trial enabled the wealthier subset of the population to take better advantage of accessing healthcare.

Conclusions:

Given the high prevalence of HIV in lower-income households in Zambia and South Africa, these results strengthen the case for interventions tailored to informing poorer households about the benefits of prevention and after-care.

Key messages:

- The PopART trial demonstrates as with any intervention, there is a risk of exacerbating an underlying inequity. Policies directed at these problems specifically may help alleviate such burdens.
- This paper shows one example of a distributional imbalance in the HIV population. Given the absence of work on RCT interventions, the findings may also be used to inform future trial design.

"A basic frame existed but was not followed" – Finnish public health system's response to COVID-19

Moona Huhtakangas

M Huhtakangas[1], L Kihlström[1], S Karreinen[2], I Keskimäki[1,2], L-K Tynkkynen[1,2]
[1]Welfare State Research and Reform, Finnish Institute for Health and Welfare, Helsinki, Finland
[2]Health Sciences, Faculty of Social Sciences, Tampere University, Tampere, Finland
Contact: moona.huhtakangas@thl.fi

Background:

Crisis management Managing crises often requires diverging from predetermined plans. In this paper, we investigate how public health authorities in Finland acted, what kind of roles they adopted and how the expected roles and actions appeared in relation to the legislative framework and preparedness plans during the COVID-19 pandemic. Based on inter-country comparisons, Finland has managed COVID-19 pandemic relatively well. The study provides qualitative insights on pandemic governance in a decentralized multi-stakeholder public health system.

Methods:

Semi-structured interviews (n = 53) with key public health actors at central, regional and local levels were conducted during March 2021-February 2022. The data was analysed with thematic analysis.

Results:

The predetermined roles and duties for pandemic management were not unequivocal in practice and appeared unrealistic considering the resources of the public health system. Responsibility was divided between several actors, but lack of interaction enhanced emerging tensions between them. Local and regional actors experienced national steering intervening in operational decisions. At central level distrust towards the capabilities of local and regional actors was expressed. The pandemic was framed and managed as a health crisis despite of its wider societal effects. This challenged local and regional decision-making, where wider societal impacts had to be considered.

Conclusions:

Public health authorities in Finland interpreted their roles and responsibilities in pandemic governance in various ways: some actors adopted more active agency than others and the roles were not always in line with the existing regulative framework.

Key messages:

- Interpretation of the roles outlined in preparedness plans are context dependent and may lead to conflicts between different actors.
- In a system with multiple actors at multiple levels, building trust and improving interaction are important for coordinated action.

Abstract citation ID: ckac131.010
Essential Medicines for Dental Caries: Cost-Effectiveness of ART and SDF

Julia Gierth

J Gierth[1,2], J Coughlan[5], N Gkekas[4], T Hofbauer[1], S Listl[1,3], M Pattamatta[3], A Pold[1]
[1]Dentistry, University of Heidelberg, Heidelberg, Germany

[3]Quality and Safety of Oral Health Care, Radboud University, Nijmengen, Netherlands
[4]Health Sciences, University of York, York, UK
[5]Health Science, Queen Mary University of London, London, UK
Contact: jgierth@gmx.de

Background:

Untreated tooth decay (caries) is the most common global health condition and one of the largest preventable disease burdens for society. It concerns both children and adults, particularly in low resource settings whereout of pocket expenditures for oral care often cause catastrophic health expenditures. The 2021 WHO Oral Health Resolution emphasized the relevance of developing so-called "Best Buys" for oral health. The purpose of this study was to identify the cost-effectiveness of Atraumatic Restorative Treatment (ART) and Silver Diamine Fluoride (SDF) as potential treatments to reduce the caries burden worldwide.

Methods:

Leaning on WHO CHOICE methodology, evidence scoping and an expert consensus were facilitated to extract model input parameters which were then fed into cost-effectiveness-analyses (CEA) for ART and SDF. The cost-effectiveness of the interventions was expressed as Cost per DALY averted.

Results:

The evidence scoping revealed relevant, information on the effectiveness and costs of ART and SDF. The CEA identified both ART and SDF to be potentially cost-efficient treatment strategies in settings with limited resources. SDF was found to provide a cost-efficient treatment alternative in settings where the comparably larger (human) resource requirements for ART cannot be met.

Conclusions:

The findings suggest that ART and SDF represent potentially cost-efficient strategies to reduce the caries burden in settings with limited resources. While ART has previously been proposed as part of WHO's essential package of oral care, SDF could provide a comparably inexpensive treatment alternative.

Key messages:

- Untreated tooth decay (caries) is the most common global health condition and one of the largest preventable disease burdens for society.
- The CEA identified both ART and SDF to be potentially cost-efficient treatment strategies in settings with limited resources.

[2]Public Health Department, AOU Federico II, Naples, Italy
[3]University Hospital, AOU Federico II, Naples, Italy
Contact: fabiana.rubba@unina.it

Fracture patients are frail and have high mortality. We investigated whether introducing a fast-track strategy during post-surgery care and including early rehabilitation protocols may shorten the length of hospital stay (LOS) while improving the overall clinical effectiveness. A training ground was built inside the inpatient area dedicated to trauma settings. Usual postoperative care consists of immobilization during the first day, but patients may start rehabilitation earlier, 24 hours after the surgical procedure, with a fast-track strategy. In general, gait speed, step length, and self-assessment in terms of mobility improve significantly in the first six postoperative weeks in fracture patients. As delayed postoperative mobility during hospitalization was observed, the established training ground may help with this concern. The expert physiotherapist may contribute to ameliorating the indicators showing great potential in postoperative rehabilitation regardless of fracture pattern. The primary outcome was postoperative physical functioning. Secondary outcomes included the patient's assessment of therapeutic effect (overall improvement), perceived pain intensity, health services utilization, treatment side effects, and adverse events. Data were analyzed by univariate analysis and binary logistic regression showing a reduction of LOS of almost three days. Further, the optimized hip fracture program reduced the rate of in-hospital post-operative complications and mortality. Adding to the schedule, some PROMPTS (Patient-reported outcome measures) could further integrate the patient empowerment perspective into the quality set of values. For this reason, 'fast track' may define a crucial policy able to guarantee rapid rehabilitation, becoming a key factor to achieving a good clinical effect. Fast-track rehabilitation facilitates a shortened hospital stay and cost-saving and can be used to optimize the patient's condition before admission to a rehabilitation facility

Key messages:

- Early rehabilitation protocols may shorten the length of hospital stay (LOS) while improving the overall clinical effectiveness.
- Human factors and patients empowerments may help.

Abstract citation ID: ckac131.012
Breast cancer incidence and mortality in Georgia by regions and municipalities in 2015-2019

Diana Nemsadze

V Tkeshelashvili[1], *T Gvazava*[1], *T Beruchashvili*[1], *E Shvelidze*[1]
[1]Georgian University, Tbilisi, Georgia
Contact: dina.nemsadze@yahoo.com

Background:

According to the NCDC, in 2015-2019, breast cancer ranked first in the structure of cancer in Georgia. Additional studies are needed to identify breast cancer incidence and mortality by regions and municipalities of Georgia.

Methods:

Electronic dBase of cancer population registry for 2015-2019 (52,178 cancer cases), Tbilisi registry database for 2002-2004 (33,478 deaths from all causes), methodology recommended by IARC and UICC, SEER program and 2014 Georgian census data were used in the study. Standardized cancer incidence and mortality rates (ASR, TASR, AAR, SRR, CR64, CR74, SIR, SMR, PIR, 95% CI) were calculated.

Results:

29,303 cases of cancer (56% of all cancers) were registered in the Georgian female population in 2015-2019, including 18,432 (62.9%) cases of breast cancer. In the mentioned 5 years, breast cancer ranks first in the general structure of cancer incidence in female population of Georgia and Tbilisi. According to ASR (world standard) and AAR (Georgia and Tbilisi standards, 2014), annual incidence was 62,9%000 / 95,7%000 in Georgia, and 85.3%000 /123,6%000 - in Tbilisi. According to the SRR, incidence of breast cancer in Tbilisi was 1.4 times higher than general incidence of breast cancer in Georgia. In 2015-2019, compared to 1988-1992, i.e., in 27-year dynamics, rate of breast cancer in Tbilisi according to the SRR increased 2.4 times, and according to SIR- by 140,2% in dynamics. ASR of breast cancer deaths in Tbilisi in 2015-2019 annually made up 112,2%000. According to the SRR, in 2015-2019, the rate of breast cancer deaths in Tbilisi increased by 3.4 times, compared to 2002-2004. In 13-year dynamics, the incidence of breast cancer deaths according to SMR increased by 238%.

Conclusions:

In order to advocate for breast cancer control it is recommended to develop regional and municipal screening programs based epidemiological maps of cancer and ensure effective screening services for each woman through the State program prevention guideline.

Key messages:

- Epidemiological maps of breast cancer are recommended for use in planning regional and municipal programs of cancer control, including screening which will help breast cancer control advocacy.
- Ensure effectiveness of screening services for each woman through the State program prevention guideline.

Abstract citation ID: ckac131.013
Healthy ageing: Herpes zoster infection and the role of the adjuvanted recombinant zoster vaccine

Desmond Curran

D Curran[1], *TM Doherty*[2], *N Lecrenier*[2], *T Breuer*[3]
[1]Value Evidence, GlaxoSmithKline, Wavre, Belgium
[2]Medical/Vaccines, GlaxoSmithKline, Wavre, Belgium
[3]Medical Governance & Bioethics, GlaxoSmithKline, Wavre, Belgium
Contact: desmond.x.curran@gsk.com

Background:

Increases in life expectancy over the last 50 years has been matched by an increase in the burden of diseases (e.g. herpes zoster (HZ)) in adults $\geq$50 years of age (YOA). Without intervention, around 30% of individuals can expect to develop HZ in their lifetime, which would impact their daily activities and healthy ageing.

Methods:

We conducted a narrative review on published literature on the impact of developing HZ on healthy ageing and the ability of vaccination to prevent the burden of disease due to HZ. Specifically, we describe HZ impact on quality of life (QoL), and impact of the adjuvanted recombinant zoster vaccine (RZV) on reducing the burden of HZ in adults $\geq$50 YOA.

Results:

In adults $\geq$50 YOA with HZ, 65.1% and 15.8% reported severe pain and worst imaginable pain, respectively. Pain persisted for up to 90 days (defined as post-herpetic neuralgia) in 10-20% of HZ patients, and occasionally for years after initial symptoms. Pain due to HZ impacted all domains of QoL (psychological, physical and social). Evidence suggested that RZV reduced HZ burden of illness and burden of interference on daily activities by > 90%. Reports also suggested that RZV retained vaccine efficacy of > 90% in all frailty subgroups, who typically respond poorly to other vaccinations. Long-term follow-up data reported vaccine efficacy against HZ of 84.1% (95% confidence interval, 64.4% - 94.0%), 8 years post-vaccination. Modelling studies demonstrated that vaccination resulted in reduced hospitalization and other healthcare visits related to HZ.

Conclusions:

Vaccination with RZV can protect older adults from HZ, thus maintaining QoL and promoting active and healthy ageing.

Key messages:

- There is significant burden of disease due to HZ among adults $\geq$50 YOA due to ageing and immunosenescence.
- Vaccination can reduce burden of disease among the elderly and frail individuals and maintain QoL.

Abstract citation ID: ckac131.014
Interorganisational collaboration to improve accessibility of diagnostic evaluations for children

Eva Cloet

E Cloet[1,2], *A Jansen*[3], *M Leys*[1]
[1]Public Health, Vrije Universiteit Brussel, Jette, Belgium
[2]Paediatric Neurology, Universitair Ziekenhuis Brussel, Jette, Belgium
[3]Paediatric Neurology, Universitair Ziekenhuis Antwerpen, Antwerpen, Belgium
Contact: eva.cloet@vub.be

Background:

Children with a suspected developmental disability need early diagnostic evaluations and support, to maximize developmental opportunities. Accessibility to diagnostic settings in Flanders, Belgium, is poor, with waiting periods up to two years. Interorganisational coordination of activities using a public health and needs of the population perspective is needed to strengthen the system. This study aims to evaluate current practices and opportunities for interorganisational collaboration of organisations active in the field of diagnostics.

Methods:

It concerns a qualitative, policy-support research project. 6 homogeneous focus groups were organised for the 6 types of organisations subsidized by the government to perform diagnostic evaluations of children with a (suspected) developmental disorders. Data were thematically analysed and categorized in a process of researcher and data-triangulation. A member check validation was done.

Results:

59 persons participated. We classified the hampering and facilitating factors for collaboration Current interorganisational collaboration is mostly limited to referral. Organisational differences in vision and goals, working processes and quality requirements, regulations and financial support criteria, a problem of accessibility and communication problems are hampering factors. Knowledge of mutual expertise and working processes, personal contacts and open communication are facilitating factors.

Conclusions:

A population public health based organisation of the field of multidisciplinary diagnostic evaluations for children with a developmental disorder, with interorganisational collaboration and coordination of activities in mandated networks, sharing experience and knowledge, would increase the accessibility for all children and strenghten the health system. The implementation of interorganisational networks would benefit from a functional and institutional analysis of organisations.

Key messages:

- Coordination of activities and interorganisational collaboration in mandated networks, could potentially improve the accessibility of diagnostic evaluations for children with a developmental disorder.
- Implementation of interorganisational networks would benefit from a functional and institutional analysis of organisations.

Abstract citation ID: ckac131.015
Thyroid cancer incidence in the female population of Georgia by regions and municipalities

Tina Beruchashvili

N Abesadze[1], V Tkeshelashvili[1], M Kereselidze[1], R Kvanchakhadze[1], T Beruchashvili[1]
[1]School of Health Sciences, University of Georgia, Tbilisi, Georgia
Contact: t.beruchashvili@ug.edu.ge

Background:

According to the NCDC (Tbilisi, Georgia), in 2015-2019, thyroid cancer ranked second in the cancer structure of cancer in Georgia. Additional studies are needed to identify the thyroid cancer incidence by regions and municipalities of Georgia.

Methods:

E-dBase of cancer population registry for 2015-2019 (52,178 cancer cases), Tbilisi registry database for 2002-2004 (33,478 deaths from all causes), methodology recommended by IARC (Lyon) and UICC (Geneva), SEER program and 2014 Georgian census data were used in the study. Standardized cancer incidence and mortality rates (ASR, TASR, AAR, SRR, CR64, CR74, SIR, SMR, PIR, 95% CI) were calculated.

Results:

Ranking and proportion of thyroid cancer in female population of Georgia in 2015-2019 according to the regions and municipalities, its age specifics and dynamics were determined. Incidence of thyroid cancer in women in Tbilisi (ASR = 52.4%000; AAR = 64.1%000), compared to Georgia (ASR = 34.4%000; AAR = 41.0%000), indicates that Tbilisi is the geographically highest prevalence zone for this site cancer and the highest levels were observed in the 25-69 age group (TASR25-69 - Georgia = 110.8%000, Tbilisi = 190.1%000). In dynamics, the incidence of thyroid cancer in the 27-year period (2015-2019 vs 1988-1992) according to the SIR, increased by 66.4%. According to the cumulative risk index (CR64, CR74), the municipalities, where the risk of developing thyroid cancer is almost 1.5 times higher than the total rate in Georgia, were identified. According to the PIR, the ratio of thyroid cancer to the share of thyroid cancer in the structure of cancer in the regions of Georgia (including Tbilisi) showed that the proportion of thyroid cancer in Tbilisi (PIR = 117.7) is 17.7% higher compared to proportion of total thyroid cancer in Georgia.

Conclusions:

It is recommended that the epidemiological map of thyroid cancer incidence be used in planning national, regional, and municipal preventive programs.

Key messages:

- It is recommended to continue study in this direction: retrospective review of histological and histochemical features of each case of thyroid cancer.
- It is recommended: to conduct molecular (oncogenes) studies in conjunction with histological and histochemical studies.

Abstract citation ID: ckac131.016
Evaluation of primary health care system in Yangon Region, Myanmar: a mixed-method approach

Jihyun Moon

J Moon[1], SJ Kang[2], JW Noh[3]
[1]Graduate School of Medical Sciences, University of Groningen, Groningen, Netherlands
[2]Institute of Health and Environment, Seoul National University, Seoul, South Korea
[3]Division of Health Administration, Yonsei University, Wonju, South Korea
Contact: jihyun.moon123@gmail.com

Background:

Many low- and middle-income countries and international organizations have invested resources to strengthen primary health care services. Despite efforts from the Ministry of Health on primary health care, barriers to accessing health care services and health inequality in Myanmar still exist. This study aimed to identify the challenges and unmet needs in the current primary health care services by assessing the experiences and perceptions of healthcare workers and local leaders in three townships (Htantabin, Hmawbi, and Taikkyi) in Yangon, Myanmar.

Methods:

The study was conducted among healthcare professionals and community leaders in three townships. By adopting a mixed-method approach, a cross-sectional health needs assessment survey was conducted for quantitative data (n = 66), and focus group discussions (15 group discussions) were conducted online for qualitative data.

Results:

As a result of the survey regarding six domains; hygiene, primary medical care, maternal and child health, infectious diseases, non-communicable diseases, and leadership, enhancing the management and leadership capacity had the lowest average score on the current achievement (2.81 out of 5), while strengthening infectious disease control service and accessibility was perceived as the highest mean on the priority of intervention (4.28 out of 5) and the impact of the intervention (4.7). The focus group discussions revealed that while specific infrastructures and equipment necessary for the category were addressed, the need for financial support has been the recurrent theme throughout the discussions.

Conclusions:

Utilizing the World Health Organization's six-building block framework, our findings suggest that a long-term targeted financial investment in the primary health care system is critical in Myanmar by increasing health care expenditure per capita. At the same time, related barriers and facilitators should be considered to optimize the effectiveness of prioritized interventions.

Key messages:

- Health care providers and local leaders perceived the management and leadership capacity as the lowest current achievement.

- A long-term targeted financial investment in the primary health care system is critical in Myanmar.

Abstract citation ID: ckac131.017
Smoking cessation for cancer patients through the lens of cancer specialists: challenges & solutions

Patricia Fitzpatrick

P Fitzpatrick[1,2], N Bhardwaj[1], S Syed[2], P Fox[3], K Frazer[3], V Niranjan[1], A Lyons[2], A McCann[4], S Brennan[5], S Guerin[6]
[1]School of Public Health, Physiotherapy and Sports Science, University College Dublin, Dublin, Ireland
[2]Department of Preventive Medicine and Health Promotion, St. Vincent's University Hospital, Dublin, Ireland
[3]School of Nursing, Midwifery & Health Systems, University College Dublin, Dublin, Ireland
[4]Biomolecular & Biomedical Research Institute, University College Dublin, Dublin, Ireland
[5]Department of Radiation Oncology, St. Luke's Radiation Oncology Network, Dublin, Ireland
[6]School of Psychology, University College Dublin, Dublin, Ireland
Contact: patricia.fitzpatrick@ucd.ie

Background:

The benefits of smoking cessation (SC) for cancer patients are widely recognised. However, there has been a limited emphasis on SC in this context and it continues to be a challenge for cancer patients. As part of a larger feasibility study aiming to develop a structured SC pathway for cancer patients in Ireland, this qualitative study explored the SC practices, experiences and opinions of oncology healthcare professionals (HCPs).

Methods:

Semi-structured interviews were conducted with 18 HCPs from lung, breast, cervical, head and neck and general oncology, across 4 specialist adult cancer hospitals in Ireland. Interview transcripts were analysed using thematic analysis.

Results:

Four key themes emerged:

(1) Frequently ask and advise but infrequently assist: most HCPs ask about smoking and many advise about available supports, but few refer patients to SC services. Where offered, referrals were to hospital SC services and/or nicotine replacement therapy was prescribed; no HCP prescribed varenicline or bupropion. Barriers included lack of time, ill-defined referral pathways and lack of knowledge.

(2) Increased willingness but differing ability to quit: most patients were interested in quitting post diagnosis and had varying support needs, linked to cancer stage, social circumstances and stress levels.

(3) Need for an integrated or parallel service: all HCPs suggested that a structured and defined referral pathway will facilitate SC.

(4) Motivational counselling and pharmacotherapy combination: many HCPs suggested face to face as the best mode of intervention initially, with regular follow ups and ongoing support virtually, started pre-treatment, with an empathetic and empowering approach with provision of both motivational counselling and SC pharmacotherapy.

Conclusions:

Smoking post cancer diagnosis has serious implications for cancer treatment and prognosis but is frequently overlooked. These findings will inform the design of a SC pathway for cancer patients.

Key messages:

- Despite increased willingness to quit, there is inadequate and inconsistent SC support provision for cancer patients.
- Tailored SC support should be an integral part of comprehensive cancer care.

Abstract citation ID: ckac131.018
Attitudes of children and adolescents towards healthy lifestyle issues

Natia Antia

N Antia[1], D Tabidze[2], L Gabunia[1], I Zarnadze[2], Sh Khetsuraini[1], N Gamkrelidze[1], N Sulashvili[1]
[1]Scientific Research Skills Center, Tbilisi State Medical University, Tbilisi, Georgia
[2]Department of Public Health, Tbilisi State Medical University, Tbilisi, Georgia
Contact: n.antia@tsmu.edu

Background:

Health education for promoting healthy lifestyle from early ages is considered to be important. However, this issue has not been thoroughly examined in Georgia. The research, undertaken on adolescents, aimed to analyse adolescents' lifestyle, awareness and attitudes towards healthy lifestyle.

Methods:

The study applied a mixed methods design and included both, qualitative and quantitative research methods. 145 students aged 17 to 23 years participated in the research. In order to evaluate the adolescent's perceptions and attitudes, qualitative individual interviews with university students were conducted. For the quantitative method, a self-administered questionnaire assessing the level of adolescents' awareness and attitudes towards healthy lifestyle was developed.

Results:

This section presents preliminary findings of the study. We found that more than 67% of adolescents were aware on the importance of healthy lifestyle. However, most of the participants did not transfer their knowledge into practice. The participants found it challenging to maintain healthy eating habits due to increased costs of healthy, organic food. The study also confirmed the need for integrated work of public, governmental, and non-governmental organizations to initiate and implement health promotion programs for children and adolescents.

Conclusions:

Overall, the study found that even though adolescents are aware about the importance of the healthy lifestyle, it is challenging for them to maintain it. In order to change adolescents' attitudes towards unhealthy behaviour, it is necessary to carry out targeted interventions.

Key messages:

- Health education is a necessary component for healthy lifestyle.
- Healthy lifestyle requires careful study of the issue and making evidence-based conclusions.

Abstract citation ID: ckac131.019
Enhancing COVID 19 vaccination coverage in Sierra Leone

Thea Scognamiglio

R Moretti[1,2], T Scognamiglio[2], A Zoli[2], A Miozzo[2], P Lansana[3], A Nunie[4]
[1]Primary Health Care, ATS Bergamo, Bergamo, Italy
[2]Direction, AREU, Milan, Italy
[3]Freetown Urban Health District, EPI District, Freetown, Sierra Leone
[4]Direction, EPI National, Freetown, Sierra Leone
Contact: t.scognamiglio@areu.lombardia.it

The project aim to support Sierra Leone in enhancing vaccination coverage. BACKGROUND In November 2021, the vaccination coverage rate was 7% for one dose and 4% for two. According with EPI program, the main problem was not the lack of vaccines (already provided by different donors) but the need of support (training, motivation, allowances) to health personnel. Lombardy project involved 31 local vaccination teams performing a refresh training, followed, by microplanning meetings. SIGNIFICANCE The Covid epidemiology in SL is not well known, but the possible new waves makes this intervention a high public health priority. USEFULNESS. The model is based on training, motivation, follow up and a very simple monetary allowance system based on performance. An online daily report available on smartphone was provided to follow up performances and manage allowances system. PROBLEM The objective was a donation of vaccines, but after a short assessment the issue changed to the need of supporting the local health staff. The goal shifted to train, give incentives for health workers, support to micro-planification and also to work on timely reporting to follow up the project results. QUESTIONS ANSWERED. Can support to micro-planning be effective in enhancing vaccination numbers? Can monetary incentives to personnel based on performances enhance vaccination numbers? Can a setting approach (school, workplaces,..) enhance vaccinations numbers? RESULTS the numbers of vaccination Increased from an average of 5 per team by day in early December (after the refresh training) up to an average of 15 by day after the support to micro-planning, the monetary progressive incentives based on performance and the introduction of settings approach. Up to 85.000 doses was performed in 4 months.

Key messages:

- Planning, performance based payement and training can enhance vaccination coverage.
- African countries can performe good vaccination programs if supported in organization and non only in vaccine donation.

Abstract citation ID: ckac131.020
Stylish UV-C lamp for disinfecting household objects

Raffaele Iannaccone

R Iannaccone[1], N Nante[1,2], I De Palma[3], D Amodeo[3], G Messina[1,2]
[1]Post Graduate School of Public Health, University of Siena, Siena, Italy
[2]Department of Molecular and Developmental Medicine, University of Siena, Siena, Italy
[3]Department of Medical Biotechnologies, University of Siena, Siena, Italy
Contact: r.iannaccone@student.unisi.it

Background:

Considering the current pandemic situation, the growing problem of antibiotic resistance and the increase in healthcare costs, attention to daily disinfection is becoming increasingly important. This study aimed to evaluate the bactericidal efficacy of a modern and stylish UV-C device designed for the home environment.

Methods:

The experimental study was conducted between July-August 2020 on four bacterial strains: Staphylococcus aureus, Salmonella typhymurium, Klebsiella pneumoniae and Escherichia coli. The UV-C device consist of a protective dome with a reflective coating, a UV-C lamp (placed in the device base) and three reflective holders. Different positions and exposure times were tested using two different carriers holder for the bacterial inoculum (plastic and stainless steel) to estimate the germicidal efficency related to UV-C lamp exposure, with direct and reflected (from the dome coating) light.

Results:

The experiment showed that the higher bacterial inactivation effect (3.5 to 7 log10) was achieved for all four strains at 3 minutes, but even at 1 minute, there is a marked reduction in the bacterial load with the only exception of Klebsiella pneumoniae. After 45 and 30 seconds, steel carriers contaminated by Escherichia coli and Staphylococcus aureus on the opposite side of the UV-C source showed significant reductions in the range between 99 and 99,9%.

Conclusions:

The device has proven to be effective for the disinfection of various everyday objects placed into the lamp and introduces beauty to the household environment.

Key messages:

- In this study, UV-C device proved to be a valuable tool for disinfecting household items and enhancing safety for everyday health.
- UV-C device proved to be a valuable tool for disinfecting household items and enhancing safety for everyday health.

Abstract citation ID: ckac131.021
Factors associated with hospitalization for aortic stenosis in Portugal from 2015 to 2017

Fernando Genovez Avelar

FG Avelar[1], J Alves[1,2]
[1]Public Health Research Centre, National School of Public Health, Lisbon, Portugal
[2]Comprehensive Health Research Centre, Lisbon, Portugal
Contact: fg.avelar@ensp.unl.pt

Background:

Severe aortic stenosis prevalence has been growing worldwide and constitutes a public health challenge. The gold-standard treatment is Surgical Aortic Valve Replacement (SAVR) however Transcatheter Aortic Valve Implantation (TAVI) has been increasing, especially in high-risk surgical patients. This study aims identifying the factors associated to the implementation of TAVI to minimize possible disparities in access to health services.

Methods:

This study used data on inpatient discharges from the Portuguese NHS, from 2015 to 2017. SAVR and TAVI, were classified according to the International Classification of Diseases (ICD). Chi-square test and independent T-tests with 1% significance level in the SPSS® were performed to identify the factors associated with both interventions.

Results:

A total of 8398 hospitalizations were analysed, 88.5% SAVR and 11.5% TAVI. The mean (SD) age for SAVR was 70 (±11) years old and 81 (±7) years old for TAVI ($p < 0.001$), 56.9% were male among SAVR and 44.6% among TAVI ($p < 0.001$). Year ($p < 0.001$), type of admission ($p < 0.001$), geographic location ($p < 0.001$), severity ($p < 0.001$) and Charlson Comorbidity Index (CCI) ($p < 0.001$) were associated with the type of intervention.

Conclusions:

TAVI was performed in more severe patients and there was an increase in TAVI over the years, which is consistent with the growing use of the technology among other patients, e.g., the high-risk surgical patients. We also found a geographic pattern in the use of SAVR and TAVI. This might reveal the existence of geographic disparities regarding availability and access to health services.

Key messages:

- In Portugal, there is an increase in the performance of TAVI, with geographical concentration that reflects on access.
- TAVI is more often performed in more severe patients as an alternative to SAVR with similar discharge outcomes.

Abstract citation ID: ckac131.022
Key issues for implementation of Genomics in Healthcare: a Policy Brief

Alexandra Costa

A Costa[1,2], A Merchant[3], MF Lopes[1], M Konopko[3], ML Cardoso[1,4], X Sitjà[3], M Bourbon[1,4], S Scollen[3], A Vicente[1,4]
[1]Department of Health Promotion and NCD Prevention, National Institute of Health Doutor Ricardo Jorge, Lisbon, Portugal
[2]Institute of Social and Political Sciences, University of Lisbon, Lisbon, Portugal
[3]ELIXIR Hub, Wellcome Genome Campus, Cambridge, UK
[4]BioISI-Biosystems & Integrative Sciences Institute, Faculty of Sciences, University of Lisbon, Lisbon, Portugal
Contact: alexandra.costa@insa.min-saude.pt

Issue/problem:

Healthcare (HC) can significantly benefit from genomic information for earlier, accurate diagnosis, effective personalized treatment with less adverse events, and accurate profiling of individuals for disease prevention. However, European countries are currently at variable maturity stages regarding the implementation of genomic medicine (GM) in healthcare, hindering the equitable delivery of personalized medicine to citizens across borders.

Description of the problem:

The European 1+Million Genomes Initiative (1+MG) aims to provide cross-border access to quality genomic information and related clinical data, to advance data-driven research and HC solutions to benefit citizens. This initiative is encouraging countries to develop national GM strategies, but guidance for successful implementation is needed. In this context, the Beyond 1 Million Genomes, a supporting action to the 1+MG initiative, organized three Country Exchange Visits (CEV) to discuss critical issues, share experiences and best practices, for the implementation of sustainable GM strategies in healthcare.

Results:

The United Kingdom, Estonia and Finland, which have advanced GM programs, hosted CEV describing progress and lessons learnt. Representatives of 1+MG signatory countries participated in these events and were able to present country level progress. The resulting Policy Brief (PB) captures key issues discussed at the CEVs, with real-life examples, and proposes policy recommendations for the successful implementation of GM in European healthcare systems.

Lessons:

Sustainable GM implementation in HC systems requires: 1) Patient and citizens trust and engagement; 2) Sustainable infrastructure and data regulation, with solid ethical and legal frameworks; 3) Capacity building of healthcare professionals; 4) A strong ecosystem involving all stakeholders, and encouraging synergies between healthcare, research and industry to promote continuous innovation.

Key messages:

- The implementation of GM in healthcare will take countries further towards making personalized medicine a reality, with remarkable health and socioeconomic benefits for patients and healthcare systems.
- Promoting cooperation, capacity building and sharing of best practices is crucial to reduce asymmetries between countries, which constrains effective and equitable cross-border personalized medicine.

Abstract citation ID: ckac131.023
Promoting positive masculinities among young people in Stockholm, Sweden. A mixed-methods study

Mariano Salazar

M Salazar[1], *A Cerdán-Torregrosa*[2]
[1]Global and Sexual Health Research Group, Department of Global Public Health, Karolinska Institutet, Stockholm, Sweden
[2]Department of Community Nursing, Preventive Medicine and Public Health and History of Science, University of Alicante, Alicante, Spain
Contact: mariano.salazar@ki.se

Background:

Despite policies aiming to curtail men's violence against women (VAW) in Sweden, one in three women have experience physical/sexual VAW. Promoting anti-VAW masculinities among young men is a key intervention to reduce VAW; yet little is known about what actions could be used to effectively do so in Sweden. This study aims to: 1. Identify actions that young people (men and women), and stakeholders believe can be used to promote anti-VAW masculinities and 2. Quantify the relationship, coherence and patterns of importance and applicability between the different identified actions.

Methods:

A mixed-methods study was conducted in Stockholm in 2019. In-depth interviews with young people aged 18-24 years (men = 16, women = 12) and stakeholders (n = 12) were used to identify actions to promote anti-VAW masculinities. Then, an online survey with 83 people (77 young people) was conducted asking participants to sort the actions and rate them in terms of importance and applicability. Multidimensional scaling and hierarchical cluster analysis were used to create clusters maps. Each cluster was rated in terms of importance and applicability.

Results:

Six clusters were identified: 1.own self-reflection and change, 2. actions in leisure-cultural spaces, 3. mandatory education on gender-VAW, 4. positive role models in public arenas, 5. support civil society and 6. strengthen government, police, and legal response. The clusters of mandatory education on gender-VAW and own self-reflection and change were rated higher in importance (mean 5.1 and 4.8 respectively). Mandatory education on gender-VAW and actions in leisure-cultural spaces were rated higher in applicability (mean 4.6 and 4.7 respectively). Correlation between importance and applicability was low (rho = 0.16).

Conclusions:

Promoting anti-VAW masculinities to tackle VAW should be done in multiple arenas. Mandatory education on gender-VAW in schools and leisure spaces are key strategies to promote anti-VAW masculinities.

Key messages:

- Preventing VAW by focusing on masculinities requires the involvement of various social spheres.
- Mandatory education on gender and VAW is considered key in curtailing men's VAW in Sweden.

Abstract citation ID: ckac131.024
Health system efficiency in Germany: results of a pilot study to assess health system performance

Philipp Hengel

P Hengel[1], *K Achstetter*[1], *M Blümel*[1], *V Schwarzbach*[1], *R Busse*[1]
[1]Department of Health Care Management, Technische Universität Berlin, Berlin, Germany
Contact: philipp.hengel@tu-berlin.de

Background:

Improved efficiency is one overall goal in WHO's Health Systems Framework. Efficiency is an important dimension of health system performance assessment (HSPA). HSPA is used as a tool to monitor and evaluate the performance of health systems and to support evidence-based policymaking. In the pilot study for a first German HSPA, efficiency was assessed as one dimension.

Methods:

Indicators were selected based on a systematic search of established instruments in national and international HSPA initiatives. Criteria for the inclusion of indicators were data availability and international comparability. Where possible, indicators were evaluated in terms of their development over time (2000-2020), in comparison to eight European countries (e.g., Austria, Denmark, France), and regarding equity aspects (e.g., age, gender, region).

Results:

Eight indicators to assess the efficiency of the German health system were identified and analysed accordingly. They cover the pharmaceutical sector, outpatient and inpatient care, and system-wide efficiency. Trend analyses were possible for all indicators, and most were also suitable for international comparisons. Overall, results of the chosen indicators indicate a moderate health system efficiency. The volume of generics as share of all pharmaceuticals, e.g., was 83% in Germany in 2019 (country average: 54%) and has been steadily increasing since 2000. In contrast, expenses for pharmaceuticals overall rose from 1.4% of GDP in 2004 to 1.7% in 2019, whereas it declined from 1.3% to 1.1% on average in the other countries.

Conclusions:

Within this first pilot study, a systematic and comparative German HSPA measuring the efficiency of the German health system using eight predefined indicators was proven to be feasible. The results give insights into efficiency measurements across different sectors, e.g., pharmaceuticals, identify developments of efficiency over time, and can support evidence-based policymaking.

Key messages:

- In the pilot study for a first German HSPA, efficiency was evaluated using eight indicators covering pharmaceuticals, outpatient and inpatient care, and system-wide efficiency.
- Based on the available data, which allowed trend analyses for all indicators and comparisons to eight European countries for most indicators, Germany's health system efficiency can still be improved.

Abstract citation ID: ckac131.025
Quality of health care in Germany: results of a pilot study to assess health system performance

Philipp Hengel

P Hengel[1], *K Achstetter*[1], *M Blümel*[1], *V Schwarzbach*[1], *R Busse*[1]
[1]Department of Health Care Management, Technische Universität Berlin, Berlin, Germany
Contact: philipp.hengel@tu-berlin.de

Background:

Health System Performance Assessment (HSPA) is used as a tool to monitor and evaluate the performance of health systems and to inform evidence-based policymaking. For the first time, a systematic HSPA was piloted for Germany. The conceptual framework includes different dimensions, e.g., access, population health, efficiency, and quality of care. In the following, Germany's performance is analysed in terms of quality of care.

Methods:

Indicators to assess the dimension of quality of care were selected based on a systematic search of established instruments in national and international HSPA initiatives. Other criteria for the inclusion of indicators were data availability and international comparability. The indicators were evaluated in terms of their time trend (2000-2020) and in international comparison (e.g., Austria, Denmark, France).

Results:

Overall, 17 indicators were selected to assess quality of care, of which two could not be analysed due to missing data. Indicators include, e.g., emergency readmissions after hospital stays, patient-reported medical errors, coercive measures in psychiatric wards, and in-hospital mortality. Trend analyses were possible for 14 indicators and most of them showed positive developments. In country comparisons, which were feasible for seven indicators, Germany mostly ranked below average. In-hospital mortality for acute myocardial infarction, e.g., was 8% in 2019 in Germany (other countries: 4%-7%) and has been stable since 2014. For stroke, Germany performs better and ranks three of five (6%; range: 5%-9%) in 2019.

Conclusions:

Measuring quality of care for a systematic and comparative German HSPA was proven to be feasible. However, some indicators could not be mapped so far due to lack of data. The results give insights into quality measurements across different sectors and can support evidence-based policymaking.

Key messages:

- In the first health system performance assessment (HSPA) for Germany, quality of care was evaluated over time (2000-2020) and compared to eight European countries using 17 indicators.
- Measurement of quality was feasible, but data availability should be strengthened in the future as country comparisons were possible for only half the indicators and two could not be analysed at all.

Abstract citation ID: ckac131.026
Towards Better Oral Health Prevention: the Value for Money of Fluoride Toothpaste

Theresa Hofbauer

T Hofbauer[1], *J Coughlan*[2], *J Gierth*[1], *N Gkekas*[3], *S Listl*[1,4], *M Pattamatta*[4], *A Põld*[1]
[1]University of Heidelberg, Heidelberg, Germany
[2]NHS Foundation, London, UK
[3]University of York, York, UK
[4]University of Radboud, Nijmegen, Netherlands
Contact: theresahofbauer@outlook.com

Background:

Although largely preventable, tooth decay (dental caries) is among the most common health conditions worldwide and contributes to substantial dental treatment expenditures. While Fluoride Toothpaste (FT) is considered an essential strategy for oral health prevention, its market price has been shown to vary substantially across various settings. Against this background, the present study aimed to develop a decision analytical model to evaluate the cost-effectiveness of FT in various settings.

Methods:

Leaning on WHO CHOICE methodology, evidence scoping and an expert consensus were facilitated to extract model input parameters which were then fed into cost-effectiveness-analyses (CEA) for FT. The cost-effectiveness of the interventions was expressed as cost per Disability-Adjusted Life Year (DALY) averted.

Results:

The CEA identified a high likelihood for FT to be a cost-efficient treatment strategy in settings with comparably low market prices for FT. FT was less likely to be a cost-efficient treatment strategy in settings with comparably high market prices for FT.

Conclusions:

The developed decision analytical model is suitable to inform policymakers about the extent to which FT represents good value-for-money under different market prices.

Key messages:

- Fluoride toothpaste can provide high value for money as an oral health preventive strategy.
- Policymakers need to ensure the affordability of fluoride toothpaste in order to harvest relevant efficiency gains.

Abstract citation ID: ckac131.027
The European pharmacy market: the density and its influencing factors

Selina Schwaabe

S Schwaabe[1]
[1]Chair of International Relations, School of Social Science and Technology, Technical University Munich, Munich, Germany
Contact: selina.schwaabe@hfp.tum.de

Community pharmacies deliver high-quality health care and are responsible for medication safety. During the pandemic, accessibility to the nearest pharmacy became more essential to get vaccinated against Covid-19 and to get medical aid. The government's goal is to ensure nationwide, reachable, and affordable medical health care services by pharmacies. Therefore, the density of community pharmacies matters. Overall, the density of community pharmacies is fluctuating, with slightly decreasing tendencies in some countries. The research question is: upon which conditions depends the variance in the density of community pharmacies in Europe? So far, the literature has shown that changes in the system affect prices and density. However, a European overview of the development of the density of community pharmacies and its triggers is still missing. This research is essential to counteract against decreasing density consulting in a lack of professional health care through pharmacies. I focus on liberal versus regulated market structures, mail-order prescription drug regulation, and third-party ownership consequences. In a panel analysis, the relative influence of the measures is examined across 27 European countries over the last 21 years. The results show that regulated pharmacy markets have over 10.75 pharmacies/100.000 inhabitants more than liberal markets. Further, mail-order prescription drugs decrease the density by -17.98 pharmacies/100.000 inhabitants. Countries allowing third-party ownership have 7.67 pharmacies/100.000 inhabitants more. The results are statistically significant at a 0.001 level. The output of my analysis recommends regulated pharmacy markets, with a ban on mail-order prescription drugs allowing third-party ownership to support nationwide medical health care through community pharmacies.

Key messages:

- Regulated pharmacy markets, with a ban on mail-order of prescription drugs and third-party-ownership have a positive effect on pharmacies density.
- The results of my analysis provide the government with measures to improve professional nationwide health care coverage for the population through pharmacies.

[7]National Institute of Health, Rome, Italy
Contact: guglielmo.arzilli@gmail.com

Issue:

The COVID-19 pandemic acted as a catalyst for a reconsidering health care professional workforce (HCPW) competency needed to face future public health challenges, in line with the recent WHO ''Global Competency and Outcomes Framework for UHC'' document. In this context, in the Italian G20 Presidency framework, the Italian National Institute of Health (ISS), launched a program named ''Laboratorium'' - recognised in the G20 Declarations of Ministers of Health and Leaders - aimed to the development of training tools suitable for distance learning in whatever context they are placed.

Description of the problem:

Common competencies and needs of the HCPW have to be fulfilled through cross-sectional and multilevel training, to overcome the current emergency and be able to face future challenges. The aim is to provide a modular educational approach that is finalized to actively involve the participant: health professionals step in their training pathway according to their knowledge gaps, identify their specific learning objectives and, through a problem-based learning approach, acquire the proper skills for their function and tasks.

Results:

We propose a two-tiered approach to training: the development of competence based courses oriented to active learning. A pilot course on Epidemic Intelligence design according to this model is ready to be released. At the same time, a repository of everything available on the web systematically selected from authorised sources by a scientific committee was created to support the training objective. It is characterised by a detailed multilevel tagging that allows an effective modularisation to reach only the content useful for its user.

Lessons:

Accessibility to health-related training materials is a required necessity at every level of HCPW. Profiles within healthcare are increasingly heterogeneous and there is a need to focus on disseminating tools that can provide knowledge to address different healthcare scenarios and common purposes.

Key messages:

- Future public health challenges underline a need for a competencies-based learning approach in Healthcare Workforce training.
- Italian National Institute of Health propose two methods within the 'Laboratorium' project to enable this type of learning: specifically designed courses and a structured document repository.

Abstract citation ID: ckac131.029
Ukrainian refugee crisis: the experience of the Roman Local Health Authority ''ASL Roma 1''

Andriy Melnyk

A Melnyk[1,3], LC Barone[3], S Messina[3], A Grossi[3], M Kohut[3], F Cascini[1], G Damiani[1,2], P Parente[4], M Goletti[4]
[1]Hygiene, Life Sciences and Public Health, Catholic University of the Sacred Heart, Rome, Italy

[3]Ukraine Emergency Coordination Unit, Italian Local Health Authority, ASL ROMA 1, Rome, Italy
[4]Health Management Directorate, Italian Local Health Authority, ASL ROMA 1, Rome, Italy
Contact: andrymelnyk@yahoo.it

Problem:

On February 24th, 2022, Ukraine was invaded by Russian forces, forcing many Ukrainians to flee from their homes as refugees. More than 55,000 Ukrainians have since arrived on Italian territory. In response to the humanitarian crisis, the Roman Local Health Authority ''ASL Roma 1'' provided socio-sanitary assistance through first reception centers to more than 7700 refugees, prioritizing people with high social vulnerability. Ukraine's vaccine hesitancy and different epidemiological landscape represented a major hurdle to be overcome.

Practice:

ASL Roma 1's practice served to ensure infectious diseases prevention and control, as well as continuity of care for non-communicable diseases and mental health issues. It consisted of repurposing resources, such as COVID-19 Hubs and their personnel, stipulating Public-Private Partnerships and collaborations with the local Ukrainian community, massive training, creating a centralized multidisciplinary team (with Ukrainian members) and a dedicated database/IT system.

Results:

ASL Roma 1 empowered local Ukrainian communities by providing equipment, medical and administrative staff and socio-sanitary assistance. Ukrainian volunteers helped bridge the cultural gap for essential service provision, such as COVID-19 screening, enrolment in the NHS, health and social orientation, vaccinations and a tailored care pathway. Thus, more than 7700 refugees were assisted, with 1830 COVID-19 vaccinations administered and 170 in critical conditions promptly receiving specialized care.

Lessons:

The multidisciplinary and cross-cultural interaction between doctors, nurses, cultural mediators, social workers, and other key actors was essential in ensuring a holistic care pathway. Services catered to Ukrainian refugees need complete integration between primary and centralized care. Flexibility and resilience are fundamental to foster an ecosystem of innovation and optimization of healthcare provision on all levels, from local to supranational.

Key messages:

- The multidisciplinary and cross-cultural interaction between all medical and non-medical key actors is essential in

ensuring a holistic care pathway and complete social integration of asylum seekers.
- Health system flexibility, resilience and an ecosystem of innovation and optimization of healthcare provision on all levels are fundamental components of preparedness for future refugee crises.

Smart Brain Care – A novel approach to health care of mild cognitive impairment and mild dementia

Ann-Kathrin Schwientek

A-K Schwientek[1], L Wolski[1], L Riedl[1], T Grimmer[1]
[1]Center for Cognitive Disorders, Technical University of Munich, School of Medicine, Munich, Germany
Contact: ann-kathrin.schwientek@tum.de

Background:
Dementia is a huge burden. Trends for the aging European nations indicate a significant increase of people with dementia. Prevention and early detection are the key elements to reduce risk factors and to treat reversible causes. In addition, identifying people at the beginning of the disease process is crucial when disease-modifying therapy becomes available.

Methods:
We aim to develop a complex intervention to improve the identification, diagnosis, and treatment of people with mild cognitive impairment (MCI) and mild dementia syndromes. Our goal is to reduce the time to diagnosis, raising awareness for MCI and increase patient involvement. First, barriers in pathways of care are determined in a systematic review and refined by conducting focus groups and interviews with primary care physicians (PCPs), specialists and experts in the field. A first theory about intervention components and how they interact are developed and will be further tested and adapted through development phase, feasibility and piloting.

Results:
The first blueprint of Smart Brain Care addresses three identified key barriers for an improved care of MCI and mild dementia syndromes (communication, skills and awareness) by three interventions (1-3), all linked and accessible through an e-database: An online platform (1) for exchange between PCPs, specialists and experts, (2) a screening tool, diagnosis-algorithm and training for PCPs as well as (3) information materials (e.g., fact sheets, short videos) separately accessible for patients.

Conclusions:
There is still low awareness about MCI under health care providers and the general population. A lack of knowledge, cooperation strategies and guidance seem to play an important role for the management of MCI and mild dementia syndromes.

Key messages:
- We need to increase focusing on the identification of people with MCI and mild dementia syndromes.
- Call for a structured diagnosis and treatment regimen to support primary care physicians as key players in the management of MCI and mild dementia syndromes.

Abstract citation ID: ckac131.031
Complete coverage by examinations: relationship to colorectal cancer burden and the COVID-19

Ondrej Ngo

O Ngo[1,2], J Kouril[1], S Suchanek[3], L Dusek[1,2], B Seifert[4], M Zavoral[3], O Majek[1,2]
[1]Institute of Health Information and Statistics, Prague, Czechia

[3]Department of Medicine, 1st Faculty of Medicine, Military University Hospital, Prague, Czechia
[4]Institute of General Practice, 1st Faculty of Medicine, Charles University, Prague, Czechia
Contact: ngo@iba.muni.cz

Background:
Colorectal cancer (CRC) is among the most common cancers and cancer causes of death worldwide. CRC screening and early detection is essential to reduce CRC incidence and mortality. CRC screening has been initiated in the Czech Republic in 2000 for persons over 50 and currently offers a faecal occult blood test (FOBT) or screening colonoscopy (CS). The aim of our study was to present complete coverage by examinations in relation to the trends in CRC burden and impact of COVID-19.

Methods:
We defined the complete coverage by examinations as the proportion of persons aged over 50 undergoing examination with CRC early detection potential (FOBT or CS for any indication) during past 3 years. Standardized incidence and mortality rates were used to assess epidemiological trends. The impact of COVID-19 was assessed for 2020 and 2021 by comparing the volume of examinations with 2019. We used national health registries (National Registry of Reimbursed Health Services, Czech National Cancer Registry) as the source of data.

Results:
Complete coverage was increasing over time and reached around 50% in recent years (target population is more than 4 million persons, most of the performed examinations were screening FOBT). However, coverage has decreased to 47.9% in 2020. In 2020 and 2021, the number of tests performed decreased by 16.9% and 5.5%, respectively, compared to 2019. CRC incidence and mortality rates have decreased by more than 20% and almost 30%, respectively, in the last decade.

Conclusions:
Complete coverage has reached a satisfactory level and has likely a positive impact on the epidemiological trends. However, further action is needed to increase coverage, recently affected by COVID-19 pandemic, when non-acute health care may have been neglected.

Key messages:
- The long-term high level of coverage by examinations likely has a positive impact on CRC burden.
- The observed decrease in coverage caused by COVID-19 needs to be appropriately compensated.

Abstract citation ID: ckac131.032
Five-hub General Conceptual Framework to improve the vaccination coverage for newly arrived migrants

Nikoletta Papaevgeniou

ME Tosti[1], G Marchetti[1,2], S Scarso[1,2,3], F D'Angelo[1], ML Russo[2,3], M Marceca[2,3], P Karnaki[4], N Papaevgeniou[4], S Declich[1,2]

[2]Italian Society for Migration Medicine, Rome, Italy
[3]Department of Public Health and Infectious Diseases, Sapienza University of Rome, Rome, Italy
[4]Institute of Preventive Medicine, Environmental and Occupational Health Prolepsis, Athens, Greece
Contact: n.papaevgeniou@prolepsis.gr

Background:
Within the Project ''Increased Access for Newly Arrived Migrants-AcToVax4NAM'' (Grant n 101018349, 3rd EU Health Programme), a General Conceptual Framework (GCF) was developed for understanding how to improve vaccination coverage for Newly Arrived Migrants (NAM), by characterizing and critically analysing system barriers and possible solutions to increase vaccination

Methods:
A logical pathway was hypothesized based on conceptual hubs in the immunization process. The identification of barriers and solutions was carried on by: a) non-systematic revision of scientific and grey literature, institutions and relevant websites, and documents suggested by Consortium Partners; b)

qualitative research conducted in each Consortium Country. The GCF was used as a guide for the above mentioned activities and organize results into the GCF itself to enrich it with content

Results:

5 conceptual hubs were identified: ENTITLEMENT to vaccination, REACHABILITY of people to be vaccinated, ADHERENCE to vaccination, ACHIEVEMENT of vaccination, EVALUATION of the intervention. All hubs are linked sequentially, starting with Entitlement without which the process cannot take place. Hubs are connected: if vaccination does not take place, it's important to go back to the previous hubs to understand the barriers. Reachability-Adherence-Achievement are closely related because some approaches are cross-cutting, such as proximity interventions which, in addition to allowing the system to approach NAM, promote adherence and thus possibility of completing the process. Other strategies may be implemented with different purposes: training aims to foster a culturally competent approach to facilitate adherence and avoid vaccination hesitancy, but also to improve competence in the entire process and lead to vaccination completion

Conclusions:

The proposed GCF facilitates identification of barriers and possible solutions to the effective achievement of immunization, at all stages of the process

Key messages:

- The GCF can be the basis for the creation of country-specific flow-charts through which to test strategies aimed at increasing immunization coverage in NAM.
- The GCF will be useful at EU level, to facilitate both the harmonisation of approaches and interventions and the evaluation of comparable approaches.

[2]Namibia Institute of Pathology, Windhoek, Namibia
[3]University of Namibia, Windhoek, Namibia
[4]Ministry of Health and Social Sciences, Windhoek, Namibia
Contact: matosc@rki.de

In 2020, the Namibian Ministry of Health and Social Services (MoHSS) and the Robert Koch Institute (RKI) started a twinning project with the long-term goal of establishing a Namibia Institute of Public Health (NIPH). A fundamental pillar of an NIPH is a fully operational Public Health laboratory system. Due to the COVID-19 pandemic, the need for strengthening the existing Namibian Laboratory system became eminent. Following the Intra-Action Review (IAR) of the COVID-19 response in Namibia in 2020, three regional diagnostic laboratories, at points of entry, were assessed. The major issues identified were long delays between sampling of both suspected cases and COVID-19 patients and receiving test results due to extended sample transport times to the central laboratory in Windhoek and the overload of the central capacities due to overwhelming numbers of samples during peak times. This led to the establishment of three SARS-CoV-2 PCR diagnostic laboratories through procurement and installation of equipment, provision of consumables/reagents, and on-site training of laboratory technicians with continued virtual technical support. Consequently, an important reduction of the diagnosis turnaround time was achieved. Of great value was the technical support given by the staff at the central laboratory during the trainings allowing for immediate validation of the newly established laboratories and to strengthen the communication between regional laboratories and the central laboratory. The Namibian molecular diagnostic capacities have increased in important regions in Namibia and will provide data to support the health policies of the future NIPH. New diagnostic protocols will be developed to foster the sustainability of the established laboratories and could support the implementation of genomic surveillance capacities. Finally, stronger relationships were built through these joint activities, which will support and the next steps of the establishment of the NIPH.

Key messages:

- Supporting and Strengthening the Namibian Public Health Laboratory system.
- Long-term goal of establishing a Namibia Institute of Public Health (NIPH).

Abstract citation ID: ckac131.034
Informal caregivers' profile needs: where do we stand?

Andreia Costa

A Henriques[1,2], *D Sousa Loura*[3,4], *P Nogueira*[1,2,5], *A Costa*[1,2]
[1]Centro de Investigação, Inovação e Desenvolvimento em Enfermagem de Lisboa, Escola Superior de Enfermagem de Lisboa, Lisbon, Portugal
[2]Isntituto de Saúde Ambiental, Faculdade de Medicina da Universidade de Lisboa, Lisbon, Portugal
[3]Hospital Dona Estefânia, Centro Hospitalar Universitário de Lisboa Central, E.P.E., Lisbon, Portugal
[4]Escola Superior de Enfermagem de Lisboa, Lisbon, Portugal
[5]Laboratório de Biomatemática, Instituto de Medicina Preventiva e Saúde, Faculdade de Medicina da UL, Lisbon, Portugal
Contact: andreia.costa@esel.pt

Background:

Non-communicable diseases' increase and demographic ageing require a solution to manage long-term care (1), where informal caregivers are key actors (2). Optimization in policies designed to support their caregiving role is needed. Portugal is an aged country with high prevalence of family that take care of dependent relatives. 'Informal caregivers' profile in Lisbon County: a health community approach' is a nurse-led research project designed to meet these challenges with the main aim: to develop a profile on informal caregivers in Lisbon county.

Methods:

Reporting the descriptive phase, a survey containing health/social questions was submitted to a non-probabilistic representative sample of careers, aged 18 years old or above in about 300 caregiver's caring dependent persons resident in Lisbon, in 2021. Univariate descriptive analysis was performed.

Results:

Married and retired women' caring for a parent were the most typical informal caregiver profile (n = 13, 4%). The majority do not have support from social services (n = 209, 61%). Two thirds live with the cared-for person (n = 219, 64%). Almost half (n = 150, 44%) have a university degree and only few planned the transition to a caregiver role (n = 13, 4%). No more than 10% had access to support programs (n = 71, 20%).

Conclusions:

Caregivers' unmet needs can complexify societal mechanisms relying on their work. Addressing these needs will be key to develop a strategy focused on supporting informal caregivers' priorities.

References

Digital transformation of public health systems: strengthening to take rights seriously

Anabelle Macedo Silva

A Macedo Silva[1], *M Ventura*[1]
[1]Public Health Institute, Federal University of Rio de Janeiro UFRJ, Rio de Janeiro, Brazil
Contact: anabelledireitoesaude@gmail.com

The expansion of digital public health, with the use of data in digital systems for planning and operation of public health policy, presents itself as strategic for the public and digital future of Public Health Systems, such as Brazilian Sistema Único de Saúde/SUS, as well as for the effectiveness of the right to healthcare and expansion of the access to public health services (with the experience of COVID-19 highlighting the importance of digital health, as well as fostering its accelerated expansion). Such digital expansion will increasingly stress the fundamental right to the protection of personal data, and it is therefore important to strengthen the regulatory and care response of SUS in the field of digital public health, both for the preservation of its regulatory capacity in digital public health (facing market private interests of Big Tech for example), but also to guarantee the protection of fundamental rights, such as the protection of personal data. The theory of fundamental rights and the dogmatics on personal data protection offer support to solve the tensions to the right to data protection arising from the expansion of digital health, with consideration between the rights of patients-data subjects and the needs of managing and planning public health policy

Key messages:

- The intense use of data and digital systems in public health policy is strategic to strengthen public health systems.
- The enhancement of Public Health Systems' regulatory capacity in digital transformation is important to protect right to health and data protection.

Abstract citation ID: ckac131.036
Socio-demographic and socio-economic disparities in medical rehabilitation in Germany in 2019

Silke Kniffert

S Kniffert[1], *O Stamm*[2], *A Heimann- Steinert*[2]
[1]BIH QUEST for Responsible Research, Berlin Institute of Health at Charité, Berlin, Germany
[2]Geriatrics Research Group, Charité – Universitätsmedizin Berlin, Berlin, Germany
Contact: silke.kniffert@bih-charite.de

Medical rehabilitation is a valuable component to restore physical and mental health, to prevent social isolation and to ensure a return to work. Due to the demographic change and the still increasing number of Post-Covid-19 patients, the demand for rehabilitation is still increasing. Latest, the COVID-19 pandemic elucidated that especially people from lower socio-economic backgrounds are disproportionally affected by health crisis. The aim of this study was to determine the influence of socio-demographic and socio-economic factors on quantitative exercise therapy in medical rehabilitation and to clarify the divergence of existing research findings. In our study we used data from 824.606 rehabilitation cases (German Federal Pension Insurance) and investigated the role of age and gender, marital status, social status and location towards inequalities in access to medical rehabilitation. Multiple linear regression and effect size calculation were used to show associations and to discuss the relation to clinical relevance. We were able to show a highly significant difference ($P < 0.001$) in access to exercise therapy in our study group. Patients aged 65+, women, single or widowed people, rehabilitants of low socioeconomic status or people located in the new federal states in Germany received shorter and less frequent exercise therapy. There are differences of up to 3.5 hours of treatment duration and 4.25 treatments per week, when disadvantaged social factors accumulate. However, despite the presented differences, the received treatments for the disadvantaged groups are still in the range of suggested minimum therapeutic requirements by the German Federal Pension Insurance. We could show a significant difference in rehabilitative therapy, which is solely based on social factors. There is an urgent need to draw special attention to the here discussed inequalities in access to medical rehabilitation for socially disadvantaged population and the overarching impact on society.

Key messages:

- The social inequality in medical rehabilitation to the detriment of the socially disadvantaged population that we have identified must give rise to clear changes in order to establish social justice.
- Equal opportunities and health quality assurance that address the individual needs of each patient should be the focus of socio-medical, policy development.

Abstract citation ID: ckac131.037
Vocational training of health mediators of primary care teams improves their sense of coherence

Karolina Kósa

K Kósa[1], *C Katona*[1], *É Bíró*[2], *S Vincze*[3]
[1]Department of Behavioral Sciences, Faculty of Medicine, University of Debrecen, Debrecen, Hungary
[2]Department of Preventive Medicine, University of Debrecen, Debrecen, Hungary
[3]Department of Economics and Methodology, University of Debrecen, Debrecen, Hungary
Contact: kosa.karolina@med.unideb.hu

Background:

A Primary Care Model Programme had been implemented in Hungary between 2013-2017 in which group practices were established that employed - among others - nonprofessional health workers (health mediators, similar to community health workers) to facilitate access for the most disadvantaged population groups. The health of mediators, themselves mostly disadvantaged ethnic Roma, was monitored every odd year of the Programme.

Methods:

A repeated cross-sectional health interview survey had been implemented inviting all health mediators who were employed at the time of the survey. The same questionnaire was used in all 3 surveys with items from the European Health Interview Survey 2009 and validated versions of other scales.

Results:

Positive changes occurred in the health status of mediators during 5 years of follow-up. Significant improvement in mental health occurred among those who completed on-the-job vocational training. By 2017, significant increase in sense of coherence was observed among those who obtained vocational qualification as opposed to those who did not. The proportion of highly stressed mediators showed a significant increase among those with no vocational training. Improvement was detected in all mediators in health awareness, dysfunctional attitudes, psychological stress and smoking prevalence.

Conclusions:

Significant improvement in mental status among those who obtained on-the-job vocational qualification were observed during follow-up of ethnic Roma health mediators in the programme in which they were equal members of the primary health care team. Employment of health mediators in primary care teams not only contributed to improving access to care for disadvantaged groups but also improved the mental health of mediators themselves.

Key messages:

- Nonprofessional health mediators are important members of primary care teams servicing disadvantaged populations.
- Significant improvement in mental status during 5 years of follow-up occurred among Roma health mediators who received vocational training and were equal members of primary health care teams.

DB Preparing for the unexpected: lessons learned from Covid-19

Implementation of ''COVID-19 case investigation and contact tracing'' training program in Armenia

Zaruhi Grigoryan

Z Grigoryan[1], *L Musheghyan*[1], *D Abrahamian*[2], *V Petrosyan*[1], *A Dorian*[2]

[1]Turpanjian College of Health Sciences, American University of Armenia, Yerevan, Armenia

[2]Fielding School of Public Health, University of California Los Angeles, Los Angeles, USA

Contact: zgrigoryan@aua.am

Background:

Comprehensive contact tracing and case identification (CICT) is key to preventing the SARS-COV-2 transmission. During the COVID-19 waves in Armenia, the effectiveness of CICT practices was suboptimal due to weak capacity of evidence-based CICT. The American University of Armenia and the University of California, Los Angeles offered a continuous education program for the public health workforce in Armenia which is relevant for any country aiming to improve its CICT capacities.

Objectives:

We developed and implemented a fully remote yet synchronous 'COVID-19 case investigation and contact tracing'' training program through didactic lectures, demonstrations of CICT interviews, small-group skill labs, and opinion polls. It covered the basic principles of public health and epidemiology, the main methods of CICT in relation to COVID-19, and health coaching techniques. We evaluated the knowledge improvement through a pre-experimental evaluation design at baseline and follow-up. The training sessions were held from November 2020 to June 2021. The participants received 10 CME credits upon completion of the training course.

Results:

The online modality allowed to reach professionals across the country, though affected the participation in the evaluation surveys. Overall, 93 professionals participated in the training program, yet only 57 returned completed surveys. The paired analysis showed an increase in the mean knowledge scores (0-24) at baseline and follow-up (14.5 vs 15.82 ($p = 0.0083$). A more notable increase was detected on questions that measured knowledge of health coaching techniques (0-6) (2.76 vs 3.44 ($p = 0.0052$)).

Conclusions:

New knowledge and skills penetrated into daily CICT practices across Armenia. This was a good example of a quick mobilization of local and international expertise to assist the national efforts in responding to a public health emergency by utilizing evidence-based approaches and lessons learned from the past infectious diseases' outbreaks.

Key messages:

- Our training program strengthened the human resource capacities of Armenia's existing public health system and assisted Armenia's COVID-19 response efforts.
- The model of our training program can be effectively adapted and extrapolated for various countries and settings which aim to improve response capacities to other threats of public health importance.

Abstract citation ID: ckac131.039

Dealing with the unknown: perceptions and fears of SARS-CoV-2 infection among hospital workers

Mireia Utzet

M Utzet[1,2,3], *R Villar*[1,3,4], *P Díaz*[1,3,4], *MP Rodríguez Arjona*[5], *JM Ramada*[1,3,4], *C Serra*[1,3,4], *FG Benavides*[1,2,3]

[1]Centre for Research in Occupational Health, Universitat Pompeu Fabra, Barcelona, Spain

[3]Hospital del Mar Medical Research Institute, Hospital del Mar, Barcelona, Spain

[4]Occupational Health Service, Parc de Salut Mar, Barcelona, Spain

[5]Funación Mémora, Barcelona, Spain

Contact: mireia.utzet@upf.edu

Introduction:

This study aims to explore perceptions, fears and worries regarding SARS-CoV-2 risk of infection and transmission to relatives and/or co-workers and non-pharmacological preventive interventions among hospital workers.

Materials and Methods:

The research used an explorative qualitative approach. Six focus groups and ten individual interviews across multidisciplinary workers (physicians, nurses, aides, cleaners, maintenance, and security staff) were conducted online and audio-recorded, transcribed verbatim and analysed using thematic analysis and mixed coding.

Results:

Forty professionals participated in the study. Four common themes emerged in all groups: challenges related to the lack of pandemic preparedness, concerns about personal protective equipment, unclear guidelines for case and contact tracing, and communication-related difficulties.

Conclusions:

This study emphasizes the key recommendations to improve non-pharmacological preventive interventions to reduce workers' fears and worries about the risk of infection and spreading the infection to others, including families. Above all, these should include ensuring the availability, and correct use of adequate personal protective equipment, improve guidelines on case and contact tracing, and setting effective communication channels for all workers of the organization. These recommendations must be reinforced in maintenance and security personnel, as well as night shift nurses and aides, in order to reduce also health inequalities.

Key messages:

- Lack of pandemic preparedness increased HCW' fear of infection, which could be reduced by ensuring the availability and good use of proper PPE, and by clear guidelines on case/contact detection.
- The improvement on non-pharmacological preventive interventions must be underpinned by effective communication channels and/or communication staff, and should reach all workers in the institution.

Abstract citation ID: ckac131.040
The impact of the AstraZeneca suspensions on the public's vaccination intentions and trust

Marion de Vries

M de Vries[1], *L Claassen*[1,2], *M Lambooij*[3], *A Timen*[1,4]
[1]Infectious Disease Control, RIVM, Bilthoven, Netherlands
[2]Environmental Safety and Security, RIVM, Bilthoven, Netherlands
[3]Nutrition, Prevention and Health Services, RIVM, Bilthoven, Netherlands
[4]Athena Institute, VU University, Amsterdam, Netherlands
Contact: marion.de.vries@rivm.nl

Background:

In spring 2021, several countries, among which the Netherlands, suspended vaccinations against COVID-19 with the Vaxzevria vaccine from AstraZeneca (AZ) after reports of rare but severe adverse events (SAE). We investigated the impact of this news and the suspension on the Dutch public's COVID-19 vaccination intentions, COVID-19 vaccination perceptions (attitudes and feelings) and their trust in the government's COVID-19 vaccination campaign.

Methods:

We conducted two surveys (N = 2628), one shortly before the AZ suspension in the Netherlands and one shortly thereafter when all vaccinations were resumed. Chi2 tests were conducted to study changes in COVID-19 vaccination perceptions, intentions and trust before and after the suspension, and differences between perceptions and intentions regarding AZ vaccines compared to COVID-19 vaccines in general. All variables were measured on a 5-point Likert scale.

Results:

No significant changes were observed in COVID-19 vaccination perceptions and intentions, but trust in the campaign declined slightly (mean diff.(ΔM) = -0.2, 95% CI = -0.3/-0.2). In addition, compared to COVID-19 vaccinations in general, respondents were less likely to vaccinate with AZ (ΔM = -0.7, 95% CI = -0.7/-0.7), reported less positive vaccine attitudes (ΔM = -0.7, 95% CI = -0.7/-0.7), and more negative feelings (ΔM = 0.5, 95% CI = 0.4/0.5).

Conclusions:

The news on SAE and the AZ suspension might have caused a decline in trust in the government's COVID-19 vaccination campaign, as well as negatively impacted AZ vaccination perceptions and intentions. These results stress the need to adapt vaccination policies to anticipated public perceptions and responses following a vaccine safety scare, as well as the importance of informing citizens about the possibility of very rare SAE prior to the introduction of novel vaccines.

Key messages:

- Trust in the COVID-19 vaccination campaign declined following the news on rare but severe adverse events (SAE) and the suspension of AstraZeneca vaccines.
- While the news on SAE and the vaccination suspension did not seem to impact COVID-19 vaccination intentions in general, intentions to vaccinate with AstraZeneca were considerably lower.

"My quality of life was not the best" experiences of Australians during the COVID pandemic

Heidi Green

H Green[1,2], *C MacPhail*[3], *R Fernandez*[1,2]
[1]Centre for Research in Nursing and Health, South Eastern Sydney Local Health District, Kogarah, Australia
[2]School of Nursing, University of Wollongong, Wollongong, Australia
[3]School of Health and Society, University of Wollongong, Wollongong, Australia
Contact: Heidi.Lord@health.nsw.gov.au

Background:

The social and economic impacts that have occurred during the pandemic can disproportionally affect those already experiencing poverty. The social determinants of health aggravate inequalities and can adversely affect wellbeing. This study aims to gain rich insight into Australian adults' experiences of the social determinants of health and the impact on their wellbeing during the COVID-19 pandemic.

Methods:

A descriptive qualitative study using purposive sampling to recruit participants for semi-structured interviews, conducted via videoconferencing between March-August 2021. Thematic analysis was performed with the support of NVivo 12.

Results:

Participants included 20 Australian adults from various socioeconomic areas ranging in age from 21 to 65 years. Three main themes emerged from the analysis of the data: Food-related concerns; Housing outcomes; and Psychological and emotional impact. Accessing food, during the COVID-19 pandemic, for most participants who resided in low socioeconomic areas, was described as stressful and challenging. Along with the burden of food security, many participants from low socioeconomic areas expressed emotional distress in relation to securing and maintaining adequate housing.

Conclusions:

The pandemic has amplified existing social determinants of health experienced by those within low socioeconomic areas, particularly those who are female and from migrant communities. The wellbeing of participants from low socioeconomic areas decreased in response to their experiences and challenges with food insecurity and housing instability, highlighting the need for housing affordability strategies and funding of emergency food relief initiatives. Food access for those in areas with high socioeconomic disadvantage, can be improved to address some of the barriers associated with food security by providing supermarket meal vouchers, access to community gardens, and school food programs.

Key messages:

- The housing and food insecurity experienced by participants in this study during the pandemic has influenced their overall wellbeing.
- The pandemic has amplified existing social determinants of health experienced by those in low socioeconomic areas.

Abstract citation ID: ckac131.042
The impact of four dominating variants and vaccine coverage on Covid-19 mortality: the Malta case

Sarah Cuschieri

S Cuschieri[1]
[1]Anatomy, University of Malta, Msida, Malta
Contact: sarah.cuschieri@um.edu.mt

Background:

Disease burden can be quantified by mortality. The European Islands of Malta experienced a seesaw of Covid-19 surges in mortality and cases across the pandemic. The study aims to assess the impact of Covid-19 mortality across the four phases dominated by different variants while considering the vaccination coverage among the Malta population.

Methods:

Covid-19 epidemiological data was obtained up till end of February 2022 from the websites of the Malta Ministry of Health and the European Centre for Disease Prevention and Control. Data was categorised into the four periods according to reported dominant Covid-19 variant. The Years of life lost (YLL) and Case-Fatality-Ratio (CFR) for each period were estimated. Correlations were performed between mortality and vaccinated age-groups.

Results:

The original Covid-19 period (54 weeks) had the highest YLL (6633.53), followed by the Omicron variant period (12 weeks; 2,692.17). The Alpha variant period (7 weeks) had the highest CFR (1.89) followed by the Original Covid-19 (1.37). A significant negative correlation was present between two dose vaccination and the 60-69 years ($p = 0.01$), 70-79 years ($p = <0.01$), and 80+ years ($p = <0.01$) age groups, while a positive correlation was present between the booster dose and the 60-69 years (p = 0.01) age group.

Conclusions:

Covid-19 variant's infectivity, transmissibility, and the effectiveness of the vaccine against the variant play an important role in the ultimate outcome. Reducing mortality by embracing mass vaccination that targets current variants along with other non-pharmaceutical interventions remains paramount.

Key messages:

- Mortality is an indicator for assessing the burden of an emerging variant within a population.
- The effectiveness of vaccination against emerging variants plays a role in reducing mortality rates.

Abstract citation ID: ckac131.043
Impact of mask-wearing on child and adolescent psychosocial development: a systematic review

Alice Freiberg

Contact: alice.freiberg@tu-dresden.de

Background:

Wearing face masks in public is recommended under certain circumstances in order to prevent infectious diseases transmitted through droplets. The objective was to compile all German and English research results from peer-reviewed journal articles using a sensitive literature search on the effects of mask-wearing for preventing infectious diseases on the psychosocial development of children and adolescents.

Methods:

A systematic review was conducted considering different study designs (search period up until 12 July 2021). The risk of bias in the studies was determined using a risk of bias procedure. A descriptive-narrative synthesis of the results was performed. A search update will be conducted shortly before the conference.

Results:

Thirteen studies were included, and the overall risk of bias was estimated to be high in all primary studies. There are some indications from the included surveys that children, adolescents, and their teachers in (pre)schools perceived facial expression processing as impaired due to mask-wearing, which were confirmed by several experimental studies. Two studies reported psychological symptoms like anxiety and stress as well as concentration and learning problems due to wearing a mask during the COVID-19 pandemic. One survey study during the 2002/2003 SARS pandemic examined oral examination performance in English as a foreign language and showed no difference between the "mask" and "no mask" conditions. The results are preliminary and may be extended due to the search update.

Conclusions:

Only little evidence can be derived on the effects of face masks on different developmental areas of children and adolescents based on the small number of studies. There is a lack of research data regarding the following outcomes: psychological development, language development, emotional development, social behaviour, school success, and participation. Further cluster-randomized controlled trials or longitudinal studies are required.

Key messages:

- Empirical and experimental evidence shows that mask-wearing impairs facial expression among children, adolescents, and teachers in (pre)schools.
- Research on the following developmental areas is missing: psychological development, language development, emotional development, social behaviour, school success, and participation.

Abstract citation ID: ckac131.044
Total, sex and age-specific excess mortality during 2020 in 20 countries part of the C-MOR consortium

Christiana Demetriou

[4]C-MOR consortium
Contact: demetriou.chri@unic.ac.cy

Nationally published COVID-19 mortality estimates might underestimate the actual mortality burden attributed to COVID-19. Estimations of excess all-cause mortality can provide more accurate estimates of the toll of the pandemic. This study aims to estimate the overall, sex and age-specific excess all-cause mortality in 20 countries, during 2020. Total, sex and age-specific weekly all-cause death counts for 2015-2020 were extracted from national vital statistics databases. Percent excess mortality for 2020 was calculated by comparing average weekly 2020 mortality rates against average weekly mortality rates from the past five years (2015-2019). Comparisons were performed for the total population, per sex, and per age groups (<65 vs. 65+ or < 70 vs.70+) depending on data availability. Percent difference in average weekly mortality between 2020 and 2015-2019 ranged from negative for Australia and Norway, to < 5% for Denmark, Cyprus, Estonia, Israel, and Sweden, 5-10% for Georgia, Mauritius, Ukraine, Austria, France, Scotland and Northern Ireland, to ∼10-21% for England & Wales, Italy, Brazil, USA, Slovenia, and to 89% for Peru. The percent difference in average weekly mortality between 2020 and 2015-2019 for males was higher than for females except for Cyprus, Estonia, Slovenia and the USA. Lastly, in age specific analyses, for the majority of countries the % increase in average weekly mortality between 2020 and 2015-2019, was higher in the oldest age group investigated, however, for Peru and the USA (<65 vs. 65+ years) and for Cyprus and Mauritius (<70 vs. 70+ years), mortality increased similarly in both age groups. This study highlights that the excess mortality burden during the COVID-19 pandemic disproportionally affected specific countries, males, and in most, but not all countries, the oldest age groups. Strengthening of health resilience in the most affected countries, while targeting population groups impacted the most, is of paramount public health importance.

Key messages:

- Excess mortality burden during the COVID-19 pandemic disproportionally affected specific countries, and even within countries specific sex and age groups.
- Further investigation into the determinants of excess mortality is needed to suggest steps to strengthen health resilience in the countries and target population groups impacted the most.

The impact of COVID-19 on persons with concurrent mental health and substance use disorders

Marja Leonhardt

M Leonhardt[1,3], *L Lien*[1,2]
[1]Sykehuset Innlandet HF, Norwegian National Advisory Unit on Concurrent Substance Abuse and Mental Health Disorders, Brumunddal, Norway
[2]Department of Health and Social Science, Inland Norway University of Applied Sciences, Elverum, Norway
[3]Faculty of Health Studies, VID Specialized University, Oslo, Norway
Contact: marja.leonhardt@sykehuset-innlandet.no

Background:

The COVID-19 pandemic with its restrictions touched the daily life of most people. While everyday social life becomes difficult for citizens with economic and cultural capital, it becomes even worse for persons with mental health (MHD) and substance use disorders (SUD), who are particularly vulnerable to social exclusion. In this project, we aim to explore the impact of the pandemic on persons MHD/SUD, nearer, how the lockdown effected their daily life and further, the utilization of health care services under the consecutive waves of the pandemic.

Methods:

The project has two parts: First we conducted 17 individual interviews and one focus group with persons with MHD/SUD, using thematic analysis. Second, we merged the Norwegian Patient Register, the Register for Infectious Diseases and data from Statistics Norway. We matched data of 41500 individuals with MHD/SUD after gender, age and health region with a sample from the general population as a control group and study the health care service utilization under the consecutive waves of the pandemic in Norway in 2020-2021.

Results:

Within the qualitative study, we identified four interrelated main themes: (1) The COVID-19 outbreak as a perceived challenge, (2) A decline in mental health and well-being, (3) Increased substance use challenges, and (4) Diverse experiences with health and social services. The results show further that people with MHD/SUD have challenges with digital tools and/ or do not have the appropriate equipment. Persons with MHD/SUD face greater barriers in accessing the health care system compared to the general population as a control group. Results of the register study are still preliminary.

Conclusions:

Persons with MHD/SUD face major challenges during the COVID-19 pandemic There is reason to believe that new pandemics will emerge in the future. In this context, it is essential to gain knowledge of how to care for vulnerable groups in society and how to reach them in emergencies.

Key messages:

- Continuous maintenance of low-threshold services for persons with MHD/SUD during a pandemic is essential.
- Improvement of digital skills of service users or alternatives to digital consultations should be considered.

Abstract citation ID: ckac131.046
Process evaluation of a university residence-based SARS-CoV-2 testing programme in the UK

Holly Blake

H Blake[1,7], S Carlisle[1], L Fothergill[1], J Hassard[2], A Favier[3], J Corner[4], JK Ball[5,6], C Denning[2,6]

[6]Biodiscovery Institute, University of Nottingham, Nottingham, UK
[7]NIHR Nottingham Biomedical Research Centre, University of Nottingham, Nottingham, UK
Contact: holly.blake@nottingham.ac.uk

Background:

Regular testing for SARS-CoV-2 is an important strategy for controlling virus outbreaks on university campuses during the COVID-19 pandemic but testing participation can be low. The Residence-Based Testing Participation Pilot (RB-TPP) was a novel 4-week intervention implemented at two student residences on a UK university campus, aiming to increase asymptomatic testing frequency and normalise university life through relaxed social restrictions onsite.

Methods:

Mixed-methods process evaluation determined whether RB-TPP was implemented as planned and identified implementation barriers and facilitators. Data were collected from meeting records, university students (online survey: n = 152; focus groups: n = 30), and staff (interviews, n = 13). Barriers and facilitators to implementation were mapped to the 'Capability, Opportunity, Motivation-Behaviour' (COM-B) behaviour change framework.

Results:

Uptake was high (n = 464 students opted-in; 98% of those living onsite). Implementation was broadly as planned, with adjustments due to national escalation of the COVID-19 Delta variant. Majority engaged in testing (88%); 46% (52% of testers) were fully compliant with pre-determined testing frequency. Most felt positively towards relaxed social distancing (97.9%). Implementation was facilitated by convenience and efficiency of testing and reduced negative impacts of isolation through opportunities for students to socialise. Barriers to implementation were mixed-messages about the rules, ambivalent attitudes, and lack of adherence to COVID-19 protective measures in the minority.

Conclusions:

This is the first process evaluation of the implementation of asymptomatic SARS-CoV-2 testing in university residences. Testing participation increased and student mental wellbeing improved. Rapid adaptions to the changing pandemic context generated complexity and challenge. Findings have global relevance for outbreak prevention and management strategies in higher education settings.

Key messages:

- Delivery of asymptomatic SARS-CoV-2 testing and relaxation of social distancing within residences led to high rates of testing participation and benefits for student mental wellbeing.
- This is the first process evaluation of the implementation of asymptomatic SARS-CoV-2 testing in university residences with global relevance for outbreak prevention in higher education settings.

Abstract citation ID: ckac131.047
Uptake and impact of COVID-19 preventive measures amongst migrant populations in the Netherlands

Marieke Torensma

Uptake of preventive measures to reduce transmission of viruses such as SARS-CoV-2, is crucial in the control of pandemics. To ensure equitable uptake we explored contextual factors that shaped uptake of COVID-19 preventive measures amongst smaller, albeit substantial, migrant populations in the Netherlands. 39 persons of Eritrean, Ghanaian, Indonesian and Filipino origin, with diverse legal status and length of stay in the Netherlands, participated in five online focus group discussions. Thematic analysis of data was informed by concepts from the Precaution Adoption Process Model and Protection Motivation Theory. Awareness and knowledge of preventive measures was shaped by limited Dutch proficiency, access to understandable information and interference of misinformation. Engagement by preventive measures was subject to COVID-19 threat appraisal and the ease with which complex behavioural messages could be translated to individual situations. Perceived vulnerability of undocumented migrants in particular, motivated information-seeking. A strong social norm to keep with cultural and religious practices, and limited opportunity for preventive behaviour in work and home context hindered uptake of preventive behaviour. Preventive measures brought about job, food, and housing insecurity, and increased barriers in access to healthcare for undocumented migrants. Migration-related, sociocultural, and socioeconomic factors shape uptake of preventive measures. Preventive measures negatively impact work, housing and access to healthcare of undocumented migrants. Our results suggest importance of multilingual information tailored to literacy needs; education and modelling of behaviour; and, regulations to ensure continued access to financial and material resources to minimise negative spillover effects. Results were incorporated in two policy briefs advising local and national government. Collaboration with municipal health services lead to multilingual public health information.

Key messages:

- Migration-related, sociocultural, and socioeconomic factors shape uptake of preventive measures.
- Preventive measures negatively impact work, housing and access to healthcare of undocumented migrants.

The EU response to NCDs: a content analysis on building resilient post-COVID health systems

Martina Paric

M Paric[1]*, R Orhan*[1,2]*, K Czabanowska*[1,3]
[1]Department of International Health, Maastricht University, Maastricht, Netherlands
[2]ASPHER, Brussels, Belgium
[3]Department of Health Policy Management, Jagiellionian University, Krakow, Poland
Contact: m.paric@maastrichtuniversity.nl

Background:

Non-communicable diseases (NCDs) impose a heavy burden on healthcare systems of countries in the European Union (EU). An estimated 91.3% of all deaths and 86.6% of DALYs in the EU-28 were attributable to NCDs. It is imperative that the EU act on mitigating this challenging health issue and help create trajectories for building resilient health systems. Using qualitative analysis, this study examines the question of how the European Commission 2019-2024 is planning to mitigate the impact of NCDs on health systems, while taking into account the COVID-19 pandemic.

Methods:

Content analysis was applied to understand how NCDs are framed and how an EU narrative is constructed to mitigate the impact of NCDs on health systems by the European Commission. A total of 44 documents were analysed, including speeches, press releases, newsletters, statements and policy documents. In vivo coding was performed using the software package ATLAS.ti 9. Unique codes were simplified and clustered into descriptive themes with a high level of abstraction.

Results:

This study identified five main themes: ‘health plan’, ‘COVID-19’, ‘future direction’, ‘collaboration and solidarity’, and ‘persuasion’. Themes show that the Commission is emphasising the impact of the pandemic and the relevance of policies tackling NCDs for developing EU-wide resilient health systems. By calling for more cross- and multi-sectoral collaboration, like creating a European Health Union, the Commission hopes to create the right climate for a European framework for cooperation, which can help develop harmonised and resilient EU health systems.

Conclusions:

Although increasing health systems resilience is high on the Commission’s agenda, it seems that there are no actionable points for Member States in terms of addressing national health policy. We recommend the Commission looks towards eliminating this observed disconnect and creating actionable points in line with Member States’ health systems’ capabilities.

Key messages:

- Our findings show emphasis is placed on EU-wide health policies, more robust health systems, and the collective power of the EU. However, there are no concrete actions coupled with these concepts.
- COVID-19 highlighted the limitations of national policy for protecting health systems against cross-border health threats. It tested the Commission’s resolve in pushing for more European cooperation.

[3]Institut for Global Health, University of Heidelberg, Heidelberg, Germany
[4]Institut for Hygiene, University of Muenster, Muenster, Germany
Contact: barbara.gruene@stadt-koeln.de

Background:

High rate of people infected with SARS-CoV-2 and their contacts in Cologne, Germany required innovative tools for notification, monitoring and reporting. The digital tool for COVID19 (DiKoMa) provides self-service symptom diaries allowing (a) the stratification for prioritized telephone contact by the health authority and (b) training a machine learning (ML) model that predicts infections with prevailing dominant variant (PDV) from early symptom profiles (SP).

Methods:

Pseudononymized SP covering the first week of diary recordings were included for training (16646 index, 11582 contacts). A balanced random forest (BRF) model was trained to differentiate early predictive symptom patterns of different PDV and contact persons. Model evaluation was performed using sex and age stratified cross validation (CV), the model was validated on SP recorded from days 1 and 6.

Results:

From 03/20 to 02/22, 90478 indeces and 75444 contact persons reported symptoms and health status, covering 46% and 42% of all reported cases, respectively. Diaries contained between 1-52 entries (566791, median 2). Daily analysis of entries, prioritized according to age, prevalent co-morbidities and detoriation of symptoms allowed risk adjusted follow up even during phases with high case notification rates. The top 5 predictive factors of the BRF were immunization, cough, dysgeusia and dysnosmia, fatigue, and sniffles to differentiate infection between wildtype, three PDV and contact persons (CV AUC 80.6%, Validation AUC 77.1%).

Conclusions:

The use of digital symptom diary surveillance helps to provide appropriate medical support for patients on a large scale. Machine learning shows potential for symptom based risk assessment to differentiate PDV for future outbreaks and can thus become a valuable tool alongside specific laboratory diagnostics.

Key messages:

- Digital symptom diaries are a powerful and widely accepted tool to attend COVID19 patients in isolation. They allow risk stratification for follow up and are a low-threshold service.
- Machine learning supports index case identification by symptom analysis and can thus become a valuable tool alongside specific laboratory diagnostics.

[7]Pettenkofer School of Public Health, Munich, Germany
[8]Department of Psychiatry and Psychotherapy, University Hospital, LMU Munich, Munich, Germany
Contact: Ana.Zhelyazkova@med.uni-muenchen.de

Background:

Considering the vaccine hesitancy recorded among healthcare workers (HCW) during the 2009/10 influenza pandemic, we aimed to examine the COVID-19 vaccination intent of HCW at one of the largest hospitals in Germany and to identify associated factors.

Methods:

We conducted a cross-sectional anonymous survey at LMU University Hospital in Munich, Germany, between February 25 and March 20, 2021. Data was collected on COVID-19 vaccination intent as main outcome and on potential associated factors.

Results:

In total, 2555 HCW completed the survey; 48,3% (n = 1325) of them had already received at least one COVID-19 vaccine dose. Of those not yet vaccinated 51,7% (n = 1320), 83,6% (n = 1104) reported intention to get vaccinated, while 10,2% (n = 134) were undecided and further 6,2% (n = 82) reported refusal. Disagreeing that everyone should receive the generally recommended vaccines was associated with refusal (RR = 529,500, p = 0,000) while being vaccinated against influenza in the 2020/21 season was linked with lower likelihood of refusal or indecisiveness (RR = 0,124, p = 0,000; RR = 0,182, p = 0,000). Low or partial conviction of the effectiveness and safety of COVID-19 vaccines were linked to refusal (effectiveness; RR = 485,471, p = 0,000; RR = 9,247, p = 0,000; safety: RR = 116,829, p = 0,000; RR = 5,423, p = 0,025). Feeling ill informed about COVID-19 vaccines was associated with refusal and indecisiveness (RR = 25,900, p = 0,000; RR = 21,104, p = 0,000).

Conclusions:

At the beginning of the vaccination campaign in Germany, a small proportion of HCW at LMU University hospital was hesitant on receiving a COVID-19 vaccine. Factors associated with refusal or indecisiveness were a sceptical attitude towards vaccines in general as well as feeling ill informed about COVID-19 vaccines, especially regarding their effectiveness and safety. Having received an influenza vaccine was associated with COVID-19 vaccination intent.

Key messages:

- The presented results provide insight into the reasons for hesitancy of HCW against COVID-19 vaccines, indicating a pattern-like behaviour in the acceptance of novel vaccines by HCW.
- The evidence from our analysis can help inform the communication aims and emphases of vaccination campaigns among HCW within similar organizational contexts or in future outbreak scenarios.

Abstract citation ID: ckac131.051

Willingness to participate in a COVID-19 follow-up study and symptoms 1.5 years after infection

Sara Schramm

S Schramm[1], L Wilk[1], B Kowall[1], KH Jöckel[1], A Stang[1], B Schmidt[1]
[1]IMIBE, University Hospital Essen, Essen, Germany
Contact: sara.schramm@uk-essen.de

Introduction:

Data on willingness to participate in population-based long-COVID studies are sparse. We invited all citizens of Essen aged 18-74 years with a positive SARS-CoV-2 PCR test between Mar-Aug 2020 and assessed COVID-related symptoms in responders ~1.5 years after infection.

Methods:

The invited population included 1282 infected citizens (48% women). At the time of testing 64% reported symptoms. We asked responders about past and current symptoms, hospitalization, smoking, sport, pre-existing conditions (heart attack, stroke, diabetes), subjective health status as compared to before infection, assessed BMI, and performed descriptive statistics.

Results:

We investigated 255 participants (50% women, 19-73 years, response rate 20%) ~20 month (median) after the PCR test. 95% reported symptoms at the time of testing: 67% fatigue, 58% taste disorders, 56% limb pain, 55% odor disorders, 54% headache, 50% cough, 43% fever; 10% needed hospitalization, 3% intensive care, 1.6% artificial ventilation. Compared to the non-hospitalized the formerly inpatients were more often male (62% vs 49%), older (56±13 vs 49±14 years), less often never smokers (42% vs 53%), had a higher BMI (31±7 vs 28±5 kg/m^2), and more pre-existing conditions (23% vs 10%). Compared to before infection, 53% rated their current health worse, with a higher rate among inpatients (81%). After ~1.5 years, 55% still reported symptoms: 25% fatigue, 20% concentration disorder, 18% breathing problems, 13% odor and 11% taste disorders. Persistent symptoms were more common in inpatients than in non-hospitalized (69% vs 53%).

Conclusions:

Symptomatic individuals are more likely to participate in a COVID19 follow-up study than asymptomatic ones. This may overestimate the number of individuals with long-term symptoms in population-based long-COVID study populations. However, persistent symptoms seem to be more likely in formerly inpatients compared to non-hospitalized individuals with former SARS-CoV-2 infection.

Key messages:

- Symptomatic individuals are more likely to participate in a COVID19 follow-up study than asymptomatic ones.
- Persistent symptoms seem to be more likely in formerly inpatients compared to non-hospitalized individuals with former SARS-CoV-2 infection.

Abstract citation ID: ckac131.052

Analysis of a test system for the detection of SARS-CoV-2 in children attending school

Edoardo Boietti

E Boietti[1], F Bert[1], G Lo Moro[1], S Barbaro[2], S Barbero[1], E Minutiello[1], T Sinigaglia[1], F Fagioli[2], R Siliquini[1]
[1]Department of Public Health Sciences, University of Turin, Turin, Italy
[2]Regina Margherita Children's Hospital, University of Turin, Turin, Italy
Contact: edoardo.boietti@unito.it

Background:

During the COVID-19 pandemic, in order to keep schools open and reduce SARS-CoV spreading, SARS-CoV-2 positive paediatric patients (PP) need to be isolated early. The aim of this study was to describe the appropriateness of school hot spot (HS) for SARS-CoV 2 testing based on open access of PP in a paediatric hospital in Turin, Italy.

Methods:

A cross-sectional study was performed between September 2020 and March 2021. The data collected included: date of swab execution, type of swab, execution setting of the swab, result of the swab, sex, age of PP and the mean value of the Rt (reproductive number) of pandemic in the Piedmont region. We collected data about PP from four different hospital settings (HS, Emergency department, day hospital and hospital wards) of Regina Margherita Children's Hospital (Turin, Italy). We analyzed a sample of 13,283 PP (aged 0-19 years) testing for SARS-CoV-2. The main outcome was the likelihood of testing positive in different settings and in different age groups.

Results:

In Our sample, females were 45.8%. The median age was 6.8 years (IQR 3.0-11.2). The swabs executed in all the hospital settings had a lower likelihood of resulting positive compared with the school HS setting. Newborns below 3 months (adj OR 1.85, 95%CI 1.14 - 3) and patients aged between 11 and 13 years old (adj OR 1.32, 95%CI 1.07 - 1.63) reported a higher probability of a swab tested positive compared to adolescents. Instead, children aged between 3 months and 2 years (adj OR 0.77, 95%CI 0.61 - 0.96) and aged between 3 years and 5 years (adj OR 0.66, 95%CI 0.53 - 0.83) were less likely to result positive.

Conclusions:

We found a high prevalence of PP positive to the test for the detection of SARS-CoV-2 at the school hot spot compared with other settings. The open access modality to the nasopharyngeal swab was effective in identifying PP with COVID-19. Public health authorities should implement this testing modality in order to reduce SARS-CoV-2 infections in PP.

Key messages:

- Open access testing system to detect SARS-CoV-2 is important to do as many tests as possible to identify COVID-19 patients and isolate them in the pediatric population.
- The open access testing modality to detect COVID-19 patients saves time for doctors who, instead of carrying out the patient history, can devote themselves to other clinical activities.

First year of the pandemic: Years of Life Lost due to COVID-19 in Serbia

Aleksandar Stevanović

A Stevanović[1,2], J Todorović[1,2], N Rosić[3], G Bjelobrk[4], S Mandić-Rajčević[1,2], M Šantrić-Milićević[1,2], V Bjegović-Mikanović[1,2]
[1]Institute of Social Medicine, Faculty of Medicine, University of Belgrade, Belgrade, Serbia
[2]School of Public Health and Health Management, Faculty of Medicine, University of Belgrade, Belgrade, Serbia
[3]City Institute of Public Health, Belgrade, Serbia
[4]Statistical Office of the Republic of Serbia, Belgrade, Serbia
Contact: aleksandar.stevanovic@med.bg.ac.rs

Background:

The first case of COVID-19 in Serbia was reported on 6th March 2020. Since then, Serbia has registered several epidemic peaks, which have led to a considerable increase in premature mortality. Basic evaluation of COVID-19 premature mortality burden needs to include frequency of COVID-19 deaths among different age-groups.

Methods:

All-cause mortality data disaggregated by age and sex, population estimates and remaining life expectancy for different age-groups were acquired from the Statistical Office of the Republic of Serbia. Years of Life Lost (YLL) due to COVID-19 were calculated for the period from March to December 2020. European Standard Population was used for calculating age-standardized mortality rates. We acknowledge the support from the BoCO-19 - The Burden of Disease due to COVID-19 project coordinated/led by Robert Koch Institute and supported by the WHO Regional Office for Europe.

Results:

In 2020, there were 127,572 YLLs due to COVID-19, with 81,147 of YLLs (63.6%) attributable to men and 46,425 (36.4%) to women. Contribution of COVID-19 to the total all-cause YLL was also higher in men comparing to women: 11.39% and 7.80%, respectively. Three epidemic peaks were observed in 2020, together composing two thirds (65.6%) of total YLLs due to COVID-19. December was the month with the greatest burden, accounting for 45.8% of all YLLs due to COVID-19. Crude YLL rate for COVID-19 was 1849.1 per 100,000, or 1733.5 per 100,000 after standardization.

Conclusions:

Registered COVID-19 deaths accounted for one tenth of total YLLs in Serbia in 2020, with men contributing almost twice as much to that number compared to women. On average, 12.32 YLLs originated from each registered COVID-19 death. Further studies need to assess the impact of the COVID-19 epidemic on avoidable mortality trends in Serbia.

Key messages:

- COVID-19 deaths comprised one tenth of all-cause YLLs, with two-thirds of COVID-19 YLLs attributable to men.
- To reduce premature mortality burden, epidemic peaks need to be prevented.

Abstract citation ID: ckac131.054
Non-COVID activity in French emergency department during COVID-19 pandemic (March 2020 to March 2022)

Anne Fouillet

A Fouillet[1], C Forgeot[1], I Pontais[1], G Pedrono[1], C Caserio-Schönemann[1]
[1]Division of Data Sciences, Santé Publique France, Saint-Maurice, France
Contact: anne.fouillet@santepubliquefrance.fr

Background:

The COVID-19 epidemic and mitigation actions had major impacts on health and healthcare use by the French population. Since 2004, the French public health agency daily collects individual data of visits in the emergency departments (ED) OSCOUR® network (94% of national visits in 2022). We aimed to analyse the evolution of non-Covid ED visits from 2020 to March 2022, in order to identify potential indirect impact of the epidemic.

Methods:

The main medical diagnosis (MD) coded in ICD-10 from each ED visit from 2017 to March 2022 was classified into 17 ICD-10 chapters and in 95 disjoint subgroups of pathologies. The observed numbers of ED visits by age group and by chapters/subgroups were compared to expected numbers, estimated using an overdispersed Poisson regression model based on 2017-2019 data.

Results:

The observed numbers of ED visits for all chapters and for a large part of subgroups were significantly lower than the expected numbers during the three lockdowns in all age groups and progressively returned to the expected level in 2021. A change in the pattern of a limited list of subgroups was observed: ED visits for purpura, chronic blood diseases and neurologic disorders in children decreased during the first lockdown and remained under the expected level until March 2022. Inversely the number of ED visits for mental health and wheezing in children, for pulmonary embolism in adults and for neoplams in the elderly increased and remained over the expected values until 2022.

Conclusions:

Syndromic ED system was a pillar of the French reactive surveillance of direct and indirect impacts of COVID-19 epidemic. The changes observed for different subgroups of pathologies may reflect a negative impact of the epidemic, a positive effect of protective measures on the spread of other infectious diseases, a modification in the organization or in the use of health care in specific domains. Further studies using hospitalization data could explore these hypotheses.

Key messages:

- Existing syndromic surveillance system implemented before the emergence of SARS-COV2 enabled to monitor non-Covid-19 visits to emergency departments and assess changes in patterns of pathologies.
- An increase in the number of emergency department visits during the COVID-19 epidemic was observed for mental health in children, for pulmonary embolism in adults and for neoplams in the elderly.

Introduction:

The COVID-19 crisis has disrupted health systems all over the world. In a survey by the WHO, 93% of the countries reported disruption in their mental health services. This research assessed the extent to which mental health was included in the national response to the COVID-19 pandemic in African countries. It also explored barriers and enablers to mental health integration into the COVID-19 response. Lessons learned from COVID-19 can help improve the response to future public health emergencies.

Methods:

A web-based survey was sent to mental health focal points in 55 African countries. The survey assessed the perceived degree of implementation of the Inter-Agency Standing Committee (IASC) "14 Globally Recommended Activities" for mental health response to COVID-19. This was followed by in-depth interviews to explore barriers and enablers to mental health integration into the COVID-19 response.

Results:

Responses were received from 28 countries. Lack of political will, poor funding, limited human resources, and weak pre-existing mental health systems were the key challenges in addressing mental health needs during COVID-19. Participants highlighted the need to capitalize on the increased attention to mental health during COVID-19 to support its integration into the emergency preparedness and response plans and strengthen health systems in the longer term. They have also stressed the importance of sustaining and strengthening the new partnerships and service delivery models that emerged during the COVID-19 pandemic.

Conclusions:

The number of recommended mental health activities implemented during the COVID-19 pandemic varied considerably across African countries. Several factors limit mental health integration into emergency response. However, there are signs of optimism, as mental health gained some attention during COVID-19, which can be built on to integrate mental health into emergency response and strengthen health systems in the long term.

Key messages:

- Capitalize on the increased attention to mental health during COVID-19 to support its integration into the emergency preparedness and response plans and strengthen health systems in the long term.
- Sustain and strengthen the new partnerships and service delivery models that emerged during the COVID-19 pandemic.

Health Emergency and Disaster Risk Management During the COVID-19 Pandemic: A Case Study from Italy

Emanuela Parotto

A Lamberti-Castronuovo[1], E Parotto[1,2], L Ragazzoni[1], M Valente[1]
[1]CRIMEDIM, Università del Piemonte Orientale, Novara, Italy

Contact: emanuela.parotto@gmail.com

Background:

The COVID-19 pandemic has profoundly impacted societies, influencing countries' Health Emergency and Disaster Risk Management (H-EDRM) systems. By taking Italy as a case study, this research aimed to investigate the response to the pandemic focusing on challenges, response strategies, lessons learned and implications for H-EDRM, with an emphasis on health workforce, health services delivery and logistics.

Methods:

This was a retrospective observational study using qualitative methodology. Data was collected via semi-structured interviews and analyzed according to the H-EDRM framework. Multiple interviewees were selected to obtain a holistic perspective on the Italian pandemic response. Stakeholders from five sectors (policymaking, hospital, primary care, third sector, lay community) from three of the most impacted Italian regions (Piemonte, Lombardia, Veneto) were interviewed, reaching 15 interviewees in total.

Results:

With regard to human resources, the main themes concerned the shortage of personnel, inadequate training, poor occupational health, and lack of multidisciplinarity. Regarding health services delivery, interviewees reported weakness of public health, hospital, and primary care systems. With regard to logistics, the following themes emerged: inadequate infrastructures, shortage of supplies, issues with transportation systems, and weak communication channels. Lessons learned stressed the importance of considering pragmatic disaster preparedness and the need for cultural and structural reforms.

Conclusions:

Implications that emerged from this study can inform advancements in disaster management in Italy.

Acknowledgments: This study was conducted in collaboration with the Department of Public Health and Health Policy, Hiroshima University, Japan and funded by the World Health Organization Kobe Centre for Health Development (WKC-HEDRM-K21001).

*ALC and EP are both first authors

Key messages:

- Findings show that great interconnection of sectors is key in overcoming challenges and for future disaster preparedness.
- Lessons learned contribute to translating the H-EDRM precepts into practice.

Contact: h.skirrow@imperial.ac.uk

Background:

COVID-19 changed access to healthcare, including vaccinations, in the United Kingdom (UK). This study explored UK women's experiences of accessing pertussis vaccination during pregnancy and infant vaccinations during COVID-19.

Methods:

An online cross-sectional survey was completed, between 3rd August-11th October 2020, by 1404 women aged 16+ years who were pregnant at some point after the first UK lockdown from March 23rd 2020. Ten follow-up semi-structured interviews were conducted.

Results:

Most women surveyed were pregnant (65.7%) and a third postnatal (34.3%). Almost all women (95.6%) were aware that pertussis vaccination is recommended in pregnancy. Most pregnant (72.1%) and postnatal women (84.0%) had received pertussis vaccination however, access issues were reported. Over a third (39.6%) of women had a pregnancy vaccination appointment changed. COVID-19 made it physically difficult to access pregnancy vaccinations for one fifth (21.5%) of women and physically difficult to access infant vaccinations for almost half of women (45.8%). Nearly half of women (45.2%) reported feeling less safe attending pregnancy vaccinations and over three quarters (76.3%) less safe attending infant vaccinations due to COVID-19. The majority (94.2%) felt it was important to get their baby vaccinated during COVID-19. Pregnant women from ethnic-minorities and lower-income households were less likely to have been vaccinated. Minority-ethnicity women were more likely to report access problems and feeling less safe attending vaccinations for both themselves and their babies. Qualitative analysis found women experienced difficulties accessing antenatal care and relied on knowledge from previous pregnancies to access vaccine appointments.

Conclusions:

COVID-19 disrupted access to vaccinations in the UK. Vaccine services must ensure equitable access to vaccine appointments during ongoing and future pandemics including tailoring services for lower income and ethnic minority families.

Key messages:

- Pregnancy and infant vaccines was disrupted by COVID-19 with women feeling less safe and having difficulties accessing vaccinations with ethnic minority women more likely to report access issues.
- Equitable access to routine pregnancy and infant vaccine appointments must be prioritised during future pandemics, including considering tailoring services for different population groups.

[4]Medical Directorate, Alessandria, Italy
[5]Department of Integrated Activities Research, Local Health Company, Alessandria, Italy
Contact: anna.odone@mail.harvard.edu

Introduction:

In Italy a Covid-19 pandemic pattern was observed, characterized by several waves, with an excess total mortality of 178000 deaths. Alessandria, Italy is the Piedmont province with the highest proportion of mortality from Covid-19 in the first 4 months of 2020, compared to the rest of the region.

Objectives:

To analyze mortality in patients hospitalized for Covid-19 in the Alessandria Hospital (AO AL), considering the first 3 waves.

Materials and methods:

Subjects aged ≥18 with a diagnosis of Covid-19 admitted to the AO AL in the first 50 days of the first 3 waves were included. The first wave started on 24 February 2020 (first day of available data by the Ministry of Health), the second wave on 14 September 2020 (first day of the 2020/21 school year), the third wave on 15 February 2021 (peak of cases detected by the Italian College of Health). The causes of death were obtained from the National Institute of Statistics death cards and codified according to the International Classification of Diseases, 9th revision, classification.

Results:

We included 825 subjects (median age: 73 years; male prevalence: 60.7%). The subjects hospitalized in the first wave were 464, in the second wave 255, in the third wave 106. A total of 309 subjects died (37.5%), of which 218 in the first wave (70.6%), 69 in the second wave (22.3%), 22 in the third wave (7.1%). The most frequent causes of death were "Covid-19 pneumonia" (61.5%) and "respiratory distress syndrome" (19.4%). Death occurred after hospital discharge in 40% of cases. 6 months after admission, the survival rate was 53% among patients of the first wave, 73% and 78% for those of the second and third wave. Patients hospitalized in the first and second waves showed a greater risk of death compared to patients of the third wave (HR = 2.8; 95% CI 1.8-4.4 and HR = 1.4; 95% CI 0.8-2.2).

Conclusions:

Data showed a difference in mortality between the 3 waves with a statistically significant variation between the first and third waves.

Key messages:

- Data showed a difference in mortality between the 3 waves.
- Data showed a statistically significant variation in mortality between the first and third waves.

Abstract citation ID: ckac131.059
Civil-military cooperation to contain COVID-19 epidemic in Israel- Lesson learned

Zohar Mor

Z Mor[1,2], *N Davidi*[3], *S Alroy Preis*[1]
[1]Public Health, Ministry of Health, Tel Aviv, Israel
[2]School of Health Sciences, Ashkelon Academic College, Ashkelon, Israel
[3]Home Front Defence, Israeli Defence Forces, Ramla, Israel
Contact: zmor100@gmail.com

Issue:

Public Health Services (PHS) has a major role in controlling COVID-19. As the epidemic propagated, and due to limited resources, PHS in Israel reached it capacity to contain the outbreak. Following a political decision in June 2020, the Home Front Command (HFC) of the Israeli Army was assigned to integrate in operating the National epidemiological efforts, while the PHS remained responsible for policy, setting guidelines and supervision.

Problem:

The civilian PHS and the military HFC had to establish cooperation, institute new hierarchical structure and divide the responsibility, despite the differences in organizational cultures, financial and human resources. Additionally, inter and intra organizational interests had to be resolved.

Results:

Formal and informal efforts were needed to bridge between the two organizations, while utilizing the comparative advantage of each agency. PHS has experience in controlling outbreaks, well-established intra-organizational communication, high professional identity, commitment and familiarity with different populations in Israel. HFC is a flexible, creative, learning and fast-responding organ, experienced in controlling emergencies and has well-established chains of command. HFC is supported by IT and intelligence officers. Organizational disadvantages had to be resolved. PHS is deficient in resources, has limited capacity in operating staff during irregular hours, and is obliged to share the health leadership and authority with the army. HFC has to confront high rotation of its manpower, difficulty in succumbing to non-military guidelines and regulations and possible mistrust between the army and special populations, such as Arabs or ultra-religious Jews.

Lessons:

Civil-military epidemiological cooperation can boost the National response in containing epidemics. Policymakers from each agency should use leadership skills to encourage integration while being sensitive to the needs and expectations of all participants.

Key messages:

- Civil–military epidemiological cooperation boosts the National response in containing epidemic. Mutual organizational sensitivity is crucial for constructive integration by leaders from each agency.
- Civil–military epidemiological cooperation boosts the National response in containing epidemic. Mutual organizational sensitivity is crucial for constructive integration by leaders from each agency.

Abstract citation ID: ckac131.060
Determinants of COVID-19 vaccine uptake among healthcare workers and the general population in Cyprus

Konstantinos Giannakou

K Giannakou[1], G Fakonti[1], M Kyprianidou[1]
[1]Department of Health Sciences, European University Cyprus, Nicosia, Cyprus
Contact: K.Giannakou@euc.ac.cy

Background:

Vaccination is a critical intervention in the fight against the coronavirus disease 2019 (COVID-19) pandemic. Various levels of COVID-19 vaccination acceptance have been observed around the world. However, a high percentage of the general population and healthcare professionals (HCPs), refuse the COVID-19 vaccination. This study aims to examine the factors influencing COVID-19 vaccine uptake among HCPs and the general population in Cyprus.

Methods:

An online cross-sectional study was conducted, using a self-administered questionnaire to collect information covering various potential determinants including sociodemographic and health-related characteristics, trust in the healthcare system, satisfaction with it, utilization of preventive healthcare services, COVID-19 vaccination information, and general vaccination knowledge.

Results:

A total of 2582 participants completed the survey, with 53.5% of individuals in the general population, and 70.0% of the HCPs received the COVID-19 vaccination. We found that as the age increases by one year among the general population, the odds of being vaccinated against COVID-19 increase by 1.02 units (95% 1.00-1.03, p-value = 0.035), whilst those with increased trust in national healthcare authorities' guidelines (OR = 3.96, 95% CI: 3.41-4.61) and increased vaccination knowledge scores (OR = 1.11, 95% CI: 1.05-1.18) were significantly more likely to be vaccinated. Furthermore, male HCPs (OR = 1.91, 95% CI: 1.01-3.59), and those who reported increased trust in national healthcare authorities' guidelines (OR = 5.38, 95% CI: 3.65-7.95) were significantly more likely to be vaccinated.

Conclusions:

Public health policymakers can use national campaigns and long-term planning to build public trust in national healthcare authorities and educate and raise awareness about the benefits of vaccination. Such strategies could pave the way for adequate vaccine uptake and prepare the public for unfavorable scenarios, such as future pandemics.

Key messages:

- Our results revealed the importance of vaccination knowledge and trust in healthcare system in respect to COVID-19 vaccination uptake.
- The urgent need for national campaigns and long-term planning to build public trust in national healthcare authorities.

Abstract citation ID: ckac131.061
Home care for vulnerable populations with special needs during a disaster in Germany

Michael Ewers

M Ewers[1], Y Lehmann[1], M Köhler[1]
[1]Institute of Health and Nursing Science, Charité – Universitätsmedizin Berlin, Berlin, Germany
Contact: m.ewers@charite.de

Background:

In Europe, too, the risk of natural, technical, or man-made disasters and public health emergencies has been growing for some time. The situation of vulnerable populations with special needs receiving intensive home care such as people of all ages with oxygen therapy, peritoneal dialysis, parenteral nutrition etc. is rarely considered in this context. This issue is addressed by the sub-project ''Safety and Nursing'' of the AUPIK consortium on ''Maintenance of home care infrastructure in crisis and disasters'' funded by the German Federal Ministry of Education and Research.

Methods:

Starting in April 2020, a systematic literature analysis was carried out, focussing on home care of populations with special needs during disasters. This was supplemented by an online survey with nurses and care workers (n = 101) and semi-structured interviews with managers of specialized home care services (n = 8). The survey data were analysed with descriptive statistics, the interview data with content analysis; results were cross-checked with the literature.

Results:

Home care providers are at best prepared for everyday tasks; even minor disruptions have far-reaching consequences. Although the impact of disasters such as large-scale and prolonged power cuts are hard to imagine, the experience with the COVID-19 pandemic and other current events (e.g., floods, heat waves) could at least raise awareness of the problem. However, there is hardly any preparation for disasters in home care yet, but there are high expectations of support from civil protection organisations or local authorities. That these, in turn, are not prepared to deal with populations with special needs in intensive home care, is overlooked.

Conclusions:

Home care infrastructure in Germany is currently inadequately prepared in terms of concept, staff, and equipment to care for vulnerable populations with special needs during disasters. Initiatives to improve disaster preparedness in home and long-term care are overdue.

Key messages:

- The situation of vulnerable populations with special needs during a disaster is a pressing public health and disaster nursing issue which needs to be considered more carefully.
- Public health nursing and health services research must contribute substantially to improving disaster preparedness in all health sectors and for all populations.

Abstract citation ID: ckac131.062
True death toll of COVID-19 in Georgia: estimates of the number of deaths from COVID-19

Levan Kandelaki

M Shakhnazarova[1]
[1]Medical Statistics, NCDC, Tbilisi, Georgia
Contact: lkandelaki8@gmail.com

Problem:

Georgia, in terms of Covid-19 attributed mortality, ranks 8th in the World.

Description:

In Georgia, there are no routinely conducted autopsies of the deceased. The identification of causes of death is based on the physician's clinical decision. Absence of autopsies, lack of experience with Covid-19, are key issues of Covid-19 death certification. Considering COVID-19 as a primary cause of death led to over-reporting of COVID mortality among patients with severe comorbidities. This affects the identification of underlying cause of death (UCOD) and leads to misclassifications.

Results:

2021 mortal cases with Covid-19 as the UCOD, were analyzed. Cases were grouped by the interval between testing and death: <1 day - 170 cases (1.5%), 2-44 days - 9468 cases (83.5%), 45+ days - 1694 cases (15%). The group of cases with time intervals of 2-44 days, was sub-grouped according to causes mentioned in death certificates: A - only U07 is indicated, B - U07&any chain-of-event condition (pneumonia, respiratory distress, respiratory failure, etc.), C - U07& 1 or more significant contributing conditions (diabetes, stroke, etc.). According to the analysis in the group, 2-44 days distribution was: A - 6%; B - 81%; C - 13%. U07 cases in groups A and C without any respiratory conditions mentioned were defined as 'unlikely' COVID-19 death (19% of total). From groups with time intervals of < 1 and 45+ days (1864) 72 cases were randomly selected for in-depth analysis by a panel of experts, using additional medical records. Out of these cases, the panel of experts considered 80%, as 'non-COVID-19' deaths.

Lessons:

If 'unlikely' and 'non-COVID-19' deaths aren't counted, the number of deaths is reduced by 29.5%. Lack of duration of a disease represents a limitation. A similar revision of all/2-44 day's interval COVID-19-related deaths is required to get a real number. Conduction of a verbal autopsy is necessary. Training on coding causes of death and existing regulations is important.

Key messages:

- There is an over-registration of COVID-19 as a UCOD.
- The lack of knowledge of death certification of cases with severe comorbidities and accidents leads to over estimates.

Abstract citation ID: ckac131.063
Bulgarian population – before COVID-19 and now

Dima Tsanova

D Tsanova[1]*, Ts Valentinova*[1]*, Ts Vitkova*[1]*, K Statev*[1]*, El Mineva-Dimitrova*[1]*, A Seizov*[1]
[1]Bulgarian Public Health Association, Faculty of Public Health, MU-Pleven, Pleven, Bulgaria
Contact: d_krumova@abv.bg

Background:

The demographic picture in Bulgaria became worse and worse since the democratic changes at the end of the 20th century. Our country was at one of the first positions according to the level of death rate and the rate of population decline. The study aims to analyse the effect of the COVID-19 pandemic on the main demographic indicators in Bulgaria.

Methods:

Data from Bulgarian National Statistical Institute were used to analyse population growth and life expectancy and to calculate the death rate, birth rate, infant mortality rate, and the share of people over 65 years of age for 2019 in comparison with 2021.

Results:

In 2019 before the onset of COVID-19, the Bulgarian population consists of 6 951 481 people. In 2021 it declines to 6 838 937 people. The decrease in birth rate is not very significant - from 8.9‰ /2019/ to 8.5‰ /2021/. The analysis provides estimates of excess deaths observed during the peak of the COVID-19 outbreak in Bulgaria. The death rate is very much increased - from 15.5‰ to 21.7‰. The increase affects the female and male populations equally - from 19.6‰ for men in 2019 to 23.2‰ in 2021 and from 16.4‰ for women to 20.2‰. The life expectancy shows a certain decrease - from 74.8 years /2019/ to 74.64 /2021/. Correspondingly, life expectancy was reduced for females- by 78.34 - 78.22 and for males by 71.37 - 71.11 years. The level of infant mortality is not changed - 5.6‰. People over 65 years are 21.6% of the total population during the compared period.

Conclusions:

The Bulgarian population is very strongly affected by COVID - 19 pandemic. The COVID-19 pandemic has caused a significant number of deaths worldwide but Bulgaria ranks first in the world in terms of mortality rates. Life expectancy decline reflects the impact of temporary epidemic mortality. The impact on children from the pandemic is not very significant for the country. Society should be making major and cost-effective efforts to reduce mortality.

Key messages:

- The sharp change in demographic realities has significant effects on the country's economy.
- The deterioration of natural growth exacerbates the need to increase labour productivity in areas with the fastest declining populations.

Abstract citation ID: ckac131.064
Impact of COVID-19 on the essential healthcare services at primary healthcare level

Serine Sahakyan

V Hayrumyan[1]*, A Abrahamyan*[1]*, A Harutyunyan*[1]*, S Sahakyan*[1]
[1]Turpanjian College of Health Sciences, American University of Armenia, Yerevan, Armenia
Contact: s.sahakyan@aua.am

Background:

The COVID-19 pandemic triggered numerous challenges for the healthcare systems worldwide, particularly affecting the continuity of essential health services in low- and middle-income countries. We explored the effects of the COVID-19 pandemic on the utilization and delivery of essential health services in Armenia.

Methods:

We applied a conventional qualitative study design using semi-structured in-depth interviews (n = 17) in public and private primary healthcare (PHC) facilities in Armenia (2021). Participants included physicians providing primary health services (e.g. endocrinologists, gynecologists/obstetricians, and pediatricians), regular PHC facility patients (e.g. adults with chronic diseases, parents of children), and policymakers. Iterative thematic analysis was done based on inductively emerged 3 main themes: patient-provider communications, maternal and child health services, and management of chronic diseases.

Results:

Overall, visits to the PHC facilities were decreased due to fear to contract COVID-19 coupled with lack of information, misinformation and panic. There was a lack of digital platforms for ensuring continuous patient-provider communication and phone calls were the main way of communication. PHC providers intentionally limited the number of maternal and child visits to only essential antenatal visits, newborn screenings and routine child immunizations. Still, the latter has suffered resulting in delayed and decreased vaccinations. The pandemic remarkably decreased the number of follow-up visits and monitoring of patients with chronic conditions resulting in more critical and severe conditions.

Conclusions:

The COVID-19 pandemic affected the provision and utilization of essential health services at PHC facilities by changing people's health-seeking behavior. Unified national-level guidance for PHC facilities is needed to direct the provision of essential services, effective health communication and usage of digital platforms.

Key messages:

- Though provider encounters should be limited during outbreaks, continuous provision of essential services is critical in the prevention of morbidity, complications and worsened disease severity.
- Efforts are needed to develop effective health and risk communication strategies and enhance appropriate usage of digital platforms to promote adequate health-seeking behavior among the public.

Abstract citation ID: ckac131.065
Tobacco control is integral to global COVID-19 response: an opportunity to accelerate toward SDGs

Daniel TH Chen

DTH Chen[1]
[1]Imperial College London, London, UK
Contact: dan0977@hotmail.com

Issue:

Tobacco use intersects with the COVID-19 pandemic not only in terms of health consequences, but also on public health systems, economies, and the environment.

Description of the problem:

The global tobacco supply contributes significantly to environmental pollution of the natural ecosystems. The damage is compounded by tobacco consumption and its resultant waste, which leaves a significant carbon footprint on the environment, undermining the planet's ecological stability and intensifying climate change. Furthermore, tobacco use exacerbates inequalities and adds burdens to COVID-19-related mortality, which are major challenges to recovery from the COVID-19 pandemic.

Results:

he pandemic has provided a chance to combat tobacco use and accelerate efforts to alleviate these challenges and accelerate progress toward Sustainable Development Goals (SDGs). The MPOWER measures from the World Health Organization Framework Convention on Tobacco Control (WHO FCTC) can play an integral part to boost sustainable and equitable COVID-19 recovery — Monitor tobacco use (article 20); Protection from tobacco smoke (article 8); Offer help for tobacco cessation (article 14); Warn about the dangers of tobacco (article 11); Enforcing bans on tobacco advertising, promotion, and sponsorship (TAPS) (article13); and Raise tobacco taxes (article 6).

Lessons:

To accelerate recovery, it is critical to call for actions for governments and policy-makers to strengthen synergies and policy actions to emphasise tobacco control across equity, public health, climate actions, and counteract against the tobacco industry during and beyond COVID-19 as global authorities pledge to achieve the SDGs.

Key messages:

- Global authorities must create better synergies on policies with a prime focus on reinforcing tobacco control to recover from the pandemic.
- The WHO FCTC MPOWER measures can play an integral part in COVID-19 recovery to fight tobacco use and accelerate progress toward SDGs.

Abstract citation ID: ckac131.066
Facing COVID-19 in Georgia - left behind children coping better with COVID-19 precautions

Khatia Antia

K Antia[1], *A Berner-Rodoreda*[1], *V Winkler*[1]
[1]Heidelberg Institute of Global Health, Heidelberg University Hospital, Heidelberg, Germany
Contact: Khatia.antia@uni-heidelberg.de

Background:

Georgia, a major migrant sending country, with about 39% of children living with their caregivers while at least one of the parents migrated (left-behind children, LBC) has been severely affected by the COVID-19 pandemic. The main aim of this study was to qualitatively explore LBC's perception and experience during the pandemic.

Methods:

Between December 2021 and January 2022, we conducted 39 (29 LBC, 10 non-LBC) individual in-depth interviews with schoolchildren aged 12-18 in a public school from a migrant sending region. We conducted life history narrative interviews and used a thematic analysis approach.

Results:

Preliminary findings show four salient themes: (1) Family members' first reactions to the pandemic influence children's emotional health irrespective of parents' working arrangements. Children express less stress and anxiety when families show emotional stability and are not overwhelmed by the pandemic; (2) All interviewed children find COVID-19 and home-schooling a challenge. (3) LBC express more intense fear about infecting their grandparents than non-LBC. (4) Closer family ties to parents and siblings and access to better equipment help LBC to cope better than non-LBC. LBC view a positive side of Covid-19 in being able to enjoy more time with a parent, who would have otherwise worked abroad.

Conclusions:

Overall, all children perceive the COVID-19 pandemic as a challenge, yet closeness with a returned parent and with siblings and more affluence helps LBC to cope better than non-LBC with COVID-19 precautionary measures like home-schooling.

Key messages:

- All children are affected by the COVID-19 pandemic. Emotional stability in the family is important in fostering resilience and coping mechanisms among children.
- LBC experience the added benefit of better equipped homes and enjoy the presence of the migrant parent at home.

Abstract citation ID: ckac131.067
What factors contribute to maintaining mental well-being during the COVID-19 pandemic?

Corinna Kausmann

Contact: KausmannC@rki.de

Background:

The COVID-19 pandemic posed numerous challenges for many people and first results indicate high variability of responses in mental well-being. Thus, this research aimed to identify longitudinal factors contributing to the maintenance of mental well-being despite the adverse life circumstances and derive recommendations suitable for the promotion of mental well-being in the context of future pandemic or similar stressful situations.

Methods:

We analysed representative longitudinal panel data of the Socio-Economic Panel (SOEP) from 15,122 adults (age range 18-99 years) who participated in the collaborative SOEP-CoV and RKI-SOEP surveys comprising self-reports of mental well-being (e.g., life satisfaction) and potentially relevant factors (e.g., control beliefs). By taking data from before (2015-2019) and during the COVID-19 pandemic (2020-2021) into account, we investigated different patterns of mental well-being trajectories and factors associated with the maintenance of mental well-being over time.

Results:

Preliminary results suggest that the majority of adults in Germany managed to maintain or even enhance their mental well-being in the considered time frame. Moreover, results suggest that certain factors seem to be of universal importance (e.g., altruism, locus of control) while others are particularly relevant for distinct mental well-being dimensions (e.g., life goals). Most decisively, the probability of experiencing mental well-being deterioration during the COVID-19 pandemic was enhanced in individuals with an internal locus of control.

Conclusions:

The findings revealed longitudinal factors that contribute to maintaining mental well-being during the COVID-19 pandemic. Promoting altruism, family-related life goals and external locus of control beliefs can help fostering resilient responses in the face of challenging life events such as the COVID-19 pandemic.

Key messages:

- Several factors (e.g., locus of control) offer the potential to maintain or even improve mental well-being in times characterized by the COVID-19 pandemic.
- To enhance preparedness for stressful life events such as the COVID-19 pandemic, the identified key factors should be included in basic universal public health promotion.

[3]UOC Food and Nutrition Hygiene-East Area, Azienda USL Toscana Sud-Est, Arezzo, Italy
Contact: m.gennari2@student.unisi.it

Background:

In 2020, the total deaths from all causes were the highest ever recorded in Italy since World War II (15.6% excess), with peaks during Sars-Cov2 waves and reductions in periods of national lockdown. On the contrary, in 2021, the total number of deaths from all causes reduced compared to the previous year. Analysing local mortality data, our study aims to assess whether, in the Casentino Valley (Arezzo, Tuscany), an excess of deaths from all causes occurred between January 2020 and December 2021 compared to the five years 2015-2019.

Methods:

We used the official mortality data from the Italian Institute of Statistics (ISTAT), and that are published in the Table of deaths by the municipality on March 2, 2022. From this database, we extrapolated all deaths from all causes between January 1, 2020, and December 31, 2021, in the 10 municipalities of Casentino. The data collected were processed using Microsoft Excel 2016 software. We then distinguished by total per month, gender, and age group and then compared these data with the previous five years' average by calculating the percentage change.

Results:

Overall, both the years 2020 and 2021, it is shown an increase in the deaths percentages compared to the previous five-year period, respectively 5.66% and 8.07%. In particular, there is an excess of mortality in November and December 2020. The increase in mortality is more remarkable for males (13% in 2020 and 20% in 2021). The highest percentage increase was recorded in 2021 for the 75-84 age group (+15%) and in 2020 for males over 85 (+29%).

Conclusions:

The data analysed confirms the excess mortality in 2020-2021 compared to the average of the previous 5 years in Casentino. There are peaks in November and December 2020, corresponding with the second wave of Sars Cov2 infection. The results obtained establish the basis for subsequent analyses that will verify the correlation of mortality peaks with the incidence of Sars-Cov2 cases in the territory studied.

Key messages:

- Between January 1, 2020, and December 31, 2021 there was an excess of all-cause mortality in our area.
- This excess mortality appears to be related to peaks in Sars-Cov2 infection.

Epidemiology of covid-19 in Mongolia: descriptive findings

Khorolsuren Lkhagvasuren

O Amartsengel[1]*, D Khishigjargal*[3]*, N Glushkova*[4]*, K Lkhagvasuren*[2]
[1]School of Public Health, Mongolian National University of Medical Science, Ulaanbaatar, Mongolia
[2]Institute of Public Health, Mongolian National University of Medical Science, Ulaanbaatar, Mongolia
[3]Health Information Office, Center for Health Development, Ulaanbaatar, Mongolia
[4]Epidemiology, Biostatistics and Evidence-Based Medicine, Al-Farabi Kazakh National University, Almaty, Kazakhstan
Contact: Khorolsuren.l@mnums.edu.mn

Background:

Mongolia is a landlocked country, and has been divided into 21 provinces plus the capital city Ulaanbaatar. In our country, Covid-19 was the first internal case (15 Nov 2020) and the first wave of pandemic occurred (peak at 14 Jun 2021) ten months later on World's first case and wave. The second and third waves were also delayed by two months, but the fourth wave occurred just in parallel (peak on 17 Jan 2022).

Methods:

This study was a retrospective cross-sectional study. We have compared incidence rate (IR) and case-fatality rates (CFR) in provinces by age groups based on publicly available data reported by MoH from January to December of 2021.

Results:

CFR in Mongolia was low (average 0.23%), and had a clear dynamic to drop from beginning to the present time (for I wave-0.49, and II-0.42, III-0.23, IV-0.04 correspondently). At the beginning of the III waves, we vaccinated 68.7% of the total population, and in the fourth wave, CFR significantly decreased. IR had two peaks: in the age group 30-34 (250.6) and over 85 (248.9). There was a strong correlation between age and morbidity. Up to age group 40-44 (0.12 %), there was a deliberate increase of CFR, further up to 65-69 ages (2.7%) gradual increase, and from age group 70-74 CFR rapidly increases reaching 10.5% at age group over 85. IR was higher in men aged 65 years and over. CFR was significantly higher in Ulaanbaatar city and Umnugovi province morbidity due to Covid-19 not being registered.

Conclusions:

Vaccination in Mongolia was a key factor in declining fatality. Umnugovi province is crucial for exports to China, so we suppose, government decisions strongly affected in fatality rate in this province, in terms of the evacuation of severely diseased patients to the capital.

Key messages:

- Vaccination is played important role in COVID-19 epidemiology.
- Burden of Covid-19 need to be investigated deeply in association with political decisions.

Abstract citation ID: ckac131.070
Modeling and analysis of psychological mechanism for preventive behaviors against the COVID-19

Yasuyuki Fukukawa

Y Fukukawa[1], *S Kurita*[2]
[1]Psychology, Waseda University, Tokyo, Japan
[2]Graduate School of Letters, Arts and Sciences, Waseda University, Tokyo, Japan
Contact: fukukawa@waseda.jp

Background:

The COVID-19 pandemic has dramatically changed human life style. People all over the world are still on the way to establish ''New Normal''. The purpose of this study was to construct a cognitive model that predicts preventive behaviors against the infectious disease.

Methods:

A total of 3,000 Japanese respondents aged from 18 to 86 years participated in a web survey in January 2021. The data of 2,913 respondents (1,633 males and 1,280 females) were eligible for analysis. The following information regarding cognitive characteristics was assessed: 1) Cognitive reflection ability (Frederick, 2005), 2) Experiential thinking style (Pacini & Epstein, 1999), 3) Germ aversion (Duncan et al., 2009). In addition to those characteristics, the participants were asked to answer 6 items to rate their preventive behaviors against the COVID-19, such as keeping social distance and wearing a mask. A structural equation modeling technique was used to test the causal relationships among the measures. We hypothesized that experiential thinking style and germ aversion would mediate the causal link between cognitive reflection ability and preventive behaviors.

Results:

Correlation analyses indicated that cognitive reflection ability was negatively associated with experiential thinking style, whereas experiential thinking style was negatively associated with germ aversion. Furthermore, the higher germ aversion was, the more the participants enforced the covid-19 preventive behaviors. Parameter estimation of the causal model using the measures by the bootstrap method indicated that the model acceptably fit the data with CFI of 0.997, TLI of 0.996, and RMSEA of 0.008 (95% CI = 0.004:0.011).

Conclusions:

The findings of the study suggest that there is a cognitive psychological process that induces preventive behaviors against the COVID-19. The results should be useful to improve public health interventions for future pandemics.

Key messages:

- A web survey was conducted for 3,000 Japanese adults to construct a cognitive model that predicts preventive behaviors against the COVID-19.
- The structural equation modeling indicated that the participants' experiential thinking style and germ aversion mediated the causal link between cognitive reflection ability and preventive behaviors.

[3]San Giovanni Bosco Hospital, ASL Città di Torino, Turin, Italy
Contact: marco.scattaglia@unito.it

Introduction:

Many consequences resulted from the breakout of the COVID-19 pandemic in Europe, which have disrupted our economic, social and medical world. This allowed us to measure and assess the hospitalisation costs regarding the COVID-19 disease at Martini Hospital in Turin, one of the hospitals entirely committed to the COVID-19 care, between January and June 2021.

Methods:

In this single center retrospective study, we collected and analysed cost data on patients admitted at Martini Hospital in the time frame of January-June 2021 and compared the analysis with the same period in 2020, at a time when the hospital was not dedicated to Covid-19 patients. Cost data included full-time and temporary employees salaries, drugs, medical and non-medical supplies and equipment and facility utilities. We then estimated the cost per treated COVID-19 episode, in comparison with the cost per any desease including Covid-19.

Results:

The first 6 months of 2021 registered 2,136 hospital discharges, while same period in 2020 counted 4376. The mean duration of the hospital stay was 7,67 days in 2020 and 12,83 in 2021. The average charge per treated episode doubled (+52,5%) from Euros 8997 in 2020 to Euros 19026 in 2021. The mean revenue increased of 35% from Euros 3280 in 2020 to Euros 5041 in 2021. This is due to the major complexity of care required for Covid patients. As it is, in 2021 the average complexity index of 2.13 while in 2020 it was 1.39.

Conclusions:

Clinical management and treatment of COVID-19 economically strain the European health-care systems. The study of COVID-19 treatment costs, and their differences between 2020 and 2021 suggests an economic challenge for the entire Italian health system and emphasises the necessity to avoid the recurrence of such an economic impact by implementing effective infection prevention and control policies.

Key messages:

- The Covid-19 pandemic has been straining both the European health and economic systems.
- Studying the Covid-19 expenditures allows to frame unexpected new challenges regarding health-care systems.

Abstract citation ID: ckac131.072
Is it really possible to leave sars-cov-2 outside the door?

Bianca Maria Bocci

BM Bocci[1], *I De Palma*[2], *D Amodeo*[2], *G Cevenini*[2], *N Nante*[1,3], *G Messina*[1,3]
[1]Post Graduate School of Public Health, University of Siena, Siena, Italy
[2]Department of Medical Biotechnologies, University of Siena, Siena, Italy
[3]Department of Molecular and Developmental Medicine, University of Siena, Siena, Italy
Contact: bocci2@student.unisi.it

Background:

In this historical period, it has become very important to live in healthy environments. By using everyday objects, cross-contamination is possible because of prolonged microbial persistence on surfaces. UV-C irradiation is an environmentally friendly method to disinfect objects as no harmful chemicals or heat are involved. This study aims to determine the virucidal activity, against SARS-CoV-2, of UV-C irradiation occurring in a designed UV device, 'Purity Capsule'.

Methods:

An experimental study was performed in September 2020. The 'Purity capsule' has an 11 W lamp (3.5W UV-C) positioned in the centre of the device. The lamp has a dome covered with a reflective, protective coating. Three metal carriers were placed at the maximum distance from the UV-C lamp in three different positions and tested at 30 and 60 seconds 3 times. The carriers were inoculated with 100 µL of SARS-CoV-2 viral suspension with a concentration of 106.5 TCID50 /mL. After treatment, laboratory procedures were used to transfer the treated virus from carriers to multiwell plates. The samples were compared with positive controls (not exposed to UV-C light) after incubation, at 37 °C in 5% COÕ · in a humidified atmosphere, for 3 days. The residual viral activity was tested by assessing the 50% infectious dose per tissue culture (TCID50%).

Results:

Tests performed at 30 seconds of UV-C irradiation show an average viral reduction of 4.0 Log10 (99.99%). All three tests performed at 60 seconds reached the maximum measurable log10 viral reduction: 5.0 Log10 (99.999%).

Conclusions:

The study assessed the effectiveness of the device in significantly reducing the viral load on all carriers regardless exposure time and distance from the UV-C light source, with no impact on the level of environmental pollution.

Key messages:

- UV-C light has the property of inactivating viral growth; its physical approach is considered a good compromise between cost and effectiveness.
- The device was effective in disinfecting all small everyday objects tested.

A time-varying SIRD model for dynamic vaccination strategies against COVID-19

Valentina Lucarelli

A Cartocci[1], *V Lucarelli*[2], *G Messina*[2], *N Nante*[2], *G Cevenini*[1], *P Barbini*[1,3]
[1]Department of Medical Biotechnology, University of Siena, Siena, Italy
[2]Department of Molecular and Developmental Medicine, University of Siena, Siena, Italy
[3]Department of Information Engineering and Mathematics, University of Siena, Siena, Italy
Contact: Valentina.lucarel@student.unisi.it

Introduction:

The COVID-19 pandemic has demonstrated how the optimal allocation of the limited doses of vaccine available represents one of the main useful measures to mitigate the transmission of the infection and reduce the mortality associated with it, especially at an early stage of the pandemic. The use of a compartmental model allows us to understand which population groups to vaccinate and to what extent to act depending on the type of health or social objective to be achieved.

Methods:

A time-varying susceptible-infected-recovered-deceased (SIRD) compartmental model, stratified into ten age groups, was developed on Italian data. Simulations were performed every 15 days from December 2020 to April 2021. An optimal vaccination strategy was achieved by minimizing deaths or infected, considering the total vaccine doses available.

Results:

We showed how the effects of a vaccination campaign can be planned in a way that maximizes lives saved and/or minimizes infections. Regarding the minimization of deaths, the model prioritizes the elderly (>80 years) and then those between 60 and 80 years, in all simulations. Regarding the cost function of new infections, the first simulation assigns all available doses to those over 90 years of age. In the later simulations, the doses are assigned mainly to the 20-29-year-old and the 89+ year old.

Conclusions:

Optimal allocation of available vaccine doses is useful in mitigating transmission of infection and reducing mortality. Application of the mathematical model can be useful at the beginning of an epidemic caused by a new pathogen, when data are scarce, and it is therefore necessary to introduce a standardized approach. This kind of simulation is useful to understand whether the implemented vaccination strategy needs to be recalibrated, too.

Key messages:

- Time-varying compartmentalised models can be used both to continuously inform decision-makers about changes in epidemic traits and to simulate the effects of targeted pandemic containment strategies.
- The application of compartmental models can be very useful at the onset of an epidemic to more successfully contain it and structure the health, political, and economic plan.

Healthy aging in place during the pandemic in Northern Italy

Sigrid Mairhofer

N Paone[2], *S Mairhofer*[1]
[1]Applied Social Sciences, Hochschule München University of Applied Sciences, Munich, Germany
[2]Faculty of Education, Free University of Bozen - Bolzano, Bolzano, Italy
Contact: sigrid.mairhofer@hm.edu

Many elderly people would like to stay in their own homes as long as possible. Therefore, a focus on enabling factors for a healthy aging in place in needed. Italy was the first European country to be hit hard by the pandemic. These had an impact on people's everyday lives, on social participation and freedom of movement for all sections of the population. But especially elderly people were considered a risk group and were urged to leave their homes as little as possible. The project aimed to analyse the situation of elderly people in South Tyrol (Northern Italy), focusing on the characteristics of enabling factors for a healthy ageing in place. The main research question was: What kind of enabling factors ensure a healthy aging in place during the pandemic? Using a mixed-methods-approach, we conducted 10 semi-structured interviews (experts: social workers, health professionals, responsible persons from senior associations, ...) analysed by qualitative content analysis and a quantitative questionnaire (536 respondents, aged 60 to 101 still living in their own home) from 2020 to 2021. The questionnaire was distributed in digital and analogue form to reach a wider study group and to facilitate access to the research group despite the infection control measures or technical challenges. The results show that there were numerous changes in the everyday life of elderly people during the pandemic, which were described as particularly important for a healthy ageing in place. Based on the answers to the pandemic-related restrictions, 6 categories could be identified: Loneliness versus desire for social contact, mobility, emotions, needs, opportunities, restrictions. To be able to guarantee healthy ageing in place, we need to examine and promote these enabling factors in the long term.

Key messages:

- A focus on enabling factors for a healthy aging in place in needed.
- There were numerous changes in the everyday life of elderly people during the pandemic, which were described as particularly important for a healthy ageing in place.

Abstract citation ID: ckac131.075
USCA service utilization in the city of Florence (Italy) during the COVID-19 pandemic

Primo Buscemi

P Buscemi[1], *B Velpini*[1], *C Cosma*[1], *C Milani*[2], *R Landi*[3], *M Innocenti*[4], *L Baggiani*[4], *M Nerattini*[5], *C Lorini*[2], *G Bonaccorsi*[2]

[1]School of Hygiene and Preventive Medicine, University of Florence, Florence, Italy
[2]Department of Health Sciences, University of Florence, Florence, Italy
[3]Azienda USL Toscana Centro, Florence, Italy
[4]Department of District Healthcare Network, Azienda USL Toscana Centro, Florence, Italy
[5]Florence Local Health District, Società della Salute di Firenze, Florence, Italy
Contact: primo.buscemi@unifi.it

Background:

In order to support primary care during the first pandemic wave (March 2020), the Italian Government instituted multi-professional health teams called ''USCA'' (Special Continuity Care Units), which ensured continuity of care for COVID-19 patients who do not need hospitalization. The aim of our study was to compare the volumes of USCA service utilization in Florence (Tuscany, Italy) during the peak of home visits of three pandemic waves.

Methods:

This single-center study followed a retrospective cross-sectional design. The USCA of the Heath District of Florence served a population of 366,190 people. The following data were collected: home medical visits, nursing home (NH) visits, visits in health-care hotels. The peak periods of three epidemic waves were considered in the analyses: the second wave (23 October - 20 November 2020), the third wave (25 March - 22 April 2021), and the Omicron period (27 December 2021 - 6 February 2022). The maximum 7-day moving averages of the daily number of visits during the three periods were calculated. Relative percent differences for visits comparing the considered periods were computed.

Results:

Home visits during the third pandemic wave increased by 14% compared to the second wave (second wave: N = 1370, third wave: N = 1562), while a decrease was observed during the Omicron period (Omicron vs third wave: -21%; peak value: 41 vs 60). Visits in health-care hotels during the third wave doubled compared to the second wave. After the start of the COVID-19 vaccination campaign, NH visits steeply declined (third wave vs second wave: -95%; N = 323 vs 15; peak value = 14 vs 2 visits per day). During the Omicron period, NH visits increased by almost four times compared to the third wave period.

Conclusions:

The USCA service utilization was significant in all the analyzed periods. In a pandemic context, it is necessary to strengthen primary care services such as USCA, which have proved to respond to rapidly changing health needs.

Key messages:

- The USCA service is an innovative model of integrated home care that has proved to respond to rapidly changing health needs during all phases of the COVID-19 pandemic.
- The USCA service utilization was significant during all phases of the pandemic. The USCA service has introduced new ways of working and new relationships between services in primary care.

Abstract citation ID: ckac131.076
Resilience and life quality of health professionals in capital of Turkey during COVID-19 pandemic

Özge Tonbuloğlu Altıner

Ö Tonbuloğlu Altıner[1], A Uğraş Dikmen[1], C Gingir[1], S Özkan[1]
[1]Public Health, Gazi University, Ankara, Turkey
Contact: ozgealtiner@gmail.com

Background:

COVID-19 pandemic has had significant effects on physical and mental health of health professionals. It is thought that resilience protects individuals against mental illness and helps individuals cope with difficulties and stress more effectively. In this study, it was aimed to evaluate resilience, life quality and related factors of health professionals during COVID-19 pandemic.

Methods:

A cross-sectional study was performed among health professionals working at a tertiary hospital in Turkey's capital Ankara. An occupation based stratified sampling was done with taking alpha 0.05 and 1-beta 0.80. A questionnaire that consists of sociodemographic information, COVID-19 Impact on Quality of Life Scale and Connor Davidson Resilience Scale was used to collect data. The results of scales were divided into two parts by taking the median values as cut off points. Descriptive/inferential statistics and logistic regression were performed on IBM's SPSS 27.0 program.

Results:

A total of 987 participants were surveyed. 66% of them were female, and the average age was 36. Multivariate logistic regression analysis results that physicians (OR:1.48, 95% CI:1.05-2.07, p = 0.024) and nurses (OR:1.46, 95% CI:1.08-1.97, p = 0.013) have lower resilience. The impact of COVID-19 on quality of life was higher for the following groups; physicians (OR:2.07, 95% CI:1.43-3, p < 0.001), nurses (OR:1.61, 95% CI:1.10-2.36, p = 0.013), who have bachelor/higher degrees (OR: 1.54,95% CI: 1.02-2.31,p = 0.038), infected with COVID-19 (OR:1.33, 95% CI:1.02-1.74, p = 0.034), have COVID-19 related relative lost (OR:1.42, 95% CI:1.06-1.89, p = 0.016), and live with risk groups (OR:1.31, 95% CI:1.01-1.71, p = 0.042).

Conclusions:

Physicians and nurses who take care of patients one-on-one have lower resilience and higher decrease in life quality due to COVID-19 impacts. This result indicates a significant quality drop in health services is inevitable during pandemics and should be considered by the policy makers.

Key messages:

- Policies should be developed to increase the resilience of healthcare professionals so that they can effectively combat public health emergencies such as COVID-19 and not affect their quality of life.
- It is necessary to determine risk groups among health workers and plan training programs to increase resilience.

[5]School of Hygiene and Preventive Medicine, University of Ferrara, Ferrara, Italy
Contact: christian.cintori@regione.emilia-romagna.it

Issue:

Vaccine hesitancy (VH) and the challenges faced by healthcare workers (HWs) in evaluating the complex risk-benefit ratio of vaccines' threaten the effectiveness of vaccination policy. The threat is enhanced when new vaccines are adopted during a pandemic emergency. In Italy, the Emilia-Romagna Region (ERR) created a specialized referral board called Vax-Consilium (VC) to support and guide HWs.

Description of the problem:

During a pandemic emergency, rapid and appropriate vaccine implementation is necessary to protect fragile individuals and to encourage vaccine adherence among exposed groups. Challenges in the realm of vaccination emerge, especially when dealing with patients with a complex medical history or previous vaccine adverse events. HWs were able to consult VC via a standardized digital form after obtaining the patient's informed consent. After a multidisciplinary and evidence-based evaluation, VC provided a conclusive report on the individual vaccine risk-benefit analysis. No cost is charged to the patient.

Results:

During the anti-COVID-19 vaccination campaign in 2021, 148 interrogations were submitted to VC: 121 were evaluated, whereas 27 were withdrawn by the HWs or rejected because of insufficient documentation. Mean patient age was 44 years. No absolute contraindication was found, whereas in 23 cases VC recommended immunization with a different vaccine. The disciplines most frequently involved were neurology, angiology and cardiology.

Lessons:

VC implementation in EER proved highly effective. Indeed, during the pandemic, anti-COVID-19 vaccination coverage reached >90%. In addition, DTaP-polio-HBV-HIb and MMR vaccination coverage reached >95%. VC proved to be a high-quality public health service. Not only was citizens' trust in the healthcare system enhanced and was VH reduced, but HWs knowledge improved even in cases not considered in national and international guidelines.

Key messages:

- A specialized referral board (Vax-Consilium) could be an effective tool for enhancing citizens' trust in vaccines.
- A specialized referral board (Vax-Consilium) contributes to lowering VH and supporting HWs decision-making process.

Contact: peruzzi37@student.unisi.it

Background:

Disinfection of contact surfaces has become common practice since the two-year Covid-19 pandemic. The transmission of microbial agents has long been the focus of public health and hygiene awareness campaigns. Indeed, the development of new disinfection technologies and approaches is attracting considerable interest in the scientific community. Mixed plastic powders with antimicrobial properties and silver ions that compromise the metabolism of microorganisms could reduce the contamination of the contact surfaces. We aimed to evaluate an inorganic antimicrobial agent (IAA) based on Ag ions and zeolite mixed in a resin.

Methods:

This experimental study was carried out at the University of Siena, Italy. Different objects were produced in two versions: i) with an IAA mixed in plastic resin; ii) with a standard plastic mixture. To the eye, the two versions were indistinguishable and were randomly contaminated with the hands of several operators. After the hand contamination, T0, we sampled the objects using RODAC plates at T1 (1h) and T2 (6h), incubating at 36 °C for 48 hours. Comparisons of the biocidal effect were made at T1 and T2. Statistical analysis was carried out with Stata.

Results:

The mean level of contamination of the objects made with standard plastic were, respectively 50 CFU (SD 36.5) at T1 and 20 CFU (SD 13.6) at T2. In comparison, the objects made with IAA resin showed a mean level of contamination of 10 CFU (SD 5.9) at T1 and 6 CFU (SD3.6) at T2. The objects made with IAA resin have shown a mean percentage reduction of contamination of 79.5% at T1 and 78.3% at T2.

Conclusions:

IAA resin reduced contamination on objects that came into contact with hands. Antimicrobial plastic blends, are a valuable aid in counteracting the spread of infection related to contact with surfaces and fomites. The public health system could support and raise awareness for using these innovative materials for everyday applications and in healthcare facilities.

Key messages:

- Inorganic antimicrobial agent based on Ag ions and Zeolite mixed in a resin are efficient in reducing the contamination on different items in a real-life context.
- Public health system have to support and sensitize to production with inorganic materials with proven antimicrobial properties.

Abstract citation ID: ckac131.079
Impact of the pandemic on surgical oncology in Piedmont, Italy: a retrospective observational study

Paolo Ragusa

Background:

To prevent the spread of SARS-CoV-2, containment measures were implemented leading to huge healthcare changes worldwide. This study aimed to describe the impact of COVID-19 pandemic on surgical oncology healthcare in a large Italian sample.

Methods:

A retrospective observational study included 99651 patients admitted to the hospitals of Piedmont (Northern Italy) to undergo oncological surgery, provided in ordinary hospitalization. We compared data of 2020 with 2016-2019 mean values. Data were stratified by tumor site, year, month and admission way. Chi-squared tests were used to assess differences in the percentage of admission modes between 2020 and 2016-2019.

Results:

An overall reduction in oncological surgery (-12.3%) was observed in 2020 (n = 17923) compared to the mean of period 2016-2019 (n = 20432). A relevant decrease began in March (-11%), continued in April (-18%) and peaked in May (-26%). There was a greater reduction in surgery of breast (-19.2%), bladder (-17.5%), colorectal (-16.5%), kidney (-14.2%), prostate (-14%). Little or no difference was observed for liver (-5.2%), body of uterus (-0.54%), ovary (-0.07%), lymphoma (+4.5%). There was a marked reduction of non-emergency admissions (-13.6%), in particular for some tumor sites: colorectal (-19.4%), breast (-19.4%), bladder (-18.7%). The overall volume of surgeries following an emergency access was unchanged (-0.3%). The proportion of hospitalizations with emergency access increased ($p < 0.001$).

Conclusions:

Our results highlight the burden of the reduction in cancer surgery in 2020 and the risk of delays in diagnosis and treatment for time-dependent conditions. For cancers that can be diagnosed early thanks to screening, the reduction in surgery is likely to be an indirect consequence of discontinuing screening activities. Therefore, further studies are needed to assess, as soon as data are available, the trend in 2021, and to compare our results with those reported in other European countries.

Key messages:

- The COVID-19 pandemic caused a significant decline in cancer surgeries in 2020 in Piedmont, Italy. It is necessary to compare our results with those reported in other European countries.

- These results show an increase in the proportion of oncological surgical admissions following emergency access in 2020 compared to the average for 2016-2019.

Are we socially equally at risk of smoking during the COVID-19 pandemic? French data from 2009-2021

Astrid Juhl Andersen

AJ Andersen[1], M Melchior[1], M Mary-Krause[1], S Wallez[1], I Hecker[1]
[1]ERES, IPLESP, Sorbonne University, INSERM, Paris, France
Contact: astridjuhlandersen@gmail.com

Background:
Since 2020, the COVID-19 pandemic has greatly affected people including a significant increase in mental health difficulties. Cigarette smoking is found to be strongly associated with mental health conditions, which is why the pandemic might have influenced the secular decline in smoking rates observed over recent years. Persons belonging to socioeconomically disadvantaged groups may be particularly affected, both because the pandemic is found to exacerbate existing social inequalities and because this group was more likely to smoke before the pandemic. We examined the prevalence of smoking in a French cohort study, focusing on differences between educational attainment. In addition, we examined the association between educational level and interpersonal changes in tobacco consumption from 2018 to 2021.

Methods:
The TEMPO cohort study included 1785 French adults followed between 1991 and 2021. With four assessments of smoking status available before and two after the onset of COVID-19, we estimated the smoking prevalence over time stratified by highest obtained diploma. We studied interpersonal change in smoking status between 2018 and 2021 among 148 smokers, using multinomial logistic regression.

Results:
The prevalence of smokers was higher among those with low educational attainment compared with those with higher diploma at all timepoints. The difference between the two groups increased from 2020 to 2021 (4.8% to 9.4%). Smokers with high educational level were more likely to decrease their tobacco consumption from 2018-2021 compared to low educated smokers (aOR = 2.72 [1.26;5.89]).

Conclusions:
Current findings showed a widening of the socioeconomic gap over time in smoking rates, which emphasizes the vulnerability of persons with low educational attainment to smoking, also during the pandemic.

Key messages:
- The existing gap in smoking prevalence between lower and higher diploma groups has increased from 2020 to 2021, which may be a consequence of the COVID-19 pandemic.
- From 2018 to 2021, people with high school as highest qualification were less likely to decrease their tobacco use compared to higher educated people.

Early evidence suggests that the COVID-19 pandemic may have reduced the proportion of individuals submitted to cervical, colorectal and breast cancer screening. However, the recovery from the pandemic impact was very heterogeneous. We aim to explore the impact of the pandemic on cancer screening and estimate the time to recover lost screening opportunities in Portugal. We used an interrupted time series to analyze the impact of the pandemic on the implementation of cancer screening. The study population was the eligible individuals screened for cervical, colorectal and breast cancer by month and health region between 2018 and 2021. We used Poisson regression with health region random effects to estimate the trend before and after the first lockdown (March 2020) and the impact of the first lockdown. We predicted the counterfactual evolution without a pandemic to estimate lost screening opportunities. The first lockdown resulted in 93,1% (95%CI 92,9-93,2), 89,4% (95%CI 89,2-89,5) and 84,1% (95%CI 83,8-84,3) decrease in the proportion of expected cervical, colorectal and breast cancer screening tests. Nonetheless, we document an increased trend difference between pre and post lockdown of 6,0% (95%CI 5,9-6,0) and 5,3% (95%CI 5,3-5,4), 3,7% (95%CI 3,6-3,7) per month. However, by December 2021, there are still many lost screening opportunities due to the pandemic - 293k cervical cytology tests (42,2% less than expected), 247k fecal occult blood tests (28,7%) and 388k mammograms (38,4%). The first lockdown resulted in an abrupt decrease in cancer screening. However, we document an increase in the cancer screening trend after the pandemic. Nevertheless, there are still considerable lost screening opportunities after 2 years.

Key messages:
- The pandemic caused a massive disruption in cancer screening. Although there was an increase in screening trends after the first lockdown, 2 years later, many lost screening opportunities remain.
- Population-based screenings need to increase the outputs to account for lost screening opportunities due to the pandemic.

Response to the COVID-19 pandemic in the legally deprived population of liberty in Cali (Colombia)

Miyerlandi Torres Agredo

M Torres Agredo[1], J Tamayo[2], E Mina[3], L Luna[1], P Guerrero-Jaramillo[1], V Benavides-Cordoba[1]
[1]Secretaría de Salud Publica Cali, Cali, Colombia
[2]Red de Salud del Centro, Empresa Social del Estado E.S.E., Cali, Colombia
[3]Centro Penitenciario Villahermosa, Cali, Colombia
Contact: despachosaludpublica@cali.gov.co

With the COVID-19 pandemic, the challenge of reducing the transmission of the disease has led to new challenges in decision-making. The vulnerability of persons deprived of liberty led to the design of contagion mitigation alternatives. Since February 2020, at the Villahermosa Penitentiary and Prison Center in Cali, the Secretaría de Salud Pública (SSP) began a series of actions that intensified on March 11, when the WHO declared COVID -19 as a pandemic. The SSP, in an articulated work; configured a series of strategies aimed at mitigating the impact and speed of contagion, infectious disease doctors and internists were also summoned who provided recommendations and contributed to decision-making. An intervention model was designed, which was guided by two main processes: promotion and prevention actions and service provision actions. The articulated work and

the high commitment of the actors involved, the development of strategies for biosecurity, hygiene, isolation, rapid detection, and, above all, immediate control of symptoms and medical care on-site with adjustments that allowed managing patients inside the institution; It has meant that to date mortality is below 1% and that for the time being the situation is under control.

Key messages:

- The humanization of health service provision is essential to achieve effective results.
- The rapid and articulated responses made it possible to maintain a mortality of less than 1% in this population.

Over-the-counter Medication Use during Pandemic: Lessons Learned from Covid-19 in Lithuania

Rachel Elands

I Bikniūtė[1,2], M Paric[1], T Clemens[1], M Commers[1], H Brand[1], J Vladičkienėa[1,2], RJJ Elands[1,3]
[1]Department of International Health, Maastricht University, Maastricht, Netherlands
[2]Department of Social Medicine, Kaunas University, Kaunas, Lithuania
[3]Historical Demography and Family History, Radboud University, Nijmegen, Netherlands
Contact: r.elands@maastrichtuniversity.nl

Background:

Despite the growing awareness about nonprescription misuse of anxiolytics, there is not much evidence about people's behavior during the covid-19 lockdown when access to healthcare specialists was limited. Over the counter drug use has risen sharply in the past decades among college students and junior health care workers, yet, there are few studies reporting on the use of nonprescription medicine groups during the COVID-19 pandemic.

Methods:

A cross-sectional study among 163 second-year medical students of the Lithuanian University of Health Sciences was conducted in Kaunas, Lithuania with self-reported measures of anxiety and insomnia and comparing nonprescription medicine use for anxiety and insomnia before and during the covid-19 pandemic.

Results:

A near two-fold increase in the prevalence of anxiety and insomnia among Lithuanian medical students was reported during the covid-19 pandemic compared to before the onset of the pandemic ($p < 0{,}001$). The use of nonprescription medication increased during the pandemic ($p < 0{,}001$), in particular anxiolytics ($p < 0{,}05$). Once-weekly anxiolytic medication use increased from 8,0% before the pandemic to 14,7% during the pandemic. Regular nonprescription medicine use (2-3 times weekly) had more than tripled, from 2,4% to 9,2%. During the pandemic, almost a fifth of the respondents were increasingly searching for information on anxiolytic nonprescription medication online during the pandemic compared to before the pandemic.

Conclusions:

During the covid-19 pandemic, the prevalence of anxiety and insomnia increased among Lithuanian medical students, along with the practice of anxiolytic nonprescription medications. Lithuanian medical students increasingly practiced self-medication during the pandemic and found the information on nonprescription medication increasingly online, which offers opportunities for telemedicine.

Key messages:

- During the covid-19 pandemic, the prevalence of anxiety and insomnia increased among Lithuanian medical students, along with the practice of anxiolytic nonprescription medications.
- During covid-19, Lithuanian medical students increasingly retrieved information on nonprescription medication online instead of consulting a pharmacist, offering opportunities for telemedicine.

Religious pilgrimage and COVID-19. An observational report in Italy from contact tracing activities

Emanuela Maria Frisicale

F Ferraro[1], EM Frisicale[1], A Rapiti[1], C Marotta[1], S Bonfigli[1], U Angeloni[1], F Maraglino[1], G Rezza[1]
[1]DG Health Prevention, Ministry of Health, Rome, Italy
Contact: em.frisicale@sanita.it

Issue/Problem:

Religious Mass Gathering (MG) represent one of public health challenges for Health Authorities due to potential spread of communicable diseases. This is much more true during a pandemic as COVID-19. Surveillance is crucial to prevent further spreading of infectious disease related to a religious MG.

Description of the problem:

During international contact tracing activities an increase of reporting of COVID-cases with a travel history to a Catholic shrine in Europe was observed, despite travel restrictions put in place. In order to promote public health actions as risk communication, a risk evaluation was conducted. A descriptive analysis was carried out: personal and vaccination data were collected; for cases, date and type of positive tests, date of symptoms' onset were collected; for high-risk contacts, date and type of negative tests at the end of follow-up were collected. Frequencies were calculated.

Results:

Six journeys back from Medjugorje were identified, with at least one positive case. All trips took place between 18/09/2021 and 29/10/2021. 31 positive cases out of 160 travellers were identified, with number of cases per travel ranging from 1 to 11.

Lessons:

Religious MG represent an important global health issue. Even though a specific surveillance was not activated, international contact tracing activities turned out a great source of epidemic intelligence and consequent surveillance and control activities led to risk assessment and communication actions.

Key messages:

- In the pandemic context, where travel restrictions were put in place, surveillance for Religious MG should be always implemented.
- Cooperation among all the stakeholders involved as Church, travel agency, Regional Health Systems and Government Bodies has to be promoted for specific surveillance in religious MG events.

Isostrain among tourism employees in Tunisia during COVID-19 pandemic

Sihem Ben Fredj

A Maatouk[1], S Ben Fredj[1,2], N Zammit[1,2], R Ghammem[1,2], J Maatoug[1,2], S Boujebha[1], N Guesmi[1], B Zendah[3], H Ghannem[1,2], K Hadj Mabrouk[3]
[1]Epidemiology Department, University Hospital Farhat Hached of Sousse, Sousse, Tunisia
[2]University of Sousse, Faculty of Medicine of Sousse, Sousse, Tunisia
[3]Groupement de Médecine du Travail de Sousse, Sousse, Tunisia
Contact: Benfredj.Sihem@famso.u-sousse.tn

Background:

Psychological and social factors related to work activity can improve or deteriorate the physical and mental health of employees. Since the COVID-19 pandemic, the psychological well-being of workers has been strongly affected. Particularly, jobs with isostrain characterized by high work demands and low work control, coupled with low social support, place employees at highest risk for poor mental health. We aimed to assess the factors associated with isostrain among employees in the tourism sector in Sousse.

Methods:

A cross-sectional study was conducted between September and November 2020 among tourism workers belonging to 12 hotels and restaurants in Sousse, Tunisia, using a self-administered questionnaire. 'Isostrain' was assessed using the Karasek questionnaire. 'Isostrain' is a situation where there is a combination of 'jobstrain' ('tension at work') and low social support (score below the median of the group). SPSS 20 software was used to analyze the data.

Results:

A total of 226 workers were included. The mean age was 38.2 ± 9.6 years. The sex ratio was 2.7. The majority of employees (64.8%) were working at workplace during COVID-19 lockdown. The prevalence of isostrain was 5.4%. Isostrain was reported by 5.7% of women (p = 1). All workers older than 50 years did not have isostrain (p = 0.6). Moreover, isostrain was found among 6.6% of workers with less than 5 years of work experience (p = 0.4), 4.8% of married employees (p = 0.7), and 7.6% of employees with a university education (p = 0.53).

Conclusions:

Isostrain can affect employees in the tourism sector. Social support should be promoted among workers to ensure good mental health.

Key messages:

- Prevalence of isostrain in tourism sector of Sousse during COVID-19 pandemic is quite high.
- Preventive strategies of mental health should be promoted at workplace in Tunisia.

Abstract citation ID: ckac131.086
Lessons from the epidemiological investigation efforts during the COVID-19 epidemic in Israel

Liron Inchi

L Inchi[1], *S Bord*[1], *B Madjar*[2]
[1]Health Systems Management, The Max Stern Yezreel Valley College, Yezreel Valley, Israel
[2]Haifa District, Ministry of Health, Jerusalem, Israel
Contact: lironi@yvc.ac.il

Background:

The COVID-19 pandemic caused a crisis in the Israeli healthcare system. The wave-like morbidity created an overload of epidemiological investigations, which led to delays and less than successful efforts to prevent infection. For this reason, Israel decided to mobilize the military for this purpose, creating a forced cooperation between the Ministry of Health (MOH) and the IDF, an expert in dealing with crises.

Aim:

To examine the implications of the forced encounter between the IDF and the healthcare system, including both tensions and cooperation efforts.

Methods:

Twenty in-depth interviews were carried out with MOH and IDF personnel in different roles at various levels towards the end of the second pandemic wave in Israel.

Findings:

The findings present a dual picture of cooperation and mutual respect, side by side with contradictions and conflicts. The feeling that the IDF came in to 'save the day' placed the healthcare people in an inferior position. Clearly, there was no explicit plan for division of authority. It was clear to the healthcare staff that they have the authority as the professionals, and to the IDF people that they have it as the 'saviors' brought in for this purpose. The healthcare people did see the potential of the military force mobilized for this purpose, but felt they were asked for their opinion only initially, when the military personnel had to study the system. As soon as they became familiar with it, they were no longer asked for advice, and control was given to the IDF. The findings also show that the MOH's qualitative professional approach often clashed with the IDF's action-based approach.

Conclusions:

The military was mobilized as a crisis expert in order to assist the healthcare system in managing said crisis, but in fact this assistance had many side effects. Managing expectations, division of authority and open, sharing communication may have been useful in preventing the conflicts and managing them.

Key messages:

- It is important to be aware of the a-symmetrical power relations of the military-healthcare system interface in order to create effective work and true, coherent cooperation.
- Management of expectations, organized division of authority and open, sharing communication may have assisted in preventing the conflicts raised and managing them.

[3]Department of Emergency, Anesthesiology and Resuscitation Sciences, Fondazione Policlinico Gemelli IRCCS, Rome, Italy
Contact: nicolamagnavita@gmail.com

Background:

The PSIC study (Prospective Study of Intensivists and COVID-19) monitored the intensivists working in one of the two COVID-19 hub hospitals in Central Italy over 2 years from April 2020. This study showed how mental health varies in relation to the stressors posed by the different pandemic phases.

Methods:

In 4 surveys corresponding to the 4 pandemic waves, the intensivists were invited to indicate changes in work activity and measure their state of mental health using standardized questionnaires administered via SurveyMonkey.

Results:

During the pandemic there was a change in occupational stressors that led to insomnia, anxiety, depression, burnout, job dissatisfaction, unhappiness and intention to quit. The predominant stressors in the first wave were fear of unprotected exposure, distrust of safety measures, and compassion fatigue from having to inform relatives of the adverse outcome of treatment. In the second and third waves the workload, the monotony due to always following only one type of patient, the isolation, and the lack of time to meditate were the more relevant factors. The fourth wave added the stress deriving from interacting with anti-vax patients

Conclusions:

Specific prevention strategies have been developed and applied for each of the stress factors identified. Excessive workload and lack of time for meditation originated from lack of staff were remedied with extraordinary temporary hires. The management of compassion fatigue and relations with anti-vax people were addressed with specific policies and training. The monotony and isolation in COVID-19 wards can only be resolved through employee turnover in ordinary departments. Organizational and financial efforts are necessary to protect the health of intensivists during a pandemic.

Key messages:

- Monitoring of critical care workers during the pandemic waves indicated the preventive measures necessary to ensure their mental health and quality of care.
- Protecting healthcare workers is a priority.

[3]Department of Hygiene and Epidemiology, Medical University in Lublin, Lublin, Poland
[4]Student Research Group, University of Zielona Gora, Zielona Góra, Poland
Contact: ganczak2@wp.pl

Background:

Sufficient knowledge and preventive practices are crucial to control the spread of SARS-CoV-2. To date, some data regarding these issues have been reported among different professions, whereas such information is inaccessible in teachers.

Methods:

An institution-based cross-sectional study was conducted between May-June 2021 in 3 randomly selected Polish provinces, in 26 schools. An anonymous, self-administered questionnaire which included 10 questions related to COVID-19 knowledge and 13 questions about preventive practices was used. Each correct answer to the question about COVID-19 knowledge was given 1 point and question about preventive practices was given 1 to 3 point (max. 11 and 39 points respectively). Bi- and multivariable logistic regression models were fitted to identify the predictors of COVID-19 knowledge; simple/multiple linear regression analyses were done for factors associated with practices.

Results:

464 teachers were included (response rate was 55%), 92% females, mean age 45.6±10.2 years. The average COVID-19 knowledge score was 6.6±3.76 points; in 77% of teachers the knowledge level was >50%. The mean of preventive practices score was 15.8±1.78 points; 204 (55.1%, 95% CI 50.0% to 60.2%) respondents scored above the mean score of preventive practices. Wearing a mask (β: 0.09 95%CI 0.00-0.03), washing hands (β: 0.09 95%CI 0.00-0.02), avoiding crowds (β: 0.12 95%CI 0.01-0.07), and avoiding visiting relatives (β: 0.10 95%CI 0.00-0.07) were significantly associated ($p < 0.05$) with knowledge about COVID-19. Knowledge was the strongest predictor of avoiding crowds (β coefficient = 0.12).

Conclusions:

Significant number of school teachers had inadequate COVID-19 knowledge and were poorly engaged in COVID-19 preventive practices. As knowledge level strongly influences adequate preventive behavior, additional educational intervention is urgently needed for teachers to help them better manage the pandemic at the school setting.

Key messages:

- This study assessed COVID-19 knowledge and preventive practices, as well as related determinants among primary school teachers.
- This study assessed the attitudes of primary school teachers towards the Covid-19 pandemic.

Introduction:

Knowing predictors for adherence to governmental recommendations is fundamental to guiding health communication in pandemic situations. This study investigated whether political stringency was associated with students' adherence to the COVID-19 governmental measures in the Nordic countries (Denmark, Finland, Norway, Iceland, and Sweden) and the United Kingdom (UK).

Methods:

We used data from a cross-sectional online survey, from university students in all Nordic countries and the UK (N = 10.345), in May 2020. Data on socio-demography, study information, living arrangements, health behaviors, stress, knowledge, and concern about COVID-19 infection supplemented with measures on political stringency from the Oxford Covid-19 Government Response Tracker were utilised. Multiple linear regression analysis methods were applied.

Results:

Around 66% reported that they followed governmental measures. Our model explained only 10% of the variation of adherence. The main predictors for adherence were older age, female sex, and being worried about the COVID-19 infection. More days since lockdown and political stringency were also associated with adherence to governmental recommendations in all countries. Sweden had the lowest willingness to adhere to governmental recommendations even though the strength of the association between political stringency and adherence was similar to other countries.

Conclusions:

Political stringency and congruent communication are important in ensuring adherence to governmental recommendations during the first wave of the COVID-19 pandemic.

Key messages:

- Political stringency is important to ensure adherence to governmental recommendations.
- Congruent communication is important to ensure adherence to governmental recommendations.

Vaccine Literacy, Covid-19 and influenza: a cross-sectional survey in Prato in the 2nd pandemic wave

Mario Bruschi

M Bruschi[1], L Stacchini[1], E Stancanelli[1], B Velpini[1], V Lastrucci[2,1], F Puggelli[3], R Berti[4], C Lorini[1], G Bonaccorsi[1]

[2]Epidemiology Unit, Meyer Children's University Hospital, Florence, Italy
[3]Management Department, Meyer Children's University Hospital, Florence, Italy
[4]Department of Prevention, Azienda Sanitaria Locale Toscana Centro, Florence, Italy
Contact: Mario.bruschi@unifi.it

Covid-19 is a pandemic and an infodemic, with contrasting information regarding risk and preventive measures, including vaccination. This study aims to assess Vaccine Literacy (VL) of a sample of workers in the province of Prato (Tuscany, Italy) in the second wave of the Covid-19 pandemic (November-December 2020) and to analyze the relationship between VL and attitudes about Covid-19 and flu vaccination. A cross-sectional design was adopted. Sociodemographic characteristics, health information, vaccination behaviour for past and current flu season and intention to get vaccinated against Covid-19 were collected. A multivariate logistic regression was performed to identify predictors of getting a Covid-19/flu vaccination. The Italian Health Literacy tool on Vaccination (HLVa-IT) tool was used to measure VL. A total of 117

questionnaires were analyzed. Among them, 64.9% intended to get Covid-19 vaccine. The mean VL was 3.18 ± 0.43 (functional 2.87 ± 0.72; interactive-critical 3.36 ± 0.45) out of 4. Having more than one comorbidity was a negative predictor of intention to get Covid-19 vaccine (OR: 0.21 95%CI: 0.04 - 0.91). Regarding the flu vaccine, being vaccinated in the previous season was the only positive predictor of being vaccinated in the current season (OR = 24.25 95%CI 7.96 - 87.73). The study was conducted before the authorization of Covid-19 vaccines: little information about them may have contributed to VL not being related to the intention to get vaccination. The negative role of comorbidities could be due to fear of adverse effects on fragile health status. For flu vaccination, VL may have exerted a lower impact because of the positive experience with the flu vaccine in terms of safety and effectiveness in the previous seasons.

Key messages:

- The introduction of new vaccines should be supported by effective communication.
- Better knowledge of current vaccines and not just routine administration is desirable for greater personal empowerment.

Background:

The National Institute of health (ISS), within the G20 Health Working Group, launched at March 2021 an innovative training Laboratorium, to strengthen the capacity and competencies of the Public Health Workforce (PHW) on prevention, preparedness and response to health crises. It was recognised in the G20 Declarations of Ministers of Health and Leaders and it was aimed to the development of training tools suitable for distance learning. ISS proposed the design of e-Learning courses based on an integration of WHO's Competency-Based Education (CBE) and Problem Based Learning (PBL) models.

Objectives:

Describe the design of a pilot e-Learning course based on CBE-PBL models, focused on Epidemic Intelligence (EI).

Results:

The pilot e-Learning course ''Use of Epidemic Intelligence systems with a particular focus on event-based surveillance for pandemic preparedness'' will be delivered by ISS e-Learning platform https://www.eduiss.it. By the end of the course participants will be able to evaluate the potential use/applicability of EI systems, focusing on event-based surveillance for preparedness and early warning at country/institutional level. CBE is the basis for articulating the outcomes and identifying the required competencies and PBL for creating learning activities associated to learning outcomes. Interactive tools (exercise, web pages, quiz and other activities) are associated to learning objectives. The course is offered to public health professionals free of charge, in English language. About 16 hours are required to complete all the activities and receive attendance certification.

Conclusions:

Continuously updated training of PHW is a hallmark to better face health challenges. In our proposal, the learning methodology integrates CBE vision with PBL approach, adapting both to e-Learning context.

Aknowledement: Pietro Carbone, Debora Guerrera, Federica Regini, Licia Bacciocchi, Stefania Bocci, Silvia Stacchini, Giovanna Failla - ISS, Rome Italy

Key messages:

- Design an innovative e-learning course through synergic integration of two educational models crucial in public health, CBE and PBL.
- Adapt e valorize CBE and PBL models in the context of e-Learning.

Abstract citation ID: ckac131.092
Migrant and ethnic minorities at higher risk of COVID-19 severe outcomes? A systematic review

Elena Mazzalai

E Mazzalai[1], D Giannini[1], ME Tosti[2], A Jaljaa[1], S Caminada[1], F Turatto[1], C De Marchi[1], A Gatta[1], G Marchetti[2], M Marceca[1]
[1]Department of Public Health and Infectious Diseases, Sapienza University of Rome, Rome, Italy
[2]National Centre for Global Health, National Health Institute, Rome, Italy
Contact: elena.mazzalai@uniroma1.it

Background:

The Covid-19 pandemic has had a recognised impact in widening health inequalities, both between and within countries, with a major impact on socially disadvantaged population groups such as Migrants and Ethnic Minorities (MEMs). While there is growing evidence on the matter worldwide, data specific to the WHO European Region is scarce. The issue, however, is pressing, since it is estimated that almost 10% of the population living in the WHO European Region is made up of migrants. The aim of the study is to investigate the impact of Covid-19 on MEMs compared to the general population in terms of serious outcomes.

Methods:

We conducted a systematic review collecting studies on the impact of Covid-19 on MEMs compared to the general population in the WHO European Region regarding hospitalisation, intensive care unit (ICU) admission and mortality, published between 01/01/2020 and 19/03/2021. Fourteen researchers were involved in selection, study quality assessment, data extraction and analysis.

Results:

Of the 82 studies included, 15 of the 16 regarding hospitalisation for Covid-19 reported an increased risk for MEMs compared to the white and/or native population and 22 out of the 28 studies focusing on the ICU admission rates found an increased risk for MEMs. Among the 65 studies on mortality, 43 report a higher risk for MEMs. 82% of the studies were conducted in the UK.

Conclusions:

These findings highlight the disproportionate impact of Covid-19 on MEMs population, with an increased risk of all the adverse outcomes taken into consideration. Social determinants of health are among the main factors involved in the genesis of health inequalities: a disadvantaged socio-economic status, a framework of structural racism and asymmetric access to healthcare are linked to increased susceptibility to the consequences of Covid-19. These findings underline the need for policy-makers to consider the socio-economic barriers when designing health promotion plans.

Key messages:

- The combination of disadvantage socioeconomic conditions with COVID-19 transmission characteristics put migrants and ethnic minorities at a higher risk of facing sever health outcomes.
- The amount of evidence on the inequal impact of COVID-19 on migrants and ethnic minorities produced by European countries is poor. This gap must be filled to develop effective health promotion plans.

Abstract citation ID: ckac131.093
Risk of SARS-CoV-2 infection in high and low-risk cohabitants, in Loures and Odivelas, Portugal

Inês Mateus Cunha

I Mateus Cunha[1], *JL Marques*[1], *IM Subtil*[1], *M Bragança Pereira*[1,2], *C Gabriel*[1], *C Vieira*[1], *C Cordeiro*[1], *F Abreu Gomes*[1], *L Bastos*[1]
[1]Public Health Unit, Group of Primary Healthcare Centers of Loures-Odivelas, Santo António dos Cavaleiros, Portugal
[2]Superior Nursing School of Lisbon, Lisbon, Portugal
Contact: inescunha12@gmail.com

Background:

Effective contact tracing, vaccination, and isolation of cases of SARS-CoV-2 infection and their high-risk contacts constituted measures to contain the spread of COVID-19. In Portugal, in October 2021, low-risk cohabitants were lifted the obligation to isolate. The aim of this study was to estimate the relative risk of infection for close contacts, regarding the type of close contact and being cohabitants.

Methods:

A descriptive longitudinal study, with an analytical component was performed. Sociodemographic and epidemiologic data from close contacts and confirmed cases in Loures and Odivelas, between October and November 2021, was collected from a regional database and from Trace COVID-19 platform. We performed a descriptive analysis and estimated the relative risk of SARS-CoV-2 positive test, stratified by type of contact and cohabitation, with 95% confidence level.

Results:

We identified 200 confirmed cases and 428 people who were close contacts, corresponding to 502 different close contacts (59 people had contact with more than a case). From 502 close contacts, 268 were classified as low-risk and 230 as high-risk. Full time cohabitation was present in 310 of close contacts. Between contact tracing day and the next 4 weeks, 58 (10.9%) of close contacts tested positive. Risk of high-risk contacts testing positive was 2.7 [1.5-4.6], compared with low-risk contacts. Risk of cohabitants testing positive was 3.5 [1.6-7.7], compared with non-cohabitants. Risk of a high-risk cohabitant testing positive was 2.2 [1.1-4.4], compared with low-risk cohabitants. There was no higher risk of high-risk cohabitants testing positive compared with high-risk non-cohabitants. Same was true for low-risk cohabitants and non-cohabitants.

Conclusions:

These results allow us to understand how to better stratify close contacts and apply isolation measures, according to the risk of testing positive. Further studies should be developed to assess the impact of other variables.

Key messages:

- We identified an increased risk of testing positive in high-risk contacts, and in cohabitants.
- Cohabitants could be stratified regarding being high or low-risk, with different measures being applied.

Covid-19-related health literacy: a cross-sectional study in Israel

Michal Laron

N Abdel-Rahman[1], *M Laron*[1], *O Baron-Epel*[2], *T Artom*[1], *D Levin-Zamir*[2,3]
[1]Health Policy Team, Myers JDC Brookdale, Jerusalem, Israel
[2]School of Public Health, University of Haifa, Haifa, Israel
[3]Department of Health Education and Promotion, Clalit Health Services, Tel Aviv, Israel
Contact: michalla@jdc.org

Background:

The "infodemic" related to Covid-19 emphasized the importance of the public's ability to access, understand, appraise and use information to make decisions about health. This study aimed to:

1. Assess the components of Covid-19 related health literacy (Co-HL)
2. Examine the associations of socio-demographic variables and health status with Co-HL

Methods:

This study was conducted as part of the European Health Literacy Population Survey 2019-2021 (HLS19). A cross-sectional survey of a representative sample of adults in Israel was conducted in December 2020 using phone interviews and an online survey (n = 1,315). Five items measuring Co-HL were added. Multivariable regression models were used to assess the associations between socio-demographic variables and health status with Co-HL.

Results:

Of participants, 63% reported concern about Covid-19. The mean general HL was lower among those who reported concern about Covid-19 compared to those who worried less (p = 0.002). The most difficult component of Co-HL was "judging the reliability of information regarding Covid-19" (36% expressed difficulty). Older participants, those with low self-reported social status, and low self-assessed health, were significantly ($p < 0.05$) more likely to express difficulty in judging the reliability of Covid-19 information. Interestingly, education level was not significantly associated with Co-HL.

Conclusions:

Our results suggest that, to best promote the use of information on Covid-19 prevention, older people, those with low social status and those with poor general health should be prioritized for improving critical health literacy.

Key messages:

- Co-HL is unequally distributed in the population, warranting tailored health promotion efforts.
- It is vital to improve the ability of the population to identify reliable information about covid-19.

Abstract citation ID: ckac131.095
The LoCo (Lockdown Cohort)-effect: Socioeconomic differences in fertility during the pandemic

Moritz Oberndorfer

M Oberndorfer[1,2], *AM Tilstra*[3], *R Dundas*[2], *AH Leyland*[2], *A Pearce*[2]
[1]Center for Public Health, Medical University of Vienna, Vienna, Austria
[2]MRC/CSO SPHSU, University of Glasgow, Glasgow, UK
[3]Leverhulme Centre for Demographic Science, University of Oxford, Oxford, UK
Contact: moritz.oberndorfer@muv.ac.at

Background:

The economic and social disruptions caused by the COVID-19 pandemic and its mitigation measures may have affected fertility unequally across social strata. If a compositional change in maternal socioeconomic characteristics is confirmed, counterintuitive changes in future population health - the LoCo-effect - are likely.

Methods:

We analysed data from maternal inpatient discharge records containing births between January 2018 and November 2021 by Scottish Index of Multiple Deprivation (SIMD) quintile. We used monthly number of births before November 2020 to estimate expected monthly births after November 2020 and compared against observed births in each SIMD quintile. Further, we estimated associations between monthly average stringency of national mitigation measures (Stringency Index (0-100)) and births 9 to 13 months later using distributed lag models.

Results:

Between November 2020 and November 2021, there were 1301 (10.3%) fewer births than expected for the most deprived quintile (Q1; 953 (8.7%) and 375 (4.1%) less in Q2 and Q3). In the two least deprived quintiles, however, fertility remained mostly unchanged. A 10-point increase in monthly average Stringency Index in Q1 was associated with an average cumulative decrease of 8.5 births (95%CI: -14.1; -2.8, p = 0.006) 9 to 13 months later. Conversely, this estimate was a 4.4 increase (95%CI: 1.3; 7.5, p = 0.008) in Q5 and a 5.9 increase (95%CI: 1.4; 10.4, p = 0.013) in Q4.

Conclusions:
Apart from their exposure to pandemic and lockdowns, it is likely that, due to compositional changes in births, the observed LoCo started life, on average, more socially advantaged than previous birth cohorts in Scotland. We show a substantial decrease in fertility in the most deprived areas, while fertility remained little changed in the least deprived areas. Increases in the stringency of lockdown measures were associated with a decrease in births in the most deprived but an increase in the least deprived areas 9 to 13 months later.

Key messages:
- Between November 2020 and November 2021, there were substantial decreases in births among deprived areas in Scotland while fertility in the least deprived areas remained mostly unchanged.
- For these births, the observed compositional shift in maternal socioeconomic characteristics may lead to changes in current and future health and health needs – the LoCo (Lockdown Cohort)-effect.

Abstract citation ID: ckac131.096
Training the Armed Forces personnel in COVID-19 contact tracing: a Portuguese case study

Sofia Carmezim Pereira

S Carmezim Pereira[1], A Bicho[1], I Guerra[1], M Borges[1], BS Vieira[1], D Loyens[1], F Barcelos[1], M Carreira[1], E Calé[1]
[1]Public Health Unit António Luz, ACES Amadora, Amadora, Portugal
Contact: scarmezimpereira@gmail.com

Background:
Local contact tracing teams needed to be reinforced in preparation for a peak in Covid-19 cases. The Portuguese Armed Forces showed availability and their members initiated a formal training facilitated by the Public Health Unit (PHU) of Amadora. Health systems must be prepared to respond to all threats, as the COVID-19 pandemic showed us the need for quick task shifting and the training of non-experts' workers.

Objectives:
The aim of the project was to develop contact tracing skills by non-health professionals, in the context of the COVID-19 pandemic. The training program was held online, with a total duration of 48 hours, distributed by the topics described: introduction to health and epidemiology concepts, the national guidelines, and the information systems (13h). We privileged demonstrative and participatory training methods, followed by continuous supervision of each contact tracing survey and constant feedback (35h). Learning support materials were sent out to assist the trainees, including written and video support.

Results:
More than 200 personnel - sailors, soldiers and airmen - were trained. Each Lisbon and Tagus Valley area PHU was reinforced with a team of military professionals in order to support the contact tracing process, with an increase in the number of surveys completed. We highlight as positive aspects: increased number of contact tracing surveys carried out; growth of inter-institutional partnerships; freeing up of specialized PHU resources to other important tasks. As for negative aspects we focus on the complexity in health communication, the limited time for training, and the lack of specific health knowledge of the trainees.

Conclusions:
This pandemic revealed the Portuguese need for a transdisciplinary approach in the provision of care, specially at a Public Health level. Training programs like these highlight the vital role of reshaping and reorganizing the healthcare workforce answering Public Health necessities.

Key messages:
- Training programs for non-health workers must be prepared to reinforce health systems when necessary. The reinforcement of contact tracing teams by the Portuguese Armed Forces was a great example.
- A transdisciplinary approach in the provision of care was essential during the COVID-19 pandemic. Specific training of non-health workers can be planned in time to respond to health threats.

Abstract citation ID: ckac131.097
Where are the children of working parents during school closures?

Sigrid Mairhofer

S Mairhofer[1,2], B Plagg[2,3], H Flarer[4]
[1]Applied Social Sciences, Hochschule München University of Applied Sciences, Munich, Germany
[2]Institute of General Practice and Public Health, Provincial College for Health Professions Claudiana, Bolzano, Italy
[3]Faculty of Education, Free University of Bozen - Bolzano, Bolzano, Italy
[4]Eurac, European Research Academy, Bolzano, Italy
Contact: sigrid.mairhofer@hm.edu

Italy was the first European country to be hit hard by the pandemic and in the context of the Covid-19 pandemic, there were several closures of education and care facilities. The first closure of education facilities lasted continuously from March to September 2020, followed by numerous shorter closures. However, if working parents continue to (have to) work, the question arises who will look after the children during this time when facilities close. To answer this question a quantitative survey of working parents during a 'hard closure' week in February/March 2021 was conducted in the province of Bolzano (Northern Italy). 3725 adults as parents of a total of 7,372 children from different households responded. Although not officially allowed, 53.4% of all participants sought help from people outside the nuclear family to bridge the situation, mostly from grandparents (79%; n = 1855). The situation that grandparents represented the main risk group at the time and could not yet have sufficient vaccination protection appears particularly worrying here. Other parents' coping strategies included working early in the morning or at night (23 %; n = 850), or leaving children unsupervised (25 %, n = 929).

Conclusions:
School closures shift families to new strategies, including unhealthy models of alternating work/childcare, 'illegal' involvement of third parties outside the nuclear family, and neglect of age-appropriate childcare. Our findings highlight that when childcare facilities are repeatedly closed, working families need additional support strategies to reduce contact and minimize secondary harms.

Key messages:
- When schools close, parents have to find new strategies for where to take their children, many have contacts outside the home.
- Grandparents (also as a risk group) play a major role in childcare even during a lockdown.

Abstract citation ID: ckac131.098
Characteristics of COVID-19 cases with breakthrough infection in the governorate of Sousse, Tunisia

Sihem Ben Fredj

S Ben Fredj[1,2], R Ghammem[1,2], N Zammit[1,2], A Maatouk[1], N Hadded[1], H Laadhari[3], J Maatoug[1,2], H Ghannem[1,2]
[1]Department of Epidemiology, University Hospital Farhat Hached, Sousse, Tunisia
[2]Faculty of Medicine of Sousse, University of Sousse, Sousse, Tunisia
[3]Regional Health Office of Sousse, Ministry of Health, Sousse, Tunisia
Contact: Benfredj.Sihem@famso.u-sousse.tn

Introduction:
In early 2021, Tunisia implemented a national COVID-19 strategy of vaccination aimed at disease elimination. In this study, we aimed to investigate the characteristics of the

breakthrough COVID-19 infection in the governorate of Sousse, Tunisia.

Methodology:

We conducted a cross-sectional study including all post-vaccination COVID-19 cases from March 2021 to August 2021. We collected data via 15-minute telephonic call interviews. We estimated the specific incidence rates (SIR) of confirmed cases by vaccine type and expressed them as cases per 100 000 inhabitants. Statistical analyzes were carried out using anonymous and codified Excel tables and SPSS 20.

Results:

Overall, we included 618 cases of breakthrough COVID-19 infection. The majority were female (sex-ratio = 0.8), and the average age of the overall cases was 55.7±14.5 years (range:19-91). Nearly half (49%) of participants had comorbidities, 19.6% were healthcare workers, and 17.9% were smokers. The majority of cases (70%) received at least one dose of Pfizer vaccine followed by CORONAVAC (15.6%; n = 96). Nevertheless, we found a higher incidence rate of COVID-19 among those vaccinated with SPUTNIK V (SIR = 1551.2) followed by SINOPHARM (SIR = 823.7). Fifty-eight percent of patients reported a poor adhesion to preventive measures, whereas 38.6% reported high respect for the preventive measures. COVID-19 infection led to hospitalization in 8.1% of cases, hospitalization in intensive care units in 2.1% of cases, and death in 1.8% of cases.

Conclusions:

The findings of our study highlight the low rate of severe cases of COVID-19 among the vaccinated population. Furthermore, we found a discrepancy in the effectiveness of vaccines in the prevention of transmission potential. Yet, many factors could influence the transmission and the severity of COVID-19 breakthrough infection from one region to another.

Key messages:

- low rate of severe cases of COVID-19 among the vaccinated population.
- discrepancy in the effectiveness of vaccines in the prevention of transmission potential.

Abstract citation ID: ckac131.099

Factors associated with post-COVID-19 confinement vape use in young adults

Josue Eli Villegas Dominguez

JE Villegas Dominguez[2,1], C Reyes Hernandez[2], AR Rodríguez Barranco[2], M Pérez Santamaria[2], H Juárez de la Huerta[2], A Martínez Torralva[2], EA Gonzalez David[2], BL Muñoz Bautista[2], FG Marquez Celedonio[2]

[1]Facultad de Medicina, Campus Veracruz, Universidad Veracruzana, Veracruz, Mexico

[2]Facultad de Medicina, Universidad del Valle de Mexico, Veracruz, Mexico

Contact: josue_eli@hotmail.com

Introduction:

The use of Vape has increased during the pandemic due to the changes generated by it. Currently we have finished the conditions of confinement, so it is important to identify

Objective: To determine the factors associated with post-COVID-19 confinement vape consumption in young adults

Methods:

A cross-sectional, prospective study was carried out between January and April 2022, including men and women residents of Veracruz aged between 18 and 35 years, excluding participants with addiction treatment or with a diagnosis of a lung disease. A survey was applied through Google Forms to identify the factors associated with Vape consumption after confinement by COVID-19, including depression, anxiety and stress evaluated with the DASS-21 instrument (Cronbach's alpha between 0.79 and 0.87). For data analysis, SPSS v22 software was used, X2 test with Odds Ratio (OR) and 95% confidence interval (CI95%) and MannWhitney U test, assigning statistical significance with $p < 0.05$.

Results:

514 participants were included, with a prevalence of vape use of 28.5%. Physical activity, cigarette consumption by a family member, levels of anxiety, depression and stress showed a value of $p > 0.05$ for Vape consumption, while other factors (OR/95%CI) such as being female (0.6/0.4-0.9), identifying vape advertising on Facebook (0.35/0.19-0.65), having a family member who vapes (2.4/1.5-3.6), consuming cigarettes (4.2/2.7-6.4) and identifying vape advertising on Instagram (1.5/1.0-2.3) had values of $p < 0.05$

Conclusions:

Post-pandemic vape use is not affected by anxiety, stress or depression, identifying other factors that favor its use such as the environment in which it develops, such as being someone with a history of tobacco use, in addition to the family smoker and advertising on Instagram, which is a social network that often works as an aspirational image for users, a situation contrary to what is shown on Facebook.

Key messages:

- Vape consumption continues to be a post-pandemic public health problem, so it is necessary to reinforce educational measures on the subject and the post-Covid complications of its use.
- It is necessary to regulate vape advertising on social networks, as has been done with tobacco in different countries, since it can become a risk factor by showing aspirational images for users.

Decolonising global health in Africa: research agendas in public health, law, and human rights

David Patterson

D Patterson[1], M Woldeyes[1], N Schuck[1], E Henricson[1], N Njuguna[2], M Oduor[3]

[1]Groningen Centre for Health Law, University of Groningen, Groningen, Netherlands

[2]Faculty of Law, University of Nairobi, Nairobi, Kenya

[3]Faculty of Law, Moi University, Eldoret, Kenya

Contact: d.w.patterson@rug.nl

Background:

In recent years the Groningen Centre for Health Law ('GCHL' - formerly the Global Health Law Groningen Research Centre), Netherlands, has held annual summer schools on global health, law, and human rights. Responding to calls to decolonise global health (Fofana, 2021), in February 2022 GCHL convened an online academic colloquium to explore the issues in Africa. Panellists and discussants comprised leading African academics and advocates for public health, law, and human rights.

Objectives:

1. Identify priority current and emerging issues in global health, law, and human rights in the African region with, where possible, reference to the climate crisis.

2. Explore opportunities for identifying academic institutions, networks, and researchers working these issues across Africa.

3. Identify opportunities to support collaboration between institutions, networks and researchers and other actors to address the issues identified across the region

Results:

Top public health issues identified for further research included: public health law frameworks in Africa; One Health and climate change; inequality in the distribution of the determinants of health and disease; international trade and public health; the right to benefit from scientific progress (e.g. in accessing vaccines for COVID-19); gender-based violence; public health and agri-food systems; noncommunicable diseases; healthy diets; poverty; mental health; social protection; and plastic pollution. The first meeting of the network on health, law and human rights in Africa was held in May 2022. The second academic colloquium was held in July 2022, co-hosted with Moi University and the University of Nairobi, Kenya.

Conclusions:

Public health and legal academics in Africa are ready to engage systematically with European partners to address key health-related law and human rights issues of global interest. Research agendas should reflect African priorities, and collaboration should be led by African institutions.

Key messages:

- Capacity must be built to understand the links between public health, law and human rights in Africa.
- Collaboration with European institutions to build capacity in public health, law and human rights is welcome, however priorities should be identified by - and responses led by - African academics.

[3]Head of Sweden Office, Tinkr, Stockholm, Sweden
[4]Kinshasa School of Public Health, University of Kinshasa, Kinshasa, Democratic Republic of the Congo
[5]Faculty of Health Science, Benadir University, Mogadishu, Somalia
Contact: ir.fbangelesa@hotmail.fr

There is great urgency for action to achieve the Sustainable Development Goals, especially in fragile settings, which face acute and complex challenges. Yet, the public sector may be limited in its capacity to address these appropriately, with devastating effects on the health of people and environment now and in the future. The challenges to sustainable health require professionals who are trained relevant competences. In 2020, Karolinska Institutet, Sweden, and Makerere University, Uganda, developed the Centre of Excellence for Sustainable Health under which a new partnership was established with Benadir University, Somalia, Kinshasa School of Public Health, the Democratic Republic of Congo, and Tinkr, Norway to develop training on innovation for sustainable health. The aim of ''Managing Innovation for Sustainable Health'' (MISH) is to strengthen the capacity to contribute to achieving sustainable health through innovation in the public sector. It targets managers in Somalia, DRC and Uganda from the public and private sector, academia, and civil society. It is one year long, part-time and delivered online with one study trip. It features three modules covering Agenda 2030 and Sustainable Health; Multisectoral Collaboration and Implementation Science; and Innovation and Innovation Management. Integration of participants' learnings into their professional role, mutual learning between participants, and an emphasis on applicability, all underpin the learning strategies of the program. Quality is monitored through expectation surveys, baseline mid and final impact assessments, module and final program evaluations. MISH has trained about 50 managers, 85% of which say that the training was useful. All partners are represented in both operational and strategic organizational bodies of the program. Our model shows what is possible through collaborative online international learning delivered by partnerships defined by teamwork, trust, and a dedication to true impact.

Key messages:

- There is great urgency for action to achieve sustainable health especially in fragile settings.
- There is momentum for higher education to leverage the opportunities of the covid-19 to rethink learning for the global challenges.

DD Achieving universal health coverage (UHC): reducing health inequity

Abstract citation ID: ckac131.102
Socioeconomic and geographic inequalities in colorectal cancer in Cyprus: An ecological study

Demetris Lamnisos

D Lamnisos[1], *K Giannakou*[1]
[1]Department of Health Sciences, European University Cyprus, Nicosia, Cyprus
Contact: D.Lamnisos@euc.ac.cy

Background:

Colorectal cancer (CRC) is one of the main causes of mortality and morbidity worldwide. To date, the relationship between regional deprivation and CRC incidence or mortality has not been studied in the population of Cyprus. The aim of this study was to analyse the geographical variation of CRC incidence and mortality and its possible association with socio-economic inequalities in Cyprus for the periods between 2000 and 2015.

Methods:

A small area ecological study in Cyprus, with census tracts as units of spatial analysis, for the period between 2000 and 2015. The incidence date, sex, age, post code, primary site, death date in case of death or last contact date in case of alive for all cases of CRC from 2000-2015 were obtained from the Cyprus Ministry of Health. Indirect standardization was used to calculate the sex and age Standardize Incidence Ratios (SIRs) and Standardized Mortality Ratios (SMRs) of CRC while the smoothed values of SIRs, SMRs and Mortality to Incidence ratio (M/I ratio) were estimated using the univariate Bayesian Poisson log-linear spatial model.

Results:

There are geographical areas having 15% higher SIR and SMR, with most of those areas located at the east coast of the island. Higher M/I ratio values were found in the rural, remote, and less dense areas of the island while lower rates were observed in the metropolitan areas. An inverted U-shape pattern in CRC incidence and mortality was observed with higher rates in the areas classified in the second quartile of the socio-economic deprivation index and lower rates in rural, remote, and less dense areas. A different pattern emerged in the M/I ratio indicating a stepwise increase across increasing levels of socioeconomic deprivation.

Conclusions:

These findings can potentially provide useful information at local and national levels and can inform public health authorities to appropriately allocate resources for geographically targeted prevention and control plans to increase CRC screening.

Key messages:

- M/I ratio of CRC was positively associated with regional deprivation since a stepwise increase was found across increasing levels of rural-related socioeconomic deprivation.
- Interventions aimed at reducing the risks of CRC should primarily focus on socially deprived communities in Cyprus.

[4]London School of Economics, London, UK
[5]University of Victoria, Melbourne, Australia
[6]Johns Hopkins Bloomberg School of Public Heal, Boston, USA
Contact: kuhlmann.ellen@mh-hannover.de

Background:

The COVID-19 pandemic caused severe disruptions in healthcare systems and societies and exacerbated existing inequalities for women and girls across every sphere. Our study explores health systems responses to gender equality goals during the COVID-19 pandemic and which role these goals play in pandemic recovery policies.

Methods:

We apply a qualitative comparative approach. Country case studies (expert information, secondary sources) were collected in March/April 2022. The sample comprised Australia, Brazil, Germany, United Kingdom and USA, reflecting conditions of high to upper-middle income countries with established public health systems, democratic political institutions and gender equality policies. Selected topics: maternity care/reproductive services, violence against women, and gender equality/female leadership.

Results:

All countries tried to keep essential maternity and reproductive services open, but strong limitations applied especially for prevention and counselling services; at the same time, digitalisation/telemedicine supported service expansion. Violence against women and children strongly increased during the pandemic. Routine services were partly kept open and new helplines occasionally established, but no action was taken to scale-up mental health support and respond to new demand. A push-back of gender equality was observed across countries in all areas of health and social care, often coupled with strong increase in intersecting social inequalities; participation of women in decision-making bodies was generally weak and not monitored.

Conclusions:

Across countries, gender equality policies cracked under the pressure of the COVID-19 pandemic; this is true for countries with male and female political leaders, and for different areas of SDG5 and health. There is an urgent need for more effective intersectional gender equality policies and improved participation of women in global health and in health system recovery plans.

Key messages:

- Health systems failed to take action to protect SDG5 goals; gender and intersecting inequalities strongly increased during the pandemic.
- Building back better after COVID-19 will only be possible with an intersectional gender equality programme and feminist policy approaches.

Using Citizen Science to examine health and access to health care of uninsured patients in Germany

Jacqueline Warth

J Warth[1], R Köllges[2], L Böckenholt[2], M Kriegsmann-Rabe[1]
[1]Institute of General Practice, Centre for Health, Medical Faculty of the Heinrich Heine University, Düsseldorf, Germany
[2]Anonymer Krankenschein Bonn e.V., Association for Medical Care for People without Health Insurance, Bonn, Germany
Contact: jacqueline.warth@med.uni-duesseldorf.de

Background:

Estimates suggest that numerous people live without health insurance in Germany. Existing evidence on uninsured patients' health and care use is scarce, specifically in Germany. The present study involves citizens' engagement to identify community perceptions of factors associated with health and medical care and to generate community-driven policy recommendations.

Methods:

Representatives of civil society, affected patients and citizens ('co-researchers') participate in a participatory health research project (MoveCitizenS) located in Bonn, Germany, using Photovoice and Community-based Mapping. The study is composed of five work packages over a 24-month period: (1) Photovoice workshops for co-researchers to produce, select and analyse photographs; (2) a series of workshops to conduct community-based mapping to identify barriers and facilitators of health care utilization; (3) workshops to co-design a cross-sectional survey of uninsured patients (n = 300); (4) project evaluation by co-researchers; (5) a dissemination strategy (e.g. advocacy event, exhibition) will be developed.

Results:

Procedures to facilitate the active engagement of citizens and patients are discussed. Preliminary results on community perceptions of uninsured patients' health and medical care and factors influencing health outcomes and care utilization are presented at the conference.

Conclusions:

This is the first citizen science study which facilitates the understanding of barriers and enabling factors of good health and access to medical care for patients who lack health insurance coverage in Germany. This case study of a participatory project can be adapted to a range of settings to integrate local perspectives to improve population health for all.

Key messages:

- Numerous patients in Germany are uninsured but evidence on their health and medical care is lacking.
- Using participatory methods to address these key questions is an important approach to generate suitable policy recommendations to meet the needs of the community and improve population health.

Prior activation of social work team process by pre-admission one-click automatic referral system

Sung-Bin Chon

S Chon[1], BE Kim[2], IJ Lee[2], GY Choi[2]
[1]Department of Emergency Medicine, CHA Bundang Medical Center, Gyeonggi-do, South Korea
[2]Department of Social Work Team, CHA Bundang Medical Center, Gyeonggi-do, South Korea

Contact: 1tim4ezra7@gmail.com

Background:

Coronary artery disease (CAD) is the leading global cause of mortality. Coronary angiography (CAG) is often performed for CAD patients, and the mean length of stay (LoS) is 4 d. Requests to the social work team (SWT) are often delayed until just before discharge, causing unnecessarily prolonged LoS and reduced chances of obtaining financial support. If the SWT's support system is activated beforehand for scheduled CAGs, the LoS would be shorter and patients would be relieved of emotional and financial burdens.

Methods:

Collaborating with the cardiology and medical informatics departments, a one-click automatic referral system (OARS) was set up (January-May 2021). When cardiologists scheduled a CAG in the outpatient department, an OARS cue popped automatically for the medical aid recipients. The cardiologists could also activate the pre-admission OARS for other patients when necessary. Subsequently, the SWT responded on that day to discuss initiating the financial support process with the candidates. The rate of cardiologists' pre-admission referral to SWT, decision-making time on financial support provision, and proportion of patients receiving financial support were compared before and after initiating OARS.

Results:

After initiating pre-admission OARS, the rate of cardiologists' pre-admission referral to SWT increased from 17.8% (18/101: mean age, 64.6±12.0 y; 32 females; January-December 2020) to 59.1% (55/93: mean age, 64.0±11.8 y; 29 females; June-December 2021) ($p < 0.001$). Although the decision-making time to provide financial support did not change significantly (8.4±11.1 vs. 4.7±11.6 d; $p = 0.96$), the proportion of patients receiving financial support increased (45.5% [46/101] vs. 60.2% [56/93]; $p = 0.045$).

Conclusions:

By enhancing the cardiologists' pre-admission referral to SWT and success rate of receiving financial support, the proactive strategy of pre-admission OARS benefits CAD patients scheduled for CAG.

Key messages:

- By building a proactive referral strategy of pre-admission OARS, more CAD patients scheduled for CAG could obtain timely financial support and be relieved both emotionally and financially by the SWT.
- This pre-admission OARS might be incorporated for more disease entities for patients in need.

Abstract citation ID: ckac131.106

Racism in German medical education – Perspectives of racialized physicians and medical students

Hans Vogt

H Vogt[1]
[1]NaDiRa, DeZIM, Berlin, Germany
Contact: vogt@dezim-institut.de

Background:

The impact of racism on health and the quality of health care services for racialized patients have been the object of prior research. The experiences of racialized medical students and physicians, who operate in a field of tension between natural sciences and practical application and between a 'medical habitus' and exclusionary discrimination, have hardly been examined to date. The education of (future) physicians is an especially fruitful research area in the context of the study of institutional racism in the health care system, as informal everyday experiences come together with formal knowledge and normative learning.

Methods:

Based on expert consultations and preliminary interviews with civic stakeholders, teaching and learning materials in German medical studies were randomly sampled and used as a starting point for qualitative guided interviews with physicians and medical students in Germany who are themselves affected by racism. The first steps of the thematic analysis of these interviews are reflected upon and further developed in focus group discussions with the interviewees.

Results:

The study is particularly concerned with the question of how certain dimensions of racism in the health care sector are related, and how racist normativity appears in this context. This is concretized in the relationship between formal and informal medical curricula as well as in the interweaving of everyday experiences and teaching materials.

Conclusions:

There are different dimensions of relation between a hegemonic normativity in the medical curriculum and the everyday experiences of racialized medical students and physicians in Germany. Politics, faculties, publishers, and civic society may be the target of several recommendations for action regarding those diverse dimensions, e.g. the line between omission and stereotyping of several patient groups.

Key messages:

- Hegemonic normativity in German medical education is an important and challenging issue. There are several institutional levels of medical knowledge reproducing racism in the health care sector.
- Both racialized physicians and racialized patients are affected by symbolic and material forms of racism in the German health care system, which are interweaving and crucial on diverse levels.

Abstract citation ID: ckac131.107

Co-developing a tailored vaccination intervention with Congolese migrants: a participatory study

Alison Crawshaw

AF Crawshaw[1], *C Hickey*[2], *LM Lutumba*[3], *LM Kitoko*[3], *SL Nkembi*[3], *F Knights*[1], *Y Ciftci*[4], *T Vandrevala*[5], *AS Forster*[6], *S Hargreaves*[1]

[4]Doctors of the World UK, London, UK
[5]Faculty of Health, Social Care and Education, Kingston and St George's, University of London, London, UK
[6]Our Future Health, Manchester, UK
Contact: acrawsha@sgul.ac.uk

Background:

Disparities in vaccination uptake among migrant populations are well documented. WHO and ECDC have sought renewed focus on participatory research that engages migrants in co-producing tailored initiatives to address vaccination inequities and increase coverage.

Methods:

This community-based participatory research study aims to engage Congolese migrants in co-developing a tailored approach to increase vaccine uptake. Phase 1 used poster walls and in-depth interviews with Congolese migrants ($n = 32$) to explore COVID-19 vaccination beliefs, experiences, and preferred information sources and communication methods, analysed iteratively and thematically in NVivo.

Preliminary results:

Institutional distrust has shaped this population's interpretation of the pandemic response and enabled vaccine misinformation and conspiracy theories to take hold. We found complex information networks and preference for Francophone, African and social media. Limited English proficiency and preference for the oral tradition restricted engagement with official public health messaging. Suspicion of government motives, low knowledge, and culturally specific perceptions about vaccination contributed to belief that breakthrough infections and need for COVID-19 boosters imply the vaccine is not effective. The population felt coerced by vaccination reminders and mandates, and were resultantly more hesitant to accept COVID-19 vaccination.

Conclusions:

The population's specific characteristics suggest that existing and trusted interpersonal networks and oral communication in first languages should be harnessed to spread credible information and encourage vaccine uptake, and mandate policies are unlikely to be effective. Training local role models to facilitate vaccination dialogues and myth-bust may be effective at changing behaviour. The next phases will gather more information from key stakeholders and engage migrants in workshops to co-design insight-driven, tailored interventions.

Key messages:

- Global policy-setting organisations have called urgently for participatory research that engages migrants in the co-production of tailored initiatives to address vaccination inequalities.
- Populations with strong interpersonal networks and low trust in public institutions may be receptive to tailored, community-centred dialogue approaches using local messengers and role models.

[3]Public Health, CIBER-ESP, Madrid, Spain
[4]Health Insurance Service, Regional Ministry of Health, Valencia, Spain
[5]Statistics, University of Alicante, Alicante, Spain
Contact: molina_anabar@gva.es

Objective:

To construct an individual socioeconomic status index (ISESI) with information available in the Population Information System of the Region of Valencia, Spain, and use it to analyse inequalities in a colorectal cancer screening programme (CRCSP).

Methods:

Cross-sectional study. The study population was composed of men and women aged between 50 and 69 who were invited to participate in the most recently completed round of the Region of Valencia CRCSP in 2020, n = 1,150,684. A multiple correspondence analysis was performed to aggregate information in the Segmented, Integrated and Geographical Population Analysis Code from the Population Information System of the Region of Valencia into an ISESI. Data from the 2016 Region of Valencia Health Survey was used for validation. The relationship between CRCSP participation and the ISESI was analysed by logistic regression models.

Results:

The variables included in the index were nationality, employment status, disability, healthcare coverage, risk of vulnerability and family size. The most important categories for determining the highest socioeconomic status were being employed and not being at risk of social vulnerability, and being unemployed and at risk of social vulnerability for determining the lowest socioeconomic status. Index validation demonstrated internal and external coherence for measuring socioeconomic status. The relationship between CRCSP participation and the ISESI categorised by quartile (Q) showed that Q4 (the lowest socioeconomic status) was less likely to participate OR = 0.769 (0.757-0.782) than Q1 (the highest socioeconomic status), and the opposite was found for Q2 OR = 1.368 (1.347-1.390) and Q3 OR = 1.156 (1.137-1.175).

Conclusions:

An ISESI was constructed and validated using Population Information System data and made it possible to evaluate inequalities in colorectal cancer screening.

Key messages:

- An individual socioeconomic status index was constructed and validated using Regional Population Information System data.
- The Individual socioeconomic status index constructed allows to systematically evaluates inequalities in colorectal cancer screening.

Abstract citation ID: ckac131.109
Short and long-term inequity in outpatient medical use by the type of medical institutions in Korea

JungYeon Yang

JY Yang[1]*, JH Lee*[2]

[1]Transdisciplinary Major in Learning Health Systems, Korea University, Seoul, South Korea
[2]Department of Health Policy and Management, Korea University, Seoul, South Korea
Contact: jyyang0705@gmail.com

Background:

Many countries agree with the horizontal equity that medical resources should be allocated according to medical needs, regardless of income. Although the short-term equity index calculated through cross-sectional data doesn't reflect the dynamics of individual income and medical use, it can be supplemented by the long-term equity index using panel data. Koreans tend to choose expensive but highly specialized services without considering their medical needs because they are free to choose service providers. This study aims to empirically examine how the patterns of outpatient medical use that are not based on medical needs differ in terms of short- and long-term equity for each type of medical institution.

Methods:

Using Korea Health Panel Survey(2014-2018), the equity of outpatient medical use(number of visits, medical expenses) of 10,244 people was measured by type of medical institution (tertiary general hospital, general hospital, hospital, clinic, and dentist). Wagstaff&van Doorslaer(2000)'s tool and Jones & Lopez-Nicolas(2004)'s tool were used to calculate the short and long-term horizontal equity index(HI), and mobility index(MI) to compare short and long-term inequity.

Results:

In tertiary general hospitals and dentists, there were short and long-term pro-rich inequalities($HI > 0$, $p < 0.05$). As a result of comparison, long-term inequality was greater in the number of visits ($MI < 0$), while inequality was easing in the long-term in medical expenses($MI > 0$) in tertiary general hospitals. In dentists, long-term inequality was less than short-term inequality in both the number of visits and medical expenses ($MI > 0$).

Conclusions:

The short-term equity index is likely to underestimate or overestimate inequity in our society, so a long-term perspective is needed. Inequality patterns for each type of medical institution should be considered in healthcare reforms for fair distribution of medical resources.

Key messages:

- Short-term equity index differs from the long-term equity index in outpatient medical use.
- The pattern of short and long-term equity indices may differ by type of medical institutions.

Abstract citation ID: ckac131.110
The role of income in the lives of people with long-term disabilities: A multi-country analysis

Ana Oña

A Oña[1,2], D Pacheco Barzallo[1,2]
[1]Health Services and Rehabilitation, Schweizer Paraplegiker-Forschung, Nottwil, Switzerland
[2]Department of Health Sciences and Medicine, University of Lucerne, Lucerne, Switzerland
Contact: ana.ona@paraplegie.ch

Background:
Health is a fundamental human right. Yet, people become ill and die because they do not have enough money to access the necessary healthcare. Studies confirm that on average, more income translates to better health status. The magnitude of this relationship and its consequences beyond health like reintegration or spillovers are not widely understood but are expected to be significantly different among countries. This is especially the case in vulnerable populations like those with a spinal cord injury (SCI). This study aims to better understand the role that income plays in promoting health in people with SCI and their differences across countries.

Methods:
The research focus on three aspects, one, the estimation of the health income gap using years after the injury and a comorbidity index, two, the decomposition of different factors of this inequality with a special interest in the unmet healthcare needs, and three, their consequences in their social participation measured by the reasons of unemployment.

Results:
There are significant differences in health status by income and between countries. On average, the poorest income groups with SCI are up to 40 times more likely to be ill than people in the richest groups and live 4-6 years less after the injury. The working conditions and the unmet health care needs are important factors that explain that differences. In addition, the health status, the lack of sustainable employment opportunities, and workplace accessibility issues are the main issues to reintegrating into the labor market.

Conclusions:
Health inequalities are a global problem that affects people with long-term health conditions disproportionately to others without. Even in more equal and high-income countries with a universal health system, there are different realities for the people according to their income, where the estimations and solutions for the 'average' individual do not target the needs of people in the extremes.

Key messages:
- This study generates evidence about the role of income in health, lack of health services, and consequences in people with SCI across and within countries.
- To achieve the goal of health equity, it is important to target the different realities focusing on the needs of people who most need which goes beyond the health system and changes by income level.

Abstract citation ID: ckac131.111
The effect of social deprivation on the dynamic of the SARS-CoV-2 infection in France

Sabira Smaili

S Smaili[1], C Pelat[1], E Chatignoux[1], M Kelly-Irving[2,3], C Delpierre[3], S Vandentorren[1,4]

[2]IFERISS, University of Toulouse Jean Jaurès, Toulouse, France
[3]CERPOP Inserm UMR 1295, University of Toulouse Paul Sabatier, Toulouse, France
[4]Inserm UMR 1219 Bordeaux Population Health, University of Bordeaux, Bordeaux, France
Contact: sabira.smaili@santepubliquefrance.fr

Background:
The association between health inequalities and the SARS-CoV-2 infection dynamic remains to be studied in France. The objective of this study was to analyse the relationship between an area-based deprivation indicator and SARS-CoV-2 infection indicators, during four epidemic waves running from August 4th 2020 to January 27th 2021 (second wave), January 28th to June 24th 2021 (third wave), June 25th to October 28th 2021 (fourth wave), and October 29th 2021 to March 29th 2022 (fifth wave).

Methods:
We analysed weekly indicators of SARS-CoV-2 infection, extracted from the national testing information system: incidence, positivity and testing rates. The associations of these outcomes with the European Deprivation Index (EDI) quintiles were estimated with negative binomial generalized additive models adjusted for epidemic waves, population density (sparsely, moderately, densely populated), region (random effect) and interactions between epidemic waves and the variables EDI, population density, and region.

Results:
The most deprived areas had a higher positivity rate than the least deprived ones during the second, third and fourth waves, but a lower rate during the fifth wave. They also had higher incidence during the third and fourth waves, but a similar incidence than the least deprived areas during the second wave, and even a lower rate during the fifth wave. The testing rate was lower in the most deprived areas than elsewhere, irrespective of the epidemic waves.

Conclusions:
People living in the most deprived areas were less likely to be tested and more likely to test positive than people living in less deprived areas. The lower incidence, positivity and testing rates during the fifth wave in the most deprived areas may be explained by the enacted change in policy whereby screening tests were no longer free. These findings may reflect structural differences in access to care and lower capacity to benefit from prevention measures by deprived populations.

Key messages:
- People living in the most deprived areas were less likely to be tested for COVID-19 irrespective of the epidemic waves.
- Health authorities should address the issues of social inequalities more rapidly and target prevention strategy to disadvantaged populations.

Abstract citation ID: ckac131.112
Healthcare use by children in North West London 2015-2019 by deprivation and integrated care access

Francesca Neale

F Neale[1], M Watson[2], D Hargreaves[1], S Arora[1]
[1]Department of Primary Care and Public Health, Imperial College London, London, UK
[2]Department of Paediatrics, St Mary's Hospital, London, UK
Contact: francesca.neale1@nhs.net

Background:
England has a health system offering universal coverage, but disparities in healthcare use are increasing. Between 2007-2017, children living in more deprived areas had higher rates of unplanned care (Emergency Department (ED) attendance and hospital admissions), whereas children from less deprived areas had higher rates of planned care (General Practitioner (GP) contact and outpatient appointments). More detailed research to find solutions for this divergent pattern is required.

Aim:
To assess the rates of GP contact, outpatient appointments, hospital admissions and ED attendance in North West London, by Index of Multiple Deprivation (IMD) decile of home postcode and access to an integrated care service providing linked care between multiple child health professionals 'Connecting Care for Children (CC4C)', for children aged 0-18 years between 2015-2019.

Methods:
Retrospective analysis of a de-identified database of integrated care records for 495,357 children.

Results:

Children from the most deprived decile had higher rates of emergency admissions (0.070 per child per year vs. overall mean 0.040), elective admissions (0.076 vs. 0.032), ED attendances (0.754 vs. 0.358) and outpatient appointments (1.702 vs. 0.756) between 01.01.2015- 31.12.2019. Children from the least deprived decile had the second highest rates of outpatient appointments (0.911 vs. 0.756) and GP contact (8.192 vs. 5.390) between 01.01.2015- 31.12.2019. Children with access to the CC4C service, despite being from more deprived backgrounds, had lower rates of emergency admissions (0.028 vs. 0.037) compared to patients with access to usual care. P values <0.001 in all cases.

Conclusions:

Greater deprivation was linked to higher rates of emergency admissions, but this was partially mitigated by access to more integrated healthcare models. Children from the least deprived decile continued to have disproportionately higher use of planned care.

Key messages:

- Despite universal health coverage, children from more deprived areas continue to have disproportionately higher use of unplanned care.
- Further research is required to explore whether integrated care solutions can reduce the burden on unplanned health services and inequalities in access to care.

Abstract citation ID: ckac131.113
How social capital enabled healthcare access and navigation by vulnerable people during Covid-19

Francesca Zanni

F Zanni[2,1]
[1]Public Health, University of Bologna, Bologna, Italy
[2]Global Public Health, Karolinska Institutet, Stockholm, Sweden
Contact: francesca.zanni6@studio.unibo.it

Background:

Healthcare systems have become complex and fragmented, negatively affecting healthcare access and navigation. This is especially the case for socio-economically vulnerable people, who encounter organisational and administrative hindrances trying to access care. These difficulties have worsened during Covid-19. Scholarly literature recognises that - by moulding navigation practices - social capital may mediate between potential and realised access to healthcare. However, little is known about how this mediating work practically unfolds.

Methods:

This case study aimed to understand how social capital might affect healthcare navigation practices. To do so, we investigated how the People's Health Lab (PHL), a community-based organisation, supported socio-economically vulnerable people in navigating healthcare during the Covid-19 pandemic in Bologna, Italy. Nine months of participant observation were conducted both in person and digitally from July 2020 to March 2021. Twelve semistructured interviews were also conducted with volunteers of the organisation. Fieldnotes and interview transcripts were analysed through Thematic Analysis.

Results:

PHL support activities addressed barriers to healthcare navigation by vulnerable people, which were found to be services fragmentation, bureaucracy and Covid-19 restrictions. Volunteers of the PHL connected vulnerable individuals to health services in manifold, flexible ways, working without standard operative protocols and relying on informal personal contacts within public services. This was found to be key in enabling navigation of healthcare during the first three waves of the pandemic.

Conclusions:

Our study provides evidence about how structural, linking social capital - the material and nonmaterial resources mobilised through the relationships between heterogeneous groups (the People's Health Lab, health authorities and vulnerable people) - can mediate access to fragmented healthcare systems by shaping navigation practices.

Key messages:

- Contemporary healthcare systems – including universal ones – have become complex and fragmented, posing access and navigation challenges to their users, especially those socioeconomically vulnerable.
- Linking social capital can mediate access to fragmented healthcare systems by flexibly mobilising material and nonmaterial resources through informal relationships between heterogeneous groups.

Epidemiological factors affecting health service utilization in diabetic patients in Ethiopia

Roberto Benoni

R Benoni[1], *A Sartorello*[1], *E Paiola*[1], *G Andreani*[2], *F Moretti*[1], *A Tsegaye*[2], *S Tardivo*[1], *F Manenti*[2]
[1]Department of Diagnostics and Public Health, University of Verona, Verona, Italy
[2]Doctors with Africa CUAMM, Padua, Italy
Contact: roberto.benoni90@gmail.com

Diabetes-related deaths reached 2 million in 2019. The highest percentage of undiagnosed diabetes (59.7%) was observed in Africa, where accessibility to health services is pivotal to improving the outcome of diabetic patients. The study aims to assess the association between diabetic patients' epidemiological factors and accessibility to healthcare services in a low-income country. The retrospective cohort study included diabetes-related outpatient department (OPD) visits and hospitalizations from 01/01/2018 to 31/08/2021 at St Luke Hospital (Ethiopia). Potential predictors were sociodemographic factors, COVID-19 cases, mean monthly temperature, and precipitations. The ARIMA method was applied to OPD visits and hospitalizations time series. OPD visits increased over time ($p < 0.001$) while hospitalizations were stable. The time series model was ARIMA(0,1,1) for OPD visits and ARIMA(0,0,0) for hospitalizations. Diabetes OPD patients were 1,685 (F = 732, 43%). Females had an average of 16% fewer OPD accesses per month ($p = 0.002$). Patients missing follow-up were 801 (48%). The time between follow-ups was longer as age increased ($p < 0.001$). There were 57 fewer forecast OPD visits per month on average using COVID-19 cases as ARIMA regressor. OPD visits decreased differently by geographic area as COVID-19 cases increased ($p < 0.001$). Hospitalized patients for diabetes were 408, 85 (20.8%) newly diagnosed. The odds ratio (OR) of diagnosis at admission was lower as age increased (OR 0.98, $p = 0.009$). Compared to type 1 diabetes, hospitalized females with type 2 (117-39.7%) were fewer than males ($p = 0.019$). Readmissions were 52, 10 (19.2%) within 30 days, without OR difference by sex, age, or diabetes type. Despite an increase in OPD visits for diabetic patients over the study period, the number of losses at follow-up and diagnoses at hospitalization remains high. Gender and age influenced service utilization. Females' access to care is still problematic (concept of "missing women").

Key messages:

- Primary health care should be implemented to improve access to health services and diabetes management.
- Ensuring equity in healthcare accessibility should be a priority in low-income countries.

Abstract citation ID: ckac131.115
Inequality in access to COVID-19 vaccines: an annual experience in Verona (Italy)

Anna Sartorello

A Sartorello[1], *E Paiola*[1], *F Moretti*[1], *L Accordini*[2], *C Postiglione*[2], *S Tardivo*[1], *R Benoni*[1]
[1]Department of Diagnostics and Public Health, University of Verona, Verona, Italy

[2]Prevention Department and Public Health, AULSS 9 Scaligera, Verona, Italy
Contact: anna.ssartorello@gmail.com

COVID-19 vaccination campaigns involved massive resources worldwide. However, the disparity in vaccine accessibility is a global issue. The study evaluated whether birthplace is a barrier to healthcare access in a high-income country (HIC). The retrospective cohort study included fully vaccinated adults in the Verona district between 27/12/2020 and 31/12/2021. In Italy, the vaccination was opened at different times according to the risk category. Two multiple linear regression models explored the relationship between (1) days before getting the first shot (IV) and (2) the distance between the municipality of residence and the vaccination point, and age, sex, and Income Group (IG, as defined by the World Bank). Distance (km) was estimated with Q-GIS. Results are reported as Marginal Effect at the Mean (MEM) with a confidence interval of 0.95. 500,001 first doses were included, with a mean age of 47 years (SD = 21) and a mean IV of 47.5 days. 6% of the sample was UpperMiddle (UMIC), 6% Lower-Middle (LMIC), and 0.3% Low-Income Countries (LIC). The mean age was higher for HIC ($p < 0.05$). Male outnumbered females in LMIC (61%) and LIC (69%), but not in HIC and UMIC ($p < 0.001$). LMIC and LIC were vaccinated at local facilities (5.8%) and pharmacies (4.2%) more than other groups (3%) and at hub centers less ($p < 0.05$). The IV was lower for subjects from HIC ($p < 0.05$) with a MEM of 24 [22; 26] for LIC, 21 [21; 22] for LMIC and 27 [26; 27] for UMIC. Men from UMIC (9 [4; 14]), LMIC (7 [6; 8]) and LIC (4 [3; 5]) had a higher IV than women. All variables being equal, IV decreased with age (MEM -0.48 [-0.49; -0.47]). Distance was shorter for LMIC and LIC than for HIC ($p < 0.05$). The MEM on the distance of the Income group was -2.8 [-3.5; -2.2] for LIC and -2.0 [-2.1; -1.8] for LMIC ($p < 0.05$). The Income Group of one's birth country is a barrier to vaccine accessibility in Italy, a HIC. Hence, we address public health workers to improve access to vaccination in community settings to narrow this gap.

Key messages:

- Birthplace Income Group could be linked to vaccine accessibility in High Income Countries.
- Public Health stakeholders should consider community and social barriers to healthcare access when planning health interventions.

Background:

WHO's Immunization Agenda 2030 has placed renewed focus on catch-up vaccination across the life course to meet global targets for reduction in vaccine-preventable diseases through increased vaccine coverage, including among migrant groups who may require catch-up vaccination to align them with host country vaccination schedules.

Methods:

We did a global rapid review (01/2010 to 04/2022) to explore drivers of vaccine hesitancy among migrants followed by an in-depth qualitative study (semi-structured, telephone interviews) among recently arrived adult migrants (foreign-born, >18 years old, residing in the UK < 10 years). Interviews explored views on routine vaccination including accessibility, confidence and awareness. Data were analysed iteratively using thematic analysis.

Results:

63 papers were included in the rapid review, including data from 22 countries/regions. Multiple factors driving under-immunisation and hesitancy in migrants were reported, including language barriers, low health literacy, social exclusion, low cultural competency and accessibility in healthcare systems. Our qualitative study recruited 40 migrants (mean age: 36.7 years; 62.5% female) resident in the UK (6 refugees, 19 asylum-seekers, 8 undocumented, 7 labour migrants). Major barriers to catch-up vaccination included a lack of provider recommendation and low awareness, with vaccination viewed as only relevant to children. Hesitancy around specific vaccines, such as MMR, was often influenced by misinformation. Participants suggested that novel strategies such as walk-in or mobile access points, consistent provider recommendations, and translation of information into relevant languages, may enhance accessibility and uptake of routine vaccinations.

Conclusions:

Targeted and tailored information campaigns, versatile and proactive access pathways and education for healthcare staff on cultural competency will be needed to ensure uptake of catch-up vaccination among marginalised migrant groups.

Key messages:

- Newly arrived adult migrants face barriers to catch-up vaccination in host countries, which may hinder immunisation coverage and increase the risk of vaccine-preventable disease outbreaks.
- Health systems must develop novel mechanisms to proactively offer culturally competent and accessible catch-up vaccination services to adult migrants on and after arrival.

Health System Performance Assessment: Does Germany provide good access to healthcare?

Miriam Blümel

M Blümel[1], P Hengel[1], M Achstetter[1], M Schwarzbach[1], R Busse[1]
[1]Department of Health Care Management, Berlin University of Technology, Berlin, Germany
Contact: miriam.bluemel@tu-berlin.de

Background:

Providing equal access to health care is a major goal of health systems and a criterion for health system performance assessment (HSPA). The first systematic HSPA for Germany has been piloted in 2021. Access is one dimension of the conceptual framework (others are, e.g., population health, quality, and efficiency), which will be analysed in the following.

Methods:

Nine indicators to measure access were selected based on a systematic search of established instruments in (inter)national HSPA initiatives. Included indicators are availability and accessibility of services (e.g., waiting times) and financial risk protection, among others. Other criteria for the inclusion of indicators were data availability and international comparability. Indicators were evaluated in terms of their trend over time (2000-2020), in international comparison (e.g., Austria, Denmark, France), and according to various equity categories (e.g., age, gender, region).

Results:

The indicator access to palliative care could not be evaluated due to lack of data. Overall, access is good in Germany. Internationally, Germany performs better than average on most of the indicators, and its performance has improved over time. Physician density in the inpatient and outpatient sectors has increased since 2000 and is above the average of comparator countries. For some specialties, physician density in rural areas is lower than in urban areas, but the gap has decreased in recent years and does not apply to primary care. Furthermore, only 0.3% of the total population report having foregone care, although they had considered it necessary.

Conclusions:

Nine indicators were identified and calculated to assess the performance of the German health system in terms of access to healthcare. Access can be assessed as predominantly positive, but inequities exist. Identified gaps and future extensions, e.g., additional data sources, can provide impetus for evidence-based policy management.

Key messages:

- First systematic Health System Performance Assessment for Germany has been piloted.
- Access to health care is good in Germany, both over time and in international comparison, but inequities exist.

Gender inequalities in mortality in Lithuania: the HAPIEE Study

Hynek Pikhart

H Pikhart[2,1], *A Tamosiunas*[3], *J Pikhartova*[2,1], *E Paulikaite*[4]
[1]RECETOX, Masaryk University, Brno, Czechia
[2]Institute of Epidemiology and Health Care, UCL, London, UK
[3]Institute of Cardiology, Lithuanian University of Health Sciences, Kaunas, Lithuania
[4]Vilnius University, Vilnius, Lithuania
Contact: h.pikhart@ucl.ac.uk

Introduction:

Gender inequalities in morbidity and mortality are important problem in countries of Central and Eastern Europe. Mortality difference between men and women in Lithuania is one of the largest in Europe. The aim of this analysis was to identify factors that influence this difference in population-based sample of middle- and older-age men and women from Lithuanian arm of the HAPIEE Study.

Methods:

Data come from the Lithuanian part of international Health, Alcohol and Psychosocial Factors In Eastern Europe (HAPIEE) longitudinal cohort study. The analytical sample included 3729 women and 3062 men aged 45-74 years at the study baseline. The study outcomes were all-cause, CVD and cancer mortality (mean follow-up approx. 10 years). Gender difference in study outcomes, and the role of wide range of socioeconomic, demographic, behavioural, metabolic and psychosocial covariates in this association was tested by regression modelling.

Results:

There were 913 deaths (576 in men) during the follow-up. Men had higher odds of mortality compared to women: for all-causes OR 2.42 (95% CI 2.09-2.81); for CVD 2.48 (2.03-3.08); for cancer 1.92 (1.54-2.38). BMI was identified as an effect modifier for all-cause and cancer mortality. When adjusted for confounders such as smoking, alcohol consumption or paid work, and stratified for BMI, the gender difference reduced a little for CVD mortality but remained virtually unchanged for all-cause and cancer mortality.

Conclusions:

We found substantial and statistically significant gender inequalities in mortality in this Lithuanian study. We found that men aged 45+ years were approximately two times more likely to die than women, with CVD mortality difference being even larger. Additionally, most of gender difference in mortality remained unexplained by the main social, psychosocial, behavioural and metabolic risk factors.

Key messages:

- Large gender inequalities in mortality have been observed in this Lithuanian study of middle- and older-age men and women.
- Most of the inequalities have not been explained by available social, psychosocial, behavioural and metabolic risk factors.

Abstract citation ID: ckac131.119
Factors influencing the implementation of school interventions: a systematic review

Friederike Butscher

F Butscher[1], *J Ellinger*[1], *C Mall*[1]
[1]Department of Sport and Health Sciences, Technical University Munich, Munich, Germany
Contact: friederike.butscher@tum.de

Background:

To investigate contextual factors that influence the implementation of obesity prevention interventions in school addressing children with low socioeconomic status (SES) is very important. Evidence about these factors helps to improve the implementation, which can promote the health of children with low SES and therefore reduce health inequity. We aimed to systematically identify, critically appraise and summarize the evidence on implementation of school-based interventions promoting obesity prevention for children with low SES.

Methods:

A systematic search in seven databases was conducted with the main inclusion criteria 1) school-based interventions and 2) age group 5-14 years. The Consolidated Framework for Implementation Research and its five domains and 39 categories was used to analyze the data deductively. If necessary, inductive sub-categories were defined within the categories. Contextual factors are assessed in the domain Outer Setting with four categories (A-D).

Results:

6.446 studies were screened and 16 studies fulfilled all inclusion criteria. Seven studies reported contextual factors in the four categories A. Needs & resources of parents (N = 4), B. Cosmopolitanism (N = 4), C. Peer pressure (N = 2), and D. External policy (N = 4) with seven sub-categories in total. In the following are examples for reported aspects in the sub-categories. In the sub-category D.2 Existing policy, policy in line with the intervention was a facilitator for implementation (N = 2), whereas lack of control over administrative changes and food served in cafeteria due to policy were reported as barriers (N = 2).

Conclusions:

Intervention research as well as applied health promotion should consider the complexity and interdependency of influencing factors for successful implementation. Albeit contextual factors are hardly changeable, they should be considered and addressed to reduce health inequity.

Key messages:

- More research is needed with detailed reporting of influencing factors, as detailed information is those of relevance for practice.
- Contributing to standardized analysis and reporting in implementation research by using a comprehensive framework.

Abstract citation ID: ckac131.120
Maternal educational inequalities in child's birth weight: ONS Longitudinal Study

Jitka Pikhartova

J Pikhartova[1,2], *N Shelton*[1]
[1]Epidemiology and Public Health, University College London, London, UK
[2]RECETOX, Masaryk University, Brno, Czechia
Contact: j.pikhartova@ucl.ac.uk

Background:

Studies found that maternal education is the most frequently assessed predictor of child's birth weight. Lower level of education was consistently found as indicator of lower child's birthweight. In turn, inequalities in child's birthweight have been repeatedly shown to be closely related to inequalities in later adult health. The aim of this project is to evaluate the association between the highest achieved level of maternal education and birthweight of single born babies in large

English and Welsh population sample, taking into account factors such as child's gender, parity, maternal age, partnership status, ethnicity, and household socioeconomic characteristics.

Methods:

Using Office for National Statistics Longitudinal Study (ONS LS) based on English and Welsh Census data, information from almost quarter of a million children born since 1981 to ONS LS sample mothers were used. Maternal education was categorised in 3 categories (below secondary, completed secondary education, degree and higher), and its association with child's birth weight was analysed by logistic regression accounting for range of available covariates.

Results:

Significant association between the level of education and birth weight was found in crude analysis ($p < 0.001$). When adjusted, the magnitude of the association with education gradient declined but remained highly significant and was found to considerably increase over the years. The birth weight difference between those born to mothers with below secondary education and those born to mothers with degree increased by more than 60 grams (p for change <0.001) between 1981 and 2016.

Conclusions:

These findings support previous evidence based on different population samples. According to our results, children of mothers with below secondary education tend to have lower birth weight. Our results suggest that the inequalities in birth weight by the highest education level achieved by mother significantly increased since 1981.

Key messages:

- Lower levels of maternal education predict low birth weight in children.
- The differences in birth weight by maternal educational demonstrate increase in inequalities over the years.

The paid sick leave and sickness benefits for universal health coverage: a scoping review

Huisun Lee

H Lee[1,2]*, Y Kwon*[1,2]*, K Ryu*[1,2]*, M Sohn*[3]*, H Chung*[2,4]

[1]Department of Public Health Sciences, Graduate School, Korea University, Seoul, South Korea

[2]BK21FOUR Learning Health Systems, Korea University, Seoul, South Korea

[3]Division of Health and Medical Sciences, Cyber University of Korea, Seoul, South Korea

[4]School of Health Policy and Management, Korea University, Seoul, South Korea

Contact: heesun1211@korea.ac.kr

Background:

The countries with paid sick leave (PSL) and sickness benefits (SB) mostly provide the benefit coverage to specific categories of workers, which results in health inequalities among employees in COVID-19. The PSL and SB are key factors to achieve universal health coverage (UHC) in that they protect access to healthcare and improve population health. This study attempted to investigate whether the policies helped achieve the UHC when they were expanded.

Methods:

This review followed the scoping review protocol of PRISMA-ScR. On April 6, 2021, we extracted the literature using the keywords 'paid sick leave', 'sickness benefits', 'paid sick day', and 'earned sick leave' from PubMed and Web of Science and added two studies through hand-search. All articles were written in English. We did not limit the publication date.

Results:

Forty-four selected studies were based in four single countries and the European Union. Most of the studies were published after 2010 (84.1%) and were conducted as cross-sectional (72.7%) studies. Not only workers who use PSL and SB but also children whose parents use PSL and SB increased their use of healthcare services and getting flu shots. Also, using PSL and SB decreased their unmet healthcare needs and emergency use. The various health status factors, such as infectious disease incidence, mortality, and presenteeism, also decreased.

Conclusions:

The provisions of PSL and SB offer individual and public health benefits by allowing employees and their families to use healthcare services. Group of employees, we can expect similar public health impacts on newly covered groups, thus contributing to achieving the UHC. Since more than 90% of articles are published from the United States, future studies need to evaluate the outcomes of health effects in various European or Asian countries.

Key messages:

- The provision of PSL and SB positively affects employees and their families by allowing them to use healthcare services.
- The expansion of PSL and SB contributes to the UHC by guaranteeing indirect medical costs that enable universal access to essential healthcare services.

[5]Epidemiology Unit, Department of Prevention, Azienda USL Toscana Sud-Est, Arezzo, Italy

[6]Department of Molecular and Developmental Medicine, University of Siena, Siena, Italy

Contact: d.marconi2@student.unisi.it

Background:

In the area of the Local Health Authority Toscana Sud-Est (LHA) 13,5% of residents are foreigners. We aim to assess the impact of our intervention to COVID-19 vaccination coverage.

Methods:

Since summer 2021, LHA has promoted vaccination sessions dedicated to foreign residents with free walk-in access, multilingual forms, flyers and TV interventions, cultural mediators and trained healthcare workers. We collected data about vaccination status of residents (28 December 2020-31 January 2022) and we analysed them using the software STATA to assess vaccine coverage by nationality and the effectiveness of our intervention. The results were adjusted for age and sex. We set significance level at $p < 0.05$.

Results:

On 31 July 2021, 78% of Italian residents (N = 685289) had received the first dose of vaccine, compared to only 43% of foreign residents (N = 106370). There was a 35% gap. On 31 January 2022, after our intervention, 89% of Italian residents and 71% of foreign residents had received the first dose of the vaccine. The gap was 18%. On 31 January 2022, 50% of residents of all nationalities had received two doses of the vaccine. A significant difference between Italian and foreign residents is still observed after adjustment for age and sex (OR 0.41 95% IC 0.40-0.41). Vaccination adherence is lower in females than males, for both Italian (OR 0.90 0.89-0.91) and foreign residents (OR 0.82 0.79-0.84). This is accentuated within some ethnic groups: Macedonians, Kosovars, Pakistanis.

Conclusions:

The creation of dedicated service guaranteed to reach a high vaccination coverage in all the nationalities and to reduce the gap between host and foreign residents. In foreigners it is lower than in the hosts, so it is necessary to investigate possible cultural factors that may influence hesitancy. A lower vaccination coverage in females, especially in foreigners, may be due to an inferior participation in social and working life as a consequence of the gender gap.

Key messages:

- The creation of dedicated interventions guaranteed to achieve high vaccination coverage in all nationalities.
- A lower vaccination adherence in females than males, especially in foreigners, may be due to an inferior participation in social and working life as a consequence of the gender gap.

Chronic diseases and multi-morbidity in persons experiencing homelessness: a cross-sectional study

Wandini Lutchmun

W Lutchmun[1,2]*, G Froeschl*[1,2]*, J Gach*[3]*, C Bader*[3]*, C Borup*[3]

[1]Center for International Health, Ludwig-Maximilians-Universitaet, Munich, Germany

[2]Division of Infectious Diseases, University Hospital LMU, Munich, Germany

[3]Aerzte der Welt Deutschland, e.V., Munich, Germany

Contact: wandini.lutchmun@med.uni-muenchen.de

Background:

Persons experiencing homelessness (PEH) suffer a high burden of chronic diseases, yet face significant barriers in accessing health services. We describe and compare chronic diseases and multi-morbidity in PEH, housing exclusion and secure housing who lacked access to regular health services in the wake of the COVID-19 pandemic in Germany.

Methods:

Study participants were adults who sought care at clinics of the humanitarian organisation “Ärzte der Welt” in Munich, Hamburg and Berlin in 2020. The patients were categorised into three groups according to the European Typology of Homelessness and Housing Exclusion (ETHOS). We described socio-demographic characteristics, self-rated health, chronic diseases, multi-morbidity and SARS-COV-2 infections in each group. Logistic regression analysis was used to identify socio-demographic factors associated with higher odds of chronic diseases and multi-morbidity.

Results:

Of the 695 study participants, 333 experienced homelessness, 292 housing exclusion and 70 had secure housing. 92.3 % had no or limited health insurance and 96.7% were below the poverty line. Males and EU citizens were highly represented among PEH (74.2% and 56.8% respectively). PEH had lower self-rated health (47.8%, p = 0.04), and higher rates of psychiatric illness (20.9%, p = 0.04). In adjusted analyses, being 35-49 and $\geq$50 years was associated with greater odds of chronic diseases (AOR = 2.33, 95% CI = 1.68-3.24; AOR = 3.57, 95% CI = 2.55-5.01, respectively), while being male was associated with lower odds of multi-morbidity (AOR = 0.602, 95% CI = 0.38-0.9). Of the 18 symptomatic patients tested for SARS-COV-2 infection, 15 were PEH, of whom one tested positive.

Conclusions:

Housing was not a risk factor for chronic disease and multi-morbidity in this study. However, PEH reported poorer self-rated and psychiatric health. Strategies to improve access to health services for persons experiencing homelessness and housing exclusion are much needed in Germany.

Key messages:

- Research to highlight the health inequity, both in access and outcomes, in persons experiencing all forms of homelessness is much needed.
- This study provides data on a population disconnected from the formal healthcare system. Making such data visible is a step towards addressing the structural causes of social exclusion.

Epidemiology of Tuberculosis in Kazakhstan: Data from National Electronic Healthcare System 2014-2019

Yesbolat Sakko

Y Sakko[1]*, M Madikenova*[1]*, A Kim*[1]*, A Gaipov*[1]

[1]Department of Medicine, School of Medicine, Nazarbayev University, Nur-Sultan, Kazakhstan

Contact: yesbolat.sakko@nu.edu.kz

Background:

Tuberculosis (TB) remains a global public health threat. WHO determined Kazakhstan as one of 18 high-priority countries for TB elimination in Europe, with reported TB incidence >20 cases per 100,000 population. There is a lack of comprehensive reseach of TB epidemiology in the country. This study aims to estimate the prevalence, incidence, mortality rates and survival hazard ratios of TB in Kazakhstan, using large-scale administrative health data records in 2014-2019.

Methods:

This is a population-wide retrospective study assessing 150 thousand TB (ICD10: A15-A19) patients’ incidence, prevalence and mortality. Demographic factors, diagnoses and comorbidities were analyzed. Univariate, bivariate and multivariate statistical analyses were performed. Cox regression and Kaplan-Meier survival analysis have been done.

Results:

Out of 150 thousand all TB patients, 61 percent were male and 94 percent had respiratory TB. During 2014-2019, the TB incidence, prevalence and mortality per 100K population declined (227-15.2), doubled (325.3-746.6) and increased (8.4-15.2), respectively. Age-specific TB incidence was lowest for 0-10 y.o., highest for 20 y.o. Being an old person, male, urban resident, retired, with HIV and diabetes was significantly associated with lower survival compared to a young, female, rural resident, employed, with no comorbidities.

Conclusions:

This was the largest TB study in Kazakhstan, presenting the country’s TB by demographic groups, incidence, prevalence, mortality trends, and risk factors against survival.

Key messages:

- During 2014-2019, the TB incidence, prevalence and mortality per 100K population declined (227-15.2), doubled (325.3-746.6) and increased (8.4-15.2), respectively.
- Being an old person, male, urban resident, retired, with HIV and diabetes was significantly associated with lower survival compared to a young, female, rural resident, employed, with no comorbidities.

[5]Department of Pediatric Surgery, Karamandaneion Children's Hospital of Patras, Patras, Greece
[6]Nea Madytos Health Center, Thessaloniki, Greece
Contact: mesbgk@gmail.com

Background:

Depression is the most common cause of emotional disorder in older adults causing functional impairment and leading to lower quality of life (QOL). The aim of the study was to investigate the prevalence of depression, measure the perceived QOL and evaluate the impact of depression on life quality of older people in the community.

Methods:

We conducted a cross-sectional study in older people, enrolled in open day care centers and other healthcare facilities. To all participants the Greek validated version of the Geriatric Depression Scale (GDS-15) was applied to screen for depressive symptoms and the EQ-5D-5L scale to estimate their self-reported health status.

Results:

A total of 634 seniors participated in the study, 53% were females, mean age 78 years. 45.6% of the participants showed moderate to severe depression. Those who suffered from at least two chronic diseases (75.6%) were more likely to develop moderate or severe depressive symptoms compared to those with only one (19.3%) or none (2.2%) chronic disease. Increased risk of depression was observed in people with Parkinson's disease (56.5%), mental illness (47.1%), respiratory disease (40%) and stroke (35.1%). Regarding the EQ-5D-5L scale, 72% reported slight to extreme anxiety or depression, 68.2% slight to extreme pain or discomfort, 59.8% slight to extreme problems in performing usual activities, 59.8% in mobility and 40.1% in self-care, respectively. Significant differences were found between people with or without depression. Specifically, participants who reported slight to severe problems in all five domains of the EQ-5D-5L, showed higher levels of depression in the GDS-15.

Conclusions:

Our results revealed that elderly with depressive symptoms have a lower quality of life. Given the mutual relationship between chronic diseases, lower life quality and depression, assessment of depressive symptoms are needed in elderly population, mainly in people with multiple chronic diseases.

Key messages:

- Depression can be a predictor of poorer quality of life in older population.

Abstract citation ID: ckac131.126
The age of chronic diseases onset – the results of the longitudinal study

Hana Slachtova

D Skybova[1,2], *H Slachtova*[1,2], *H Tomaskova*[1,3], *J Klanova*[4], *R Madar*[1]
[1]Faculty of Medicine, University of Ostrava, Ostrava, Czechia
[2]Centre for Epidemiological Research, University of Ostrava, Ostrava, Czechia
[3]Department of Occupational Medicine, Public Health Institute, Ostrava, Czechia
[4]Centre RECETOX, Faculty of Science, Masaryk University, Brno, Czechia
Contact: hana.slachtova@osu.cz

Background:

A current aging of the European population call questions into how to protect a high quality of health in the elderly which was the reason to establish the longitudinal HAIE Project. As the baseline information, the longitudinal ELSPAC study results were used. The aim of the analysis was to learn a life-course-dependent risk factors of the onset chronic diseases in middle-aged population.

Methods:

The cohort includes data on both parents. Their number decreased during the follow up from 4,500 to about 1,000 parents. The selected questionnaire data of the cohort gained at consecutive intervals during the years 1990-2010 were analysed descriptively, according the distribution of data by respective statistical methods and survival analysis. Differences between curves were tested by log-rank tests (significance level of 5%). The SW Stata v.15 was used.

Results:

The mean age of mothers (N = 823) at study entry was 25.0 years (SD = 4.86), the age of fathers (N = 385) 28.8 years (SD = 6.05). Good self-reported health has decreased continually over time from more than 80% in both parents aged 30 to about 50% in the age of mid-forties. Most parents suffered from back pain, hypertension, and joint pain. The prevalence of diseases has raised over time. Problems with hypertension begin in women from the age of 38 (39 in men) and there was no statistically significant difference by sex ($p = 0.265$). Survival analysis found a significant difference by sex for depression ($p < 0.001$) and physician-confirmed back pain ($p < 0.001$), which affect parents from 35 years (significantly more in women than men).

Conclusions:

The processed analysis will refine the findings of the longitudinal Project HAIE (CZ.02.1.01/0.0/0.0/16_019/0000798) and subsequent projects monitoring the factors influencing healthy aging. The (C)ELSPAC studies are supported by the projects RECETOX RI (No LM2018121) and CETOCOEN EXCELLENCE (No CZ.02.1.01/0.0/0.0/17_043/0009632).

Key messages:

- About 50% of the mid-forties aged population did not declare good self-reported health. They suffered mostly from back pain, hypertension, and joint pain. The diseases prevalence has raised over time.
- The onset of hypertension begin from the age of 38 (39) with no difference by sex, depression and physician-confirmed back pain start from 35 years of age, significantly more in women than men.

Abstract citation ID: ckac131.128
People with diabetes have a substantial lower life expectancty

Henk Hilderink

H Hilderink[1]*, R Poos*[1]*, C Leemrijse*[2]*, M Heins*[2]
[1]RIVM, Bilthoven, Netherlands
[2]NIVEL, Utrecht, Netherlands
Contact: henk.hilderink@rivm.nl

Background:

People with diabetes live shorter lives on average than people without diabetes. This is not only because they have diabetes, but also more often other chronic diseases. This causes a greater risk of death. It makes a difference what kind of diabetes someone has. In type 1 diabetes, the natural immune system does not work properly. In type 2, an unhealthy lifestyle plays a role. An unhealthy lifestyle increases the chance that someone will get type 2 diabetes and the chance that that person will die of another disease, such as cardiovascular disease.

Methods:

RIVM has linked general practitioners' data from 2012-2019 to the vital statistics of the Dutch National Statistical Office. The population of people registered with and without diabetes were coupled with the mortality data. Making use of life tables, associated life expectancies were calculated. For people under the age of 45, no robust analysis could be made.

Results:

People aged 45 with type 1 diabetes live on average 13 years shorter than people without diabetes. For a 45-year-old with type 2 diabetes, that is on average 4 years shorter. The chance of dying is about 5 times greater for people aged 45 to 60 with type 1 diabetes than for people without diabetes of this age. This difference becomes smaller as they get older, because people without diabetes also get one or more diseases more often. In type 2 diabetes, the mortality rate for people aged 45 to 60 years is about 2 times greater than for people without diabetes. Again, the difference decreases as they age.

Conclusions:

A substantial lower life expectancy of 13 years for type 1 and 4 years for type 2 diabetes has different societal and policy consequences. Since type diabetes 1 is unavoidable, more attention should be given to living with this condition, while for type 2 prevention of for example overweight should get attention.

Key messages:

- People with for type 1 and type 2 diabetes have 13 and 4 years lower life expectancy.
- More attention should be given to prevention and to living with diabetes.

Background:

We assessed the difference in survival rates for people with diabetes experiencing LEA in England and Scotland, using large databases held by the Royal College of General Practitioners (RCGP) and the Scottish Diabetes Register (SCI-DC).

Methods:

Observational retrospective study of T2D adults 18+ years with LEA between 1/1/2008-1/1/2018 from 1,800 general practices in England (7.4%) and all primary, secondary care units in Scotland. Significance tests were carried out using univariate odds ratios within each database.

Results:

On 1/1/2018, N = 127,100 people with T2D were registered alive in RCGP, with N = 1,052 (832 per 100,000) experiencing prior LEA, vs N = 2,200 (783 per 100,000) out of 280,908 in SCI-DC. Among them, England recorded N = 405 patients (72.5%) with prior DFU diagnosis vs N = 993 in Scotland (74.3%), with a median time DFU to LEA of 2.0 vs 2.4 years. The median time spent with LEA was 3.4 years in England vs 3.9 years in Scotland. After including those dying earlier, different univariate patterns were found for England and Scotland. In both networks, increased risk was found for those aged 50+ at first LEA, with prior history of acute myocardial infarction, peripheral arterial disease, ischemic heart disease, cerebrovascular event, higher glomerular filtration rate and major LEA first. In England, reduced risks were found for males (OR = 0.77, 95%CI: 0.64-0.93) and people with retinopathy (0.69; 0.57-0.82), while higher risk were found for hypertension (1.29; 1.09-1.54). In Scotland, lower risks were found for obese (0.59; 0.52-0.66) and those with DFU after LEA (0.74; 0.62-0.89), vs higher rates among those of non-white ethnicity (1.63; 1.19-2.23) and dyalisis (2.31; 1.75-3.07).

Conclusions:

Notable differences were found between England and Scotland in terms of characteristics associated with different outcomes following LEA among T2D adults. Multivariate analyses of aggregate patterns are currently ongoing to adjust for potential confounding.

Key messages:

- Routine datasets from England and Scotland showed a differential impact of case-mix characteristics on lower extremity amputations among adults with Type 2 diabetes.
- Information available from different clinical networks can be mapped against the available standard sets to compare health care outcomes of people with different complex conditions.

Abstract citation ID: ckac131.130
Knowledge, attitudes, practices on hepatitis C and HCV screening: an Italian cross-sectional study

Giuseppina Lo Moro

G Lo Moro[1]*, G Scaioli*[1]*, R Frattin*[1]*, L Guastavigna*[1]*, L Vola*[1]*, F Bert*[1]*, R Siliquini*[1,2]
[1]Department of Public Health Sciences, University of Turin, Turin, Italy
[2]A.O.U. City of Health and Science of Turin, Turin, Italy
Contact: giuseppina.lomoro@unito.it

Background:

Hepatitis C has the highest burden in the Eastern Mediterranean Region and European Region. This study aimed to explore knowledge, attitudes and practices towards hepatitis C and HCV screening, which has been large-scale implemented in Italy recently.

Methods:

An online nationwide cross-sectional survey was conducted (Italy, December 2021). Five outcomes were used: HCV knowledge (from 0 to 100%: 100% represents the lowest knowledge); not being aware of the screening; wrong attitudes in case of contact with positive people (from 0 to 5: 5 represents more wrong attitudes); having performed an HCV test; sharing of blood-contaminated objects. Multivariable regressions were run.

Results:

Participants were 813 (74.7% females; mean age 37 years, SD 12.4). The median score of HCV knowledge was 20% (IQR 16-24). There was a positive correlation between poor knowledge and wrong attitudes ($p = 0.001$). People who underwent an HCV test were less likely to have poor knowledge ($p = 0.040$). The 23.2% was not aware of screening existence. People who had a postgraduate degree were less likely of not being aware ($p = 0.004$). Investigating attitude score, the median was 0 (IQR 0-1). Increasing age was associated with wrong attitudes ($p = 0.020$). The 43.4% underwent an HCV test. This likelihood was greater for: residence in a municipality with more than 50000 inhabitants ($p = 0.032$); having at least one child ($p = 0.009$); considering oneself at risk ($p = 0.004$); being informed about HCV ($p < 0.001$). The 31.8% shared objects. Increasing age was associated with reduced odds of sharing ($p = 0.033$). The 72.4% would like to receive more information on HCV, preferring brochures and short videos.

Conclusions:

This study showed good knowledge and attitudes, with a substantial frequency of individuals who never underwent an HCV test or shared contaminated objects. It also suggested brochures and short videos may be the most acceptable ways to implement awareness campaigns in comparable European contexts.

Key messages:

- Italian general population had good knowledge and attitudes towards hepatitis C and its screening, while it showed poor practices.
- Most of participants were willing to receive more information on HCV, especially through brochures and short videos.

Abstract citation ID: ckac131.131

Walk the path of cervical cancer elimination in Italy: current scenario and shared recommendations

Chiara de Waure

C de Waure[1], *MT Riccardi*[2], *F D'Ambrosio*[2], *C Castagna*[2], *M Sapienza*[2], *R Millevolte*[1], *A Pellacchia*[1], *RP de Vincenzo*[4], *GE Calabrò*[2,3]
[1]Department of Medicine and Surgery, University of Perugia, Perugia, Italy
[2]Department of Life Sciences and Public Health, Università Cattolica del Sacro Cuore, Rome, Italy
[3]VIHTALI spin-off, Università Cattolica del Sacro Cuore, Rome, Italy
[4]Gynecologic Oncology Unit, Fondazione Policlinico Universitario A. Gemelli, Rome, Italy
Contact: chiara.dewaure@unipg.it

Issue/problem:

In 2020, the World Health Organization (WHO) called for the elimination of cervical cancer. In order to get it, vaccination against Human Papillomavirus (HPV), screening of cervical cancer and treatment of high-grade cervical disease and cancer must be implemented at country level.

Description of the problem:

Italy has implemented HPV vaccination and cervical cancer screening for many years. Nevertheless, nationwide data show that both vaccination coverage and adherence to screening programs are unsatisfactory as compared to the WHO 90 and 70 targets, namely 90% of girls fully vaccinated by the age of 15 years and 70% of women screened with a high-performance test (i.e., HPV-DNA test) by age 35 and again by 45.

Results:

In order to address the progress of vaccination and screening at regional level in Italy, a project was conducted in 2021-2022 in order to collect data on relevant indicators and issues. In particular, information was collected on both coverage indicators (for both vaccination and screening) adherence (for screening) and history and characteristics of the vaccination offer (e.g., targets, gratuity) and of screening (e.g., presence of clinical pathways, type of tests used). Collected data were shared with a multidisciplinary panel of experts on HPV-related diseases to issue recommendations to foster the elimination of cervical cancer in Italy. For this purpose, a survey was also conducted to identify potential actions in respect to vaccination, screening and treatment.

Lessons:

A great heterogeneity across Italian regions was observed. The following actions were identified to implement vaccination, screening and treatment: educational campaigns, reminders and active calls for both vaccination and screening and more interoperability of data and definition of clinical pathway involving a multidisciplinary medical team for the proper management of all HPV-related diseases.

Key messages:

- Actions are requested at national level to achieve the goals set by the global strategy for cervical cancer elimination with respect to vaccination, screening and treatment.
- Actions identified to foster cervical cancer elimination in Italy includes educational campaigns, reminders and active calls, better interoperability of data and integrated medical team.

Abstract citation ID: ckac131.132

Pharmacist care in hypertension management: systematic review of randomized controlled trials

Viktoria Gastens

V Gastens[1,2], *S Tancredi*[2], *B Kiszio*[3], *C Del Giovane*[1,2], *R Tsuyuki*[4], *G Paradis*[5], *A Chiolero*[1,2,5], *V Santschi*[3]

[4]EPICORE Centre, University of Alberta, Edmonton, Canada
[5]School of Population and Global Health, McGill University, Montreal, Canada
Contact: viktoria.gastens@biham.unibe.ch

Background:

Hypertension management remains a major public health challenge in primary care. Recent hypertension guidelines recommend the involvement of pharmacists for team-based care management of hypertension. Our objective is to systematically review the evidence of the impact of pharmacist care alone, or in collaboration, on BP amongst hypertensive outpatients compared with usual care. One major focus is to assess the heterogeneity in the effects of these interventions to identify which ones work best in a given healthcare setting.

Methods:

In collaboration with a medical librarian, a systematic literature search was conducted for any article published up to 22.10.2021 in MEDLINE, EMBASE, CENTRAL, CINAHL, Web of Science, and Trip databases. Randomized controlled trials assessing the effect of pharmacist interventions on BP among outpatients were included. The outcomes are the change in BP, BP at follow-up, or BP control. Results will be synthesized descriptively and, if appropriate, will be pooled across studies to perform meta-analysis. We published the study protocol in BMJ Open.

Results:

A total of 1768 study records were identified by electronic database searching and loaded to the systematic review management software Covidence. After removal of duplicates, 1744 were independently screened based on title and abstract by two authors

(VG, ST), and 242 full texts were evaluated. A total of 72 studies with 32641 patients are currently included for data extraction. These studies were published between 1973 and 2021 and conducted in different regions (North America: n = 34, Europe: n = 13, other: n = 25). The data extraction and analysis are ongoing. Results will be presented at the congress.

Conclusions:

This systematic review provides updated evidence on the effect of pharmacist intervention on BP management. Heterogeneity in the effect of interventions will be carefully evaluated which will help the implementation of effective interventions in various healthcare settings.

Key messages:

- Recent hypertension guidelines recommend the involvement of pharmacists for team-based care management of hypertension.
- This systematic review provides updated evidence on the effect of pharmacist intervention on blood pressure management.

Abstract citation ID: ckac131.133
The association between body fat percentage and self-reported depression in the United Arab Emirates

Mitha Al Balushi

M Al Balushi[1,2]*, A Ahmad*[1]*, S Javaid*[3]*, L Ahmed*[2]*, F Al Maskari*[2]*, A Abdulle*[1]*, R Ali*[1]
[1]Public Health Research Center, New York University Abu Dhabi, Abu Dhabi, United Arab Emirates
[2]Institute of Public Health, United Arab Emirates University, Abu Dhabi, United Arab Emirates
[3]Department of Mental Health, United Arab Emirates University, Abu Dhabi, United Arab Emirates
Contact: ma4643@nyu.edu

Background:

The United Arab Emirates Healthy Future Study (UAEHFS) is one of the first large prospective cohort studies in the region which examines causes and risk factors for chronic diseases among adult UAE nationals. The aim of this study was to explore the relationship between body fat percentage (BF%) and the eight-item Patient Health Questionnaire (PHQ-8) as a screening instrument for depression among the UAEHFS pilot study participants.

Methods:

We analyzed the UAEHFS pilot data to investigate the association between BF% and PHQ-8 adjusted for age and gender. We used multivariate logistic ordinal regression model. To impute missing values, 100 multiple imputations (MI) were performed using multivariate imputation of classification and regression tree. The statistical analysis was performed using R Statistical Software (version 4.2.0)

Results:

Out of 517 participants, data from 487 (94.2%) were analyzed after excluding participants who didn't fill out the questionnaires. The median age was 30 years (Interquartile Range: 23 - 38). There were more males (67.8%) than females in the UAEHF pilot data. Approximately, 64 (13.1%) of the participant reported depression. The prevalence of obesity was 35.2% in this study population. The estimated odds ratio of BF% from the fitted multivariate logistic ordinal regression model was OR = 1.046 (95% CI: 1.012-1.08), and OR = 1.03 (95% CI: 1.003-1.057) for the omitted data, and MI (sensitivity analysis) respectively.

Conclusions:

High body fat percentage was statistically significantly associated with high risk of reporting depression. Additional research is needed, using the main UAEHFS data (after recruitment is complete), to further investigate the association between body fat percentage and depression.

Key messages:

- Our results can help contribute to the knowledge based on current and potential population mental health in the UAE and Gulf Region.
- The main finding of this study that excess body fat is associated with an increased risk of developing depression and vice versa; thus, this could add to the future direction of mental health research.

[10]Internal Medicine and Gastroenterology, Cristo Re Hospital, Rome, Italy
Contact: gabrynasi@gmail.com

Background:

Diverticulosis is increasing worldwide as a public health problem. The Combined Overview on Diverticular Assessment (CODA) score, merging Diverticular Inflammation and Complication Assessment (DICA) and few clinical parameters, may reliably predict the occurrence of acute diverticulitis and surgery due to complications. Thus, the aim of the study is to confirm the value of DICA classification and to develop and validate the CODA endoscopic-clinical score.

Methods:

A number of 2198 patients, at the first diagnosis of diverticulosis/diverticular disease were enrolled in a multicentre, prospective, international cohort study. Participants were scored according to DICA classifications. A 3-year follow-up was performed. Survival methods for censored observation were used to develop and validate the CODA score for predicting diverticulitis and surgery.

Results:

The 3-year cumulative probability of diverticulitis and surgery was $\leq$4%, and $\leq$0.7% in CODA A; <10%and <2.5% in CODA B; >10%and >2.5% in CODA C, respectively. The 3-year cumulative probability of diverticulitis and surgery was of 3.3% (95% CI 2.5% to 4.5%) in DICA 1, 11.6% (95% CI 9.2% to 14.5%) in DICA 2 and 22.0% (95% CI 17.2% to 28.0%) in DICA 3 ($p < 0.001$), and 0.15% (95% CI 0.04% to 0.59%) in DICA 1, 3.0% (95% CI 1.9% to 4.7%) in DICA 2 and 11.0% (95% CI 7.5% to 16.0%) in DICA 3 ($p < 0.001$), respectively. The CODA score showed optimal discrimination capacity in predicting the risk of surgery in the development (cstatistic: 0.829; 95%CI 0.811 to 0.846) and validation cohort (c-statistic: 0.943; 95% CI 0.905 to 0.981).

Conclusions:

DICA endoscopic classification was confirmed to have a significant predictive value in terms of acute diverticulitis occurence/recurrence and risk of surgery. CODA score could provide a new risk stratification tool useful for everyday clinical practice and also with a significant public health impact in terms of treatment effectiveness and decision making.

Key messages:

- DICA endoscopic classification of diverticular disease is a clear predictor of the outcome of diverticulosis/diverticular disease.
- The CODA score, combining DICA and few clinical parameters, may reliably predict the occurence of acute diverticulitis and surgery due to complications.

Abstract citation ID: ckac131.135
Higher VTE in a Roma population attributed to raised genetic risk and gene-environmental interaction

Shewaye Natae

S Natae[1,2], *J Sándor*[1], *R Ádány*[1,3], *S Fiatal*[1]
[1]Department of Public Health and Epidemiology, University of Debrecen, Debrecen, Hungary
[2]Doctoral School of Health Sciences, University of Debrecen, Debrecen, Hungary
[3]MTA-DE Public Health Research Group, University of Debrecen, Debrecen, Hungary
Contact: natae.shewaye@med.unideb.hu

Background:

Interactions between genetic and environmental risk factors (GxE) contribute to an increased risk of venous thromboembolism (VTE). Understanding how these factors interact provides insight for the early identification of at-risk groups within a population and creates an opportunity to apply appropriate preventive and curative measures.

Objective:

To estimate and compare GxE for VTE risk in the general Hungarian and Roma populations.

Methods:

The study was based on data extracted from a database consisting the results obtained previously in a three pillars complex health survey. DNA was genotyped for rs121909567 (SERPINC1), rs1799963 (F2), rs2036914 (F11), rs2066865 (FGG), rs6025 (F5), and rs8176719 (ABO) polymorphisms. Multivariable linear regression analysis was applied to test the impact of GxE on VTE risk.

Results:

Interestingly, the rs121909567 (SERPINC1) SNP was not present in the general population, however the risk allele frequency was 1.4% among Roma, which might suggest a founder effect in this minority. The risk of VTE was higher among depressive Roma subjects who carried the risk variant of rs2036914 (β = 0.819, p = 0.02); however, not for the general subjects. The joint presence of high level of LDL-C and rs2066865 increased the VTE risk only among Roma (β = 0.389, p = 0.002). A multiplicative interaction between rs8176719 and cancer was identified and higher for the Roma population (β = 0.370, $p < 0.001$). The VTE risk increased in the Roma population (β = 0.280, p = 0.001) but was higher in the general population (β = 0.423, p = 0.001) as a result of the multiplicative interaction between CAD and rs2036914 (F11).

Conclusions:

rs121909567 (SERPINC1) was confirmed as a founder mutation in the Roma population. As a result of higher genetic load and GxE interactions, the minority Roma population is at higher risk of VTE than the general Hungarian population.

Key messages:

- Our study revealed some evidence on the burden of the joint presence of genetic and environmental risk factors on VTE.
- A marginalized and segregated Roma community could need due attention for the prevention and control of CVDs.

Abstract citation ID: ckac131.136
Association of HDL subfractions with cardiovascular risk in Hungarian general and Roma populations

Péter Pikó

P Pikó[1], *NA Werissa*[1], *Z Kosa*[2], *J Sandor*[3], *I Seres*[4], *G Paragh*[4], *R Adany*[1,3]
[1]ELKH-DE-Public Health Research Group, University of Debrecen, Debrecen, Hungary
[2]Department of Health Methodology and Public Health, University of Debrecen, Debrecen, Hungary
[3]Department of Public Health and Epidemiology, University of Debrecen, Debrecen, Hungary
[4]Department of Internal Medicine, University of Debrecen, Debrecen, Hungary
Contact: pikopeter@gmail.com

Background:

High-density lipoprotein (HDL) cholesterol levels are inversely associated with cardiovascular risk (CVR). However, HDL cholesterol is not a homogeneous lipid and can be subdivided into subfractions, which are not uniformly associated with CVR. Among Roma populations, the prevalence of reduced HDL cholesterol levels and, consequently, that of cardiovascular diseases is very high. However, it is not known how this reduction affects the different HDL subfractions and whether changes in their representation are associated with changes in CVR.

Methods:

The study aimed to investigate whether there is a difference in the HDL subfraction profile between the Hungarian general (HG) and Roma populations and to determine the association of the different subfractions with the CVR estimated by the Framingham Risk Score (FRS) and the Systematic COronary Risk Evaluation (SCORE) algorithms. HDL cholesterol was separated using the Lipoprint system, which separates 10 subfractions into three classes: large HDL (HDL-L), medium HDL (HDL-I), and small HDL (HDL-S). Analyses were carried out on samples of 100 control subjects (50 Hungarian general and 50 Roma individuals with normal lipid profiles) and 277 individuals with reduced HDL-C levels.

Results:

Our results show that Roma has reduced levels of the overall HDL subfraction profile, with significant decreases in HDL-6, and -7. Regardless of the estimation method, elevated levels (in mmol/L) of HDL-1 to 3 and HDL-L were significantly associated with reduced risk. A higher representation (in %) of HDL-1 to 3 subfractions have a significant risk-reducing, while HDL-8 to 10 have a risk-increasing effect estimated by FRS.

Conclusions:

The results of our study show that levels of CVR protective HDL subfractions are significantly lower in Roma individuals and their reduced levels are associated with increased CVR, suggesting that the distribution of HDL subfractions contributes to the overall unfavourable CVR profile of Roma.

Key messages:

- Levels of HDL-6 and -7 subfractions were significantly lower in the Roma population than in the Hungarian general one.
- The HDL subfraction profile of the Roma population is associated with a higher cardiovascular risk among them.

Abstract citation ID: ckac131.137
Two-decade trends and factors associated with overweight and obesity among young adults in Nepal

Sujata Shakya

S Shakya[1], *S Neupane*[1], *P Absetz*[1]
[1]Faculty of Social Sciences, Tampere University, Tampere, Finland
Contact: sujata_8@iom.edu.np

Background:

Young adults are vulnerable to obesity due to different life stresses and challenges, leading to risks of cardiovascular and metabolic disorders. Studies on the long-term trends of overweight and obesity, especially among young people in Nepal are scanty. The problems among this productive age group should be checked and prevented at the earliest. The study aimed to assess more than two decades of trends from 1996 to 2019 of overweight and obesity among Nepalese young adults (18-29 years) and the socio-demographic factors associated with it.

Methods:

We utilized data from the nationwide Demographic and Health Survey (DHS) and WHO STEPwise approach to surveillance (STEPS) survey. These surveys adopted multistage stratified cluster sampling techniques and used house-to-house structured interviews for data collection. We assessed the prevalence of overweight (BMI 25-29.9 kg/m2) and obesity

(BMI≥30 kg/m2) in 1996, 2001, 2006, 2011, 2012, 2016, and 2019 among 18,714 young adults in total, and evaluated the associated socio-demographic factors from the 2016 survey, using logistic regression model.

Results:

The preliminary study findings showed that from 1996 to 2019, overweight in women increased from 1.5% to 17.0%, and obesity from 0.1% to 3.4%. For men, overweight rose from 14.4% to 16.6%, and obesity from 1.3% to 2.5% from 2012 to 2019. Higher age was associated with higher odds of overweight and obesity compared to a younger age. Men were less likely to have overweight (AOR: 0.68, CI: 0.53-0.88) and obesity (AOR: 0.42, CI: 0.23-0.78) compared to women. Moreover, urban residents had higher odds of having obesity (AOR: 2.35, CI: 1.25-4.44) compared to rural residents.

Conclusions:

Overweight and obesity have rising trends among young adults in Nepal. Older age, female and urban residence were associated with higher odds of overweight and obesity. Therefore, the interventions targeted to the risk groups can help in curbing the increasing obesity trends in Nepal.

Key messages:

- The information on trends and the factors associated with overweight and obesity may help to identify needs and opportunities to halt the rising obesity trend and prevent risk factors.
- The study findings can guide in formulating a national strategy to combat overweight and obesity among Nepalese youths.

Abstract citation ID: ckac131.138
Involving YOUNG people with Type 1 Diabetes in reSearch and the development of healTh cARe activities

Kristin Ganahl

K Ganahl[1], *K Paldán*[2], *A Bernhard*[3]
[1]Research Division, Agency of Preventive and Social Medicine, Bregenz, Austria
[2]Research Centre for User Centred Technologies, Vorarlberg University of Applied Science, Dornbirn, Austria
[3]Research & Development, aha Youth Info, Dornbirn, Austria
Contact: kristin.ganahl@aks.or.at

Background:

Typ1 Diabetes (T1D) us a complicated condition that requires constant monitoring and making many decisions. Living with T1D means to check blood sugar levels, inject oneself insulin, and be careful what you eat. In the life of a young adult there are a lot of things going on and youngsters don't want to control themselves all day and night. They want to rebel and feel free.

Methods:

Teenagers living with T1D are actively involved in the research process from data collection to data interpretation. Following the photo voice method the teenagers documented their everyday life with T1D by photographs and recordings (Summer 2021), and discussed their need and resources in group discussions. The visual and audio-data was structured on a muti-touchscreen for which a software was developed during the project. From the inductively formed categories, measures were derived together with the young people and transferred into an action plan, which was presented and discussed with decision-makers.

Results:

During the photo voice process, the teenagers identified 26 categories (i.e. nutrition, coping strategies, autonomy, etc.) that were important for describing their life with diabetes and there categories were categorized into 4 dimension: psycho-social, time, subject and space. The project-team used a systematic action planning process to develop 9 goals for an action plan to improve their life with T1D. They presented their action plan to local political leaders and stakeholders from different setting, such as health care and youth work. The responses during the stakeholder dialog were positively and there was agreement to achieve the defined goals.

Conclusions:

The photo-voice method was helpful in immersing the participants in the lives of young people with type 1 diabetes. Structuring and organizing the visual- and audio-data together was beneficial for the participatory process. Together, an action plan could be developed and discussed with decision makers.

Key messages:

- The photo voive method using digital tools (like smart-phones and multitouchscreen) is a route to empower young people and give them a voice.
- The participating patients are experts for their bodies and the disease and should be perceived and taken seriously as such.

Abstract citation ID: ckac131.139
Trends of hospital admissions and mortality of patients with dementia: descriptive study in Lombardy

Paola Bertuccio

L Blandi[1,2], *A Amorosi*[2], *P Bertuccio*[1], *A Odone*[1]
[1]Public Health, Università di Pavia, Pavia, Italy
[2]Welfare Directorate, Regione Lombardia, Milan, Italy
Contact: paola.bertuccio@unipv.it

Background:

In 2017 the amount of people globally affected by dementia was estimated about 50 million and is predicted to increase to 132 million by 2050. Coping with dementia is one of the most important challenges of governmental organizations' agenda. The objective of this study is to analyse the hospital admissions trends and monitor the overall mortality in a population of older patients with dementia over the last two decades in northern Italy.

Methods:

This study is based on the healthcare utilization database of the Lombardy region (Italy), considering on hospital discharge records and death registry flows. Primary or secondary diagnosis at admission of dementia was coded according to the ICD9-CM. We carried out descriptive analyses of hospital admissions' data from 1 Jan 1999 to 31 Dec 2020 of older patients aged 65 or more. We then conducted a temporal analysis of mortality rate over the study period.

Results:

A total of 15,683,024 hospital admissions occurred during the study period. Over the last two decades, the prevalence of dementia among patients admitted to acute care hospitals remained around 1.1-1.3%. Considering the total of 183,268 patients with dementia over the study period, the average age at admission increased from 80.2 in 1999 to 83.3 years old in 2020, whereas annual mortality rate increased from about 1,950 to 3,230 deaths per 10,000 person-years. The mortality rate ratio of patients with versus without dementia fluctuated between 1.28 and 1.70.

Conclusions:

Our findings suggest that there is an ever-greater appropriateness of hospitalizations over the last two decades, supported by out-of-hospital care that led patients to hospitalization in increasingly late and serious phases of the disease. The present study has a great future potential as well as limitations, due to the dependence on a correct coding of cases by clinicians according to the ICD9-CM system.

Key messages:

- We observed an increased mortality among older people with dementia admitted to hospital over the last two decades.
- Our descriptive study, based on the Lombardy regional healthcare database, provides evidence of an increasing appropriateness of hospitalizations.

Abstract citation ID: ckac131.140
Trends in incidence of cervical cancer in England, 1985-2019

Anjum Memon

L Fox[1], *P Bannister*[1], *A Memon*[1]
[1]Department of Primary Care and Public Health, Brighton and Sussex Medical School, Brighton, UK
Contact: a.memon@bsms.ac.uk

Background:
Worldwide, cervical cancer is the 4th most common cancer in women. The highest incidence is observed in Africa (25.6/100,000) and the lowest in North America (6.1/100,000). Over 99% of cases are caused by human papillomavirus (HPV). In the UK, HPV vaccination has been offered to school children aged 12-13 years since 2008. We conducted a retrospective population-based cohort study to examine whether there have been changes in the incidence of cervical cancer in England during the past four decades.
Methods:
Individual level data for women diagnosed with cervical cancer in England during 1985-2019 were obtained from the Office for National Statistics/Public Health England. Average annual incidence rates were calculated by two age categories (0-49, 50+ years) and all ages combined during the seven five-year time periods (1985-89 to 2015-19). The percentage change in incidence was calculated as change in the average annual incidence rate from the first (1985-89) to the last time period (2015-19). Index of Multiple Deprivation (IMD) quintiles (2015-19) were examined to determine the social gradient of the disease.
Results:
During the 35-year study period, a total of 100,303 women with cervical cancer were registered in England. In women aged 0-49 years, the average annual incidence rates declined by about 20% (from 11.6/100,000 in 1985-89 to 9.3/100,000 in 2015-19), and in women aged 50+ years, the rates declined by about 64% (from 26.1/100,000 in 1985-89 to 9.5/100,000 in 2015-19). At all ages combined, the rate declined by 43%. With regard to the social gradient, about half of the cases occurred in women in the most deprived quintiles.
Conclusions:
There has been a steady decline in the incidence of cervical cancer in England over the past four decades. These findings are consistent with reports from other Western countries. The finding of relatively increased risk of cervical cancer among women from most deprived communities needs further investigation.
Key messages:
- Considering that over 99% of cervical cancers are potentially preventable, there is an urgent need to support low- and middle-income countries to roll out HPV vaccination programme.
- The difference in risk of cervical cancer by social gradient highlights the importance of reducing health and social inequalities.

[3]Basic and Clinical Sciences, University of Nicosia Medical School, Nicosia, Cyprus
[4]Bank of Cyprus Oncology Center, Nicosia, Cyprus
[5]Health Monitoring Unit, Ministry of Health, Nicosia, Cyprus
[6]School of Health Sciences, Cyprus University of Technology, Limassol, Cyprus
Contact: quattrocchi.a@unic.ac.cy

Background:
In Cyprus, breast cancer (BC) is the first in incidence and second in mortality cancer in women. A national screening programme (NSP), targeting women 50-69 years, was introduced in 2007. The aim of this study is to provide a better understanding of cancer trends.
Methods:
Data from the national population-based Cyprus Cancer Registry on adult women diagnosed with BC between 2004-2017 with follow-up until 2019 were analysed as follows: Joinpoint regression for age-adjusted (overall and by tumor stage at diagnosis - TSD) and age-specific rates (<50, 50-59, 60-69, 70-79, ≥ 80) incidence and mortality rates; 5-year age-adjusted Net Survival (NS) rates, overall and by TSD. TSD was categorised as localised, regional, and distant.
Results:
Age-adjusted incidence rate increased from 135.3 (2004) to 153.2 (2017) per 100,000, with an annual percentage change (APC) of 1.1% (95%CI: 0.4-1.9). The greatest increase was in the age groups ≥70 years. A positive time trend was found for localized cancers between 2006-2017, while for all other stages nonsignificant trends were detected. Age-adjusted mortality rate increased from 37.0 (2004) to 50.0 (2019) per 100,000 (APC: 2.7%; 95%CI: 1.9-9.4). Significant increases in mortality rates were detected in the age groups ≥70 years. By TSD, increased rates were found at localised and regional stages, however smaller increases were detected since 2007. NS rates for the most recent period (2014-2017) was 93% for localized, 81% for regional, and 32% for distant and did not significantly improve compared to the previous years.
Conclusions:
Trends in BC incidence continues to increase, especially in the older age groups and for early-stage cancers. As expected, since the introduction of the NSP, the incidence of localised cancers increased whilst the incidence of advanced stage cancer decreased, albeit non-significantly. Survival trends did not change but mortality rates for localised and regional cancers increased at a slower pace.
Key messages:
- The introduction of the national screening programme may have played an important role in the increasing BC incidence trends.
- Despite survival rates not improving since the introduction of the national screening programme, mortality rates for early-stage cancers show a less steep increase.

Prevalence of chronic diseases among United Arab Emirates University students: cross-sectional study

Maryam Mohammed Bashir

MM Bashir[1], *M Alshamsi*[2], *S Almahrooqi*[2], *T Alyammahi*[2], *W Alhammadi*[2], *S Alshehhi*[2], *H Alhosani*[2], *F Alhammadi*[2], *F Al-Maskari*[1,3]
[1]Institute of Public Health, United Arab Emirates University, Al Ain, United Arab Emirates
[2]College of Medicine and Health Sciences, United Arab Emirates University, Al Ain, United Arab Emirates
[3]Zayed Centre for Health Sciences, United Arab Emirates University, Al Ain, United Arab Emirates
Contact: 201890105@uaeu.ac.ae

Background:
Chronic disease burden is increasing globally. In Arab Gulf Countries, the burden has increased exponentially over the past five decades due to rapid economic growth and urbanization. In the United Arab Emirates (UAE), chronic diseases are the leading cause of mortality and economic burden, hence, there is need to explore their patterns for targeted interventions. Studies among university students in Europe and the United States show chronic diseases prevalence ranging from 16.5% to 30.0%, respectively. To our knowledge, this is the first study in the Gulf region to assess multiple

chronic diseases among university students. Our study describes the prevalence and patterns of multiple chronic diseases among UAE University (UAEU) students.

Methods:

We conducted a descriptive cross-sectional study among UAEU students ≥18years from July to October 2021. Online questionnaire was used to collect data. Self-reported chronic diseases were described and compared between male and female students using chi-square and t tests. Other students' characteristics were also explored. All analyses were conducted using STATA statistical software.

Results:

902 students participated in the study with mean age of 21.9±5.2yrs. 79.8% were females. 80.7% were undergraduates. The prevalence of self-reported chronic diseases was 23.0%. Obesity, Diabetes and Asthma/Allergies were the commonest (12.5%, 4.2% & 3.2%, respectively). 34.8% of the students were either overweight or obese. Overall chronic disease prevalence was similar between males and females [27.5% vs 21.8%, 0.104] though it was significantly higher among postgraduates, students who are older, married and have family history of diabetes. 4.7% of the students reported 2 or more chronic diseases.

Conclusions:

Our study showed that more than 1 in 5 of the students reported at least one chronic disease. This shows the need for proactive chronic disease screening and prevention programs to meet the health needs of the students.

Key messages:

- Prevalence of chronic diseases (Diabetes, Prediabetes, Obesity, Hypertension, Asthma/Allergies, Lipid disorders, Thyroid disorders, GI disorders, and CVDs) was high among the university students.
- Universities should commit to researching students' health and creating targeted health policies and interventions, as chronic diseases have direct and indirect negative impact on students' education.

Abstract citation ID: ckac131.143
The impact of smoking on immunological response to SARS-COV 2: a nationwide seroepidemiological study

Serine Sahakyan

S Sahakyan[1], *L Musheghyan*[1], *D Muradyan*[1], *Z Sargsyan*[1], *V Petrosyan*[1], *V Khachadourian*[1], *A Harutyunyan*[1]
[1]Turpanjian College of Health Sciences, American University of Armenia, Yerevan, Armenia
Contact: s.sahakyan@aua.am

Background:

Smoking influences cellular and humoral immune responses and affects the immune system by increasing inflammation and decreasing activity against infections. The current study investigates the association between smoking and immunological response to SARS-CoV-2 in the Armenian population.

Methods:

We performed a nationwide cross-sectional seroepidemiological study among the adult population (≥18 years old) in Armenia. We used a multi-stage cluster random sampling to recruit participants from the capital city and all regions of Armenia. We invited selected participants to primary healthcare facilities to provide blood samples for antibody testing followed by a phone survey on demographic characteristics, smoking status, and other variables. Logistic regression analysis was used to test the relationship between smoking and having SARS-CoV-2 antibodies adjusted for other covariates.

Results:

3483 people participated in the study (71% women). The total sample included 16.8% current smokers (n = 571), 8.6% past smokers (n = 294) and 76.4% never smokers (n = 2538). The prevalence of SARS CoV-2 antibodies among current smokers was statistically significantly lower as compared with never smokers (46.9% vs 73.4%, p-value<0.001). In the multivariable logistic regression model, the odds of having SARS CoV-2 antibodies among the current smokers was 70% lower (OR 0.30, 95%CI: 0.22; 0.40) compared to never smokers, when adjusted for demographic factors and the time of PCR diagnosis of COVID-19. No statistically significant difference was found between past smokers and having SARS CoV-2 antibodies.

Conclusions:

In addition to being a risk factor for various chronic diseases, smoking weakens immune response to infectious diseases, including COVID-19, worsening the outcomes. The significantly lower level of antibody prevalence among smokers with previous PCR confirmed COVID 19 implies a poorer immune response to the infection and not a lower risk of getting the infection.

Key messages:

- Smoking weakens immune response and contributes to a higher burden of infectious diseases, such as COVID-19.
- Lower level of antibody prevalence among smokers indicates a poorer immune response to the infection rather than a lower risk of getting the infection.

Abstract citation ID: ckac131.144
Treatment burden and associated factors: a population-based survey in Central Denmark Region 2017

Marie Hauge Pedersen

MH Pedersen[1], *P Duncan*[2], *M Lasgaard*[1], *K Friis*[1], *C Salisbury*[2], *FB Larsen*[1]
[1]Public Health and Health Services Research, DEFACTUM, Central Denmark Region, Aarhus N, Denmark
[2]Centre for Academic Primary Care, NIHR School for Primary Care Research, University of Bristol, Bristol, UK
Contact: marie.pedersen@rm.dk

Background:

Exploring treatment burden at a population level can provide evidence of the types of patients who need special attention and support. We aimed to determine factors associated with high perceived treatment burden in a population-based survey of adults living in the Central Denmark Region (23% of the Danish population).

Methods:

The Danish Multimorbidity Treatment Burden Questionnaire (MTBQ) was included in the 2017 Danish population health survey. 28,627 individuals aged 25 years or over participated (64% response rate). Individuals who reported having one or more medical conditions or attending regular health check-ups were asked to complete the MTBQ. A global MTBQ score was calculated (range 0-100) and both the continuous scores and a four-category grouping of the scores into no, low, medium and high burden were used to statistically assess the association between treatment burden and sociodemographic and health-related factors.

Results:

13,407 individuals completed the Danish MTBQ (mean age 59 years). Treatment burden was negatively associated with self-related health (rs = -0.45, $P < 0.0001$), health-related quality of life (rs = -0.46/-0.51, $P < 0.0001$) and positively associated with the number of long-term conditions (rs = 0.26, $P < 0.0001$) and perceived stress (rs = 0.44, $P < 0.0001$). Higher treatment burden was associated with young age, male sex, high educational level, unemployment, not living with a spouse/cohabitant, living with child(ren) and specific long-term conditions, including heart disease, stroke, diabetes and mental illness.

Conclusions:

This is the first known population-based study of treatment burden. The findings provide important evidence to policy makers and clinicians about sociodemographic groups at risk of higher treatment burden. We recommend that patient-perceived treatment burden is included when evaluating interventions targeting patients with long-term conditions and multimorbidity and health-care system reorganisations.

Key messages:

- Treatment burden is associated with poor health and health-related quality of life and, among others, young age, male sex, unemployment, not living with a spouse, and specific long-term conditions.
- We recommend that patient-perceived treatment burden is included when evaluating interventions targeting patients with long-term conditions and multimorbidity and health-care system reorganisations.

Abstract citation ID: ckac131.145
Comparing health insurance and survey data in estimating prevalence of chronic diseases

Maria Salve Vasquez

E Mertens[2], *JL Peñalvo*[2], *S Vandevijvere*[1]
[1]Lifestyle and Chronic Diseases, Sciensano, Brussels, Belgium
[2]Non-communicable Diseases, Institute of Tropical Medicine, Antwerp, Belgium
Contact: MariaSalve.Vasquez@sciensano.be

Background:

Population prevalence of chronic conditions can be estimated from national health surveys and from administrative data sources such as insurance records. This study evaluated the agreement between the Belgian Health Interview Survey (BHIS) and the Belgian compulsory health insurance data (BCHI) in ascertaining chronic hypertension, hypercholesterolemia and diabetes in Belgium.

Methods:

The most recent cycle of BHIS (2018) provided the self-reported prevalence of diabetes, hypertension, and hypercholesterolemia among a representative sample of Belgian adults. For BCHI, the chronic conditions were attributed for every individual in the BHIS reviewing the medication prescription records identified using the ATC/DDD system. These two data sources were linked through unique identifiers by STATBEL. Disease prevalence, measures of agreement, and measures of concordance were estimated. Logistic regression was performed to determine the factors affecting agreement between BHIS and BCHI's disease classifications.

Results:

Data linkage was done for 9,753 individuals aged 15 years and older. From the sample, BHIS and BCHI respectively identified 5.9% and 5.6% diabetes cases, 18% and 24% of hypertension cases, and 18% and 16% of hypercholesterolemia cases. The kappa coefficient between BCHI and self-reported diabetes, hypertension, and hypercholesterolemia was 0.79, 0.59, and 0.49, respectively. Gender, age, and subjective health significantly affected the agreement in chronic condition classification between BHIS and BCHI.

Conclusions:

Data on reimbursed drugs is a potential alternative method in the surveillance of chronic diabetes. This procedure could be used in estimating disease prevalence but further validation is needed to evaluate its applicability and bias in other chronic conditions.

Key messages:

- BCHI is a possible alternative data source for the surveillance of diabetes in the population.
- BCHI overestimated hypertension and underestimated hypercholesterolemia prevalence.

Abstract citation ID: ckac131.146
The economic burden of Diabetes Mellitus in Belgium from 2013 to 2017

Vera Pinheiro

V Pinheiro[1,2], *V Gorasso*[3,4], *B Devleesschauwer*[3,5]
[1]CINTESIS, Centre for Health Technology and Services Research, Porto, Portugal
[2]Public Health Unit, ACES Arco Ribeirinho, ARS LVT, Lisbon, Portugal
[3]Department of Epidemiology and Public Health, Sciensano, Brussels, Belgium
[4]Department of Public Health and Primary Care, Ghent University, Ghent, Belgium
[5]Faculty of Veterinary Medicine, Ghent University, Ghent, Belgium
Contact: verafcpinheiro@gmail.com

Background:

Considering the growing prevalence of chronic disease and diabetes mellitus (DM) in Belgium, alongside population aging, insight into the economic burden of DM is essential for decision makers. To the best of our knowledge, there is no research on the subject in Belgium. Thus, our aim was to estimate the direct and indirect costs associated to DM in Belgium between 2013 and 2017.

Methods:

On a first phase, we performed a retrospective observational study, calculating the direct (i.e., ambulatory care, hospitalizations and medications) and indirect (work absenteeism, by multiplying mean daily wage and days absent from work) costs in the Belgian population with DM in 2013-2017. Data was retrieved from the Belgian Intermutualistic Agency (which manages compulsory health insurance) database and the Belgian Health Interview Survey database, namely DM prevalence, healthcare costs, days absent from work and sociodemographic and health factors. Subsequently, negative binomial regression models were used to assess the association of mean yearly costs to DM and adjustments for age, education level, physical activity, sugared drink consumption and body-mass index were included. Mean incremental costs were estimated through recycled predictions, considering the observed DM prevalence in Belgium in the study period and a counterfactual scenario with null prevalence.

Results:

We found a direct mean yearly incremental cost of €2 477 per DM patient, in Belgium, associated with age, low educational level and low physical activity. In the total Belgian population, the total yearly incremental healthcare cost of DM was €1.5 billion. Indirect yearly incremental cost of DM resulted to be not significantly different from the population without DM.

Conclusions:

DM has a major economic burden in Belgium, one that is expected to continue to rise in the future, alongside population aging. These results are essential for health planning and resource allocation.

Key messages:

- DM has a major economic burden in Belgium, especially when it comes to direct health expenditures with ambulatory care, hospitalizations and medications.
- Considering the growing prevalence of DM and population aging, these results are essential for health planning and resource allocation.

Abstract citation ID: ckac131.147
Cervical cancer rates in relation to the Roma population distribution in Slovakia in 2013 – 2020

Dominika Plančíková

D Plančíková[1], *J Melichová*[1], *P Sivčo*[1], *M Majdan*[1]
[1]Department of Public Health, Faculty of Health Care and Social Work, Trnava University in Trnava, Trnava, Slovakia
Contact: dominika.plancikova@truni.sk

Background:

Globally, more than 300 000 women die due to cervical cancer (CC) each year despite its high preventability and treatability in its early stages. This study aimed to analyse CC rates at the regional level in Slovakia from 2013 to 2020 in relation to the distribution of the Roma population.

Methods:

An ecological study was conducted using data obtained from the relevant national and regional authorities in Slovakia. Mortality, incidence, precancerous lesions incidence and the number of colposcopy and oncocytology examinations per 100 000 females 15 years and older were calculated. Linear regression models were performed in the R Project to assess associations between the rates and the estimated percentage of the Roma population at the regional level after adjusting for the unemployment, at-risk-of-poverty rate, and average disposable household income per month.

Results:

CC mortality in Slovakia declined from 10.0 in 2013 to 7.1/100 000 in 2020 ($p < 0.05$). Average mortality ranged from 5.9 in the Presov region to 10.7 in Kosice. Incidence varied from 108 in 2019 to 160/100 000 in 2017, with the highest average rates in Bratislava and the lowest in Banska Bystrica (194 and 89/100 000). Precancerous lesions incidence rates significantly differed between the regions (400 in Kosice, 984/100 000 in Trnava). The average colposcopy and oncocytology examinations rates were found to be lower in Presov (177 and 226) and Kosice (166 and 223) compared to the other regions (318 and 283/100 000 on average). After adjusting for the selected factors, CC mortality ($p < 0.05$), incidence ($p < 0.05$) and both preventive examination rates ($p < 0.01$) were statistically significantly associated with the percentage of the Roma population.

Conclusions:

Substantial differences in CC rates and preventive examinations were identified at the regional level in Slovakia. To eliminate CC in line with the WHO Global Strategy, suitable approaches to reaching those at the highest risk should be implemented.

Key messages:

- Substantial regional differences in preventive examination and cervical cancer incidence and mortality rates were identified in Slovakia in relation to the distribution of the Roma population.
- Strategies to eliminate cervical cancer should be adjusted to the regional differences and seek alternative approaches for implementing screening in hard-to-reach communities at the highest risk.

Abstract citation ID: ckac131.148
Impact of a Cancer Diagnosis on Quality of Life among Cancer Survivors and their Partners

Ana Rute Costa

F Bessa[1], *S Morais*[1,2,3], *L Lopes-Conceição*[1,2], *AR Costa*[1,2,3]
[1]EPIUnit, Instituto de Saúde Pública da Universidade do Porto, Porto, Portugal
[2]ITR, Laboratório para a Investigação Integrativa e Translacional em Saúde Populacional, Porto, Portugal
[3]Departamento de Ciências da Saúde Pública e Forenses, e Educação Médica, Porto, Portugal
Contact: arcosta@ispup.up.pt

Background:

Cancer survivors (CS) often experience physical, psychological and socioeconomic problems, which may have a negative effect on their quality of life (QoL). Additionally, cancer may also have a significant impact on patientś families, particularly their partners (PCS), who are typically the main informal caregiver.

Objective:

To estimate the association between a cancer diagnosis and a poor QoL among both members of the couples, according to sociodemographic, health-related and cancer characteristics.

Methods:

This cross-sectional study was based on data from the Sixth Wave of the Survey of Health, Ageing and Retirement in Europe - SHARE, conducted in 2015, in 18 countries. All cancer survivors (n = 2,040) who lived with a partner in the same household, as well as PCS (n = 2,040) were selected, and were country-, sex-, age- and education-matched (1:1) to non-cancer individuals (NC) and their partners (PNC), respectively. QoL was assessed using the Control, Autonomy, Self-Realization and Pleasure scale (CASP-12). The association between a cancer diagnosis and a poor QoL among both members of the couple was estimated through odds ratios (ORs) and 95% confidence intervals (95%CIs).

Results:

In nearly one-fifth of couples, both members reported a poor QoL (17.0%); this outcome was more frequently observed among CS than NC (OR = 1.31, 95%CI: 1.10-1.56). A tendency towards stronger odds of poor QoL among both couples' members was observed among CS who lived in urban areas (OR = 1.91, 95%CI: 1.30-2.80), with no multimorbidity (OR = 2.07, 95%CI: 1.14-3.76), as well as among those diagnosed <5 years (OR = 1.65, 95%CI: 1.21-2.24) and with cancers with a usually poor prognosis (OR = 1.82, 95%CI: 1.04-3.18), when compared with respective NC.

Conclusions:

A poor QoL among both couples' members was more frequent among couples dealing with cancer than those without cancer, which highlights the importance of closely monitoring CS and their partners, throughout the cancer survivorship course.

Key messages:

- Couples dealing with cancer more frequently reported a worse quality of life among both members, when compared with couples without cancer.
- The findings of this study highlights the importance of family-focused care from an early phase after the cancer diagnosis and throughout the cancer survivorship trajectory.

[3]University of Eastern Finland, Kuopio, Finland
[4]Rigshospitalet, Copenhagen, Denmark
[5]LIFE, University of Leipzig, Leipzig, Germany
[6]University of Leipzig, Leipzig, Germany
[7]German Environment Agency, Berlin, Germany
[8]UK Health Security Agency, Oxfordshire, UK
[9]Fraunhofer Institute for Biomedical Engineerig, Sulzbach, Germany
Contact: hanna.tolonen@thl.fi

Background:

The European Human Biomonitoring Initiative (HBM4EU) is a program protecting humans from the health effects of chemicals. The goal of HBM4EU is to make use of human biomonitoring (HBM) to assess human exposure to chemicals in Europe to better understand the associated health effects for citizens and to improve chemical risk assessment. Harmonisation and sustainable implementation of the HBM programme across Europe are important aims. In parallel to HBM studies, health examination surveys (HESs), dietary surveys, and disease specific health surveys are conducted in many European countries. In HESs, information collected by questionnaire(s) is supplemented with physical examinations and analysis of biomarkers from biological samples. HBM and

HES use similar sample and data collection methods and infrastructures hence combining the two is being explored.

Methods:

Within HBM4EU, three feasibility studies (Finland, Germany, and UK/England) were conducted to evaluate opportunities and obstacles in combining HBM and health studies. We describe the contents and differences of these feasibility studies, and discuss the matters of shared benefits, obstacles, and lessons learned.

Results:

Benefits of combining HBM and HESs include the use of shared infrastructures, participants receiving additional health information from HES, and higher participation rates. Obstacles can be encountered when obtaining ethical approval and during time-consuming and complicated preparatory phases. Recruitment of participants and low participation rates are common concerns and designing participant-friendly questionnaires is important. Unexpected events such as the COVID-19 pandemic can cause challenges to studies. Furthermore, experiences from several countries demonstrated that long-term funding for combined studies can be difficult to obtain.

Conclusions:

In the future, incorporating HBM modules into HESs can provide a feasible and cost-effective method to conduct HBM studies.

Key messages:

- The European Human Biomonitoring Initiative (HBM4EU) protects humans from the health effects of chemicals in Europe. HBM4EU uses human biomonitoring (HBM) to evaluate human exposure to chemicals.
- In addition to HBM studies, health examination surveys (HESs) are conducted. In the future, incorporating HBM modules into HESs can provide a feasible and cost-effective method to conduct HBM studies.

Building capacity to use legal tools to address climate change through a public health lens

David Patterson

D Patterson[1], A Garde[2]
[1]Groningen Centre for Health Law, University of Groningen, Groningen, Netherlands
[2]Law and Non-comminicable Diseases Unit, University of Liverpool, Liverpool, UK
Contact: d.w.patterson@rug.nl

Background:

EPH Conferences have an increased focus on the health impacts of climate change. However, until 2021 EPHC abstracts did not address opportunities to challenge government inaction in national and international courts. ASPHER's European List of Core Competences for the Public Health Professional (2018) only mentions NCDs and data protection law. Yet litigation to address environmental degradation and climate change is well-developed in Europe and beyond. International environmental law was presciently framed as part of global health law by Joaquin Cayon in Laaser U. and Beluli F. A Global Public Health Curriculum. South Eastern European Journal of Public Health (2016).

Objectives:

1. Clarify the role of litigation in achieving environmental and climate goals
2. Highlight the role of public health practitioners (PHP) in documenting evidence of harms
3. Propose ways to build PHP capacity to use litigation to address related public health challenges

Results:

In 2021 EUPHA-LAW, EUPHA-ENV, the Faculty of Public Health (FPH) (UK) and partners co-hosted a multi-stakeholder, interdisciplinary, open-access webinar on public health, climate change and litigation with experts from WHO, Greenpeace, ClientEarth, Lancet Countdown and the Groningen Centre for Health Law (GCHL). A related workshop was held at the 14th EPHC. In March 2022, EUPHA-LAW, FPH, GCHL and the University of Liverpool hosted a webinar on climate action in the European Court of Human Rights. [Patterson et al, Post COP26: legal action now part of public health's environment and climate change toolbox, EJPH 31/5/2022.] EUPHA-LAW is preparing a toolkit for public health practitioners and a conference on public health litigation in 2023.

Conclusions:

There is keen interest in the public health community to better understand how litigation can address public health challenges including climate change and environmental degradation. Capacity building is needed.

Key messages:

- Climate litigation supported by interdisciplinary collaboration can strengthen government resolve and accountability for action to address environmental and climate commitments.
- Litigation can advance public health objectives even without a favourable court decision. Its value also includes the publicity and awareness generated and engagement of multiple stakeholders.

[7]Department of Primary Care and Population Health, University of Nicosia Medical School, Nicosia, Cyprus
Contact: paraskevi.kinni@cut.ac.cy

Background:

Countries of the Mediterranean basin such as Cyprus are experiencing frequent desert dust storm (DDS) events that adversely impact children with asthma. As school health visitors (SHVs) have important role in asthma management, we examined SHVs practices and perceptions on asthma management and their level of engagement in school-based interventions to mitigate DDS- health effects.

Methods:

A descriptive cross-sectional survey was conducted among SHVs across state schools in Cyprus via an anonymous questionnaire, which rated the importance of asthma management measures (10-point scale), current implementation of these practices (1 = never - 5 = always), and regulatory authorities' preparedness to respond to DDS events (1-5 Likert scale).

Results:

Responses from 78 of the 93 SHVs (84%), with an average work experience of 13.5 years (SD 7.3), revealed discordance between high perception of the importance of asthma management measures and their actual implementation, with poor scoring especially in assessment of asthma control (M = 2.4, SD = 1.5), tracking school absenteeism (M = 2.1, SD = 1.0) and monitoring of asthma triggers (M = 1.9, SD = 1.4). Any DDS-related measures (e.g. air quality real-time monitoring, warnings, recommendations, awareness campaigns, etc) were implemented very infrequently. Ratings of authorities' preparedness were moderate (<3.5), and only slightly higher in the health versus the educational or other government services. SHVs who recognized the severity of DDS and potential impact on asthmatic children were more likely to support school-based interventions for DDS events (OR = 7.3, 95% CI: 2.1-25.3).

Conclusions:

Asthma management practices in school settings in Cyprus are suboptimal and responses during DDS are fragmented. While SHV's awareness and support for interventions is high, this is not reflected in current practices. A concerted effort is needed for adoption of policies and implementation of action plans for DDS within school settings.

Key messages:

- Suboptimal asthma management policies and practices were found to be implemented in schools in Cyprus, a country highly exposed to dust events.
- School health visitors recognize the health impact of desert dust on asthmatic children and support the plan for dust-mitigation programmes in schools, despite authorities' low preparedness.

Microplastics inhalation and their effects on human health: a systematic review

Gaia Surya Lombardi

G Lombardi[1,3], M Di Russo[1,3], D Zjalic[1,3], T Lanza[1,3], M Simmons[2], U Moscato[1], W Ricciardi[1,3], C Chiara[1,3]
[1]Department of Life Sciences and Public Health, Catholic University of Sacred Heart, Rome, Italy
[2]College of Population Health, Thomas Jefferson University, Philadelphia, USA
[3]Istituto di Planetary Health, Rome, Italy
Contact: gaiasuryalombardi@gmail.com

Background:

Microplastics (MPs) are defined as small particles less than 5 mm in size occuring in the environment as a consequence of plastic pollution. MPs are classified into primary MPs, which are created for industrial uses, and secondary MPs, that derive from the degradation of larger plastic items. With the global increase in plastic production, MPs have become widely distributed in the natural ecosystems and have been charged with causing several detrimental effects on both the environment and on human health. Moreover, plastics often include additives to improve their properties, which may produce additional toxic substances. Humans can be exposed to MPs through different pathways, including ingestion, inhalation and dermal contact. The aim of this systematic review is to synthesize whether inhaled microplastics and plastic additives have negative effects on human health.

Methods:

MEDLINE, Scopus and Web of Science were searched starting from December 2021. The systematic review was conducted according to the PRISMA guidelines. Eligible studies were primary studies which reported the effects of inhaled MPs on the respiratory system. Appropriate quality assessment tools were used according to the study design of primary studies.

Results:

38 studies met the inclusion criteria. Most of the studies were conducted in vitro, while there was a scarcity of papers that investigated the effects of MPs in population cohorts. Preliminary results show that MPs can induce pro-inflammatory or pro-carcinogenic effects by different mechanisms, depending on particles' concentration, size, type and surface charge.

Conclusions:

Literature has underlined several negative health concerns resulting from the absorption of microplastics and plastic additives. By gathering this information, this systematic review sheds light on the possible threats of MPs inhalation to human health and discusses whether an implementation of new public health policies for the foreseeable future is needed.

Key messages:

- Inhalation is a major route of exposure to microplastics.
- Inhaled microplastics or plastic additives may have detrimental effects on human health, promoting respiratory diseases or carcinogenic processes.

Abstract citation ID: ckac131.153
Increasing urban health awareness using an interactive approach: evidence from a school-based study

Doris Zjalic

D Zjalic[1,2], L Nachira[1,2], TE Lanza[1,2], A Perilli[1,2], A Paladini[1,2], G Santoli[1,2], A Heidar Alizadeh[1,2], W Ricciardi[1,2], U Moscato[1], C Cadeddu[1,2]
[1]Department of Life Sciences and Public Health, Università Cattolica del Sacro Cuore, Rome, Italy
[2]Italian Institute for Planetary Health, Rome, Italy
Contact: doriszjalic@gmail.com

Issue:

Urbanization is a cause of climate change, as cities are where these changes are most visible. Climate change also leads to significant inequalities and health issues in urban settings. In this context, urban health promotion is mandatory to increase adaptive capacity. Since the late 1980s the World Health Organization (WHO) has emphasized schools' role in promoting health, as they can play a crucial role in increasing health awareness to future urban inhabitants.

Description:

The objective of this pre/post-interventional study is to measure the awareness of urban health and green spaces among high school students and to rise it through an educational intervention. Four interactive sessions were delivered to 319 students from 13 to 18 years old in a high school in Rome, Italy during spring 2022. Data was gathered anonymously and analysed using descriptive and inferential statistics.

Results:

A total of 192 (60%) students successfully completed the pre/post-intervention surveys. An increase in students' knowledge of urban health and urban green areas was observed. Before the intervention 11.8% of participants were aware of urban health, whereas after the intervention 87.5% were aware. A rise across different areas appeared to be related to how many times the teachers repeated that concept during the intervention. For topics discussed in more than one session, the increase in correct answers averaged 13.9%. Two different trends emerged from the data analysis: one whose post-intervention test improved on most of questions and one whose post-intervention test remained unchanged.

Lessons:

The results of the present study suggest that school-based interventions using interactive approaches on climate change and urban health are effective for increasing the knowledge level of scholars on these topics, and can be a useful way to promote health in an urban setting. This type of approach maintains high levels of concentration and interest in most students.

Key messages:

- Urban health training activities in schools are needed to empower youth who live in urban settings.
- Interactive sessions keep student concentration high and improve their participation.

Abstract citation ID: ckac131.154
Temperature related infectious disease mortality among infants and seasonality in Sweden, 1868-1892

Johan Junkka

J Junkka[1], M Hiltunen[1]
[1]Centre for Demographic and Ageing Research, Umeå University, Umeå, Sweden

Contact: johan.junkka@umu.se

Background:

Climate conditions, such as ambient temperature, are crucial to infants' vulnerability to infectious diseases. However, little is known about how climate conditions, such as temperature and seasonality, affects infectious disease mortality among infants in high mortality settings. The aim was to investigate the association between ambient temperature, seasonality and cause-specific infant mortality.

Methods:

We applied a retrospective study design using parish register data from Sweden covering the period 1868-1892 in combination with daily temperature data. Population data and temperature data were combined in a time-series dataset, accounting the number of deaths per day by age group. Mortality due to water- and foodborn diseases, airborne infectious diseases, and other causes were modelled as a function of temperature exposure in the previous 14 days using distributed lagged non-linear models.

Results:

We found that airborne infectious disease mortality was not related to cold temperatures but rather to seasonality. At the 1st of february IIR was 2.98 (CI 1.30 - 6.85). The summer mortality peak due to water- and foodborne infections were associated with high temperatures and not with seasonality. At + 20 °C (the 99th percentile temperature exposure) IRR was 5.52 (CI 3.13-9.74).

Conclusions:

The increased vulnerability to infectious diseases of infants at high temperatures is a significant future risk, given the expected global warming in the coming decades.

Key messages:

- Airborne infectious disease mortality was related to seasonality while water- and foodborne infectious diseases were related to high temperatures.
- The increased vulnerability to infectious diseases of infants at high temperatures is a significant future risk, given the expected global warming in the coming decades.

Abstract citation ID: ckac131.155
Education in Urban Health: the experience of Public Health residents in an Italian high school

Chiara Cadeddu

C Cadeddu[1,2], D Zjalic[1,2], TE Lanza[1,2], L Nachira[1,2], A Perilli[1,2], A Paladini[1,2], GS Lombardi[1,2], M Di Russo[1,2], W Ricciardi[1,2], G Damiani[1]
[1]Department of Life Sciences and Public Health, Università Cattolica del Sacro Cuore, Rome, Italy
[2]Italian Institute for Planetary Health, Rome, Italy
Contact: chiara.cadeddu@unicatt.it

Background:

Urban health has become an increasingly important aspect of Public Health curriculum for residents as people living in urban areas will substantially rise in the next 30 years so will their impact on health. Residents are both contributors and partners in creating sustainable solutions for their growing cities and can be involved in this aim as individual learners and also educators for younger students.

Objectives:

A group of 15 Italian residents in Public Health were involved in creating and delivering 4 lessons on urban health to 319 students at Nomentano High School in Rome during spring 2022. After the 4th lesson, semi-structured interviews were conducted with the residents in order to assess perceptions, acceptance, barriers and facilitators of the experience. Data was gathered anonymously and analyzed using standard qualitative methods.

Results:

All the residents answered the interview. Almost all reported the experience as highly impactful for training, team building, and increase in accountability. Most of residents also felt more confident on the topic of urban health and more involved in concrete actions for tackling pollution and climate change after delivering the lessons. Most perceived barriers mentioned were difficulties interacting with students, especially during the first two lessons, and their compliance. The opportunity to give lessons in the high school setting facilitated direct contact with students and better feedback was received.

Conclusions:

Giving responsibility and leadership roles to Public Health residents and involving them in the education of younger students could improve their self-confidence and feelings of value and helpfulness, especially for urban health and climate change issues sensed by youth. Further experiences in other settings, specialties, and countries could be valuable to notice differences related to age groups and personal involvement.

Key messages:

- The involvement of Public Health residents in education on urban health is highly impactful and well perceived for their personal growth.
- This kind of experience is applicable to other relevant topics in Public Health.

[8]INERIS DEVELOPPEMENT SAS, Verneuil-en-Halatte, France
[9]BreezoMeter Ltd, Haifa, Israel
Contact: bastien.caillard@ineris-developpement.com

Background:

WHO states that 9 out of 10 persons in the world do not breath clean air and 8 million people die prematurely from air pollution each year. The problem is well understood, but actions to mitigate it are lacking. The purpose of the EU-funded AQ-WATCH Project is precisely to develop effective tools based on the most advanced science technologies to help decision-makers in government and the private sector to address air pollution issues in regions of the world where they operate.

Objectives:

AQ-WATCH aims to develops a supply chain to generate innovative downstream products for improving air quality forecasts and attribution based on existing space/in-situ observations to improve public health and to optimize renewable energy in regions of the world. The project consortium includes research and business-oriented partners, who brings together the required expertise to define the optimal functionalities of these products to bring them to the market.

Results:

The AQ-WATCH products are organized into 5 modules: (1) Air quality atlas, (2) Air quality attribution & mitigation, (3) Dust and fire forecast, (4) Fracking analysis, and (5) Air quality forecast. They are developed for 3 target regions (Beijing, Colorado and Santiago de Chile) and are integrated into a unified user-interface, the AQ-WATCH Toolkit. Product developers and prime users in the target regions are constantly interacting, and the user feedback is collected, analyzed and included during the product development.

Conclusions:

Collaborative work done in AQ-WATCH shows strategic interaction between our research and business-oriented partners. Contributions from local parties are proven to be valuable for regional adaption of the products. A throughout dissemination including regional workshops is essential to ensure proper knowledge uptake by the target audience. Constant exchange with the private sector is required for a smooth transfer from scientific results to commercialized marketable products.

Key messages:

- The AQ-WATCH Project follows EU's initiative to utilize its space observations with added values to develop easily-accessible tools to fight air pollution applicable to regions of the world.
- The AQ-WATCH Toolkit is developed with iterative feedback exchanges between product developers and local users to address air pollution issues, and will be eventually exploited to the market.

[5]Department of Health and Family Welfare Services, Government of Puducherry, Puducherry, India
[6]Centre for Statistical Methodology, LSHTM, London, UK
Contact: shreya.shrikhande@swisstph.ch

Background:

Climate change has far-reaching consequences on human health globally. Cardiovascular diseases (CVDs), the global leading cause of death, are climate sensitive, mainly to temperature. The temperature-CVD association is region-specific, with several studies from Europe but relatively few from low-and-middle-income countries (LMICs).

Methods:

We used a binomial regression model to analyze the association between apparent temperature and in-hospital CVD mortality in Puducherry city. A distributed lag non-linear model was used to capture the delayed and non-linear trends over a 21 day lag period to estimate the burden of in-hospital CVD mortalities attributable to non-optimal temperature between 2010 and 2020.

Results:

Tapp in Puducherry ranges from 23°C to 40°C. We found that the optimal temperature range for Puducherry is between 33°C and 35°C with respect to CVDs. Temperatures both above and below the optimal temperature range were associated with an increased risk of overall in-hospital CVD mortalities, resulting in a U-shaped association curve. Up to 20% of the CVD deaths could be attributable to non-optimal temperatures, with a slightly higher burden attributable to cold (11.2%) than heat (9.12%). We also found that males above 60 years of age were more vulnerable to colder temperatures while females above 60 years were more vulnerable to the heat. Mortality with cerebrovascular accidents was associated more with heat compared to cold, and ischemic heart diseases did not seem to be affected by temperature.

Conclusions:

Both cold and heat is associated with CVD mortality in Puducherry. The comparison of the results of this exploratory Indian study with those from European contexts show that the associations differ based on several factors. There are also age, gender and CVD type differences in Tapp attributable CVD mortalities. More region specific studies on Tapp- CVD mortality are needed from LMICs to better understand this association and build capacity.

Key messages:

- The regional burden of cold attributable CVD deaths needs to be considered along with heat. Age and gender specific differences in the association need to be further studied globally.
- The development regional and contextual climate-health action plans, as seen in some European countries, could be enhanced by such studies and reduce the burden of temperature attributable CVD deaths.

Short-term exposure to PM2.5 and hospital admissions for respiratory causes in the Czech Republic

Hana Tomaskova

H Tomaskova[1,2,3]*, H Slachtova*[1,3]*, I Tomasek*[2]*, P Polaufova*[2]*, L Hellebrandova*[2]*, A Splichalova*[2]
[1]Department of Epidemiology and Public Health, University of Ostrava, Ostrava, Czechia
[2]Institute of Public Health Ostrava, Ostrava, Czechia
[3]Centre for Health Research, Faculty of Medicine, University of Ostrava, Ostrava, Czechia
Contact: hana.tomaskova@osu.cz

Background and Aims:

The Regions Ostrava and Karvina are the most polluted areas in the Czech Republic. The aim of this study was the analysis of effect of ambient fine particles (PM2.5) on acute hospital admissions for respiratory causes.

Methods:

In the period 2013-2019, a total of 20,490 cases of acute hospitalization from respiratory causes (J00-99 according to ICD-10) was registered. The daily PM2.5 concentrations were measured at 5 stations. The analyses were performed in two ways: i) including extreme values (max. 224 μg.m-3) and ii) for PM2.5<60 μg.m-3 (5% of the highest values were cut off). The generalized additive model (GAM) for Poisson distribution was used for the analyses; the „thin plate regression spline" was applied to smooth the pressure, relative humidity and a temperature. The model was adjusted for meteorological conditions, incidence of acute respiratory infections, days off, the order of a day in a week and the area. The calculation was done for lag0 to lag3 days. The analyses were completed using the SW Stata v.14 and SW R v.3.6.1 with the use of mgcv package v.1.8-28.

Results:

The median age of patients was 57 years (IQR 4-75 years), 56% were men. The annual PM2.5 values ranged from 18.5 to 31.0 μg.m-3. Based on the fully adjusted model, a10 μg.m-3 increase in PM2.5 was associated with an increase in hospital admission of 1.0% (95% CI: 0.2-1.8%) for lag0 and lag2, 1.2% (95% CI: 0.5-1.9%) for lag3. The percentage changes for models with values of PM2.5<60 μg.m-3 were higher - 1.8% (95% CI: 0.3-3.2%) for lag0 and 3.3% (95% CI: 2.0-4.7%) for lag1-lag3.

Conclusions:

The analyses confirmed the effect of ambient fine particulates (PM2.5) on acute hospital admissions for respiratory causes in the regions Ostrava and Karvina.

This presentation was supported by the project TH03030195 of the Technology Agency of the Czech Republic and the project Healthy Aging in the Industrial Environment CZ.02.1.01/0.0/0.0/16_019/0000798 (HAIE).

Key messages:

- A positive association was confirmed between short-term concentrations of PM2.5 and acute hospital admissions for respiratory causes (lag0-lag3).

- No statistically significant difference was found between the identified C-R functions and C-R functions published by the WHO for the relationship between respiratory hospitalizations and PM2.5.

Abstract citation ID: ckac131.159
Impact of seasonality on physical activity: a systematic review

Raquel Faubel

R Faubel[1,3,4], A Garriga[1], N Sempere-Rubio[1,2], MJ Molina-Prados[1]
[1]Department of Physiotherapy, Universitat de València, Valencia, Spain
[2]Clinical Biomechanics Research Unit, Universitat de Valencia, Valencia, Spain
[3]Joint Research Unit in ICT Applied to Reengineering Socio-Sanitary Process, IIS La Fe-Universitat Politècnica de València, Valencia, Spain
[4]PTinMOTION Research Group, Universitat de València, Valencia, Spain
Contact: raquel.faubel@uv.es

Background:
The purpose of this study was to collect and analyze the available scientific evidence of the impact of seasonality on physical activity (PA). PA refers to walking, biking, sports and/or active recreation.

Methods:
The systematic search was performed in the following databases: PubMed, PEDro, Cochrane and Embase. All publications from January 2015 to September 2020 assessing seasonal variations on physical activity development in adults were selected.

Results:
A total of 1159 articles were identified, of which 26 fulfilled the selection criteria involving 9300 participants from 18 different countries. The results obtained suggest that seasonality affects PA independently of the countries, pathologies of the participants and the tool to collect PA information.

Conclusions:
PA level varies across the seasons, with higher PA level in summer compared with other seasons, especially in winter. Sedentary behavior follows the opposite trend. Impact of seasonality variations should be considered in clinical research involving PA as a primary outcome as well as in interventions on PA promotion.

Key messages:

- Impact of seasonality variations should be considered in clinical research involving PA as a primary outcome as well as in interventions on PA promotion.
- Seasonality affects PA independently of the countries, pathologies of the participants and the tool used to collect PA with higher PA level in summer compared with other seasons, especially in winter.

Coping strategies and barriers to coping in climate-vulnerable Bangladesh: a qualitative study

Kyra Lilier

K Lilier[1], SA Selim[2], ST Raihan[2], R Islam[2], J Das[2], I Danquah[1], R Sauerborn[1], K Bärnighausen[1]
[1]Heidelberg Institute of Global Health, Faculty of Medicine and University Hospital, Heidelberg University, Heidelberg, Germany
[2]Centre for Sustainable Development, University of Liberal Arts, Dhaka, Bangladesh
Contact: kyra.lilier@uni-heidelberg.de

With the mental wellbeing of billions of people at risk due to climate change, more research is required to better understand mental health and psychological implications of climate vulnerability. This research contributes to understanding how people in climate vulnerable populations psychologically cope with stress with crucial implications for adaptation efforts. We conducted n = 60 qualitative in-depth interviews with men and women in Bhola, Bangladesh to elicit the lived experiences of a climate vulnerable population. We analysed data following the tenets of Grounded Theory. Through our inductive analysis, we found coping strategies where participants highlighted what they did when encountering stress, such as ‘Resignation’ or ‘Help Seeking’. Barriers to coping were, among others, limited ‘Efficacy’, ‘Time’ or ‘Stigma’. We categorized coping strategies with barriers as high-barrier coping strategies and, those without reported barriers, as low-barrier coping strategies. High-barriers restricted participants - especially women - in their coping efforts and led them to using low-barrier coping strategies. Some low-barrier coping strategies can be interpreted as maladaptive if used frequently, as they are unhealthy and draw upon resources needed to adapt for the future. Maladaptive coping strategies can thus impede long-term adaptation by reducing motivation and the ability and willingness to act. To enable adaptive coping, we recommend lifting the barriers to coping through community-led interventions where community workers create platforms for sharing problems and knowledge, such as group support meetings. Sharing and discussing could strengthen efficacy and open new opportunities for functional, adaptive coping. As the negative impacts of climate change will be felt globally with more intensity and frequency, enabling adaptive coping and removing barriers to coping in frontline communities will be essential to supporting physical and mental wellbeing.

Key messages:

- Barriers to adaptive coping strategies can lead people to using maladaptive low-barrier coping strategies, which draw upon resources needed for long-term adaptation.
- Enabling adaptive coping by lifting barriers to coping in climate vulnerable populations is crucial to strengthen adaptation efforts.

Safer school with near-UVA technology: novel applications for Environmental Hygiene

Roberta Bosco

R Bosco[1], D Amodeo[2], I De Palma[2], G Cevenini[2], G Messina[1,3]
[1]Post Graduate School of Public Health, University of Siena, Siena, Italy
[2]Department of Medical Biotechnologies, University of Siena, Siena, Italy
[3]Department of Molecular and Developmental Medicine, University of Siena, Siena, Italy
Contact: robertabosco0@gmail.com

Background:
Schools are crowded places where outbreaks can occur. Systems capable of disinfecting air and surfaces could reduce the risk of transmission of infectious diseases.

Aim:
to evaluate the effectiveness of a near-UVA (nUVA) LED ceiling lamp in improving environmental hygiene.

Methods:
This cross-sectional study was conducted for 2 weeks between November and December 2020 in a kindergarten in Siena, Italy. Four ceiling lamps with LED wavelength of 405 nm were mounted on the room ceiling. The distance of the lamps from the floor was 2.70 m and 2.0 m from the desks. We preliminary selected 12 points in different sites of the room by measuring their irradiance values. We randomly sampled between 8 and 12 pairs of Petri Dishes (PD) daily during the study, incubated at 22 and 36C°, at different irradiation times: 8, 12 or 36 hours. Paired controls were used before using the lamps (at time T0), which were automatically switched ON overnight and compared with treatment (at time T1). Air sampling was also performed at T0 and T1. Statistical analysis was performed with Stata 14. Significance was set at 95% ($p < 0.05$).

Results:
520 PDs were used in the study: 130 PDs at T0 matched at T1 incubated at 36 °C and as many at 22 °C. The mean level of contamination at T0 was respectively 249 CFU (95 % CI 193.1 - 305.0) at 36 °C and 535.2 CFU (374.3 - 696.1) at 22 °C. The reduction was significant ($p < 0.05$) at T1: we had 87.4 CFU

(56.3 - 118.6), equal to 65%, at 36C° and 149.6 CFU (83.7 - 215.4), equal to 72%, at 22C°. Different values were recorded stratifying for dose (irradiance per exposition time). A significant mean percentage reduction of air contamination was 95.3% (98.4 - 92.3).

Conclusions:

The system was able to improve the environmental hygiene of the kindergarten. The advantage of using this technology in the presence of people is very important in the context of controlling environmental contamination.

Key messages:

- Near-UVA are efficient in reducing the contamination level significantly in a real-life context, on the surfaces and of the air.
- Crowded places favour germ outbreaks. Hygiene control is essential to reduce the risk of transmission of infectious diseases.

[7]Victoria Health, Melbourne, Australia
Contact: magdalene.parkes@gmail.com

Background:

It has long been a maxim of climate and health research that heatwaves kill more people than all other natural disasters combined. Heatwave frequency, severity and duration have increased as climate change intensifies, and recorded temperatures during recent heat events now regularly surpass previous worst-case projections. Temperate zones, between 40°-60° north or south of the Equator, are particularly vulnerable, as small variations in mean temperature can trigger large-scale increases in morbidity, mortality and concomitant health service strain. Heat Health Warning Systems (HHWSs) combine temperature forecasts with public health actions to mitigate these impacts. However, in the absence of a consensus definition of heatwaves multiple systems have developed, and comparative analysis of the effectiveness of different HHWS and their interventions are hindered by lack of a common threshold metric for defining and predicting heatwave severity.

Methods:

This paper provides a comprehensive review of current HHWS and their evidence base in temperate zones in Europe, the United Kingdom and Australia - contiguous landmasses containing multiple jurisdictions with high heterogeneity in local HHWSs, in which single heatwave events trigger vastly different public health responses. A systematic review of available published and grey literature was undertaken to generate a schema of HHWSs in these zones. Results were then narrowed to review and synthesise evidence for each, with a focus on threshold effectiveness in predicting health impacts.

Results and conclusions:

Over twenty distinct HHWS are reviewed, with substantial variation in the evidence for their effectiveness. We make the case for a unified threshold metric for defining heatwaves, to facilitate research and identify warning systems which accurately predict health impacts and effectively communicate risk.

Key messages:

- Lack of definitional consensus and heterogeneity in threshold metrics hinders comparison of Heat Health Warning Systems.
- Accurate prediction and rapid communication of heat risk is crucial to prevent health impacts of heatwaves.

Particulate matter with a diameter of 2.5 μm or less (PM2.5) are one of the air pollutants more detrimental to human health, being responsible for around 400 000 premature deaths in Europe every year. The cardiovascular diseases (CVD) and air pollution are linked, with existing evidence of a causal relationship between exposure to particulate matter and cardiovascular morbidity and mortality. Under the scope of PMCardImpact, a national funded project, data collected from Portuguese air monitoring platform (2005-2021) (>60 stations) was used to estimate the attributable number of cases of acute myocardial infarction. The air monitoring data and parameters such as exposure-response factors will support the risk assessment in AirQ+ software (WHO Regional Office for Europe). Preliminary results showed that exceedances of Air Quality Directive in Portugal ranged between 0.1 % and 10.2% for PM10 and PM2.5 in 2019. Results obtained will include the number of cases of CVD attributable to exposure to PM2.5 in the Portuguese population. Four scenarios of exposure will be considered for presenting the results: current scenario of exposure, new WHO Air Quality guidelines, European Commission Air Quality Directive and lastly, a worst-case scenario. This assessment will be the starting point for calculation of the burden of disease of CVD that exposure to PM2.5 represent in Portugal. With a view to promote the science to policy interface, PMCardImpact project will make available to policy makers the needed supporting information to act, including actionable knowledge on air pollution trends and related health effects, to implement reducing air pollution policies.

This work is funded by FCT/MCTES through national funds to PMCardImpact (EXPL/SAU-PUB/0944/2021) and CESAM (UIDP/50017/2020 + UIDB/50017/2020 + LA/P/0094/2020).

Key messages:

- PMCardImpact will make available to policy makers the needed supporting information to act to implement reducing air pollution policies.
- Risk assessment will allow to determine the number of CVD cases attributable to air pollution.

Abstract citation ID: ckac131.164
Drivers of Energy Consumption in Portuguese Hospitals - a panel analysis

Jose Chen-Xu

J Chen-Xu[1,2], *V Moutinho*[3]
[1]NOVA National School of Public Health, Lisbon, Portugal
[2]Public Health Unit, Primary Health Care Cluster Baixo Mondego, Coimbra, Portugal
[3]Management and Economics Department, University of Beira Interior, Covilhã, Portugal
Contact: josechenx@gmail.com

Background:

Buildings represent about 40% of global energy consumed, playing an important role in sustainable transformation.

Health institutions account for 10% of the energy consumed by the commercial sector, however public policies do not cover energy management in this setting. Energy poverty in hospitals, such as poor heating, affect patients' and workers' health and wellbeing. As such, this study aims to analyse drivers of electricity and natural gas consumption of Portuguese hospitals.

Methods:

Data regarding 25 hospitals in Portugal's National Health Service from 2015-2020 were analysed as logarithms in a panel of 18 trimesters, using Panel-corrected Standard Errors estimators. The PSAR model considers the presence of an autocorrelation within the panel, and the Hetonly modeling deals with heteroscedasticity and autocorrelation.

Results:

There is an elastic elasticity and a statistical significance of electricity and natural gas consumption in relation to the number of beds occupied, with a greater variation of natural gas than electricity consumption. In turn, there is a predominance of an inelastic elasticity of electricity and natural gas consumption in relation to the number of workers and number of emergency episodes.

Conclusions:

Energy consumption is highly influenced by the number of beds occupied, highlighting the need for a strategic management of energy and planning of hospital capacity. Overall, the positive absolute effects of the elasticities for energy consumption reveal that hospitals do not use effective measures aimed at rational and cleaner energy consumption, requiring a paradigm shift in the energy matrix. Increasing energy efficiency policies and environmental practices, such as autonomous energy production and renewable energies, might effectively contribute in reducing conventional energy consumption and associated energy poverty, which in turn improve patients' and workers' conditions within the hospital and their health and wellbeing.

Key messages:

- Strategic energy management and capacity planning can contribute to lower energy poverty and a paradigm shift in the energy matrix.
- Hospital sustainability policies must include energy management, including autonomous energy production and investment in renewable energies.

Health and medical apps - Same same but different? A review of definitions in public health and law

Laura Maass

L Maass[1,2], *M Freye*[1,3], *C-C Pan*[1,4], *H-H Dassow*[1,5], *J Niess*[1,6], *T Jahnel*[1,7]

The terms health app and medical app are often used interchangeably but do not necessarily mean the same. Medical apps can be regulated as mobile medical devices and therefore need to meet general safety and performance requirements. On the contrary, health apps are not part of this legal framework and do not need proof of their efficacy or guaranteeing data security. We need distinct definitions of health and medical apps to understand these terms better and regulate such technologies more effectively. We will provide an overview of health and medical apps definitions and a differentiation flowchart from public health and legal perspectives. A search in 6 databases identified 22 publications that defined health apps and 11 reports that described medical apps. The core elements of these definitions were identified through qualitative analysis. Health and medical apps share the same devices, technical functions and collect health data. While it can be highly challenging to decide which legal requirements have to be fulfilled by an app, we deem it unfit as a distinction criterion. It requires legal knowledge, which is neither suitable nor practical for users. However, medical device law is closely linked to the app's intended medical or health purpose criteria, which allows a clear differentiation. Additionally, the difference in the user group can be used for separation. Our suggestion for the definition would be that health apps are software programs on mobile devices that process health-related data on/for their user. They can be used by every health-conscious person to maintain, improve or manage the health of an individual or the community. As an umbrella term, health apps include medical apps. They share the same technological functions and devices as health apps. Health professionals, patients, and family caregivers are the main user groups of medical apps. Due to the intended use for clinical purposes, medical apps can be regulated as mobile medical devices.

Key messages:

- Separating apps based on legal regulation is impractical & can't be expected from all stakeholders. Differencing between health and medical apps requires the user group and the health aim of the app.
- Health apps include medical apps. Since 2019, medical apps in Germany contain digital health applications (DiGA). Since 2022, medical apps partly include digital care applications (DiPA).

Abstract citation ID: ckac131.166

Health promotion and disease prevention with digital technologies for older people: Scoping review

Karina Karolina De Santis

KK De Santis[1,2], *L Mergenthal*[1], *L Christianson*[3], *H Zeeb*[1,2,4]
[1]Department of Prevention and Evaluation, Leibniz Institute BIPS, Bremen, Germany
[2]Leibniz-Science Campus Digital Public Health, Bremen, Germany
[3]Department of Administration, Leibniz Institute BIPS, Bremen, Germany
[4]Faculty 11 Human and Health Sciences, University of Bremen, Bremen, Germany
Contact: desantis@leibniz-bips.de

Background:

In the aging world digital technologies are needed to target the health needs of older people. This study aimed to identify digital technologies for health promotion and disease prevention for older people by performing a scoping review.

Methods:

A search of MEDLINE, PsycINFO, CINAHL and SCOPUS on 09.03.2022 identified 2150 studies. The inclusion criteria were: 1) Population: older people, 2) Concept: any digital health technology, 3) Context: health promotion and disease prevention in home or community settings. Preliminary study selection was performed automatically using the smart groups function in EndNote. Studies were clustered by digital technology type, health target, study design and study focus. Final study selection and data coding will be performed manually by two authors.

Results:

Of the 2150 studies, 1874 studies were excluded, 159 studies met the inclusion criteria 1) and 2), but addressed different contexts (digital competence, digital technology development, disease management) or setting (care) and 117 studies were included. Digital technology types were: 1) any technologies (digital, virtual, video, eHealth or telehealth), 2) internet websites accessed via computer, 3) SMS or mobile phones, 4) exergaming or 5) smartphones or wearables. Health targets were: 1) physical activity, 2) mental health and wellness, 3) nutrition or 4) cognitive functioning. Study designs included primary studies (randomized-controlled trials) or reviews (systematic or scoping). Study focus was on effectiveness, feasibility or evaluation of digital technologies.

Conclusions:

The health needs of older people are addressed by older technologies. Newer studies use heterogeneous terminology when referring to digital technologies. Future studies should focus on multiple aspects of healthy aging beyond mobility. More work is also needed to understand if and how a shift towards newer technologies occurs and if that is associated with health benefits in older people.

Key messages:

- Older digital technologies (computers and mobile phones) address the health needs of older people.
- Mobility is the main health target of digital technologies for older people in the context of health promotion and disease prevention.

Digital coping of parents in conflict-affected communities: a path to maintain health and well-being

Stav Shapira

S Shapira[1], D Yeshua Katz[2], O Braun-Lewensohn[3]
[1]School of Public Health, Ben-Gurion University of the Negev, Beer Sheva, Israel
[2]Department of Social Work, Ben-Gurion University of the Negev, Beer Sheva, Israel
[3]Conflict Resolution and Conflict Management Program, Ben-Gurion University of the Negev, Beer Sheva, Israel
Contact: stavshap@bgu.ac.il

Background:

Mobile apps such as WhatsApp have become significant resources for information and social support in times of crisis. Little is known about the role WhatsApp groups play in the context of living in conflict-affected regions. Living in such areas is associated with myriad mental health impacts, and recent studies have identified parents of young children as highly vulnerable in this regard. The study's aim was to examine parents' digital coping with political violence in southern Israel.

Methods:

In-depth interviews were conducted with 21 parents of young children (<17) residing in communities near the Israel-Gaza border and who are members of local online parents' groups on WhatsApp. Data were analyzed to answer questions regarding the benefits and disadvantages that parents assign to online groups; and regarding the role of digital communication in maintaining health and well-being.

Results:

The findings reveal that online groups are often discussed as a shared and ubiquitous coping resource that supports mental health and well-being. Parents report they use the group to share ways to deal with the situation effectively and exchange social support, and as a space that facilitates community cohesion. Furthermore, during escalations, members perceived the group as the most trustworthy source of information. The groups' continuous availability had drawbacks as well. Some participants pointed to digital stress caused by the fear of missing out on information, or by information overload.

Conclusions:

Our results demonstrate the effectiveness of digital environments in helping parents cope with a collective stressor: a particularly worthy goal given that social media apps now constitute the primary online connection for most individuals. This has broad impacts on health promotion efforts for mental health issues related to political violence as well as other large-scale health crises such as the COVID-19 pandemic.

Key messages:

- Digital environments can serve as a platform for successful coping with collective stressors.
- Health practitioners should consider drawbacks when planning digital support efforts.

Abstract citation ID: ckac131.168
Digital phenotyping for monitoring and prediction of physical activity level during pregnancy

Mahdieh Shojaa

M Shojaa[1], N Schmitz[1]
[1]Population-Based Medicine, Tuebingen University, Tuebingen, Germany
Contact: mahdieh.shojaa@med.uni-tuebingen.de

Background:

Gestational diabetes mellitus (GDM) is one of the most common complications in pregnancy. Physical activity (PA) during pregnancy may reduce the adverse pregnancy outcomes. Digital phenotyping can develop interactive risk profiles to better reflect a person's daily mobility than traditional retrospective self-assessment questionnaires. Therefore, the aims of the proposed research are to 1) test the acceptability and applicability of the BEIWE app during pregnancy, 2) characterize daily physical mobility during pregnancy, and 3) describe differences in physical mobility in women with and without diabetes.

Methods:

This prospective cohort study will include 20 pregnant women with GDM and 20 without GDM from the Diabetes Center of the Medical Clinic or outpatient clinics of the Tübingen Women's Clinic, Tuebingen, Germany. The study was approved by the Ethics Committee of the University Hospital Tuebingen (004/2022BO1). At baseline (22 weeks gestation), participants will be instructed to download the app. Passive data (phenotypic information) is collected automatically during the observation period. The follow-up assessment will be conducted three weeks after delivery. The acceptance of the app and comparison of the groups with and without diabetes will be conducted through Statistical analysis.

Results:

Recruitment of participants has started and follow-up assessment is estimated to be finalized in fall 2022. Study design and results will be presented at the conference.

Conclusions:

PA during pregnancy has been associated with minimum risk of a pregnancy, and self-monitoring of PA via an app may play a role in improving pregnancy outcomes. However, the success of Apps depends on their validity and reliability, which lack evidence.

Key messages:

- The result of the study will develop a qualification measure for PA with no intervention.
- It also provides information for planning and conducting subsequent intervention studies.

Abstract citation ID: ckac131.169
Innovative Health Technologies to Improve Emergency Department Performance

Dario Tedesco

D Tedesco[1,2], *A Capodici*[2], *G Gribaudo*[2], *Z Di Valerio*[2], *M Montalti*[2], *A Salussolia*[2], *V Barbagallo*[1], *M Rolli*[1], *MP Fantini*[2], *D Gori*[2]
[1]General Directorate of Healthcare and Welfare, Emilia-Romagna Region, Bologna, Italy
[2]Unit of Hygiene, University of Bologna, Bologna, Italy
Contact: dario.tedesco@unibo.it

Background:
Emergency Departments (EDs) are increasingly pivotal, with a constant increment in their use, despite stable or declining fundings. Crowding can lead to disruptions and the COVID-19 epidemic has further burdened ED services. However, the pandemic has seen an increased use of telemedicine and digital health tools, which may be notably beneficial for EDs. This study offers a review of the latest available digital health technologies and their effectiveness to improve ED performance.

Methods:
We performed a narrative review to identify digital and technological innovations in EDs. The themes of interest were defined in 4 areas: Patient Assessment, Patient Experience, Resource Allocation, and Discharge. Data was analyzed by 5 independent reviewers who focused on different macro-areas. Disagreement on data was discussed with 2 independent tiebreakers.

Results:
Our search yielded 25 articles addressing 4 topics: Patient Assessment, Resource Allocation, Patient Experience, Discharge. We found that digital tools and Artificial Intelligence are powerful tools to detect, collect, and process data from patients, to improve healthcare delivery in EDs. The Resource Allocation category showed to be key in optimizing services already in place. New technologies showed effective to improve Patient Experience by curbing pain and anxiety. Innovative technologies demonstrated efficacy after Discharge when patients need guidance from clinicians for follow-up care.

Conclusions:
Our review shows evidence of increasing effectiveness of innovative tools in reducing wait time and improving performance and patient experience in EDs. Technology applied to resource allocation appeared to be the most effective category. Prediction algorithms could be used to improve workforce allocation and bed management. Critical care systems must meet the challenge of innovative technologies which can lead to a new era in healthcare delivery with improvements for patients and healthcare professionals.

Key messages:
- Digital innovation will have a significant impact on several dimensions of healthcare in the near future.
- Healthcare systems and EDs must meet the challenge of innovative technologies which can lead to a new era in healthcare delivery with improvements for both patients and healthcare professionals.

Abstract citation ID: ckac131.170
Attitudes of doctors of medicine and dental medicine towards contacting patients via social networks

Marko Marelic

D Relic[1], *M Marelic*[1], *L Machala Poplasen*[1], *J Viskic*[2], *K Sedak*[3], *M Majer*[1], *T Vukusic Rukavina*[1]
[1]Andrija Stampar School of Public Health, School of Medicine University of Zagreb, Zagreb, Croatia
[2]Department of Fixed Prosthodontics, School of Dental Medicine University of Zagreb, Zagreb, Croatia
[3]Department of Communication Sciences, Catholic University of Croatia, Zagreb, Croatia
Contact: marko.marelic@snz.hr

Background:
As the use of social networking sites (SNSs) has greatly increased among health professionals, it is necessary to investigate their use of SNSs. The aim of this study was to identify the patterns of SNS use for contact with patients between medical doctors (MD) and doctors of dental medicine (DMD) in Croatia.

Methods:
In collaboration with the Croatian Medical Chamber and the Croatian Chamber of Dental Medicine, a quantitative cross-sectional study was conducted on the use of SNSs and the attitudes of MDs and DMDs towards e-professionalism. Data were collected using online questionnaires. The data were analyzed using descriptive statistics.

Results:
A total of 753 responses were processed, 507 (67,3%) MDs and 246 (32,7%) DMDs. DMDs were significantly more likely to visit patients or their family members' profiles on SNSs (60,6% vs 33,3%, $P < 0.001$). The main reason for visiting a patient's or family member's profile is social communication, which is significantly more common among DMDs (46,3% vs 29,0%, $P < 0.002$). DMDs are significantly more likely to send friend requests from private SNS profiles to patients or their family members (15,0% DMDs vs 3,4% MDs, $P < 0.001$). Patients are much more likely to send friendship and connection requests on SNS to DMDs (91,1% DMDs vs 62,7% MDs, $P < 0.001$) who are also significantly more likely to accept these requests (76,8% DMDs vs 41,5% MDs, $P < 0.001$). MDs and DMDs would find the presence of e-professionalism guidelines useful (72,2% MDS vs 78,0% DMDs, $P = 0.103$).

Conclusions:
The results show that DMDs are more open to communicating with patients via SNSs. Results showed a difference between MDs and DMDs in both directions - in sending requests to patients or their family members and in positive responses to their requests for connection. The findings point to the need to develop guidelines for health professionals regarding e-professionalism.

Key messages:
- There are differences between MDs and DMDs toward communicating with patients using SNSs, DMDs being more open to the communication with patients.
- There is a need to develop guidelines for health professionals on e-professionalism with emphasis regarding how to professionally communicate with patients on SNSs.

Abstract citation ID: ckac131.171
The development of new Electronic Health Record Exchange Format Use Cases - an evaluating perspective

Anja Stradner

K Trunner[1], *E Leuprecht*[1], *A Stradner*[1], *C Pinto*[2], *S Franconi*[3], *M Melgara*[4], *A Boumpaki*[5], *F Soares*[2], *G Liapi*[6]

Contact: anja.stradner@goeg.at

The EU-funded X-eHealth project aims to lay the foundations for a common framework for medical imaging, discharge letters, laboratory results and rare diseases to advance an interoperable Common European Health Data Space for citizens and healthcare providers in accordance with privacy and cybersecurity regulations. To ensure sustainability of the project, it is crucial to assess whether X-eHealth is achieving its planned objectives and delivers tangible results. A key challenge in evaluating project outcomes lies in the partial lack of visibility of direct impacts due to a time lag of effects or attribution problems (i.e., identifying the main cause of a particular impact). In X-eHealth, we address this problem by defining a framework of Key Performance Indicators (KPI) that allows the monitoring of project outcomes. In addition, qualitative interviews with a focus on the following questions are conducted towards the end of the project to complement the evaluation:

- Does X-eHealth advance the integration process of eHealth services in Europe?
- Will X-eHealth lead to increased use of the new European Electronic Health Record Exchange Format (EEHRxF) specifications?

Although final results are not yet available, we expect X-eHealth to have a positive impact at all stakeholder levels by accelerating the implementation of EEHRxF through the harmonisation of health data, thus providing patients, health professionals and institutions with increased quality, safety and efficiency. There is little evidence to analyse the impact of eHealth policy interventions. For this reason, the present evaluation makes a significant contribution to impact research in this area. X-eHealth highlights the importance of international cooperation in creating a common framework for the future development of digital health in the EU. The continuous evaluation, moreover, facilitates a more efficient management of resources through KPI observance and the implementation of project results.

Key messages:

- X-eHealth aims to accelerate the implementation of the European eHealth Record exchange Format (EEHRxF) through the standardisation and harmonisation of health data.
- By evaluating and monitoring the project processes, it is possible to ensure the progress of the project and to measure the potential impacts of the outcomes on stakeholders and other target groups.

Abstract citation ID: ckac131.172
Use of Hashtags related to Covid-19 infodemics by bot accounts

Victor Suarez-Lledo

V Suarez-Lledo[1], *B Ramos-Fiol*[1,2], *ME Ortega-Martin*[1], *J Carretero-Bravo*[1], *J Alvarez-Galvez*[1]
[1]Department of Biomedicine, Biotechnology and Public Health, University of Cadiz, Cádiz, Spain
[2]Clinical Medicine and Health Public, University of Granada, Granada, Spain
Contact: victor.sanz@uca.es

Background:

Along with the Covid-19 pandemic we need to fight an ‘infodemic’. Some of the most widespread social media platforms such as Facebook, Instagram and Twitter have implemented policies to combat the spread of misinformation about Covid. However, the online ecosystem is still full of health myths, hoaxes, and fake news that-either consciously or unconsciously-is propagated by social media users with different purposes, messages that can lead to attitudinal and behavioral changes which might result in inadequate health decision making

Methods:

We use Twitter Stream API to collect tweets about Covid-19 during the early outbreak. Then we filtered those tweets with hashtags related to three infodemic topics: 5g, bill gates, UV and hydroxychloroquine. Then, we use Botometer to obtain the probability that each account is a bot or not. We use bot classification along with network analysis (Louvain community detection) to delve into the subtopics and the use of hashtags.

Results:

The resulting data collection contains ~14M tweets from ~285K of different Twitter accounts. We selected only tweets written in English. Regarding 5G, the most important communities link China with the virus, are about ‘‘democratshateamerica’’ or conspiracy theories. Tweets about Bill Gates contain hashtags about Trump, America, or mention the batflu. Communities related with UV are about Trump disinfectant, or pointing out that tv channels spread fake news. Those tweets that mention hydroxychloroquine mostly contain hashtags that mention qanon or maga content.

Conclusions:

In this paper, we analyze the use of hashtags by accounts classified as bots. Using Louvain community detection we identify co-occurring hashtags. Using social network analysis we identify which hashtags are the most important within the conversation.

Key messages:

- We identify several communities around most important infodemic topics. Bots activity in most of the cases is about political content than spreading health misinformation.
- This method allows to find subtopics based on the use of hashtags. Which allow public health policies to prevent the spread of infodemics.

Abstract citation ID: ckac131.173
Mapping core characteristics of internet-based tools to maintain and improve population health

Laura Maass

L Maass[1,2,3], *M Freye*[2,4], *CC Pan*[2,5]

[5]Leibniz Institute for Prevention Research, and Epidemiology - BIPS, Bremen, Germany
Contact: laura.maass@uni-bremen.de

Rapid developments and implementation of digital technologies in public health domains throughout the last decades have changed the landscape of health delivery and disease prevention globally. Many countries introduce digital interventions to their health systems to improve their populations’ health and make access to health care more accessible. Despite multiple definitions for digital public health and the development of different digital interventions, no study has analysed whether the used technologies fit the definition and the core characteristics of digital public health interventions. Digital public health for us means using digital tools to achieve public health goals. We conducted a scoping review to map the characteristics of digital public health interventions, see how the understanding of specific interventions differs between countries, and how they fit in the theoretical framework of digital public health definitions. Our review is the first to display the landscape of worldwide existing digital public health interventions that use information- and communication technologies. The study’s protocol was published in March 2022 in JMIR Research Protocols (DOI 10.2196/33404). We searched five databases (PubMed, Web of Science, CENTRAL, Ieee, and ACM) for publications. Given the broad search string, we retrieved 13,869 results screened for eligibility. A total of 1,429 publications were included for full-text screening. The study showed that the terms for specific interventions are related to the context in which they are used. Scandinavian countries displayed a different understanding of electronic health records (EHRs) than South American countries. We also identified that the separation between digital health and digital public health is blurry in praxis. Although interventions such as EHRs target individuals to improve their health, the collected data can also be pooled to allow research and the development of interventions on a public health level.

Key messages:

- When comparing interventions internationally, it's best to compare based on the characteristics of the intervention rather than on the name.
- Although, in theory, the distinguishment between digital health, digital public health, and public health became more precise in recent years, the practical reality between them remains still blurry.

Abstract citation ID: ckac131.174
Moving a youth trauma support group online: participatory adaption, usability and pilot test

Georgina Warner

A Perez Aronsson[1], M Thell[1], E Lampa[1], S Gupta Löfving[1], A Tokes[1], N Torakai[2], K Ibrahim[2], R Aljeshy[2], G Warner[1]
[1]Department of Public Health and Caring Sciences, Uppsala University, Uppsala, Sweden
[2]Uppsala University, Uppsala
Contact: georgina.warner@pubcare.uu.se

Background:

Posttraumatic stress poses a significant threat to a young person's development. Internet-based delivery could ameliorate barriers to care, but has mostly been tested with adults. This project aimed to (i) adapt the group intervention Teaching Recovery Techniques for online delivery through a participatory process, (ii) investigate the usability of the online format and (iii) pilot the new format.

Methods:

Adaption recommendations were generated through participatory workshops with service users and providers, and consultation with an advisory panel with professionals and parents. Usability testing was conducted with intervention leaders (n = 5) and youth (n = 5). The public involvement in the project was assessed through a multi-method approach including behavioural observations, questionnaires and field notes. A pilot study (n = 14) is ongoing.

Results:

The workshops focused on safety, participation and learning. Recommendations included an emergency response protocol, communication strategies, and guidance on intervention delivery. Whilst the advisory panel largely agreed, points of disagreement included workshop ideas around personalisation, where the panel conveyed the importance of consistency in manualised interventions. Usability testing highlighted the need for explicit guidance, particularly on safety processes.

Conclusions:

Online delivery of trauma group support requires adaptions to ensure positive group dynamics, learning and safety. Yet, some adaptions resulting from the usability testing were also relevant to the original format, pointing to the need for more extensive use of usability testing across intervention manuals. The young people, parents and professionals involved in the project provided rich and varied perspectives, illustrating the value of broad stakeholder engagement. The ongoing pilot study explores the feasibility of online delivery, including youth perceptions of the format.

Key messages:

- The varied perspectives in the participatory process highlighted the importance of broad stakeholder engagement for interventions to be equally evidence-based and adapted to the target population.
- The current pilot study explores the feasibility of online delivery, including youth perceptions of the format, in order to assess the potential for scale up.

Abstract citation ID: ckac131.175
Trauma support in your pocket

Maria Thell

M Thell[1], K Edvardsson[1], G Warner[1]
[1]Department of Public Health and Caring Sciences, Uppsala University, Uppsala, Sweden
Contact: maria.thell@pubcare.uu.se

Background:

Research indicates that technological approaches to the delivery of trauma-based support can help address structural and perceptual barriers. Yet, there is a lack of research on digital trauma support for children and adolescents. A systematic review of trauma apps identified 2 of 69 were for children, of which neither were evidence based. The aim of this project was to develop a trauma support app, co-designed with and for children and young people, based on a community-based group support program called Teaching Recovery Techniques.

Methods:

In a series of workshops utilising the Design Studio method, a team of 7 young people between 14-20 years (3 boys and 4 girls) co-created the app. The team were recruited via youth organisations and self-reported having experienced (undisclosed) trauma. The techniques presented in the manual have been prioritised via stepwise consideration of content session by session. Prototypes were developed based on the generated ideas and shared with the team for feedback.

Results:

Contributions of the young people to the design can be considered in three categories: mechanics, dynamics and aesthetics. Mechanics are the rules and interactions that inform the structure of the app. Dynamics refers to what the user can actually see, e.g. the outcome when the user presses a button. Aesthetics relate to the desirable emotional responses evoked in the user when they interact with the app. Beyond influence on basic aesthetics, such as fonts and symbols, the young people actively contributed to the user experience and gave great consideration to the emotional responses that could be evoked.

Conclusions:

Young people with personal experience of trauma can actively engage in the development of a digital trauma intervention. Design Studio was an effective method for the co-creation process, enabling the generating and converging of young peoples' ideas.

Key messages:

- Co-creating an app for trauma support with youth with experience of trauma was a feasible process for both researchers and youth.
- Using Design Studio, a collaborative workshop method, facilitated the co-creative process, allowing the youth to contribute to the mechanics, dynamics and aesthetics factors of the app.

Abstract citation ID: ckac131.176
Gauging Public Health Literacy needs through Google Trends: the COVID-19 vaccination example

Juan Rachadell

J Rachadell[1,2,3], R Vareda[3,4], A Santos[5]
[1]Public Health Unit, ACES Lisboa Ocidental e Oeiras, Oeiras, Portugal
[2]EUPHA-DH
[3]Institute for Evidence Based Health, Lisbon, Portugal
[4]Public Health Unit, ACES Lisboa Norte, Lisbon, Portugal
[5]Public Health Unit, ACES Almada-Seixal, Almada, Portugal
Contact: juan.rachadell@campus.ul.pt

Background:

The rollout of the COVID-19 vaccination program in Portugal was one of the most successful in the world. However, there was still a challenge for Public Health services to determine the health literacy needs of the population in the context of a new vaccine and the uncertainty of the pandemic. The goal of this study was to evaluate the usefulness of Google Trends data to gauge the health literacy needs of the general population during the pandemic.

Methods:

A Google Trends search was performed for Portugal including 5 topics related to health literacy needs of the population (''vaccination'', ''scheduling'', ''isolation'', ''booster dose'' and ''vaccination certificate'') between the 28th of december 2019 and the 10th of march 2022. The variation shows the relative popularity of each term referring to the total number of Google searches during that period in a normalized scale of 0-100. The variation was compared to the number of doses administered daily in Portugal and key moments of the vaccination campaign as defined by the Directorate-General for Health in Portugal.

Results:

The terms ''vaccination'' and ''isolation'' had a steady rise in popularity from December 2019 to January 2021. The term ''vaccination'' was the most popular search term with peak popularity in July 2021 and a downward trend followed by an ascent to a lower peak in popularity in January 2022. The terms ''scheduling'' and ''vaccination certificate'' both followed a similar pattern, though at lower popularity levels. The term ''isolation'' was low on popularity since February 2021, with a significant rise and peak in January 2022. This variation relates to key dates during the Portuguese vaccination campaign.

Conclusions:

Google Trends data seems to correlate with key events during the Portuguese COVID-19 vaccination campaign. That data might be incorporated in the planning framework of health literacy activities for national and local Public Health services.

Key messages:

- Google Trends might be an important source of information for public health teams.
- There is a need for further research into how Google Trends data can be incorporated with other sources of information to inform health literacy activities.

Abstract citation ID: ckac131.177
How to design information strategies on e-mental health services for prospective healthcare providers

Pia Braun

P Braun[1]*, A-K Schwientek*[1,2]*, A Loerbroks*[1]*, J Apolinário-Hagen*[1]
[1]Medical Faculty, Heinrich Heine University Dusseldorf, Dusseldorf, Germany
[2]Department of Psychiatry and Psychotherapy, Technical University of Munich, Munich, Germany
Contact: braunp@hhu.de

Background:

Among prospective healthcare providers (HCPs) such as medical students, mental health problems are prevalent, but they seem reluctant to seek help. Barriers include fear of stigmatization or limited resources of counseling centers. Electronic mental health services (eMHSs) seem to be promising low-threshold and evidence-based tools for increasing treatment availability. However, uptake rates remain low. Reasons include skepticism and lacking awareness, which can be addressed through acceptance-facilitating interventions (AFIs) such as multi-attributes information strategies. To date little is known about how to design AFIs to meet prospect HCPs' information needs and preferences.

Methods:

Between August 2021 and June 2022, n = 21 semi-structured online interviews and n = 3 co-design workshops were conducted with medical and psychology students across Germany to define attributes and levels of information strategies. Interviews were recorded, transcribed and content-analyzed using MAXQDA.

Results:

Most students reported having little knowledge about eMHSs but would have liked to be informed at the beginning of their studies or as an integral part of their study program. We identified 5 attributes that information strategies should consist of: information source (e.g., student counseling center), information path (e.g., flyer), timing (e.g., during freshman week), recommendation (e.g., from HCPs), and quality criterion (e.g., evidence-base). Attributes included 4 to 6 levels. Concerning design preferences, students favored green or blue as colors, and short texts with images.

Conclusions:

For a comprehensive dissemination of eMHSs into the healthcare system, prospective HCPs need to be educated on eMHSs. This study gives first insight into how AFIs should be designed to inform prospective HCPs. Future research should focus on systematic variations of AFIs' attributes and their levels mimicking real-world decision scenarios through discrete choice experiments.

Key messages:

- Through tailored AFIs, prospective HCPs can be informed about eMHSs for both personal and professional needs.
- Our results give student counseling centers with limited resources clear guidelines on how to inform prospective HCPs on low-threshold eMHSs.

Abstract citation ID: ckac131.178
Expectations of patients for the implementation of new nursing technology

Ronny Klawunn

R Klawunn[1]*, ML Dierks*[1]
[1]Institute of Epidemiology, Social Medicine and Health System Research, Hannover Medical School, Hannover, Germany
Contact: klawunn.ronny@mh-hannover.de

Background:

New technologies, including robots, incidence detection or patient mobilization units, are increasingly assumed to support nurses in their routines while improving care quality. In the Nursing Care Centre Hanover study (funded by the German ministry of education and research), new technologies are implemented in a hospital ward and used by nurses in their routines. As part of this study, hospital patients were interviewed regarding the question: What are patients' expectations for the implementation of new technology into care delivery?

Methods:

Between August 2019 and February 2020, 17 semi-structured interviews were conducted with patients from the project ward. To stimulate a response, 8 presentation of technologies by video and text (3 per interview) were given during the interviews. Interviews were recorded, transcribed and coded by evaluative, qualitative content analysis. The coded material was then interpreted in light of the research question.

Results:

Patients anticipate positive and negative effects of new technology concerning themselves, but they also expect effects on nurses: Health, safety and health service quality improvements might be positive effects for patients, but they are concerned about emerging threads to health by unintended consequences. They raise concerns about the possible inabilities of elder patients to use technology properly. Patients expect physical and emotional stress release for nurses when using technology, but they fear the replacement of nurses. This would have negative consequences for patients, like social isolation due to being cared for by machines.

Conclusions:

Patients have ambivalent perceptions of new technologies in nursing care. They have a differentiated view of possible consequences, not merely for themselves but also for nurses. In general, they are positive about the implementation, but this must be carried out under certain conditions, so that technology is used in a supportive, but not replacing, manner.

Key messages:

- The patients' perspective must be take into account for the implementation of nursing technology to avoid negative, unintended consequences.
- Inclusion and consideration of older patients and their technology skills can be a relevant factor for advancing the adoption of new technology into care delivery.

Abstract citation ID: ckac131.179
Online information seeking and attitudes towards COVID-19 vaccination in Germany

Lisa Schmidt

L Schmidt[1], *B Babitsch*[1]
[1]School of Human Sciences, Osnabrück University, Osnabrück, Germany
Contact: lisa.schmidt@uni-osnabrueck.de

Background:

A large proportion of the European population seeks information about the COVID-19 vaccination on the internet. The population seems to split into those with positive stance on the vaccination and those with negative stance, but there are still individuals who do not have a final position yet. By now, there is a lack of understanding about the online information seeking behavior in these three groups. The current analysis sheds light on differences in internet usage and requested qualities of online information regarding the COVID-19 vaccination.

Methods:

An online survey with N = 1,000 people (18-74 years) living in Germany was conducted between November 26 and December 8, 2021. The questionnaire included closed questions about frequency, information channels, formats and reasons of online information seeking, as well as one open question about requested qualities of online content. We conducted bivariate analysis for differences in information seeking behavior and content analysis for the requests.

Results:

Information seeking behavior differed significantly by attitude towards the vaccination regarding frequency, almost all types of formats, three of ten listed information channels, and three of six reasons for online information seeking. Undecided participants and those who support COVID-19 vaccination used the internet more often than participants who are against the vaccination. Individuals supporting vaccination preferred reading text contributions (e.g. online articles). Informative videos were more often consumed by those who are undecided or against vaccination. Those who have not decided yet preferred online resources providing full information about side-effects and showing reliable facts by credible sources.

Conclusions:

Our findings support an online vaccination communication that is tailored to target groups with different attitudes towards the vaccination. Overall, online campaigns should focus on transparent, reliable and complete information.

Key messages:

- Online information seeking behavior regarding COVID-19 vaccination varies between individuals with different attitudes towards the vaccination.
- Online information about the COVID-19 vaccination should focus on transparency and reliable information.

Abstract citation ID: ckac131.180
The usage of DiGA, stratified by sociodemographic/ socioeconomic characteristics

Niels Hannemann

N Hannemann[1], *B Babitsch*[1]
[1]New Public Health, Osnabrück University, Osnabrück, Germany
Contact: niels.hannemann@uni-osnabrueck.de

Background:

The German government undertakes efforts to implement DiGA into the statutory health insurance to improve its quality. DiGA are physician-prescribed applications for patients with certain diagnosed diseases, whose costs are covered by the statutory health insurers. DiGA have the potential to improve healthcare, but it is also possible, that the usage of these applications perpetuates existing health inequalities, summarized by the term Digital Divide; meaning that socially deprived populations are less able to benefit from digital technologies. The aim of this analysis is to determine whether differences exist in DiGA use by sociodemographic/ socioeconomic characteristics.

Methods:

The results based upon the analysis of an online survey involving 1,200 people (18-74 years) living in Germany between March 10 and March 18, 2022. The sample composition reflects the current distribution of age, gender, and place of residence in the federal states (uncrossed). The questionnaire focused, among other aspects, on the use of DiGA. A binary logistic regression was used for the analysis.

Results:

Compared to the lowest subjective social status (SSS), probands with a medium (OR 2.865) or a high SSS (OR 4.085) are more likely to use DiGA. Compared to the reference group (60 years and older), the 18-29-year- (OR 2.044) and the 30-39-year-olds (OR 1.952) tend to have a higher likelihood of using DiGA. The likelihood of the use decreases among probands with medium (OR 0.632) and high educational degree (OR 0.580) compared to the reference group (low education).

Conclusions:

In accordance with the results of existing studies, social differences could be identified regarding known determinants of health inequalities, like age and SSS. In this analysis, the highest degree of education does not appear as a predictor for an increased likelihood of use. Thus, further analyses are needed to address the influence of education, especially to develop a broader understanding of the DiGA use.

Key messages:

- It appears that DiGA are not equally accessible or used across different population groups, and thus indicating an already existing or emerging Digital Divide regarding the use of DiGA.
- Contrary to the broad assumption that higher expressions of health determinants are related to a higher likelihood of using DiGA, a higher degree of education decreases the likelihood of using DiGA.

Abstract citation ID: ckac131.181
Use and barriers to the use of telehealth services among the Arab population in Israel

Michal Laron

M Laron[1], *N Penn*[1]
[1]Health Policy Team, Myers JDC Brookdale, Jerusalem, Israel
Contact: michalla@jdc.org

Background:

Telehealth services tends to be used relatively infrequently by minority populations, thereby exacerbating health inequalities. This study examines the individual, circumstantial and environmental factors that facilitate or hinder usage of telehealth among Israeli Arabs, who constitute 21% of the Israeli population.

Methods:

Data was collected through a telephone survey among the adult Arab population in October 2020 with 501 respondents (42% response rate). Analysis included logistic regression.

Results:

Most of the Arab population use the internet several times a week (93%) and have a smartphone (96%). The most popular telehealth service was telephone appointments with a doctor (66%). Two thirds have never used the health plan's mobile application, though most have no objection to using chat (75%) or video conversation (51%) with a medical professional. The most significant barrier to using telehealth is lack of awareness of services such as ordering medicines (23%). Conversely, factors that facilitate the use of telehealth include previous acquaintance with the doctor (91%); Arabic services (82%); and recommendation by health professionals (79%). Multivariate analyses indicate a strong positive correlation between education and the use of telehealth for written correspondence with a known health professional (p = 0.001).

Conclusions:

Telehealth services (e.g., phone appointments) which are already used widely by the Israeli-Arab population, should be retained and developed further. In parallel, digital health literacy and linguistically and culturally adaptation of digital services should be promoted. Awareness of those services should be enhanced through culturally adapted marketing and via recommendations from the family doctor.

Key messages:

- Identification of the barriers to the use of telehealth services among minority populations can help service providers reduce usage gaps between minority and majority population.
- The use of telehealth services should be simplified to suit people with a low digital health literacy.

Abstract citation ID: ckac131.182
Technology-aided community engagement for exercise promotion: a mixed-methods systematic review

Gian Marco Raspolini

GM Raspolini[1], *MT Riccardi*[1], *G Damiani*[1,2]
[1]Igiene e Medicina Preventiva, Università Cattolica del Sacro Cuore, Rome, Italy
[2]Igiene e Medicina Preventiva, Fondazione Policlinico Universitario Agostino Gemelli IRCCS, Rome, Italy
Contact: gmraspo@gmail.com

Background:

This review aims to provide an overview of evidence on feasibility and effectiveness in diverse populations of eHealth physical activity (PA) community engagement (CE) interventions. Increasing global PA levels would have a substantial positive impact on population health. Given their diffusion, eHealth technologies may address certain barriers to PA and reach wide audiences. The most recent Italian guidelines on PA highlight inequalities in health, which can be addressed using CE models. The potential scalability of successful eHealth CE interventions and the scarcity of previous reviews on the topic are reasons which convinced us to work on this paper.

Methods:

This mixed-methods systematic review utilized the Joanna Briggs Institute methodologies. Primary quantitative outcome measures were minutes of PA per week. Qualitative outcome measures included self-efficacy and user engagement. Data were processed using a segregated convergent design. A narrative summary and a meta-aggregation were performed for synthesizing quantitative and qualitative data respectively. Only the interventions where CE principles were fulfilled were analyzed.

Results:

Quantitative evidence supported effectiveness and feasibility of interventions to improve PA outcomes and related proxy indicators across studied populations. Qualitative findings suggest the utility of peer-support and that from other health care providers.

Conclusions:

Implementing CE in future PA interventions will be critical for producing an effective digital application with the potential for considerable impact in the real world. If supported by central governments and the European Union, entities such as primary care hubs and local health units with their professionals and CE capabilities may play the key role in implementing evidence.

Key messages:

- eHealth PA CE interventions work better when peer support takes place.
- Health systems could pursue these prevention strategies for population health gains.

Abstract citation ID: ckac131.183
Social networks and health information sharing in COVID-19 pandemic

Tetine Sentell

M Phillips[1], *R Weldon*[1], *U Patil*[1]
[1]Office of Public Health Studies, University of Hawaii at Manoa, Honolulu, USA
Contact: tsentell@hawaii.edu

Background:

Understanding health information flow in social networks is important for designing effective health communications strategies and to achieve health literacy. Limited information is known about variation in social networks and health information sharing in the COVID-19 pandemic by demographic factors. Young people are of particular interest given their heavy exposure to digital media sources, which include considerable health misinformation.

Methods:

Hawai'i (n = 324) residents between 18-35 completed a Spring 2021 online survey including questions on health information flow in social networks: (1) how many they talked to and (2) listened to about health. Two Poisson regression models were fit with gender, education, and race/ethnicity predicting social network size.

Results:

Respondents were 67.6% female. Respondents discussed their own health with 2-3 people (M = 2.18, SD = 2.95) and listened to roughly the same number. Respondents who talked with a greater number of individuals about their own health were significantly more likely to have larger networks for listening to others (r (317) = .614; p< .001). In the model for discussing their own health, as education increased so did social network size. For the model predicting discussing others' health, gender was significant (p = 0.003); women listened to 30.6% more individuals than men. Most (73%) respondents had conducted a recent digital health search for either themselves or someone else, including for parents, grandparents, and children. Facebook (63%) and Instagram (58%) were the most popular online sources for COVID-19 health information.

Conclusions:

Understanding social networks and digital health sources in young people are important for designing effective health communications to reach all communities, especially those experiencing health inequities, given the amount of health misinformation circulating and the need to build trust in public health communication.

Key messages:

- Social networks provide access to critical health information including information obtained from digital sources.
- Gender and education were important predictors of social network size in COVID-19 health communications.

Abstract citation ID: ckac131.184
Communication on analgesia and sedation: parents' opinions in six pediatric ICU in northern Italy

Eleonora Monaco

M Martinato[1,2], *PC Fazio*[3], *R Sagredini*[4], *G Pagano*[5], *S Ferrario*[6], *A Conio*[7], *E Monaco*[1], *D Gregori*[1], *A Amigoni*[3], *MC Mondardini*[8]

[7]PICU, Azienda Ospedaliero-Universitaria Città della Salute e della Scienza, Turin, Italy
[8]PICU, Azienda Ospedaliero-Universitaria di Bologna IRCCS Policlinico, Bologna, Italy
Contact: fedele9297@gmail.com

Introduction:

Communication between healthcare professionals and parents regarding analgesic and sedative treatments for seriously ill children is challenging. Although appropriate information may help parents during admission to the pediatric intensive care unit (PICU), some areas of communication may be missed.

Objectives:

To explore and describe the opinions of parents of children admitted to PICU about analgosedation, information received about it and its potential adverse effects, and suggestions for improving the comfort of hospitalized children.

Methods:

Parents' opinions were collected in six PICUs in northern Italy. Parents of children who were hospitalized for more than 48 hours and required analgesia and sedation were asked to provide opinions on the quality of information with respect to the treatments used, possible short- and long-term sequelae, satisfaction with efficacy, environmental factors perceived as disturbing, and suggestions for improving children's comfort.

Results:

Forty-eight parents participated. Information about analgosedation was rated, as was its effectiveness. Parents pointed out some interesting suggestions to improve their children's comfort during their hospitalization in PICU. On the other hand, it was found that information about possible complications, withdrawal syndrome, delirium, or difficulties in obtaining the desired level of sedation was often provided poorly or inadequately. In addition, wide differences were found between centres, particularly with regard to analgosedation side effects and withdrawal syndrome.

Conclusions:

Parents should receive early explanations of these potential complications. Even considering the limited number of participating PICUs, distributed exclusively in northern Italy, and the small number of participants, this is the first data collection focused on communication between health professionals and parents of children undergoing analgosedation treatment in pediatric intensive care units.

Key messages:

- This is the first data collection focused on communication between health professionals and parents of children undergoing analgosedation treatment in pediatric intensive care units.
- Information about possible complications, withdrawal syndrome, delirium, or difficulties in obtaining the desired level of sedation was often provided poorly or inadequately.

Abstract citation ID: ckac131.185
Knowledge, attitude and practice about the Personal Health Record among general population in Italy

Alessandro Prinzivalli

A Prinzivalli[1], *G Scaioli*[1], *L Guastavigna*[1], *A Scacchi*[1], *G Lo Moro*[1], *F Bert*[1], *R Siliquini*[1,2]
[1]Department of Public Health Sciences, University of Turin, Turin, Italy
[2]A.O.U. City of Health and Science of Turin, Turin, Italy
Contact: alessandro.prinzivalli@unito.it

Background:

The Personal Health Record (PHR) is an online tool containing a person's health-related data, which can be shared with health professionals. This tool is widely used throughout Europe but is not very popular in Italy, despite its implementation being mandatory. This study aims to investigate knowledge, attitudes and practices (KAP) associated with the PHR among the general population in Italy, to identify the main obstacles in the usage of PHR and to establish strategies that lead to their resolution.

Methods:

A cross-sectional survey was designed and shared both online and on paper (in the waiting rooms of the outpatient clinics) to an opportunistic sample of people aged $\geq$18 years. Factors associated with a higher knowledge and willingness to activate the PHR were investigated through multivariable logistic regression analyses.

Results:

Preliminary results of the on paper survey (243 answers) showed that the median age of the participants was 45, 46% were women, 9% worked in healthcare and 68% had chronic diseases. Only 31% heard about the PHR, of which 22% showed a good knowledge of it. The 66% declared the willingness to activate the PHR and 92% agreed that the PHR is a useful tool for physicians to share information. Multivariable logistic regression models showed that those who were employed and those who were visited by a doctor in the last three months had a higher likelihood of having heard about PHR (OR 2.56, 95% CI 1.12 - 5.82 and OR 2.67, 95% CI 1.20 - 5.90 respectively). The likelihood of being willing to activate the PHR is lower for those who live alone, and is higher for those who are employed (OR 0.35, 95% CI 0.14 - 0.88 and OR 2.35, 95% CI 1.06 - 5.24).

Conclusions:

The results confirm the low level of knowledge and diffusion of the PHR in Italy, although a relatively high interest in this tool was highlighted, along with a favorable perception of its usefulness. Promotional interventions are needed to increase knowledge and awareness of this tool.

Key messages:

- Awareness about Personal Health Record among the Italian population is low. Despite this, a high level of willingness to activate this tool and a high perception of its usefulness were registered.
- Identifying factors that lead to lower awareness on Personal Health Record may help Public Health professionals to implement targeted promotional interventions aimed to increase the usage of this tool.

Abstract citation ID: ckac131.186
Digital health activism of patients with chronic diseases: discursive strategies and themes

Victoria Dudina

V Dudina[1]
[1]Sociology, St. Petersburg State University, St. Petersburg, Russia
Contact: viktoria_dudina@mail.ru

Background:

On the Internet, there are many online communities where people living with chronic life-threatening diseases can discuss their problems. On the one hand, digital health activism promotes patient empowerment and could lead to better disease self-management. But, on the other hand, digital health activism raises concerns as it undermines the monopoly of expert medical knowledge. The objective of the research was to reveal the main discursive strategies and themes represented in Russian-language online communities for people with chronic life-threatening diseases. It could help to gain a better understanding of the purposes and effects of digital health activism on patients.

Methods:

Data were collected through the popular Russian-language social networking site "Vkontakte". We selected open groups with memberships of more than 1000 users devoted to

HIV/AIDS, cancer, tuberculosis, and diabetes. Discourse analysis and thematic analysis were implemented.

Results:

Revealed discursive strategies include the patients' rights advocacy and resistance to the established order of health care. Three main types of discursive themes were identified:

a. Overcoming shortcomings of the health care system such as lack of qualified doctors, medicine shortage, and unethical behavior of health care personnel.

b. Overcoming the monopolization of expert medical knowledge and criticizing some treatment approaches.

c. Overcoming stigma and discrimination associated with disease both in healthcare settings and in everyday life.

Conclusions:

Research on digital activism of patients with chronic life-threatening diseases makes it possible to identify hidden discrimination practices and patient rights violations in healthcare settings. Members of online patient communities turn from objects of care into informed active subjects who critically evaluate medical prescriptions, are active in finding the better treatment, and in defending their rights.

Key messages:

- The research contributes to the revision of the paternalistic model of patient-doctor interaction.
- Attention to digital activism is important for the identification of hidden issues in healthcare.The research was supported by RSF (project No 22-18-00261).

Abstract citation ID: ckac131.187
Can YouTube be used as a credible source of information for COVID-19 vaccination in Italy?

Angela Ancona

A Ancona[1], M Godoy[1], P Bertuccio[2], L Gentile[1], A Odone[2], C Signorelli[1]

[1]School of Public Health, University Vita-Salute San Raffaele, Milan, Italy
[2]Department of Public Health, University of Pavia, Pavia, Italy
Contact: angela.anconaa@libero.it

Background:

The COVID-19 pandemic led to an 'infodemic', as defined by the WHO, which made it difficult to be accurately informed on public health topics. For this purpose, many people use social media as a source of information, mainly YouTube. Given the great resonance of this platform, our study aims at assessing quality and reliability of its content regarding the COVID-19 vaccination.

Methods:

During March 2022, six searches were performed on the Italian YouTube platform using the following terms: ''Covid vaccination'', ''Covid vaccine'', ''Coronavirus vaccination'', ''Coronavirus vaccine'', ''Sars-Cov-2 vaccination'' and ''Sars-Cov-2 vaccine''. A total of 329 videos were analysed, after removing 271 duplicated videos, and classified in seven types of channel. The reliability of the content was evaluated through the HoNCode score, while quality was tested using the validated DISCERN tool.

Results:

The most frequent category was 'Internet Media' (33%), while the less frequent one was 'Educational Medical' (7%). The content reliability (i.e. HoNCode score) resulted higher for videos produced by medical healthcare workers than non-medical ones. Concerning the quality, the DISCERN score resulted significantly higher for the Educational channels (median 46.0 for medical and 41.3 non-medical ones) as compared to Internet Media (26.5) and New Agencies (24.3).

Conclusions:

Although YouTube has implemented a policy against misinformation related to the COVID-19 vaccination, the study highlights that there is extreme heterogeneity in reliability and quality of videos. Content produced by non-medical users, especially ''Internet Media'' and ''News Agencies'' categories should be evaluated with attention by users, as their quality is not appropriate to the importance of the topic.

Key messages:

- Because of to the heterogeneity of its content, YouTube should be evaluated carefully when used as a source of information for Covid-19 vaccination.
- Content produced by non-medical users, is generally of poor quality, not appropriate to the importance of the topic.

Patient expectations do matter - experimental evidence on antibiotic prescribing decisions

Sophie Wang

S Wang[1,3], P Cantarelli[2], O Groene[1], N Belle[2]

[1]Research and Innovation, OptiMedis, Hamburg, Germany
[2]Management and Healthcare Lab, Sant'Anna, Pisa, Italy
[3]Hamburg Center for Health economics, University of Hamburg, Hamburg, Germany
Contact: s.wang@optimedis.de

Inappropriate prescription of antibiotics remains a major contributor to the global antimicrobial resistance crisis despite clear linkages between antibiotic utilization and resistance spread. This study aims to better understand the simultaneous and independent effect of previous prescription behavior, patient expectation, and clinical uncertainty on antibiotic prescribing. This discrete choice experiment was embedded within a routine organizational climate survey administered to all physicians working in the Tuscany healthcare system administered between Nov 11 and Nov 20, 2019 (Qualtrics). Participants were provided with a patient encounter vignette and subsequently asked to in which of two alternatives they were more likely to prescribe antibiotics. The two alternatives varied in levels of clinical uncertainty, patient expectations, and the physician's past behavior. We fitted a conditional logistic regression model. Respondents included 1,436 hospital-based physicians, of which 52% were female, 78% practiced in a general hospital setting, and 33% were between the ages of 50 and 59. Results show that the odds of prescribing antibiotics decrease when a patient requests it (OR = 0.80, 95%CI [0.72,0.89]) and increase when the physician has prescribed antibiotics to a patient under similar circumstances previously (OR = 1.15, 95%CI [1.03,1.27]). We found no significant effect of clinical uncertainty on the odds of prescribing antibiotics (OR = 0.96, 95%CI [0.87, 1.07]). We show that patient expectation has a significant negative association with antibiotic prescribing among hospital-based physicians. Our findings inform the design of antibiotic stewardship programs in Tuscany and highlight the importance of cultural context in shaping the physician's disposition when confronted with patient expectations. We suggest shared decision-making to improve prudent prescribing without compromising on patient satisfaction.

Key messages:

- Health administrators should address patient expectations when designing hospital antibiotic stewardship programs.
- Physicians' past prescribing behaviour influences antibiotic prescribing decisions and should be considered during intervention design.

Contact: heitor.cavalini@upe.br

Background:

The COVID-19 pandemic has changed the way infectious diseases are perceived. Global healthcare systems have faced challenges since the start of the COVID-19 epidemic, particularly in developing countries. Some individuals with an acute COVID-19 diagnosis have developed symptoms persisting beyond 90 days. Long-Covid is the new term for this syndrome (LC). LC, on the other hand, is poorly known and appears to cause a wide range of symptoms, particularly among Brazilian patients. As a result, utilizing retrospective data from patients in Petrolina, Brazil's largest city in the northeast, we conducted an exploratory epidemiology study.

Methods:

A retrospective, cohort study design was used with a real-world dataset. The primary aim was to evaluate the prevalence of LC within Petrolina. The sample size was 1,164 LC patients. A comparative and subgroup analysis was conducted to evaluate demographics, comorbidities, clinical symptoms, and mortality. A k means model was used to assess disease severity using a clustering analysis based on the presence of comorbidities.

Results:

The prevalence of physical symptoms identified was 69·5%. The strongest physical symptom was fever with resultant of 64·09% followed by pain, 43·64%. The prevalence of autonomic and neurological symptomatology was 8·59% and 8·16% respectively. A higher prevalence of autonomic symptoms were reported among older men of Black and Caucasian in comparison to Pardo. Disease severity within the sample could be associated with the presence of comorbidities which were identified based on medication history. Pregnant women have high rate of comorbidities. 529 patients have at least one comorbidity and 28·73% of them are pregnant.

Conclusions:

It is useful to evaluate symptoms although a definitive diagnosis of LC is essential. This study provides insightful information around LC within a Brazilian population to develop better infection control protocols, as well as future management of similar pandemics.

Key messages:

- This study could potentially improve the prognosis and mortality among LC patients with comorbidities.
- Our findings could be combined with other regional datasets to predict pattern inferences of LC spread, prognosis and morbidity, including for multimorbidity and pregnant patients.

Abstract citation ID: ckac131.190
Locality based Approach for containment of COVID-19 Infections in Pakistan's High risk Districts-ICT

Nadia Noreen

N Noreen[1], I Naveed[2], F Bashir[3]
[1]Directorate of Central Health Establishment, Ministry of National Health Regulations, Islamabad, Pakistan
[2]PIMS, Covid Ward, Islamabad, Pakistan
[3]PHRC, NIH, Islamabad, Pakistan
Contact: nadia.jamil3@gmail.com

Background:

In May 2020, considering gradual restoration of all economical activities the Government of Pakistan updated containment strategy from locking down the whole country to locking down high-risk areas to mitigate COVID-19 spread. All districts having $\geq$300 cases/100,000 population. COVID-19 case incidence and test positivity rates by real-time RT-PCR before and after zonal lockdown were compared to assess whether the locality-based lockdowns can be used as an alternative to country lockdown to contain COVID-19 spread.

Methods:

Smart lockdowns were implemented in ten localities in the Islamabad Capital Territory (ICT), having a population of 60,000 from 12 May 2020 to June 3, 2020. Movements were restricted. Entry and exit points were guarded by police. Any person with symptoms of fever, cough, or sore throat tested by real-time RT-PCR methods and reported within 24 hours of collection. To compare the rate of active cases and positivity rate by weeks, we performed a z-test for two proportions and set $p < 0.05$ as the level of significance.

Results:

The red zone had 60,000 persons in 2.00 square kilometers. The rate of active COVID-19 cases significantly decreased ($p < 0.0001$) during intervention from 300/100,000 population pre-containment time to 22/100,000 population after the first three weeks of lockdown. The COVID-19 positivity rate also decreased significantly ($p < 0.0001$) from 24% (24/78) pre-containment to 5.3% during containment. A total of 3800 people were tested in the following three weeks of intervention and 26 cases were detected.

Conclusions:

The smart lockdowns approach reduced COVID-19 transmission in the ICT district. This type of intervention was recommended to reduce the COVID-19 infection spread

Key messages:

- Reduced COVID-19 transmission in the ICT district.
- Keeping balance between life and economy.

Abstract citation ID: ckac131.191
Socioeconomic Inequalities in pediatric Metabolic Syndrome: mediation by parental health literacy

Alexander Lepe

A Lepe[1], MLA de Kroon[1,2], SA Reijneveld[1], AF de Winter[1]
[1]Health Sciences, UMC Groningen, Groningen, Netherlands
[2]Public Health and Primary Care, KU Leuven, Leuven, Belgium
Contact: a.lepe@umcg.nl

Background:

Parental health literacy may explain the relationship between parental socioeconomic status (SES) and pediatric metabolic syndrome (MetS). For this reason, we assessed to what extent parental health literacy mediates the relationships between parental SES and pediatric MetS.

Methods:

We used data from the prospective multigenerational Dutch Lifelines Cohort Study. Our sample consisted of 6,683 children with an average follow-up of 36.2 months (SD 9.3) and a mean baseline age of 12.8 years (SD 2.6). We used natural effects models to assess the natural direct, natural indirect, and total effects of parental SES on MetS.

Results:

On average, an additional four years of parental education, e.g. university instead of secondary school, would lead to cMetS scores that were 0.499 (95% confidence interval (CI) 0.364; 0.635) units lower, which is a small effect (d 0.18). If parental income and occupational level were one standard deviation higher, on average cMetS scores were 0.136 (95%CI 0.052; 0.219) and 0.196 (95%CI 0.108; 0.284) units lower, respectively; these are both small effects (d 0.05 and 0.07, respectively). Parental health literacy partially mediated these pathways; it accounted for 6.7% (education), 11.8% (income), and 8.3% (occupation) of the total effect of parental SES on pediatric MetS.

Conclusions:

Socioeconomic differences in pediatric MetS are relatively small, the largest being by parental education. Improving parental health literacy may reduce these inequalities. Further research is needed into the mediating role of parental health literacy on other socioeconomic health inequalities in children.

Key messages:

- Parental socioeconomic status (SES) has a small inverse relationship with pediatric metabolic syndrome (MetS), which is partially mediated by parental health literacy.
- Targeting parental health literacy may reduce inequalities in pediatric MetS. It may also influence other pediatric socioeconomic health inequalities, but further research is needed.

The impact of the SARS-CoV-2 pandemic on cause-specific- mortality: a systematic literature review

Davide Golinelli

F Sanmarchi[1]*, F Esposito*[1]*, E Adorno*[1]*, MP Fantini*[1]*, D Golinelli*[1]
[1]DIBINEM, Department of Biomedical and Neuromotor Sciences, Bologna, Italy
Contact: davidegolinelli@gmail.com

Background:

Although investigating the patterns of COVID-19 excess mortality (EM) is relevant, understanding the effects of the pandemic on cause-specific mortality is even crucial and should also be assessed, as this metric allows for a more detailed analysis of the true impact of the pandemic. The aim of this systematic literature review is to estimate the impact of the pandemic on different causes of death, providing a quantitative and qualitative analysis of the phenomenon.

Methods:

We searched MEDLINE to identify studies that reported cause-specific mortality during the COVID-19 pandemic. We adopted several inclusion criteria: original article; assessed at least one cause-specific mortality during the pandemic; assessed causes of deaths using the ICD-10 classification; reporting of at least one of the following outcomes: cause-specific mortality estimates or cause-specific EM; full-length articles. Several relevant data were extracted (e.g. publication year, data stratification, territory, country income level, all-cause EM, and cause-specific mortality, etc.).

Results:

The search identified 548 articles. After title, abstract and full-text screening, we extracted relevant data from the final set of 14 articles. Cause-specific mortality was reported using different units of measurement. Only 9 studies reported the statistical significance and/or confidence intervals. The most frequently analyzed causes of death were cardiovascular diseases (n = 11), cancer (n = 7), diabetes (n = 6), and suicide (n = 5). We found very heterogeneous patterns of cause-specific mortality, for all the specific causes of deaths, except for suicide and road accident.

Conclusions:

The impact of the pandemic on cause-specific deaths has been very heterogeneous and the analyses conducted so far are not exhaustive. We advocate for the urgent need to find a consensus to define uniform methodological approaches to establish the true burden of the COVID-19 pandemic on non-COVID-19 mortality.

Key messages:

- We reviewed the body of literature to estimate the impact of the COVID-19 pandemic on different causes of death, and to provide a quantitative and qualitative analysis of the phenomenon.
- We did not identify unique patterns of cause-specific mortality due to too varied approaches in terms of disease classification and coding, and methodologies used for estimating mortality.

Abstract citation ID: ckac131.193
Childhood adversity and risk of later labor market marginalization in young employees in Sweden

Emma Björkenstam

E Björkenstam[1,2,3]*, M Helgesson*[1]*, E Mittendorfer-Rutz*[1]
[1]Department of Clinical Neuroscience, Karolinska Institutet, Stockholm, Sweden
[2]Department of Community Health Sciences, University of California Los Angeles, Los Angeles, USA
[3]Department of Medical Sciences, Neuroscience, Uppsala University, Uppsala, Sweden
Contact: emma.bjorkenstam@ki.se

Background:

The present study examined the independent and combined effects of childhood adversity (CA) and occupational class on the risk of future labor market marginalization (LMM) in young employees in Sweden. Occupational class (non-manual/manual workers) was also explored as a potential mediator.

Methods:

This population-based longitudinal cohort study included 556,793 employees, 19-29 years, residing in Sweden in 2009. CAs included parental death, parental mental and somatic disorders, parental separation, household public assistance, single-parent household and residential instability. Measures of LMM included long-term unemployment (LTU), long-term sickness absence (LTSA) and disability pension (DP). Estimates of risk of each LMM measure, between 2010 and 2016 were calculated as Hazard Ratios (HR) with 95% confidence intervals (CI), using a Cox regression analysis.

Results:

Those exposed to CA had an elevated risk for all measures of LMM. Manual workers with a history of household public assistance had the highest risk estimates compared to non-manual workers with no CAs (adjusted HR spanning from 1.59 (LTSA) to 2.50 (LTU). Regardless of occupational class, the risk of LMM grew higher with increasing number of CAs (e.g. adjusted HR of LMM in manual workers with 3+ CAs: 1.87, 95% CI: 1.81-1.94). These patterns persisted after adjustments for a range of confounders, including psychiatric and somatic morbidity. Last, we found a small but significant mediating effect of occupational class in the association between CA and LMM.

Conclusions:

Information on CAs are important determinants of LMM in young adults, and especially in manual workers.

Key messages:

- Those exposed to childhood adversity had an elevated risk of labor market marginalization, in terms of long-term unemployment, long-term sickness absence and disability pension.
- Information on childhood adversity is an important determinant of labor market marginalization in young adults, and especially in manual workers.

Abstract citation ID: ckac131.194
Socioeconomic differences in contact reduction in the first COVID-19-wave in Germany (CoMoLo-study)

Benjamin Wachtler

F Beese[1], B Wachtler[1], S Haller[2], C Koschollek[1], T-K Pfoertner[3], J Hoebel[1]
[1]Department of Epidemiology and Health Monitoring, Robert Koch Institute, Berlin, Germany
[2]Department of Infectious Disease Epidemiology, Robert Koch Institute, Berlin, Germany
[3]IMVR, University of Cologne, Cologne, Germany
Contact: wachtlerb@rki.de

Background:

The COVID-19 pandemic has led to physical distancing measures across a range of countries to control the spread of the virus. Evidence referring to contact dynamics in different socioeconomic populations is still sparse and may contribute to the explaining of socioeconomic inequality of infections.

Methods:

Data came from two early COVID-19 hotspots in Germany using the CORONA-MONITORING-lokal study (CoMoLo). The sample (n = 3,637) was restricted to working age (18-67 years). We calculated the association of individual education and occupation status (low, middle, high) and self-reported private and professional contact reductions. Using weighting factors (adaptation to local age, gender and education distribution), we performed multivariate Poisson regressions (prevalence ratios; PR) with different sets of covariates: hotspot, age, sex, country of birth, household size, contact level before physical distancing measures and home office.

Results:

The descriptive analyses show a clear socioeconomic gradient in private (low education: 70,0%; middle: 79,1%; high: 86,2%) and professional contact reductions (low education: 54,6%; middle: 61,3; high: 77,2%). The multivariate analyses confirm these associations, with a stronger gradient for professional contacts (private contact reduction: PR low vs. high education = 0,83 [KI:0.74-0.93]; professional contact reduction: PR low vs. high education = 0,75 [KI:0.64-0.89]) as well as for professional contact reduction when occupational status is considered instead of education.

Conclusions:

Our results show disadvantages in groups with lower educational or occupational status in private and professional contact reductions in the first pandemic wave. This might result in a higher risk of infection. Preventive measures that a) adequately explain the importance of contact restrictions and b) facilitate the implementation of these reductions seem necessary to better protect structurally disadvantaged people during epidemics.

Key messages:

- Groups with lower educational or occupational status were less likely of being able to reduce their private and professional contacts in the first wave of the pandemic.
- Socioeconomic differences were more pronounced in professional contact reduction compared to private contact reduction.

Abstract citation ID: ckac131.195
Class inequalities in physical functioning trajectories before and after retirement

Eero Lahelma

J Lahti[1], O Pietiläinen[1], O Rahkonen[1], T Lallukka[1]
[1]Department of Public Health, University of Helsinki, Helsinki, Finland
Contact: eero.lahelma@helsinki.fi

Background:

Longer work careers are discussed, but inequalities in health trajectories among employees facing retirement remain poorly understood. We examined social class trajectories in physical functioning among ageing female employees ten years before and after transition to old-age or disability retirement.

Methods:

We used Helsinki Health Study cohort data. The baseline (2000-02) included 7168 women, aged 40-60, employed by the City of Helsinki, Finland (response 67%). Follow-ups took place in 2007, 2012 and 2017 (response 78-83%). The outcome was RAND-36 Physical Functioning subscale, range 0-100, with higher scores indicating better functioning. Social classes were upper and lower class, and covariates age, work conditions and health behaviours. Mixed-effect growth curve models were used to predict functioning scores and 95% confidence intervals (CI) 10 years before and after mandatory old-age or disability retirement.

Results:

Old-age and disability retirees lacked class inequalities in functioning 10 years prior retirement. Towards retirement transition, functioning declined and inequalities emerged. Among old-age retirees, the predicted score was 86.1 (CI 85.2-86.9) for upper class and 82.2 (81.5-83.0) for lower class. Among disability retirees, the score was 70.3 (67.8-72.9) for upper class and 62.2 (60.4-63.9) for lower class. Among old-age retirees, functioning declined and inequalities slightly widened. Among disability retirees, the decline plateaued and inequalities narrowed. Physical work and BMI somewhat attenuated the inequalities.

Conclusions:

Among female employees, functioning declined and class inequalities emerged towards retirement transition. Widening inequalities were seen among old-age retirees, but not among disability retirees. Preventing the decline of functioning and related inequalities would help safeguard a healthy and successful ageing among female retirees.

Key messages:

- As functioning shows a constant decline before and after old-age retirement, there is a need for slowing down the pace of the decline.
- Class inequalities in functioning tend to widen among old-age retirees; egalitarian measures are needed to turn the development to narrowing inequalities.

Abstract citation ID: ckac131.196
The effect of BMI at cancer diagnosis on survival of patients with head and neck carcinoma

Roberta Pastorino

R Pastorino[1,2], P Boffetta[3], M Hashibe[4], A Yuan-Chin[4], S Boccia[1,2]
[1]Section of Hygiene, Institute of Public Health, Rome, Italy
[2]Department of Woman, Children and Public Health Scineces, Fondazione Policlinico Universitario A. Gemelli, Rome, Italy
[3]The Tisch Cancer Institute, Icahn School of Medicine at Mount Sinai, New York, USA
[4]Division of Public Health, University of Utah, Utah, USA
Contact: roberta.pastorino@unicatt.it

Background:

Previous findings suggest a positive association between body mass index (BMI) and survival from head and neck cancer (HNC). The aim of this study is to investigate the prognostic role of BMI at the time of diagnosis in a large international cohort of HNC patients.

Methods:

We performed a pooled analysis of studies included in the INHANCE consortium. Cases were adults with HNCs of the oral cavity, oropharynx, hypopharynx, and larynx. We used Cox proportional hazards models to estimate the adjusted hazard ratios (HR) for overall survival and HNC-specific survival, by cancer site. Subgroups analyses were performed according to smoking status and duration of follow-up.

Results:

The study included 10,177 patients from 10 studies worldwide with a median follow-up of 48 months; 3654 patients (35.9%) died from all causes, including 1202 (11.8%) from HNC.

Underweight patients had lower overall survival (HR = 1.69, 95% CI: 1.31-2.19) respect to normal BMI patients (BMI = 18.5-24.9 kg/m2) with consistent results across the HNC sites. In HNC-specific mortality analyses, the survival for underweight patients was not significant, except for underweight patients with oropharyngeal cancer (HR = 1.43, 95% CI: 1.11-1.83). Overweight and obese patients for oropharyngeal cancers had a favourable HNC-specific survival (HR = 0.50 (95% CI: 0.33-0.75) and HR = 0.51 (95% CI: 0.36-0.72), respectively). Among never smokers, overall BMI status was not associated with HNC-specific survival. Among ever smokers overweight and obese categories showed a favourable HNC-specific survival (HR = 0.69 (95% CI: 0.56-0.86) and HR = 0.70 (95% CI: 0.61-0.80)).

Conclusions:

Our findings show that high BMI values increase the survival rates in smoking patients with HNC, suggesting that a nutritional reserve may help patients survive HNC cancer. This effect, however, may be partly explained by residual confounding, reverse causation, and collider stratification bias.

Key messages:

- Our analysis reports the results of the largest available pooled analysis on the prognostic significance of BMI in the survival of 10,177 HNC patients from 10 studies worldwide.
- Lower overall survival was observed in underweight patients for all HNC sites and a lower HNC-specific survival was observed with oropharyngeal cancer. Adiposity could serve as a nutrient reserve.

Abstract citation ID: ckac131.197
Excess mortality during the coronavirus pandemic (COVID-19) in Poland

Monika Burzyńska

M Pikala[1], *M Burzyńska*[1]
[1]Department of Epidemiology and Biostatistics, Medical University of Lodz, Łódź, Poland
Contact: monika.burzynska@umed.lodz.pl

The COVID-19 pandemic, has begun a global changes in the mortality model, exceeding its predicted levels under standard conditions. The aim of the study was to assess the phenomenon of excess mortality in Poland in 2020 and in the first half of 2021 compared to 2016-2019 based on the data of the Central Statistical Office. The number of excess deaths was defined as the difference between the deaths in 2021 and the average number of deaths in the previous years. In accordance with the Eurostat methodology the 2016-2019 average was taken as the reference point. In 2020, the number of deaths in Poland amounted to 485,259 and was higher by 14.9% than expected on the basis of mortality in 2016-2019 (the absolute excess number of deaths amounted to 67,112). 43% of the excess deaths were deaths caused by Sars-Cov-2, 27% other deaths among infected people, and 30% deaths among those without confirmed infection. In this group, the highest increases were recorded for deaths due to cardiovascular diseases, neurological diseases and mental disorders. In the first half of 2021, 270,662 people died in Poland, i.e. 23.9% more than in the corresponding period in 2016-2019 and 22.9% more than in the first half of 2020, whereas 58,096 people died due to COVID-19 (22% of all deaths). The highest increases for non-viral deaths compared to 2016-2019 were recorded for blood diseases and immune mechanisms (121.53%), infectious and parasitic diseases (90.76%), mental disorders (34.93%) and cardiovascular diseases (11.65%). Excess mortality is a very serious problem of the public health. The increased mortality in 2020 and 2021 was closely related to the pandemic, as direct COVID-19 victims accounted for the majority of the observed increases in mortality. However, attention should be paid to the growth in mortality related to other causes, mainly mental disorders, for which mortality increases most rapidly, which requires immediate action.

Key messages:

- The increased mortality in 2020 and 2021 was closely related to the pandemic, as direct COVID-19 victims accounted for approximately 90% of the observed increases in mortality in Poland.
- In the group of no-related with COVID-19 deaths the highest increases were recorded for mortality due to cardiovascular diseases, neurological diseases and mental disorders.

Abstract citation ID: ckac131.198
Acute Alcohol intoxication in Belgian adolescents: a retrospective hospital chart study

Hanna van Roozendaal

HE van Roozendaal[1], *G Van Hal*[1], *N van der Lely*[1,2]
[1]Family Medicine and Population Health, University of Antwerp, Wilrijk, Belgium
[2]Department of Paediatrics, Reinier de Graaf Gasthuis, Delft, Netherlands
Contact: hanna.vanroozendaal@uantwerpen.be

Background:

Binge drinking by adolescents in Belgium is an increasing problem, according to emergency physicians who have recently alerted society about the increasing numbers of adolescents admitted to hospital due to acute alcohol intoxication (AAI). Until now, only estimations of the prevalence of AAI in adolescents are known and research about potential risk factors has not yet been conducted in Belgium.

Methods:

To gain more insight into the prevalence, medical characteristics, and context of AAI, a retrospective study in hospitals in the city of Antwerp was conducted. Medical charts of 10 to 18-year-old patients admitted with AAI between 2015 and 2021 were investigated and analysed.

Results:

Between 2016 and 2021, 547 adolescents with AAI were admitted to 5 of the 8 hospitals in Antwerp. In the University Hospital of Antwerp (n = 177) mean age at admittance was 15.9 years. Older patients had a significantly higher BAC than younger patients (U:2357, 1, p-value: <0.001). In 10% of the patients combined drug use was proven and in this group, BAC was significantly lower (U:209, 1, p-value: <0.001). 60% of the patients were transmitted to the hospital by ambulance and in 31% the ambulance was assisted by specialised medical care. In 18% of the cases, the police were involved. The results of the other hospitals are not yet known at the time of submission but will be presented at the EPH conference.

Conclusions:

According to the data so far, younger patients and patients with comorbid drug use are admitted with a lower BAC, which could be seen as a potential risk factor. This should be considered in developing preventive measures like sensitization. Moreover, in a noteworthy percentage, ambulances, specialized care, and police are involved, which contributes to high medical and social costs. However, data addressing demographics and the context of AAI were mostly missing. Therefore, prospective research is required to further investigate potential risk factors for AAI.

Key messages:

- A significant amount of adolescents with AAI are admitted in the city of Antwerp every year, with a mean age of 15.9 years old, which is below the legal alcohol age.
- Considering the high prevalence of AAI and the major impact it has on adolescents health and medical and social costs, it is necessary to decrease the prevalence of binge drinking in adolescents.

Abstract citation ID: ckac131.199
Birth order and sickness absence: register-based evidence from Finland

Jan Saarela

K Reini[1]
[1]Åbo Akademi University, Vasa, Finland
Contact: jan.saarela@abo.fi

Background:

In working ages, sickness absence is strongly related to persons' health condition. We studied how birth order was associated with receipt of sickness absence, distinguishing mental disorders, musculoskeletal disorders and injuries.

Methods:

A follow-up study based on the entire Finnish population was conducted for sibling groups born 1969-1982, in which each sibling was observed from age 35 years in the period 2004-2018. Focus was on within-family variation in first-time sickness allowance receipt. Stratified Cox regressions were estimated using Stata 16.

Results:

Each increase in birth order was associated with a higher risk of sickness absence. For mental disorders, the hazard ratio as compared to first borns was 1.03 (95% CI: 0.98, 1.08) of second borns, 1.10 (95% CI: 0.99, 1.22) of third borns, and 1.52 (95% CI: 1.25, 1.85) of fourth or higher borns. Corresponding numbers for musculoskeletal disorders were 1.12 (95% CI: 1.07, 1.17), 1.19 (95% CI: 1.09, 1.30) and 1.15 (95% CI: 0.96, 1.38), and for injuries 1.06 (95% CI: 1.01, 1.12), 1.09 (95% CI: 1.21, 1.14) and 0.96 (95% CI: 0.77, 1.20), respectively. These associations were notably stronger for women than men, but modestly influenced by mother's age at birth, educational level, occupation, income and family composition.

Conclusions:

The study was the first to provide evidence about an interrelation between birth order and sickness absence, utilising diagnose information and family fixed effects methods. A clear birth order pattern was observed for these main causes, but not for a residual group that consisted of other miscellaneous causes. Higher birth order was found associated with a higher risk of sickness absence, and particularly so for mental disorders and muscoloskeletal disorders in women. The underlying mechanisms behind these associations constitute an avenue for future research.

Key messages:

- Using sibling fixed effects, the study was the first to analyse if sickness absence by main cause is associated with birth order in working ages.
- First-born siblings were the least likely to be sick because of mental or musculoskeletal disorders, and the associations were notably more accentuated for women than men.

Abstract citation ID: ckac131.200
Prevalence of hepatitis B and C, HIV, and syphilis among people who inject drugs in Germany

Gyde Steffen

G Steffen[1], *A Krings*[1], *R Zimmermann*[1]
[1]Department of Infectious Disease Epidemiology, Robert Koch Institute, Berlin, Germany
Contact: steffeng@rki.de

Background:

We piloted a future monitoring system among people who inject drugs (PWID) in Germany (DRUCK2.0). Monitoring is needed to inform and support the viral hepatitis/HIV/STI elimination process in Germany by providing regular up-to-date prevalence and behavioural data for this key population.

Methods:

PWID aged 16+ years who injected drugs within the last 12 months were recruited by time location sampling via low threshold drug services and opioid substitution treatment (OST) practices during routine services in Berlin and Bavaria between 01/06/2021 and 28/02/2022. All participants filled a questionnaire on sociodemographics, behaviour and access to care and were tested for hepatitis B and C (HBV, HCV), HIV and syphilis using capillary dried blood spots. All received a 10 Euro incentive voucher.

Results:

In total, 495 PWID were included, median age was 39 years [range 18-66], 68% (336/494) were male, and 23% (114/492) born outside Germany, mostly in eastern Europe. Of all participants, 58% (275/477) reported recent use of unsafe needles/syringes and 77% (372/485) detention experience. Current OST was reported by 62% (304/487). Prevalence was 46% (229/495) for cured HCV, 26% (130/495) for active HCV, 17% (80/482) for cured HBV, 1.2% (6/483) for active HBV, 2.7% (13/482) for HIV and 2.1% (10/473) for previous Syphilis. Serological HBV vaccination coverage was 24% (115/475). Of all, 95% (453/475) reported previous HCV testing. Of those with cured/active HCV infection 88% (296/337) knew about their infection and 56% (161/285) of them reported previous/current treatment.

Conclusions:

To decrease the heavy burden of infection among PWID in Germany, targeted measures regarding access to HCV treatment, HBV vaccination, and harm reduction (safer use measures, OST) need to be implemented and rolled out. Nationwide regular monitoring of indicators in this key population is needed to guide the elimination progress of viral hepatitis and HIV in Germany.

Key messages:

- High burden of active Hepatitis C infection and low Hepatitis B vaccination coverage among people who inject drugs in Berlin and Bavaria require improved access to treatment and prevention efforts.
- National Monitoring is needed to inform and support the viral hepatitis/HIV/STI elimination process among people who inject drugs in Germany.

Abstract citation ID: ckac131.201
Prevalence of blood-borne viral and sexually transmitted infections among homeless people in Berlin

Navina Sarma

G Steffen[1], *C Weber*[2,3], *C Cawley*[1], *A Leicht*[4], *N Sarma*[1], *K Jansen*[1], *S Kröger*[1], *K Kajikhina*[1], *R Zimmermann*[1], *V Bremer*[1]
[1]Robert Koch Institute, Berlin, Germany
[2]BeSog Sozialprojekte GgmbH, Berlin, Germany
[3]Checkpoint BLN, Berlin, Germany
[4]Fixpunkt e.V., Berlin, Germany
Contact: sarman@rki.de

Background:

Risk factors associated with precarious living conditions make people experiencing homelessness (PEH) also highly vulnerable for blood-borne viral and sexually transmitted infections (BBVSTI) and tuberculosis (TB). The number of PEH in Germany is rising, yet little data is available on the infectious burden among this population. A pilot study assessed the prevalence of BBVSTI, TB, behaviours and access to medical services among PEH.

Methods:

We recruited PEH from April-June 2021 in five low-threshold medical services in Berlin. Behavioural data was collected via questionnaire-based interviews. Serological/molecular testing from venous blood samples was performed for Hepatitis B (HBV), Hepatitis C (HCV), HIV, syphilis and TB and from urine for Neisseria gonorrhoeae (NG) and Chlamydia trachomatis (CT).

Results:

Of 216 participants, 88% (191/216) were male and 73% (158/215) were born abroad. Mean age was 41 years (range 19-68). No health insurance was reported by 57% (123/216) and previous incarceration by 71% (153/214). Of all, 53% (114/216) injected drugs in the last 30 days, and 41% (89/216) reported unprotected sex in the last 12 months. Prevalence of active HBV was 1.9% (4/212), of active HCV 15.9% (34/213), and of HIV 2.8% (6/213). No active TB was diagnosed, while 14.4% (31/216) tested positive for latent TB infection. Active syphilis was found in 1.4% (3/212), NG in 2.0% (4/197), CT in 3.0% (6/197), and serological evidence of HBV vaccination in 26% (56/212). While 44% (96/216) of participants were ever tested for HCV, 71% (36/51) of those with HCV antibodies knew about their infection, 36% (13/36) of them reported previous/current treatment.

Conclusions:

Burden of HCV and HIV was high among PEH in Berlin, and risk behaviours were frequently reported. There is a need to improve access to regular health care, accompanied by low-threshold prevention offers in cooperation with drug and homeless services. A nationwide expansion of the study is planned.

Key messages:

- High burden of Hepatitis C and HIV among people experiencing homelessness in Berlin, Germany.
- Access of people experiencing homelessness to regular health care needs improvement, accompanied by low-threshold prevention offers in cooperation with drug and homeless services.

Abstract citation ID: ckac131.202
Healthcare-associated infections in a neonatal ICU before and during COVID-19: preliminary results

Mariateresa Ceparano

M Ceparano[1], *A Sciurti*[1], *C Isonne*[1], *MR De Blasiis*[1], *V Imeshtari*[1], *V Cammalleri*[1], *A Romano*[1], *RK Bellomo*[1], *C Marzuillo*[1], *P Villari*[1]
[1]Public Health and Infectious Diseases, Sapienza, Rome, Italy
Contact: mariateresa.ceparano@uniroma1.it

Background:

Healthcare-associated infections (HAIs) are a frequent complication in neonatal intensive care units (NICUs). Hospital policies caused by COVID-19 pandemic may have played a role in HAIs development. The aim of this study was to describe and characterize over time the occurrence of HAIs in a NICU at the Policlinico Umberto I in Rome both before and during the COVID-19 pandemic.

Methods:

All infants of all birth weight (BW) classes with >2 days in the NICU, admitted from January 2018 to December 2021, were included. To assess the effect of the pandemic, we compared surveillance data from 2018-2019 with those from 2020-2021. Infections were defined using standard Centers for Disease Control and Prevention definitions.

Results:

We included 513 infants, 274 admitted in 2018-2019 and 239 between 2020-2021. NICU stay in days was similar in the two periods (14.4 and 15.3 respectively) but the number of patients who died in 2018-2019 (N = 13) was almost double that of 2020-2021 (N = 7). A total of 27 infections were recorded in the post-pandemic period compared to 9 recorded in the previous period, mainly central line-associated bloodstream infections (CLABSI) (7% vs 3.0%, p = 0.043), followed by ventilator-associated pneumonias (VAP) (3.0% vs 0.4%, p = 0.019). The incidence density of device-associated infections was higher in patients with lower BW class in both periods analyzed. Different microorganisms were isolated: in 2018-2019 K. pneumoniae (33.3%) and Serratia marcescens (33.3%) were the most found, while S. aureus (29.0%) and Staphylococci coagulase negative (51.6%) were predominant in the following years.

Conclusions:

Results indicate that patient management may have influenced the occurrence of HAIs during the pandemic. This reinforces the importance of the HAI surveillance protocol in the NICU, which monitors microbiologic isolates and medical device use for all classes of infants with BW.

Key messages:

- The Covid-19 pandemic has resulted in an increase in healthcare-associated infections occurrence in our neonatal intensive care unit.
- Monitoring device-associated infections in all BW classes of infants is critical to prevent nosocomial infections.

The impact of the COVID-19 pandemic on the incidence of herpes zoster

Nicolas Lecrenier

N Lecrenier[1], *R Parikh*[1], *C Wang*[2], *D Curran*[3], *R Widenmaier*[4]
[1]Global Medical Affairs, GlaxoSmithKline, Wavre, Belgium
[2]Epidemiology, GlaxoSmithKline, Rockville, USA
[3]Value Evidence, GlaxoSmithKline, Wavre, Belgium
[4]Global Medical Affairs, GlaxoSmithKline, Rockville, USA
Contact: nicolas.lecrenier@gsk.com

Background:
There have been several case reports of herpes zoster (HZ) following COVID-19 disease and vaccination. We conducted a non-systematic literature search to elucidate the global effects of the COVID-19 pandemic on the incidence of HZ.
Methods:
The literature search was performed in October 2021 using PubMed and Embase. The search string was herpes zoster AND COVID-19. Publications were manually reviewed; case reports were removed.
Results:
Three retrospective studies reported the risk of HZ following COVID-19 disease. One study (Bhavsar, 2021) used two US databases and found higher risk of HZ following COVID-19 disease (relative risk [RR] = 1.15) and COVID-19 hospitalisation (RR = 1.21), respectively. A strong association between HZ and COVID-19 disease (RR = 5.27) was also reported in a study of the University of Florida patient registry (Katz, 2021). The third study (Barda, 2021) reported no association between COVID-19 disease and risk of HZ (RR = 0.82). In two of the three observational studies in Israel (Furer, 2021 and Barda, 2021), the incidence of HZ was increased following COVID-19 vaccination. The third study (Shasha, 2021) found no association (RR = 1.07). Other studies included a report in Brazil (Maia, 2021) that demonstrated a 35% increase in HZ diagnoses during the pandemic versus pre-pandemic and a published model (La, 2021) that estimated the declining uptake of recombinant zoster vaccine in the US may result in 63,117 avoidable HZ cases in those who remain unvaccinated in 2021.
Conclusions:
Emerging data suggest that the COVID-19 pandemic may have increased the risk of HZ and negatively impacted HZ vaccine uptake. Therefore, there is an important need to increase awareness of HZ and HZ vaccination during the pandemic.
Key messages:
- There is a need to increase awareness of HZ and HZ vaccination during the COVID-19 era.
- Further studies are needed to fully understand the impact of COVID-19 on the risk of HZ.

Quality of life assessment in breast cancer patients during palliative treatment in Indonesia

Ljupcho Efremov

D Gayatri[1,2]*, L Efremov*[1,3]*, A Wienke*[1]*, R Mikolajczyk*[1]*, EJ Kantelhardt*[1,4]
[1]Institute for Medical Epidemiology, Martin-Luther-University Halle-Wittenberg, Halle, Germany
[2]Department of Epidemiology, Faculty of Public Health, Universitas Indonesia, Depok, Indonesia
[3]Department of Radiation Oncology, Martin-Luther-University Halle-Wittenberg, Halle, Germany
[4]Department of Gynecology, Martin-Luther-University Halle-Wittenberg, Halle, Germany
Contact: ljupcoefremov@hotmail.com

Background:
This study aimed to prospectively assess quality of life (QOL), QOL domains, and pain severity in advanced stage breast cancer patients during palliative oncology treatment in Indonesia.
Methods:
Advanced stage breast cancer patients > 18 years (n = 160) who began palliative oncology treatment were enrolled in the study using convenience sampling. They completed the EORTC QLQ-C15-PAL questionnaire and pain severity (Visual Analogue Scale, VAS) score at three-time points (baseline (T0), three-(T1) and six-months (T2) follow-up). The repeated measures analysis of variance (ANOVA) model was used to assess the QOL, QOL domains, and pain severity changes over time adjusted for age, place of residence, marital status, and Karnofsky Performance Status score at baseline. We classified the change over time in three qualitative groups (deterioration, improvement, or trivial/no difference). We considered it clinically relevant if patients had a 10-point difference.
Results:
The mean age of included patients (n = 159) was 50 years. Most lived in an urban area (72.3%), had low education (71.7%), and were married (81.8%). The repeated measures ANOVA showed that the QOL score, emotional functioning, fatigue, dyspnea, appetite loss, constipation, and VAS pain score remained stable over the 6-months period. In contrast: physical functioning declined (medium to large deterioration (-19.8 (95% CI -27.2 to -12.5)) between T0 to T2), however there was an improvement in the insomnia domain (medium improvement (-13.4 (95% CI -19.9 to -6.9)) between T0 to T2).
Conclusions:
Our findings indicated that advanced stage breast cancer patients adapted well to palliative oncology treatment over six months of observation. There was deterioration in physical functioning, but improvement in insomnia. However, more attention is needed from clinicians to achieve improvement in the overall QOL score and specific QOL domains.
Key messages:
- Focusing on improvement overall QOL score and specific QOL domains will lead to better advanced stage breast cancer patients' satisfaction and care.
- Information is limited on palliative treatment satisfaction in low and lower middle-income countries, therefore this study has important impact on further policy considerations in Indonesia.

[4]San Timoteo Hospital, ASREM Molise, Termoli, Italy
[5]Department of Translational Medicine, Maggiore della Carità Hospital, University of Eastern Piedmont, Novara, Italy
Contact: paolomatteoangeletti@gmail.com

Background:
During SARS-CoV-2 pandemic, various studies have shown a significant reduction of Emergency Department (ED) presentations for acute cardiac diseases requiring in-hospital management. The aim of our study was to quantify hospital admission and mortality, comparing pandemic period and pre-pandemic period in different countries.
Methods:
We performed an updated meta-analysis of observational studies to quantify on a large basis the impact of the SARS-CoV-2 outbreak on patients admitted to the ED for STEMI and NSTEMI. The literature research was conducted on PubMed, EMBASE, Scopus, Science Direct, Web of Science and Cochrane database registry on 6 January 2022. We performed a random-effect model meta-analysis.
Results:
A total of 61 studies were included: came from Italy, China, Germany, Israel, Turkey, France, Helvetic Confederation, India, Poland, Spain, US, UK, Albania, Austria, Egypt, Greece, Iran, Ireland, Japan, Pakistan, Portugal, Saudi Arabia and Canada. Hospital admissions for STEMI decreased in most country. The countries with the high levels of reduction were Italy (IRR = 0.68) and Germany (IRR = 0.69). Mortality rates for STEMI increased differently among countries analyzed: p = 0.003. The

highest mortality rate was in Serbia (OR = 2.15), followed by Italy (OR = 1.97), Pakistan (OR = 1.69) and France (OR = 1.55). Among the High-Income countries, the highest mortality rate was in Italy (OR = 3.71), the highest among the Upper-Middle-Income was in Serbia (OR = 2.15) and the highest among Low- Middle-Income was in Pakistan (OR = 1.69). Regarding NSTEMI, hospital admissions showed that Italy had the lowest value for with IRR = 0.59. Among countries, the meta-regression subgroups analysis, showed statistical difference ($p < 0.001$).

Conclusions:

Our meta-analysis may represent a robust snapshot that might help healthcare systems manage and assist an expected higher number of people coming to the hospitals for severe, post-acute cardiological issues in the future.

Key messages:

- The study shows hospital admission and mortality, comparing pandemic period and pre-pandemic period in different countries.
- Epidemiological data suggests that one-fourth to one-third of MI patients, in large areas of the globe, during the COVID-19 pandemic in 2020, remained at home and did not have access to ED.

Abstract citation ID: ckac131.207
Seroprevalence of SARS-CoV-2 before/after case zero

Valerio Bordino

V Bordino[1], *C Vicentini*[1], *AR Cornio*[1], *D Meddis*[1], *CM Zotti*[1]
[1]Department of Sciences of Public Health and Pediatrics, University of Turin, Turin, Italy
Contact: valerio.bordino@unito.it

Introduction:

Italy was one of the first EU countries hit by the COVID-19 pandemic. Currently, Italy has reported 15.5 million cases of COVID-19 and 161000 deaths. Meanwhile, the vaccination campaign against COVID-19 began in Italy at the end of 2020, using mRNA and viral vector vaccines (immunizing people against Spike protein of SARS-CoV-2. The purpose of this study was to estimate, in a representative sample of the Italian population, the prevalence of antibodies against SARS-CoV2 in 2019 (before case zero, identified in Italy in February 2020) and in 2021, after 3 pandemic waves and a vaccination campaign.

Methods:

During October / November 2019: 365 participants were selected in the Piedmontese population among those who went to a hospital for routine blood tests. The population was selected on the basis of age and gender to be representative of the Italian population. The same number of patients was selected in the first quarter of 2021, the inclusion and exclusion criteria remained the same. Sera were searched for spike protein of SARS-CoV-2 and, if positive, tested for anti-nucleocapsid antibodies.

Results:

Our preliminary data show that half of the sample for both years is female. In the 2019 sample, i.e. before case zero was identified in Italy (Lombardy), five of the sera (4 males and one female) tested positive for anti-Spike,indicating a previous infection (vaccine didn't exist). In the 2021 sample, 152 males and 139 females tested positive for IgG anti-spike, for a total of 291. The prevalence therefore passed from 1.37% to 79.73%. As regards the search for ANti-Nantibodies, one male and one female tested positive in 2019; in 2021 9 males and 13 females.

Conclusions:

The results of our study show that in 2019, before the first official case in Italy was highlighted, coronavirus was already circulating. The prevalence has risen exponentially, going from less than 2% to around 80%.

Key messages:

- Covid-19 was circulating in Italy in 2019.
- Seroprevalence of anti-S in 2021 was about 20%.

Abstract citation ID: ckac131.208
Oral Contraceptive Use and Breast Cancer Risk According to Molecular Subtypes Status: A Meta-Analysis

Sanne van Weers

S van Weers[1], *R Hrzic*[1], *RJJ Elands*[1,2]
[1]Department of International Health, Maastricht University, Maastricht, Netherlands
[2]Historical Demography and Family History, Radboud University, Nijmegen, Netherlands
Contact: sannevw2001@gmail.com

Background:

Breast cancer is a heterogeneous disease with distinct molecular signatures of disease etiology, evidenced by the joint expression of molecular tumor markers. Differential effects of oral contraceptive use on breast cancer risk by molecular subtypes have been reported. This is the first meta-analysis to investigate associations between oral contraceptive use and subsequent breast cancer risk stratified by combined estrogen receptor (ER) and progesterone receptor (PR) status alongside the Luminal A and B subtypes, which additionally consider the human epidermal growth factor receptor 2 (HER2) status.

Methods:

A systematic review and meta-analysis of case-control and cohort studies was conducted in PubMed and Web of Science. The odds ratios (ORs) were summarized using a random-effects model.

Results:

Eleven studies met the inclusion criteria for qualitative and quantitative analysis. Random effects meta-analyses revealed significant risk increasing effects for ever-users of oral contraception on ER-PR- breast cancer compared to never-users (OR = 1.30, 95% CI; 1.07 to 1.56, $p < 0.01$). Ever-use of oral contraception was not associated with breast cancer risk when stratified by the ER+PR+ breast cancer subtype (OR = 1.00, 95% CI; 0.86 to 1.16, p = 0.99). Data on Luminal A and B subtypes was limited and not suggestive for associations with breast cancer risk in ever-users of OCs compared to never-users. Furthermore, a significant increased risk of ER-PR- breast cancer was observed for OC use duration of > 4 years compared to never-users (OR = 1.74, 95% CI: 1.15 to 2.63, $p < 0.01$).

Conclusions:

The current state of the evidence suggests that OC use longer than 4 years is associated with an increased breast cancer risk, pertaining to the estrogen and progesterone double negative breast cancer subtype. Large-scale prospective observational studies including more comprehensive molecular signature of breast cancer aetiology, including HER2 status, are needed.

Key messages:

- The use of oral contraception was associated with estrogen and progesterone receptor double negative breast cancer, but not hormone receptive positive cancer.
- This is the first meta-analysis to investigate oral contraceptive use and associations with breast cancer risk by combined estrogen and progesterone receptor status.

Abstract citation ID: ckac131.209
Future trends of overweight and obesity in Belgium using Bayesian age-period-cohort models

Robby De Pauw

R De Pauw[1,2], *M Claessens*[1], *V Gorasso*[1,3], *S Drieskens*[1], *C Faes*[4], *B Devleesschauwer*[1,5]

[3]Public Health, Ghent University, Ghent, Belgium

[4]Mathematics, University of Hasselt, Hasselt, Belgium
[5]Veterinary Sciences, Ghent University, Ghent, Belgium
Contact: robby.depauw@sciensano.be

Background:

Considering the current overweight and obesity epidemic and its associated increase in non-communicable diseases and healthcare costs, the current study aimed to project the trends in prevalence of overweight and obesity in Belgium using a Bayesian age-period-cohort (APC) model to support policy planning.

Methods:

Height and weight of 58,369 adults aged 18+ years, collected in six consecutive cross-sectional health interview surveys between 1997 and 2018, were evaluated. Criteria used for overweight and obesity were defined as body mass index (BMI) $\geq$ 25, and BMI $\geq$ 30. A Bayesian APC model was applied to evaluate past trends and associated socio-demographic risk factors, and to forecast trends to 2019-2029. All analyses were performed based on integrated nested Laplace approximation (INLA) and took the complex survey design into account.

Results:

The prevalence of overweight and obesity has increased between 1997 and 2018. If current trends continue, it is likely to that a further increase in the prevalence of overweight and obesity in the population will be seen by 2029 with a probability of growth of 51.2% and 73.3%, respectively. Forecasts indicated a potential prevalence of 50.1% [16.2%; 84.4%] in 2029 for overweight, and 21.4% [9.0%; 43.4%] for obesity. Among survey participants, middle-aged men with no higher education and a middle income showed the highest risk of overweight and obesity.

Conclusions:

We projected an alarming increase in the prevalence of overweight and obesity. A decrease in cases seems very unlikely. There is an urgent need to target younger age groups for prevention and implementation of public educational programs to limit the increasing trend in overweight and obesity.

Key messages:

- The occurence of obesity is likely to increase in the following 10 years.
- Projection of trends can serve as a useful tool for policy planning on the mid- and longer term.

Abstract citation ID: ckac131.210
The contribution of health behaviours to waist circumference change following employment transitions

Alexander Tam

ACT Tam[1], RA Murphy[1,2], W Zhang[1,3], AI Conklin[3,4]
[1]School of Population and Public Health, Faculty of Medicine, University of British Columbia, Vancouver, Canada
[2]Cancer Control Research, BC Cancer, Vancouver, Canada
[3]CHÉOS, Providence Research, Vancouver, Canada
[4]Faculty of Pharmaceutical Sciences, University of British Columbia, Vancouver, Canada
Contact: atam0996@gmail.com

Background:

Mechanisms through which retirement and later-life job loss lead to subsequent weight change are poorly understood, and include changes to one's health behaviours (HBs) after employment changes. Our study assessed the potential role of HBs in the impact of employment transitions (ET) on waist circumference (WC), by gender.

Methods:

We used two waves of survey data from a Canadian sample of 45- to 85-year-olds with objectively measured WC. For 10,117 participants who were working at baseline, we categorized them into three ET statuses: stayed working, entered retirement, and stopped working. Changes in HBs [sleep, smoking, drinking, and physical activity (PA)] were coded by comparing baseline and follow-up responses. Change in WC was analyzed using multivariable linear regression and multinomial logistic regression models ($\geq$5% gain or loss, no change).

Results:

Multivariable models showed that the addition of change in HBs did not alter the effect sizes of ETs on WC change. Regardless of ET status, women who quit smoking had an increased WC compared to persistent non-smokers (1.43cm, 95% Confidence Interval 0.07 - 2.79). Women who became habitual drinkers showed more increases in WC compared to non-habitual drinkers (1.43cm, 0.16 - 2.69). Changes to sleep duration were not associated with WC change; however, women who became satisfied with their sleep had greater WC increases compared to already satisfied sleepers (0.79cm, 0.12 - 1.46). Men who increased their PA by > 1hr to 2hrs were less likely to gain $\geq$5% weight compared to men with no PA change (OR = 0.75, 0.57 - 0.99). Women who increased their PA by > 1hr to 2hrs were less likely to lose $\geq$5% weight (OR = 0.74, 0.56 - 0.99).

Conclusions:

Our study of this Canadian cohort of middle-aged and older adults suggests some HBs are independent risk factors for weight change rather than mechanisms in the employment-anthropometry relationship.

Key messages:

- Health behaviour changes in middle-aged and older adults have anthropometric effects that differ by sex/gender, independent of employment transitions.
- Promotion of persistently good sleep quality to women may help maintain waist size.

Contact: garazi.ruizdeazua@iplesp.upmc.fr

Background:

As survival rates among breast cancer patients improve there is an increasing need to address breast cancer survivors' (BCS) issues, professional life being a key aspect. Return to work (RTW) of BCS has been largely studied, but studies on job maintenance and its determinants are scarce. We aim to study job maintenance after RTW and the associated factors among BCS.

Methods:

We used data from the CANTO cohort, a French prospective cohort of BCS. We included 1643 BCS aged <57 at diagnosis (dx) who returned to work two years after dx. We excluded self-employed BCS. Using multinomial logistic models, we assessed the association between activity status one year after they return to work. (i.e. active, sick leave, or unemployed, retired or invalidity) and sociodemographic, clinical, health status and work-related factors.

Results:

Overall, 87% of BCS were active, 10% were on sick leave and 3% were on unemployment, retirement or invalidity one year after they return to work. In the fully adjusted model being on sick leave was associated with stage III at dx (OR: 1.89, 95% CI: 1.11-3.22), being severely fatigued at the moment of returning to work (OR: 1.53, 1.04-2.27), and having workplace accommodations (OR: 1.79, 1.14-2.81). The unemployed, retired, invalidity status was negatively associated with professional life being more than or as important as one's personal life (OR: 0.51, 0.26-0.98) and being <50 years old (OR: 0.51, 0.27-0.96), and positively associated with having a fixed-term contract (OR: 2.69, 1.39-5.18) and working for a small company (OR: 2.73, 1.24-6.02).

Conclusions:

A non-negligible proportion of BCS are non-active one year after they return to work. While clinical factors are associated with sick leave, work related factors are associated with the unemployed, retired, and invalidity status. RTW should not be regarded as the ultimate goal and future policies should focus on ensuring people are ready to return to work and maintain their jobs.

Key messages:

- A non-negligible proportion of breast cancer survivors are non-active one year after they return to work.
- Future policies should ensure job maintenance along with return to work.

Abstract citation ID: ckac131.212
Contextual effects on health: systematic review of studies using natural experiments among migrants

Louise Biddle

L Biddle[1], M Hintermeier[2], D Costa[1], Z Wasko[2], K Bozorgmehr[1,2]
[1]Population Medicine and Health Services Research, University Bielefeld, Bielefeld, Germany
[2]Section Health Equity Studies and Migration, University Hospital Heidelberg, Heidelberg, Germany
Contact: louise.biddle@uni-bielefeld.de

Background:

Many studies on contextual health effects suffer from compositional bias and selective migration into neighbourhoods. Longitudinal natural experiments have the potential to overcome these limitations, and there are several opportunities for this research design in the migration context. We aimed to synthesize evidence from natural experiments among migrants studying the effect of contextual factors on health and healthcare.

Methods:

Peer-reviewed literature in English or German was systematically searched in four major databases in December 2021. Following systematic abstract- and fulltext-screening, 32 studies were included for analysis. Evidence on contextual impacts on physical and mental health, mortality, and healthcare was narratively synthesized and quality appraisal conducted.

Results:

We found four types of contextual health effects: factors of the place of residence in receiving countries (n = 6), migration-context interactions (n = 10), policy environments (n = 15) and cultural factors (n = 1). Results show the negative impacts of post-migratory contexts on physical health and mortality and the favourable impacts on child health. Impacts on mental health are mixed. Analyses of policy contexts indicate the negative impacts of restrictive migration and social policies on healthcare utilization, mental health and mortality as well as the positive effects when restrictions are lifted.

Conclusions:

Natural experiments can serve as powerful tools in disentangling the effect of context on health and reducing bias through self-selection. Results demonstrate the negative impacts for health which lie at the nexus of migration and neighbourhood disadvantage. At the same time, studies uncover the potential of health, welfare and visa programs to counteract such disadvantages and create healthy post-migratory contexts. With careful consideration of causal pathways, results from migration contexts can serve as a magnifying glass for effects of context in other population groups.

Key messages:

- Natural experiments can serve as powerful tools in disentangling the effect of context on health and reduce bias through self-selection.
- Results show the negative impacts for health that lie at the nexus of migration and neighborhood disadvantage, as well as the potential of inclusionary policies to counteract them.

Abstract citation ID: ckac131.213
Impact of BMI on breast screening participation: a data linkage study

Kate Mcbride

K McBride[1,2], S Munasinghe[2], S Sperendei[1,2], A Page[1,2]
[1]School of Medicine, Western Sydney University, Penrith, Australia
[2]Translational Health Research Institute, Western Sydney University, Penrith, Australia
Contact: k.mcbride@westernsydney.edu.au

Background:

Regular mammographic screening can reduce breast cancer morbidity and mortality. Participation rates are suboptimal in Australia's fully funded biennial breastscreening program (BreastScreen) for women aged 50-74. Despite obesity being a well-established risk factor for post-menopausal breast cancer, cross sectional data suggests obesity may be a risk factor for non-participation in recommended screening, due to adverse screening experiences. This research aimed to ascertain the link obesity and non-participation by using data linkage of routinely collected data.

Methods:

Data for women age eligible for breast screening were linked between the NSW Cancer Registry and the Australian Longitudinal Study of Women's Health (ALSWH) to create a cohort of women who either participated in screening as recommended or not. Women from the 1946-1951 ALSWH birth cohort were included in the study. These women reported BMI via 8 survey waves. The primary outcome was adherence to breast screening measured by frequency of screening over the follow-up period (1998-2016). Unadjusted risk ratios were calculated using mixed-effects logistic regression for the association between BMI and screening participation.

Results:

The study included 2804 linked records of age eligible women (mean age of 52.37[SD 5.47]). 22.8% of the cohort were obese (BMI>30kg/m2). Obesity was significantly associated with non-recommended screening participation (screening within 3 years of last breast screen); odds ratio 1.63 (95% confidence interval 1.32 to 2.00, $p < 0.0001$).

Conclusions:

Obesity has a significantly impact on recommended participation in a nationally provided breast screening program, despite obesity being a risk factor for post- menopausal breast cancer. Optimising participation among higher risk and under-screened women in under utilised breast cancer screening programs is warranted. Development of targeted interventions to increase screening participation among these higher risk women is needed.

Key messages:

- Women living with obesity and less likely to participate in recommended breast screening.
- Targeted interventions are needed to optimise participation in breast screening to ensure these higher risk women are not at higher risk of adverse outcomes due to breast cancer.

Abstract citation ID: ckac131.214
Challenges faced by parents of screen-detected children with Cystic Fibrosis: The ICOS study

Patricia Fitzpatrick

R Bhatnagar[1], B Linnane[2], M Herzig[3], M Ni Chroinin[4], D Cox[5], B Elnazir[6,7], R Segurado[1], L Kirwan[8], KW Southern[9], P Fitzpatrick[1]

[5]Children's Health Ireland at Crumlin, Dublin, Ireland
[6]Children's Health Ireland at Tallaght, Dublin, Ireland
[7]Trinity College Dublin, Dublin, Ireland
[8]Cystic Fibrosis Registry, Dublin, Ireland
[9]University of Liverpool, Liverpool, UK
Contact: patricia.fitzpatrick@ucd.ie

Background:

Informal care is an essential component of overall care for patients, particularly those with chronic illnesses such as Cystic Fibrosis (CF). This study aims to assess the level of caregiving burden faced by parents/caregivers of children with CF (CwCF) recruited to the Irish Comparative Outcomes Study of CF (ICOS), a historical cohort study of CwCF. In July 2011, a new-born screening programme began in Ireland.

Methods:

The study population includes the parents of screen-detected CwCF born between July 2011-2021. The Challenge of Living with CF-Short Form is a new, validated 15-item tool that evaluates the caregiving burden faced by parents from the child's diagnosis until early adolescence. Comparisons based on the age of screen-detected CwCF were conducted. SPSS was used for analysis.

Results:

69 parents of screen-detected CwCF responded. Fifty percent of parents of older children (aged 4-12+ years) and 35% of the parents of toddlers (0-3 years) faced moderate-high level difficulties in managing the extra expenses required for the care of their CwCF, despite all children receiving free clinical care, prescriptions and medications. A significantly greater proportion of the parents of older children than younger children experienced constant problems in managing daily oral medication routines (37% vs 13%; $P = 0.039$), nebulised medication routines (67.5% vs 21.4%; $P = 0.003$), and physiotherapy routines (57.8% vs 31.8%; $P = 0.046$)

Conclusions:

Using the novel Challenge of living with Cystic Fibrosis-Short Form questionnaire, our findings suggest that the caregiving burden is higher for parents of older CwCF. Expenses incurred by parents of a child with a serious chronic medical condition go beyond medical care and treatment expenses.

Key messages:

- The challenge of living with Cystic Fibrosis-Short Form is being used for the first time in a population setting.
- The caregiving burden was more pronounced in the parents of older CwCF.

Abstract citation ID: ckac131.215
New proposed measures to evaluate contact tracing effectiveness

João Vasco Santos

JV Santos[1,2,3], D Fernandes Silva[1], F Santos Martins[1], Espinho/Gaia Public Health Unit working group[1]
[1]Public Health Unit, ACES Espinho/Gaia, ARS Norte, Porto, Portugal
[2]MEDCIDS, Faculty of Medicine, University of Porto, Porto, Portugal
[3]CINTESIS, Centre for Health Technology and Services Research, Porto, Portugal
Contact: jvasco.santos@gmail.com

Issue/problem:

Contact tracing is an important and widely used method to control transmission of communicable diseases. The COVID-19 pandemic presented a new and big challenge with a high number of confirmed cases and contacts and subsequent high burden on contact tracing activities. Naturally, the effectiveness of such interventions needs to be assessed, and appropriate measures are still rather underdeveloped.

Description of the problem:

We propose two new measures for assessing contact tracing effectiveness: "number needed to quarantine" (NNQ), which is the number of quarantined person-days needed to prevent one infectious person-day, and the proportion of infectious days prevented by the quarantined (PPID). We have applied these measures to assess COVID-19 contact tracing effectiveness in COVID-19 confirmed cases diagnosed between July and mid-September 2020 in a local Public Health Unity in the Northern region of Portugal (Espinho/Gaia). For robustness checks and accounting for the uncertainty of the infectiousness period, we used three different scenarios.

Results:

Depending on the infectiousness period considered, we have found a NNQ between 19.8 and 41.8 and a PPID between 19.7% and 38.2%. Contact tracing effectiveness was higher for some specific groups such as cohabitants and symptomatic contacts. Effectiveness also decreased with the increasing time from diagnosis or symptom onset to contact isolation

Lessons:

NNQ and PPID are straightforward and easy to use measures to evaluate contact tracing effectiveness in communicable diseases. Although this example focuses in the COVID-19 pandemic at a local setting, these measures can also be used for different communicable diseases and at different levels. This assessment step can be important for priority setting of transmission control activities but also on a health management perspective.

Key messages:

- New measures to evaluate contact tracing effectiveness are proposed: "number needed to quarantine" and "proportion of prevented infectious days".
- These measures allow the identification of priority groups that must be quarantined, as well as time periods of intervention, for better transmission control.

Alarming trends in Tobacco use in high school Tunisian adolescents: MedSPAD2013-2021

Ahlem Silini

A Silini[1], S Rejaibi[1,2,3], M Zid[1], N Zoghlami[1], R Mallekh[1], I Ben Slema[1], S Ben Youssef[1], M Zribi[1], N Ben Salah[2,4], H Aounallah-Skhiri[1,2,3]
[1]Epidemiology Department, The National Health Institute, Tunis, Tunisia

[3]Nutrition Surveillance and Epidemiology, SURVEN, Research Laboratory, Tunis, Tunisia
[4]Intensive Care Unit Department, Center for Urgent Medical Assistance, Tunis, Tunisia
Contact: ahlemsilini7@gmail.com

Background:

Tobacco use is a global health concern, with smoking initiation often beginning in adolescence. In Tunisia, published data assessing trends of tobacco consumption at the national level only concerns middle school students aged 13 to 15 years. No data related to high school students are however published yet. We aimed to determine tobacco smoking prevalence in Tunisian adolescents and assess trends from 2013 to 2021.

Methods:

Pooled data from three Mediterranean school surveyson alcohol and other drugs (MedSPAD surveys: 2013, 2017, and 2021) were used. Based on three-stage stratification sampling method, teenagers aged between 15 and 17 years, were enrolled. Were not included students enrolled in vocational training centers and out-of-school adolescents. Data collection was performed using a self-administered standardized questionnaire assessing socio-demographic characteristics and risky behaviours. We studied weighted prevalence estimates of cigarettes and water pipe (WP) smoking. All statistical analysis, including trend analysis, were performed with STATA software.

Results:

A total of 14.723 students were enrolled with sex ratio (M/F) equal to 0.6 and mean age of 16.2±0.8 years. The prevalence of cigarette smoking increased from 17.8%, to 20.2% then to 24.7% for 2013, 2017 and 2021, respectively. As for WP smoking, its prevalence increased from 14.8%, to 16.7% then to 19.9% for 2013, 2017 and 2021, respectively. Trends analysis concluded to significant increase over study period for cigarettes and WP smoking ($p < 10\text{-}3$). The increase was most alarming for girls regarding WP smoking (consistent increase over the study period).

Conclusions:

Our findings underscore the alarming increasing trend for different forms of tobacco smoking among Tunisian youth. It is therefore crucial to strengthen tobacco control measures among young adolescents in order to counteract the tobacco industry's expanding marketing of new products primarily targeting this population.

Key messages:

- The prevalence of cigarette and water pipe smoking increased significantly among high school Tunisian adolescents from 2013 to 2021.
- A better commitment to the implementation of MPOWER measures for tobacco control is therefore urgent.

Abstract citation ID: ckac131.217
Nonmedical use of anxiolytics among Tunisian students: Connecting the dots from 2013 to 2021

Ahlem Silini

A Silini[1], S Rejaibi[1,2,3], M Zid[1], N Zoghlami[1], I Ben Slema[1], R Mallekh[1], M Zribi[1], S Ben Youssef[1], N Ben Salah[2,4], H Aounallah-Skhiri[1,2,3]
[1]Epidemiology Department, The National Health Institute, Tunis, Tunisia
[2]Faculty of Medicine, Tunis El Manar University, Tunis, Tunisia
[3]Nutrition Surveillance and Epidemiology, SURVEN, Research Laboratory, Tunis, Tunisia
[4]Intensive Care Unit Department, Center for Urgent Medical Assistance, Tunis, Tunisia
Contact: ahlemsilini7@gmail.com

Background:

Nonmedical use of prescription drugs such as sedatives and anxiolytics is a fast growing public health threat in several countries. In Tunisia, although several studies have investigated the prevalence of nonmedical use of anxiolytics among school-age students, there is a gap in knowledge regarding trends in anxiolytics misuse. We aimed to determine the prevalence of nonmedical use of anxiolytics and examine trends between 2013 and 2021.

Methods:

Pooled data from three Mediterranean school surveys on alcohol and other drugs (MedSPAD I-2013, MedSPAD II-2017, MedSPAD III-2021) were used. Based on three-stage stratification sampling method, teenagers in first and second grades of secondary education, were enrolled. Were not included students enrolled in vocational training centers and out-of-school adolescents. Data collection was performed using a self-administered standardized questionnaire. We studied weighted lifetime nonmedical use of prescription anxiolytics and performed global and by gender trend analysis. Epi data software was used for data entry and all statistical analysis, were performed with STATA software.

Results:

A total of 14.723 students were enrolled with sex ratio (Male/Female) equal to 0.61 and mean age of 16.2±0.8 years. The prevalence of nonmedical anxiolytics' use increased from 2.1% to 3% then to 8.4% for 2013, 2017 and 2021, respectively. Global and by gender trends analysis concluded to significant increase from 2017 to 2021 ($p < 10\text{-}3$). However, a non-significant increase was revealed from 2013 to 2017.

Conclusions:

Our study is the first to confirm a significant increasing trend in non-medical use of anxiolytics among Tunisian adolescents. These findings emphasize the urgent need for early detection of psychological vulnerability among adolescents in order to prevent their engagement in such risky behaviors.

Key messages:

- Decision makers should be sensitized regarding the alarming increasing trend in non-medical use of anxiolytics, among Tunisian adolescents.
- The state control of these substances accessibility and early detection of psychological vulnerability, are highly required.

Abstract citation ID: ckac131.218
Leading causes of death in Tunisia, 2020

Salsabil Rejaibi

S Rejaibi[1,2,3], N Zoghalami[1], A Silini[1], I Ben Slama[1], A Skhiri[4], I Mariem[1], I Mensi[1], MA Bennour[1], S Taibi[5], H Aounallah-Skhiri[1,2,3]

[3]Nutrition Surveillance and Epidemiology, SURVEN, Research Laboratory, Tunis, Tunisia
[4]Epidemiology and Statistics Department, Abderrahman Mami Hospital, Tunis, Tunisia
[5]UNFPA, Tunis, Tunisia
Contact: salsabil.rejaibi@fmt.utm.tn

Background:

Mortality data represent a primary source of information for monitoring a population health status over years. In Tunisia, the national Information System on Causes of Death (ISCD) lacks completeness (average coverage rate of 40%); however, in order to examine covid-19's effect on mortality data, the ISCD was reinforced. We aimed to give an overview of leading causes of death in Tunisia for 2020.

Methods:

Data were obtained from Medical Certificates of Cause Of Death (MCCOD) sent by municipalities to the National Institute of Health in accordance with the legislative framework. Causes of Death (CoD) coding process was performed based on the International Classification of Diseases, Tenth Revision (ICD-10). The underlying cause of death was identified based on IRIS software, and mortality statistics were presented based on the world health organization cause-of-death lists for tabulating mortality statistics. Data analysis was performed using SPSS software.

Results:

A total of 46.420 MCCOD among 75.365 deaths officially declared by the National Institute of Statistics, were analyzed (coverage rate of 61.2%). The 10 leading causes of death for both sexes, in rank order were: diabetes mellitus, cerebrovascular diseases, covid-19, ischemic heart diseases, external causes of death, digestive and pulmonary malignant neoplasms, conditions of neonatal period, hypertensive diseases, and influenza and pneumonia. Leading causes of infant deaths were: certain conditions originating in perinatal period, congenital malformations, deformations and chromosomal abnormalities, diseases of respiratory system, certain infectious and parasitic diseases, and diseases of nervous system.

Conclusions:

The COVID-19 pandemic was an opportunity to improve the Tunisian ISCD's coverage rate. However, efforts should be maintained to optimize system completeness, and decision makers should be more sensitized regarding the urgent need for system digitalization.

Key messages:

- Mortality statistics have shown that covid-19 ranks third among leading causes of death in Tunisia for 2020; and non communicable disease accounted for 6 out of 10 leading causes of deaths.
- The ISCD coverage rate was improved in 2020 reaching 61.2%; however the system digitalization is an essential and sustainable solution to optimize completeness.

Abstract citation ID: ckac131.219
Temporal trends of suicidality among adolescents in the last decade in Piedmont, Northwestern Italy

Michela Bersia

P Berchialla[1], M Bersia[2,4], E Koumantakis[2,4], E Ferracin[3], RI Comoretto[2], L Charrier[2], P Dalmasso[2]
[1]Clinical and Biological Science, University of Torino, Orbassano, Turin, Italy

[2]Sciences of Public Health and Pediatrics, University of Torino, Turin, Italy
[3]Epidemiology Service, ASL TO3 Piedmont Region, Grugliasco, Turin, Italy
[4]Post Graduate School of Medical Statistics, University of Torino, Turin, Italy
Contact: michela.bersia@edu.unito.it

Background:

Over the last decade, trends of suicidality among adolescents remain unclear. We conducted a cross-sectional study using surveillance data collected over the past 10 years in the Piedmont region, Italy, to explore temporal trends in suicidality among hospitalized adolescents.

Methods:

This was a retrospective study over an 11-year period of time. The target cohort was adolescents aged 13-19 discharged from inpatient/day-hospital care with at least one suicidality-related ICD9-CM code (i.e., suicidal ideation-SI, suicidal risk-SR and suspected suicide-SS) between 2011 and 2021 in Piedmont (Northwestern Italy). Social-economic related data is available from Census 2011. Yearly incidence rates (IR) were calculated based on the overall hospitals' catchment population and by sex. Poisson regression model was estimated to evaluate the trend over time and the association with sex, and a potential effect of the COVID-19 pandemic. A non-linear trend was allowed by modelling natural splines.

Results:

We included 490 adolescents (median age: 15 years, IQR: 13-16), 380 girls and 110 boys, with ICD9-CM codes for SI (264; 53.9%), SR (142; 29%), SS (90; 18.4%) at first discharge. Girls showed a higher risk of repeated inpatient care than boys (19.2% vs 7.3%, $p < 0.01$). Since 2013, yearly suicidality IRs started increasing linearly in boys (+1.7/100,000 per year, 95%CI: 0.7-2.8). Apparently, suicidality IRs increasing in girls were observed since 2011 (+5.8/100,000 per year, 95%CI 2.8-8.9) and were significantly higher than in boys ($p < 0.001$).

Conclusions:

Suicidality among young inpatients increased in Piedmont during the last decade. Females seemed to be more affected than males. Further research is needed to better understand gender-related risk factors for suicidality.

Key messages:

- There has been an increase in the number of adolescents reporting suicidal ideation in the last decade, especially in girls.
- Intervention strategies are urgently needed to reverse a potentially alarming trend in suicidality among young people.

Abstract citation ID: ckac131.220
Social inequality in health behaviours in cohabitating individuals with CVD

Jes Bak Sørensen

JB Sørensen[1], K Friis[1], NK Nissen[1], T Maribo[1,2], BK Nielsen[1], CT Mejdahl[1], AML Thomsen[1]
[1]Public Health and Quality Improvement, DEFACTUM, Central Denmark Region, Aarhus N, Denmark
[2]Department of Public Health, Aarhus University, Aarhus, Denmark
Contact: jesbso@rm.dk

Background:

Despite a decrease in mortality rates CVD remains the leading cause of morbidity and mortality in Europe. Health behavioural risk factors, low socioeconomic status and cohabitation status are all associated with CVD. However, little is known about social inequality in health behaviour among cohabitating individuals with CVD. Thus, the aim of this study was to examine social inequality in health behaviour among cohabitating individuals with CVD.

Methods:

Register data on CVD were linked with self-reported health behaviour from the Danish 2017 population-based health survey 'How are you?'. In total, 2,443 survey participants aged 45 years and above were registered with CVD. Daily smoking was assessed using a single question about smoking habits. Physical inactivity was categorised as less than 30 minutes of physical activity at least six days per week. Respondents with a BMI ≥ 30 were considered obese. Unhealthy diet was assessed using the Diet Quality Score. Moderate risk alcohol consumption was categorised as exceeding the Danish Health Authority's recommendations. Self-reported educational attainment was used as a marker of social position and was categorised as low (0-10 years), medium (11-15 years) or high ($\geq$ 15 years). Sociodemographic differences in health behaviour were compared using adjusted logistic regression models with health behaviours as dependent variables and adjusted for sex, age, ethnic background, time since initial CVD diagnosis and multimorbidity.

Results:

Cohabitating individuals with CVD and low educational attainment had higher adjusted odds for daily smoking (3.31), physical inactivity (2.10), unhealthy diet (6.37) and obesity (2.55) than cohabitating individuals with CVD and high educational attainment. However, they also had lower adjusted odds for moderate risk alcohol intake (0.35).

Conclusions:

Social inequality in daily smoking, physical inactivity, unhealthy diet and obesity was found among cohabitating individuals with CVD.

Key messages:

- Social inequality in health behaviour was found among cohabitating individuals with CVD. Thus, low educational attainment affects CVD risk profile regardless of cohabitation status.
- Social inequality in health behaviour among cohabitating individuals with CVD should be addressed in public health strategies, targeted secondary prevention, treatment and rehabilitation.

Cannabis use in Tunisian adolescents: Alarming trends from 2013 to 2021

Salsabil Rejaibi

S Rejaibi[1,2,3], M Zribi[1], A Silini[1], M Zid[1], N Zoghlami[1], R Mallekh[1], I Ben Slama[1], S Ben Youssef[1], N Ben Salah[2,4], H Aounallah-Skhiri[1,2,3]
[1]Department of Epidemiology, National Institute of Health, Tunis, Tunisia
[2]Medical Faculty of Medicine, Tunis El Manar University, Tunis, Tunisia
[3]Nutrition Surveillance and Epidemiology, SURVEN, Research Laboratory, Tunis, Tunisia
[4]Intensive Care Unit Department, Center for Urgent Medical Assistance, Tunis, Tunisia
Contact: salsabil.rejaibi@fmt.utm.tn

Background:

Cannabis is the most widely used illicit psychoactive substance worldwide. In Tunisia, the prevalence of cannabis use and its association with other risky behaviours were reported in several publications interesting mainly early adolescence. However, no publications exploring trends based on national epidemiological data are available yet. Our purpose was to determine cannabis prevalence in Tunisian high school adolescents and assess significant trends from 2013 to 2021.

Methods:

Pooled data from Mediterranean school surveys on alcohol and other drugs conducted in 2013, 2017, and 2021, were used. Based on three-stage stratification sampling method, first and second grade secondary education students were enrolled. Were not included students enrolled in vocational training centers and out-of-school adolescents. Self-administered standardized questionnaire was used in data collection. We studied weighted lifetime prevalence of cannabis use and chi square test for trend was used for global, by gender and by sector (private/public) trends assessement. STATA software was used for statistical analysis.

Results:

A total of 14.723 students were enrolled with sex ratio (M/F) equal to 0.61 and mean age of 16.2±0.8 years. The prevalence of cannabis use increased from 1.4%, to 3.8% then to 7.9% for 2013, 2017 and 2021 respectively. Trend assessement concludes to significant increase in overall cannabis use ($p < 10\text{-}3$). Besides, there was a significant increase in both public and private schools, and among both boys and girls. However, the greatest increase was among male students (3.5% in 2013, 9.2% in 2017 and 16.1% in 2021) ($p < 10\text{-}3$).

Conclusions:

Despite the reinforcement of restrictive legislative measures, the prevalence of cannabis use among Tunisian high school adolescents is significantly increasing. Moreover, it's important to further investigate problematic cannabis use and its effects on adolescents' physical and mental health.

Key messages:

- Trend assessement confirmed the significant increase in lifetime cannabis use in high school adolescents in Tunisia, for both sexes and for both private and public sector.
- This alarming public health issue requires urgent legislation review and close multisectoral collaboration to control supply and demand.

Ethical perspectives of the involvement of vulnerable populations in health research

Elin Lampa

E Lampa[1], *G Warner*[1], *A Sarkadi*[1], *A Perez Aronsson*[1], *M Thell*[1], *U Kihlbom*[2]
[1]Child Health and Parenting, Uppsala University, Uppsala, Sweden
[2]Centre for Research Ethics and Bioethics, Uppsala University, Uppsala, Sweden
Contact: elin.lampa@pubcare.uu.se

Background:

Public involvement in research has potential to transform public health research processes and outcomes, as well as contribute to sustainable collaborations between academia and the civil society. However, this all relies on public involvement being conducted in an ethical and inclusive way, especially when involving representatives from vulnerable populations.

Methods:

In this empirically informed theoretical reflection, ethical perspectives on involvement of vulnerable populations in health research were explored using data collected within a public involvement evaluation project. By analysing observational and longitudinal qualitative data from research projects involving public representatives from vulnerable groups, ethical aspects were identified.

Results:

Responsibility and decision-making appeared as important ethical aspects, where laws and regulations conflicted with involvement ideals. Similarly, reimbursement and recognition for public contributors became an ethical issue when facing legislation and bureaucracy, especially when involving children or refugees. Another ethical aspect concerned researchers' concerns in balancing involvement and protection of vulnerable groups, especially when involving contributors living under unstable circumstances. Finally, effectively communicating around research and involvement in an accessible way, for contributors to be involved but not burdened, was a challenge for researchers.

Conclusions:

Public involvement of vulnerable populations led to ethical challenges related to conflicting ideals and practical realities, including balancing involvement and protection of contributors. This highlighted a need for ethical guidance to support ethical decision-making and practice. The findings are used to guide the development of an ethical framework for decision-making in public involvement.

Key messages:

- Researchers involving public contributors from vulnerable groups face ethical challenges which causes barriers to involvement.
- There is need for guidance on ethical decision-making for researchers involving representatives from vulnerable groups in research.

Letters from Mars. Soft law under scrutiny of ethics during crisis. Responsibility and accountability

Serge Morard

S Morard[1], *S Guinoiseau*[2]
[1]Centre Hospitalier de Crépy-en-Valois, Crépy-en-Valois, France
[2]Centre Hospitalier Layon Aubance, Martigné Briand, France
Contact: s.morard@ch-crepyenvalois.fr

Like most of western countries France has been severely hit by the first wave of covid during Spring 2020. France managed to get through it thanks to a confinement, full dedication of health and << first line >> workers and of course the excellency of its bureaucracy. France is now famous for its digitalized self-made one-hour-walk certificate. It is however less-known for its MARSes, acronym for << message d'alerte rapide sanitaire >> or quick sanitary warning messages that got usually sent to hospitals and nursing homes... on Friday nights or weekends. Some lawyers saluted the method as an innovative and modern process that adapted quickly the response to the evolution of the situation shifting from hard rules written in the due process of law to an era of properly crafted regulations. Professionnals were less enthusiastic regarding this matter. It was less an issue of professional curtesy expected form a central state towards civil servants than one related to the content of the messages. Quality varied depending on the news. Some messages imposed very clear and strict rules such as: << no visit under any circumstances in nursing homes >> or later when tests were available, << should any cluster appear, all residents must be tested. >> However, all messages ended the same and ritual way: << Provisions included in this message must be performed and adapted under direction supervision and adapted to the context of the institution >>. Interestingly enough the way the text was written rose questions: If the rule is clear, why should it be adapted? The rule enters in conflict with other preexisting rules. Which one should apply? Classical legal and political theory are of great help sorting formal issues. Hume's non ethical cognitivism and Kant's categorical imperative were used redesigning the working frame. Since accountability was for direction to bear, so was it for it to draw fair and acceptable solutions in due respect of democratic principles.

Key messages:

- Limit cases prove that rules are unsufficient in decision making.

- Balanced decisions require collegiality to overstep limited rationality.

Who is following me? Public attitude towards government tracing apps in the covid Era in Israel

Shiran Bord

O Golan[1], *S Bord*[1], *C Satran*[1]
[1]Health Systems Management, Yezreel Valley College, Yokneam ilit, Israel
Contact: shiranb@yvc.ac.il

Background:

In the battle to decrease coronavirus infection and mortality, Israel has employed emergency tools, e.g., tracking civilians' locations via their cellphones or activating the HaMagen app that identifies when a person is near someone who has been diagnosed with the virus. While the aim of these tools is to ensure the public's health, they could harm human rights.

Objective:

To examine the Israeli public's attitudes towards enhancing public health during the pandemic while preserving privacy, by examining the relationship between trust in the healthcare system, threat perceptions, cellphone tracking, and HaMagen App.

Methods:

Surveys (distributed by iPanel) was completed by 741 adults, aged $\geq$18.

Results:

About half the respondents (47.1%) perceived cellphone tracking as harmful to privacy, yet one-quarter (24.4%) reported that this increases their sense of security. About half (48.4%) agreed/greatly agreed with the item whereby the government uses the gathered data for non-coronavirus purposes. Jewish respondents had more positive attitudes towards government tracking than Arab ones, yet the latter reported higher downloading of HaMagen. The findings indicate that threat perceptions and positive attitudes towards cellphone tracking were related to greater chances of downloading the app. Moreover, attitudes towards such tracking were mediated by the relationship between trust levels/threat perceptions and downloading the app, whereby the former was association with more positive attitudes towards cellphone tracking, which in turn was related to greater app downloading.

Conclusions and Recommendations:

Trust plays a central role in people's willingness to forgo their privacy for the good of public health. To enhance trust, messages must be suited to a range of communities, presented in a suitable language by local professionals.

Key messages:

- Trust plays a central role in people's willingness to forgo their privacy for the good of public health.
- Concern for public health must include ethical considerations.

A review of European and international phthalates regulation: focus on daily use products

Marco Monti

M Monti[1], *M Fasano*[1], *L Palandri*[1], *E Righi*[2]
[1]Postgraduate School of Public Health, University of Modena and Reggio Emilia, Modena, Italy
[2]Department of Biomedical Sciences, University of Modena and Reggio Emilia, Modena, Italy
Contact: montimarco7@gmail.com

Background:

Phthalates are known endocrine disruptors used in a wide range of industrial and household products. With globalization and interdependency of the supply chain, the control of toxic substances in daily use products has become more challenging. Many countries have implemented laws and policies to limit their use, although these regulations are neither unified nor seem adequate, as studies suggest that more vulnerable populations (children, pregnant women) are exposed to phthalates that should be restricted.

Methods:

For seven of the most used phthalates - bis(2-Ethylhexyl) phthalate (DEHP), Butylbenzyl phthalate (BBP), Dibutyl phthalate (DBP), Diisobutyl phthalate (DIBP), diisononyl phthalate (DINP), diisodecyl phthalate (DIDP), Di-n-octyl phthalate (DNOP) - we performed an online research on institutional sites and dedicated Agencies of the three largest world economies (European Union (EU), United States of America (USA), China) to analyze their uses and bans, focusing on Food Contacts Materials (FCM), cosmetics, toys and childcare articles.

Results:

In the EU area DEHP, BBP, DBP and DIBP are not allowed in toys and childcare articles above 0,1% by weight. All the seven phthalates are also severely restricted in FCM, and mostly banned as cosmetic components. In the USA, there is no formal prohibition to their use in cosmetics but phthalates are mostly limited in FCM. In China, the limit for DBP, BBP, DEHP, DNOP, DINP, DIDP in plastic toys is 0,1% of the material composition; regarding cosmetics DEHP, BBP and DBP are prohibited.

Conclusions:

We found substantial differences in the international legislation. Though there is essential agreement on toys and childcare articles legislation, there are many discrepancies about FCM and cosmetics. Further research is needed to compare the regulation with data about concentrations of these ubiquitous elements, to underline the real exposure and risk in different populations and to improve knowledge and safety on this matter.

Key messages:

- Phthalates, known endocrine disruptors, in daily use products are a matter of concern.
- Coordinated international laws to prevent exposure, especially in vulnerable populations, are needed.

Guidelines for outsourcing collective catering services in the Friuli Venezia Giulia region

Giulio Barocco

G Barocco[1], *M Palei*[2], *E Croci*[1], *A Savoia*[3], *M Mauro*[3], *F Stuto*[4]

[1]Servizio Igiene Alimenti e Nutrizione, Azienda Sanitaria Universitaria Giuliano Ison, Trieste, Italy

[2]Servizio Prevenzione, Sicurezza Alimentare, Direzione Centrale Salute, Regione FVG, Trieste, Italy

[3]Servizio Igiene Alimenti e Nutrizione, Azienda Sanitaria Universitaria Friuli Centra, Udine, Italy

[4]Servizio Igiene Alimenti e Nutrizione, Azienda Sanitaria Friuli Occidentale, Pordenone, Italy

Contact: giuliobarocco@gmail.com

Issue:

Many stakeholders involved in collective catering services (CCS) of schools, hospitals, elderly care homes, and workplaces of the autonomous region of Friuli Venezia Giulia (ARFVG) have reported some non-compliance with the nutritional, environmental or social standards required by public administrations (PA) procurement contracts (PC), which included the recommendations of the WHO, EU, Ministry of Health, and Ministry of the Environment (MHE).

Description of the problem:

The ARFVG prevention plans have set the goal to overcome the critical issues of the regional CCS which serve over 10% of the population (130,000 meals a day). Between 2019 and 2021, a multidisciplinary group of experts from health services and from the association of 215 regional municipalities developed the guidelines (GL) for outsourcing of CCS. The aim was to support PA in the drafting of PC, evaluation of offers and verification of contractual performance. Reference was made to Dir. 2014/24/EU, EU green public procurement criteria for food, catering services and vending machines, the national lines for CCS of MHE. The GL are characterized by the integration between the tender document models and the 8 qualification areas detailed in: restructuring; supplies; environmental impact and sustainability; production processes; personnel qualification and training; nutritional standards; customer satisfaction; and verification and research of quality.

Results:

Two regional central purchasing bodies have already used the GL to draft the PC for school CCS of 26 municipalities and for the whole hospital CCS of RAFVG. The application of guidelines in PC has introduced homogeneous high level qualification and verification standards for the CCS of the RAFVG.

Lessons:

To ensure the application of food, nutritional, environmental and social policies in CCS, it is essential to activate networks between professionals from different sectors in order to share tools to achieve the common sustainable development goals.

Key messages:

- To integrate food, nutritional, environmental and social regional policies into collective catering services, it is essential to apply systemic tools shared by all Public Administrations.
- Central purchasing bodies have the potential to introduce homogeneous and shared high level qualification and verification standards for collective catering services.

The effect of Kefir consumption on blood pressure some blood parameters in hypertensive individuals

Erkan Pehlivan

A Ozyazgan Tokay[1], *E Pehlivan*[2]

[1]Akcadag Public Hospital, Province Health Directorate, Akcadag/Malatya, Turkey

[2]School of Medicine, Inonu University, Battalgazi/Malatya, Turkey

Contact: erkan.pehlivan@inonu.edu.tr

Aim:

In this study is to examine the effect of kefir consumption on blood pressure, some blood parameters and anthropometric measurements in hypertensive individuals.

Methods:

The study is a randomized controlled clinical trial. The mean systolic blood pressure in hypertensive individuals was taken as 145.2±19.2. The minimum sample size was determined as 30 for each group with a 95% CI and 80% power. The study was conducted by face-to-face interviews with a total of 100 volunteers, 35 male, 65 female, aged 18 and over, who were hypertensive and volunteered to participate in the study and applied to the internal medicine outpatient clinics of Akçadag Public Hospital between September 2020 and May 2021. The experimental (n = 42) and control (n = 58) groups that the patients are randomly assigned into, the experimental group was ensured to consume 250 ml/day kefir for 28 days. During the study, The study was completed with 56 volunteers. At the beginning of the study and the end of 4 weeks, blood samples, blood pressure, pulse and anthropometric measurements of the individuals were taken.

Results:

When the anthropometric measurements were compared, the body weight, body mass index, waist circumference, and hip circumference of the individuals in the experimental group decreased significantly at the end of the study. There was no significant difference between the experimental and control groups in terms of glycemic parameters. While no significant change was observed in the lipid profile in the experimental group, total and LDL cholesterol levels decreased in the control group. There was no statistically significant difference in kidney function parameters in both groups. In addition, at the end of the study, there was no significant change in diastolic blood pressure and pulse in the experimental group, but systolic blood pressure decreased significantly.

Conclusions:

Regularly kefir consumption has positive effects on systolic hypertension and weight control.

Key messages:

- Regular daily consumption of kefir reduces systolic blood pressure and provides weight control.
- Regular daily consumption of kefir did not lead to an effective result on blood and kidney parameters.

[5]Department of Global Health, Stellenbosch University, Stellenbosch, South Africa
[6]EPI Unit, Instituto de Saúde Pública, Universidade do Porto, Porto, Portugal
Contact: elias.militao@miun.se

Background:

Food insecurity (FI) is one of the major causes of malnutrition in low- and middle-income countries. In Mozambique, the burden of FI and how it's related to negative health outcomes is unknown. This study aimed to investigate the prevalence of FI as well as the factors associated with FI in southern Mozambique.

Methods:

Preliminary data from 301 household heads residing in suburb and peri-urban districts of Maputo were analysed in a cross-sectional design. Accordingly, FI was assessed using the 8-items of the United States Department of Agriculture Household Food Security Survey Module, and its association with various factors was determined through multiple regression models.

Results:

The prevalence of FI was 62.8% (23.6% of households had mild FI, 16.6% had moderate FI, 22.6% had severe FI). Based on multiple regression models, 10 variables (out of 11) were relevant drivers of FI and reached statistical significance (p-value<0.05) with focus on food diversity, climate change, illnesses, household income, number of meals, type of work, household size.

Conclusions:

These preliminary findings suggest the need for decent work and job creation. In addition, food diversity, climate change and some relevant diseases should be taken into account in the development of public health policies designed to alleviate household food insecurity in Mozambique.

Key messages:

- Food insecurity in Mozambique calls for joint efforts from government, private sector, international institutions and communities.
- The basic food basket for the most vulnerable groups is encouraged as a short-term solution.

Dietary supplements intake among youth: preliminary results of a multicentric survey

Andrea De Giorgi

C Protano[1], *A De Giorgi*[1], *F Valeriani*[2], *F Gallè*[3], *G Liguori*[3], *VR Spica*[2], *M Vitali*[1]
[1]Public Health Department, Sapienza University of Rome, Rome, Italy
[2]Public Health Department, Foro Italico University, Rome, Italy
[3]Public Health Department, Parthenope University, Naples, Italy
Contact: andrea.degiorgi@uniroma1.it

Background:

In the last decades, a wide spread of dietary supplements (DSs) has been observed worldwide. However, DS use is not always motivated by real nutritional needs. In this context, commercial strategies and peers' suggestions seem to play an important role in determining this habit, with harmful effects on consumers' health. This cross-sectional study was aimed to evaluate the DS consumption patterns among a sample of undergraduate students attending 14 Italian universities.

Methods:

An anonymous web questionnaire was used to collect information about DS use and consumption habits, related motivations and possible adverse effects. The survey is still ongoing and its conclusion is expected to be on May 2022.

Results:

On a total of 2019 participants enrolled so far (69.7% female, mean age 22.8±4.7), 72.6% reported the use of at least a DS in the last six months. Multivitamin and multimineral products were the most used, being reported by 35.8% of the participants, while caffeinated energy supplements were the less reported (2.0%). The main reason for DS use was to deal with a specific deficiency following a physician or nutritionist indication (47.8%). The 3.4% of participants reported the occurrence of negative outcomes, mainly gastrointestinal disorders (74%).

Conclusions:

These preliminary results evidenced a wide use of DSs in the studied population. Although the main motivation was a nutritional need with a medical recommendation, a notable proportion of the sample assumed DSs without any specific prescription. Thus, it is essential to increase the knowledge about DSs and related threats deriving from their inappropriate use in the population, especially among youths. Further analysis will allow to identify possible correlations with socio-demographic and behavioural variables.

Key messages:

- It is essential to increase the knowledge about dietary supplements to avoid an inappropriate use in the population.
- Youths are the most exposed to this consumption.

Abstract citation ID: ckac131.231
Risk analysis of biological hazards in food industry in terms of Public Health

Apostolos Vantarakis

A Vantarakis[1], *M Dimitrakopoulou*[1]
[1]Medical School, University of Patras, Patras, Greece
Contact: avanta@upatras.gr

Numerous pathogens are transmitted via food and according to recent surveys, there are millions of incidents recorded in Europe in the last decade. More specific, foodborne pathogens such as bacteria, fungi, parasites, and viruses can be detected in different stages of production or distribution of a food product. Examples of predominant symptoms caused by these foodborne pathogens are nausea, vomiting, diarrhea, cramps, fever, headache, cough etc. Therefore, it is essential need to detect, manage, and prevent of foodborne pathogens ''from farm to fork'' regarding consumers health risks. Europe has established and suggested management systems in food industry that control hazards in food products. However, outbreak incidents by foodborne pathogens existing until now. By using PRISMA guideline, we searched for the most recent publications referring microbiological risk assessments from online databases Scopus, PubMed and Science Direct. From 505 articles initially captured, data was extracted from 84 studies regarding microbiological risk factors in terms of food quality and safety, that are evidenced in European studies. Moreover, information about country of origin, food type, production phase and technology used for detection of pathogens, are also presented. Our results indicated that quality systems should be further developed to control all possible routes of contamination in the supply chain. This work provided information to managers in food industry and scientists for further research regarding microbiological risk assessments. Implementation of effective risk management systems in food industry could contribute to identify and eliminate potential risks and thus, consumer's health and food quality could be reassured. Therefore, our findings could provide managers in food industry either to build up more effective management systems or even help scientists to better understand ecology of pathogens regarding food matrix and environmental conditions.

Key messages:

- Risk analysis of biological hazards in food industry could prevent foodborne diseases.
- Risk analysis of foodborne pathogens is important for public health.

Is parental socioeconomic status associated with irregularity of energy intake among children?

Eva Roos

E Roos[1,2], *R Pajulahti*[1,3], *R Lehto*[1], *K Nissinen*[3], *M Erkkola*[3], *C Ray*[1,3], *L Korkalo*[3]
[1]Folkhälsan Research Center, Samfundet Folkhälsan, Helsinki, Finland
[2]Department of Food Studies, Nutrition and Diet, Uppsala University, Uppsala, Sweden
[3]Department of Food and Nutrition, University of Helsinki, Helsinki, Finland
Contact: eva.roos@folkhalsan.fi

Background:

The timing of eating, chrono-nutrition, is a relatively new research area, where the focus is not on only what we eat but also when we eat and of irregularity between days. Chrono-nutrition have been associated with cardiovascular risk factors among adults. Societal factors influence the chrono-nutrition, but there is limited research on how different socioeconomic factors are associated with chrono-nutrition, especially among children. The aim of this study is to examine the association between parental socioeconomic status and irregularity of children's energy intake.

Methods:

We used data from the DAGIS (Increased Health and Wellbeing in Preschools) study in years 2015-2016, in which 864 preschool children participated (age 3-6 years old). Childreńs dietary intake was measured by a 3-day food record. We included only children that had complete data from all three days and the child was at day care on two of those days and one day was a weekend day (n = 568). To calculate the irregularity score, the absolute difference between the daily energy intake and 3-day mean intake for each three days was divided by the 3-day mean energy intake, multiplied by 100 and then averaged over the 3 days; this served as a measure of irregularity of energy intake, with a low score indicating a more regular energy intake and a higher more irregular energy intake. The parents reported highest parental educational level and household income on a questionnaire. The associations were tested by general linear models on SPSS.

Results:

No association was found between parental educational level or household income with irregularity of children's energy intake.

Conclusions:

There was no association between parental socioeconomic status and children's irregularity of energy intake. Other aspects of children's chrono-nutrition should also be tested to be able to conclude that children's chrono-nutrition is not influenced by parental socioeconomic status.

Key messages:

- We found no association between parental socioeconomic status and irregularity in children's energy intake.
- Chrono-nutrition among children is under-examined.

Abstract citation ID: ckac131.233
The characteristics of caffeine intake in Croatian university students

Maja Miskulin

D Laslo[1], *I Miskulin*[1], *N Srb*[1], *T Klepo*[1], *S Bonet*[1], *M Miskulin*[1]
[1]Department of Public Health, Faculty of Medicine Osijek, University of Osijek, Osijek, Croatia
Contact: maja.miskulin@mefos.hr

Background:

Excessive caffeine intake combined with increasing numbers and availability of caffeine-containing products in modern societies are causes for concern. University students may be at increased risk of excessive caffeine consumption due to seeking caffeinated products with well-known wakefulness effects and cognitive benefits. This study aimed to highlight the characteristics of caffeine consumption among Croatian university students.

Methods:

This cross-sectional questionnaire study was conducted from May 2020 to April 2021 period. A validated, anonymous questionnaire that contained questions regarding demographic data, data about caffeine consumption habits, and its sources was self-administered via an online link to a cross-faculty representative student sample of the University of Osijek in Eastern Croatia.

Results:

The study sample included 1197 subjects with, median age of 22 years (interquartile range 21-24), 24.1% males, and 75.9% females. The median caffeine intake was 512.0 mg/day (interquartile range 228.0-972.0). The higher caffeine intake was observed in part-time students ($p = 0.026$), students who were preparing for exams during the participation in this study ($p = 0.010$), and students who smoked cigarettes ($p < 0.001$). There was a poor positive correlation between the amount of caffeine intake and academic success connected with caffeine consumption ($rs = 0.225$; $p < 0.001$). There were fair positive correlations between the amount of caffeine intake and caffeine consumption because of the avoidance of the withdrawal symptoms ($rs = 0.490$; $p < 0.001$) and between the amount of caffeine intake and knowledge of the impact of caffeine consumption on the occurrence of social conflicts ($rs = 0.349$; $p < 0.001$).

Conclusions:

The study revealed high caffeine intake among Croatian university students. The implementation of specific preventive measures directed toward the protection of students' health from adverse health effects related to caffeine is needed.

Key messages:

- Croatian university students have displayed high caffeine intake in their everyday life.
- There is a need for the implementation of specific preventive measures directed toward the protection of students' health from adverse health effects related to caffeine consumption.

Abstract citation ID: ckac131.234
How healthy is it to consume soft and energy drinks? – primary school pupils' opinions from Hungary

János Girán

J Girán[1], *K Girán*[2], *D Ormándlaky*[3], *Z Kollányi*[4], *I Kiss*[1]
[1]Department of Public Health, University of Pécs, Medical School, Pécs, Hungary
[2]Bachelor Programme, Eötvös Loránd University, Faculty of Education and Psychology, Budapest, Hungary
[3]Directorate, Kodály Z. Catholic Primary School and Kindergarten, Komló, Hungary
[4]Department of Economics, Eötvös Loránd University, Faculty of Social Sciences, Budapest, Hungary
Contact: janos.giran@aok.pte.hu

Background:

The consumption of soft drinks and energy drinks (SaED) in EU27 has hardly changed over the past decade. In contrast, it grows massively in Hungary, mainly among youths. In 2021, our research group studied the causes of the growing SaED consumption of primary school pupils. Now, we deliver our key findings on how pupils consider the health impacts of SaED consumption.

Methods:

The study took place in a primary school in Komló, Hungary, in a mixed methods design: 157 pupils aged 10 to 15 filled out a survey, which we analyzed using descriptive statistical methods and independency tests. Besides, focus groups were conducted involving three stakeholder groups: a) school pupils; b) pupils' parents; c) school teachers (39 respondents in total).

Results:

Every fifth pupil consumes soft drinks daily and every third more than once a week. 28.1% of pupils consume energy drinks with some regularity, the majority more than once a week. Of those who think that soft drinks are rather unhealthy, 37.2% consume them daily or several times a week. Of those who believe that energy drinks are rather unhealthy, 24.6% consume them with some regularity. The focus groups confirmed that pupils perceive SaED consumption as accepted and "normal" behavior, and for the majority, the health consequences of the consumption are not a point.

Conclusions:

Although many pupils are aware of the health risk of SaED, they still drink them regularly. The general social acceptance of SaED consumption and the influential marketing of these products both support this attitude. To affect consumers' behavior, messages on how "unhealthy" SaED are does not seem adequate: a change in community acceptance is needed.

Key messages:

- The knowledge of adverse health effects of soft and energy drinks itself won't reduce consumption as long as its social acceptance is high.
- Preventive interventions should apply similar tools that have made soft and energy drink consumption popular and accepted to reverse recent trends.

Abstract citation ID: ckac131.235
Ginger Constituents and its Effects on Gastrointestinal malignancies: A Review of clinical trials

Lemlem Gebremariam Aregawi

L Aregawi[1,2], *Z Csiki*[1], *M Shokralahi*[1], *H Teame*[2]
[1]Institute of Nutrition, University of Debrecen, Debrecen, Hungary
[2]Public Health, Adigrat University, Adigrat, Ethiopia
Contact: lemgmed@yahoo.com

The gastrointestinal tract (GI tract) is the tract of the digestive system that contains all the major organs of the digestive system. Disorder in any part of the GI tract results in various disease forms such as malignancies. The occurrence of GI cancer is very high in developed countries including Europe. A wide variety of natural products containing anticancer properties showed significant effects. Ginger, the rhizome of Zingiber officinale, is among one of the natural herbal remedies widely used for its spice and medicinal properties. It is fair sources of vitamins like, β-carotene, vitamin C and minerals. Recently ginger has shown significant attention in clinical studies due to its anti-cancer effects that possesses promising potential for inhibiting the proliferation of multiple cancer cells. The aim of this review is to provide a summarized report of clinical trials on ginger constituents and its effects on gastrointestinal malignancies. A systematic search was conducted by two independent authors on the databases of Scopus, Clinical Trials, PubMed and Science with the search term of the key words. This review article supported that ginger is an important plant with several constituents and gastrointestinal medicinal effects. Ginger constituents suppress the growth and induce apoptosis of variety of cancer types including colon, gastric, pancreatic and other GI cancers. It is mainly the 6-gingerol and 6-shogaol, of the major compounds in ginger rhizomes, among hundreds of molecules. It is reported that antioxidant and anti-inflammatory properties of ginger support its preventive role against the gastrointestinal malignancies.

Key messages:

- This review article provided evidences supporting the effects of ginger on gastrointestinal malignancies and demonstrates the importance of future studies.
- Therefore, more extensive and well-controlled clinical trial studies of ginger are required to demonstrate its effect on gastrointestinal malignancies.

Abstract citation ID: ckac131.236
Nutritional composition of substitutes for meats and sausages on the German market

Corinna Gréa

C Gréa[1], *S Roser*[2], *I Hoffmann*[1], *S Storcksdieck genannt Bonsmann*[1]
[1]Nutritional Behaviour, Max Rubner-Institut, Karlsruhe, Germany
[2]Presidential Office, Max Rubner-Institut, Karlsruhe, Germany
Contact: corinna.grea@mri.bund.de

Background:

Substitutes for meats and sausages are growing both in demand and supply in Germany. Monitoring their nutritional composition helps characterise this novel product group in terms of its dietary contribution.

Methods:

Data on substitutes for meats and sausages were collected in a baseline survey in 2016 and an in-depth follow-up survey in 2021. In both surveys, mandatory nutrition declaration ("Big 7") and other packaging information were collected via online research and supermarket visits. Products were categorised according to the substituted animal products and their contents of energy, fat, saturated fatty acids, and salt investigated. Changes in energy and nutrient contents between baseline and follow-up survey were assessed statistically using Welch's t-test.

Results:

The follow-up survey included 421 meat substitutes and 292 sausage substitutes, split into 27 subgroups. Substitutes for meat products like meat strips and schnitzel show widely varying energy contents. Sausage substitutes show higher medians for fat, saturated fatty acids and salt than meat substitutes; spans of salt content (0,1-4,0 g per 100 g product) and saturated fatty acids (0,1 g - 23,0 g per 100 g product) are particularly wide. Relative to the baseline survey, which included 69 meat substitutes and 61 sausage substitutes, the follow-up revealed significantly higher contents of energy and saturated fatty acids overall and in some subgroups (e.g. nuggets and burger patties). The sole significant reduction was seen for energy in substitutes of precooked sausages.

Conclusions:

The observed wide spans of energy and nutrient content imply 1) the potential to reformulate substitutes for meats and sausages at the top end of the spectrum 2) the availability of healthier choices within the various subgroups. The increases shown in energy and saturated fatty acids content warrant further monitoring.

Key messages:

- Wide spans of energy and nutrient contents reveal the potential for the development of more nutritionally favourable substitutes for meats and sausages.
- As substitutes for meats and sausages are perceived to have nutritional advantages the observed increases in energy and saturated fatty acids contents over time should be further monitored.

Abstract citation ID: ckac131.237
Gluten quantification in gluten-free food for celiac people in Lombardy and Emilia Romagna - Italy

Enrico Pavoni

E Pavoni[1], *B Bertasi*[1], *G Finazzi*[1], *V Filipello*[1], *M-N Losio*[1,2]
[1]Food Safety Department, IZSLER, Brescia, Italy
[2]NRC for Emerging Risks in Food Safety, IZSLER, Brescia, Italy
Contact: enrico.pavoni@izsler.it

Background:

In recent decades, the celiac disease showed a gradual increase in prevalence. Therefore, there was a raised demand of gluten-free products. EU Reg. 1169/2011 states that 20 mg.kg-1 (ppm) is the maximum gluten content in food for celiac people, and that “gluten-free” labelling must be put on compliant food packages. This work is a study on different food categories, aiming at verifying the safety of analyzed samples.

Methods:

Totally, 4615 gluten-free-labelled specimens were collected from January 2019 to April 2022 (pasta, 2944; cured meat, 566; flours/bakery, 489; sweets, 125 and other matrices, 491). A commercially available E.L.I.S.A. kit, according to the AOAC 2012.01-2016 method, was used to quantify gluten.

Results:

In 97% of samples (4475) the gluten content was <5 ppm (lower LOD), and in 2.4% (112) it was between 5 ppm and <20 ppm. In the remaining 0.6% (28), the gluten concentration was ≥20 ppm. Of these, 0.32% (15) were between 20 and <80 ppm (upper LOD), and 0.28% (13) ≥80 ppm.

Conclusions:

The increased prevalence of celiac disease and the consumers’ perception that a gluten-free diet gives benefits, lead to a greater demand of gluten-free products. In this study, 99.4% of samples were compliant with the gluten-free labelling and safe for celiac consumers. The 0.32% had a gluten content between 20 and 80 ppm, still considered “compliant”, according to the EU Reg. 828/2014 that defines as very low gluten containing (thus edible for some celiac groups), those products with a gluten content <100 ppm. Only 0.28% of samples was non-compliant (≥80 ppm). However, the authors accounted irregular those foods with ≥20 ppm. Considering the importance of these products in the daily diet, and the increasing probability to get sick by individuals, the study of their compliance to the law limits results to be important.

Key messages:

- A continuous surveillance of gluten-free-labelled food products is very important to prevent risks for celiac consumers.
- The foodstuffs distributed in the two considered regions are mainly safe for celiac patients.

Abstract citation ID: ckac131.238
Self-assessed achievement of eating balanced meals – is it reliable for tailoring interventions?

Melanie Schneider

M Schneider[1], *C Nössler*[1], *PM Lührmann*[1]
[1]Institute of Health Science, University of Education, Schwäbisch Gmünd, Germany
Contact: melanie.schneider@ph-gmuend.de

Background:

Recording the self-assessed achievement of eating balanced meals offers the possibility to tailor nutritional interventions to the stage of behaviour change. Beforehand of an intervention, the self-assessed achievement of eating balanced meals was recorded and verified against the actual consumption.

Methods:

Self-assessed achievement of eating balanced meals was operationalised using the behavioral stages of the Health Action Process Approach (HAPA). The actual consumption was assessed by a validated 3-day dietary record and the Healthy Eating Index of the National Nutrition Survey (HEI-NVS) was calculated. A score of 100 points represents one hundred percent compliance with the recommendations of the German Nutrition Society. Ten additional points could be scored if vegetables and fruit were consumed above the recommendation. An HEI-NVS score of ≥ 80.0 points was considered a cut-off for ‘eating balanced meals’.

Results:

In a sample of 130 participants (86.9 % female, 29.0 ± 11.3 years), 9.2 % rated themselves as Non-Intenders, 17.7 % as Intenders, and 73,1 % as Actors. Their HEI-NVS was 69.6 ± 10.6 points, 79.2 ± 9.5 points, and 79.7 ± 9,0 points, respectively (ANOVA, $p < 0.01$). In the post-hoc-Test (Scheffé) Non-Inteders differed from the other groups ($p < 0.05$), Intenders and Actors were not different (n.s.). The proportion of participants with an HEI-NVS score ≥ 80.0 points was 16.7% for Non-Intenders, 60.9% for Intenders, and 51.6% for Actors (Chi^2-Test, $p < 0.05$).

Conclusions:

Self-assessed achievement of eating balanced meals is characterised by self-underestimation (predominatly Intenders) and self-overestimation (predominatly Actors). Tailored interventions should take this into account.

Key messages:

- Self-assessed achievement of eating balanced meals is characterised by self-overestimation.
- Self-assessed achievement of eating balanced meals is also characterised by self-underestimation.

Abstract citation ID: ckac131.239
How can policies to reduce obesity be more effective and equitable following the COVID-19 pandemic?

Charlotte Gallagher Squires

C Gallagher Squires[1], *A Isaacs*[1], *P Coleman*[1], *C Hawkes*[1]
[1]Centre for Food Policy, City, University of London, London, UK
Contact: charlotte.gallagher-squires@city.ac.uk

Despite being a public health priority in the UK for decades, rates of childhood obesity are continuing to rise along a highly unequal socioeconomic gradient. COVID-19 has radically changed daily life, altering the economy, work, social lives and engagement with the food environment. This research aimed to investigate families’ lived experiences of food in the COVID-19 pandemic to understand how policies to reduce obesity can be more effective and equitable. We conducted a remote longitudinal qualitative study, engaging 62 parents of school or nursery age children in England. Participant demographics were diverse in terms of socioeconomic status and ethnicity. Participants took part in semi-structured interviews and photo-elicitation three times at six-month intervals between October 2020 and December 2021. The role of food in day-to-day life shifted in the context of changes brought about by the pandemic. Whether this led to healthy or unhealthy food practices was shaped by socioeconomic resources. Food became a key source of pleasure in daily life as social and leisure activities were restricted in lockdowns. As schools and childcare closed, when this work fell on one parent food became a source of relentless work and parents sought more convenient options. Those with financial resources were able to access healthier convenient options (e.g. meal boxes), while low incomes restricted parents to low-cost options (e.g. ready meals and fast food). For those experiencing financial insecurity, food became a financial management strategy and parents sought discounts and promotions to save money to cover other non-food essentials. These contexts have the capacity to occur again both on a large scale (e.g. disruptions to the food system) and in the context of an individual’s lifetime (e.g. ill health or job loss). Policy now has a window of opportunity to implement learnings from this period and shape obesity prevention policy to be more effective and equitable.

Key messages:

- COVID-19 has revealed the multiple resources and systems of support that underpin families' ability to eat well and, when disrupted, can limit capacity to procure and prepare nutritious foods.
- Policies designed to improve diets must consider the multiple roles food plays in everyday life, beyond just a source of nutrition, to ensure actions are effective and equitable.

Abstract citation ID: ckac131.240
A dietary intervention study to reduce Metabolic Syndrome risks in heart-transplanted patients

Valentina Moretti

G Valdi[1], V Ferrara[1,2], M Marinoni[1], C Nalli[2], C Di Nora[2], S Sponga[1,2], G Benedetti[2], M Parpinel[1], U Livi[1,2], V Moretti[1]
[1]DAME, Università di Udine, Udine, Italy
[2]Cardiothoracic Department, Friuli Centrale Healthcare and University Trust, Udine, Italy
Contact: moretti.valentina001@spes.uniud.it

Background:

Since heart transplantation (HTx) has become the gold standard therapy in end-staged heart failure, many factors, including metabolic syndrome (MS), represent a burden in HTx patients. Considering key role of immunosuppressive therapy and its side effects on the appearance of MS, we focused on modifiable factors including adherence to Mediterranean Diet (MD) and improvement of dietary habits.

Methods:

21 heart-transplanted patients were enrolled and randomized in a control group (CG; N 10) and an intervention group (IG; N 11). During two meetings (baseline, 6-month follow-up) were administered a validated Food Frequency Questionnaire (FFQ), to assess adherence to MD, and collected clinical and anthropometric parameters, IG were additionally requested to fill a food diary. IG received personalized advices, CG received standard recommendations. Comparison between IG and CG were analyzed, differences into the IG were also assessed.

Results:

The prevalence of MS at baseline was 46% in IG and 20% in CG. During 6-month follow-up, significant lower blood pressure values were observed (median, 25th-75th: systolic 130, 120-130 IG vs 145, 130-147 CG; p = 0.004). Seven patients of IG underwent a 12-month meeting. In this group MD scores increased significantly (7 + 1.3 vs 4 + 1.5, p = 0.001). Furthermore, significant decrease of fat mass percentage (%) (23.3 + 6.3 vs 14.8 + 10.1, p = 0.014), increase of fat free mass % (76 + 6.3 vs 85.2 + 10.1, p = 0.014) and increase of body cell mass % (50.9 + 3.8 vs 53.4 + 3.4, p = 0.031) were observed. Dietary data in IG showed significant decrease of energy from saturated fatty acids % (13.0±2.1 vs 9.6±1.5, p = 0.001), sodium (mg) (2138±359 vs 1822±417, p = 0.045), and decreasing trend for cholesterol (mg) (219±82 vs 171±59, p = 0.082).

Conclusions:

Dietary intervention based on MD perhaps can improve MS risks in heart-transplanted patients. Further investigations may be needed to assess the fundamental role of a structured nutritional follow-up in these patients.

Key messages:

- Personalized nutritional advices based on the MD, compared to general recommendation, can significantly improve health and quality of life in heart-transplanted patients.
- A structured nutritional follow-up for heart-transplanted patients may be desirable to prevent risks of Metabolic Syndrome as a public health instrument in selected categories as these patients.

Cost-effectiveness of hospice-based palliative care in Kazakhstan

Islam Salikhanov

I Salikhanov[1], B Crape[2], S Wieser[3], M Katapodi[1]
[1]Medical Faculty, University of Basel, Basel, Switzerland
[2]School of Medicine, Nazarbayev University, Nur-Sultan, Kazakhstan
[3]ZHAW School of Management and Law, Zurich University of Applied Sciences, Zurich, Switzerland
Contact: islam.salikhanov@nu.edu.kz

Background:

According to the Quality of Death Index, Kazakhstan ranks 50th out of 80 countries assessed. Currently, some form of inpatient end-of life care in Kazakhstan is provided by only 9 hospices, palliative care units and mobile teams. In 2020, the total number of palliative care beds did not exceed 980 across the country, while around 135,000 patients need palliative care at any given time.

Objective: To assess the effectiveness and cost-effectiveness of hospice-based palliative care for cancer patients compared to usual hospital care in cancer centers across Kazakhstan from societal perspective.

Methods:

A total of 182 family caregivers were recruited, 104 in a hospice group and 78 in a control (palliative units). Patients' state of health and family caregivers' burden been measured using Palliative Outcome Scale (POS) and Zarit Burden Inventory (ZBI) on 14th day of the inpatient palliative care. Direct and indirect medical costs as well as family caregivers' out-of-pocket expenses associated with the care has been collected. The cost-effectiveness analysis was conducted by calculating the difference between mean cost of treatment, including OOPs, over 14 days of treatment. Uncertainty around the cost-effectiveness estimates was explored by generating 10,000 resamples using bootstrapping.

Results:

At 14 days, patients' mean quality of life was 2,4 points better (95% CI: 0,06 - 4,9) in the hospice group compared to the control. Family caregiver burden was 4,6 points better in the hospice group (95% CI: -0,26 - 9.3). Mean treatment costs, including direct medical costs and out-of-pocket expenditures over 14 days were $31 lower for the hospice group (95% CI: $29 - $32). There was a significant correlation between the total cost of treatment and patients' quality of life (rxy = 0,58; $p < 0{,}01$). The cost-effectiveness plane graphically represents 10,000 replications, 85% of them showed that hospice care has better outcomes and lower costs than the control group.

Key messages:

- Hospice-based palliative care is cost-effective compared to the care provided in palliative units of cancer centers.
- There is a significant correlation between patients' quality of life and family caregivers' burden.

The Effect of Smartphone Use and Nomophobia on Sleep Quality and Daytime Sleepiness in Turkey

Erkan Pehlivan

B Erten[1], E Pehlivan[2], E Yalcin[2]
[1]Public Health, Balikesir Provincial Health Department, Altieylul, Balikesir, Turkey
[2]School of Medicine, Inonu University, Battalgazi, Malatya, Turkey

Contact: erkan.pehlivan@inonu.edu.tr

Background:

Smartphones used unconsciously and in an uncontrolled manner make young people experience sleep problems. This study aimed to investigate the effects of university students' smartphone addiction and nomophobia levels on sleep quality and excessive daytime sleepiness.

Methods:

This study, which had a cross-sectional design, was conducted with 390 people who were first-year and senior students at Inonu University between November and December 2019. The Pittsburgh Sleep Quality Index, Epworth Sleepiness Scale, Nomophobia Scale, and Smartphone Addiction Scale were used in the present study used. For statistical analysis, the chi-squared test, the Student's t-test, one-way ANOVA, Spearman's rank correlation coefficient and binomial logistic regression analysis were used. The research has ethics committee approval.The error level was chosen as $p = 0.05$.

Results:

The smartphone use time of the students was finded to be 5.4±2.6 years, daily online time was 4.3±2.6 hours, and daily sleep time was 7.4±1.5 hours. The students received 78.3±25.8 points from the Nomophobia Scale, 90.3±29.7 from the Smartphone Addiction Scale, 7.2±2.8 from the Pittsburgh Sleep Quality Index, and 5.9±4.1 points from the Epworth Sleepiness Scale. A total of 54.4% of students had moderate, and 22.8% had severe nomophobic symptoms; 83.6% of the group had poor sleep quality, and 14.6% had excessive daytime sleepiness. A positive, moderate and significant relation was detected between the mean Nomophobia score and the mean Smartphone Addiction Scale score. It was also determined that those with less than 30 minutes of smartphone use before sleeping had low nomophobia, smartphone addiction and daytime sleepiness scores, and better sleep quality.

Conclusions:

Nomophobic symptoms and smartphone addiction were observed to be high in university students. Most students had poor sleep quality. The awareness of students on healthy sleep, and conscious and controlled smartphone use should be increased.

Key messages:

- Smartphone addiction increases the level of nomophobia moderately in university students.
- Those who use a smartphone less than 30 minutes before going to sleep have better sleep quality and lower daytime sleepiness.

Abstract citation ID: ckac131.243
Development of a refugee health assessment toolkit for specific populations to support primary care

Talia Boshari

T Boshari[1], S Hassan[2], K Hussain[2], J Billett[2], S Garry[3,4], L Weil[2]
[1]Public Health, London Borough of Newham, London, UK
[2]London Operations Team, Office for Health Improvement and Disparities, London, UK
[3]Public Health, London Borough of Southwark, London, UK
[4]Asylum Seekers and Refugees, Association of Directors of Public Health, London, UK
Contact: t.boshari@gmail.com

Issue/problem:

The United Kingdom (UK) hosts c.136,000 refugees and last year received the most asylum applications in two decades. Despite this, expertise in migrant health is not widespread in general practice, with few comprehensive toolkits available to support crucial initial health assessments of new arrivals.

Description of the problem:

A large influx of Afghan refugees entered the UK in autumn 2021. In London, primary care practitioners quickly identified a lack of readily accessible, comprehensive guidance to support them in conducting health assessments for arrivals with a complex range of needs. This was compounded by many in primary care having little or no experience of migrant health.

Results:

To address this gap in advice on conducting initial health assessments, a bespoke toolkit was created. The toolkit consolidated advice from a range of partners and resources: the UK Afghan migrant health guide, clinicians with humanitarian experience, front-line practitioners, Doctors of the World, and those leading on the health and public health response. The toolkit ensured greater consistency in the nature and content of assessments, considered not only primary needs but also broader wellbeing, and was responsive to both anticipated and known health priorities.

Lessons:

The initial health assessment toolkit for Afghan migrants was well received by frontline staff and has implications for international practice in other areas providing similar health support. The toolkit and associated supporting information has formed a template that can be rapidly adapted to suit emerging needs, as has been done for new arrivals from Ukraine. This work has fed into best practice by the UK National Asylum Steering Group and is to be a case study for a WHO project on country-specific health assessments.

Key messages:

- The toolkit is a proof of concept for partnership working towards holistic initial health assessments of new migrants in primary care, bringing together best evidence and pragmatic practice.
- This work has implications for other countries experiencing similar trends in migration and providing health support to an increasing number of new refugees.

Abstract citation ID: ckac131.244
An integrated hospital-district evaluation for communicable diseases in low/middle-income countries

Sara Mazzilli

L Tavoschi[1], P Belardi[2], S Mazzilli[1,3], F Manenti[4], G Pellizer[4], D Abebe[5], G Azzimonti[6], JB Nsubuga[7], G Dall'Oglio[8], M Vainieri[2]

[6]Doctors with Africa CUAMM, Iringa, Tanzania
[7]Doctors with Africa CUAMM, Matany, Uganda
[8]Doctors with Africa CUAMM, Gulu, Uganda
Contact: sara.mazzill@gmail.com

Background:

The last two decades saw an extensive effort to design and implement integrated and multidimensional healthcare evaluation systems in high-income countries. However, in low/middle-income countries, few experiences of such systems implementation have been reported in the scientific literature. We developed and piloted an innovative tool to assess the performance of health services provision for communicable diseases in three African countries.

Methods:

A total of 42 indicators, 14 per each communicable disease care pathway (Tuberculosis, Gastroenteritis, and HIV/AIDS), were developed. A sub-set of 23 indicators was included in the evaluation process. The indicators assessed four care phases: prevention, diagnosis, treatment, and outcome. All indicators were calculated for the period 2017-2019, while performance evaluation was performed for 2019. The analysis involved four health districts and their relative hospitals in Ethiopia, Tanzania, and Uganda.

Results:

Substantial variability was observed over time and across the four different districts. In the TB pathway, the majority of indicators scored below the standards and below-average performance was mainly reported for prevention and diagnosis phases. Along the Gastroenteritis pathway, excellent performance was instead evaluated for most indicators and the highest scores were reported in prevention and treatment phases. The HIV/AIDS pathway indicators related to screening and outcome phases were below the average score, while good or excellent performance was registered within the treatment phase.

Conclusions:

The bottom-up approach and stakeholders' engagement increased local ownership of the process and the likelihood that findings will inform health services performance and quality of care. Despite the intrinsic limitations of data sources, this framework may contribute to promoting good governance, performance evaluation and accountability in settings characterised by multiple healthcare service providers.

Key messages:

- A successful experience in developing and implementing a communicable diseases performance evaluation systems in three sub-Saharan African countries using a bottom-up approach.
- The communicable diseases performance evaluation tool helped the data sharing between local healthcare providers and the development of competencies in data collection, analysis and interpretation.

[2]Centre for Epidemiological Research, Univesity of Ostrava, Ostrava-Vítkovice, Czechia
[3]Department of Occupational Medicine, Public Health Institute, Ostrava, Czechia
[4]Department of Laboratories, Public Health Institute, Ostrava, Czechia
Contact: hana.slachtova@osu.cz

Background and aims:

The PM air pollution is a serious concern in northern Moravia in the Czech Republic. The aim is to evaluate the risk of acute hospital admissions for cardiovascular and respiratory causes with the use of the Geographic information system (GIS).

Methods:

The data on acute hospital admissions for cardiovascular (I00-99 according to ICD-10) and respiratory (J00-99) causes was assigned based on the information on residence to 77 geographical units (601,299 inhabitants). The annual concentrations of PM2.5 in the period 2013-2019 were assigned to this units according to the respective concentration iso-shapes (step 2 µg.m-3, concentrations ≤29 to ≥ 38 µg.m-3). The Incidence Rate Ratio (IRR) and 95% confidence interval (CI) was calculated for each concentration category. The incidence in the first category with the lowest PM2.5 concentrations (≤29 µg.m-3) was chosen the reference category. The statistical analyses were performed using the SW STATA v.15.

Results:

About a half of population (56%) in the year 2013 belonged into the PM2.5 category 34-35 µg.m-3, 26 thousand of inhabitants (4%) live in the PM2.5 concentrations ≥38 µg.m-3. During the analysed period the average concentration values decreased from 30.8 to 21.4 µg.m-3. A statistically significant risk of the acute hospitalization for cardiovascular causes was identified in the categories ≤36 µg.m-3, in the highest interval of PM2.5 the IRR values were 2-3-fold higher comparing with the reference category. As for respiratory causes, the trend is similar, but the statistically significant risk was found already from the interval 34-35 µg.m-3.

Conclusions:

With increasing concentrations, the risk of both acute cardiovascular, and respiratory hospitalizations increased.

This presentation was supported by the project TH03030195 of the Technology Agency of the Czech Republic and the project Healthy Aging in the Industrial Environment CZ.02.1.01/0.0/0.0/16_019/0000798 (HAIE).

Key messages:

- A statistically significant increase of the IRR for acute cardiovascular and respiratory hospitalizations was found at PM2.5 concentrations ≤34 µg.m-3 compared to the reference category ≤29 µg.m-3.
- Average annual PM2.5 concentration decreased from 30.8 to 21.4 µg.m-3 during the followed period and also the risk of acute hospitalization from cardiovascular and respiratory causes decreased.

Abstract citation ID: ckac131.246
The computer-assisted interview In My Shoes – a successful method to capture children's perspectives

Karin Fängström

K Fängström[1]*, A Dahlberg*[1]*, A Sarkadi*[1]
[1]CHAP, Public Health and Caring Sciences, Uppsala University, Uppsala, Sweden
Contact: karin.fangstrom@pubcare.uu.se

Background:

Child mental health problems are considered the second highest cause of burden of disease in Europe and the Americas. Children's own opinions and experiences are pivotal in addressing these problems. However, including young children as active informants in health research and practice not only requires a well-trained and highly qualified workforce, but also valid methods that enhance and support children's self-expression. The aim was to investigate preschool aged children's experiences in two health and welfare contexts using the interactive computer-assisted interview In My Shoes (IMS).

Methods:

Interviews were conducted using IMS in three studies encompassing 43 children aged 3-6 years old. The setting for the first and second study was Child Health Centres and the third setting was families entering the Triple P group parenting programme. Qualitative content analysis was performed.

Results:

The IMS interview aided preschool aged children to report on the factual, emotional and physical aspects of their experiences within a health care context. In addition, IMS helped young children verbalise unique information on negative interplay within their families, especially experiences of negative parenting including verbal and physical child abuse. The successes with IMS are likely related to the structured and systematic approach, that it is pictorial-based and emotion-focused, as well as the interactive, collaborative and triadic conversation between the child, the interviewer and the computer.

Conclusions:

The interactive computer-assisted interview IMS, is a suitable and valid method for aiding young children to provide unique and extensive information about different aspects of their experiences and lives. We urge professionals and researchers to systematically include the young children's own perspectives to better tailor and evaluate interventions on all levels to improve children's health and wellbeing.

Key messages:

- Young children's own perspectives on their health and wellbeing are pivotal to better tailor and evaluate interventions.
- The interactive computer-assisted interview In My Shoes is a suitable and valid method to capture children's voices.

Abstract citation ID: ckac131.247
Evaluation of a universal early intervention for parents and children from birth to age five

Filipa Sampaio

F Sampaio[1], J Häggström[2], R Ssegonja[1,3], E Eurenius[4], A Ivarsson[4], AM Pulkki-Brännström[4], I Feldman[1]
[1]Department of Public Health and Caring Sciences, Uppsala University, Uppsala, Sweden
[2]Department of Statistics, Umeå University, Umeå, Sweden
[3]Department of Medical Sciences, Uppsala University, Uppsala, Sweden
[4]Department of Epidemiology and Global Health, Umeå University, Umeå, Sweden
Contact: filipa.sampaio@pubcare.uu.se

Background:

This study aimed to investigate the health and economic outcomes of a universal early intervention for parents and children, the Salut Programme, from birth to when the child completed five years of age.

Methods:

This study adopted a retrospective observational design using routinely collected register data with respect to both exposures and outcomes from a county in northern Sweden. Areas that received care-as-usual (non-Salut area) were compared to areas where the Programme was implemented after 2006 (Salut area) in terms of: i) health outcomes, healthcare resource use and related costs around pregnancy, delivery and birth, and ii) healthcare resource use and related costs, as well as costs related to care of sick child. Costs were estimated for inpatient care and specialised outpatient care for mothers and children. Two analyses were conducted: a matched difference-in difference analysis using the total sample and an analysis including a longitudinal subsample.

Results:

The longitudinal analysis on mothers who had given birth in both the pre- and post-measure periods showed that those that had been exposed to the Salut Programme, had on average 6% (95% CI 3-9%) more full-term pregnancies and 2% (95% CI 0.03-3%) more babies born within normal weight range, compared to mothers who had only care-as-usual. Savings were incurred in terms of outpatient care related costs for children of mothers in the Salut area ($826). The difference-in-difference analysis using the total sample did not result in any significant differences in health outcomes or cumulative resource use over time.

Conclusions:

The Salut Programme achieved health gains at a reasonable cost for children and parents, and may lead to lower usage of outpatient care. Other indicators point towards positive effects but the small sample size may have led to underestimation of true differences. The current findings support the continuous investment in this early childhood programme.

Key messages:

- The Salut Programme improves the health of children and parents at a low cost.
- The Salut Programme as a health promotion early intervention is value for money and should be included in the local policy investment agenda.

Abstract citation ID: ckac131.248
Mina Svar: A tool for measuring social impact

Raziye Salari

R Salari[1], J Westberg[1], Å Moum[2], Youth in Save the Children programs[2], M Thell[1], O Dyar[1], A Sarkadi[1]
[1]Child Health and Parenting, Uppsala University, Uppsala, Sweden
[2]Save the Children, Stockholm, Sweden
Contact: raziye.salari@pubcare.uu.se

Background:

Each year, numerous initiatives are carried out to improve the outcomes for youth living in vulnerable areas. However, the impact of these initiatives is rarely measured, partly because there is no reliable, valid, relevant and easy-to-use tool available to measure the impact of social investments from the youth perspective. Mina Svar is an app co-created with youth that aims to address this gap.

Methods and results:

Save the Children led the collaboration in defining a measurement framework. Experts from Save the Children, researchers from Linköping University, and representatives from Accenture, Skandia and Apoteket as well as youth themselves were involved in an iterative process. Five interconnected areas were identified as central: democracy and influence, education, work, housing and neighbourhood, and health. The first version of Mina Svar included 34 items. Researchers from Uppsala University were involved to help with testing the psychometric properties of Mina Svar in a sample of 237 youths. We examined the tool's internal consistency, content validity and structure validity. Analyses showed that all the subscales except democracy and influence had good internal consistency (0.70 and higher). However, inspection of individual items revealed that several items lacked clarity and many items did not comprehensively reflect the related constructs as intended. Confirmatory factor analysis suggested a poor fit for the proposed model (CFI = 0.52 TLI = 0.56, and RMSEA = 0.103). Currently, we are going through a second iterative process to increase the reliability and validity of Mina Svar. The work involves refining the framework, rewriting ambiguous items, generating new items, and re-examining the psychometric properties of the revised version.

Conclusions:

Mina Svar is a promising short multidimensional survey tool which offers a potential solution to tackle the problem with measuring the impact of social investments from the youth perspective.

Key messages:

- Mina Svar is an app-based assessment tool co-created with youths living in vulnerable areas.
- Mina Svar is a promising short multidimensional tool which offers a potential solution to tackle the problem with measuring the impact of social investments.

Air purifiers, comparison between real and declared surface for use: fake it or make it?

Lorenzo Dragoni

C Gullotto[1], L Dragoni[1], D Amodeo[2], G Cevenini[2], N Nante[1,3], G Messina[1,3]
[1]Hygiene and Preventive Medicine, University of Siena, Siena, Italy
[2]Department of Medical Biotechnologies, University of Siena, Siena, Italy
[3]Department of Molecular and Developmental Medicine, University of Siena, Siena, Italy
Contact: dragoni11@student.unisi.it

Introduction:

Air pollution has been recognized as one of the major risk factors for the global burden of disease. In modern society, most exposure occurs indoors, and air quality may be improved with air purifiers utilizing various cleaning techniques. This analysis aims to evaluate whether recommended room surface in which to use these devices as declared by producers is actually in line with their real effective area of activity.

Methods:

A review of devices for the purification of the air was carried out between January-April 2022. Four different types of air purifiers were considered based on the adopted technologies: I) HEPA filters and UV lamps; II) only with HEPA filters; III) only UV lamps and IV) those using other technologies. For each group, based on the CADR (Clean Air Delivery Rate) provided by the producers, the optimal real surface area of the room to use the device was calculated, referring to the standard EN779:2012. This value was compared with the recommended area of the room declared by the producers. Descriptive statistics and Wilcoxon matched pair test used for comparisons. The significance level was set at $p < 0.05$.

Results:

The analysis was carried out on 252 devices; I) 52 had HEPA filters + UV lamps, with a recommended mean room area of 40 m2 (IQR 49.75), II) 142 devices had only HEPA filters with 52.5 m2 (IQR 46.75), III) 27 devices only UV lamps, 40 m2 (IQR 105), IV) 31 devices with other technologies, 54 m2 (IQR 84.2). As required by EN779:2012, the effective area of activity was calculated using CADR x 0.075: the medians of the 4 groups were I) 12 m2 (IQR 16.5), II) 15.83 m2 (IQR 26.4), III) 4.5 m2 (IQR 22.5), IV) 7.5 m2 (IQR 21.53), respectively. Comparing declared and calculated CADR values, all the groups showed significant differences ($p < 0.05$).

Conclusions:

Results show that recommended surfaces derived from CADR declared by producers largely overestimate the real volume of the room that devices can purify, whatever the technology used.

Key messages:

- There's no correspondence between recommended area of room to be sanitized indicated by producers of air purifiers and area that they are actually able to sanitize, which is significantly lower.
- It is necessary to be aware of the difference between data indicated by producers and real data, in order to purchase a device that actually corresponds to dimensional needs of the environment itself.

Abstract citation ID: ckac131.250
Which one to choose? A cost-effectiveness analysis between different technologies of air purifiers

Marco Sparacino

C Gullotto[1], M Sparacino[1], A Amodeo[2], G Cevenini[2], N Nante[1,3], G Messina[1,3]
[1]Hygiene and Preventive Medicine, University of Siena, Siena, Italy
[2]Department of Medical Biotechnologies, University of Siena, Siena, Italy
[3]Department of Molecular and Developmental Medicine, University of Siena, Siena, Italy
Contact: m.sparacino@student.unisi.it

Introduction:

CoViD19 pandemic highlighted the importance of air purifiers and, in commercialization, their performance and price influence the choice. Since primary focus concerns only performance in terms of CADR (Clean Air Delivery Rate), this study aims to compare: I) levels of declared air purifications according to different types of air purification technologies; II) price of them to evaluate if, with similar group-mean CADR (within +/- 1 SD), there are significant differences in selling prices.

Methods:

A review of several devices was carried out, collecting data in January-April 2022. Four different types of air purifiers were considered, divided into as many groups: those equipped with HEPA filters + UV lamps, only with HEPA filters, only with UV lamps and those using other technologies. We applied Kruskal-Wallis test to evaluate statistical differences among prices normalized by CADR, at significant level of 0.05.

Results:

Analysis was carried out on 186 devices: I) 37 had HEPA filters + UV lamps, II) 117 only HEPA filters, III) 11 only UV lamps and IV) 21 other technologies. Eight system had HEPA H11 (95% reduction of particle matter 0.5 µm), 8 had HEPA H12 (99.5%), 70 had HEPA H13 (99.95%), 11 had HEPA H14 (99.995%). The mean normalized costs of each group devices, in Euros/CADR were I) 1.22 (SD 2), II) 1.49 (SD 1.4), III) 7.63 (SD 7.38), IV) 1.22 (SD 0.99), respectively. Statistical comparison of four-group selling prices show significant differences ($p < 0.05$) due to the devices equipped with only UV lamps.

Conclusions:

Comparison between technologies analyzed by mean price normalized to CADR showed significant differences between those that used only UV lamps compared to all the others. This is reasonably due to the fact that the use of only UV lamps requires radiant powers considerably greater than all the others, therefore also higher costs (about 5-6 times). In all cases, the level of disinfection reached, as declared, was always > 95%.

Key messages:

- With the same mean price normalized to CADR, the selling price is significanly different only for devices equipped with UV lamps compared to all the others.
- Choice of devices with a certain level of declared air purifications can be directed towards those with HEPA+UV/HEPA/other without the mean price normalized to CADR undergoing significant differences.

A novel technology for disinfecting surfaces infested with Candida auris: the UVC chip

Elena Frongillo

E Frongillo[1], D Amodeo[2], N Nante[3], G Cevenini[2], G Messina[1,3]
[1]Post Graduate School of Public Health, University, Siena, Italy
[2]Department of Medical Biotechnologies, University, Siena, Italy
[3]Department of Molecular and Developmental Medicine, University, Siena, Italy
Contact: elefrongillo@gmail.com

Background:

The fungal pathogen Candida Auris is increasingly associated with multidrug-resistant infections that are highly expensive for the Health Care System. The spreading of this pathogen can occur, among others, through contact with infected surfaces or medical instruments. This study evaluated the efficacy of a novel UVC chip, novel alternative to UVC LEDs and lamps, in inactivating Candida auris strain.

Methods:

This experimental study was carried out between July and September 2020 at the University of Siena. Candida auris (ATCC 12372) at two known concentrations (1.5X107 and 1.5x106 CFU/ml) at a fixed distance (7,5 cm) from the chip (5.1mW radiant power) was tested, in triplicates, with three exposure times (5, 10 and 15 minutes). Potato Dextrose Agar (PDA) plates without the plate lid and containing Candida auris were exposed to UVC light. Subsequently, the plates were incubated at 36 °C for 48 h. Log reduction between treated and positive control (not exposed to UVC light) samples was calculated.

Results:

At 15 minutes, we had the highest inactivation result, mean 4.43 log10, starting from a 1.5x106 CFU/mL concentration. At a higher concentration, 1.5X107 CFU/mL, the reduction had a mean of 3.51 log10.

Conclusions:

The results of the experiments showed a significant microbial reduction in relation to the exposure time. The highest level of reduction was reached after 15 minutes of exposure. UVC chip had a relevant biocidal effect on Candida auris and may represent a valuable tool in the prevention of infections caused by this pathogen, which is becoming increasingly prevalent and persistent globally.

Key messages:

- The use of UVC Chip decreases surface contamination.
- New technology against healthcare-associated infections.

Abstract citation ID: ckac131.252
Does Portuguese pharmaceutical market follow an innovative trend? The INFOMED database analysis

Fernando Genovez Avelar

FG Avelar[1], B Raposo[1], A Torres[1], AR Pedro[1,2]
[1]Public Health Research Centre, National School of Public Health, Lisbon, Portugal

[2]Comprehensive Health Research Centre, Lisbon, Portugal
Contact: fg.avelar@ensp.unl.pt

Background:

Product innovation in the pharmaceutical market is, although not exclusively, a new product with the capacity to generate value. Thus, it must represent an invention through investment in research and development, and not a commercial monopoly. The aim is to identify innovation trends by Marketing Authorization (MA) granted in Portugal.

Methods:

Quantitative descriptive study based on data (years 2017 to 2021) from Human Medicinal Products Database (INFOMED), managed by the National Authority of Medicines and Health Products, I.P. The parameters identified and used were MA and medical product subject to medical prescription. List was filtered by Product Group - New Active Substance. To identify innovation, findings were compared with the Anatomical Therapeutic Chemical (ATC) database and scientific literature to find other therapeutic options available.

Results:

A total of 2695 records were identified. 1804 (67%) were generic drugs. Regarding new substances, 46 registrations (1.7%) were obtained, with the highest number recorded in 2017 (n = 13 - 2.03%) and the lowest in 2019 (n = 3 - 0.76%). After exclusion of different concentrations with the same therapeutic indication, a total of 26 medicines were observed: 54% had a listed ATC code and those, 64% had more than two linked ATC codes; 12 medicines had no related ATC code and 5 were classified as vaccine and therefore were not considered, thus 7 medicines were classified as major innovation.

Conclusions:

Most of the innovation seen in the pharmaceutical market is not major innovation, but rather due to structural changes to chemical compositions. The Portuguese scenario is no different. Generic drugs, although not innovative, are important in the pharmaceutical market from a public health perspective. The identified innovations, although not major innovations, are important from a clinical and market availability perspective, however they should not represent a large portion of the pharmaceutical market.

Key messages:

- In Portugal, the innovation trend in the pharmaceutical industry is based essentially on modifications in chemical composition and related therapeutic class.
- The development of major innovation in medicines should be stimulated and new models of financing and sustainability should be improved.

Contact: riccardo.calsolaro01@universitadipavia.it

Background:

Thoracoabdominal aortic aneurysms (TAAAs) are defined as those aortic aneurysms involving renovisceral arteries. They account for around 10% of aortic aneurysms, and their treatment is burdened by considerable mortality and morbidity. Open surgical repair has been practised as the standard of care since the 1950s. In 2001 endovascular repair was introduced to reduce treatment invasiveness, and the technology is still evolving. The potential benefits of endovascular repair over open surgery should be carefully weighed in a multidimensional framework.

Methods:

We applied the Health Technology Assessment (HTA) framework (EUnetHTA core model with 9 dimensions) to conduct a report comparing the two technologies. A multidisciplinary working group was established. We derived and pooled: i) secondary data derived from systematic literature reviews, and ii) original data from IRCCS San Raffaele Hospital, Milan, a national referral centre for TAAA (qualitative and economic data).

Results:

Endovascular repair resulted superior to the traditional open surgery in terms of efficacy and safety, as justified by the meta-analysis we performed. Despite the higher costs, a significant impact on budget and slightly lower cost-effectiveness, the endovascular protheses' adoption could provide conspicuous benefits in terms of social and ethical dimensions without affecting long-term organisational and legal aspects.

Conclusions:

The multi-criteria decision analysis carried out from a hospital point of view shows that there is no significant difference (final score endovascular repair 0.68 vs open surgery 0.63) between the two procedures considering all the dimensions. Still, the endovascular repair is slightly superior to the open surgery in terms of safety, effectiveness, social, ethical, legal, and organisational impact. From the policy maker's point of view, technologies with a score superior to 0.6 are equally valuable, and the final decision should be left to the clinicians.

Key messages:

- Further research is needed to compare endovascular prostheses and open surgery's long-term population benefits, balancing clinical, economic, organisational and patient-related outcomes.
- HTA methodology offers substantial support to compare in-use technologies, informing clinicians' and decision-makers' choices to strengthen healthcare provision equity and preparedness.

Federated learning for describing COVID-19 patients and hospital outcomes: An unCoVer analysis

José L Peñalvo

JL Peñalvo[1], E Mertens[1], J Cottam[1], V Berrozpe-Maldonado[1], D Fernández-Lobón[2], O Solarte-Pabón[1,2], E Menasalvas[2]
[1]Unit of Non-Communicable Diseases, Institute of Tropical Medicine, Antwerp, Belgium
[2]Biomedical Engineering and Telemedicine, Universidad Politécnica de Madrid, Madrid, Spain
Contact: jpenalvo@itg.be

Background:

Since the onset of the pandemic, the unCoVer network has been identifying real-world data from EMR of hospitalised patients with COVID-19 across countries. These heterogeneous data are integrated into a multi-user data repository operated through Opal/DataSHIELD, an interoperable open-source server application, providing privacy-preserving access to individual-level information for federated data analyses.

Methods:

unCoVer's federated data platform provided access to EMR collected between 02/2020 - 04/2022 from 6 hospitals in Bosnia and Herzegovina (1), Romania (2), Spain (2), and Turkey (1) for a total of 14,236 patients. Demographics, and co-morbidities at admission, length of hospital stay and intensive care (ICU) needs, are presented according to the patients' status at discharge.

Results:

A total of 11,248 (79.0%) of all patients reviewed recovered from COVID-19 after an average 11.5 (SD 10.8) days hospitalised, with only 4.09% of patients needing ICU. A smaller proportion of patients were transferred (5.93%), and 2143 (15.1%) were considered in-hospital deaths after an average 11.6 (SD 10.5) days in the hospital where most (81.2%) needed ICU. Recovered patients had a mean age of 57.7 (SD 16.3) years old, and gender neutral (51.2% men), in contrast to deceased patients that were 74.2 (SD 12.4) years old (59.7% men). Current smoking was infrequent for both recovered or deceased patients (3.27%, and 2.83%, respectively). Cardiometabolic conditions were less commonly reported among later recovered patients in comparison with deceased patients: obesity (10.7% vs 12.1%), diabetes (15.9% vs 27.4%), hypertension (23.2% vs 42.7%), and CVD (9.33% vs 44.9%). Chronic pulmonary disease was also more frequent among deceased patients (10.3% vs 18.1%).

Conclusions:

Characteristics of hospitalised COVID-19 patients differ according to outcomes at discharge with more in-hospital death reported among older, chronic patients across 6 hospitals in 4 countries.

Key messages:

- Federated analyses provide unique opportunities for robust results by privacy-preserving accessing individual-level data from heterogeneous data sources.
- The unCoVer network aims to demonstrate the usability of the infrastructure to address research questions related to the COVID-19 while extending the concept to other clinical areas.

Self-esteem associated with the use of social networks in university students

Josue Eli Villegas Dominguez

JE Villegas Dominguez[2,1], BL Muñoz Bautista[2], EA Gonzalez David[2], R Vazquez Garate[2], S Uscanga Alcantara[2], JJ Pavan Gallardo[2], C Reyes Hernandez[2], AJ Cruz Garduza[1], FG Marquez Celedonio[2,1]

[2]Facultad de Medicina, Universidad el Valle de Mexico, Veracruz, Mexico

Contact: josue_eli@hotmail.com

Introduction:

Currently, the consequences of social networks on the self-esteem of users have been demonstrated in dissemination sources, and can generate problems in their mental and physical health.

Objective:

To determine the association between self-esteem and addiction to social networks in university students.

Methods:

A cross-sectional, prospective study was carried out between January and April 2022, including male and female university students, aged between 18 and 26 years, excluding participants with already diagnosed psychological disorder, such as depression, anxiety and body dysmorphia. A survey was applied through Google Forms, including the Rosenberg self-esteem scale and the social network addiction test (Cronbach's alpha 0.91). SPSS v22 software was used for data analysis, X2 test with Odds Ratio (OR) and 95% confidence interval (95%CI), assigning statistical significance with $p < 0.05$.

Results:

A total of 407 students were included, with moderate social network addiction in 57.4% and severe in 8.1%, with low self-esteem in 22.1% and moderate in 50.6%. Values of $p < 0.05$ were obtained for low self-esteem (OR/95%CI) when the most used social network is WhatsApp (0.5/0.2-0.8) and Instagram (1.8/108-3.2), as well as when having a number of followers between 1501-2000 (0.2/0.1-0.7) and 2501-3000 (10.8/1.1-106). Regarding network addiction, studying a humanities degree showed OR of 12(1.6-88.1). The rest of social networks such as Facebook, tik-tok, twitter, youtube, among others, showed values of $p > 0.05$ for both addiction to social networks and low self-esteem.

Conclusions:

Instagram is identified as a social network that facilitates the presence of low self-esteem in its users, while addiction to social networks is not associated with self-esteem. The number of followers is an associated factor for low self-esteem, and may be preventive or risky according to their total.

Key messages:

- We must propose the legislation of social networks, requesting the guarantee of studies for the algorithms that compose them in order to avoid harm to users from them.
- Work with students to have mental health and emotional intelligence should be one of the aspects to be covered by universities, as part of the comprehensive care for students.

Contact: nadinehamieh1@gmail.com

Background:

We examined prospective associations between atypical working hours, substance use and sugar and fat consumption.

Methods:

In the French population-based CONSTANCES cohort, 47,288 men and 53,324 women currently employed included between 2012 and 2017 were annually followed for tobacco and cannabis use; among them, 35,647 men and 39,767 women included between 2012 and 2016 were also followed for alcohol and sugar and fat consumption. Three indicators of atypical working hours were self-reported at baseline: working at night, weekend work and non-fixed working hours. Generalized linear models computed odds of substance use and sugar and fat consumption at follow-up according to atypical working hours at baseline while adjusting for sociodemographic factors, depression and baseline substance use if appropriate.

Results:

Working at night was associated with increased tobacco use in women [odds ratios ranging from 1.45 to 1.48], with increased cannabis use in men [from 1.40 to 1.54] and with increased alcohol use in both men and women [from 1.12 to 1.14]. Weekend work and non-fixed working hours were associated with increased tobacco and alcohol use in both men and women [from 1.15 to 1.54 and 1.12 to 1.14, respectively]. Dose-dependent relationships were found regarding the association between working at night and tobacco use in women as well as regarding non-fixed working hours and tobacco use in both men and women (P for trends <0.001).

Conclusions:

The potential role of atypical working hours on substance use should be considered by public health policy makers and clinicians in information and prevention strategies.

Key messages:

- Night shifts were associated with increased smoking in women with dose-dependent relationships, cannabis use in men and alcohol use in both.
- Weekend work and non-fixed working hours were associated with increased alcohol and tobacco use with dose-dependent relationships in men and women.

Impact of occupational SARS-CoV-2 risk on the mental distress of non-healthcare employees in Germany

Swaantje Casjens

S Casjens[1], *D Taeger*[1], *T Brüning*[1], *T Behrens*[1]
[1]Institute for Prevention and Occupational Medicine of the DGUV, Institute of the Ruhr University Bochum, Bochum, Germany
Contact: swaantje.casjens@dguv.de

Background:

The SARS-CoV-2 pandemic posed major challenges to employees and companies. Differences between industries and professions in occupational SARS-CoV-2 infection risk (OSIR) became apparent early on. This study examines the mental distress in terms of depression and anxiety symptoms of non-healthcare workers during the first and second Corona waves in Germany.

Methods:

We conducted an online survey from December 2020 to June 2021 among employees from industrial enterprises, local public transport, the public and the financial sector. High and potential OSIR was defined based on job information. Depression and anxiety symptoms were rated with the 4-item Patient Health Questionnaire (PHQ-4). Categorized PHQ-4 scores were modeled with ordinal random-intercept logistic multinomial regression models and presented with odds ratios (OR) and 95% confidence intervals (95% CI).

Results:

Overall, 516 of 1,545 participants (33.4%) were determined to be at increased OSIR. Anxiety and depression symptoms worsened during the pandemic in all OSIR groups. Risks for more severe depressive and anxiety symptoms were higher among employees with high (OR 2.35; 95% CI 1.33-4.16) and potential OSIR (OR 1.70; 95% CI 1.19-2.43) compared to employees without OSIR. Severity of mental distress differed also by the extent of perceived job protection, interactions with colleagues, work-privacy conflicts, and overcommitment.

Conclusions:

OSIR had a negative impact on employee's depressive symptoms and anxiety. Reducing SARS-CoV-2 exposure through workplace protective measures, strengthening interactions among colleagues, and supporting employees with work-privacy conflicts could help better protect employees' mental health.

Key messages:

- The risk for more severe depressive and anxiety symptoms increases with higher occupational SARS-CoV-2 infection risk.
- Improvements in SARS-CoV-2 exposure at work, colleague interactions, and work-privacy conflicts could help better protect mental health.

Abstract citation ID: ckac131.258
Health absenteeism due to dementia in Slovenia and its costs in the period from 2015-2018

Marjetka Jelenc

M Jelenc[1,2], *S Sedlak*[1]
[1]Center for Health Care, National Institute of Public Health, Ljubljana, Slovenia
[2]University of Maribor, Faculty of Health Sciences, Maribor, Slovenia
Contact: marjetka.jelenc@nijz.si

Background:

The number of employed people with certain mental or chronic illnesses is increasing. Given the fact that these are mainly diseases of the elderly and the fact that working life is increasing and populations are aging, we are already facing a public health problem that can increase without appropriate measures. Dementia mainly affects the elderly, but may occur in employed persons as well. This impairs their ability to work and is associated with costs. For the first time in Slovenia we performed a study to assess health absenteeism due to the diagnosis of dementia in the period from 2015 to 2018, to show its economic consequences and to plan the measures.

Methods:

The method of direct and indirect costs was used. We showed the indirect costs, which represent a loss, ie goods and services not produced on the market, namely, absenteeism due to dementia, and its economic impact. The costs of temporary absence from work were calculated on the basis of data obtained from the national health databases. The estimated cost of compensation for absence from work is based on the average gross salary. International Classification of Diseases-10 edition was used for the diagnoses of dementia; the Health Insurance Institute of Slovenia was the source of financial data.

Results:

Temporary absence from work due to the diagnosis of dementia in the period 2015-2018 in Slovenia amounted to around 0.6% of all calculated direct and indirect costs for this period, amounting to 11,037,275.00 EUR. The cost has been rising over the years.

Conclusions:

The results are underestimated, as rare cases of dementia are diagnosed before the age of 65 and due to data limitations. The employers should keep affected persons as long as possible active by adjusting the labour environment, working hours, providing an ergonomically designed workplace or by implementing preventive measures. These will reflect in positive financial effects on the economy, companies and the individuals.

Key messages:

- It is fundamental to encourage employers of persons with dementia to keep them in the initial phase of dementia active for as long as possible by adopting proper measures.
- Awareness of dementia is extremely important, as rapid recognition of signs of dementia and subsequent diagnosis, allow early and appropriate treatment.

Health and morbidity among those in paid work after age 64: a systematic review

Kristin Farrants

K Farrants[1], *K Alexanderson*[1], *J Dervish*[1], *S Marklund*[1]
[1]Division of Insurance Medicine, Department of Clinical Neuroscience, Karolinska Institutet, Stockholm, Sweden
Contact: kristin.farrants@ki.se

Background:

Despite the increase of labour market participation at older ages, very little is known about health and morbidity among those who remain in a paid work after age 64. The aim was to systematically review the scientific knowledge on health and morbidity among people aged above 64 years who are in paid work.

Methods:

A systematic literature review of studies published in English in scientific journals in 2014-2020. We identified 18,972 unique publications, of which 66 were deemed relevant by at least two independent researchers. Quality judgements and data extraction were done by at least two independent researchers according to pre-specified templates.

Results:

There was a great heterogeneity in the included studies regarding study design, included populations (both size and type), exposures, outcomes, covariates, measures, and analytical methods. Few were assessed as having high quality. Most studies (95%) were from OECD countries and results were about men to a greater extent than women. 42 of the 66 studies had results indicating that being in paid work after age 64 was associated with good health and less morbidity. Six studies presented at least one result showing the opposite; those in paid work had worse health than those not, while 21 studies presented at least one result showing that there were no health/morbidity differences between those in paid work and who were not. Only one study presented results regarding mortality. Many aspects had not been studied at all, or only in one or two studies.

Conclusions:

Many studies had results indicating that those who were in paid work >64 had better health/less morbidity than those who were not, however, there was a great variety in the results. There are surprisingly few studies about health/morbidity among people in paid work after age 64, and those published are heterogeneous: it is thus not possible to draw conclusions regarding scientific evidence based on the currently existing studies.

Key messages:

- Both study designs and results were very heterogenous in the 66 studies that presented results on health or morbidity among people in paid work after age 64.
- More and better studies are needed as well as greater clarity regarding study designs, populations, measures, analytical methods and definitions of central concepts such as work, health and morbidity.

Abstract citation ID: ckac131.260
Methodologies for determining staffing needs in healthcare: systematic literature review

Luca Pirrotta

L Pirrotta[1], *A Da Ros*[1], *P Cantarelli*[1], *N Bellè*[1]
[1]Managemet and Healthcare Laboratory, Sant'Anna School of Advanced Studies, Pisa, Italy
Contact: luca.pirrotta@santannapisa.it

The determination of staffing needs in healthcare is not just calculating the optimal number of professionals but is defining how the professional contingent accompanies the development of the healthcare organisation and of the population's care needs. This research investigates the existence of a gold standard for determining health personnel requirements. We perform a systematic literature review to explore several approaches worldwide, examining a wide range of contextual variables, useful for the definition of an omni-comprehensive approach. A total of 557 articles was initially detected, then reduced to 57 after excluding everything not related to healthcare context and staff planning models. Results do not reveal a recognized standard for determining staffing needs. Approaches to the definition of staffing standards are mainly ex-ante (31%), based on the characteristics of specific models and organisational needs, or ex-post (62%), based on production analysis and historical trends. Most of these refer to the medical and nursing category (68.4%), while the minority proposes a multi-professional approach (17.5%). This review highlights innovative approaches based on algorithms which, starting from historical data, are adjusted by moderating key variables such as contextual factors, healthcare organisation models and professional attributes.

The review suggests:

1. Develop and share a unique tool for defining standards based on several variables that identify the characteristics of the context
2. Use up-to-date information flows and quality data
3. Consider a multi-professional approach
4. Adopt a long-term vision and continuous dialogue with the training process

It is clear the need to develop a tool for the definition of personnel requirements in line with internal and external changes in the health system. Therefore, such models need to account for an adequate number of variables, useful to identify the characteristics of the overall context.

Key messages:

- The development of staffing needs estimates must necessarily rely on a certain level of standardisation, but at the same time must take into account the variability characterising different contexts.
- In order to respond to recent demographic and epidemiological trends, it is crucial to include in the model skill mix and task shifting strategies involving health professionals as a whole.

Abstract citation ID: ckac131.261
Managers' prevention and self-confidence in supporting employees with common mental disorders

Monica Bertilsson

J Hultqvist[1], *P Zhang*[2], *C Staland-Nyman*[3], *M Bertilsson*[2]
[1]Department of Health and Rehabilitation, University of Gothenburg, Göteborg, Sweden
[2]School of Public Health and Community Medicine, University of Gothenburg, Göteborg, Sweden
[3]School of Health and Welfare, Halmstad University, Halmstad, Sweden
Contact: monica.bertilsson@socmed.gu.se

Background:

Despite managers' responsibility for work environment and employee health few studies have investigated managers' actions to prevent common mental disorders (CMD). Concerning prevention of CMD, qualitative studies report managers feeling unconfident. We investigated managers' self-confidence in supporting employees with CMD and two managerial preventive actions (MPA): 'reviewing assignments and the work situation' (MPA-review) and 'taking initiative to talk about depression and anxiety at the workplace' (MPA-talk). We hypothesized that managers' self-confidence in supporting employees with CMD would be positively associated with both MPAs.

Methods:

An on-line survey was sent in 2017 to 4737 managers, answer rate 71% (n = 3358), of which 2 899 were included in this study. Both independent and dependent variables were measured through single questions. Self-confidence in supporting employees with CMD was analyzed in relation to MPA-review and MPA-talk using binary logistic regression analysis adjusted for sex, education, managerial experience and training, lived experiences of CMD, work organizational context and general preventive actions in the organization towards CMD.

Results:

The proportion of managers with higher self-confidence in supporting employees with CMD was 48.9%, performing MPA-review and MPA-talk was 50% and 57% respectively. Adjusted for all co-variates, managers with higher self-confidence in supporting employees with CMDs were more likely to do both MPA-review (OR 1.57; 95% CI, 1.31-1.87) and MPA-talk (OR 2.06; 95% CI, 1.71-2.25).

Conclusions:

The study hypotheses were confirmed. Managers with more self-confidence in supporting employees with CMD were more likely to take actions to prevent CMD, particularly regarding initiating talks about CMD with subordinates. The study suggests it is important to strengthen managers self-confidence in supporting employees with CMD to increase their preventive actions towards CMD.

Key messages:

- Managers' self-confidence in supporting employees with CMD is vital for workplace prevention.
- To strengthen managers' self-confidence in supporting employees with CMD is essential.

Abstract citation ID: ckac131.262
Managerial preventions of common mental disorders and the association with stigmatizing attitudes

Monica Bertilsson

J Hultqvist[1], *P Zhang*[2], *C Staland-Nyman*[3], *M Bertilsson*[2]
[1]Department of Health and Rehabilitation, University of Gothenburg, Göteborg, Sweden
[2]School of Public Health and Community Medicine, University of Gothenburg, Göteborg, Sweden
[3]School of Health and Welfare, Halmstad University, Halmstad, Sweden
Contact: monica.bertilsson@socmed.gu.se

Background:

Common mental disorders (CMDs) are an extensive problem in the society and attributed to stigma. Prevention of CMD at work is advocated but few studies have investigated what kind of preventive actions managers take. We investigated managers' attitudes to depression and two managerial preventive actions (MPA): 'reviewing assignments and the work situation' (MPA-review) and 'taking initiative to talk about depression and anxiety at the workplace' (MPA-talk). We hypothesized that managers' negative attitudes towards depression would be negatively associated with both MPAs.

Methods:

An on-line survey was sent in 2017 to 4737 managers, answer rate 71% (n = 3358), of which 2 899 were included in this study. Negative attitudes were measured through the 12-item instrument "Managerial stigma towards employee depression" (scores 12-72), a cut-off at the 3rd quartile was used as an indicator for having negative attitudes. MPAs were measured with two single questions. Negative attitudes to depression were analyzed in relation to MPA-review and MPA-talk using binary logistic regression analysis with adjustments for sex, education, managerial experience and training, lived experiences of CMD, work organizational context and general preventive actions in the organization towards CMD.

Results:

The proportion of managers with negative attitudes to depression was 20%, performing MPA-review and MPA-talk was 50% and 57% respectively. Adjusted for all co-variates, managers with negative attitudes towards employees with depression were less likely to do both MPA-review (OR 0.71; 95% CI, 0.57-0.89) and MPA-talk (OR 0.53; 95% CI, 0.42-0.66).

Conclusions:

Managers with negative attitudes to depression were less likely to take actions to prevent CMD among their employees which confirmed the study hypotheses. The study suggests that initiatives to reduce stigma among managers could be a way forward to prevent CMD at work.

Key messages:

- Stigma to depression hampers managers' prevention of CMD and needs to be addressed.
- To increase managers prevention of CMD, managerial training to reduce stigma towards depression is essential.

Abstract citation ID: ckac131.263
The effect of employment services on employment and health among unemployed persons: an IV approach

Merel Schuring

M Schuring[1], *MG Knoef*[2], *A Burdorf*[1]
[1]Erasmus MC, Rotterdam, Netherlands
[2]Leiden University, Leiden, Netherlands
Contact: m.schuring@erasmusmc.nl

Background:

In a large city in the Netherlands, professionals of one department of the municipality focus on rapid return to work, even if that work is not directly in line with education, experience or preference of the client. The first aim was to investigate the effects of this work-first strategy of the municipality on entering paid employment and on health among unemployed persons. The second aim was to determine whether these effects differed between persons, depending on age, sex, education, health, and employment history.

Methods:

To identify the effectiveness of employment services of the municipality, a judge leniency instrumental variable (IV) design was used, based on referral behaviour of case workers. In total, 3272 persons who applied for welfare in a large city in the Netherlands in the year 2015, were included in the study. Information on employment services was derived from the municipality. Information on individual characteristics and employment status was derived from register data from Statistics Netherlands. Information on diseases was derived from a medication register. IV regression models and ordinary least squares (OLS) regression models were performed.

Results:

The work-first strategy increased the likelihood of entering paid employment by 27% points (b = 0.26, se = 0.07) and had a positive influence on health by 4% points (b = 0.06, se 0.03) of welfare recipients compared to other employment services. Although standard errors were larger for subgroups, the positive effect of the work-first strategy on employment was driven by relatively young (18-30 yrs) and old (45-65 yrs) welfare recipients, with low and intermediate education level.

Conclusions:

The instrumental variable approach is a valuable approach to investigate the effect of employment services on entering paid employment and health. To improve health of unemployed persons, it is important to promote entering paid employment.

Key messages:

- Active labour market policies, such as the work-first approach, are beneficial for individuals, by increasing employment participation and health, and society, by increasing the employment rate.
- The IV approach is a promising approach to study causal relations in a quasi-experimental study. By using large datasets, differential effects across different groups of participants can be studied.

Abstract citation ID: ckac131.264
Night work and sustainable working life - a prospective trajectory analysis of Swedish Twins

Annina Ropponen

A Ropponen[2,1], *M Wang*[2], *A Raza*[2], *J Narusyte*[2,3]
[1]Finnish Institute of Occupational Health, Työterveyslaitos, Finland
[2]Division of Insurance Medicine, Department of Clinical Neuroscience, Karolinska Institutet, Stockholm, Sweden
[3]Center of Epidemiology and Community Medicine, Stockholm County Council, Stockholm, Sweden
Contact: annina.ropponen@ttl.fi

Objectives:

Night work has been widely studied for the associations with diseases, sickness absence (SA) and disability pension (DP), but less for sustainable working life. We aimed to investigate the longitudinal changes in sustainable working life among those with or without baseline night work.

Methods:

Using data from Swedish national registers, sustainable working life was defined as employment during follow-up without interruptions due to SA/DP, unemployment, and old-age pension. Survey data for two cohorts (i.e., born before or after 1959) were utilized to assess night work at baseline (yes/no) in 1998-2003 and 2004-2006, respectively. The final samples for the two cohorts were 34680 and 19637, respectively. Group-based trajectory models were applied.

Results:

Among those born before 1959 (mean age 59 years, 13 years follow-up), a five-trajectory solution was best for those with and without night work. The trajectory groups were stable sustainable working life (38-42%), stable unsustainable working life (24-25%), early (13%) or later (13%) decreasing sustainable working life, and between sustainable and unsustainable working life (7%). Among those born after 1958 (mean age 37 years, follow-up 10 years), four trajectories were detected for those with night work: stable sustainable working life (81%), stable unsustainable working life (6%) and increasing (7%) and decreasing (5%) sustainable working life. For those without nightwork, a three-trajectory solution was best: stable sustainable working life (83%), stable unsustainable working life (6%) and between sustainable and unsustainable working life (11%).

Conclusions:

Sustainable working life was similar across baseline night work statuses of older cohort but differed in younger cohort. The findings suggest that at least night work at one time point does not affect sustainable working life. However, night work at early stages of working life could be accompanied with lifestyle counselling for sleep and recovery.

Key messages:

- Trajectories of sustainable working life seem similar for those with or without night work adding to the understanding of effects of such work to health.
- From public health perspective, counselling employees with night work already at early stages of working life for health behaviours including sleep and recovery could support sustainable working life.

Abstract citation ID: ckac131.265
Work-related stress predicted future sick leave in primary health care patients

Anna-Maria Hultén

A-M Hultén[1], *P Bjerkeli*[2], *K Holmgren*[1]
[1]Institute of Neuroscience and Physiology, University of Gothenburg, Gothenburg, Sweden
[2]Department for Public Health Research, University of Skövde, Skövde, Sweden
Contact: anna-maria.hulten@gu.se

Background:

Studying the relationship between work-related stress and sick leave is valuable in taking actions for workers' health. This study aimed to analyse the association between work-related stress, measured with the Work Stress Questionnaire (WSQ), and registered sick leave among primary health care patients in Sweden.

Methods:

The prospective longitudinal study included 232 patients who were non-sick-listed, employed, aged 18-64 years and sought care for mental and/or physical health complaints. Logistic regression analysis was performed with questionnaire data on work-related stress from baseline together with sick leave data from a national register for the following 12 months.

Results:

High stress due to indistinct organization and conflicts was reported by 21% (n = 49), while 45% (n = 105) reported high stress due to individual demands and commitment. During 12 months 36% (n = 83) were on sick leave for 15 days or more. The odds of being on sick leave was twice as high for patients perceiving high stress due to indistinct organization and conflicts, high stress due to individual demands and commitment, low influence at work, or high interference between work and leisure time. Perceiving high stress due to both indistinct organization and conflicts as well as individual demands and commitment quadrupled the odds of sick leave, OR 4.15 (95% CI 1.84; 9.38).

Conclusions:

Work-related stress and sick leave were prevalent among the patients. Primary health care can therefore be a suitable arena for addressing these issues. Perceiving work-related stressors and stress within one or multiple areas increased the odds of registered sick leave by two to four times. Hence, a wide spectrum of factors needs to be considered, to capture the dynamic interaction between the individual and the work environment.

Key messages:

- Work-related stress is associated with future sick leave for primary health care patients.
- Early identification of patients with work-related stress is important for the primary health care.

Violence against healthcare workers during COVID-19 vaccination campaign

Tancredi Lo Presti

T Lo Presti[1], *E Scarpis*[1], *L Arnoldo*[1,2], *F Fiorillo*[3], *P Zuliani*[2], *F Farneti*[2], *E Croci*[4], *B Pellizzari*[5], *R Cocconi*[2], *L Brunelli*[1,2]

[4]Department of Prevention, Giuliano Isontina Healthcare University Trust, Trieste, Italy
[5]Department of Prevention, Friuli Occidentale Healthcare Trust, Pordenone, Italy
Contact: tancredi.lopresti89@gmail.com

Background:

Violence against healthcare workers (HCWs) has gained increasing attention in recent years, both because it is on the rise and because there is growing concern about these incidents, which are classified as sentinel events by the Italian Ministry of Health. Since little is known about the actual burden of this phenomenon, especially during the stressful COVID-19 vaccination campaign, we decided to explore the problem in our region.

Methods:

Between January and March 2022, in the 1.2 million-inhabitant Friuli Venezia Giulia region (Italy), we conducted an anonymous online survey to collected data on episodes of violence and their consequences for HCWs. Data from validated tools assessing characteristics of violent episodes and post-trauma impact were analyzed in conjunction with socio-demographic data of respondents.

Results:

200 HCWs participated in the survey, most of whom were women (72%), worked as nurses (107) or doctors (71), and had a mean age of 47 years. More than half of them (59%) reported at least one episode of violence, mainly in the form of a verbal assault (64%); there were no differences between victims. In 72 cases, these incidents affected the HCW's private life, mainly disturbing sleep or concentration (68%). Most HCWs stated that inadequate communication was a trigger for the violence (97%). Although 80% of HCWs would readily report any violent incident, to improve the situation they called for certainty of action against the perpetrator (87%), more organizational support (85%), standard procedures (75%) and self-defense courses (75%).

Conclusions:
Violence in COVID-19 vaccination campaign appears to be common and to affect both the personal and professional lives of HCWs. Improvements at the institutional and personal level could help to address this problem that affects the health workforce.

Key messages:
- Given the growing public debate, violence in healthcare settings is an important issue that needs to be addressed in the coming years.
- Assessing workplace violence and its associated risk factors will help focus on the strategies that can be usefully employed to prevent it in the future.

Abstract citation ID: ckac131.267
Does sickness absence history affect work participation after vocational labour market training?

Laura Salonen

L Salonen[1], *S Solovieva*[1], *A Kauhanen*[2], *E Hartikainen*[1], *E Viikari-Juntura*[1], *T Leinonen*[1]
[1]Finnish Institute of Occupational Health, Helsinki, Finland
[2]ETLA Economic Research, Helsinki, Finland
Contact: laura.salonen@ttl.fi

Background:
Active labour market programmes, such as vocational training, have become widely adopted measures to increase job seekers' employment opportunities, but evidence of their effectiveness in later employment is mixed. Individuals who enter training differ greatly in their socioeconomic background, health, and labour market history, which can affect the effectiveness of these programmes. There is still uncertainty, for example, on how vocational labour market training works for individuals with prior health problems.

Methods:
We use nationally representative Finnish register data on 88,283 individuals aged 25-59 who participated in vocational labour market training in 2008-2013, 23,715 of whom had sickness absence lasting at least 10 weekdays (including Saturday) three years prior to the training and 64,568 of whom did not. To adjust for the differences in socio-demographic and work-related factors between these groups, we will conduct propensity score matching. We will analyze work participation three years before and after the training among those with sickness absence and those without using a difference-in-difference analysis.

Results:
Our preliminary results show that before training the work participation rate was similar in those with sickness absence history (58.5 %) and those without (58.1 %). After training, those with a sickness absence history had slightly lower work participation than those without (54.6% versus 59.6 %). The differences in work participation between these groups increased slightly over time after training.

Conclusions:
Vocational labour market training does not necessarily work equally well for everyone in terms of enhancing employment, and job seekers with work disability history should be offered either extra support or another type of unemployment service. However, these are our pre-matching results, and they cannot be causally interpreted. Next, we will conduct the propensity score matching and difference-in-difference analysis.

Key messages:
- Having a sickness absence history prior to vocational labour market training is associated with lower work participation after training compared to participants without a sickness absence history.
- The main advantage of the study is the use of a quasi-experimental study design to test the effectiveness of vocational training, using rich nationally representative register data with long follow-up.

Non-standard employment and mental health during the COVID-19 pandemic in Spain: a qualitative study

Eva Padrosa

E Padrosa[1,2,3], *M Julià*[1,2,3], *M Bolíbar*[4,3], *M Gutiérrez-Zamora*[3,5], *A Escrig-Piñol*[1,2], *The PWR Consortium*[1]
[1]ESIMar, Parc de Salut Mar, Universitat Pompeu Fabra, Barcelona, Spain
[2]SDHEd, IMIM, Barcelona, Spain
[3]GREDS, Universitat Pompeu Fabra, Barcelona, Spain
[4]Department of Sociology, Universitat de Barcelona, Barcelona, Spain
[5]JHU-UPF Public Policy Center, Universitat Pompeu Fabra, Barcelona, Spain
Contact: epadrosas@esimar.edu.es

Background:
The COVID-19 pandemic entailed a deep economic crisis that affected working populations globally. However, non-standard workers (NSW, understood as workers with temporary contracts, not working full-time, self-employed or not paying taxes/making active pension contributions) were more severely hit than workers with more stable and protected jobs. The aim of this study thus was to explore the experiences of NSW during the pandemic and how these affected their mental health in Spain, one of the countries in Europe with the highest shares of temporary and self-employment and the one that applied the most restrictive containment measures during the first waves of the pandemic.

Methods:
As part of a larger multi-country study, 41 semi-structured interviews with NSW aged 25-55 were conducted between March-July 2021 and analyzed thematically.

Results:
Analyses revealed that job loss or insecurity and subsequent reductions in income were central to the experience of NSW during the pandemic in Spain, which affected their mental health negatively. Both the existing social protection framework and the policies deployed during the pandemic to outweigh these consequences were perceived by NSW as insufficient or could not access them due to their condition of NSW. This was particularly the case for self-employed and temporary agency workers. Moreover, NSW expressed that containment measures and reductions in income prevented them from engaging in activities to cope with such adversities, aggravating their mental health.

Conclusions:
These findings suggest that, in Spain, the pandemic intensified but also made more visible the defenselessness of NSW (especially self-employed and temporary agency workers) in terms of social protection in the event of sudden unemployment or reductions in income. This situation had harmful consequences for their mental health. Yet, new policies and measures fall short in fitting the necessities of an increasing share of the workforce.

Key messages:
- In Spain, non-standard workers are more vulnerable to and defenseless against sudden unemployment or reductions in income.
- The pandemic intensified this problem and put them at higher risk of suffering from poor mental health.

Abstract citation ID: ckac131.269
Organizational cultures in the Swedish restaurant business and the risk for sexual harassment

Katja Gillander Gådin

K Gillander Gådin[1], *K Zampoukos*[2]
[1]Mid Sweden University, Department of Health Sciences, Sundsvall, Sweden
[2]Mid Sweden University, Department of Economics, Geography, Law and Tourism, Östersund, Sweden
Contact: katja.gillandergadin@miun.se

Background:
The hospitality sector has the highest level of sexual harassment incidents compared to any other sector. The negative consequences of sexual harassment at the restaurant

workplace are not limited to the health of the victim alone as it also affects the organization as well as the health of a society. The organizational context is a fundamental determinant of sexual harassment and we need to increase our understanding of organizational cultures that affect such behaviors in order to develop and implement effective interventions in the restaurant business. The aim of this study was to give a comprehensive picture of organizational cultures that increase the risk for sexual harassment in the restaurant business.

Methods:

Individual interviews with twenty-nine employees in the restaurant business (e.g. waiting staff, chefs, bartenders, managers) were conducted during 2019-2021. Thematic analysis was used to analyze organizational cultures that increase the risk for sexual harassment in the restaurant business. Preliminary results show a complex web of intersecting cultures such as a toxic macho culture, a weak leadership culture and a close relational culture that cooperate at different hierarchical levels and increase the risk for sexual harassment. The results also show how organizational factors such as workforce demography, unsocial working hours, staff turnover and understaffing are interacting with the organizational cultures in the creation of a hostile environment that increases the risk for sexual harassment.

Conclusions:

The results elucidate why traditional interventions such as training or bystander interventions are inefficient in the restaurant business. The results can be used to develop interventions that focus on macho-cultures in restaurants, the leadership culture and the specific relationship culture that develop due to the specific organizational structures in the restaurant business.

Key messages:

- There is a need to focus on organizational factors in order to work against sexual harassment in the restaurant business and is a prerequisite for developing efficient interventions.
- Sexual harassment affects many people in working life and is a serious public health problem. Also, sexual harassment at work maintains gender-based inequalities that exist at a structural level.

Abstract citation ID: ckac131.270
Sexual harassment, other types of harassment and derogatory treatment in the academy

Frida Pilgaard

F Pilgaard[1], A Agardh[1], P-O Östergren[1], G Priebe[1,2]
[1]Division of Social Medicine and Global Health, Lund University, Malmö, Sweden
[2]Department of Social and Psychological Studies, Karlstad University, Karlstad, Sweden
Contact: frida.pilgaard@med.lu.se

Background:

Sexual harassment (SH) continues to be a significant public health problem, especially among women. SH and other types of harassment and derogatory treatment/bullying exist at many academic workplaces. The aim of this study is to explore how SH relates to other forms of harassment among staff at a large Swedish university, separated by gender.

Methods:

Using data from a web-based survey sent out to all staff in November 2019 (response rate 33%), a multiple logistic regression analysis was performed. Exposure to SH was defined as having experienced at least one of ten defined SH behaviours related to work. Exposure to harassment (other than sexual) was defined as having experienced violation of onés dignity associated with one of the Swedish seven legal grounds for discrimination: sex, transgender identity or expression, ethnicity, religion or other belief, disability, sexual orientation or age. Exposure to derogatory treatment was defined as having experienced undesirable negative behaviours, such as withholding information, derogatory comments or exclusion. All SH, harassment and derogatory treatment took place during the last 12 months.

Results:

Preliminary results show a sixfold increased risk among women subjected to SH to also experience harassment, a three times higher risk to experience derogatory treatment and a seven times higher risk to experience multiple forms of harassment (two or more forms of harassment or derogatory treatment) compared to women unexposed to SH. The elevated risk remained after adjusting for relevant background variables. The pattern was similar among men but with lower prevalence of SH, harassment and derogatory treatment.

Conclusions:

The results indicate that individuals subjected to SH at work have an increased risk of experiencing other types of harassment or derogatory treatment. This new information is relevant to consider in prevention of SH and harassment in academia.

Key messages:

- The results indicate that individuals subjected to sexual harassment at work have an increased risk of experiencing other types of harassment or derogatory treatment.
- Findings indicating a relationship between sexual harassment and other types of harassment or derogatory treatment may be valuable for counteracting the problem.

Abstract citation ID: ckac131.271
A Sick Benefit Scheme Reduces Unmet Healthcare Needs: An Natural Experiment in Seoul

Sarah Yu

S Yu[1,2], D Moon[3], M Sohn[4], J Kim[2], H Chung[1,2]
[1]BK21FOUR R&E Center for Learning Health Systems, Korea University, Seoul, South Korea
[2]Health Policy and Management, Korea University, Seoul, South Korea
[3]Center for Labour and Health, People's Health Institute, Seoul, South Korea
[4]Division of Health and Medical Sciences, The Cyber University of Korea, Seoul, South Korea
Contact: sara521@korea.ac.kr

South Korea experiences four times more unmet healthcare needs than OECD countries (11.6% and 2.6% respectively). Unmet healthcare needs are caused by the double burden of direct and indirect costs including income loss, and OECD countries operate a sickness benefit scheme to resolve sudden loss of pay. Seoul introduced the first sickness benefit system, Seoul-Type Paid Sick Leave Support (hereinafter Seoul Sick Leave), for self-employed national healthcare insurance subscribers to reduce the rate of unmet healthcare needs. By comparing the amount of increasing medical expenses between the beneficiary and non-beneficiary before (2018) and after (2019-2020) the introduction of the system, the study was intended to confirm the reduced unmet healthcare needs. This study used data from the National Health Information Database (NHID) and the difference in differences (DID) analytic framework. 96 and 121 patients were included in benefit and non-benefit cohorts, respectively. As a result, the beneficiary group's expenses were smaller than those of the non-beneficiary group (coef. = -1.24, p = 0.026). However, the beneficiary group had a greater amount of increase in hospitalization expenses before and after the introduction than the non-beneficiary group did (coef. = 1.66, p = 0.005). Our finding showed that the Seoul Sick Leave helped the precarious workers as they were able to use inpatient services when they needed. If it is to be scaled up to the national level, it should be applied all people to enhance universal health insurance in Korea.

Key messages:

- Identified the effectiveness of the first sickness benefit system as it helped the precarious workers as they were able to use inpatient services when they needed.

- By financially supporting them, the Seoul Sick Leave support can achieve health promotion through early detection and treatment.

Abstract citation ID: ckac131.272
Predictors of job satisfaction among German teachers during the SARS-CoV-2 pandemic

Theresa Dicks

T Dicks[1], V Eggert[1], C Köstner[1], T Beutel[2], K Kalo[3], C Zähme[1], S Letzel[1,2], P Dietz[1]
[1]Institute of Occupational, Social and Environmental Medicine, University Medical Center of the University of Mainz, Mainz, Germany
[2]Institute of Teachers' Health, University Medical Center of the Johannes Gutenberg University of Mainz, Mainz, Germany
[3]Department of Sports Medicine, Disease Prevention and Rehabilitation, Johannes Gutenberg University Mainz, Mainz, Germany
Contact: tdicks@students.uni-mainz.de

Background:

To contribute the containment of the infections during the SARS-COV-2 pandemic, changes in working conditions occurred worldwide. In the school context, teaching was changed several times to distance learning and teachers were forced to work from home. This increasing spatial separation between work and private life increased the potential for conflicts. Based on the theoretical assumption that stressors worsen job satisfaction and resources increase satisfaction, the aim of our study was to identify the predictors of teachers' job satisfaction during the pandemic. The focus on job satisfaction is interesting because the concept is often related to health-related aspects from a public health perspective.

Methods:

A nationwide cross-sectional survey was conducted among German teachers in March 2021. After data cleaning, 31,089 participants were included in the analyses. The survey consisted of established instruments (e.g., COPSOQ) and self-developed items if necessary. A multiple linear regression was performed to predict teachers' job satisfaction by stepwise inclusion of sociodemographic, work-related and covid-specific variables.

Results:

Overall, the regression revealed that especially work-related variables were strong predictors of job satisfaction. The analyses showed that higher levels of meaning of work, autonomy and predictability of work increased job satisfaction. In contrast, increased emotional stress, feelings of unfair treatment, and work-privacy conflicts deteriorated job satisfaction.

Conclusions:

The present study identified important predictors of job satisfaction which may be used to derive specific recommendations for improving teachers' job satisfaction during the SARS-CoV-2 pandemic. The relevance of job satisfaction for the scientific and public discourse becomes apparent because it was closely related to teachers' somatic and mental health.

Key messages:

- Teachers' job satisfaction during the pandemic can be further improved by making appropriate adjustments, particularly in work-specific requirements.
- Improving job satisfaction significantly contributes to promoting teachers' health.

Abstract citation ID: ckac131.273
Working re-organisation due to the pandemic may negatively affect workers' quality of life

Giulia Squillacioti

F Ghelli[1], V Bellisario[1], G Squillacioti[1], M Panizzolo[1], R Bono[1]
[1]Department of Public Health and Pediatrics, Università degli Studi di Torino, Turin, Italy
Contact: giulia.squillacioti@unito.it

Background:

From the beginning of 2020, the COVID-19 pandemic imposed many changes in the organization of our personal and professional life, allowing a shift to teleworking and hybrid working arrangements worldwide. The persistence of this condition determined the integration of these changes in the daily routine, and our aim was to investigate how these changes could affect workers' Quality of Life (QOL) in the long run.

Methods:

An online questionnaire was administered to 650 workers employed in an Italian company in July 2021. The domains considered were socio-demographic characteristics, QOL (WHOQOL-bref and Healthy Days), lifestyle, health status, physical activity, and work-related factors. Comparisons were performed with non-parametric tests.

Results:

Among the 332 respondents (response rate = 51.1%), 79.2% were white-collar workers. The concern for the pandemic affected workers' QOL, especially in the physical health and the environmental domains ($p < 0.001$ and $p = 0.001$, respectively), with lower values in subjects reporting the highest values of concern. A similar effect was found also for healthy days concerning physical and psychological health, and the ability to perform usual activities ($p = 0.003$, $p = 0.003$, and $p = 0.029$, respectively). As well, changes in working arrangements significantly affected the environmental and physical domains ($p = 0.023$ and $p = 0.015$, respectively) and the ability to do usual activities ($p = 0.011$), with lower values in those who interrupted the working activity. Workers whose activity required a shift to teleworking reported higher scores in the physical health domain ($p = 0.041$) and a higher number of days with good physical health ($p = 0.002$), while a lower number of days with good psychological health ($p = 0.006$).

Conclusions:

These preliminary data revealed that organizational strategies adopted in working scenarios to contain the spread of COVID-19 may have an impact on workers' QOL, as well as the concern for the pandemic.

Key messages:

- Changes in the working arrangements due to pandemic may negatively affect the workers' Quality of Life, especially for those who had to interrupt their working activity.
- The shift to telework, even if appearing to be beneficial for physical health perception, seems to negatively affect workers' psychological health.

Abstract citation ID: ckac131.274
Association between job exposures and employment status 2 years after medical rehabilitation

Martin Brünger

M Brünger[1], K Spyra[1], S Bernert[1]
[1]Institute of Medical Sociology and Rehabilitation Science, Charité - Universitätsmedizin Berlin, Berlin, Germany
Contact: martin.bruenger@charite.de

Background:

Research shows an important association between job exposures and various health- and employment-related outcomes. On contrast, little is known about the impact of job exposures on the employment status after medical rehabilitation. Thus, the aim of this study is to investigate the association between job exposures and employment, unemployment, and disability pension entry 2 years after rehabilitation.

Methods:

A retrospective cohort study was performed based on the scientific use file "SUFRSDLV15B" of the German Pension Insurance containing rehabilitation and occupational data at a monthly level. We included n = 597,021 insured persons aged

18 to 63 years completing a medical rehabilitation between 2008 and 2013 in Germany and traced their employment status over a 24-month follow-up period. Job exposures were operationalised with the Overall Job Exposure Index (Kroll, 2015) by applying job-exposure-matrices.

Results:

Persons with high job exposures in comparison to those with low job exposures were less likely to be employed (87.6% vs. 92.6%) and more likely to be unemployed (13.9% vs. 7.7%) and to draw disability pension (4.8% vs. 4.4%) for at least one month in the 2-year-period after rehabilitation. One minus survival curves showed that the differences were already evident in the first month after rehabilitation and further increased during the following 24 months. Cox regressions revealed that these associations remained stable when adjusting for gender, age, and employment status before rehabilitation.

Conclusions:

The results underline the importance of addressing job exposures during rehabilitation to enhance return-to-work and stay-at-work after rehabilitation. These findings could help to identify particularly vulnerable groups of insured persons based on routine data at an earlier stage than has been the case so far and to give them access to structured workplace-oriented medical rehabilitation programmes that have been established in recent years.

Key messages:

- High job exposures are associated with less work participation after medical rehabilitation.
- To increase return-to-work, it may be useful to address job exposures in rehabilitation more than before.

Abstract citation ID: ckac131.275
Effort-reward imbalance and the mental health of middle managers in Europe

Mattias Vos

M Vos[1], *D De Moortel*[1], *C Vanroelen*[1]
[1]SOCI, Vrije Universiteit Brussel, Elsene, Belgium
Contact: mattias.philippe.vos@vub.be

Background:

According to the Neo-Marxist Class Theory, supervisors' health is at risk due to their position of authority without strategic power. We investigate how the interaction between the class location and an Effort-Reward Imbalance (ERI) is related to mental health risk, including gender differences and mediation by work-life balance.

Methods:

From the 6th wave of the European Working Conditions Survey, we selected workers aged 15 to 64 of the 28 European Member States (pre-Brexit). ERI was measured with 18 proxies for the ERI Questionnaire items. For mental health, the WHO-5 well-being index was used. Relationships were analyzed using linear regression models.

Results:

We found evidence for the relationship between ERI and mental health of European employees (ß = -0.641, $p < .001$), partially mediated by work-life balance. Contrary to previous NMSC studies, we did not find worse mental health for supervisors. The vulnerability for ERI increases with class position (supervisors ß = -0.703; topmanagers ß = -1.099), with supervisors showing a higher mean ERI (subordinates M = 0.445; supervisors M = 0.459; topmanagers M = 0.437, $p < .001$). The mental health of female supervisors appears more vulnerable to ERI than men's.

Conclusions:

Our findings show that mental health risks of supervisors become apparent especially in situations where esteem, job security and promotion opportunities do not match the status expectations of the position. A labor market policy that encourages organizations to have those tasks performed by their own permanent employees (as opposed to outsourcing them), with a focus on a healthy work-life balance and fair remuneration, can benefit the mental health of this group of employees.

Key messages:

- The mental health of employees in higher positions of authority is more vulnerable to situations of effort-reward imbalance.
- European labor market policies focused on security for employees, rather than flexibility for employers, can reduce mental illness among the European middle managers and subordinates.

Abstract citation ID: ckac131.276
Discrimination and sexual harassment – Results from the largest German medical university

Sabine Ludwig

S Ludwig[1,2], *S Jenner*[1], *R Berger*[1], *S Tappert*[1], *C Kurmeyer*[1], *S Oertelt-Prigione*[3,4], *M Petzold*[1]
[1]Charité - Universitätsmedizin Berlin, Berlin, Germany
[2]Catholic University of Applied Sciences, Mainz, Germany
[3]Bielefeld University, Bielefeld, Germany
[4]Radboud University, Nijmegen, Netherlands
Contact: sabine.ludwig@charite.de

Background:

Discrimination and sexual harassment in the workplace and in higher education institutions are important public health issues. Here we aim at analyzing the prevalence of discrimination and sexual harassment of lecturers and students at one of the largest teaching hospitals in Europe. We assess whether there are differences between lecturers and students, women and men, and different study programs.

Methods:

An online questionnaire was sent to N = 7095 students of all study programs and N = 2528 lecturers at Charité - Universitätsmedizin Berlin. The survey was conducted from November 2018 to February 2019. We investigated experienced or observed discrimination or sexual harassment at the medical faculty. Furthermore, we analyzed frequency, perpetrators, situational factors, attributed reasons and forms of harassment encountered.

Results:

A total of 964 (14%) students (S) and 275 (11%) of lecturers (L) participated in the survey. Discriminatory behavior was witnessed and/or experienced by 49,6% of students (L: 31%), sexual harassment by 23,6% of students (L: 19,2%). Students state lecturers (85,9%) as main source of discriminatory behavior (L: directors/supervisors: 47,4%; students 41,0%). Sex/Gender (S: 71%; L: 60,3%) is cited most frequently as reason for discriminatory experiences. Female students and faculty experience more discrimination and sexual harassment.

Conclusions:

Discrimination and sexual harassment are prevalent in academic medicine. There are differences in the reasons and sources of discrimination and sexual harassment between students and lecturers. Specific programs for lecturers and students are necessary to educate the faculty on how to prevent and respond to it and whom to address.

Key messages:

- National preventive strategies should be implemented to tackle issues of discrimination and harassment in higher education institutions.
- Special attention should be paid to female students and lecturers.

Abstract citation ID: ckac131.277
Sickness absence among 299484 blue-collar workers in the trade industry during the Covid-19 pandemic

Kristin Farrants

K Farrants[1], *K Alexanderson*[1]
[1]Division of Insurance Medicine, Department of Clinical Neuroscience, Karolinska Institutet, Stockholm, Sweden

Contact: kristin.farrants@ki.se

Background:

Many blue-collar workers in the trade and retail industries have jobs that make it hard to avoid contacts with other people, which may have increased their risk for sickness absence (SA) during the Covid-19 pandemic. The aim was to investigate rates of SA and sociodemographic and occupational differences in risk of SA during the Covid-19 pandemic.

Methods:

A prospective cohort study of all blue-collar workers in Sweden in the trade and retail industry aged 18-67 in 2018 (n = 299 484), followed 5 years (2016-2020) using linked microdata from nationwide registers. Descriptive statistics of rate of workers having had at least one SA-spell >14 days were calculated, and logistic regression was used to calculate odds ratios (OR) and 95% confidence intervals (CI) of having SA due to Covid-19 or related diagnoses (some infectious, respiratory, and symptom-based diagnoses).

Results:

Their SA rates increased from fluctuating between 7.6%-8.2% in 2016-2019 to 10.0% in 2020. 0.05% had SA due to Covid-19 and 2.2% had SA due to Covid-19 or related diagnoses. Factors associated with having SA due to Covid-19 or related diagnoses were older age (OR age 55-64: 3.41, CI 3.04-3.82 compared to 18-25) and only elementary education (OR 1.50, CI 1.37-1.64 compared to university/college). Warehouse and terminal staff (reference category) was the occupational group with the highest risk of SA/DP due to Covid-19 or related diagnoses. Cashiers had the second highest risk, with CIs that overlapped 1 (OR 0.91, CI 0.77-1.06). All other occupational groups had significantly lower ORs (0.48-0.78).

Conclusions:

The SA rates increased slightly during the Covid-19 pandemic. Within the trade and retail industry, the warehouse and terminal staff was the occupational group with the highest risk of SA due to Covid-19 or related diagnoses.

Key messages:

- The rates of SA among blue-collar workers in the trade and retail industry increased slightly during the first year of the Covid-19 pandemic.
- Warehouse and terminal staff and cashiers were the occupational groups with the highest risk of SA due to Covid-19 or related diagnoses among blue-collar workers in the trade and retail industry.

Abstract citation ID: ckac131.278

Factors associated with gender-based violence in couples during confinement by COVID-19 in Veracruz

Josue Eli Villegas Dominguez

AJ Cruz Garduza[1,2], AR Rodriguez Barranco[2], R Vazquez Garate[2], S Uscanga Alcantara[2], A Martinez Torralba[2], M Perez Santamaria[2], H Juarez de la Huerta[2], JJ Pavan Gallardo[2], JE Villegas Dominguez[1,2]
[1]Facultad de Medicina, Campus Veracruz, Universidad Veracruzana, Veracruz, Mexico
[2]Facultad de Medicina, Universidad del Valle de Mexico, Veracruz, Mexico
Contact: josue_eli@hotmail.com

Background:

In the world, about a third of women who have had a relationship have suffered some type of violence and Veracruz city in Mexico presented 83 femicides, 519 assaults and 686 disappearances, occupying the 2nd place national in this field.

Objetives:

To determinate the factors associated with gender violence during confinement by covid-19

Methods:

A cross-sectional, prospective, analytical and observational study was conducted between August - December 2021. Women residents of Veracruz who have or have had a relationship in the last year were included. Violence was quantified by applying to through Google Forms® assessment inventory of mistreatment of women by their couple (APCM) with cronbach's alpha of 0.94; this instrument takes into account physical and psychological violence. SPSS v22 software was used for data analysis, X2 test with Odds Ratio (OR) and 95% confidence interval (95%CI) and MannWhitney U test.

Results:

A total of 740 women participated, with a mean age of 28.1±12.07, 87.8% heterosexual. Gender, sexual preference, educational level, witnessing violence in the family or in relationships with friends obtained values of $p > 0.05$ to suffer violence, while age was higher for those who suffered gender-based violence (28.8 vs 24.2) and the associated factors (OR/CI95%) were being a housewife (3.1/1.4-6.9), being a student (0.5/0.3-0.8), being married (1.8/1.05-3.3), having a boyfriend (0.3/0.2-0.5), having suffered violence in a previous relationship (1.6/1.06-2.5), identifying gender-based violence correctly or perceived (0.2/0.1-0.4), having suffered gender-based violence at some time by their partner in their last relationship (15.9/5.0-50.9) ($p < 0.05$)

Conclusions:

Being a housewife, being married, having suffered violence in previous relationships and in the last relationship increase the risk of gender violence, while being a student, having a boyfriend and knowing the concept of gender violence decrease the probability of suffering it.

Key messages:

- We must work on a deconstruction of ideas that allows women with risk factors for violence with their couples to identify it without fear of not meeting the socio-cultural expectations assigned to it.
- Including a woman's partner within the structure of prevention of violence against women must be fundamental to promote an environment free of violence.

Background:

While the Canadian universal health system provides access to basic services, key health benefits are employer dependent. Given that non-standard workers (NSWs) only rarely have access to such benefits they have increased vulnerability to the many insecurities derived from their precarious employment, as clearly seen during the pandemic. The growing problem of non-standard work and workers' heightened risk for health status deterioration, followed by a possible accentuation of health inequities, is a population health concern. This study summarizes several health services gaps experienced by NSWs and discusses policy implications and possible solutions.

Methods:

From January to July 2021, we conducted semi-structured interviews with a purposive sample of 40 NSWs in Ontario, Canada, part of a larger mixed-methods six-country study, including three European countries. The target population consisted of workers aged 25 to 55 who, at the time of the survey, were in non-standard employment or lost their job due to the COVID-19 pandemic.

Results:

Our findings highlight complex physical and mental health problems and an overall high burden of disease facing NSWs during the pandemic as linked to a combination of constant stress and worry arising from their employment insecurity, the limited and inconsistent income available to cover their basic needs, and the inadequate and unsafe working conditions they are afraid to challenge. Despite their increased health needs, given that specialized health services are not available to them for free they face financial barriers in accessing much needed health services that could help improve their health status and as a result, delay seeking care or avoid it altogether.

Conclusions:

Sustainable multi sectorial policy solutions are needed including the adoption of relevant labour market legislation and increases in social and health expenditures along with re-adjustments in the ways in which health services are delivered.

Key messages:

- During the pandemic non-standard workers in Ontario, Canada experienced complex health problems and, despite increased health needs, encountered barriers in accessing specialized health services.
- The growing problem of non-standard work and workers' heightened risk for health status deterioration, followed by a possible accentuation of health inequities, is a population health concern.

[4]Sociology, University of Valparaiso, Valparaiso, Chile
Contact: marisol.ruiz@uach.cl

Background:

In the last decades, non-standard employment has grown globally. Especially for own account workers (OAW), this implies the self-management of economic, health and other work-related risks. In the context of COVID19, this management was stressed by lockdowns and the novel health risks imposed by an unknown and highly contagious virus, demanding the incorporation of new knowledge and preventive actions. As part of a six-country multiple case qualitative study on non-standard workers (NSW), we explore their experiences and strategies deployed to protect their health while continuing to work.

Methods:

We performed 40 in-depth interviews to NSWs between October 2020 and February 2021, identified through the PWR online-survey and selected through an intentional sampling strategy according to levels of precarity (high-low), gender (male/female) and age (18-39/40-55). Interviews were analysed through abductive thematic analysis.

Results:

We observed a significant transfer to platform, Uber-like jobs in the delivery of goods during lockdown (n = 7). In the absence of institutional prevention programs and provision of protective equipment, OAWs (n = 13) refer the self-provision of COVID19 prevention to protect themselves and their families while continuing to work, deploying a series of strategies amidst limited understanding of both mode of transmission of the virus and actual effective preventive measures. This had serious consequences for them and their families, expressed in anguish, sense of lack of control, fear, and fragility in the face of a major health risk given their constant potential exposure to the virus, leading to both physical and mental health problems, as well as COVID19 infection.

Conclusions:

The substantial growth worldwide of gig delivery work during lockdowns magnified a pressing public health problem, critically requiring social security for gig and OAWs and the development of more equitable and accessible occupational health for all.

Key messages:

- Substantial growth worldwide of gig delivery work during lockdowns magnified a pressing public health problem.
- Social security for gig and OAWs are critically required as well as the development of more equitable and accessible occupational health for all.

Abstract citation ID: ckac131.281
Evaluation of the prescription amount of narcotic analgesics based on cancer pain relief management

Jinsang Park

J Park[1]
[1]Department of Pharmaceutical Sciences, International University of Health and Welfare, Fukuoka, Japan
Contact: park21@iuhw.ac.jp

Background:

A basic plan for promoting pain relief management for cancer patients was formulated in Japan, and proper use of narcotic analgesics is being promoted to relieve cancer pain. We aimed to explore the relationship between age and opioid narcotic dose in cancer patients and examine the effects of healthcare systems and social policies to prevent opioid abuse and addiction in a national cohort in Japan.

Methods:

Data were collected from April 2014 to March 2019 from the nationwide health insurance claims open database in Japan. Prescription data were collected for opium alkaloids and synthetic narcotics. A multivariate logistic regression analysis was performed based on the age groups and in- or out-of-hospital prescription quantities (mg), taking into account equivalences in quantities of opioids prescribed yearly on the hypothesized relationships between variables.

Results:

The average annual quantities of opium alkaloid prescribed gradually decreased by 2.8% (mg = 10,249,115) over six years, especially in in-hospital prescriptions. On the other hand, in-hospital annual prescriptions of synthetic narcotics increased by 24.1% (mg = 2,135,568), out-of-hospital opium alkaloid by 1.3% (mg = 37,565,229), and synthetic narcotics by 25.9% (mg = 1,404,641). Among the demographic variables, cancer patients aged 65 years or older were significantly associated with the types of opioid variables ($p < .001$) and annual reductions in prescribed amounts ($p < .001$).

Conclusions:

Treatment with opium alkaloids and synthetic narcotics increased among outpatients in the years examined; however, the trend varied across age groups. Our findings suggest that improvements in early detection and treatment have resulted in a rise in the number of cancer patient survivors, thereby leading to an increase in narcotic analgesic dose. The palliative care for cancer patients will contribute as an epidemiological indicator to review the evidence-based health-related impact on public health.

Key messages:

- Treatments other than medical intervention should also be considered, taking into account the increase in the number of outpatient opioid prescription recipients due to increased cancer survival.
- Social interventions to prevent opioid abuse during cancer pain relief will contribute to preventing substance abuse by promoting collaboration between clinicians and local communities.

Abstract citation ID: ckac131.282
Patient experiences of hospital care during the COVID-19 pandemic in Ireland

Daniela Rohde

D Rohde[1], *C Foley*[1], *R Murphy*[1], *M Kelly*[1], *L Drummond*[1]
[1]National Care Experience Programme, Health Information and Quality Authority, Dublin, Ireland
Contact: drohde@hiqa.ie

Introduction:

The COVID-19 pandemic has greatly impacted healthcare service delivery. This study explored patient experiences of hospital care during the COVID-19 pandemic in Ireland, using National Inpatient Experience Survey (NIES) 2021 data.

Methods:

NIES is a repeat cross-sectional survey of inpatient experiences in all public acute hospitals in Ireland. Patients who spent 24+ hours in hospital and were discharged in September 2021 were eligible to participate. 7 questions addressed experiences specific to the pandemic. Comparisons between 2019 and 2021 were conducted using t-tests. Effect sizes (d) are reported. Qualitative data were thematically analysed.

Results:

10,743 patients participated (42% response rate). While 68% did not feel at risk of catching COVID-19, 9% felt at risk. 35% reported that staff always helped them to keep in touch with family. There were small, statistically significant differences between 2019 and 2021 ratings, with questions on opportunity for family to talk to a doctor ($d = -.328$), provision of information to family ($d = -.136$), and being able to find staff to talk to about worries and fears ($d = -.167$) recording the biggest decreases. Scores for cleanliness of wards ($d = 0.063$) and bathrooms ($d = .075$), and privacy during examination or treatment in the ED ($d = 0.085$) improved significantly. Patients commented on their appreciation of staff, but missed having visitors, with restrictions posing challenges for those with sensory or physical impairments.

Conclusions:

Given the unique challenges experienced by acute healthcare services during the COVID-19 pandemic, comparisons with pre-pandemic patient experiences should be interpreted with caution. Continuing to gather patient feedback during a pandemic presents a unique opportunity to understand the resilience of healthcare systems as they continue to operate under unprecedented pressure, with the potential to inform responses and delivery of care during future pandemics or other emergencies.

Key messages:

- Visiting restrictions posed many challenges for patients and affected communication both between patients and their family members, as well as between healthcare staff and patients' family.
- Gathering patient feedback during a pandemic presents a unique opportunity to inform responses and delivery of care during future pandemics or other emergencies.

Health workers labor market before and during the Covid-19 pandemic: Health sector capacity of Serbia

Milena Šantrić Milićević

M Šantrić Milićević[1,2], *S Mandić-Rajčević*[1,2], *A Stevanovic*[1,2]
[1]School of Public Health and Health Management, Faculty of Medicine, University of Belgrade, Belgrade, Serbia
[2]Institute of Social Medicine, Faculty of Medicine, University of Belgrade, Belgrade, Serbia
Contact: milena.santric-milicevic@med.bg.ac.rs

Background:

During the COVID-19 pandemic surges, healthcare stakeholders were concerned with the sufficiency of available health workforce capacity. In this study we examined the changes in the supply and demand of physicians, nurses and care workers in Serbia over the period 2011-2021.

Methods:

The National Employment Service (NES) data on total number of unemployed physicians, nurses and care workers, and vacancy data in health sector were described using the annualized % change for the period 2011-2021. The long-term duration of unemployed female physicians and nurses was further analyzed.

Results:

In 2021, NES has registered total of 13,332 unemployed physicians, nurses and care workers, out of which the majority were females (79%), and nurses and care workers (88%). 2021 data on vacancies showed that only 16% of unemployed workers were needed. The peak of health workers unemployment was in 2016, highlighting the period of unemployment rise (2011-2016) at an annualized rate of 3.7% for medical doctors' specialists, 6.4% for medical doctors without specialization, and 3.2% for nurses and care workers, and the period of unemployment decline (2017-2021) at an annualized rate of -7.9% for medical doctors' specialists, -10.9% for medical doctors without specialization, and -5.9% for nurses and care workers. The annualized rate of decline was the lowest for female nurses and care workers. On average 53% of all long term unemployed medical doctors, nurses and care workers were women. In comparison to 2019, during the COVID-19 epidemic in 2020 and 2021 the number of vacancies for specialists and nurses and care workers has increased by one-third.

Conclusions:

The study indicated a continuous mismatch between the supply and demand of physicians and nurses in Serbia (a surplus of some categories of nurse-specialists versus a shortage of some doctor specialists). The Serbian stakeholders need to urgently intervene regarding the long-term unemployment of female health workers.

Key messages:

- NES data imply a low capacity of the Serbian health sector to absorb the huge numbers of (long-term) unemployed health workers.
- It is necessary to thoroughly examine and counteract the causes of the dramatic number of unemployed health workers on the NES records in Serbia.

Abstract citation ID: ckac131.284
Linking health system inputs, processes and outputs to identify medical deserts in Serbia

Stefan Mandić-Rajčević

S Mandić-Rajčević[1,2], *M Šantrić-Milićević*[1,2]
[1]University of Belgrade, Faculty of Medicine, Institute of Social Medicine, Belgrade, Serbia
[2]University of Belgrade, Faculty of Medicine, School of Public Health, Belgrade, Serbia
Contact: stefan.mandicrajcevic@gmail.com

Background:

Medical deserts (regions where the population does not have adequate access to health care) indicate the failure of the health system to achieve the goals of improving the health of the population. Identifying medical deserts (MD) is far from simple. The aim of this study is to describe the approach to identification of medical deserts in Serbia using indicators for the health system inputs, processes and outputs.

Methods:

We investigated the basic healthcare-related medical deserts using the indicators of primary health care centers' inputs (accessibility: annual number of patients per physician), processes (performance: annual workload of patient visits per physician) and outputs (unmet needs: percentage of patients unable to access health services) in all 25 Serbian districts in 2020, using data of the Health Statistical Yearbook of the Republic of Serbia and the National Patient Satisfaction Survey of the Institute of Public Health. We developed a Multiple Criteria Scoring System (MCSS) incorporating the weighting and scoring of accessibility and performance for four types of physicians (general practitioners, pre-school pediatricians, youth pediatricians, and gynecologists) and five dimensions of unmet needs (financial reasons, waiting times, lack of personal time, long-distance and COVID-19). MCSS final scores 0 (none) - 100% (MDs on all indicators) are assessed using the regulatory norms.

Results:

MDs partially overlap by different criteria: accessibility, 4-10 districts; performance, three districts; unmet needs: 2-5 districts. Top five medical deserts identified according to the MCSS are Mačvanski, Šumadijski, Moravički, Srednjebanatski, and Podunavski district.

Conclusions:

Serbia has at least one MD per administrative region according to the objective normative indicators and patients' subjective experiences. The study findings can be used to inform district stakeholders on how to use health workforce policy and planning to address medical deserts.

Key messages:

- MCSS indicates potential medical deserts in 20% of all districts in the Republic of Serbia.
- Evidence on poor health workforce accessibility and performance in light of the patient unmet healthcare needs could be used to inform stakeholders on medical deserts in the country.

The value of uterine oncological surgery in a University Hospital. Results of a break-even analysis

Maria Lucia Specchia

ML Specchia[1,2], G Arcuri[1], A Di Pilla[1,2], E La Gatta[2], T Osti[2], P Limongelli[1], G Scambia[1,2], RDA Bellantone[1,2]
[1]Fondazione Policlinico Universitario Agostino Gemelli IRCCS, Rome, Italy
[2]Università Cattolica del Sacro Cuore, Rome, Italy
Contact: marialucia.specchia@unicatt.it

Background:

Robotic surgery has many clinical advantages but high costs, raising the issue of healthcare sustainability. This study aims to a comparative analysis of the value, in terms of costs and outcomes, of robotic, laparoscopic, and laparotomy surgery for uterine cancer in a University Hospital.

Methods:

An observational retrospective study was carried out on hospitalizations between 1 Jan 2019 and 31 Oct 2021 for uterine cancer surgery. DRG amount, costs, economic margins and 30-days readmissions percentage (mean values and 95% CIs) were calculated for robotic, laparoscopic and laparotomy surgery. Student's t and Chi-square tests were used to assess differences and the break-even point was calculated.

Results:

1336 hospitalizations were analyzed, 366 with robotic, 591 with laparoscopic, and 379 with laparotomy surgery. Robotic surgery compared to laparoscopic and laparotomy ones showed a significant difference ($p < 0,001$) for economic margin, which was largely negative (-1069.18 €; 95%CI: -1240.44 - -897.92 €) mainly due to devices cost (3549.37 €; 95%CI: 3459.32 € - 3639.43 €), and a lower 30-days readmissions percentage (1.4%; 95%CI: 0.2% - 2.6%) with a significant difference only versus laparotomy ($p = 0.029$). Laparoscopic compared to laparotomy surgery showed a significantly ($p < 0,001$) more profitable economic margin (1692.21 €; 95%CI: 1531.75 € - 1852.66 €) without a significant difference for 30-days readmissions. The break-even analysis showed that, on average, for every uterine cancer laparoscopic elective surgery, 1.58 elective robotic surgeries are sustainable for the hospital (95% CI: 1.23 - 2.06).

Conclusions:

The systematic application of the break-even analysis will allow defining over time the right distribution of robotic, laparoscopic and laparotomy surgeries' volumes to perform in order to ensure both quality and economic-financial balance and therefore value of uterine oncological surgery in the University Hospital.

Key messages:

- The value-based healthcare approach, defined as the measured improvement in a patient's health outcomes in relation to its cost, finds effective application in uterine cancer surgery.
- The use of the break-even approach allows to promote the value-based view by identifying a useful criterion for the planning and governance of interventions for uterine malignancies.

Abstract citation ID: ckac131.286
Determinants of regulatory compliance in health and social care services: a systematic review

Paul Dunbar

P Dunbar[1], F Barry[2], J Browne[2], L O'Connor[1]
[1]Regulation Directorate, Health Information and Quality Authority, Cork, Ireland
[2]School of Public Health, University College Cork, Cork, Ireland
Contact: pdunbar@hiqa.ie

Background:

The delivery of high quality health and social care services is a fundamental goal for health systems worldwide. Quality is variable in services and settings. One response to variation in quality is a regulatory framework that looks to set minimum standards that are enforced by an independent public authority. This systematic review seeks to identify and describe determinants of regulatory compliance in health and social care services.

Methods:

Systematic searches were carried out on five electronic databases and grey literature sources. Titles and abstracts were screened by two reviewers independently. Determinants evaluated in studies were identified, extracted and allocated to constructs in the Consolidated Framework for Implementation Research (CFIR). The included studies were quality appraised by two reviewers independently. The results were synthesised narratively under each CFIR domain.

Results:

The search yielded 6,515 articles for screening, of which 148 were included. Most studies were quantitative designs focused on specific exposures (e.g. staffing levels, size, for-profit status). Qualitative studies were sparse, limiting investigation of the processes underlying regulatory compliance. Most of the determinants identified fit within the inner and outer setting domains of the CFIR, many with mixed findings in terms of an association with compliance. There were fewer determinants identified in the intervention characteristics, characteristics of individuals, and process domains of the CFIR.

Conclusions:

The literature in this field focuses on the broader concept of quality and appears to neglect the more nuanced issues surrounding the successful implementation of regulatory standards i.e. compliance. A number of gaps, particularly in terms of qualitative work focussed on the mechanism involved in implementing regulations, remain in the literature and further research in this area is needed to provide a clearer picture.

Key messages:

- No clear determinants of regulatory compliance were identified, suggesting it is complex and context specific.
- There are gaps in the literature around the underlying processes which contribute to the achievement of compliance that warrant research attention.

Abstract citation ID: ckac131.287
Function, coping and health as predictors of sick leave after rehabilitation

Anne Mette Berget

AM Berget[1,2], *VP Moen*[1,3], *M Hustoft*[1,3], *J Assmus*[4], *LI Strand*[2], *JS Skouen*[5], *Ø Hetlevik*[2]
[1]Centre of Habilitation and Rehabilitation, Haukeland University Hospital, Bergen, Norway
[2]Department of Global Public Health and Primary Care, University of Bergen, Bergen, Norway
[3]Department of Health and Functioning, Western Norway University of Applied Sciences, Bergen, Norway
[4]Centre for Clinical Research, Haukeland University Hospital, Bergen, Norway
[5]Department of Physical Medicine and Rehabilitation, Haukeland University Hospital, Bergen, Norway
Contact: anne.mette.gravaas.berget@helse-bergen.no

Background:

Function, coping and health are central factors in rehabilitation after injury or sickness. To investigate how these factors are associated with sick leave during 12 months after rehabilitation is the aim of this study.

Methods:

A sample of 412 rehabilitation patients $\leq$ 67years were included. They were all employed, and referred to inter-professional rehabilitation in western Norway. Rehabilitation consisted of physical activity/exercise, cognitive approaches and pain management. In two surveys patients reported mental (MCS) and physical (PCS) function (SF-36), self-perceived health (EQ-VAS) and coping (SOC-13). Register data on sick leave during 12 months in the calendar year after rehabilitation was retrieved from Statistics Norway and categorised to; non, (n = 168), $\leq$ 364 days (n = 152) and 365 days (n = 92). Ordinal regression was used to analyse association between sick leave and MCS, PCS, EQ-VAS and SOC-13, adjusted for age, sex and diagnoses.

Results:

The levels of MCS and PCS (SF-36) were found to be associated with sick leave; OR 0.96, 95% CI 0.92-0.99, $p = 0.004$ and OR 0.93, 95% CI 0.90-0.97, $p < 0.001$, respectively (Pseudo R2 = 0.1133). EQ-VAS and SOC-13 were significant predictors of sick leave in crude analysis (EQ-VAS: OR 0.97, 95% CI 0.96-0.98, $p < 0.001$. SOC-13: OR 0.98, 95% CI 0.95-0.98, $p < 0.001$), but not in the fully adjusted model (EQ-VAS: OR 0.98, 95% CI 0.96-1.01, $p = 0.178$. SOC-13: OR 0.99, 95% CI 0.99-1.03, $p = 0.479$).

Conclusions:

Patientś self-reported mental and physical function were associated with sick leave 12 months after inter-professional rehabilitation. Higher level of function was associated with no sick leave. In our study, patient's self-reported health and coping were not associated with sick leave. This suggest that interventions for functional improvement are beneficial in health care strategies to help patients return to work after injury or sickness.

Key messages:

- Achieved higher physical and mental function after rehabilitation seems to contribute to reduced sick leave after injury or sickness.
- Improving function should remain a central factor in rehabilitation.

Abstract citation ID: ckac131.288
The humanization of care after the COVID-19 pandemic in Italian historical hospitals

Martina Giusti

M Giusti[1], *C Cosma*[2], *S Stefania*[1], *N Persiani*[1]
[1]Experimental and Clinic Medicine, Università di Firenze, Florence, Italy
[2]Postgraduate Medical School in Public Health, Università di Firenze, Florence, Italy
Contact: martina.giusti@unifi.it

Globally, the reforms of healthcare systems aim to bring back the patient at the centre of these organisations after the issues related to the COVID-19 outbreak. The patient returns to be fully considered, as an individual whose must be protected physical and psychological health as well as social well-being. Humanization of care is returning to the foreground. For centuries, art has been used throughout Europe in the health context for its power to support patients in their disease. Today, this approach can be rediscovered in historical hospitals, where tradition, art and assistance coexist. This study aims to investigate the interest for the development of projects for the humanization of care exploiting the artistic heritage of the historical hospitals owned by Health Authorities. The cross-case analysis was chosen as study design. The case studies are the historical hospitals in the city centre of Venice, Florence, and Rome. The evaluation of the proposal was carried out through semi-structured interviews with the general managers of the Health Authorities, the medical directors of the selected hospitals and the delegates for the protection and promotion of cultural heritage. The results were analysed using a qualitative model (coding). All respondents welcomed the proposal to launch projects for the humanization of care that foresee the use of the artistic heritage of the historical hospitals to involve patients in the field of health care. Interviewees expressed the desire to invest human and structural resources in the development of these projects. Moreover, directors suggest choosing a specific target with which to start the experimentation and to dispense a specific training to future engaged social and health personnel. The implementation of projects for the humanization of care using the artistic heritage of historical hospitals can be replicated worldwide where healthcare institutions have a cultural wealth to be handed down, shared and valued.

Key messages:

- In the post COVID-19 era, it is strategic to exploit artistic heritage owned by the Health Authority for the positive impact in the patient's experience.
- Artistic heritage claims its role as a health service for supporting patients, caregivers and also health workforce.

Abstract citation ID: ckac131.289
Hospitalist System under the Covid-19 Pandemic: The Perspective of Value Co-creation

Yu Hua Yan

Y Yan[1]
[1]Superintendent Office, Tainan Municipal Hospital, Tainan, Taiwan
Contact: anne@cvig.org

Background:

The core spirit of the Hospitalist system aims to set up dedicated wards, integrate physician manpower, focus on whole-person care, in order to cope with the aging population and Covid-19 pandemic, and to ensure that both parties, the medical personnel and patients, can provide or receive complete medical care. As the Taiwan medical system is facing a paradigm shift, the Taiwan hospitalist system will play an essential role in the transition as moving forward to provide professional care for inpatients.

Methods:

Hospitalists from 12 hospitals across Taiwan completed a cross-sectional survey. The target population was identified through Taiwan Doctors and Nurses. Survey questionnaire was accessed by 342, incomplete response (18) were excluded and 324 completed responses were analysed.

Results:

That the higher the cognition of medical staff on whole-person care, the higher the motivation to participate in cross-team cooperation (F = 35.914, $p < 0.001$); when the motivation to participate in cross-team cooperation was higher, the behavior of participating in whole-person care also increased. Will be higher (F = 36.483, $p < 0.001$); whole-person care behavior participation behavior has a significant impact on value creation (F = 21.068, $p < 0.001$)

Conclusions:

As the Taiwan medical system is facing a paradigm shift, the Taiwan hospitalist system will play an essential role in the transition as moving forward to provide professional care for inpatients. This change will make possible the improvement of patient safety and quality medical care. The research results can be provided for reference in European and American countries.

Key messages:

- A hospitalist support system is essential for establishing an efficient medical environment and reducing administrative work, which can help hospitals introduce a hospitalist system.
- To build a more stable and sustainable system, it is necessary to create a systemic operational foundation for proceeding with this new hospitalist system.

Abstract citation ID: ckac131.290
Associations of dietetic care and pregnancy outcomes in women with gestational diabetes

Paige van der Pligt

P van der pligt[1], *G Absalom*[2], *J Zinga*[3], *C Margerison*[1], *G Abbott*[1], *S O'Reilly*[4]
[1]Institute for Physical Activity and Nutrition, Deakin University, Victoria, Australia
[2]School of Exercise and Nutrition Sciences, Deakin University, Victoria, Australia
[3]Department of Nutrition, Royal Women's Hospital, Victoria, Australia
[4]School of Agriculture and Food Science, University College Dublin, Dublin, Ireland
Contact: p.vanderpligt@deakin.edu.au

Background:

Gestational diabetes mellitus (GDM) is a significant, global public health problem. Subsequent strain on healthcare systems is widespread and multidisciplinary care may be inadequate. We assessed current nutrition management of GDM in a large, metropolitan maternity hospital in Melbourne, Australia and associations between the model of dietetic care and maternal and neonatal health outcomes.

Methods:

Hospital medical record data from The Women's Hospital, Melbourne for women with GDM (n = 1,185) (July 2105-May 2017) was retrospectively analysed. Adjusted linear and logistic regression were used to assess associations between the number of dietitian consultations and maternal and neonatal health outcomes.

Results:

Half of all women received two consultations with a dietitian. Nineteen percent of women received three or more consultations and of these women, almost twice as many were managed by medical nutrition therapy (MNT) and pharmacotherapy (66%) compared with MNT alone (34%). Odds of maternal complications increased with number of consultations ($p = 0.008$). Lower odds of infant admission to the Neonatal Intensive Care Unit were observed among women receiving one (OR = 0.38 [95% CI: 0.18, 0.78], $p = 0.008$), two (OR = 0.37 [95% CI: 15 0.19, 0.71], $p = 0.003$), or three+ dietitian consultations (OR = 0.43 [95% CI: 0.21, 0.88], $p = 0.020$), compared to no consultations.

Conclusions:

The optimal schedule of dietitian consultations for women with GDM in Australia is unclear. Alternative delivery of nutrition education for women with GDM such as telehealth and utilisation of technology may assist in relieving public health and healthcare system pressures and ensure optimal pregnancy outcomes.

Key messages:

- Delivering medical nutrition therapy through individual consultations does not deliver a linear benefit to women with GDM and their offspring.
- Alternative delivery modes are needed to optimise outcomes for healthcare services and their patients.

Abstract citation ID: ckac131.291
Results of the requirement analysis as part of the Austrian research project linked care

Gabriele Salomon

G Salomon[1], *N Sturm*[1]
[1]Research, Johanniter Ausbildung und Forschung gem. GmbH, Vienna, Austria
Contact: gabriele.salomon@chello.at

Sufficient information is the foundation for efficient and high-quality health care services. In the field of extramural health care, this challenge is particularly evident: missing or insufficient information can lead to underuse, overuse, or misuse of health care, e.g. due to the necessity of multiple assessments or lack of relevant information. The noticeable shortage of health care professionals further underscores the urgent need for efficient and quality-assured health care services. The aim of the project LICA - linked care - is to provide a platform for better coordination and information exchange between health professionals involved in home care, with a focus on ICT in nursing in Austria. The project is funded by the Austrian Research Promotion agency (FFG) as part of the ''benefit - demografischer Wandel als Chance'' program (April 2020-March 2025). The requirement analysis was conducted from April to December 2021. In light of the user-centered approach a mix of methods was chosen, consisting of: literature analysis, 5 guideline-based focus group interviews, guideline-based expert interviews n = 44 (people in need of care n = 23, health professionals n = 21), documentation-analysis (4 care documentation systems - from participating project partners) and working diaries: n = 5 on 5 consecutive working days (= 25 diaries). Therefore, three main target groups were identified: i) people in need of care, ii) healthcare professionals and iii) healthcare providers. The data were analyzed using a qualitative content analysis based on Kuckartz. The main results regarding the status quo are: i) different documentation systems are utilized, ii) lack of digitized documents, iii) currently no standardized documentation system is in use. Thus, following requirements could be identified: i) interoperability with existing systems, ii) setting comprehensive function, iii) usability, iv) interdisciplinary readability, v) error-management, and vi) proper data protection measures.

Key messages:

- Healthcare systems are under great pressure worldwide. Innovative solutions can help maintain and improve the quality and efficacy of healthcare services.
- Gapless and efficient information provision is a key essential to high quality healthcare. The project offers a user-centric approach to develop a platform for connectivity of existing systems.

Abstract citation ID: ckac131.292
The effect of vocational rehabilitation on the use of health care services in Finland

Hanna Rinne

H Rinne[1]
[1]Social Insurance Institution of Finland, Helsinki, Finland
Contact: hanna.rinne@kela.fi

Background:

Because vocational rehabilitation is a separate service from other health services, there may be interruptions at their interface. We examined whether the use of health services changes before and after rehabilitation.

Methods:

Longitudinal individual-level register-based data was utilized on all individuals aged 15-60 living in the city of Oulu, Finland and starting vocational rehabilitation in 2014-2015 (N = 792). We compared their use of outpatient health care services in 3-month periods from 1.5 years before to 1.5 after the rehabilitation period to the total population of the same age and to the propensity score matched controls. Several socio-demographic factors and sickness and employment histories were used for matching.

Results:

According to the preliminary results, rehabilitees had on average 1.5 visits to outpatient health care services in the 6th quarter before the start of rehabilitation, twice that of the total population. In the 4th quarter before the start of rehabilitation, the number increased to 1.8. After the rehabilitation period, the quarterly number of visits were at the same level as in the beginning of the follow-up. The biggest changes took place in the use of occupational health services. Changes were modest in public health care services. In other services changes were minimal. Compared to the propensity score matched controls, vocational rehabilitation did not appear to have an effect on the use of health care services.

Conclusions:

The use of health care services is more common before vocational rehabilitation than after it. The effect of rehabilitation on the use of health care needs further analysis.

Key messages:

- The pattern of the use of health care services changes in the course of vocational rehabilitation. The changes are mainly due to visits in occupational health care services.
- The use of health care services is most common before rehabilitation. However, vocational rehabilitation does not appear to have an effect on the use of outpatient and inpatient health care services.

Abstract citation ID: ckac131.293
Patient-Reported Outcome Measures for care quality assessment of a breast cancer Care Pathway

Alessio Perilli

C Angioletti[2]*, E de Mattia*[2]*, A Perilli*[1]*, AG de Belvis*[1,2]
[1]Department of Life Sciences and Public Health, Università Cattolica del Sacro Cuore, Rome, Italy
[2]Critical Pathway and Outcome Evaluation Unit, Fondazione Policlinico University A. Gemelli IRCCS, Rome, Italy
Contact: alessio.perilli@outlook.com

Background:

Breast Cancer (BC) is the most common type of cancer among women in Europe, accounting for around 28% of newly diagnosed female cancers. A clinical Pathway (CP) is an effective tool able to deliver high quality care especially if linked to a Monitoring System. Still, it is essential to integrate them with the patient's perspective according to Value-Based Care. This paper aims to define and test a tool for care quality assessment in patients with breast cancer, in a value-based perspective.

Methods:

A scoping search of the main databases (PubMed, Scopus, Web of Science) and official websites of institutions and organizations (AIOM, CIPOMO, EORTC, ICHOM, Istat) was carried out. A Delphi survey was conducted to assess the tool, according to four criteria (general relevance, evidence-based, measurability, actionability). We only included indicators that achieved strong agreement. Time-points for data collection were defined and validated in relation to the different steps of the CP.

Results:

The final tool consists of 21 questions coming from the following sources: BREAST-Q and EORT QLQ-BR23 questionnaire. BREAST-Q's questions, have to be administered at T0 (first medical contact) and T12 (follow-up), while the EORT QLQ-BR23's questions have to be administered at T0 (first medical contact) T Surgery, T6 (follow-up) and T12 (follow-up). The survey will be administered to a sample of 152 BC patients (MOE 5%; CL 95%) undergoing surgery in the period June-September 2021.

Conclusions:

The present tool will give a quick view of Value provided by the CP to these patients. In light of the high volume of patients treated at our center (1008 breast cancer surgery hospitalisations in 2020), this study acquires further public health relevance. Additionally, this approach can be extended for further evaluation of other CPs.

Key messages:

- We assess care quality for Breast Cancer patients in a large hospital in Italy through Patient-Reported Outcome Measures, based on an evidence-based, Value-based, Delphi-validated tool.
- Assessing Value brought to patients with Breast Cancer gives a unique perspective on care quality assessment and paves the way for further quality improvements and extension to other health issues.

Abstract citation ID: ckac131.294
Continuity of care in Danish peer-led patient online communities on social media. A survey study

Loni Ledderer

L Ledderer[1]*, A Karlsson*[2]*, C Stage*[2]
[1]Institute of Public Health, Aarhus University, Aarhus, Denmark
[2]School of Communication and Culture, Aarhus University, Aarhus, Denmark
Contact: loni.ledderer@ph.au.dk

Background:

Patients in the Danish healthcare system and other Western countries experience a lack of 'continuity of care' due to inadequate communication and sharing of clinical information. 'Continuity of care' is often defined as informational, managerial and relational failures. A lack of continuity is particularly problematic for patients with chronic conditions as they are often highly dependent on longitudinal and complex treatment processes. Some of these patients have formed self-organised groups on social media in order to share their personal experiences with the health care system and discuss health related problem with peers. The aim of this paper is to understand the role peer-led online communities (PLOC) play for patients with chronic conditions experiences of continuity of care.

Methods:

The material consists of survey data from patients with chronic conditions participating in peer-led online communities on the experience of continuity of care in the Danish healthcare system. A link to the survey was posted in the public online community "Chronic Influencers" (Instagram 10,000 followers), and in the closed Facebook group "Chronic pain patients" (Facebook, 2,200 members). The questionnaire was posted three times between 10 and 30 March 2022.

Results:

207 respondents answered all questions in the survey of which 95% were women. Most of them (62 %) were between 36 and 55 years. 37 % live with chronic conditions for more that 20

years. 72 % of the respondent experience lack of continuity with the healthcare system, often with regard to information or communication with health professionals and they look for peers' advices or experiences in the online groups. 68 % felt recognized by the peers in the online community in another way than in the meeting with the healthcare system.

Conclusions:

Patients use PLOC to find and exchange experiences from other patients with chronic conditions about their treatment and especially daily life with chronic conditions.

Key messages:

- Patients participating in peer-led online communities provide online support and recognition to each other than that provided by the healthcare system.
- Patients use peer-led online communities to read about other patients' experiences with chronic conditions and learn about their treatment and daily life.

[7]Department of Laboratory Medicine, AUSL Modena, Modena, Italy
Contact: erika.govoni@regione.emilia-romagna.it

Background:

Hospitals falls are an important challenge for healthcare systems. An early identification of patients at risk is critical, but no assessing tool has proven to be sufficiently predictive. This review aims at identifying factors associated with an increased risk of falls in hospitalized adults and at mapping them according to main international classification systems.

Methods:

We carried out a systematic literature review and metanalysis to detect risk factors positively associated with the increase of falls in hospitals, searching litterature from January 2015 to March 2022. We included studies investigating falling risk factors in patients older than 16 years. Researchers independently assessed records' eligibility and the methodological quality of included studies was assessed. When possible, data was processed using a random effects model and odds ratio (OR) with 95% confidence interval to quantify the effect. Risk factors were than classified according to ICF, ICD, and ATC classifications.

Results:

We included 40 observational studies, enrolling 3,495,552 patients. Considering ICF-factors, mental and sensory functions-pain have a strong association with falls (OR = 3.311 and 2.149, respectively). ICD-factors associated with falls were mental and behavioural disorders (OR = 2.219), diseases of the nervous system (OR = 2.974), and symptoms, signs, and abnormal clinical and laboratory findings (OR = 2.665). Considering ATC-related factors, medications for alimentary tract and metabolism (OR = 1.978), and nervous system (OR = 1.779), showed a strong association with falls. Other factors were also associated with a moderately increased risk.

Conclusions:

The comprehensive evidence-based assessment achieved with this meta-analysis alongside with the classification according to ICF, ICD and ATC systems provides a new standardized identification of the risk factors associated with an increase of falls in hospital.

Key messages:

- Falls occurring in hospital are an important challenge for health care systems. Therefore the identification of risk factors associated to patients increased risk of fall is fundamental.
- The comprehensive evidence-based assessment achieved with this meta-analysis provides a new standardized identification of the risk factors associated with an increase of falls for hospital.

Abstract citation ID: ckac131.296
Collaboration and health promotion for the health care system – evaluation of the WOL healthcare

Julia Schorlemmer

J Schorlemmer[1], *B Jung*[2], *C Zeller*[3]
[1]Institute for Health, FOM Hochschule fuer Oekonomie und Management, Berlin, Germany
[2]Wiesbaden, Germany
[3]Zukunftsherz, Frankfurt, Germany
Contact: julia.schorlemmer@fom.de

Background:

Health care and social services are industries with special challenges: Constant emotional demands, the shortage of skilled workers is noticeable (in Germany) and special organizational stresses, not only since the Corona pandemic. This study evaluates the Working out Loud (WOL) program for healthcare, which aims to create a learning culture for interdisciplinary collaboration and network-oriented learning and increases growth-oriented thinking at organizational level.

Methods:

The sample consists of 51 participants. From 16 persons data could be analyzed in the pre-post-design of the 10-week intervention accompanied by individual coaching. All respondents work in the health care system in Germany. Dependent variables were collected with validated scales for psychological safety, psychological flexibility, cooperative learning, emotional energy, engagement and voice behavior.

Results:

Effects of moderate strength were shown for all variables: psychological safety (Mt1 = 4.86, Mt2 = 5.45 t(15) = -1.86, p = .083, d = 0.46), psychological flexibility (Mt1 = 3.57, Mt2 = 3.82 t(15) = -2.12, p = .051, d = 0.53), cooperative learning (Mt1 = 4.63, Mt2 = 4.81 t(15) = -2.18, p = . 045, d = 0.54), emotional energy (Mt1 = 2.70, Mt2 = 2.75 t(15) = -0.82, p = .423, d = 0.20), engagement (Mt1 = 2.87, Mt2 = 3.05 t(15) = -1.65, p = .119, d = 0.41)and voice behavior (Mt1 = 3.84, Mt2 = 4.05 t(15) = -1.64, p = .120, d = 0.41). Correlations are shown for psychological safety with emotional energy (r = .426, p = .012) and job satisfaction (r = .612, p = .000).

Conclusions:

The 10-week WOL Healthcare program can strengthen employees in the important area of health promotion and care. The program serves as behavioral prevention and, by empowering individuals, brings about job crafting structural prevention in the workplace. The intervention follows a bottom-up principle, it is an approach for health promotion in the healthcare sector, that can strengthen patient's safety.

Key messages:

- Evidence for the effectiveness of a health promotion intervention for health care workers.
- Organizational learning promotes workers health.

Age ranges in breast cancer screening: simulated scenarios and analysis of benefits and harms

Marina Pinto-Carbó

M Pinto-Carbó[1], *M Vanaclocha-Espi*[1], *J Martín-Pozuelo*[1], *P Romeo-Cervera*[1], *M Hernández-García*[2], *J Ibañez*[1,3], *S Castán-Cameo*[1,3], *NT Van Ravesteyn*[4], *O Zurriaga*[3,5,6], *A Molina-Barceló*[1]

[1]Cancer and Public Health, Foundation for the Promotion of Health and Biomedical Research of Valencia Region, Valencia, Spain
[2]INCLIVA Health Research Institute, Valencia, Spain
[3]Health Promotion Prevention in Health Environment, General Directorate of Public Health and Addiction, Valencia, Spain
[4]Public Health, Erasmus MC, University Medical Center Rotterdam, Rotterdam, Netherlands
[5]CIBERESP, Madrid, Spain
[6]Preventive Medicine and Public Health, Valencian University, Valencia, Spain
Contact: pinto_mar@gva.es

Background:

The Valencia Region Breast Cancer Screening Programme (VR-BCSP) (Spain) invites women aged 45-69 for mammography every 2 years (y). The aim is to evaluate benefits and harms of 3 age range scenarios of the VR-BCSP according to different adherence rates.

Methods:

Long-term impact simulation study (2020-2050) of 3 age range screening scenarios (S) for women $\geq$40y of the VR in 2020 (n = 1487000): S1, 45-69y (current VR-BCSP scenario); S2, 50-69y (excluding 45-49y) and S3, 45-74y (including 70-74y). A biennial screening interval was considered. The simulations were performed for 4 participation rates: A = current adherence (72.7%), B = +5%, C = +10% and D = +20%. Benefit indicators were: nº of BC in situ and invasive (screened vs. clinically detected), nº of BC deaths and % of BC mortality reduction. Harms indicators were: nº of false positives (FP) and % of overdiagnosis. Screening scenarios were simulated using the EUTOPIA evaluation tool.

Results:

Considering the current adherence, a reduction of BC mortality was observed in all scenarios (S1A = 30.6%, S2A = 27.9%, S3A = 32.2%). In S2A the harms decreased vs. S1A: nº of FP (236vs423 x1000) and overdiagnosis (4.9%vs5.0%), but also the benefits: BC mortality reduction (27.9%vs30.6%) and nº of invasive BC screen detected (15/28vs18/25). In S3A vs S1A, an increase of benefits was observed: BC mortality reduction (32.2%vs30.6%) and nº of in situ BC screen detected (5/2vs4/3). On the other hand the nº of FP increased (460vs423 x1000), but overdiagnosis decreased (4.8%vs5.0%). All the results with an increased adherence had similar trend as the previous scenarios, showing a gradual increment in BC mortality reduction. Nevertheless overdiagnosis increase significantly in S3 (5.8% in all adherence increments), being higher than S1 (S1B = 5.0%, S1C = 4.9%, S1D = 5.0%) and S2 (S2B = 4.9%, S2C = 4.9%, S2D = 4.9%).

Conclusions:

The wider age range, the greater reduction in BC mortality but also the probability of FP and overdiagnosis.

Key messages:

- The wider age range, the greater reduction in BC mortality but also the probability of FP and overdiagnosis.
- This study provides a balance between benefits and harms of different screening scenarios allowing evidence-based decision making.

Abstract citation ID: ckac131.298

Use of healthcare services and hospitalisation among elderly people in Latvia

Ieva Reine

S Dātava[1], I Reine[2]
[1]Public Health, Riga Stradiņš University, Rīga, Latvia
[2]Statistic Unit, Riga Stradiņš University, Rīga, Latvia
Contact: ieva.reine@rsu.lv

Background:

Demographic changes have occurred worldwide during the recent decades, with an increasing proportion of the elderly in the society, leading to higher average age of the population. Older people are more likely to suffer from different chronic diseases, and higher consumption of healthcare services and, thus, posing additional burden and challenges to the healthcare system.

Methods:

The descriptive analysis relied on the longitudinal study of Health, Ageing and Retirement (SHARE). The target population included people aged 50 years or older, a total of 782 residents living in Latvia. We used the data from wave 8, collected from 2019-2020.

Results:

The mean age in the study population was 69 years, and 62.5 % of the respondents were women. Results show that 14.7 % of all respondents were hospitalised in the last 12 months. The average length of stay at hospital was 10.9 days (range 1 - 71, SD 10.5). In 36.7 % of the cases hospitalisation was planned, but in 42.9 % it was due to an emergency. More than a half had visited hospital only once, but 19.1 % four times or more. The most common diseases among the hospitalised patients were high blood pressure/hypertension (60 %), heart attack (27.8 %), high cholesterol (26.1 %), osteoarthritis (21.7 %), stroke (18.3 %), diabetes (12.2 %) and different fractures (11.3 %).

Conclusions:

We found that the main ailments for hospitalised patients were both chronic diseases like cardiovascular diseases, rheumatism, diabetes and acute conditions like fractures. The average hospital stay was 11 days.

Key messages:

- Understanding how causes of hospitalisation among elderly interact with the use of healthcare services might help to reduce risk factors associated with hospitalisation and improve the health systems.
- Further studies on hospital admissions among older persons with particular characteristics health conditions could help to reduce the burden of disease and improve the well - being of the elderly.

Abstract citation ID: ckac131.299

How to improve the rehabilitation outcome after total knee replacement?

Lorenzo Dionisi

L Dionisi[1], G De Gironimo[2], F Praino[2], G Abinova[2], C Averame[2], AM Gentile[2], N Nante[1,3]
[1]Post Graduate School of Public Health, University of Siena, Siena, Italy
[2]San Michele, Private Hospital, Albenga, Italy
[3]Department of Molecular and Developmental Medicine, University of Siena, Siena, Italy
Contact: l.dionisi@student.unisi.it

Background:

Even if total knee replacement has revolutionized the treatment of degenerative knee diseases, the definition of an ideal rehabilitation protocol is still in progress. The aim of this study is to identify the factors that influence the outcomes after early, intensive, hospitalized treatment.

Methods:

A retrospective study was conducted in 2019 on 545 patients admitted to a northern Italy private clinic specialized in post-surgery rehabilitation, which applies a bio-psycho-social-environmental model and individual rehabilitation plans. Data regarding each patient were collected from medical records: age, numeric pain rating scale (NPRS) at admission, days between surgery and the beginning of rehabilitation (DBS). The outcomes were measured as the difference (Δ) between the values at discharge and admission of the Barthel scale (ΔBS), Tinetti scale (ΔTS), passive flexion (ΔPF) and active flexion (ΔAF). We performed a univariate linear regression through STATA, to determine which factors influence the outcomes. A $p < 0.05$ was considered statistically significant.

Results:

Our sample (69.17% female) was 69.8 ± 9.4 years old. ΔBS was significantly influenced by age (Coef. 0.270, CI [0.173 - 0.367]) and NPRS (Coef. 1.434, CI [0.979 - 1.890]). ΔTS was significantly influenced by age (Coef. 0.024, CI [0.011 - 0.037]) and NPRS (Coef. 0.130, CI [0.067 - 0.191]). ΔPF was significantly influenced by age (Coef. - 0.158, CI [- 0.266 - - 0.050]), DBS (Coef. - 1.047, CI [- 1.401 - - 0.687]) and NPRS (Coef. 1.825, CI [1.333 - 2.318]). ΔAF was significantly influenced by age (Coef. - 0.171, CI [- 0.300 - - 0.042]), DBS (Coef. - 1.150, CI [- 1.580 - - 0.721]) and NPRS (Coef. 2.504, CI [1.928 - 3.080]).

Conclusions:

Older patients obtain a higher functional outcome (ΔBS, ΔTS) but lower improvement in range of motion (ΔPF, ΔAF). Patients with higher NPRS at admission obtain an overall better outcome. Higher DBS is associated to lower articular outcomes (ΔPF, ΔAF).

Key messages:

- A better outcome can be achieved if rehabilitation is started immediately after knee replacement.
- Pain and age are not factors that impede effective rehabilitation.

Categorical principal component analysis to characterize patients at Intensive Care Unit admission

Martina Barchitta

G Favara[1], *M Barchitta*[1,2], *A Maugeri*[1,2], *E Campisi*[1], *C La Mastra*[1], *MC La Rosa*[1], *R Magnano San Lio*[1], *I Mura*[2,3], *A Agodi*[1,2], *SPIN-UTI network*[2]
[1]Department G.F. Ingrassia, University of Catania, Catania, Italy
[2]Italian Study Group of Hospital Hygiene, Italian Society of Hygiene, Rome, Italy
[3]University of Sassari, Sassari, Italy
Contact: martina.barchitta@unict.it

Background:

Healthcare-associated infections (HAIs) are the most frequent complications in healthcare settings, with a major impact on adverse outcomes. Here, we aimed to identify the relationships between patients' characteristics admitted to Intensive Care Units (ICUs).

Methods:

We used data of patients included in the ''Italian Nosocomial Infections Surveillance in Intensive Care Units'' (SPIN-UTI) project, who stayed in ICU for more than 2 days. Using Categorical principal component analysis (CATPCA) two components of risk were assessed. Values of variance accounted for (VAF) >0.3 were accepted as the significant effect of a variable on each component. A Chronbach's alpha >0.7 was accepted as a measure of the internal consistency of the model.

Results:

A total of 22402 admissions (62% female) were included. The average age was 65.7 years (SD = 16.6). Our model explains 35.3% of the total variability, with a Cronbach's alpha value of 0.847. The visual examination of component loading plot allows to evaluate the correlation between the quantified variables and each of the two components. In particular, the first component is explained by the presence of intubation (VAF = 0.826), central venous catheter (VAF = 0.749), and urinary catheter (VAF = 0.727), patient's origin (VAF = 0.584), antibiotic treatment (VAF = 0.479), non-surgical treatment for acute coronary disease (VAF = 0.375), type of admission (VAF = 0.509), surgical intervention (VAF = 0.419). In the second component, the variables with the greatest contribution were the SAPS II (VAF = 0.660), age (VAF = 0.583), type of admission (VAF = 0.531), surgical intervention (VAF = 0.522). Thus, the first component would represent the exposure to invasive devices and medical procedures, and the second component the severity of patients.

Conclusions:

Our results proposed the usefulness of CATPCA to identify factors involved in the development of adverse outcomes, highlighting the role of exposure to invasive devices and severity of patients.

Key messages:

- There are several relationships between patients clinical and personal characteristics.
- CATPCA represents a useful approach for the analytical exploitation of healthcare data.

Clinical practice variability: a systematic review of shock wave therapy for spasticity

Raquel Faubel

R Faubel[1,6,7], *IM Martínez*[2], *O Navarro*[4,5], *N Sempere-Rubio*[1,3]
[1]Department of Physiotherapy, Universitat de València, Valencia, Spain
[2]Asociación de Familiares y Enfermos Parkison, Centro de Rehabilitación Neurológica, Villarobledo, Spain
[3]Research Unit in Clinical Biomechanics, Universitat de València, Valencia, Spain
[4]Department of Nursing, Catholic University of Valencia, Valencia, Spain
[5]Instituto ITACA, Universitat Politècnica de València, Valencia, Spain
[6]Joint Research Unit in Biomedical Engineering, IIS La Fe-Universitat Politècnica de València, Valencia, Spain
[7]PTinMOTION Research Group, Universitat de València, València, Spain
Contact: raquel.faubel@uv.es

Background:

The purpose of this study was to collect and analyse the available scientific evidence on the clinical practice variability and effectiveness of shock wave therapy as a treatment for spasticity.

Methods:

the systematic search was performed in the following databases: PubMed, PEDro, Cochrane, Embase, and the Virtual Health Library. All publications from November 2009 to November 2019 were selected that included a sample of patients with spasticity and prior suspension of botulinum toxin, to whom shock wave therapy was applied. The methodological quality of the articles was evaluated using the Jadad scale and the pyramid of quality of scientific evidence.

Results:

25 studies involving 866 participants with spasticity were selected. The results obtained suggest that shock wave therapy appears to be effective in reducing spasticity levels irrespective of the age of the participants, the type of injury, and the tool used to measure the effect.

Conclusions:

shock wave therapy reports evidence of improvement in motor function, motor impairment, pain, and functional independence, applied independently of botulinum toxin. However, due to the heterogeneity of the protocols, there is no optimum protocol for its application, and it would be appropriate to gain more high-quality scientific evidence through primary studies.

Key messages:

- Shock wave therapy reports evidence of improvement in motor function, motor impairment, pain, and functional independence, applied independently of botulinum toxin.
- Due to the heterogeneity of the protocols, there is no optimum protocol for its application, and it would be appropriate to gain more high-quality scientific evidence through primary studies.

[3]University Hospital of Siena, Siena, Italy
[4]Department of Molecular and Developmental Medicine, University of Siena, Siena, Italy
Contact: fanti3@student.unisi.it

Background:

Crowding in Emergency Departments(ED)is a severe public health issue.Length of stay(LOS)is not a direct measure of crowding,but it is an essential indicator for monitoring emergency care quality.LOS in ED can be associated with delays in treatment,decreased patient satisfaction and adverse outcomes.The aim of this study is to analyze ED LOS in the Teaching Hospital of Siena for further strategies.

Methods:

A retrospective observational study was conducted between January 1,2019, and December 31,2021.To manage admissions and discharges, all patients' data admitted to ED of the University Hospital of Siena were accessed by Aurora,the IT system.In addition,a descriptive analysis was performed, collecting the following variables:sex,age,arrival mode,ED visit reasons,triage code,discharge mode,hospital admission area and LOS(cut-off>8hours).The analysis was carried out using STATA 17:variables were analyzed with ANOVA test.

Results:

Our sample consisted of 152.393 patients (F49.47% M50.53%),and the average age was 50.51(SD ± 26.07).During the years total ED visits decreased:65.426(2019);40.318(2020); 46.649(2021),and there was a significant increase ($p < 0.001$) of patients with LOS>8 hours:13.96%(2019); 21.51%(2020); 23.10%(2021).In the years 2019,2020 and 2021, admissions of patients with LOS>8 hours were respectively: 25.92%; 43.95% and 37.09%, with the following percentage in medical areas:69.96% in 2019;70.51% in 2020;64.55% in 2021.A progressive increase of admissions in COVID area resulted since 2020(2.23%-2020;6.07%-2021).

Conclusions:

The spread of COVID-19 and the containment measures,such as lockdown,caused a significant decrease in ED access.The increase LOS>8h could be primarily due to the time needed to perform laboratory investigations for the search for SARS-CoV-2 but also to the overflow of SARS-CoV-2-infected patients rapidly saturating the ED boxes and hospital bed capacity,with the need sometimes to dedicate other medical areas to manage COVID patients.

Key messages:

- ED-LOS is a proxy indicator to monitor emergency care quality.
- Further investigations should be performed to analyze the leading causes of ED LOS increase during the pandemic period.

Abstract citation ID: ckac131.303
What kind of patient benefits the most from an intensive physiotherapy after total hip replacement?

Lorenzo Dionisi

L Dionisi[1], I Accame[2], F Praino[2], G Abinova[2], I Sanguineti[2], AM Gentile[2], N Nante[1,3]
[1]Post Graduate School of Public Health, University of Siena, Siena, Italy
[2]San Michele, Private Hospital, Albenga, Italy
[3]Department of Molecular and Developmental Medicine, University of Siena, Siena, Italy
Contact: l.dionisi@student.unisi.it

Background:

Hip replacement is a common orthopaedic surgery procedure that produces great improvement in the quality of life. Despite this, a globally standardized post-operative physiotherapy protocol still does not exist. The aim of this study is to identify the factors that influence the motor and functional outcome after early, intensive, hospitalized treatment.

Methods:

A retrospective study was conducted in 2019 on 509 patients admitted to an Italian private clinic specialized in post-surgery rehabilitation, which applies an original bio-psycho-social-environmental protocol and individual rehabilitation plans. Data regarding each patient were collected from medical records: age, haemoglobin, Body Mass Index (BMI), Cumulative Illness Rating Scale (CIRS), Tinetti scale (TS) and Barthel scale (BS) at admission and discharge. The outcome was measured as the difference (Δ) between the values at discharge and admission of BS (ΔBS) and TS (ΔTS). We performed a univariate linear regression using STATA, to determine which factors influence the outcome. A $p < 0.05$ was considered statistically significant.

Results:

Our sample (57.4% female) was 70.1 ± 10.4 years old. ΔBS was significantly influenced by motor performance at admission (BS: Coef. - 0.708, CI 95% [- 0.743 - - 0.673]; TS: Coef. - 1.697, CI 95% [- 1.849 - - 1.544]), global health conditions (CIRS Severity index: Coef. 4.925, CI 95% [1.037 - 8.814]) and age (Coef. 0.312, CI 95% [0.221 - 0,403]). ΔTS was significantly influenced by the same factors, BS: Coef. - 0.167, CI 95% [- 0.184 - - 0.149]; TS: Coef. - 0.667, CI 95% [- 0.703 - - 0.631]; CIRS Severity index: Coef. 1.254, CI 95% [0.012 - 2.511]; age: Coef. 0.090, CI 95% [0.061 - 0.120]. BMI and haemoglobin did not influence the studied outcomes.

Conclusions:

Patients with worse health conditions, advanced age and lower motor performance at admission obtain a higher outcome.

Key messages:

- A broader knowledge of rehabilitation influencing factors would provide higher outcomes.
- The diffusion of individual rehabilitation plans would allow the achievement of better results.

Abstract citation ID: ckac131.304
Perspectives of clinicians and patients on community-based maintenance care for adults with obesity

Kate McBride

K McBride[1], G Alsultany[1], J Termaat[1], K Williams[2]
[1]School of Medicine, Western Sydney University, Penrith, Australia
[2]Nepean Family Metabolic Health Service, Nepean Local Health District, Penrith, Australia
Contact: k.mcbride@westernsydney.edu.au

Background:

Tertiary metabolic health services are in high demand as people with severe obesity increase. Once predetermined health goals have been achieved patients must transition to community-based care to urgently free up capacity in tertiary services. Maintenance of successful outcomes achieved via tertiary services is therefore important to limit rates of relapse back to these services.

Methods:

This qualitative project explored community-based care needs to help individuals living with obesity maintain health gains. An interview schedule guided one-on-one interviews with patients and staff from metabolic clinics in Sydney, Australia.

Results:

We interviewed 22 patients and 13 clinicians. A lack of appropriate and consistent clinical support in the community was identified by patients and clinicians. Most clinicians agreed primary care was key to successful maintenance care. Lack of primary care understanding of appropriate management and support for patients with obesity, lack of bariatric equipment and limited funding for allied health were all seen barriers to appropriate support beyond their clinics. Patients were highly reluctant to transition from tertiary clinics and reluctant to engage with community-based care due to experience of limited clinical/social support and bariatric equipment, demeaning clinical interactions, lack of care coordination and being stigmatised. Support groups outside of the clinic were also identified important in mitigating social isolation and stigma. Both patients and clinicians felt support groups have potential to provide important supplementary help to individuals with obesity outside tertiary settings.

Conclusions:

Currently, individuals aiming to maintain their weight are likely to struggle in the context of existing community care provisions. Integrated, community-based and affordable models of care are needed now to allow tertiary metabolic services discharge their patients safely.

Key messages:

- Tertiary obesity services are at capacity.
- Subsequent community care for people wth obesity needs to be mote appropriate tp promote weight maintenance.

Abstract citation ID: ckac131.305
Piloting a Health System Performance Assessment for Germany - insights from trend and equity analyses

Katharina Achstetter

K Achstetter[1], M Blümel[1], P Hengel[1], V Schwarzbach[1], R Busse[1]
[1]Department of Health Care Management, Technische Universität Berlin, Berlin, Germany
Contact: katharina.achstetter@tu-berlin.de

Background:

Health System Performance Assessment (HSPA) is a tool for the evaluation of the performance and efficiency of a health system and can be used for evidence-based policymaking. For the first time, a country specific HSPA for the German health system is piloted with a focus on trend and equity analyses.

Methods:

Based on the conceptual framework developed in a feasibility study, the pilot study in Germany has being conducted between 2020 and 2023. The framework includes 90 internationally compatible indicators, each of which can be assigned to one of nine dimensions (e.g., access, quality, population health, responsiveness, efficiency). The aim of this pilot study is to conduct trend analyses over the period 2000-2020 and equity analyses (e.g., age, gender, region, education). Data from 56 different national and international secondary data sources (e.g., epidemiologic registry data, claims data, and survey data) were collected, analyzed, and compiled in a report.

Results:

In total, 84 of the 90 indicators could be analyzed with data for Germany. The indicators (e.g., access to acute care, 30-day mortality, amenable mortality rate) are prepared as a trend analysis for Germany for up to 20 years and with regard to various equity aspects. Most indicators can be presented in international comparison with eight selected European countries (e.g., Denmark, France). Furthermore, recommendations were derived to improve the availability and/or quality of data.

Conclusions:

The first German HSPA pilot study provides valuable insights into the performance of the health system. The results based on the analysis of the 90 indicators are an important basis for identifying inequities and needs for improvement. In the future, the lessons learned from the pilot study can be helpful for a permanent implementation of a German HSPA. However, the fragmented data structure in Germany will be a future challenge.

Key messages:

- The first country specific health system performance assessment for the German health system was conducted as a pilot study.
- Trends over time, inequities, and needs for improvement can be derived from the analysis of 90 indicators.

Abstract citation ID: ckac131.306
Introduction of medical assistants in France: an innovative approach to healthcare access?

Ophelie Guyonvarch

O Guyonvarch[1], Y Bourgueil[2,3], F Dugué[4]
[1]Faculty of Medicine, Sorbonne University, Paris, France
[2]Health Chair, Sciences Po, Paris, France
[3]Center for Primary Care and Public Health, University of Lausanne, Lausanne, Switzerland
[4]Directorate of Public Health, Municipality of Paris, Paris, France
Contact: ophelie.guyonvarch@gmail.com

Epidemic transition, sustained costs and health workforce shortage challenges have led numerous countries to strengthen primary care (PC) and implement new models of care. Faced with declining numbers of general practitioners (GPs), France has introduced medical assistants (MAs) in 2019 to guarantee access to care and maintain workforces in deprived areas. Trained to perform administrative and clinical tasks delegated by a physician, MAs are expected to optimize medical time and improve working conditions in practices. How does French model of MAs impact quality and productivity in GPs' practices and articulate with other policies? We conducted a qualitative case study in 6 pilot practices to explore the effects of MAs' work (interviews with 12 GPs, 6 MAs, collection of tasks performed by 6 MAs), complemented with views from public policy makers and health professional unions (9 interviews). MA was defined as a function centered on physicians' needs, accessible both to administrative staff and nursing professions. MAs with a clinical profile performed a wider range of tasks, were more prone to perform clinical tasks and build developed interactions with patients, and seemed better fitted for chronic disease care management. Recruitment of MAs by physicians is supported with grants that decrease yearly while practice productivity is expected to rise. In general, a gain of efficiency in daily workload enabled GPs to slightly increase their productivity. However, for most GPs, it primarily helped them to maintain high workload without burning out. Although MAs with clinical background seem better suited for patients' needs, recent figures have shown that more than half of MAs employed are former secretaries. If in-person secretaries could be endorsed with further administrative duties, MAs could hold a more clinical role in PC teams including physicians and allied health professionals. Other aspects than productivity must be taken into account in a support policy.

Key messages:

- Regardless of productivity objectives to attain, hiring MAs can relieve physicians' workload and stress, preventing them from burning out and guarantee access to care in deprived areas.
- MA's clinical profile could have a stronger impact on public health issues such as chronic disease care management.

Abstract citation ID: ckac131.307
The COVID – 19 pandemic influence on hospitalizations for ambulatory care-sensitive condition

Ivana Marasovic Šušnjara

I Marasovic Šušnjara[1,2]
[1]Public Health, Public Health Institute of Split-Dalmatia County, Split, Croatia
[2]University Department of Health Studies, University of Split, Split, Croatia
Contact: ivana_ms@yahoo.com

Aim:

To explore whether the COVID-19 pandemic influenced hospitalizations for ambulatory care-sensitive conditions (ACSCs) during the COVID-19 pandemic in Split-Dalmatia County, Croatia.

Methods:

We employed a cross-sectional comparative study using two different time periods, the prepandemic (March 2019 to February 2020) and the pandemic (March 2020 to February 2021) to explore possibilities of COVID-19 pandemic influence on hospitalizations for ambulatory care-sensitive conditions (ACSCs) during the COVID-19 pandemic in Split-Dalmatia County. The research used data from the national information system on hospitalizations from the Clinical Hospital Center Split, University Hospital Split. The ACSCs was classified in the categories of vaccine preventable, chronic and acute disease. The indicators were statistically analysed. The z-score test for two population proportions is used.

Results:

During prepandemic (March 2019 to February 2020) there were 48,289 hospitalizations, in the pandemic period (March 2020 to February 2021) there were 37,999 hospitalizations. The ACSCs hospitalizations made 6.4% in the prepandemic and 7.1% in the pandemic period. In the pandemic there was a significantly higher ACSCs hospitalizations compared to the prepandemic ($z = -3.9348$; $p = 0.00008$; $p < 0$), which was supported by a significant increase regarding ACSCs hospitalizations in the category of acute diseases, among women ($z = -3.6614$; $p = 0.00026$; $p < 0 .05$), in age groups 0-19 years ($z = -4.0492$; $p < 0.00001$; $p < 0.05$) and 20-64 years ($z = -3.8818$; $p = 0 .0001$; $p < 0.05$).

Conclusions:

The results of the study show that the COVID-19 pandemic contributed to the total number of hospitalizations as well as the hospitalization of the ACSC. One of the reasons for these changes was certainly the changed organization of the work of the entire health system due to the COVID-19 pandemic.

Key messages:

- The results of the study show that the COVID-19 pandemic contributed to the total number of hospitalizations as well as the hospitalization of the ACSC.
- One of the reasons for these changes was certainly the changed organization of the work of the entire health system due to the COVID-19 pandemic.

Abstract citation ID: ckac131.308
Measuring the performance of health systems in Latin America

Sergio Flores

S Flores[1]*, M San Sebastian*[2]*, P De Alva*[1]
[1]Institute for Public Health and Caring Science, Uppsala University, Uppsala, Sweden
[2]Department of Epidemiology and Global Health, Umeå University, Umeå, Sweden
Contact: sergio.flores@pubcare.uu.se

Background:

Efficiency has been identified as a key intermediate policy objective for Universal Health Coverage. Despite that, it was estimated that 20 to 40% of health sector resource utilization is wasteful globally. An efficient use of existing resources in healthcare is critical and a priority policy in sustaining positive health outcomes for the population. This study aimed to perform a longitudinal efficiency analysis was found concerning health systems specific to all the Latin America region over the last 13 years.

Methods:

Health Adjusted Life Expectancy (HALE), Diphtheria Pertussis Tetanus (DPT)Immunization and Survivability Rate of under-5 were chosen as outputs, while Pooled Health Expenditure, Gross Domestic Product (GDP) per Capita and Population over 65 were selected as inputs. Cross sectional Data Envelopment Analysis using five-year averages and a longitudinal Data Envelopment Analysis (DEA) were performed creating several model iterations with our selected indicators. All the models had an output orientation, adjusted for variable returns to scale and incorporating a five-year time lag between inputs and outputs.

Results:

Our cross-sectional DEA Analysis found that the best performing country ended up being Nicaragua, followed by Cuba, Honduras, Costa Rica and Chile, while the countries performing the worst were Suriname, Venezuela and Guatemala. When observing efficiency scores behaviors longitudinally, all our model iterations result in the region decreasing efficiency in their health systems by 2.5% to 6.9% from 2000 to 2013, depending on the model chosen.

Conclusions:

The study reveals that all countries in Latin American can improve their health systems efficiency performance to different extents. Latin America reduced total health system productivity between 2000 and 2013. Further studies are required to uncover the extent and causes of this regression. A similar analysis in Europe may be warranted and could aid policy making.

Key messages:

- Overall efficiency in Latin American health systems has decreased by 3% to 7% over the last thirteen years.
- Nicaragua, Cuba, Honduras and Costa Rica seem to have the most efficient health systems in the region, whereas Venezuela and Guatemala are the least efficient.

Abstract citation ID: ckac131.309
Use of diabetic healthcare according to the accessibility of diabetology services

Kateřina Maláková

K Maláková[1]*, L Šídlo*[1]
[1]Department of Demography and Geodemography, Charles University, Prague, Czechia
Contact: malakovk@natur.cuni.cz

Background:

Diabetologists, as other specialists, are more likely concentrated in towns and cities rather than in the countryside so the people who live in these municipalities have a wider supply of health services. Our aim is to determine whether there are significant differences in the use of diabetology services between patients who live in the municipality with these services or not in Czechia.

Methods:

The sorted anonymized data obtained from the General Health Insurance Company of the Czech Republic (GHIC CR) were used. The studied patients were people with a diagnosis of type 2 diabetes mellitus (E11) who were insured by GHIC CR and used health services in 2019 in Czechia.

Results:

The distribution of providers of diabetology services (PDS) is relatively even throughout the country, and PDS are mainly concentrated in the municipality with a large population. In total, 52% of patients have the diabetologist in their municipality of residence. Patients living in the municipality with PDS have greater odds of using their services (OR 1.63, Cl 1.61-1.65). Specifically, 67% of the patients who have the diabetologist in their municipality of residence use diabetology services compared to 55% of the patients living in the municipality without PDS commute for diabetology services to the other municipality.

Conclusions:

The results show that diabetology services are concentrated mainly in towns and cities and patients living in the municipality with the diabetologist use more diabetology services compared to patients living in the municipality without them. At the same time, it seems that more than half of the patients in the municipality where is not PDS are willing and able to commute for diabetology services.

Key messages:

- Although patients living in the municipality without the diabetologist use diabetology services less often than with them, due to the commuting for healthcare, the differences are blurred.

Abstract citation ID: ckac131.310
Development of cancer policies between Europe Against Cancer Programme and Europe's Beating Cancer

Tit Albreht

T Albreht[1,2], *M Jelenc*[1]
[1]Centre for Health Care, National Institute of Public Health, Ljubljana, Slovenia
[2]Department of Public Health, Faculty of Medicine, University of Ljubljana, Ljubljana, Slovenia
Contact: tit.albreht@nijz.si

Issue/problem:

European Union has legally certain limitations in developing joint policies for services, activities and interventions that belong to the national competencies. Cancer control and cancer policy occupy a special place as they have received special attention throughout the last 40 years.

Description of the problem:

European Union launched its first important disease policy with the start of the Europe Against Cancer Programme in 1984/85. It was a step, supported by a few interventions and activities, which facilitated the development of several important policy tools. After its closure in 2003, there was some unease, especially in view of the forthcoming biggest enlargement of the EU in 2004. Several activities revived the EU cancer policy and these processes culminated in the adoption of the Europe's Beating Cancer Plan. There were some doubts whether the latter would be feasible but a careful development process at different levels resulted in success.

Results:

A policy analysis will be presented that will introduce key steps and documents that mark the period between the two milestones - Europe Against Cancer Programme (EACP) and Europe's Beating Cancer Plan (EBCP). We will present the development of various tools as well as the important outcomes of the different policies and interventions triggered by the two documents. The period between 2003 and 2019 will be elaborated in view of the adoption of EBCP. Three Joint Actions and their various outputs with a strong impact on the cancer policy development, contributing also to the development of flagships and actions of EBCP will be presented as well.

Lessons:

EU top level decisions and policies can be developed harmoniously and to the benefit of both - the EU and the Member States - when launched in a joint process and with the involvement of all the relevant stakeholders.

Key messages:

- EU policy documents are important drivers for the development of health policy tools at both the EU level as well as at the Member State level.
- A combination of top-level documents with carefully developed policy tools enables the development of cancer policies acting at both EU and Member State level.

The development of a regional network for health care research in Hamburg, Germany

Christina Lindemann

C Lindemann[1], *S Busch*[2], *T Bott*[3], *A Meusch*[8], *B Loewe*[4], *M Scherer*[5], *O von dem Knesebeck*[6], *M Haerter*[7]
[1]University Medical Center Hamburg-Eppendorf, Centre for Health Care Research, Hamburg, Germany
[2]University of Applied Sciences, Competence Center Gesundheit, Hamburg, Germany
[3]AOK Rheinland/Hamburg, Hamburg, Germany
[4]University Medical Center Hamburg-Eppendorf, Department of Psychosomatic Medicine and Psychotherapy, Hamburg, Germany
[5]University Medical Center Hamburg-Eppendorf, Department of General Practice and Primary Care, Hamburg, Germany
[6]University Medical Center Hamburg-Eppendorf, Institute of Medical Sociology, Hamburg, Germany
[7]University Medical Center Hamburg-Eppendorf, Institute and Outpatients Clinic of Medical Psychology, Hamburg, Germany
[8]TK, Hamburg, Germany
Contact: ch.lindemann@uke.de

Background:

At the University Medical Center Hamburg-Eppendorf (UKE), health care research has been established as one of five research priorities recommended by the Research Council with the founding of the Center for Health Care Research (CHCR) in 2006. The CHCR was involved in numerous research projects with the focus on strengthening regional networking. Despite the numerous initiatives, there is still potential for improvement with regard to a systematic and sustainable exchange in the region of Hamburg, Germany.

Methods:

These requirements led to the initiation of the 'Hamburg Network Health Services Research (HAM-NET)'. The mission of HAM-NET is to build an open forum for all relevant institutions, to concentrate their interests and needs in health services research and to promote and conduct innovative, efficient, needs-based and patient-centred health services research projects in the metropolitan area of Hamburg. Three main tasks were appointed: 1) linking health care research to relevant regional institutions, 2) promoting research activities and new fields of research and 3) using methodological expertise to promote young scientists.

Results:

By today 40 institutions from all sectors of health care joined HAM-NET. The regularly general meetings offer exchange and advice. Internal communication is promoted by mailing lists and newsletters. Also, HAM-NET presents itself with a website, logo and by organizing recurring events and participating in international and national congresses and networks. Within two funding phases a total of four overarching research projects were developed and implemented. Furthermore, a person with lived experience committee was established.

Conclusions:

For the further development of health care research as one the core disciplines of public health a regional network with an efficient infrastructure is needed. HAM-NET promotes this with the implementation of an innovative, efficient and patient-oriented network.

Key messages:

- Regional networks help to integrate multiple public health initiatives and community stakeholders.
- Public health networks can be established on multidisciplinary cooperations in different out- and inpatient sector levels.

Hospital discharge for stroke patients: Transitional Care is Brain

Paola Bertuccio

AC Sgueglia[1], *M Zeduri*[1], *M Rissone*[1], *P Bertuccio*[1], *A Cavallini*[2], *A Martignoni*[3], *A Muzzi*[4], *S Cutti*[4], *AG Ambrosio*[4], *A Odone*[1]
[1]Department of Public Health, Università degli Studi di Pavia, Pavia, Italy
[2]Cerebrovascular Department, IRCCS Mondino Foundation, Pavia, Italy
[3]Unit of Cardiac and Cerebrovascular Disease, Fondazione IRCCS Policlinico San Matteo, Pavia, Italy
[4]Medical Direction, Fondazione IRCCS Policlinico San Matteo, Pavia, Italy
Contact: paola.bertuccio@unipv.it

Background:

Among cerebrovascular disease, stroke is a life-threatening neurological event and a main cause of serious long-term disability, with relevant healthcare and economic burden. Treatment of stroke is time dependent and organised integrated stroke care enables quick and effective responses to reduce stroke-related death and disability. This study aimed at evaluating the amount of hospital discharge to transitional care facilities for stroke patients to support integrated care models in the city of Pavia (Italy).

Methods:
In 2017 in Pavia, Fondazione IRCCS Policlinico San Matteo started a partnership with Fondazione Mondino to build a specific stroke pathway, becoming a leading centre for stroke treatment. We conducted a retrospective chart review (RCR) of patient-centred data to quantify the volume of discharge for stroke patients. Two trained public health residents reviewed medical records with stroke admission diagnosis during 2021, analysing onset (e.g., Emergency Room, other hospital, emergency network), ward, treatment and discharge types (e.g., home, death, transitional care facility).

Results:
Our RCR found 669 patients with a stroke diagnosis treated at San Matteo hospital in 2021, the vast majority of which were admitted to the neurology ward (375 patients, 56%). The recanalization rate was 32% (150 on 464 ischemic stroke patients). Regarding the discharge type, 299 patients (45%) were sent home, while 297 patients (44%) needed transfer to rehabilitation or long-term care facilities. About 8% (52 patients) of the overall sample died in hospital.

Conclusions:
Our analysis showed that, while most stroke patients were discharged and sent home, more than two-third need to be transferred to continue to get the right healthcare from the right professional. Transitional care facilities should receive the greatest consideration by systems and providers seeking to implement care models to reduce residual neurological disabilities for stroke patients.

Key messages:

- A fast and accessible emergency chain is essential to reduce residual neurological disabilities and the related healthcare and economic burden in stroke patients.
- Extending the stroke path model to other time-dependent diseases is increasingly high-priority to shape a strong and resilient healthcare system, ensuring qualified health coverage.

Can the virtual reality intervention VR FestLab improve Danish studentś alcohol competences?

Julie Dalgaard Guldager

J Guldager[1,2], *SL Kjær*[1], *U Grittner*[3], *C Stock*[1,4]
[1]Department of Public Health, University of Southern Denmark, Esbjerg, Denmark
[2]Department of Physiotherapy, University College South Denmark, Esbjerg, Denmark
[3]Institute of Biometry and Clinical Epidemiology, Charité - Universitätsmedizin Berlin, Berlin, Germany
[4]Institute of Health and Nursing Science, Charité - Universitätsmedizin Berlin, Berlin, Germany
Contact: jguldager@health.sdu.dk

Background:
VR FestLab is a newly developed simulated ‘‘party’’ where the player is being offered alcoholic beverages while steering their own party experience in virtual reality. We evaluated the efficacy of VR FestLab on drinking refusal self-efficacy of Danish male and female 15-18-year-old students and tested user satisfaction. Secondary outcomes were drug refusal skills, knowledge/awareness, communication skills, social support willingness, susceptibility to peer pressures, and outcome expectations.

Methods:
The intervention consisted of 15 minutes of gameplay and 30 minutes of group/in class discussion. The intervention group played VR FestLab where the control group played the VR game ‘‘Oculus Quest - First Steps’’ (no educational content). In a cluster-randomised controlled trial schools were randomly assigned to the intervention/control group. 13 Danish schools were recruited containing 181 students in intervention/191 in control groups. Students completed a questionnaire before and immediately after the intervention. Data was analysed using mixed linear regression models.

Results:
50% of students found VR FestLab to be realistic, 57% would like to explore it further, and 43% would recommend it to friends. We found a small, but non-significant effect on drinking refusal self-efficacy favoring the intervention. No differences between the intervention and control group were observed for the secondary outcomes.

Conclusions:
VR FestLab should be used with higher frequency than in this trial and in combination with other evidence-based alcohol prevention interventions adolescents. Further research is needed to improve the effectiveness of VR FestLab.

Key messages:
- VR FestLab could be a valuable contribution to school-based alcohol prevention education but cannot stand alone.
- Future research should focus on the dose-effect relationship of the novel tool.

Abstract citation ID: ckac131.315
Feasibility of a social network-based physical activity intervention targeting vocational students

Liane Guenther

L Guenther[1], *S Schleberger*[1], *CR Pischke*[1]
[1]Heinrich-Heine-University Duesseldorf, Institute of Medical Sociology, Düsseldorf, Germany
Contact: liane.guenther@hhu.de

Background:
Globally, four of five adolescents do not meet the recommendations for physical activity (PA). This is a public health concern because moving large segments of young adults from inactivity to activity, is essential to reach the global target of a 15% relative reduction of inactivity by 2030 worldwide. This study aimed to pilot a social network-based PA intervention in a sample of young adults enrolled at vocational schools.

Methods:
Fourteen students from one vocational school located in Duesseldorf were encouraged to walk 10.000 steps per day over an intervention period of six weeks. In the WALK2gether intervention, students received general information on PA in a Facebook group and were instructed to use the pedometer app Pacer to monitor their individual steps and compare their daily step count with fellow participants. The framework by Thabane et al. (2010) was was taken as a basis for examining the feasibility of the methods and procedures employed and for estimating the magnitude of potential intervention effects.

Results:
The WALK2gether intervention turned out to be minimally resource intensive with, in total, 92 hours spent by the study staff on development and implementation. The recruitment rate was 19.2% and loss-to-follow was 28.6%. Descriptively analysed data revealed no noteworthy changes from baseline to follow-up neither in PA nor in other health outcomes, such as body mass index and quality of life. The target population did not interact in the Facebook group, while a moderate interaction with Pacer was noted.

Conclusions:
This pilot study and intervention were only partially feasible. Although the results ought to be interpreted with caution due to the small sample size, our results suggest that the target group would rather benefit from a structured PA regimen with regular check-ins and PA counselling, possibly by vocational school teachers, than the very autonomous approach piloted in this study.

Key messages:
- Results of this pilot study can inform the development and implementation of future social media-based PA interventions targeting young adults in vocational schools.
- Optimization of the intervention and studies on a larger scale are necessary.

Abstract citation ID: ckac131.316
Health promotion among unemployed people – meta-analytic evidence

Alfons Hollederer

A Hollederer[1], *K Paul*[2]
[1]Faculty of Human Sciences, University Kassel, Kassel, Germany
[2]Faculty of Business, Economics and Law, Friedrich-Alexander-University of Erlangen-Nü, Nuremberg, Germany
Contact: alfons.hollederer@uni-kassel.de

Background:
It is well known that unemployment impairs health. However, less is known about health promotion among unemployed people and healthy coping strategies to deal with unemployment.

Methods:
A random-effect meta-analysis was applied to statistically integrate quantitative controlled intervention studies among unemployed people.

Results:
The meta-analysis included 34 eligible primary studies with 36 independent intervention samples. For mental health, the average meta-analytic effect sizes for the comparison of intervention group and comparison group was significant and of small size after the intervention d = 0.25; 95% CI [0.10, 0.39], and at follow-up, d = 0.13; 95% CI [0.04, 0.22]. For health behavior (measured as physical activity), the effects were also significant after the intervention, d = 0.30; 95% CI [0.12, 0.47] (no data available at follow-up). Effects on self-assessed physical health status were very small and not significant. However, when health improvement was the only goal of the respective intervention (in contrast to studies with multiple goals, e.g., health improvement plus re-employment), the effect on physical health was significant, too, d = 0.15; 95% CI [0.04, 0.25]. Moderator tests showed that intervention effects on mental health were significantly stronger when cognitive-behavioral methods were used ($p < .05$), while the use other kinds of stress-management techniques ($p < .05$), of methods to increase social support ($p < .05$), or of relaxation techniques ($p < .07$) did not improve the effectiveness of the intervention.

Conclusions:
The present meta-analyses provided evidence that, on average, interventions aiming at improving unemployed people's health do indeed improve participants' health.

Key messages:
- The present meta-analysis confirms that it is possible to promote unemployed people' health. The moderator effects for type of intervention that were found here might be helpful for health promotion.
- The inclusion of cognitive-behavioral methods, appears to be a successful approach for health-oriented interventions with unemployed people.

Nutrition Literacy of Overweight/Obese and Non-Overweight/Obese Turkish Women and Affecting Factors

Ezgi Hasret Kozan Çıkırıkçı

EH Kozan Çıkırıkçı[1,2], *MN Esin*[2]
[1]Nursing, Haliç University, Istanbul, Turkey
[2]Public Health Nursing, Istanbul University Cerrahpasa, Istanbul, Turkey
Contact: e.h.kozan@gmail.com

Background:
Nutrition literacy is having the skills and abilities required to prepare food, make healthy food preferences, and understand its effects on health, environment, and economy. Inadequate nutrition literacy can lead to an unhealthy diet, overweight, or obesity. Along with inadequate nutrition literacy, gender is also a risk factor for obesity. In this regard, it is seen that women's level of nutrition literacy has an important role in gaining healthy eating habits and preventing chronic diseases related to

nutrition such as obesity. This study aims to determine the level of nutrition literacy of adult Turkish women and the factors affecting.

Methods:

In this comparative descriptive research, 239 women were selected into 2 groups by their BMI, from Public Education Centers in Istanbul, Turkey, by using simple random sampling method. Data were collected using Introductory Characteristics Form and Adult Nutrition Literacy Assessment Tool. For statistical analysis, Pearson Chi-Square, Mann Whitney U and logistic regression were used.

Results:

In the study, adequate numerical literacy and food label reading rates in overweight/obese women were found lower (p = 0.000) than non-overweight/obese women. It was found that the number of main meals increases the nutrition literacy level of non-overweight/obese women 2.628 times (p = 0.012). In the overweight/obese group, it was found that number of children (p = 0.040), waist circumference (p = 0.048), snack amount (p = 0.022) and Youtube usage (p = 0.041) increase nutrition literacy levels.

Conclusions:

The nutrition literacy of both groups was found to be high. However it is highly affected by YouTube usage which provides a new perspective in terms of public health practices and policies. It is recommended for public health professionals to:

- use social media platforms and provide evidence-based information
- monitor the height, weight and BMI of individuals in the risk group
- organize interventions to strengthen nutritional literacy

Key messages:

- Adequate numerical literacy and food label reading sub-dimension mean scores of overweight/obese women was lower than the non-overweight/obese women.
- Spending time on Youtube increases the nutrition literacy levels in overweight/obese women by 91,116 times which points to the relationship between nutritional literacy and social media use.

Abstract citation ID: ckac131.318
Changes in university student health behaviors since the beginning of the COVID-19 pandemic

Marie-Pierre Tavolacci

A Patin[1], J Ladner[2,3], MP Tavolacci[1,3]
[1]CIC 1404, CHU Rouen, Rouen, France
[2]DEPS, CHU Rouen, Rouen, France
[3]INSERM 1073, Université de Rouen, Rouen, France
Contact: Marie-Pierre.Tavolacci@chu-rouen.fr

Background:

The COVID-19 pandemic lead many upheavals in the life habit whith lockdowns and curfews since March 2020 and possibly in the health behaviours of university students could be impacted. The objective of the study was to assess the evolution of the health behaviors of university students between before the COVID-19 period and May 2021.

Methods:

Two retrospectives online studies of a university students in France were in May 2020 and May 2021 were conducted. Socio demographics and academics environment data, tobacco smoking, binge drinking, cannabis use, and vigorous physical activity were collected in a declarative way.

Results:

In 2020, 3483 (72.5% of women, mean age 20.9 (SD = 2.46)) and in 2021, 3504 (74.4 of women, mean age 20.73 (SD = 2.32)) university students were included. After logistic regression, in 2020 compared to the pre-COVID19 period, the regular vigorous physical activity didn't change significantly while there appears to be a study period effect with a decrease of the regular binge drinking (AOR = 0.24 IC95% [0.20,0.29]). In 2021 compared to the pre-COVID19 period, the regular vigorous physical activity and the regular binge drinking decreased respectively, (AOR = 0.53; IC95% [0.48,0.59]) and (AOR = 0.60 IC95% [0.52,0.70]). Regular tobacco smoking and cannabis use didn't change significantly in 2020 and 2021 compared to the pre-COVID period.

Discussion: The decrease of binge drinking and physical activity between preCOVID-19 and 2021 could be attribute by the restricting mobility and social interactions. We did not observe an increase in risky health behaviors as smoking and cannabis use. These behaviors remain to be monitored in the future to assess the long-term effects of the pandemic COVID-19 on student health behaviors

Key messages:

- Health-promotion strategies directed at adopting or maintaining positive mental health should be developed for university students to better manage future lockdown periods.
- Recommendations to maintain health during the ongoing COVID-19 pandemic specifically target university student populations are needed.

Abstract citation ID: ckac131.319
Positive Health and palliative care: an exploration among nurses

Cindy De Bot

C De Bot[1], J Dierx[1], M Echteld[2]
[1]Researchgroup Living in Motion, Avans University of Applied Sciences, Breda, Netherlands
[2]Researchgroup End of Life Care, Avans University of Applied Sciences, Breda, Netherlands
Contact: cma.debot@avans.nl

Background:

The current WHO definition of health seems to no longer meet the changes in the current Dutch health system. An alternative approach which puts emphasis on health, not disease, is Positive Health (Huber et al, 2011). This focus shifts the emphasis on improving resilience and well-being rather than the perspective on what is lacking in health.In this study, the attitudes towards the concept of Positive Health of palliative care nurses are examined.

Methods:

A mixed-methods approach design was used for this study. This involved the collection of both quantitative and qualitative data. Among the nurses, 134 questionnaires were administered. SPSS was used to analyze these results. For this study, six interviews were conducted and analyzed through thematic coding.

Results:

The quantitative analysis shows that the respondents are look positively about the Positive health description. Nurses find it important that it emphasizes that someone is more than his illness. In addition, the emphasis is on personal control. However, the question is also raised whether every patient can handle this. Nurses find the most important dimension 'quality of life'. This is followed by the dimension 'mental well-being' and 'spiritual existential'. The dimension 'daily functioning' is found to be the least important. The qualitative analysis also shows that the concept of Positive Health is viewed positively. The concept is considered positive, because it covers several areas of health. However, it was also indicated that the concept is still too broad. However, all respondents found that the concept can be applied in practice.

Conclusions:

This study shows that palliative care nurses have a positive attitude towards Positive Health. Nurses consider the all the dimensions important and also embed the aspects of it in their daily practice. However, the implementation of new concept should be explored.

Key messages:

- Palliative care nurses have a positive attitude towards Positive Health.

- The implementation of Positive Health in palliative care should be explored.

Abstract citation ID: ckac131.320
Assessing perceived and functional health literacy among Cypriot parents

Ioanna Menikou

I Menikou[1], N Middleton[1], E Papastavrou[1], C Nicolaou[1]
[1]Nursing, Cyprus University of Technology, Limassol, Cyprus
Contact: i.menoikou@euc.ac.cy

Background:
Health literacy (HL) refers to people's competencies in accessing, understanding, assessing and applying health information to meet demands in healthcare, preventing illness and promoting health. In the case of children, parental HL is important in establishing health-promoting behaviours and better health outcomes.

Methods:
A cross-sectional study was conducted among parents of children, aged 6 months to 15 years, in Cyprus with the aim of assessing perceived and functional HL. A convenience sample of parents presenting in pediatric outpatient departments in three Cypriot cities rated their HL using the HLS-EU-Q47 and the NVS (Newest Vital Sign), a performance-based measure of HL. Participants were classified according to the overall and domain-specific scores and associations with socio-demographics were explored.

Results:
HLS-EU-Q47 mean score among 416 parents (83.2% female, 83.8% tertiary education) was 35.30 (SD = 7.45). Based on suggested ranges, almost half (42.6%) were classified as having inadequate or problematic HL. Consistently, 62.8% showed high likelihood or significant possibility of limited functional HL, based on the NVS with a mean score of 2.73 (SD = 2.02). Competency of understanding health information was rated higher (37.71, SD = 7.39), whereas assessing health information was rated lower (33.55, SD = 9.05). Among the three domains of the HLS-EU-Q47, the highest mean score was for healthcare (36.16, SD = 7.04) and the lowest score for health promotion (34.60, SD = 8.88). Parental HL was statistically significantly associated with education and financial difficulties.

Conclusions:
Moderate-to-low levels of perceived HL appear consistent with a performance-based measure of HL. As a high number of parents may face challenges in assessing and applying health information to improve outcomes for their children, healthcare services should be oriented towards identifying problematic HL, while Public Health interventions are needed to enhance parental HL.

Key messages:
- According to both a perceived and a performance-based measure of health literacy, the study suggests that a high proportion of parents in Cyprus may have inadequate or problematic health literacy.
- Health education interventions within clinical settings as well as at Public Health level are needed to enhance parental health literacy, currently not standard practice.

Abstract citation ID: ckac131.321
Teachers at vocational schools as ambassadors for physical activity? Developing an empowering webinar

Holger Hassel

V Kaiser[1], E Foitzik[1], H Hassel[1]
[1]Institute for Applied Health Sciences, Coburg University of Applied Sciences and Art, Coburg, Germany
Contact: iag@hs-coburg.de

Background:
Childcare centres have the potential to promote health-enhancing physical activity (PA) in children. However, institutions with need for action seem to be hard to reach. During the project "QueB 2 - developing quality with and through physical activity" different strategies to empower multipliers in spreading awareness for PA were tested. Currently, the aim of the project is to involve teachers at vocational schools for early childhood education in order to sensitize prospective educators and ensure quality in planning interventions.

Methods:
The webinar was developed in three steps: (1) Four workshops were implemented in two vocational schools by participating 80 future educators to train them in planning PA interventions. (2) The collected students' recommendations and sample projects were categorized in eight steps of a theoretical model for project planning. (3) After finalizing the webinar, questionnaires were used to reflect on its application, utilization, and design.

Results:
The results of the second step were summarized in a manual for planning PA interventions in childcare centres. This forms the basis of the webinar to enable teachers to disseminate PA promotion in class. The developed modules were installed at a website and provided for free in order to be used by the interested public. In step three, teachers tested the webinar and filled in the questionnaire. The majority perceived the webinar as useful, appreciated its clear structure and appealing design, and expressed an increased awareness of factors concerning PA in childcare centres.

Conclusions:
Teachers at vocational schools perceived the webinar as useful to integrate parts of planning PA interventions in childcare settings in the curriculum. Transferring developed manuals and training modules to multipliers by providing an appealing, informative webinar seem to be a successful and sustainable way to ensure quality in planning processes.

Key messages:
- Involving teachers at vocational schools as multipliers for PA in childcare centres by performing a webinar is a sustainable strategy to maintain quality in intervention planning.
- Early childhood education students can act as ambassadors for PA.

Abstract citation ID: ckac131.322
What do future public health doctors know about the One Health concept in Portugal?

Ana Margarida Alho

AM Alho[1], R Vasconcelos[2], B Gomes[3], AB Nunes[4]
[1]ACES Lisboa Norte, Portuguese Association Public Health Doctors, Lisbon, Portugal
[2]ACES Oeste Norte, Portuguese Association Public Health Doctors, Caldas da Rainha, Portugal
[3]ACES Entre Douro Vouga I, Portuguese Association Public Health Doctors, Santa Maria da Feira, Portugal
[4]Portuguese Association Public Health Doctors, Lisbon, Portugal
Contact: margarida.alho@arslvt.min-saude.pt

Background:
The One Health (OH) approach brings together a transdisciplinary collaboration between human, animal, and environmental health, to tackle emerging zoonotic diseases, antimicrobial resistance, and food safety. Therefore, incorporating of OH principles in the education of health care providers is fundamental.

Methods:
To assess OH knowledge, attitudes and practices (KAP), an anonymous, multiple-choice, online self-administered survey was sent to 1st year Portuguese Public Health Medical Residents (PPHMR), during an online congress targeted to them. A descriptive analysis was performed.

Results:

A 50.0% response rate was obtained out of the 42 PPHMR attendees. Only 33.3% were familiar with OH concept; 57,1% had heard of it but were not aware of its meaning, and 9.5% had never heard of it. Concerningly, 9,5% believed zoonosis were diseases transmitted between animals and 42.9% considered that ''antimicrobial resistance'' is applied to antibiotics only. Regarding major zoonosis, etiologic agents were not recognized for Cryptosporidiosis (47.6%), Echinococcosis (42.9%), Toxoplasmosis and Leptospirosis (38.1%), Dermatophytosis (33.3%), Rabies (28.6%), Borreliosis/Brucellosis (23.8%). Half (52.4%) were unaware of the transmission route of Brucellosis/Dermatophytosis, followed by Leptospirosis (38.1%), Toxoplasmosis (28.6%) and Borreliosis/Rabies (23.8%). Remarkably, all participants showed willingness to be informed on OH issues and agreed that prevention and speed of intervention would be higher with greater collaboration between health technicians. About education towards OH throughout their medical curricula, 61.9% classified it as low, 23.8% as absent, 14.3% as sufficient and none classified it as adequate or very adequate.

Conclusions:

This is the first study assessing KAP regarding the OH concept among PPHMR. Results highlight the need to bring OH to the Portuguese medical schools' agenda to better prepare the next generation of PPHMR to the emerging health crisis.

Key messages:

- Despite the interest shown by 1st year Portuguese Public Health Medical Residents concerning One Health, a general lack of knowledge on the topic was found.
- The majority qualified as insufficient their training on this subject, highlighting the need for medical schools to improve education and raise awareness regarding this transdisciplinary approach.

Abstract citation ID: ckac131.323
Tools for assessing implementation of health promotion standards in hospital/health service settings

Keriin Katsaros

K Katsaros[1,2], *O Groene*[1,2]
[1]International Secretariat, International HPH Network, Hamburg, Germany
[2]Research & Innovation, OptiMedis AG, Hamburg, Germany
Contact: info@hphnet.org

The International Network of Health Promoting Hospitals and Health Services (HPH) was initiated by the World Health Organization as a settings approach toward reorienting health services. Over 600 members from 30 countries promote the integration of health promotion into the hospital/ health service setting. The International HPH Network developed the 2020 Standards for Health Promoting Hospitals and Health Services, representing years of experience and expertise reflected in 5 standards, 18 substandards, and 85 standard statements. Complementary self-assessment tools were developed to operationalize the standards and to identify concrete measurable elements against which each standard can be measured. The aim of the tools is to assist hospitals and health services in transforming the setting into a health promoting one. The standards are comprehensive and address topics to encourage the complete refocusing of an organization's strategy and to stimulate a process of continuous internal improvement. Standards address management, patient-centered care, occupational health, health literate organizations, environmental sustainability, and target groups such as the elderly and children and adolescents. Excel and pdf tools may be utilized by institutions to measure and track progress in implementing each of the standards. The tools state measurable elements for each standard that were identified by an expert panel of HPH members and external subject experts to be directly observable and applicable across various regional and institutional contexts. As part of internal and external assessment processes, standards can be rated on a scale from 1 (not implemented) to 10 (fully implemented). The tools store data and generate graphs that allow organizations to assess their level of performance, identify areas for improvement, and devise data-driven action plans.

Key messages:

- Progress towards transforming the setting must be tracked and included in an organization's continuous internal improvement processes.
- The transformation of the hospitals/health service setting into a health promoting environment results in better health outcomes for patients, families, the community, and the environment.

Abstract citation ID: ckac131.324
A whole-of-community approach to promote cardiovascular health: Healthy Communities in Moldova

Florence Secula

F Secula[1,2], *D Berari*[3], *A Curteanu*[3,4], *S Nicolaescu*[5,6], *H Prytherch*[1,2]
[1]University of Basel, Basel, Switzerland
[2]Swiss Tropical and Public Health Institute, Basel, Switzerland
[3]Healthy Life project, Swiss Agency for Development and Cooperation, Chisinau, Moldova
[4]Mother and Child Institute, Chisinau, Moldova
[5]Ministry of Health, Chisinau, Moldova
[6]School of Public Health Management, Chisinau, Moldova
Contact: florence.secula@swisstph.ch

A low-income country, Moldova is facing a rapidly growing burden of non-communicable diseases with a cardiovascular disease mortality rate of 202.2 per 100'000. Scarce resources require urgent preventative actions and involvement of communities and patients in the definition and design of locally relevant health promoting activities. Our intervention is a holistic, whole-of-community approach to foster local leadership in health promotion for the prevention of cardiovascular risks. The Healthy Life project to reduce the burden of non communicable diseases, funded by the Swiss Agency for Development and Cooperation (SDC), operates since 2016 in rural communities of Moldova. We present a 5-step model towards initiating Healthy Communities in Moldova based on 5 complementary steps:

1. Raising awareness on cardiovascular risk factors through community education seminars tailored to audience needs
2. Building multisectoral community coalitions for health between local elected leaders and community representatives around local health data and locally defined health priorities
3. Fostering community leadership in defining local health solutions through health asset mapping exercises
4. Community-led small projects based on identified needs and assets to improve local cardiovascular health
5. Empowering chronic patients for healthy behavior change through community-based self-management workshops

The Healthy Communities intervention was rolled out to 40 communities in 20 districts, reaching 1332 direct beneficiaries. Important learning emerged from social accountability mechanisms embedded in community coalitions which ensure regular, health-focused dialogue on community health. Using local assets to health problem solving is changing the perspective on the resourcefulness of community actors in health. Progress towards sustainability is achieved by local public authorities and community making a matching contribution to start-up funding to small projects.

Key messages:

- Our Healthy Communities model proposes a strength-based vision of health promotion which empowers community coalitions to self-organize for the prevention of cardiovascular risk factors.

- We promote bottom-up approaches that strengthen local health governance and community leadership into defining and addressing local health priorities.

Abstract citation ID: ckac131.325
Promoting health literacy during Covid-19 pandemic–valuable partnership with Portuguese pharmacists

Filipa Malcata

F Malcata[1], *B Raposo*[2], *D Costa*[2], *MT de Arriaga*[2]
[1]Public Health Unit, ACES Porto Ocidental, Porto, Portugal
[2]Directorate-General of Health, Lisbon, Portugal
Contact: filipamalcata@hotmail.com

Issue/Problem:

COVID-19 pandemic has amplified the amount of health information available; however, hard-to-reach populations remain and much of the information available is not accurate. Therefore, the use of new proximity approaches in the promotion of health literacy is essential because people face challenges and barriers when trying to find information relevant to them.

Description of the problem:

From the beginning of the COVID-19 pandemic in 2020, the Division of Literacy, Health and Wellbeing of the Directorate-General of Health in Portugal developed Social Mobilization and Community Engagement training sessions-which included a presentation and a toolkit of flyers/posters/videos. These sessions had the goal of disseminating public health measures through good practices in health literacy and communication methods/skills to promote efficient communication among people who play an active role (as microinfluencers) in prevention and mitigation of risks associated with COVID-19, as is the case of pharmacists.

Results:

A total of 200 Portuguese pharmacists enrolled on the Social mobilization training session in November 2021. More than 150 initiatives were implemented thereafter by those microinfluencers (pharmacists) in the local communities-31% directed to children or young people, 31% to older adults, and 13.8% to migrants or tourists. 70% of the participants considered the materials of the toolkit as adequate and sufficient, and 62.1% answered that people in the community showed interest for those materials available in the pharmacies.

Lessons:

This Social mobilization project was important because it assembled and preserved trust- basing the information of the training on reliable sources about COVID-19 virus. It also trained the microinfluencers (pharmacists) in communication strategies. All these approaches were important to prevent and mitigate the impact of COVID-19 via adoption of non-pharmacological measures and promotion of vaccination.

Key messages:

- Portugal was pioneer in promoting Social mobilization and community engagement training sessions, maintaining a proximity communication, tailoring the information, and maximizing its impact.
- Within the group of health professionals, pharmacists are a privileged group to promote these communication strategies and social mobilization due to their proximity with the local community.

Abstract citation ID: ckac131.326
Measuring the burden of infodemics on health outcomes through harmonized global metrics

Tina Purnat

A Ishizumi[1], *AG Dunn*[2], *T Purnat*[1], *B Yau*[1], *C Bertrand-Ferrandis*[1], *B White*[1], *S Briand*[1], *T Nguyen*[1]
[1]Epidemic & Pandemic Preparedness & Prevention, WHO, Geneva, Switzerland
[2]Biomedical Informatics and Digital Health, University of Sydney, Sydney, Australia
Contact: tina.purnat@gmail.com

Issue/problem:

Infodemics happen when an excess of information makes it difficult for people to discern what they see and hear to make good health decisions. Several challenges limit the usefulness of applying infodemiology research to the practice of managing infodemics including inconsistency in how information exposure is measured and a lack of focus on assessing associations with health behaviors.

Description of the problem:

In 2021, WHO partnered with the University of Sydney to develop a study toolkit. We sought to create novel tools for measuring information exposure that can be easily deployed, linked to surveys measuring health behaviors, and implements a standardized study protocol so that data can be directly synthesized into a global analysis of information risk factors associated with health behaviors.

Results:

A web-based study platform was developed, comprising tools for capturing information exposures within studies that link to health behavior surveys. The first tool is a smartphone application that asks users to actively record relevant information they see or hear in diary. The second application is a web browser plugin that passively tracks webpages with relevant keywords. Because localized studies follow a standardized protocol and de-identified participant data are recorded in a common format, local study investigators can opt-in to contributing study data to support global surveillance efforts.

Lessons:

Through standardization of measurement tools and relevant study protocols, the toolkit can be used to quickly collect and synthesize data for global or regional analysis of infodemics, including in Europe. Validation of the toolkit in the field is needed to inform its open-source release.

Key messages:

- A toolkit for measuring information risk factors associated with behavioral outcomes was developed.
- Global collaboration using the toolkit can improve synthesisability of studies investigating infodemic burden of disease.

Abstract citation ID: ckac131.327
The effect of alcohol marketing on people with, or at risk of, an alcohol problem: A rapid review

Tessa Langley

T Langley[1], *J Leonardi-Bee*[1], *A Barker*[1], *O Brown*[1], *R Murray*[1]
[1]School of Medicine, University of Nottingham, Nottingham, UK
Contact: tessa.langley@nottingham.ac.uk

Background:

Little is known about the impact of alcohol marketing on people with, or at risk of, an alcohol problem. A rapid review of primary studies was conducted with the aim of exploring the effect of alcohol marketing in this population.

Methods:

People with, or at risk of an alcohol problem were defined as people with an alcohol use disorder, in recovery from an alcohol use disorder, and hazardous and harmful drinkers. Searches for relevant literature were conducted through Medline, EMBASE and PsychINFO; reference list scanning and citation tracking of included studies; and grey literature searching of relevant websites. A narrative synthesis of included studies was undertaken.

Results:

The review included 11 studies, which focused on participants recovering from an alcohol use disorder (AUD, 6 studies) and those with hazardous or harmful consumption levels of alcohol (5 studies). 7 studies were quantitative and 4 were qualitative. The effect of alcohol advertising on alcohol use was only assessed in one small experimental study of young adult heavy drinkers, which found no apparent effect. Studies looking at other outcomes suggested that a significant proportion of people with or at risk of alcohol problems notice alcohol advertisements and can find them appealing, and that advertisements may have an effect on positive alcohol-related emotions and cognitions. Among people in recovery from an alcohol use disorder, findings suggested that there could be an effect on craving, and that alcohol marketing may be perceived to trigger a desire to drink.

Conclusions:

Several studies report effects of alcohol marketing which may translate into effects on consumption. There is also evidence that alcohol marketing is perceived to act as a trigger by people in recovery from alcohol problems. Further longitudinal and experimental research is needed to determine whether alcohol marketing has a causal effect on alcohol use in this population.

Key messages:

- The findings of the studies included in the review suggest that an effect of alcohol marketing in people with, or at risk of, an alcohol problem is likely.
- The impact of alcohol marketing on people with or at risk of an alcohol problem should be a concern for marketing regulators and a focus for future research.

Abstract citation ID: ckac131.328
Making Every Contact Count with people with MSK conditions: Exploring physiotherapist acceptability

Amelia Parchment

A Parchment[1], W Lawrence[3], E Rahman[4], N Townsend[1], E Wainwright[2], D Wainwright[1]
[1]Department for Health, University of Bath, Bath, UK
[2]Aberdeen Centre for Arthritis and MSK Health, University of Aberdeen, Aberdeen, UK
[3]MRC Lifecourse Epidemiology Unit, University of Southampton, Southampton, UK
[4]Public Health Workforce Development, Health Education England Wessex, Winchester, UK
Contact: adp56@bath.ac.uk

There are known risk factors that are associated with the onset and exacerbation of musculoskeletal (MSK) conditions and pain. Physiotherapists are uniquely placed to deliver brief interventions with their patients. Healthy Conversation Skills is the main training component of the Wessex approach to Making Every Contact Count. Despite its potential for promoting MSK health and wellbeing, there is no evidence to support its acceptability within MSK services. This is the first known study to explore the use and perceptions of the Wessex model of MECC HCS within MSK services. A mixed method design was used. Phase one employed an online questionnaire, open to all professionals trained in MECC HCS, consisting of items relating to implementation outcomes. Barriers and facilitators to delivery were explored and mapped to the Theoretical Domains Framework. Phase two invited physiotherapists for a follow-up interview and qualitatively explored their acceptability of delivering MECC HCS to patients with MSK conditions. MECC HCS was found to be highly acceptable, appropriate, and feasible. Physiotherapists reported using their skills at least daily but missed opportunities for delivering MECC HCS were evident. Barriers mapped mostly to ‘Environmental Context and Resources’ on the Theoretical Domains Framework. Qualitative themes developed during phase two were: ‘Recognising the patient as the expert supports change’, ‘MECC HCS improves physiotherapy practice’, ‘MECC HCS shared problem solving reduces workload’, ‘time as a perceived barrier to MECC HCS’ and ‘system-level support needed to sustain MECC HCS’. MECC HCS is a promising brief intervention for supporting people with MSK conditions. Further rollout of this intervention may be beneficial for meeting the goals of the NHS and Public Health England in prevention of MSK conditions and promotion of MSK health. Barriers associated with sustainability must, however, be addressed.

Key messages:

- Making Every Contact Count Healthy Conversation Skills is considered a highly acceptable brief intervention for supporting behaviour change in people with musculoskeletal conditions.
- Organisational, system-level barriers to implementation must be addressed in order to increase sustainability and enhance future roll out of the brief intervention.

Abstract citation ID: ckac131.329
Parents’ evaluations on the service delivery and communication skills of the pediatric dentists

Nevra Karamüftüoğlu

N Karamüftüoğlu[1], A Uğraş Dikmen[2], D Atabek[3], FS Korkmaz Öner[2], S Özkan[2]
[1]Pedodontics, Dentistry Faculty, Cyprus International University, Lefkoşa, Cyprus
[2]Public Health, Gazi University, Ankara, Turkey
[3]Pedodontics, Dentistry Faculty, Gazi University, Ankara, Turkey
Contact: nvrserbest@hotmail.com

Aim:

In the study,it was aimed that parents who need oral health services for their children for any reason should evaluate pediatric dentists in terms of service provision and communication skills.

Methods:

The study was conducted with 123 parents who applied to a private oral health clinic in Ankara between 20/06/2021-20/07/2021.For parents,10 descriptive and 20 face-to-face questionnaires questioning service delivery and communication skills on a 5-point Likert scale were applied.

Results:

The mean age of the participants was 40.9±5.9 years.Only 34.1%(n = 42) of the parents who needed oral health services for their children directly applied to the pediatric dentist,while the others 65.9%(n = 81) applied to dentists who were not pediatric dentistry specialists.The mean score of evaluation of parents’ pediatric dentists in terms of service delivery and communication skills is 4.16±0.44.When pediatric dentists were evaluated in terms of service delivery and communication skills.74.8%(n = 92) made the explanations in a way that they could easily understand,67.8%(n = 82) did not speak fast enough to prevent them from understanding the words,66.9%(n = 79) stated that they created an environment that respects privacy and 72.6%(n = 85) stated that they allocated enough time as “always”.

Conclusions:

As a result, it has been determined that the frequency of parents applying to physicians who are not pediatric dentists for their children’s oral health problems is high. However,the parents who applied to the pediatric dentist found the pediatric dentist to be more competent in terms of service delivery and communication skills.It is necessary to increase the awareness of the parents about the pediatric dentistry expertise.

Key messages:

- Parental evaluations of pediatric dentists regarding service delivery and communication skills are important.
- Oral health literacy of parents should be developed.

Contact: steven.laujac@univ-tln.fr

Background:

In children a sedentary lifestyle is associated with the development of chronic diseases, as well as unfavorable body composition and physical condition, lower levels of self-esteem, sociability, and school results. In Europe 39,8% of children (6-9 years) spend on average more than 2h/day in front of a screen, and 14,6% over 3h/day. In this context, designing and testing effective interventions to decrease sedentary behavior in children is a major public health research gap. The CIPRES intervention aims to reduce sedentary time in school-age children (7-10 years).

Methods:

The CIPRES intervention is co-constructed with key local actors, by using a socio-ecological approach, and theory-based on the transcontextual model. The intervention is evaluated by a cluster-randomized controlled study currently ongoing. The target population is made up of 1000 children from 13 primary schools (in years 4-5) from southeast of France with different levels of social deprivation. Main outcomes are assessed by accelerometer and questionnaires before (T0) and after a six-week intervention (T1) and include sedentary behavior, physical activity (PA) and variables of the transcontextual model.

Results:

Preliminary data were available in 152 children (53 intervention and 99 control). There was no significant difference across the time in sedentary time between intervention and control group (p = 0.11; $\eta^2 = 0{,}017$); however, moderate-to-vigorous physical activity (MVPA) tended to be better in intervention vs control (p = 0.06; $\eta^2 = 0{,}023$). In the intervention group, sedentary time and MVPA were significantly better across the time (p = 0.028 and p = 0.011, respectively) for children having a father with a university diploma as compared to children having a father with a lower education level.

Conclusions:

Preliminary results on a small group of subjects (n = 152) are encouraging and suggest a positive impact of the intervention on children. More results will be available by summer 2022.

Key messages:

- Based on the socio-ecological model, the CIPRES intervention aims to prevent sedentary in school-aged children.
- Preliminary data suggests a favorable impact of the intervention on physical activity.

Abstract citation ID: ckac131.331
Health literacy among older adults 77+ in Sweden

Josefin Wångdahl

J Wångdahl[1,2], J Agerholm[2,3], A Liljas[3], J Heap[2], C Lennartsson[2,4]
[1]Department of Public Health, Uppsala University, Uppsala, Sweden
[2]Aging Research Center, Karolinska Institutet and Stockholm University, Stockholm, Sweden
[3]Department of Global Public Health, Karolinska Institutet, Stockholm, Sweden
[4]Swedish Institute for Social Research, Stockholm University, Stockholm, Sweden
Contact: josefin.wangdahl@ki.se

Background:

Health literacy (HL) is an essential component of an individual's ability to gain access to, understand and use information to improve and maintain good health and is an important prerequisite for managing health and care needs. Therefore, knowledge on older people's HL is vital to meet the care needs of the rapidly aging population efficiently and equitably. Knowledge on HL in the older population is limited, both in an international perspective and in Sweden. Challenges linked to limited HL are expected to increase with advanced age, emphasizing the importance of conducting a study using a nationally representative sample of older adults. The aim of the study was to explore the level of HL in older adults living in Sweden.

Methods:

A cross sectional study using data from the Swedish Panel Study of Living Conditions of the Oldest Old (SWEOLD), which is a nationally representative sample of the Swedish population aged 77+ years (N = 1500). SWEOLD covers areas such as health, socioeconomic and social factors. HL is assessed with the communicative and critical health literacy scale. The data was collected through telephone interviews in fall 2021 and spring 2022. Respondents not able to answer themselves were excluded.

Results:

Preliminary results show that 49 % of the participating adults aged 77+ have limited HL. HL was significantly associated with age (77-85 years OR: 1.80; 86+ OR: 3.04), education level (OR: 1.76), vision (OR: 2.40) and cognitive ability (OR: 0.88). HL was not significantly associated with sex.

Conclusions:

These preliminary results shows that a large proportion of Swedish older people might face difficulties related to accessing, understanding, appraising, and applying health information in ways which promote and maintain good health, and stresses the importance of examining the topic in greater detail.

Key messages:

- A high proportion of older adults in Sweden have limited health literacy.
- Health literacy among older adults in Sweden varies with age, level of education, vision and cognitive ability.

Abstract citation ID: ckac131.332
Masculinity norms and help-seeking intentions after experiences of interpersonal violence

Nikola Komlenac

N Komlenac[1], E Lamp[1], F Maresch[1], M Hochleitner[1]
[1]Institute of Diversity in Medicine, Medical University of Innsbruck, Innsbruck, Austria
Contact: nikola.komlenac@i-med.ac.at

Background:

High levels of self-compassion might increase men's willingness to seek formal help, including those men, who rigidly conform to masculinity norms (CMN). However, self-compassion has rarely been considered as an enabling factor for women's help-seeking intentions. The current study analyzed the links between CMN, self-stigma, self-compassion and willingness to seek formal help after experiences of interpersonal violence (IPV) in women and men.

Methods:

A cross-sectional online-questionnaire study was conducted with 491 German-speaking participants (65.6% women/34.4% men; age: M = 36.1 years; SD = 14.2). Participants read three vignettes about experienced IPV. Afterwards, they indicated how likely they would be to seek medical or psychological help if they were in the main characters' situation. The Conformity to Masculine Norms Inventory, Self-Stigma of Seeking Help Scale, Self-Compassion Scale were used. Separate manifest path models were calculated for women and men.

Results:

CMN and low self-compassion were linked to strong self-stigma. In turn, strong self-stigma was associated with reduced help-seeking intentions. In men, the interaction term Self-Compassion x CMN on self-stigma indicated that strong CMN was linked to increased self-stigma, especially in men with low self-compassion. Also, indirect links between CMN and help-seeking intentions via self-stigma have been found. However, in people with strong self-compassion, direct links between CMN and help-seeking intentions became evident.

Conclusions:

In women and men self-compassion was linked to reduced self-stigma. As is suggested from past research, self-compassion might "buffer" the link between CMN and self-stigma, especially in men. However, there might be an influence of strong CMN on help-seeking intentions also in people with strong self-compassion. This route might not be mediated by self-stigma and therefore, future research is needed to detect other potential mediators.

Key messages:

- Self-compassion might "buffer" the link between CMN and self-stigma in men.
- Future research is needed to study mediators between strong CMN and help-seeking intentions in people with strong self-compassion.

Abstract citation ID: ckac131.333
Use of TikTok by nutrition healthcare professionals: analysis of the Italian context

Alessandro Durbano

A Durbano[1], *F Bert*[1], *A Pivi*[1], *G Lo Moro*[1], *G Scaioli*[1], *R Siliquini*[1,2]
[1]Department of Public Health Sciences, University of Turin, Turin, Italy
[2]A.O.U. City of Health and Science of Turin, Turin, Italy
Contact: alessandro.durbano@unito.it

Background:

Over the past 20 years, Social Media (SM) have become fundamental tools for quickly and effectively spreading health information in Europe. One of the most popular topics in the health sector is food and nutrition. TikTok is one of the most recent-born and most popular SM. Our study aims to analyze how healthcare professionals in the nutrition sector communicate through TikTok, and to assess characteristics of their accounts and videos.

Methods:

We included in the present study 53 Italian healthcare professionals who post videos on TikTok through a search on this SM using nutrition-related keywords. For each tiktoker, we described the characteristics of their last 10 videos, through an ad hoc checklist. We performed multilevel multivariable linear regression models in order to identify factors (healthcare professional or video related) that could be associated with a higher popularity of the video.

Results:

The 67.7% of the tiktokers considered were female; 46% had more than 30 years, 62.3% were biologists. The median number of likes was 300 (IQR 75 - 1070). The linguistic register was "formal" in the 11.3% of the videos. In the 31.9% of them, the location was the office of the healthcare professional. In the 67.3%, the topic was "diet-related". Multilevel multivariable linear regression models showed that "diet-related" topics were associated with more likes (coeff 1111.63, p = 0.048), and comments (coeff 13.42, p = 0.018).

Conclusions:

Many Italian nutrition professionals are present on TikTok, and perform videos in their offices discussing mainly diet-related topics. There are no specific factors associated with the popularity of their videos, other than the presence of "diet-related" topics. Since the TikTok audience is very young, and wrong messages on this topic could lead to serious health-related consequences, there is the need to pay a specific attention on the contents of the videos, to avoid the spread of potentially dangerous information.

Key messages:

- Italian healthcare nutrition professionals are present on TikTok and perform videos with diet-related contents in their workplaces.
- Since wrong information on diet and nutrition could lead to serious health consequences for the audience, it is important to monitor the content of the videos to avoid the spread of dangerous messages.

Abstract citation ID: ckac131.334
Moveluencer - movement promotion in the context of covid 19

Silvia Tuttner

S Tuttner[1], *P Holler*[1], *F Amort*[1]
[1]Health- and Tourismmanagement, Universitiy of Applied Sciences - JOANNEUM, Bad Gleichenberg, Austria
Contact: silvia.tuttner@gmail.com

In times of a pandemic, regular physical activity is recommended as protection against the additional stressors caused by a significantly changed daily routine and, above all, severe restrictions in social life. Within this context, promoting active mobility is a meaningful approach to improving the health of the population. The project 'MOVEluencer' is a physical activity promotion project following a multidimensional and participatory approach. It has been running since July 2021 in six small rural communities in Styria, a province of Austria (average: 2262 residents). These communities were selected based on inequality factors related to health and physical activity. The promotion of active mobility is at the heart of the project. The main target groups include children and adolescents, their parents, as well as older adults. The aim of the analysis phase was to identify infrastructural resources that are favorable to a physically active lifestyle through a photo contest. A total of 268 photos were sent in by 67 people (43% female). In spring 2022, 'movement events' were implemented to raise awareness in terms of active mobility among the population. These events were supplemented by the offer of fitness tests and approximately 265 persons (age: 10 to 84 years) participated. As a follow-on activity, 4 to 5 'walking buddies' will be trained in each community and they will subsequently offer regular walking meetings. In the 3rd project phase, specific physical activity programs will be developed and implemented together with the target groups of the project. Aspects for the sustainable anchoring of physical activity promotion are considered in each project phase. It has been shown that awareness of the health benefits of active mobility in rural areas is rather low. Therefore, improving lifestyle and infrastructural conditions as well as measures to promote physical literacy are important.

Key messages:

- Awarenes among the population regarding the health benefits of active mobility is low in rural areas.
- Social media campaigns to promote physical activity are successful in all age groups.

Hand Hygiene: do we know the WHO 5 moments?

Javier Baca Hidalgo

J Baca Hidalgo[1], *M Pérez Dionisio*[1], *V Salguero Cano*[1], *J Díaz Campanón*[1], *S Gutiérrez Linares*[1], *R Padilla Matas*[1]
[1]Medicina Preventiva, Hospital Universitario Clínico San Cecilio, Guadix, Spain
Contact: javier.baca.hidalgo@gmail.com

Background:

The proliferation of multi-resistant bacteria to antibiotics is one of the main global health problems of the 21st century. The World Health Organization (WHO) has listed antibiotic resistance as one of the top ten public health threats facing humanity. The hands become the main vehicle for transmission by contact of the microorganisms that cause healthcare-associated infections (HAIs). Its control provides a main point in patient safety. Hand Hygiene (HH) is a good practice consolidated in the technical guides of good practices for patient safety, being essential due to its easy use, low cost and effectiveness in preventing the cross-transmission of micro-organisms. Our objective is to analyze the knowledge of healthcare professionals in reference to HH according to the WHO's indications.

Methods:

Descriptive study through cross-sectional surveys based on the HH Knowledge Questionnaire for healthcare professionals translated by the Health Ministry, Social Policies and Equality of Spain and validated by the WHO, carried out voluntarily and anonymously between September 2021 and March 2022, prior and after training sessions in HH.

Results:

There were total of 558 surveys (questionnaires) with 57% correct answers in the questionnaires before training and 62.9% after the trainning. The highest percentage of correct answers, both before and after the trainning, correspond to the HH technique and the wrong ones are related to the 4th Moment and 3rd Moment of the WHO HH.

Conclusions/ recommendations:

Despite being immersed in a pandemic where adherence to the correct technique of HH has been revealed, the need for healthcare professionals to carry out continuous training regarding HH and Health-care associated infection (HAI) is unquestionable.

Key messages:

- Hand Hygiene is a crucial good practice to control Health-care associated infection.
- Continuous trainning improves compliance in Hand Hygiene.

Abstract citation ID: ckac131.336
Parent-child nature visits and young Finnish childreń nature connectedness

Carola Ray

C Ray[1,2]*, J Kokkonen*[1]*, N Simonsen*[1,3]*, N Wackström*[1]*, J Ray*[1]*, E Engberg*[1,4]
[1]Public Health, Folkhälsan Research Center, Helsinki, Finland
[2]Department of Food and Nutrition, University of Helsinki, Helsinki, Finland
[3]Department of Public Health, University of Helsinki, Helsinki, Finland
[4]Department of Psychology and Logopedics, University of Helsinki, Helsinki, Finland
Contact: carola.ray@folkhalsan.fi

Background:

It is well-known that frequent nature visits are associated with health benefits in children. Global climate crisis and environmental challenges emphasize the need for reconnecting children to nature, as well. Young children's nature connectedness (NC) involves enjoyment of nature, sense of responsibility, empathy, and awareness of nature. The study examines whether there is an association between the frequency of parent-child nature visits and young children's NC.

Methods:

The study uses WEB survey data from the Finnish Empowered by Nature project. Respondents, n = 1463, were parents of children aged 2 to 7 years old. NC was assessed by 11-items derived from the NC questionnaire of Sobko et al (2018). Multinomial logistic regression analysis was used and the lowest tertile of NC was used as reference group. Analysis were adjusted for child's age and gender, and highest education of parent.

Results:

Children with moderate (1-2 times a week in previous month) or high (3 times a week or more) frequency of parent-child nature visits were more likely to have strong than weak NC compared to children with low frequency (less than once a week) of adult-child nature visits. Odds ratios (OR) in adjusted models were: moderate frequency 1.67 (1.21- 2.32), and high frequency 2.31 (1.67-3.18). The odds of having medium NC compared to weak NC were more likely in moderate frequency compared to low frequency of parent-child nature visits in the adjusted model (OR 1.46; 1.07-2.00).

Conclusions:

The results highlight the importance of parents visiting nature frequently with their children during early childhood. It promotes young children's NC and may further contribute to raising environmentally responsible children.

Key messages:

- More frequent parent-child visits promote young children's nature connectedness which involves enjoyment of nature, sense of responsibility, empathy, and awareness of nature.
- A strong nature connectedness among children is highly relevant, as it may contribute to raise environmentally responsible children.

Abstract citation ID: ckac131.337
LärMiljö (Learning Environment) - study protocol: movement, outdoor learning and well-being in school

Nina Simonsen

N Simonsen[1,2]*, N Wackström*[1]*, J Ray*[1]
[1]Folkhälsan Research Center, Public Health Research Program, Helsinki, Finland
[2]University of Helsinki, Department of Public Health, Helsinki, Finland
Contact: nina.simonsen-rehn@helsinki.fi

Background:

Outdoor education (OE) is a teaching method aiming to promote children's learning, physical activity (PA) and wellbeing. OE in green areas may further increase positive effects. There is little knowledge on use of OE and its possible effects in a Finnish context. Also, there is a need to evaluate OE from a teacher perspective. The aim of the LärMiljö-study is to: a) survey the use of OE in Swedish-language primary schools and investigate factors related to its use; b) investigate the associations between OE and PA, wellbeing, nature relations and learning among children aged 9-13 years, considering other related factors.

Methods:

The self-determination theory (SDT) is used as theoretical framework. Data is collected via electronic surveys in Swedish-language primary schools, including: a) national surveys among principals and teachers; b) surveys among children and guardians. Children's PA is measured for a 7-day period via accelerometers and a diary is kept. Teachers keep a class diary on OE provided. Academic tests are performed. Data will be analyzed using quantitative methods.

Results:

This abstract describes the study protocol. The investigation of associations between OE and outcomes among children is mainly done by comparing classes that regularly use OE with classes that do not. Main outcomes are PA, psychosocial wellbeing, academic performance and nature connectedness; secondary outcomes are school motivation, social relations and sleep. Teachers' experience and use of OE is explored, as is perceived effects of and barriers to OE use. Based on SDT, associations between OE and need satisfaction at work, competence, motivation and work engagement are studied.

Conclusions:

The study represents a unique opportunity to explore OE use in primary schools, its effects among children and teachers, and what the supporting and hindering factors for its use are. The study contributes knowledge that can be used to promote learning and wellbeing in school.

Key messages:

- Outdoor education in primary school may promote school-children's learning, physical activity, wellbeing and nature relation, but more knowledge is needed, including the perspective of teachers.
- The LärMiljö-study will broaden the understanding of the potential effects of OE in primary education and school health promotion, and on factors supporting and hindering its use.

Abstract citation ID: ckac131.338
Digital Health Literacy in the Training of Informal Caregivers – Community Intervention

Andreia Costa

D Águas[1,6], M Paço[1], A Henriques[2,3], M Arriaga[4,5], A Costa[2,3,5]
[1]USF, ACES Lisboa Norte, Lisbon, Portugal
[2]Centro de Investigação, Inovação e Desenvolvimento em Enfermagem de Lisboa, Escola Superior de Enfermagem de Lisboa, Lisbon, Portugal
[3]Instituto de Saúde Ambiental, Faculdade de Medicina da Universidade de Lisboa, Lisbon, Portugal
[4]DGS, Direção-Geral da Saúde, Lisbon, Portugal
[5]Católica Research Centre for Psychological, Family and Social Wellbeing, Universidade Católica Portuguesa, Lisbon, Portugal
[6]ESEL, Escola Superior de Enfermagem de Lisboa, Lisbon, Portugal
Contact: andreia.costa@esel.pt

Background:

Health Literacy allows optimizing healthy lifestyles and preventive and health protective behaviors (DGS, 2019). Low literacy can lead to a greater number of hospitalizations, a more frequent use of emergency services and a lower prevalence of preventive attitudes in the field of health. Internet-based interventions could have a positive impact on informal caregivers, reducing the geographical barrier, promoting self-efficacy in managing their own emotions, reducing burden.

Aim:

Contribute to the training of informal caregivers of a primary health care unit in Lisbon, through the promotion of digital health literacy.

Methods:

The Community Intervention project was carried out in the context of a home visit, focusing on 11 informal caregivers, through the presentation of an interactive digital manual. It was based on the methodology of health planning, through the elaboration of a diagnosis of the situation, definition of priorities, setting of objectives, selection of strategies, operational preparation and evaluation (Imperatori & Giraldes, 1993).

Results:

It was found that not all informal caregivers have access to the internet or digital technologies, and it was necessary to deliver the printed manual. Caregivers who accessed the interactive digital manual rated its content as very important, having accessed the suggested links without difficulty. The possibility of forwarding the digital manual to other caregivers was valid for all.

Conclusions:

Digital technologies promote communication in terms of health promotion, contributing to universal access and digital training in health, giving individuals the opportunity to increase care for their own health. The creation of digital health tools must be directed to the characteristics of the population. For individuals with low digital literacy, simple technologies must be created and for those who cannot or do not want to use digital tools, adequate alternatives must be created.

Key messages:

- Primary care health professionals may use digital technologies to promote health literacy.
- Vulnerable groups with low digital health literacy need support to increase access to digital technology that can promote health literacy.

[5]Life and Health Sciences Research Institute, University of Minho, Braga, Portugal
[6]School of Medicine, University of Minho, Braga, Portugal
Contact: rrosario@ese.uminho.pt

Background:

Noncommunicable diseases (NCDs) share key determinants like unhealthy diet, unhealthy 24h- movement behaviour (sleep, sedentary behaviour and physical activity), leading to other risks including overweight, obesity and raised blood pressure. Although the manifest of the NCDs in childhood is rare, risk behaviours, obesity, and raised blood pressure that accelerates their development begin during childhood. The current study aims to analyze the effectiveness of the intervention program based on the promotion of health literacy and lifestyles, on children's health literacy, lifestyles (e.g. dietary intake, 24hmovement behaviour) and overweight and obesity.

Methods:

478 children (6 schools) aged 6-12years old will participate in this cluster-randomized trial, having schools as the unit of randomization, assigned into intervention (239-3schools) and the control arm (239-3schools). This project is currently performing social listening (online and offline) and stakeholders' involvement. Data collection includes sociodemographics, health literacy and infodemic resilience, dietary intake and children's 24-h movement behaviour (e.g. accelerometry), anthropometry (e.g. weight, height and waist circumference) and blood pressure. It will occur at baseline and after the intervention (follow-up, 6 months after the beginning of the intervention).

Results:

Expected outputs and outcomes include the 1-creation of a model for characterizing NCDs and health topics based on artificial intelligence techniques (e.g. deep learning, social network analysis methods).2- improved health literacy and infodemic resilience of children, families and teachers.3- enhanced children's lifestyles. 4- reduce NCDs' physical risk factors (e.g. overweight, raised blood pressure).

Conclusions:

A feasible intervention program for school-aged children with vulnerabilities enhances tailored policies about health promotion and NCDs' prevention, respecting the contextś singularities.

Key messages:

- Health promotion and NCDs prevention are crucial for the well-being of our societies.
- Feasible intervention programs advocates for evidence-based policies that respect local singularities.

Contact: aurelie.bocquier@univ-lorraine.fr

Background:

HPV vaccine coverage (VC) in France has always been lower than in most high-income countries. The French authorities launched in 2018 the PrevHPV national research program aimed at codeveloping with stakeholders and evaluating the impact of a multicomponent intervention to improve HPV VC among French adolescents.

Methods:

We identified three components to address main barriers to HPV vaccination in France: adolescents' and parents' education and motivation (component 1); general practitioners (GPs)' training (component 2); and access to vaccination at school (component 3). We developed the intervention using the UK Medical Research Council framework for developing complex interventions as a guide. We used (i) findings from published evidence; (ii) primary data on knowledge, attitudes, behavior and preferences collected through a mixed methods approach (quantitative/qualitative studies, discrete choice experiment); (iii) the advice of stakeholders (e.g., adolescents, parents, school nurses, GPs) involved in working groups. We will evaluate the effectiveness, efficiency and implementation of the components (applied alone or in combination) through a pragmatic cluster randomized controlled trial. The primary endpoint is the HPV VC ($\geq$ 1 dose) among adolescents aged 11-14 years, 2 months after the end of the intervention, at the municipality level.

Results:

Primary data highlighted the need to improve adolescents, parents and school staff knowledge on HPV and to help GPs communicate with patients on this topic. They provided guidance on the most effective communication contents. For each component, we codeveloped tools with a participatory approach (e.g., eHealth tools for adolescents, a decision aid tool for GPs). The trial will end in June 2022; 90 middle schools (i.e., about 40,000 adolescents) and 46 GPs accepted to participate.

Conclusions:

Should the intervention prove effective, results from the implementation evaluation will help us refine it before scaling it up.

Key messages:

- The PrevHPV study is supported by the French health authorities and conducted by a multidisciplinary consortium to tackle a long-lasting public health concern in France.
- It will add to the small number of studies that compared the effectiveness of various strategies to promote HPV vaccination and will provide key results on cost-effectiveness and implementation.

Abstract citation ID: ckac131.341
Sport federation investment in health promotion: program implementation and viability

Aurélie Van Hoye

A Van Hoye[1], C Regan[2], A Lane[3], B Cullen[4], A Vuillemin[5], C Woods[1]
[1]Physical Education and Sport Sciences, University of Limerick, Limerick, Ireland
[2]Community and Health Department, Gaelic Athletic Association, Dublin, Ireland

[4]Innovation and Research, Sport Ireland, Dublin, Ireland
[5]LAHMESS, Université Côte d'Azur, France, France
Contact: aurelie.vanhoye@ul.ie

Background:

Researchers have called for a better recognition of the potential of sports clubs for health promotion (HP), but less is known on the support provided by sports federation. The present study analyses the the implementation of the Gaelic Athletics Association (GAA) Healthy Club Project, to investigate its organization's viability.

Methods:

A single case study was realized, based on observation, document analysis and interviews, to document the viable system model.

Results:

Results have identified a three-level structure, where 6 employees at national level support the work of 28 volunteer's county health and well-being officers and 439 clubs implicated. Strengths of the organization are the identification of a single national referent for clubs or county, the learning process and openness to novelty, as well as the enhanced workforce through county implication as role model. Challenges are the financial and human resources provision, the ability to implicate county and club board and the training in HP of volunteers. Interlevel relationship are supported by the creation of a community of practice and the centralization of the project at national level, but hindered by a clear definition of county tasks. The strengths of the controlling system include a steering committee implicating partners completing each other and the proper use of evaluation to build evidence on the project, where challenges remains in wider collaboration within the GAA.

Conclusions:

The present work has underlined key scaling up factors of the HCP implementation to support its viability, which could be learnt from other sports federation implementing HP interventions.

Key messages:

- Sports federation have a key role to play to support sports clubs to promote health, by developing specific programs.
- Health Promotion development in sports clubs has similar scaling up implementation factor than other public health interventions.

Abstract citation ID: ckac131.342
Impact of a multidisciplinary intervention on Mediterranean diet adherence and cardiovascular health

Eleonora Marziali

E Marziali[1], S De Marco[2], L Nachira[1], P Arcaro[1], F D'Ambrosio[1], L Villani[1], V Galasso[3], P Laurenti[1,4], S Bruno[1,4]

[4]Department of Woman, Child Health and Public Health, Fondazione Policlinico Universitario A. Gemelli IRCCS, Rome, Italy
Contact: eleonora.marziali@outlook.com

Background:

Cardiovascular diseases represent a significant public health issue, and the promotion of healthy lifestyles plays a major role in their prevention. Good adherence to the Mediterranean diet has a protective effect on cardiovascular health and may reduce the risk of developing cardiovascular disease. Our prospective study aimed to evaluate the impact of educational lifestyle interventions on cardiovascular risk parameters and the improvement in adherence to the Mediterranean diet of the involved population.

Methods:

Participants have been recruited by General Practitioners in Torresina neighborhood in Rome. From December 2018 to June 2020, 41 patients were involved in nutritional, psychological, and physical activity meetings by a multidisciplinary team of healthcare professionals. In particular, a nutritionist provided information to patients on balanced nutrition, considering the Mediterranean diet as a dietary model. Information on lifestyle, dietary habits and physical activity, anthropometric data and laboratory measurements were collected at baseline and after 12 months. The variations of the evaluated parameters were analyzed by paired t-test e Wilcoxon signed-rank test.

Results:

The analysis showed statistically significant decreases in weight ($p = 0.03$) and BMI ($p = 0.02$), as well as in systolic ($p < 0.001$) and diastolic ($p = 0.001$) blood pressure and in total ($p = 0.02$) and LDL ($p = 0.01$) cholesterol level. Results also showed an improvement in the adherence to the Mediterranean diet ($p = 0.001$): the frequency of consumption of fruits and vegetables, legumes, cereals and fish has increased significantly, while the consumption of meat, milk and dairy products and alcohol decreased.

Conclusions:

This study highlights that a multidisciplinary educational program can be effective in improving healthy habits and in reducing cardiovascular risk factors, supporting its implementation in primary prevention at the community level.

Key messages:

- Promoting healthy lifestyle through primary prevention and health promotion actions is critical to reduce the onset of cardiovascular diseases.
- A population-based multidisciplinary educational intervention may be effective in improving adherence to a healthy, balanced diet and decreasing cardiovascular risk factors.

Crowdsourcing to Reduce Stigma Around HIV testing Among Adolescents and Young Adults in Kazakhstan

Gaukhar Mergenova

G Mergenova[1], D Gryazev[1], A Kuskulov[2], Y Sun[2], S Landers[2], A Tolegenova[3], V Gulyayev[1], P Gulyayev[1], A Davis[2], JasSpark Study Research Group[2]

[1]Global Health Research Center of Central Asia, Almaty, Kazakhstan
[2]School of Social Work, Columbia University, New York, USA
[3]Epidemiology, Asfendiyarov Kazakh National Medical University, Almaty, Kazakhstan
Contact: gaukhar.mergenova@gmail.com

Background:

New cases of HIV infection are increasing among adolescents and young adults (AYA) in Kazakhstan, and now account for over 23% of all HIV infections. Testing is key to reducing new infections, yet HIV-related stigma is a major barrier. Crowdsourcing contests could engage AYA in the development of interventions and increase the likelihood that an effective approach will be developed to reduce stigma and increase HIV testing among Kazakhstan AYA.

Objective:

To determine the response to a crowdsourcing approach to collect media content for the development of an intervention focused on HIV testing stigma reduction among AYA in Kazakhstan.

Methods:

To organize the crowdsourcing contest we organized a community steering committee; developed platforms to solicit crowd input; engaged AYA to contribute ideas through social media and in-person events. We present data on social media use and contributions.

Results:

The contest website was visited by 2,893 people, and 76 AYA submitted 91 works for the contest from all over Kazakhstan. Most AYA (60%) visited the website of the contest via social media. Types of submitted content for the contest included video: 31 (34.0%), pictures: 29 (31.8%), text: 24 (26.3%), and other types of content including a chatbot, online game, and website: 7 (7.6%). Fifty (65.7%) participants were between 13-19 years, and 26 (34.2%) were between 20-29 years. Thirteen (17.1%) submissions were in Kazakh, and the rest in Russian 63 (82,9%). A number of submissions required further guidance due to a lack of understanding about stigma, accurate facts, and copyright issues.

Conclusions:

AYA engaged in a crowdsourcing contest and used multiple modalities/types of content, from younger and older AYA, in both Kazakh and Russian, and representation from most regions of the country. Providing clearer guidance about facts and stigma may be helpful prior to submission.

Key messages:

- Crowdsourcing approach has a potential to engage adolescent and young adult into development of various types of media content focused on public health issues, such as HIV testing stigma reduction.
- Adolescents and young adults may need additional information and guidance regarding complex concept of stigma around HIV testing.

Abstract citation ID: ckac131.344
Attitudes of university students towards mandatory COVID-19 vaccination: a cross-sectional survey

Antonio Sciurti

A Sciurti[1], V Baccolini[1], E Renzi[1], G Migliara[1], C De Vito[1], C Marzuillo[1], P Villari[1]

[1]Department of Public Health and Infectious Diseases, Sapienza University of Rome, Rome, Italy
Contact: antonio.sciurti@uniroma1.it

Background:

Vaccination is an effective public health measure to control the COVID-19 pandemic. In Italy, vaccination against SARS-CoV-2 was made compulsory by law for some job categories, such as healthcare and education workers. Although students required a valid COVID-19 certificate to access university, they were never subjected to mandatory vaccination. In this context, we investigated their attitudes towards mandating COVID-19 vaccination to be able to access schools and universities.

Methods:

We conducted a cross-sectional survey from September 2021 to February 2022. A multivariable logistic regression model was built to identify predictors of positive attitudes towards the outcome. Adjusted odds ratio (aOR) and 95% confidence intervals (CIs) were calculated.

Results:

We collected 5287 questionnaires, grouped into three periods (September-October 2021, November-December 2021 and January-February 2022). The highest proportion of students supporting COVID-19 mandatory vaccination (62.5%) was found between November and December 2021. Multivariable analysis showed that November-December and January-February participants had higher odds of having a positive attitude towards the vaccine mandate than September-October respondents (aOR = 1.26, 95% CI:1.09-1-48; and aOR = 1.22, 95% CI:1.01-1.48). Other positive predictors were age (aOR = 1.01, 95% CI:1.01-1.03), higher levels of perceived COVID-19 severity (aOR = 1.09, 95% CI:1.05-1.14), concern for the emergency (aOR = 1.09, 95% CI:1.05-1.14), getting vaccinated for fear of infecting other people or being infected (aOR = 1.08, 95% CI:1.04-1.12; and aOR = 1.07, 95% CI:1.03-1.10) and believing that vaccines could end the pandemic (aOR = 1.49, 95% CI:1.41-1.56).

Conclusions:

Attitudes towards COVID-19 mandatory vaccination changed over time, probably in relation to the pandemic trends. Moreover, feeling involved in the pandemic situation seems to be related with a positive attitude.

Key messages:

- Pandemic trends may affect the attitude towards vaccine mandates. Mandating vaccines to access universities could be taken into account in emergency situations to ensure a safer learning environment.
- Involvement in the pandemic situation seems related with a supportive attitude towards vaccine mandates, suggesting that awareness is a key factor to be addressed to implement mandatory vaccination.

[3]Medical Sciences - Germ Protection, Reckitt, Hull, UK
[4]New Growth Platforms, Reckitt, Slough, UK
Contact: lisa.ackerley@reckitt.com

The COP26 conference in Glasgow, November 2021 presented a unique public health challenge in the midst of the COVID-19 pandemic. With 38,457 delegates attending, this international event posed a risk for SARS-CoV-2 infection. We used Targeted Hygiene theory to carry out a large event risk assessment process that focused on how spaces were used, referred to evidence from scientific literature, and identified key moments for surface and hand hygiene interventions. We relied on behavioural science evidence to optimize hand hygiene compliance at the event. To do so, we secured the opportunity to use hand sanitizer by determining the most suitable locations for over 500 hand sanitizing stations. To further motivate uptake of personal hygiene, kits were provided for each delegate with hygiene messaging to improve knowledge of the importance of hand hygiene in breaking the chain of infection. A COP26-branded face covering, personal hand gel and wipes were provided in the pack. Training and cleaning protocols centred on Targeted Hygiene were developed for cleaning teams to implement. Compliance monitoring through observation and daily real-time reporting of over 250 adenosine triphosphate (ATP) checks on just-cleaned surfaces provided reassurance for public health agencies that our Targeted Hygiene approach was effective.

The messaging and cleaning interventions were carried out for the duration of the COP26 conference. The number of individuals officially affiliated with COP26 that tested positive was ∼2 in 1,000 as compared to ∼11-12 in 1,000 individuals in Scotland during the same period (6-13 November 2021 as reported by Public Health Scotland). Whilst no single control can be attributed to this achievement, effective hand and surface hygiene interventions contributed by helping to break the chain of infection. This risk-based approach to Targeted Hygiene serves as a blueprint for effective, sustainable and measurable nonpharmaceutical interventions at large scale events.

Key messages:

- To mitigate risk of infection at COP26, key moments for surface and hand hygiene were identified and emphasized in cleaning protocols and education.
- Using a risk-based approach to Targeted Hygiene serves as a blueprint for effective, sustainable and measurable non-pharmaceutical interventions at large scale events such as COP26.

Abstract citation ID: ckac131.346
The effect of social desirability bias on the measurement of subjective health literacy of children

Torsten Michael Bollweg

T Bollweg[1], *O Okan*[1]
[1]TUM Department of Sport and Health Sciences, Technical University Munich, Munich, Germany
Contact: torsten.bollweg@tum.de

Background:

When measuring children's health literacy (HL) with self-report questionnaires, there is doubt whether high scores reflect good HL, or if they are caused by social desirability bias, meaning that children present themselves favorably. This study explores how the tendency to answer in a socially desirable way impacts HL scores.

Methods:

A cross-sectional study was conducted among fourth-graders in North-Rhine Westphalia, Germany. The study was designed as a representative survey starting in 12/2020, which could not be realized due to pandemic-related constraints. Data collected between 07/21 and 11/21 is included here. Subjective HL was assessed with the HLS-Child-Q15 and a validated 10-item scale (AFS) was used for social desirability bias. Also included in linear regression explaining HL scores are age, sex, country of origin, home language, family affluence (FAS), interest in learning new things about health, the belief that parents are able to answer own questions about health and frequency of conversations with parents about health. Variables were dichotomized where necessary.

Results:

$n = 364$ students are included (49.5% female). Mean age is 9.5 years ($SD = .69$). In the regression model ($F(9, 271) = 6.724$, $p<.001$), which explains 15.5% of variability in HLS-Child-Q15 scores, frequency of communication about health at home ($\beta = .147$, $p<.01$), interest in learning about health ($\beta = .268$, $p<.001$), and the belief that parents are able to answer own questions about health ($\beta = .209$, $p<.001$) are the only significant predictors. Sociodemographic variables and the tendency to answer in a socially desirable way don't have a significant effect on HL.

Conclusions:

Our findings suggest that social desirability is not a significant source of bias when measuring children's HL with the HLS-Child-Q15. Communication about health at home and children's interest in health seem to be much more important for children's HL. Further research is necessary to verify these findings.

Key messages:

- Social desirability doesn't seem to be a source of bias when measuring children's HL with the HLS-Child-Q15.
- Speaking about health at home and children's interest in health are important predictors of HL.

Abstract citation ID: ckac131.347
Facemasks and Public Health: analysis of bacterial contamination in FFP2 masks

Gaia Papale

G Papale[1], *I De Palma*[2], *D Amodeo*[2], *G Messina*[1]
[1]Department of Molecular Medicine, University of Siena, Siena, Italy
[2]Department of Medical Biotechnologies, University of Siena, Siena, Italy
Contact: gaia.papale@student.unisi.it

Background:

Facemasks (FM), due to the Covid-19 pandemic, are extensively used and often worn beyond the recommended time. This has led to questions about the negative impact persistent contamination on FMs might have on public health. The study aims to assess the level of contamination reached in a small cohort of subjects after the recommended use (8 h) of FM.

Methods:

This descriptive study was carried out between January and April 2022 on 17 people: 9 women and 8 men aged between 25-45 years. These two groups were divided into two micro-groups: women were selected according to their skincare habits (no skincare and skincare with cosmetics). In contrast, men were selected according to the length of their beards (thick or short beard). The FM was worn for 8 h in a controlled office setting, to avoid possible uncontrolled variables. Then, the FM was cut, placed in a tube with a recovery medium and centrifuged. The supernatant was removed and the pellet resuspended. Aliquots were plated on Petri plates and incubated for 48 h at 36 °C to count the Colony Forming Units (CFU). The statistical analysis was conducted using Stata software, performing the Wilcoxon matched-pairs and setting a significance level of $p < 0.05$.

Results:

Women had higher FM contamination than men (= 4960 vs 3130 CFU/ml). Also, we found more colonies (= 18890 vs 3420 CFU/ml) in the FMs of women without skincare ($p = 0.06$), while among men, more colonies were reported for those with a thicker beard than for those with a shorter one (= 3300 vs 2960 CFU/ml).

Conclusions:

Extensive FM use increases bacterial contamination exponentially. This could lead to changes in the facial microbiome, inducing skin conditions (such as allergic dermatitis and acne). Facial skin conditions are important public health issues for people wearing FMs daily. In addition, responsible handling of this equipment is essential to avoid the spread of SARS-CoV-2 through contact with these items, which can persist for many days.

Key messages:

- Gender and physical characteristics may influence the level of contamination present on FFP2 face masks.
- There is a need to increase community awareness on the proper handling of facemasks, prevent health problems for users, and limit the spread of infection to those around them.

Contact: vgallinoro@gmail.com

Gender appears to be a strong predictor of online health information-seeking behaviour (OHISB). Gender differences in OHISB have been studied in different countries with different results, but no studies investigated gender-specific behaviour among University students during the COVID-19 pandemic, which has brought with it a consequential infodemic. We sought to investigate any gender differences in OHISB in the period between the first and the second wave of the COVID-19 pandemic. A questionnaire promoted by the COVID-HL network was administered to 2996 students of all the courses at the University of Florence. It included existing validated scales adapted to the COVID-19 pandemic and newly developed scales. Gender differences were tested using the χ2 test or the Mann-Whitney U test, where appropriate. Male students reported a higher score in DHL than females ($p < 0.001$). However, female students reported using more often different sources for online information seeking ($p < 0.05$, except for YouTube), searching more corona-related topics ($p < 0.05$, except for economic and social consequences) and considering "very important" each item in the "Importance of internet information search" section ($p < 0.05$). Furthermore, female students are more likely to be "often dissatisfied" or "partly satisfied" with information about COVID-19 ($p < 0.001$) and to search more often for information for themselves and other people. Our study confirmed that gender could affect the way students search for health information on the Internet. Since students, in particular females, have been affected by stress and anxiety during the pandemic, these findings could help institutions to promote gender-specific education programmes to improve students' DHL and their mental health outcomes, as well as to provide health information that fit specific gender needs.

Key messages:

- Gender influences how university students search on the Internet for health information.
- This should guide institutions to better address educational programmes to improve their Digital Health Literacy.

[5]Centre Hospitalier Universitaire Androva, Mahajanga, Madagascar

[6]University Fianarantsoa, Fianarantsoa, Madagascar

Contact: sarah.gruninger@bnitm.de

Background:

Infections with S. haematobium are endemic in tropical regions and emerging in some European countries. Prolonged chronic infection with S. haematobium can cause Female Genital Schistosomiasis (FGS), which can lead to serious gynecological conditions, including infertility. However, awareness of FGS is limited, as are adequate guidelines and public health strategies to manage the disease. The aim of this study is to determine the levels and quality of FGS awareness among women and healthcare workers (HCW) in the Boeny region of Madagascar, where the disease is endemic.

Methods:

Data collection involved a cross-sectional survey of adult women ($n = 694$) and HCWs ($n = 93$) on topics, such as respondents' sociodemographic background characteristics, FGS awareness, and risk perceptions. Results were analyzed using descriptive statistics including proportions and 95% confidence intervals.

Results:

Of the 694 women included in the study, 11.2% (CI [9.0-13.8%]) had heard of FGS. Among these, 34.6% (CI [24.1-46.2%]) were unaware of the gynecological symptoms signature for FGS, and 41% (CI [30.0-52.7%]) were unaware of the urological symptoms of the disease. Out of the 93 HCW surveyed, 53.2% (CI [42.6-63.6%]) had heard of FGS. Among these, 42.0% (CI [28.1-56.8%]) were unaware of the gynecological symptoms, and 52.0% (CI [37.4-66.3%]) were unaware of the urological symptoms.

Conclusions:

Preliminary results show overall low levels of FGS awareness among the study population. While more women reported to have never heard of FGS than HCW, the proportion of HCWs who did not know the gynecological and urological symptoms of FGS was higher. Given the occurrence of FGS in Europe and the chronic character of the disease it would be crucial to conduct similar investigations in Europe. Such findings can contribute to the design of targeted local and global FGS awareness campaigns to improve the health of women affected by this disease worldwide.

Key messages:

- Awareness of FGS among the study population in Madagascar, an endemic country, is low.
- Lack of awareness can delay the identification of the disease and increase individual and community burden.

Abstract citation ID: ckac131.350
The role of health literacy in vaccination behaviours: a systematic review

Claudia Isonne

LM Siena[1], *C Isonne*[1], *A Sciurti*[1], *MR De Blasiis*[1], *G Migliara*[1], *C Marzuillo*[1], *C De Vito*[1], *P Villari*[1], *V Baccolini*[1]
[1]Public Health and Infectious Diseases, Sapienza University, Rome, Italy
Contact: claudia.isonne@uniroma1.it

Background:

Health literacy (HL) is recognized as a driver of health-promoting behaviors, including preventive actions. However the influence of HL on vaccines uptake remains unclear. This study aimed at summarize the evidence on the role of HL in vaccination behaviors.

Methods:

PubMed, Scopus, and Web of Science were searched. Observational studies of any design conducted worldwide, published through June 2021 and investigated the association between HL and vaccination intention or status using HL validated tools were included. Any vaccine was considered. An adapted Newcastle-Ottawa Scale was used to assess quality.

Results:

Twenty-one articles were included, 6 investigated intention to vaccinate and 15 explored vaccination status. Studies of the first group had a cross-sectional design, considered anti-COVID-19 vaccination and were judged of high or fair quality. Population investigated was heterogeneous as well as the tool used to assess HL. Five analysis provided adjusted estimates. HL seemed not influence the vaccination intention in 3 studies whereas adequate HL was associated with positive attitude to get vaccinated in the remained 3 ones. The majority of articles assessed vaccine status, had a cross sectional design (N = 11) and were of high quality (N = 8). The HL tool more frequently used was TOFHLA (N = 5), sample investigated was heterogeneous included parents of children who received vaccinations (N = 5). Four articles considered multiple vaccinations, thus providing a total of 19 analysis. Vaccine against influenza was the most investigated (N = 11) and 15 studies provided adjusted estimates. No association was found between HL and the receipt of vaccination in 11 analysis, whereas HL levels significantly influenced vaccination uptake in 8 studies.

Conclusions:

Health literacy did not seem to strongly influence people decision on vaccinations. Difference in population and vaccines considered, but also in tool used to measure HL might explain the heterogeneity of the results.

Key messages:

- The impact of HL on vaccination behaviours remains controversial.
- Efforts to extend the studies on targeted populations applying a comprehensive HL measurement tool should be devised.

Covid-19 vaccination adherence and correlated factors in patients with substance use disorders

Francesco Mondera

F Mondera[1], *GFM Direnzo*[2], *V Cammalleri*[1], *FM Forestiero*[1], *F Turatto*[1], *V Baccolini*[1], *C Marzuillo*[1], *M Barra*[2], *P Villari*[1]
[1]Department of Public Health and Infectious Diseases, Sapienza University of Rome, Rome, Italy
[2]Fondazione Villa Maraini, Rome, Italy
Contact: francesco.mondera@uniroma1.it

Background:

Analyzing trends and patterns of vaccination during COVID-19 pandemic is important to understand how current policies are working. Evidence regarding the general population is already available, but hard-to-reach populations as migrants or minorities, but also people suffering from a Substance Use Disorder (SUD), have not been fully explored. To understand the extent of vaccine adherence and evaluate associated factors in this population subgroup, we conducted a cross-sectional study in collaboration with Villa Marini Foundation, national agency of the Italian Red Cross for pathological addictions.

Methods:

We developed a questionnaire regarding COVID-19 vaccination, adherence to prevention measures, concerns about COVID-19 and questions relating to drug use that we administered to each participant. Only people aged over 18 with a diagnosis of SUD were included in the study. A multivariable logistic regression model was built to identify the predictors associated with anti-SARS-CoV-2 vaccination, estimating adjusted odds ratios (aOR) and 95% confidence intervals (CIs).

Results:

We recruited 200 participants between December 2021 and January 2022. Most respondents were male (84.5%), Italian (72%), aged 44 years on average. A total of 40 patients (20%) reported they haven't received any dose of COVID-19 vaccine; the most common motivations were lack of trust in the vaccine and fear of side effects. At multivariable analysis, the use of heroin appears to be negatively associated with vaccination acceptance (aOR = 0.31 CI 95%: 0.11-0.81) as well as not being Italian (aOR = 0.27 CI 95%: 0.12-0.63).

Conclusions:

The vaccination rate in our sample was consistent with the one of the general Italian population in the same period, whereas the reasons behind the lower adherence to vaccination in the heroin group need to be further investigated. It's also important to reduce possible bureaucratic obstacles that could explain the lower number of vaccinated foreign citizens.

Key messages:

- People with Substance Use Disorder are a fragile and often overlooked population that needs to be considered during Public Health intervention and vaccination campaigns.
- The access to vaccination for foreigners should be made more simple and easier to increase accessibility and participation.

Abstract citation ID: ckac131.352
Behavioral innovations in the management of obesity and overweight using the COM-B model

Vladimíra Timková

V Timkova[1], *D Minarikova*[2], *Z Katreniakova*[1], *P Mikula*[1], *A Husivargova*[1], *I Nagyova*[1]
[1]Department of Social and Behavioural Medicine, Faculty of Medicine, PJ Safarik University in Kosice, Košice, Slovakia
[2]Organisation and Management of Pharmacy, Faculty of Pharmacy, Comenius University in Bratislava, Bratislava, Slovakia
Contact: vladimira.timkova@upjs.sk

Background:

Increasing overweight and obesity rates represent one of the global health challenges in the 21st century. Obesity is a gateway to many non-communicable diseases and shorter life expectancy. Understanding individual capability, opportunity, and motivation for health behavior change (COM-B) may help to develop effective public health interventions. However, so far, only a very few studies examined interventions based on behavior change theories. Thus, we aimed to assess the potential facilitators and barriers to behavior change in weight management using the COM-B model.

Methods:

We included 146 people with overweight and obesity (66.7% female; mean age 46.62±14.51 years; body mass index 32.46±6.51 kg/m2) from primary care settings. All participants completed the Brief Measure of Behavior Change (COM-B), the General Self-Efficacy Scale (GSE), the Rosenberg Self-esteem Scale (RSE), and the Self-Rated Heath scale (SRH). Multiple linear regression analyses were used to analyze the data.

Results:

In univariate analyses COM-B domains were positively associated with female gender, living with a partner, lower body mass index, and higher SRH. However, the associations between sociodemographic and clinical variables and COM-B domains were no longer significant when self-esteem and general self-efficacy were added to the multivariate regression models. Self-efficacy was associated with reflective motivation (β: 0.53; $p < 0.001$), physical capability (β: 0.43; $p < 0.001$), and psychological capability (β: 0.44; $p < 0.001$) the most significantly. Self-esteem was strongly associated with physical capability (β: 0.41; $p < 0.01$). Total explained variances in the final models varied from 17.7% to 25.0%.

Conclusions:

Personal resources may play a significant role in weight management and should be included in tailored public health interventions (Grant support: VEGA: 1/0748/22).

Key messages:

- Interventions focused on the enhancement of personal resources may improve weight management.
- Behavioral and cultural aspects should be considered when designing effective public health interventions.

Abstract citation ID: ckac131.353
Impact of community outreach programme on improving cancer related preventive health behaviour

Vikram Niranjan

V Niranjan[1], P Fitzpatrick[1], R Morrogh[2], K O'Hagan[2]
[1]School of Public Health, Physiotherapy and Sports Science, University College Dublin, Dublin, Ireland
[2]Irish Cancer Society, Dublin, Ireland
Contact: vikram.niranjan@ucd.ie

Cancer services were negatively affected due to the Covid-19 pandemic and will have likely delayed early detection and diagnosis. The Irish Cancer Society (ICS) planned and delivered a number of cancer roadshow events in 4 deprived regions in Ireland to address improvements in awareness of cancer signs, importance of screening, positive lifestyle changes and encourage medical care-seeking behaviour. Health checks (blood pressure, BMI & CO2 monitoring) and motivational interviews were carried out by ICS nurses and trained ICS volunteers. Data was collected via anonymous questionnaire from participants and volunteers. SPSS was used for analysis. 98 people (54 male, 44 female) participated; 87.7% found the information provided useful, 84.7% approved of the health check and 72.5% stated that they would likely make changes to their current lifestyle to reduce their cancer risk. Moderate/high understanding of cancer signs and symptoms and moderate/high awareness of cancer risk factors both rose post event (from 62.2% to 81.6% ($p < 0.001$) and from 49% to 61.2% ($p < 0.001$) respectively). If symptomatic for cancer 77.6% of participants would likely visit their GP and 73.5% would likely contact ICS. Younger people (aged ≤40 years) were more likely to consider consulting a healthcare professional if symptomatic ($p = 0.027$) and to contact the ICS ($p = 0.007$) for more information. High numbers of participants (98.9%) and volunteers (95.2%) recommended a nationwide roll out. Volunteers reported moderate/high levels of public engagement; the most common topics discussed were own treatment experience, cancer screening, information on making lifestyle changes and ICS services. Volunteers reported the need for more training and improvements to some organisational aspects. More rigorous cancer health promotion programmes are required to counter disrupted cancer services. Our results suggest such cancer roadshow events are both feasible and beneficial at this time post pandemic.

Key messages:

- Health literacy is continuous process to achieve positive health outcomes.
- Reaching out to people in different setting is acceptable and potentially effective.

Longitudinal relationships between youth assets, seat belt use while driving, and the environment

Eleni Tolma

E Tolma[1], S Vesely[2], R Oman[3], L Boeckman[2], C Aspy[2]
[1]Education Sciences, European University Cyprus, Nicosia, Cyprus
[2]School of Public Health, University of Oklahoma Health Sciences Center, Oklahoma City, USA
[3]School of Public Health, University of Nevada, Reno, USA
Contact: L.Tolma@research.euc.ac.cy

Background:

Positive youth development theory can provide an alternative approach to promote Seat Belt Use while Driving in a Car (SBUDC) among youth. The study aims to explore the relationship between youth assets, and the neighborhood environment in predicting SBUDC.

Methods:

The Youth Asset Study (YAS) is a 4-year (5 waves) longitudinal study of a random sample of 1,111 youth (12-17 years old) and their parents, taking place in a Midwestern city, USA from 2003-2008. Seventeen youth assets were developed. The environment was measured objectively via the broken windows survey and subjectively via parents' interviews. Assets and environmental factors at Waves 1-4 were predicted SBUDC at Waves 4-5 while controlling for demographics. Data were analyzed via marginal logistic regression and generalized estimated equations analyses.

Results:

The sample consisted of 1001 youth: 53% female; mean age = 14.36 (SD = 1.59); 50% with income <$35,000; and 69% two-parent families. The proportion of youth not wearing a seat belt while driving increased from wave 4 to 5 only among African American youth. Individually, most assets had a positive relationship with SBUDC (ORs ranged from 1.3 to 2.7), with general aspirations for the future, educational aspirations for the future and positive peer role models having the largest ORs [2.7, 95% CI (1.7, 4.3); 2.2, 95% CI (1.5, 2.0); 1.9, 95% CI (1.5,2.4)] respectively. Youth with a higher (≥ 12) number of assets were almost twice as likely to use a seat belt while driving than those with a lower (<12) number [OR = 1.8, 95% CI (1.4, 2.3)]. Only one environmental factor had a significant effect on SBUDC [(OR = 1.32, 95% CI (1.01, 1.72)]. Assets retained their impact on SBUDC, controlling for the environmental and demographic factors.

Conclusions:

Youth assets can be a promising approach to promote SBUDC among teens with emphasis on promoting general aspirations for the future, educational aspirations, and positive peer role modeling.

Key messages:

- Building youth assets can be another mechanism to promote seat belt use while driving among youth.
- The neighborhood environment might not be as important as other factors are in the promotion of seat belt use while driving.

Contact: L.Tolma@research.euc.ac.cy

Background:

Positive youth development theory can provide an alternative approach to promote Seat Belt Use while Riding in a Car (SBURC) among youth. The study aims to explore the relationship between youth assets, and the neighborhood environment in predicting SBURC.

Methods:

The Youth Asset Study (YAS) is a 4-year (5 waves) longitudinal study of a random sample of 1,111 youth (12-17 years old) and their parents, taking place in a Midwestern city, USA from 2003-2008. Seventeen youth assets were developed. The environment was measured objectively via the broken windows survey and subjectively via parents' interviews. Assets and environmental factors at Waves 1-4 predicted SBURC at Waves 4-5 while controlling for demographics. Data were analyzed via marginal logistic regression and generalized estimated equations analyses.

Results:

The sample consisted of 1001 youth: 53% female; mean age = 14.36 (SD = 1.59); 50% with income <$35,000; and 69% two-parent families. The proportion of youth not wearing a seat belt while riding in a car decreased from wave 4 to 5 among all youth. Individually, most assets had a positive relationship with SBURC (ORs ranged from 1.4 to 2.0), with parental monitoring, responsible choices, general aspirations for the future and good health practices having the largest ORs [2.0, 95% CI (1.5, 2.7); 1.9, 95% CI (1.5, 2.6); 1.8, 95% CI (1.2,2.8); 1.8, 95% CI (1.5,2.3)] respectively. Youth with a higher ($\geq$ 12) number of assets were almost twice as likely to use a SBURC than those with a lower ($^{<}$12) number [OR = 1.9, 95% CI (1.5, 2.3)]. Only one environmental factor, had a significant effect on SBURC [(OR = 0.64, 95% CI (0.45, 0.90)]. Assets retained their impact on SBURC, controlling for the environmental and demographic factors.

Conclusions:

Youth assets can be an alternative approach to promote SBURC among teens with emphasis on promoting parental monitoring, responsible choices, general aspirations for the future, and good health practices.

Key messages:

- Building youth assets can be another mechanism to promote seat belt use while driving among youth.
- The neighborhood environment might not be as important as other factors are in the promotion of seat belt use while driving.

Abstract citation ID: ckac131.356
Promoting migrant health literacy in adult education, from research to practice

Stefanie Harsch

S Harsch[1], *U Bittlingmayer*[1]
[1]University of Education Freiburg, Freiburg, Germany
Contact: stefanie.harsch@ph-freiburg.de

Background:

As migration affects health, migrants need context-appropriate health literacy (HL) to maintain and promote health. Possible venues to improve HL are adult education programs, i.e., language courses (LC). However, empirical evidence on these courses and their contribution to HL is scarce. Moreover, general HL recommendations and conceptually developed HL programs often proved unsuitable in practice as they insufficiently incorporate the multiple influences. This paper's purpose is to show, using key findings, how ethnographic research can contribute to developing appropriate programs and how the transfer from research to practice can succeed.

Methods:

The SCURA project conducted extensive ethnographic research on HL in second LC, i.e., 100 h participant observation in 2 classes, 40 teacher interviews, analysis of 24 textbooks, and teacher training. On this basis, we designed programs and drew lessons from comparison with other programs.

Results:

The study revealed that health and HL as a situational social practice play a key role in LC e.g., as prerequisites for attendance and learning, part of the syllabus, and an occasion for informal conversations. Multiple concepts of health and HL coexist and influence HL promotion. Besides the setting and course conditions, teachers strongly shape HL activities and students show varying degrees of HL practice. We exposed the complexity and diversity of HL situations, meaning-making processes, strategies to acquire and promote HL, and actual space of action. Then, we developed participatory practicable approaches to promote HL in the educational offer. Compared to other programs, the ethnographic study allowed us to address the major factors, tap into the actual space of action, and increase acceptance, uptake, and sustainability.

Conclusions:

Improving HL in existing offers requires a profound understanding of the logic of the field. Ethnographic studies facilitate describing these peculiarities and tailoring interventions.

Key messages:

- Ethnographic studies allow understanding the relevant factors, actors, situations, contexts, processes, strategies, the logic within and the scope for action.
- The empirical evidence gained in ethnographic studies enable researchers to develop promising, accepted, and sustainable interventions.

Abstract citation ID: ckac131.357
Promoting migrant HL, good practice in adult education and lessons learned for other interventions

Stefanie Harsch

S Harsch[1]
[1]University of Education Freiburg, Freiburg, Germany
Contact: stefanie.harsch@ph-freiburg.de

Problem:

Migration is a global phenomenon, and migrants face myriad challenges, e.g., building context-specific health literacy (HL). To sustainably promote HL, translations, interpreters, or programs in other languages are insufficient. Courses that promote HL holistically are needed, e.g., second language courses. In the SCURA research project, part of the HLCA Consortium, we ethnographically studied language courses and developed interventions. The insights gained are relevant not only for courses promoting HL of migrants or in Germany but also for other target groups and countries.

Description:

Based on extensive ethnographic research, we participatory created interventions to promote HL. As language courses promote HL to varying degrees but are severely limited by the rigid conditions and support, we identified strategies to improve HL therein and ensure uptake and sustainability: add-in, pimp-up, dive deeper. The multimodal intervention consists of an extensive collection of teaching ideas, materials to prepare and reflect on sessions, and a 6-part teacher training (in-house, online, and self-study course, based on adult learning principles). The 90-minutes sessions address Health in Language Courses, Health and Me, Using materials, Critically Analyzing Materials and Developing Empowering Activities, Promoting Family HL, and Mental HL. A hands-on tool was developed to help teachers intentionally promote the seven components of HL.

Results:

The preliminary results of the ongoing evaluation showed that the flexibly adaptable and applicable offerings, the online workshop, and self-study courses, were well received. The teachers liked the choice of topics and the combination of short inputs and many recommendations for practice.

Lessons:

The project's success relies on knowing the context and setting, considering the needs of all stakeholders, and developing offerings that are a relief but not an additional burden, and that can be easily integrated into the program.

Key messages:

- A thorough ethnographic understanding of the course is key to developing interventions that will be perceived to be appropriate and relevant.
- HL promotion should integrate teachers' HL, informal occasions on health information exchange, diverse and multilingual ways to engage with health information and a systematic, deliberate development.

Health literacy and its association with health outcomes among students in upper secondary education

Nina Simonsen

H Paasio[1], *E Roos*[1,2], *S Kokko*[3], *N Simonsen*[1,4]

[1]Folkhälsan Research Center, Public Health Research Program, Helsinki, Finland

[2]Uppsala University, Department of Food Studies, Nutrition and Dietetics, Uppsala, Sweden

[3]University of Jyväskylä, Faculty of Sport and Health Sciences, Jyväskylä, Finland

[4]University of Helsinki, Department of Public Health, Helsinki, Finland

Contact: nina.simonsen-rehn@helsinki.fi

Background:

Health literacy (HL) - as a broad range of health-related competencies and skills- has been recognized as a determinant of health outcomes, and suggested to be a modifiable health resource and a factor contributing to empowerment and equity. Thus, there is a need to identify the state of HL in various population groups. The aim of this study was to investigate HL levels and associations between HL, physical activity and subjective health among students in general upper secondary and vocational Swedish-language schools in Finland.

Methods:

The study used cross-sectional data from the Finnish LIITU-study among students in Swedish-speaking general upper secondary and vocational schools (N = 887; age 16-20 years) conducted in the spring and autumn 2020, during the covid-19-pandemic. Students answered a web-based questionnaire during school hours. HL was measured with the 10-item Health Literacy for School-Aged Children (HLSAC) instrument. Data was analyzed with descriptive statistics and logistic regression analyses.

Results:

According to preliminary findings, one third of students had high HL. HL was higher among female than male students, general upper secondary school students than vocational school students, and in spring than in autumn 2020. A higher proportion of students with high HL, as compared to students with low/medium HL, reached the national recommendations for physical activity, perceived their health to be excellent and, moreover, did not have recurrent psychological symptoms.

Conclusions:

The findings confirm previous research findings on the importance of HL in promoting health outcomes. The pandemic year 2020 provided a unique perspective to the subject. It would be important to survey and discuss the role of schools in providing equal opportunities for the promotion of HL as this may contribute to decreasing health disparities in the population.

Key messages:

- One third of students in upper secondary education (age 16-20 years) had high HL; there were differences between genders, students on different educational paths, and in spring and autumn 2020.
- High HL was associated with better self-rated health, less psychological symptoms and reaching national recommendations for physical activity among students in upper secondary education.

Do religious people in Western Balkans have faith in COVID-19 vaccines?

Smiljana Cvjetkovic

S Cvjetkovic[1], *V Jeremic Stojkovic*[1], *J Jankovic*[2], *S Mandic-Rajcevic*[2]

[1]Department of Humanities, Faculty of Medicine, University of Belgrade, Belgrade, Serbia

[2]Institute of Social Medicine, Faculty of Medicine, University of Belgrade, Belgrade, Serbia

Contact: smi13smi@yahoo.com

Background:

Recently, it was established that more religious people tend to have less favorable views of vaccination. The aim of this study was to assess the relationship between the religiousness and attitudes towards COVID-19 vaccination and disease, in five Western Balkans countries.

Methods:

Using online questionnaire and convenience sampling procedure, data were obtained from 1605 respondents aged 18-75 years. Perceived COVID-19 vaccine safety and efficacy, and observed danger and susceptibility to disease were assessed by short five-point Likert scales. Religiousness was estimated using single item scale. Multivariate regression analysis was employed.

Results:

In Serbia, respondents who assessed themselves as more religious considered vaccine against COVID-19 as less safe ($\beta = -.10$, $p<.01$) and effective ($\beta = -.12$, $p<.01$), were more prone to the attitude that dangers of COVID-19 are not that serious ($\beta = -.09$, $p<.01$), and believed to a greater extent that they are less susceptible to the virus ($\beta = -.07$, $p<.01$). Similarly, in Bosnia and Herzegovina more religious individuals were less convinced that vaccine is effective ($\beta = -.07$, $p<.05$), less inclined to believe that danger of the virus is serious ($\beta = -.07$, $p<.05$), and assessed their susceptibility as lower ($\beta = -.06$, $p<.05$). More religious people in Montenegro ($\beta = -.06$, $p<.05$) regarded the vaccine as less safe, while in North Macedonia ($\beta = .06$, $p<.05$) and Albania ($\beta = .08$, $p<.01$) stronger religiosity was associated with more favorable attitudes towards vaccine safety.

Conclusions:

The relationship between religiosity and attitudes towards COVID-19 vaccination and disease is culturally conditioned. While in some Western Balkans societies religious beliefs render individual with a sense of lack of control triggering worry and anxiety, in some others they work as psychological shield against existential threats.

Key messages:

- Religiosity should be considered as a relevant factor in vaccination campaigns implementation.
- In the societies where negative attitudes towards vaccination prevail among the believers, religious leaders should be peculiarly educated and encouraged to participate in vaccination campaigns.

Organizational health literacy and health promotion in health care settings: Results from Germany

Katharina Rathmann

K Rathmann[1,2], *LD Salewski*[1,2], *LV Zelfl*[1,2]

[1]Department of Health Sciences, Fulda University of Applied Sciences, Fulda, Germany

[2]Public Health Centre Fulda, Fulda University of Applied Sciences, Fulda, Germany

Contact: katharina.rathmann@pg.hs-fulda.de

Introduction:

Health care organizations (HCO) are increasingly required to provide health literate structures and processes to strengthen organizational health literacy (OHL). So far, little is known about the extent of OHL in HCO in Germany. Aims are therefore 1) to examine the level of OHL in health care organizations, and 2) to investigate the impact of organizations level of health prevention and workplace health promotion on the level of OHL.

Methods:

Analyses are based on a nationwide cross-sectional study (online survey) among management staff (N = 564) in HCO (hospitals, nursing homes, facilities for disabled people). OHL was measured by the German version of the 'Health literate health care organization 10 item questionnaire' (HLHO-10). Health prevention and workplace health promotion were operationalized by the ''Worksite Health Promotion Capacity Instrument' (WHPCI). Uni- and bivariate analyses were carried out, on an item-basis and as an index (median-split).

Results:

Regarding OHL, 55.1 % of the health care organizations reported below-average levels of OHL. On an item-basis, the highest below-average levels were given for the standard 'communication' (59.1 %) and the 'provision of information to patients/residents via various media' (57.4 %). Regarding the level of health prevention (51.8 %) and the existence of workplace health promotion structures (55.7 %), more than half of HCO reported a below-average level. In addition, results showed that HCO that indicate a below-average level of prevention and few structures of workplace health promotion also revealed a below-average level of OHL.

Conclusions:

There is need to strengthen OHL in German HCO.

Key messages:

- HCO are required to strengthen HLO, particular in communication and participatory approaches.
- A higher level of prevention and workplace health promotion on HCO can contribute to the implementation of OHL initiatives.

Abstract citation ID: ckac131.361
Assessing sun protection practices for children: knowledge and behaviours of parents

Diana Nemes

D Nemes[1,2], *MA Coman*[1,2]
[1]Department of Public Health, Babes-Bolyai University, Cluj-Napoca, Romania
[2]Center for Health Workforce Research and Policy, Babes-Bolyai University, Cluj-Napoca, Romania
Contact: diana.nemes@publichealth.ro

Background:

The development of melanoma in adulthood is strongly associated with sunburns during childhood. Parental knowledge and behaviours play a key role in sun protection behaviour from which children can acquire general and integrated learning patterns. With this being known, numerous positive preventive health behaviours can be initially shaped in the family, with children having parents as a model.

Methods:

A cross-sectional approach (web-based questionnaire) was conducted to gather information regarding parents' knowledge and behaviours of children's sun protection, alongside the predictors that might influence the adoption of these behaviours, between April and May 2021. The survey was disseminated to 53 primary school teachers from 9 schools in Cluj-Napoca Romania, and the data set included 355 valid surveys (parents with at least one child aged between 0 to 12 years old) out of 476 total surveys. Descriptive statistics, Chi-square tests of association and logistic regressions were computed.

Results:

The study showed differences in children's sun exposure patterns, their sunburn and parental sun protection behaviour. Overall, parents reported fair sun protection behaviours and children's sunburn frequency was overall moderate among all children in the previous summer season. However, an increase in children's age generates an increase in parents' sunscreen application for their children in both planned and incidental situations. There were statistically significant associations between parents' sex and their knowledge about the fatal consequences of skin cancer or their level of education and the damage produced by tanning bed usage or sunscreen efficiency measures.

Conclusions:

These results are a starting point for various program interventions that can be done for parents in order to increase their knowledge on sun protection practices for their children.

Key messages:

- Skin cancer is substantially preventable if unprotected exposure to ultraviolet radiation is reduced during the first years of a child's life.
- Parental knowledge and behaviors play a key role in sun protection behavior from whom children can acquire general and integrated learning patterns.

Abstract citation ID: ckac131.362
Health Literacy, Covid-19 and risk perception: a cross-sectional survey in Prato in the 2nd wave

Beatrice Velpini

B Velpini[1], *E Stancanelli*[1], *L Stacchini*[1], *M Bruschi*[1], *V Lastrucci*[2,1], *F Puggelli*[3], *R Berti*[4], *C Lorini*[1], *G Bonaccorsi*[1]
[1]Department of Health Sciences, University of Florence, Florence, Italy
[2]Epidemiology Unit, Meyer Children's University Hospital, Florence, Italy
[3]Management Department, Meyer Children's University Hospital, Florence, Italy
[4]Department of Prevention, Azienda Sanitaria Locale Toscana Centro, Florence, Italy
Contact: beatrice.velpini@unifi.it

During the Covid-19 pandemic, individual and collective public health measures were undertaken to control the spread of the virus. Their effectiveness relies on people's abilities to understand and adopt the correct behaviors. This study aims to evaluate the role of Health Literacy (HL) in influencing the adherence to Covid-19 preventive measures and risk perception of a sample of workers employed in various activities involving close contact with the population in the province of Prato (Tuscany, Italy) in the second pandemic wave (November-December 2020). A cross-sectional survey was conducted on a sample of public workers (e.g., teachers, educators, assistants/aides, other health personnel). Data on knowledge, attitudes and practices towards (KAP) Covid-19 preventive measures and risk perception were collected. HL was measured with the HLS-EU-Q6 tool. Spearman correlation analysis was used to assess the correlation between HL and KAP and Covid-19 risk perception. Multivariate linear regression analyses were performed to evaluate the role of HL in predicting KAP and Covid-19 risk perception, adjusted for sex, age, comorbidity, educational level, country of birth. A total of 402 people participated in this study; 47.8% had a problematic HL level. The HL level was correlated with KAP and practices towards Covid-19 prevention measures; no significant associations were found with Covid-19 risk perception. In multivariate models, HL significantly and positively predicted a higher level of knowledge of Covid-19 preventive measures (B = 0.413 for problematic HL; B = 0.542 for sufficient HL). Confirming a previous study conducted in Prato in the first pandemic wave, HL did not predict adherence to Covid-19 infection control measures, probably due to fear of the disease and attention towards prevention behaviors being still higher in the second pandemic wave.

Key messages:

- HL skills are linked to understanding of public health measures.
- HL skills should be improved to favor the adherence to correct behaviors.

Abstract citation ID: ckac131.363
Living Lab: Design a digital health intervention for healthy diet of ethnic minority adolescents

Ji Su Lee

J Lee[1,2,3]*, H Lee*[2,3]*, H Lee*[1,2,3]*, K Konlan*[2,3]*, J Seo*[3]
[1]Brain Korea 21 FOUR Project, Yonsei University, Seoul, South Korea
[2]Mo-Im Kim Nursing Research Institute, Yonsei University, Seoul, South Korea
[3]College of Nursing, Yonsei University, Seoul, South Korea
Contact: geeesu8193@naver.com

Eating habits cultivated during adolescence continue through adulthood, and can widen the health gap in adulthood for vulnerable ethnic minority adolescents (EMA). Living Lab is a methodological approach through which stakeholders co-create innovations as citizen scientists in real-life settings. This study aimed to design a digital health intervention (DHI) for enhancing the heathy diet of EMA using the Living Lab approach. The DHI's content and strategies were derived through literature reviews and focus group interviews. The Living Lab was structured by using 5 principles: real-life setting, user engagement, multi-stakeholder participation, multi-method, and co-creation. It has four activity phases of discovering problems, exploring solutions, solving problems, and disseminating solutions putting more emphasis on the use of digital device and multiple stakeholders such as peers and teachers in co-ideation. DHI participants were grouped into equal proportions of EMA and Korean-ethnic peers. The DHI operates for 2 hours once a week for 4 weeks, with orientation and wrap-up sessions before and after the DHI. Each activity of the co-working process is designed by applying behavior change techniques such as prompts/cues, framing/reframing, and credible sources in a digital educational environment: creating content using Google Jamboard and Padlet, and working on the metaverse platform ZEP. The responses and feedback from the participants are received through an online reflection diary weekly. Usability and acceptability of digital technology are assessed by an online survey on completion of the DHI. The efficacy of DHI is assessed through the change in dietary behavior and food literacy. This study was designed to enable EMA recognize the harmful effects of an unhealthy diet and co-create solutions through dynamic activities in a digital environment. Further, it may serve to change the cultural sensitivity of native peers that influence the health choices of EMA.

Key messages:

- Digital-based intervention would be an effective way for vulnerable ethnic minority adolescents to engage in healthy diet.
- The Living Lab approach was used as an essential strategy to develop a digital health intervention to improve the healthy diet of ethnic minority adolescents.

Abstract citation ID: ckac131.364
Appraising the quality of guidelines for caries management using AGREE II: a systematic review

Anna Odone

D Lamloum[1,3]*, P Ferrara*[1]*, A Arghittu*[2]*, P Castiglia*[2]*, M Gaeta*[1]*, A Odone*[1]*, G Campus*[3]
[1]Department of Public Health, University of Pavia, Pavia, Italy
[2]Department of Dentistry, University of Sassari, Sassari, Italy
[3]Department of Dentistry, University of Bern, Bern, Switzerland
Contact: anna.odone@mail.harvard.edu

Background:

Caries is one among the most prevalent dental disease and its prevention and treatment are crucial from both dental care and public health perspectives. Yet, caries' management greatly varies across contexts according to the availability of specific Clinical Practice Guidelines (CPGs). Here, we present the results of a systematic review aimed at the appraisal of the current available CPGs on caries prevention and treatment.

Methods:

A literature search was performed in PubMed, EMBASE, SCOPUS, and seven relevant guidelines databases up to March 2022, exploring CPGs published from 2012. The literature review was conducted in accordance with PRISMA guidelines. The Appraisal of Guidelines, Research and Evaluation (AGREE) II checklist was used to measure the methodological rigour and quality of the retrieved CPGs.

Results:

The systematic search resulted in a total of 1403 records, and 21 CPGs met the inclusion criteria. Overall, these considered different aspects of caries prevention and treatment. Regarding the appraisal through the AGREE II tool, the overall median score was 60.2% and 11 out of 21 CPGs were classified as ''Recommended'', while the others as ''Recommended with modification''. The domain analysis showed that the highest median scores were reached for Scope and Purpose (88.9%), Clarity of Presentation (86.9%), and Rigor of Development (67.8%), while the lowest were seen for Stakeholder Involvement (63.3%), Applicability (17.5%), and Editorial Independence (50%).

Conclusions:

This systematic review showed that the rigor of CPGs for caries prevention and treatment remained suboptimal according to AGREE II evaluation, and highlighted that more efforts are needed to improve their quality. The AGREE II checklist is a comprehensive and easy-to-use tool for the development of CPGs, and its use ensures that evidence-based approaches are incorporated into consistent recommendations for the translation of evidence into practice.

Key messages:

- The rigor of CPGs for caries prevention and treatment is suboptimal according to AGREE II evaluation, however, more efforts are needed to improve their quality.
- The AGREE II checklist is a comprehensive and easy-to-use tool for the development of CPGs.

Abstract citation ID: ckac131.365
Exploring behavior change motivation in an outpatient sample with more than one health risk behavior

Lisa Voigt

L Voigt[1,2]*, A Ullrich*[1,2]*, S Ulbricht*[1,2]
[1]Prevention Research and Social Medicine, University Medicine Greifswald, Institute for Community Medicine, Greifswald, Germany
[2]Partner site Greifswald, German Centre for Cardiovascular Research, Greifswald, Germany
Contact: lisa.voigt@med.uni-greifswald.de

Background:

Evidence from western countries shows that the majority of adults have two or more health risk behaviors. The motivation to engage in a health behavior change (HBC) is the most proximal determinant of behavior change in the future. The aim of this study was to investigate the intention to increase physical activity and to quit smoking in an outpatient sample that show both health risk behaviors.

Methods:

We used baseline data ($n = 109$) of an intervention study (Germany, 2016-2019) on physical activity and smoking cessation. Eligibility criteria were: aged 40 to 65 years, systolic blood pressure ≥ 130 mmHg, no history of cardiovascular event or vascular intervention. We collected information on HBC motivation, sex, age, and self-rated health (SRH) and identified 32 physically inactive smokers. Descriptive analyses and Fisher's exact test were used to explore the proportion of those motivated for HBC and differences according to sex, age (45-55 vs. 56-65 years), and SRH (excellent-good vs. poor-very poor).

Results:

Participants (50% female) were on average 52.6 years old and 78% had school education ≤10 years. Overall, 44% intended to change physical inactivity only, 34% intended to change both behaviors, 13% wanted to change neither, and 9% intended to change smoking only. There was no difference in HBC motivation according to sex and age. But, there was a significant difference according to SRH (Fisher's exact = 0.048); e.g., there were more individuals motivated to change both behaviors among those with lower SRH (64%) compared to those with higher SRH (19%).

Conclusions:

In this baseline sample of an intervention study, the majority of participants intended to change physical inactivity but not smoking. Among those with lower SRH, almost two-thirds intended to change both behaviors. Thus, individuals with more than one health risk behavior differ in their HBC motivation. Lower SRH may offer a window of opportunity to promote HBC interventions.

Key messages:

- Physically inactive smokers with a systolic blood pressure ≥130 mmHg differ in their motivation to change these behaviors.
- Lower self-rated health may offer a window of opportunity to promote interventions to change health behavior.

Abstract citation ID: ckac131.366
Assessing the impact of the COVID-19 infodemic on older people in the region of Crete

Maria Papadakaki

K Vagionaki[1,2], *M Papadakaki*[1], *E Petelos*[2], *C Lionis*[2]
[1]Department of Social Work, LaHeRS & PHC-HMU, Hellenic Mediterranean University, Heraklion, Greece
[2]Clinic of Social and Family Medicine, University of Crete, Heraklion, Greece
Contact: mpapadakaki@hmu.gr

The COVID-19 pandemic has been accompanied by an unprecedented infodemic, a key global public health challenge. Older people are more susceptible to COVID-19 and to misinformation, with WHO indicating the need for research on how people process and manage information in physical and digital environments to better understand how this phenomenon affects individuals. A qualitative study was developed in to explore the infodemic impact on elderly groups (eligible beneficiaries, aged 60-75 y, users of social services in the Heraklion Regional Unit, Crete Greece). Preliminary results indicate low trust levels for information delivered online and through media. Physicians remain the most trusted and preferred source of information, yet participants questioned their expertise level given the various issues emerging during the pandemic. Most of them report poor quality, incomplete information and point out the misleading role of media pluralism. Key topics of concern include the origin of SARS-CoV-2 and the safety and effectiveness of COVID-19 vaccines. The majority strongly believes that coronavirus is of lab origin, as they have read on the Internet. They are also susceptible to fake news and myths surrounding COVID-19 vaccines. Many of them also suffer from "pandemic fatigue", i.e., information overload, preferring not to further follow COVID-19 updates. Fear about their vulnerability was the major factor mentioned regarding scientific evidence, stating they prefer information to be conveyed clearly and in an understandable manner. Some exchange information with relatives and friends whilst others prefer not to discuss COVID-19, unless they consider the other person knows more than they do. Nevertheless, they all believe they make the best choices on how to protect their health, whilst having mixed feelings about the manner and content of communication received both in physical and digital environments.

Key messages:

- COVID-19 care for the elderly should encompass infodemic management elements, incl. information presented using simple terms, from updated and regularly verified sources, ideally in printed form.
- Health and social care professionals' training should include media discourse, compassionate care, and motivational communication techniques rather than directional speeches of coercion and fear.

Abstract citation ID: ckac131.367
What influences the intention to get vaccinated against COVID-19 in the Western Balkans?

Smiljana Cvjetkovic

V Jeremic Stojkovic[1], *S Cvjetkovic*[1], *A Stevanovic*[2], *J Jankovic*[2], *S Matovic-Miljanovic*[3]
[1]Department of Humanities, Faculty of Medicine of University of Belgrade, Belgrade, Serbia
[2]Institute of Social Medicine, Faculty of Medicine of University of Belgrade, Belgrade, Serbia
[3]Euro Health Group, Copenhagen, Denmark
Contact: smi13smi@yahoo.com

Background:

Although effective vaccines against COVID-19 have been developed with the unprecedented speed, insufficient vaccine uptake suggests that many people are unwilling to get vaccinated worldwide. The aim of this study was to assess factors influencing intention to get vaccinated against COVID-19 in five Western Balkans countries.

Methods:

Total of 700 unvaccinated respondents aged 18-75 participated in the study. Intention was assessed by a single item gauging the likelihood of getting vaccinated on a 5-points Likert scale. Multiple linear regression was used to determine whether socio-demographics (gender, age, religiousness, educational level, employment status, presence of chronic diseases) and attitudes towards vaccination predict intention to get vaccinated.

Results:

Proportion of respondents willing to get vaccinated against COVID-19 ranged from 22.6% in Serbia to 40.4% in Montenegro. In Bosnia and Herzegovina and Albania stronger intention to get vaccinated in the future was associated with confidence in vaccine safety ($\beta = .24$, $p<.01$ and $\beta = .20$, $p<.01$ respectively) and efficacy ($\beta = .28$, $p<.01$ and $\beta = .26$, $p<.001$), higher feeling of danger of the disease ($\beta = .21$, $p<.05$ and $\beta = .17$, $p<.05$) and higher social responsibility ($\beta = .35$, $p<.001$ and $\beta = .18$, $p<.01$). Confidence in vaccine efficacy ($\beta = .34$, $p<.001$) and social responsibility ($\beta = .24$, $p<.01$), accompanied with higher sense of susceptibility to the disease ($\beta = .13$, $p<.05$), were significant predictors of intention in Serbia. In North Macedonia willingness to get the vaccine was significantly associated only with social responsibility ($\beta = .09$, $p<.001$), while in Montenegro age was the single predictor ($\beta = -.32$, $p<.001$);

Conclusions:

Results of this study suggest that vaccination campaigns should focus on specific set of socio-psychological factors in each country, enhancing confidence in vaccine efficacy and appealing to collective responsibility as most prevalent determinants of vaccination intention in Western Balkans.

Key messages:

- Specific set of socio-psychological factors influenced vaccination intention in each country.

- Most prevalent factors influencing intention to get vaccinated against COVID-19 were confidence in vaccine efficacy and social responsibility.

Addressing health literacy to reduce inequalities among migrants: which profiles need our attention?

Ana Gama

MJ Marques[1,2], A Gama[1,2], C Cheng[3], R Osborne[3], S Dias[1,2]
[1]NOVA National School of Public Health, PHRC, Universidade NOVA de Lisboa, Lisbon, Portugal
[2]Comprehensive Health Research Center, Lisbon, Portugal
[3]Centre of Global Health and Equity, School of Health Sciences, Swinburne University of Technology, Melbourne, Australia
Contact: anafgama@gmail.com

Health literacy, the ability to access, understand, appraise, remember and use health information and services, has great potential to reduce inequalities in access to and outcomes of care. People may have different patterns of health literacy needs and strengths. Yet, the design of interventions is frequently not responsive to the specificities of different segments of the population, including migrant groups. We aimed to identify profiles of migrants to inform the co-design of interventions targeting people at risk of poor outcomes. A cross-sectional survey was conducted with 1126 adult migrants living in Portugal. Data were collected using the 9-dimension HLQ (Health Literacy Questionnaire), and a sociodemographic questionnaire. A cluster analysis of data was performed. Semi-structured interviews were conducted with 15 migrants, stratified by the clusters. The optimal cluster solution yielded 16 profiles revealing diversity in combinations of strengths and needs across the HLQ domains. While 29.8% of migrants scored moderate to high on all 9 domains (profiles 2, 6, 8, 16), 63.4% of participants struggled with 1 or several aspects of health literacy, namely 'Feeling understood and supported by healthcare providers'. Notably, 36.8% (6 profiles) exhibited difficulty across most of health literacy domains. The interviews provided a tangible description of the health literacy needs and resources with five main themes (access, understand, appraise, retrieve and use). Regarding 'access', migrants expressed different preferred learning styles and needed to access different sorts of information at distinct times. The 'use' of information was rarely a one-time decision but a decision that people needed to make repeatedly. Health literacy is a highly diverse concept where subgroups exhibited diverse patterns. The cluster analysis can be used to inform the co-design, prioritisation and implementation of locally designed, fit-for-purpose solutions to improve health literacy.

Key messages:

- Health literacy profiles can inform interventions to mitigate health inequalities among vulnerable migrant groups.
- The identification of distinct profiles can contribute to minimise the disconnect between what people/communities need and what is developed to improve health and equity.

Abstract citation ID: ckac131.369
A unified qualitative-quantitative method to evaluate the impact of being a near-peer health educator

Dorottya Árva

Contact: arva.dorottya@med.semmelweis-univ.hu

Grasping the complexity of public health interventions is of increasing interest. Program evaluation may involve previously known and unknown variables; the former are best explored with quantitative, the latter with qualitative methods. As part of the impact evaluation of the Balassagyarmat Health Education Program (BEP), a near-peer education intervention targeting adolescents from a disadvantaged region of Hungary, we aimed to understand the complex effects of being an educator on medical students' knowledge about the biopsychosocial model of health. Thus, we developed a unified method that enables us to conduct an exploratory study on the effects of our intervention, then quantify and model that qualitative data. We started the method design with literature review and consultations with methodological and public health experts. We then refined the research questions based on a focus-group discussion held with 6 peer educators. After a set of pilot-interviews, we chose simulation interviewing as our knowledge elicitation procedure, then finalized the protocol with the help of additional piloting. In this unified method, simulation interviews are administered to peer educators and aligned controls, and cognitive task analysis is performed with the help of visual stimuli. Codes are developed inductively and, along with segmentation procedures, applied deductively to the entire dataset via the Reproducible Open Coding Kit. Resulting quantified narratives are further processed with Epistemic Network Analysis. The relative frequency of code co-occurrence in each segment is modelled with networks enabling the qualitative and statistical comparison of data between subsamples. Building on the benefits of qualitative and quantitative approaches, this method offers a complex evaluation of the impact of health education interventions. By strengthening the methods of program evaluation we aim to facilitate the development of more effective interventions.

Key messages:

- Qualitative and quantitative methods can be unified in program evaluation to promote a deeper understanding of the complexity in public health interventions.
- Cognitive task analysis as a knowledge elicitation procedure can be used for the impact evaluation of health education programs.

Abstract citation ID: ckac131.370
Coronavirus-related health literacy and knowledge among German fourth-graders

Torsten Michael Bollweg

T Bollweg[1], O Okan[1]
[1]TUM Department of Sport and Health Sciences, Technical University Munich, Munich, Germany
Contact: torsten.bollweg@tum.de

Background:

Little is known about how easy it is for children to deal with coronavirus-related information, or to what degree children have accurate knowledge about the virus. However, both might influence children's preventive behaviors. Thus, this study explores children's coronavirus-related health literacy (CHL) and related knowledge.

Methods:

In a classroom survey among fourth graders' in North-Rhine Westphalia, Germany (07/21 - 11/21), 4 items were used to assess CHL. 5 items were used to measure coronavirus knowledge, while also assessing the frequency of speaking about the coronavirus with parents. Sociodemographic characteristics were recorded, including family affluence (FAS). Bivariate correlations are reported.

Results:
n = 364 students are included (49.5% female), the mean age is 9.5 years (SD = .69). 47.5% of the sample find it rather difficult or very difficult to find information about the coronavirus, while this share is 36.1% for understanding, and 39.1% for appraising coronavirus information. 22.4% say it's difficult to not infect themselves or others (applying information). Dealing with coronavirus-related information is more difficult for children who less frequently talk to their parents about the virus (ρ = 0.166, p<.01) and have lower family affluence (r = .119, p<.05). While certain misbeliefs are rare (''the coronavirus doesn't exist''; 3.9% agreement; ''Children can't get infected''; 3.0%), the belief that eating healthy prevents an infection (15.6%), that all infected people have coughs and fever (62.8%), and that a face mask doesn't help prevent an infection (44.3%) are more prevalent. Children who have a home language other than German state more inaccurate knowledge (p<.05).

Conclusions:
This study suggests that children's needs for accessible and understandable information on the coronavirus were met only party. Also, certain misbeliefs are prevalent which might undermine adherence to preventive measures. More research is needed to verify these findings.

Key messages:
- In our sample, children's needs for accessible and understandable information on the coronavirus were met only party.
- Misbeliefs about the coronavirus are prevalent which might undermine preventive measures.

Abstract citation ID: ckac131.371
A study on doctors' health status living in Turkey

Dilek Aslan

M Sengelen[1], *G Erisgen*[2]
[1]Department of Public Health, Hacettepe University Faculty of Medicine, Sihhiye-Ankara, Turkey
[2]Turkish Medical Association-Council of Medical Specialties, Ankara, Turkey
Contact: diaslan.dr@gmail.com

Background:
Health is a human right for every individual independent from his/her occupation. If provided, physicians' wellbeing might also have a positive influence on the patient care and the population health. In this paper, health (or risky) behaviors, and health status of a group of doctors in Turkey were presented based on the results of a descriptive study.

Methods:
Study population was accessed via google form created by the Turkish Medical Association. 626 physicians participated in the study. Perception of health status, nutritional status, tobacco use, and physical activity status of the participants were recorded. Doctors were also asked about their chronic disease existence. Ethical approval and institutional permission were obtained before the study. Study was conducted between 2020 and 2021. Logistic regression analysis was performed for further analysis.

Results:
Of the 626 physicians participating in the study, 374 (59.7%) were male and 252 (40.3%) were female. Mean age of the physicians was 45.3±10.7. 58.3% (n = 359) of the physicians perceive themselves as healthy and very healthy. 57.8% (n = 362) of the physicians stated their eating habits as healthy. Majority of the physicians (n = 516, 82.4%) were not doing enough physical activity as recommended by the World Health Organization. 28.0% of the physicians (n = 175) used tobacco products. 48.1% of the physicians (n = 301) had a chronic disease. The three most frequently mentioned chronic diseases have been cardiovascular diseases (n = 141; 46.8%), diabetes mellitus (n = 67; 22.2%) and mental diseases (n = 42; 13.9%). Young age, positive perception of health, not using tobacco decreased the chronic disease risk in the logistic regression model.

Conclusions:
Physicians were not good in performing healthy life behaviors and almost one out of two doctors had a chronic disease. Our results emphasized a strong need to enhance a program for the doctors to integrate healthy life skills into their life practices.

Key messages:
- Doctors have poor health which can also influence population health.
- Medical associations may lead to enhance healthy life practices among doctors.

Improving the quality of medical records

Giovanni Guarducci

G Guarducci[1], *I Sanguineti*[2], *C Cuccaro*[1], *R Randisi*[4], *G Messina*[1,3], *N Nante*[1,3]
[1]Post Graduate School of Public Health, University of Siena, Siena, Italy
[2]San Michele Private Hospital, Albenga, Italy
[3]Department of Molecular and Developmental Medicine, University of Siena, Siena, Italy
[4]Legal Affair Unit, Regional Technical-Administrative Support Agency - ESTAR, Florence, Italy
Contact: giovanni.guarducc@student.unisi.it

Background:
Medical record is an essential tool both in patients' diagnostic and therapeutic pathways and communication between different care providers. It also has an economic-administrative, medical-legal and epidemiological function. From an economic-administrative point of view, a medical record allows an evaluation and review of services to better manage the corporate health budget. In addition, it allows traceability and complete transparency of the health activities carried out. The study evaluates the formal quality of medical records compiled in an Italian private clinic before and after a training intervention.

Methods:
In June 2019, a retrospective study was carried out to assess a private clinic's quality of medical records. One month later, healthcare providers were trained on the appropriate compilation of medical records, whose pre-printed format was structurally improved. In March 2020, we verified the quality of medical records produced after that training intervention. Statistical analysis (Wilcoxon test) was carried out through Stata.

Results:
A total of 149 medical records were reviewed. Statistically significant improvements (p < 0,05), between before and after training intervention, were for overall readability (33.3% vs 74.7%), completeness of admission and discharge dates (33.3% vs 74.40%), for completeness of anamnesis (13.6% vs 63.9%), for completeness of therapeutic card (53% vs 85.5%), in the reduction of non-compliance corrections (22.7% vs 4.8%),

signature presence of physical examination (34.9% vs 71.1%) and for signature presence in the hospital discharge card (86.4% vs 96.4%).

Conclusions:

The results show that simple measures, such as staff training and restructuring of the format, are effective in improving the quality of medical records.

Key messages:

- Healthcare providers should perceive the proper completion of medical records as a common goal.
- Well-completed medical records contribute to better health care.

Abstract citation ID: ckac131.373
Training Needs and Quality of Public Health Inspectors in Greece during the COVID-19 pandemic

Demetris Lamnisos

I Adamopoulos[2,4], D Lamnisos[1], N Syrou[3], G Boustras[2,4]
[1]Department of Health Sciences, European University Cyprus, Nicosia, Cyprus
[2]School of Sciences, European University Cyprus, Nicosia, Cyprus
[3]Department of Physical Education and Sport, University of Thesally, Thesally, Greece
[4]CERIDES, European University Cyprus, Nicosia, Cyprus
Contact: D.Lamnisos@euc.ac.cy

Background:

Public Health Inspectors (PHI) task is to promote health, respond to emerging threats in Public Health and prevent and control of the communicable and environmental diseases. During the COVID-19 pandemic, PHI and other Healthcare Workers faced greater biological risks of infections and therefore personal protection was of great importance for their health and safety. Staff education and training is an important factor of disaster management capability and may help prevent and control pandemics. This study took place during the COVID-19 pandemic and aimed to investigate the training needs and training quality of Greek Public Health Inspectors.

Methods:

A nationwide cross-sectional study was conducted between March and June 2021 in Greece. An online survey was distributed to respondents by email through the National Public Health Inspectorate Administration. The survey included seven Likert scale items for assessing the training needs (health and safety of work, stress management, health services administration, crisis management in the health sector, natural disasters, personal protective equipment and protection against biological agents and protection from chemical agents) and two Likert scale items for assessing the training quality.

Results:

The response rate was 30.5 % (185/606 PHI). The 62.2% were females with a mean age of 49 years old (sd = 8.2) and a mean work experience of 15.9 years (sd = 8.5). Most participants (64.51%) reported high training needs on health and safety at work, stress management and personal protective equipment. Most participants (43.78%) also reported low training quality. Training needs were higher for women and in urban and semi-urban workplace environments.

Conclusions:

High training needs and low rate in training quality are important issues for PHI in all workplace environments. PHI need training in health and safety at work, stress management and personal protective equipment.

Key messages:

- High training needs and low rate in training quality are important issues for Public Health Inspectors in all workplace environments in Greece.
- Future training for Greek Public Health Inspectors should focus on health and safety at work, stress management and personal protective equipment.

Abstract citation ID: ckac131.374
Trends in emigration of Polish health professionals. Where are we heading?

Alicja Domagała

A Domagała[1], M Kautsch[1], A Kulbat[1], K Parzonka[1]
[1]Jagiellonian University Medical College, Krakow, Poland
Contact: alicja.domagala@uj.edu.pl

Background:

Migration of health professionals is one of the key challenges for many healthcare systems. In Poland this phenomenon is still under-researched. The aim of our study was to explore the estimated trends and directions of emigration among Polish health professionals.

Methods:

The research was based on the data analysis of specifying the number of people who applied for the certification of their professional qualifications (the right to practice a profession) at five national registers maintained by chambers of health professionals: 1) doctors and dentists, 2) nurses and midwives, 3) physiotherapists; 4) pharmacists and 5) laboratory diagnosticians. The gathered data reported information which allows for an approximate determination of how many professionals are considering a decision to migrate from Poland. Additionally exploration of data from the European Commission Regulated Profession Database in the EU Single Market was performed.

Results:

About 7-9% of Polish doctors and nurses have applied for certificates, which confirm their right to practice their profession in other European countries. The number of such certificates applied for by physiotherapists is also worrying. Emigration among pharmacists and laboratory diagnosticians is rather marginal. The biggest number of certificates, was issued to health professionals in the years 2004-2007, right after Poland joined the EU. In the period 2008-2015 the trend was not constant and it was related to the healthcare reform and changes in health professionals' remuneration. Since 2016 the number of health workers applying for the certificates is by to a certain extent falling. The main destination of Polish emigrants were and are: United Kingdom, Germany, Sweden, Spain, Ireland, and EFTA countries (Norway, Switzerland).

Conclusions:

Implementation of a mechanism for monitoring emigration is necessary, but systemic improvement of working conditions in Polish healthcare system is also needed.

Key messages:

- The emigration, especially of young generations of medical staff, causes significant problems for the Polish healthcare system.
- More in-depth research on migration of health professionals is necessary.

Abstract citation ID: ckac131.375
Factors associated with Finnish home care workers job satisfaction

Salla Ruotsalainen

S Ruotsalainen[1], V Väisänen[1], L Corneliusson[1], A Noro[1], T Sinervo[1]
[1]Welfare State Research and Reform, Finnish Institute for Health and Welfare, Helsinki, Finland
Contact: salla.ruotsalainen@thl.fi

Background:

In Finland, home care is seen as a primary form of care for older people. However, rising numbers of clients with increasingly complex conditions have led to deteriorated working conditions and poor job satisfaction among home care staff. In this study, we examined if greater amount of direct care time, higher team autonomy, number of unique clients, and client's need for care are associated with job satisfaction.

Methods:

Data for the study was collected in October 2021. The amount of direct care and number of unique clients were obtained from a staff time measurement in home care units. The level of team autonomy was obtained from a survey sent to managers of participating organizations. Demographic information and a score for job satisfaction were retrieved from a survey for workers in the participating organizations. Client's need for care was based on Resident Assessment Instrument (RAI). Data was analyzed using multiple linear regression.

Results:

The number of respondents was 387, of which the majority were practical nurses 307 (79%). Higher team autonomy was associated with better job satisfaction, whereas higher number of unique clients and higher amount of direct care time were associated with poorer job satisfaction. The models were adjusted with clients' care needs, but these effects will be further examined.

Conclusions:

The results demonstrated that the workers are more satisfied if there is enough time to perform the work, they have adequate number of clients, and teams have autonomy over their work. This seems to be the case despite the level of clients' need for care, however this needs further analysis. By increasing job satisfaction, better retention of care workers and attraction of care work might be achieved.

Key messages:

- Higher team autonomy is associated with care worker's job satisfaction.
- Enhancing care continuity is important, therefore, when planning home care workers' workday, it is important to consider that the workers could work with clients they know.

Abstract citation ID: ckac131.376
Multiprofessional teamwork in Finnish health and social service centers, experiences of managers

Timo Sinervo

T Sinervo[1], *L Hietapakka*[1]
[1]Welfare State and Reform, Finnish Institute for Health and Welfare, Helsinki, Finland
Contact: timo.sinervo@thl.fi

Background:

Health and social service centers are developed for the first contact points in Finland. Long waiting times, shortage of staff and lack of coordination have been major problems in primary care. As a solution, multiprofessional teams and better collaboration between professionals have been built. This study explores, how the teams work and what challenges they have.

Methods:

The study is based on 16 interviews (25 managers) in 5 health and social services centers. County provided specialized care in the whole area as well as primary services in two centers, one center was provided by a municipality, and two by a private firm. The managers were asked about work organization, their experiences of the team model and about well-being of employees. The interviews were analyzed using content analysis.

Results:

The managers saw the team work as functioning rather well. They also highlighted effective digital services and task shifting. Easy consultation of GP' was important as nurses were the first contact for clients in phone. In this call, the client' case was tried to be handled as far as possible. The competences of new professionals, such as social workers or psychiatric nurses had high value for the team. But the service processes and team-building were in progress. Working in mutual facilities and easy consultation of professionals was seen important. In most organizations clients were separated to different teams based on their service needs (acute or chronic conditions), or earlier clientele. As a result, some teams gained a more burdensome clientele, which increased stress.

Conclusions:

Multiprofessional work can streamline and improve the treatment process, but this requires more information which ways to collaborate work best for the clients and professionals.

Key messages:

- Multiprofessional team work, task shifting and digital services may increase efficiency and well-being of workers at health and social centers.
- Easy consultation of GP's is required for task shifting.

Abstract citation ID: ckac131.377
Longitudinal analysis of Israeli nurses' perceptions, trust & emotions during the COVID-19 pandemic

Shiran Bord

S Bord[1], *S Shaharabani*[2], *H Baruch*[3], *H Admi*[4]
[1]Health Systems Management Department, The Max Stern Yezreel Valley College, Yezreel Valley, Israel
[2]Economics and Management Department, The Max Stern Yezreel Valley College, Yezreel Valley, Israel
[3]Rambam, Rambam Health Care Campus, Haifa, Israel
[4]Nursing Department, The Max Stern Yezreel Valley College, Yezreel Valley, Israel
Contact: Shiranb@yvc.ac.il

Background:

The nursing sector is the largest human resource in the healthcare system providing direct patient care. The Covid-19 pandemic has forced nursing teams into a sustained state of emergency, and with it, much uncertainty and risk taking.

Aims:

Examining the emotions, risk and threat perceptions, trust in the healthcare system and compliance with Ministry of Health (MOH) regulations among nurses at two points in time during the COVID-19 pandemic in Israel.

Methods:

Research questionnaires were distributed to nurses at the height of the pandemic's first wave (March-May 2020). Among the respondents, 140 agreed to continue with the follow-up study. During the pandemic's third wave (January 2021), the research questionnaire was re-sent to these respondents. Of these, 80 filled-in the second questionnaire.

Findings:

Naturally, there was a higher level of experience among the nursing staffs in dealing with the virus in the second as compared to the first period in time. During the first wave, approximately a fifth of the participants (21%) reported that they had cared for patients who had been confirmed as having COVID-19, while during the third wave, most of the participants (66%) reported caring for people who had been confirmed as having contracted the virus. The findings demonstrate significantly lower levels of compliance with regulations and risk perception, and a significantly higher level of emotions in the third wave as compared to the first. However, there was no change in the level of trust in the healthcare system or in the pandemic-related threat perception.

Conclusions:

The findings provide us with some information regarding the process the nursing staffs have undergone (and are still undergoing) in dealing with the pandemic, and may point at a 'pandemic fatigue' amongst them. This concept relates to progressively lower regulation compliance levels appearing over time, affected by the target population's emotions, experiences and perceptions.

Key messages:

- It is important to assist the nurses' emotional regulation with the help of professionals in the organization, form colleagues' support groups and ensure management recognition of the situation.

- Resilience-raising steps should be taken, for example by ensuring rest times and sufficient medical and protective equipment.

Abstract citation ID: ckac131.378
Developing and implementing a methodology for forecasting of medical doctors in Slovenia

Tit Albreht

T Albreht[1], *P Ogrin-Rehberger*[1], *B Povž*[1]
[1]Centre for Health Care, National Institute of Public Health, Ljubljana, Slovenia
Contact: tit.albreht@nijz.si

Issue/problem:
Modelling and forecasting the number of health professionals in Slovenia, in particular medical doctors, and nurses, has been a serious challenge for health policy for decades. No serious methodology has ever been implemented to support this process.

Description of the problem:
Methodology was developed with the support of the EU SRSS (Structural Reform Support Service) mechanism and further adapted according to the specifics of the Slovenian health system and of the needs of the MoH. The project took two years and was developed jointly with the relevant stakeholders - MoH, National Health Insurance, Medical and Nursing Chambers, Association of Public providers of health care. It was building on the experiences of Austria and Germany. Methodology included the supply and demand side of retrospective data and forecasting data on the population demographic structure as well as the current numbers of doctors and nurses in training.

Results:
We have developed a model for forecasting the needs for medical specialists and we tested it on the example of paediatrics, gynaecology, orthopaedics, general surgery, neurology, infectious diseases, and urology. We calculated the forecasted needed numbers for the year 2035 for each of the specialties, where we also indicated the increases and decreases in demand expected based on the demographic, epidemiological and service use projections.

Lessons:
Most importantly, the report was endorsed by all the participating stakeholders in the process. The MoH adopted the methodology as a part of the planning mechanism for prospective and current needs for medical specialists in training. Some flaws in the processes identified together with the inadequacies in the updating of data on health professionals led to the MoH's recommendations to providers on regularly updating their data in the national health providers' registry.

Key messages:
- Methodology developed in the project was implemented as a part of the requirement for the planning of medical specialists.
- Processes enacted in the project contributed to the improvements in the national health providers registry.

Abstract citation ID: ckac131.379
Transformation-oriented leadership in German hospitals: beneficial attributes and competencies

Joan Kleine

J Kleine[1], *J Köppen*[1], *C Maier*[1,2]
[1]Department of Health Care Management, Technische Universität Berlin, Berlin, Germany
[2]European Observatory on Health Systems and Policies, Brussels, Belgium
Contact: joan.kleine@tu-berlin.de

Introduction:
Due to a shortage of health professionals and economic pressure, many German hospitals are required to transform the clinical work environment to increase job satisfaction, but also to attract and retain health professionals. Leadership is a key factor for the successful implementation of organization-wide change. The aim of this study was to identify the attributes and competencies among leaders that are beneficial for implementing and managing hospital-wide transformations.

Methods:
A qualitative study design. In 2020, 18 face-to-face, semi-structured interviews were conducted with chief nursing officers, ward managers, nurses and physicians in five German hospitals which have started implementing a hospital-wide transformation (e.g. Magnet® or Pathway®). Interviews were recorded and transcribed verbatim. Data were analyzed in Atlas.ti using the content analysis method according to Mayring.

Results:
Results show five beneficial leadership elements to instigate and steer hospital-wide transformation: (1) Charismatic leaders are role models and idealists with well-communicated visions that are grounded in clinical practice and reflect the clinical practitioners. (2) Mentally strong leaders have courage, stamina, and are resilient. (3) Empowering leaders are highly supportive and increase the intrinsic motivation of employees. (4) Imparting interprofessional appreciation refers to leaders who cultivate a respectful relationship with persons from other professional groups and recognize their daily performance. (5) Agile leaders are well and quickly accessible for employees and respond situationally to changing demands in everyday work.

Conclusions:
Interviewees described characteristics of hospital leaders as success factors for establishing and maintaining continuous change processes. Charismatic and supportive leaders are critical to transform the hospitals' culture and values. In addition, equitable interprofessional collaboration is of utmost importance.

Key messages:
- Charismatic, agile, empowering leaders can have a positive impact on system-wide change processes.
- The successful transformation of hospitals' work environment needs interprofessional appreciation and the mutual acknowledgement of competences.

Abstract citation ID: ckac131.380
Migration from Latin America to Italy and EU: the issue of health professionals

Elisabetta Corvo

W De Caro[1], *E Corvo*[2]
[1]CNAI Italian Nursing Association, Rome, Italy
[2]Canterbury Christ Church, Canterbury, UK
Contact: sii@cnai.pro

Introduction:
The estimated shortage of more than 15 million health and social care professionals, including over 6 million nurses, together with the significant phenomenon of international migration of such professionals, emerged, during COVID-19, with even more evidence. During the pandemic the danger of a collapse of health systems in many areas due to a shortage of staff was manifest. This leads, among other reasons for several professionals to migrate from South America to Italy and Europe.

Methods:
an integrative review analysis (2011-2021), of trend in terms of legislation and policy documents were conducted using health and social database and gray literature. 34 different documents were included in this review.

Results:
Several initiatives have been developed to establish international and/or bilateral obligations among countries in terms; however, this showed to be insufficient. There is confusion in terms of the necessity of harmonizing rules, nursing curricula,

monitor systems, and innovative rules for recognition. With covid-19 and the increase in shortage of health professionals, a number of countries decide to reduce the general criteria of recognition.

Conclusions:

It is time to develop specific actions aimed at setting up a passport for public health and health care professionals which allows guaranteeing prior certification and accreditation of skills by independent agencies. There is the need to set up a joint effort/actions among different stakeholders such as Government, Higher Education institutions, International Labor health market actors, and NGOs in the field of migration, labor, and training of public health and health care professionals to better meet health needs worldwide

Key messages:

- it is necessary balancing the rights of individuals to migrate with the potential loss of essential health care services in source countries.
- migration and shortage of nurses is a serious ethical issues.

Abstract citation ID: ckac131.381
The effect of the SARS-CoV-2 pandemic in the compliance of hand hygiene in ICU in a tertiary hospital

Marta Russo Sanjuabenito

M Russo Sanjuanbenito[1], *MJ Urquijo Valdovinos*[1], *AB Sánchez de la Ventana*[2], *M Ibáñez Rebe*[3], *I Carnicer Gil*[2], *T Blanco Maestro*[4], *L Mascaraque Sánchez*[5], *M Fuentes Ferrer*[1]

[5]Traumatology Department, Hospital Clinico San Carlos, Madrid, Spain
Contact: martarusso7@gmail.com

Background:

Hand hygiene (HH) is one of the main preventive methods for healthcare-associated infections. Our aim is to compare the level of HH compliance in 2021, SARS-CoV-2 pandemic period, with the previous 2019 period.

Methods:

Descriptive cross-sectional study of direct observation on compliance of HH in adult intensive care unit (AICU) and neonatal intensive care unit (NICU) in a third-level hospital in Madrid during the years 2019 and 2021. Trained healthcare workers observed and recorded hand hygiene opportunities (HHO) among staff (nurse, nurses' aide, physicians and orderly) using the World Health Organization's "My Five Moments for Hand Hygiene" tool. All observations of professional that attended patients in SARS-CoV-2 isolation units were excluded.

Results:

Overall, there was a total of 1199 HHO, 961 in AICU (2019:466; 2021:495) and 238 in NICU (2019:122; 2021:116). HH compliance in AICU improved from 57.5% in 2019 to 65.9% in 2021 ($p = 0.008$) and remained unchanged in NICU (2019:90.2% vs 2021:88.8%; $p = 0.730$). In AICU all professional categories, except nurse's aide, improved HH compliance being statistically significant in physicians (2019:33.8% vs 2021:50.0%; $p = 0.009$). In relation to the 5 moments, an increase in HH compliance was observed in: before and after touching a patient/after touching patient surroundings, being only statistically significant in moment after touching a patient (2019:69.4% vs 2021:83.7%; $p = 0.001$). In NICU there were no significant changes between the two periods regarding to the professional category or the five moments of HH. In NICU there were no significant changes between the two periods regarding to the professional category or the five moments of HH.

Conclusions:

The increase in compliance of HH within the adult ICUs demonstrates this adaptation, stating a behavioural change in the habits of professionals. This increase was no observed in the NICU since their compliance was already extremely high.

Key messages:

- There has been an increase in HH compliance in the AICU.
- The HH method has varied, becoming COVID-19 specific.

Syllabi collection on diversity and intersectionality in public health: reflecting on the development

Lisa Wandschneider

L Wandschneider[1], *D Podar*[1], *L Wetzel*[2], *H Luetke Lanfer*[1], *O Skrypnikova*[3], *O Razum*[1], *S Selig*[4], *Y Namer*[1]
[1]School of Public Health, Bielefeld University, Bielefeld, Germany
[2]Health Sciences, University of Applied Sciences Fulda, Fulda, Germany
[3]School of Public Health, National University of Kyiv-Mohyla Academy, Kyiv, Ukraine
[4]Department of Public Health and Health Sciences, University of Michigan-Flint, Michigan-Flint, USA
Contact: lisa.wandschneider@uni-bielefeld.de

Background:

Highlighting the intersectionalities between different markers of diversity and health inequities encourages the reconsideration of normativities in public health (PH). We developed an open access collection of syllabi on the relevance of intersectionality and diversity in PH together with the Association of Schools of Public Health in the European Region (ASPHER).

Objectives:

We developed the syllabi in a participatory, iterative process guided by transformative teaching pedagogy. We reflect on this process and how this can inform the enhancement of the syllabi themselves, as well as future curriculum development.

Results:

We recruited a core group of 9 PH researchers, teachers and professionals from all career levels from participants of introductory session presentations in different settings (e.g., 14th EPHC, ASPHER Retreat). The core group met once a month for one year online, and each meeting took the form of co-working sessions in breakout rooms to develop the syllabi based on interest and expertise. We designed a qualitative online survey to evaluate and ensure the scientific rigor and pedagogical value of the syllabi. We invited critical and constructive input from ASPHER member school professionals with expertise in intersectionality, diversity or curriculum development in PH in terms of content and pedagogy.

Conclusions:

Drawing from the expertise of the PH community we combined diverse professional and cultural backgrounds, experiences from different career levels and PH education systems, as well as specialisation in the PH field. The transformative pedagogical approach was considered particularly valuable in strengthening competences such as reflexive strategies and self-, social- and global awareness which are key to teaching on diversity and intersectionality issues. The peer-review structure supports the uptake in PH education and a sustainable implementation. The collection will also allow PH faculty to diversify their pedagogical approaches.

Key messages:

- Inclusion of health inequities, diversity and social injustice issues is crucial in public health curricula, since an intersectional perspective is increasingly acknowledged in public health research.
- The syllabi collection will equip public health teachers of all career levels to develop their own course material on social identities and their significance for public health.

Abstract citation ID: ckac131.383
Evidence-based development of new qualification models for public health practice and science

Laura Arnold

L Arnold[1], *S Bimczok*[1], *N Dragano*[2], *S Götz*[2], *A Kietzmann*[3], *A Melville-Drewes*[3], *S Weyers*[2], *D Starke*[1]
[1]Applied Research and Transfer, Academy of Public Health Services, Duesseldorf, Germany
[2]Institute of Medical Sociology, Centre for Health and Society, University of Düsseldorf, Duesseldorf, Germany
[3]Health Department, State Capital Düsseldorf, Duesseldorf, Germany
Contact: arnold@akademie-oegw.de

The Public Health Service (PHS) needs a sufficient and well-trained workforce to fulfill core public health activities. Given the multitude of complex challenges, from often short-term crisis management to long-term health promotion, a better integration of science and practice in the PHS is essential. In Germany, there is a lack of systematically established cooperations and integrated training concepts. However, both are essential to ensure continuous knowledge transfer between science and practice. In the EvidenzÖGD study, representatives from practice, teaching and science jointly develop and pilot new qualification models to qualify public health professionals for work at the interface of practice and science. Based on a systematic analysis of existing collaborations and qualification models, 23 expert interviews were conducted to identify qualification approaches that will enable future public health professionals to work at the interface between science and practice. In a stakeholder workshop planned for July 2022, a multistage decision-making process based on strategic orientation mapping will be conducted to prioritize the identified approaches and generate ideas for new qualification models. In total 17 papers were analyzed and inductively coded according to three main categories. In addition to (1) context-related aspects, such as credentialing, recruitment strategies and resources, also (2) content-related aspects, such as training forms and didactical concepts were extracted. Furthermore, criteria relevant for the further development and continuation of the models (3) could be identified. By strengthening the scientific nature of practice in PHS and anchoring PHS-relevant topics in academia, the EvidenzÖGD project contributes to a sustainable strengthening of evidence-informed approaches in PHS practice. The evidence-informed, participatory development of a tailored qualification model is intended to promote the pilot of the model, which is due in 2023.

Key messages:

- Integrated qualification models support the strengthening of evidence-based approaches in the public health service (ÖGD) and promote the integration of ÖGD-relevant issues in science.
- Participatory approaches with explicit consideration of the perspective of young health professionals ensures that new qualification approaches meet the needs and requirements of future generations.

Abstract citation ID: ckac131.384
Determination of Admission Criteria for Global Public Health Master at the University of Georgia

Tamar Lobjanidze

T Lobjanidze[1], *N Skhvitaridze*[1], *K Antia*[1], *M Lobjanidze*[1], *M Nonikashvili*[1], *G Shakarishvili*[1]
[1]School of Health Sciences and Public Health, University of Georgia, Tbilisi, Georgia
Contact: t.lobjanidze@ug.edu.ge

Background:

Recent events in the world, wars, pandemics, have once again raised the issue of the need for competent human resources in global public health (GPH). In Georgia, there are master's degree programs in public health where global health is mostly offered as an elective or core course of the curriculum. University of Georgia (UG) is involved in the ERASMUS + project in GPH (BACE). UG initiated to create new GPH Master Program, which will be response towards local, regional and international challenges and demand.

Objective:

Main objective of developing GPH program was to address and meet national and international global health education needs and challenges. The aim of the study was to identify evidence-based prerequisites for the MPH in GPH (UG). We conducting document review based on the GPH competency model (GPHCM) and evaluated: 1) GPH & MPH programs of the top 20 world university ranking (THE/2022); 2) CUGH associated programs; 3) Georgian MPH programs; 4) Georgian education documents (such as Georgian National Qualifications Framework (GNQF)); 5) Main directions of career development in global health. In addition, interviews with national experts were conducted (in education, employment, program leaders) using the Delph method.

Results:

Study found that depending on the scope and content of the program, prerequisites for obtaining MPH in GPH varies. In addition to English competence and a high GPA, working or research experience or interviews or additional exams or other are required. In Georgia, there is no adopted GPHCM, but GNQF allows the establishment of MPH in GPH. UG new Master program (120 ECTS) will include 99 ECTS core (including research practicum & thesis) and 21 ECTS elective courses based on 6 domains of GPHCM. The program will mostly focus on population health management at a global level.

Conclusions:

Study findings suggest any undergraduates with appropriate conditions could be eligible for admission to the UG (MPH in GPH).

Key messages:

- UG admission prerequisites for Health Science undergraduates: National entrance exam, English proficiency B2, working experience and motivation letter.
- UG additionally admission prerequisites for Health Science undergraduates: basic knowledge epidemiology and medical terminology (if credits available or test).

Abstract citation ID: ckac131.385
Towards collaborative action: A project on interprofessional stroke care in the Covid-19 pandemic

Tamara Schloemer

T Schloemer[1,2], *A Schüller*[1]
[1]Department of Applied Health Sciences, Hochschule für Gesundheit, Bochum, Germany
[2]Care and Public Health Research Institute, Maastricht University, Maastricht, Netherlands
Contact: tamara.schloemer@maastrichtuniversity.nl

Background:

Stroke is one of the leading causes of disability in adulthood. Cooperatively organised stroke care requires a high degree of interprofessional competence of junior professionals.

Objectives:

The project aim was to develop interprofessional competences for stroke care, to identify gaps in care as well as approaches to innovation during the pandemic through joint research. The focus was on person-centred care, communication and collaboration, roles and responsibilities, including stroke-navigators. German Bachelor students of occupational therapy, physiotherapy and speech therapy of the 7th semester (n = 22) were accompanied online in 60 teaching units in 2020/2021. The seminars consisted of (a) theoretical introduction to interprofessional stroke care (b) case-based collaboration with problem-based learning (c) applied health services research. The evaluation was based on a central questionnaire and written reflections from all students.

Results:
The following themes were identified and investigated in 5 interprofessional groups: (1) Impact of the Covid-19 pandemic on the acute care and rehabilitation of stroke patients, (2) International comparison of interprofessional stroke care based on guidelines to improve current practice, (3) Interprofessional diagnostics in stroke care, (4) Interprofessional patient-centered goal setting in outpatient stroke care, (5) Agreements of actors involved in stroke treatment to best serve the needs of the patient. The response rate to the centralised evaluation was low (14%). The project was rated good to very good in terms of planning and presentation, relevance, and interaction with students.

Conclusions:
The students reported central aspects for interprofessional learning: The reflections predominantly described growth in professional competences, in skills for cooperation and problem solving, which can be transferred to professional life. The main point of criticism was the necessity of digital teaching in the pandemic.

Key messages:

- Empowering interprofessional cooperation through a joint project of different Bachelor programmes helps to strengthen the students' professional identity and shared responsibility for stroke care.
- Online teaching can be a valuable facilitator of learning, but should not completely replace face-to-face teaching for stroke care.

[2]Faculty of Medicine of Sousse, University of Sousse, Sousse, Tunisia
[3]LR20SP06, Emerging Bacterial Resistance in Hospitals Veterinarians and the Environment and Security of Care, Tunisia
Contact: hela.ghali@outlook.com

Background:
Surgical site infections (SSIs) are the most common hospital-acquired infections (HAIs) in low- and middle-income countries. Many reports have shown that surveillance and management of factors associated with SSI decreased rates and improved overall outcomes.This study aimed to appraise the prevalence trend and risk factirs of SSIs during 10-year period (2012 - 2021) in a Tunisian university hospital.

Methods:
The SSI surveillance module is based on the National Healthcare Safety Network (NHSN), Centers for Disease Control and Prevention (CDC). For the current study, data collected over ten years through point prevalence surveys were analyzed. Univariate and multivariate logistic analysis were used to identify SSI risk factors.

Results:
Overall, 2957 patients were observed; the mean age was 48.4 ± 23.5 years and 57.2% were male. We identified 289 infected patients (9.8%) and 319 HAIs (10.8%). SSIs were found in 21.6% of cases.The prevalence of SSI decreased from 27.9% in 2012 to 21.6% in 2021. However, this decrease was not statistically significant. The majority of the positive cultures were Staphylococcus aureus (14.3%) followed by Escherichia Coli (11.1%) and Klebsiella pneumoniae (9.5%). Antimicrobial resistance was found in 17.5% of cases. Univariable analysis found that lenght of stay ($p < 10\text{-}3$), obesity ($p = 0.047$), the use of antibiotic treatment in 6 months ($p = 0.002$), and the use of central line ($p < 10\text{-}3$) were associated with SSI. Independent risk factors significantly associated with SSIs were length of stay (aOR = 8.6), the use of central line (aOR = 3), and the use of antibiotic treatment in 6 months (aOR = 2.2).

Conclusions:
With continuous surveillance, the prevalence of SSIs decreased. In Sahloul university hospital, there has been a strengthening of the application of hygiene standard precautions during the two last years, and more particularly the respect of hand hygiene, combined with continued inpatient antimicrobial stewardship programs.

Key messages:

- Active surveillance and management of factors associated with surgical site infection (SSI) decreased the incidence and improved overall outcomes.
- With continuous surveillance, the prevalence of SSIs decreased over the 10-year study period.

Abstract citation ID: ckac131.387
Antimicrobial stewardship programs in Italy: structure, process and outcome indicators, 2017-2019

Costanza Vicentini

C Vicentini[1], V Blengini[1], G Libero[1], R Raso[2], CM Zotti[1]
[1]Department of Public Health, University of Turin, Turin, Italy
[2]SEREMI, ASL AL, Alessandria, Italy
Contact: costanza.vicentini@unito.it

Background:
The increasing spread of antimicrobial resistance (AMR) represents a global public health threat, and a significant challenge for healthcare delivery. Antimicrobial stewardship (AMS) programs have proven to be effective and cost-effective strategies for optimizing antimicrobial use. We aimed to assess key aspects of AMS programs implemented in acute-care trusts of the region of Piedmont, and to evaluate changes in antimicrobial usage against a score we attributed to structural and functional elements of AMS programs.

Methods:
AMS programs operating in acute-care trusts in the region of Piedmont were investigated via a survey addressing program characteristics, divided into structure and process quality indicators. All public health trusts of the region of Piedmont were invited to complete the survey. The indicators were selected based on core elements identified by international guidelines and were reviewed by a multi-disciplinary panel. Antimicrobial usage was expressed as defined daily doses, DDD per 1000 patient-days. The annual means for the years 2017-2019 were considered, as well as the percentage change between 2017 and 2019. Variables were investigated in relation to structure and process scores using Spearman correlation. Analyses were performed using SPSS v. 27.0 (SPSS Inc., Armonk, NY).

Results:
In total, 25 AMS programs were surveyed. Higher scores were achieved for process rather than structure indicators. Improvements in total antimicrobial usage (-4%) were found between 2017 and 2019. A moderate correlation was found

between structure score and percentage change in antimicrobial usage (Spearman's ρ -0.603, p 0.006).

Conslusions:

This study highlighted important areas for improvement, such as accountability, microbiological laboratory quality management and feedback. Repeated measurements of structure, process and outcome indicators will be important to guide continuing quality improvement efforts.

Key messages:

- Results of this study support the effectiveness of AMS programs in reducing antimicrobial use.
- Important areas for improvement were identified. Improving the organization of AMS programs in particular should be prioritized.

Abstract citation ID: ckac131.388
Linear pathway analysis of European botulism poisoning response guidelines

Tristán Learoyd

T Learoyd[1]
[1]MCM Medical Affairs, Emergent Biosolutions, Dublin, Ireland
Contact: learoydt@ebsi.com

Background:

Botulism is a rare illness caused by Clostridium botulinum toxin with a naïve case fatality ratio of 40-50%. There is no coordinated collective worldwide reporting on cases and comparatively few recommendations on case management. This study examined 14 European botulism treatment guidelines.

Methods:

A ten-language search was conducted to examine European botulism guidelines. The guidelines were classified by differential diagnosis advice; expert advice access; mention of causalities; contract tracing; biological sampling method; and treatment access rapidity. The guidelines were linearly represented on a probability pathway. Quantified probabilities were entered into the algorithm. Probabilities for algorithmic delay or deviance were estimated or mathematically modeled against Hamiltonian, Ford- Fulkerson and Kruskal pathways. Case recognition was deemed proportional to the availability of information at point of care and produced a hazard function related to a Bayes' probability model.

Results:

Two guidelines did not display all diagnostic information in one place, and six European nations had incomplete descriptions of the chain of causality linking botulism cases: factorially reducing the Borel algorithmic likelihood of diagnosis through contact tracing and decreasing the affectable survival chance. Another limitation was specialist advice and treatment availability in a 48-hour window. Survival probability models to the quoted naïve minimum constraint of a 60% survival factor were depicted, with pharmacokinetic tendential to an exponential decay model. This highlighted the importance of well-constructed case management and logistical stockpiling methods.

Conclusions:

In botulism poisoning the 48-hour window is cited as crucial to patient survival chances, to this extent, the availability of clear diagnostic criteria including causation considerations, expert advice access and logistically considered therapeutic stockpiles could improve survival probability.

Key messages:

- An international standard for botulism guidance may further improve botulism case identification and survival rates.
- National botulism guidelines with direct contact method to an expert and with strategic positioning of therapeutic stockpiles may reduce time to treatment and improve survival chances.

Abstract citation ID: ckac131.389
Trust and its relations to vaccine beliefs: a latent class analysis on 140,000 individuals worldwide

Francesco Sanmarchi

F Sanmarchi[1], *D Gibertoni*[2], *D Golinelli*[1], *D Gori*[1], *LM Scheier*[3]
[1]Department of Biomedical and Neuromotor Science, Alma Mater Studiorum - Università di Bologna, Bologna, Italy
[2]Research and Innovation Unit, IRCCS Azienda Ospedaliero-Universitaria di Bologna, Bologna, Italy
[3]LARS Research Institute, Inc., Scottsdale, USA
Contact: francesco.sanmarchi@studio.unibo.it

Background:

Research shows that vaccine-related beliefs (i.e., about efficacy, safety, purpose) may reflect a host of within-person and contextual factors yielding homogeneous subgroups of individuals. This study aims to characterize distinct subgroups of people and identify ideal targets for tailored public health interventions to increase vaccine adherence.

Methods:

Latent class analysis was used to derive subgroups based on unique response profiles using the 2019 Gallup survey of 140 countries (>140,000 individuals). We modeled a composite of vaccine beliefs as a distal outcome examining differences for the obtained classes, with and without covariates in the model.

Results:

A 5-class model fit best with classes distinguished primarily on whether individuals possessed or sought personal knowledge about science, medicine, and health, whether they trusted science, scientists and have confidence in the healthcare system. The lowest levels of vaccine beliefs were reported by a class not endorsing any of these indicators and the highest levels by a class endorsing all the indicators ($p < 0.001$). Age class showed a U-shaped relation with vaccine beliefs, while higher educational level ($p = 0.025$), higher subjective income ($p = 0.006$) and employment ($p < 0.001$) were related to higher vaccine beliefs. Country-level income was moderately related to class membership and vaccine beliefs were higher in lower-income countries ($p < 0.001$).

Conclusions:

Our findings suggest that more work is needed to improve trust in science and medical providers. Tailored interventions grounded in a community-based and empowering approach with the collaboration of multiple stakeholders seems to be needed to improve vaccination rates. This can only be achieved when individuals trust science, scientists and healthcare providers and accrue the necessary wisdom to make good healthcare decisions that affect not only themselves but their fellow citizens.

Key messages:

- Efforts to alter vaccine beliefs should touch on where people access information on science and health, the processes that build trust, and their belief whether science improves well-being.
- Public health interventions should focus on reassuring individuals that science and health workers are benevolent. An essential first step in the health worker-patient relations is building trust.

[3]Family Medicine, Faculty of Medicine of Sousse, Sousse, Tunisia
[4]LR20SP06, Emerging Bacterial Resistance in Hospitals Veterinarians and the Environment and Security of Care, Tunisia
Contact: hela.ghali@outlook.com

Introduction:

Acinetobacter baumannii is an emerging pathogen that is increasingly resistant to antibiotics and is mainly responsible for pneumopathy in fragile patients. This germ is frequently responsible for epidemics in hospitals. We aimed to describe the steps of the investigation of an outbreak of Acinetobacter baumannii affected our hospital, the measures implemented and the follow-up of the actions.

Methods:

Following alerts issued by the microbiology department concerning 5 swabs detecting Acinetobacter of the same strain and the same antibiotic resistance profile in 3 different departments of intensive-care units (ICU), a team of the prevention and healthcare security department went onsite for an investigation in the hospital.

Results:

We identified five cases with identical strains of multi-resistant Acinétobacter. The field visit allowed to identify some deficiencies in professional practices. All the patients were hospitalized in ICU (medical and surgical). The synoptic table showed that there was an overlap of hospitalization periods.A crisis cell was set up to validate, coordinate and implement control measures in accordance with CTINILS recommendations. Indeed, we proceeded to a technical isolation of the cases in their hospitalization sector, reinforced the basic hygiene and bio-cleaning measures and sensitized the medical and paramedical. Given that the three ICU departments shared the same medical staff during night shifts, the assumption that the germ was carried by the caregivers was the most likely hypothesis. We proceeded with a swab of the elements of the environment in the services concerned. Results showed that Acinetobacter was found on the nursing cart (visibly clean). A training about bio-cleaning and hygiene standard precautions is programmed.

Conclusions:

Continuous surveillance, continuous hygiene trainings, combined with a rapid reaction capacity in case of identification of a new case, is essential to control the spread of nosocomial germs.

Key messages:

- Multidrug-resistant Acinetobacter baumannii (MRAB) is an emerging cause of intensive care unit (ICU) outbreaks.
- Enhanced infection control measures limited the outbreak.

Abstract citation ID: ckac131.391
Flu shot in the era of COVID-19 vaccination: findings from a research hospital of Rome

Domenico Pascucci

D Pascucci[1,2], MC Nurchis[1,2], M Sapienza[1], A Lontano[1], E Marziali[1], F Castrini[1], W Ricciardi[1], G Damiani[1,2], P Laurenti[1,2]
[1]Università Cattolica del Sacro Cuore, Rome, Italy
[2]Fondazione Policlinico A. Gemelli IRCCS, Rome, Italy
Contact: domenico.pascucci@outlook.it

Influenza represents a major burden for public health. Healthcare workers (HCWs) are a priority target group for flu vaccination. During the COVID-19 pandemic, when SARS-CoV-2 vaccines were not yet available, susceptibility to influenza vaccination especially by HCWs increased. The aim of this study is to analyze the flu vaccination coverage among HCWs and to study which factors affected their adherence given the concomitant COVID-19 vaccination. The retrospective study was conducted in an Italian research hospital from October 2021 to January 2022. A total of 7,048 individuals was included. Age class, gender and job category variables were analyzed. Statistically significant differences among groups were tested through $\chi 2$ test. Univariate and multivariate analyses ($p < 0,005$) were performed to assess differences towards vaccination attitude. The flu vaccination coverage rate was 24.6%. Among the selected job categories, 29.8% of physicians, 19.9% of nurses and 19.7% of other HCWs were vaccinated with a statistically significant decrease ($p < 0.001$) across all categories respect with the last campaign. The findings of the logistic regression depicted that the 40-59 years old age class, compared with the youngest age class (OR 1.30, 95% CI 1.12-1.43) as well as being physician (OR 2.79, 95% CI 1.87-3.41) with the respect to being nurses, had a higher adherence to vaccination. Interestingly, being male, is associated with a statistically significant reduction (OR 0.71, 95% CI 0.59-0.87) in vaccination uptake. Study findings showed a several decline in the flu vaccination coverage comparing with previous campaigns, probably due to the concomitant administration of the booster dose against SARS-CoV-2. This alarm should not be underestimated and requires timely and innovative organizational approaches (i.e., combined vaccine). Further studies are needed to analyze the reasons for this poor adhesion and the strategies to be adopted to increase the awareness of the HCWs.

Key messages:

- Reaching high coverage rates and restore a positive trend for the future campaign for flu vaccination it is essential strategy to protect HCWs themselves, their patients and the hospital community.
- Decision-makers should implement consistent communication strategies to lessen vaccine hesitancy among HCWs.

Abstract citation ID: ckac131.392
Prevalence and risk factors of hepatitis C virus infection in Armenia, 2021

Anahit Demirchyan

A Demirchyan[1], S Sahakyan[1], L Aslanyan[1], L Mushegyan[1], D Muradyan[1], A Mozalevskis[2], N Sargsyants[3], G Ghukasyan[4], V Petrosyan[1]
[1]Turpanjian College of Health Sciences, American University of Armenia, Yerevan, Armenia
[2]WHO Regional Office for Europe, Copenhagen, Denmark
[3]National Centre for Infectious Diseases, Yerevan, Armenia
[4]WHO Country Office in Armenia, Yerevan, Armenia
Contact: ademirch@aua.am

Background:

Liver damage caused by hepatitis C virus (HCV) is common, especially in low- and middle-income countries. Chronic HCV infection is among the leading causes of chronic liver disease, cirrhosis and hepatocellular carcinoma. Data on prevalence and risk factors of HCV infection are important for planning effective interventions to fight the virus. This study investigated the prevalence of HCV, its genotypes and factors associated with chronic HCV infection in Armenia.

Methods:

The study included 3838 individuals 18 years and older selected via stratified two-stage cluster sampling from all regions of Armenia. Anti-HCV antibodies were detected using a third generation immunoassay. Those testing positive were further tested by Polymerase Chain Reaction and genotyping. Shortly after testing, the participants underwent a telephone survey. Logistic regression model was fitted to identify factors associated with chronic HCV infection.

Results:

The participants mean age was 49.5 years, 70.0% were female. The prevalence of HCV antibodies weighted by age and sex was 1.9% (95% CI 1.5, 2.3), and chronic HCV infection - 0.7% (95% CI 0.4, 0.9), with genotype 3 being the most common (41.7%), followed by genotypes 2 (37.5%) and 1 (20.8%). The prevalence of both antibodies and chronic infection were higher among 50-69 years old (3.4% and 1.3%, respectively). In weighted analysis, the risk factors for chronic HCV infection included male sex (95% CI 1.23, 11.59), having tattoos (95% CI 1.10, 7.80), and reporting liver disease (95% CI 1.24, 14.61). Being employed was protective (95% CI 0.14, 0.93).

Conclusions:

This study was the first attempt to measure the prevalence of HCV infection among the general population of Armenia, creating prerequisites for estimating the HCV-related disease burden and developing strategies to cope with it. The identified risk factors demonstrate that there is still room for strengthening safety measures to prevent the transmission of HCV in Armenia.

Key messages:

- The prevalence of HCV antibodies is 1.9% among adult population of Armenia, increasing with age. Over one-third of seropositive cases have chronic infection caused by HCV genotypes 3, 2 or 1.
- Having tattoos is associated with higher risk of being infected with HCV, demonstrating the need for strengthening safety measures during similar procedures to prevent viral transmission.

Abstract citation ID: ckac131.393
Costs of delivering human papillomavirus vaccination in Tanzania

Verena Struckmann

Background:

Cervical cancer caused by human papillomavirus (HPV) is the most frequent cancer in women in many low-income countries.Tanzania implemented a national HPV vaccination program in 2018 using a two-dose quadrivalent HPV vaccine. This study aimed to (1) estimate financial and economic costs of a two-dose vaccination program based on experiences with the national vaccination program, (2) estimate costs of a one-dose vaccination schedule to enable future cost-effectiveness analyses, and (3) assess the effect of alternative assumptions for future vaccination coverage rates on estimated costs of vaccination.

Methods:

The WHO Cervical Cancer Prevention and Control Costing (C4P) tool was used to estimate the incremental costs of the national vaccination programme from the perspective of the Tanzanian government using data collected via surveys, workshops, and interviews with local stakeholders. Deterministic sensitivity analyses were performed to estimate the effect of alternative assumptions for coverage rates and delivery strategies and to assess the impact of a potential one-dose vaccination schedule.

Results:

The total financial and economic costs were US$10,117,455 and US$45,683,204, respectively, at a financial cost of $5.17 per two-dose fully immunized girl (FIG), and an economic cost of $23.34 per FIG. Under the assumption of a one-dose vaccination schedule, costs per FIG would reduce to financial costs of $2.51 and economic costs of $12.18.

Conclusions:

The overall cost of Tanzania's HPV vaccination program was lower per vaccinee than previous demonstration projects in the region suggest. These data provide important baseline data for Tanzania's HPV vaccination program to date and may serve as a guide for improving coverage going forward. The findings may also aid in the prioritization of funding for countries that have not yet added HPV vaccines to their routine immunizations.

Key messages:

- If a single dose regimen were found to be as effective as a two-dose series, it would result in significant cost savings as well as an increase in the number of girls that could be reached.
- School-based vaccinations resulted in the lowest price per fully immunized girl, but other settings are needed to achieve equitable high coverage of HPV vaccination in Tanzania.

Knowledge about HPV vaccination among Croatian university students

Ivan Miskulin

I Miskulin[1], I Simic[1], Z Pavic[2], M Miskulin[1], V Bilic-Kirin[1], J Kovacevic[1]
[1]Department of Public Health, Faculty of Medicine Osijek, University of Osijek, Osijek, Croatia
[2]Department of Sociology, Faculty of Humanities and Social Sciences, University of Osijek, Osijek, Croatia
Contact: ivan.miskulin@mefos.hr

Background:

Studies have shown the low uptake of the human papillomavirus (HPV) vaccine among university students. Knowledge about the HPV virus and the vaccine can be a factor that may sway an individual's decision to receive the vaccine. This study aimed to investigate HPV vaccine uptake and knowledge about HPV vaccination among Croatian university students.

Methods:

This cross-sectional questionnaire study was conducted from February to May 2021 period. A validated, anonymous questionnaire that contained questions regarding demographic data, data about HPV vaccine uptake, and data regarding knowledge about the HPV virus and the vaccination was self-administered to a cross-faculty representative student sample of the University of Osijek in Eastern Croatia.

Results:

The study sample included 840 subjects with, median age of 20 years (interquartile range 20-21), 45.8% males, and 54.2% females. The prevalence of vaccination uptake in the studied population was 20.8%. The study revealed that there were 25.6% of students with a low level of knowledge and 74.4% of students with satisfactory levels of knowledge about the HPV virus and the vaccination. The excellent knowledge about the HPV virus and the vaccination was more frequently shown by students who studied in biomedicine and health area of science ($p < 0.001$) and students with an excellent average grade of study ($p < 0.001$). HPV vaccination uptake was higher among females ($p < 0.001$), students who studied within biomedicine and health area of science ($p < 0.001$), students with an excellent average grade of study ($p < 0.001$), and students who showed excellent knowledge about the HPV virus and the vaccination ($p < 0.001$).

Conclusions:

The majority of Croatian university students had a satisfactory level of knowledge about the HPV virus and the vaccination but the vaccination uptake is still very modest. Additional efforts are needed to organize more appropriate education and promotion of vaccine uptake in the studied population.

Key messages:

- The HPV vaccination uptake among Croatian university students is very modest although the majority of students have a satisfactory level of knowledge about the HPV virus and the vaccination.
- Continuous examination of HPV knowledge gaps and identification of factors influencing vaccine uptake is key to increasing vaccination rates in the Croatian university student population.

Abstract citation ID: ckac131.395
Improving childhood vaccination in minorities: a realist review of health system interventions

Jumanah Essa-Hadad

J Essa-Hadad[1], Y Gorelik[1], M Edelstein[1]
[1]Faculty of Medicine, Bar-Ilan University, Safed, Israel
Contact: jumanah.essa-hadad@biu.ac.il

Background:

Most minority populations in Europe have lower childhood vaccine uptake than the general population. Improving uptake in these populations requires specifically developed, context-specific interventions. As part of the EU-funded RIVER-EU project, we conducted a realist review to identify interventions effective at improving vaccine uptake among underserved communities.

Methods:

We searched MEDLINE, EMBASE, CINAHL, COCHRANE, and Proquest for articles published between 2005 and 2022, using combination keyword searches in English. Following title and abstract screening, full texts were assessed for relevance. We also searched grey literature and references of references. Data extraction and analysis was performed by two reviewers. Programme theories were generated from included articles and data extraction were carried out paying particular attention to context, mechanisms, and outcome configurations.

Results:

From 1942 screened titles we selected 87 studies for full-text review of which 34 were included. We identified 10 primary intervention categories: parental and youth education; clinic outreach; quality improvement; health provider training; school-based education; technology interventions; cash incentives; home visits; comic books; community leaders education; and consent policy changes. The analysis highlighting contextual factors enabling or hindering each intervention category's success is ongoing.

Conclusions:

Several intervention categories can potentially improve vaccine coverage among underserved minority populations. We will describe their effectiveness and the contextual factors contributing to their success or failure to inform the development of tailored interventions targeting these populations.

Key messages:

- Improving vaccination in underserved minority populations requires identification of effective interventions, barriers/enablers to their success, specific to the context in which they are implemented.
- Appropriately tailored health system interventions are effective at improving vaccine uptake among underserved minority communities.

COVID-19 knowledge among Ukrainian refugees in Poland

Maria Gańczak

O Pasek[1], M Ganczak[2], A Sikora[1], E Sobieraj[1], Ł Duda-Duma[1], K Pyzio[1], J Goławski[1]
[1]Student Research Group, University of Zielona Gora, Zielona Góra, Poland
[2]Department of Infectious Diseases, University of Zielona Gora, Zielona Góra, Poland
Contact: ganczak2@wp.pl

Background:

The constantly growing refugee population may constitute public health threat in Poland in the context of COVID-19 pandemic. This study objective was to investigate COVID-19 knowledge among Ukrainian refugees in Poland.

Methods:

This cross-sectional study was carried out between March-April 2022 among Ukrainian refugees registering in Zielona Góra, Poland. An anonymous, self-administered questionnaire was used which included 10 questions related to COVID-19 knowledge. Each correct answer was given 1 point.

Results:

Response rate was 96.0%, 190 Ukrainians responded (mean age 37.8±15.7 years; 42.1% males); 52.1% were living in the cities >50,000 inhabitants; 61.6% reported high SES; 39% higher education; 44.2% were married. The mean knowledge score was 3.47 (SD ± 2.2), 15.8% collected >50% points. The knowledge level was higher among those with higher SES ($p < 0.0001$) and higher education ($p = 0.003$); 31.7% stated that SARS-CoV-2 is an animal-human transmitted disease (more with high SES, $p = 0.004$), 55.0% considered COVID-19 as highly contagious disease (more living in bigger cities, $p = 0.04$), 26.3% reported that SARS-CoV-2 infection ensures lifetime immunity (more unmarried, $p = 0.02$); 24.7% correctly stated that compared with 18- to 30-year-olds COVID-19 mortality rate is about 10 times higher in those who are >65 years (more with higher education and high SES; $p < 0.05$, $p = 0.01$ respectively), 44.4% - that COVID-19 treatments are now available (more with high SES and higher education; $p = 0.03$ both). Regarding prevention, 37.0% reported that FFP3 is the most protective type of mask, 43.3% that vaccines effectively protect against COVID-19 (more with high SES; $p = 0.006$, $p < 0.001$ respectively).

Conclusions:

COVID-19 knowledge among Ukrainian refugees in Poland was far unsatisfactory, in particular among those with lower education and lower SES. Educational campaigns are urgently needed to effectively raise the knowledge level in this vulnerable group to better control the pandemic.

Key messages:

- This study results may be used by public health experts to expand educational campaigns targeting Ukrainian refugees in Poland.
- COVID-19 education oriented to Ukrainian refugees in Poland should specifically address deficits of knowledge identified in this study.

Abstract citation ID: ckac131.397
Measles, rubella, mumps and chicken pox seroprevalence of health workers in a second level hospital

Inmaculada Guerrero Fernández de Alba

I Guerrero Fernández de Alba[1], E Soler Iborte[1], R Padilla Matas[1], J Diaz Campanón[1], M Rivera Izquierdo[1], J Perez de Rojas[1]
[1]Preventive Medicine and Public Health, Hospital Universitario Clínico San Cecilio, Granada, Spain
Contact: inmagfa@gmail.com

Healthcare workers are a professional group subject to a risk of occupational exposure to a variety of infectious agents. From a public health perspective, their immune status has a great impact on the worker's own health, on the patients and on the general population. Measles, mumps, rubella, and chickenpox are vaccine-preventable diseases caused by viruses. Seroprevalence surveys are a powerful evaluation tool that provide information on the frequency, distribution, and dynamics of communicable diseases. In this study, the prevalence of immunity to measles, mumps, rubella, and varicella viruses was analyzed in healthcare workers in a General Hospital of Granada (Spain). A cross-sectional study examining the seroprevalence was carried out in a population of health professionals incorporated into the General Hospital between January 2021 and February 2022. 260 professionals were studied, classified into groups according to age: 20-29, 30-39. Serum determination of IgG to measles virus was performed using a marketed chemiluminescent immunoassay. The resulting seroconversion rates were: 66.54% measles, 89.75% rubella, 84.62% mumps, and 88.08% chickenpox. The lowest rates were observed for measles, resulting in a minimum among professionals between 20-29 years of age, with a seroconversion rate of 65.4%. In general, women had a higher percentage of antibodies against measles. The highest rates were for the varicella virus, reaching up to 93.18% among health professionals between 30-39 years old. Considerable decrease in titers of antibodies against measles is observed in healthcare workers, especially in the age group 20-29 years, which may be due to the loss of serological protection as time goes by since vaccination with the 2nd dose of Triple Viral, possibly due to the absence of contact with the wild virus. It will be necessary to assess the need for new vaccination strategies in certain population groups such as healthcare workers based on their risk of exposure.

Key messages:

- It will be necessary to assess the need for new vaccination strategies in certain population groups.
- More seroprevalence studies are necessary to update the status of protection against infectious disease.

[5]Department of Infectious Diseases, University of Fianarantsoa Andrainjato, Fianarantsoa, Madagascar
Contact: jule.hameister@bnitm.de

Background:

Schistosomiasis is a disease of poverty, prevalent in tropical regions and emerging in Europe. Mass drug administration (MDA) is a common strategy to fight the disease. Pre-school aged children (PSAC) are conventionally considered not to be at high risk of infection and thus usually excluded from MDA. However, chronic infections at young ages can result in serious health consequences. Our study aims to better understand the schistosomiasis transmission routes in PSAC and risk perceptions among caretakers in the endemic context of Madagascar.

Methods:

This is a cross-sectional sub-study embedded in the clinical trial freeBILy. Using a mixed methods approach, 86 women and their two-year-old children in four communities of the Amoron' I Mania and Itasy regions of Madagascar in April 2022 were interviewed using structured questionnaires, focus group discussions and in-depth-interviews. Additionally, structured observational data were collected on the behaviours of 20 PSAC around waterbodies in the communities where notes and anonymised photos were taken.

Results:

Preliminary analysis shows that knowledge of schistosomiasis, its transmission routes and effects is limited. Risky behaviours of children were reported during the observations. They joined their mothers during daily activities and spent between 3-60 mins in rivers, lakes and rice fields. The exposure time to potentially contaminated waters was sufficient to represent a risk for infection.

Conclusions:

Even though our preliminary results show that PSAC are at risk of schistosomiasis infection, they are currently excluded from systematic public health interventions. The lack of risk awareness among caretakers in endemic countries calls for actions to establish tailored programs on health literacy and education. Treatment should be considered for PSAC as well as the implementation of awareness campaigns, both locally and globally given the re-occurrence of schistosomiasis in countries outside the tropics.

Key messages:

- Pre-school aged children are exposed to the risk of early infection with schistosomiasis.
- Public health programs against schistosomiasis should address pre-school aged children in endemic countries and in health promotion strategies globally.

Abstract citation ID: ckac131.399
Safe Hands 3.0: new tool to prevent healthcare associated infection

Inmaculada Guerrero Fernández de Alba

C Valero-Ubierna[1], J Perez deRojas[1], E Marin Caba[1], D Martinez Bellón[1], S Gutierrez Linares[1]
[1]Medicine Preventive and Public Health, Universitary Clinic Hospital San Cecilio, Granada, Spain
Contact: inmagfa@gmail.com

Background:

Healthcare associated infection (HAI) is a Public Health problem. Hands of healthcare workers are a key for transmission. Compliance with WHO 5 moments for hand hygiene (HH) has been emphasized, but there are other aspects: appropriate use of gloves and healthy hands skin of professionals. Gloves protect the professionals but it may increase cross-transmission. Hands dermatitis is a handicap for the use of alcohol-based handrubs. Data collection and analysis, to have a good communication system to improve training, information and to get feedback from professionals are necessary. The aim of this work is to develop the Safe Hands 3.0 Project in a General Hospital.

Methods:

Preventive Medicine and Public Health Department carried out a descriptive study carried out in a 477-bed General Hospital in last semester 2021. Compliance with HH and the possible causes of non-compliance were assessed with observations and knowledge surveys included appropriate use of gloves in healthcare practice and the impact on hand in professionals. The surveys were carried out using Lime Survey for mobile devices and Google for WhatsApp.

Results:

From 550 observations of HH compliance for the WHO 5 moments is less than 40%. Half of non-compliance was due to inappropriate use of gloves. 266 surveys answered highlighting the need for continued training. Survey on hand skin health perception was answered by 182 professionals, 44% reported dermatological issues and 81% notice that their work damaged their hands skin. A corporate logo was created, use the hospital website and a structured Communication Plan for its implementation.

Conclusions:

To prevent HAI transmission, the concept of Hand Hygiene is limited. Safe Hands 3.0 Project comes up with a bundle of care: proper use of gloves, compliance the WHO 5 moments and skin care of healthcare workers' hands. Update data management and a corporate communication plan with social networks is necessary to improve training and compliance.

Key messages:

- A bundle of care is the key for Safe Hands: proper use of gloves, compliance the WHO 5 moments and skin care of healthcare workers' hands.
- Update data management and a corporate communication plan with social networks is necessary to improve training and compliance.

Abstract citation ID: ckac131.400
Design of a care pathway for Hepatitis C: a pilot study with three University Hospitals from Tuscany

Ilaria Corazza

I Corazza[1], L Ceccarelli[1,2], G Moretti[1], L Tavoschi[2], M Vainieri[1]
[1]Health and Management Laboratory, Sant'Anna School of Advanced Studies, Pisa, Italy
[2]Faculty of Medicine and Surgery, University of Pisa, Pisa, Italy
Contact: ilaria.corazza@santannapisa.it

Monitoring and evaluation activities are recognised as key to quality improvement in healthcare performance. The present study is intended to design a performance evaluation system for care pathway for patients with chronic Hepatitis C virus

(HCV) infection, to follow them along the continuum of care throughout regional healthcare services, from diagnosis to treatment course completion. Four phases of the care pathway, namely diagnosis, linkage to care, treatment, and outcome were identified. Each phase of the care pathway was populated by a set of observation and evaluation indicators. Data sources were: administrative health data from the Tuscany Regional Healthcare System; patient-reported experience and outcome measures collected by means of questionnaires administered by the health professionals during patients' consultation in the three University Hospitals of the Tuscany Region. The availability of data, collected from the administrative flows and thanks to the active involvement of health professionals, showed the feasibility of designing a care pathway for HCV. More particularly, using administrative data, three performance indicators were calculated for the prevention phase, two for the linkage to care phase and two more for the treatment and outcome phases, respectively. Moreover, two indicators related to linkage to care and outcome phases were designed, but data require further investigation. On the other hand, using patient-reported experience data, four indicators can be calculated for the linkage to care phase, while regarding patient-reported outcomes, the feasibility of calculation depends on the number of patients that will be involved in follow-up visits. The care pathway designed may be useful to: identify shortcomings of the healthcare services for chronic HCV patients; foster quality improvement actions; inform allocation of resources to accelerate HCV elimination in Tuscany.

Key messages:

- The authors propose a care pathway for Hepatitis C, consisting of four distinct phases, populated respectively with diagnosis, linkage to care, treatment, and outcome indicators.
- The care pathway can be used as a management tool for the identification of possible quality improvement actions to be undertaken with respect to the healthcare services provided to HCV patients.

Abstract citation ID: ckac131.401
Public Health Response to Outbreaks of Highly Pathogenic Avian Influenza (H5N1)

Keith Ian Quintyne

K Quintyne[1,2], C Kelly[1], E Brabazon[1], K Harrison[3], E White[3]
[1]Department of Public Health, Health Service Executive North-East, Kells, Co. Meath, Ireland
[2]School of Public Health, University College Cork, Cork, Ireland
[3]Department of Agriculture, Food and the Marine, Dublin, Ireland
Contact: kianq1972@gmail.com

Aim:

Human infections from highly pathogenic avian influenza (HPAI) H5N1 are associated with significant morbidity and mortality internationally. This study aimed to use routinely available data to examine key strategies to prevent H5N1 transmission to humans during outbreaks in poultry in residents in Cavan, Louth, Meath and Monaghan.

Study design:

Cross-sectional based study.

Methods:

Data were obtained from Health Protection Team (HPT) in the Department of Public Health (DPH), HSE North-East and Department of Agriculture, Food, and the Marine (DAFM). Data entry and analyses were conducted using Microsoft Excel 2016.

Results:

The public health response focussed on contact tracing, monitoring, and follow-up for household, farm-workers, and DAFM staff exposed on the affected farms. A total of 157 contact episodes were identified. Contacts received advice about active monitoring from their last exposure. A total of 111 (80%) were recommended chemoprophylaxis for exposure to HPAI H5N1. During the active monitoring period, two contacts developed acute respiratory symptoms, and parainfluenza 3 and rhino/enterovirus were identified in these individuals respectively.

Conclusions:

The findings of this study, using routinely gathered data, highlighted that collaboration between public health and DAFM at regional and national level was key to rapid response to these outbreaks of HPAI in domesticated poultry. In addition, the public health response was successful in preventing H5N1 transmission from domesticated birds to humans.

Key messages:

- HPAI H5N1 virus infections transmissions from poultry to humans is low.
- Effective public health measures are crucial to further mitigate the risks to an absolute minimum.

Abstract citation ID: ckac131.402
Flu immunization during pregnancy: a cross-sectional study among Italian healthcare providers

Francesca Licata

F Licata[1], S Angelillo[1], G Della Polla[2], CP Pelullo[3], F Napolitano[4], G Di Giuseppe[4], M Romeo[1], A Bianco[1]
[1]Department of Health Sciences, University of Catanzaro ''Magna Græcia'', Catanzaro, Italy
[2]Health Direction, University of Campania ''Luigi Vanvitelli'', Naples, Italy
[3]Department of Movement Sciences and Wellbeing, University of Naples ''Parthenope'', Naples, Italy
[4]Department of Experimental Medicine, University of Campania ''Luigi Vanvitelli'', Naples, Italy
Contact: francesca17licata@gmail.com

Background:

Flu vaccination during pregnancy has been proven to be effective in preventing illness and hospitalization in both pregnant women and newborns. However, flu vaccination uptake is still suboptimal. The study aimed to assess if healthcare providers (HCPs) are knowledgeable about flu vaccination recommendation during pregnancy and if they routinely recommend the vaccination.

Methods:

The present survey was carried out among obstetricians-gynaecologists (OBs), midwives and primary care physicians (PCPs) in the Southern part of Italy. Data were collected through an anonymous self-administered questionnaire that included professional information, knowledge, perceptions and practices on flu vaccination during pregnancy.

Results:

96 participants were hitherto enrolled (36.5% OBs, 35.4% PCPs and 28.1% midwives). Among the responders, 63.5% and 66.7% knew that flu vaccination can be administrated during any trimester of pregnancy and reduces the risk of preterm birth and miscarriage, respectively. Alarmingly, more than a fifth (22.9%) of the sample believed that vaccines during pregnancy are more dangerous than safe and only 67.7% routinely recommend the flu vaccine to all women regardless of their stage in pregnancy. Among HCPs who did not recommend the flu shot, the most frequently reported reasons were that flu vaccine recommendation was outside the scope of their practice (62.5%), that women are more hesitant about vaccines during pregnancy (37.5%) and lack of time (25%).

Conclusions:

The preliminary results highlight alarming gaps in knowledge (e.g. immunization timing) and suboptimal routine recommendation of the flu vaccine that represents a missed opportunity. Indeed, it has been demonstrated that when women are offered vaccination, most tend to accept it.

Key messages:

- Unmotivated concerns about vaccine safety during pregnancy have to be addressed among HCPs to enhance flu recommendation and, subsequently, immunization coverage in pregnant women.

- Strategies to disseminate evidence-based recommendations to HCPs regarding flu immunization during pregnancy have to be implemented and evaluated in order to improve public health.

COVID-19 sequelae among competitive athletes: a systematic review

Valerio Flavio Corona

VF Corona[1], MR Gualano[2,3], A Valz Gris[1], MR Rossi[1], L Regazzi[1], W Ricciardi[1]
[1]Department of Life Sciences and Public Health, Catholic University of the Sacred Heart, Rome, Italy
[2]Department of Public Health Sciences, University of Turin, Turin, Italy
[3]Center for Leadership in Medicine Research, Catholic University of the Sacred Heart, Rome, Italy
Contact: valerioflaviocorona@gmail.com

Background:
During the COVID-19 pandemic, several professional athletes from different sports were infected by SARS-CoV-2. The aim of this systematic review was to evaluate the currently available scientific evidence regarding the cardiological, pulmonary, psychological, and combined sequelae, in professional athletes.
Methods:
The present systematic review was performed following the PRISMA statements, thereby searching on 3 databases: PubMed, ISI Web of Science, Scopus. Primary studies published between January 2020 and March 2022, investigating symptomatic and instrumental sequelae in competitive athletes after COVID-19 infection, were included.
Results:
A total of 1,957 articles were screened, finally 18 were included (6 cohort studies, 2 case-control studies and 10 cross-sectional studies). Studies' sample size ranged from a minimum of 12 to 1908 athletes playing different sports. In addition, the studies examined the following type of sequelae: 12 cardiological, 2 psychological, 1 pulmonary and 3 combined. Regarding the cardiological field, the prevalence of anomalies in instrumental examinations ranged 0-27.89% for first level tests (echocardiography, electrocardiogram, troponin), and 0-6.21% for second level tests (cardiac magnetic resonance). The prevalence of myocarditis and pericarditis in the athletes ranged from 0 to 3.33%, whereby the prevalence of myocarditis was in the range 0-2.32% and that of pericarditis in the range 0-2.22%.
Conclusions:
The results show that post SARS-CoV-2 infection cardiac sequelae have a quite low prevalence among competitive athletes included in our review, but it would be important to set up a gradual and continuous testing approach to preserve sports performance. Public health framework, such as vaccination campaign, is important both at European and international level in order to address potential consequences of infectious diseases among competitive athletes.
Key messages:
- It is important to monitor all COVID-19 sequelae in European competitive athletes playing different sports.
- Considering anti-COVID-19 vaccination in competitive athletes as an important preventive measure, to limit the circulation of the virus and the physical consequences that may occur.

Abstract citation ID: ckac131.404
Understanding barriers to dTap vaccination recommendations during pregnancy among healthcare workers

Aida Bianco

A Bianco[1], S Angelillo[1], C Riillo[1], CGA Nobile[2], C Campione[1], S Freccia[1], M Romeo[1], F Licata[1]
[1]Department of Health Sciences, University of Catanzaro, Catanzaro, Italy
[2]Department of Pharmacy, Health and Nutritional Sciences, University of Calabria, Cosenza, Italy
Contact: a.bianco@unicz.it

Background:
Diphtheria, tetanus and pertussis (dTap) vaccination is heavily endorsed during pregnancy. However, maternal dTap immunization rates in Italy remain low. Lack of healthcare workers (HCWs) recommendation to get vaccinated represents one of the main barriers to immunization during pregnancy. Therefore, this study aimed to investigate what HCWs know about dTap vaccination, practices and potential barrier to recommending immunization during pregnancy.
Methods:
This cross-sectional study was conducted among obstetricians-gynaecologists (OBs), midwives and general practitioners (GPs) in 2 regions of Southern Italy. An anonymous self-administered questionnaire was used to collect data on professional information, knowledge, risk perceptions and practices regarding dTap vaccination during pregnancy.
Results:
Until now 94 HCWs were recruited (36.2% OBs, 35.1% GPs and 28.7% midwives). Overall, 63.8% knew that dTap vaccination has to be administered during the third trimester of gestation and 94.7% that it is able to protect newborns against pertussis before active immunization. One-third of the HCWs believed that vaccines in pregnancy were more dangerous than safe. Seven out of ten HCWs routinely recommended dTap vaccine and provided information about dTap vaccination to all pregnant women. Most frequent reported reasons for not recommending dTap vaccination during pregnancy were that it was outside the scope of their practice (72.4%), that women are more vaccine hesitant during pregnancy (42.9%), lack of time (28.6%), lack of knowledge on the topic (28.6%) and the belief that the vaccine could interfere with the development of the fetus (14,3%).
Conclusions:
Lack of knowledge, unsatisfactory recommendation of dTap immunization during pregnancy and uncertainty over their responsibility around vaccination suggest that public health organisations should strengthen dissemination and implementation of evidence-based recommendations.
Key messages:
- Barriers to recommending dTap immunization during pregnancy remain among healthcare workers.
- Strategies (e.g. electronic reminders) to facilitate HCWs in recommending and informing on dTap immunization should be implemented and evaluated to improve vaccination coverage in pregnant women.

In two studies (''App-based infection assessment in RESIST (iAR)'' and ''Digital infection monitoring in persons living with immunodeficiency (DIMI)''), we monitor health related items, as vaccination against SARS-CoV-2 and conduct syndromic surveillance of acute respiratory infections in high-risk populations, i.e. elderly persons and persons living with HIV, respectively. In a third very similar study ("Sensors for measuring aerosols and reactive gases to deduce health effects (SMARAGD)") mainly healthy adults participate. To record incident or recurring transient health events, risk factors and further health data in real-time, we developed the eResearch system "PIA - Prospective Monitoring and Management App". Recruitment for RESIST, SMARAGD and DIMI started in March 2021 and is ongoing. The questionnaire was presented in April 2022. Preliminary results include 86 participants from the three cohorts. In total, one indicated to be not vaccinated, none were vaccinated once, three (3.5%) twice, 63 (73.3%) three times and 19 (22.1%) four times. Participants reported the following adverse events after immunization (AEFI): after 40 applied doses with Vaxzevria® 24 AEFI (60%); after 158 doses of Comirnaty® 41 AEFI (26%); after 62 doses of Spikevax® 19 AEFI (30.7%); and after three doses of Janssen®, one AEFI (33.3%). In these cohorts, 20 (23.36%) participants stated having had a SARS-CoV-2 infection, of these 16 (80%) after the last vaccination dose, three (15%) before the first dose and one (5%) in between doses. Most participants were vaccinated three times, with Comirnaty being the most applied vaccine, as in officially reported numbers. AEFI varied according to vaccine and were higher than in the German surveillance system (1.64/1000 doses). Most infections were indicated to have been diagnosed after the booster vaccination. The results are limited by the small sample size and possible bias through self-reporting and social desirability regarding vaccination status.

Key messages:

- Overall, most participants were vaccinated with Comirnaty and had three doses of vaccine. Of the participants with a diagnosed SARS-CoV-2-infection, most got infected after the booster vaccine.
- The number of reported AEFI was higher than in the official surveillance in Germany.

Abstract citation ID: ckac131.406
Elizabethkingia miricola: an opportunistic pathogen in ICU

Eva Soler

E Soler[1], *E Marín*[1], *I Guerrero*[1], *S Martínez*[1], *MA Fernández*[1], *C Valero*[1]
[1]Medicina Preventiva y Salud Pública, Hospital Clínico San Cecilio, Granada, Spain
Contact: esoleriborte3@gmail.com

Background:

The Elizabethkingia genus is formed by a group of bacteria which are widely distributed in nature. Elizabethkingia is not part of human microbiota, therefore is considered to be an opportunistic pathogen. In the last years, it has become a cause of potentially fatal disease, becoming an emerging bacteria of increasing relevance. The objective of this study is to describe the impact of Elizabethkingia bacteria in infected patients in the ICU of a hospital in Granada.

Methods:

Descriptive study. Patients who have been isolated in a biological sample of Elizabethkingia miricola throughout the year 2.021 in the ICU of San Cecilio University Hospital in Granada. Date and place of isolation were registered. Other variables registered were sex, age, length of ICU stay, days between ICU admission and bacterium isolation, days between bacterium isolation and death, infection, cause of admission or cause of death.

Results:

Bacterium was isolated in 15 patients. Cause of admission was COVID-19 in 73.3% of patients. 73.3% were men and 26.6% women.The average age was 56.9 years. The average length of ICU stay was 43.8 days. 4 patients were diagnosed with ventilator-associated pneumonia and 5 patients were diagnosed with tracheobronchitis.The average days between ICU admission and bacterium isolation was 26,4 days. The average days between mechanical ventilation and bacterium isolation was 25.9 days. 53.3% of patients died. The average days between bacteria isolation and death was 18.2 days.

Conclusions:

Elizabethkingia miricola is an emerging bacterium under special vigilance due to its capacity to cause major morbidity and mortality in admitted patients in ICU. The rapid identification and the study of the antibiotic susceptibility is considered of special relevance so they can be correctly managed to avoid infections and complications resulting from this microorganism.

Key messages:

- Elizabethkingia is a special surveillance bacterie due to its morbidity and mortality effects.
- Elizabethkingia could be a severity indicator in admitted patients to the ICU.

[7]Center for Health Technology Assessment, Semmelweis University, Budapest, Hungary
[8]Department of Primary and Community Care, Radboud University Medical Center, Nijmegen, Netherlands
[9]WP4, VITAL, Netherlands
Contact: manuela.wennekes@rivm.nl

Background:

The COVID-19 pandemic highlighted the significance of vaccination for older adults (OA), however, more health benefits could be gained with vaccination against influenza, pneumococcal disease, herpes zoster and tetanus as their uptake remains rather low. As healthcare professionals (HCP) play an important role in the vaccination decision making of OA, this study identifies obstacles in vaccination communication between HCP and OA.

Methods:

80 in-depth structured interviews have been conducted with HCPs in Hungary (HU), Italy (IT), the Netherlands (NL) and France (FR). Participants were general practitioners, medical specialists, public health physicians, occupational physicians, pharmacists, geriatricians, specialists elderly care and nurses. The interview included questions on HCPs' perceptions regarding information provision to OA on vaccines. Data were analyzed cross-country, using thematic analysis.

Results:

Preliminary results reveal that a factor hindering HCPs to initiate conversations with OA on vaccines was lack of time (FR, IT, HU, NL). In hospitals this was often due to (acute) clinical problems taking precedence over discussing vaccines (IT, NL). In ambulatory settings the high number of patients waiting to be seen prevented discussing vaccines with OA (HU). Moreover, HCPs sometimes forgot to discuss vaccines with OA (NL, HU, IT). Patient factors hindering the conversation of HCPs on OA vaccines were a negative attitude (IT, HU) and lack of understanding the information provided (IT, HU). Also, misinformation on vaccines (FR, HU), as well as anti-vax beliefs from patients (NL) or their relatives (FR, IT) hampered the conversation on vaccines. HCPs mentioned their need to learn communication skills to convince OA on vaccines (FR, IT, HU).

Conclusions:

HCPs encounter various obstacles in communicating with OA about vaccines. Lack of time and not recognizing the opportunity to discuss vaccines are important barriers for initiating vaccine conversations.

Key messages:

- Providing HCPs with communication strategies is important to support HCPs in discussing vaccines with OA.
- Reminder systems are important to help HCPs remember address vaccination.

Integrated monitoring of AMR and enterotoxins genes of S. aureus isolated in Lombardy

Giulia Magagna

E Spinelli[1], G Magagna[1], M Tilola[1], F Rossi[1], V Filipello[1,2], F Guarneri[3], N Formenti[3], A Ianieri[4], GL Alborali[3], G Finazzi[1,2]
[1]Food Safety, IZSLER, Brescia, Italy
[2]CRESA, Milan, Italy
[3]Territorial Site of Brescia, IZSLER, Brescia, Italy
[4]UNIPR, University of Parma, Parma, Italy
Contact: giulia.magagna@izsler.it

Background:

S. aureus is a widespread pathogen responsible for mild to severe human and animals' infections. The abuse of antimicrobials provides the potential for selection of resistant strains in livestock, which represents a public health concern. S. aureus can carry several virulence factors of which staphylococcal enterotoxins (SEs) play a key role during food poisoning in human populations. The aim of this study is to monitor the prevalence of antimicrobial resistance factors in S. aureus isolates and their ability to produce enterotoxins.

Methods:

Within an ongoing monitoring plan for the assessment of antimicrobial resistance in S. aureus strains, a total of 83 isolates collected from food, and swine and dairy farms, between 2020-2022, were characterized using MLST and then screened for the presence of methicillin resistance and SEs genes. The isolates were tested for susceptibility to a panel of 14 antimicrobial agents using the disc agar diffusion method on Mueller-Hinton agar.

Results:

Among 83 S. aureus isolates, 53% carried at least one SEs gene. Eighteen isolates were methicillin-resistant of which 17 were no-enterotoxigenic strains belonging to ST398, and one was a food origin ST8 strain and harbored SEs genes. Among the ST398 isolates, only one was a food origin strain, while the others were from swine farms. The antibiogram showed that a few isolates were susceptible to nalidixic acid, and 42% resulted multidrug-resistant.

Conclusions:

Our results showed that more than half of S. aureus isolates were enterotoxigenic, the majority belonging to food industries. Numerous tested isolates resulted multidrug-resistant, confirming that antimicrobial resistance is a critical public health threat in a food safety perspective.

Key messages:

- The antimicrobial resistance profiles of S. aureus isolates underlines the importance of monitoring plans with a One Health perspective.
- The prevalence of enterotoxins genes in S. aureus strains in Lombardy confirms the relevance of the microorganism as a foodborne pathogen.

Abstract citation ID: ckac131.409
International Health Regulations core capacities monitoring in 2020-2021 at Italian Points of Entry

Emanuela Maria Frisicale

E Frisicale[1], S Zichichi[2,3,4], A Di Virginio[1], R Falvo[1], U Angeloni[1], G Rezza[1]
[1]Directorate General of Health Prevention, Ministry of Health, Rome, Italy
[2]Cross Border Health Authorities, Ministry of Health, Palermo, Italy
[3]School of Hygiene and Preventive Medicine, University of Perugia, Perugia, Italy
[4]Committee of Palermo, Italian Red Cross, Palermo, Italy
Contact: em.frisicale@sanita.it

Under the International Health Regulations (IHR) 2005 States Parties (SP) are required to develop and maintain core public health capacities and report related progress to World Health Organization (WHO) annually,including those related to Points of Entry (PoEs).Using an appropriate tool,provided by WHO, Italian PoEs assessments in 2020 and 2021 were conducted to have the status quo,describe any differences among years and promote corrective actions if required. The tool was designed in 2009 to support SP in ascertaining prior capacities in PoEs and monitoring their progress in order to designate PoEs under IHR.The tool was translated in Italian.Coordination and communication among authorities involved in each PoE (C1),core capacity at all times (C2) and at PHEIC (Public Health Emergency of International Concern) (C3) were assessed by cross border health Authorities for 2020 and 2021.For each of these sections the maximum score is 100%. For each year,a descriptive analysis was conducted and any differences in scores between the two years were noted.The presence of a contingency and vectors' control plans was also investigated.The assessment was completed respectively for 2020 and 2021 by 24 and 25 airports, 53 and 52 ports. C1 in 2020 resulted on average 89% for airports and 95% for ports, in 2021 respectively 90% and 95%; C2 in 2020 resulted on average 64% for airports and 63% for ports, in 2021 respectively 63% and 64%; C3 in 2020 resulted on average 68% for airports and 61% for ports,in 2021 respectively 63% and 58%.Few differences in scores between 2020 and 2021 were noted in some PoEs. 4 PoEs declared the presence of a contingency plan only in 2021.Few PoEs stated to not have a vectors' control plan in both years.The assessment pointed out a good level of coordination and communication among all the stakeholders involved, including the Italian Red Cross,but it revealed lower scores for the other IHR core capacities. Improvement actions have to be pursued surely.

Key messages:

- The specified tool helps cross border and national Authorities to understand strengths and weaknesses in each PoE and leads to develop a specific plan of action to overcome potential gaps.
- Maintaining a good level of core capacities at points of entry is fundamental to protect national public health.

Abstract citation ID: ckac131.410
Social differences in COVID-19 vaccination rates–Findings from a German nationwide study

Susanne Bartig

S Bartig[1], S Müters[1], J Hoebel[1], NK Schmid-Küpke[2], C Hövener[1]
[1]Epidemiology and Health Monitoring, Robert Koch Institute, Berlin, Germany
[2]Infectious Disease Epidemiology, Robert Koch Institute, Berlin, Germany
Contact: BartigS@rki.de

Background:

The COVID-19 vaccination aims to prevent the transmission of the novel coronavirus (SARS-CoV-2) as well as to reduce severe courses of the disease and deaths. But various studies indicate social differences in willingness to be vaccinated. This study aims to examine the influence of different social determinants on COVID-19 vaccination in Germany.

Methods:

The analyses are based on data from the sixth follow-up survey of the German Health Update (GEDA 2021), a nationwide cross-sectional telephone survey of the adult population living in Germany. COVID-19 vaccination rates are analyzed considering age, education, income, urban-rural residence and migration background. Poisson regressions were used to examine associations of each social determinant with COVID-19 vaccination rates. Adjustments were made for age, sex, (education) and date of participation.

Results:

Overall, the rate of COVID-19 vaccination for the survey period was 86.7%, with significant differences in vaccination rate by social determinants. The vaccination rate increases significantly with age (94.2% for over 60-year-olds), higher level of education (91.5%) or income (93.0%). In addition, people living in rural areas in Germany (83.5%) and people with an own migration experience (79.1%) had a significantly lower vaccination rate. An age-differentiated analysis also showed the social differences in COVID-19 vaccination rate are significantly lower among those over 60-years old.

Conclusions:

The results suggest social differences in COVID-19 vaccination especially in younger age groups. This should be considered when designing targeted measures to overcome potential barriers to vaccination. However, a large number of other factors affecting vaccination behavior must be taken into account like structural barriers, confidence in decision-makers, the safety of vaccination, and a sense of responsibility towards the community.

Key messages:

- Sociodemographic and socioeconomic determinants affect COVID-19 vaccination rates.
- The social differences in COVID-19 vaccination are lower among those over 60-years old.

Abstract citation ID: ckac131.411
Seroprevalence and SARS-CoV-2 antibodies distribution in Portugal following mass vaccination campaign

Irina Kislaya

I Kislaya[1], P Gonçalves[2], V Gaio[1], R Matos[2], M Barreto[1], A Melo[2], R Guiomar[2], A P Rodrigues[1], PT ISNCOVID-19 group[1,2]
[1]Department of Epidemiology, National Institute of Health Doutor Ricardo Jorge, Lisbon, Portugal
[2]Department of Infectious Diseases, National Institute of Health Doutor Ricardo Jorge, Lisbon, Portugal
Contact: irina.kislaya@insa.min-saude.pt

Introduction:

Information on post-infection and vaccine-induced SARS-CoV-2 seroprevalence is important for public health policies. A 3rd wave of National Serological Survey (ISN3COVID-19) was conducted to measure SARS-CoV-2 seroprevalence and characterize specific antibodies distribution in Portuguese population in September - November 2021, following a mass vaccination campaign.

Methods:

ISN3COVID-19 was a cross-sectional epidemiological study that collected serum samples and questionnaire data on a sample of Portuguese residents aged 1 year or older (n = 4545). SARS-CoV-2 IgG anti-nucleoprotein and anti-spike antibody levels were measured using Abbott Chemiluminescent Microparticle Immunoassays. Seroprevalence was estimated for the overall sample and stratified by age group, sex, region and self-reported chronic conditions. Medians and respective 95% confidence intervals (95%CI) were used to describe the distribution of SARS-CoV-2 antibodies in specific population subgroups.

Results:

The overall seroprevalence of SARS-CoV-2 (post-infection or vaccine-induced) was 86.4% (95%CI: 85.2 to 87.6%), post-infection seroprevalence was 7.5% (95%CI: 6.6 to 8.5). Higher seroprevalence was observed among 50-59 years-old (96.5%), women (88.3%), and those with two or more self-reported chronic conditions (90.8%). Higher IgG (anti-Spike) levels were estimated for individuals vaccinated with the booster dose (median = 12601.3 AU/ml; 95%CI: 4127.5 to 19089.1) and for those vaccinated with two doses of Spikevax® vaccine (median = 7012.7 AU/ml, 95%CI: 5568.8 to 8456.6).

Conclusions:

The SARS-CoV-2 seroprevalence was high and consistent with vaccine coverage in Portugal. Seropositivity was associated with sex, age and previous chronic conditions. The anti-SARS-CoV-2 anti-spike IgG levels varied according to vaccine brand and number of doses. These results show that monitoring seroprevalence and SARS-CoV-2 antibody distribution is of paramount importance to guide public health policies.

Key messages:

- Significant increase in SARS-CoV-2 seroprevalence following the mass vaccination campaign consistent with the high vaccine coverage achieved in Portugal.
- Continuous monitoring of the population-level IgG response after vaccination remains important to guide further public health measures.

Abstract citation ID: ckac131.412
Not just anti covid vaccine in hub! Local Health Authority Rome 4, Lazio, Italy experience

Clara Fusillo

C Fusillo[1], C Di Carluccio[1], D Scognamiglio[1], G Belfiori[1], M Sinopoli[1], S Ursino[1], C Matera[1], C Matranga[1]
[1]Vaccination Service, ASL Roma 4, Civitavecchia, Italy
Contact: clara.fusillo@aslroma4.it

Issue:

At the end of December 2020 in Italy was started anti-covid vaccination campaign. For this purpose in the territory of Local Health Authority Rome 4, vaccination Hubs have been set up, one per each of four territory districts. The Hubs were large, never available previously, with routes suitable for welcoming and vaccinating a large number of people. Vaccination Service (SV) has organized anti-covid vaccinations with every day open Hubs, for 12 hours a day and more, without stopping, reaching very high vaccination coverage, but adherence to vaccinations into the calendar for 0-16 years further decreased during the pandemic period, particularly in adolescence.

Description of the problem:

At the end of January covid vaccination requests decreased and SV realized a vaccination line dedicated to other vaccinations in each Hub so SV decided to invite the cohort of those born in 2010 that defaulted with the vaccination against human papilloma virus (HPV) and other mandatory/recommended vaccines.

Results:

There were 2629 non-compliant adolescents (83% of resident population in 28 company territory municipalities). 2,353 phone calls were made and 232 smart-sms were sent (very recent method). They booked 598 children, who were vaccinated in just 3 days from 8.30 to 12.30 between February and March 2022. Total vaccines performed were 678: HPV9 389; meningococcal (ACWY and B) 278; 11 other. About 38 teenagers vaccinated every hour

Lessons:

The way we used to contact resident population was innovative, easy and quick, necessary features to complete the intervention in a short time. This confirmed the importance in recruiting and adhering to vaccinations and leds to a driving effect also in the following days. Hubs as capacious and familiar places for the population, have allowed an excellent organization with a fast vaccination course, facilitated reception, resources optimization of health personnel.

Key messages:

- To achieve vaccine prevention goals it is important to take advantage of available opportunities.
- It is very important to apply the experience gained with the Covid vaccination to non covid vaccinations as well.

Abstract citation ID: ckac131.413
Impact of COVID-19 on flu vaccination among pregnant women in a Teaching Hospital in Rome

Lorenza Nachira

L Nachira[1]*, S Bruno*[1,2]*, B Carducci*[2]*, L Villani*[1]*, D Pascucci*[1,2]*, G Quaranta*[1,2]*, G Damiani*[1,2]*, B Federico*[3]*, A Lanzone*[2]*, P Laurenti*[1,2]

[1]Hygiene, Life Sciences and Public Health, Catholic University of Sacred Heart, Rome, Italy
[2]Women, Children and Public Health Sciences, Fondazione Policlinico Universitario Agostino Gemelli IRCCS, Rome, Italy
[3]Human Sciences, Society and Health, University of Cassino and Southern Lazio, Cassino, Italy
Contact: lorenzanachira@gmail.com

Background:

According to WHO, UNICEF, GAVI and the Sabin Vaccine Institute data, the COVID-19 pandemic caused the disruption of routine vaccinations in at least 68 countries. In March ‘20, the WHO published a guide to help countries continuing their provision safely to prevent unnecessary visits and hospitalizations: especially flu vaccination is paramount to reduce respiratory illnesses and their burden on healthcare systems. For the flu season 2021-22, the Italian Ministry of Health recommended prioritizing flu vaccination for pregnant women. This study aims at comparing flu vaccination rates between pre-pandemic and pandemic periods in pregnant women attending a birthing preparation course at the Fondazione Policlinico Universitario A.Gemelli IRCCS (FPG) in Rome.

Methods:

A repeated cross-sectional study was carried out in FPG during two flu epidemic seasons (October ‘19-January ‘20 and September ‘20-January ‘21), when two different cycles of birthing preparation courses were held (face-to-face and online, respectively). Pregnant women and their partners attending them were offered flu vaccination at FPG. A $\chi 2$ test was performed to compare vaccination rates, with statistical significance set at $p = 0.05$.

Results:

In 2019-20, 48 out of 119 women and 39 men out of 119 attending the course accepted flu vaccination, while in 2020-21 they were respectively 88 out of 317 and 89 out of 317. Overall vaccination compliance among pregnant women was significantly higher in 2019-20 than in 2020-21 (40.3% and 27.8% respectively, $p = 0.012$), while the difference was not significant among their partners (32.8% and 28.1% respectively, $p = 0.337$).

Conclusions:

The COVID-19 pandemic negatively affected flu vaccination adherence among the pregnant women involved. Fear of contagion and access to facilities closer to their home could be potential key drivers. These results represent an important warning on flu vaccination attitudes during the pandemic: more actions are needed to improve compliance.

Key messages:

- COVID-19 might have hindered access to immunization services for at-risk populations, such as that of pregnant women.
- From a Public Health point of view, more actions are needed to harmonize interactions between hospitals and local national health services to improve vaccination compliance.

Qualitative research for improving Access to Vaccination for Newly Arrived Migrants (AcToVx4NAM)

Pania Karnaki

P Karnaki[1]*, A Dalma*[1]*, K Katsas*[1]*, N Papaevgeniou*[1]*, A Linos*[1]

[1]European and International Projects, Prolepsis Institute, Marousi, Greece
Contact: p.karnaki@prolepsis.gr

Background:

Increasing vaccination uptake among vulnerable groups constitutes a high priority across Europe. Access to Vaccination for Newly Arrived Migrants (AcToVx4NAM) is a 3-year project (Grant n 101018349, 3rd EU Health Programme) with a mission to increase vaccination uptake in Newly Arrived Migrants (NAM) regardless of legal status. AcToVx4NAM will improve health system Vaccination Literacy (VL) and vaccination access, by making access conditions more equitable and guaranteed.

Methods:

Across 8 countries research took place to identify barriers, enablers and solutions to system level problems. Qualitative analysis through focus groups and interviews took place with professionals who work with NAMs including administrative personnel, cultural mediators, policy officers as well as physicians, nurses, social and mental health care professionals. Research examined barriers across the different dimensions that constitute the ActoVax4NAM General Conceptual Framework namely Entitlement, Reachability - Adherence (vs. hesitancy), Achievement of vaccination (execution and completion) and Evaluation.

Results:

A number of common system level barriers were identified related to gaps in the registration process and problems in reaching people eligible for vaccinations. Not all NAMs face the same problems in terms of accessing the health system (i.e asylum seekers vs economic migrants). Communication breaks exist between the various services involved with delivering care and vaccination to NAMs while the lack of appropriate culturally sensitive and appropriate informative material still remains. The role of non-medical personnel in promoting vaccinations was emphasized as well as the importance of evaluating and disseminating best practice.

Conclusions:

Findings direct to specific evidence based solutions with an emphasis on tailored made to specific needs activities.

Key messages:

- Shift focus from individual level barriers to system level barriers considering all hubs of the vaccination process.
- Address vaccination needs of NAM early to stress the importance of prevention in the health integration process.

Abstract citation ID: ckac131.415
The impact of Covid-19 vaccines on fertility-A systematic review and metanalysis

Emanuele La Gatta

D Zaçe[1]*, E La Gatta*[2]*, L Petrella*[2]*, A Shukhovtseva*[3]*, ML Di Pietro*[2]

[1]Università Cattolica del Sacro Cuore, Rome, Italy
[2]Department of Life Sciences and Public Health, Università Cattolica, Rome, Italy
[3]Sechenov University, Moscow, Russia
Contact: emanuele.lagatta01@icatt.it

Introduction:

Despite literature’s proofs about their safety, concerns arose regarding adverse events due to Covid-19 vaccines, including the possible impact on fertility, accentuated by misinformation and anti-vaccine campaigns. The aim of this study was to evaluate the Covid-19 vaccines’ impact on male and female fertility.

Methods:

PubMed, Scopus, Web of Science, Cochrane and Embase databases were searched for eligible studies until March 7th,

2022. Primary studies investigating the Covid-19 vaccines impact on male and female fertility, were included. Studies' quality was assessed by the Newcastle-Ottawa and the Before and After Quality Assessment scales for cohort and pre-post studies, respectively. Random-effect meta-analyses were performed for parameters considered in ≥ 2 studies, calculating means, p-values and 95% Confidence Intervals (CIs). I^2 statistics was used to assess statistical heterogeneity.

Results:

Out of 1406 studies screened, 20 studies were included in the systematic review. These studies, conducted in Israel (35%), USA (30%), Russia (25%), China (5%) and Italy (5%), were of poor (15%), moderate (75%) and good (10%) quality. Meta-analyses among five studies considering several vaccines were performed for pre- and post-vaccination sperm progressive motility ((49%, 95% CI 36-67% vs 49%, 95% CI 39-61%; $p = 0.963$) and concentration (64.39 mln/ml, 95% CI 47.51-87.28 and 72.00 mln/ml, 95% CI 51.22-101.21; $p = 0.03$). Subgroup meta-analyses based on the type of vaccine showed no significant difference: between vaccinated with mRNA vaccines and non-vaccinated regarding biochemical pregnancy rates; pre- and post-vaccination with Gam-COVID-Vac regarding testosterone, FSH and LH levels; pre- and post-vaccination with BNT162b2 vaccines regarding sperm volumes.

Discussion:

There is no scientific proof of any association between Covid-19 vaccines and infertility in men or women. Misinformation and doubts about vaccines should be properly addressed.

Key messages:

- The doubts regarding Covid-19 vaccines' impact on both male and female fertility resulted to be unfounded. Covid-19 vaccines remain the most important weapon to fight the pandemic.
- It is important to keep providing to public opinion and health care providers evidence-based scientific information, in order to effectively combat misinformation and anti-vaccines campaigns.

Prevalence of injected drug use and access to OAT in prison: survey in 7 EU countries, 2014-2018

Sara Mazzilli

S Mazzilli^{1,2}, L Royuela^{3}, L Tavoschi^{2}, L Vandam^{3}, L Montanari^{3}

[1]Scuola Normale Superiore, Pisa, Italy

[2]Department of Translational Research in Medicine, University of Pisa, Pisa, Italy

[3]Public Health Unit, European Monitoring Centre for Drugs and Drug Addiction, Lisbon, Portugal

Contact: sara.mazzill@gmail.com

Background:

People in prison report high rates of drug use and drug-related problems and people who use or inject drugs (PWUD) have higher rates of offending and an increased likelihood of spending part of their lives in prison. They represent a vulnerable population with high burden of diseases, socio-economic disadvantages and limited access to healthcare. In this study, we aimed to describe the lifetime prevalence (LTP) of heroin use, injected drug use and opioid agonist therapy (OAT) among people living in prison.

Methods:

Individual data collection was carried out in seven European countries (Czech Republic, Latvia, Lithuania, Poland, Portugal, Slovenia, Spain) between 2014 and 2018 with a model European Questionnaire on Drug use among people in Prison. Risk factors analysis was carried out using multivariate logistic regression model.

Results:

The analysis of EQDP data found that the LTP of heroin use was overall 22.4% (ranged from 7.3% in Poland to 27.5% in Spain). Female, recidivist offenders, individuals aged below 44 and with an history of mental health condition had a higher likelihood of being heroin user (p-value<0.05). The LTP of injected drug use was overall 20.6%(2176/10,587), while the prevalence of injected drug use in prison was 8.1%(745/9273) (with higher prevalence in countries that did not allow OAT initiation in prison: 17.5% in Latvia, 22.1% in Lithuania and 26.7% in Czech Republic). Among those who used heroin, 44.5%(772/1735) had access to OAT and among them 95.8(566/591) had access to OAT in prison.

Conclusions:

Despite the heterogeneity of the results, there is a clear evidence that people in prison have a high prevalence of heroin and injected drug use. Prisons are an important point of access to OAT, and where treatment is available there is a reduction in risk behaviour. It is also important to implement tailored preventive interventions among vulnerable social groups at the community level.

Key messages:

- People in prison in Europe have a high prevalence of heroin and injected drug use. Prisons can represent a point of access to integrated prison-community healthcare and social services for PWUD.
- In order to plan adequate healthcare interventions, there is an urgent need to assess and monitor the prevalence of drug use also in other European countries.

Abstract citation ID: ckac131.417
Integrated system for the proactive analisys of risk infection in patient's surgical route

Emma Montella

E Montella^{1}, S Iodice^{1}, S Bellopede^{1}, A Frangiosa^{1}, A Giovagnoli^{1}, G Mazia^{1}, M Triassi^{1}

[1]Public Healt Departement, Università degli Studi di Napoli, Naples, Italy

Contact: emma.montella@unina.it

Background:

The most common hospital safety incidents are Hospital-Acquired-Infections (HAI) and among these Surgical Site Infections (SSIs). Our study proposes the use of a proactive system to manage risk combining the new Risk Identification Framework by WHO (IPCAF), the Lean method and the hospital's Procedure Analysis. Each of the methods has pros and cons, and there is no existing literature that researches the concurrent use of all three methods. We focused on analysing patients' surgical route to demonstrate that using an integrated system for preventing SSIs delivers enhanced results and significantly contibutes to a reduction in occurence of SSIs.

Methods:

We conducted a retrospective observational study from 18 March 2019 to 20 April 2019 at Azienda Ospedaliera Universitaria Federico II di Napoli, Italia (Europa). The study is structured in 3 phases:

Phase 1- application of proactive risk management tools (18 March- 15 April 2019);

Phase 2-integration of results with the elaboration of a single system for proactive risk management (15-20 April 2019);

Phase 3- collection of epidemiologic data concerning SSI. We used the incidence of surgical site as efficiency indicator (1-10 March 2022).

The endpoints identified were:

Primary Endpoint: a reduction of infection occurrence in surgical sites

Secondary Endpoint: identification of critical points and control points within the surgical process with relevant corrective measures

Results:

The rate of incidence of SSIs was selected as the efficacy indicator for the system. Our study recorded a 2.40% incidence rate for SSIs in 2020, compared to an incidence rate of 3.80% in 2018 and of 3.5% in 2017.

Conclusions:

Considering the economic impact of the infections, along with the increased incidence of mortality and morbidity, employing all available tools to try and reduce SSIs incidence becomes paramount. A small reduction can produce significant cost savings that can be invested in other prevention programs.

Key messages:

- Integrated system in proactively and promptly identifying risks related to patients' surgical routes is effectiveness.
- The system can be adapted to different healthcare settings, to prevent adverse incidents by employing a risk management strategy, and to further enhance existing strategies.

A 6 years trends in hospitalization: retrospective study of Traumatic Brain Injury

Nino Chikhladze

N Chikhladze[1], E Burkadze[1], N Pitskhelauri[1], A Tsiskaridze[1], C Peek-Asa[2], M Coman[3]
[1]Faculty of Medicine, Ivane Javakhishvili Tbilisi State University, Tbilisi, Georgia
[2]University of California, San Diego, USA
[3]Department of Public Health, Babes-Bolyai University, Cluj-Napoca, Romania
Contact: chikhladze.nino@gmail.com

Introduction:

Traumatic Brain Injury (TBI) is a significant public health issue globally, and the mortality and morbidity burden is particularly high in low- and middle-income counties (LMICs). The WHO predicts a disproportionately large increase of TBI burden in LMICs. The aim of this study was to identify trends in hospitalization associated with TBI in Georgia from 2015-2020.

Methods:

The study was designed in the framework of the project INITIatE: International Collaboration to Increase TBI Surveillance in Europe, funded by the US National Institutes of Health (NIH/NINDS R21NS098850). The surveillance database of National Center for Disease Control and Public Health of Georgia was used for the study.

Results:

During the study period a total 51 147 patients were admitted in hospitals throughout the country. In 2015-2019 the hospitalization increased and highest number of cases was in 2019 (n = 11779; 23,0%), in 2020 hospitalization decreased in comparison with the previous year (n = 9228; 18,0%). The highest number of burn injuries (n = 22963; 45,0%) occurred in the capital of Georgia (Tbilisi). Among hospitalized patients about 61,0% were males (n = 31162) and 39,0% females (n = 19985), retrospectively with ratio 1,6:1. The modal age of hospitalized patients was 25-44 and the highest hospitalization was in the age group of 15-24. 92,5% of cases were unintentional. The leading cause of Traumatic Brain Injury in all years were falls with some variations (57%-71%), followed by road traffic injuries (12%-25%). The average of LOS was 3 days, the highest LOS was 702 days. 1,6% (n = 805) of patients died. The most common mechanism of fatal injuries were falls.

Conclusions:

The study provide important information about trends in hospitalization, size of the TBI problem, which is crucial for elaborating relevant policy and establishing priorities in order to reduce the burden of Traumatic Brain Injury in Georgia, as well to identify directions for further TBI related research.

Key messages:

- Epidemiological data are essential for designing relevant preventive programs.
- Prevention is a key component of public health efforts to reduce TBI burden.

[3]University of California, San Diego, USA
[4]Babes-Bolyai University, Cluj-Napoca, Romania
Contact: n_a_t_o_nato@yahoo.com

Introduction:

Falls are one of the major public health problems and a leading cause of injury-related morbidity and mortality globally. Around of 80% of fall deaths occur in low- and middle-income countries. Falls are the most common cause of hospitalization among the population aged 65 years and older. According the data from Global Burden of Disease (GBD) Study in Georgia, DALYs from falls exceed the average in LMICs. The aim of this observational study was to explore epidemiological characteristics of fall-related injury among hospitalized elderly patients in Georgia in 2020.

Methods:

This study was designed in the framework of the project iCREATE: Increasing Capacity for Research in Eastern Europe' funded by the NIH (2D43TW007261). All patients aged 65 and older admitted to hospital settings due fall-related injury in 2020 were identified from the Hospital Registry (included a total of 152 hospitals in the country) of the National Center for Disease Control and Public Health of Georgia.

Results:

A total of 7159 injured patients age 65 and above were admitted to hospitals in Georgia, and among them 4213 were hospitalized due to the falls (60%). Males comprised 30,7% of cases and females - 69,3%. The most common source of hospital arrival was ambulance 2791 (65,0%), followed by private/public transport 1432 (33,3%). The highest number of injuries (43,5%) occurred in Tbilisi (capital of Georgia). The leading cause in fall-related hospitalization was fall on same level. Pelvis and the head were the most common body regions injured accounting for 48,0% and 22,9% of cases, respectively. The highest LOS was 2014 (SD 6,161). 111 patients died due to falls related injury during the study period.

Conclusions:

This study indicates that fall- related injury prevention among elderly population should become a key priority area in Georgia. There is a need for elaborating relevant preventive interventions of falls injuries in population aged 65 years and older.

Key messages:

- Falls are the leading cause of hospitalization of patients 65 years of age and older.
- Fall risk awareness campaigns should be the first step to fall prevention among elderly.

[2]Department of Psychology, Faculty of Philosophy and Arts, Trnava University in Trnava, Trnava, Slovakia
[3]Department of Nursing, Faculty of Health Care and Social Work, Trnava University in Trnava, Trnava, Slovakia
[4]Department of Sports Educology and Humanistic, Faculty of Physical Education and Sports, Comenius University, Bratislava, Slovakia
[5]Department of Sports Game, Faculty of Physical Education and Sports, Comenius University, Bratislava, Slovakia
Contact: denishazerova@gmail.com

Background:

Many sports are associated with an increased risk of traumatic brain injury (TBI), often in a form of repeated minor trauma. While the pathophysiological changes of the brain after TBI have been relatively well studied, data on cognitive aspects are relatively scarce. The main objective of this study was to measure the cognitive consequences of repeated heading in a controlled set of training exercises in 21 years old football players.

Methods:

The study design is quasi-experiment. Participants consisted of male football players (N = 27) and were tested under 3 conditions: before the sports activity, after the sports activity not involving heading, after the sport activity focused on heading. To monitor the cognitive changes we used neuropsychological methods: the Trail Making Test (TMT), the Verbal reproduction test. Blood samples were taken to analyse the presence of biomarkers (glucose). Linear regression and repeated-measures ANOVA were used for statistical analysis.

Results:

The data showed significant relationships between the glucose level (before and 1-hour after the heading) and the TMT (part B) score /(F(1,22) = 6.03; p = .001; R-square = .223/. Based on TMT (part B) scores, the cognitive flexibility and glucose lowered after the sessions. For both parts of TMT we found significantly worse scores after both training sessions compared to baseline testing (Part A: F(2,46) = 189.354; p<.001; Eta2 = .892; Part B: F(2,46) = 10.191; p<.001; Eta2 = .307). Post-hoc tests revealed slightly worse results in the TMT (part A) after non-heading than after the heading training which means, that the focused attention was affected. In the TMT (part B) no difference was found between the results after non-heading and heading training.

Conclusions:

This study has a unique potential to highlight the relations between biomarkers and psychological abilities and their possible changes caused by heading, which may have beneficial as well as damaging impact on the body and cognitive functioning.

Key messages:

- The findings of this study suggest a potential relationship between repeated minor head trauma and cognitive performance in young adults.
- Besides physiological changes, cognitive impact on cognitive performance may be a consequence of repeated minor head trauma; further study is required to elucidate these associations.

The association between Chorionic Villus Sampling and preterm birth: A systematic review

Konstantinos Giannakou

K Giannakou[1], L Mastrou[1]
[1]Department of Health Sciences, European University Cyprus, Nicosia, Cyprus
Contact: K.Giannakou@euc.ac.cy

Background:

Preterm birth is defined as a syndrome that can be initiated via various mechanisms. During the past few decades, it has been an emerging health issue worldwide and thus, several actions to benefit public health have been undertaken to reduce its rate. Chorionic Villus Sampling (CVS) is one of the methods that are performed prognostically for prenatal diagnosis. However, several complications can occur after this invasive method is performed. The aim of this review is to identify whether CVS may result in preterm birth as a complication, compared to other invasive or non-invasive methods.

Methods:

A systematic literature review was conducted in PubMed and Scopus from inception until December 2021, to identify studies examining the above association. The research strategy included a combination of search and MESH terms related to CVS and preterm birth, Inclusion and exclusion criteria were set. The research was conducted by two researchers that thoroughly screened the articles and extracted the data.

Results:

37 studies met the inclusion criteria. Comparisons were performed between CVS and amniocentesis or control group or between the different weeks that CVS was performed. No significant difference was observed in most of the studies when CVS was compared to amniocentesis, control groups, or between different weeks of gestation that was performed.

Conclusions:

The risk of preterm birth of women undergoing CVS was relatively lower or had no difference compared to the other methods or controls investigated. Therefore, CVS is considered as a safe prenatal diagnostic procedure with minimum rates of preterm birth as a complication.

Key messages:

- The risk of preterm birth of women undergoing CVS was found to be relatively lower with no significant differences compared to the other methods or controls.
- Future studies should be performed recruiting a large sample with women of different age and compare it with a control group that will not undergo any invasive method.

Abstract citation ID: ckac131.422
Predicting low cognitive ability at age 5 using machine learning methods and birth cohort data

Anthony Staines

A Bowe[1], A Staines[2], F McCarthy[1,4], G Lightbody[1,5], D Murray[1,3]
[1]INFANT Research Centre, University College Cork, Cork, Ireland
[2]Nursing, Psychotherapy and Community Health, Dublin City University, Dublin, Ireland
[3]Paediatrics, Cork University Hospital, Cork, Ireland
[4]Obstetrics and Gynaecology, University College Cork, Cork, Ireland
[5]Electrical and Electronic Engineering, University College Cork, Cork, Ireland
Contact: anthony.staines@dcu.ie

Background:

Early intervention is essential to address disparities in cognitive development. Current developmental screening will not detect the vast majority of children who go on to have below average cognitive ability at school age. In this study, we applied the random forest (RF) algorithm, a highly interpretable machine learning method, to birth-cohort data to train a model to predict low cognitive ability at 5 years of age using perinatal features.

Methods:

Data was from 1,070 participants in the Irish population-based BASELINE birth cohort. A RF model was trained to predict an intelligence quotient (IQ) score <90 at age 5 years using a broad selection of maternal, infant, birth, and sociodemographic features, all of which could be easily measured at a population level in the perinatal period. Feature importance was examined using mean decrease in Gini impurity, mean decrease in accuracy, and mean minimal depth. Recursive feature elimination was used to develop a parsimonious model. Internal validation was performed using 10-fold cross validation repeated 5 times.

Results:

The most predictive features for low cognitive ability at 5 years of age were the total years of maternal schooling, infant Apgar score at 1 minute, socioeconomic index, maternal BMI, and units of alcohol consumed in the first trimester. A parsimonious RF model based on 11 features showed excellent predictive ability, with a sensitivity of 0.89 and a specificity of 0.98, providing a foundation suitable for external validation in an unseen cohort.

Conclusions:

Machine learning approaches to large existing datasets can provide accurate feature selection to improve risk prediction. Further validation of this model is required in additional cohorts, representative of the general population. Accurate risk prediction can facilitate targeted screening and intervention.

Key messages:

- The application of machine learning to large population-based data can improve feature selection and accuracy in risk prediction models.
- Accurate risk prediction may enable early intervention to address disparities in cognitive development. Individual interventions must occur in conjunction with population level policy changes.

Factors promoting or limiting self-determined childbirth: midwives' perspectives in Germany

Marie Tallarek

M Tallarek[1], *J Spallek*[1]
[1]Department of Public Health, Brandenburg University of Technology Cottbus-Senftenberg, Senftenberg, Germany
Contact: tallarek@b-tu.de

Background:

Claims for self-determined childbirth (SDC) have gained increasing scientific, political and societal attention. However, research on SDC is limited. This study analyzes and compares midwives' experiences and perspectives on factors that promote or limit SDC in hospitals, birthing centers and during home births in Germany. We argue that these insights are essential in order to foster self-determination and to avoid its violation.

Methods:

A qualitative case study was conducted based on semi-structured face-to-face interviews with midwives working in hospitals, birthing centers, and offering home births in Germany. In total, nine interviews were conducted in 2021 and have been audiotaped, transcribed, anonymized and analyzed by use of Thematic Analysis.

Results:

The results indicate eight inter-related categories, each of which imply promoting and limiting factors: 1) Structural/legal conditions; 2) Perception of birth (e. g. as natural or medical process; required competence and control); 3) Trust and atmosphere; 4) Getting acquainted/relationship building; 5) Birthing person's socioeconomic position; 6) Birthing person's preparation/ education; 7) Birthing person's capability of decision making and expression; and 8) Behavior of accompanying persons. Moreover, we identified midwives' strategies to extend possibilities of choice. Several factors clearly differ depending on the birth setting.

Conclusions:

The opportunities for SDC seem to differ according to the setting (e.g. institutional routines), inter-personal relations (e.g. getting acquainted, trust), and individual factors (e.g. socioeconomic position, capabilities). Hence, political, institutional and individual strategies may support SDC in consideration of the above factors. Measures may, among others, include the improvement of information processes, the reduction of economic barriers, relationship building before and during birth as well as respective structural adjustments.

Key messages:

- Self-determination (SD) in childbirth is influenced by several factors at individual, inter-personal, institutional and macro level.
- Individual, institutional and political strategies may support SD.

Abstract citation ID: ckac131.424
Factors associated with the closure of German obstetric units and its effects on accessibility

Jan Hoffmann

J Hoffmann[1], *N Scholten*[1], *T Dresbach*[2]
[1]Institute for Medical Sociology, Health Services Research, and Rehabilitation Science, University of Cologne, Köln, Germany
[2]Department of Neonatology and Pediatric Intensive Care Medicine, University Hospital Bonn, Bonn, Germany
Contact: jan.hoffmann@uk-koeln.de

Background:

An increase in regionalization of obstetric services is being observed worldwide. This study investigated factors associated with the closure of obstetric units in hospitals in Germany and aimed to examine the effect of obstetric unit closure on accessibility of obstetric care.

Methods:

Secondary data of all German hospital sites with an obstetrics department were analyzed for 2014 and 2019. Multivariate logistic regression was performed to identify factors associated with obstetrics department closure. Subsequently, the driving times to a hospital site with an obstetrics department were mapped, and different scenarios resulting from further regionalization were modelled.

Results:

Of 747 hospital sites with an obstetrics department in 2014, 85 obstetrics departments closed down by 2019. Only the annual number of live births was observed to be a factor significantly associated with the closure of obstetrics departments (odds ratio: 0·995; confidence interval: 0.993-0.997). Areas in which driving times to the next hospital site with an obstetrics department exceeded the 30 and 40 min threshold increased from 2014 to 2019. Scenarios in which only hospital sites with a pediatrics department or hospital sites with an annual birth volume of ≥ 600 were considered resulted in large areas in which the driving times would exceed the 30 and 40 min threshold.

Conclusions:

The annual number of live births is a factor significantly associated with the closure of obstetrics departments. Despite the closure, good accessibility is maintained for most areas in Germany. Although further regionalization may ensure high-quality care and efficiency, it will have an impact on accessibility.

Key messages:

- Despite the closure of many obstetric departments, regional accessibility to obstetric care remains good for most areas in Germany.
- Further regionalization may ensure high-quality care and efficiency but will have an impact on accessibility.

Abstract citation ID: ckac131.425
Childhood obesity prevention in schools and municipalities – the digital planning tool WEPI

Holger Hassel

M Schröder[1], R Berner[2], B Babitsch[2], H Hassel[1]
[1]Institute for Applied Health Sciences, Coburg University of Applied Sciences and Art, Coburg, Germany
[2]Department of New Public Health, Osnabrück University, Osnabrück, Germany
Contact: iag@hs-coburg.de

Background:
The development of theory-based prevention efforts is complex and often not feasible in the daily work of project planners. Planning tools such as the Intervention Mapping Approach (IMA), which is a gold standard for project planning, cannot be used in practice without preconditions. How can prevention planning be evidence-based but also practical? Against this background, the research project WEPI was developed, funded by the Federal Ministry of Health, Germany. WEPI is a digital planning tool based on the IMA, that guides municipalities and schools in planning childhood obesity prevention efforts.

Methods:
From April 2019 to October 2020, the planning tool was developed. In October 2020 and February 2021, WEPI was tested for the first time by selected municipalities (n = 4) in Bavaria and schools (n = 4) in Lower Saxony. Based on this, the modified planning tool was tested for a second time throughout Germany (05-11/2021). Handling and acceptance were evaluated in a questionnaire survey.

Results:
The first test showed that content and technical aspects needed to be optimised in order to bring scientific demands and practical feasibility together. Six municipalities and eight educational institutions participated in the second test phase. The respondents (n = 14) indicated that WEPI facilitates structured project planning (86%) and supports collaboration with colleagues (64%). 93% would use the planning tool again. WEPI offers evidence-based methods for practical implementation as well as a download area, including a template for a project application or a project summary. This service was also evaluated as very helpful (64%).

Conclusions:
Through step-by-step guidance, WEPI facilitates evidence-based project planning and ensures planning quality. Effort and benefit are in good proportion. Further optimisations are needed to improve the user-friendliness.

Key messages:

- WEPI provides a comprehensive roadmap, helping practitioners to approach a structured project planning.
- Practitioners' participation promotes acceptance and provides a user-friendly development.

Abstract citation ID: ckac131.426
Information-seeking on the internet during the transition to motherhood: descriptive survey, Cyprus

Nicos Middleton

N Middleton[1,2], I Koliandri[1], O Kolokotroni[1,2], E Hadjigeorgiou[1], V Christodoulides[2], C Nicolaou[1], C Kouta[1], M Karanikola[1], N Middleton[1,2], Baby Buddy Forward partnership
[1]School of Health Sciences, Department of Nursing, Cyprus University of Technology, Limassol, Cyprus
[2]Birth Forward, Non-Govertmental Organization, Nicosia, Cyprus
Contact: nicos.middleton@cut.ac.cy

Background:
Internet use in pregnancy is very prevalent. However, there are issues with information quality as well as acceptance by healthcare providers which can add to the frustration.

Methods:
An online anonymous survey, shared via Baby Buddy Cyprus, addressed women who are pregnant or recently gave birth in Cyprus. Adapting previously used questionnaires, the survey covered reasons and patterns of internet use, perceptions of trustworthiness, appraisal means and usefulness in decision-making.

Results:
Among 357 responses so far in this ongoing survey (38% pregnant, 62% new mums, 66% primiparas, 42% C/S, 78% private sector), searching online seems very frequent, even though 70% report coming across wrong or misleading information often. Checking for consistency across sites and/ or with information by healthcare provider (HP) is the most common technique for assessing trustworthiness. While the majority discuss information with HP, only half characterize their reception as positive and welcoming. As many as 89% believe that HP should recommend sites, but only 6.5% report their HP made recommendations. The role of the internet in assisting decision-making is rated as moderate (M = 3.0, SD = 1.0 on 5-point scale averaged across 11 items); yet more than half search online to be prepared and have control over decisions. Among reasons cited for using the internet is insufficient time with HP and/or is unclear or unsatisfactory information. While only 11.6% prepare material for the next appointment, 54.5 % use the internet to verify information given by HP or for a second opinion.

Conclusions:
While a prevalent source of information, the flow is problematic as it appears that women are more likely to search online to verify information rather than discuss this information with their providers. Insights about characteristics and attributes of internet use in pregnancy suggest that health services need to engage with, rather than ignore, this reality and offer appropriate guidance.

Key messages:

- Pregnant women in Cyprus search for information online, due to insufficient time or information by healthcare providers, even though they recognize there are issues with quality and expect guidance.
- In a landscape of unguided information-seeking, searching for consistency and verification, a shift in current practices is needed whereby healthcare providers and services engage with this reality.

Abstract citation ID: ckac131.427
Parental Knowledge on Prevention of SUID

Dziyana Nazaruk

D Nazaruk[1], A Palacios[1], N Marshall[1], J Choongo[1]
[1]Health Policy and Community Health, Georgia Southern University, Savannah, USA
Contact: dnazaruk@georgiasouthern.edu

Background:
According to the 2018 America's Health Ranking Annual Report, the U.S. infant mortality rate (IMR) was 5.9 deaths per 1,000 live infant births, which placed the U.S. at No. 33 out of 36 countries with the world's largest economies in 2018. The IMR in Georgia has been on the rise since 2014. Even though there was a sharp decline in sudden unexpected/unexplained causes of death (SUID) beginning in 1990, the decrease has considerably slowed down since 1999. In 2017, the top ten leading causes of infant death were responsible for 67.8% of all infant deaths in the United States. Sudden Infant Death Syndrome (SIDS) and death from unintentional injuries were

in third and fourth place. Therefore, the purpose of this research is to utilize qualitative research guided by the Socio-Ecological model to understand better how prepared first-time mothers are to take care of their infant upon hospital release.

Methods:

An intensity sampling was utilized to recruit participants. The inclusion criteria for the participants included first-time mothers with children under one year of age, women, Georgia residents over 18 years of age, and English speaking. A semi-structured guide was based on research queries and the ideological concepts of the Socio-Ecological Model. For the qualitative data examination, the thematic analysis was performed. All the interviews were transcribed verbatim and coded by using the program NVivo 11.

Results:

A total of 25 women participated in the study. We will finish the data analysis by the end of May, 2022. The results of this qualitative study will help to fully understand the knowledge, perceptions, skills, and confidence of mothers about infant care.

Conclusions:

The study's results will help develop an information guide on primary infant care. Besides, health professionals and community organizations can utilize the study results to determine the information and support needed for new mothers.

Key messages:

- The results of this qualitative study will help to fully understand the knowledge, perceptions, skills, and confidence of mothers about infant care.
- This study's results will help develop an information guide (electronic or/and printed) on primary infant care based on first-time mothers' needs.

Abstract citation ID: ckac131.428
A preliminary study of bullying on University of Nursing in Taiwan

Ming Hsin Hsieh

M Hsieh[1]
[1]Nursing Institute, Hung Kuang University, TaiChung, Taiwan
Contact: hsieh1979@outlook.com

Background:

According to the COVID-19 pandemic progress, the increase in online learning and communication, the survey shows that 36.3% of children have been bullied online (Children's Welfare Alliance, 2021). However, campus bullying has long-term effects on students' physiology and psychology, and will also extend to society in the future to form a social problem.

Aims:

It is generally believed that university students are relatively mature and have more freedom in taking courses. They believe that there are few bullying incidents that need attention on university campuses. Therefore, to understand the patterns of bullying on university campuses of nursing in Taiwan through this study.

Methods:

Referring to the definition and selecting the published within good reliability and validity of 'University Students' Campus Life Experience and Interpersonal Interaction Experience Survey', the subjects in domestic university campuses choose the closest answer according to their own situation.

Results:

In a total of 2570 valid questionnaires, the highest incidence of verbal bullying (38%), and those who don't want to answer gender ''experienced bullying in person'' (42.9%). Gender was shown to be statistically significant in bullying experience (p = .017). It shows that university students of nursing in Taiwan have obvious room for improvement in gender issues.

Conclusions:

Through this study, it is known that campus bullying exists in different types of experiences on university campuses of nursing in Taiwan. The bullying impact is often not only in school, and the impact will even extend to enter social work. Faculties must also be the gatekeepers of bullying prevention, but in fact, even senior faculties may not be very clear about what bullying is, how to properly handle bullying incidents, and how to prevent bullying, so every faculty should have the ability to take appropriate, fast and effective treatment when bullying occurs.

Key messages:

- Campus bullying has long-term effects on students' physiology and psychology, and will also extend to society in the future to form a social problem.
- Verbal bullying (38%) had the highest incidence, those who don't want to answer gender ''experienced bullying in person'' (42.9%).

Abstract citation ID: ckac131.429
Timing and social patterning of weaning practices in Cyprus: BrEaST start in life longitudinal study

Mary Economou

M Economou[1]*, O Kolokotoni*[1,2]*, E Hadjigeorgiou*[1]*, I Paphiti-Demetriou*[2]*, V Hadjiona*[3]*, C Kouta*[1]*, E Lambrinou*[1]*, I Hadjipanteli*[1]*, N Middleton*[1]
[1]Department of Nursing, Cyprus University of Technology, Limassol, Cyprus
[2]Cyprus Breastfeeding Association ''Gift for Life'', Nicosia, Cyprus
[3]Archbishop Makarios Pediatric Hospital, Nicosia, Cyprus
Contact: economoum80@hotmail.com

Background:

Introduction of solids in the infant diet, according to WHO recommendations, should initiate onwards of sixth months. Evidence, however, suggests that solids introduction occurs earlier even if breastfeeding continues. With low breastfeeding rates, Cyprus is ranking last in Europe and little is known about the timing and socio-demographic pattern of solid introduction.

Methods:

Using the retrospective event calendar method at the 4th and 6th month after birth, the timing of initiation of solids was estimated among a consecutive sample of 350 mother-baby dyads from all public (N = 5) and 29 (of 35) private maternity clinics. The likelihood of early introduction according to socio-demographic characteristics and breastfeeding self-efficacy (measured at birth and 1st month) was estimated in logistic regression models.

Results:

Three out of ten women (30.8%) had initiated solids before the 4th month and only 20% hadn't by the 6th month. Almost half of non-Cypriot mothers (47.1%) initiated solids earlier than the 5th month, twice more likely compared to 25.1% of Cypriot mothers (OR: 2.45 95% CI: 1.30-4.57). There was a stepwise association with educational attainment with mothers with tertiary education more likely to initiate solids later (OR: 2.76 95% CI: 1.33-5.71) compared to those with at most secondary education. A similar social gradient was observed with income but was not statistically significant in multivariable models, while no association was observed with mode of birth (55.9% by C/S). Even though low breastfeeding self-efficacy at first month was predictive of earlier initiation, surprisingly, primiparous or multiparous mothers without previous breastfeeding experience were more likely to initiate solids later.

Conclusions:

Early introduction of solids with a clear social gradient suggests the need for strengthening the currently weak community-based interventions to improve weaning practices, including screening for breastfeeding self-efficacy.

Key messages:

- Four in five mums in Cyprus introduce solids before the 6th month with one in three introducing solids in the infant's diet before the 4th month, with a clear social gradient in the patterning.

- Community-based intervention programmes are needed to improve weaning practices, including screening for low breastfeeding self-efficacy in a country with low breastfeeding rates.

Abstract citation ID: ckac131.430
Associations between breastfeeding and the ''10 Steps for Successful Breastfeeding''

[3]Archbishop Makarios Pediatric Hospital, Nicosia, Cyprus
Contact: economoum80@hotmail.com

Background:

The Baby-Friendly Hospital Initiative's (BFHI) ''Ten Steps for Successful Breastfeeding'' has been the cornerstone of national and international strategies for decades; however, adherence is suboptimal. Despite successive National Strategies, breastfeeding rates remain low in Cyprus.

Methods:

The overall experience of a consecutive sample of 568 mother-baby dyads (response: 70.8%) across all public (N = 5) and 29 (of 35) private maternity clinics was operationalized as the sum score of full, partial or no implementation of each WHO/UNICEF BFHI self-assessment questionnaire item, with the exclusion of Step 6 (exclusivity). Associations with initiation and continuation of any (BF) and exclusive breastfeeding (EBF) up to the 6th month were explored in logistic regression after adjusting for potential confounders, including breastfeeding self-efficacy.

Results:

At mean score 5.6 (SD = 2.4), the overall 10 steps experience was low (theoretical range 0-14), even among those who breastfed exclusively (M = 6.9, SD = 2.1; $p < 0.001$). EBF and BF initiation and continuation showed a stepwise association with self-reported experience of the 10 steps. Across quartiles of increasing scores, the prevalence of EBF was 7.1%, 15.1%, 17.0% and 35.6%. The quartile of mothers who assessed their experience more favourably were 8- (adjOR: 8.4, 95% CI 1.5-48.0; p = 0.017) and 4-times (adjOR: 4.1; 95% CI 1.7-9.8, p = 0.002) more likely to initiate BF and EBF, even though only 6.5% continued EBF by the 6th month. Step 7 (rooming-in) and step 9 (no pacifiers) were least practiced but more strongly associated with EBF initiation.

Conclusions:

While breastfeed intention may determine the actual experience of the 10 steps, implementation across maternity clinics appeared fragmented, despite clear association with successful initiation and continuation of BF, at the same time that the Cyprus National Committee for Breastfeeding is embarking on the first BFHI accreditation of maternity clinics.

Key messages:

- Despite successive National Strategies identifying breastfeeding as Public Health priority, adherence to the WHO/UNICEF's 10 Steps appears fragmented across Cypriot maternity clinics.
- Despite low overall adherence, mothers reporting experiencing more of the 10 steps were more likely to initiate and continue breastfeeding.

Abstract citation ID: ckac131.431
Supply-side contribution to the lack of PBF impact on unmet need for family planning in Burkina Faso

Christopher Hertler

C Hertler[1], *J Lohmann*[2,1], *JL Koulidiati*[1], *PJ Robyn*[3], *SMA Somda*[4,5], *M De Allegri*[1], *S Brenner*[1]
[1]Heidelberg Institute of Global Health, Heidelberg University, Heidelberg, Germany

[4]Centre MURAZ, Bobo-Dioulasso, Burkina Faso
[5]UFR/ST, Université Nazi Boni, Bobo-Dioulasso, Burkina Faso
Contact: christopher.hertler@uni-heidelberg.de

Background:

In 2020, about one in four women in Burkina Faso faced an unmet need for family planning (FP). Between 2013 and 2017, Burkina Faso implemented a performance-based financing (PBF) program to improve primary health care service provision (including FP) at rural health centers. Our prior work revealed that PBF did not lead to a reduction in unmet need for FP, in spite of FP being an explicitly targeted service. Our current study assesses supply-side factors that have likely contributed towards this lack of effect at population level, by examining changes in facility-based indicators relevant to the provision of FP induced by PBF.

Methods:

We used facility-based survey data from 406 PBF and 117 control facilities collected before and after the PBF implementation. To compare changes in FP service provision, we examined changes in a number of relevant indicators including: a. the types of FP methods offered by facilities; b. trainings received by different FP providers; and c. available stocks of modern contraceptives. We relied on a difference-in-differences (DID) regression model to estimate the impact of PBF on these indicators.

Results:

We observed a significant positive impact on the number of staff qualified to provide injectables, implants and IUDs (effect size 0.47, p 0.003) as well as the number of facilities offering IUDs (effect size 0.28, p 0.016) and a significant reduction in the number of facilities experiencing stock-outs of female condoms (effect size -0.09, p 0.007) and implants (effect size -0.03, p 0.042).

Conclusions:

Given the significant positive impacts on the number of qualified staff, facilities providing IUDs and a reduction in stock-outs of female condoms and implants attributable to the PBF intervention without showing signs of negative effects on the indicators measured supply-side factors might not have been the main reason for the lack of effect of the PBF program on unmet need for FP.

Key messages:

- Supply-side factors might not have been the main reason for the lack of effect of the PBF program on unmet need for FP.
- Further research is needed to explore other potential underlying reasons.

Abstract citation ID: ckac131.432
Parental Perception of childhood obesity

Alechia Van Wyk

A Van Wyk[1]
[1]Middlesex University, Hendon, UK
Contact: a.vanwyk@mdx.ac.uk

Background and aims:

Childhood obesity rate continues to grow in the UK with children from deprived backgrounds being at greater risk. While a large part of the literature focuses on the determinants of child obesity less is known about the factors that can lead a parent to misclassify their child's weight status. The aim of this study was to investigate parental perception of their child's weight status, compared to their measured weight.

Methods:

Height, weight, and waist circumference were measured for 232 school children enrolled in Year 2 and Year 5 during the academic year 2019-2020 from ten schools in Barnet Council, London, UK. In addition, data were collected from parents on their child's weight status and perception, health beliefs, eating habits, exercise habits, family anthropometric and health information. Information from 110 mothers and 17 fathers was retrieved. The WHO growth charts were used to classify the children's BAZ scores.

Results:

Results show that 46% of the parents classified their child's weight status incorrectly, they either overestimated or underestimated their child's body weight and/or shape. Specifically, 52% of parents of overweight/obese children reported their children as normal weight. Factors associated with parents' child weight status misclassification child's age (p = .771), ethnicity (p = .445), parents' education (p = .227), and marital status (p = 0.07).

Conclusions:

Parental perception of child's weight status has important implications in terms of changes in household eating behaviours and attitudes. Understanding the key factors affecting parental perception is of paramount importance when developing interventions and policies aimed at tackling child obesity.

Key messages:

- Parents classify their children's weight status incorrectly, making it hard for policy change to be effective.
- Policy change can only happen if parents play an active role in understanding and perceiving if their child is overweight or obese.

Abstract citation ID: ckac131.433
Self-reported physical and emotional health among left behind children in Lithuania. A pilot study

Justina Racaite

J Racaite[1]*, K Antia*[2]*, V Winkler*[2]*, E Dambrauskaite*[3]*, I Tracevskyte*[3]*, S Lesinskiene*[4]*, G Surkiene*[1]
[1]Department of Public Health, Faculty of Medicine, Vilnius University, Vilnius, Lithuania
[2]Heidelberg Institute of Global Health, Heidelberg University Hospital, Heidelberg, Germany
[3]Institute of Psychology, Faculty of Philosophy, Vilnius University, Vilnius, Lithuania
[4]Clinic of Psychiatry, Faculty of Medicine, Vilnius University, Vilnius, Lithuania
Contact: justina.racaite@mf.vu.lt

Background:

Left behind children (LBC) are children living with caregivers, while their parents work abroad. In recent decades Lithuania had lost ¼ of its population due to emigration, but the prevalence of LBC and their health needs are not sufficiently studied. The aim of study was to evaluate the association between self-reported health, emotional and behavioural difficulties between LBC and non-LBC.

Methods:

The cross-sectional study was approved by the Biomedical Research Ethics Committee, No. 2021/11-1378-861. In March 2022, this pilot study collected data from adolescents aged 12-17 years at three randomly selected schools from the migration affected regions. Parents and children provided informed consent to participate in pilot study. Self-reported measures collected from the participants: Strengths, and Difficulties Questionnaire (Goodman, 2005) and a questionnaire on demographics and on the health situation. Chi^2 tests and logistic regression were calculated by using Stata (version 15.1).

Results:

The sample consisted of 127 children (mean age 15.2, SD 1.27; 54 boys, 72 girls) including 39 LBC. Mostly fathers left to work abroad (n = 36), but majority of children (n = 36) regularly communicated remotely with their migrated parents. Binary logistic regression results show that LBC children tend to evaluate their health as 'poor, 'bad', or 'very bad' (OR 2,33; 95CI [1,02-5,33]). There were no differences for emotional and behavioural problems. Preliminary results from multiple regression model showed that children with self-reported emotional/behavioural difficulties (OR 3,06; 95CI [1,12-7,84]), females (OR 4,99;95CI [1,55-16,13]) and LBC (OR 2,44; 95CI 0,95-6,25]) more likely evaluate their health as 'poor', 'bad' or 'very bad' (likelihood-ratio test = 23,72; model $p < 0.001$).

Conclusions:

This pilot study found negative association between parental migration and children's self-reported health. However, a more comprehensive study with a larger sample size is needed.

Key messages:

- Pilot study suggests negative association between parents migration and children's self-reported health.
- More comprehensive study in bigger sample for the emotional/behavioural/communication difficulties between left behind children needs to be done.

Abstract citation ID: ckac131.434
Performance evaluation drives organizational change: a case-study from Tuscan Teaching Hospitals

Amerigo Ferrari

A Ferrari[1]*, M Bonciani*[1]*, M Vainieri*[1]
[1]Management and Health Laboratory, Sant'Anna School of Advanced Studies, Pisa, Italy
Contact: amerigo.ferrari@santannapisa.it

The 1985 WHO recommendation on caesarean-section (CS) stated that CS rates over 10-15% might be clinically unnecessary. The Performance Evaluation System of Sant'Anna School of Advanced Studies systematically monitors the regional health performance of Tuscany, ITALY. CS rates in Pisa Teaching Hospital (TH) were the highest in Tuscany before 2018 (almost 30%), but then started to decrease, reaching the lowest values in Tuscany, around the WHO threshold (15%). We aimed to assess and demonstrate such performance improvement in Pisa TH, taking the other two THs of Tuscany as comparators. Our outcomes were NTSV CS rates (nulliparous, term pregnancy, singleton, vertex), total CS rates, Robson Class 1 CS rates, NTSV episiotomy rates, and operative delivery rates, computed annually from 2016 to 2020 in the three THs of Tuscany. We obtained data from regional administrative databases. We performed difference-in-differences to compare the average change from the pre- (2016-2017) to the post-period (2018-2020) in the outcomes between Pisa TH and the other two THs, assuming that Pisa TH implemented organizational changes at the end of 2017 to improve the hospital performance on CS. Comparing Pisa TH with the other two THs, we found a significant pre-to-post reduction in NTSV CS rates ($p < 0.001$), total CS rates (p = 0.016), Robson Class 1 CS rates (p = 0.039), and episiotomy rates (p = 0.059), while no significant change emerged for operative deliveries. As a result, after 2017, Pisa TH reached significantly lower NTSV CS rates ($p < 0.001$) and Robson Class 1 CS rates (p = 0.027) and non-significantly higher total CS rates and episiotomy rates compared to the other two THs. This case study proved beyond a mere descriptive assessment that a statistically significant performance improvement in CS and episiotomy rates occurred in Pisa TH after 2017 following organizational changes. Comparison with the pre-period trend and the other two THs of Tuscany made these findings robust and reliable.

Key messages:

- The Performance Evaluation System allowed to benchmark the performance of Tuscan THs, revealing the worst practice of Pisa TH on CS, and fostering organizational changes to be explored qualitatively.
- Such organizational changes improved hospital performance on CS rates and on the maternity pathway in general, eventually making Pisa TH the best performer on CS in Tuscany.

Abstract citation ID: ckac131.435
Women's preferences in the low-risk pregnancy management: Discrete Choice Experiments from Tuscany

Ilaria Corazza

M Bonciani[1], I Corazza[1], A Ferrari[1], L Batinelli[2], F Pennucci[1]
[1]Health and Management Laboratory, Sant'Anna School of Advanced Studies, Pisa, Italy
[2]School of Health Sciences, University of London, London, UK
Contact: ilaria.corazza@santannapisa.it

During the last years, organizational models to assist women during pregnancy have changed. The physiological management of low-risk pregnancy is gaining momentum thanks to increased available evidence. Therefore, a need to assess women's acceptance of these new proposals is emerging. This study aims to explore women's preferences during pregnancy and childbirth. We enrolled women from the continuously active survey on the maternity pathway in Tuscany, Italy. We designed Two Discrete Choice Experiments (DCE) and administered them through web-based surveys. We sought to catch women's preferences on health professionals to be involved, team-based or exclusive assistance, the physical proximity of healthcare services, and cost per service. We also explored women's decision-making autonomy and pain management during labour and childbirth. Additionally, we investigated women's information needs on the physiological model of low-risk pregnancy management through qualitative methods. Mixed logit models on the DCEs results show that women prefer being assisted during pregnancy and childbirth by healthcare services that are free of charge, easily accessible from a geographic point of view, and provided by a gynaecologist. The interaction effects reveal statistically significant differences for some sociodemographic variables of respondents and maternity pathway attributes. Besides, qualitative analyses highlight that women are interested in the physiological management of low-risk pregnancy according to their level of knowledge, confidence and safety feelings, and beliefs concerning non-medicalization and autonomy. The main findings of this study point out several implications for policy and managerial practice to effectively implement the physiological model of low-risk pregnancy management.

Key messages:

- This study proves that costs, travel distance, and type of health professional are the main determinants of women's elicited preferences during pregnancy and childbirth.
- Policymakers and healthcare managers should consider these findings in organizing and providing maternal and childbirth health services to foster the physiological management of low-risk pregnancies.

Abstract citation ID: ckac131.436
Support perceived by foreign-origin women in Finnish maternity care: a comparison of two surveys

Alexandra Schmidt

A Schmidt[1,3], A Chen[2], R Klemetti[1]
[1]Finnish Institute for Health and Welfare, Helsinki, Finland
[2]Aalto University, Espoo, Finland
[3]Rutgers, Robert Wood Johnson Medical School, Piscataway, USA
Contact: afs111@rwjms.rutgers.edu

Background:

Evidence suggests that foreign-origin women are at risk of poorer pregnancy outcomes, both worldwide and in Finland. This study examined if foreign-origin women felt adequately supported by healthcare providers during their perinatal care in Finland.

Methods:

Foreign-origin women who gave birth in Finland within the last 3 years were recruited via snowball method as part of the MOM Survey (MS). Data were also extracted from birthing parents' responses to the 2020 national FinChildren Survey (FC), which consisted of data from parents in Finland with 3-6-month-old babies. Only responses submitted to MS from women born outside of Finland (n = 291) and responses submitted to FC by women born in Finland (n = 7984) were analyzed. Reported levels of adequate support from each group were compared using an independent sample proportion t-test. Data were then pooled and analyzed via binomial logistic regression.

Results:

MS respondents were older, more highly educated, and reported a higher proportion of single parenthood. 70.9% of MS respondents reported receiving adequate support regarding general well-being during pregnancy, compared to 90.2% of FC respondents ($p < 0.001$). Statistically significant differences ($p < 0.001$) were also seen in levels of support for parenthood (MS 74.3%, FC 92.8%), depression (MS 68.1%, FC 94.7%), fear of childbirth (MS 81.5%, FC 91.7%), and preparing for childbirth (MS 65.0%, FC 80.6%). After adjusting for age, education, and relationship status, FC mothers were still 4 to 9 times more likely to report receiving adequate support in these areas as compared to their MS counterparts.

Conclusions:

Women born outside of Finland were significantly more likely to report receiving inadequate support in multiple aspects of their perinatal care when compared to Finnish-born women. This held true even after adjusting for demographic differences. More research is needed to better understand this phenomenon and to ensure equitable care in the future.

Key messages:

- Minority populations continue to grow in Finland, a country often seen as a global leader in maternal care. Supporting these populations is imperative to ensure quality maternal healthcare for all.
- Our observation that foreign-origin women felt less supported during pregnancy suggests that new care models or strategies may be needed to address their unique needs in peripartum care.

Parents' perceptions of barriers & facilitators for adhering to advice from community health nurses

Rikke Rothkegel Carlsson

RR Carlsson[1], LAS Brautsch[1], L Kierkegaard[1], CT Bonnesen[1]
[1]National Institute of Public Health, Copenhagen, Denmark
Contact: roca@sdu.dk

Background:

Childhood obesity is a global health problem and infancy is an important window of opportunity for promoting healthy weight development. In Denmark, community health nurses cover most families with a new-born child leaving a huge potential for promoting healthy weight development. This study examines parents' perceptions of barriers and facilitators for adhering to advice from the health nurse regarding healthy weight development of their child.

Methods:

Sixteen interviews with parents (children aged 0- 2 years) living in Denmark were conducted. Parents were strategically sampled representing variations across child age, family socioeconomic position, ethnicity, and geography. All interviews were based on a semi-structured interview guide, recorded, and transcribed verbatim and analysed using a thematic analysis.

Findings:

Parents generally experience visits from their health nurse positively. Health nurses are emphasized as a confident and trustful relation and the key informant about children's' health. Variations in how parents adhere to advice favouring healthy weight development of their child were found.

Generally, parents adopted a positive attitude towards the health nurse, also when she addressed behaviour or practice of the parents, but parents expressed the importance of doing so in a non-stigmatising or finger pointing manner. The degree to which parents follow the advice from their health nurse depend on cultural background, advice from family and friends, and use of online information.

Conclusions:

Parents generally have a confident and trustful relation to the health nurse, and she constitutes the key informant on child health. This leaves a potential for the structure of Danish health nurses for future interventions promoting healthy weight development. Adaptation of the future intervention program to the needs of parents will increase the chances of developing a relevant, successful, and sustainable intervention.

Key messages:

- Health nurses are emphasized as a trustful relation and the key informant about children's' health, but parents expressed the importance of addressing behaviours in a non-stigmatising manner.
- Adapting information gained from parents in development of the trial will increase the chances of a relevant, successful, and sustainable intervention promoting healthy child weight development.

Abstract citation ID: ckac131.438

Barriers to prevent second-hand smoke (SHS) exposure among pregnant women and children in Egypt

Tessa Langley

Z Hassanein[1,2]*, T Langley*[1]*, I Bogdanovica*[1]*, R Murray*[1]
[1]Academic Unit Lifespan and Population Health, University of Nottingham, Nottingham, UK
[2]Public Health Department, Assiut University, Assiut, Egypt
Contact: tessa.langley@nottingham.ac.uk

Background:

The prevalence of daily second-hand smoke (SHS) exposure among pregnant non-smoking women and children in Egypt is estimated to be about 50% and 55%, respectively. This study aimed to explore barriers to preventing SHS exposure among pregnant women/children and smoking behavior at home in Egypt.

Methods:

Focus group discussions (FGDs) with pregnant women/mothers of children residing in urban/rural areas (n = 61). Data were coded and analyzed thematically.

Results:

61 participants were recruited, aged 18-49. They reported being never smokers and SHS exposure for themselves and their children was mainly at home. Pregnant women/mothers had some general knowledge of the dangers of SHS, but their knowledge appeared incomplete. The most commonly reported barriers to preventing SHS exposure/adopting a smoke free home or workplace were having men who smoke in the household, doctors not being supportive regarding smoking cessation, SHS exposure is socially accepted and fear among women of damaging a relationship; being nervous about asking smokers to stop, and being worried about disputes and arguments with husband. The majority of interviewees' families were reported to allow smoking anywhere in the home; others implemented some measures to prevent SHS, however, these tended to be inconsistently implemented and unlikely to be effective.

Conclusions:

This study increases our knowledge of the barriers of non-smoking Egyptian pregnant women/mother of children in creating and maintaining smoke free environment for themselves and their children. There is a need to denormalise SHS exposure and better enforcement of smoke free policies.

Key messages:

- Better enforcement of smoke free policies, and more support for smoking cession services are needed in Egypt.
- SHS policy, practice, and research should focus on male family members to increase their effectiveness.

Abstract citation ID: ckac131.439

Co-creating an intervention promoting healthy weight development during infancy

Lene Kierkegaard

L Kierkegaard[1]*, R Rothkegel Carlsson*[1]*, L Ayoe Sparvath Brautsch*[1]*,*
C Thørring Bonnesen[1]
[1]National Institute of Public Health, Copenhagen, Denmark
Contact: leki@sdu.dk

Background:

Childhood obesity is a major public health challenge, and it is recommended to promote healthy weight development already during infancy. It is important to co-create interventions to maximize the feasibility and thus improve the chances of successful implementation. This paper describes the co-creation process of the Danish Bloom Trial - an early intervention to promote healthy weight development among children of first-time parents.

Methods:

Development of the trial is inspired by co-creation frameworks and the Intervention Mapping protocol. The co-creation process comprises three stages: 1) Evidence review, qualitative research with community health nurses (CHNs) and parents, and stakeholder consultations; 2) co-creation of the intervention content including workshops and group meetings with CHNs and other stakeholders and focus group discussions with parents; and 3) prototyping, feasibility- and pilot-testing. Currently, we are in stage 2 and have conducted four workshops with CHNs and one parent group discussion.

Results:

During stage 1, we identified the intervention setting; the unique system of CHNs in Danish municipalities. Furthermore, we identified the need for developing intervention content focusing on nutrition, physical activity, sleep, screen time and sense of security to promote healthy child weight development. The main intervention components are a course for CHNs and guidelines on how to talk to parents about behavioral risk factors. The main components for parents are eight home visits and six telephone consultations from CHNs during pregnancy and until the child is 2½ years old and a video library.

Conclusions:

The description of the development of the Bloom Trial provides an example of how to co-create an intervention balancing evidence, the practical work of the implementers and the needs of the families. Co-creation with relevant stakeholders increases the chances of producing a relevant, successful, and sustainable intervention.

Key messages:

- The co-creation process resulted in development of intervention content focusing on nutrition, physical activity, sleep, screen time and sense of security from pregnancy to child age 2½ years.
- Involving parents and stakeholders in the development of an intervention increases the chances of producing a relevant, successful, and sustainable intervention.

Abstract citation ID: ckac131.440

Associations between social support and physical activity among postpartum women: a cohort study

Karin Elisabeth Bennetter

KE Bennetter[1]*, CW Waage*[1,2]*, KR Richardsen*[2]*, AK Jenum*[1]*,*
NK Vøllestad[1]*, HS Robinson*[1]
[1]University of Oslo, Institute of Health and Society, Oslo, Norway
[2]Oslo Metropolitan University, Faculty of Health Science, Oslo, Norway
Contact: k.e.bennetter@medisin.uio.no

Background:

Moderate-to-vigorous physical activity (MVPA) enhances postpartum women's health, and social support is associated with higher self-reported physical activity (PA) postpartum. It is unknown if this association exist across ethnic groups. Our research questions are: are overall family or friends' support associated with objectively recorded MVPA postpartum, 2) are specific types of family or friends' support associated with MVPA and 3) does the association differ across ethnic groups?

Methods:

We used data from 662 women participating in the STORK Groruddalen cohort study (2008-2010). MVPA in bouts ≥ 10 minutes was recorded by SenseWear ArmbandTM Pro3 14 weeks postpartum. Family and friends' support was measured by the Social Support for Exercise Scale. We used single items and mean score for family (6 items) and friends' (6-items) support in separate linear regression models, and adjusted for age, ethnicity, education, parity, weeks since birth and body mass index. We tested for interactions between social support and ethnicity. Analyses were performed on complete cases and imputed data due to missing MVPA data.

Results:

Based on imputed data we observed an association between family support and MVPA ($\beta = 4.0$, 95% CI, 0.18 to 7.74, $p = 0.040$). Women reporting high family support on two specific items spent 9 MVPA minutes/day more than women reporting low support ('discuss PA': $\beta = 8.6$, 95% CI: 0.37 to 16.87 and 'co-participation': $\beta = 8.8$, 95% CI: 1.79 to 15.86). Associations were not modified by ethnicity. No statistically significant association between friends' support and MVPA was observed. Similar results were found in complete case analyses, with few exceptions.

Conclusions:

Overall family support and specific form of family support (i.e., PA discussion and co-participation) were associated with MVPA postpartum across ethnic groups. Friends' support was not associated with MVPA.

Key messages:

- Postpartum health may be improved across ethnic groups through increased PA facilitated through overall family support for PA and specifically through PA discussions and co-participation from family.
- Friends' support for PA was not associated with PA.

Abstract citation ID: ckac131.441
Sexual education in the school setting: an overview of the Italian situation

Toni Cappelletti

T Cappelletti[1], G Lo Moro[1], HSMA Elhadidy[1], F Bert[1], G Scaioli[1], R Siliquini[1,2]
[1]Department of Public Health Sciences, University of Turin, Turin, Italy
[2]A.O.U. City of Health and Science of Turin, University of Turin, Turin, Italy
Contact: toni.cappelletti@unito.it

Background:

There is an important interaction between sexuality and many life factors. A good sexual education at school can improve knowledge and behaviour in young people giving them a healthy sexual life. Unlike most European countries, sexual education in Italy is not compulsory in the school curriculum, so this study explored the Italian regional initiatives realised over a span of 15 years.

Methods:

A review of grey literature was conducted on Public Health Administrations/Regions websites of each Italian region, focusing on official documents containing training catalogues for schools. The search was conducted in December 2021, including documents produced between 2006 and 2021. We used the topics recommended by UNESCO as quality markers for the projects found.

Results:

Among the 20 Italian regions, 12 had at least one programme. A total of 39 projects were found. All UNESCO topics were covered, with notable differences between north, centre and south of Italy, which had the lowest number of projects. Most of the projects (23) were carried out only once, the others were repeated at least for two years in a row. Contraception, along with love, marriage, partnerships, and family, were the main topics discussed during sexual education programs in schools (92%), followed by biological aspects, body awareness, and anatomy (83%); birth, disability, human rights, and online media were less common (33%). Regarding the target, disability, human rights, and mutual consent were deepened only for middle and high school students.

Conclusions:

Considering the fundamental importance of sexual education, there is an important lack in promotion and planning in Italy. There is a large discrepancy between the northern and southern regions and it is necessary to implement and standardize the offer of sexual education programs in schools.

Key messages:

- Unlike the European average, In Italy there is an important lack on sexual education, whit large discrepancies between the northern and southern regions, putting the latter at disadvantage.
- Contraception, marriage, couples, and family were the main topics discussed during sexual education programs in schools; birth, disability, human rights, and online media the least.

Abstract citation ID: ckac131.442
Empowering pregnant women to improve diet quality: a RCT among pregnant women in the Netherlands

Renske van Lonkhuijzen

RM van Lonkhuijzen[1], A Wagemakers[1], JHM de Vries[2]
[1]Health and Society, Wageningen University and Research, Wageningen, Netherlands
[2]Human Nutrition and Health, Wageningen University and Research, Wageningen, Netherlands
Contact: renske.vanlonkhuijzen@wur.nl

Objective:

A healthy diet during pregnancy is crucial for the health of both mother and child, but pregnant women often do not meet the nutritional requirements. Empowering pregnant women to improve their diet quality could play a significant role in improving maternal nutrition and health. However, empowerment has been rarely used in nutritional interventions. Based on research and input from stakeholders, we developed Power 4 a Healthy Pregnancy (P4HP). P4HP consists of four additional consults by the midwife or dietician to discuss nutrition with the pregnant women from an empowerment perspective. This study aims to evaluate the effectiveness of P4HP on diet quality, empowerment, and health of pregnant women.

Methods:

A cluster randomized controlled trial started in January 2022 in 14 Dutch midwifery practices, with a total of 175 pregnant women in both the control and intervention groups ($N = 350$). Women in the intervention group follow P4HP in addition to their usual birth care. Measurements are carried out at the beginning and end of pregnancy. Diet quality is measured using the Dutch Healthy Diet index 2015, specifically adapted for pregnancy. Empowerment is assessed using the Pregnancy-Related Empowerment Scale, Sense of Coherence (SOC) using the SOC-3 scale, Self-Rated Health using a General Self-Rated Health question, and Quality of Life using a Visual Analogue Scale. Results will be analyzed using Linear Mixed Models to analyze the treatment effect of clustered data.

Results:

Baseline results of 100 pregnant women indicate that they do not meet the Dutch dietary guidelines. We hypothesize that P4HP will lead to improvements in diet quality, empowerment, and health among the intervention group compared to the control group.

Conclusions:

Our findings will show the effect of P4HP on pregnant women's diet quality, empowerment, and health. We expect to present our preliminary results during the congress.

Key messages:

- Our findings will show the effect of four additional nutritional consultations from an empowerment perspective on pregnant women's diet quality, empowerment and health.
- Empowering pregnant women to improve their diet quality could play a significant role in improving maternal nutrition and health.

Abstract citation ID: ckac131.443
Implementing the Bloom Trial: Community health nurses' perceptions of potential barriers

Louise Ayoe Brautsch

L Brautsch[1], L Kierkegaard[1], RR Carlsson[1], CT Bonnesen[1]
[1]National Institute of Public Health, Copenhagen, Denmark
Contact: loas@sdu.dk

Background:

The overall aim of the Bloom Trial is to develop and test a program promoting healthy weight development during infancy within the community health nurse setting in Denmark. Many interventions are poorly implemented, and to ensure adequate implementation support, previous studies have suggested to assess barriers and organizational readiness before intervention start. The aim of the present study is to assess barriers for implementing and sustaining the Bloom Trial among program adopters and implementers.

Methods:

Telephone interviews with managing health nurses (adopters) and health nurses (implementors) from twenty Danish municipalities were carried out (n = 22) in 2017. Moreover, two workshops with health nurses, and continuously meetings with implementation science experts were conducted in 2021-2022.

Results:

Barriers were identified on different levels. Organizational barriers within the work of health nurses included lack of time, economic resources, project fatigue, and political priority. Furthermore, health nurses lacked relevant tools to guide parents about promoting healthy weight development. Interpersonal barriers between health nurses and parents were identified as the difficulties of having conversations about healthy weight development, especially if the parents or health nurses were overweight themselves. Cultural differences including language barriers and different perceptions of for example healthy food choices were also found.

Conclusions:

The findings are central for ensuring that the Bloom Trial is relevant and applicable to the setting of health nurses in Danish municipalities. This is crucial for ensuring successful adoption, implementation, and prolonged sustainability.

Key messages:

- The study pinpoints key barriers (e.g. lack of time, project fatigue and cultural factors) of implementing an intervention promoting healthy weight in the community health nurse setting in Denmark.
- Involving community health nurses' perceptions aim at increasing the chances of producing a relevant and successful implementation strategy.

[6]Unit of Clinical Biostatistics, Aalborg University Hospital, Aalborg, Denmark
[7]Department of Clinical Medicine, Aalborg University, Aalborg, Denmark
Contact: julie.rasmussen@rn.dk

Background:

The incidence of inflammatory bowel disease (IBD) among children and adolescence is increasing worldwide. Having a chronic condition at a young age may affect educational achievement and later employment and self-support. The study aims to examine the impact of being diagnosed with IBD before 18 years of age on achieving an upper secondary education before 25 years of age.

Methods:

Using the Danish National Patient Register (1980-2018) all patients (born 1970-1994) diagnosed with IBD at a young age (<18 years) were identified. The IBD-patients were matched on age and sex with 10 references without IBD at the index date (date of diagnosis of IBD). The outcome was achieving an upper secondary education using data from Danish Education Registers. The association between IBD diagnosis and achieving an upper secondary education was analyzed using Cox regression with robust variance estimation adjusting for parents' highest educational level. Furthermore, stratified analyses were performed on parental socioeconomic status (education and income).

Results:

We identified 3,178 patients with IBD: Crohn's disease (CD) n = 1,344, Ulcerative colitis (UC) n = 1,834. Reference n = 28,220. The median age at diagnosis was 15.3 years (IQR: [13.0;16.9]). At the age of 25 74.0% (CI: 71.6-76.4) for CD, 75.8% (CI: 73.8-77.8) for UC, and 69.7% (CI: 69.2-70.3) for references had achieved an upper secondary education. The adjusted Hazard ratio (HR) of achieving an upper secondary education was 1.05 (CI: 1.00 -1.11) for CD and 1.09 (CI: 1.04 - 1.15) for UC. When stratifying the IBD-patient with the lowest socioeconomic status performed better than their peers.

Conclusions:

Being diagnosed with IBD before 18 years of age did not reduce the chance of achieving an upper secondary education. Patients with low socioeconomic status performed better than their peers, however the study gives no explanation of this.

Key messages:

- Children diagnosed with IBD before 18 years of age had at least the same chance of achieving an upper secondary education compared to references.
- IBD patients with low social economic status performed better than their peers.

Abstract citation ID: ckac131.445
Forced migrant women's Mental Health in the perinatal period in Germany- A mixed-method study

Theda Borde

R Al Munjid[1], L Teschemacher[2], E Mohr[1], M Engelhardt[1], J Breckenkamp[3], T Borde[1]
[1]Alice Salamon Hochschule Berlin, Berlin, Germany
[2]Klinik für Gynakologie, Charité Universitatsmedizin, Berlin, Germany
[3]Epidemiologie und International Public Health, Universität Bielefeld, Bielefeld, Germany
Contact: borde@ash-berlin.eu

Background:

After forced migration, pregnant women and new mothers face specific challenges in the host country. Little research focuses on the impact these challenges have on forced migrant (FM) women's mental health (MH). The study's aim shed light on FM women's mental wellbeing in the perinatal period.

Methods:

For this mixed-method study 15 individual problem-centered interviews were carried out in Arabic with FM mothers living in Germany within the postnatal period to one year postpartum. The transcripts were analysed using the Framework Analysis. In addition, structured quantitative interviews with 3070 new mothers were conducted on 3 obstetric wards in Berlin over a period of 23 months using an adapted version of the MFMCQ and the PHQ4. FM women (n = 187) were compared with immigrant (n = 1192) and non-immigrant women (n = 1673). A Kruskal-Wallis-Test was performed to compare the three groups.

Results:

In the qualitative interviews mothers stated having depression and varied emotions (e.g. unavoidable sadness, relief). Most FM mothers indicated contextual factors (e.g. bad housing conditions) and structural barriers in perinatal healthcare as negatively impacting their MH. The preliminary quantitative analysis of the interviews conducted in birth clinics directly after birth showed no significant differences in the mean scores of the PHQ-4 within the compared groups (mFMW = 2.83; mimmi = 2.61; mnonimmi = 2.5; p = .72).

Conclusions:

While the quantitative study part indicates that PHQ-4 scores are independent of FM experience, the qualitative part shows that FM new mothers face particular burdens in their living conditions that make them vulnerable to MH issues. Inconsistent results could be attributed to the different timing in which the structured questionnaires and qualitative interviews were conducted.

Key messages:

- To promote Mental health of new mothers, we advocate for a diversity oriented, responsive healthcare system.
- Effective approaches must be provided to include FM mothers in existing Early Childhood Intervention programs.

Abstract citation ID: ckac131.446
Feeding preterm infants with breast milk – the role of maternal pressure

Isabella Schwab

I Schwab[1], I Okumu[1], I Ohnhäuser[1], II Dresbach[2], I Scholten[1]
[1]Institute of Medical Sociology, Health Services Research, and Rehabilitation Science, University of Cologne, Cologne, Germany
[2]Department of Neonatology, University Hospital Bonn, Bonn, Germany
Contact: isabella.schwab@uk-koeln.de

Background:

Mother's own milk (MOM) is the best nutrition for preterm infants because of its preventive effects. Nevertheless, current research shows that mothers have problems getting into continuous lactation, especially after preterm birth. Breastfeeding-related pressure after prematurity has not been measured yet. It's relevance for the lactation is thus unclear, as well as the role of the NICU staff's attitudes. The aim of this study is to gain more knowledge about breastfeeding-related pressure in order to enable mothers to have a positive breastfeeding experience and to sensitise NICU staff about this topic.

Methods:

The written survey included mothers of preterm infants with a birth weight under 1500g and an age from 6 to 24 months at the time of the survey. Descriptive and bivariate testing was used for analyses.

Results:

Data of 506 mothers was included (32% response rate). One third totally agreed to perceive pressure regarding breastfeeding their child with MOM (36%). A milk volume over 500ml/day 14 days post-partum was reported in 60%. That the nutrition with MOM was promoted by the physicians in the NICU was totally agreed by 44% of the mothers. To the promotion by nurses, 50% totally agreed. Pearson Chi^2-Test showed a significant correlation between milk volume and breastfeeding-related pressure (p = 0.005). Spearman's correlation test showed a significant correlation between a high promotion of MOM by physicians (Spearman's rho: -0.1150, p = 0.0109) and nurses (Spearman's rho: -0.0949, p = 0.0362) and lower breastfeeding-related pressure.

Conclusions:

Our findings indicate that breastfeeding-related pressure seems to affect most of the mothers of preterm infants and correlates with lactation, even if no direction of effect can be stated. A more breastfeeding promoting NICU staff is related to lower breastfeeding-related pressure. Therefore, NICU staff should be sensitised to breastfeeding-related pressure with regard to communication with mothers.

Key messages:

- Noticing breastfeeding-related pressure as an important factor for mothers within their lactation process may have the potential to enhance mothers to achieve their breastfeeding goals.
- NICU staff should be aware of breastfeeding-related pressure to enable more mothers to have a positive breastfeeding experience.

Abstract citation ID: ckac131.447
Germany vs. Austria: country-specific differences in becoming parents during the COVID-19 pandemic

Jasmin Preiß

J Preiß[1,2], C Florea[1,2], M Angerer[1,2], M Schabus[1,2]
[1]Laboratory for Sleep & Consciousness Research, University of Salzburg, Salzburg, Austria
[2]Centre for Cognitive Neuroscience Salzburg, University of Salzburg, Salzburg, Austria
Contact: jasmin.preiss@plus.ac.at

Background:

Becoming parents can be a big challenge, but how is this experience affected by the COVID-19 pandemic and its measures?

Methods:

Between 18.05.2021 and 01.07.2021, we conducted an online-survey to gain insight into becoming parents during the COVID-19 pandemic in Germany and Austria. The sample mentioned in this report consists of biological mothers living in Austria (n = 952) and Germany (n = 1012) who gave birth between the 16th of March 2020 (the beginning of the first lockdown in Austria) and the time of completion of the study. The mothers' current stress levels were assessed with the Perceived Stress Scale (PSS), and postnatal depression symptoms were quantified with the Edinburgh Postnatal Depression Scale (EPDS). Furthermore, we included questions to measure perceived social support and pandemic-related stress.

Results:

Current stress levels (U = 555677.50, z = 5.90, p < .001) and postnatal depression symptoms (U = 546354.00, z = 5.15, p < .001) were significantly higher in the German sample as compared to the Austrian sample. Yet, Austrian mothers reported higher social support as compared to the German mothers (U = 387834.00, z = -7.48, p < .001). Furthermore, we found higher levels of perceived social support to be associated with lower current stress levels (rs = -.40, p < .001). On average, perceived stress was moderately high in both samples (MGermany = 18.58, SDGermany = 6.60; MAustria = 16.76, SDAustria = 6.57).

Conclusions:

Stress levels and depression symptoms seem to be high and prevalent due to the pandemic and it is highly indicated to take action such as supporting families in need and emphasising social support in order to reduce mental health problems of parents as well as their children in the aftermath of the pandemic.

Key messages:

- Findings underpin the protective role of social support against psychological distress in new parents and show the high strain at current.
- Action needs to be taken in order to support parents and children at risk.

Designing active breaks in secondary school, results from focus group with teachers: the brave study

Giulia Longo

G Longo[1], *A Masini*[1], *M Ricci*[1], *S Marini*[2], *A Sansavini*[3], *LM Scheier*[4], *A Ceciliani*[2], *L Dallolio*[1]
[1]Department of Biomedical and Neuromotor Sciences, University of Bologna, Bologna, Italy
[2]Department for Life Quality Studies, University of Bologna, Rimini, Italy
[3]Department of Psychology Renzo Canestrari, University of Bologna, Bologna, Italy
[4]LARS Research Institute, Inc., Scottsdale, USA
Contact: giulia.longo9@studio.unibo.it

Background:
Many adolescents are unable to accomplish the daily 60 minutes of moderate to vigorous physical activity (PA) recommended by WHO. Secondary school is a critical period for developing healthy habits and PA interventions have the potential to promote healthy development. Active Breaks (ABs) are a school-based intervention consisting of short bursts (5-15 minutes) of PA made part of the academic routine. Primary school has been ABs main setting, while secondary school interventions received less attention. The aim of the BRAVE Study is to investigate teachers' opinion about the feasibility of ABs in Italian secondary school.

Methods:
In November 2020 20 teachers from two secondary schools located in Bologna province (Italy) were enrolled in two focus groups (FGs). FGs were held online, recorded, and transcribed. Questions were asked about the role of PA in the school routine and related experiences, perceived barriers and facilitators of the intervention, suggestions regarding the intervention design. Final expectations were then discussed.

Results:
Despite limited experience with PA interventions, participants felt ABs would improve psycho-physical well-being for both students and teachers. Lack of time and space and a wary attitude towards ABs were listed as barriers. Program flexibility regarding content, administration time frames and implementation mode was listed as a great facilitator: program should be adaptable to participants' needs, favoring easy and quick exercises. Overall, expectations emphasized improving classroom behavior and promoting healthy habits.

Conclusions:
Teachers felt that inclusion of ABs in secondary school was promising and could lead to many health benefits. ABs were deemed feasible given their short duration and adaptability, since the program can be implemented with current personnel resources and space configurations. Co-design is essential to overcome personal barriers and create an effective and sustainable intervention.

Key messages:

- According to secondary school teachers, PA interventions have the potential to improve psycho-physical well-being and classroom environment, promoting healthy habits among students.
- ABs are deemed as a feasible and sustainable PA intervention thanks to program flexibility regarding contents, administration time frames and implementation mode.

Evaluation of an integrated physical activity program for pregnant women: WELL-DONE! Study

Anna Zannoner

S Marini[1], *A Masini*[2], *I Caravita*[3], *A Zannoner*[2], *F Scognamiglio*[2], *AA Coa*[2], *I Rescigno*[2], *G Sicari*[2], *G Castagna*[2], *L Dallolio*[2]
[1]QUVI, University of Bologna, Bologna, Italy
[2]DIBINEM, University of Bologna, Bologna, Italy
[3]DIMEC, University of Bologna, Bologna, Italy
Contact: anna.zannoner2@studio.unibo.it

Background:
Regular practice of physical activity (PA) during pregnancy has benefits for maternal and fetal health. Therefore, pregnant women (PW) should practice at least 150 minutes of moderate PA per week following the WHO guidelines. The aim of the study is to evaluate the effect of an adapted physical activity (APA) intervention for PW, to be included in childbirth preparation classes (CPCs) in terms of levels of PA, quality of life, physical performance, self-efficacy, sleep quality and anxious-depressive states.

Methods:
The WELL-DONE! Study is a quasi-experimental study conducted with pregnant women at St. Orsola hospital, Bologna. We compared an experimental group (EG) with a control group (CG). EG attended 1hour/week session of APA during the usual CPCs for a 6 weeks period, while the CG received a one hour lesson about PA recommendation in pregnancy. The pre-post evaluation was carried out through questionnaires and motor tests, to which PW were subjected at baseline (T0), after the intervention (T1) and 3 months after delivery (T2). We used the Pregnancy Physical Activity Questionnaire (PPAQ) to collect data regarding PA levels and sedentary behavior.

Results:
A sample of 50 pregnant women aged between 29-46 (mean age = 35.44±3.99) was involved in the study (39 CG, 11 EG). After the intervention, PPAQ sedentary activity score was reduced in the EG group (-10.20±24.12) while remaining similar in the CG (0.58±22.65) without statistically significant differences between groups.

Conclusions:
Preliminary results of the study show a reduced sedentary time in PW, highlighting a positive trend in the EG. This data underlines that incorporating APA in the CPCs can be an effective and safe strategy. Nevertheless, further analysis must be needed to find out if this trend can be observed in light PA, in the moderate and vigorous one.

Key messages:

- Physical activity during pregnancy is a valuable tool for improving both mother and child well-being.
- Physical activity interventions, implemented in CPCs, seem useful in order to raise awareness about PA importance and reduce sedentarism in PW.

Abstract citation ID: ckac131.450
Potential association between working memory and physical fitness status: the BRAVE study

Francesco Sanmarchi

A Masini[1], *F Sanmarchi*[1], *M Ricci*[1], *G Longo*[1], *ER De Gioia*[1], *A Zannoner*[1], *A Tessari*[2], *A Ceciliani*[3], *L Dallolio*[1]
[1]Department of Biomedical and Neuromotor Sciences, Alma Mater Studiorum - Università di Bologna, Bologna, Italy
[2]Department of Psychology ''Renzo Canestrari'', Alma Mater Studiorum - Università di Bologna, Bologna, Italy
[3]Department of Life Quality Studies, Alma Mater Studiorum - Università di Bologna, Rimini, Italy
Contact: francesco.sanmarchi@studio.unibo.it

Introduction:
The World Health Organization launched a global action plan targeted to obtain a 15% relative reduction in the global prevalence of physical inactivity in adolescents by 2030 also

promoting school-based PA interventions and programs in school. Active Breaks (ABs) are a school-based intervention consisting of short bursts (5-15 minutes) of Pa led by teachers or peer. Many researches investigated the implementation of ABs into primary school setting as a strategy to reduce sedentary behaviour, improve cognitive and physical function. However, this kind of intervention has not extended to secondary school, especially in Italian context. For this reason we started the BRAVE study to evaluate the potential effect of implementing ABs in secondary school. The study is currently in the administration phase of ABs to adolescents The preliminary analysis aims to underline a potential association between working memory performance (WM) and physical fitness status among secondary school students at baseline.

Methods:

In March 2022 we conducted baseline assessment in a secondary school in Valsamoggia (Bologna, Italy). Working memory was evaluated using backward digit span while physical fitness status was assessed using three different fitness test: standing long-jump (SLJ), six minute Cooper Test (6MCT) and Shuttle run test (SR).

Results:

A total of n = 125 adolescent, mean age 12.79±0.89, were enrolled in the study. After performing a regression analysis we found that WM is significantly associated only with age of student (b = 0.2, 95%CI 0.25, 0.11 p = 0.02). A trend also emerged between WM performance and SLJ but with no statistically significant differences (b = 0.160, 95%CI 0.03, 0.02, p = 0.09). The 6MCT and HT have no relevant associations with WM score.

Conclusions:

These preliminary results suggest that age is associated with cognitive performance but no positive association were found between WM score and physical fitness status excepted for a small trend with SLJ test.

Key messages:

- Age is related to WM in adolescent students.
- ABs interventions could represent a valid strategy to encourage movement, improve cognitive and physical fitness performance.

Abstract citation ID: ckac131.451
Invisible mother-daughter heredity

Elena Capitani

E Capitani[1], *C Lorenzini*[1], *E Baragatti*[2], *L Alaimo*[2], *G Messina*[1,3], *N Nante*[1,3]
[1]Post Graduate School of Public Health, University of Siena, Siena, Italy
[2]Degree Course in Obstetrics, University of Siena, Siena, Italy
[3]Department of Molecular and Developmental Medicine, University of Siena, Siena, Italy
Contact: ecapitani89@gmail.com

Background:

The type of maternal caregiving impacts children's growth and can lead to heritable changes in gene expression. When women become mothers, they adopt parents' behaviours similar to those received in the family of origin. The study investigates if a birth's social and cultural content can be seen as heredity transmitted from mother to daughter.

Materials and methods:

A retrospective study was conducted on a group of mothers recruited across Italy through the social network Facebook. The study was carried out using a questionnaire administered from July to September 2021. The survey consisted of 21 questions. The analysis was carried out using STATA 14.

Results:

Our sample consisted of 6051 mothers; the mean age was 37.7 years. Womens born by spontaneous birth has 2.1 times higher risk of having a spontaneous birth for their first child. Those born by operative labour have 2.7 times higher risk of having an operative delivery for their first child. Finally, those born by caesarean section are 2.3 times more likely to have a caesarean section for their first child. On the other hand, those born by preterm labour have 1.8 times higher risk of delivering their first child preterm. Those who were breastfed have 2 times higher risk of breastfeeding their first child. Women who have been told their birth is an extraordinary event are 2 times more likely to consider the birth of their first child as a problematic but still extraordinary event. Those who received a description of childbirth from their mother as a problematic event are twice as likely to consider the birth of their first child as a traumatic event overall.

Conclusions:

The results show that transmission, written in the psyche, in preverbal and in internalisations derived from the relationship with one's mother, is true and strongly present. Also, the ways of one's own birth are so strong as to have repercussions on the daughter's own and subsequently also on her children.

Key messages:

- The unconscious objects, which are projected onto the children, can also take the form of both physical and psychic somatisations, which are repeated cyclically between generations.
- The way in which birth is cared for and the quality of care provided at this unique time in a woman's life will leave an imprint not only on the woman herself, but also on future generations.

Abstract citation ID: ckac131.452
Enablers and barriers to effective parenting within the first 1000 days of life

Babatope Adebiyi

B Adebiyi[1], *T Goldschmidt*[1], *F Benjamin*[1], *I Sonn*[1], *E Rich*[1], *N Roman*[1]
[1]Centre for Interdisciplinary Studies of Children, Families and Society, University of the Western Cape, Cape Town, South Africa
Contact: atommega@yahoo.com

Background:

The first 1000 days is the period between conception and a child's second birthday. Globally, research on parenting is in an advanced stage, but parenting research focusing specifically on parenting in this developmental phase is limited in South Africa. Therefore, this study explores the enablers and barriers to effective parenting within the first 1000 days through the lens of parents and caregivers in low socio-economic communities.

Methods:

This study was conducted in low socio-economic communities of South Africa. An exploratory qualitative research design explored the enablers and barriers to effective parenting within the first 1000 days of life. Thirty participants were purposively selected and interviewed in this study. A semi-structured interview schedule was used for all interviews. The data were analysed using inductive thematic analysis.

Results:

Two main categories emerged (effective parenting enablers and effective parenting barriers) during the data analysis. The main enablers of effective parenting within the first 1000 days of life include a support system, healthy behaviours/environment, job opportunities, religion, information/knowledge, and professional assistance. On the other hand, the main barriers to effective parenting were low socio-economic circumstances, environmental circumstances, lack of partner's support, the negative impact of technology, and lack of access to services.

Conclusions:

Enablers that need to be promoted for effective parenting range from support systems to professional assistance for parents. Also, barriers that need to be removed for effective parenting range from low socio-economic circumstances to a lack of partner's support for parents. This is because effective parenting is vital in improving developmental outcomes for children within the first 1000 days of life. Therefore, there is a need to develop policies and interventions to promote effective parenting within the first 1000 days in the communities.

Key messages:

- Effective parenting is vital in improving developmental outcomes for children within the first 1000 days of life.
- There is a need to develop policies and interventions to promote effective parenting within the first 1000 days in low socio-economic communities.

Abstract citation ID: ckac131.453
Maternal dietary adherence during pregnancy to recommendations: a cross-sectional study in Modena

Lisa De Pasquale

L De Pasquale[1], L Palandri[1], MA Casalucci[1], D Azzalini[1], L Lucaccioni[2], E Passini[2], F Facchinetti[2], E Righi[2]
[1]Department of Biomedical, Metabolic and Neural Sciences, University of Modena and Reggio Emilia, Modena, Italy
[2]Department of Medical and Surgical Science, University of Modena and Reggio Emilia, Modena, Italy
Contact: lisadepa93@gmail.com

Background:

Unbalanced nutrients intake and incorrect weight gain can lead to immediate and future adverse health consequences for both mother and child. The Italian Society of Gynaecology and Obstetrics (SIGO), has drawn up a series of nutritional recommendations with the aim of promoting a correct food intake for future mothers. The purpose of our study was to assess adherence to good dietary indications during pregnancy and to evaluate if voluptuary habits could play a role.

Methods:

This cross-sectional study investigated dietary habits during the last trimester of pregnancy. We evaluated the adherence to dietary SIGO recommendations of a sample of pregnant women representative of physiologic full-term pregnancies (n = 572, mean age 33.4±5.2) living in Modena (Italy), recruited between 2016 and 2020. Maternal diet during pregnancy was assessed by a self-administered questionnaire fill in at the hospital after childbirth, evaluating lifestyle habits and usual food intake. Descriptive statistics and bivariate associations (Chi-square tests) were performed.

Results:

More than 50% of women did not comply with SIGO dietary recommendations. Overall, adherence was very low, ranging between 8.4% (sweets) and 38.8% (seafood), for all food categories, excluding coffee and tea (89%), alcohol (76.2%), red wine (99.1%) and seasoning (olive oil 93.4%). Preliminary results suggest that several factors and behaviours, including BMI before pregnancy, age, smoking habits, education, are associated with levels of adherence to different food categories.

Conclusions:

Poor adherence to a proper dietary regimen during pregnancy is a missed opportunity for prevention and demonstrates the importance of promoting public health interventions to improve dietary recommendations adherence. Several initiatives, such as courses, information campaigns, use of social media and counselling can be useful for a nutrition education in pregnancy, raising awareness of the related benefits for both mother and child.

Key messages:

- Nowadays pregnant women's compliance to diet recommendations is still low.
- There is still a lot to do in terms of education and awareness of future mothers.

Abstract citation ID: ckac131.454
The Brave study: promoting active breaks in secondary school from students' point of view

Matteo Ricci

M Ricci[1], A Masini[1], G Longo[1], A Sansavini[2], LM Scheier[3], S Marini[4], A Ceciliani[4], L Dallolio[1]
[1]Department of Biomedical and Neuromotor Sciences, Alma Mater Studiorum - University of Bologna, Bologna, Italy
[2]Department of Psychology ''Renzo Canestrari'', Alma Mater Studiorum - University of Bologna, Bologna, Italy
[3]LARS Research Institute, Inc., Scottsdale, USA
[4]Department for Life Quality Studies, Alma Mater Studiorum - University of Bologna, Rimini, Italy
Contact: matteo.ricci18@studio.unibo.it

Background:

According to the WHO recommendations, children and adolescents should perform at least 60 minutes per day of moderate to vigorous physical activity (PA). Active Breaks (ABs) interventions, short physical activity breaks of 5-15 minutes during school hours, have been examined in primary school children as a potential strategy to counteract a sedentary lifestyle, with minimal disruption to school learning activities. The aim of the BRAVE STUDY is to investigate the feasibility of ABs in a secondary school setting from the students' point of view.

Methods:

In December 2020, 10 students (age 12-13, 6 females and 4 males) attending the second and third grade of secondary schools located in Bologna province (Italy) were involved in a focus group (FG). The FG was conducted online because of COVID-19 and the answers transcribed for a later analysis. Students' opinions were probed on the role of PA in school and possible facilitators/barriers to implementation of ABs in the school.

Results:

Students reported they wanted to be more active as a consequence of time spent in class sitting at a desk. Students also reported that an organized activity like ABs conducted in the classroom setting provides an excellent opportunity to improve social relations with classmates. Students also highlighted the possible psycho-physical well-being benefits arising from PA. Among the potentially negative aspects reported, students underlined the possible confusion that would be created in classroom and the time subtracted from academic learning activities.

Conclusions:

The FG represents an ideal mean to obtain in-depth information on how people feel about a pending program or a change in their routine. The current FG reinforces positive outcomes from exposure to a PA program that can be intertwined with their daily classroom activities. ABs programs can help to reconcile the needs of students that arise during the day with the PA objectives recommended by the WHO.

Key messages:

- ABs can be a zero-cost intervention strategy to achieve WHO recommendations and would create conditions for a greater psycho-physical benefits in classrooms.
- A qualitative approach, such as FGs, provides a mean to collect information not obtainable with quantitative methods, that could be useful to co-design interventions for children and adolescents.

Abstract citation ID: ckac131.455
Removing barriers to utilisation of support services for abused female adolescents in Nigeria slums

Olutoyin Ikuteyijo

OO Ikuteyijo[1], AI Akinyemi[4], S Merten[1,2], MD Fetters[3]
[1]Society, Gender and Health, Department of Epidemiology and Public Health, Swiss Tropical and Public Health Institute, University of Basel Switzerland, Basel, Switzerland
[2]Center for African Studies, University of Basel, Basel, Switzerland
[3]Mixed Method Program and Faculty of Medicine, University of Michigan, Michigan, USA
[4]Department of Demography and Social Statistic, Obafemi Awowolo University, Ile Ife, Nigeria
Contact: ikuteyijotoyin@gmail.com

Background:

Female adolescents in urban slums experience a plethora of violence. The inherent health inequalities in the urban slums also present barriers to adolescents' access to support services that can alleviate the impact of violence and bring perpetrators to justice. Health facilities can play key proactive roles in facilitating effective responses to address the problems of violence. This research sought to answer the questions: what support services are available to female adolescents in the event of violence; what are the barriers to accessing these services; and what roles can health workers play in removing these barriers?

Methods:

The study used an ethnographic approach involving 40 in-depth interviews and 9 focus group discussions with female adolescents, 17 in-depth interviews were conducted with health providers and community leaders. The study setting comprised intentionally sampled slum communities in Lagos and Oyo states, southwest Nigeria. Thematic data analysis was conducted to address the study questions.

Results:

Potential support services available to female adolescents in the study setting included the Community Development Association, police, family members, and health facilities. Identified barriers to utilizing available support services included stigmatization, non-formalization of police reports of violence, ambiguous attitudes of health workers to abused adolescents, and unfamiliarity on the part of adolescents. Although resources are available to adolescents in the event of violence, the lack of coordination of services has led to gross inefficiency for intervening.

Conclusions:

To address the inefficiency of services, the health sector is best positioned to ensure synergy among the key stakeholders to reduce stigma and stop abuse experience among adolescent girls. Beyond a reactionary, curative approach, health providers need to play a preventive role through education, advocacy, and coordination of interventions at the community level.

Key messages:

- Health workers at primary health facilities need to support adolescents who experience violence, especially those who using their services.
- In addition, health workers are best positioned to create synergy among available support services to alleviate and mitigate the impact of violence on female adolescents in the community.

Strengthening antenatal care providers' role to address HIV: experiences of pregnant women in Russia

Elizabeth J King

EJ King[1], *MV Vetrova*[2]
[1]School of Public Health, University of Michigan - Ann Arbor, Ann Arbor, MI, USA
[2]First Pavlov Medical University, St. Petersburg, Russia
Contact: ejking@umich.edu

Background:

Significant gaps in HIV treatment remain in Russia. Women are often diagnosed during pregnancy, which is important for prevention of mother-to-child transmission and mothers' longer-term treatment. We aimed to learn the needs of HIV-positive pregnant and postpartum women and to identify opportunities for antenatal care (ANC) providers to better address these needs.

Methods:

We conducted in-depth interviews with Russian women who were diagnosed with HIV during pregnancy in July-November 2021. We conducted thematic analysis using team-based deductive and inductive coding of the interview transcripts.

Results:

The Russian healthcare system operates in silos, which means that while pregnant women are tested in ANC services, they must visit a specialized AIDS Center for their HIV care. Our respondents mostly appreciated the specialized care, but they recognized that it presented difficulties in discussing their HIV-related needs with ANC providers. Respondents noted a lack of coordination and collaboration between the AIDS Centers and the ANC services. Respondents described how ANC providers were often ill-equipped to answer questions, offer information, or provide extensive counseling upon diagnosis. However, some respondents shared the positive impact a supportive and trustworthy ANC provider had on their engagement in HIV care. This included psychological, informational, and instrumental support. Respondents were receptive to the empathy and openness of ANC providers as long as they did not exhibit incompetence or judgement. The stigma and discrimination that many respondents encountered in the healthcare setting served as significant barriers to openly discussing HIV with ANC providers.

Conclusions:

Issues of trust, knowledge, support, compassion, de-stigmatization, and coordination of services are important considerations in strengthening the role that ANC providers can have in improving HIV-positive pregnant women's engagement in HIV treatment.

Key messages:

- Pregnant women who are diagnosed with HIV require more comprehensive psychosocial support from the healthcare system. This could have a positive impact on longer-term engagement in HIV treatment.
- Antenatal care providers need better preparation and empathy to address the concerns of HIV-positive pregnant women and to support these women through the process of accessing HIV treatment and care.

[5]Department of Environmental and Preventive Sciences, Università di Ferrara, Ferrara, Italy
Contact: fedele9297@gmail.com

Introduction:

Congenital heart diseases (CHD) represent abnormalities of cardiovascular structure or function present at birth. The degree of knowledge of parents of children with CHD determines the quality of care and the quality of life of their children. Several studies have shown that parents' knowledge is still lacking.

Objectives:

This study aims to translate and validate in Italian the Leuven Knowledge Questionnaire for Congenital Heart Disease (LKQCHD) and to assess the knowledge of parents of children with CHD about heart defect, treatments, preventive measures, opportunities for physical activity and reproductive problems of their children.

Methods:

Translation and validation of the questionnaire were performed using a multistep method: forward translation, backward translation, and pilot testing. Five experts in CHD were included for the validation of the questionnaire. The sample consisted of fifty-four pairs of parents of children with CHD. Parents were contacted by telephone; knowledge was assessed using an electronic questionnaire.

Results:
Five items were found to have an Item Content Validity Index (I-CVI) of 0.6, 2 of 0.5, and 2 of 0.2. The Scale ContentValidity Index (S-CVI) was found to be 0.80. Regarding parental knowledge, the results show that almost all parents are able to correctly state the name of the diagnosis and the description and location of the heart defect. However, parental knowledge has important gaps; in particular, parents are less informed about the most characteristic sign of endocarditis, the possibility of contracting endocarditis more than once in a lifetime, and risk factors. Parental knowledge also seems to be lacking regarding symptoms suggesting worsening health status in their children.

Conclusions:
The Italian version of the LKQCHD has proved to be a valid tool to measure the level of knowledge of parents of children with CHD, allowing to identify in which areas it is necessary to improve the education addressed to parents.

Key messages:

- Assessing the knowledge of parents of children with CHD allows to improve their education.
- The Italian version of the LKQCHD is a valid tool to measure the level of knowledge of parents of children with CHD.

Abstract citation ID: ckac131.458
Importance of communication between health care professionals and forced migrant women during birth

Mathilde Gaudion

M Gaudion[1], M Engelhardt[1], J Kamhiye[1], T Borde[1]
[1]Alice Salomon Hochschule Berlin, Berlin, Germany
Contact: mathilde.gaudion@gmail.com

Background:
Communication and information are part of the Sexual and Reproductive Health and Rights (SRHR). Various studies show that successful communication between birthing person and health care professionals (HCP) has a positive impact on birth and lowers risk of traumatic birth experience for women. Since information and communication is a major challenge for both forced migrant women (FMW) and health workers during birth, we investigated experiences of both sides in qualitative study.

Methods:
Qualitative interviews were conducted with 7 maternal HCPs (midwifes, physicians, social workers) and with 7 FMW 1-9 months after the birth of their child in 3 regions in Germany. The refugee sample included new mothers from 6 countries of origins, 14 languages, and an average of three years living in Germany. The interviews were analyzed via framework analysis.

Results:
The majority of the interviewed FMW had no or little knowledge about SRHR. Good communication is one of the main factors allowing a safe and trustful environment with the birthing women. If verbal communication is not possible nonverbal communication helps to create and maintain a care relationship with the women is given. However, due to lack of staff, time and interpreters FMW with little German language proficiencies receive hardly any relevant information and had a poorer accompaniment during birth.

Conclusions:
To provide for equity and SRHRs in maternal health and care there is an urgent need for reliable professional interpretation and easily accessible information in relevant languages material about giving birth, medical possibilities, procedures and interventions. Additionally, further training on heterogeneous needs and life contexts is necessary, to improve professional care during birth in maternity wards. HCPs 1:1 support is strongly recommended.

Key messages:

- Information on SRHR and communication are a fundamental part of birth work and should be made possible for all women including FMW to prevent discrimination and traumatic birth experiences.
- If given, 1:1 support by HCPs during birth can comensate missing communication.

Abstract citation ID: ckac131.459
Trends of risk behaviors in adolescents: a 10-year study in a representative sample of Tuscany, Italy

Vieri Lastrucci

V Lastrucci[1,4], M Lazzeretti[2], F Innocenti[2], A Berti[2], C Silvestri[2], A Schirripa[3], S Paoli[3], C Lorini[4], F Voller[2], G Bonaccorsi[4]

[2]Epidemologic Observatory, Regional Health Agency of Tuscany, Firenze, Italy
[3]Medical Specialization School of Hygiene and Preventive Medicine, University of Florence, Firenze, Italy
[4]Department of Health Sciences, University of Florence, Firenze, Italy
Contact: vieri.lastrucci@gmail.com

Background:
The aim of the study was to evaluate the trends of prevalence of several health risk behaviors (HRBs) and health conditions over a 10-years period in a representative sample of adolescents of Tuscany Region, Italy.

Methods:
The study had a repeated cross-sectional design, data from the last four survey waves of EDIT surveillance (2008-2018) were used. EDIT surveillance investigates HRBs in a representative sample of students attending the upper secondary schools of Tuscany. Prevalence of 17 HRBs and health conditions were considered and analyzed by age, sex, and socioeconomic status (SES).

Results:
A total of 21.943 students were surveyed from 2008 to 2018. Declining trends in the participation in smoking, cocaine use, driving under the influence of alcohol and drugs, and problem gambling were observed, while alcohol abuse and at-risk sexual behaviors remained unchanged or increased during the study period. During the most recent survey males resulted more frequently involved in most of the HRBs, while females more frequently reported physical inactivity, regular smoking and not using a condom. Female participation in smoking and alcohol abuse behaviors, fruit and vegetables consumption, and bullying worsened over the study period. Smoking, poor dietary habits, physical inactivity, high distress level, and obesity were more frequently observed in low SES students than in high SES students.

Conclusions:
In conclusion findings showed various different tendencies in adolescent participation in HRBs over the course of the last decade; concerning trends in at-risk sexual behaviors and alcohol consumption and females' risk-taking behavior on the rise require careful monitoring and intervention.

Key messages:

- Distinct tendencies according to sex, socio-economic condition and specific health risk behavior were observed in adolescent participation in health risk behaviors over the course of the last decade.
- Health promotion and prevention interventions tailored on specific health risk behaviors and population groups are needed.

Issue:

Female genital mutilation (FGM) comprises all procedures that injury female genital organs for non-medical reasons, with several health impacts. Due to global migration, FGM has been increasingly recognised as a healthcare issue in Europe, affecting nearly 1 million women. In Portugal it is estimated that 5483 migrant women have undergone FGM in the Lisbon region. Intervention is required to tackle this issue.

Description:

Portugal launched the ''Healthy Practices: End of FGM'', a multiagency project targeting Lisbon and Tagus Valley region. Project implementation started in Nov 2018 at 5 local public health units (PHU) and was scaled-up to 5 more in Feb 2020. Project comprises 3 main axes: 1) inclusion in public policy instruments; 2) professionals' education and awareness; and 3) community intervention. We describe inclusion of FGM in public policy, professionals training and changes in FGM recording before and after intervention.

Results:

Between 2018-2022, inclusion of FGM in municipalities' migration policies doubled. Between 2019-2021, 110 training sessions (n = 1722 professionals) were promoted. During pandemic years, only 344 (2020) and 202 (2021) were trained. Raising awareness and empowerment to risk communities happened mainly through local/online open sessions, workshops, flyer distribution, video projections. These occurred in all 10 PHU, mostly through partnerships with Non-Governmental Organizations and municipalities. According to the Portuguese Health Records, until 2018 there were only 300 women registered with FGM. Between 2019-2021, 363 more were added.

Lessons:

The multisectoral approach allowed PHU professionals to collaborate directly with external organizations from different society sectors. COVID-19 pandemic posed a challenge to implementation, especially in the community intervention axis. Notification numbers increased after interventions, though causality could not be established and impact evaluation is yet to be performed.

Key messages:

- Multisectoral projects for FGM intervention have specific implementation challenges, including how to justify and evaluate them, that must be considered in each setting.
- Training health professionals might increase identification and notification of FGM, but the impact in preventing FGM in the Portuguese reality is still largely unknown.

[4]RIVM, Bilthoven, Netherlands
[5]Karolinska Institutet, Stockholm, Sweden
[6]Department of Social Epidemiology, Bremen University, Bremen, Germany
[7]Institute of Public Health of Republic of North Macedonia, Skopje, Republic of North Macedonia
Contact: benz@zeusgmbh.de

Background:

Exposome research looks into how combined exposures affect human health. The EU-funded Equal-Life project focuses on physical and social exposures in a child's environment and its effects on children's mental health and cognitive development in the life course. Perspectives and priorities on what to study in particular might differ between practitioners and researchers. Therefore, collaboration with external stakeholders from various fields is encouraged to integrate practical experience and link it to the researchers' aims.

Methods:

Two Delphi studies were conducted collecting and evaluating research questions to be studied in the project among a) the researchers within the project and b) among external stakeholders from various European countries. The exercise was to evaluate the research questions for group a) based on relevance and testability and for b) e.g. regarding practitioners' work and options for policies. Involved stakeholders work in health care, and urban planning, among others. Prioritised questions are collated.

Findings:

Within the researchers' group, top-rated questions were mainly mechanism-directed in terms of how and to what extent certain factors affect children's mental health and cognitive development, cumulative effects in different settings, among others. Stakeholders most value research questions on practical issues, e.g. effects of early experiences of discrimination, critical windows in children's lives that are most sensitive regarding the impact of exposures on mental health and cognitive development, or impact of exposures in early stages of life.

Discussion:

In comparing approaches of stakeholders and researchers, stakeholders' input from the practical field can shape the approach of the research process. The second benefit is to derive implications for creating effective interventions and policies to prevent adverse effects of environmental exposures and to foster positive health in children and later on in life.

Key messages:

- Bi-directional exchange between researchers and external stakeholders can make gaps visible.
- Engaging stakeholders into a research process can help sharpening the aim and outcome of a project.

Prospective prediction of alcohol consumption among a Tunisian sample of adolescents

Hela Ghali

N Zammit[1,2,3], *H Ghali*[2,4,5], *R Ghammam*[1,2,3], *S Ben Fredj*[1,2,3], *W Ben Belgacem*[1], *S Boujebha*[1], *M Ouertani*[1], *A Maatouk*[1], *J Maatoug*[1,2,3], *H Ghannem*[1,2,3]
[1]Department of Epidemiology, University Hospital Farhat Hached, Sousse, Tunisia
[2]Faculty of Medicine of Sousse, University of Sousse, Sousse, Tunisia
[3]LR19SP03, University Hospital Farhat Hached, Sousse, Tunisia
[4]Department of Prevention and Security of Care, University Hospital Sahloul, Sousse, Tunisia
[5]LR20SP06, University Hospital Sahloul, Sousse, Tunisia

Contact: hela.ghali@outlook.com

Background:

During adolescence, alcohol consumption represents a new experience with the advantage of facilitating the integration of a peer group. The global overall prevalence of this risk behavior among the 15-19 years old was over 25% in 2018. However, this prevalence varies between countries.

Objectives:

To determine the incidence and the predictors of alcohol consumption among high school students in Sousse, Tunisia between 2017/2018 and 2018/2019.

Methods:

A prospective longitudinal study was conducted in four high schools in the governorate of Sousse during the 2018-2019 school year. Pre-trained medical doctors used an anonymous self-administered questionnaire to collect data about socio-demographic and educational features, alcohol consumption, tobacco use, illicit substances use and emotional disorders.

Results:

Participants accounted for 404. Their average age was 16.4 (±1.1) years. Females represented 68%. The prevalence of alcohol consumption in 2017/2018 was 5.9% while the cumulative incidence during the 2018/2019 school year was 3.5%. Among males, this incidence was of 11.9%. Among females, it was of 3% ($p = 0.020$). Illicit substance use among friends was the main predictor of becoming alcohol consumer with an adjusted odds ratio of 6.4 (95% CI: 1.9-21.3) on the other hand, having an anxiety trouble predicted less this risk behavior (adjusted odds ratio =0.2 95% CI: 0.1-0.8).

Conclusions:

Alcohol consumption is becoming more and more common among the adolescents of Sousse especially among males. The current national strategy against substances use in schools should be reinforced. Implementation of a social skills training among adolescents to improve assertiveness is essential.

Key messages:

- Alcohol consumption has an upword trend among the adolescents of Sousse.
- The current prevention programs targetting adolescents in Tunisia should be revised and integrate a comprehensive and multisectoral program.

Erasmus+sport let's move Europa: learning units for health promotion among children and adolescents

Giulia Longo

A Masini[1], *G Zanutto*[1], *G Longo*[1], *S Marini*[2], *G Soldà*[1], *A Salussolia*[1], *A Anastasia*[1], *D Sánchez-Oliva*[3], *A Ceciliani*[2], *L Dallolio*[1]
[1]Department of Biomedical and Neuromotor Sciences, University of Bologna, Bologna, Italy
[2]Department for Life Quality Studies, University of Bologna, Rimini, Italy
[3]Faculty of Sport Sciences, University of Extremadura, Cáceres, Spain
Contact: giulia.longo9@studio.unibo.it

Background:

School years are crucial for acquiring life-lasting healthy habits. However, an increasing rate of children and adolescents fail to maintain a healthy lifestyle. European Union has financed the Erasmus+ Sport Let's Move Europa project to design an innovative digital tool for promoting healthy lifestyles among those age groups. University of Bologna, partner of the project, has developed 30 Learning Units (LUs) about Physical Activity, Sleep and Nutrition to be integrated in the school program by teachers.

Methods:

A group of 17 teachers (15 females and 2 males, mean SD age 49,5 ±11,6) from primary and secondary schools located in Bologna province (Italy) took part in semi-structured focus groups (FGs). The investigation focused on facilitators/barriers of the intervention and possible solutions, identifying time frames and locations, suggestions for engaging the different stakeholders (teachers, students and families). All FGs were recorded, transcribed, anonymized, and analyzed through inductive thematic analysis.

Results:

30 LUs were created based on the latest scientific evidence and the FGs output. Each LU addresses a specific topic and is tailored differently for primary and secondary school. The layout includes an investigation on the topic, classroom activities, and a section about "healthy homework" or "challenges" to be accomplished at home, engaging families in the construction of a healthy routine. All the activities were designed to be feasible and sustainable. Each LU includes a discussion phase to understand students' feedback about proposed homework and learning content.

Conclusions:

FGs have proven crucial to tailoring LUs on the needs of different stakeholders and co-designing an effective intervention. "Healthy homework" and "Challenges" encourage students to pursue healthy habits also outside the school setting, involving families. Feedback on the activity provides an insight into the progression and effectiveness of the intervention.

Key messages:

- The EUmove project integrates knowledge about sleeping, nutritional and physical activity habits into the school curriculum to promote healthy lifestyles among students and their families.
- Thanks to the FGs, LUs are designed to suit the target audience. LUs integration into school curricula is therefore a feasible intervention, not requiring specialized personnel to be implemented.

Self-reported strengths and difficulties among Swedish adolescents: presence, continuity and change

Karina Grigoryan

K Grigoryan[1], *V Östberg*[1], *J Raninen*[2,3], *J Åhlén*[4,5], *S B Låftman*[1]
[1]Department of Public Health Sciences, Stockholm University, Stockholm, Sweden
[2]Department of Clinical Neuroscience, Karolinska Institutet, Stockholm, Sweden
[3]Centre for Alcohol Policy Research, La Trobe University, Melbourne, Australia
[4]Centre for Epidemiology & Community Medicine, Stockholm County Council, Stockholm, Sweden
[5]Department of Global Public Health, Karolinska Institutet, Stockholm, Sweden
Contact: karinaa.grigoryan@gmail.com

Background:

The Strengths and Difficulties Questionnaire (SDQ) is a screening instrument for emotional and behavioural problems. Swedish reference values based on large-scale national data are lacking for mid- and late adolescents. Also, there is a scarcity of longitudinal studies about the development of strengths and difficulties from middle to late adolescence. The study aims were 1) to report on Swedish adolescents' assessment of their strengths and difficulties and to present joint and gender-specific reference values for identifying risk groups; 2) to examine the continuity and change of strengths and difficulties and to what extent this differs by gender.

Methods:

Data was based on a national Swedish sample of adolescents aged 15-16 years in 2017 ($n = 5338$) who were surveyed again in 2019 ($n = 3973$). Mean values and reference values for "close to average" (0th-80th percentile), "slightly raised" (>80th-90th percentile) and "high" (>90th percentile) SDQ scores were calculated. Comparison in SDQ scores by gender and across time was approached using inferential statistics.

Results:

Girls reported higher levels of emotional problems ($p = <0.001$), whereas boys showed higher levels of conduct problems ($p = <0.001$) at t1 and t2. Hyperactivity slightly prevailed in girls (p = 0.007), and peer problems were slightly higher in boys (p = 0.027) at t2. Prosocial behaviour was higher in girls than boys (p = <0.001) at t1 and t2. Changes in SDQ scores across time were in general small. Yet, analyses focusing on risk groups showed that among those who scored >80th or > 90th percentile at t1 about half scored above the same threshold at t2.

Conclusions:

This study provided joint and gender-specific reference values for mid- and late adolescents in Sweden, and found some gender differences in SDQ scores and degree of change. Reported national gender-specific reference values may facilitate identifying adolescents at risk and potentially increasing timely mental health intervention measures.

Key messages:

- Among the subscales indicating difficulties, the highest was level of emotional problems in girls and hyperactivity in boys; the largest increase over time was in emotional problems for both genders.
- Analyses of changes in SDQ mean scores showed only minor changes between t1 and t2, while analyses of movement between categories defined by cutoffs presented a more noticeable degree of change.

Abstract citation ID: ckac131.465
Consequences of Housing Conditions on Maternal Health of Forced Migrant Women

Theda Borde

M Engelhardt[1], *M Gaudion*[1], *J Kamhiye*[1], *R Al-Munjid*[1], *T Borde*[1]
[1]Pregnancy and Obstetric Care of Refugees, Alice Salomon Hochschule Berlin, Berlin, Germany
Contact: borde@ash-berlin.eu

Background:

Housing is a major social determinant and contextual factor of health. Forced migrants are restricted in their freedom of choosing and shaping their housing conditions. This qualitative study highlights the impact of housing restrictions on reproductive and maternal health from the lived experience of forced migrant women who recently gave birth to a child.

Methods:

Qualitative problem-centered interviews were conducted with 33 refugee mothers (Mage = 31 years) 1-9 month postpartum. Interviewees came from 19 countries of origins, spoke 22 languages, and had lived in Germany for an average of three years. The mothers' perspectives were complemented by 75 qualitative interviews with maternal health care professionals, (HCPs: midwives, gynecologists, social workers). Interview transcripts were analyzed via framework method regarding (1) type of housing: shared accommodation vs. private apartment, (2) region: rural vs. urban, (3) exhausting and supporting conditions as well as (4) consequences on maternal health.

Results:

Interviewees living in shared accommodations reported exhausting conditions hindering self-determined upbringing of their newborn, e.g., confined living spaces, racism of staff, shared kitchen and bathrooms, lack of privacy, mobility, access to medical care, hygiene. Reported consequences on maternal health ranged from physical stress to social stress and mental stress (e.g., sleeping problems, depression, fear, worrying about health of the newborn). Interviewees living in private apartments showed higher autonomy and contentment. HCPs reported missing time and staff to provide adequate support.

Conclusions:

Both refugee women and HCPs reported housing as main stressor during pregnancy and childbed, resulting in higher physical, social, and mental stress. Strategic social support for finding suitable private apartments for new families is needed as well as comprehensive visiting midwifery care in accommodations.

Key messages:

- Living conditions in shared accommodations are unacceptable from a public health and human rights perspective, especially for women during pregnancy and childbed.
- Negative effects on maternal health and self-determination of families were shown.

Abstract citation ID: ckac131.466
Prospective prediction of substances use among a cohort of Tunisian adolescents

Amel Amara

N Zammit[1,2,3], *A Amara*[4,5], *R Ghammam*[1,2,3], *S Ben Fredj*[1,2,3], *A Maatouk*[1], *M Ouertani*[1], *W Ben Belgacem*[1], *S Boujebha*[1], *J Maatoug*[1,2,3], *H Ghannem*[1,2,3]
[1]Epidemiology, University Hospital Farhat Hached, Sousse, Tunisia
[2]Faculty of Medicine of Sousse, University of Sousse, Sousse, Tunisia
[3]LR19SP03, University Hospital Farhat Hached, Sousse, Tunisia
[4]Department of Family and Community Medicine, Faculty of Medicine of Sousse, University of Sousse, Sousse, Tunisia
[5]LR12ES03, Faculty of Medicine of Sousse, University of Sousse, Sousse, Tunisia
Contact: amel.amara1@yahoo.fr

Background:

The risk of substances use increases during adolescence. In Sousse (Tunisia), an upward trend of these risk behaviors has been observed during the last years among young adolescents. Among older adolescents, the trend of their use is unknown.

Objectives:

To determine the incidences and the most influencing factors on substances use among high school students in Sousse between 2018 and 2019.

Methods:

A prospective longitudinal study was conducted among a cohort of high school students from Sousse. The same pretested questionnaire served to collect data in 2018 and 2019 from the same participants in their classes and in the presence of pre-trained investigators.

Results:

A total of 404 high school students have participated in the study. Their median age was of 17 (IIQ: 15.8-17.6) years. Girls represented 66.8% of participants. The incidence rates of lifetime tobacco use, alcohol consumption, lifetime inhalants use and lifetime illicit substances use between 2018 and 2019 were 13%, 3.5%, 1.8% and 2 .9% respectively. Lifetime tobacco use was the main predictor of inhalants experimentation. This latter was the main predictor of becoming a user of e-cigarettes while alcohol consumption was the most influencing factor on cannabis experimentation among high school students. On the other hand, illicit substances use among friends predicted e-cigarette use, alcohol consumption, and cannabis experimentation among participants.

Conclusions:

The existing prevention programs aiming at reducing tobacco use and substances use in the schools of Tunisia should be reinforced and integrate a comprehensive and multi-sectoral prevention program. The implementation of a national observatory of substances use would ensure the continuous improvement of this program.

Key messages:

- There is an upward trend on using substances among the adolescents of Sousse, Tunisia.
- Tobacco experimentation and alcohol consumption are the gateway to later substances experimentation among the adolescents of Sousse, Tunisia.

Abstract citation ID: ckac131.467
It matters what we do: Relationships between forms of media use and life satisfaction of adolescents

Tamara Schloemer

T Schloemer[1,2,3], I Rocco[4], P Kolip[1]
[1]Department of Prevention and Health Promotion, Bielefeld University, Bielefeld, Germany
[2]Department of Applied Health Sciences, Hochschule für Gesundheit, Bochum, Germany
[3]Care and Public Health Research Institute, Maastricht University, Maastricht, Netherlands
[4]School of Statistical Sciences, Sapienza University of Rome, Rome, Italy
Contact: tamara.schloemer@maastrichtuniversity.nl

Background:

Electronic media communication is firmly anchored in the leisure time of adolescents. Adolescents use electronic devices (ED) as a means of interpersonal communication with friends, such as text messaging, for entertainment in the form of receptive communication, such as watching movies, in the form of interactive communication, such as playing computer games, and for other purposes, such as homework. We aimed to identify how these communication forms are related to and interact on life satisfaction (LS) of girls and boys.

Methods:

We conducted multivariable linear regression analysis with the dataset of 5,961 adolescents aged 11, 13 and 15 years, obtained from the German Health Behaviour in School-aged Children (HBSC) survey of 2013/2014. Separate statistical analyses were performed for girls and boys, including statistical interactions. We controlled for age, family affluence and family structure.

Results:

Interpersonal communication with friends has a positive relationship with LS in boys ($\beta = 0.12$, $t = 3.19$, $p = 0.001$), but no effect in girls. Whereas other communication forms have a negative main effect on life satisfaction in girls (entertainment $\beta = -0.1$, $t = -3.79$, $p < 0.001$; gaming $\beta = -0.09$, $t = -4.12$, $p < 0.001$; using the ED for other purposes $\beta = -0.04$, $t = -2.26$, $p = 0.024$), we found no association of entertainment with LS for boys. The negative effect of gaming in boys is conditional on the level of using the ED for other purposes: the results show a reinforcing statistical interaction ($\beta = 0.02$, $t = 3.24$, $p = 0.001$).

Conclusions:

The results demonstrate the relevance of considering the differences in associations between single forms of communication and LS for boys and girls separately. This confirms our theoretical focus on a communication-centred approach. Moreover, it is of high relevance to identify potentially enabling and harmful media communication and to understand adolescents' perspectives on these forms of communication.

Key messages:

- When examining associations between media use and life satisfaction among adolescents, form of communication and gender should be taken into account.
- Investigating interactions of different forms of communication can help to better understand their influence on adolescents' life satisfaction.

Abstract citation ID: ckac131.468
Insufficient support and help for adolescents with disabilities during the COVID-19 pandemic

Marja Eliisa Holm

ME Holm[1], P Sainio[1], S Sjöblom[1], P Nurmi-Koikkalainen[1]
[1]Department of Public Health and Welfare, Finnish Institute for Health and Welfare, Helsinki, Finland
Contact: marja.holm@thl.fi

Background:

The COVID-19 pandemic may have increased the need for help and support for adolescents with disabilities. At the same time, moving to distance learning can reduce access to support services. Despite this, little is known about this issue. Thus, we investigated differences in the unmet need for help and support between adolescents with and without disabilities during the COVID-19 pandemic.

Methods:

We analyzed large population-based data from the Finnish School Health Promotion study obtained during 2019 and 2021 (2019: n = 87,215; 2021: n = 91,560). The target group comprised adolescents from lower secondary schools in Finland (age: M = 15.3, SD = .64). Logistic regression models were applied to investigate differences in the unmet need for help and support between adolescents with and without disabilities.

Results:

During the pandemic, adolescents with disabilities reported insufficient help and support related to their learning and well-being from teachers, school curators and psychologists, and school nurses and doctors more often than other adolescents ($p < .001$). Adolescents with disabilities reported more often than others that distance learning involved insufficient learning support ($p < .001$). Between 2019 and 2021, an increasing proportion of adolescents with disabilities felt that they had received insufficient help and support related to their well-being from nurses, doctors, psychologists, school curators, and teachers. To summarize, the COVID-19 pandemic reduced access to support and assistance for adolescents, particularly those with disabilities.

Conclusions:

Policies in schools should be developed and resources secured so that support and help for adolescents with disabilities can be secured in exceptional circumstances. Insufficient support and assistance for adolescents with disabilities can impair their learning outcomes and health.

Key messages:

- During the COVID-19 pandemic, adolescents with disabilities reported insufficient help and support related to their learning and well-being more often than other adolescents.
- In times of crisis, support and help for adolescents with disabilities must be guaranteed.

Abstract citation ID: ckac131.469
Parents' experiences of an antenatal visit being part of a home visiting program in deprived areas

Gunilla Lönnberg

G Lönnberg[1], K Edvardsson[1], J Leissner[1], R Salari[1], G Warner[1], A Sarkadi[1]
[1]Department of Public Health and Caring Sciences, Uppsala Universitet, Uppsala, Sweden
Contact: gunilla.lonnberg@pubcare.uu.se

Background:

There are considerable health divides between residential areas in many Swedish cities. In more disadvantaged areas children grow up with poorer health outcomes than the country average. To meet the greater needs of children growing up in these areas through proportionate universalism, an extended home visiting program has been delivered. A novel part of this program has been the social worker and nurse later conducting home visits meeting the parents at the maternity care clinic before childbirth. The aim of this study was to explore parents' experiences of that antenatal visit.

Methods:

Semi-structured interviews were carried out with nine mothers and three fathers around 3 months postpartum. Nine of the participants were foreign-born and a translator was used for four of the interviews. The interviews were recorded and transcribed verbatim and the data was analyzed with thematic analysis with an inductive approach.

Results:

The parents' overall experiences are comprised in the main theme: 'A feeling of security and care for the whole family'.

This main theme is derived from the three following themes: 1) 'Staff - a trustworthy source of information'. Parents perceived the staff as experienced and knowledgeable and appreciated obtaining information about practical things and about the Swedish system; 2) 'Access to emotional support'. Several parents expressed the need for emotional support and valued that by meeting the staff they knew they had someone to turn to; 3) 'Becoming familiar with the staff'. It was appreciated to know who will come to your home as this gave parents an increased sense of security.

Conclusions:

Initiating the program through introducing home visiting staff at a scheduled antenatal visit benefited parents, by giving them useful information and social support. The visit also seems to be indirectly beneficial as it contributes to building trust for the staff and the rest of the program.

Key messages:

- Initiating an extended home visiting program at a scheduled antenatal visit benefited parents, by giving them useful information and social support.
- Initiating an extended home visiting program at a scheduled antenatal visit contributed to building parents' sense of trust for the staff and the rest of the program.

Low birth weight in Angola and its socioeconomic determinants

Joana Sofia da Silva Maia

J da Silva Maia[1], *JP Teixeira*[2], *G Queiroz*[3,4], *J Félix China*[5]
[1]Public Health Unit, Primary Healthcare Cluster Estuário do Tejo, Lisbon, Portugal
[2]Public Health Unit, Primary Healthcare Cluster Sintra, Lisbon, Portugal
[3]Public Health Unit, Primary Healthcare Cluster Baixo Vouga, Aveiro, Portugal
[4]Antropology and Health Research Center, University of Coimbra, Coimbra, Portugal
[5]Public Health Unit, Primary Healthcare Cluster Arrábida, Setúbal, Portugal
Contact: joanamaia93@gmail.com

Background:

In low-income nations, low birth weight (LBW) is still a major public health concern, which accounts for 96.5 % of global LBW cases. Any newborn weighing less than 2500g is considered LBW, which is associated with a 20-fold increase in the chance of dying during infancy. Despite the severity of the problem, in Sub-Saharan Africa the high rates of LBW have not diminished in the recent decade. The goal of this study is to evaluate the prevalence of LBW and its risk factors in Angola, as there is a pressing need to address LBW and its substantial health and social implications.

Methods:

We used secondary data from the Angola Children's Record Database of Demographic and Health Survey from 2015 to 2016. A binomial logistic regression model was used to investigate the prevalence of LBW and its related risk variables.

Results:

From the 3738 children selected, 9.2% were born with LBW. The complete lack of formal maternal education ($p = 0.011$; adjOR = 4.56, 95%CI 1.41-14.74), the absence of maternal iron supplementation during pregnancy ($p = 0.017$; adjOR = 1.42, 95%CI 1.07-1.89) and women living in rural areas ($p = 0.016$; adjOR = 1.37, 95%CI 1.06-1.78) were associated with LBW.

Conclusions:

Education appears to have a significant impact on LBW, emphasizing the importance of addressing literacy in Public Health policies. Lack of iron supplementation and rural residence can also be used as indicators of poor health-care access. Understanding the factors informs decision-makers and should pave the way for more targeted intervention and more efficient LBW policy.

Key messages:

- Intervention in socioeconomic factors and health access during pregnancy might have a high impact on the LBW problem.
- Addressing literacy as a major health determinant can guide a more efficient policy making and help stakeholders target their interventions.

Abstract citation ID: ckac131.471
Suicide as a public health concern: Confronting the means, motives, and opportunity

James Overholser

J Overholser[1], *C McGovern*[1], *C Silva*[1], *S Gomez*[1]
[1]Psychology, Case Western Reserve University, Cleveland, USA
Contact: overholser@case.edu

Issue:

Suicide continues to present a major public health concern in many societies. Suicide prevention efforts have failed to reduce the rate of suicide in most countries. A change of intervention strategy can help to prevent these deaths from despair.

Description of the problem:

Suicide prevention strategies are examined through an integrative review combined with more than 30 years of experience conducting research on suicide attempters and psychological autopsy research on adults who had died by suicide. Journal articles published since 2005 were reviewed for strategies designed to prevent death by suicide.

Results:

Suicide risk is examined by confronting the means, motives and opportunities for suicidal behavior. Prevention strategies that limit access to lethal means can have a beneficial impact if the method is easily accessible and not easily replaced. Unfortunately, some individuals merely shift to a different method for their suicidal act. Prevention strategies that restrict the opportunity for self-injury provide time to confront underlying disorders and initiate treatment. Unfortunately, many patients do not continue treatment beyond the acute crisis, and there is often a resurgence of suicidal behavior after discharge from the hospital. Prevention strategies that aim to confront the person's motivation to die may reduce the underlying cause. It is important to provide interventions to help reduce the desperation and isolation that underlie suicidal urges. These intervention strategies hold potential for making lasting changes that could eliminate, instead of temporarily suppressing, the desire to die.

Lessons:

Restricting access to lethal methods and limiting times when a suicidal person is left alone can temporarily block suicidal urges. However, the motive underlying the suicidal urges remains intact. The motivation to die can be addressed through interventions that focuses on helping clients to build a life worth living.

Key messages:

- Suicide prevention strategies can confront the desire for death by helping to build a life that is worth living.
- Comprehensive interventions aimed at reducing depression, isolation and addiction hold potential for reducing the rate of suicide.

Abstract citation ID: ckac131.472
Assessment of Psychological Impact of Covid Pandemic on Frontline workers at Points of Entry,Pakistan

Nadia Noreen

N Noreen[1], S Habib Ullah[1], S Ali Khan[2], A Ullah Faiz[3]
[1]Directorate of Central Health Establishment, Ministry of National Health Regulations, Islamabad, Pakistan
[2]Health Services Academy, MOH, Islamabad, Pakistan
[3]Admin, MOH, Islamabad, Pakistan
Contact: nadia.jamil3@gmail.com

Background:

The unprecedented public health crisis of the COVID-19 pandemic has caused heightened levels of stress and fear among health care workers.With the advent of COVID-19 in Pakistan,frontline workers of POEs have been under physical and psychological pressure including a high risk of infection, abnormal levels of workload, prolonged working hours, lack of personal protective equipment for safety from contagion, isolation, exhaustion, and lack of contact with family.The study aims to assess the impact of Covid-19 on the mental health of frontline healthcare workers.

Methods:

A descriptive study was conducted among HCWs across points of entry from 1st October 2020 to 31st December 2020.Data was collected using a structured questionnaire.Depression, anxiety, and stress scale (DASS-21)was used for the assessment of depression, stress, anxiety. Descriptive analysis of socio-demographic and professional factors was done. Multivariable logistic regression analysis (MLRA) was performed using SPSS version 23.0.

Results:

A total of 628 participants (586 males and 42 females) completed questionnaire.The mean age of the participants was 42.6 ± 45.9 years. The majority of the respondents were married (94.3%). The frequency of depression, anxiety, and stress in the HCWs was 12.1%, 42.3%, and 22.1 %, respectively. Multivariable logistic regression analysis found that the depression in HCWs was significantly associated with the profession and age ($P < 0.001$). The anxiety in HCWs was associated with their age and gender ($P < 0.005$). The stress in HCWs was significantly associated with their age ($P < 0.05$).

Conclusions:

The HCWs at the Points of entry across Pakistan showed mild to moderate symptoms of DAS. The COVID-19 pandemic has caused a heavy psychological impact among the frontline healthcare professionals. Timely psychological counseling and early psychological intervention need to be implemented for HCWs to alleviate their anxiety and stress and improve their general mental health.

Key messages:

- The COVID-19 pandemic has caused a heavy psychological impact.
- Timely psychological counseling and early psychological intervention.

Trajectories of sickness absence among young people with prior depression/anxiety symptoms

Iman Alaie

I Alaie[1], P Svedberg[1], A Ropponen[1,2], J Narusyte[1,3]
[1]Department of Clinical Neuroscience, Karolinska Institutet, Stockholm, Sweden
[2]Finnish Institute of Occupational Health, Helsinki, Finland
[3]Center for Epidemiology & Community Medicine, Stockholm County Council, Stockholm, Sweden
Contact: iman.alaie@ki.se

Background:

Depression and anxiety are associated with elevated risks of sickness absence (SA), but less is known about the development of SA over time in young people experiencing these mental health conditions. This study aimed to identify latent trajectories of SA in young people with a history of depression and/or anxiety symptoms, while accounting for sociodemographic factors.

Methods:

This was an observational cohort study of 1,445 twin individuals who had elevated depression/anxiety symptoms in late adolescence or young adulthood (age range: 19-30), as assessed in Swedish surveys completed in 2005. Through linkage to the national registries, the individuals were prospectively followed from 2006 to 2018. The outcome included consecutive annual net days of SA, which were analyzed using group-based trajectory modeling with zero-inflated Poisson regression. Multinomial logistic regression estimating odds ratios (OR) with 95% confidence intervals (CI) was used to examine the influence of age, sex, and educational level on the resulting trajectory groups.

Results:

Four distinct trajectories of SA were identified: 'high-increasing' (6%), 'low-increasing' (12%), 'high-decreasing' (13%), and 'constant-low' (69%). The constant-low was used as the reference in all analyses. Increasing age was found to be associated with higher odds of belonging to the low-increasing trajectory (OR = 1.07, 95% CI = 1.02-1.12). Women had higher odds of belonging to the low-increasing trajectory (OR = 1.67, 95% CI = 1.10-2.53), compared to men. Higher education was associated with lower odds of belonging to the high-increasing (OR = 0.34, 95% CI = 0.22-0.54) and high-decreasing (OR = 0.59, 95% CI = 0.43-0.81) trajectories, compared to lower education.

Conclusions:

Distinct group-based trajectories of SA were identified in young people with early depression/anxiety symptoms. Targeted and timely public health strategies aiming to improve adolescent and young adult mental health may help reduce SA in the long run.

Key messages:

- We identified four trajectories of sickness absence in young people with common mental health problems.
- Public health efforts to improve mental health may reduce sickness absence in vulnerable groups.

Positive mental health and COVID-19 pandemic in Slovenia

Matej Vinko

M Vinko[1], P Mikolič[1], S Roškar[1], H Jeriček Klanšček[1]
[1]Centre for Health Research and Development, National Institute of Public Health, Ljubljana, Slovenia
Contact: matej.vinko@nijz.si

Background:

The COVID-19 pandemic is having a major impact on mental health. In contrast to studies on mental disorders, our study contributes to the under-researched area of the impact of the pandemic on positive mental health. We compare the prevalence of positive mental health before and during the pandemic and identify factors associated with flourishing and languishing mental health during the pandemic.

Methods:

We used data from two nationally representative cross-sectional surveys of Slovenian adults conducted in 2019 and 2021. Outcome included positive mental health (Mental Health Continuum - Short Form). Cross-sectional prevalence estimates were calculated and logistic regression assessed associations between positive mental health and the COVID-19 specific and other health-related factors.

Results:

In 2021, 38.6% (95% CI, 37.0%-40.2%) had flourishing mental health, compared to 61,5% (95% CI, 60.5%-62.5%) before the pandemic. In contrast, the share of people in languishing mental health during the pandemic (8.0%; 95% CI, 7.1%-8.9%) was nearly two times higher than in 2019 (4,5%; 95% CI, 4.1%-4.9%). Both flourishing and languishing were significantly associated with changes in family relations, social interactions and dietary habits, resilience and COVID-19 literacy.

Conclusions:

Positive mental health in Slovenia worsened drastically during the pandemic compared with before. Results indicate important role of family relationships, social interactions and dietary habits on positive mental health. Both prevention of mental disorders and mental health promotion need to be considered in order to address the full range of public mental health needs, with increased attention to strengthening resilience and health literacy.

Key messages:

- We noted an substantial decline in flourishing and rise in languishing mental health during the pandemic.
- Public health efforts need to address the impact of the pandemic on family relations and social interactions.

Abstract citation ID: ckac131.475
Correlates of mental health in the Swiss Household Panel – a network analysis

Dawid Gondek

D Gondek[1], E McElroy[2], L Bernardi[1]
[1]University of Lausanne, Lausanne, Switzerland
[2]Ulster University, Ulster, UK
Contact: dawid.gondek@unil.ch

Background:

Firstly, we aim to describe any differences in the mean levels of correlates and indicators of mental health and wellbeing between young (25-39 years) and middle-aged adults (40-55 years). Secondly, we aim to compare the network models depicting interrelations between correlates and indicators of mental health and wellbeing among these age groups.

Methods:

This paper draws on longitudinal data from 6 waves (2013-2018) of the Swiss Household Panel (SHP) study, with a total sample of 5,315 individuals, including 2,044 young (25-39 years) and 3,271 middle-aged (40-55 years) participants. We used network analysis to examine and present complex relationships between the correlates and the indicators of mental health and wellbeing.

Results:

Middle-aged individuals had worse mental health and wellbeing on all indicators but energy and optimism, which did not differ across groups. The effect sizes (according to Cohen's d) were small, reaching the maximum of 0.20 for sadness. Despite higher household income and financial satisfaction, perceived job insecurity and work strain were higher in midlife, with socioeconomic prestige being lower. Moreover, middle-aged individuals had lower social support, relationships satisfaction, and health satisfaction. The network was denser in midlife, with two direct interrelations being stronger in this age group: health satisfaction and energy/optimism as well as accommodation satisfaction and life satisfaction. There were also several other differences in indirect interrelations between correlates and indicators of mental health and wellbeing, including a potentially more important role of self-mastery in midlife in bridging socioeconomic indicators, wellbeing and mental health.

Conclusions:

We suggest further exploring the workplace as an avenue to improving population mental health and wellbeing, with a particular focus on the role of self-mastery.

Key messages:

- Middle-aged individuals appear to have worse mental health and lower wellbeing than young adults.
- Health satisfaction is not only lower in midlife, but it seems of greater importance for mental health and wellbeing.

Abstract citation ID: ckac131.476
Impact of COVID-19 on University Students' Quality of life and mental health in Greece

Apostolos Vantarakis

A Vantarakis[1], F Fotini Tsami[1], A Kanellopoulou[1], L Alexopoulou-Prounia[1], A Tsapara[1], P Alexopoulos[2], K Katsadoros[3]

[3]Klimaka, Athens, Greece
Contact: avanta@upatras.gr

COVID-19 has a serious impact on people's physical health and mental health. The COVID-19 pandemic has highlighted an increasing deterioration of university students' quality of life and mental health due to several factors. The COVID-19 pandemic forced university students to take online classes, which may have bad impacts on students' learning. In addition, the students lost many job opportunities during the pandemic. Faced with employment and study pressure and worried about the epidemic, university students were prone to increased overall negative emotion, anxiety and depression. Our study aims to conduct a timely assessment of the impact of the COVID-19 pandemic on the quality of life and mental health of University students. We conducted a cross sectional study using an online interview survey in students at public universities in Greece to better understand the effects of the pandemic on their quality of life and mental health. Three questionnaires were used (WHOQOL-BREF, IES-R and HADS). The data were analyzed with IBM SPSS 26. 1.266 university students from public Greek Universities participated in the study, 73.1% of which were female, 26,3% were male. We observed that 55,8% had a score lower in psychological domain and 52,3% in social domain of WHOQOL-BREF. Also 46.6% of the respondents had a score of 37+ on the IES-R questionnaire, 45% of the respondents had abnormal results regarding anxiety and 33.6% had abnormal results regarding depression. Due to the long-lasting pandemic and onerous measures such as lockdown and stay-at-home orders, the COVID-19 pandemic brings negative impacts on University education and quality of life of students. The findings of our study highlight the urgent need to develop interventions and preventive strategies to address the quality of life and mental health of University students.

Key messages:

- There is a need for preventative measures for university students to ensure that their mental health and quality of life do not suffer.
- Female students reached higher levels of anxiety in the COVID-19 pandemic period.

Abstract citation ID: ckac131.477
Low resilience as risk factor of mental disorders during COVID-19 pandemic: A cohort study

Pere Castellvi

P Castellvi[1], M Llistosella[2,3], A Miranda-Mendizabal[1], S Recoder[4], E Calbo[2], M Casajuana-Closas[5], D Leiva[6], R Manolov[6], N Matilla-Santander[7], C Garcia-Forero[1]

[6]Psychology, Universitat de Barcelona, Barcelona, Spain
[7]Occupational Medicine, Karolinska Institutet, Stockholm, Sweden
Contact: pcastellvi@uic.es

Background:

To analyze whether people with low resilience are at higher risk of mental health problems during the COVID-19 pandemic in Spanish adults.

Methods:

A longitudinal cohort study was carried out. Resilience was measured pre/post-pandemic with the CD-RISC. Mental health problems assessed were: Major Depressive Episode (MDE), Generalized Anxiety Disorder (GAD), Suicidal Thoughts and Behaviors (STB), and Posttraumatic Stress Disorder (PTSD) symptoms.

Results:

We found statistically significant differences between groups and resilience scores in MDE [F (3;48.40) = 19.55], GAD [F(3;19.63) = 6.45] and STB [F(3;111.74) = 31.94]. Multivariable analyses showed individuals with very low resilience were at a 5-fold risk of Incidence of MDE and a 4-fold risk of STB. Persistent group presented a 21-fold risk of MDE and 54-fold risk of STB, respectively. No evidence of higher risk was found for GAD. Individuals with low resilience and exposed to COVID-19 did not have a significantly higher risk. Individuals with low resilience were at higher risk of PTSD in general population [β(95%CI) = -3.25(-3.969 to -2.54)], but not for individuals with COVID-19.

Conclusions:

In the general population, having low or very low resilience increases the risk of suffering MDE, STB, and PTSD, but not GAD during the COVID-19 pandemic, but not in the population with COVID-19.

Key messages:

- Resilience was a buffer of mental health problems in general population, but not in those exposed to COVID-19.
- Those with low resilience were at 21-fold risk of mental health problems before and during the first year of pandemic.

Abstract citation ID: ckac131.478
Anxiety among students during the pandemic - Results from the C-19 German Student Well-being Study

Eileen Heumann

[5]Institute of Medical Sociology, Heinrich Heine University Duesseldorf, Duesseldorf, Germany
[6]Department of Social Sciences, University of Siegen, Siegen, Germany
Contact: eileen.heumann@charite.de

Background:

Anxiety is widespread among university students. The COVID-19 pandemic af-fected students' mental health negatively. Given the long duration of the pandemic monitoring mental health remains important. This study aims to determine to which extent anxiety is preva-lent among students (1), what factors are associated with it (2) and which student groups are mostly affected (3).

Methods:

The cross-sectional COVID-19 German Student Well-being Study (C19 GSWS) sur-veyed mental health and well-being of students at five universities in Germany from 27.10.-14.11.21. Anxiety was assessed using the GAD-2. Associations between anxiety and sociodem-ographic, socioeconomic/social support factors as well as health- and COVID-19-related factors were determined using multiple binary logistic regression models.

Results:

The mean age of students was 24.1 years (SD = 4.9), 67% were women and 31% men. The prevalence of anxiety was 32% and diverse gender (OR = 3.98, 95% CI: 1.71-9.23), a com-plicated relationship status (OR = 1.66, 95% CI: 1.06-2.60), the lack of a confidant (OR = 2.50, 95% CI: 1.80-3.46), and financial difficulties (e.g., being able to cover monthly expenses; OR = 1.76, 95% CI: 1.36-2.29) were associated with anxiety. Participants who were worried about (re)infection with COVID-19 had a 1.28-times higher chance (OR, 95% CI: 1.03-1.59) for anxie-ty. Students who were (rather) not worried that a relative would become severely ill with COVID-19 had a lower chance to experience anxiety (OR = 0.72, 95% CI: 0.53-0.98) as well as those who were confident receiving medical care in case of an infection with COVID-19 (OR = 0.80, 95% CI: 0.65-0.98).

Conclusions:

Concepts for prevention and counselling in terms of mental health problems in students should be developed considering specific stressors due to the pandemic.

Key messages:

- This study shows that anxiety is widespread among university students and associated with a variety of stressors.
- The findings can help to develop specific concepts for prevention and counselling.

Abstract citation ID: ckac131.479
Sleep quality in the Croatian adult population during the COVID-19 pandemic

Ivan Miskulin

I Miskulin[1], I Fotez[1,2], M Miskulin[1], J Milas[1], H Palenkic[2], M Kristic[3]
[1]Department of Public Health, Faculty of Medicine Osijek, University of Osijek, Osijek, Croatia
[2]Department of Clinical Medicine, Faculty of Dental Medicine and Health Osijek, Osijek, Croatia
[3]Department of Psychiatry, University Hospital Split, Split, Croatia
Contact: ivan.miskulin@mefos.hr

Background:

The COVID-19 pandemic as a worldwide public health issue is a traumatic event that has affected both the sleep and mental health of the general population. This study aimed to evaluate the quality of sleep in the Croatian adult population during the COVID-19 pandemic.

Methods:

This cross-sectional questionnaire study was conducted from February to June 2021 period. A validated, anonymous questionnaire that contained questions regarding demographic data, as well as Pittsburgh Sleep Quality Index (PSQI) and Coronavirus Anxiety Scale (CAS) was self-administered to a convenient sample of Croatian adults from central and northwestern Croatia.

Results:

The study sample included 939 subjects with, median age of 42 years (interquartile range 35-48), 35.4% males, and 64.6% females. At the PSQI 22.6% of subjects presented sleep disturbances while at the CAS 0.4% of subjects presented dysfunctional anxiety associated with the COVID-19 pandemic. Sleep disturbances were more frequent among females ($p < 0.001$), inhabitants of the Croatian capital Zagreb ($p = 0.001$), subjects who were not infected with COVID-19 virus ($p = 0.042$), subjects who had fear of coronavirus infection in the workplace ($p < 0.001$), subjects who had fear of coronavirus infection during daily life activities ($p < 0.001$), subjects who had fear of coronavirus infection during daily physical activities ($p < 0.001$), subjects who worked with limited social contact ($p = 0.005$), and subjects with dysfunctional anxiety associated with the COVID-19 pandemic ($p = 0.003$).

Conclusions:

Poor sleep quality is common during the COVID-19 pandemic in Croatia. Identifying factors associated with poor sleep would help develop specific intervention programs that enhance mental health and sleep quality during pandemics.

Key messages:

- The COVID-19 pandemic has a significant negative influence on the mental health of the Croatian general population.

- Appropriate supportive programs and interventional approaches directed toward the general population are needed to address mental health problems in Croatia during the COVID-19 pandemic.

Abstract citation ID: ckac131.480
Building capacity for mental health resilience – local impact of the UK Better Mental Health Fund

Mabel Lie

M Lie[1], S Visram[1]
[1]Population Health Sciences Institute, Newcastle University, Newcastle upon Tyne, UK
Contact: mabel.lie@ncl.ac.uk

Background:
COVID-19 as a public mental health emergency has exacerbated existing mental health inequalities. The UK government invited local authorities with areas of high deprivation to apply for a year of funding, in order to address the mental health impacts of COVID-19 and incentivize investment in prevention and promotion interventions for better mental health. South Tyneside Council in North East England made a successful bid to the Better Mental Health Fund (BMHF), and distributed grants to 7 organisations delivering 13 programs. A qualitative evaluation of these programs aimed to answer the following questions:

1. How were the funded programs implemented?
2. What difference did they make to local beneficiaries?
3. How might these programs and their impacts be sustained into the future?
4. Has the BMHF led to any wider impacts on organisations and local communities?

Methods:
In-depth interviews with individuals, pairs and groups were conducted online or in person with service providers and beneficiaries. Non-verbatim transcripts were made from recordings, checked with verbatim transcripts from Teams and Zoom, and analyzed thematically to generate a coding frame. Throughout the analysis, comparisons were made between organizations and programs.

Results:
Fifteen interviews involving 22 participants lasting up to an hour each were conducted. The main themes identified as impactful were 1) community approaches based on supportive and good relationships between the local authority public health lead and participating organizations (mainly voluntary agencies), enabling 2) capacity-building for mental health resilience and 3) community empowerment. This was despite the short turnaround of the grant application process, limited time to deliver on targets, and anxieties about future sustainability.

Conclusions:
Short-term funding can build capacity in mental health resilience in deprived areas if administered by public health leaders who relate well with provider organizations.

Key messages:

- Public health leaders who relate well with provider organizations are key drivers of community health promotion strategies that include mental health capacity building.
- Qualitative methods used in evaluations can inform public health commissioning by capturing the benefits and challenges of short-term funding for interventions promoting community mental health.

Abstract citation ID: ckac131.481
Gambling disorder symptoms among Slovenian gamblers

Špela Selak

Š Selak[1], M Žmavc[1], I Makivić[1]
[1]National Institute of Public Health, Ljubljana, Slovenia
Contact: spela.selak@nijz.si

Background:
We are facing a growing popularity of gambling, partly due to the rapid rise of internet related technologies. This growth has been linked to a considerable increase in problem gambling and gambling disorder, which has been an established non-substance addiction. The aim of our study was to assess the prevalence rate of gambling disorder among the Slovenian population.

Methods:
National Survey on the Use of Tobacco, Alcohol and Other Drugs was conducted in 2018 on a nationally representative sample (n = 16,000; age: 15-64 years), using mixed-mode data collection (CAWI and CAPI). Responses were obtained from 9,161 respondents, of those 18.4% (n = 1,686) reported to have gambled in the last 12 months (i.e. gamblers). Gambling disorder symptoms were assessed using Berlin Inventory of Gambling Behavior - Screening, consisting of 14 items with a yes/no response option, which measure 9 gambling disorder criteria (DSM-V). Participants who reported at least 5 out of 9 gambling disorder criteria were classified as disordered.

Results:
Data shows that 4.3% of Slovenian gamblers met the criteria for gambling disorder. Significantly higher shares were observed among men (5.9%; compared to 1.2% of women) and among younger generations (highest shares among 15-19 year olds (19.4%) and 20-24 year olds (14.5%)). The same goes for money spent for gambling. Namely, males (4.4% of men; compared to 0.6% of women) and younger generations (highest shares among 20-24 year olds (9.2%) and 30-34 year-olds (6.9%)) were more likely to spend more than 100 EUR in a day for gambling.

Conclusions:
Data obtained in the present study indicates the extent of gambling disorder symptomatology and highlights key demographic groups with risk for gambling disorder. These findings are consistent with previous comparable studies and provide a basis for tailored public health measures in Slovenia with an emphasis on early intervention.

Key messages:

- 4.3% of Slovenian residents, who engaged in gambling in the last 12 months met the criteria for gambling disorder.
- Males and younger generations were more likely to report gambling disorder symptoms and spent more money on gambling. The data shows the need for tailored public health measures.

Abstract citation ID: ckac131.482
Health-related behaviors during adolescence and subsequent anxiety and depression: the HUNT study

Annette Løvheim Kleppang

AL Kleppang[1], MV Vettore[1], I Hartz[2], SH Haugland[3], TH Stea[1]
[1]Department of Health and Nursing Sciences, University of Agder, Kristiansand, Norway
[2]Innlandet Hospital Trust, Innlandet, Norway
[3]Department of Psychososial Health, University of Agder, Kristiansand, Norway
Contact: annette.kleppang@uia.no

Background:
Evidence on the predictors of common mental disorders using nationwide health registries are scarce in Norway. Identifying modifiable behaviours affecting mental health across the lifespan is paramount to develop tailored strategies to tackle mental illnesses. The aim of this study was to identify patterns of health-related behaviours in adolescence and their influence on anxiety and/or depression in adulthood.

Methods:
This was a prospective study based on data from the Trøndelag Health Study (HUNT) and health register data (N = 2061). Patterns of health-related behaviours were assessed according to physical activity, consumption of wholegrain bread, fish, fruit, vegetables, and sugar sweetened beverages and insomnia.

Participant's use of healthcare system for anxiety and/or depression was recorded at least once in the health registries. The patterns of health-related behaviors were identified through latent class analysis. Multivariable logistic regression was used to test the association between patterns of health-related behaviors and depression or/and anxiety.

Results:

Four classes of health-related behaviors were identified: class 1 (15.2%), class 2 (36.0%), class 3 (24.2%), class 4 (24.6%). Adolescents with unhealthy behaviors (classes 1, 2 and 3) had 82%, 34% and 84% higher odds of depression and/or anxiety during adolescence and early adulthood than those from the healthy-related behaviors group (class 4).

Conclusions:

Our findings suggest that health-related behaviors are clustered among Norwegian adolescents. There was a meaningful association of the three patterns of unhealthy behaviors during adolescence with anxiety and depression in adulthood. Population strategies and policies aiming to tackle unhealthy behaviors among adolescents can positively impact on adult's mental health.

Key messages:

- Improving healthy behaviors during adolescence may reduce the burden of mental illness in adulthood.
- Population strategies and policies aiming to tackle unhealthy behaviors among adolescents can positively impact on adult's mental health.

Abstract citation ID: ckac131.483
The Werther effect: adherence of Italian newspapers to the ''reporting on suicide'' recommendations

Giacomo Scaioli

G Scaioli[1], *G Giacomini*[1], *P Galvagno*[1], *F Bert*[1], *G Lo Moro*[1], *R Siliquini*[1,2]
[1]Department of Public Health, University of Turin, Turin, Italy
[2]A.O.U. City of Health and Science of Turin, Turin, Italy
Contact: giacomo.scaioli@unito.it

Background:

Reporting a case of suicide on a newspaper could lead to an emulation effect (Werther effect). It is important to report suicide cases by following specific recommendations implemented by World Health Organization (WHO). This study aimed to analyze articles published on Italian newspapers to quantify the adherence to the WHO recommendations in suicide report.

Methods:

All the articles published in the three most important Italian newspapers from June 2019 to May 2020 that described one or more cases of suicide were included. Two researchers analyzed all the articles through an ad-hoc checklist, constructed on the basis of the WHO recommendations, that included 18 ''negative'' items (e.g. ''presence of suicide-related words in the title'') and nine ''positive'' items (e.g. ''the article reports the contacts of a suicide-prevention hotline''). For each negative item a ''-1'' point, and for each positive item a + 1 point, was assigned. Multivariable linear regressions were performed to identify factors related with a lower adherence to the WHO recommendations and with higher social engagement of the articles.

Results:

A total of 110 articles were analyzed. In the 73% of the cases, the individual was male. The 14.5% of the suicide cases were homicide-suicide, while 9% were femicide-suicide. The median score of the checklist was -6 (IQR 3). Only 5% of the articles had at least one positive item. The word ''suicide'' (or related words) were present in 90% of the titles. Multivariable analyses showed that female suicides were associated with a higher score of the checklist (coeff 0.816, p = 0.039). No correlation was retrieved between the score of the checklist and the social media engagement of the articles included.

Conclusions:

Italian newspapers do not follow WHO recommendations on how to report suicide cases, leading to a potential emulation effect. Public health professionals should raise decision makers' and journalists' awareness about the importance of these recommendations.

Key messages:

- Since Italian newspapers are not compliant with the recommendations of the World Health Organization on how to report a suicide case, there is the risk of a potential emulation effect.
- Specific training for journalists and other professionals in the field of communication should be implemented, to raise the awareness on the importance of the ''reporting on suicide'' recommendation.

Abstract citation ID: ckac131.484
Analysis of suicides in one of the administrative regions of Bulgaria for 10-year period (2009-2018)

Ivanka Veleva

I Veleva[1], *K Stoychev*[1], *M Stoimenova*[1], *E Mineva*[2]
[1]Psychiatry and Medical Psychlogy, Medical University of Pleven, Pleven, Bulgaria
[2]Department of Public Health Sciences Medical University of Pleven, Pleven, Bulgaria
Contact: ivanka.sirashky@gmail.com

Background:

Suicide is an important medical and social problem responsible for nearly one million deaths per year globally. However, distal and proximal risk factors for suicide, expect being mentally diagnosed, are not enough studied. The aim of the study was to analyze the dynamics, structure, socio-demographic and clinical characteristics of all suicides committed by persons with mental disorder for 10-year period (2009-2018) in Pleven district.

Methods:

Retrospective analysis of medical records of all mentally ill persons who committed suicide was done. Data were extracted from the databases of all in- and outpatient mental health centers in the region. Data processing was performed by IBM SPSS Statistics v.25. Statistical associations between a number of socio-demographic and clinical characteristics and the age of suicide victims was studied by dispersion analysis and Mann-Whitney test. Statistical significance was set at $p \leq 0.05$.

Results:

Among all 281 registered suicide cases during the studied period, 77 (28%) were with mental disorders. The most common were mood disorders (44%), followed by schizophrenia, anxiety disorders, substance abuse disorders and organic mental conditions. The mean age of all suicides was 55.62 years; significantly lower in males than in females (p = 0.042); lower in divorced or never married/single living persons compared to married or who had lived with a partner (F (2.74) = 17.682, $p < 0.001$]; the lowest in patients with schizophrenia (44.62 years), and the highest in organic disorders (66.83 years). Higher educational degree was associated with lower age of suicide (U = 3.713, $p < 0.01$) and the earlier age of onset of the psychiatric disorder (r = 0.754, $p < 0.001$). Most of the suicide cases had occurred in March and September. Tuesdays and Fridays were most suicidal.

Conclusions:

Severe mental disorders are major risk factors for suicide with the additional contribution of certain socio-demographic and disease related characteristics.

Key messages:

- Suicide monitoring should be constant in all patients with chronic and severe mental disorders.
- Suicide registration in Bulgaria needs to be improved in terms of collecting sufficient and reliable information about the mental health of suicide victims.

Abstract citation ID: ckac131.485
Pandemic-related determinants of depression in Czech older persons: Evidence from the HAPIEE cohort

Andrea Dalecká

A Dalecká[1], H Pikhart[1,2], N Čapková[3], M Bobák[1,2]
[1]RECETOX, Faculty of Science, Masaryk University, Brno, Czechia
[2]Institute of Epidemiology & Health Care, University College London, London, UK
[3]National Institute of Public Health, Prague, Czechia
Contact: andrea.dalecka@recetox.muni.cz

Background:

A number of studies reported higher levels of mental health issues during the COVID-19 pandemic but only minority of studies focused to assess changes in mental health against measurements taken before the pandemics. We investigated a change in depressive symptoms using repeated measurements and the impact of the pre-existing and COVID-19-related stressors in an ageing cohort in the Czech Republic.

Methods:

We used data on 2853 subjects (mean age 73 years) from the Czech part of the prospective HAPIEE cohort that participated on postal questionnaire surveys before (2017) and during the pandemic (autumn 2020 to early 2021). Participants reported their depressive symptoms using validated CESD-10 report tool. The impact of pre-existing stressors (age, sex, education, living alone, self-rated health, employment status, depression before pandemic), as well as pandemic-related stressors on change in depressive symptoms were tested using multivariable linear regression, after adjustment for age and potential confounders.

Results:

Compared with pre-pandemic period, there was a significant increase in depression score during the COVID-19 pandemic. The mean CESD-10 score increased from 4.92 to 5.37 ($p < 0.001$). Significantly larger increases in depressive score reported older persons ($\beta = 0.073$; $p < 0.001$) and those with poor self-rated health ($\beta = 0.170$; $p < 0.001$) in the fully adjusted model. Moreover, those who experienced social deprivation ($\beta = 0.057$; $p < 0.001$), death or hospitalization of a close person ($\beta = 0.064$; $p < 0.001$), delays in healthcare ($\beta = 0.048$; $p = 0.005$) and those who suffered from COVID-19 ($\beta = 0.045$; $p = 0.008$) also reported worsened depressive symptoms.

Conclusions:

This longitudinal study confirms important increase in depressive symptoms during the COVID-19 pandemic and contributes to identify pandemic-related risk factors. Interventions and future public health policies should address vulnerable individuals and population groups.

Key messages:

- Mental health worsened during the COVID-19 pandemic compared to previous years.
- Social deprivation, delays in healthcare and experiencing COVID-19 infection affected mental health of older people.

Anxiety and depression disorders in Portugal during the COVID-19 pandemic

Juan Rachadell

A Santos[1], J Rachadell[2,3,4]
[1]Public Health Unit, ACES Almada Seixal, Almada, Portugal
[2]Public Health Unit, ACES Lisboa Ocidental e Oeiras, Oeiras, Portugal
[3]EUPHA-DH
[4]Institute for Evidence Based Health, Lisbon, Portugal
Contact: juan.rachadell@campus.ul.pt

Background:

Mental disorders are a major contributor to the global burden of disease. During the first year of the pandemic by COVID-19, increases of 25% in the prevalence of anxiety and depression were reported globally. In Portugal, studies conducted during lockdown showed an increase in the prevalence of these disorders. However, previous studies have shown that negative life events, such as exposure to disasters or grief, later lead to resilience or recovery. It is therefore necessary to study the evolution of these disorders in order to adapt mental health measures.

Methods:

The number of patients registered with "P76 - Depressive Disorder" and "P74 - Anxiety Disorder/anxiety state", according to ICPC-2 criteria, and the total number of patients registered in the Portuguese Health Centers for the months of January 2019 to 2022 were obtained from the Portuguese NHS Information and Monitoring System (SIM@SNS). We calculated the percentage of patients with each of the disorders, individually and combined. Data by health regions were also obtained in order to compare the evolution within each region (North, Center, Lisbon and Tagus Valley, Alentejo and Algarve).

Results:

Between January 2019 and 2022, the proportion of patients with anxiety disorder increased linearly from 8% to 9%. Similarly, the proportion of patients with depressive disorder increased from 11% to 12%. When considered together, anxiety and depression disorders affected 21% of users in mainland Portugal at the beginning of 2022. The Alentejo and Center regions have the highest prevalence of anxiety and depression (24.9% and 24%, respectively) and the Algarve region has the lowest (16.74%). The increases were consistent across health regions, with the largest increase in the North region (2.6%) and the smallest in the Central region (1.7%).

Conclusions:

Anxiety and depression disorders increased in mainland Portugal during the years of the COVID-19 pandemic.

Key messages:

- Mental health has been an important factor in public health since before the pandemic.
- Monitoring depression and anxiety levels in the general public can guide priorities after the pandemic.

Mental health surveillance of German adults in the COVID-19 pandemic: trends in depressive symptoms

Lena Walther

L Walther[1], S Junker[1], C Kersjes[1], S Damerow[1], S Mueters[1], J Thom[1], E Mauz[1]
[1]Epidemiology and Health Monitoring, Robert Koch Institute, Berlin, Germany
Contact: waltherl@rki.de

Background:

While literature on mental health in the COVID-19 pandemic has grown rapidly, studies reporting on developments beyond the first wave using continuous, population-based data are still scarce. We examined monthly estimates of depressive symptom levels in Germany's adult population covering almost two years of the pandemic and the year prior.

Methods:

We analyzed representative data from two population-based telephone surveys of German adults: "German Health Update (GEDA)" and "COVID-19 vaccination rate monitoring in Germany (COVIMO)." Core symptoms of depression measured using the Patient Health Questionnaire-2 (PHQ-2) were observed in approximately 1,000 randomly sampled participants monthly from April 2019 to December 2021. We estimated three-month moving means and proportions as well as smoothing curves to produce time series graphs. Statistical comparisons between specific time periods were used to verify results of visual inspection. Analyses were stratified by gender, age and level of education to assess potential time trend differences between subgroups.

Results:

Both the mean population depressive symptom score and the proportion of the population with a positive PHQ-2 depression screen first decreased to below 2019 levels between the first wave and summer of the pandemic and then increased from autumn 2020, reaching levels significantly above 2019 in 2021 and remaining elevated. 2021 saw a 2.2% increase in positive screens compared to 2019. Women, the youngest and eldest adults, and those with a high level of education experienced a particular increase in depressive symptoms between 2019 and 2021. However, we found no corresponding changes in symptom level differences between population subgroups.

Conclusions:

Our finding of elevated depressive symptoms among Germany's adults following an increase in the second wave of the pandemic demonstrate the importance of continued surveillance to assess the further development of mental health in the ongoing crisis.

Key messages:

- Monthly data from April 2019 to December 2021 suggests that depressive symptoms decreased at the start of the pandemic and then increased from autumn 2020, reaching levels above 2019 in 2021.
- Continued mental health surveillance is needed to assess the further development of mental health indicators in the ongoing crisis and its aftermath.

Abstract citation ID: ckac131.488
Mental health and well-being of students at TU Dresden

Maria Girbig

M Girbig[1], L Huebner[1], D Kaempf[1], T Lesener[2], B Gusy[2], A Seidler[1]
[1]Institute and Policlinic for Occupational Polyclinic for Occupational and Social Medicine, TU Dresden, Dresden, Germany
[2]Department of Education and Psychology, FU Berlin, Berlin, Germany
Contact: maria.girbig@tu-dresden.de

Background:

University life can be a particularly challenging phase in the development of young adults. Current research shows that mental disorders occur more frequently in students compared to workers of the same age. The coronavirus pandemic has exacerbated the problem. The TUDo! Study, done in cooperation with the FU Berlin, aimed to assess the health status of students at TU Dresden, with a focus on mental health.

Methods:

In 2020/2021 students at TU Dresden (excluding students in the medical school) completed an online-based questionnaire. Validated questionnaires, e.g. the PHQ 4 (depressive disorder and generalized anxiety disorder) and the ERI student (student gratification crisis) were used. We evaluated descriptively and analytically, according to the questionnaire-specific specifications.

Results:

A total of 2,683 students (12.3%) at the TU Dresden took part in the survey. The majority of study participants were female (n = 1,507; 56.7%) and had an average age of 22.9 years (SD = 4.3). 32.8% (n = 856/2,611) of the participating students reported a depressive syndrome and 32.5% (n = 848/2,612) a generalized anxiety disorder. Almost half of participating students (40,0%; n = 515/1,310) indicated an imbalance between effort (E) and reward (R) (ER ratio>1). 51.23% (n = 693/1,50) of respondents reported a decline of mental well-being because of the coronavirus pandemic.

Discussion:

Unlike similar studies, this study shows that TU Dresden students were particularly affected with regards to perceived psychological stress and complaints. The existing differences seem to be partly due to the coronavirus pandemic. These results indicate that universities should regularly check their studying conditions and provide appropriate preventive measures.

Key messages:

- Students are at higher risk than workers of the same age for mental health problems.
- Students reported a decline in mental well-being due to the coronavirus pandemic.

Abstract citation ID: ckac131.489
The effectiveness of interventions to prevent loneliness in the community-dwelling elderly population

Ludwig Grillich

L Grillich[1,2], V Titscher[1], P Klingenstein[1], E Kostial[3], R Emprechtinger[4], I Sommer[1]
[1]University for Continuing Education Krems, Department for Evidence-based Medicine and Evaluation, Krems, Austria
[2]University of Vienna, Department of Clinical and Health Psychology, Faculty of Psychology, Vienna, Austria
[3]Gesundheitsvorsorge GmbH, St. Pölten, Austria
[4]University for Continuing Education Krems, Faculty for Health and Medicine, Krems, Austria
Contact: ludwig.grillich@donau-uni.ac.at

Background:

Loneliness and social isolation have comparable health effects to widely acknowledged and established risk factors. Although the elderly are particularly affected, the effectiveness of interventions to prevent and/or mitigate social isolation and loneliness in the community-dwelling elderly is unclear. The aim of this review of reviews was to pool the findings of systematic reviews addressing the question of effectiveness.

Methods:

Ovid MEDLINE®, Health Evidence, Epistemonikos and Global Health (EBSCO) were searched from January 2017 to November 2021. Two reviewers independently assessed each systematic review in two consecutive steps based on previously defined eligibility criteria and appraised the methodological quality using AMSTAR 2. One author extracted data from both systematic reviews and eligible studies; another checked this. We conducted meta-analyses to pool the study results. We report the results of the random-effects and common-effect models.

Results:

We identified 5 systematic reviews containing a total of 30 eligible studies, 16 with a low or moderate risk of bias. Our random-effects meta-analysis indicates an overall SMD effect of 0.63 [95% CI: -0.10; 1.36] for loneliness and was unable to detect an overall effect of the interventions on social support [SMD: 0.00; 95% CI: -0.11; 0.12].

Discussion:

The results show interventions can potentially reduce loneliness in the non-institutionalised, community-dwelling elderly population living at home. As confidence in the evidence is low, rigorous evaluation is recommended.

Key messages:

- The meta-analysis indicates that psychosocial interventions have the potential to reduce loneliness in the community-dwelling elderly population.
- As confidence in the evidence is low, healthcare providers should only implement interventions that are, firstly, based on a sound theory of change and, secondly, subject to rigorous evaluation.

[3]Department of Neuromedicine and Movement Science, Norwegian University of Science and Technology, Trondheim, Norway
[4]Department of Public Health, University of Stavanger, Stavanger, Norway
[5]Faculty of Nursing and Health Sciences, Nord University, Levanger, Norway
Contact: Bodil.E.V.Aasan@ntnu.no

Background:

Emerging research findings suggest that the Covid-19 pandemic may have affected various social groups differently. Using follow-up health data from Norway, the aim of this study was to investigate whether change in psychological distress in adolescents during the Covid-19 pandemic differed across socioeconomic position (SEP).

Methods:

Data consisted of 1254 Norwegian adolescents who participated in Young-HUNT4 (2017-19) and Young-HUNT COVID (spring 2021). Psychological distress (PD) was assessed by the Symptom Checklist-10, using a cut-off point of ≥ 1.85 to identify adolescents with high PD. Based on the adolescents PD score prior to and during the Covid-19 pandemic, four groups were identified: persistent low PD, improved PD, worsened PD, and persistent high PD. Adolescents reported their parents' education level which was used as an indicator for SEP. SEP was dichotomized separating low and high SEP, where having at least one parent with a higher education was defined as high SEP. Multinomial logistic regression models were used to investigate if the likelihood of the outcome groups varied across SEP, adjusted for age and sex.

Results:

Compared to the persistent low PD group, no statistically significant difference was found between low and high SEP in the improved PD and worsened PD group (RR 1.33 95% CI 0.77 - 2.31, RR 1.22 95% CI 0.82 - 1.81, respectively). However, adolescents of low SEP had a higher likelihood to be in the persistent high PD group compared with the high SEP group (RR 1.93 95% CI 1.30 - 2.87).

Conclusions:

These preliminary findings suggest that the pandemic may not have led to greater social inequality in mental health among Norwegian adolescents. However, the results showed that social inequality that existed prior to the pandemic has persisted, as adolescents of lower SEP had a higher likelihood of reporting high PD that persisted from prior to and throughout the Covid-19 pandemic.

Key messages:

- Social inequality in psychological distress among Norwegian adolescents has persisted prior to and during the Covid-19 pandemic.
- The Covid-19 pandemic does not seem to have increased existing social inequalities in psychological distress among Norwegian adolescents.

Abstract citation ID: ckac131.492
Suicidality among children and adolescents "in the COVID-19 era": a worldwide metanalytic picture

Michela Bersia

M Bersia[1,2], E Koumantakis[1,2], P Berchialla[3], L Charrier[1], P Dalmasso[1], RI Comoretto[1]
[1]Department of Public Health and Pediatrics, University of Torino, Turin, Italy
[2]Post Graduate School of Medical Statistics, University of Torino, Turin, Italy
[3]Department of Clinical and Biological Science, University of Torino, Orbassano, Italy
Contact: michela.bersia@edu.unito.it

Background:

The impact of the COVID-19 pandemic on adolescent suicidality is still controversial. The present systematic review and meta analysis aim to summarise findings from emerging literature about prevalences of the main suicidal outcomes among children and adolescents under 19 years old, and to compare them with the pre-pandemic period.

Methods:

Five databases (PubMed, Embase, Scopus, CINAHL and Web of Science) were systematically searched for studies published in English from January 1st, 2020 until November 3rd, 2021, reporting prevalence for suicidal ideation (SI), suicidal behaviors (SB) and suicide (S) in the general population aged <19 during the COVID-19 pandemic. Single-study prevalence data were pooled using random-effects meta-analysis. If studies reported prevalence estimates for both pre- and during-pandemic periods, prevalence ratio (PR) comparing the two periods has been computed and pooled.

Results:

Sixteen observational studies were selected: 10 about SI, 9 about SB and 3 about S. During the pandemic, prevalence of SI among adolescents was 21% (95% CI 12-34%) while prevalence of SB was 3% (95% CI 1-10%). Comparing pre- and during- pandemic prevalences, a significant overall increase in SB was observed (PR 1.35; 95% CI 1.06-1.72) while the prevalence rates of SI remained substantially steady

(PR 0.95; 95% CI 0.64-1.39). A narrative review on the population-based data on suicide rates suggested an escalating trend since Summer 2020, after an initial stability of the phenomenon.

Conclusions:

During the COVID-19 pandemic SB showed a 35% increase and suicides rates escalated after a initial stability. School closures might be involved, representing an initial protective factor for suicidality, while after the reopenings we could have assisted to a suicide rebound, especially among the most vulnerable young people.

Key messages:

- The topic of suicidality among young people is still affected by a cultural stigma that hampers the development of both academic research, early detection and preventive policies.
- The increase in suicidal behaviors among youths after the COVID-19 outbreak highlights a major public health issue that requires adequate supporting policies to control and prevent this phenomenon.

Abstract citation ID: ckac131.493
Project SELfit: training socio-emotional skills in a school environment in Porto

Filipa Malcata

F Malcata[1], A Rodrigues[2], A Machado[1], MT Saraiva[1], D Antunes[1]
[1]Public Health Unit, ACES Porto Ocidental, Porto, Portugal
[2]Catholic University of Portugal, Braga Region Centre, Braga, Portugal
Contact: filipamalcata@hotmail.com

Issue/Problem:

Mental disorders are the main cause of years lived with disability (YLD) in 5-14-year-old people around the world, in Western Europe, and particularly in Portugal. Young people who experience anxiety during childhood have a 3,5-fold likelihood of suffering from depression or anxiety during adulthood. COVID-19 has aggravated this situation, namely regarding socio-emotional competencies.

Description of the problem:

SELfit, a project based on the Socio-emotional learning (SEL) methodology, aims promoting mental health, by training teachers and community nurses to develop socio-emotional skills in students from primary schools. The project includes a theoretical and a practical/training session, and monthly supervision sessions by a team that includes a psychologist, a public health doctor and public health nurses. The period of implementation is between February to July 2022.

Results:

A total of 8 community nurses and 13 teachers from 3 primary schools in Porto enrolled in this project, which corresponds to a total around 272 students from 5 to 8-year-old. Knowledge of nurses and teachers regarding mental health literacy, and social emotional learning was assessed, before and after the theoretical session. The mean percentage of correct answers before was 49% (54% regarding nurses and 45% teachers) compared to 84% (92% regarding nurses and 78% teachers) after. Concerning socio-emotional skills of the primary school students, possible improvement will be evaluated at the end of the project (July 2022).

Lessons:

Mental health literacy and social emotional learning knowledge increased 35%, which highlights the importance of these theoretical sessions promoting mental health literacy. By the end of this project, it is expected to exist an improvement on socio-emotional skills of the primary school students. This is a very important project, expected to be implement and replicated in other schools in Porto and in Portugal.

Key messages:

- Mental disorders are the main cause of years lost due to disability (YLD) in primary school students in Portugal; hence, it was chosen for this mental health promotion project.
- This is a pioneer project in Porto, involving both community nurses and primary teachers, in which all are involved in training and promoting social-emotional learning in a school context.

Background:

The COVID-19 pandemic has created a very large workload burden on health systems worldwide, Kosovo is no exception to this trend. A pandemic may have a negative impact on health care workers' (HCWs) mental health. In this cross-sectional study, we assessed the self-reported prevalence of stress, anxiety, and depression and identified their predictive factors among HCWs in Kosovo.

Methods:

Data were collected on sociodemographics (sex, age, occupation, education, workplace) and the presence and severity of depression, anxiety, and stress through the 21-item Depression, Anxiety, and Stress Scale (DASS-21) online questionnaire. Descriptive statistics, t-tests, and linear logistic regression were used to analyze the data.

Results:

Of the 545 respondents, the majority were male (53.0%), under 60 years of age (94.7%), and married (81.7%). Most of them were physicians (78.2%), while the remaining respondents were nurses, midwives, and other health professionals (22%). The prevalence rates for moderate to extremely high levels of stress, anxiety, and depressive symptoms were 21.9%, 13.0%, and 13.9%, respectively. Nurses reported significantly higher mean scores for depression and anxiety than physicians ($P < 0.05$). Being married, having poor health, not exercising, and reporting 'burnout' from work significantly predicted higher levels of depressive, anxiety, and stress symptoms among health workers ($P < 0.05$).

Conclusions:

HCWs require specific national mental health intervention programs that will, among other effects, help raise awareness of the early recognition of symptoms related to stress, anxiety, depression, and burnout due to workload as well as the importance of regular physical exercise. These programs should be part of the national emergency preparedness, emergency response, and health sector strategy, aiming to build and sustain a resilient health system.

Key messages:

- During COVID-19 pandemic, certain factors predicted higher levels of mental health burden among HCWs.
- Addressing these factors require policy recommendations with concrete systemic interventions.

Development and evaluation of an evidence-based health information on benzodiazepines and z-drugs

Christina Lindemann

C Lindemann[1]*, J Heeg*[1]*, J Dirmaier*[1]*, U Verthein*[2]*, M Haerter*[1]
[1]University Medical Center Hamburg-Eppendorf, Institute and Outpatients Clinic of Medical Psychology, Hamburg, Germany
[2]University Medical Center Hamburg-Eppendorf, Centre of Interdisciplinary Addiction Research, University Hamburg, Hamburg, Germany
Contact: ch.lindemann@uke.de

Background:

With approximately 1.1-1.4 million people in Germany taking benzodiazepines (BZDs) and z-drugs in a problematic or dependent manner, this is a relevant public health problem which needs to be adressed. However, it is well known that affected individuals do not receive the counseling or treatment they need. One possible solution is preventive education of affected individuals and medical practioners using evidence-based and target-group-health information (HI).The project EDER-MIA aimed to develop and evaluate evidence-based and target-group-related HI.

Methods:

With the help of three different focus groups (18-40-years; women: 40-60-years; > 60-year-olds), the information needs of affected individuals were assessed. Based on the results, we developed the HI and received feedback from health experts. The HI was implemented online (http://www.psychenet.de) and evaluated with the 'Usefulness Scale of Patient Information' (USE): An assessment was made on 3 subscales with a 10-point scale from '1 = disagree at all' to '10 = agree completely'. By forming a sum score (range: 0-90), an overall assessment was calculated.

Results:

The results of the focus group study revealed the persons taking BZDs or z-drugs were in need about informations about sleep problems, the risk of taking BZDs and z-drugs and a better orientation regarding help services. The evaluation of the health information achieved medium acceptance rates of usefulness for affected persons (N = 192, 68.2% female; mean = 54.3, sd = 15.4). A somewhat higher usefulness was recognised by the medical staff (N = 58, 69.0% female, mean = 64.7, sd = 17.2).

Conclusions:

The development of target group-specific HI with the participation of affected individuals and experts is suitable for topics that are associated with possible experiences of shame and stigma. In addition to providing information about the risks of taking BZDs and z-drugs, screening of problematic BZD and z-drug use is also a matter of concern.

Key messages:

- BZDs and z-drug use is a relevant public health concern which needs to be adressed.
- Target-group specific health information for BZD and z-drug use accompanied by a screening-test can encourage affected individuals to seek medical advice.

Abstract citation ID: ckac131.496
The role of gender in the association between mental health and avoidable hospitalization

Alessandro Catalini

A Catalini[1]*, C Mazza*[2]*, C Cosma*[3]*, L Stacchini*[3]*, M Caminiti*[4]*, G Minutolo*[5]*, D Genovese*[5]*, G Ferraguzzi*[6]*, E Cavaretta*[6]*, F Cedrone*[7]
[1]Department of Biomedical Sciences and Public Health, University of the Marche Region, Ancona, Italy

[6]Department of Biomedical Sciences for Health, University of Milan, Milan, Italy
[7]Health Management of ''SS. Spirito'' Hospital, Local Health Authority of Pescara, Pescara, Italy
Contact: alecata@me.com

Background:

Hospital discharge records (HDR) can indirectly assess the quality of primary care through algorithms proposed by the Agency for Health Research and Quality (AHRQ). Mental illnesses or substance addictions represent barriers to accessibility to medical care which, can lead to hospitalizations deemed potentially preventable. The aim of this study is to evaluate the gender differences in the association between potentially preventable acute hospitalizations whether mental health or addiction.

Methods:

The study examined HDRs of the Local Health Authority of Pescara, Abruzzo, period 2015-2021. The aggregate Prevention Quality Acute Composite 91 (PQI-91) has been coded according to the indications of the AHRQ. Were selected HDRs with a diagnosis of depression, psychosis, alcohol or substance abuse according to Enhanced ICD-9-CM Elixhauser algorithm. Four univariate logistic regression models were implemented correcting for age.

Results:

In the study period 252,775 HDRs of which 3,459 PQI-91 were analyzed. A diagnosis of depression is positively associated with a PQI-91 hospitalization only in the male gender (aOR 3.16; 95%CI 2.18-4.58) and not in the female one (aOR 1.13; 95%CI 0.75-1.72). The same is true for a diagnosis of psychosis, males (aOR 2.41; 95%CI 1.66-3.48) and females (aOR 1.19; 95%CI 0.67-2.12). In both genders there was an association with substance abuse, males (aOR 3.92; 95%CI 2.65-5.81) and females (aOR 2.68; 95%CI 1.19-6.07), while for the alcohol abuse the female gender is positively associated (aOR 2.52; 95%CI 1.11-5.73) and not the male one (aOR 1.24; 95%CI 0.80-1.92).

Conclusions:

Gender is an innovative approach to health inequalities: women and men respond to a different diagnostic-prescriptive appropriateness, which depends both on biology and on social, cultural, psychological and economic distances. Research efforts must be made to observe the effect healthcare access disparities have on patients who experience mental illness or addiction.

Key messages:

- Mental health can limit access to primary care for other comorbidities or acute diseases; poor-quality primary care can result in preventable hospitalizations that increase the cost of health care.
- The gender differences for the same diagnosis of mental illness/addiction that cause potentially preventable acute hospitalizations impose gender-specific strategies aimed at modifying care pathways.

Abstract citation ID: ckac131.497
Bullying victimization among middle school students in el kef governorate (Tunisia)

Amel Amara

A Amara[1,2]*, A Mtiraoui*[3]*, D Nammouchi*[1]*, J Sahli*[1,2]*, M Mellouli*[1,2]*, A Mtiraoui*[1,2]*, C Zeddini*[1,2]*, M El Ghardellou*[1,2]
[1]Department of Family and Community Medicine, Faculty of Medicine of Sousse, Sousse, Tunisia
[2]Research Laboratory, LR12ES03, Sousse, Tunisia
[3]Department of Psychiatry, Farhat Hached University Hospital, Sousse, Tunisia
Contact: amel.amara1@yahoo.fr

Background and aim:

Bullying is a complex and widespread public health issue that one can be exposed to at any age and at any field, but it is considered particularly frequent during times of transition in children's and adolescents' lives. This study aims to investigate the prevalence and various forms of bullying victimization and explore culture of bullying victimization among students.

Methods:

A cross-sectional study was conducted during the Academic year 2018/2019 among middle school students in the governorate of El Kef, Tunisia. The sampling method adopted for this research was a cluster sampling technique. Data were collected using self-administered questionnaires. The Students' involvement in bullying victimization was assessed using a validated Arabic version of the revised Olweus Bully/Victim Questionnaire.

Results:

A total of 1111 middle school students were enrolled. The prevalence of bullying victimization behavior in this study was 45.8 % [95% CI: 45.5- 46]. Looking at the forms of bullying experienced by students: ''Being called mean names'' was the most prevalent form of being bullied with 26.9% (n = 299), followed by 16.9% reported ''being kicked in some place'', 16.3% reported ''being bullied through false rumors'' and 14.3% experienced bullying through messages, calls or images by means of mobile phones or Internet and 8.1% of the students reported being bullied with sexual gestures or comments. Verbal bullying (29.5%) was the most common type of victimization, followed by physical victimization, relational victimization and cyber victimization with 22.5%, 22.2% and 14.3% respectively. More than half of the students (58.5%) were more likely to inform others about incidents of bullying in their schools, mainly their parents (36.6%) or a friend (32.6%).

Conclusions:

Bullying is serious and major public health issue that have a negative impact on adolescents' well-being, and require special attention at the family, school, and community level

Key messages:

- High prevalence of bullying victimization with predominace of verbal type.
- Culture of bullying victimization and taking care of victims is still weak.

Mental health promotion in the school environment

Raissa Kouznetsov

R Kouznetsov[1], *E Jelastopulu*[1]
[1]Department of Public Health, School of Medicine, University of Patras, Patras, Greece
Contact: raissakouznetsov@upatras.gr

Issue/problem:

The practice took place in a private school with students from 9 to 15 years old. The purpose of the intervention was to promote the mental health of students. The school's goal was to eliminate school bullying incidents. The phenomenon of school bullying has global dimensions.

Description of the problem:

The teachers of the school did not consider that they should be involved in issues of mental health of the students and did not take steps to reduce the phenomena of school bullying. In the meetings with the students, which had duration of six months, concepts such as self-esteem, empathy, emotional intelligence, cooperation, respect, stress, failure were analyzed. The causes and consequences of school bullying were discussed. The aim of the meetings was to raise students' awareness to the above issues, to understand themselves and others and to develop teamwork. In the meetings with the students, three basic principles were developed: Facilitate-Respect-Recognize.

Results:

After the end of the practice in the school context, students, teachers and parents completed an evaluation questionnaire anonymously. It turned out that the meetings at school became a cause for discussion in the classroom by 100% and at home by 65%. The students stated that they would not allow school violence or bullying after the meetings. It is noteworthy that one in three teachers did not consider the promotion of mental health as part of their duties while the parents expected the teachers to fulfill this goal 100%.

Lessons:

It would be especially useful to conduct training seminars for teachers on adult (to enable better communication channels with parents) and child mental health and conflict management. Respectively, the parents should be educated on issues of mental health and psychopedagogy. The innovation of this action was that it involved teachers, parents and students while similar initiatives seldom take place in a Greek school environment.

Key messages:

- Promoting healthy interpersonal relationships at school between students and teachers.
- Recognizing children's emotions promotes their mental health during school life.

Abstract citation ID: ckac131.499
A six-week parenting program for parents of children with learning disabilities in Greece

Maria Papadakaki

N Pedioti[1], *M Papadakaki*[1], *K Koutra*[2], *S Parlalis*[3]
[1]Department of Social Work, LaHeRS & PHC-HMU, Hellenic Mediterranean University, Heraklion, Greece
[2]Department of Psychology, University of Crete, Heraklion, Greece
[3]Department of Social Work, Frederick University, Limassol, Cyprus
Contact: mpapadakaki@hmu.gr

Children with learning disabilities have been shown to experience complex emotional and conduct difficulties due to late diagnosis and inappropriate parental management. Parenting support have been deemed necessary for a holistic management of learning disabilities. The current presentation reports on the methodology and initial results of a program offered to parents of children aged 8-12 years with learning difficulties at the region of Crete in Greece, during the school year 2020-2021. The program aimed at improving parenting skills and parent-child interaction, through a short training (four meetings) and a set of seven techniques offered to parents for boosting children's positive response. All children diagnosed with a learning disability by an interdisciplinary team of experts serving a mobile unit, were approached and their parents were offered a personalised intervention plan and a package of counselling services including a six-week program, based on the ''A Six Week Parenting Program For Child Compliance'' (Cipani, 2005). Parents were randomly assigned to an intervention (n = 40, 6-week parenting program) and a control group (n = 29, no intervention). A pre- and post evaluation design, with self-administered questionnaires, was used to assess changes in parental skills and performance as well as the quality of parent-child interaction (Parenting Style Questionnaire; the Family Quality of Life Scale (FQOL)). Most of the participants were mothers (n = 63), of low educational level (n = 26) and low income (n = 49). Statistically significant improvements were evident in the intervention group at post-intervention level in parenting skills as compared to baseline scores. Significant differences were also observed in the parenting skills at post-intervention level, between the intervention and the control group. Findings are expected to highlight new approaches towards improving the parental role, with an impact on the quality of life of families.

Key messages:

- Training on parenting skills should be included in family support services offered to children with learning disabilities.
- Professionals working with learning disabilities should be trained to assess deficits in parenting skills and offer brief counseling to parents.

Abstract citation ID: ckac131.500
Anxiety, depression, and lower quality of life among Danish women with polycystic ovarian syndrome

Subash Thapa

V Abdelkarim[1], *S Thapa*[2]
[1]Public Health, University of Southern Denmark, Odense, Denmark
[2]Research Unit of General Practice, University of Southern Denmark, Odense, Denmark
Contact: sthapa@health.sdu.dk

Background:

Polycystic Ovarian Syndrome (PCOS) is the most frequent hormonal/endocrine disorder in women of reproductive age and is one of the most common causes of infertility. Approximately 20% of Danish women of reproductive age are diagnosed with PCOS, and yet only a little attention has been paid to the psychological symptoms appearing in women with PCOS. The present study investigated anxiety, depression, and lower quality of life among Danish women of reproductive age who are diagnosed with PCOS.

Methods:

This was a cross-sectional survey study among 326 Danish women who self-reported as being diagnosed with PCOS. The Hospital Anxiety and Depression Scale (HADS) was used to measure anxiety and depression, and the PCOS-QOL scale was used to measure the quality of life. Chi-square tests and logistic regression analyses were used for analyzing data.

Results:

Sixty-six percent of women were found to have anxiety (n = 216), 41% of women had depression and 70% of women had low quality of life The most frequently reported symptoms were irregular menstrual cycle (86%), overweight (73%), and mood swings (65%), and irregular menstrual cycle, overweight and infertility were the were perceived of having higher severity. After adjusting for age, ethnicity, education, and income, the severity of symptoms, namely irregular menstrual cycle, infertility, overweight, and hirsutism, were independently and positively associated with depression, and severity of symptoms, namely irregular menstrual cycle, mood swings, and hirsutism, was independently and positively associated with anxiety. Lower quality of life was independently associated with both anxiety and depression.

Conclusions:

Women with PCOS are at higher risk of anxiety, depression, and consequently, lower quality of life. Clinicians and other healthcare professionals should pay attention to the importance of mental health support in women with PCOS and work towards promoting it.

Key messages:

- Women with PCOS are at higher risk of anxiety and depression, and lower quality of life.
- Health care professionals working with women with PCOS should be aware of this and be prepared to offer necessary support.

Abstract citation ID: ckac131.501
Mental health of migrants during the COVID-19 pandemic: additional stressors, increased inequalities

Ana Gama

MJ Marques[1,2], *A Gama*[1,2], *AR Pedro*[1,2], *R Magano*[1,2], *C Tiessen*[3], *P Hollanders*[4], *S Dias*[1,2]
[1]NOVA National School of Public Health, Universidade NOVA de Lisboa, Lisbon, Portugal
[2]Comprehensive Health Research Center, Universidade NOVA de Lisboa, Lisbon, Portugal
[3]Vrije Universiteit Amsterdam, Amsterdam, Netherlands
[4]Maastricht University, Maastricht, Netherlands
Contact: anafgama@gmail.com

The COVID-19 pandemic has resulted in an unprecedent range of negative mental health outcomes across populations worldwide. Such effects are increasingly being documented, however an evidence gap persists on the consequences on most vulnerable groups, as certain subgroups of migrants. These populations already suffer from increased psychological burden, and the pandemic effects may potentially exacerbate adverse experiences and outcomes. This study aims to uncover the perceived impact of the COVID-19 pandemic on the mental health of migrants in Portugal and the associated sociodemographic aspects. A survey was conducted with a community-based sample of 1126 adult migrants in Portugal, assessing sociodemographics, migration-related characteristics and the perceived impact of the pandemic on mental health. Association between sociodemographics and mental health indicators was measured through bivariable analysis. In total, 1126 adult migrants were surveyed: 53.4% female, mean age of 35.8 years (range 18-77), 48.9% from African countries, 29.5% from Middle East/Asian countries, 21.6% from Brazil. Most participants (80%) reported feelings of agitation, anxiety or sadness during the pandemic period with 26.4% experiencing these feelings most days. The pandemic had a disproportionate impact on women (86.9% reported negative impact compared to 72.5% of men, $p < 0.05$), those undocumented (83.3% vs 75.4%, $p < 0.05$), those whose financial situation got worse since the pandemic (82.8% vs. 77.3%, $p < 0.05$) and those who had increased food shortages (84.4% vs 79%, $p < 0.05$). Migrants perceived an elevated deterioration of their mental health during the COVID-19 pandemic. In addition, particular groups such as women and those with a more insecure income or residence status are particularly susceptible to experiencing negative mental health outcomes.

Key messages:

- There is a need to recognize the detrimental mental health impact of the COVID-19 pandemic on particular migrant groups and to develop interventions that target their unique needs.
- Investigating sociodemographic and migration aspects could help identifying migrants at a higher risk of experiencing mental health distress.

Abstract citation ID: ckac131.502
Distribution of Suicides in India: A Decadal Data Analysis (2011-2020)

Areiba Arif

A Arif[1]
[1]Public Policy, IIM Ahmedabad, Ahmedabad, India
Contact: phd18areiba@iima.ac.in

Background:

India accounts for a significant proportion of suicide deaths globally. As per the Global Burden of Disease Study, India's share of global suicides from 1990 to 2016 increased from 25·3% to 36·6% among women and 18·7% to 24·3% among men. However, medical factors are not the sole contributors to the suicide burden.

Methods:

I analyze decadal data (2011-2020) on suicides in India provided by National Crime Records Bureau. This data contains the distribution of suicidal deaths based on age groups, causes, professions, gender, and residence zones.

Results:

The analysis suggests that individuals aged '15-29 years' were most affected (35.05%) by suicides, followed by those aged '30-44 years' (32.61%). Family problems contribute to the highest burden of suicides among both these age groups. Such deaths can be attributed to personal reasons. Suicides due to dowry disputes are exclusive to women. Also, women report the highest instances of suicides due to marriage-related issues. While suicides due to drug abuse, bankruptcy, unemployment, poverty, and property disputes were mainly reported among males. In 2020, the rise in annual suicide rate was found to be highest among business persons (29.43%), especially tradesmen (49.9%) and vendors (26.11%) against other businesses

(12.13%). Other professions which witnessed a steep rise in annual suicide rates in 2020 were agricultural laborers (17.90%) and daily wage earners (15.76%). This increase in suicide rates may be linked to economic reasons post lockdown imposition during the Covid-19 outbreak in 2020.

Conclusions:

Women commit suicide mainly due to marriage-related causes, while men are more vulnerable to suicide due to economic factors. Not all suicides can be traced back to diagnosed mental illnesses. A significant proportion of suicides are attributed to personal, economic, and social problems. The insights generated from this analysis can help identify the vulnerable groups and target the much-needed interventions.

Key messages:

- Suicide is a multifaceted problem involving various personal, economic, cultural, and social factors, besides medical reasons.
- Multidimensional strategies targeted at vulnerable groups could be potentially effective in curbing suicide rate.

DU Migration, LGBTI and minorities health

Abstract citation ID: ckac131.503

Good health information for people with a migration background

Sandra Ecker

S Ecker[1], *M Weigl*[1], *S Gaiswinkler*[1]
[1]Health, Society and Equity, Austrian National Public Health Institute, Vienna, Austria
Contact: sandra.ecker@goeg.at

Background:

Studies show that people with a migration background are often uncertain concerning the kinds of health services that are offered and where to turn to with which health concerns. Some factors, like fears or obstacles (e.g. deductibles), lead to the health system not being used (on time). This is particularly true for those who are socioeconomically or socially disadvantaged. The aim of the project was to get an insight into the information needs of this population group as a basis for producing and disseminating good health information in the future.

Methods:

In this qualitative study co-researchers conducted guided focus groups (separated by sex) or interviews in their first languages. In total, more than 100 people from 16 different countries of origin were involved in the survey.

Results:

In general, a substantial need for multilingual health information prepared in easy-to-understand language was expressed. Some health topics (e.g. the Austrian health system, mental health and available support) were mentioned by many participants. Other issues were relevant for few groups only (e.g. TCM). Gender differences can be seen in some groups but not in all. Besides acquaintances/relatives, general practitioners were named as main source of information. Indications can be derived on how health information should be prepared, designed and distributed. Besides multilingual health information, translation services are needed during appointments but also for the medical reports.

Conclusions:

When searching for health information, but also when trying to understand it, language barriers are a major obstacle. Multilingual and culture-sensitive explainer videos on selected topics are an appropriate medium for reaching a broad group of people. Low-threshold multilingual regional contact points could provide an important contribution to health equity, as a guide in the health system, providing information and translation services, and setting health promotion offers.

Key messages:

- Language barriers represent a major obstacle for vulnerable population groups with migration background in all stages of the health care process.
- There is a substantial need for adequately prepared multilingual health information.

Abstract citation ID: ckac131.504

The influence of social support on subjective health among people with selected citizenships

Marleen Bug

M Bug[1], *K Kajikhina*[1], *C Hövener*[1], *C Koschollek*[1]
[1]Robert Koch-Institute, Berlin, Germany
Contact: bugm@rki.de

Background:

Social support as a psychosocial resource has a significant impact on health. However, data on the association between social support and subjective health among people with a migration history is scarce. The aim of this analysis was to examine this association among a sample of people with selected citizenships in consideration of socio-demographic and migration-related factors.

Methods:

Data from the project ‘‘Improving Health Monitoring in Migrant Populations (IMIRA)’’ was used, including people with Croatian, Polish, Romanian, Syrian, and Turkish citizenship. Descriptive and logistic regression analyses were conducted to analyse the effect of socio-demographic (gender, age, socio-economic status (SES)) and migration-related factors (length of residence, residence status, German language proficiency) on the association between social support and subjective health (very good/good).

Results:

A total of 60.8% of participants with a low level of social support, indicated good subjective health in comparison to 78.8% among those who reported strong support. Participants with a length of residence of over 20 years (aOR = 0,29) and (very) poor German language proficiency (aOR = 0,39) were less likely to report good health. A high SES had the strongest impact on good subjective health (aOR = 5,42).

Conclusions:

Overall, the results confirm the findings for the general population in a sample of people with selected citizenships. The fact that people with a migration history more often face structural and health related barriers and that the existence of resources is helpful in overcoming these, a differentiated consideration of the relationship between social support and subjective health seems necessary in order to establish targeted prevention measures.

Key messages:

- Among people with selected citizenships, good social support has a positive impact on subjective health.
- Results remain consistent when considering socio-economic and migration-related factors.

Abstract citation ID: ckac131.505
Psychiatric Comorbidity Among Sexual and Gender Minority Youth and Young Adults at Risk for Suicide

Arjan van der Star

A van der Star[1], JP Brady[2], CA Albright[2], M Gonzales IV[2], C Garcia Alcaraz[2], R Cobian Aguilar[2], A Askew[2], AJ Blashill[1,2], KJ Wells[1,2]
[1]Department of Psychology, San Diego State University, San Diego, CA, USA
[2]Joint Doctoral Program in Clinical Psychology, San Diego State University, UC San Diego, San Diego, CA, USA
Contact: arjan.van.der.star@ki.se

Background:

Compared with peers, young sexual and gender minorities (SGM) are at a four to seven-fold increased risk of attempting suicide. Prior epidemiological studies, mainly focusing on monomorbid inequalities and without conducting diagnostic clinical interviews, have been unable to report robust data on psychiatric comorbidities among those who attempted suicide. The purpose of this presentation is to describe the presence of current psychiatric comorbidities among SGM youth and young adults at elevated risk for repeat suicide attempts.

Methods:

A diverse convenience sample of SGM youth and young adults with a lifetime history of suicide attempts and current suicidal ideation was recruited for an open-phase suicide prevention trial in San Diego, CA. At baseline, participants underwent a 15-module DIAMOND interview for adults or computerized K-SADS for minors, and a battery of self-report questionnaires.

Results:

Among the 31 participants (Mage = 22 years [Range: 16, 29]; 100% sexual, 52% gender, and 61% racial/ethnic minority), 27 (87%) participants met criteria for any mood disorder, 24 (77%) for any anxiety disorder, 16 (52%) for any trauma or stress disorder, and 2 (6%) for any psychotic disorder. One (3%) participant did not meet criteria for any psychiatric diagnoses, while five (16%) met criteria for a single and 25 (81%) for multiple diagnoses. The average number of diagnoses was 3.2 (Range: 0, 7). Additionally, 20 (65%) participants met the cut-off for likely ADHD, 20 (65%) for possible borderline personality disorder, and 21 (68%) for likely body dysmorphic disorder, with 11 (35%) within the 90th percentile for reference eating disorder severity.

Conclusions:

The degree of psychiatric comorbidities in the sample of SGM youth and young adults at elevated risk for suicide was high. Beside direct suicide risk mitigation efforts, suicide prevention programs that target young SGM with a history of attempts should screen for untreated psychiatric disorders.

Key messages:

- LGBTQ+ youth and young adults at elevated risk for repeat suicide attempts experience a high degree of psychiatric comorbity.
- Beyond suicide risk mitigation, LGBTQ+ youth suicide prevention programs should focus on untreated psychiatric comorbidities.

Abstract citation ID: ckac131.506
Up to the TASG: a participatory study on sexual health of trans and non-binary persons in Germany

Uwe Koppe

U Koppe[1], C Spurgat[2], JM knoop[3], A Hahne[4], MN Appenroth[5], K Pöge[1], J Hamm[2]
[1]Department of Infectious Disease Epidemiology, Robert Koch Institute, Berlin, Germany
[2]Deutsche Aidshilfe, Berlin, Germany
[3]Kiel, Germany
[4]Hamburg, Germany
[5]Institute of Public Health, Charité Universitätsmedizin Berlin, Berlin, Germany
Contact: koppeu@rki.de

Problem:

Comprehensive data on the sexual health of trans and non-binary people are not available due to lacking focus on these groups and inappropriate study designs that often fail to capture the lived realities of these communities.

Description of the practice:

A participatory study was developed with trans and non-binary representatives with a qualitative part involving single and group interviews as well as the development and roll-out of a quantitative online questionnaire. After securing funding, we started the study in 2020 ensuring community involvement in as many parts as possible.

Results:

A crucial component is the advisory board including people representing a broad spectrum of trans and non-binary communities, organizations, who are also representing a variety of intersectional perspectives, e.g. BIPoC and neurodiverse people. The advisory board provides crucial input to the design and conduct of the study components. For the qualitative part, a unique study design was developed using sexual health & empowerment workshops for trans and non-binary people in a trustful peer setting combined with qualitative data collection. This way, participants of the study truly benefit from participation and the data quality is improved. The quantitative study was created together with >20 community representatives. Items on gender identity, transition, and experiences of discrimination were developed using online workshops and written feedback. The questionnaire was checked by community members to ensure appropriate language. Through diverse community channels and social media, we recruited 58 participants for the qualitative part and more than 2000 participants for the online questionnaire. The results are expected in late 2022.

Lessons:

Involvement of community representatives and the participatory study design ensured strong community support. This enables the capture of meaningful information on the sexual health of trans and non-binary people.

Key messages:

- Using a participatory study design was crucial to the success of this study.
- We were able to conduct a study capturing meaningful data on the sexual health of trans and non-binary communities.

Abstract citation ID: ckac131.507
Factors associated with SARS-CoV-2 infections among migrants in Germany

Carmen Koschollek

C Koschollek[1], K Kajikhina[1,2], N Michalski[1], C Hövener[1]
[1]Department Epidemiology and Health Monitoring, Robert Koch Institute, Berlin, Germany
[2]Department Infectious Disease Epidemiology, Robert Koch Institute, Berlin, Germany
Contact: KoschollekC@rki.de

Background:

International research shows increased risks for SARS-CoV-2 infection and severe disease progression in people with migration history. In Germany, data on this topic is scarce. Aim of this contribution is to examine the association between migrant status and risk of SARS-CoV-2 infection and discuss potential explanatory mechanisms.

Methods:

We analysed data from the German COVID-19 Snapshot Monitoring online-survey and performed hierarchical multiple regression models to calculate probabilities for a self-reported SARS-CoV-2 infection. Main predictor variable was the migrant status; besides, the association with gender, age, education, household size, household language (German vs. other), and occupation in the health sector was analysed.

Results:
Of 45,858 participants, 3.5% reported a current or previous infection with SARS-CoV-2, 16% reported own or parental history of migration. The probability of reporting an infection was 3.95 percentage points higher among migrants. The effect of different characteristics on self-reported SARS-CoV-2 infection varied. Higher probabilities were shown for individuals living in bigger households and those not speaking German at home. Stepwise integration decreased the observed association with migrant status. When adding an interaction term of migrant status and occupation in the health sector, the probability to report an infection was 11.5 percentage points higher for migrants working in the health sector.

Conclusions:
People with migration history, health sector employees and particular migrant health workers are at a higher risk of SARS-CoV-2 infection. However, the migrant status itself does not determine the risk of infection, but the living and working conditions. Therefore, targeted and multilingual prevention measures are needed that consider living and working conditions.

Key messages:

- Higher SARS-CoV-2 infection risks are not solely determined by migrant status, but were shown for health care workers, people living in bigger households and those not speaking German at home.
- As not the migrant status determines infection risks, multilingual and targeted prevention measures considering the living and working conditions of people are necessary.

Abstract citation ID: ckac131.508
eHealth solutions for trans* persons: a systematic literature review of research from 2000 till 2021

Susanne Gahbauer

S Gahbauer[1], *D Haluza*[2]
[1]Department of Social and Preventive Medicine, Medical University of Vienna, Vienna, Austria
[2]Department of Environmental Health, Medical University of Vienna, Vienna, Austria
Contact: susanne.gahbauer@meduniwien.ac.at

Though familiarity with trans* persons ́ needs has increased in the new millennium, still, addressing their specific health issues is challenging. In and outside of complex interdisciplinary settings with trans* persons and health care workers, ICT solutions are used to remind trans* persons of their hormone injection or to conduct voice training. Hence, we reviewed the pertinent literature to shed light on what kind of eHealth solutions are investigated, what diagnosis and treatment are eHealth solutions related to, and how are trans* persons enacted within these eHealth solutions. We conducted a systematic literature review analyzing peer reviewed articles presenting all kind of studies except literature reviews. Using the electronic databases PubMed and Scopus, we analyzed data from 1 January 2000 to 31 December 2021. For screening purposes we used the PRISMA checklist and, data extraction followed the PICO (Population, Intervention, Control, Outcome, and Improvement) model. We also analyzed studies covering aspects of the impact on the COVID-19 pandemic. Overall, we identified 322 records, 187 from Scopus and 135 from PubMed. Removing 117 duplicated and 47 records for other reasons, 158 reports were assessed for eligibility. Our results show that trans* persons were often presented as subsamples in larger samples of non-binary populations. Also, eHealth solutions related to very different technological solutions and to a wide range of treatment models, with the vast majority relating to sexual health. Hence, we could also see that trans* women were the more interesting group in the research included in this review. We found 23 studies relating to COVID-19. eHealth solutions have great potential to contribute to a better healthcare for trans* persons but the needs of different groups during healthcare have to be taken into account in further research. During the COVID-19 pandemic, the need for research on eHealth solutions for trans* persons came into focus.

Key messages:

- Our analyzes showed that research on eHealth solutions for trans* persons takes place in complex interdisciplinary settings which need to be taken into account in further research.
- The COVID-19 pandemic crisis lead to an uptake of eHealth interventions in mental, endocrinological, and sexual health care, especially in younger groups and in the frame of routine clinical care.

Barriers to primary care access for asylum seekers and refugees in the UK: a systematic review

Priyamvada Paudyal

S Harrington[1], *S Sornalingam*[1], *R Evenden*[1], *N Singh*[1], *P Paudyal*[1]
[1]Primary Care and Public Health, Brighton and Sussex Medical School, Brighton, UK
Contact: p.paudyal@bsms.ac.uk

Background:
Recent armed conflicts, in addition to the deterioration of humanitarian conditions across the world, has led to the biggest increase in civilian displacement since World War II. Exploration of the barriers and facilitators to primary healthcare access amongst asylum seekers and refugees (ASRs), from the perspective of both service users and service providers, is important for improving policy and practice to ensure more equitable health care.

Methods:
Systematic searches of PubMed, EMBASE, MEDLINE, and CINHL databases were conducted to identify articles until May 2021 using a combination of relevant search terms. Studies were eligible if they were published in English and conducted in ASR populations in primary care settings the UK using qualitative approaches. Literature was thematically analysed using Braun and Clarke's 6-step process. Quality assessment of included studies was conducted using the Mixed Methods Appraisal Tool.

Results:
Nine studies were included in the review. Key themes identified included: accommodation within services; awareness of service navigation, negotiation and eligibility of care; accessibility; availability of appointments; acceptance; complexity within health needs; and cultural appropriateness. Healthcare professionals encounter barriers and facilitators within the healthcare setting, the overall healthcare system, and with regards to their understanding of migration policy. ASRs experience barriers and facilitators with regards to accessing and understanding the health system, cultural appropriateness of care, cost, stigma and prejudice, and availability of specialist services.

Conclusions:
This study highlights the difficulties ASRs and healthcare professionals face in primary care settings, the need for consistent and unambiguous guidance that supports the cultural competence of the heath service, and the need for further research into the efforts made to eliminate health discrimination within primary care.

Key messages:

- Barriers exist to primary healthcare amongst asylum seekers and refugees.
- Specialised and incorporated healthcare and support is needed due to unique social, cultural, and demographical differences of this population.

Abstract citation ID: ckac131.510
Health interventions for migrants and refugees in host Southeast Asian countries: a systematic review

Khatia Antia

J Sappyabanphot[1]*, TT Aye*[1]*, P Shreedhar*[1]*, Z Wasko*[1]*, K Antia*[1]*, V Winkler*[1]
[1]Heidelberg Institute of Global Health, Heidelberg University Hospital, Heidelberg, Germany
Contact: khatia.antia@uni-heidelberg.de

Background:
Understanding the different types of health interventions that have been conducted for migrants and refugees is crucial for the improvement and implementation of future health interventions for these populations. This systematic review aimed to identify and to look at the scope and outcomes of health interventions focused on migrants and refugees in the main host counties in Southeast Asia which are Thailand, Singapore, and Malaysia.

Methods:
This study was conducted in line with the PRISMA guidelines and its protocol has been submitted to PROSPERO. The following databases were searched until June 2021: PubMed, Web of Science, Science Direct, Cochrane, and Google Scholar. Studies were excluded if: 1) they were conducted outside Thailand, Singapore, and Malaysia; 2) had only had qualitative results; 3) were non-peer reviewed; 4) not written in English.

Results:
The search yielded 8,266 studies, out of which 33 were included in the review. The majority of the studies (79%) were conducted in Thailand of which most were focused on migrants or refugees from Myanmar (85%). Besides two randomized controlled trials (RCTs) of mental health interventions, most Thai studies were observational (81%) and focused on infectious disease-related interventions (33%) or the evaluation of health-related programs (29%). Six studies were conducted in Malaysia (18%) of which 4 assessed mental health interventions in refugees. Three of these studies were RCTs, whereas 1 was an observational study. Only 1 study was situated in Singapore and was an RCT evaluating treatments for COVID-19 in migrant workers. Even in studies with similar interventions, outcomes were too diverse to conduct a meta-analysis.

Conclusions:
The low number of studies highlights the gap in literature on health interventions for migrants and refugees, especially in Malaysia and Singapore. More rigorous and cohesive intervention-related research needs to be conducted in Southeast Asia.

Key messages:
- More intervention-related research for migrant and refugee populations in the main Southeast Asian host countries is needed.
- Interventions for migrant and refugee populations in host countries in Southeast Asia often do not follow the gold standard RCT study design, limiting the knowledge on their effectiveness.

Abstract citation ID: ckac131.511
Health and equity: Venezuela's and Brazil's public health policies aimed at the LGBTQ+ population

Carolina Knihs de Camargo

C Knihs de Camargo[1]*, S Moncada*[1]*, N Nawal Huda*[1]
[1]Global Public Health, Karolinska Institutet, Solna, Sweden
Contact: carol.knx@gmail.com

Background:
Public health policies aimed at the LGBTQ+ population within Latin America have been a theme of discussion among policymakers, governments, and society. Latin America's conservative idiosyncrasy has delayed advances in this regard. A common factor has been inequity and difficulty in access to healthcare institutions by LGBTQ+ groups. Despite some improvements in some regions, there are still huge gaps between neighboring countries as in the case of Brazil and Venezuela. The aim of this study is to investigate and compare the existence and implementation of health policies aimed to improve the health equity of the LGBTQ+ population in both countries.

Methods:
Scoping review in international journal databases and grey literature, such as official government websites, and NGOs reports.

Results:
In Brazil, the "National Policy for comprehensive health of lesbians, gays, bisexuals and transgender populations" was created in 2011. Nonetheless, its implementation encounters challenges. The main difficulties are: under budgeting, lack of training of healthcare personnel, and challenges in monitoring and assessing proposed health interventions. In Venezuela, till today there is a lack of institutional protective policies and health policies directed at this population. Some examples include the impossibility to rectify documents to reflect transgender people's identity, adequate protection from the law against civilian violations, same-sex marriage, and legal conditions for children of same-sex parents.

Conclusions:
The points presented above restrain satisfactory access to health care, positioning the LGBTQ+ population in a vulnerable setting, and making it a challenge to achieve health equity. In order to strengthen the health care systems in both countries, breakthrough measures need to be taken to assure fundamental human rights.

Key messages:
- Venezuela lacks basic institutional protective policies aimed towards LGBTQ+ population, while Brazil has a National LGBT Health Policy.
- Achieving health equity and assurance of rights to the LGBTQ+ population remains a challenge in both Brazil and Venezuela.

Abstract citation ID: ckac131.512
Opportunities and Challenges in community-based inclusive science education

Sarah Scheer

S Scheer[1]*, O Orban*[2]
[1]Health and Social Science, IB University of Applied Health and Social Science, Berlin, Germany
[2]Medical Faculty Department of Health Sciences, Lund University, Lund, Sweden
Contact: sarah.scheer@ib-hochschule.de

Background:
This research is part of a Horizon2020 funded project named C4S - Community for sciences. The project aims to implement co-created inclusive science activities with children 0-16 years and their families in vulnerable communities. Best practice strategies will be developed to promote the empowerment of children in vulnerable situations. In six European cities, community-based inclusive science activities will be realized and evaluated. What is the impact of inclusive science education on vulnerable communities' health in Europe? Why is community-based inclusive science education an urgent issue to improve health conditions of children and families?

Methods:
Guided by the research questions this method includes an integrative literature review to explore barriers and facilitators to delivering inclusive science in European countries and a questionnaire delivered to 6 Hubs involved in the C4S project. The questionnaire identifies core elements of a community, e.g. "Joint action", "social ties" and "Diversity". Both the literature review and the community questionnaire are performed in co-creation with inclusive science activities.

Results:

Preliminary findings of 214 bibliographical references show the importance and evidence of inclusive science education. When it comes to specific groups of people who are in vulnerable situations, only a few references could be identified. Most results are related to children with disabilities in comparison to children from ethnic minorities. However, ongoing discussions about intersectionality and decolonial theories were identified topics to answer our research questions.

Conclusions:

The literature shows evidence about inclusive science but lack of specific information for specific target groups. Therefore, the questionnaire distributed to the Hubs may offer new perspectives and will lead to specific knowledge about communities' needs and resources to ensure inclusive science with and for children in vulnerable situations.

Key messages:

- Inclusive and community-oriented science education is relevant to empower children in vulnerable situations.
- New perspectives and deeper knowledge about context specific factors that facilitate inclusive science education may contribute to sustainable health.

Abstract citation ID: ckac131.513
National belonging and psychological strain among Finnish migrant populations

Anna Seppänen

A Seppänen[1], H Kuusio[1], L Mäkipää[1], E Lilja[1], S Rask[1], A Castaneda[1]
[1]Equality, Public Health and Welfare, Finnish Institute for Health and Welfare, Helsinki, Finland
Contact: anna.p.seppanen@thl.fi

Background:

National identities are socially constructed and imaginary groups with real-life consequences. Migrants are in a heightened risk to be treated as 'others' who do not belong to society. It remains unclear, to what extent national belonging is experienced among Finnish migrants and what consequences on health this has. We study migrants' sense of belonging to Finns, how it's manifested in sociodemographic groups and whether it's associated with psychological strain.

Methods:

We used nationally representative data from the cross-sectional Survey on Well-Being among Foreign-Born Population (FinMonik, n = 6836). National belonging was assessed by the item "Finns" in question "which of the following areas or groups you feel you belong to?". Response options fully and quite a lot were coded to indicate sense of belonging. Logistic regression was used to test the association between belonging, sociodemographic factors and psychological strain (MHI-5). Weights were used to correct the sample.

Results:

51% reported sense of belonging to Finns. 46% of those aged 30-44 reported sense of belonging to Finns, whereas the youngest and oldest age groups yielded highest prevalences (18-29 = 53% and 45-64 = 58%, p<.001). Married persons reported sense of belonging to Finns more than those who weren't (55% vs. 48%, p<.01). Country group accounted for the variation in Finnish identification with a p-value of less than 0.001. Only 27 percent of those born in East Asia reported sense of belonging to Finns, whereas almost 60% of those born in Middle East and North Africa sensed belonging to Finns. Those with sense of belonging to Finns were twice as likely to report lack of psychological strain than those with no sense of belonging to Finns (p<.001).

Conclusions:

Achieving national belonging to the receiving society seems to be more difficult or non-appealing for some migrant populations than others. Lack of national belonging poses risk of deterioration of mental health.

Key messages:

- The socially constructed boundaries of national belonging can be exclusionary and have negative consequences for the health of migrant populations.
- Experiencing a sense of national belonging to the country of residence has positive associations with mental wellbeing.

Abstract citation ID: ckac131.514
Psychiatric and somatic health of homeless individuals in the context of their migration history

Franziska Bertram

F Bertram[1], A Hajek[2], H-H König[2], B Wulff[1], B Ondruschka[1], K Püschel[1], F Heinrich[1]
[1]Institute of Legal Medicine, University Medical Center Hamburg-Eppendorf, Hamburg, Germany
[2]Health Economics and Health Care Research, University Medical Center Hamburg-Eppendorf, Hamburg, Germany
Contact: f.bertram@uke.de

Background:

Descriptions of homeless individuals' somatic and psychiatric health status remain scarce. The heterogenicity of the population is increasing, with more people migrating within the European Union. Migration history has been described as a determinant of health and healthcare access.

Methods:

A multicenter cross-sectional study design included homeless individuals in Germany. Using interview-based questionnaires, the prevalence of mental and somatic illnesses, as well as healthcare use and access, were determined. Multinominal logistic regression analysis was performed to examine the influence of the homeless migration history on health status.

Results:

306/635 (48.2%) of the homeless individuals were born outside Germany; 213/306 (69.6%) came from another EU country. Homeless people from EU countries frequently reported economic reasons for leaving their home country (51.0%) and entering Germany (64.4%). Compared to homeless individuals of German origin and homeless non-EU migrants, they stated to live rough (48.2% p = 0,03), not hold health insurance (62.4% p < 0,0001), and not receive state funds (82.6% p < 0,0001) more often. Prevalences of psychiatric and somatic illnesses among homeless people were high compared to the general German population. There were no differences observed between the prevalence of chronic diseases if stratified by the origin of the homeless individuals.

Conclusions:

Homeless individuals report higher prevalences of psychiatric and somatic illnesses than the general population. Compared to homeless people of other origins, homeless EU migrants may be disadvantaged in their housing situation and integration into the German social security system.

Key messages:

- Programs aiming to integrate homeless people into mainstream health care should focus on homeless EU migrants.
- Our data underline the need for specific care services for homeless individuals.

Abstract citation ID: ckac131.515
Co-production in public health research grant writing: engaging underserved migrant mothers in the UK

Kerrie Stevenson

K Stevenson[1,2], K Ogunlana[2], Y Ciftici[3], M Knight[4], R Aldridge[2], F Stevenson[5]
[1]Faculty of Public Health and Policy, LSHTM, London, UK
[2]Institute for Health Informatics, University College London, London, UK
[3]Doctors of the World UK, London, UK
[4]National Perinatal Epidemiology Unit, University of Oxford, Oxford, UK
[5]Primary Care and Population Health, University College London, London, UK
Contact: kerrie.stevenson@lshtm.ac.uk

Background:
In the UK, one in three births is to a non-UK born woman, but there is a gap in co-produced research to explore their experiences. The National Institute for Health and Care Research (NIHR) defines co-production as 'an approach in which researchers, practitioners, and members of the public work together, sharing power and responsibility'. This project co-produced a grant proposal to improve maternity care for underserved migrant women in the UK. We reflect on transferrable learning for engaging those whose voices are less often heard in grant writing.

Methods:
An expert by experience, an underserved migrant woman who gave birth in the UK, joined the research team. Four online engagement workshops were conducted; two involved only migrant women, two were multi-disciplinary. 26 underserved migrant women attended. NIHR INVOLVE public involvement guidance was consulted.

Results:
Women said they were often asked about negative experiences which felt disempowering, and rarely asked about solutions. Thus, we shifted the focus of our work to co-designing solutions. Women said that having an expert by experience co-host workshops encouraged engagement, so we integrated this into our methods. Some women were uncomfortable in professional groups. Thus, our proposed steering and focus groups will have an expert by experience subgroup with elected members attending multi-disciplinary groups. We will engage mostly online as women preferred this to enable flexibility with childcare. The lead expert by experience helped form the proposal through brainstorming, co-drafting, and feedback; experts by experience commented on the draft via email and workshops. The lead expert by experience wished to gain further experience of research methods, for which we requested additional funding.

Conclusions:
This project highlights the immense potential for co-production in public health research, and the value of adapting research planning to maximise the voices of the less often heard.

Key messages:
- Engaging experts by experiences in public health research planning is key to ensuring our work addresses the needs of underserved communities.
- Co-Production of research requires determination to involve those whose voices are less often heard from the beginning of the research process, and to commit to joined working throughout.

Abstract citation ID: ckac131.516
Substance use prevention among migrant children in Serbia- challenges and opportunities

Biljana Kilibarda

B Kilibarda[1], P Simonovic[1], A Medarevic[1], V Jovanovic[1], M Vasic[1], I Misic[2], J Zajeganovic-Jakovljevic[2]
[1]Institute of Public Health of Serbia, Belgrade, Serbia
[2]UNICEF Serbia, Belgrade, Serbia
Contact: kilibarda_b@yahoo.com

Among almost millions of children asylum seekers registered in the EU in 2015-2017, there were one-fifth unaccompanied children. These children are facing many challenges, including substance use while at the same time the recommendations for prevention are underdeveloped in many countries. To address the issue of substance use among migrant children in Serbia, the Institute of Public Health of Serbia with the support of the UNICEF and in cooperation with other partners developed recommendations for preventive activities in 2022 based on the migrant needs and country-specific situation. In the first phase of development, a desk review of current legislation and available relevant data was done. In the second phase, in order to gain in-depth view of the challenges and opportunities, workshops were conducted in two migrant centers with medical and other staff. Based on the findings and consultation process, feasible, evidence-based interventions were recommended. Several barriers to the implementation of evidence-based prevention activities in migrant centers were identified. To address the knowledge gap on the management of acute intoxication and the current referral system, guidelines were developed. The diversity of professional backgrounds of staff in migrant centers was identified as a barrier and recommendations for further training were made. There are several barriers that need further action and solutions such as short periods of stay in centers that hinder the provision of structured programs, language barriers, and ethical issues for minors, especially unaccompanied children. Prevention activities in migrant centers need to consider the specific needs of migrants, such as language barrier, capacities, and relevant knowledge of available staff and country-specific situations. The development of guidelines and a flowchart for a referral system for migrants at risk for substance abuse and dependence can be a useful tool for staff in migrant centers.

Key messages:
- Substance use prevention among migrants should be evidence-based and in line with migrant needs and country-specific situations.
- Guidelines for prevention should be available to migrant centers' staff.

Abstract citation ID: ckac131.517
COVID-19 among migrants, refugees, and IDPs: a synthesis of the global empirical literature

Maren Hintermeier

M Hintermeier[1,2], N Gottlieb[2], J Oppenberg[2], A Mohsenpour[2], S Flores[3], S Rohleder[1,2], S Pernitez-Agan[4], J Lopez[4], K Wickramage[4], K Bozorgmehr[1,2]
[1]Department of General Practice and HSR, University Hospital Heidelberg, Heidelberg, Germany
[2]Departmentof Population Medicine and Health Research, Bielefeld University, Bielefeld, Germany
[3]Department of Public Health and Caring Sciences, Uppsala University, Uppsala, Sweden
[4]UN Migration Agency, International Organization for Migration, Manila, Philippines
Contact: Maren.Hintermeier@med.uni-heidelberg.de

Background:
The COVID-19 syndemic reveals social and health inequalities, putting marginalized groups such as migrants at greater risk. Yet health systems fail to routinely monitor the health of migrants, refugees, and internally displaced persons. Our systematic review provides an up-to-date synthesis of the empirical evidence on COVID-19 infection risk, transmission, outcome of disease and risk of severe course of disease among migrant populations. It further aims to compile extant evidence on COVID-19 vaccination coverage among these groups, and on the effects of pandemic control measures on their health.

Methods:
Following PRISMA guidelines, we registered a review protocol, searched 14 scientific databases and 4 pre-print servers using the WHO database of global literature on COVID-19, and hand-searched relevant websites for grey literature. The search period covers the time from 12/2019 to 11/30/2021. Articles in English, German and Spanish and all study designs were included.

Results:
A total of 6966 references were identified for title and abstract screening. 518 records were screened in full-text, out of which 204 articles were included so far (conflict solving at full-text stage and data extraction are ongoing). Our review presents a broad landscape of different study designs, migrant populations and COVID-19 outcomes. Based on previous work, we

expect to find a higher risk of infection in migrants and their disproportionate share among COVID-19 cases, and consolidate the (mental) health impacts of pandemic control measures. Our preliminary findings indicate a vast knowledge gap on vaccination coverage among migrant groups.

Conclusions:

Two years into the syndemic, this review summarizes the global empirical evidence on the impact of the COVID-19 syndemic on migrant populations. With health systems often lacking related data, the review provides an important evidence base for the consideration of migrants in future pandemic preparedness policies.

Key messages:

- The systematic review provides an up-to-date synthesis of the empirical evidence on COVID-19 among diverse migrant populations globally.
- Knowledge on vaccination coverage in migrants remains patchy.

Abstract citation ID: ckac131.518
Cross-sectional nutrition assessment in a refugee camp in Gambella region, Ethiopia

Roberto Benoni

R Benoni[1], A Sartorello[1], E Paiola[1], F Moretti[1], R Buson[2], A Tsegaye[2], S Tardivo[1], F Manenti[2]
[1]Department of Diagnostics and Public Health, University of Verona, Verona, Italy
[2]Doctors with Africa CUAMM, Padua, Italy
Contact: roberto.benoni90@gmail.com

Minors account for 20 percent of the world's migrants, reaching 33 million in 2019. The prevalence of malnutrition has been reported between 17 and 21% among refugees. However, data about Sub-Saharan African refugees is lacking. The study evaluates the nutritional status of refugees in the Nguenyyiel camp in Gambella (Ethiopia). The retrospective cohort study included all children under five attending the first visit to the refugee camp's health post between 01/06/2021 and 31/08/2021. Sociodemographic data, body weight, and upper arm circumference (MUAC) were recorded. The z-score of weight for age (WFA) and MUAC for age (MUACZ) were estimated using the R 'anthro' package developed by the World Health Organization (WHO). Children with WFA <-2 standard deviations (SD) were considered underweight, those >2SD overweight. A MUACZ <-2SD defined acute malnutrition. Among the 782 patients admitted, 415 (53%) were under five. Females were 195 (47%). The mean age was 2.1 years (SD 1.6). The mean body weight was 11kg (SD 5). Considering the WFA, 200 (48%) children were within +2 SD. Children with WFA <-2SD were 92 (29%), those > 2SD were 28 (9%). The frequency of children with WFA <-2SD was higher in boys (p = 0.049). There were no differences in the frequency of children with WFA >2SD based on sex (p = 0.998). WFA decreased as age increased (p = 0.048). MUAC was recorded for 273 (66%) children. The mean MUAC was 14.2mm (SD 2.4). Children with MUAC z-scores within +2SD were 245 (77%). Children <-2SD were 92 (8%). The frequency of children with MUACZ <-2SD was not significantly different based on sex or age (p = 0.125, p = 0.324). The prevalence of malnutrition was moderate in the Nguenyyiel camp. At the same time, the frequency of underweight children was high, particularly among boys (34%) and with increasing age.

Key messages:

- Nutrition remains a problem in refugee camp settings, especially in children.
- Ensuring the health of refugees, as vulnerable population, should be a priority for both governments and international organizations.

Abstract citation ID: ckac131.519
Digital health information and female adolescents with turkish migration background

Zeynep Islertas

Z Islertas[1], UH Bittlingmayer[1]
[1]Educational University Freiburg Germany, Freiburg, Germany
Contact: zeynep.islertas@ph-freiburg.de

Background:

Youth with Turkish migration background (TRMB) are repeatedly classified as a vulnerable group. Digital health information, which is prepared and made available by various providers in a variety of ways, may represent an opportunity to promote the health of these adolescents. Empirical findings on wheter young people have access to digital health information and what role digital health information plays in their everyday lives are hard to find.

Methods:

In the project ELMi, a project of the HLCA Consortium, funded by the BMBF, female adolescents with TRMB were interviewed. Individual interviews as well as a focus group discussion were conducted and evaluated according to the Qualitative Content Analysis.

Results:

Female adolescents with TRMB have technical access to digital health information. They use New Media to obtain health information. When searching for digital health information, it is important for the adolescents to be able to find factual and comprehensibly formulated information quickly. German-language homepages are preferred by them. Parallel to the digital platform they regard female persons from their own social network as contact persons for health questions. They draw on their health-related knowledge and experience in order to be able to obtain answers to their own questions.

Conclusions:

Digital health information and the health-related knowledge and experience of the female social network are considered as a health related resource. German-language electronic information with low-threshold content can represent an opportunity to reach female adolescents with TRMB

Key messages:

- Female adolescents with TRMB demonstrate technical and content access to digital health information.
- Digital health information represents an opportunity to reach the target group.

Abstract citation ID: ckac131.520
Health in refugees and migrants who self-identify as sexual or gender minority

Erica Mattelin

E Mattelin[1,4], F Fröberg[1], L Korhonen[1,4,5], AR Khanolkar[2,3]
[1]Barnafrid, Linköpings University, Linköping, Sweden
[2]School of Life Course and Population Sciences, King's College London, London, UK
[3]Department of Global Public Health, Karolinska Insitute, Stockholm, Sweden
[4]Center for Social and Affective Neuroscience, Linköping University, Linköping, Sweden
[5]Department of Child and Adolescent Psychiatry, Linköping University, Linköping, Sweden
Contact: ericamattelin@gmail.com

Background:

In 2019, 80 million individuals were forcibly displaced. Yet, there is little knowledge on the health of refugees and migrants who self-identify as sexual- or gender minority (SGM). The aim was to examine health and health-related behaviors in refugee and migrant individuals who identify as SGM, and in comparison, to their heterosexual peers.

Methods:

This study included 168,952 persons aged 16-84 who answered the Swedish National Public Health Survey in 2018 and 2020. Participants were grouped into White heterosexual, White

SGM, migrant heterosexual, migrant SGM, refugee heterosexual, and refugee SGM. Outcomes included mental health (f.e. mental ill-health, suicidal ideation), general health, risky behaviors (f.e drug and alcohol use), and experiences of violence. Associations were analyzed using logistic and linear regression adjusting for sex, age, and educational level.

Results:

Being an SGM, regardless of refugee or migrant minority status, was associated with worse general health and mental ill-health compared to heterosexual peers including suicidal ideation in refugee SGM (OR 2.42, 95 % CI 1.44-4.08). Both refugees and migrants had for example lower odds of drug and risk alcohol use compared to heterosexual peers but higher odds of risk gambling (OR 1.88, 1.49-2.37 for refugee SGM). Transgender refugees had high odds for risk gambling (OR 8.62, 1.94-38.40) and exposure to physical violence (OR 7.46, 2.97-18.70).

Conclusions:

In this national population-based study, SGM have worse mental and general health regardless of being refugee or migrant minority. SGM refugees did not have worse health compared to migrant and White SGM and their heterosexual peers. While more research is needed, our study shows the need for public health personnel to be aware of potentially worse health and adverse experiences in SGM individuals, regardless of ethnic origin including refugees.

Key messages:

- Our study provides evidence for poorer health outcomes in diverse SGM-groups.
- Policies tackling health in refugees and SGM are still inadequate.

Abstract citation ID: ckac131.521
Vaccinating The Invisibles, the COVID-19 vaccination of irregular migrants in Rome

Ornella Punzo

O Punzo[1], *C Ferrara*[1], *S Pierconti*[2]
[1]CNEC, Istituto Superiore di Sanità, Rome, Italy
[2]INMP, Rome, Italy
Contact: ornella.punzo@iss.it

Background:

The death toll of the COVID-19 pandemic has been hugely downsized by the advent of the currently available vaccines, at least in high-income countries. Nevertheless, there is a huge gap between countries and within countries with respect to vaccination access and coverage. In June 2021, several non-governmental non-profit organizations responded to a call issued by Regione Lazio to help organize and enrol for vaccination vulnerable people such as irregular migrants and migrants living in temporary or informal settlements. Through a huge effort, non-profit voluntary organizations Nonna Roma and Intersos enabled the vaccination of thousands of immigrants from different countries, age and residence status.

Methods:

We obtained a dataset regarding part of the people these NGOs facilitated in accessing the vaccination booking. We had information regarding age, sex, country of origin, nationality and type of document.

Results:

These populations were from different ethnic backgrounds, in majority males and below 50 years old on average. We found an association between the continent of origin and holding any document and between age and holding any document, both at a significant level ($p < 0.05$). Coming from Asia, as opposed to coming to any other continent, and being younger, i.e. under 25 years of age, were associated with holding any type of document.

Conclusions:

We reflect on the need of rethinking the services for this population, having in mind article 25 of the Universal Declaration of Human Rights, but also, more practically, that often these people work in our elderly homes as caregivers or as cleaners in our offices. Therefore, making it easier to access health services would be in any country's interest, especially during a pandemic. Policy efforts directed at facilitating migrant access to health services would ultimately help create a safer community for both migrants and residents, for whom migrants often work as strategic employees.

Key messages:

- Irregular migrants have not been included in national vaccination plans everywhere, despite WHO and other entities recommendations.
- An integrated national plan for irregular migrants vaccination would be useful for protecting other vulnerable populations such as elderly.

Abstract citation ID: ckac131.522
Understanding clinician barriers to providing equitable healthcare for ethnic minority populations

Rebecca Newell

M Patel[1], *R Newell*[1], *S George*[1], *H Clark*[1]
[1]Newham University Hospital, Barts Health NHS Trust, London, UK
Contact: Rebecca.newell1@nhs.net

Background:

It has long been recognised that ethnic minority groups have worse health outcomes in the UK. Social determinants of health (SDH) contribute significantly to these inequalities. However, inequalities persist, even after controlling for these determinants. As well as being less likely to engage with healthcare services, ethnic minority groups are more likely to report poor experiences. The majority of healthcare in the UK is delivered through patient: clinician interactions (PCI), therefore a good working relationship with patients is paramount. Recent focus has been placed on ensuring "cultural competence". Whilst this is important, we suggest also examining the culture within healthcare itself. Healthcare professionals are not immune to bias, preconceptions and the stresses of work and this must be taken into account. A seminal piece of work on this is the "culture of medicine" framework proposed by Boutin-Foster et al, which examines the impact of these factors.

Aims and Methodology:

This paper aims to examine barriers within PCI that impact healthcare for ethnic minorities. A formal literature review was conducted and 131 relevant studies were identified. Grounded theory was used for analysis and data was categorised into themes with Boutin-Foster's framework used as a structure.

Results:

The review found that the concept of implicit bias was paramount in PCI. Three major barriers resulting from this bias are suggested: its impact on clinical decision making, the impact on clinician-patient communication and finally the resultant lack of trust in clinicians and poor perceived quality of care by ethnic minority groups.

Conclusions:

Clinician implicit bias is a major barrier to equitable healthcare for ethnic minority populations. A solution we propose is to acknowledge our own preconceptions. Awareness of our own culture, preconceptions and the pressures around us will allow us to find solutions to these barriers, including further research and education.

Key messages:

- Clinician implicit bias within the "Culture of Medicine" is a barrier to equitable healthcare for ethnic minority populations.
- Awareness of our own culture and preconceptions is paramount to addressing these barriers.

Making blind spots visible: the lack of race-conscious research and data in public and global health

Marie Meudec

M Meudec[1,2,3], *C Affun-Adegbulu*[1,3], *T Cosaert*[1,3], *T Verdonck*[1,3]
[1]Department of Public Health, Institute of Tropical Medicine, Antwerpen, Belgium
[2]Outbreak Research Team, Institute of Tropical Medicine, Antwerpen, Belgium
[3]Data Science Hub, Institute of Tropical Medicine, Antwerpen, Belgium
Contact: mmeudec@itg.be

In Continental Europe, race-conscious research and data (RCRD) is not adequately deployed in support of policy-making and social change to tackle health disparities. One reason is a lack of national data systems based on race in many countries, another is that researchers or policymakers are unaccustomed to taking them into account. One consequence of this for public and global health is the adoption and implementation of policies that are ostensibly race-neutral but which in fact reproduce ''methodological whiteness'' (Bhambra, 2017) and create or exacerbate racial health inequities. Calls to decolonise public health recognize the importance of RCRD, yet race or ethnicity as a variable in research continues to be seen as a contentious issue for a number of reasons. First, while some researchers see it as a valuable tool for addressing health inequalities or the impact of institutionalized and systemic racism on racialized/ethnic minority groups, others oppose its use on the ground that it can lead to stigmatization or racial stereotyping. Second, RCRD is often seen as too difficult to implement in practice, due to challenges of finding appropriate approaches to conceptualisation, operationalisation, data (non)collection, and interpretation. Third, many researchers fear that the use of race and ethnicity in research may be instrumentalized against minorities in ways that are sometimes difficult to anticipate. This project aims to contribute to addressing this, by building expertise for RCRD and creating a knowledge network and community of practice for researchers working in Public and Global Health in Continental Europe. The project begins by examining how RCRD is used at the Institute of Tropical Medicine Antwerp, which is located in Belgium, Europe but has research collaborations on other continents. It then continues with a scoping review on the use of RCRD to address racial and ethnic health disparities more generally across Europe.

Key messages:

- Race-conscious research and data are lacking in public and global health research and policy-making, leading to racial health disparities.
- Need to develop expertise and a network of researchers in race-conscious research and data in Europe.

Abstract citation ID: ckac131.524
Ethnic disparities in clinical severity of coronavirus disease 2019 (COVID-19) upon admission

Maria Goldschmidt

M Goldschmidt[1,2], *M Norredam*[1,2], *T Benfield*[2]
[1]Centre for Migration, Ethnicity and Health, Institute of Public Health, Copenhagen University, Copenhagen, Denmark
[2]Department of Infectious Diseases, Hvidovre Hospital, Copenhagen, Denmark
Contact: maria.goldschmidt@sund.ku.dk

Background:

Reports from all over the world have shown great ethnic disparities in COVID-19 morbidity and mortality. Recent European studies have found discrepancies between higher risk of admission and intensive care treatment among ethnic minorities but lower mortality rates compared to the ethnic majority. This study will elucidate the ethnic differences in disease severity upon admission as a possible factor in explaining these discrepancies.

Methods:

A retrospective cohort study of 1442 patients admitted with COVID-19 at three hospitals in Copenhagen, Denmark, between 1st February 2020 and 31st May 2022. Clinical, demographic and ethnicity data were extracted from health care records and collected using REDCap. Severity upon admission (< 24 hours) was assessed as 1) oxygen need, 2) oxygen administration and 3) need for intensive care.

Results:

Ethnicity was registered on 1341 patients (57,0% Danish, 34,8% non-Western). Over all, preliminary descriptive analyses show patients of non-Western origin had symptoms of COVID-19 for a longer period (8,0 vs 6,7 days, $p < 0{,}0001$) and had a higher oxygen need (7,0L vs 5,2L, $p = 0{,}02$) upon admission compared to patients of Danish origin. A higher percentage of patients of non-Western origin needed high flow oxygen administration upon admission (30,2% vs 22,9%, $p = 0{,}006$) and were transferred to the ICU within the first 24 hours (4,9% vs 2,2 %, $p = 0{,}02$) compared to patients of Danish origin. Further analysis will be done, including biochemistry and link to registers in order of obtaining more accurate info on country of birth and migration status. We will do logistic regression regarding ethnic differences in severity of COVID-19 upon admission adjusting for comorbidities, age, sex and BMI.

Conclusions:

Preliminary data on disease severity of COVID-19 upon admission show some ethnic disparities. Language barriers, low health literacy or the fear of stigma might explain this. Further analyses are needed.

Key messages:

- Preliminary data from this cohort study suggest that patients of non-Western origin had symptoms of COVID-19 for a longer period before being admitted compared to patients of Danish origin.
- Preliminary data on disease severity of COVID-19 upon admission show ethnic disparities with regard to oxygen need, oxygen administration and need for intensive care.

[3]Mo-Im Kim Nursing Research Institute, Yonsei University, Seoul, South Korea
[4]College of Nursing, Kosin University, Busan, South Korea
[5]School of Nursing, Soonchunhyang University, Cheonan, South Korea
Contact: leeleah86@gmail.com

Background:

As Korea transforms into a multicultural society, social vulnerability of the multicultural adolescents (MAs) puts them at risk for poor health and health disparities. However, there is shortage of evidence on social determinants of health (SDH), which refers to the circumstances of people from birth to death, which affects their health outcomes, for MAs. Thus, this study aims to explore the SDH of MAs from diverse stakeholders' perspectives.

Methods:

This qualitative study comprised 17 focus group interviews with 99 participants (MAs, peers, parents, teachers, neighbors, and community leaders), conducted from June to September 2020. The directed content analysis was conducted using the Minority Health and Health Disparities Research Framework with a high rigor level based on the four criteria of Lincoln and Guba's trustworthiness.

Results:

The participants addressed SDH of MAs in five domains: biological (vulnerability and mechanism); behavioral (health behavior, family/school/peer functioning, and policies and laws); physical/built environment (school/community environment); sociocultural environment (MAs'/parental sociodemographic, language proficiency, MAs'/parental acculturation, social network, and response to/interpersonal/local/societal structural discrimination); and health care system (insurance coverage, MAs'/parental health literacy, availability of services, and health care policies). However, limited SDH in biological and physical/built environment domains were identified.

Conclusions:

SDH in sociocultural environment domain and interpersonal influence level were the most commonly addressed. Interpersonal discrimination of both MAs and parents were found to be the most important SDH. These findings suggest that future programs to enhance MAs' health may be targeted toward reducing discrimination and involving their parents.

Key messages:

- Sociocultural environment was found to be the most salient SDH domain to affect MAs' health.
- SDH of MAs are linked to discrimination and their parents' sociocultural aspects such as acculturation.

Abstract citation ID: ckac131.526
Being a refugee in childhood and health in adulthood

Erica Mattelin

E Mattelin[1,2], AR Khanolkar[3,5], L Korhonen[1,2,4], F Froberg[1]
[1]Barnafrid, Linköpings University, Linköping, Sweden
[2]Center for Social and Affective Neuroscience, Linköpings University, Linköping, Sweden
[3]School of Life Course and Population Sciences, King's College London, London, UK
[4]Department of Child and Adolescent Psychiatry, Linköping Univerisity, Linköping, Sweden
[5]Department of Global Public Health, Karolinska Institutet, Stockholm, Sweden
Contact: ericamattelin@gmail.com

Aim:

To examine whether individuals who migrated to Sweden as refugees in childhood are more likely to experience poor mental and general health and violence in adulthood, compared to individuals born in Sweden, or who were migrants but not refugees.

Methods:

This study included 151,614 individuals who answered the Swedish National Public Health Survey in 2018 or 2020. We grouped the participants into refugees in childhood, migrants in childhood, or non-migrants. Information about outcomes - mental health, general health, and risk behaviors - was collected through questionnaires. We analyzed the associations using logistic regressions.

Results:

Overall, having been a refugee in childhood was generally not associated with poor general health and mental ill-health, risk behaviors, or exposure to violence, compared to those who were migrants or born in Sweden. However, there were some exceptions. For example, young men, who were refugees in childhood, had a higher likelihood of suicide attempts than non-migrants. Interestingly, childhood refugees and childhood migrants were less likely to use drugs and to have risky alcohol use as adults, compared to non-migrants, but were more likely to be risk gamblers.

Conclusions:

Being a refugee in childhood was not, in general, associated with negative health consequences in adulthood with some exceptions, such as gambling, that will be discussed in the presentation.

Key messages:

- In this study, refugee experience in childhood is not, in general, associated with worse health outcomes in adulthood.
- There are certain risk groups that need to be highlighted such as young males with refugee experience in childhood.

Abstract citation ID: ckac131.527
Maternal and perinatal health in undocumented migrants: estimating access and outcomes through HMIS

Eleonora Genovese

E Genovese[1], A Cantarutti[2], G Corrao[2], A Locatelli[1]
[1]Department of Medicine and Surgery, University of Milan-Bicocca, Milan, Italy
[2]Department of Statistics, University of Milan-Bicocca, Milan, Italy
Contact: eleonoragenovese1@gmail.com

Background:

Vulnerability and inequality are exacerbated in undocumented migrants, the most invisible to health systems.

Objectives:

To estimate maternal and perinatal health needs in undocumented migrants and test a methodology for systematic monitoring & evaluation.

Methods:

Population-based retrospective cohort study based on routine data through maternity records and temporary registration code in a sub-national Health Management Information System.

Results:

420924 deliveries including 1524 undocumented migrants having accessed maternity care through the NHS in Lombardy Region (Italy) from 2016 to 2021 were included. Demographics and social determinants: undocumented migrants were born in Europe (non-EU) (36%), Americas (30%), Africa (6%), Western Pacific (3%), South-East Asia (2%), Italy (2%), were stateless (7%); 52% had no/low schooling, 92% were unemployed and 52% non-married, compared to 15%, 20%, and 44% Italians. Obstetric history and antenatal care: 22% undocumented migrants had a previous abortion and 15% a previous cesarean delivery; 58% had $\geq$5 antenatal visits, 67% first ANC visit in trimester 1, 64% $\geq$ 2 ultrasounds incl. first in trimester 1, 6% full laboratory tests, compared to 90%, 97%, 97%, and 66% Italians. Intra-partum and perinatal care: 45% undocumented migrants delivered in a public hospital with neonatal intensive care unit; 69% had a normal delivery, 5% instrumental delivery, 10% and 27% emergency and total cesarean section; 2.6% neonates had emergency resuscitation and 49% were breastfed <2h from birth. Outcomes: 81% physiological pregnancies, 2.3% severe hemorrhage, 4.8% intra-uterine growth retardation, 9.3% pre-term delivery, 17% small for gestational age, 7% low birth weight, 0.6% poor Apgar score, 3% malformations.

Conclusions:

Maternal and perinatal health was poor in undocumented migrants, varying by birthplace. Social determinants, health coverage and outcomes showed vulnerability and inequality compared to the general population.

Key messages:

- Tailored interventions are needed: outreach health promotion on safe motherhood and neonatal care, healthcare provider training, cultural mediation, translation, and functional language learning.
- A systematic monitoring and evaluation system needs to routinely collect, integrate, and analyze data on key indicators.

DW Policy, politics and public health

Methodological choices in brucellosis burden of disease assessments: A systematic review

Carlotta di Bari

C di Bari[1,5], N Venkateswaran[2,5], G Patterson[3,5], D Pigott[2,5], B Devleesschauwer[1,4,5]
[1]Department of Epidemiology and Public Health, Sciensano, Brussels, Belgium
[2]Department of Health Metrics Sciences, Institute for Health Metrics and Evaluation, Seattle, USA
[3]Department of Population Medicine, University of Guelph, Guelph, Canada
[4]Department of Translational Physiology, Infectiology and Public Health, Ghent University, Ghent, Belgium
[5]Human Health, Global Burden of Animal Diseases, Liverpool, UK
Contact: carlotta.dibari@sciensano.be

Background:
Foodborne and zoonotic diseases such as brucellosis present many challenges to public health and economic welfare. Increasingly, researchers and public health institutes use disability-adjusted life years (DALYs) to generate a comprehensive comparison of the population health impact of these conditions. DALY calculations entail several methodological choices and assumptions, with data gaps and uncertainties to accommodate. The following review identifies existing brucellosis burden studies and analyses their methodological choices and assumptions.

Methods/Findings:
A systematic search for brucellosis burden calculations was conducted in pre-selected international and grey literature databases. Using a standardized reporting framework, we evaluated each estimate on a variety of key methodological assumptions necessary to compute a DALY. One study reported estimates at the global level, the rest (13) at national or subnational. Most studies retrieved brucellosis epidemiological data from administrative registries. Incidence data were often estimated based on laboratory-confirmed tests. Not all studies included mortality estimates (YLLs) in their assessments due to the lack of data or the assumption that brucellosis is not a fatal disease. Only two studies used a model with variable health states and corresponding disability weights. The rest used a simplified singular health state approach. Wide variation was seen in the duration chosen for brucellosis, ranging from 2 weeks to 4.5 years, irrespective of whether a chronic state was included.

Conclusions:
Available brucellosis burden assessments vary widely in their methodology and assumptions. Further research is needed to characterize better the total clinical course of brucellosis and estimate case-fatality rate. In addition, reporting of methodological choices should be improved to enhance transparency and comparability of estimates. These steps will increase the value of these estimates for policymakers.

Key messages:
- Inconsistencies in reporting methods and assumptions are found, which hinder transparency and understanding of the methodological choices and the reuse of estimates for prioritization purposes.
- Thus, there is a need for a more standardized reporting system for DALY estimates, which could resemble a checklist that reports the methodological choices and assumptions.

Abstract citation ID: ckac131.529
Quality of national cancer control programmes in Europe

Marjetka Jelenc

M Jelenc[1,2], T Albreht[1,3]
[1]Center for Health Care, National Institute of Public Health, Ljubljana, Slovenia
[2]Faculty of Health Sciences, University of Maribor, Maribor, Slovenia
[3]Medical Faculty, University of Ljubljana, Ljubljana, Slovenia
Contact: marjetka.jelenc@nijz.si

Background:
Cancer remains among the leading causes of death worldwide and the COVID-19 pandemic had a negative impact on its diagnosis and treatment. National Cancer Control Programmes (NCCPs) are key documents in the field of cancer control. As they are directed at reducing cancer morbidity, mortality, and improvement of the quality of life of cancer patients, they can make a significant contribution in tackling the challenges posed by cancer in Europe. The aim of the present study, which is unique of its kind, was to evaluate the situation regarding the presence of NCCPs in Europe in 2016, as well as to analyse the presence and implementation status of the key elements of NCCPs that European Guide for Quality National Cancer Control Programmes (Guide) recommends.

Methods:
In the frame of the Cancer Control Joint Action a policy survey was carried out through 35 countries: EU member states, Iceland, Montenegro, Norway and Turkey, focusing on inclusion of the chapters from the Guide, participation of stakeholders, preparation, implementation and dissemination.

Results:
Thirty countries responded and 28 out of those had a NCCP or a similar cancer document. NCCPs were mostly single documents; 9 documents were defined as programmes, 8 as plans and 6 as strategies. The terminology was mixed in 5 countries. NCCPs were managed by the Ministries of Health and communicated to the public via websites and/or press. Drafting of NCCPs was mostly done through discussions, consensus meetings and negotiations. Only 10 countries included all elements suggested in the Guide in their NCCPs.

Conclusions:
The results of the survey showed that there are still countries without a NCCP. Regarding the content of NCCPs and other cancer documents the results indicated that the quality of the documents should be improved by covering all key elements suggested in the Guide and adding other innovative approaches.

Key messages:
- Instruments for more efficient cancer management are needed; they should encompass the entire pathway of cancer control from health promotion, to survivorship and supportive care.
- The ongoing and quickly developing activities on NCCPs in Europe should be monitored regularly.

Abstract citation ID: ckac131.530
Structural intervention proposals and the delegitimization of the institutions involved

Tim van Meurs

T van Meurs[1], J Oude Groeniger[1,2], W de Koster[1], J van der Waal[1]
[1]Department of Public Administration and Sociology, Erasmus University Rotterdam, Rotterdam, Netherlands
[2]Department of Public Health, Erasmus MC, Rotterdam, Netherlands
Contact: vanmeurs@essb.eur.nl

Improving citizens' nutritional intake is crucial to combat obesity. Especially structural interventions are effective; likely due to bypassing issues of individual agency. However, such restrictive interventions have low public acceptance, and pushback may create a negative feedback loop, adversely impacting the perceived legitimacy of the institutions involved. This may be especially so among less-educated individuals, as they consider health promotion institutions less legitimate.

Recent theorizing argues this may be due to the cultural distance perceived towards those populating the institutions. As structural interventions mainly target behavior more prevalent among less-educated individuals - e.g. sugar-sweetened beverage (SSB) consumption - this perceived distance may be enhanced. With a preregistered survey-experiment among a high-quality representative sample, fielded in February ‘22, we test if proposed structural interventions affect perceived legitimacy of health promotion institutions, and if this differs between educational groups. We used the strategically selected case of interventions to reduce SSB consumption in the Netherlands - currently not tackled by official interventions. This allowed us to confront citizens with a potential - rather than implemented - intervention, singling out its effects more clearly. Respondents were randomized into i) a control group presented with an explanation of the institutions and their information provision approach; or a treatment group with this information, plus ii) a proposed sugar tax or iii) a proposed regulated decrease of sugar content. Results indicate that institutions are perceived as less legitimate when citizens are confronted with structural intervention proposals, but little evidence for a moderating role of education is found. These results can improve awareness among policymakers regarding interventions effects besides health outcomes, and their risk for delegitimizing health institutions.

Key messages:

- Proposals for structural interventions decrease the perceived legitimacy of involved health promotion institutions across society.
- Less-educated citizens perceive health promotion institutions as less legitimate at baseline; structural intervention proposals maintain and occasionally increase this gap.

Abstract citation ID: ckac131.531
The gaps in health-adjusted life Expectancy (HALE) by income and region in Korea

Yoon-Sun Jung

YS Jung[1], *YE Kim*[2], *M Ock*[3], *SJ Yoon*[4]
[1]Institute for Future Public Health, Korea University, Seoul, South Korea
[2]Department of Big Data Strategy, National Health Insurance Service, Wonju, South Korea
[3]Department of Preventive Medicine, University of Ulsan College of Medicine, Ulsan, South Korea
[4]Department of Preventive Medicine, Korea University College of Medicine, Seoul, South Korea
Contact: sunnyaurora@nate.com

This study aims to calculate the health-adjusted life expectancy (HALE) by using years lived with disability (YLD) from the national claims data, as well as to identify the differences and inequalities in sex, income level and region. The study was carried out on total population receiving national health insurance and medical benefits. We calculated incidence-based YLD for 260 disease groups, and used it as the number of healthy years lost to calculate HALE. We adopted the insurance premium to calculate the income as a proxy indicator. For the region classification, we chose 250 Korean municipal-level administrative districts. The primary outcome was HALE in the Korean population. The second outcome was the HALE’s gap in terms of sex, income, and region. Our results revealed that HALE increased from 2008 (68.89 years) to 2019 (70.58 years). HALE in males increased faster than that in females. HALE was higher in higher income levels. In 2019, the gap in HALE between Q1 and Q2, the lower income group, was about 5.70 years. The gap in females by income level was smaller than that in males. Moreover, the gap in HALE by region was found to increase. Results suggest that there is an inequality in YLD in terms of income level in Korea. Therefore, we need intensive management for the low-income group to increase HALE at the national level.

Key messages:

- Males’ health level may be more sensitive to the socio-economic level than females’ health level.
- In the 5th National Health Plan (HP2030), it was decided to set a target value for the overall goals based on this result.

Abstract citation ID: ckac131.532
Patients’ migration for orthopaedic intensive rehabilitation among Italian Regions

Giovanni Guarducci

G Guarducci[1], *A Urbani*[2], *S Carbone*[2], *F Moirano*[3], *G Messina*[1,4], *N Nante*[1,4]
[1]Post Graduate School of Public Health, University of Siena, Siena, Italy
[2]General Directorate for Health Planning, Ministry of Health, Rome, Italy
[3]Fucina Sanità, Cuneo, Italy
[4]Department of Molecular and Developmental Medicine, University of Siena, Siena, Italy
Contact: giovanni.guarducc@student.unisi.it

Background:

Interregional patients’ migration, according to Italian Law, can be considered an expression of the (inviolable?) right to health and freedom of choice regarding place of care. It contributing, albeit perversely, to guaranteeing equity in the Italian National Health Service allowing citizens to overcome territorial inequalities in the distribution of healthcare services. The aim of our study was to analyze fulfilment of needs for orthopaedic intensive rehabilitation hospital services on site and interregional patients’ migration trends.

Methods:

We conducted an observational cross sectional study on Hospital Discharge Cards provided by the Ministry of Health, upon specific request, from 2011 to 2019. The study of interregional patients’ migration, for orthopaedic intensive rehabilitation, relative to single Italian regions was carried out from data of Residents, Attractions and Escapes, which were graphically developed through Gandy’s Nomogram. Trend analysis (Cuzick’s Test) was performed through STATA. Were considered statistically significant at level of 95% ($p < 0.05$).

Results:

In our studied period, Gandy’s Nomogram showed that only Piedmont, Lombardy, A.P. of Trento, E. Romagna, Umbria and Abruzzo had a good public hospital planning for orthopaedic intensive rehabilitation. Attractions increased significantly for Lombardy, A.P. of Trento, Veneto and Basilicata, while they decreased significantly for A.P. of Bolzano, Veneto, F.V. Giulia, Abruzzo, Calabria and Sicily. Escapes increased significantly for Veneto, F.V. Giulia, E. Romagna, Tuscany, Molise, Puglia and Basilicata, while they decreased significantly for Piedmont, Aosta Valley, A.P. of Trento, Umbria, Abruzzo and Sicily.

Conclusions:

Only six regions (4 in the North, 1 in the Centre and 1 in the South) satisfied care needs of their Residents, with an Attractions minus Escapes positive balance. Only A.P. of Trento appears to have been able to reduce Escapes and increase Attractions at the same time.

Key messages:

- Studying patients’ migration by type of health benefit makes it possible to identify specific situations of lack of supply.
- Patients’ migration is an indirect Index of a region’s health policy.

Abstract citation ID: ckac131.533
Viral hepatitis C – a challenge for the public health

Ivaylo Pakov

I Pakov[1], *K Terzieva*[1], *M Kunchev*[2], *D Shalamanov*[3], *M Karcheva*[1], *G Gancheva*[1]
[1]Department of Infectious Diseases, Epidemiology, Parasitology and Tropical Medicine, Medical University-Pleven, Pleven, Bulgaria
[2]Laboratory of Virology, Military Medical Academy, Sofia, Bulgaria

[3]Scientific Centre of Military Epidemiology and Hygiene, Military Medical Academy, Sofia, Bulgaria
Contact: ivaylo.pakov@gmail.com

Background:
Viral hepatitis C (VH C) is a global health problem with overall prevalence in 3-5% of the human population. This study provides the relevance of viral genome characterization in clinical settings.
Methods:
Retrospective study was conducted upon epidemiological, demographic, clinical, laboratory and viral characteristics in fifty cases of VH C confirmed with positive anti-HCV, evaluated by ELISA. Thirty eight of cases were hospitalized in different clinics of the University Hospital "Dr Georgi Stranski" - Pleven (2017-2018) and remainders were blood-donors registered in Regional Center of Transfusion Hematology - Pleven. The viral load and genotype of HCV had been investigated by Real-Time PCR in Laboratory of Virology at Military Medical Academy - Sofia.
Results:
The prevalence of cases was equal and highest in age groups 30-39 years and 60-69 years (24%, respectively). Males were 69.81% ($p < 0.05$). Surgical interventions (26.32%), blood infusions (23.68%) and hemodialysis (15.79%) were at highest risk for VHC ($p > 0.05$). Thirty hospital patients were with chronic VH C (78.95%) ($p < 0.05$). Clinical symptoms suggestive viral hepatitis were adynamia (39.47%; OR 5.25), anorexia (28.95%; OR 2.16), heaviness in the abdomen (21.05%; OR 23.33), and 52.63% of patients were asymptomatic ($p < 0.0005$). Laboratory investigations revealed slightly or moderately elevated total bilirubin (mean 53.27 ± 37.38 μmol/L; 95% CI 18.48-88.06) and transaminases - ASAT (mean 231.36 ± 155.82 IU/L; 95% CI 79.91-382.80) and ALAT (mean 294.48 ± 196.26 IU/L; 95% CI 96.37-492.59) ($p > 0.05$). Investigation of viral load of HCV revealed 22 samples with detectable viral load (range 683-673 720 copies/ml). All isolates of HCV had been proved to be genotype 1b.
Conclusions:
VH C is mostly asymptomatic. Screening for anti-HCV in risk groups and genotyping of HCV will improve surveillance, reduce nosocomial HCV-infections, facilitate therapeutic management and prevent complications of infected individuals.
Key messages:
- Screening for anti-HCV in risk groups and genotyping of HCV improves surveillance and reduces nosocomial HCV-infections.
- Screening for anti-HCV facilitates therapeutic management and prevents complications of infected individuals.

Abstract citation ID: ckac131.534
Alcohol industry's arguments against French pregnancy warning labels: a press coverage analysis
Ana Millot

A Millot[1], M Serra[2], K Gallopel-Morvan[1]
[1]Arènes UMR CNRS 6051, Inserm U1309, Ecole des Hautes Etudes en Santé Publique, Rennes, France
[2]Département des Sciences en Santé Environneme, Ecole des Hautes Etudes en Santé Publique, Rennes, France
Contact: ana.millot@ehesp.fr

Background:
Alcohol drinking during pregnancy has harmful consequences. Warnings displayed on alcohol bottles are an effective measure to inform people about these risks and have been put in place in France. However, the alcohol industry (AI) resisted this measure when it was introduced in 2007 and during an expansion project in 2018. This study aims to identify arguments used by the AI against warnings targeting pregnant women.
Methods:
A documentary method was used to analyse these arguments disseminated by the AI and its partners (elected representatives of wine-producing regions, etc.) in the French mainstream press (the national, regional and specialised press) from 2000 to 2020 through the Europresse documentary database. A quantitative analysis (number and evolution of press articles, mapping of the actors of AI who expressed themselves) and an inductive thematic content analysis (analytical framework of the arguments identified) using NVivo Software were carried out.
Results:
Among the 85 articles included in this study, a majority of the arguments used by the AI are against this measure. It argues that this measure (1) is a questionable measure because ineffective in changing behaviours, (2) will have counterproductive effects (on women and on the economy); and (3) there are other preferred alternatives than warnings (targeted prevention programs, etc.). A minority is nevertheless in favour of this measure. Among the actors who expressed themselves, a large majority comes from the winegrowing sector.
Conclusions:
The analysis of these arguments will add new insights about AI lobbying against warnings, by analyzing the arguments over a 20 years period covering a failure and a success of industry lobbying. It will also be useful for public health advocacy to better counter this lobbying influence and these arguments, which are not necessarily evidence based.
Key messages:
- Warnings displayed on alcohol bottles are an effective measure which is challenged by the alcohol industry.
- Analysing the arguments disseminated by the alcohol industry is useful for public health advocacy in order to counter them.

Abstract citation ID: ckac131.535
How does better regulation shape EU health policy? A case study of unhealthy advertising regulation
Kathrin Lauber

K Lauber[1], E Brooks[1]
[1]Global Health Policy Unit, University of Edinburgh, Edinburgh, UK
Contact: kathrin.lauber@ed.ac.uk

Introduction:
Better Regulation is a meta-regulatory tool designed to improve regulatory quality and reduce regulatory burden in the development of EU policy. Despite concerns by civil society that its operation may have a chilling effect on regulatory protections, its impact on health policy has not been researched systematically. Using provisions on high fat, sugar and salt (HFSS) food and alcohol advertising to children within the revision of the audiovisual media services directive (AVMSD) as a case study, we explore how the operation of Better Regulation affects EU health policy processes.
Methods:
We employ a qualitative process tracing approach based on policy documents, Freedom of Information requests, media reporting, and expert interview data.
Results:
After an evaluation in 2016, the revised AVMSD maintained a reliance on self- and co-regulation of alcohol and HFSS food advertising to children, despite significant evidence supportive of statutory measures and pressure from the public health community to strengthen provisions. This result aligns with calls from commercial actors to retain the status quo. Preliminary results indicate that pathways via which Better Regulation guidelines may have contributed to this outcome include, for instance, the structure and approach used in the impact assessment and the related scrutiny process, the design of the consultation strategy, and the evaluation criteria of the AVMSD proposal.
Conclusions:
Considering how policymaking infrastructure - as a key political determinant of health - may shape the processes

and dynamics underlying decision-making can support those working towards a policy environment which protects human and environmental health. In examining EU alcohol and HFSS food advertising provisions within the AVMSD revision through a focus on Better Regulation processes, we contribute a novel perspective towards explaining how measures to improve regulatory quality interact with actors' agency to shape policy outputs.

Key messages:

- The Better Regulation agenda should be understood as a key political determinant of health at the EU level.
- Understanding the ways in which governance tools such as Better Regulation can shape health policy is important for those engaged in promoting effective and evidence-informed public health action.

Abstract citation ID: ckac131.536
Together for better health in Germany. Towards a public health strategy

Svenja Matusall

S Matusall[1]
[1]Zukunftsforum Public Health, Berlin, Germany
Contact: matusalls@rki.de

In Germany, the responsibility for public health is divided both between federal levels and between sectors, and there is no national or general strategy for public health. However, a strategy is essential for achieving the overarching goal of ensuring the best possible health for all people, including preventing and addressing significant health challenges such as pandemics and climate change.

In 2016, Zukunftsforum Public Health (Future Forum Public Health) was established with the primary goal to enhance coherence and collaboration between public health stakeholders from academia, policy and practice. According to the principle of health in all policies, it also aims to promote collaboration across federal levels and political sectors. Within the platform provided by Future Forum, the public health community agreed that a strategy was necessary for strengthening and uniting the disparate field of German public health even though no official mandate for developing a strategy existed. Thus, Future Forum launched a grassroots process to identify key elements for a strong and resilient public health system, based on the essential public health operations (EPHOs), as defined by WHO Europe. For each of the ten EPHOs, the key issues paper "Towards a Public Health Strategy - Together for Better Health in Germany" presents a description of the current situation and challenges, an introduction to the key players, a definition of the aims and objectives, and concrete proposals on how to achieve these. Through its participative nature, the process of developing the key issues itself was an important factor for strengthening the public health community. This process highlights that even where national public health strategies and structures are missing, grassroots public health movements can be effective in strengthening the public health community as well as producing a visible set of recommendations for a resilient public health system.

Key messages:

- Based on WHO's essential public health operations, Future Forum Public Health developed a key issues paper with guidelines for a resilient public health system.
- The participative process leading to the key issues paper was itself an important factor for networking and strengthening Germany's public health community.

Abstract citation ID: ckac131.537
Problems of communication skills of GPs in Bulgaria

Biserka Vasileva

B Vasileva[1], *M Karcheva*[2]
[1]Department of Therapeutic Care, Faculty of Health Care, Medical University-Pleven, Pleven, Bulgaria
[2]Department of Epidemiology, Medical University-Pleven, Pleven, Bulgaria
Contact: b.ilieva84@abv.bg

Problem:

The effective communication between a doctor and a patient is considered to be essential, for providing high-quality medical care. A new model of cooperation and partnership which focuses on the patient is being established in the modern healthcare.

Description of the problem:

Data collected by empirical study on the doctor-patient communication has been presented and analyzed based on an overview analysis of the phenomenon communication. An anonymous survey among respondents was taken in the period September 1st-30th 2018 in the region of Pleven, Bulgaria. The respondents were patients who visited their GPs during that period. The results were processed with Microsoft Office Excel 2007. The quantitative analysis was done with statistical software programs - SPSS 17.0.

Results:

The respondents in the region of Pleven were 1053. It was found that the patients' satisfaction was poor in the matter of two crucial issues: 481 (46 %) of the respondents were dissatisfied with the time that was spent for a conversation with each patient and 470 (45 %) - with the information given by the GP regarding their health condition. According to 345 of the respondents (32,8 %) GPs do not practice informed consent and it is rarely required from patients according to 317 of the respondents (30,3 %).

Lessons:

The analysis shows that there are a number of flaws and unsolved problems in the doctor-patient communication. The verbal communication of the doctor is a serious problem: the ability to ask and to listen. The need of communication training for the doctors in their gradiate study and post-graduate education is evident. It is recommended that a specific training programs for communication in the primary health care should be developed and evaluated.

Key messages:

- At the present time the communication skills of the general practitioner should be acknowledged and regulated as priority criteria for their overall assessment.
- It is necessary that a profound study on the barriers for effective communication between a doctor and a patient is conducted.

Abstract citation ID: ckac131.538
Understanding how organisational culture supports patient involvement in a national research agency

Marie Dauvrin

I Cleemput[1], *M Dauvrin*[1], *L Kohn*[1], *P Mistiaen*[1], *W Christiaens*[1], *C Léonard*[1]
[1]Belgian Health Care Knowledge Centre, Brussels, Belgium
Contact: marie.dauvrin@kce.fgov.be

Background:

The Belgian Health Care Knowledge Centre (KCE) formally involves stakeholders in its researches since 2012. Patients are treated as one stakeholder amongst others, but it is recognized that patient involvement (PI) requires a different approach. The success of implementing PI depends, however, on the organizational culture towards PI.

Objectives:

The objective of this study was to map the PI culture at KCE in the context of the development of organization-wide supported position statements about PI.

Methods:

A nominal group technique was used to measure the PI culture at KCE. Arguments for and against PI and conditions for PI in different phases of the research process were collected. A literature review and interviews fed the draft position statements, for which support was assessed by means of a two-round Delphi process.

Results:

Arguments in favour of PI in research related to the relevance of the scope, expertise with data collection, bringing in fresh ideas for study design, access to survey participants, validation of data analyses, adherence to recommendations. Disadvantages and risks included the lack of scientific knowledge of involved patients, resources requirements, conflicts of interest, and heterogeneity within patient populations. Conditions for meaningful PI referred to measures mitigating the identified disadvantages. Eighteen position statements supported by KCE could be formulated.

Conclusions:

The KCE culture seems predominantly positive towards PI, although attitudes vary between researchers. KCE recognizes the potential value of PI in research, but considers the level of involvement to be contingent on the topic and phase in the research process.

Key messages:

- Organizational culture towards patient involvement is a driver of successful researches.
- 18 position statements supported implementation of patient involvement in a national health agency.

Abstract citation ID: ckac131.539
Citizen engagement in health policymaking: challenges and recommended solutions

Rima Nakkash

R Nakkash[1,3], *R Abla*[1], *R Saleh*[2], *F El Jardali*[2]
[1]Health Promotion and Community Health, American University of Beirut, Beirut, Lebanon
[2]Health Management and Policy, American University of Beirut, Beirut, Lebanon
[3]Global and Community Health Department, George Mason University, Fairfax, USA
Contact: rnakkash@gmu.edu

Background:

Involving citizens in health policymaking leads to the development of policies that are tailored to their needs and enables them to exercise their right as citizens. Citizen engagement in health policymaking in low and middle-income countries (LMICs) is rarely practiced and so understanding barriers and facilitators to engagement and the factors that impede effective participation is crucial. This study aims to understand views from policy stakeholders and citizens on citizen participation in health policy making and solicit recommendations on how to improve this process in the context of Lebanon.

Methods:

We conducted 29 individual in-depth interviews with stakeholders who work in fields relevant to health policy and/or have had experience in engaging citizens and four focus groups (average 8 to 10 participants each) with citizens from four municipalities in different governorates across Lebanon. Participants were purposively sampled through local Primary Healthcare Centers and municipality networks.

Results:

Barriers to engagement were seen as a manifestation of a dysfunctional and top-down political system, weak culture of participation, and lack of formal processes and platforms for engagement. Citizens' attributed lack of participation to mistrust with the political system while on the other hand, stakeholders thought that citizens lacked the needed skills for active engagement. Recommendations for improvement focused on the importance of implementing system level changes, developing contextualized citizen engagement processes, and ensuring its adoption and implementation.

Conclusions:

Although participants identified many challenges to engagement, they acknowledged its value and were able to propose concrete solutions and recommendations for change. Those recommendations are useful for other LMICs of similar contexts whose mandates require participation.

Key messages:

- By identifying and understanding barriers to citizen participation in health policymaking, public health professionals can work towards improving engagement.
- Strategies and methods such as implementing system level changes and developing contextualized citizen engagement processes can be applied to improve citizen participation were needed.

Abstract citation ID: ckac131.540
A matter of freedom? Right-wing populist frames of Austria's smoke-free policy

Marike Andreas

M Andreas[1]
[1]Heidelberg University, Center for Preventive Medicine and Digital Health, Mannheim, Germany
Contact: marike.andreas@medma.uni-heidelberg.de

Background:

Even though right-wing populist parties (RWPP) are increasingly influential in Europe, their position on public health has hardly been researched. I aimed to fill this research gap by focusing on the case of the FPÖ (Freiheitliche Partei Österreichs) and its opposition to Austriás smoke-free policy. Understanding RWWP positions on health policy can help to prevent detrimental influences on health policy making. Therefore, this project aimed to investigate how the FPÖ framed Austria's smoke-free policy and whether newspaper articles reflect these frames.

Methods:

Online archives of the three most-read Austrian newspapers (Standard, Kurier, Kronenzeitung) were searched for articles on the policy published in November 2019, when the policy was implemented. Furthermore, speeches by FPÖ politicians in the parliamentary debate on the policy in June 2019 were identified via the parliamentary archive. Drawing on 4 speeches by FPÖ politicians and 29 newspaper articles, I used frame analysis to answer the research question.

Results:

The analysis yielded that FPÖ politicians used authoritarian, populist, and libertarian frames to argue against the implementation of the smoke-free policy. Thus, the policy was portrayed as not being in the interest of the people, restricting personal and economic freedom, and as elitist. These frames were not reflected in newspaper reports that mainly focused on the practical aspects of the policy implementation. However, in contrast to politicians supporting the policy, FPÖ politicians were overrepresented in newspaper reports representing 47% of political actors cited in newspaper articles.

Conclusions:

Authoritarian, populist, and libertarian frames were used by the FPÖ in opposition to the smoke-free policy. While these frames were not replicated by Austrian newspapers, RWP politicians were overrepresented in articles on the policy. These findings illustrate the importance of effective counter-framing by health advocates.

Key messages:

- RWPP used authoritarian, populist, and libertarian frames to oppose Austria's smoke-free policy.
- Even though RWPP frames were not replicated in newspaper articles, RWPP politicians were overrepresented in reports on the policy.

Contact: mfranco@uah.es

Issue/Problem:

The social, ecological, health and economic crisis exacerbated by COVID-19 is a challenge of extraordinary magnitude and complexity for global public health. Part of the response to these challenges requires strong public health institutions.

Description of the problem:

Component 18 of the Government of Spain's Recovery, Transformation and Resilience Plan proposes the creation of a Spanish Agency of Public Health (SAPH), a centre of excellence to perform surveillance and health system preparedness functions in the face of new or emerging public health threats. The government has opened the debate on what design and functions it should have.

Results:

SESPAS, the Spanish Society of Public Health and Public Administration, set out a proposal for the design and organization of the future Spanish Agency for Public Health [SAPH]. A large working group, made up of experts from various fields of public health and from its ten federated scientific societies, has designed the SAPH proposal. The scope of the public health functions to be assumed include: the strategic planning of the State's public health (including health security), the prioritisation of public health policies and communication strategies, the assessment of the population's health status and social conditions, the guarantee of the transversality and horizontality of health policies (health and health equity in all State policies), as well as their verticality (serving as an enriching link between the European Union level and the administrations of the Autonomous Communities and local authorities). The proposal also include 11 recommendations on the main elements to be taken into account in the establishment of the future SAPH.

Lessons:

COVID19 pandemic has highlighted the need of creating strong public health institutions. Spain is giving its first steps toward the creation of the SAPH, which constitute a key step in addressing the current and future challenges of public health in Spain.

Key messages:

- Spanish Public Health Agency is an opportunity to transform health policies and to improve the health of the Spanish population.
- Strengthening public health starts with building national institutions that ensure comprehensive and integrated health policies.

Abstract citation ID: ckac131.542
The health impact of the Triple Challenge of Brexit, COVID-19 and Climate Change in Wales

Liz Green

L Green[1]
[1]Wales HIA Support Unit, Public Health Wales, Wrexham, UK
Contact: liz.green@wales.nhs.uk

The COVID-19 pandemic has revealed the complex relationships between health, well-being, economy and society. The United Kingdom's (UK) withdrawal from the European Union (Brexit) and climate change are having a cumulative, magnifying impact. UK nations have to tackle the multifaceted nature of Brexit, COVID-19 and climate change ('Triple Challenge' or TC) not only in isolation, but as a cumulative whole.This study provides a strategic overview of the interactions of the TC on determinants of health and equity in Wales and proposes opportunities to take forward. Using findings from existing Welsh Health Impact Assessments (HIAs) undertaken on the single challenges, rapid searches of the academic and grey literature were undertaken to identify evidence which focused on the TC and its impacts.From this, key determinants impacted and spotlight examples were identified and analysed. Evidence indicates the TC will have a wide range of compounding impacts across multiple determinants and inequalities. These will need to be viewed in synergy, not singularly. Determinants affected include i.e mental well-being, food insecurity, employment.Population groups potentially affected include rural communities, fishers/farmers, young people. Policy responses need to be constructed in an integrated way with cross sector involvement as actions intended to have positive impacts for one challenge could also have negative unintended impacts for others. This innovative work has highlighted the significant interconnectedness of the challenges. Developing an overarching policy approach could support lasting change.Having the TC as the underpinning focus point for new policies and strategies will help to maximise impact when addressing concerns in relation to post Brexit policy/actions, COVID recovery and climate change adaptation/mitigation.This work can be utilized by other nations as an example for challenges they may face in their context and nations in the UK/Europe affected by the TC.

Key messages:

- Brexit, COVID-19 and climate change have cumulative health impacts which must be considered together.
- Health impact assessment can provide a core framework through which to explore inequalities and health impact of multiple policy and practical issues.

Abstract citation ID: ckac131.543
Categorising commercial sector practices to advance human and planetary health

Anna Gilmore

A Gilmore[1], *A Fabbri*[1], *K Bondi*[1], *A Bertscher*[1], *J Lacy-Nichols*[2]
[1]Department for Health, University of Bath, Bath, UK
[2]School of Population and Global Health, University of Melbourne, Melbourne, Australia
Contact: a.gilmore@bath.ac.uk

Background:

There is growing interest in the commercial determinants of health, broadly understood as the ways in which commercial actors influence health & health equity. Such actors can impact on health & health inequity, positively or negatively, through two main routes: (1) producing & driving use of/access to products or services potentially damaging or beneficial to health. (2) through diverse commercial practices which range from marketing, through lobbying, to tax & labour practices. Practices are arguably of greater importance given the growing shift to private sector employment & because all industries, not just those whose products are harmful, engage in them. Yet their contribution to physical, mental & planetary ill health is generally under-recognised with a focus hitherto on unhealth commodities. We aim to develop a practical categorisation of commercial sector practices

Methods:

Narrative review & content analysis of existing categorisations (those attempting to cover all practices), & taxonomies (those focused on specific practices (e.g., marketing), related academic &grey literatures.

Results:

There is dualism between the business studies & public health literatures, the latter tending to dichotomise market & non-market strategies while the former sees this as an outdated approach. While some specific practices are well documented, others remain poorly understood & theorised. A simplified categorisation is proposed which attempts to identify key commercial sector practices that can impact on health, the ways in which they overlap & reinforce each other. Evidence-based taxonomies for specific practices are identified.

Conclusions:

Our categorisation provides a simple approach through which the commercial practices that can harm human & planetary health & drive health equity can be understood & addressed. It draws attention to the diverse ways through which corporations can harm health, identifies areas for action & further research.

Key messages:

- The ways in which commercial sector practices influence health and health equity are diverse yet poorly understood.
- We offer a simple categorisation of commercial practices which draws attention to the diverse ways through which they can harm health, helps identify solutions and areas for PH action.

Abstract citation ID: ckac131.544
Agnogenic practices: an analysis of UK gambling industry-funded youth education programmes

May Van Schalkwyk

MCI van Schalkwyk[1], *B Hawkins*[2], *M Petticrew*[3], *A Reeves*[4], *M McKee*[1]
[1]Department of Health Services Research and Policy, LSHTM, London, UK
[2]MRC Epidemiology Unit, University of Cambridge, Cambridge, UK
[3]Department of Public Health, Environments and Society, LSHTM, London, UK
[4]Department of Social Policy and Intervention, University of Oxford, Oxford, UK
Contact: May.VanSchalkwyk@lshtm.ac.uk

Background:

The corporate political activities of harmful industries, including the use of agnogenic (ignorance or doubt producing) practices and the construction of dystopian narratives, directed at influencing policymaking are well documented. However, the use of agnogenic practices by industry-funded organisations who deliver industry-favoured education-based measures remains unexplored. This study aims to build understanding of this by analysing three UK gambling industry-funded youth education programmes that represent key policy responses to gambling harms.

Methods:

Using a published typology of corporate agnogenic practices the ways that evidence is used within the programmes' resources to legitimise their content and implementation were analysed. Programme evaluations and claims about the programmes' evidence base and effectiveness were also analysed.

Results:

Agnogenic practices, including confounding referencing, misleading summaries and evidential landscaping, that resemble those adopted by harmful industries are used within gambling industry-funded youth education programmes and by the charities that oversee their delivery. These practices serve corporate interests, distort the limited evidence in support of youth gambling education measures, and legitimise industry favoured policies.

Conclusions:

This novel study demonstrates that agnogenic practices are used to construct utopian narratives that claim that gambling industry-favoured youth education programmes are evidence-based and evaluation-led. These practices misrepresent the literature and evaluation findings and may undermine effective policymaking to protect children and young people from gambling harms.

Key messages:

- Gambling industry-funded education programmes warrant greater scrutiny and conflicts of interest need to be addressed.
- The methods and findings of this study are of relevance to other contexts and areas in the field of the commercial determinants of health given other harmful industries adopt similar approaches.

Abstract citation ID: ckac131.545
Citizen participation in healthcare: a field perspective

Rob Timans

R Timans[1], *J de Jong*[1,2], *A Brabers*[1], *M Horsselenberg*[1], *L Damen*[1]
[1]ZOS, Nivel, Utrecht, Netherlands
[2]Faculty of Health, Medicine and Life Sciences, Maastricht University, Maastricht, Netherlands
Contact: r.timans@nivel.nl

Background:

Many nations are faced with challenges regarding the sustainability of their healthcare systems. Rising costs and limited financial and human resources mean that difficult decisions regarding the provision of healthcare are imminent. Which care should be provided, when and where? These decisions will affect all current and future users of healthcare. This has given rise to calls from policy makers and others to include citizens in the decision making process. The question is how this can be done. What are viable ways of citizen participation in healthcare? What are critical issues to take into account? And how do citizens themselves want to participate?

Methods:

We use results from a literature review, six interviews with organizations in the field and the results of two citizen platforms to map the challenges and opportunities for citizen participation in healthcare. We study the case of the Netherlands, a country with a long and singular tradition of participatory policies.

Results:

Preliminary findings indicate there are six key decision variables that are instrumental in shaping citizen participation in the field of healthcare. Among those are the kinds of knowledge that participants possess and the valuation of these kinds of knowledge by agents in the field of healthcare.

Conclusions:

We interpret the results using a Bourdieusian conceptual framework, which emphasizes the contextual framing of participation. Citizen participation can be understood as an intervention in the field of healthcare. Participation is structured by the different forms of knowledge of participants as capitals. This highlights power differences that must be understood in order to design fruitful participatory processes.

Key messages:

- Citizen participation in healthcare understood as an intervention in the field of healthcare.
- Understanding power differences is crucial for designing and implementing this intervention.

Abstract citation ID: ckac131.546
Implementation of integrated knowledge translation in NCD research: Examining intervention components

Kerstin Sell

K Sell[1,2], *EA Rehfuess*[1,2], *LM Pfadenhauer*[1,2]
[1]IBE, LMU Munich, München, Germany
[2]PSPH, München, Germany
Contact: ksell@ibe.med.uni-muenchen.de

Background:

Integrated knowledge translation (IKT) has been a cornerstone of the Collaboration for Evidence-based Healthcare and Public Health in Africa (CEBHA+) with partners in Ethiopia, Germany, Malawi, Rwanda, South Africa, and Uganda. The consortium conducts research on preventing and treating non-communicable diseases as well as road traffic injuries. IKT is understood as the continuous engagement of decision-makers throughout the research process in order to build equitable, mutually beneficial partnerships to conduct policy-relevant research and, ultimately, strengthen evidence-informed decision-making (EIDM). Gradually, a structured ‘‘CEBHA+ IKT approach’’ was developed, including systematic stakeholder mapping and analysis, and the development of local IKT strategies.

Methods:

We conducted a mixed-methods process and outcome evaluation of this IKT intervention. This comprised structured interviews, an online survey, and document analyses at two time points, two and four years after IKT initiation.

Results:

Preliminary results show that partnerships with decision-makers were successfully established or strengthened. While continuous engagement was implemented, fidelity to formalised IKT strategies was variable. The development, monitoring and updating of the IKT strategies, originally conceptualised as an essential intervention component, has been helpful for some CEBHA+ researchers and may facilitate implementation. However, the vision for decision-maker engagement as well as emphasis on continuous engagement (defined as a deliverable) emerged as more important intervention drivers and may be conceptualised as intervention components.

Conclusions:

A strong vision and continuous engagement with decision-makers are critical for strengthening EIDM. Formalised IKT strategies proved to be of moderate importance in current CEBHA+ research activities, but may turn out to be an essential intervention component if implemented from the start of a research project.

Key messages:

- Continuous engagement with decision-makers has successfully strengthened or established partnerships between researchers and decision-makers.
- Formal IKT strategies to plan stakeholder engagement were developed but continuous stakeholder engagement and a strong vision proved to be of greater importance.

Abstract citation ID: ckac131.547
Political consciousness, agency and mental health. Students in the Covid 19-Pandemic

Yasemin Niephaus

Y Niephaus[1], *T Nink*[1]
[1]Department of Social Sciences, University Siegen, Siegen, Germany
Contact: yasemin.niephaus@uni-siegen.de

Introduction:

The influence of social crises in their objective quality as well as their subjective processing on health well-being has been researched many times. The loss of agency that can be observed in the course of social crises is considered to be a negative mediating factor between both variables. The Corona pandemic was also associated with a loss of options and routines for action for most of the population.

Methods:

We conducted two quantitative surveys on mental health in the pandemic in spring 2020 and autumn 2021. While the first international comparative survey was conducted under the auspices of the University of Antwerp, the second was carried out at five German universities.

Results:

The quantitative data show the negative impact of the pandemic on students’ mental health - CES-D 8 (0 to 24) ($\bar{x}2020 = 9.22$, $\bar{x}2021 = 9.38$). They also show a negative correlation between whether students’ concerns are sufficiently considered by policy makers in the pandemic and depressive symptomatology ($r = -0.146$, $p < 0.01$). That is, the less satisfied students are with political measures, the lower the depressive symptomatology.

Conlusion:

Against the background of the socio-psychological inequality study ‘Die Arbeitslosen von Marienthal’, which is considered a classic, this connection is far less paradoxical than might initially be assumed if one interprets political awareness as a correlate of a subjectively perceived power to act, which has a positive effect on mental health. Based on this thesis, we have opted for a mixed-methods design and are conducting qualitative interviews on subjective crisis processing, the results of which we will be able to present at the conference.

Key messages:

- Subjectively perceived agency reduces the health-reducing effect of social crises.
- Students are a relevant group to learn from for capacity building.

Abstract citation ID: ckac131.548
Map of Health Needs – basis for the national strategic frameworks

Jan Olminski

J Olminski[1], *M Koziol-Rostkowska*[1], *A Smiglewska*[1]
[1]Department of Analyses and Strategies, Ministry of Health, Warsaw, Poland
Contact: j.olminski@mz.gov.pl

As the economies transform into data-centred, so do the health systems. Responding effectively to emerging challenges through right decisions and setting up adjusted policies require a well-functioning evidence-based tool. The one developed in Poland is called ‘Maps of Health Needs’. It provides key stakeholders with unbiased data to support decision making processes. The Map depicts the current situation in the system, and forecasts the changes in upcoming years. The system is shown widely: starting with the background of demography and epidemiology, later moving to the out- and in-patient care, including long term care and rehabilitation, concluding with resources (staff and infrastructure). This broad and unbiased view on the system now and in the years to come, allows the public sector institutions to plan the short, medium and long term actions. It regards both strategic and operational levels, for the whole country and for the regions respectively. The documents juxtapose the current and the desired state of the system in the future, outlining necessary actions and goals in order to achieve it. In the recent years a few strategic frameworks have been developed in Poland, as the preparation for the next EU programming period advanced and in reaction to the pandemic crisis. The main documents include:

1) Healthy Future, the umbrella-like framework for the period 2021-2027,
2) Recovery and resilience plan,
3) Transformation plans.

The first and the second one became a part of the negotiation conditions at the European level, as they form a reliable source for modelling the flux of investments’ financing. In that way the maps shape the national policies, becoming the basis for strategic frameworks.

Key messages:

- Reliable data is nowadays a key factor in strategic planning, also in the healthcare system.
- The tool developed in Poland, called Maps of Health Needs, serves as a base for strategic national frameworks.

Abstract citation ID: ckac131.549

Design of value-added tax on medicines in 41 European countries

Sabine Vogler

S Vogler[1], *N Zimmermann*[1]
[1]WHO Collaborating Centre for Pharmaceutical Pricing and Reimbursement Policies, Austrian National Public Health Institute, Vienna, Austria
Contact: sabine.vogler@goeg.at

Background:

Recently, among others due to the COVID-19 pandemic and the war in Ukraine, European countries have been experiencing rising inflation. Value-added taxes (VAT) on essential goods have gained public attention, and abolishing VAT for these goods has been discussed as a measure to prevent poverty and inequities. The study aims to investigate the relevance of value-added tax on medicines in European countries.

Methods:

We collated information on medicines-specific and standard VAT rates in 41 countries of the WHO European Region (all 27 European Union Member States, Albania, Armenia, Iceland, Israel, Kazakhstan, Kyrgyzstan, Kosovo, Moldova, North Macedonia, Norway, Serbia, Switzerland, Turkey and United Kingdom). Data were reviewed from literature and were validated by national public authorities.

Results:

In three countries (Albania, Kazakhstan and Malta), all medicines are exempt from VAT. 28 of the 38 countries with VAT on medicines impose a single VAT rate on all medicines, and in most of these countries (21 countries) the medicines-related VAT is lower than the standard VAT rate. Ten countries have differentiated VAT rates: In Ireland, Kyrgyzstan, Sweden and the UK defined medicines (e.g. oral medicines, prescription-only medicines) are exempt from VAT, whereas for the other medicines the standard VAT rate applies; six further countries have a lower VAT rate for some medicines (e.g. heparins, blood products, contraceptives or reimbursed medicines in general) compared to the remaining medicines, whose VAT rate equal the standard rate or is lower.

Conclusions:

Some European countries apply specific mechanisms (exemptions, reduced rates) regarding the VAT for defined or all medicines. This may act as a protective measure for patients in case of non-reimbursed medicines and help public payers to ensure financial sustainability to funded medicines. Further medicines-specific research is needed to understand the impact of inflation.

Key messages:

- Value-added tax is a relevant component of medicine prices.
- Lowering or abolishing the VAT on medicines can be an important policy espeically when patients pay out-of-pocket.

Abstract citation ID: ckac131.550

Paid Sick Leave and Sickness Benefits for employees' economic and job security: A Scoping Review

Yewon Kwon

Y Kwon[1,2], *H Lee*[1,2], *K Ryu*[1,2], *D Moon*[3], *H Chung*[2,4]
[1]Department of Public Health Sciences, Graduate School, Korea University, Seoul, South Korea
[2]BK21 FOUR Learning Health Systems, Korea University, Seoul, South Korea
[3]People's Health Institute, Seoul, South Korea
[4]School of Health Policy and Management, Korea University, Seoul, South Korea
Contact: dpdnjs9723@gmail.com

In health emergencies, such as in the COVID-19 pandemic, the need to expand or introduce the Paid sick leave(PSL) and Sickness benefits(SB) increases. They are key components of the universal health coverage(UHC) and active labor market policies(ALMPs) that enable workers to take care of their health and guarantee return-to-work after recovery. This study examines effects those policies in achieving economic stability and job security of covered workers through a scoping review. Studies were selected using the search terms 'paid sick leave', 'sickness benefits', 'paid sick day', and 'earned sick leave' in PubMed and Web of Science. Our search conducted on 6th April 2021 yielded 1,030 articles, of which 22 articles were included in the review. All articles were analyzed by the 4 subgroups(employees, families, employers, and government) and we investigated indicators of socio-economic impacts on their lives. Articles are largely PSL(90.9%)-focused. PSL guarantees not only workers' job security by securing employment agreement, but also their income security by promising part of wages enough to afford healthcare and living expenses during the medical treatment and recovery. Additionally, PSL attenuates employers' financial risk, as it reduces presenteeism while increasing the return-to-work rate. Moreover, PSL and SB reduce the total healthcare and social security expenditures of the government. To sum up, PSL and SB guarantee health and labor rights by ensuring income and job security to employees while assuring financial stability to both employers, and the government. However, as the previous studies paid less attention on the equity of these impacts at the system levels, future research should more focus on the dimension.

Key messages:

- PSL and SB guarantee health and labour rights by ensuring income and job security for employees, while assuring financial stability for both employers and the government.
- The previous studies that examined the effects of PSL and SB paid less attention on the equity of ensuring income and employment security, therefore future studies should focus more on this dimension.

Abstract citation ID: ckac131.551

Implementing pictorial health warning labels on waterpipe tobacco products: a qualitative study

Rima Nakkash

R Nakkash[1,2], *M Jaafar*[1], *T Asfar*[3], *S Chehab*[1], *W Maziak*[4]
[1]Health Promotion and Community Health Department, American University of Beirut, Beirut, Lebanon
[2]Global and Community Health Department, George Mason University, Fairfax, USA
[3]Department of Public Health Sciences, University of Miami, Miami, USA
[4]Epidemiology Department, Florida International University, Miami, USA
Contact: rnakkash@gmu.edu

Background:

Waterpipe smoking rates in Lebanon are among the highest in the in the world. Research has documented the effectiveness of introducing pictorial health warning labels (PHWLs) in curbing waterpipe smoking. Seventeen years after ratification of the WHO Framework Convention on Tobacco Control and twelve years post adoption of a tobacco control law, PHWLs have not yet been implemented in Lebanon. This study aims to gain insight into stakeholders opinions and recommendations for adopting and implementing PHWLs on WP products within the current tobacco control policy environment.

Methods:

We conducted 13 online interviews with policymakers, media, owners of establishments that serve waterpipe, as well as international and local NGO representatives whose mandate is tobacco control. During the interview process, key informants were shown PHWLs on waterpipe tobacco products and asked about feasibility of implementation and enforcement. National documents and legislations related to PHWLs were obtained from public record. We conducted content analysis on the documents. Interviews were transcribed, coded, and analyzed thematically.

Results:

The majority of the key informants agreed on who is responsible for enforcement of PHWLs and on the contextual obstacles to enforcement. Main barriers to implement PHWLs on WP products were: 1) the fact that the WP is a multi-component tobacco use method that will require including all WP components (charcoal, tobacco, device); 2) WP usually is used in several locations (e.g., home, restaurants); and 3) WP is sold via multiple sources (supermarkets, tobacco shop, etc). Stakeholders recommended some solutions to address barriers to implementation.

Conclusions:

Stakeholders responsible for implementation of PHWLs need to take into consideration contextual barriers as well as the particularities of waterpipe tobacco smoking in terms of multiple components used to smoke, locations of consumption, and sources where it is sold.

Key messages:

- Implementing PHWLs on waterpipe tobacco products requires distinct understanding of policy environment and context.
- Implementing PHWLs on waterpipe tobacco products needs to address the complex nature of waterpipe smoking as a multi-component tobacco use method .

Abstract citation ID: ckac131.552
Stakeholder perceptions and public health system performance: evidence from Greece

Vassilis Karokis-Mavrikos

V Karokis-Mavrikos[1], *M Mavrikou*[2]
[1]Department of Politics, University of Surrey, Surrey, UK
[2]Health Policy, Vianex, Athens, Greece
Contact: v.karokis-mavrikos@surrey.ac.uk

Policy choices, aims and priorities are defined by the dominant belief system among stakeholders in a policy area (Jenkins-Smith et al., 2018). Traditional assessments of health systems performance have focused on the institutional configurations, processes and resources in place (Murray and Frenk, 2000). We argue that the more latent dimension of 'stakeholder perceptions' is crucial to understanding why seemingly effective health system policy designs underperform during implementation. This paper brings in new evidence (2020) from an elite population study of 261 stakeholders in Public Health policy in Greece (politicians, civil servants, experts, interest groups, industry). We questioned stakeholders on: their conceptual understanding of public health, public health determinants, the field's policy responsibilities and jurisdiction, threats and enabling factors to policy advancement, and public health systemic performance in Greece. Our findings highlight that: 1) stakeholder beliefs converge regarding drivers for effective policymaking - most prominently resources, expertise, coordination and management - but respondents also identify their scarcity in the Greek public health system (GPHS); 2) stakeholders converge regarding systemic pathogenies - most prominently managing inequalities and monitoring - and rank all legally stated functions of the GPHS poorly on average; 3) stakeholders agree that the existing paradigm in Greek public health policy does not promote the holistic perspective to health but most maintain a medicine-centric view of public health. We conclude that despite Greece enjoying a progressive public health system policy design, the mismatch between the system's stated aims and the prevailing anachronistic stakeholder perceptions has hampered effective policy development. Future research should zero in on the importance of installing a co-oriented culture among stakeholders to achieve success in the performance of health systems.

Key messages:

- Stakeholder perceptions are crucial to understanding why seemingly effective health system policy designs underperform during implementation.
- Despite Greece enjoying a progressive public health system policy design, the mismatch between the stated aims and the prevailing anachronistic stakeholder perceptions has hampered policy development.

Abstract citation ID: ckac131.553
Response to the Ukrainian war: Support to the Ukrainian health professionals – war refugees

Alena Petráková

A Petráková[1], *N Veselá*[1], *M Ponomarenko*[1], *S Hrdličková*[2], *M Barták*[1], *M Dlouhý*[1]
[1]School of Public Health, Institute for Postgraduate Medical Education, Prague, Czechia
[2]Teaching, Institute for Postgraduate Medical Education, Prague, Czechia
Contact: alenapetrakova@gmail.com

Issue/problem:

There are currently more than 300,000 war refugees from Ukraine in the Czech Republic, including several hundred health workers of various health professions, including physicians, dentists, pharmacists, nurses and others. The Institute for Postgraduate Medical Education (IPVZ) on behalf of the Ministry of Health prepares and organizes the approbation exams of physicians, dentists and pharmacists who as foreign nationals have obtained medical qualification outside the EU and wish to practice their profession in the Czech Republic or the EU.

Description of the problem:

To follow up on new legislation of the Czech Republic, valid from 21 March 2022, focused on the Ukrainian war refugees and their stay in the Czech Republic, IPVZ immediately formulated its strategic response and support to an urgent needs of the Ukrainian refugees with a focus on health professionals and their integration to the Czech health system. IPVZ and its School of Public Health (SPH) work on capacities development courses, in particular on the Czech language courses and on introduction to the Czech health system.

Results:

First 3 Czech language courses, held on 2 May -1 July 2022, were completed by 34 attendees. Next 10 courses will start on 1 August 2022. There is an interest in both face-to-face and online Czech language courses. In parallel, we provide the introduction to the Czech health system through consistent creation of bilingual cycle of short videos, first videos are available free of charge on IPVZ web site at https://ua.ipvz.cz.

Lessons:

Interest in the Czech language classes indicates its importance for all Ukrainian health professionals - war refugees, who plan to stay in the Czech Republic and to work in the Czech health system in their health professions -physicians, nurses and others. Cycle of short bilingual videos is an important support tool for adoption of the Czech health system terminology and for their preparation for the approbation exams.

Key messages:

- Institute for Postgraduate Medical Education in Prague formulated its immediate strategic response to the Ukrainian war and needs of the Ukrainian war refugees with a focus on health workers.
- Intensive Czech language courses supplemented by the cycle of short bilingual videos, introducing the Czech health system, available free of charge at https://ua.ipvz.cz, fully support MoH CZ policy.

Differential willingness for genetic testing to target treatment in older Danish citizens

Anja Leppin

A Leppin[1], *JB Nielsen*[2]
[1]Unit Health Promotion, Department of Public Health, University of Southern Denmark, Esbjerg, Denmark
[2]Unit General Practice, Department of Public Health, University of Southern Denmark, Odense, Denmark
Contact: aleppin@health.sdu.dk

Background:

Studies from different countries have shown that population majorities are willing to accept genetic tests for treatment personalisation and that considerable proportions are ready to donate their data to research. However, it has also been shown that concerns, for example about data use and confidentiality or treatment rationing, are common. To enable a more targeted communication process with the public about personalized medicine, more knowledge is needed on views in different sub-populations. In the present study, a hypothetical scenario was used to investigate differential readiness to accept a genetic test for treatment targeting and to permit use of personal data for research.

Methods:

A cross-sectional survey was conducted with 50-80-year-old Danish citizens (n = 6807) who were sampled to represent the Danish population in that age segment. Socio-demographic data were added from a national registry. Data were analyzed by multivariable logistic regression analysis.

Results:

Preliminary results showed that a majority was willing to be tested (78.3%). Readiness was lower in women [OR = .67; CI = .59-.77] and those 70-80 [OR = .72; CI = 61-.86], while it was higher in those with better income [OR = 1.29; CI = 1.09-1.52]. Further, those less satisfied with their health, the obese and those with a perceived genetic vulnerability were more willing to be tested. Over 90% of those ready to be tested were also willing to permit use of their data for research. Rates were higher in men, older segments, those with higher income/ education as well as those with current pain experience and those aware of a personal genetic vulnerability.

Conclusions:

Findings indicate group differences in acceptance of a genetic test for personalisation of medicine and data use for research. Further research should investigate group-specific benefit perceptions versus concerns in population subgroups to inform implementation and enable targeted communication strategies.

Key messages:

- Acceptance of genetic testing for personalisation of treatment as well as willingness to contribute data to research may differ between population subgroups.
- Women and those with lower income are less willing to accept genetic testing for treatment personalisation and accept research use of data while health vulnerabilities increase acceptance.

The influence of overweight and obesity in the oral health of a sample of portuguese adults

Nélio Veiga

N Veiga[1,2], *L Ferreira*[2], *P Couto*[1,2], *P Correia*[1,2], *P Lopes*[2], *MJ Correia*[1,2], *I Coelho*[3]
[1]Centre Interdisciplinary Research in Health, Universidade Católica Portuguesa, Viseu, Portugal
[2]Faculty of Dental Medicine, Universidade Católica Portuguesa, Viseu, Portugal
[3]Family Health Unit Grão Vasco, Health Centre III, Viseu, Portugal
Contact: nveiga@ucp.pt

Background:

Overweight and obesity may lead to different problems in various body systems and in the oral cavity. Dental caries and periodontal disease have been related with overweight. The aim of this study was to assess how overweight and obesity have impact on the lifestyle, oral habits and oral pathologies.

Methods:

We conducted an observational cross-sectional study where we applied a questionnaire to 140 individuals from Lisbon and Viseu, Portugal., which 70 had a normal Body Mass Index (BMI) (control group) and 70 had an excessive BMI. We also made an oral observation in each individual to record the permanent teeth decayed, missing and filled index (DMFT), the Community Periodontal Index and the oral hygiene status.

Results:

From the final sample, 30% of the subjects with overweight brushed their teeth once a day or less, while the majority (62.9%) of the control group brushed twice a day. In the oral examination, 70% had calculus, while in the control group only 22.5% presented calcified plaque. The DMFT was higher among the obesity group in comparison with the control group. Regarding periodontal disease, the participants with overweight need more dental intervention (81.4%) in contrast with the control group (14%).

Conclusions:

Most overweight and obese individuals present precarious oral hygiene habits, higher prevalence of dental caries, and worse periods of periodontal health. They are not aware of the repercussions of the association between their cariogenic diet, oral health and overweight.

Key messages:

- Oral health behaviors are related with other health conditions, namely obesity and this is a fundamental public health issue.
- Primary preventive strategies should be established having in consideration the oral health status of adults in treatment for obesity and in weight control programs.

Abstract citation ID: ckac131.556

Measured vs self-reported overweight/obesity in the Italian adult population: CUORE Project 2018-19

Luigi Palmieri

C Donfrancesco[1], *E Bologna*[2], *L Iannucci*[2], *E Profumo*[1], *C Lo Noce*[1], *B Buttari*[1], *A Di Lonardo*[1], *S Vannucchi*[1], *G Onder*[1], *L Palmieri*[1]
[1]Istituto Superiore di Sanità, Rome, Italy
[2]Italian National Institute of Statistics, Rome, Italy
Contact: luigi.palmieri@iss.it

Background:

In monitoring population health and the effectiveness of public health strategies, the body mass index (BMI) is often assessed within national surveys from self-reported height and weight rather than measured values. Using data collected within a recent health examination survey (HES), the discrepancies between self-reported and measured values were assessed, and correction models were estimated and implemented on national interview survey data.

Methods:

Within the CUORE Project, the Italian National Institute of Health conducted the HES 2018-2019 measuring height and weight as well as collecting data on self-reported values in random samples of general population aged 35-74 years residing in ten (of 20) Italian regions distributed in the North, Centre and South: 1033 men and 1061 women.

Results:

Self-reported and measured data comparison showed greater differences in mean values of height than weight and in women than in men (height +2 cm in men and +3.2 in women; weight -0.7 kg and -1.4 kg, respectively) and a corresponding under-estimation of BMI (-0.7 kg/m2 and -1.4 kg/m2, respectively). Differences were stable across age groups and educational levels, except for height discrepancy, which was greatest in women aged 65-74 years. Self-reported vs measured prevalence were: normal weight 39.7%-33.3% in men and 54.8%-44.7% in women, overweight 45.8%-46.1% and 26.0%-29.2%, obesity 13.8%-20.1% and 15.7%-23.9%. Linear regression models adjusted by sex and age classes were assessed for height and weight (R2 > = 0.92) and implemented to estimate adjusted BMI and normal weight/overweight/obesity prevalence on the national multi-purpose interview survey data collected by the Italian National Institute of Statistics.

Conclusions:

To provide more accurate prevalence of normal weight, overweight and obesity, self-reported values could be adjusted using correction models developed on the basis of the relationship between self-reported and measured height and weight values.

Key messages:

- Discrepancies between self-reported and measured values of height and weoght were found.
- Self-reported values could be adjusted using correction models developed on the basis of the relationship between self-reported and measured height and weight values.

Abstract citation ID: ckac131.557
Algorithm for early diagnosis of viral hepatitis C

Ivaylo Pakov

I Pakov[1], *K Terzieva*[1], *D Shalamanov*[2], *M Karcheva*[1], *G Gancheva*[1]
[1]Department of Infectious Diseases, Epidemiology, Parasitology and Tropical Medicine, Medical University-Pleven, Pleven, Bulgaria
[2]Scientific Centre of Military Epidemiology and Hygiene, Military Medical Academy, Sofia, Bulgaria
Contact: ivaylo.pakov@gmail.com

Issue:

Viral hepatitis C (VH C) is a global problem of the public health. Different interventions for achieving the Global Health Sector Strategy on viral hepatitis targets (65% reduction in HCV-related deaths, 90% in new infections and 90% of infections diagnosed by 2030) were considered. Increased diagnosis and treatment rates would be required to achieve these targets in all countries, even with the introduction of high sustained viral response therapies.

Description of the problem:

The latest global HCV disease burden estimates showed that about 71.1 million people worldwide are viremic, corresponding to a prevalence of 1%. The prevalence of HCV is not homogenous: the WHO Eastern-Mediterranean Region is with the highest number of infected subjects (15 millions), followed by the European Region (14 million). In Bulgaria, the incidence of VH C is 0.63-1.30 at 100 000 population (2008-2020) and in Pleven region is 0.38-3.8, respectively.

Results:

Retrospective study was conducted upon epidemiological, demographic, clinical, laboratory and viral characteristics in fifty cases of VH C confirmed with positive anti-HCV, evaluated by ELISA. Thirty eight of cases were hospitalized in different clinics of the University Hospital “Dr Georgi Stranski”-Pleven (2017-2018) and remainders were blood-donors registered in Regional Center of Transfusion Hematology-Pleven. Surgical interventions (26.32%), blood infusions (23.68%) and hemodialysis (15.79%) were at highest risk for VH C. Twenty five hospital patients were with chronic VH C (66%), five with cirrhosis (13%) and eight (21%) with acute hepatitis C. Twenty of the patients (53%) were asymptomatic about hepatitis and were hospitalized because of different comorbidities ($p < 0.0005$).

Lessons:

We propose an algorithm for early diagnosis of VH C based on mandatory screening for anti-HCV in risk groups, especially before invasive procedures. The early detection of HCV infection will reduce the complications and nosocomial infections.

Key messages:

- Different scenarios developed to achieve the WHO Targets in all countries assume an implementation of national policies to prevent new infections and to diagnose current infections through screening.
- The early detection of HCV infection will reduce the complications and nosocomial infections.

Abstract citation ID: ckac131.558
Health, wellbeing, and the impact of Corona in older adults in Dresden, Germany: the LAB60+ study

Karla Romero Starke

K Romero Starke[1], *J Hegewald*[1], *S Schmauder*[1], *P Kaboth*[1], *L Uhlmann*[2], *J Wegge*[2], *G Marquardt*[3], *A Seidler*[1]
[1]TU-Dresden, Institute for Occupational Social Medicine, Dresden, Germany
[2]TU-Dresden, Chair of Work and Organisational Psychology, Dresden, Germany
[3]TU-Dresden, Chair of Social and Healthcare Buildings and Design, Dresden, Germany
Contact: karla.romero_starke@tu-dresden.de

Introduction:

As the proportion of older people increases, it is necessary to evaluate their health and well-being to identify measures to promote healthy ageing. Moreover, the COVID-19 pandemic has impacted older adults’ health- not just through the infection itself, but also due to infection protection ordinances.

Methods:

LAB60+ is a population-based cross-sectional study investigating, among other things, the physical and mental health of older adults. Residents of Dresden aged 60 years and older were invited to participate in the first half of 2021. Participants answered questions on their habits, health status and well-being, using, among others, the Short Form-8 Health Survey and the WHO wellbeing index.

Results:

2399 people participated in the study (40% response). Participants assessed their physical health similar to the German population. The most common chronic conditions were hypertension (54%), chronic pain (32%) and osteoarthritis (31%). 42% of the participants were overweight and 20% were obese. One-fifth did not engage in physical activity: this number increased with age and decreased socioeconomic status. Participants reported lower levels of wellbeing compared to the German population (58 vs. 67 pts.). One-third had higher levels of depressiveness and half reported an increase in their experienced loneliness due to the pandemic. 34% participated in risky alcohol consumption, but it did not markedly change during the pandemic. The greatest negative impact of the pandemic on health behaviors was physical activity: more than one-third exercised less compared to the time before the pandemic.

Conclusions:

Physical health was comparable to the German population, while depressivity was higher, perhaps due to the pandemic. Age-appropriate interventions should especially target an increase in physical activity. It is important to take measures to reduce the possible negative effects of the pandemic, such as increased loneliness or reduced physical activity.

Key messages:

- This is the first study on health and wellbeing on older adults (60+ years) in the city of Dresden, Germany.
- The COVID-19 pandemic had a high impact on older adults' physical activity and loneliness.

Abstract citation ID: ckac131.559
Are pressures sores in nursing homes related to nursing home size? A cross-sectional analysis

Niall McGrane

N McGrane[1], P Dunbar[1], A Luding[1,2], L Keyes[1]
[1]LENS Projects, Health and Information Quality Authority of Ireland, Dublin, Ireland
[2]School of Public Health, University College Cork, Cork, Ireland
Contact: nmcgrane@hiqa.ie

Background:

Incidence of pressure sores are an indicator of quality of care provided. Pressure sores requiring hospitalisation are a very poor outcome and may indicate a chronic unmet need. Organisational factors of services are modifiable factors and may be associated with occurrence and severity of pressure sores. However, little investigation has been completed on this to date. The aim of this study was to assess the association of size of nursing homes and pressure sores requiring hospitalisation.

Methods:

Using the Database of Statutory Notifications from Social Care in Ireland we identified from notifications received by the regulator in 2019, the number of pressure sores that required hospitalisation from nursing homes. Association of size of service (registered beds) and the percentage of pressure sores requiring hospital treatment was investigated, using negative binomial regression, unadjusted and adjusted for provider type (company, sole trader, statutory body, unincorporated body, partnership), staff to resident ratio and distance to hospital (km), and nurse to resident ratio as a proxy for resident complexity in a further model.

Results:

598 Nursing homes were in operation in 2019. 1 was excluded for missing covariate data and 597 included for analysis. 447 submitted 2996 notifications of pressure sores, median (IQR): 3 (0 to 8). 255 pressure sores (8.51% of total) required hospitalisation. Pressure sores that required hospitalisation and size of service was positively associated, incidence rate ratio (95% confidence interval): 1.001 (1.000 to 1.002). This remained when adjusted for covariates, 1.003 (1.001 to 1.006) and additionally for nurse to staff ratio, 1.013 (1.011 to 1.016)

Conclusions:

A small but significant higher number of pressures sores required hospitalisation from larger nursing homes. The reasons for this are unknown but may include cultural differences and ability to provide continuity of care between larger and smaller nursing homes.

Key messages:

- Larger nursing homes are associated with higher incidents of pressure sores that require hospitalisation. This association remains when adjusted for covariates and nurse to staff ratio.
- Reasons larger nursing homes are associated with higher incidents of pressure sores that require hospitalisation are unknown but may be influenced by their ability to provide continuity of care.

Sentinel monitoring of COVID-related daily activity in primary care practices of the canton of Vaud

Yolanda Mueller

Y Mueller[1], D Auderset[1], M Maeder[1], J Schwarz[1], E Masserey[2]
[1]Department of Family Medicine, Center for Primary Care and Public Health, Lausanne, Switzerland
[2]Cantonal Health Directorate, Lausanne, Switzerland
Contact: yolanda.mueller@unisante.ch

Introduction:

During the COVID pandemic, COVID-related data collected in family medicine were scarce. We aimed to monitor cantonal trends of COVID-related activity in family medicine and paediatric practices during the year 2021.

Methods:

Family physicians and paediatricians established in the canton of Vaud were invited to join an ad hoc sentinel surveillance system. Online data collection was based on daily activity reports and monthly questionnaires. In particular, participants categorized daily counts of consultations and phone calls into predefined COVID-related categories.

Results:

Thirty-seven practices contributed regularly to the system between March 20th and December 31st 2021. Out of 81'407 medical consultations, 4'950 (6.1%) were related to new COVID suspicions as defined by the Federal Office of Public Health, and 5'252 (6.4%) otherwise related to COVID. Depending on the week and the practice, between 5.6% and 26.5% of face-to-face consultations were COVID-related. In paediatrics, COVID-related activity corresponded mostly to new COVID suspicions (11.2% of on-site consultations), whereas among family physicians other COVID topics predominated (9.8% of face-to-face consultations), mainly questions about vaccination. Consultations for persisting COVID-related symptoms were stable at a low level throughout the year, and constituted less than 1% of all consultations. Most practices swabbed patients for SARS-CoV-2 tests, and an increasing proportion performed rapid antigenic tests over the year. In paediatrics, COVID-suspicions were not systematically tested.

Conclusions:

Throughout 2021, COVID-related consultations constituted an important part of family medicine and paediatric practices' activity in the canton of Vaud. Monitoring COVID-related activity in primary care during a pandemic documents how physicians translate recommendations into practice and provides health authorities with valuable information to guide public health action.

Key messages:

- Throughout 2021, COVID-related consultations constituted an important part of family medicine and paediatric practices' activity in the canton of Vaud.
- Monitoring COVID-related activity in primary care during a pandemic documents how physicians translate recommendations into daily practice.

Abstract citation ID: ckac131.561
Digital COVID-19 surveillance tool for a mass gathering event - a prospective cohort study

Nils Hohmuth

N Hohmuth[1,2], A-L Lang[1], C Remschmidt[1], R Leistner[2]
[1]Data4Life, Potsdam, Germany
[2]Institute of Hygiene and Environmental Medicine, Charité, Berlin, Germany
Contact: nils.hohmuth@data4life.care

Introduction:

Mass gatherings have been associated with a high risk of SARS-CoV-2 transmission. On-site research can foster knowledge of risk factors for infections and improve risk assessments and precautionary measures at future events. We tested a web-based participatory disease surveillance tool to detect COVID-

19 infections at and after an outdoor mass gathering by collecting self-reported COVID-19 symptoms and tests.

Methods:

We conducted a digital prospective observational cohort study among fully immunized attendees of a sports event that took place from September 2 to 5, 2021 in Thuringia, Germany. Participants used our study app to report demographic data, COVID-19 tests, symptoms, and their contact behavior. This self-reported data was used to define probable and confirmed COVID-19 cases during the full "study period" (08/12/2021 - 10/31/2021) and within the 14-day "surveillance period" during and after the event, in which the highest likelihood of an event related COVID-19 outbreak could be expected (09/04/2021 - 09/17/2021).

Results:

A total of 2,808 of 9,242 (30.4%) event attendees participated in the study. During the study period, 776 symptoms and 5,255 COVID-19 tests were reported in the study app. During the surveillance period, seven PCR positive COVID-19 cases were found to be associated with the event. This translated to an estimated seven-day incidence of ~125/100,000 cases (95% CI [67.7/100,000, 223/100,000]), which was comparable to the average age-matched incidence in Germany during this time (118.3/100,000).

Conclusions:

COVID-19 cases attributable to the mass gathering were comparable to the German-wide age-matched incidence, implicating that our active participatory surveillance tool was able to detect mass gathering related infections. Further studies are needed to evaluate and apply our participatory disease surveillance tool in other mass gathering settings.

Key messages:

- Our digital COVID-19 surveillance tool for mass gathering events was easy to implement within the organizational structure of the event and well accepted amongst event attendees.
- Our active participatory surveillance tool was able to detect mass gathering related infections comparable to the Germany-wide incidence.

Innovative methods for health monitoring in Europe: results of a cross-sectional study

Brigid Unim

B Unim[1], MJ Forjaz[2], M Thissen[3], N Schutte[4], L Palmieri[1]
[1]Cardiovascular, Endocrine-metabolic Diseases, National Institute of Health, Rome, Italy
[2]National Center of Epidemiology, Health Institute Carlos III, Madrid, Spain
[3]Department for Epidemiology and Health Monitoring, Robert Koch Institute, Berlin, Germany
[4]Epidemiology and Public Health, Sciensano, Brussels, Belgium
Contact: brigid.unim@iss.it

Background:

Innovative solutions are used to monitor the spread of COVID-19, to research and develop vaccines, and to ensure online privacy and security. The aim of the study is to investigate which innovative methods, including algorithms and digital tools (e.g., social media, artificial intelligence, contact tracing applications) are used to monitor health issues related to COVID-19 in Europe, and who is using them.

Methods:

A questionnaire was developed and administered online to European countries' representatives and stakeholders of the project Population Health Information Research Infrastructure (PHIRI). The survey investigated the use of innovative solutions and digital tools in Europe to monitor COVID-19 and vaccination programs, to research and develop diagnostics and teleconsultations, and to fight online disinformation. Legislative and ethical aspects were also considered. A descriptive data analysis was performed.

Results:

19 responses were collected from 14 countries. Digital tools are used to monitor COVID-19 (13/14 countries), vaccination programs (12/14), for telemedicine (7/14), and to fight disinformation (10/14). Specific algorithms to detect the patterns of the pandemic spread are available in five countries. The main target groups of the tools are the general population, healthcare providers, patients and epidemiologists. The uptake rate of the tools ranged 5-100% across countries. Measures to evaluate the impact of digital tools (e.g., user surveys, reviews, evaluation teams) have been adopted in seven countries. Information on legislative and ethical aspects related to the use of digital solutions are available in 10 countries.

Conclusions:

The development and use of innovative methods for population health monitoring and research purposes have been the key to mitigate the COVID-19 pandemic. Improving the uptake rate, impact assessment of digital tools and fight against disinformation could enhance countries' preparedness for future pandemics.

Key messages:

- Given that digital solutions are deployed in population health monitoring, research, and for online privacy and security, they have a key role in mitigating the COVID-19 pandemic.
- Enhancement of the uptake rate and assessment of digital tools, and fight against disinformation could strengthen countries' preparedness for future pandemics.

Abstract citation ID: ckac131.563
The study on health of older people in Germany (Health 65+): Design and first results

Judith Fuchs

J Fuchs[1], B Gaertner[1], H Perlitz[1], T Kuttig[1], C Scheidt-Nave[1], Study Group Health 65+[1]
[1]Department of Epidemiology and Health Monitor, Robert Koch Institute, Berlin, Germany
Contact: fuchsj@rki.de

Background:

Integrating older persons into continuous national public health monitoring is crucial but challenging. Health 65+ is the first national health interview and examination survey in Germany specifically tailored to the needs of the population 65+ years.

Methods:

Health 65+ is based on two-stage stratified random sampling from 128 local population registries. It is based on a previously tested three-step procedure to contact the study population (letter, telephone, home visits). 12,448 individuals 65+ years were invited for survey participation between June 2021 and April 2022. Participation comprised answering a baseline-questionnaire/interview covering a consented set of key health indicators including SARS-COV2 infections, and 3 follow-ups. After one year participants are invited to an examination (e.g. blood pressure, grip strength, cognitive function) during a home visit. All-cause mortality, health insurance data and information on social and built environment will be linked to survey data. The preliminary data set comprises 3,107 baseline participants.

Preliminary results:

Only few individuals were excluded for survey participation as they had deceased before invitation, moved to an unknown residence or had insufficient German language skills. Of the adjusted gross sample, 32% took part in the survey (47.9% women, mean age 78.8 years). Only 3.3% of the participants did not receive any vaccination against COVID-19, with no differences between gender or age-groups. 3.5% had already experienced a laboratory-confirmed SARS-CoV-2 infection.

Conclusions:

Health 65+ collects information that cannot be obtained from any other data sources. In combination with information from routine health data and official health statistics, the results will aid health policy planning and implementation research to improve health and wellbeing of older people in Germany. For example, preliminary results show, that vaccination acceptance was high in persons 65+ years in Germany.

Key messages:

- Health 65+ will provide health data of people 65+ years in Germany.
- The results will aid health policy planning.

HPV self-sampling acceptability among women in Italy: preliminary results of a cross-sectional study

Silvia Angelillo

S Angelillo[1], *F Licata*[1], *EA Errico*[1], *R Maruca*[1], *S Freccia*[1], *R Pujia*[2], *G Di Gennaro*[1], *A Bianco*[1]
[1]Department of Health Sciences, University of Catanzaro, Catanzaro, Italy
[2]Department of Medical and Surgical Sciences, University of Catanzaro, Catanzaro, Italy
Contact: silviangelillo96@gmail.com

Background:

Secondary prevention measures have strongly contributed to the reduction of incidence and mortality of cervical cancer (CC) identifying women at high risk of developing it. This cross-sectional study aimed to investigate the acceptability of a home-based self-sampling methodology for Human Papilloma Virus (HPV) testing and the factors that may influence women's preference.

Methods:

A random sample of women over the age of 50 years has been selected in Southern part of Italy. Data was collected through an anonymous self-administered questionnaire and included socio-demographic characteristics, knowledge of HPV infection and prevention measures, and attitudes towards the acceptability of self-collected cervico-vaginal sampling (CVS) and urine sampling (US).

Results:

Among the 321 women who completed the survey, more than two-thirds (73.7%) knew that CC is caused by HPV, only 68.9% knew that the HPV screening is useful for an early detection and diagnosis of CC, and 17% never had Pap-test or HPV-DNA test. Of the respondents, 67.9% declared that they preferred self-collected US for future HPV testing compared with clinician-taken cervical samples (CCS). The most common reasons reported for preferring US included that it was easier (54.8%), more convenient (28.7%), and less embarrassing (21.7%). Among those women who showed negative attitude towards self-collected US, 8 out of 10 (77.3%) expressed scepticism about its diagnostic performance. Only 37% of the sample preferred CVS, and this attitude is mainly attributable to the fear of not carrying out a correct self-sampling (71.2%) and to its underrated diagnostic performance (33.7%).

Conclusions:

The preliminary results suggest that US is more acceptable than CCS and CVS in Italy. Urinary HPV test presents similar accuracy of the latter tests to detect CC and its supply in the context of population-based screening programmes could improve adherence, reducing the cost and burden on physicians.

Key messages:

- Urine self-sampling could represent an innovative early detection approach to increase adherence to cervical cancer screening programmes.
- Further research is needed to assess whether the screening status and the strategy of self-samplers distribution could act as predictors of screening uptake.

Abstract citation ID: ckac131.565
Dissemination of knowledge from Cochrane systematic reviews in public health: Cross-sectional study

Stefanie Maria Helmer

SM Helmer[1,2], *L Mergenthal*[3], *K De Santis*[3,2], *K Matthias*[4]
[1]Human and Health Sciences, University Bremen, Bremen, Germany
[2]Cochrane Public Health Europe, Bremen, Germany
[3]Department of Prevention and Evaluation, Leibniz BIPS, Bremen, Germany
[4]Faculty of Electrical Engineering, University of Applied Science Stralsund, Stralsund, Germany
Contact: sthelmer@uni-bremen.de

Background:

Appropriate dissemination of public health evidence is of high importance to ensure that relevant knowledge reaches potential stakeholders and relevant population groups. A wide distrust towards science and its findings indicates that communication thereof remains below its potential. Cochrane Public Health (CPH) provides an important source of high-quality scientific evidence. This study aimed to identify (1) dissemination strategies and (2) possible stakeholders of Cochrane Public Health reviews.

Methods:

This is a cross-sectional, meta-research study. All 68 records (reviews or protocols) listed on the CPH website https://ph.cochrane.org/cph-reviews-and-topics up to 08.03.2022 were included. Record characteristics, dissemination strategy information and potential stakeholder details were coded by one author and 10% of records were checked by another author. Data were descriptively analysed.

Results:

53 reviews (46 systematic reviews, 6 rapid reviews, 1 scoping review) and 15 review protocols were included. The 53 reviews were published between 2010-2022 and included 1-153 primary studies. All reviews had an open-access plain language summary (PLS) in English with translations in 3-13 other languages. Although 16 of 53 reviews and 4 of 15 protocols reported any involvement in the review process of an advisory group, only 3 of 68 records included a dissemination plan aiming to inform non-academic audiences or policy.

Conclusions:

All identified records can be considered as relevant to a wide range of stakeholders and population groups. However, CPH reviews or protocols rarely report their dissemination strategies. It is unclear what dissemination strategies are used after CPH reviews are published. High relevance of CPH evidence for non-academic stakeholders and the general population highlights the need for adequate knowledge translation beyond academia.

Key messages:

- Dissemination plans and implementation is rarely reported in CPH reviews.
- Evidence from CPH reviews is relevant for a multitude of stakeholders.

Abstract citation ID: ckac131.566
Access to nicotine products among Polish youth – PolNicoYouth study results

Anna Tyrańska-Fobke

A Tyrańska-Fobke[1], *Ł Balwicki*[1], *D Kaleta*[2], *M Goniewicz*[3], *G Juszczyk*[4]
[1]Department of Public Health and Social Medicine, Medical University of Gdańsk, Gdańsk, Poland

[3]Department of Health Behavior, Roswell Park Comprehensive Cancer Center, Buffalo, USA
[4]National Institute of Public Health - National Institute of Hygiene, Warsaw, Poland
Contact: anka.tyranska@gumed.edu.pl

Smoking and the use of electronic cigarettes pose a risk of cardiovascular disease. The aim of the study was to analyze the

availability of these products for Polish youth. The cross-sectional study was carried out in 2020 on a sample of secondary school students (N = 19241) representative of the Polish population, using the CAWI method. In order to estimate the relationship between the independent variables and the outcome variables, the Bayesian multivariate logistic regression was used in the R program using the brms library. It was observed that there were differences in the factors related to the refusal to sell traditional cigarettes and e-cigarettes to Polish youth. The age of adolescents has a more significant relationship (lnBF <2.3) with the refusal to sell them traditional cigarettes (lnBF = 49.65) than e-cigarettes (lnBF = 25.21). Contrary to gender and province of residence, which show a significant relationship only with the refusal to sell e-cigarettes (lnBF = 4.9, lnBF = 3.5). However, they are not related to the refusal to sell traditional cigarettes at all. The amount of expenditure of Polish youth on traditional cigarettes and e-cigarettes significantly depends on the size of pocket money (lnBF = 49.39), the type of school attended by young people (lnBF = 12.19) and the province of residence (lnBF = 3). Other factors, such as age, gender or the size of the place of residence, remain irrelevant. Higher pocket money contributes to higher spending on nicotine products ((lnBF = 12.19). It seems that the age of adolescents does not equally limit access to nicotine products, making e-cigarettes more easily available for sale. Action is needed to effectively limit the access of young people to harmful products.

Key messages:

- It seems that the age of adolescents does not equally limit access to nicotine products, making e-cigarettes more easily available for sale.
- Action is needed to effectively limit the access of young people to harmful products.

Abstract citation ID: ckac131.567
Nicotine initiation risk among Polish youth - PolNicoYouth study results

Łukasz Balwicki

Ł Balwicki[1], *A Tyrańska-Fobke*[1], *D Kaleta*[2], *M Goniewicz*[3], *K Klimiuk*[4]
[1]Department of Public Health and Social Medicine, Medical University of Gdańsk, Gdansk, Poland

[3]Department of Health Behavior, Roswell Park Comprehensive Cancer Center, Bufflo, USA
[4]Faculty of Medicine, Medical University of Gdańsk, Gdansk, Poland
Contact: balwicki@gumed.edu.pl

Smoking and the use of electronic cigarettes pose a risk of cardiovascular disease. The aim of the study was to analyze the initiation of these behaviors among Polish youth. The cross-sectional study was carried out in 2020 on a sample of secondary school students (N = 19241) representative of the Polish population, using the CAWI method. In order to estimate the relationship between the independent variables and the outcome variables, the Bayesian multivariate logistic regression was used in the R program using the brms library. Among Polish youth, age (lnBF = 303.55), smoking of traditional cigarettes by parents (lnBF = 117.29) and the type of school to which youth (lnBF = 36.15) and the province of residence (lnBF = 9.08) attend. Gender, size of the place of residence and parents' education are not related to the risk of tobacco initiation with traditional cigarettes. When e-cigarettes were tried at least once in their life, a significant correlation was identified with a greater number of factors, such as age (lnBF = 124.87), smoking of traditional cigarettes by parents (lnBF = 56.48), province of residence (lnBF = 23.41), gender (lnBF = 16.53), use of heated tobacco (lnBF = 9.34) and e-cigarettes (lnBF = 9.13) by parents, size of the place of residence (lnBF = 8.61) and school type (lnBF = 7.26). Only the level of parents' education remains unrelated. Factors related to the initiation and attempted use of nicotine products by adolescents indicate potential targets for the intervention. Parents who smoke and use e-cigarettes and heated tobacco should be made aware that their addiction is a strong risk factor for their children's health. It can become a motivating factor for quitting the addiction.

Key messages:

- Parental health behaviors are factors related to the initiation and attempted use of nicotine products by adolescents and indicate a potential target for a public health intervention.
- Parents who smoke and use tobacco products should be made aware that their addiction is a strong risk factor for their children's health. It can become a motivating factor for quitting the addiction.

Abstract citation ID: ckac131.568
The burden of disease due to COVID-19 in Sweden: a disability-adjusted life years (DALY) study

Patricia Ernst

J Shedrawy[1], *P Ernst*[2], *K Lönnroth*[1,3], *F Nyberg*[2]
[1]Department of Public Health Sciences, Karolinska Institutet, Stockholm, Sweden
[2]School of Public Health and Community Medicine, University of Gothenburg, Gothenburg, Sweden
[3]Centre for Epidemiology and Community Medicine, Stockholm County Council, Stockholm, Sweden
Contact: patricia.ernst@gu.se

Background:

Many countries have been severely affected by the COVID-19 pandemic, including Sweden, which has been in the spotlight regarding its policies and their impact on mortality and morbidity. Therefore, it is of high interest to measure the disease burden of COVID-19 in terms of disability-adjusted life years (DALYs). DALYs have two main components: the years of life lost through premature death (YLL) and the number of years lived with disability (YLD). This study aims to measure DALYs due to COVID-19 in Sweden.

Methods:

This study used data from the nationwide multi-register observational study SCIFI-PEARL (Swedish COVID-19 Investigation for Future Insights - a Population Epidemiology Approach using Register Linkage) covering the entire Swedish population. The methodology used in the modelling and calculation of DALYs was based on the Global Burden of Disease guidelines, using Sweden-specific life tables for estimated life expectancies.

Results:

In Sweden, 152877 DALYs were lost to COVID-19 between March 2020 and October 2021, corresponding to 1447/ 100 000, 99,3% of which was attributed to YLL. DALYs loss occurred mainly among elderly groups with 66,78 % of DALYs being attributed to individuals above 70 years old. 57,6% of the lost DALYs occurred among men that lost more DALYs compared to females in all age groups.

Conclusions:

Similar to other countries, the burden of COVID-19 in Sweden is concentrated mainly among the elderly, which contributed to the highest DALY loss due to mortality. Yet, DALY loss remains lower for COVID-19 compared to other major non-communicable diseases such as cardiovascular diseases and neoplasms. The contribution of YLD was minimal. However, YLD due to post-Covid is not well understood and long-term disability is likely still underestimated.

Key messages:

- The burden of COVID-19 was mainly due to premature mortality in the older age groups.
- More research is needed especially on post-COVID disability to derive better estimates of YLD.

Abstract citation ID: ckac131.569
Harnessing the potential of digital data for infectious disease surveillance in sub-Saharan Africa

Juliane Boenecke

J Boenecke[1,2], J Brinkel[2], M Belau[3], M Himmel[4], J Ströbele[5]
[1]Department of Health Sciences, Hamburg University of Applied Sciences, Hamburg, Germany
[2]Department Infectious Disease Epidemiology, Bernhard Nocht Institute for Tropical Medicine, Hamburg, Germany
[3]Institute of Medical Biometry and Epidemiology, University Medical Center Hamburg- Eppendorf, Hamburg, Germany
[4]Department for Microbiology and Biotechnology, Institute for Plant Sciences and Microbiology, University of Hamburg, Hamburg, Germany
[5]Department of Computer Science, Hamburg University of Applied Sciences, Hamburg, Germany
Contact: juliane.boenecke@haw-hamburg.de

Despite efforts by the WHO to support local surveillance strategies in developing countries, there is a lack of robust public health surveillance frameworks. As a result, early infectious disease outbreak detection and response remain a significant challenge for local health systems in low-resource settings such as sub-Saharan African countries. In contrast, the growing digital infrastructure, especially in the mobile phone sector, and the global availability of extensive digital data offer promising solutions to enhance and strengthen epidemiological surveillance. Yet, there is little insight into concepts of utilisation and transfer into local public health practice. Using Tanzania as an example, a novel electronic surveillance and early outbreak alert framework is being developed that links signals on emerging diseases with relevant contextual Open Data for rapid outbreak risk assessment. The concept focuses on haemorrhagic fever diseases, specifically dengue virus disease, which is increasingly spreading in sub-Saharan Africa. A data stack framework forms the core of the system, which augments electronic information on the occurrence of acute haemorrhagic fever syndrome, e.g., collected via mobile phone-based surveillance tools, with openly available socio-ecological context data specific to dengue. Preliminary results on the data and information flow within the surveillance framework are presented and strategies for an automated indicator-based risk assessment for dengue outbreaks will be discussed, supplemented by an agent-based simulation framework to model possible short-term outbreak scenarios. In addition, adequate data inputs, identified through an appraisal of various data sources available for Tanzania, are outlined. The framework could serve as a blueprint for designing locally implementable early warning and decision support systems integrated with existing digital surveillance infrastructure.

Key messages:

- Digital health surveillance and Open Data offer great potential for early outbreak detection and supporting health decisions but require tailored solutions to benefit low-resource settings.
- Building on existing digital surveillance infrastructure, the framework may serve as a blueprint for designing an enhanced surveillance and decision support system for infectious disease outbreaks.

[3]LR19SP03, University Hospital Farhat Hached, Sousse, Tunisia
[4]Department of Family and Community Medicine, Faculty of Medicne of Sousse, University of Sousse, Sousse, Tunisia
[5]LR12ES03, Faculty of Medicne of Sousse, University of Sousse, Sousse, Tunisia
Contact: amel.amara1@yahoo.fr

Background:

Smoking is the leading cause of preventable death. This risk behavior usually begins during adolescence. However, only the third of the countries are monitoring this risk behavior among adolescents.

Objective:

To assess the prevalence of tobacco use and to determine the predictors of its experimentation among high school students from Sousse (Tunisia) in 2018 and 2019.

Methods:

In 2018 and 2019, two cross-sectional studies were led among 1399 and 1342 adolescents randomly selected from the same four high schools in Sousse. For data collection, the same pre-tested questionnaire was self-administered anonymously to the participants in the presence of pre-trained investigators.

Results:

Girls represented 60.5% and 63.2% of participants in 2018 and 2019 respectively. The prevalence of tobacco experimentation was of 29.4% in 2018 and of 26.7% in 2019. Current cigarette smoking was objectified in 9.8% and 7.4% of participants in 2018 and 2019. Regardless of the year of the study, the main predictors of lifetime tobacco use among them were: current use of e-cigarette (adjusted OR of 6.4 [4.5-9.0]), cannabis experimentation (adjusted OR of 5.3 [2.7-10.7] and alcohol consumption (adjusted OR of 3.9 [2.5-6.3]).

Conclusions:

Experimentation and current use of tobacco are common among the high school students of Sousse. The national smoking prevention program should be reinforced by multi-sectoral prevention actions targeting not only tobacco use but also the consumption of other substances.

Key messages:

- Tobacco experimentation is high among the adolescents of Sousse.
- Tobacco experimentation is strongly associated with other substances use among the adolescents of Sousse.

Impact of the COVID-19 pandemic on the health behaviour of university students in Hamburg, Germany

Ralf Reintjes

M Loof[1], F Czech[1], M Fiedler[1], M Kewitz[1], L Kunze[1], Y Munusy[1], R Reintjes[1]
[1]Health Sciences, Hamburg University of Applied Sciences, Hamburg, Germany
Contact: ralf.reintjes@haw-hamburg.de

Background:

The academic surveillance system SuSy has been collecting and analysing data regarding the health behaviour of health sciences and medical technology students twice a year since 2014. The aims of the project are to identify risk factors as well as trends and to explore the impact of the COVID-19 pandemic on university students. The data provides a suitable basis for planning and implementing health promotion and prevention measures to improve students' health.

Methods:

A cross-sectional assessment as part of a rolling cohort analysis overall captured data of more than 3,000 cases using quantitative paper-pencil and online questionnaires at a German university in Hamburg. In autumn 2021, 257 students (193 women, 62 men), aged 18 to 54 years participated in the survey. However, trends are only described among undergraduate health sciences students ($n \approx 150$ each survey).

Results:

During the COVID-19 pandemic the health behaviour of students has changed considerably in many aspects. After remaining almost constant for five years the percentage of students consuming analgetic drugs regularly increased significantly from 45 % to 68 % during the first two years of the pandemic. The percentage of students consuming soporific drugs and tranquilizers has doubled during the same time and reached a new high (28 %) in autumn 2021. Parallel to the implementation and relaxation of relevant restrictions the consumption of alcohol first decreased noticeably, but then rose to an even higher level. Also, the percentage of students exhibiting low mental well-being more than doubled from 18 % to 43 %.

Conclusions:

The surveys indicate that students started to engage in riskier health behaviour during the COVID-19 pandemic while being subjected to low mental well-being. In addition to the observed vulnerability, further research regarding students' health is required to identify potential, yet generalisable health risks to enhance and initiate expedient preventive measures.

Key messages:

- The development, implementation and regular enhancement of a student health-related surveillance system is advisable.
- University students need to receive more public health attention in the future.

Multi-drug and β-lactam resistance in Escherichia coli and food-borne pathogens

Miguel Costa

M Costa[1,2], M Cardo[3], P Soares[1,2], M Cara d'Anjo[4], A Leite[1,2]
[1]NOVA-National School of Public Health, Public Health Research Centre, Universidade NOVA de Lisboa, Lisbon, Portugal

[4]Veterinary Public Health Department, Directorate-General of Food and Veterinary, Lisbon, Portugal
Contact: mm.costa@ensp.unl.pt

Antimicrobial resistance (AMR) is one of the top ten global public health threats facing humanity by menacing the effective use of available antimicrobials for treatment of an ever-increasing range of infections caused by bacteria. Its potential recognize the transmission to humans by contact with commensal and zoonotic resistant bacteria from animal and food sources. The aim of this study is to describe multi-drug resistance (MDR) profile in Campylobacter (n = 541), Salmonella (n = 919) and commensal Escherichia coli (n = 2777) isolated from animal and food samples between 2014 and 2019 in Portugal. Antimicrobial susceptibility testing results to fluoroquinolones/quinolones, macrolides, 3rd generation cephalosporins, polymyxins, carbapenems, penicillins, aminoglycosides, tetracyclines, sulphonamides, trimethoprim and chloramphenicol were clustered using k-modes. Clusters were described by population (broilers, broilers meat, turkeys, pigs, pig meat), AMR classification (mono/dual-resistance, MDR to 3-4, 5-6 and $\geq$7), β-lactamases production, sample stage (farm, slaughterhouse, processing plant, retail), season, and year. Overall, the results suggest an escalating MDR behavior from farm to post-farm stages in all bacteria, including E. coli MDR to critically important antimicrobials, and that Salmonella (fluoro)quinolones resistance may be associated with broilers. Most ESBL/AmpC producing E. coli were resistant to both C3G and C4G in isolates from animal and food samples (respectively, 77%; n = 846; and 74%; n = 188). The statistical method, K-modes, offers an overall visualization of the data with the identification of AMR profiles that have been further described using surveillance variables. Our results provide relevant information to support policy and decision making to tackle MDR in farm and post-farm stages.

Key messages:

- An escalating multi drug resistance behavior from farm to post-farm stages.
- Escherichia coli multi drug resistance to critically important antimicrobials.

Mortality before and during COVID-19 outbreak in the Federation of Bosnia and Herzegovina

Šeila Lagarija

Š Cilović-Lagarija[1], S Musa[1], S Skočibušić[1]
[1]Institute of Public Health for FBiH, Sarajevo, Bosnia and Herzegovina
Contact: s.cilovic@zzjzfbih.ba

Background:

Mortality data are essential for monitoring population health and is one of the most important data for evaluation and comparison of health status at the local, national, and international level.

Objective: We analysed all-cause mortality data in the Federation of Bosnia and Herzegovina (FBiH) for the period 2016-2021 and compared it with mortality occurred during the COVID-19 pandemic, in 2020 and 2021.

Methods:

Using data on all-cause deaths for the period 2016-2021, obtained from the Institute for Statistics of the Federation of Bosnia and Herzegovina, we compared annual number of deaths (all-ages) and death rates during the 2020 and 2021 to pre-pandemic years.

Results:

In 2016 the reported number of death was 21,146, in 2017 was 21,942, in 2018 was 21,691, and in 2019 was 22,024, and during the pandemic period in 2020 and 2021, 26,026 and 29,086 deaths were reported respectively. In 2020, 4,115 more deaths has been reported (15,8%), and in 2021 more 6,438 death (22,1%) compared with period 2016-2019. In FBiH in 2021, the death rate per 100,000 inhabitants was 1,341.2 and it is recorded an increase compared to 2020 when it had a value of 1,208.3 while in 2016 the value was 951.7.

Conclusions:

A large proportion of increased mortality during pandemic was probably caused directly by COVID-19. However, the pandemic also resulted in deaths that would otherwise not have occurred (indirect deaths) due lack of access to medical services when hospitals were overwhelmed and changes in health seeking behaviour. An in-depth investigation of the underlying causes of the high excess mortality should be conducted to inform changes in the health care system and efforts to prevent severe COVID-19 through vaccination of vulnerable groups should be a priority.

*This abstract is support by 'BoCO-19 - The Burden of Disease due to COVID-19'. Project is coordinated/led by Robert Koch Institute and supported by the WHO Regional Office for Europe.

Key messages:

- During the two years of the COVID-19 pandemic, population in FBiH had a significant increase in all-cause mortality.

- The direct standardized death rate for all causes and age groups per 100,000 inhabitants in 2020 for FBiH was 818.0 and it is slightly higher compared to the EU average.

Masculinities and self-perceived risk of contracting STIs among young men in Stockholm, Sweden

Ana Canabarro

A Canabarro[1], *M Salazar*[1]
[1]Department of Global Public Health, Karolinska Institutet, Stockholm, Sweden
Contact: ana.paula.finatto.canabarro@ki.se

Background:
Risk perception is a key factor influencing young men's health-seeking behavior for sexually transmitted infections (STIs) detection. Men's risk perception could be influenced by gendered norms embedded in social constructions of masculinities. However, the association between different domains of traditional masculinities and young men's risk perception - which is key to inform effective health interventions - has not been studied yet. This study aimed to test if young men's endorsement of different traditional masculinities forms were associated with current self-perceived risk of contracting STIs among young men in Stockholm, Sweden.

Methods:
A population-based cross-sectional survey was conducted in 2018 in Stockholm (N = 521 men aged 20-29 years). The Conformity to Masculinity Norms Inventory 46-items tool was used to measure different traditional masculinity domains (Winning, Emotional control, Risk taking, Violence, Playboy, Self-reliance, Primacy of work, Power over women and Heterosexual self-presentation) and overall masculinity. Adjusted multinomial logistic regressions tested the associations between masculinities (overall and each domain) and self-perceived risk of contracting STIs.

Results:
Any self-perceived risk of contracting STIs was reported by 39.5% of the sample. After adjusting for confounding factors, endorsing any traditional masculinity behavior was associated with reporting any perceived risk of contracting STIs (RRR 4.9; 95% CI 2.4-10.0). Among the domains, Playboy showed the strongest association (RRR 3.6; 95% CI 2.5-5.1), followed by Risk taking (RRR 1.8; 95% CI 1.3-2.5).

Conclusions:
Young men who endorse traditional masculinities behaviors have higher self-perceived risk of contracting STIs, especially those endorsing playboy and risk-taking norms. These findings highlight the need to design policies challenging traditional masculinity behaviors among young Swedish men that can be underpinning their self-perceived STIs risk.

Key messages:
- Endorsement of playboy (willingness to have casual sexual partners) and risk taking (willingness to be exposed to risk) masculinity norms were associated with perceiving any risk of contracting STIs.
- Policies challenging traditional masculinity norms among young Swedish men can be designed to influence behaviors underpinning the self-perceived risk for STIs in this group.

Peristomal skin complications in ileostomy and colostomy patients: a systematic literature review

Floriana D'Ambrosio

F D'Ambrosio[1], *C Pappalardo*[1], *A Scardigno*[1], *A Maida*[1], *R Ricciardi*[2], *GE Calabrò*[1,2]
[1]Section of Hygiene, University Department of Public Health, Università Cattolica del Sacro Cuore, Rome, Italy
[2]VIHTALI, Spin-Off of Università Cattolica del Sacro Cuore, Rome, Italy
Contact: florianadambrosio@libero.it

Background:
Peristomal skin complications (PSCs) are one of the main post-operative complications of ostomy surgery. They have a considerable impact on patients' quality of life and represent a challenge for healthcare professionals involved in their management. The majority of PSCs is preventable and costly. Knowing their burden could guide decision makers on the ostomy patients' management who are predominantly cancer and chronic bowel disease patients. Thus, the aim of this study was to summarize existing literature regarding the clinical-epidemiological burden of PSCs in ostomy patients.

Methods:
A systematic literature review was performed querying three database (PubMed, Scopus, Web of Science) from January 2012 to February 2022. It included studies in English language and focused on the clinical and epidemiological burden of PSCs in the adult patients with ileostomy and colostomy.

Results:
Overall, 35 studies were considered. Epidemiological data on PSCs were not systematically collected in the available literature. The principal underlying disease requiring the ostomy surgery were rectal, colon and gynaecological cancers, inflammatory bowel diseases, diverticulitis, occlusion and intestinal perforation. It was described a range of PSCs from 11% to 45%. The PSCs were most commonly erythema, papules, erosion, ulceration and vesciculation. Skin complications increased the average number of hospitalization days and of hospital readmission within 120-day following surgery.

Conclusions:
The data on PSCs are still limited. Estimating the PSCs burden could support healthcare professionals and decision makers called upon to identify the most appropriate responses to patients' health needs. The management of these complications plays a vital role to improve patient's quality of life and a multidisciplinary approach with the active involvement of stomatherapist, surgeon and dermatologist is critical. Furthermore, a better patient education and empowerment is needed.

Key messages:
- Developing a multidisciplinary approach to managing PSCs is essential in order to provide the best treatment possible and the best outcomes for patients.
- Further studies should be conducted in order to better define the clinical-epidemiological burden of ileo- and colostomies and to support better health planning.

Drinking water quality as a risk factor for pupils' health in rural schools in Serbia

Dragana Jovanovic

D Jovanovic[1], *V Karadzic*[1], *M Vasic*[1,2], *V Jovanovic*[1], *K Paunovic*[3]
[1]Institute of Public Health of Serbia, Belgrade, Serbia
[2]Faculty od Dentistry, Pancevo, Serbia
[3]Institute of Hygiene and Medical Ecology, Faculty of Medicine, University of Belgrade, Belgrade, Serbia
Contact: dragana_jovanovic@batut.org.rs

Background:
Access to safe drinking water in schools is essential for a good health, wellbeing, learning and dignity of pupils. The rural schools are most frequently connected to the rural water supply system or own water supply source, where the monitoring of drinking water quality is scarced. The study was conducted in the rural regions in Serbia in 2016, aiming at assessing drinking water quality and sanitary conditions of school water supply facilities.

Methods:
In total 238 school facilities, including 108 in Šumadija and 130 in Pomoravlje District were investigated using laboratory testing of drinking water and sanitary inspection.

Results:

Study revealed that 32% of analysed samples showed microbiological faecal contamination with bacteria E. coli, while 52% of samples showed physico-chemical non-compliance with the national standards, where higher nitrates were the most common cause. Overall non-compliance of drinking water from school rural water supply systems amounted to 66% of tested water samples. This study also showed the main technical shortcomings of school water supply facilities and distribution networks such as the lack of fencing of the water source, damaged or absence of drainage channels from the well concrete floor and poor construction characteristics of wells.

Conclusions:

The results of this study, particularly presence of E. coli in drinking water may affect pupils' health and is a consequence of poor sanitary conditions and maintenance of small rural drinking water supply systems and individual wells. It is necessary to provide continuous disinfection of water available in schools and to undertake measures for technical improvements in order to provide better sanitary protection of water sources and other water supply facilities in rural schools.

Key messages:

- Drinking water quality in schools is vital for children public health.
- Raise awareness of local community on drinking water safety and enforce continuous monitoring of drinking water quality in small rural water supply systems in schools.

Abstract citation ID: ckac131.577
Strengths and weaknesses in the implementation of the IHR (2005) in low GNI countries

Milena Vasic

M Vasic[1,2], *V Karadzic*[1], *D Jovanovic*[1], *B Kilibarda*[1], *V Jovanovic*[1]
[1]Institute of Public Health of Serbia, Belgrade, Serbia
[2]Faculty of Dentistry, Pancevo, Serbia
Contact: milena_vasic@batut.org.rs

Background:

The International Health Regulations (IHR) 2005 are an international legal instrument adopted by World Health Organization General Assembly to strengthen global health security and empower the countries to prevent and respond to public health threats.

Methods:

This study was done within the Joint Action on Strengthened International Health Regulations and Preparedness in the EU (SHARP JA) with the aim to assess the strengths and weaknesses in preparedness and IHR implementation in order to develop and improve countries' IHR capacities. Desk-based review and analysis of available data from the States Parties Annual Report tool (SPAR) from 2019 were done. Data (for 13 IHR capacities with 24 indicators) were analyzed for 15 countries participating in SHARP JA with gross national income (GNI) less than 90% of the EU average.

Results:

The overall capacity for IHR implementation in low GNI countries is 69%, ranging from 33% in Bosnia and Herzegovina to 84% in Spain. The highest capacities are recognized in the area of Legislation and financing - 78%, IHR Coordination & NFP Functions - 77%, Food Safety - 76%, and Health service provision - 76%. The weak areas with the need for further improvement are recorded in the Points of entry (PoE) - 51%, Risk Communication - 52%, Chemical events - 60%, National health emergency framework - 65%, Surveillance - 66%, and Human Resources - 67%. The overall IHR capacity of low GNI countries is lower compared to the SHARP JA countries and the European average (76% and 73% respectively).

Conclusions:

The results have shown the strongest and the weakest points of the IHR implementation in low GNI countries. This indicates the need for capacity building and further development in identified areas (Points of entry, Risk Communication, Chemical events, National health emergency framework, Surveillance, and Human Resources).

Key messages:

- The assessment of the strengths and weaknesses in preparedness and IHR implementation is the key prerequisite for identifying countries' needs for their capacity enhancement.
- Special attention should be given to the strengthening low GNI countries' capacities.

Burden of road traffic injuries in Federation of Bosnia and Herzegovina – fifteen-year survey

Šeila Cilović Lagarija

Š Cilović-Lagarija[1], *S Skočibušić*[1], *S Musa*[1], *A Jogunčić*[2]
[1]Institute of Public Health for FBiH, Sarajevo, Bosnia and Herzegovina
[2]Public Health Institute of Canton Sarajevo, Sarajevo, Bosnia and Herzegovina
Contact: s.cilovic@zzjzfbih.ba

Introduction:

Road traffic injuries (RTI) are among the ten leading causes of death worldwide, and they are the leading cause of death among young adults aged 15-29 years. In Federation of Bosnia and Herzegovina (FBiH), with population of 2,1 million, around 380 people die every year and additional 11.000 get seriously injured in RTI.

Aim:

The aim of this study was to investigate the incidence and fatality rate of RTI in FBiH in the period of 2006 until the end of 2020.

Methods:

Data source of RTI (ICD-X) incidence and fatality rate was Statistical book for Federation of Bosnia and Herzegovina, which includes all injuries and deaths reported through Ministry of internal affairs. Fatality rate was calculated as number of confirmed deaths in total number of reported RTI. To compare frequencies of reported deaths Chi square test was used. YLD were calculated based on information on injury that was caused in road traffic accidents.

Results:

In the last 15 years, in FBiH, total 39,455 injuries related to road traffic were reported. According to the official data, over the period 2006-2020 the peak of fatality rate (8.52% deaths among all cases with RTI) was in 2016, while it had a statistically significant decline in 2018: 6.51%; 2019: 6.35%; and 2020: 6.32% ($x2 = 7728{,}584$; $p < 0{,}0001$). It is estimated that young adults (in the age group 30 to 39 years) injured in the road traffic accidents have 197.01 patient-years of total 881.17 years to live with disabilities just based on serious RTI in 2020.

Conclusions:

RTI pose a significant burden on the health of the population in FBiH. After implementing strict laws in the year 2017, and 2018, a significant decrease of RTI was registered, including the number of deaths due to RTI (fatality rate).

This abstract is support and sponsorship by 'BoCO-19 - The Burden of Disease due to COVID-19'. Project is coordinated/led by Robert Koch Institute and supported by the WHO Regional Office for Europe.

Key messages:

- RTI are significant burden for health of population in FBH. Strict laws and stronger punishments and fees are decreasing number of RTI.
- This abstract is support and sponsorship by 'BoCO-19 - The Burden of Disease due to COVID-19'. Project is coordinated/led by Robert Koch Institute and supported by the WHO Regional Office for Europe.

Healthcare utilization among aging Latvians with diminished activities of daily living

Ieva Reine

C Queen[1,2], *R Pasupathy*[1], *I Reine*[2,3]
[1]Department of Public Health, Texas Tech University Health Sciences Center, Abilene, USA
[2]Institute of Public Health, Riga Stradins University, Riga, Latvia
[3]Department of Public Health and Caring Sciences, Uppsala University, Uppsala, Sweden
Contact: Ieva.reine@rsu.lv

The population in Latvia is aging. Independence in performing activities of daily living (ADL) is a core aspect of functioning, and the elderly frequently experience limitations in functioning. Little is known about the utilization of healthcare of elderly Latvians with functional difficulties. The purpose of this study was to determine the relationship between functional difficulties and utilization of healthcare among the elderly in Latvia. This study had three overall objectives: (i) to investigate the determinants of utilization of health care for elderly Latvians with functional difficulties; (ii) examine the relationship between predisposing characteristics, enabling resources, and need with specific measures of access to care using the Behavioral Model for Vulnerable Populations and to (iii) identify the nature and existence of health disparities among the elderly in Latvia, with and without functional difficulties. Data from the 2017 Survey of Health, Ageing and Retirement in Europe (SHARE) survey, with a sample size of 1479 was utilized. There was a statistically significant difference in the utilization of healthcare between individuals with and without functional disabilities ($F(4,1) = 759.615$, $p < 0.01$), with a higher utilization of healthcare among individuals with functional difficulties ($p < .01$). The results of Automatic Linear Modeling indicate that significant ($p < 0.05$) factors in predicting utilization of healthcare include factors such as age, public sickness benefit and disability pension, and overall health status. This study is significant because it fills critical gaps in knowledge that exist with respect to healthcare utilization for elderly Latvians with functional disabilities.

Key messages:

- This study contributes to our understanding of healthcare utilization of aging Latvians.
- This study provides insight into the functional limitations of the aging Latvian population.

[3]Internet Express snc, Pescara, Italy
[4]Hub for International Health ReSearch, Perugia, Italy
Contact: fabrizio.carinci@unibo.it

Background:

The SCORE2 risk model has been recommended for cardiovascular risk assessment in individuals aged over 40 years without diabetes in 4 defined risk regions of Europe. We aimed to validate a novel SCORE2-DM model in Type 2 diabetes with additional risk factors mainly based on UK datasets, using federated databases from the EUBIROD network.

Methods:

We defined a full operational protocol to implement a standard procedure for validation across contributing sources in Europe. The manual described inclusion/exclusion criteria (aged 40+, diagnosis of T2 diabetes at 30+, no prior CVD), risk factors measured over a baseline interval (1/2013-62015), target/competing events at follow-up (2015-2019). We specified a common data model with 9 steps required to process longitudinal records and deliver summary cohort data (one record per person). All rules were implemented in R and NeuBIRO, an original tool written in Java/Groovy and H2 SQL (https://github.com/eubirodnetwork/neubiro).

Results:

Software was able to produce the following outputs at each source: distribution of risk factors by sex and 5-year age groups; Harrell's C-index and standard error of SCORE2 and SCORE2-DM by sex and 10-year age groups, C-index differences; average 5-year predictive vs observed risk by risk deciles; adjusted cumulative incidence of 5-year competing risk by sex and 5-year age groups. Code was packaged into a standalone bundle, with test data and coefficients ofthe SCORE2-DM model. The procedures allowed either creating cohort data autonomously to run the supplied R code, or let NeuBIRO complete all steps foreseen to deliver. Tests have been successfully completed in the derivation data, with results from federated databases expected to contribute to the final external validation of SCORE2-DM by midyear.

Conclusions:

We defined a collaborative method to validate risk prediction models in high risk subgroups using international pooling of cohort data with privacy protection.

Key messages:

- Collaborative methods to validate risk prediction models can enhance access to real world data for researchers across chronic diseases.
- Implementation of flexible and reusable source code can increase opportunities to use prediction models for robust clinical decision making in multimorbidity.
