Welcome to the EAAP 2024 in Florence

Ladies and Gentleman,

on behalf of the organizing committee and of the whole community of the Italian Association for Animal Science and Production I am very happy and honored to welcome you to the 75th annual meeting of the European Association for Animal Production, that will take place in Firenze (Florence) from September 1st to September 5th 2024.

Firenze is one of the main art cities of Italy. An outstanding richness of monuments, historical sites, museums and churches represents the cultural and artistic heritage of Firenze, considered the capital of the Renaissance. Firenze is the capital of the region of Tuscany, placed in the heart of Italy, and known worldwide for its beautiful hilly agricultural Landscapes, the country mansions of the region of Chianti, the wines, the olive oil, the autochthonous giant beef cattle "Chianina", the "Fiorentina" steak. These products represent excellences of the Italian agriculture. Social events during the EAAP congress, hosted on some of the most spectacular venues of the City, will offer the opportunity to directly taste several of these products.

The general theme of the congress is "Global quality: Environment, Animals, Food". The congress will consist in several parallel scientific sessions where updated research results covering the whole domain of the Animal Science will be presented and discussed together with the presentation of main ongoing research projects. With its geographical position, Italy exhibits a great variety of environments, ranging from Alpine to Mediterranean climate. This peculiarity is reflected in the structure of its agriculture. Intensive dairy and beef cattle, pigs and poultry farms are typical of the Northern district. Buffalo farming can be found in Latium and Campania, in the Central-Southern part of Italy. Small ruminant systems characterize Southern Italy and the two main islands: Sicily and Sardinia. This richness results in a number of biodiverse livestock farming systems, which generate high-quality products, in many cases certified as PDO or PGI. The products are expression of local genetic resources and of the Italian cultural heritage and they contribute to define the "Made in Italy" brand. Some of these production systems will be the target of technical tours organized at the end of technical sessions.

Benvenuti a Firenze!

Presidents

Nicolò Pietro Paolo Macciotta

Marcello Mele

Industry Members Club

EAAP started in 2023 a new initiative to create closer connections between European livestock industries and the animal science network. Therefore, the “EAAP Industry Club” was shaped with the specific aim of bringing together the important industries of the livestock sector with our European Federation of Animal Sciences. All companies dealing with animal production (nutrition, genetic, applied technologies, etc.) are invited to join the “EAAP Industry Club” because industries will have opportunity to increase their visibility, to be actively involved in European animal science activities, and to receive news and services necessary to industries. In addition, through the Club, industries will enlarge their scientific network and will receive specific discounts on sponsoring activities.

The Industries that already joined the “EAAP Industry Club” are:

The Club gives:

Visibility • Company name and logo at EAAP website and all relevant documents • Slides with name and logo at Official Events • Priority links with EAAP Socials • Invite, through EAAP dissemination tools and socials, people to events organized by your company • Information disseminated through a brand new Industry Newsletter • Networking • Joining the Study Commissions and Working Groups • Suggest topics to be considered for Annual Meetings Scientific Sessions • Organize Professional Panel through the EAAP platforms • Economic Benefits • One free registration to each Annual Meeting and at every meeting organized by EAAP • Five individual memberships at no cost • Many possible discounts (-30%) to increase company visibility through: EAAP Newsletter, EAAP website, EAAP Annual Meetings and workshops • Support young scientist by sponsoring scholarships named by the company • Co-Organize and sponsor webinars

Make yourself more visible within the livestock industry via the animal science network!

Silvafeed ATX to mitigate the effect of oxidative stress in animals' health and meat quality

Elizabeth Santin, DMV, PhD – esantin@silvateam.eu

Polyphenols are a diverse group of naturally occurring compounds found in plants, known for their potent antioxidant properties. In animal studies, polyphenols have demonstrated significant potential in mitigating oxidative stress, a condition characterized by an imbalance between the production of reactive oxygen species (ROS) and the antioxidant defense system. Oxidative stress is implicated in various pathological conditions, including inflammation, aging and chronic diseases. In livestock, oxidative stress can adversely affect meat quality, leading to lipid peroxidation, protein oxidation, and discoloration, which in turn reduce shelf life and consumer acceptability. Polyphenols exert their beneficial effects by scavenging free radicals, chelating metal ions and modulating antioxidant enzyme activities. Additionally, they influence cellular signaling pathways and gene expression related to oxidative stress responses. However not all polyphenols have the same anti-oxidant effect. We will present evidence regarding Silvafeed ATX, a well-balanced blend of polyphenols that stands out for its efficacy in improving antioxidant status, reducing markers of oxidative damage and enhancing meat quality. The mechanisms by which this specific blend of polyphenols counteract oxidative stress will be presented to discuss their potential applications in animal health management, disease prevention and improvement of meat quality.

Tecnosens Sniffer for CO₂ and CH₄ monitoring: Our experience in smart agriculture

Greta Bonacina, Tecnosens Sales Department - gbonacina@tecnosens.it

Established in 1994, Tecnosens has always been involved in the latest technologies for gas monitoring, sensing technology and equipment. Also, environmental issues have always been a Leitmotiv in Tecnosens R&D. As a contribution to livestock research, thanks to the cooperation with several research institutes and the environmental sensitivity, Tecnosens could develop MooLogger, a robust and reliable Sniffer to be installed in farms to monitor the breath of the ruminants composed mainly by CO₂ and CH₄. Tecnosens provides a wide range of sensors and solutions for farm emissions monitoring and environmental control, to monitor NH₃ and other pollutants, for several farming and agriculture application: discover which solution may suit your needs.

Technology for farms: a crucial turning point for the sector

Massimiliano Intini - massimiliano.intini@msd.com

The introduction of technology in farms is a topic of crucial importance for the agricultural sector and represents a turning point for the sector for dairy cattle farming. We, at MSD Animal Health, feel responsible for promoting innovations that guarantee the sustainability of production and safety for consumers. Advanced monitoring systems allow real-time control of the health of cows, optimizing the use of resources and improving animal welfare. Sophisticated sensors can accurately detect vital parameters, allowing timely and targeted interventions. This not only increases productivity but also reduces the risk of diseases, improving the quality of the milk produced. Sustainability is another fundamental pillar. Thanks to innovative technologies, we can minimize the environmental impact of our activities. Advanced management systems allow more efficient use of water and energy, reducing waste and cutting greenhouse gas emissions. In this way, we not only respect the environment but also meet the needs of an increasingly attentive and aware consumer. Speaking of consumers, it is essential to ensure them maximum transparency and safety. Traceability technologies allow us to follow every stage of the production process, from field to table, respecting the highest quality standards. Consumer trust is our most precious resource and technology is the tool that allows us to earn it every day. In conclusion, the introduction of technology in Italian dairy farms is not just an option, but a necessity: it is a path that we must follow with determination and vision, aware that every step forward is an investment in our future.

From mitigating environmental impact to antimicrobial reduction: how botanicals can improve animal production sustainability

Benedetta Tugnoli - benedetta.tugnoli@vetagro.com, Richard Paratte - richard.paratte@vetagro.com

The goal of our talk is to explore the potential of botanical compounds and organic acids to improve the sustainability of animal production. Two experts, one specialized in ruminant species and the other in monogastric species, will guide you through this analysis.

Key challenges

We will focus on two key challenges:

- Environmental impact: the use of functional nutritional strategies allows us to improve the metabolism of farmed animals in order to reduce its environmental impact.
- Antimicrobial resistance: Excessive use of antibiotics in animals threatens human and animal health.

Potential of botanical compounds

Botanical extracts offer various beneficial properties:

- Antimicrobial: fight pathogens and reduce the need for antibiotics.
- Antioxidants: protect cells from oxidative damage.
- Immunomodulatory: strengthen the immune system of animals.

Applications

The use of microencapsulated botanical compounds in animal diets has been shown to promote gut health, improve nutrient utilization and reduce dependence on antibiotics.

Our experts will delve into the specific applications of botanical compounds for:

- Ruminants: dairy cows
- Monogastric: pigs, poultry

Conclusion

Botanical compounds can play a key role in making animal production more sustainable. Using these solutions can reduce environmental impact, improve animal health and help fight antimicrobial resistance.

Question and answer session

At the end of the presentation, there will be the opportunity to ask questions to our experts.

Genomics in Agriculture: Advancing Productivity and Sustainability through a One Health Framework

André Eggen: aeggen@illumina.com

The integration of genomics into the agricultural and food industries has ushered in a new era of innovation, promising to enhance productivity, sustainability, and food safety from farm to fork. Adopting a One Health framework ensures that the use of genomics tools considers the broader ecological impacts, promoting sustainable practices. For instance, reducing the prevalence of antimicrobial resistance (AMR) benefits both human and animal health. Furthermore, monitoring environmental DNA (eDNA) can assess the impact of farming practices on biodiversity, guiding more eco-friendly approaches.

Research is written in our DNA

Research is part of the Vetagro essence:
all our solutions are the result of the
passionate and dedicated work of
specialized researchers. This is what
we rely on to stand out.

INNOVATION BY NATURE

Inspired by nature,
to help nature.

- ▣ Increase in production performance
- ▣ Reduction of methane emissions
- ▣ Reduction of ingested dry matter
- ▣ Improvement of animal welfare

VetosEurope was founded by combining the expertise and savoir faire of one of the most important families in the world in live cattle trade and the technical and scientific knowledge of a group of scientists and researchers specialized in the research and development of **natural feed supplements and nature-identical substances for cattle**, aimed at increasing production while at the same time reducing CH_4 and CO_2 emissions.

The research into an innovative technology aimed at protecting the environment by using nature has led VetosEurope to create **ANAVRIN®**.

#OneHealth

Salute degli animali, degli esseri umani e dell'ambiente.

La nostra natura è unica. Siamo tutti parte dello stesso ecosistema a cui dobbiamo dedicare attenzione e cura.

Per questo la ricerca scientifica di MSD Animal Health è impegnata a offrire trattamenti innovativi e a promuovere azioni concrete che proteggano gli animali, le persone e il nostro pianeta attraverso prevenzione, sostenibilità, sicurezza alimentare, tracciabilità, cura e benessere.

Scientific programme

EXPLANATORY NOTES ON SESSIONS

Abbreviations after the title are (Organising Commission; Session Type)

Commissions are:

Cattle (C), Genetics (G), Health and Welfare (H+W), Horse (H), Insect (I), Livestock Farming Systems (LFS), Nutrition (N), Pig (P), Physiology (Ph), Precision Livestock Farming (PLF), Sheep and Goat (S+G), Animal Task Force (ATF)

Session types are:

Theme Sessions (T) are on key topics in animal science and consist of invited and offered papers.

Industry sessions (I) are led and supported by Industry and comprise invited and offered papers.

Free communications/Bottom-Up (B): these sessions will be created from submitted abstracts and titles will be announced in early April.

Discovery Sessions (D) are invited single/multiple presentations on hot/emerging topics.

Challenge Sessions (C) are free format (workshop, open committee, round table) to debate important issues, not theatre paper presentation.

Early-career (EC) scientist's Session.

Project session (P) are sessions based around a project which wants to share its results, often combined with submitted abstracts.

Working Group sessions (WG) are the results of an EAAP working group.

Room	Tuesday Sept 3rd 8.30 – 12.30	Tuesday Sept 3rd 14.30 – 18.00
Auditorium Palazzo Congressi Lower Ground Floor	43. Digital phenotyping sensors, 'omics' and genetics in enhanced sustainability (G/PLF, T)	57. Socio-economic approaches to address the contemporary issues of the horse industry (H, BU)
Pisana Palazzo Congressi 2nd Floor	44. Genetics of food quality (G, T)	58. The role of breeding and genetics in the sustainable transformation of the livestock sector (G/ANRWG, WG)
Valdostana Palazzo Affari 3rd Floor	45. Indicators, hi-tech solutions, and tools to effectively manage cattle (C, T)	59. Milk properties for the valorization of dairy (by-products) manufacturing (C/ADSA, T)
Reggiana Palazzo Affari 2nd Floor	46. Viable future dairy farming systems and products from production, feeding, environmental and consumer viewpoint, Part 1 (C, P)	60. Viable future dairy farming systems and products from production, feeding, environmental and consumer viewpoint Part 2 (C, P)
Chianina Palazzo Affari 1st Floor	47. Nutrition management to reduce methane emissions and environmental impact, Part 2 (N, T)	61. Advances in fish nutrition (N, T)
Maremmiana Palazzo Affari 2nd Floor	48. Horse genetics and genomics (H, BU)	62. Feeding for improving the nutritional, safety and organoleptic characteristics of animal-derived foods (N, T)
Romagnola Palazzo Affari 1st Floor	49. Nutrition in health and welfare of ruminants (N/H+W, T)	63. Improving animal welfare by optimising nutrition/feeding behaviour, Part 1 (H+W/N, T)
Piemontese Palazzo Affari 2nd Floor	50. Sustainable solutions to support and sustain gut health in monogastric livestock (with project MONOGUTHEALTH), Part 1 (P, P)	64. Sustainable solutions to support and sustain gut health in monogastric livestock (with project MONOGUTHEALTH), Part 2 (P, P)
Podolica Limonaia - Garden	51. Genetic progress vs animal welfare? (H+W/G/FABRE-TP, C)	65. PLF for health, behaviour and welfare, Part 2 (H+W/PLF, T)
Marchigiana Palazzo Affari Ground floor	52. Redesigning the trajectory: the contribution of research to the development of resilient Livestock Farming Systems and their role in climate change and biodiversity (LFS, T)	66. The current and future role of pasture production systems in the mitigation of and adaptation to climate change impacts in livestock farming systems (LFS, T)
Rendena Palazzo Affari 4th Floor	53. Insect genetics, reproduction, physiology and behaviour (I, T)	67. Innovative insect applications and technologies (I, T)
Calvana Palazzo Congressi Ground floor	54. Sustainable sheep and goat high-yield production systems: Management, nutrition, mechanization, health, and welfare aspects (S+G, T)	68. Small ruminant health and welfare aspects (S+G/H+W, T)
Modicana Palazzo Affari 3rd Floor	55. Host physiology/genetics and microbiome interactions – The holobiont concept (Ph/G, T)	69. Epigenetics, adaptation and intergenerational transmission (Ph/G, T)
Sarda Palazzo Affari Below ground Floor	56. PLF for health, behaviour and welfare, Part 1 (PLF/H+W, T)	70. RES4LIVE: (renewable) energy for livestock, incl. free communications on energy and sensors for thermal comfort of livestock (PLF, P)

Room	Wednesday Sept 4th 8.30 – 12.30	Wednesday Sept 4th 14.00 – 18.00
Auditorium Palazzo Congressi Lower Ground Floor	71. Genetic evaluations: new methods, new species, new proxies (G, BU) <i>Genetics Commission Business Meeting</i>	85. Genetics of novel health and welfare traits (G/H+W, T)
Pisana Palazzo Congressi 2nd Floor	72. Methods in prediction of genetic merit and assessment of genetic diversity (G, BU)	86. Tailored housing and management strategies from incubation to slaughter house, for poultry (P, WG)
Valdostana Palazzo Affari 3rd Floor	73. Targeting ecosystem services provision by grasslands and protein self-sufficiency in cattle production (C, T) <i>Cattle Commission Business Meeting</i>	87. Dairy herd management (C, EC)
Reggiana Palazzo Affari 2nd Floor	74. From horse welfare to social license to operate (H, T) <i>Horse Commission Business Meeting</i>	88. How the dairy sector copes with EU-Green deal (C, T)
Chianina Palazzo Affari 1st Floor	75. Advances in non-ruminant nutrition, Part 2 (N, T) <i>Nutrition Commission Business Meeting</i>	89. Free communications in animal nutrition (N, BU)
Maremmana Palazzo Affari 2nd Floor	76. Advances in ruminant nutrition, Part 2 (N, T)	90. Nutrition and feeding in the circular economy (N, T)
Romagnola Palazzo Affari 1st Floor	77. Improving animal welfare by optimising nutrition/feeding behaviour, Part 2 (H+W/N, T)	91. Young EAAP session. Project writing: tools, opportunities and experiences (All, EC)
Piemontese Palazzo Affari 2nd Floor	78. Collaboration in experimental research for sustainable pig production (with PIGWEB) (P, P) <i>Pig Commission Business Meeting</i>	92. Good practices in experimental research for sustainable pig production (with PIGWEB) (P, P)
Podolica Limonaia - Garden	79. Welfare issues for small ruminants (H+W/S+G, EC) <i>H+W Commission Business Meeting</i>	93. Preventive approaches to livestock diseases to reduce drug resistance (H+W, T)
Marchigiana Palazzo Affari Ground floor	80. Technologies for GHG emission mitigation on farm: options, opportunities and challenges (LFS, T) <i>LFS Commission Business Meeting</i>	94. Living labs and demonstration farms: approaches to improve sustainability of LFS globally (LFS, T)
Rendena Palazzo Affari 4th Floor	81. Safety, sustainability and welfare in the insect (I, T) <i>Insect Commission Business Meeting</i>	95. Insects as food & feed (I/PWG, T)
Calvana Palazzo Congressi Ground floor	82. Optimization of pasture forage and by-product resources to improve sheep and goat production (S+G, T) <i>Sheep + Goat Commission Business Meeting</i>	96. Optimization of technical, economic, and environmental efficiency in sheep and goat production systems (S+G, T)
Modicana Palazzo Affari 3rd Floor	83. Early life nutrition and its latent impact on growth, lactational and reproductive physiology (Ph, I) <i>Physiology Commission Business Meeting</i>	97. Biological mechanisms regulating inflammatory and energy metabolism in livestock species (Ph, T)
Sarda Palazzo Affari Below ground Floor	84. PLF systems to face climate change and increase sustainability (PLF, T) <i>PLF Commission Business Meeting</i>	98. Nutrition in health and welfare in monogastric animals (N/H+W, T)

Scientific programme

Session 1. Integrating mitigation and adaptation breeding strategies

Date: Sunday 1 September 2024; 8:30 - 12:30

Chair: Sell-Kubiak / Gredler-Grandl

Theatre Session 1

Global Methane Genetics: a global program to accelerate genetic progress for reduced methane emission in ruminants	163
<i>invited</i> B. Gredler-Grandl, C. I. V. Manzanilla-Pech, R. Banks, H. Montgomery, R. F. Veerkamp	
Are the most productive, the less thermotolerant animals in low input beef cattle populations? The case of the Avileña-Negra Ibérica beef cattle breed	163
C. Diaz, M. Ramón, C. Meneses, M. J. Carabaño	
Feed efficiency, performance, and methane emissions of finishing Hereford steers with high and low residual feed intake	164
P. Peraza, C. G. Ciappesoni, A. La Manna, J. I. Velazco, E. A. Navajas	
Trait definitions for methane production in Australian beef cattle	164
T. Granleese, R. Hergenhan, S. Clark	
Genotype by environment interaction for growth traits in the Italian Limousine population	165
S. Simone, F. Tiezzi, M. C. Fabbri, C. Maltecca, R. Bozzi	
Future emission reductions deliverable by Irish beef and dairy breeding indices	165
D. Kenny, J. Sise, P. Amer, R. Evans, F. Hely	
Exploring different definitions of methane concentration phenotypes in dairy cattle	166
C. I. V. Manzanilla-Pech, A. E. Van Breukelen, O. Gonzalez-Recio, E. Teran, M. Pszczola, T. Strabel, R. F. Veerkamp, Y. De Haas, B. Gredler-Grandl	
Relationships between methane emissions and milk production traits, an unfinished story	166
N. Gengler, H. Atashi	
Estimation of heritability and genetic correlation of methane phenotypes and yield traits in the Spanish Holstein population	167
E. M. Teran, A. García-Rodríguez, J. A. Jiménez-Montero, O. Gonzalez-Recio	
Genetic correlations between feed intake and GHG emissions measured on young bulls with production and reproduction traits measured in Italian Holstein cows	167
F. Tiezzi, R. Finocchiaro, L. Benzoni, J. T. Van Kaam, M. Marusi, R. Bozzi, M. Cassandro	
Genetic parameters for methane production, intensity, and yield predicted from milk mid-infrared spectra throughout the lactation in Montbéliarde cows	168
S. Fresco, D. Boichard, S. Fritz, P. Martin	
Sequence-based GWAS of heat tolerance traits in Holstein and Montbéliarde cattle	168
A. Vinet, S. Mattalia, R. Vallee, A. Barbat, C. Bertrand, C. Hoze, S. Taussat, M. P. Sanchez, M. Boussaha, B. Cuyabano, D. Boichard	

Drafting the genomic landscape of North African sheep and chicken adaptation to harsh environments	169
<i>P. Ajmone Marsan, B. Benjelloun, M. Ben Larbi, A. Carta, G. Chillemi, S. B. S. Gaouar, H. El-Hentati, A. Jannoune, C. Jerrari, H. Khemiri, V. Loywick, N. M'Hamdi, N. Tabet Aoul, A. Stella, M. Tixier-Boichard, R. Valentini, G. Zitouni</i>	
Poster Session 1	
Characterization of a new heat tolerance phenotype in dairy cattle based on automatic milking systems and mid-infrared spectra	169
<i>T. Pook, M. Ramon, C. Diaz, M. J. Carabano Luengo, M. L. Van Pelt, L. Zetouni, C. Orrett, C. Kamphuis, Y. De Haas, B. Gredler-Grandl</i>	
Genetic parameters of feed efficiency, predicted methane-related, and carcass traits during fattening period in Japanese Black cattle	170
<i>M. Takeda, F. Homma, K. Ichinoseki, N. Takei, H. Matsuda, S. Fujiwara, J. Hashiba, T. Kojima</i>	
Sequencing of the GHRL gene by NGS reveals a multi-SNP cluster associated with feed efficiency	170
<i>I. Trapina, S. Plavina, N. Krasnevska, J. Paramonova, D. Kairisa, N. Paramonova</i>	
On the use of mid-infrared spectra and physiological measures for the characterization of dairy cattle thermotolerance	171
<i>M. Ramon, C. Diaz, T. Pook, B. Gredler-Grandl, M. J. Carabaño</i>	
A single-step genomic evaluation of maturing rate index in French beef breeds	171
<i>A. Lepers, P. Martin, S. Taussat</i>	
Genetic relationship between young bulls' feed intake and GHG emissions measured on cows' heat tolerance measures in Italian Holstein cows	172
<i>R. Finocchiaro, F. Tiezzi, L. Benzoni, J. Van Kaam, M. Marusi, R. Bozzi, M. Cassandro</i>	
Identification of functional SNPs linked to feed efficiency in Canadian Beef cattle	172
<i>S. Lam, L. Guan, G. Plastow, Á. Cánovas</i>	
Is methane emission the same trait genetically in young bulls and lactating dairy cows?	173
<i>B. Heringstad, K. A. Bakke</i>	
Genetic evaluation for feed efficiency in German Holsteins	173
<i>E. Abdalla, J. Heise, S. Rensing, Z. Liu, H. Alkhoder, L. Polman, R. Reents</i>	
Investigating Methane and Carbon Dioxide Emissions in Hanwoo Steers: Implication of Age and Genetic Traits	174
<i>J. Berdos, S. H. Kim, C. M. Ncho, A. R. Son, M. Miguel, K. C. Nam, S. S. Lee</i>	
Impact of Temperature-Humidity Index on Milk Production in Crossbred Dairy Cows	174
<i>R. Chejj, G. Molina, V. Landi, W. Mancuso, P. R. Marini</i>	
Modelling the environmental and genetic effects of climate conditions on the growth of a local cattle breed	175
<i>E. Rulli, R. Mantovani, E. Mancin, G. Gomez-Proto, C. Sartori</i>	
Exploring potential GxE interactions in the lifetime performance of suckling ewes	175
<i>M. Hiltbold, R. Trépos, F. Douhard</i>	
Genetic diversity of South American Criollo cattle adapted to a wide range of environmental conditions	176
<i>E. Somenzi, J. Ramirez-Diaz, E. Armstrong, A. Villalobos-Cortès, A. Gutierrez, E. L. Aguirre, L. Echavarria,</i>	

Simplified workflow for faster genotyping-by-sequencing using partial combinatorial dual barcodes and optimized analysis pipeline 176
A. Burrell, K. Gujjula, S. Chadaram, J. Lavoie

Assessment and distribution of Runs of Homozygosity and their relation to water stress in the Rasa aragonesa sheep breed 177
S. Pérez-Redondo, C. Calvete, M. Joy, A. Dominguez, S. Lobón, J. H. Calvo

Session 2. Breeding scheme optimization: balancing breeding goal(s), genetic progress and diversity

Date: Sunday 1 September 2024; 8:30 - 12:30

Chair: Berg / Rind Thomassen

Theatre Session 2

Economic values for organic dairy cattle production systems in Denmark 177
H. M. Nielsen, J. Rind Thomassen, S. Østergård, L. P. Sørensen, M. Kargo

Modelling the transition from conventional to genomic selection in German Merino sheep breeding by stochastic simulations 178
R. Martin, T. Pook, J. Bennewitz, M. Schmid

Only 100% to share - breeding objectives revisited for improved sustainability and animal welfare 178
invited B. Fuerst-Waltl, A. Willam, C. Egger-Danner, C. Fuerst

Stratified mating quota: a novel approach to effectively reduce the inbreeding rate 179
M. J. Steensma, H. P. Doekes, T. Pook, M. F. Derks, N. Bakker, B. J. Ducro

Using alternative relationship matrices for genomic prediction and managing genetic diversity 179
X. Yu, P. Berg, T. Meuwissen

Study of genetic progress in the context of disconnection between two originally connected populations 180
M. Wicki, A. Legarra, J. Raoul

A comparison between phenotypic and genotypic strategies of crossbred individuals in a crossbred scheme of laying chickens 180
M. Sánchez Díaz, L. Varona, N. Ibáñez Escriche, D. López Carbonell, D. Caverio

Selection for antagonistic traits must balance diversity in terms of genetic correlation 181
B. Cuyabano, S. Aguerre, S. Mattalia

New insight in genomic inbreeding assessment in domestic animals 181
M. Shihabi, L. Vostry, V. Cubric-Curik, M. Ferenčaković, I. Curik

Prediction of hidden individual inbreeding depression load in French dairy sheep 182
S. Antonios, S. T. Rodriguez-Ramilo, A. Legarra, J. M. Astruc, L. Varona, Z. G. Vitezica

Genotype by environment interaction and response to selection for milk production traits in Lacaune sheep 182
S. Vouraki, S. Priskas, A. Argyriadou, P. D. Carvalho, J. M. Astruc, G. Lagriffoul, R. Rupp, G. Banos, G. Arsenos

How dual-purpose is dual-purpose? The balancing act between fattening and laying performance: An index to describe dual-purpose poultry <i>H. Pluschke, P. Thobe, S. Lombard, M. Reverchon, S. Steinfeldt, K. Germain, D. Werner, A. Collin</i>	183
Inbreeding depression for litter size in a mice population divergently selected for environmental variability of birth weight <i>C. Ojeda-Marín, I. Cervantes, N. Formoso-Rafferty, J. P. Gutiérrez, S. T. Rodríguez-Ramilo</i>	183
Poster Session 2	
Genome-wide variability and selection signatures in autochthonous Spanish cattle breeds <i>P. E. Milia, A. Cesarani, C. Diaz, C. Meneses, J. C. Parejo, N. P. P. Macciotta, C. Dimauro</i>	184
Networks of inbreeding in two lines of mice divergently selected for environmental birth weight variability <i>C. Ojeda-Marín, J. P. Gutiérrez, N. Formoso-Rafferty, I. Cervantes, S. T. Rodríguez-Ramilo</i>	184
Population dynamics of potentially harmful haplotypes: pedigree evidences <i>K. D. Arias, I. Fernández, J. P. Gutiérrez, I. Álvarez, F. Goyache</i>	185
Occurrence of haplotypes in low frequency is not explained by recombination and CNV regions only <i>K. D. Arias, I. Fernández, J. P. Gutiérrez, I. Álvarez, F. Goyache</i>	185
Genomic partitioning of inbreeding depression in Jersey cattle <i>C. Maltecca, F. Tiezzi, J. Jiang</i>	186
Impact of the DGAT1 mutation in a Bos Taurus x Bos Indicus crossbred population in India <i>M. A. Touchard, Y. Gaundare, S. Jadhav, V. Dhanikachalam, V. Podtar, N. Punde, T. Shirsath, A. Joshi, K. Bhave, S. Joshi, M. Swaminathan, M. Boussaha, V. Ducrocq</i>	186
Footprints of balancing selection in the genome of Original Valachian sheep <i>N. Moravčíková, R. Kasarda, A. Halvoník, M. Chalupková, L. Vostrý, H. Vostrá-Vydrová, I. Pavlík</i>	187
How directional artificial selection has shaped the genome of Italian heavy pig breeds <i>J. Vegni, G. Schiavo, M. Ballan, S. Bovo, F. Bertolini, L. Buttazzoni, M. Gallo, L. Fontanesi</i>	187
Influence of inbreeding on reproduction traits in Swiss pig breeds <i>A. Burren, N. Khayatzadeh, I. Haefliger, H. Joerg</i>	188
Rapid, low-input, targeted NGS workflow for DNA methylation in dogs <i>A. Burrell, K. Gujjula, J. Lavoie, S. Chadaram, A. Hatch, G. Yavas, L. Pickle</i>	188
SMARTER-database: a tool to explore genomic diversity in small ruminants <i>A. Stella, A. Manunza, B. Servin, R. Rupp, P. Cozzi</i>	189
Efficient calculation of linkage analysis based genomic relationship matrices for optimum contribution selection. <i>T. Meuwissen, X. Yu, P. Berg</i>	189

Session 3. N, P and C efficient use and circularity in dairy farms - high utilization, minimal losses

Date: Sunday 1 September 2024; 8:30 - 12:30

Chair: Kuipers / Ruska

Theatre Session 3

Characterisation of grazing dairy cows differing in how they utilise their ingested nitrogen <i>E. Tavernier, L. Delaby, I. C. Gormley, M. O'Donovan, D. Berry</i>	190
Feed, nitrogen and phosphorus-use efficiency in organic and conventional dairy farming systems in The Netherlands <i>M. G. J. Edens, J. W. Peek, E. L. P. Guennoc, H. Bovenhuis, M. S. Gilbert, J. Dijkstra</i>	190
Carbon footprints result from livestock production in Poland based on NPC tools from CCCFarming project - limitations and perspectives <i>M. Szumacher-Strabel, P. Sidoruk, M. De Vries, D. Ruska, K. N. L. Naglis-Liepa, P. R. Hargreaves, R. M. Rees, X. Vergé, P. Robin, P. Galama, V. Juskiene, A. Kuipers</i>	191
The duration of outdoor stay affects the urinary and faecal nitrogen excretion in dairy cows <i>S. Arango, L. Bailoni, N. Guzzo, V. Trabacchin, E. Bianco, E. Simonetti, E. Zerbinati, S. Rainis, C. Sartori</i>	191
The characterization of microbiome and resistome in feces and slurry of dairy cows in different livestock production systems <i>I. Nejjam, A. Varsaki</i>	192
Response of early and late lactation dairy cows to diets differing in levels of human edible ingredients <i>A. Cushnahan, C. P. Ferris</i>	192
Reduced climate change impact of milk achieved with introduction of faba bean in dairy cows' diet <i>S. Hietala, A. Vanhatalo, K. Kuoppala, T. Kokkonen, A. Reinikainen, K. Vikki, A. L. Välimaa</i>	193
System level impacts of environmental and social economic optimization-expert analyses of different countries <i>P. Galama, B. Rees</i>	193
N, P and C efficient use and circularity <i>J. Roche</i>	194
New York dairy farms: their whole-farm nitrogen and phosphorus balances and greenhouse gas footprints <i>O. Godber, K. Czymmek, K. Workman, Q. Ketterings</i>	194
Potential use of drones and ICT in livestock farming to deal with environmental sustainability <i>V. Becciolini, M. Merlini, A. Mattia, G. Rossi, L. Conti, M. Barbari</i>	195
Reducing slurry temperature to lower NH ₃ , N ₂ O and CH ₄ emissions from fattening housing <i>N. Guingand, Y. Rousseliere, J. Thomas, A. Collin</i>	195
Response of grazing dairy cow production to different grass swards under varying nitrogen fertiliser rates <i>M. H. Bock, Z. C. McKay, L. Delaby, D. Hennessy, B. Mccarthy</i>	196
White clover's positive impact in perennial ryegrass swards with reduced nitrogen inputs on milk production and nitrogen use efficiency <i>Á. Murray, H. Irish, L. Delaby, M. O'Donovan, D. Hennessy</i>	196

Poster Session 3

Analysis of nitrogen fertilizer efficiency in rotational grazing: Impact on the quality and productivity of *Lolium multiflorum* Lam. Forage 197
C. Maduro-Dias, M. Machado, H. Nunes, A. Borba, J. Madruga, P. Monjardino

Variation of in vitro utilisable crude protein in different red clover accessions 197
M. Vaga, D. Parsons, S. J. Krizsan

Session 4. Research on young stock care: the journey of calves from gestation onwards

Date: Sunday 1 September 2024; 8:30 - 12:15

Chair: Costa / Vestergaard

Theatre Session 4

Success with better calves starts well before birth 198
invited M. Winters

Adequate milk feeding of dairy calves 198
H. M. Hammon, L. N. Neal

Growth performance of calves fed milk replacer or dams milk during the first week of life 199
A. M. Vorndran, J. Steinhoff-Wagner

Evaluating early life feeding strategies on the development and health of pre-weaned surplus calves 199
J. Echeverry Munera, S. Marti, M. A. Steele, M. Devant, J. Martin-Tereso, L. N. Neal

Observations on neonatal calves' urine excretion during the first week of life 200
A. M. Vorndran, J. Steinhoff-Wagner

Predicting pre-weaned dairy calf weight from morphometric measurements 200
F. Silva, E. Carreira, J. Ramalho, T. Correia, M. Meira, A. Pereira, C. Conceição, S. Silva, J. Cerqueira

Ultrafiltration enhances the passive immunity properties of low-quality colostrum 201
T. Jarltoft, C. Jessen, T. Larsen, P. Raundal, M. Vestergaard

Impact of growth rate of dairy heifers on long term performance: a quantile regression analysis 201
M. Lamérand, B. Ampe, E. Canniere, K. Goossens, L. Vandaele

Tube ventilation systems for optimizing stable climate in calf barns 202
I. Mösenbacher-Molterer, E. Zentner, C. Schmied-Wagner, J. Neumayer

Relationship between growth parameters of heifers at various stages of rearing and milk production in first lactation 202
A. Garus-Piętak, W. Jagusiak, J. Kański, Z. Kowalski, Z. Lach, P. Górka

Selection for the price of young calves in Italian Simmental breed 203
L. Degano, D. Vicario, M. Wenter, A. Cesarani, N. Macciotta

Effects of undernutrition and hydroxytyrosol supplementation during last third of pregnancy on the immune status of suckler cows and their calves 203
L. López De Armentia, A. Noya, J. L. Alabart, N. Escalera, B. Serrano-Pérez, O. Akesolo-Atutxa, J. Ferrer, A. Sanz

Poster Session 4

- Undernutrition and hydroxytyrosol supplementation during the final third of gestation modulate immune response and redox balance in newborn beef calves 204
N. Escalera-Moreno, J. Álvarez-Rodríguez, M. J. Martín-Alonso, D. Villalba, E. Molina, L. López De Armentia, A. Sanz, B. Serrano-Pérez
- Interplay between pre-partum nutrition and hydroxytyrosol supplementation on calf behavior 204
N. Escalera-Moreno, L. López De Armentia, A. Sanz, A. Noya, I. Blanco-Penedo, E. Molina, B. Serrano-Pérez, J. Álvarez-Rodríguez
- Effects of polystyrene nanoparticles on bovine oocyte in vitro maturation 205
B. Merlo, A. M. Volsa, P. M. Gugole, E. Iacono
- Effects of undernutrition and hydroxytyrosol during last third of pregnancy on newborn vitality and cortisol levels of cow-calf pair 205
L. López De Armentia, A. Noya, J. Ferrer, N. Escalera, B. Serrano-Pérez, G. Quintans, O. Akesolo-Atutxa, A. Sanz
- Serum and salivary immunoglobulins associations in newborn calves 206
F. Silva, E. Lamy, L. Hernández-Castellano, S. Silva, J. Cerqueira, J. Ramalho, M. González-Cabrera, P. Caetano, E. Carreira, L. Martins, A. Pereira, C. Conceição
- Salivary immunoglobulin concentrations (IgG, IgM, and IgA) in calves during the first week of life 206
F. Silva, E. Lamy, L. E. Hernández-Castellano, S. Silva, J. Cerqueira, J. Ramalho, M. González-Cabrera, P. Caetano, E. Carreira, L. Martins, A. Pereira, C. Conceição
- Impact of diarrhea and respiratory diseases in calves on reproductive performance in dairy breed heifers 207
M. Gicquel, A. Gaigeard, L. Danjou, F. Guillaume, S. Saille, S. Meier
- Pilot study to identify stress level at cow-calf separation after a few days of contact 207
N. Palladini, B. Serena, A. Tamburini, L. Bava
- Keeping up with changing standards: A survey on how Canadian farmers currently rear dairy calves 208
E. R. Russell, M. Vonkeyserlingk, D. Weary
- Enriching colostrum IgG concentration by ultrafiltration has no negative effects on in vitro cell viability and wound healing capacity 208
T. Jarltoft, S. Purup, M. Vestergaard, Y. Yue
- Saccharomyces cerevisiae fermentation products supplementation to dairy calves: effects on growth, metabolism, and immune status 209
M. Sfulcini, V. Lopreato, A. Zontini, I. Yoon, L. Cattaneo, F. Piccioli-Cappelli, E. Trevisi, A. Minuti
- Effect of age, undernutrition and hydroxytyrosol supplementation on metabolic stress markers during the last third of gestation in beef cattle 209
N. Escalera-Moreno, J. Álvarez-Rodríguez, M. J. Martín-Alonso, D. Villalba, E. Molina, L. López De Armentia, A. Sanz, B. Serrano-Pérez
- Interesting genes and effect of inbreeding depression over traits with economic and productive importance in Rubia Galega beef cattle breed 210
N. Mejuto-Vázquez, C. Hervás-Rivero, R. Rodríguez-Bermúdez, P. Martínez, M. Hermida, D. López-Carbonell, J. Altarriba, L. Varona
- Bovine faecal biomarkers of intestinal inflammatory process: calprotectin and lactoferrin, a comparative study 210
Y. Saco, N. Crusellas-Vallorbina, R. Pato, R. Peña, S. Martí, L. Pisoni, M. Devant, A. Pelegrí-Pineda, A. Bassols

Session 5. Innovative and emerging feed and forage resources

Date: Sunday 1 September 2024; 8:30 - 12:00

Chair: Ranilla García / Stergiadis

Theatre Session 5

- Effects of goat willow's tannin profile on in vitro methane production and rumen fermentation 211
N. Sari, K. Kliem, L. Whistance, J. Smith, A. Natalello, K. Theodoridou, P. Ray, C. Rymer, S. Stergiadis
- Effects of ten freshwater microalgae on in vitro ruminal methane production and digestibility 211
Y. Li, M. Bagnoud, Y. Zhang, C. Kunz, S. Dubois, R. Peng, F. Wahl, M. Niu
- In vitro rumen fermentation characteristics of insect processed proteins compared to a conventional protein source 212
M. Ottoboni, I. Mateos, C. Saro, N. Merino, L. De Matos, L. Pinotti, M. J. Ranilla Garcia
- Screening of Mediterranean agro-industrial by-products on in vitro ruminal fermentation 212
B. Mora, A. Torrent, A. Vastolo, S. Calabrò, M. I. Cutrignelli, E. Barbier, H. Hoste, V. Niderkorn
- Effect of the use of Lactiplantibacillus plantarum strain 5BG and of a commercial mix of polygalacturonase and glucanase on the quality of artichoke bracts silage 213
R. Greco, M. Ferrara, P. De Bellis, F. Giannico, G. Mulè, A. Maggolino, P. De Palo
- Effect of conservation length on fermentation characteristics of teff as alternative forage for Mediterranean livestock farming systems 213
R. Primi, R. Spina, F. Luziatelli, M. Ruzzi, U. Bernabucci, F. Manganello, C. Evangelista, F. Lazzari, R. Ruggeri, F. Rossini, A. Benelli, R. Moschetti, A. Brunetti, I. Bottoni, S. Ceci, G. Fabbrizi, P. P. Danieli, B. Ronchi
- Understanding gastrointestinal tract transcriptomic adaptations in dairy cattle during lactation reveals molecular tissue and stage specific adaptations 214
invited R. Baldwin, Y. Gao, G. Liu, L. Ma, L. Fang, C. J. Li
- Nutritional value of Nannochloropsis oceanica for post-weaning piglets 214
A. Chaves, D. Ribeiro, C. Martins, M. Maia, A. Fonseca, A. Cabrita, R. Bessa, A. Almeida, J. Freire
- Growth performance and carcass traits of heavy pigs fed diets with a partial to total replacement of soybean meal with spirulina powder 215
L. Gallo, G. Don, D. Giannuzzi, A. Toscano, S. Schiavon
- Soybean meal fermentation: is it worth investigating in Europe? A review 215
V. Heuzé, E. Tormo, I. De La Borde, P. Carré, G. Tran
- Extruded or Enzyme-Treated Chlorella vulgaris in Broilers Diets: Effects on Performance and Digesta Viscosity 216
A. Mendes, C. Martins, D. Carvalho, O. Madacussengua, M. Spínola, M. Costa, J. Pestana, J. Ferreira, A. Fontes, A. Almeida, J. Prates, M. Lordelo

Poster Session 5

- Evaluation of different algae for ruminant feeding 216
C. N. Marcos, A. De Las Heras-Molina, T. De Evan, C. Gómez-Serrano, M. Terré, S. Pérez-Garnelo
- In vitro evaluation of discarded carrot and pepper as feed ingredients for ruminants 217
N. Merino, M. Ottoboni, L. G. De Matos, I. Mateos, C. Saro, M. J. Ranilla

In vitro evaluation of discarded leek as feed ingredients for ruminants <i>N. Merino, M. Ottoboni, L. G. De Matos, I. Mateos, C. Saro, M. J. Ranilla</i>	217
Use of sunn hemp as forage for beef cattle <i>J. Vendramini, J. Lazzarin, M. L. Silveira, H. Da Silva, H. De Oliveira, J. Garzon, D. Cook, D. Gardner, R. Cooke, P. Moriel</i>	218
Assessment of the potential of BSF meal in broiler chicken feed <i>A. Monteiro, T. Mariano, S. Botelho, A. Santos</i>	218
Intercropping cash and forage crops to improve the land equivalent ratio of Mediterranean organic cereal-based systems <i>D. Scordia, M. Oteri, F. Calderone, F. Gresta</i>	219
Nutritional quality of feed resources used by smallholder dairy farmers in the Northern Province of Rwanda <i>M. A. Mukasafari, M. Mutimura, E. Wredle, H. Gonda</i>	219

Session 6. Advances in ruminant nutrition, Part 1

Date: Sunday 1 September 2024; 8:30 - 12:00

Chair: Ranilla García / Foggi

Theatre Session 6

Cu, Zn, and Mn sources effect on 48 hour in-vitro fermentation and CH ₄ production <i>C. B. Peterson, G. M. Boerboom, J. S. Heldt, K. E. Griswold, J. Johnston</i>	220
Factors affecting the in vitro kinetics of total gas and methane in dairy cows using Gas Endeavor System <i>R. Iqbal, J. Bisello, S. Arango, N. Guzzo, F. Tagliapietra, L. Bailoni</i>	220
Impact of low-density polyethylene microplastic on ruminal degradability of feeds <i>S. Glorio Patrucco, K. Abid, S. Barbera, H. Kaihara, S. Tassone</i>	221
Rumen contents from slaughtered cattle and sheep to study in vitro degradation of selected feeds <i>A. Chaudhry</i>	221
Reducing lactating cows dietary sodium to reduce environmental cost of dairy farms <i>D. Espinoza, S. Mabjeesh, Y. Ben Meir</i>	222
Replacing hexane by 2-methyloxolane for defatting soybean meal does not impair fattening performance of beef cattle supplemented with methionine <i>C. García-Vázquez, V. Menoury, P. Faure, L. Salis, A. Ferlay, P. Noziere, G. Cantalapiedra-Hijar</i>	222
2-methyloxolane can replace hexane for defatting soybean meal fed to cows without affecting dairy performance, rumen volatile fatty acid proportions and major fatty acid secretion in milk <i>V. Menoury, P. Nozière, G. Leday, J. Engel, A. Ferlay</i>	223
Effects of pre- and postpartum dietary management on performance in dairy cows <i>M. V. Sanz-Fernandez, D. J. Seymour, R. Rauch, J. B. Daniel, J. Doelman, J. Martín-Tereso</i>	223
Resilience to acute underfeeding in dairy ewes diverging in feed efficiency: rumen dimethyl acetal composition <i>P. G. Toral, S. Alves, R. J. B. Bessa, P. Frutos, G. Hervás</i>	224

How does lamb feeding management during early life and high-cereal finishing affect the rumen trans fatty acid profile at weaning and the end of the fattening period? 224
L. Fialho, O. Guerreiro, S. Alves, R. Bessa, E. Jerónimo

Micronutrient Supply, Developmental Programming, and Strategic Supplementation 225
invited J. S. Caton

Session 7. Emerging practices and tools in horse production

Date: Sunday 1 September 2024; 8:30 - 12:30

Chair: De Palo / Tapprest / Vial / Auclair-Ronzaud

Theatre Session 7

How can the seasonal climate changes influence horse's health and welfare in the extensive farming system? 225
E. Atallah, F. Cerasoli, M. G. Riva, V. Antognoli, G. Saluti, F. Castellani, A. Manucci, G. Centorotola, M. Podaliri, L. Iannetti, E. Dalla Costa

Omic evaluation of resilience and adaptation to the combination of heat and exercise stressors in horse athletes 226
S. Mecocci, F. Beccati, E. Chiaradia, M. Pepe, F. Passamonti, E. Porzio, A. Paris, G. Chillemi, K. Cappelli

Agonistic interactions at straw racks in group-housed horses 226
N. Puttkammer, F. Hildebrandt, J. Krieter, I. Czycholl

Milking procedure and frequency: what influence on mares and foals behaviour? 227
J. Auclair-Ronzaud, M. Bouchet, L. Wimmel, S. Henry

Effect of antioxidant supplementation on faecal microbiota of horses at different exercise levels 227
A. Ramírez, S. Gómez Acata, O. Gaona-Pineda, L. Falcón Álvarez, A. Ramírez

A possible mathematical approach to predict forage digestibility from faecal particle size distribution in horses 228
T. Danese, F. Martuzzi, M. Simoni, E. Valle, F. Righi

Effect of phytochemicals on cyathostomins ecological interactions 228
J. Malsa, A. Chereau, F. Guégnard, D. Serreau, A. Gesbert, F. Reigner, N. Mach, G. Fleurance, A. Williams, G. Sallé

Possibilities and prerequisites for digital-technical systems in horse husbandry 229
L. T. Speidel, U. Dickhoefer, D. Winter

Air quality welfare factors in horse husbandry - Dusk pollution and digital technology 229
H. Unseld, E. Gallmann, D. Winter

Evaluation of shelter design on equine rhythmicity 230
S. Rey, H. R. Nasser, M. Cockburn

Time-controlled hay racks in group-housed horses: What ratio of horses to feeding places is appropriate? 230
M. Baumgartner, M. Erhard, M. Zeitler-Feicht

Thermographic Images as a Diagnostic Tool for Equine Headshaking Syndrome 231
L. M. Stange, J. Krieter, I. Czycholl

Anatomical bridles, do they really alter and reduce pressure distribution on the horse's head? 231
R. Clarke, G. Cross, M. Entwistle, M. Leftherioti

The possibilities of using genomic information in the selection of horses for meat production 232
M. Šimon, A. Kaič, B. Luštrek, K. Potočnik

Poster Session 7

Influence of head hair whorls on behavioral measurements assessed with infrared thermography and behavioral surveys 232
A. Encina, M. Valera, M. Ligeró, E. Bartolomé, M. J. Sánchez-Guerrero

Session 8. Innovative approaches to pig and poultry production

Date: Sunday 1 September 2024; 8:30 - 12:30

Chair: Verschuren / Nilsson

Theatre Session 8

Inter- and transgenerational impacts of in ovo nutriepigenetic intervention on chicken male gonadal transcriptome 233
M. Ibrahim, E. Grochowska, M. Bednarczyk, K. Stadnicka

Early life profiling of weaning robustness using productive performance and gut microbiota composition 233
J. M. Ortiz Sanjuán, M. As Ornelas, L. O'Neill, G. Lemonnier, M. N. Rossignol, D. Leong, F. Crispie, P. D. Cotter, E. G. Manzanilla, J. Estellé

Intestinal health status and dietary spray dried porcine plasma inclusion on faecal calprotectin and performance in weaned piglets 234
J. Suppi, E. Lauradó-Calero, P. Aymerich, A. Pelegrí-Pineda, Y. Saco, A. Bassols, D. Solà-Oriol

In pursuit of a self-assembling protein decoy to counter Enterotoxigenic Escherichia coli F4+ strains causing piglet post-weaning diarrhea 234
T. Rossi, P. Trevisi, P. Costantini, M. Calvaresi, A. Carboni, A. Danielli

Oral alternatives for intramuscular iron administration in suckling pigs 235
S. Goethals, K. Hertogs, K. Buysse, K. Hooyberghs, N. Buys, S. Janssens, J. Van Meensel, S. Millet

Effect of authorized level of Zn supplied in three different forms on the physiology and performance of piglets weaned at different age 235
C. Negrini, D. Luise, F. Correa, S. Viridis, M. Mazzoni, A. Romeo, A. Monteiro, P. Trevisi

Uncovering the genetic background of porcine congenital splay leg syndrome in piglets 236
J. De Kort, W. Gorssen, R. Meyermans, S. Janssens, N. Buys

Interobserver reliability of different methods to evaluate sows' body condition 236
R. Carnevale, K. Segers, N. Nollet, A. Cools, G. Janssens, S. Millet

The secret of each sow: exploring the impact of sow and litter features on within-litter uniformity 237
K. Hooyberghs, S. Goethals, W. Gorssen, L. Chapard, R. Meyermans, N. Aerts, S. Millet, S. Janssens, N. Buys

Effect of top-dressed arginine supplementation in different gestation periods and seasons on the colostrum composition and productive performance of sows and piglets 237
S. Viridis, D. Luise, F. Correa, L. Laghi, F. Palumbo, C. Negrini, G. Orazzo, M. V. Graziosi, U. Rolla, P. Trevisi

Impact of replacing diet soybean with spirulina on blood metabolic profile of heavy pigs <i>A. Toscano, D. Giannuzzi, G. Don, S. Schiavon, L. Gallo</i>	238
Effect of soybean reduction and crude protein restriction on the performance of fattening pigs <i>M. Graziosi, D. Luise, F. Correa, S. Virdis, F. Palumbo, F. Soglia, M. Petracci, C. Negrini, G. Biagi, P. Trevisi</i>	238
Analysis of the effects of temporary outdoor access during the fattening phase on pig welfare, health and growth <i>A. Jahoui, S. Gavaud, J. Lion, K. Haurogné, F. Guiraud, T. Terrasson, B. Lieubeau, C. Tallet, J. Hervé</i>	239
Effects of different olive cakes inclusion in the diet of the Bísaros pigs on the chemical composition and fatty acids profile of Biceps Femoris muscle <i>J. Paié-Ribeiro, V. Pinheiro, A. Teixeira, C. Guedes, M. J. Gomes, J. Teixeira, O. M. Divanildo</i>	239

Poster Session 8

In vitro metabolic footprint and interaction with intestinal cells of candidate probiotic and prebiotics for poultry <i>S. Zuo, K. Grudlewska-Buda, K. Skowron, W. Studziński, P. Kosobucki, K. Guinan, J. T. O'sullivan, K. Stadnicka</i>	240
Effects of maternal antioxidant supplementation on the development of the offspring's ovaries <i>A. Heras-Molina, G. Gómez, H. Laviano, M. Muñoz, J. García-Casco, R. Benítez, F. Sánchez-Esquiliche, A. González-Bulnes, A. Rey, C. López-Bote, C. Óvilo</i>	240

Session 9. Alternative production systems and free communications in animal behaviour and welfare

Date: Sunday 1 September 2024; 8:30 - 12:15

Chair: Holinger / Blanco-Penedo

Theatre Session 9

Farm animal health and welfare at the heart of agroecological livestock system priorities: proposed research questions to contribute to this objective <i>invited X. Fernandez</i>	241
Slow and local or fast and global – examining business opportunities to advance good welfare practices in organic and outdoor farming <i>J. Niemi, M. Väre, P. Thobe, A. Collin</i>	241
Behaviour and health of entire male pigs in a semi-natural habitat <i>H. Zobrist, B. Früh, M. Garcia, M. Holinger</i>	242
Assessment of welfare of dromedary camels kept under pastoralism in Pakistan <i>B. Padalino, A. Faraz, N. A. Tauqir, A. Waheed, A. R. Abbasi, N. Masebo, L. Menchetti</i>	242
Ensuring good animal welfare in extensive farming systems: lessons from dairy farmers in Canterbury, New Zealand <i>K. Alvåsen, K. Bicknell</i>	243

Organic pig production in mixed free-range systems: the ROAM-FREE project <i>D. Bochicchio, L. Deiana, A. Wibe, B. Blomstrand, T. Ruud, R. Helliwell, M. Koesling, A. G. Kongsted, M. Štukelj, M. Spinu, A. Vasiu, A. Williams, A. C. Pedersen, H. Mejer, S. Thamsborg</i>	243
On-farm animal welfare assessment in slaughter pigs across different production systems in four European countries <i>M. L. V. Larsen, L. J. Pedersen, Consortium mEATquality, T. Rousing</i>	244
Navigating the complexity of boar taint detection: Advancing towards a castration-free future for piglets <i>L. Morgan, T. Ignat, M. Font-I-Furnols, N. Panella-Riera, R. I. D. Birkler</i>	244
Automated monitoring of pig and chicken welfare at the slaughterhouse – tracing back to farm, transport and slaughter <i>F. Tuytens, J. Maselyne, & Awish-Consortium</i>	245
Reliability of different behavioral tests as welfare indicator for dairy cows <i>P. Hasenpusch, T. Wilder, C. Straßburg, S. Menke, J. Krieter, G. Thaller, I. Czzycholl</i>	245
Welfare protocols for rabbits <i>M. Almeida, S. Silva</i>	246
Behaviour of laying hens of two genotypes in a cage-free system enriched with hay bales <i>C. Ciarelli, F. Bordignon, G. Pillan, G. Xiccato, A. Trocino</i>	246
Poster Session 9	
Improvement of the welfare of Iberian cull sows fattened through the immunocastration <i>J. García-Gudiño, F. Hernández-García, M. Izquierdo, I. Blanco-Penedo</i>	247
Impact of outdoor farming on pig welfare: insights from a study in Italy <i>L. Deiana, S. Santini, D. Bochicchio</i>	247
Could a low input/low output forage-based system be the solution for future organic dairy production? An exploration of the concept of a LILO production system <i>A. Hägglund, K. Alvåsen, N. Fall, R. Danielsson, P. Tidåker</i>	248
First evaluation of the CLASSYFARM welfare assessment protocol applied in extensive farming systems in Central Italy <i>R. Primi, V. D'Onofrio, A. Macciocchi, G. De Vittoris, G. Saralli, T. Galli, C. Di Giovannantonio, B. Ronchi</i>	248
Season effects on somatic cell count as an indicator for mastitis in Romanian Spotted cows <i>D. E. Ilie, A. E. Mizeranschi, C. V. Mihali, R. I. Neamt, L. T. Czisster</i>	249
Environmental enrichment in rabbit generations: Impact on behavior and performance <i>G. K. Nakamura, D. Alencar, K. G. Silva, L. B. Costa, R. R. Daros</i>	249
Animal welfare: perceptions and practice evolution in the broiler production in France – A pilot study <i>C. Lesimple, T. Petit, C. Dezetter</i>	250

Session 10. Livestock are more than food, Part 1

Date: Sunday 1 September 2024; 8:30 - 12:30

Chair: Lee / O'Mara

Theatre Session 10

Livestock are more than food: welcome and introduction <i>invited</i> F. O'Mara, M. R. Lee	250
Role of livestock in circular bioeconomy systems <i>invited</i> T. Mcallister, B. Amon, L. Tag, P. Becquet	251
Beyond edibles: unveiling the full socio-economic value of animal production through non-food products in circular economy designs <i>invited</i> L. Cembalo	251
Genetic determinism of quality of lamb leather in Lacaune dairy sheep breed L. Drouilhet, E. Dugas, F. Woloszyn, F. Plisson-Petit, J. Gayraud, J. C. Duchêne, J. Frayssignes, A. Gille, S. Brenot, D. Allain, H. Larroque	252
A systemic description of the dairy value chain's contribution to inclusive sustainable development in highland A. Ceppatelli, C. Pozo, C. Bonnet, M. Vogg, P. Strankman, L. Wedderburn, E. Sturaro	252
What is the performance of a low-input sheep flock integrated into an agroecological field crop system? M. Benoit, T. Boistard, O. Brodin, D. Marcon, L. Sagot, J. Boucherot	253
Livestock manure for fertiliser and biofuels <i>invited</i> H. Bjarne Møller	253
Cow's Milk – Going beyond basic nutrition to harness functional components <i>invited</i> P. Cotter	254
Evolving standards: ethical perspectives on animal welfare in agroecology <i>invited</i> J. Goracci	254
Panel discussion <i>invited</i> M. R. Lee, F. O'Mara	255

Session 11. Insect nutrition

Date: Sunday 1 September 2024; 8:30 - 12:30

Chair: Bellezza Oddon / De Smet

Theatre Session 11

Growth performance of black soldier fly (<i>Hermetia illucens</i>) reared on substrate mixtures from regional agricultural and food production side-streams T. Freimuth, M. Mielenz, G. Das, L. Hüther, S. Dänicke, C. C. Metges	255
Fortification of circular substrate for black soldier fly with zinc and/or selenium: effect on growth performances A. Moradei, M. Ottoboni, C. Jucker, S. Savoldelli, S. Malabusini, A. Luciano, L. Pinotti	256

Optimal balance between protein and carbohydrate in industrial diet for black soldier fly larvae (Hermetia illucens) <i>J. De Montigny, C. Brouzes, F. X. Boulanger</i>	256
Evaluating amino acid requirements of neonatal black soldier fly larvae <i>C. Sandroock, J. Wohlfahrt, T. Stadtländer, F. Schindler, M. Hardick, M. Terranova, C. Lambertz, A. Lemme</i>	257
Amino acid requirements of the black soldier fly larvae (Hermetia illucens) <i>I. E. Berggreen, M. L. Schön, J. V. Nørgaard, K. Jensen</i>	257
Growth performance of black soldier fly larvae on high fibrous residual streams pretreated by composting and fungi <i>T. Veldkamp, E. Hoek - Van Den Hil, P. Van Wikselaar, E. De Lange, L. Francuski, R. Zheng, S. Naser El Deen</i>	258
Fat chemical characteristics of the Black soldier fly larvae fed different diets <i>M. Tognocchi, S. Tinagli, G. Foggi, A. Serra, M. Mele, G. Conte</i>	258
Fatty acid profile of black soldier fly larvae reared on winery by-products <i>M. Renna, C. Lussiana, L. Livorsi, M. Mele, G. Conte, L. Gasco</i>	259
Efficiency of rearing yellow mealworms (Tenebrio molitor L.) on fibre-rich composted and mycoremediated residual streams <i>S. Naser El Deen, E. F. Hoek – Van Den Hil, P. Van Wikselaar, E. De Lange, N. Steeghs, T. Veldkamp</i>	259
New life for rice by-products through yellow mealworm bioconversion <i>A. Resconi, S. Bellezza Oddon, Z. Loiotine, R. L. Passaro, K. Y. Mendez Rondo, L. Gasco, J. Bacenetti, I. Biasato</i>	260
Optimizing the reproduction of Tenebrio molitor <i>D. Deruytter, J. Claeys, C. L. Coudron</i>	260
Comparative larval growth of Alphitobius diaperinus populations on various substrates <i>G. V. Baliota, N. Steeghs, C. I. Rumbos, C. G. Athanassiou</i>	261
Black soldier fly: progress and challenges <i>invited A. Van Huis</i>	261

Poster Session 11

Assessing the optimal carbon-to-nitrogen ratio to improve black soldier fly larvae production for future use as animal feed <i>T. Thiabching, S. Okrathok, C. Pukkung, M. Sirisopapong, S. Khempaka</i>	262
Promoting insect farming sustainability with the utilization of oilseed presscakes as nutrient-rich feed for Tenebrio molitor larvae <i>C. Chrysanthopoulou, C. Adamaki-Sotiraki, C. Rumbos, C. Athanassiou</i>	262
Performance and bioconversion of black soldier fly across different content of fiber and protein in the substrates <i>A. Hosseindoust, S. R. Park, S. D. Choi, P. Neves-Silvestre, H. Tajudeen, J. S. Kim</i>	263
Nutritional profiling and efficiency of black soldier fly bioconversion across different substrates and developmental stages <i>S. H. Ha, A. Hosseindoust, S. R. Park, S. A. Park, S. D. Choi, J. S. Kim</i>	263
Fatty acid composition of Hermetia illucens larvae grown on different expired wet pet-food <i>G. Secci, L. F. Pulido Rodriguez, M. V. Tignani, A. C. Lira De Medeiros, N. F. Addeo, F. Bovera, G. Parisi</i>	264

Effects of herbs dietary inclusion on growth performance and nutrient composition of <i>Tenebrio molitor</i> larvae <i>A. Moradei, T. Spranghers, D. Deruytter, M. Ottoboni, L. Pinotti</i>	264
--	-----

Session 12. Effectiveness of breeding programs for local breeds in the Mediterranean region and other harsh environments

Date: Sunday 1 September 2024; 8:30 - 12:15

Chair: Hadjipavlou / Ligda

Theatre Session 12

Prospects of breeding programs for small ruminant breeds in the Mediterranean region <i>invited</i> <i>A. Carta, G. Hadjipavlou, C. Ligda</i>	265
Derivation of economic weights for sheep breeding goal traits considering production system characteristics <i>J. Oberpenning, K. Brügemann, S. König</i>	265
Intra-island patterns of genetic divergence in Cyprus Chios sheep: minimizing genetic background noise to enable more precise genetic improvement <i>G. Maimaris, A. C. Dimitriou, L. Koniali, T. Christofi, P. Markou, S. Andreou, S. Panayidou, P. Savvides, G. Hadjipavlou</i>	266
Genomic analysis of dominance and inbreeding effects on milk production traits in Pag sheep <i>C. Rochus, M. Špehar, A. Kasap, Z. Barač, J. Ramljak, I. Pocrnic</i>	266
Evaluation of crossbreeding potential in heavy suckling lambs obtained by crossbreeding Sarda dairy ewes with Dorper rams <i>M. F. Lunesu, A. Fenu, A. Mazza, R. Rubattu, M. R. Mellino, S. Carta, G. Battacone, A. Nudda</i>	267
Using genotypes from Australia's numerically smaller sheep breeds to expand the genomic reference population <i>P. Alexandri, P. Gurman, K. Gore, R. Macarthur-Onslow, D. Brown</i>	267
Phenotypic and genetic parameters of lactation persistency and milk yield of patch-faced Maritza sheep breed <i>P. Zhelyazkova, D. Dimov, H. Grosu</i>	268
Enhancing breeding programs for local breeds in challenging environments: insights and innovations <i>invited</i> <i>S. Savoia, A. Schurink, S. Kumar, B. Santos, T. Byrne, P. Amer</i>	268
Genomic insights into Milk Coagulation Properties and Curd Firmness in Pag Island Sheep: a Genome-Wide Association Study <i>F. Oštarić, M. Ferenčaković, L. Vostry, N. Amalfitano, G. Bittante, I. Držaić, V. Cubric-Curik, V. Brajković, I. Curik, N. Mikulec</i>	269
Estimation of genetic parameters for fertility and prolificacy in the Lacaune meat sheep population carrying a hyperprolific gene <i>E. Cobo, L. Bodin, J. Raoul</i>	269
Early-life trait effects on the reproductive performance of Cyprus Damascus goats <i>L. Koniali, S. Andreou, T. Christofi, G. Hadjipavlou</i>	270

Poster Session 12

- Benefit of including female genotypes in the reference population of French Lacaune dairy sheep, a simulation study 270
B. De Laet, P. Arsac, J. Raoul
- Genetic diversity of related sheep breeds Sarda and Pag 271
L. Falchi, C. M. Rochus, M. Špehar, J. Ramljak, A. Kasap, N. P. P. Macciotta, A. Cesarani, I. Pocrnic
- Using cryptorchid rams to induce a ram effect in a flock of ewes and successful insemination upon natural heat 271
C. Nassif, L. Mara, F. Chessa, F. Melis, M. Gallus, A. Ledda, M. Dattena, A. Cannas
- Quantitative-genetic characterization of wool quality traits in German Merino 272
N. Zimmermann, M. Schmid, J. Bennewitz, W. Pflanz
- Evaluation of milk quantity and quality traits using BLUP models and longitudinal lactation records of a Cyprus Damascus Goat population 272
S. Andreou, L. Koniali, S. Panayidou, G. Hadjipavlou

Session 13. Sensing Physiology: Tools towards optimising livestock husbandry

Date: Sunday 1 September 2024; 8:30 - 12:30

Chair: Montanholi / Garcia-Roche

Theatre Session 13

- Adoption of computer vision algorithms to monitor respiratory rates in dairy cattle 273
invited P. Curti, A. Souza, D. Pinto, A. Ruiz, L. Kobayashi, J. Balieiro, A. Castanheira, E. Souza, F. Renno, R. Ventura
- A novel method to differentiate and profile ruminal vs. breath volatile organic compounds for metabolic assessment in dairy cows 273
M. Barrientos-Blanco, M. Islam, R. Peng, S. Räisänen, F. Wahl, R. Zenobi, S. Giannoukos, M. Niu
- Development of an HPLC method for the quantification of allantoin, creatinine and uric acid in Holstein cows' urine 274
E. Visentin, S. Magro, S. Sabbadin, G. Niero, M. De Marchi
- The volatolomic signature differs between primiparous and multiparous cows across different matrices 274
E. Jorge-Smeding, C. Martin, L. Volmerange, Y. Rochette, F. Violleau, N. Salah, M. Silberberg
- Individual response of dairy cattle to heat waves: phenotypic and genotypic characterization 275
R. Cresci, A. Cesarani, N. P. P. Macciotta, A. S. Atzori
- Supplementing Bovacillus to weaned beef steers during a 90-day grazing period 275
R. Cooke, S. Mackey, F. Cooke, A. Pickett, K. Harvey, B. Karisch, B. Cappellozza
- Development of a proxy to estimate individual daily DMI of Belgian Blue bulls using fecal NIR spectra 276
L. Le Gall, V. Decruyenaere, E. Henrotte, F. Gueret, N. Lorant, M. Khamassi, A. Vanlierde
- Early post-mortem discrimination between grass- and grain-fed beef cattle using muscle lipid biomarkers 276
D. S. Antonelo, M. E. O. Santos, L. R. Oliveira, W. Maccalman, C. F. Ramires, J. C. C. Balieiro

Continuous monitoring of glycaemia to detect variations in intermediary metabolism during night and day cycles in growing pigs <i>C. Xavier, C. H. Malbert, S. Brajon, F. Gondret</i>	277
Faecal microbiota and stillbirth rate in sows <i>T. L. Nowland, R. J. Moore, T. T. H. Van, K. J. Plush</i>	277
Prediction of the daily nutrient requirements of gestating sows based on behavioural sensor data and machine-learning algorithms <i>M. Durand, C. Largouët, L. Bonneau, J. Y. Dourmad, C. Gaillard</i>	278
Comparison of stress markers for measuring heat stress of meat type ducks <i>S. J. Lim, S. N. Chun, K. Y. Yang, C. H. Kim, J. H. Jeon</i>	278

Poster Session 13

A meta-analysis assessed factors affecting milk components and intake in response to metabolizable methionine fortification using INRA 2007 <i>L. Bahloul, S. Lemosquet, C. Loncke</i>	279
---	-----

Session 14. Integration of PLF and context data to improve decision making

Date: Sunday 1 September 2024; 8:30 - 12:30

Chair: Foy / Maroto

Theatre Session 14

Moo-ving forward: AI's role in transforming dairy calf care <i>invited M. Cantor</i>	279
New directions on precision management for dairy cows <i>C. Gaillard, J. Abarnou, O. Martin</i>	280
Improved monitoring with historical data, expert knowledge and context measures integration applied to dairy cow heat stress <i>I. Adriaens, H. P. Doekes, M. Gote, B. Aernouts, J. Verwaeren</i>	280
Integrating IMU wearable sensor data for enhanced PLF in dairy calves <i>D. Foy, M. Brause, T. Smith, J. Reynolds</i>	281
Designing a local-level data space platform as a strategic approach to reduce human-wildlife conflicts in rural Italy <i>M. Odintsov Vaintrub, P. Di Giuseppe, D. Chavez, O. Corcho</i>	281
Quantifying beef cattle grazing behaviour using Sentinel-2 data in South Africa's Strandveld region <i>W. Hough, C. J. Harmse, T. S. Brand, J. H. Van Zyl</i>	282
LiDAR technology as a contactless tool for quantitative analysis of body condition score in beef cattle <i>S. Marchegiani, S. Chiappini, M. Pasquini, A. Ragaini, M. F. Trombetta, E. Marchegiani, S. Ceccobelli</i>	282
Early lactation body condition and milk production affects fertility performance in dairy cows <i>D. Meuwissen, M. J. Gote, I. Adriaens, B. Aernouts</i>	283
Digital and precision livestock farming (PLF) technologies: gaps between sheep and goat farmers' needs and existing solutions <i>C. Morgan-Davies, A. McLaren, L. Grova, V. Giovanetti, L. Depuille, T. W. J. Keady, B. Mccllearn, R. Klein,</i>	283

A. Godo, I. Halachmi, P. Piirsalu, I. Llach, J. M. Gautier, F. Kenyon

Using accelerometers for goat activity monitoring 284
M. Bonneau, L. Faillot, W. Troupe, L. Riaboff

IntelliRAS – some results from a project on precision fish farming in recirculation aquaculture systems 284
L. Foldager, V. M. Thorup, M. Pastell, M. Frandsen, B. Bang Jensen, M. A. Krogh

Optimizing Disease Risk Classification: A Data-Integrative Approach 285
C. Matzhold, K. Schodl, C. Egger-Danner

Assessing the future uptake of digital tools and technologies by sheep and goat farmers in the meat and dairy industries 285
A. McLaren, L. Grøva, A. De Boer, T. W. Keady, B. Mclearn, G. Valeria, M. Acciaro, L. Depuille, R. Klein, A. Godo, P. Piirsalu, F. Kenyon, I. Halachmi, I. Llach, C. Morgan-Davies

Poster Session 14

Web platform for technical and economic comparisons of environmentally beneficial practices and investments in pig, poultry, and cattle farming 286
P. Levasseur, V. Blazy, L. Jarrige De La Sizeranne, S. Bourrin

CowBase: a Python package for streamlining data management in dairy farming 286
M. J. Gote, M. Ceccarelli, D. Meuwissen, L. D'Anvers, B. Aernouts, I. Adriaens

Improving conception rates for farms with a milk progesterone sensor 287
D. Meuwissen, M. J. Gote, I. Adriaens, B. Aernouts

Session 15. Role of bioinformatics applied to livestock data - Exploiting structural variation and pangenome-based techniques for livestock

Date: Sunday 1 September 2024; 14:00 - 18:00

Chair: Pocrnic / Bickhart

Theatre Session 15

Genotyping complex structural variants using a Chicken Pangenome reference 287
invited D. Bickhart, E. Rice, L. Frantz, W. Warren

Construction of a cattle pangenome for 14 French dairy and beef breeds provides new insights into their genetic diversity 288
V. Sorin, M. P. Sanchez, C. Iampietro, C. Eché, A. Suin, C. Marcuzzo, L. Drouilhet, D. Milan, G. Tosser-Klopp, C. Donnadieu, C. Gaspin, C. Birbes, C. Klopp, D. Boichard, M. Boussaha

Construction and characterization of a comprehensive ovine pangenome from 11 breeds provides new insights into their genetic diversity 288
V. Sorin, C. Birbes, C. Eché, C. Marcuzzo, J. Sarry, A. Suin, C. Donnadieu, C. Gaspin, C. Iampietro, D. Milan, C. Klopp, M. Boussaha, L. Drouilhet, M. P. Sanchez, G. Tosser-Klopp

Translocations associated with gonadal hypoplasia and colour-sidedness are common in northern Swedish cattle breeds 289
J. Hinken, T. Vanhala, M. Gòdia, M. Johnsson, A. M. Johansson

Uncovering functional INDELS leading to alternative splicing in grazing sheep with different immune profiles exposed to gastrointestinal nematode infection <i>S. Cunha, F. Schenkel, B. Mallard, N. Karrow, Á. Cánovas</i>	289
SNP-based identification of Robertsonian translocation 1;29 in 32 Italian cattle breeds <i>M. Cortellari, A. Bionda, L. Liotta, P. Parma, P. Crepaldi</i>	290
Determining differential splice junction usage in the suckling lamb adipose transcriptome by comparing perirenal and tail fat <i>M. Alonso-García, B. Gutiérrez-Gil, P. A. Fonseca, R. Pelayo, J. J. Arranz, A. Suárez-Vega</i>	290
Exploiting WGCNA to analyse the suckling lamb liver transcriptome profiles of males and females <i>M. Vrcan, A. Suarez-Vega, P. A. S. Fonseca, M. Alonso-García, J. J. Arranz, B. Gutierrez-Gil</i>	291
The genotypes of Myostatin gene are associated with weight gain indicators of intensively fattened lambs of Latvian sheep <i>I. Trapina, S. Plavina, N. Krasnevskā, J. Paramonovs, D. Kairisa, N. Paramonova</i>	291
Estimating haplotype and mutation effects in the context of genome sequence via ancestral recombination graphs <i>G. Mañra Fortuna, J. Obšteter, A. Moškrič, G. Gorjanc</i>	292
Genomic prediction using functional annotations and QTL features in dairy and beef cattle breeds <i>P. Croiseau, F. Mollandin, A. Rau, M. P. Sanchez, D. Boichard</i>	292
A genome-wide association study to identify novel genomic regions associated for aviary with winter garden usage by laying hens <i>K. Hoeksema, C. Baes, S. Gebhardt-Henrich, M. Petelle, M. Toscano, B. Mäkinen</i>	293
Detecting NGT Products: The Role of the GenEdit Database <i>F. Debode, V. Gelhay, G. Cartik, A. Granados, E. Clark, H. Mbaya, J. Hulin</i>	293

Poster Session 15

The Genome sequence of the Nguni Sheep, <i>Ovis aries</i> <i>L. T. Nesengani, S. Mdyogolo, T. Ebenezer, A. Djikeng, T. Masebe, A. Muigai, J. Rees, N. Mapholi</i>	294
Whole Genome Sequencing of Aosta cattle to assess breed genomic diversity <i>F. Bernini, M. Vevey, V. Blanchet, A. Bagnato, M. G. Strillacci</i>	294

Session 16. Genomic selection tools for within- and across- herd management in livestock species

Date: Sunday 1 September 2024; 14:00 - 18:00

Chair: Kargo / Lourenco

Theatre Session 16

Genetic diversity of local chickens in the Mediterranean area: Morocco, Algeria and Tunisia <i>S. Ait Tizi, S. Simma, A. Ouhrouch, M. Milanesi, B. Badaoui, M. Benbati, B. El Amiri, M. Ibbelbachyr, E. M. Sekkour, O. Mahir, N. Tabet-Aoul, F. Z. Mahamm, S. B. S. Gaouar, M. Ben Larbi, E. Somenzi, M. Tixier-Boichard, P. Ajmone Marsan, B. Benjelloun</i>	295
--	-----

A genomic-based approach to redefine herd book information in two local cattle breeds <i>G. Schiavo, S. Bovo, F. Bertolini, A. Ribani, V. Taurisano, S. Dall'Olio, M. Bonacini, L. Fontanesi</i>	295
Effects of indirect genetic effects on fish breeding programs <i>G. Rovere, F. Phocas</i>	296
Selection for protein digestibility in pigs <i>R. Bergsma, H. Lei, K. Hov Martinsen, Q. Hui, A. Rodas-Gonzalez</i>	296
Genetic variability for key biomarkers involved in body reserves dynamics in meat ewes <i>A. Nyamiel, E. González-García, D. Marcon, C. Durand, A. Tesnière, D. Hazard</i>	297
Genome-wide SNP markers from ddRAD reveals the population structure of Italian donkey populations <i>G. Chessari, A. Criscione, A. Cesarani, M. Ablondi, V. Asti, D. Bigi, S. Bordonaro, R. Ciampolini, C. Cipolat-Gotet, M. Congiu, P. De Palo, V. Landi, N. P. P. Macchiotta, D. Matassino, B. Portolano, S. Riggio, A. Sabbioni, M. T. Sardina, G. Senczuk, S. Tumino, M. Vasini, E. Ciani, S. Mastrangelo</i>	297
Comparison of milk-related traits' heritability evaluated by functional controls vs Automatic Milking Systems <i>R. Moretti, E. Ponzo, S. Chessa, F. Masia, E. Vrieze, P. Sacchi</i>	298
Polygenic selection in Finnish Ayrshire cows <i>K. Sarviaho, P. Uimari, K. Martikainen</i>	298
Phenotype-Genotype Linkage through Modern Data Logging: Developing a Protocol Application for Animal Research <i>M. Volk, D. Hinrichs</i>	299
Development of an analytical tool for animal genetic progress assessment based on gEBVs and results of its on-farm implementation <i>Y. Tavyrikov, Y. Pekov, D. Iakovishina, A. Dekin, A. Vasina</i>	299
Beef-on-Dairy leads to increased longevity of Holstein cows <i>L. Hüneke, J. Heise, S. Rensing, C. Schmidtman</i>	300
Assessing genome complementarity in beef-on-dairy crosses through selection scans, runs of homozygosity and genomic variation <i>D. Lindtke, S. Lerch, I. Morel, M. Neuditschko</i>	300
Milk yield, weight gain, feed intake, and feed efficiency in second lactation Holstein x Red Dairy Cattle F1 crossbreds compared to Holstein and Red Dairy Cattle <i>L. Hein, J. Clasen, M. Vestergaard, M. Kargo</i>	301
Performance of purebred dairy cows and crossbreds between Swedish Red, Swedish Holstein, Jersey, and Montbéliarde in Swedish herds <i>S. Liedgren, W. F. Fikse, K. Nilsson, E. Strandberg</i>	301

Poster Session 16

Heritability and Genetic Correlations of Resilience Indicators in Beef Cattle <i>J. N. S. G. Cyrillo, G. R. Rodrigues, V. T. Rezende, R. C. Canesin, J. P. S. Valente, M. E. Z. Mercadante</i>	302
Genomic-based genetic parameters for resilience indicators and pregnancy in beef cattle <i>J. N. S. G. Cyrillo, G. R. D. Rodrigues, V. T. Rezende, J. P. S. Valente, M. E. Z. Mercadante</i>	302

Estimation of genomic inbreeding coefficients based on SNP markers in Serbian Holstein cows <i>S. Trivunović, D. Stanojević, L. Štrbac, N. Gligović, M. Despotov, M. Šaran, D. Janković, R. Đedović</i>	303
CapraGEN project: managing genetic variability in Alpine and Saanen goats through genomic approach <i>C. Ferrari, C. Punturiero, A. Delledonne, R. Milanese, M. G. Strillacci</i>	303
Genome-wide scan for lethal haplotypes in Nellore cattle <i>G. R. D. Rodrigues, L. F. M. Mota, J. N. S. G. Cyrillo, P. I. Schmidt, J. P. S. Valente, L. G. Albuquerque, M. E. Z. Mercadante</i>	304
AgriSeqPI 1.0 & AgriSeqRI 1.0: Reporting utilities for SNP based parentage determination and testing for traits and disorders with Targeted Genotyping by Sequencing panels <i>S. Chadaram, A. Burrell, K. R. Gujjula, C. Carrasco, S. Daly, S. Udumudi, N. Anjuri, V. H. Kema, A. Udumudi</i>	304
Resilience indicators in beef cattle selected for high performance <i>S. F. M. Bonilha, G. R. D. Rodrigues, V. T. Rezende, R. C. Canesin, J. P. S. Valente, M. E. Z. Mercadante, J. N. S. G. Cyrillo</i>	305
Genetic background of beef-on-dairy calving ease <i>A. O. Garcia, J. B. Cole, A. A. Mikush, S. Tsuruta, S. E. F. Guimarães, I. Misztal, D. Lourenco</i>	305
The use of cooperative herds in the promotion of genetic resources of cold-blooded horses in Poland <i>A. Chelmińska, B. Smulska, G. Polak, E. Sosin, J. Wójtowicz</i>	306
Genome-wide association study for milk and blood indicators of hyperketonemia in Holstein dairy cattle <i>S. Magro, G. Visentin, A. Costa, J. T. Van Kaam, R. Finocchiaro, M. Marusi, M. Cassandro, M. De Marchi</i>	306
An association study with dairy traits confirms the importance of three SNPs for the assisted selection in the Mediterranean river buffalo <i>A. Pauciullo, G. Gaspa, Y. Zhang, Q. Liu, G. Cosenza</i>	307
Exploring the resilience of an intensive Holstein farm in Lombardy, Italy <i>C. Punturiero, A. Delledonne, A. Bagnato, M. G. Strillacci</i>	307

Session 17. Global quality of animal products in 2024: stakeholders' perceptions, desires, and priorities in a changing world

Date: Sunday 1 September 2024; 14:00 - 17:45

Chair: Martin / Anastasi

Theatre Session 17

Exploring the sustainability aspects of innovative livestock systems in Europe <i>E. Diaz Vicuna, N. Adams, L. Smith, C. Forte, A. Hesse</i>	308
Adopting low carbon practices: a cost-effective strategy for French dairy farms <i>E. Castellan, M. Gregoire, N. Gaudilliere, L. Benoist, F. Tattevin, T. Perez</i>	308
Life Cycle Assessment of different poultry production systems around Europe: mEATquality project <i>C. Reyes-Palomo, S. Sanz-Fernández, J. Marchewka, P. Sztandarski, A. Jaszczyk, M. Solka, H. Louton, L. Quirin, L. Vogt, C. Díaz-Gaona, V. Rodríguez-Estévez</i>	309
Life cycle assessment of two common dairy cattle farming systems in an Alpine area <i>G. Fichter, S. Hörtenhuber, T. Zanon, G. Peratoner, W. Zollitsch, M. Gaulty</i>	309

Quick sustainability scan calculator for intensive and extensive broiler farms <i>S. Sanz-Fernández, C. Reyes-Palomo, J. Marchewka, P. Sztandarski, A. Jaszczuk, M. Solka, H. Louton, L. Quirin, L. Vogt, C. Díaz-Gaona, V. Rodríguez-Estévez</i>	310
A case study on carbon neutrality of Podolian beef productions in the marginal area of Southern Italy <i>E. Sabia, C. Pacelli, A. Di Trana, R. Paolino, A. Coppola, A. Braghieri</i>	310
Animal Welfare Status in Dairy Cattle Farms of the Parmigiano Reggiano Consortium <i>M. Odini, G. Esposito, G. Cappelli, M. Nocetti, A. D. Whetton, N. Geifman, C. Dadousis</i>	311
Effect of extensification factors on broiler welfare and meat quality <i>I. De Jong, J. Van Der Eijk, S. Yigitturk, S. Erasmus</i>	311
Consumer expectations for beef in the French region Auvergne-Rhône-Alpes <i>S. Chriki, J. Normand, F. Noël, V. Payet, J. F. Hocquette</i>	312
Consumer preferences for cheeses derived from the milk of goats reared under different farming systems <i>V. Korelidou, A. I. Gelasakis, I. Bossis, T. Moschakis, E. Jamieson, P. Refinetti, C. Montagnese, A. Pennachio, M. Anastasi, A. Giusti</i>	312
Identification of breast defects in broilers with short-wave pocket near-infrared spectrometer <i>C. L. Manuelian, S. Magro, A. Goi, J. C. Parisse, A. Travel, C. Berri, M. De Marchi</i>	313
Does breeding for A2 cows alter milk yield and composition? <i>S. Serhan, C. L. Manuelian, A. A. K. Salama, G. Caja, X. Such</i>	313
Lipid oxidation and physical quality characteristics of beef as affected by storage condition <i>M. Tognocchi, S. Tinagli, R. E. Amarie, F. Narra, A. Serra</i>	314

Poster Session 17

Potential use of a pocket near-infrared spectroscopy device to directly discriminate local chicken meat <i>N. Stoppani, C. L. Manuelian, S. Sciuto, E. E. Cappone, M. Gariglio, P. Acutis, A. Schiavone, D. Soglia</i>	314
Feasibility of near-infrared spectroscopy to predict dry matter digestibility in broilers <i>O. Tej, E. Albanell, I. Kaikat, J. F. Pérez, C. L. Manuelian</i>	315
Health status of Skopelos goats and its impact on milk yield <i>V. Korelidou, A. I. Kalogianni, G. Arsenos, A. I. Gelasakis</i>	315

Session 18. Sustainable and smart integration of the dairy and beef sectors in EU

Date: Sunday 1 September 2024; 14:00 - 18:00

Chair: Vestergaard / Devant

Theatre Session 18

Addressing the challenges of the European dairy beef production system <i>invited M. Devant</i>	316
Longitudinal retrospective study of intake recovery and growth in unweaned dairy beef calves subjected to fasting, transport, and entire commercialization at farm arrival <i>S. Marti, L. Pisoni, M. Blanch, A. Bassols, Y. Saco, J. Pujols, M. Devant</i>	316

Total protein and hemoglobin levels of veal calves at arrival are associated with antibiotic use and mortality <i>invited</i> A. Willemsma, I. Carvalho, M. Van De Vosse, P. Mölder	317
A proteomics-machine learning approach to unravel the impact of protozoan infection on calves' intestinal morphology and development M. Bonnet, F. Dengler, L. Bachmann, W. Liermann, C. Helm, R. Ulrich, C. Delling, H. M. Hammon	317
Portable nanosensor for rapid detection and characterization of botulinum neurotoxins in cattle N. D. Kumar, G. Shtenberg	318
Effects of milk supplementation with different levels of soy protein isolate on growth performance and health indicators of the Holstein calves V. Yekani, H. Khalilvandi-Behroozyar, R. Pirmohammadi, M. Donyadoost-Chelan, M. Hosseini Ghaffari	318
Impact of breed and colostrum intake on serum IgG, growth, health, and blood lymphocyte profiles in preweaning dairy and crossbred bulls H. Mccarthy, M. Kovacs, T. Chapelain, J. Leão, D. Renaud, M. Steele	319
Genetic parameters for calf resilience and milk feeding traits recorded by automated milk feeding machines and their relationship with bovine respiratory disease in North American Holstein calves L. F. Brito, J. Graham, L. Gloria, J. Boerman, M. Taghipoor	319
Prevalence and distribution of foot lesions in French slaughter dairy and beef young bulls housed in indoor feedlot S. Ishak, R. Guatteo, A. Lehébel, N. Brisseau, A. R. Enraygues, M. Gall, A. Duvauchelle Waché, A. Relun	320
Updating preliminary study of multiphase diet for dairy beef cattle P. Guarnido Lopez, M. Benaouda, L. Llonch, S. Marty, M. Devant, L. Tedeschi	320
Carbon footprint of Holstein bull calves fed two different total mixed rations from 4 to 12 months L. Mogensen, M. Vestergaard	321
Innovative sustainable organic beef production system where quality replaces quantity L. Mogensen, T. Kristensen, M. Therkildsen, I. A. Christiansen, K. F. Jørgensen, C. Kramer, B. V. Andersen, T. Dorca-Preda, M. Vestergaard	321
Novel administration of meloxicam to surgically castrated bull calves via medicated lick blocks S. Rudd, D. Van Der Saag, S. Lomax	322
Sustainability, Animal Welfare and Surplus Calves in the Australian Dairy Industry: Perspectives from the public – a focus group study S. Bolton, B. Vandresen, M. Von Keyserlingk	322
Poster Session 18	
The use of gamma-glutamyl transferase as potential biomarker of colostrum consumption to evaluate the maternal antibody interference with subcutaneous and intranasal vaccines against BRD in unweaned dairy beef calves. An exploratory field study C. García-Vázquez, L. Llonch, A. Bassols, Y. Saco, J. Pujols, M. Campas, M. Devant, S. Marti	323
Evaluation of milk replacer acidification according to the cattle origin as a feeding strategy during pre-weaning period on diarrhea incidence and performance in dairy beef calves M. Verdú, X. Soldevila, M. Villarte, D. Villalba, G. De La Fuente, J. Cucurull	323

Effect of a phytogenic feed additive (POWERJET®) on calves' growth performance and intestinal permeability <i>M. Verdú, X. Soldevila, J. Cucurull, A. Pérez, J. Grau, M. S. Gómez</i>	324
Use of foster cows to produce rosé veal of spring-born dairy calves in an organic setting <i>M. Vestergaard, T. Kristensen, L. Mogensen, B. V. Andersen, I. A. Christiansen, K. F. Jørgensen, C. Kramer, M. Therkildsen</i>	324
Can cakes rich in polyunsaturated fatty acids substitute palm oil and reduce methane emissions in dairy beef calves fed high-concentrate diets? In vitro screening <i>M. Devant, L. Llonch, S. Martí, G. Verge, J. Riera, C. Medinyà, J. Cucurull, A. Pérez, B. Fernández</i>	325
Effect of substituting palm oil by sunflower oil in fattening dairy beef bulls fed high-concentrate diets on performance and enteric methane emissions <i>L. Llonch, S. Martí, M. Devant</i>	325
Can algae rich in polyunsaturated fatty acids reduce methane emissions when substituting palm oil in dairy beef calves fed high-concentrate diets? In vitro screening <i>L. Llonch, S. Martí, G. Verge, J. Riera, C. Medinyà, J. Cucurull, A. Pérez, B. Fernández, M. Devant</i>	326
Carcass traits of Lidia breed heifers: preliminary results <i>M. Cantarero, E. Angón, J. Claros, L. Jiménez, J. Caballero, J. Perea</i>	326

Session 19. Nutritional Models development and applications in livestock farming

Date: Sunday 1 September 2024; 14:00 - 18:00

Chair: Atzori / Munoz

Theatre Session 19

The 11th Modelling Nutrient Digestion and Utilization in Farm Animals (MODNUT) Workshop amidst the majestic Swiss Alps <i>invited M. Lautrou, S. Lerch, A. Cannas, J. Dijkstra, M. D. Hanigan, E. Kebreab, R. Muñoz-Tamayo, A. Remus, I. A. M. A. Teixeira, N. Mehaba</i>	327
From the biochemical pieces to the nutritional puzzle: using meta-reactions in teaching and research <i>invited J. Van Milgen</i>	327
Hybrid local and global sensitivity analysis: Evaluation of dairy cow response predicted through INRA 2018 feeding system according to feed characteristics <i>S. Jeon, T. Senga Kiesse, S. Lemosquet, P. Nozière</i>	328
Predictive modelling of dry matter intake in lactating dairy cows based on routinely available variables <i>N. Mehaba, S. Schrade, F. Dohme-Meier, L. Eggenschwiler, P. Schlegel</i>	328
Dynamic sensitivity analysis of a mathematical model describing the effect of the macroalgae <i>Asparagopsis taxiformis</i> on methane production in a rumen in vitro continuous system <i>P. Blondiaux, T. Senga Kiessé, M. Eugène, R. Muñoz-Tamayo</i>	329
Using risk analysis to compare the accuracy of enteric methane emissions models of dairy cattle <i>P. Blondiaux, E. H. Cabezas-Garcia, T. Senga Kiessé, R. Muñoz-Tamayo, K. F. Reed, M. Eugène</i>	329
Byproducts in Ruminant Feeding: Exploring their Mitigating Effects on Enteric Methane Emissions <i>T. Akinropo, J. S. Adjassin, D. Morgavi, M. Eugène</i>	330

Hybrid Intelligent Mechanistic-Dynamic Models: Mathematical Animal Nutrition Models to Predict Enteric Methane Emissions of Grazing Beef Cattle <i>H. Menendez, J. R. Brennan, A. S. Atzori, P. Guarnido Lopez, L. O. Tedeschi</i>	330
Systemic modelling application in animal science: archetypes for teaching and research in animal nutrition <i>A. S. Atzori, B. Atamer Balkan, H. Menendez, B. Turner, A. Gallo, L. O. Tedeschi</i>	331
Enhancing Agricultural Sustainability: An Optimization Model for Crop Rotation and Diet Formulation in Dairy Farms under European Union Common Agricultural Policy (EU CAP) <i>Y. Gong, A. Bellingeri, F. Fumagalli, G. Sechi, A. Atzori, F. Masoero, A. Gallo, V. Cabrera</i>	331
Assessment of amino acid requirements by crossbreed and sex of growing pigs based on sequential measurements of body weight and feed intake <i>N. Quiniou, M. Launay</i>	332
OCaM: A new dynamic model to simulate the fate of calcium and phosphorus in laying hens <i>B. Méda, E. Pampouille, T. Burlot, M. J. Duclos, C. Guerini, M. Quentin, A. Narcy, Y. Guyot</i>	332
Evaluation of a mechanistic model predicting phosphorus and calcium requirements for bone mineralization of growing broilers <i>M. Reis, A. Narcy, N. Sakomura, I. Bouvarel, C. R. Angel, M. P. Létourneau Montminy</i>	333

Session 20. Functional feed additives in poultry nutrition

Date: Sunday 1 September 2024; 14:00 - 17:45

Chair: Kreuzer-Redmer / Camarinha Silva

Theatre Session 20

Effects of dietary supplementation with cocrystals of thymol and carvacrol on quality, nutrient composition, and oxidative stability of broiler meat <i>Y. Li, S. Jiang, W. Yang</i>	333
Replacing Vitamin E in Broiler Diets with Polyphenolic-Rich Greek Vinification By-Products <i>A. Mavrommatis, P. Kyriakaki, S. Koulocheri, A. Pappas, E. Tsiplakou</i>	334
Modulation of broiler gut microbiota by dietary particle size, exogenous phytase and calcium concentration <i>I. Rubio-Cervantes, S. Wolfrum, M. Rodehutsord, A. Camarinha-Silva</i>	334
Effects of <i>Saccharomyces Cerevisiae</i> hydrolysate on Growth performance and gut health of broilers <i>M. Comi, J. Lin, H. J. Zhang, A. Agazzi, V. Perricone</i>	335
Carnosine in broiler diet: A promising nutritional strategy to reduce the prevalence of breast muscle myopathies <i>A. Askri, L. Saucier, N. Alnahhas</i>	335
The effect of a phytogenic on broiler performance and feed costs in normal and reduced energy diets <i>M. De Kock, M. Verdú, S. Van Kuijk, X. Soldevila, G. Farré</i>	336
Effects of yeast nucleotides administration via drinking water on broiler chickens <i>V. Perricone, S. Sandrini, N. Irshad, C. Lecchi, Y. Dadi, L. Aidos, P. Cremonesi, B. Castiglioni, F. Biscarini, G. Savoini, A. Agazzi</i>	336

Vertical transmission of gut bacteria in chickens and the implications of growing chicks in the absence of adults <i>E. Mills</i>	337
Development of eco-friendly feeding approaches in poultry. Assessment of different dietary zinc sources <i>A. Sarmiento-García, O. Olgun</i>	337
The inclusion of microalga <i>Dunaliella salina</i> in the diet of laying hens: effects on production performance and egg quality <i>O. Madacussengua, M. Lordelo, A. Almeida, R. Mendes, C. Martins, B. Tavares, D. Carvalho, T. Guerra, A. Pagarete</i>	338
Unveiling the Immunomodulatory Potential of Probiotic <i>Bacillus</i> Strains in Chicken Peripheral Blood Mononuclear Cells <i>F. Larsberg, M. Spreichert, D. Hesse, C. Falker-Gieske, G. Loh, G. A. Brockmann, S. Kreuzer-Redmer</i>	338
Chicken immune cell assay to evaluate the immune-modulating effect of grape by-products <i>M. Manoni, F. Larsberg, L. Pinotti, S. Kreuzer-Redmer</i>	339
Investigating the impact of Sodium Butyrate on gene expression profiles in chicken intestinal organoids <i>E. Pietrzak, S. Knaga</i>	339

Poster Session 20

Supplemental effect of <i>Aspergillus oryzae</i> phytase on growth performance, nutrient digestibility, and health parameters in Ross 308 broilers <i>S. Y. Jang, J. H. Park, S. B. Cho, D. K. Kang, I. H. Kim</i>	340
Growth performance, nutrient digestibility and intramuscular fatty acid composition of chickens fed Camelina Cake <i>V. Juskiene, R. Juodka, R. Leikus, G. Kadziene, D. Stankeviciene, R. Nainiene, A. Urbšys, R. Juska</i>	340
Silvafeed® ATX efficacy in improving performance of broiler chickens <i>V. A. R. D. Castilho Heiss, C. M. Komiyama, R. G. Garcia, M. F. D. C. Burbarelli, B. B. Przybulinski, J. R. F. Vieira, J. B. Lancini</i>	341
Influence of L-Glu and L-Gln supplementation in broilers subjected to an <i>Eimeria</i> challenge on performance <i>E. Kim, S. Lecuelle, A. Simongiovanni, E. Kiarie, W. Lambert</i>	341
Production results and carcass characteristics of Cherry Valley broiler ducks fed with halloysite <i>S. Wlazlak, M. Banaszak, J. Biesek</i>	342
Assessment of Natural Silicate-Based Minerals Effects on Compound Feed Pelletizing Processes <i>M. Hankare, A. Vigh, C. Careme</i>	342
Effect of dietary micelle quercetin on growth performance, egg production, and blood profile in Hy-line brown laying hens <i>S. Y. Jang, G. S. Ahammad, I. H. Kim</i>	343
Dietary incorporation of Zinc-Beta glucan improves immune status, gut microbial composition, egg quality, and mitigates gas emissions in laying hens' diets <i>S. Y. Jang, S. T. Wahid, S. Cho, D. K. Kang, I. H. Kim</i>	343
The supplementation of a mixed- phytase and xylanase product on older laying hens for improved phosphorus retention and ileal phosphorus digestibility <i>H. Walker, K. Bauer, D. Cvejić, J. D. Keegan, J. Taylor-Pickard, I. Nikodinoska, C. A. Moran</i>	344

The effect of different calcium sources on eggshell mineral content and breaking strength in laying hens <i>O. Demehin, M. Bouwhuis, K. Kozlowski, S. O'connell</i>	344
Dietary Arginine Supplementation as a Mitigative Strategy Against Mycotoxin-Induced Adverse Effects in Laying Hens <i>S. Y. Yoon, H. Tajudeen, P. Neves-Silvestre, J. Y. Mun, S. H. Ha, J. S. Kim</i>	345
Evaluation of the Efficacy of a Yeast Mannan Product on the Performance of Laying Hens <i>J. Taylor-Pickard, D. Currie, J. Keegan, C. Moran</i>	345

Session 21. Heat stress in pig and poultry production: consequences and strategies to cope with the consequence of the global warming

Date: Sunday 1 September 2024; 14:00 - 17:30

Chair: Chalvon-Demersay / Stadnicka

Theatre Session 21

Overview of heat stress management in fattening pigs: impact, influencing factors, and control strategies <i>invited L. De Prekel, D. Maes, A. Van Den Broeke, M. Aluwé</i>	346
Antioxidant-enriched or energy-dense diet in heat stressed fattening pigs <i>L. De Prekel, D. Maes, A. Van Den Broeke, M. Aluwé</i>	346
A dietary phytogetic solution mitigates heat stress indicators in pigs <i>A. Morales, P. Sakkas, M. Soto, N. Arce, N. Quilichini, M. Cervantes</i>	347
Maternal supplementation with betaine or amino acids during lactation improves the viability of Iberian piglets under heat stress <i>C. García-Contreras, I. Fernández-Figares, M. Lachica, F. Sánchez-Esquiliche, L. Ramírez, F. Gómez-Carballar, R. Nieto</i>	347
Heat stress effects on the gut microbiome profile of Iberian purebred and Duroc x Iberian crossbred weaned piglets <i>A. Heras-Molina, J. M. García-Casco, E. Gomez-Izquierdo, J. Gómez-Fernández, H. Laviano, F. García, C. Óvilo, M. Muñoz</i>	348
Maternal resveratrol improves sow's performance and the intestinal health and weight gain of suckling piglets under high summer temperature <i>H. Xiao, X. Yang, L. Wang, Z. Jiang</i>	348
Thermal adaptation in chicks: epigenetic regulation of resilience and vulnerability <i>invited N. Meiri, P. Malini, T. Kisliouk</i>	349
Trend analyses revealed increasing heat stress situations in German regions with intensive turkey production <i>N. Volkmann, B. Sake, N. Kemper, J. Schulz</i>	349
The potential of in ovo-fed amino acids to alleviate the detrimental effects of heat stress on broiler chickens <i>M. Yehia, V. Ouellet, N. Alnahhas</i>	350
Impacts of betaine and feed restriction on blood parameters in heat-stressed laying hens <i>R. De Baets, K. Buyse, G. Antonissen, E. Delezie</i>	350

Poster Session 21

- Impact of on-farm temperature on feed intake in Duroc pigs 351
T. Okamura, M. Tomiyama, M. Kimata, K. Ishii
- Effects of mineral interactions on oxidative stress in lactating sows subjected to heat stress 351
J. Y. Mun, A. Hosseindoust, S. H. Ha, S. A. Park, S. Y. Yoon, J. S. Kim
- Effect of heat stress on genetic evaluations for maternal traits in Iberian pigs 352
J. M. García Casco, P. Palma Granados, L. Ramírez Hidalgo, F. Sánchez Esquiliche, M. Muñoz Muñoz
- Heat stress effects on the growth and metabolism profile of Iberian purebred and Duroc x Iberian crossbred weaned piglets 352
A. Heras-Molina, J. García-Casco, E. Gómez-Izquierdo, J. Gómez-Fernández, H. Laviano, C. López-Bote, S. Astiz, C. Óvilo, M. Muñoz
- Heat tolerance in Polish local pigs: preliminary results of metabolomics analysis of blood 353
E. Sell-Kubiak, M. Pszczola

Session 22. Innovation in pig genetics

Date: Sunday 1 September 2024; 14:00 - 17:30

Chair: Verschuren / Nilsson

Theatre Session 22

- Breed Differences in Semen Quality Characteristics in Commercial Boars 353
N. Lewis, J. A. Calderon Diaz, C. R. G. Lewis, P. Ellis
- On the genetics of farrowing duration in pigs 354
M. S. Lopes, H. S. Wendling, E. Grindflek, E. F. Knol
- Dam parity is associated with reproductive performance in primiparous sows 354
J. A. Calderon Diaz, S. Casiro, I. Huerta, C. R. G. Lewis
- Validation of a Piétrain sire breeding program on crossbred piglets' vitality and congenital defects 355
W. Gorssen, C. Winters, R. Meyermans, L. Chapard, K. Hooyberghs, J. Depuydt, S. Janssens, N. Buys
- Genetic trends in the lysine requirements of growing-finishing pigs and reproductive sows, due to genetic trends in production traits 355
P. Knap
- Genetic Effects on Weight in Growing Piglets (prae iPig project) 356
E. M. Strucken, E. M. Saliu, J. Schulze Holthausen, L. Grzeškowiak, J. Zentek, G. A. Brockmann
- Differentially expressed genes in Piétrain sired pigs when feeding a high-fat high-fibre diet 356
E. U. Nwosu, B. Chakkingal Bhaskaran, R. Meyermans, E. Kowalski, W. Gorssen, S. Janssens, S. Millet, M. Aluwe, S. De Smet, N. Buys
- Sires of low ad libitum-residual feed intake progeny have no undesirable effects on growth performance, gain composition and carcass traits of restricted-fed heavy pigs 357
S. Faggion, L. Gallo, S. Schiavon, P. Carnier
- Impact of selection for birth weight uniformity in meat quality traits in SRC Iberian pigs 357
J. P. Gutierrez, N. Formoso-Rafferty, F. Sánchez-Esquiliche, A. Márquez, M. Muñoz, J. M. García-Casco, I. Cervantes

Differential Cold Adaptation Mechanisms: Adipose Tissue Subpopulation Variances in Tibetan and Bama Pigs 358
J. Liu, T. Liu, C. Chen, C. Tao, J. Zhao, Y. Wang

Exploring the potential of genetic selection for enhanced pork belly quality 358
Z. Mozduri, G. Plastow, B. Kemp, M. Juarez

Sire selection for infrared prediction of ham weight-loss during dry-curing affects green ham traits, and measured ham weight-loss in heavy pigs 359
K. Ivanov, V. Bonfatti, S. Faggion, L. Gallo, S. Schiavon, P. Carnier

Poster Session 22

Association between feed efficiency traits and disease resistance genes in pigs 359
K. Ishii, T. Okamura, M. Tomiyama, M. Kimata

A study on the effect of not approved semen doses on fertility traits 360
I. Andersen-Ranberg, A. H. Gaustad, R. M. Godinho

Session 23. Management measures to reduce production disease

Date: Sunday 1 September 2024; 14:00 - 18:00

Chair: Lewis / Lopreiato

Theatre Session 23

Keel bone lesions in laying hens: occurrence and risk factors 360
invited A. Trocino, G. Di Martino

Effects of a Bacterial Compound on Litter to reduce Footpad Lesions in Broilers 361
L. Galosi, A. R. Attili, A. M. Tambella, G. Rossi, L. Biagini, F. Gigli, M. Guarino, G. M. Provolo, R. Falconi, G. Castiglione, A. Roncarati

Effects of genotype and husbandry system on pododermatitis and plumage soiling in organic turkey production 361
D. Haug, R. Schreiter, B. Thesing, L. Rathmann, C. Lambertz, P. Hofmann, M. Erhard, G. Bellof, E. Schmidt

Incomplete Milking for metabolic relief of dairy cows 362
R. Joest, K. .. Südekum, U. Müller

Influence of incomplete milking on the metabolic and oxidative stress status in early-lactating cows with high lipolysis 362
U. Müller, R. Joest, K. . H. Südekum, S. Häußler

Insights into Mastitis Management: Unveiling the Drivers and Goals Behind Swedish Dairy Farmers and Veterinarians Decision-Making 363
N. Lind, H. Hansson, U. Emanuelson, C. J. Lagerkvist

Impact of early life experiences on the development of ear necrosis in weaned pigs 363
L. Markland, K. O'Driscoll, F. Leonard, L. Boyle

Identifying risk factors of piglet mortality at birth, before and after weaning 364
B. Garré, D. Maes, M. Aluwé

Environmentally enriched housing reduces disease severity in pigs after co-infection, with stronger effects when applied from birth than from weaning	364
<i>B. De Bruijn, I. Van Dixhoorn, J. Bolhuis, N. Stockhofe-Zurwieden, M. Kluivers, J. Rebel</i>	
Relationship between animal-based on-farm indicators and meat inspection data in pigs	365
<i>J. Witt, J. Krieter, K. Büttner, T. Wilder, M. Hasler, R. Bussemas, S. Witten, I. Czzycholl</i>	
Identifying barriers and facilitators to implementing veterinary telemedicine in swine, poultry, and bovine production using a COM-B approach	365
<i>A. Guintard, L. Lefèvre, S. Assié, M. Delsart, N. Millar</i>	
Implementation of sustainable parasite control strategies on extensively managed sheep farms	366
<i>E. Geddes, C. Morgan-Davies, A. McLaren, P. J. Skuce, J. M. Duncan, N. Sargison, F. Kenyon</i>	
Feed intake, growth performance and gut health parameters of broiler chickens are positively affected by the supplementation of chestnut tannins in a dose-dependent manner	366
<i>C. Techer, Q. Pagé, W. Lambert, A. Mayer, E. Berwanger, J. Fernandes</i>	

Poster Session 23

Use of infrared thermography for predicting the infectious etiology of subclinical bovine mastitis in a robotic milking system using machine learning	367
<i>L. F. Zafalon, R. C. M. Santana, M. V. Santos, T. C. Alves, A. R. Garcia, S. C. M. Niciura, F. D. Caracuschanski</i>	
Prevalence and characterization of rib injuries in dairy cows: a neglected welfare issue of dairy production	367
<i>J. M. Pankratz, I. C. Colaço Bez, J. L. Sviech Ratim, D. A. Duarte Santana, R. D. Ollhoff</i>	
Fertility and health traits of dairy cows on farms with short versus long productive lifespan profiles	368
<i>A. Bieber, M. Lozano-Jaramillo, M. Walkenhorst, R. Eppenstein</i>	
The influence of sample size on fitting the true flock prevalence in animal welfare assessment impressively presented	368
<i>L. Jung, B. Kulig, B. Schäfer, S. Addo, D. Hinrichs</i>	
Introducing blood gas and ionogram analysis in swine farms for diagnostic and studies : sows reference values and practical aspects	369
<i>M. Couteau, M. Chabane, E. Cantaloube, M. Delsart, V. Prodhomme, C. Guilloton, P. Y. Moalic</i>	
Fecal biomarkers in piglets: assay validation	369
<i>A. Pelegrí-Pineda, Y. Saco, R. Pato, R. Peña, J. Suppi, E. Llauradó-Calero, D. Solà-Oriol, A. Bassols</i>	

Session 24. Livestock are more than food, Part 2

Date: Sunday 1 September 2024; 14:00 - 17:45

Chair: Lee / O'Mara

Theatre Session 24

Influence of pastoral management on the conservation of the cultural landscape and biodiversity of mountain pastures	370
<i>invited M. Probo, C. Pauler</i>	
Trends in the association of herbivores and pigs in the Massif Central	370
<i>C. Roguet, S. Honor, H. Rapey, B. Dounies</i>	

Contribution of livestock in organic agriculture development: a study on nitrogen flows in expansion scenarios in France <i>F. Vergely, A. Wilfart, J. Aubin, S. Harchaoui</i>	371
The representations and attractiveness of livestock farming professions under the influence of societal issues. The French situation in a European perspective <i>invited A. C. Dockes</i>	371
Life cycle and ecosystem services assessments provide opposite evaluations of the food and non-food contributions of livestock farming systems <i>F. Joly, P. Roche, J. Dewulf, H. M. Van Der Werf, L. Boone</i>	372
Beyond the Pigs: Socio-Economic Impacts of African Swine Fever (ASF) on Indigenous Breeds in Bulgaria and Eastern EU <i>G. Angeloni, E. Lazzaro, A. Cristalli, R. Doneva, D. Dimitrova</i>	372
Biopolymers of animal origin: production, properties and applications <i>invited V. Khutoryanskiy</i>	373
Valorization of a waste from food industry: bovine hide to leather <i>invited S. Zanchin, G. Zorzi</i>	373
Cross-analysis of crop-livestock integration, sustainability and biodiversity on 10 French experimental farms <i>G. Martel, J. Pourias, J. Bernier</i>	374
Bee friendly livestock systems <i>L. Garcia, J. C. B. Dubeux, M. A. Bernardini, A. Cuminale, W. Piwowarek</i>	374
Closing remarks <i>invited M. R. Lee, F. O'Mara</i>	375

Session 25. Project session ADVAGROMED

Date: Sunday 1 September 2024; 14:00 - 18:00

Chair: Rumbos / Biasato

Theatre Session 25

Formulating balanced diets with local agricultural by-products from Greece as sustainable feed ingredients of <i>Tenebrio molitor</i> larvae <i>F. Kokonaki, C. Adamaki-Sotiraki, C. I. Rumbos, C. G. Athanassiou</i>	375
Yellow mealworm larvae fed on Italian by-products <i>S. Bellezza Oddon, I. Biasato, Z. Loiotine, A. Resconi, L. Gasco</i>	376
WP2 – Local agricultural by-products as substrate for insects: results in Portugal <i>R. Antunes, R. Fantatto, C. Ligeiro, D. Murta</i>	376
Effect of different diets on the larvae growth performance of Black Soldier Fly « <i>Hermetia illucens</i> » <i>L. Gasco, I. Biasato, C. Athanassiou, C. Rumbos, R. R. Garcia, S. Bellezza Oddon, I. Giannenas, R. Antunes, D. Murta, T. Ainane, A. Lamaadli, S. Cherroud, A. El Yaacoubi</i>	377
Effect of agro-industrial by-products-based diet on the gene expression of antimicrobial peptides in <i>Tenebrio molitor</i> L. (Coleoptera: Tenebrionidae) larvae <i>V. Candian, S. Bellezza Oddon, I. Biasato, L. Gasco, R. Tedeschi</i>	377

WP3 – The use of live insect larvae as feed ingredients for local poultry strains <i>I. Biasato, S. Bellezza Oddon, R. García, I. Giannenas, A. El-Yaacoubi, C. Athanassiou, C. Rumbos, R. Antunes, D. Murta, L. Gasco</i>	378
Responses of Pita pinta laying hens fed live black soldier fly (<i>Hermetia illucens</i>) larvae in Northern Spain <i>R. Rosa-García, R. Antunes, M. Menéndez-Miranda, L. Royo, A. Somoano, D. Murta, F. Vicente, A. Perez-Arcoiza</i>	378
Insect frass and poultry manure: a novel circular economy approach for sustainable vegetable production in the Mediterranean regions. The PRIMA project ADVAGROMED experiences <i>A. Parente, A. El Yaacoubi, R. Rosa-García, C. G. Athanassiou, C. Rumbos, L. Gasco</i>	379
The effect of added insect frass as a soil amendment in the NPK content of two pepper varieties <i>G. Thalassinou, N. Papadimitriou, V. Antoniadis, E. Levizou, C. Rumbos, C. Athanassiou</i>	379
<i>Hermetia illucens</i> frass and Pita pinta laying hens manure as biofertilizers for Asturian crops: effects on seed germination and growth <i>A. Perez-Arcoiza, C. S. E. Souza, I. Feito, G. Gonzalez, R. F. P. Antunes, R. Rosa-Garcia</i>	380
Effect of insect frass on the growth of barley crop <i>S. Khuli, L. Gasco, I. Biasato, C. Athanassiou, C. Rumbos, R. R. García, S. Bellezza Oddon, I. Giannenas, R. Antunes, D. Murta, T. Ainane, S. Cherroud</i>	380
Insect Frass Fertilizer: A Green Solution for Tomato and Brassica Microgreens <i>M. D'Imperio, G. Di Cuia, A. Marzulli, F. Baruzzi, M. Ferrara, G. Mulè, M. Gonnella, F. Gai, A. Parente</i>	381
Metagenomic insights into the effect of frass fertilizer application on rhizosphere microbial community: the case study of Italian turnip <i>G. Di Cuia, M. D'Imperio, G. Mulè, M. Gonnella, F. Gai, A. Parente, M. Ferrara</i>	381
Social LCA of a small-scale insect-fed broiler farm <i>D. Ristic, V. Khieya, S. Smetana</i>	382

Poster Session 25

ADVanced AGROecological approaches based on the integration of insect farming with local field practices in MEDiterranean countries. The PRIMA project ADVAGROMED <i>L. Gasco, S. Smetana, A. Parente, A. El Yaacoubi, R. Rosa-Garcia, D. Murta, C. Athanassiou</i>	382
Local agri-food wastes and by-products in Asturias (NW Spain): current situation and potential role as substrates for insect rearing <i>R. Rosa-García, M. Menéndez-Miranda, I. Feito, S. Baizán, A. Martínez, F. Vicente, A. Perez-Arcoiza, G. García</i>	383

Session 26. Production potential and adaptation of camelid species to extensive, semi-intensive and intensive production systems in arid and semi-arid environments

Date: Sunday 1 September 2024; 14:00 - 18:00

Chair: Nagy

Theatre Session 26

The state of camel genetics: recent phenotyping approaches and genetic findings <i>invited H. Alhaddad, B. H. Alhajeri</i>	383
---	-----

The relevance of camel reasearch and development for One Health <i>P. Burger</i>	384
Recent discoveries in two milk proteins genes (CSN1S2 and LALBA) revealed useful markers for gene's assisted selection in camels <i>N. Letaief, G. Gaspa, A. Pauciullo</i>	384
Genome-wide Association Study of Hair Shape Variation in Dromedaries from Kuwait <i>H. Alhaddad, S. Bruno, K. Akbar, E. Ciani</i>	385
Case/Control Association Study on Trypanosome Infection in Algerian Dromedaries: Unraveling Genetic Determinants <i>S. Bruno, I. Meghelli, E. Ciani, A. Sharaf, S. B. S. Gaouar</i>	385
Glycosylation dependent cell adhesion molecule, first genetic diversity investigation in dromedary camels <i>N. Letaief, G. Gaspa, A. Pauciullo</i>	386
Fragility and challenges in the development of the camel milk sector worldwide <i>invited B. J. Faye, G. Konuspayeva</i>	386
Alpacas in Austria: Survey on current situation on management and breeding <i>L. Bauer-Feiertag, B. Fuerst-Waltl, M. Braito, M. Wurzinger</i>	387
Lessons learned from the intensification of milk production in dromedaries and how it advances the camel dairy industry in arid, semi-arid countries <i>P. Nagy, J. Juhasz</i>	387
Study on anatomical structures of the dromedary udder <i>A. Mueller, U. Wernery, J. Kinne, P. Nagy, J. Juhasz, M. De Bont, C. Booth, P. Azmanis, A. Appelt, T. Wittek</i>	388
Insights into Dromedary Camel Pregnancy: Practical Applications of Dromedary Placenta Anatomy in Abortion Prevention Strategies <i>M. Chemin, U. Wernery, P. Nagy, J. Juhasz, M. Sobczak-Filipiak, M. Kulka</i>	388
Effect of pasteurization and simulated digestion on insulin content of camel milk <i>R. S. Aljumaah, M. Ayadi, M. M. Abdelrahman, A. M. Matar, M. Alshaikh, G. Caja, A. A. K. Salama</i>	389
Poster Session 26	
Adaptive evolution patterns in the genome of dromedary camels <i>H. Bahbahani</i>	389
Genetic parameters of fibre density in alpacas <i>A. Cruz, A. Burgos, A. Yucra, R. Morante, G. Gutierrez-Reynoso, M. Quispe, E. Quispe, J. P. Gutierrez</i>	390
Time budgets in stabled dairy dromedary camels <i>C. Chaouch Aoun, M. Atigui, M. Brahmi, E. Gherairi, W. Ben Salem, M. Hammadi</i>	390

Session 27. Physiology of resilience and adaptation to climate change

Date: Sunday 1 September 2024; 14:00 - 17:15

Chair: Zachut / Bernabucci

Theatre Session 27

Dairy cows' diversity of responses to heat stress: between resilience and adaptation 391
E. Vanbergue, L. Brun-Lafleur, P. Massabie, M. Prezelin, B. Vaillant, V. David

Genetic mechanism of brain-gonad axis regulating sex differentiation in sex-biased zebrafish families 391
S. Hosseini, A. R. Sharifi, B. Brenig

Physiological and Productive responses to a natural short-term heat wave in Holstein Friesian and Brown Swiss lactating cows 392
A. Maggiolino, A. Aloia, E. Trevisi, U. Bernabucci, C. Lecchi, V. Landi, P. De Palo

Effects of Heat Stress on energy and protein metabolism in Iberian and crossbred pigs 392
L. Sarri, É. Labussière, J. Balcells, G. De La Fuente

Can we breed cattle with more efficient rumen microbiome? 393
L. L. Guan, T. Mcallister, Á. Cánovas

Characterization of physiological responses in Rasa Aragonesa ewes under water restriction 393
S. Pérez, C. Calvete, M. Joy, A. Domínguez, J. H. Calvo, S. Lobón

Links between gills genes expressions during moderate heat stress and resistance to acute hyperthermia using rainbow trout isogenic lines 394
H. Lagarde, D. Lallias, M. Marchand, F. Phocas, L. Goardon, M. Bideau, F. Guyvarc'H, L. Labbé, S. Pouil, M. Dupont-Nivet, I. Leguen

Time-dependent molecular adaptation of immune and platelet function to heat stress in PBMC of Holstein dairy cows 394
F. Koch, B. Kuhla, C. Kühn

How does ewe age affect reproductive performance relative to rainfall conditions? 395
P. Theron, T. Brand, S. Cloete, J. Van Zyl

Sperm mitochondrial gene-dependent activity mediated the stress capacity in young and old Holstein bulls 395
K. Anwar, G. Thaller, M. Saeed-Zidane

Modeling the changes in daily rumination time and milk yield to detect the onset of heat stress in lactating dairy cows 396
A. M. Serviento, Y. Chang, G. Guo, A. Wang, K. Wang, H. Zhang, D. E. Rico, Y. Wang, M. Niu

Poster Session 27

Rumen-protected dry grape extract supply during natural heat stress improves the whole-blood immune response of Simmental cows 396
M. Forleo, A. Amato, C. Cavallo, E. Gugliandolo, L. Liotta, E. Trevisi, A. Minuti, H. Bui, P. Engler, V. Lopreiato

Individual variability in trajectories of key plasma biomarkers involved in body reserves dynamics in meat ewes 397
A. Nyamiel, E. González-García, D. Marcon, C. Durand, A. Tesnière, D. Hazard

Differences Between Swiss Dairy Breeds in the Relationship Between Milk Urea Nitrogen and Urine Nitrogen Excretion 397
A. Burren, M. Terranova, M. Kreuzer, T. Kupper, S. Probst

Session 28. EU-LI-PHE: Livestock phenomics, incl free communications on livestock phenotyping and phenomics

Date: Sunday 1 September 2024; 14:00 - 18:00

Chair: Fontanesi / Tiezzi

Theatre Session 28

European Network on Livestock Phenomics (EU-LI-PHE): boosting phenotyping in livestock 398
L. Fontanesi, T. Norton, A. Ašič, L. Boyle, E. Clark, I. Djurkin Kušec, J. Maselyne, H. Soyeurt, M. Toscano

Structured resilience phenotyping using big dairy data 398
J. I. Ohlsson, T. Klingström, L. M. Tamminen, M. Johnsson, A. Englund, J. Svensson, R. Ginlund, M. Zhou, J. De Koning

Large-scale phenotyping through milk infrared spectroscopy for enhancing resilience in dairy cattle: the contribution of LEO 'Livestock Environment Opendata' project 399
A. Cecchinato, M. A. Ramírez Mauricio, L. F. Macedo Mota, L. Gallo, S. Schiavon, S. Pegolo, E. Trevisi, M. Nocetti, E. Sturaro, R. Negrini, D. Giannuzzi

Ensemble Learner Enhances Prediction Accuracies for Extreme Body Condition Classes in Jersey Dairy Cattle in a 3D Image High-Throughput System 399
R. Stephansen, G. Gebreyesus, G. Sahana, J. Lassen

Phenotyping of beef calves BW and morphological scores based on 3D imaging and AI 400
T. Dechaux, Y. Do, M. El Jabri, E. Deste, C. Allain, L. Delattre, C. Gillé-Perrier, M. Bruyas, A. Lebreton

Molecular phenotyping through metabolomic analyses in pig breeds 400
M. Bolner, S. Bovo, G. Schiavo, G. Galimberti, F. Bertolini, A. Ribani, M. Gallo, S. Dall'Olio, L. Fontanesi

Integrating genomic information in metabolomic networks to dissect molecular phenotypes in pigs 401
S. Bovo, G. Schiavo, F. Bertolini, M. Bolner, M. Gallo, L. Fontanesi

Novel resilience indicators based on egg production in laying hens 401
I. Fodor, P. Duenk, B. Visser, D. Janssen, M. P. L. Calus, M. Van Der Sluis, C. Kamphuis

Towards a 24hr chicken surveillance system 402
J. Geibel, H. Schomburg, O. Sanders, C. Reimer, S. Weigend

A tracking tool for monitoring activity in broilers 402
J. Tarres, J. P. Sanchez

Computer-vision based analysis of turkey locomotion 403
Z. Wang, H. Doekes, P. Langenhuizen, B. Visser, P. De With, P. Bijma

Inertial measurement unit technology for gait detection: a comprehensive evaluation of gait traits in two Italian horse breeds 403
V. Asti, A. Sabbioni, M. Vasini, M. Abondi

LIPH4SAS (« Livestock Phenotyping for Sustainable Agroecological Systems »): a national research infrastructure for livestock phenotyping 404
J. P. Bidanel, M. Loucif, Y. Billon, S. Ingrand

Poster Session 28

Exploring the potential of an image analysis mobile app to estimate horse body morphometric measurements 404
C. Bordin, M. Greppi, T. Danese, V. Asti, M. Ablondi, F. Raspa, E. Valle

Phenotool: An information-sharing platform for livestock phenotyping methods and tools 405
M. Loucif, G. Pairault, Y. Billon, S. Ingrand, J. P. Bidanel

Feature identification for fattening pig body weight prediction: insights from correlation analysis 405
J. Sloomans, J. Maselyne, T. Norton

Session 29. Reassessing our relationship with farmed animals

Date: Monday 2 September 2024; 8:30 - 12:00

Chair: Rosati / Jacobs

Theatre Session 29

Animal Science and Production in Italy 406
invited N. P. P. Macciotta, M. Mele, B. Ronchi, G. Pulina

Scientific perspectives on the sustainable development of our relationship with farm animals 406
invited L. J. Keeling

Perspectives from the Animal Advocacy Movement 407
invited E. Nalon

Industry Insights 407
invited C. Cucurella

The Consumer-Citizen Dilemma of Animal Welfare amid Farmer Protests and Agricultural Policy Failures 408
invited A. Spiller

Influence of early nutrition and nutritional programming on performance and physiological parameters of pigs 408
invited C. C. Metges

Session 30. Relationships between environmental efficiency traits – an interdisciplinary approach

Date: Monday 2 September 2024; 14:30 - 17:00

Chair: Pszczola / Pinotti

Theatre Session 30

How to reduce enteric methane from dairy cows 409
invited P. Lund, C. Børsting, G. Giagnoni, M. Kjeldsen, M. Larsen, M. Maigaard, M. Nielsen, D. Olijhoek, M. Thorsteinsson, W. Wang, M. Weisbjerg

A holistic approach for monitoring the environmental sustainability of the Italian Holstein cattle population <i>R. Finocchiaro, L. Benzoni, G. Visentin, M. Dorigo, F. Tiezzi, M. Marusi, J. Layton, A. Bracchi, G. Bonacina, Z. Maddalena, G. Gilson, M. Cassandro</i>	409
Measuring the Environmental Impact of a Local Cattle Breed via DHI Longitudinal Data <i>E. D'Anza, S. Albarella, F. Luongo, G. Ferronato, F. Luisi, V. Peretti, R. Negrini</i>	410
Comparison of different residual carbon dioxide formulations for selection of feed efficient dairy cows <i>A. Chegini, E. Negussie, A. R. Bayat, T. Stefanski, M. H. Lidauer</i>	410
Circadian variation and animal-wise association between methane and a new feed efficiency trait in Nordic Red dairy cows <i>E. Negussie, A. Chegini, T. Stefanski, A. Bayat, M. Lidauer</i>	411
Correlation between mid-infrared-based predicted methane production and milk urea in Walloon Holstein dairy cows <i>H. Atashi, Y. Chen, N. Gengler</i>	411
Estimating Direct and Maternal Effects on Residual Metabolizable Energy Intake in Holstein Calves <i>R. E. Jahnel, K. Hoeksema, B. O. Makanjuola, C. M. Rochus, F. Miglior, F. S. Schenkel, M. A. Steele, C. F. Baes</i>	412
Genetic relationships between methane emissions, dry matter intake, bodyweight, and milk yield of dairy cows <i>A. Van Breukelen, M. Aldridge, Y. De Haas, R. Veerkamp</i>	412
The potential of residual feed and energy intake as direct selection traits for Fleckvieh cows <i>S. J. Burn, B. Fuerst-Waltl, C. Egger-Danner, G. Terler, A. Steinwidder, W. Zollitsch</i>	413
Genetic correlation between body weight and methane emission in Norwegian Red <i>K. A. Bakke, B. Heringstad</i>	413
Describing feed efficiency using metabolomic data in pigs <i>F. Bertolini, S. Bovo, M. Bolner, G. Schiavo, M. Cappelloni, M. Gallo, L. Fontanesi</i>	414
Poster Session 30	
Network analysis unraveled the complex interactions in the rumen microbiome associated with methane emission in dairy cattle <i>X. Ye, G. Sahana, M. Lund, B. Li, Z. Cai</i>	414
Investigating microbiability and microbiome-wide association analysis across diverse gut sections in growing-finishing pigs fed nitrogen- and phosphorus-restricted diets <i>B. Bonhoff, C. Große-Brinkhaus, W. Seel, E. Tholen</i>	415
Genetic architecture of feed efficiency traits in American mink <i>P. Davoudi, D. Ngoc Do, S. Colombo, B. Rathgeber, M. Sargolzaei, Z. Wang, G. Plastow, Y. Miar</i>	415
Effect of paternal breeding values for residual feed intake on reproductive performance of Hereford heifers <i>T. Devincenzi, M. Lema, L. Del Pino, E. A. Navajas</i>	416
Deep phenotyping of feed efficiency in individual dairy cattle using longitudinal and average feed quality data <i>N. Adhikari, A. Van Der Linden, B. Gredler-Grandl, R. F. Veerkamp</i>	416

Session 31. Breeding schemes for development of small populations

Date: Monday 2 September 2024; 14:30 - 17:00

Chair: Hiemstra / Fernández

Theatre Session 31

- Cosmopolitan and local Italian beef cattle breeds uncover common patterns of heterozygosity related to fitness traits 417
M. C. Fabbri, F. Tiezzi, A. Crovetto, C. Maltecca, R. Bozzi
- Estimating effective population size from genomic rates of coancestry and inbreeding 417
R. López De La Torre, J. Fernández, E. Morales-González, M. Á. Toro, A. Caballero, B. Villanueva
- Genomic analysis of diversity and population structure of baroque horse breeds in Czech Republic and Slovakia 418
H. Vostra-Vydrova, N. Moravcikova, R. Kasarda, M. Shihabi, V. Brajkovic, B. Hofmanova, V. Cubric-Curik, L. Vostry, I. Curik
- Identifying genetic loci influencing body weight in the endangered dual-purpose German Black Pied (DSN) cattle breed 418
P. Korkuc, M. Reißmann, G. A. Brockmann
- The benefits of genomics in small populations: case study of type traits in the Dual-Purpose Blue cattle breed 419
K. Wijnrocx, H. Wilmot, S. Vanderick, G. Glorieux, N. Gengler
- Genetic analysis of calf survival in a critically endangered antelope (Nanger dama mhorh) 419
S. Domínguez, I. Cervantes, E. Moreno, J. P. Gutiérrez
- Towards a generic measure of genetic relatedness of populations 420
J. Ten Napel, J. Windig, M. Schoon, M. Spoelstra, S. J. Hiemstra
- Derogations in breeding programmes for endangered breeds according to EU animal breeding legislation (EU 2016/1012) 420
H. Göderz, L. Balzar, J. Wider, C. Danchin, M. Spoelstra, M. Schoon, S. J. Hiemstra
- Simulation of genetic rescue from a gene bank using a complex load structure 421
C. Reimer, J. Geibel, T. Pook, S. Weigend
- Sheep along the trading routes: what may we tell from their demographic history? A case study from Hungary 421
A. Manunza, J. Ramirez-Diaz, B. Gulbrandtsen, A. A. Schönherz, P. Cozzi, S. Kusza, G. Sahana, A. Stella
- First insights in the genetic structure of Cyprus's indigenous cattle 422
A. C. Dimitriou, A. Spyrou, G. Hadjipavlou
- Exploring genomic selection opportunities in Italian local cattle breed 422
E. Mancin, C. Sartori, A. Bagnato, M. G. Strillacci, F. Bernini, G. Schiavo, S. Bovo, L. Fontanesi, R. Mantovani

Poster Session 31

- Genome-wide approaches reveal novel genetic markers potentially involved with Visna Maedi virus infection in Valle del Belice sheep 423
S. Riggio, M. Tolone, G. Sottile, S. Tumino, B. Portolano, A. M. Sutura, M. T. Sardina, A. Cesarani, S. Mastrangelo

ARDI2: Towards the consolidation of joint work in research, development and innovation in sheep <i>C. Pineda-Quiroga, I. Granado-Tajada, J. M. Astruc, F. Fidelle, Z. Vitezica, S. Rodriguez-Ramilo, I. Beltran De Heredia, M. Lasarte, E. Ugarte</i>	423
GEREMES: a project to improve the genomic insight on the resilience background in Mediterranean sheep breeds <i>S. Mastrangelo, G. Senczuk, A. Cesarani</i>	424
Insight into the genetic composition of the South African Bonsmara breeds using whole-genome sequencing data <i>D. Alberts, E. Van Marle-Köster</i>	424
Genomic evaluation for persistence of lactation in Girolando cattle <i>M. V. G. B. Silva, J. C. C. Panetto, R. Negri, S. Kluska, P. I. Otto, M. A. Machado, E. Ferreira Junior, J. A. Cobuci, D. S. Dalro</i>	425
Genetic Characterization and Pathway Analysis of Carcass Weights in a Jeju Native Black×Hanwoo Crossbred Population <i>M. Won, Y. K. Kim, S. M. Sin, T. H. Kim, H. B. Park</i>	425
Selection signature analyses revealed multiple genomic regions associated with milk production in Girgentana breed <i>A. Criscione, S. Ben-Jemaa, G. Chessari, S. Riggio, G. Cammilleri, A. Lastra, A. Cesarani, M. T. Sardina, S. Bordonaro, S. Mastrangelo</i>	426
Genomic analysis of longevity with productive and reproductive traits in Girolando cattle <i>M. V. Silva, E. Kern, R. Negri, S. Kluska, P. Otto, M. Martins, J. C. Panetto, D. Dalro</i>	426
Calvana breeding scheme using genomic information and optimal contribution selection <i>M. C. Fabbri, R. Bozzi</i>	427
Genomic characterization of the Montanina cattle <i>M. Cortellari, A. Bionda, M. Barbato, V. Floridia, V. Chiofalo, N. A. Virga, C. Cavallo, P. Crepaldi, L. Liotta</i>	427
Evaluation of genetic diversity in beef cattle breeds of Centre-Italy <i>E. Mancin, C. Sartori, F. Sbarra, A. Quaglia, E. Rulli, G. Gomez-Proto, R. Mantovani</i>	428
Genomic Landscape of a Newly Unveiled Meleagris gallopavo Population in South Italy: A Leap Toward Understanding Turkey Biodiversity <i>M. Saleh, A. Camarda, P. De Palo, N. Pugliese, E. Circella, M. G. Strillacci, A. Bagnato, C. Abatino, N. Perrone, P. Arthur, G. Fiorentino, M. Groenen, M. Derks, V. Landi</i>	428
Next-Generation sequencing errors lessens the estimation of recent inbreeding <i>L. Gomez-Raya, W. M. Rauw, O. Torres, M. G. Gil, R. Peiro</i>	429
Bayesian Genome-wide Association Study of udder-type traits in Alpine Grey Cattle <i>G. Gomez Proto, E. Mancin, E. Rulli, C. Sartori, R. Mantovani</i>	429

Session 32. The role of marbling in beef quality - development, importance, measurement; harmonisation

Date: Monday 2 September 2024; 14:30 - 17:00

Chair: Pethick

Theatre Session 32

- Italian deli meats quality perspective with focus on best practices and commitments towards a new business model 430
D. Calderone
- Understanding the development of intramuscular fat in cattle – a mini review 430
J. F. Hocquette, D. W. Pethick
- Transforming chemical intramuscular fat% into MSA and AUS-MEAT marbling scores and potential application in the Australian beef industry 431
S. Stewart, G. Gardner, G. Tarr
- Prediction of consumer palatability in beef using visual marbling scores and chemical intramuscular fat percentage 431
G. Tarr
- Flavour drives consumer eating quality acceptability as intramuscular fat increases in Australian lamb 432
S. Moyes, G. Gardner, D. Pethick, L. Pannier
- Effects of live yeast and selenium supplementation on rumen parameters in long-transported Charolais bulls 432
M. Santinello, I. Lora, C. Villot, G. Cozzi, M. Penasa, E. Chevaux, B. Martin, A. Guerra, M. De Marchi
- An evaluation of muscle cut, maturation and meat quality of beef using Rapid Evaporative Ionisation Mass Spectrometry (REIMS) analysis 433
L. Perkins, W. Jia, T. Rowe, R. Polkinghorne, P. Nicholas-Davies, A. Koidis, N. Scollan
- REIMS (Rapid Evaporative Ionisation Mass Spectrometry) prediction of beef sensory quality and its relationships to fat level 433
J. Liu, N. Birse, C. Álvarez, J. Liu, I. Legrand, M. P. Ellies-Oury, D. Durand, S. Prache, D. Pethick, N. Scollan, J. F. Hocquette
- A cuts-based Meat Standards Australia grading system for sheepmeat 434
L. Pannier, T. Pleasants, G. E. Gardner, G. Tarr, A. Ball, P. Mcgilchrist, D. W. Pethick
- Exploring the meat quality of Lidia heifer meat: preliminary results 434
M. Cantarero, E. Angón, J. Claros, L. Jiménez, I. Garzón, J. Perea
- Characterisation of Meat Quality Attributes in Different Cattle Breeds: Implications for Labelling and Consumer Choice 435
L. Grispoli, E. Costanzi, C. Truzzi, M. Tassinari, B. Cenci Goga
- Evolution of animal and meat research over the past 50 years 435
Y. Cui, J. F. Hocquette

Poster Session 32

- Meat quality for once-calved heifers and heifers of Holstein-Friesian × Limousine crossbreds 436
Z. Nogalski, M. Sobczuk-Szul
- Impact of immunocastration on meat quality and muscle transcriptome of Angus × Nellore cattle 436
S. Pereira Junior, F. Soares, R. Ribeiro, H. Souza, J. Galvão, W. Baldassini, R. Curi, L. A. Chardulo, M. R. Chiaratti, O. Machado Neto
- Investigating tissue specific differences in the adipogenic cascade in bovine preadipocytes differentiation 437
B. Soret, J. A. Mendizabal, A. Arana, L. Alfonso
- On-farm preconditioning affects cattle stress, immune, and respiratory microbiota responses after transportation and feedlot placement 437
T. Alexander, S. M. Uddin, K. Schwartzkopf-Genswein, J. Ortiz Guluarte, O. Lopez-Campos, D. Holman

Session 33. Mediterranean buffalo farming for sustainable milk and meat production

Date: Monday 2 September 2024; 14:30 - 17:00

Chair: Neglia / Niero

Theatre Session 33

- Use of a commercial feed supplement based on diatom earth and yeast products on oxidative status and in vitro immune response in buffaloes during peripartum 438
A. Maggiolino, E. Casalino, T. Latronico, G. M. Liuzzi, M. F. Sgarro, P. De Palo
- Effects of a nutritional supplement in Italian Mediterranean Buffalo exposed to heat stress 438
F. Petrocchi Jasinski, C. Evangelista, R. Steri, M. Iacurto, C. Petricca, L. Basiricò, D. Meo Zilio, U. Bernabucci
- Feasibility of visible/near-infrared spectroscopy to predict the chemical composition of feces and total-tract apparent nutrients digestibility in lactating buffaloes 439
A. Guerra, M. Simoni, V. Longobardi, A. Goi, G. Mantovani, T. Danese, G. Neglia, M. De Marchi, F. Righi
- Influence of an Automatic milking system on milk yield and quality in Italian Mediterranean buffaloes 439
R. Matera, A. Calanni Macchio, F. D'Acerno, M. T. Verde, F. Bonavolontà, S. Lauriola, G. Neglia
- Transcriptomic characterization of buffalo's extracellular vesicles from colostrum and milk: cargo comparison for potential applications 440
S. Mecocci, D. Pietrucci, M. Milanese, S. Capomaccio, L. Pascucci, C. Evangelista, L. Basiricò, U. Bernabucci, G. Chillemi, K. Cappelli
- Prediction of blood parameters of buffaloes from the milk mid-infrared spectra 440
S. Magro, S. Esposito, G. Neglia, G. Niero, M. De Marchi
- Cortisol concentrations in different matrices: predictive potential and relationship with productive level, lactation stage and parity in dairy buffaloes 441
A. Cotticelli, F. Aragona, T. Peric, I. Pividori, A. Salzano, V. Longobardi, G. Campanile
- Characterization of buffalo faecal microbiome depending on ration concentrate level 441
C. Evangelista, D. Pietrucci, M. Milanese, L. Basiricò, F. Gabbianelli, U. Bernabucci, G. Chillemi
- Assessment of infrared spectroscopy for the quantification of protein fractions in buffalo milk 442
E. Visentin, G. Niero, A. Guerra, R. Matera, V. Longobardi, G. Neglia, M. De Marchi

Biosecurity correlation with Antimicrobial Use and Animal Welfare in buffalo farm evaluated by ClassyFarm System 442
D. Vecchio, F. Scali, A. M. Maisano, F. Fusi, V. Lorenzi, G. Di Vuolo, C. D. Ambra, M. Serrapica, G. Cappelli, C. R. Romeo, C. Lecchi, L. Bertocchi, A. J. Zanella, E. De Carlo

A new version of buffalo SNP array to support Mediterranean breed genomic improvement 443
M. Milanese, D. Pietrucci, L. Picarone, G. Vignali, G. Cosenza, M. Gomez, G. Chillemi

Influence of udder type traits on stayability in the Italian Mediterranean buffalo 443
D. Altieri, Y. Gombia, N. Piscopo, F. Carnovale, M. Neri, R. Di Palo

Poster Session 33

How old is too old? Effects of parity in dairy water-buffalo on milk and reproduction efficiency 444
M. Mincu, I. Nicolae, A. Bota, D. Gavojdian, T. Constantin

Accuracy of a fast low-priced device based on 2D image analysis in predicting body weight of Italian Mediterranean buffalo 444
D. Meo Zilio, G. Bianconi, C. Petricca, P. Negretti, F. Petrocchi Jasinski, C. Evangelista, R. Steri

Analysis to the microbiome of buffalo milk and mozzarella cheese using next generation sequencing techniques 445
C. Ferrari, L. Basiricò, U. Bernabucci, M. Ruzzi

Effect of seasonality and farm management on the buffalo's milk lipidome 445
L. Basiricò, P. Bonini, C. Evangelista, U. Bernabucci, M. Ruzzi

Influence of breeding techniques during the dry period on welfare in buffalo species 446
A. Cotticelli, L. Borzacchiello, G. Pacelli, G. Bifulco, M. Giombolini, T. Peric, G. Neglia

Meat and milk from dual-purpose water buffalo production systems in Greece 446
G. Arsenos, I. Tsakmakidis, D. Roustemis, D. Patousis, S. Vouraki, V. Papanikolopoulou, A. Lympelopoulou

Session 34. Nutrition management to reduce methane emission and environmental impact, Part 1

Date: Monday 2 September 2024; 14:30 - 17:00

Chair: Bruggeman / Pinotti

Theatre Session 34

The use of coproducts to mitigate the environmental footprint of pigs and broiler chicken production 447
S. Cisse, H. Bui, J. Laurain, M. E. A. Benarbia

Methane emissions from beef fed different protein sources and a forage-based diet 447
C. Christodoulou, K. E. Kliem, M. D. Auffret, D. J. Humphries, J. R. Newbold, N. Davison, P. Kirton, L. Smith, S. Stergiadis

Effect of dietary protein concentrations on feeding efficiency and methane emissions of dairy cows across lactation 448
S. Ormston, T. Yan, X. Chen, A. W. Gordon, K. Theodoridou, S. Huws, S. Stergiadis

Dietary crude protein reduction in poultry diets allows to decarbonize poultry meat and egg production with different levels of expected benefits across segments <i>M. Durand, A. Mathiaud, C. Raybaud, P. Moquet, W. Lambert</i>	448
Effect of fresh hemp and savory leaves on feed intake and rumen fermentation: in vitro and in vivo trials <i>S. Massaro, N. Amalfitano, D. Giannuzzi, F. Tagliapietra</i>	449
Effect of β -mannanase on growing-finishing pig performance, economics, and carbon footprint <i>A. Huting, M. L. Augé, Q. Bringas, F. Molist</i>	449
Exploring Kaempferol 3-O-Glucoside as a Potential Feed Additive: In vitro Assessment for Mitigating Methane Emissions in Livestock Nutrition <i>A. Vastolo, M. Formato, S. Piccolella, S. Calabrò, S. Pacifico, M. I. Cutrignelli</i>	450
Quantifying methane emissions and animal performance from zero-grazed beef steers supplemented with <i>Ascophyllum nodosum</i> via a water-based delivery system <i>A. Casey, S. Vigors, T. Boland, F. Godwin, J. O'Sullivan, M. O'Donnell</i>	450
Effect of rape seed fat and saturated fat on milk production and enteric methane, when added to diets with different ratios between grass-clover and maize silage <i>C. F. Børsting, S. Lashkari, M. H. Kjeldsen</i>	451
Mango and Avocado Byproducts as Feed Ingredients and Additives in Ruminant diet <i>H. Jalal, E. Sucu, M. Giammarco, G. Vignola, M. Z. Akram, I. Fusaro</i>	451
Effect of <i>Cymbopogon citratus</i> on Enteric Methane Emission and Energy Partitioning in Growing Beef Cattle <i>M. F. Vázquez-Carrillo, M. González-Ronquillo, R. Zaragoza-Guerrero</i>	452
Including dried algae in dairy cow diets decreases emissions, yield and intensity of enteric methane <i>C. Benchaar</i>	452
Poster Session 34	
Phenotypic traits related to methane yield in dairy cows <i>M. H. Kjeldsen, T. De Evan Rozada, S. J. Noel, A. A. Schönherz, A. L. F. Hellwing, P. Lund, M. R. Weisbjerg</i>	453
Effects of high-fat oats, rapeseed cake, and 3-NOP on milk production and methane emissions of dairy cows <i>P. Fant, G. Mantovani, M. Vadroňová, M. Ramin</i>	453
Repeatability of enteric methane measurements using GreenFeed systems on upland pastures <i>M. Bouchon, M. Coppa, Y. Rochette, C. Pichon, R. Chadaigne, B. Martin, C. Martin</i>	454
Quebracho condensed tannins fed to dairy goats: effect on milk fatty acids and their use for CH ₄ prediction <i>M. Battelli, F. Scicutella, G. M. Crovetto, A. Buccioni, L. Rapetti</i>	454
Dietary incorporation of Zinc-Beta glucan improves immune status, gut microbial composition, and mitigates gas emissions in weaning pigs <i>S. T. Wahid, S. Cho, M. H. Oh, K. Han, D. K. Kang, I. H. Kim</i>	455
<i>Enterococcus gallinarum</i> Reduce Methane Production in Rumen Fermentation In Vitro <i>M. A. Park, D. J. Lim, S. Park, S. Son, S. Choe, D. H. Kim, Y. Kim</i>	455
Insights into Effects of Combined Capric and Lauric Acid on Rumen Microbial Composition <i>M. Vadroňová, A. Štoviček, K. Jochová, A. Výborná, Y. Tyrolová, D. Tichá, M. Joch</i>	456

Enhancing Ruminant Fermentation Efficiency: Mitigating Methane Emissions through Persistent Peroxide Addition	456
<i>A. Bartle, C. Thorn, P. Abberton, S. Mills, S. O'Connor, M. McDonagh, V. O'Flaherty</i>	
Performance evaluation and enteric methane emission in bovines treated with natural Fator P additive	457
<i>L. Fernandes, L. Ferreira, W. Araújo, A. D'Aurea, G. Moura, V. Fonseca, A. Maia</i>	
Utilizing a Feed Additive to Mitigate Methane Emissions from Dairy Cows: On-Farm Trial Employing Methane Laser Detector	457
<i>E. Senatore, G. Foggi, A. Silvi, M. Schiera, G. Mattera, A. Mantino, M. Mele</i>	
In vitro and in vivo assessment of a blend of chestnut and quebracho tannins on rumen fermentation, methane production and digestibility in ruminants	458
<i>E. Ramos-Morales, I. Rivelli, E. Soussan, M. García, S. Danesh, R. Rauch, P. Lund, D. Yanez-Ruiz</i>	
Can almond hulls reduce in vitro ruminal methane production?	458
<i>T. De Evan, A. Recalde, C. Fernández, R. Jiménez, S. Calero, M. D. Carro</i>	
Anti-methanogenic feed additives in pasture-based dairy systems	459
<i>H. Costigan, B. Lahart, L. Shalloo, C. Dwan, V. O'Flaherty</i>	
The Effect of Ensiling Alfalfa with Acacia (<i>Robinia pseudoacacia</i>) Tree Leaves and Sugar Beet Molasses on Silage Fermentation Quality, In-vitro Ruminal Fermentation and Methane Production	459
<i>M. U. Hassan, M. Gül</i>	
Temporal effects of botanicals on total gas and methane production in ruminal fermentation in vitro	460
<i>F. Ferrero, B. Tugnoli, V. Sáinz De La Maza-Escola, R. Majer, F. Ghiaccio, A. Federiconi, A. Palmonari, A. Formigoni, A. Piva, E. Grilli</i>	
High throughput in vitro screening of natural essential oils, rumen buffers, and plant extracts for enteric methane mitigation in cattle	460
<i>I. Hodge, P. Quille, M. Ayyachamy, S. O'Connell</i>	
Effect of using essential oils blend on performance in dairy cows	461
<i>M. Agovino, C. Moran, C. Necula, H. Warren, K. Spengler</i>	
Culture and growing conditions has an impact on methane mitigation properties in red algae	461
<i>M. Angellotti, M. Lindberg, S. J. Krizsan, R. Danielsson</i>	
Freshly cut grass-clover vs. grass-clover silage and grass-clover pulp silage for organic growing-finishing pigs	462
<i>M. Eskildsen, E. Jørgensen, L. Stødkilde-Jørgensen</i>	

Session 35. Advances in non-ruminant nutrition, Part 1

Date: Monday 2 September 2024; 14:30 - 17:00

Chair: Alvarez-Rodriguez / Kar

Theatre Session 35

Variation of zinc release from phytate by phytase is dependent on the level of dietary Zn supplementation in pig: a meta-analysis

J. Labarre, P. Schmidely, C. Loncke, M. P. Letourneau-Montminy

462

The combination of an alternative zinc source and low ABC-4 diets can replace the high levels of ZnO in nursery piglet diets	463
<i>J. Riedmüller, J. E. G. Faccin, S. Durosoy, Y. J. Manaig, J. Zentek, J. M. Derouchev, J. T. Gebhardt, R. D. Goodband, J. C. Woodworth, M. D. Tokach</i>	
Nursery pigs kept in poor sanitary housing conditions benefit from diets with low buffer capacity	463
<i>T. Hulshof, H. Van Hees, L. Fabà</i>	
Effect of zinc on phosphorus and calcium digestibility in post-weaning pigs: a meta-analysis	464
<i>J. Labarre, P. Schmidely, C. Loncke, M. P. Letourneau-Montminy</i>	
Effect of full matrix application of a novel phytase without or with a multi-enzyme complex containing xylanase, β -glucanase, amylase and protease on performance of piglets	464
<i>R. Lizardo, H. Quesada, A. Ghane, G. Nguyen, E. Vinyeta, D. Velayudhan, Y. Dersjant-Li</i>	
Kinetics of bone mineralization and allometric changes in response to calcium and phosphorus deficiency in broiler chickens	465
<i>F. Piterson, A. R. Alfonso Avila, M. D. P. Reis, A. Narcy, M. P. Letourneau-Montminy</i>	
Assessment of new phytase products through an in-vitro digestion model alongside a broiler chicken trial	465
<i>M. Mireaux, F. Richard, F. Czernikarz, F. Robert</i>	
In vitro prediction of calcium and phosphorus availability in monogastric feed using marine sourced calcium and limestone	466
<i>O. Demehin, T. Higgins, M. Bouwhuis, S. O'connell</i>	
Impacts of <i>Saccharomyces</i> yeast postbiotics on intestinal response and growth of nursery pigs	466
<i>S. W. Kim, M. E. Duarte</i>	
Effect of hydrolyzed yeast from <i>Kluyveromyces fragilis</i> replacing high-dose zinc oxide on growth performance, diarrhea incidence and intestinal health of weaned piglets	467
<i>C. Yin, M. Comi, W. Chen, V. Perricone, W. Sun, Y. Pi, Y. Li, A. Agazzi, X. Li, X. Jiang</i>	
In vitro and in vivo evaluation of L-Lysine solid lipid microcapsules for swine	467
<i>C. Bonnici, M. F. Marchesi, R. Majer, G. Gallina, A. Piva, E. Grilli</i>	
Effect of a botanical-based feed additive in vitro on cultured enterocytes and in vivo on weaned piglets challenged with F4+ enterotoxigenic <i>Escherichia coli</i>	468
<i>A. Bonetti, B. Tugnoli, A. Piva, A. Middelkoop, F. Molist, E. Grilli</i>	
Poster Session 35	
Evaluation of dietary selenium nanoparticles and curcumin nanospheres on growth, feed utilization and fecal gas emissions in weaned piglets	468
<i>M. Moniruzzaman, T. Min</i>	
The use of levan in laying hens nutrition - influence on the microflora of the gastrointestinal tract	469
<i>D. Konkol, M. Kuźmińska-Bajor, Z. Lazar, E. Popiela, M. Korczyński</i>	
Mint oils: ability to perform in vitro anti-inflammatory and their antimicrobial effect	469
<i>M. Hejna, L. Kovanda, L. Rossi, Y. Liu</i>	

Session 36. Slow-growing meat-type and dual purpose genotypes for conventional and alternative farming systems in the EU

Date: Monday 2 September 2024; 14:30 - 16:45

Chair: Stadnicka / Petracci / Das

Theatre Session 36

Update on the use of slow-growing chicken genotypes for conventional and alternative farming systems in the EU 470

invited C. Castellini

Crossbreeding as an innovative way to preserve local chicken breeds through use in organic farming 470
S. Weigend, I. Tiemann, S. Hillemacher, J. Stuff, J. Tetens, P. Hoffmann, W. Vogt-Kaute, D. Hinrichs

The biodiversity of local poultry breeds: characterisation of two Tuscany breeds to save them from extinction 471
F. Mannelli, I. Galigani, L. Versino, M. Biagi Arroyo, L. Fantechi, M. Daglio

Multiperformance of slow-growing and dual-purpose strains in organic chicken production: learning from the PPILOW project 471

invited C. Bonnefous, C. Castellini, S. Mattioli, S. Mignon-Grasteau, J. Collet, L. A. Guilloteau, B. Méda, T. De Rauglaudre, H. Pluschke, P. Thobe, D. Werner, L. Calandreau, V. Guesdon, S. Steinfeldt, K. Germain, L. Ravon, C. Berri, S. Lombard, M. Reverchon, E. Le Bihan-Duval, A. Collin

What do dual purpose cockerels feed on in the range area? 472
S. Hübner, D. Werner

An index for adaptability evaluation of slow-growing chicken genotypes reared in free-range system 472
S. Mattioli, L. Menchetti, E. Angelucci, A. Cartoni Mancinelli, A. Dal Bosco, L. Madeo, D. Chiattelli, F. Di Federico, C. Castellini

Application of Quality of Life approach to evaluate the behavior of four slow growing chicken genotypes reared in free range 473
A. Cartoni Mancinelli, D. Chiattelli, L. Menchetti, A. Trocino, C. Ciarelli, C. Castellini

Productive performance and nitrogen excretion of fast-, medium- and slow-growing chicken genotypes fed diets varying in protein-to-energy ratio 473
M. Zampiga, M. Petracci, R. Piscitelli, F. Volpe, F. Ceccaroni, F. Sirri

Feather's transcriptome analysis in local chickens fed with two different diets: a possible marker to study lipid metabolism 474
N. Stoppani, F. Raspa, E. Fiorilla, S. Maione, C. Mugnai, A. Schiavone, D. Soglia

Poster Session 36

Suitability of commercial crossbred dual-purpose male chicks for capon production 474
D. Murawska, M. Gesek, D. Witkowska, J. Błażej-Grabowska

Exploring the influence of alternative feed ingredients on meat production and quality in a slow-growing autochthonous chicken breed 475
M. Gariglio, E. E. Cappone, V. Bongiorno, C. Bianchi, V. Zambotto, A. Schiavone

Genetic characterization of Collo Nudo Italiana and Millefiori Piemontese chicken breeds through high-density SNP genotyping 475
F. Cendron, F. Perini, E. Lasagna, D. Soglia, A. Schiavone, M. Cassandro, M. Penasa

How does the diversification of farming methods in Europe influence the main indicators of the technological and sensory quality of chicken meat? 476
E. Baéza, M. Petracci, S. De Smet, R. Eppenstein, M. Bourin, A. Cartoni Mancinelli, E. Kowalski, C. Berri

Session 37. Rethink the transition from suckling to weaning to prevent negative consequences of the stress on pig health

Date: Monday 2 September 2024; 14:30 - 17:00

Chair: Trevisi / Chalvon-Demersay

Theatre Session 37

Getting weaned pigs off to a great start: What we have learned to reduce stress and improve performance 476

invited J. C. Woodworth, M. D. Tokach, R. D. Goodband, J. M. Derouchey, J. T. Gebhardt, K. N. Gaffield

Effects of early socialisation on growth, health and welfare of piglets raised on commercial farms 477
S. Gavaud, C. Perrier, A. Nalovic, J. Lion, A. Jahoui, V. Müller, D. Marchand, C. Belloc, B. Lieubeau, J. Hervé

Spray dried plasma improves piglets' performance and gut function in the first week post-weaning 477
Z. W. Ng'Ang'A, J. Tarradas, R. Beltrán-Debón, J. Polo, D. Torrallardona

Effects of maternal probiotic, and/or piglet dietary tryptophan supplementation pre-weaning, on gene expression in the pre-weaned pigs stomach 478
D. P. Kiernan, J. V. O'Doherty, M. Ryan, T. Sweeney

The leucine-derived gut microbiota metabolite isovalerate enhances the epithelial barrier function in cell monolayers derived from pig ileum organoids 478
M. Beaumont, C. Lencina, E. Jones, A. Simongiovanni, T. Chalvon-Demersay

The impacts of resistant potato starch and *Lactiplantibacillus plantarum* on growth and health of post-weaned pigs 479
K. R. Connolly, T. Sweeney, J. V. O'Doherty

Impact of Deoxynivalenol in a Nutritional Calcium Depletion and Repletion Protocol in Piglets 479
B. Sauvé, F. Guay, M. P. Létourneau-Montminy

Welfare is the best medicine: Management strategies to prepare piglets for weaning 480
invited L. Boyle

The effect of increased energy and amino acid levels in lactation diets on the performance of sows' piglets 480
S. Millet, S. Goethals

Conventional farrowing crates vs. Loose housed system. Effects on performances of sows and piglets 481
S. Querido, M. Parreiras, V. Pinheiro, D. Monteiro

Poster Session 37

Effects of uncutting piglets tails on tail biting 481
S. Querido, M. Vieira-Pinto, M. Parreiras, D. Monteiro

Session 38. Best-practice in addressing pig welfare on-farm

Date: Monday 2 September 2024; 14:30 - 17:00

Chair: Quinn / Nilsson

Theatre Session 38

- WelFarmers: The best practices in welfare for pigs 482
invited A. Quinn, P. Ferrari, J. Lorente
- Is it possible to end piglet castration forever? 482
invited L. Morgan
- The influence of fibre sources on tail damage in docked pigs 483
K. Plush, S. Small, S. Tritton, L. Staveley, R. Hewitt, E. Clayton, D. D'Souza
- Tail lesions monitoring in weaned undocked tail pigs 483
A. Zoratti, G. Chiarelli, A. Zuliani, M. Corazzin, E. Piasentier
- The effect of stocking density on performance, lesions and soiling 484
M. Aluwé, E. Kowalski, L. De Prekel, A. Van Den Broeke, S. Millet
- Effects of light spectrum on health and behaviour of growing-finishing pigs 484
A. Scaillierez, S. Van Nieuwamerongen-De Koning, I. Boumans, R. Van Der Tol, E. Bokkers
- Use of an outdoor run by group-housed sows in the mating area depending on weather conditions 485
S. Geisler, A. Van Asten, N. Kemper, I. Traulsen
- Study of the attractiveness and longevity of enrichment materials and wood species in a blocked farrowing house and a large gestation group setting 485
A. Poissonnet, L. Parra-Sourdeau, V. Courboulay
- Evaluating the impact of enrichment material in farrowing pens on sow and piglet performance 486
M. Cupido, S. Mullan, L. Boyle, K. O'Driscoll
- Positive effect of nesting material on crushing losses in free farrowing pens with short-term fixation 486
J. Wahmhoff, N. Kemper, A. Van Asten, I. Traulsen

Poster Session 38

- Can black soldier fly live larvae improve postweaned piglets' welfare? 487
S. Belperio, G. Martelli, M. Meneguz, E. Nannoni, D. Ventrella, N. I. Vannetti, N. Govoni, L. Sardi
- Effects of deck height during transport of weaners: in-vehicle conditions and clinical indicators 487
L. Foldager, K. Thodberg, G. Chen, J. K. Kristensen, L. D. Jensen, M. Kaiser, C. Kobek-Kjeldager, L. Rong, M. S. Herskin
- Determination of social interactions in a group of gestating sows based on location, posture and orientation 488
A. Blanc, M. De La Bourdonnaye, V. Courboulay, A. Poissonnet, N. Quiniou, J. Thomas, C. Gaillard
- Strategies for minimizing dust in straw-based-systems for pigs 488
I. Mösenbacher-Molterer, M. Kropsch, E. Zentner, B. Heidinger, C. Auinger

Session 39. Building quality into animal products to improve the sustainability of farming systems for the future

Date: Monday 2 September 2024; 14:30 - 17:15

Chair: Thenard / da Silva

Theatre Session 39

Building sustainable systems at the era of farm-to-fork and agroecology: Unraveling the interplay of quality attributes of animal-source foods 489

invited B. Lebret, M. Gagaoua, C. Van Baelen, S. Prache

Dairy Milk vs Plant-Based Milk Alternatives: Exploring Fat Nutritional Indices in Retail Products 489

G. Papatzimos, Z. Basdagianni, M. A. Karatzia, P. Mitliangi, E. Kasapidou

Case study of the market situation of calves from Alpine dairy farms and the effect of dams' grazing during the last three months of gestation on auction parameters 490

T. Zanon, L. Degano, M. Gauly, P. Sartor, G. Cozzi

Truly superior? Consumer ratings of meat from an endangered German pig breed 490

A. Olschewsky, D. Hinrichs, D. Mörlein

Informing about higher levels of animal welfare increases sensory consumer liking of pork 491

N. Gier, R. Harms, D. Moerlein

Implementing sustainability frameworks on product level- exploring the usability 491

A. Woodhouse, B. Aspehølen Åby, H. Fjerdingby Olsen

Economic sustainability and resilience of extensiveness in fattening pig farms 492

L. Giglio, P. Ferrari

Green willow biomass as feed source for pigs 492

A. G. Kongsted, S. Ugilt Larsen, L. Dinesen Jensen, K. Horsted, M. Eskildsen

Organic pig farming: from feeding strategy to meat organoleptic quality 493

C. Van Baelen, E. Vossen, L. Montagne, A. Prunier, S. De Smet, B. Lebret

Land use efficiency to protein production of French dairy cattle contrasted in their feeding systems 493

M. Allix, B. Rouillé, R. Baumont

Characterization of small egg producers in the O'Higgins region, Chile 494

P. Toro-Mujica, F. Gálvez, J. Aldana, P. Lisboa

Farm level economic effects of introducing forage crop silage in the feed regimen to fattening pigs 494

M. Presto Åkerfeldt, E. Owusu Sekyere, J. Friman, S. Zira, H. Hansson

Poster Session 39

Evaluation of milking attitude and milk quality in native Ciuta sheep breed 495

A. Lopez, B. Marcolli, M. Greco, S. Mattiello, V. M. Moretti, F. Bellagamba

Milk production in Rubia Gallega suckler cows: estimation methods and correlation with morphological and anatomical measurements 495

T. Moreno, C. Montes, S. Crecente

Total phenolic content and antioxidant profile – A comparative study between retail goat and cow milk <i>G. Papatzimos, P. Mitlianga, M. A. Karatzia, Z. Basdagianni, E. Kasapidou</i>	496
Valorisation of the triple attitude in Ciuta sheep through the characterization of productions: the VAL3CIUTA project <i>A. Lopez, V. M. Moretti, S. Mattiello, C. Mazzocchi, F. Bellagamba</i>	496
Dietary supplementation of orange peel ingredient in lactating ewes: effect on yoghurt physicochemical characteristics <i>E. Kasapidou, G. Papatzimos, P. Mitlianga, Z. Basdagianni, S. Mai, E. M. Barampouti, M. A. Karatzia</i>	497
Dietary supplementation of orange peel ingredient in lactating ewes: effect on yoghurt sensory characteristics <i>E. Kasapidou, P. Mitlianga, Z. Basdagianni, G. Papatzimos, S. Mai, E. M. Barampouti, M. A. Karatzia</i>	497
Discrimination of organic goat retail milk by fatty acid biomarkers <i>E. Kasapidou, P. Mitlianga, G. Papatzimos, Z. Basdagianni, M. A. Karatzia</i>	498
Application of NIR spectroscopy coupled with DA-PCA for the authentication of lamb meat <i>S. Parrini, M. C. Fabbri, A. Croveti, C. Aquilani, C. Pugliese, R. Bozzi</i>	498
Characterization and typology of egg consumers in the Central zone of Chile <i>P. Toro-Mujica, F. Gálvez, J. Aldana</i>	499
The effect of gender on meat quality of the longissimus lumborum muscle in growing-finishing pigs <i>K. Dobiesz, W. Kozera, U. Czarnik, A. Okorski, G. Żak, M. Dąbrowski, Ł. Zielonka, K. Karpiesiuk</i>	499
Effect of sex on the quality and fatty acid profile of the longis muscle in danbred hybrid pigs <i>K. Dobiesz, W. Kozera, A. Okorski, G. Żak, J. Krzysztoń, K. Karpiesiuk</i>	500
Comparison of the slaughter weight, slaughter characteristics and carcass composition of South African Boer Goats and Dohne Merino sheep <i>T. Brand, J. Van Der Westhuizen, R. Swart, P. Strydom, B. Van Zyl</i>	500
Beef × dairy crossbreeding in mountain farms: major effects on carcass weight and retail cuts <i>N. Amalfitano, M. Berton, I. Bazzoli, G. Bittante, L. Gallo, E. Sturaro</i>	501
Rheological and protein thermal denaturation properties of eggs from different farming systems <i>K. Kotsiou, C. Mouzakitis, A. Lazaridou, C. Biliaderis, I. Stavropoulos, N. Van Leuffen, J. Smits, Z. Basdagianni, I. Bossis</i>	501

Session 40. Zooarchaeological research lessons for contemporary livestock management, conservation and genetics

Date: Monday 2 September 2024; 14:30 - 16:45

Chair: Pouloupoulou / Rahmatalla

Theatre Session 40

Some genomic insights into the spatio-temporal dynamics of domestication and dispersal of sheep <i>invited I. Medugorac, J. Peters</i>	502
What does the past tell us about the future – examinations of remains from domestic livestock <i>R. Schafberg</i>	502

From Wild to Tamed and Back: demographic reconstruction of Sardinian sheep from whole-genome sequences	503
<i>V. Florida, M. Dehasque, P. Morell Miranda, P. Mereu, M. Pirastru, N. Columbano, S. Naitana, G. G. Leoni, T. Günther, M. Barbato</i>	
Differential trajectories of the annual reproductive cycle in sheep and cattle from Neolithic to modern times	503
<i>M. Balasse, P. Chemineau, A. Sierra, E. Gutierrez, P. Pignaut, L. Garbé, M. Brummelhuis, S. Bréhard, S. Michalopoulou, L. Gourichon, D. Binder, J. Guilaine, M. Ivanova, U. Leuzinger, C. Manen, M. Keller</i>	
African indigenous cattle genealogy revealed by whole-genome tree sequences	504
<i>I. Houaga, G. Mafra Fortuna, J. Obsteter, S. Kambal, A. Tijjani, O. Hanotte, I. Pocrnic, G. Gorjanc</i>	
Unravelling the genetic diversity among Nubian, Old English, and Anglo-Nubian goat breeds	504
<i>S. Rahmatalla, G. Neumann, D. Arends, P. Korcuć, G. Tarekegn, S. Gaouar, H. Abdel-Shafy, J. Conington, M. Reissmann, M. Nassar, G. Brockmann</i>	
Genetic diversity of eight local Belgian sheep breeds using pedigree and SNP data	505
<i>N. Aerts, R. Meyermans, W. Gorssen, L. Chapard, K. Hooyberghs, N. Buys, S. Janssens</i>	
Integrating zooarchaeological, historical and genomic data to explore potentials for conserving the indigenous cattle breed of Cyprus	505
<i>A. Spyrou, G. Hadjipavlou, A. C. Dimitriou, D. G. Bradley</i>	
Evolution of genetic parameters for production traits and conception rate in the Dutch Holstein population	506
<i>J. Vandenplas, Y. Wientjes, P. Bijma, M. Schrauf, M. Van Pelt</i>	
Genetic diversity and population structure of the endangered Tanzanian Mpwapwa cattle breed	506
<i>I. Houaga, Z. Nziku, A. Nguluma, G. Msuta, O. Opoola, M. Okeyo, R. Mrode, A. Djikeng, G. Gorjanc, C. M. Rochus</i>	
Poster Session 40	
Genomic analysis of Greek mouflon	507
<i>E. Tarsani, S. Katsipodas, I. Hadjigeorgiou, A. Kominakis</i>	
Morphostructural and phaneroptic variability of creole goats in the Southern Highlands of Peru	507
<i>E. A. Sessarego, F. C. Trillo, D. J. Godoy, J. A. Cruz</i>	
Genetic analysis of Mediterranean wild rabbit populations (<i>Oryctolagus cuniculus</i>) using whole genome sequencing data	508
<i>A. Kominakis, J. M. Alves, I. Hadjigeorgiou</i>	
Session 41. Optimising reproductive physiology of livestock	
Date: Monday 2 September 2024; 14:30 - 15:15	
Chair: Kenny / Randi	
Theatre Session 41	
Estimated output from assisted reproductive techniques (OPU/IVF) in Holstein cattle associated with the genetic background	508
<i>F. Guillaume, S. Brard-Fudulea, B. Desnoues, H. Grothmann, S. Meier</i>	

Effects of moderate exercise regimen on reproductive development of replacement beef heifers reared in drylots at a high stocking density <i>R. Cooke, F. Cooke, S. Mackey, A. Pickett, K. Harvey</i>	509
Seminal cytokine profiles as markers of bovine sperm quality <i>J. Statham, N. Gahir, K. Burton, C. Freer, G. Mappa, C. Smalley, A. Lancaster, N. Orsi</i>	509
From womb to bloom: conception, early life and maternal effects on boar semen production <i>P. Sá, R. M. Godinho, M. Gòdia, C. A. Sevillano, B. Harlizius, O. Madsen, H. Bovenhuis</i>	510
Effect of grazing pastures with rich tannin legumes on ovarian activity in suckling anoestrous beef cows <i>G. Quintans, M. Lema, G. Fernandez-Turren, G. Banchemo</i>	510
Relationship between sperm DNA fragmentation, semen quality and serum mineral concentration of bulls <i>A. Benito-Diaz, A. Sarmiento-García, M. Montañes-Foz, R. Bodas-Rodríguez, J. J. García-García, P. Vicente-Galindo</i>	511
Genomics of boar semen quality traits in U.S. Large White and Duroc breeds <i>M. Terribile, G. Visentin, A. Costa, D. Bucci, Y. Huang, J. Jiang, F. Tiezzi, C. Maltecca</i>	511
Poster Session 41	
Effects of prolactin on serum hormones and related genes of ewes in the estrus cycle <i>S. Yue, R. Yang, Y. Liu, Y. Zhang</i>	512
Effect of storage time in epididymis at 5°C on motility, viability and morphology of spermatozoa of European red deer (<i>Cervus elaphus elaphus</i>) <i>A. Dziekońska, N. M. Neuman, M. Koziorowska-Gilun, P. Gilun</i>	512
Effect of oxidative stress on reproduction of dairy cattle <i>J. Sekaninová, M. Janků, L. Luhová, M. Petřivalský, J. Bezdíček, J. Ducháček, L. Stádník</i>	513
The effect of adding penicillin on the quality of pig semen <i>T. Sitorus, A. Tarigan</i>	513
Correlated response to divergent selection for litter size variability in rabbits' semen quality <i>D. Serrano-Jara, M. J. Argente, M. D. L. L. García</i>	514
Reproductive tract morphology and symmetry of farmed common eland (<i>Tragelaphus oryx</i>) bulls, and their relationship with secondary sexual traits and social rank <i>J. Consolacion, F. Ceacero, A. S. Musa, V. Ny, R. Kotrba, J. Illek, M. Škorič, T. Needham</i>	514
Effect of food restriction on rabbit ovarian functions <i>I. Hadjadj, Z. Fabova, M. D. L. L. García, B. Loncova, M. Morovic, D. Serrano-Jara, P. Makovicky, M. J. Argente, A. V. Sirotkin</i>	515
Camelina sativa L cake as a source of n-3 fatty acids does not affect the reproductive traits of HF heifers <i>R. Poplawski, K. Szkudelska, M. Pszczola, M. Murawski, D. Fabian, B. Nowak, P. Sidoruk, P. Kolodziejski, D. Lechniak-Cieslak</i>	515
Implementation of an Artificial Intelligence system for morphological evaluation of spermatozoa in routine bull semen analysis <i>S. Urlí, F. Corte Pause, T. Dreossi, G. Stradaoli</i>	516
Combined transcriptome analysis reveals the effect of prolactin inhibition on epididymal function in cashmere goats <i>X. Liu, Y. Liu, Y. Zhang</i>	516

Morphometric study of the goat cervix during stages of natural estrus cycle <i>S. Kanthawat, F. Thatsanabunjong, P. Raksaseri, S. Panyaboriban, S. Srisuwatanasagul</i>	517
Timing of Pregnancy Loss in Lactating Holstein Cows <i>P. Carvalho, V. Santos, S. Priskas, V. Papanikolopoulou, C. Maia, A. Souza, G. Arsenos</i>	517

Session 42. Digital technologies for management

Date: Monday 2 September 2024; 14:30 - 17:00

Chair: Morgan-Davies / Gautier

Theatre Session 42

The impact of virtual fence on cattle's learning curve over several weeks with multiple borders <i>L. Wahlund, P. Nielsen, A. Jansson, L. Rönnegård</i>	518
Virtual and electrical fences – perspectives from a survey for cattle farmers in Norway and Sweden <i>F. Petters, P. P. Nielsen, L. Wahlund</i>	518
Drone RGB Image-Derived Vegetation Indices to Predict Yield in Humidicola (<i>Brachiaria humidicola</i>) Grass <i>A. Astillero, E. C. Lin</i>	519
Advancing Agricultural Efficiency: Unmanned Aircraft Vehicle in Soil and Pasture Management <i>G. Menezes, A. Franco, J. Dorea</i>	519
Can we use open data to track grazing intensity? <i>E. Padrón-Tejera, M. J. García-García, D. C. Pérez-Marín, F. Aranda-Viana, F. Maroto-Molina</i>	520
Digital ear tags in remote monitoring – exploring new (ab)use cases <i>K. Ueda, A. Ingham, G. Bishop-Hurley, S. Rieder</i>	520
Tracking bull reproductive dominance by measuring male-female interactions using Bluetooth Low Energy <i>M. J. García García, E. Padrón Tejera, D. C. Pérez Marín, F. Maroto Molina</i>	521
Improving animal health and welfare by using sensor data in herd management and dairy cattle breeding – a joint initiative of ICAR and IDF <i>C. Egger-Danner, I. Klaas, L. Brito, K. Schodl, J. Bewley, V. Cabrera, N. Charfeddine, N. Gengler, M. Haskell, B. Heringstad, M. Hostens, M. Iwersen, R. Linde, K. Stock, A. Stygar, E. Vasseur</i>	521
TechCare: Technologies to manage the welfare of sheep and goats – from pilots to large-scale studies <i>C. Morgan-Davies, G. Tesniere, C. M. Dwyer, G. Jorgensen, E. Gonzalez-Garcia, J. M. Gautier, L. Grova, M. Decandia, F. Kenyon, G. Caja Lopez, I. Halachmi, A. Godo, E. Sossidou, S. Patsios, L. T. Csiszter, T. W. Keady, B. Mcclearn, G. Lagriffoul, N. Litalien, L. Riaguas</i>	522
Transferring a 3D imaging POC to beef cattle breeding stakeholders to do on-farm high-throughput phenotyping: the PHENO3D example <i>A. Lebreton, C. Gillé-Perrier, L. Delattre, C. Allain, M. Bruyas</i>	522
Guideline to validate sensor output of animal-based measurements <i>J. Maselyne, A. Stygar, M. Pastell, Q. Allueva Molina, A. Ramon Pérez, P. Llonch, H. L. Ko</i>	523

AgrifoodTEF's pioneering EU service provider from research to industry for the development of Artificial Intelligence and robotic solutions 523
Z. Guy, J. M. Gautier, J. Contreras

Poster Session 42

Innovative Orchestration in Sheep Farming-IOSheep 4.0: Ensuring complete welfare, ecofriendly, quality and traceability of lambs 524
B. Odevci, E. Emsen

The current use and demand for tracking systems on German grazing cattle farms 524
J. Maxa, S. Thurner

Veterinarians' perceptions on Precision Livestock Farming application in pig health management 525
L. Dieste-Pérez, X. Zhou, B. Garcia-Morante, A. Burrell, K. Eenink, C. Correia-Gomes, J. Segalés, M. Sibila, T. Tobias, C. Vilalta, A. Bearth

Optimizing Low-Frequency Ultrasound for Enhanced Sow Pregnancy Diagnosis Using Vision Transformer-High (ViT-H) Approach 525
T. K. Kim, Y. H. Choi, J. S. Hong, H. J. Park, J. E. Kim, Y. D. Jeong, C. H. Kim, S. H. Back, S. J. Sa, J. H. Lee, J. S. Kim, H. C. Cho

Predicting the botanical composition of pastures using Near Infrared Spectroscopy 526
C. Reyes-Palomo, S. Gil-Domínguez, S. Sanz-Fernández, C. Díaz-Gaona, P. Rodríguez-Hernández, V. Rodríguez-Estévez, N. Núñez-Sánchez

Session 43. Digital phenotyping, sensors, 'omics' and genetics in enhanced sustainability

Date: Tuesday 3 September 2024; 8:30 - 12:15

Chair: Egger-Danner / Lebreton

Theatre Session 43

Genomic selection in the era of digital phenotyping 526
invited D. Lourenco, M. Bermann, M. K. Hollifield, M. Billah, C. Y. Chen, E. Psota, J. Holl, S. Tsuruta, I. Misztal

Comparison of the potential of cow-side blood tests, MIR spectra and wearable sensor devices for breeding for metabolic health in dairy cows 527
K. Schodl, B. Fuerst-Waltl, D4Dairy Consortium, C. Egger-Danner

Can daily rumination time be used to breed for resilient Holstein cows? 527
W. Lou, B. Ducro, A. Van Der Linden, Y. Wang

Use of machine learning methods to predict feed efficiency traits in dairy cows using phenotypic and genomic information 528
A. Seidel, L. Stahmer, G. Thaller

Comparison of methods to identify resilience indicator phenotypes using across lactation robot milk yield dynamics in the Nordic Red cows 528
A. Kavliak, E. Negussie, M. Lidauer, M. Pastell

Genetic correlation between residual feed intake and easily measurable plasma parameters in early-fattening young bulls <i>S. Taussat, H. Aboshady, P. Martin, G. Cantalapiedra-Hijar</i>	529
Genetic parameters for novel climatic resilience indicators derived from automatically-recorded vaginal temperature in lactating sows under heat stress conditions <i>L. F. Brito, H. Wen</i>	529
The relationship between microbial composition and feed efficiency in Iberian pigs <i>P. Nuñez, C. Casto-Rebollo, S. Negro, J. Casellas, L. Varona, R. Pena, N. Ibáñez-Escriche</i>	530
Machine learning approaches for classifying the Iberian pig strains based on microbiome <i>L. Azougagh, C. Casto-Rebollo, L. Varona, J. Casellas, S. Negro, M. Martínez-Álvaro, N. Ibáñez-Escriche</i>	530
In-abattoir 3D measurements of beef carcasses for the prediction of saleable meat yield and novel carcass traits <i>H. Nisbet, N. Lambe, G. Miller, A. Doeschl-Wilson, D. Barclay, A. Wheaton, C. A. Duthie</i>	531
Pixels to feed: Digital phenotyping potential for genetic analysis of feed intake and efficiency in Atlantic salmon <i>A. Ahmad, A. Sonesson, B. Hatlen, G. Bæverfjord, P. Berg, A. Norris, G. Difford</i>	531
Genotype-by-environment interaction with high-dimensional environmental data: an example in pigs <i>F. Bussiman, D. Lourenco, C. Y. Chen, J. Holl, I. Misztal, Z. G. Vitezica</i>	532
Poster Session 43	
Association analysis of daily rumination time with hindgut microbiota and metabolites in dairy cows <i>H. Lu, F. Li, Y. Wang</i>	532
Sensitive pathogens detection using nanozyme-based catalysis amplification on Ag-PSi SERS scaffold <i>G. Shtenberg, N. R Nirala</i>	533
Usability of raw phenotypic data in selective breeding of dairy cattle on health traits in Slovakia <i>M. Chalupková, N. Moravčíková, A. Halvonik, J. Candrák, L. Zavadilová, R. Kasarda</i>	533
Machine learning and parametric methods for genomic prediction of feed efficiency-related traits <i>L. F. M. Mota, L. M. Arikawa, S. W. Boer, M. E. Z. Mercadante, J. N. S. G. Cyrillo, H. N. Oliveira, L. G. Albuquerque</i>	534
Prediction of blood β -hydroxybutyrate and hyperketonemia based on milk mid-infrared spectra in dairy cows <i>S. Gruber, A. Köck, C. Egger-Danner, M. Iwersen, B. Fuerst-Waltl, J. Sölkner</i>	534
Dissecting production traits using metabolomics in pigs <i>S. Bovo, G. Schiavo, F. Bertolini, M. Bolner, M. Cappelloni, M. Gallo, P. Zambonelli, S. Dall'Olio, L. Fontanesi</i>	535
Longitudinal feed intake deviations at the pen level as a resilience indicator for pigs <i>W. Gorssen, C. Winters, R. Meyermans, L. Chapard, K. Hooyberghs, J. Depuydt, S. Janssens, N. Buys</i>	535
Genetic analysis of milk FTIR spectra in Italian Simmental Cattle <i>R. Negri, G. Gaspa, L. Degano, D. Vicario, A. Cesarani, N. P. P. Macciotta</i>	536
Prediction of nutritional content of black soldier fly (BSF) larvae using multispectral imaging <i>G. Gebreyesus, K. Jensen, A. Luca</i>	536

Comprehensive analysis of whole-transcriptome and metabolome provides insights into estrus expression in Holstein cattle <i>T. Yang, Y. Chang, Y. Wang</i>	537
Unraveling metabolic stress response in dairy cows: genetic control of plasma biomarkers throughout lactation and the transition period <i>M. M. Passamonti, M. Milanese, L. Cattaneo, J. Ramirez Diaz, A. Stella, M. Barbato, C. Urbano Braz, R. Negrini, D. Giannuzzi, S. Pegolo, A. Cecchinato, E. Trevisi, J. L. Williams, P. Ajmone Marsan</i>	537
Phenotyping tools and data collection for the agroecological transition <i>G. Pairault, C. Allain, R. Baumont, Y. Billon, S. Brard-Fudulea, M. Brochard, B. Dumon-Saint-Priest, N. Gaudillière, L. Griffon, L. Journaux, J. Magadray, T. Morin, M. Tabouret, M. Sourdioux, A. Travel, J. P. Bidanel</i>	538
Blood metabolic biomarkers predicted from milk spectra are heritable in Holstein transition cows <i>S. Magro, A. Costa, R. Finocchiaro, M. Marusi, M. Cassandro, M. De Marchi</i>	538
Evaluating the Efficiency of Phenomic Selection in Dairy Cattle <i>E. O. Odah, M. P. Sanchez, B. Cuyabano, P. Croiseau</i>	539
Genomic evaluation of SA Holsteins incorporating local and foreign genetic markers under two production systems <i>M. Van Niekerk, E. D. Cason, F. W. C. Naser, J. B. Van Wyk, V. Ducrocq</i>	539
Evaluation of muscle transcriptome of beef cattle after intramuscular application of vitamin A <i>W. Baldassini, C. Costa, M. Tagiariolli, L. Camargo, R. Curi, G. Pereira, G. Ramírez-Zamudio, O. Machado Neto, M. Ladeira, L. A. Chardulo</i>	540

Session 44. Genetics of food quality

Date: Tuesday 3 September 2024; 8:30 - 12:30

Chair: Schiavo / Pocrnic

Theatre Session 44

Deciphering the Genomic Architecture of Intramuscular and Subcutaneous Fat Composition in Iberian Pigs <i>C. Hervás-Rivero, H. Srihi, D. López-Carbonell, J. Casellas, N. Ibáñez-Escriche, S. Negro, L. Varona</i>	540
Single marker and haplotype-based GWAS for meat quality and carcass traits in Italian heavy pigs <i>P. Zambonelli, S. Bovo, G. Schiavo, M. Ballan, J. Vegni, F. Bertolini, A. Ribani, V. Taurisano, M. Gallo, M. Zappaterra, S. Dall'Olio, L. Fontanesi</i>	541
A promising genetic background of pork hemorrhages occurring at slaughter <i>J. Gelhausen, T. Friehs, J. Knöll, I. Wilk, D. Mörlein, J. Tetens</i>	541
Characterization of the relationship between olfactory perception and quantified compounds as phenotypes for genetic selection against boar taint using a recursive model <i>A. Markey, C. Große-Brinkhaus, D. Mörlein, E. Tholen, N. Gengler</i>	542
The effect of myostatin gene mutation on productive traits in Marchigiana young bulls in performance test <i>D. Colombi, F. Perini, V. Polifroni, F. Sbarra, A. Quaglia, E. Lasagna</i>	542

Genetic parameters, genome-wide associations and single-gene effects for intramuscular fat content in a local dual-purpose cattle breed <i>I. Giambra, S. König, M. Bohlouli, K. Halli</i>	543
Genotype by management-system interaction on origin group of milk fatty acids in Holsteins <i>Y. Masuda, N. Yamamoto, D. A. L. Lourenco, S. Tsuruta, I. Misztal</i>	543
Investigating the effect of animal genotype on milk fat production in grazing dairy cows <i>C. Heffernan, R. Fitzgerald, J. A. O'Mahony, T. O'Callaghan, M. Dineen</i>	544
Colostrum yield is heritable and genetically correlated with immunoglobulins concentration in Holstein cows <i>A. Goi, M. De Marchi, M. Cassandro, R. Finocchiaro, M. Marusi, A. Costa</i>	544
Heritability of traditional milk coagulation properties in Manchega dairy sheep <i>I. Heddi, A. Garzón, R. Arias, L. Jiménez, A. Cecchinato, N. Amalfitano, J. Caballero-Villalobos, M. Ramon</i>	545
Effect of protein polymorphisms on milk composition, coagulation properties, and protein profile in dairy sheep <i>A. C. Marshall, V. Vigolo, M. De Marchi, N. Lopez-Villalobos, S. M Loveday, M. Weeks, W. Mcnabb</i>	545
Heritability of milk Fourier transform infrared spectra in sheep <i>S. Casu, M. G. Usai, S. Salaris, M. Caredda, M. Addis, A. Carta</i>	546
The genetic background of goat milk oligosaccharides content <i>R. Gonzalez-Prendes, R. Crooijmans, B. Dibbits, K. Laport, S. Breunig, P. Keijzer, L. Pellis, H. Bovenhuis</i>	546
Uncovering environmental effects and genetic parameters on the mineral composition of sheep milk <i>J. Ramírez-Díaz, G. Stocco, C. Cipolat-Gotet, M. Ablondi, A. Summer, A. Negro, A. Lotto, S. Blotta, F. Tiezzi, S. Biffani</i>	547

Poster Session 44

Molecular detection for <i>Coxiella burnetii</i> in bovine milk collected from bulk tank of small dairy farms in São Paulo, Brazil <i>S. Lucheis, T. Bertozzo, A. Paes, A. Flaminio, A. Valim, A. Bertolini, I. Aires, S. Manzini, M. Mioni, V. Pereira, M. Medeiros</i>	547
Single-step genomic prediction for live animal ultrasound measures of carcass traits in Czech Aberdeen Angus <i>Z. Veselá, M. Brzáková, A. Novotná, L. Vostrý</i>	548
Evaluation of texture properties and consumer perception of pork from high-marbled Duroc leptin receptor genotypes <i>R. Suárez-Mesa, L. Salvia-Trujillo, R. Soliva-Fortuny, J. Estany</i>	548

Session 45. Indicators, hi-tech solutions, and tools to effectively manage cattle

Date: Tuesday 3 September 2024; 8:30 - 12:15

Chair: Aernouts

Theatre Session 45

Estimation of individual CH ₄ emissions using fecal near infrared spectra for young, dairy and beef cattle <i>A. Vanlierde, C. Martin, A. Mertens, N. Lorant, L. Le Gall, I. Morel, G. Renand, Y. Rochette, F. Picard, F. Dehareng, D. Andueza</i>	549
--	-----

Learning behavior of dairy cows in automatic milking systems <i>J. Stuhlträger, F. Rosner, S. König, K. May, L. Behren, L. Breitmeier, H. H. Swalve</i>	549
Identification of SNPs affecting conformation traits of dairy cows <i>M. Kolenda, M. Gozdek, D. Piwczyński, B. Sitkowska</i>	550
Optimize the individual insemination strategy in extended lactations of dairy cattle using a neural net to predict phenotypic lactation curves <i>L. Polman, J. Wabbersen, J. Braunleder, S. Schierenbeck, R. Reents</i>	550
Real-Time Milk Yield Prediction and Health Monitoring System for Dairy Cows <i>M. J. Gote, D. Meuwissen, L. D'Anvers, I. Adriaens, B. Aernouts</i>	551
Modern Genetic Evaluation Systems: A Python-Based Programming Approach <i>K. Lee, R. Ventura, F. Schenkel, G. Vandervoort, A. Cánovas</i>	551
Immunomodulatory effect of small extracellular vesicles from the plasma of heat-stressed cows on bovine immune cells <i>L. G. De Matos, G. Salvi, Y. Dadi, F. Ceciliani, V. Martini, A. Agazzi, A. Maggolino, P. Depalo, C. Lecchi</i>	552
Coupling remote sensing techniques and Virtual Fencing in Alpine dairy production system: enhancing livestock management and environmental conservation <i>A. Confessore, C. Aquilani, L. De Guttry, N. Staglianò, G. Argenti, C. Dibari, E. Simonetti, F. Sirtori, C. Pugliese</i>	552
The confidence ratio: an approach to calculate the confidential learning of the virtual fencing system <i>D. Hamidi, N. A. Grinnell, M. Komainda, L. Wilms, F. Riesch, J. Horn, M. Hamidi, I. Traulsen, J. Isselstein</i>	553
Effectiveness of energy dispersive X-ray fluorescence (ED-XRF) for the prediction of mineral elements in individual cow urine <i>E. Visentin, M. Pozza, A. Guerra, S. Sabbadin, G. Niero, S. Magro, M. De Marchi</i>	553
Effects of unplanned regrouping on activity, feed intake and milk yield of dairy cows <i>T. Wilder, P. Hasenpusch, A. Seidel, G. Thaller, J. Krieter</i>	554
Insights into monitoring livestock on the move <i>T. Collins, E. Dunston-Clarke, E. Schoonens, R. O'reilly, E. Taylor, L. Pannier, A. Barnes</i>	554
Development of a multidimensional and customizable decision support tool for dairy culling management <i>H. Simon, E. Reding, C. Grelet, M. N. Tran, C. Wallesmart, F. Dehareng</i>	555
Poster Session 45	
Genetic correlations between udder conformation and milking traits of Holstein-Friesian cows milked by milking robots <i>K. Siatka, M. Kolenda, G. A. Iwuchukwu, D. Piwczyński, B. Sitkowska</i>	555
The effects of bed cleanliness on the lying postures of Japanese Black fattening cattle <i>S. Dan (Tan), H. Kato, T. Nakayama, T. Chiba, M. Fukasawa</i>	556
Studies on in vitro Embryo Splitting as a method for Sex-Selective Production of cattle <i>S. Y. Lee, Y. G. Ko, S. R. Cho, M. R. Park, S. M. Ha, N. T. Kim</i>	556
Effect of Milking pulsators efficiency on Udder Health <i>L. Pascarella, S. Biffani, M. Fioretti, C. Melilli, F. Luisi, R. Negrini</i>	557
Genetic identification to ensure blockchain-based traceability in beef supply chain <i>S. Vouraki, V. Papanikolopoulou, F. Fotiadou, G. Batikas, T. Kallitsis, M. J. Arrizubieta, T. Dimitraki, G. Arsenos</i>	557

Automated measurement of milk yield in suckler cows <i>B. Sepchat, M. Barbet</i>	558
Behaviour and welfare monitoring of cattle using computer vision and machine learning <i>B. Aernouts, M. Perneel, I. Adriaens, J. Verwaeren</i>	558
Climate change indicators as proxy for economic efficiency of dairy farming <i>M. D. G. Azzena, D. Zaccari, S. Curreli, A. Cannas, A. S. Atzori</i>	559
Effects of an automatic feeding system on Swiss dairy farms <i>K. Kamber, A. Burren, M. Schwager, C. Giger, S. Probst</i>	559

Session 46. Viable future dairy farming systems and products from production, feeding, environmental and consumer viewpoint, Part 1

Date: Tuesday 3 September 2024; 8:30 - 12:30

Chair: Galama / Brocard

Theatre Session 46

R4D project - 100 best practices for resilient dairy farming in Europe <i>invited E. Castellan, J. Fagon, S. Debevere, N. Browne, F. Launay</i>	560
Resilient future dairy farming systems <i>invited J. Roche</i>	560
Towards future sustainable dairy farming systems: An integrated, adapted and circular approach <i>invited X. Díaz De Otálora, A. Wilfart, J. Fratzak-Müller, L. Balaine, G. Ragaglini, F. Dragoni, B. Amon</i>	561
Perspectives on further integration of dairy and arable crop production <i>G. Van Duinkerken</i>	561
Farmer logics – motivations and driving forces influencing a sustainable and resilient Swedish dairy production <i>invited U. Nordling, S. Widgren, N. Lind, L. Ekman</i>	562
True Cost Accounting for sustainable livestock production <i>C. Van Wagenberg, M. Van Galen, L. Vissers, F. Bunte</i>	562
Evaluation of the environmental efficiency of innovative dairy cattle housing and management systems in Germany <i>J. Drews, I. Edebohls, C. Deblitz, A. Roemer, P. Sanftleben</i>	563
Environmental challenges with intensive dairy production <i>P. Galama, A. Kuipers</i>	563
Dear Dairy, is it love or is it over? Australian public attitudes to the dairy industry <i>S. Bolton, B. Vandresen, M. Von Keyserlingk</i>	564

Session 47. Nutrition management to reduce methane emission and environmental impact, Part 2

Date: Tuesday 3 September 2024; 8:30 - 11:45

Chair: Bruggeman / Pinotti

Theatre Session 47

Effects of hydrolysable tannin metabolites on rumen microbiota and enteric methane production 564
M. Manoni, F. Gschwend, S. Amelchanka, M. Terranova, L. Pinotti, F. Widmer, P. Silacci, M. Tretola

Assessing the potential of six plants from Auvergne region to reduce in vivo methane emissions and nitrogen excretion by dairy cows 565
M. Bouhafs, F. Anglard, F. Fournier, S. Guillaume, T. Chabrilat, S. Kerros, D. Macheboeuf, C. Martin

Development, in-vitro and in-vivo assessment of novel feed additives to reduce enteric ruminant methane emissions 565
A. Graham, C. Thorn, C. O'Donnell, M. Mcdonagh, S. Nolan, S. F. Kirwan, S. O'Connor, C. O. Nzetue, A. C. V. Montoya, A. Bartle, A. Hall, S. M. Waters, V. O'Flaherty

The effect of an essential oil blend on performance, feed efficiency, methane emission and rumen microbiome in lactating dairy cows 566
C. F. Børsting, S. J. Noel, S. Lashkari, A. L. F. Hellwing

Does processing of the straw have an effect on methane production from feedlot beef cattle? 566
A. Arbaoui, G. Gonzalo, A. Belanche, A. De Vega

Effect of prickly pear (*Opuntia ficus-indica*) in diets on growth performance and methane emissions of yearling male Pedi goats 567
T. T. Magonyane, J. W. Ng'Ambi, M. Mabelebele, T. G. Manyelo

Effects on methane emissions and growth performance in beef cattle supplemented with oil macerate of *Asparagopsis taxiformis* 567
D. M. Soares, I. Gama, N. Rodrigues, A. Oliveira, H. Ramos, G. M. Marques, J. Santos-Silva, R. J. B Bessa, T. Domingos

Impact of fucosidase on pig growth performance and enteric methane production 568
D. Georgaki, M. E. Van Der Heide, L. Foldager, C. Poulsen, D. Velayudhan, J. Værum Nørgaard, N. Canibe, . Højberg

Nitrogen use efficiency from beef fed different protein sources and a forage-based diet 568
C. Christodoulou, K. E. Kliem, M. D. Auffret, D. J. Humphries, J. R. Newbold, N. Davison, P. Kirton, L. Smith, S. Stergiadis

Effect of alpine plant species on in vitro ruminal fermentation characteristics 569
A. Cabbia, A. Romanzin, M. Braidot, M. Spanghero

Replacement of total mixed ration with fresh alfalfa on productive performance, nutrient utilization, ruminal environment, and methane emissions of dairy cows 569
G. Fernández-Turren, J. L. Repetto, P. Veliz, J. Montini, J. Bigot, D. Fontes, C. Simon, J. Mariotta, V. Ciganda, C. Cajarville

Poster Session 47

Enteric methane and digestibility: are these phenotypes correlated in dairy cows? 570
G. Giagnoni, W. Wang, M. Maigaard, M. Johansen, P. Lund, M. Riis Weisbjerg

Herd-level greenhouse gas emissions of dairy rations optimized for reduced carbon footprint <i>M. Managos, U. Sonesson, C. Lindahl, S. Agenäs, M. Lindberg</i>	570
How much of the between-cow variation in enteric methane production can performance and digestibility measures explain <i>G. Giagnoni, W. Wang, M. Maigaard, M. Johansen, P. Lund, M. Riis Weisbjerg</i>	571
Development of an Effective Microbial Agent Utilizing Beneficial Microorganisms for Odor Reduction and its On-Site Evaluation in Pig Farms <i>Y. J. No, Y. S. Choi, M. R. Lee</i>	571
Effect of a molasses based liquid feed on diet digestibility, volatile fatty acid production and methane emissions in lactating dairy cows <i>G. Chapman, P. Holder, D. Humphries</i>	572
Dose effects of feed supplemented calcium peroxide as a methane inhibitor on feed intake and digestibility in beef cattle <i>A. Graham, S. Kirwan, A. Bartle, C. Thorn, M. Mcdonagh, A. C. V. Montoya, A. Hall, S. M. Waters, V. O'Flaherty</i>	572
Development of an odor-reducing probiotic Bacillus strains isolated from swine feces and Korean fermented soybean pastes <i>Y. J. No, M. R. Lee</i>	573
The updated FEEDAP Guidance on the assessment of efficacy of feed additives: additives which favourably affect the environmental consequences of animal production <i>J. Ortuño, J. Galobart, M. Innocenti, A. Navarro-Villa</i>	573
A review of dairy production performance on different methane reducing dietary treatments: 3-NOP, nitrate, linseed and rapeseed <i>J. Vandicke, J. Van Mullem, N. Peiren, S. De Campeneere, L. Vandaele</i>	574
Effects of Anavrin® on dry matter intake, ruminal environment, and methane emissions of finishing steers <i>J. Montini, A. Santana, G. Fernández-Turren, J. Bigot, C. Cajarville, J. L. Repetto, J. Gere</i>	574
Substitution of soybean meal with rapeseed meal decreases the ratio of urinary to fecal nitrogen excretion in growing pigs <i>I. Kaikat, L. Piquer, A. Cerisuelo, E. López, J. F. Pérez</i>	575
Reduction of CH ₄ production in ruminants using encapsulated feed additives in vitro <i>L. G. De Matos, N. Merino, I. Mateos, A. Martin, C. Saro, M. J. Ranilla, E. Bacchin, M. Perissinoto, M. Lorenzon, Y. Dadi, C. Lecchi, F. Cecilian</i>	575
Do cows visit the GreenFeeder randomly? <i>A. L. F. Hellwing, C. F. Børsting</i>	576
Effect of pastures with rich tannin legumes on ruminal environment and methane emissions of beef cattle <i>G. Fernandez-Turren, M. Lema, G. Banchoero, G. Quintans</i>	576
Effects of biochar in lactating dairy cows diet <i>M. Dittmann, C. Baki, M. Terranova, S. Amelchanka, S. Dubois, A. Wiget, F. Leiber, H. Krause, S. Baumann</i>	577
Metabolomic Approach for the Quality Assessment of <i>Ulva australis</i> as a Promising Feed Supplement for Reduction of Methane Emission in Livestock <i>H. Hyeon, E. B. Jang, M. Kwon, D. J. Oh, E. Kim, W. J. Yoon</i>	577

Exploring Microbial Community Dynamics in Cow Gastric Juice with Seaweed-Enhanced Feed: Implications for Methane Reduction Strategies <i>Y. H. Jo, M. R. Kang, E. Kim, W. J. Yoon</i>	578
Evaluating the potential of 3-nitrooxypropanol to reduce enteric methane emissions of autumn-calving cows <i>N. Maher, B. Lahart, A. Lawless, H. Costigan, C. Dwan, K. Pierce, M. Dineen</i>	578
Effects of oxidising methane inhibitors on emissions, fermentation patterns, and rumen microbial communities in vitro using the rumen simulation technique <i>C. O'Donnell, C. Thorn, A. C. V. Montoya, S. Waters, V. O'Flaherty</i>	579

Session 48. Horse genetics and genomics

Date: Tuesday 3 September 2024; 8:30 - 12:30

Chair: Tan / Mantovani

Theatre Session 48

Deriving genotypes of non-genotyped horses <i>C. Jansen-Noordijk, R. Bergsma</i>	579
Single-step GWAS of factors for young horse test traits in Swedish Warmblood horses <i>A. Nazari-Ghadikolaei, W. F. Fikse, Å. Gelinder Viklund, S. Eriksson</i>	580
Development and Genetic Architecture of White Markings in Heavy Warmblood Horses <i>M. Schafflik, F. Rosner, M. Wensch-Dorendorf, R. Fischer, C. Kubitz, W. Nolte</i>	580
Evaluation of genetic variants proposed as myopathy risk factors in relation to sport performance in riding horses <i>J. Mayer, K. F. Stock, H. H. Swalve</i>	581
Comparison between SNP array and imputed data to estimate population structure in horse breeds <i>G. Chessari, P. Reich, A. Criscione, C. Falker-Gieske, S. Mastrangelo, S. Tumino, S. Bordonaro, D. Marletta, J. Tetens</i>	581
Comparison of genomic signatures of selection in Icelandic horses and Exmoor ponies <i>H. Sigurdardottir, M. Ablondi, T. Kristjansson, G. Lindgren, S. Eriksson</i>	582
Genomic Dive into Nordic Horse Breeds <i>N. Almaas Smogeli, I. Shutava, S. K. Joensen, S. Mikko, S. Eriksson, P. Berg</i>	582
Genomic characterization of three indigenous Slovenian horse breeds <i>B. Luštrek, M. Šimon, K. Potočnik</i>	583
Predicting show jumping performance in Belgian Warmbloods using combinations of early life jumping traits <i>L. Chapard, W. Gorssen, R. Meyermans, K. Hooyberghs, N. Aerts, N. Buys, S. Janssens</i>	583
Heritability of the ability to race barefoot in Swedish trotters <i>P. Berglund, S. Andonov, A. Jansson, T. Lundqvist, C. Olsson, E. Strandberg, S. Eriksson</i>	584
Genetic parameters of summarizing performance traits for evaluating selection approaches for dressage and show jumping sport performance in riding horses <i>K. F. Stock, J. Mayer, P. Eitenmüller, I. Workel</i>	584

Conformational limbs defects of Pura Raza Menorquina horses: prevalence, heritability and relationship to functionality 585
M. Ripollés-Lobo, D. Perdomo-González, M. Valera, M. D. Gómez

From fertility to longevity and climate adaptability: genetics of fitness traits in horses 585
C. Sartori, E. Mancin, E. Rulli, A. Oian, G. Gomez-Proto, R. Mantovani

Structural variants and tandem repeats in horses and their potential impact on withers height 586
P. Reich, C. Falker-Gieske, G. Chessari, A. Criscione, K. F. Stock, C. Kühn, G. Thaller, J. Tetens

Poster Session 48

Current and Past Development of White Markings in Heavy Warmblood Horses 586
M. Schafflik, M. Wensch-Dorendorf, F. Rosner, R. Fischer, C. Kubitz, W. Nolte

How to combine microsatellite and SNP for parentage verification in horses? 587
M. Ablondi, S. Biffani, G. Stocco, A. Summer, C. Fontana, V. Asti, A. Sabbioni

Genomic inbreeding based on runs of homozygosity in the regional German horse breed Schleswig coldblood 587
M. Wobbe, H. Alkhoder, C. Schmidtman, K. F. Stock, H. H. Swalve

Single nucleotide polymorphisms in four indigenous horse breeds from Poland 588
A. Bieniek, A. Piestrzynska-Kajtoch, A. Radko

The genomic homozygous landscape reveals selection sweeps in Argentinean Polo ponies 588
F. Azcona, A. Karlau, N. Laseca, A. Molina, S. Demyda-Peyras

Genetic relationship between Neck and Conformational Limb defects in Pura Raza Española Horses for Improved Breeding and Performance Management 589
M. Ripollés-Lobo, D. I. Perdomo-González, M. Liger, M. J. Sánchez-Guerrero, M. Valera

Population structure of the Pura Raza Española horse Europe vs America 589
A. Encina Martínez, D. I. Perdomo-González, M. J. Sánchez-Guerrero, A. Rodríguez-Sainz De Los Terreros, M. Valera Córdoba

A protocol to detect early selection criteria for jumping longevity: first results on blood parameters 590
A. Ricard, S. Harari, B. Dumont-Saint-Priest, S. Deretz, E. Richard

The possibilities of using genomic information in the selection of mares for milk production 590
M. Šimon, B. Lušterek, K. Potočník

Session 49. Nutrition in health and welfare of ruminants

Date: Tuesday 3 September 2024; 8:30 - 12:30

Chair: Kreuzer-Redmer / Foris

Theatre Session 49

Mineral metabolism and health status of dairy cattle fed adjusted mineral supplementation 591
R. Balegi, A. Boudon

Nutritional epidemiology sheds light on the effects of alfalfa on dairy cow health, reproduction, and productivity 591
M. Caillat, N. Bareille, J. M. Ariza

Effect of sampling method, oral-stomach sampling vs. sampling through ruminal cannula, on pH and concentrations volatile fatty acids and mineral of rumen fluid during an acidogenic challenge in dairy cows	592
<i>D. Kwiatkowski, V. Niderkorn, E. Forano, P. Nozière, M. Silberberg</i>	
Effect of a blend of natural isoquinoline alkaloids on production efficiency, health, and cortisol levels in dairy cows during summer	592
<i>S. Grossi, A. Pastor, C. A. Sgoifo Rossi</i>	
Bacillus coagulans supplementation in Holstein Friesian female calves' diet	593
<i>L. Marchetti, R. Rebucci, C. Piantoni, D. Bertarelli, S. Bertani, B. Castiglioni, P. Cremonesi, M. Severgnini, C. Ceccarani, V. Bontempo</i>	
Effects of live yeast <i>Saccharomyces cerevisiae</i> boulardii on gut permeability and milk performance in transition in dairy cows	593
<i>A. Pineda, C. Villot, K. Dekraker, S. Kvidera, S. Jantzi, S. Cartwright, M. Boerefyn, M. Steele</i>	
Reducing the omega-6-to-omega-3 ratio in milk replacers modulates feed intake behavior and growth in calves fed ad libitum	594
<i>E. Pellissier De Féligonde, J. N. Wilms, J. Echeverry-Munera, M. H. Ghaffari, H. Sauerwein, J. Martín-Tereso, L. N. Leal</i>	
Incorporation of butyric and caproic acids in milk replacers modulates postprandial metabolism in calves	594
<i>A. Henry, J. N. Wilms, M. Sanz-Fernandez, M. Steele, J. Martín-Tereso, L. N. Leal</i>	
Evaluating the effects of rumen originated lipopolysaccharide on the pathogenesis of rumen acidosis	595
<i>X. Dai, G. Menni, S. Colombini</i>	
In vitro effects of mycotoxin Enniatin B on bovine PMNs immune function	595
<i>S. Sandrini, G. Salvi, D. Ravanelli, V. Perricone, L. G. De Matos, F. Cecilian, C. Lecchi, A. Agazzi</i>	
Phenolic Compounds in Animal Nutrition and Health: Chronic Kidney Disease	596
<i>F. Baptista, J. Paié-Ribeiro, M. Almeida, A. N. Barros</i>	
Protective effect of chlorogenic acid on liver injury in heat-stressed meat rabbits	596
<i>R. Ji, J. Chen, J. Xu, L. Zhang, L. Liu, F. Li</i>	
In vitro nutritional interventions to enhance rumen fermentation during the post-weaning process	597
<i>J. Muñoz-Grein, M. Fondevila, M. Á. Latorre, A. Belanche</i>	
The form of administration and dose of astaxanthin on calves' growth and health	597
<i>E. Sosin, A. Burmańczuk</i>	
Poster Session 49	
Development of suitable exterior indicators of milk-deprived and milk-fed suckling calves dependent on age	598
<i>J. Kurek, T. Liegsalz, A. M. Vorndran, A. Kurek, V. Huber, G. Hammerl, H. Spiekers, J. Steinhoff-Wagner</i>	
Survivability of LACTIFERM® as a direct fed microbials for calves: application to feeding practices	598
<i>R. Gresse, B. Ieda Cappellozza, P. Fantinati, E. Forano, G. Copani</i>	
Daily fluctuation in voluntary dry matter intake effects on feedlot performance of Nellore cattle	599
<i>S. F. M. Bonilha, J. A. Muñoz, R. C. Canesin, M. E. Z. Mercadante, J. N. S. G. Cyrillo</i>	
TMR quality preservation supports milk production performance	599
<i>T. Fumagalli, A. Lopez Karolys</i>	

Effect of a blend of essential oils on rumen microbiota for relieving sub-acute ruminal acidosis <i>G. Menni, X. Dai, K. Palanisamy, L. Rapetti</i>	600
Bromide: A water quality constituent of concern <i>N. Casey</i>	600
Evaluation of tannins supplementation as functional feed additive on neonatal diarrhea in calves <i>M. Dell'Anno, R. Carminati, O. Desrues, L. Rossi</i>	601
Does <i>Saccharomyces cerevisiae</i> postbiotic affect hay in vitro digestibility? A comparison between inclusion in the rumen fluid inoculum and dietary supplementation in the donor Chianina bullocks <i>S. Bettini, D. Colombi, F. Perini, M. Ghilardi, M. Tralbalza Marinucci, E. Lasagna</i>	601
Assessing the colostrum proteome of Holstein cows, and its effect on calf passive immunity acquisition <i>E. Castillo-Lopez, S. Kreuzer-Redmer, P. Biber, A. Sener-Aydemir, K. Hummel, E. Razzazi-Fazeli, N. Reisinger, Q. Zebeli, T. Hartinger</i>	602
Changes in calves' immune response affected by herbs and their blends – ex vivo study <i>E. Kowalczyk-Vasilev, J. Fabjanowska, O. Witkowska-Piłaszewicz, R. Klebaniuk</i>	602
Effect of supplementing a <i>Saccharomyces cerevisiae</i> fermentation product from dry-off through 90 days of lactation on the metabolic adaptations of dairy cows with previous lactation high somatic cell count <i>M. Mezzetti, A. M. Zontini, A. Minuti, L. Cattaneo, I. Yoon, E. Trevisi</i>	603
Effects of supplementation with vitamin E or plant extracts on immune and mammary epithelium integrity after a LPS challenge in lactating dairy cows <i>A. Corset, A. Boudon, A. Remot, S. Philau, K. Reis-Santos, O. Dhumez, J. F. Ricouleau, B. Graulet, P. Germon, M. Boutinaud</i>	603
Phenotypic variation of colostrum yield and its association with immunoglobulin G content in Simmental cows <i>A. Goi, M. De Marchi, A. Costa</i>	604
Plant extracts to optimize rumen fermentation from artificially reared lambs <i>J. Muñoz-Grein, M. Fondevila, M. Á. Latorre, A. Belanche</i>	604
Characterizing rumen fermentation profiles associated with early lactation feed efficiency at different levels of milk production in transition dairy cows <i>G. G. Begalli, L. D. P. Maldonato, V. A. De Oliveira, L. Buraschi, A. F. Souza Lima, J. Halfen, T. Fernandes, J. S. Osorio</i>	605
Effect of a citrus-based sensory feed additive on heat-stressed dairy cows <i>Q. Tiqui, G. Desrousseaux</i>	605

Session 50. Sustainable solutions to support and sustain gut health in monogastric livestock (with project MONOGUTHEALTH), Part 1

Date: Tuesday 3 September 2024; 8:30 - 12:30

Chair: Bee / Trevisi

Theatre Session 50

MonoGutHealth: An Interdisciplinary approach for enhancing livestock resilience through nutritional strategies <i>invited G. Bee, M. Siwek, C. Metges, P. Lawlor, M. Therkildsen, N. Everaert</i>	606
--	-----

Differences between low and high body weight broilers and strategies for catch up growth of low performing chickens	606
<i>invited</i> M. Z. Akram, A. Dunislawska, N. Everaert	
Effects of in-ovo stimulation on gut health and production of broiler chickens	607
<i>invited</i> R. N. Wishna - Kadawarage, M. Mangana, A. Dunislawska, C. C. Metges, R. Hickey, M. Siwek	
Transcriptional and metabolic responses in chickens infected with mixed parasite species	607
O. J. Oladosu, B. S. B. Correia, B. Graf, D. Liebhart, H. Reyer, R. Weikard, H. C. Bertram, C. Kühn, C. C. Metges, G. Daş	
Monoguthealth in Denmark: Early interventions in pigs and broilers to improve their health and welfare	608
<i>invited</i> N. Canibe, T. Ketrukut, K. Jerez Bogota, M. Jensen, O. Højberg, R. Engberg, M. Therkildsen	
Pre- and post-weaning liquid feeding of pigs	608
<i>invited</i> P. Lawlor, S. Vasa, E. Arnaud, G. Gardiner	
Glutamine supplementation during the suckling period and its influence on piglet growth and intestinal metabolism	609
<i>invited</i> Q. L. Sciascia, J. Buchallik-Schregel, J. Schulze Holthausen, Z. Li, D. De Leonardis, S. Goers, J. Zentek, C. C. Metges	
Effect of creep feeding on pre-weaning growth of suckling pigs	609
W. O. Izedonmwun, R. Muns, C. Mulvenna, A. Jones, P. Cormican, G. Gardiner, P. Lawlor	
Feeding a gestation diet to sows in early lactation and liquid creep feeding of suckling pigs	610
S. R. Vasa, M. Girard, G. E. Gardiner, K. O'driscoll, G. Bee, P. G. Lawlor	

Poster Session 50

Maternal and/or direct feeding of organic acid-preserved grain improves pig lifetime growth performance	610
S. Maher, J. Ryan, J. O'Doherty	
Organic acid-preserved grain improves growth performance and gut health of post-weaned pigs	611
S. Maher, T. Sweeney, S. Vigors, K. Connolly, J. Ryan, J. O'Doherty	
Effects of multi-strain probiotic supplementation on microbiota and performance in pigs	611
S. Park, D. Lim, M. Park, M. A. Park, H. J. Jang, S. Son, D. H. Kim, Y. Kim	
Effects of Lactobacillus pentosus supplementation on growth performance and short-chain fatty acids in feces of growing to finishing pigs	612
J. H. Lee, H. J. Park, J. E. Kim, C. H. Kim, J. S. Hong, Y. D. Jeong, S. H. Back, Y. M. Kim, S. J. Sa	
Effects of valerate glycerides in vitro using porcine cell culture models	612
L. Kovanda, M. Hejna, S. Rengman, S. Tawde, J. Pos, Y. Liu	
Evaluation of the effects of a standardized citrus extract on the intestinal microbiota and welfare of peripartum sows under commercial breeding conditions	613
B. Gabinaud, E. Belz, P. Chicoteau, M. E. A. Benarbia, O. Zemb	
Effects of maternal probiotic, and/or piglet dietary tryptophan supplementation pre-weaning, on sow and offspring performance	613
D. P. Kiernan, J. O'Doherty, T. Sweeney	

Session 51. Genetic progress vs animal welfare?

Date: Tuesday 3 September 2024; 8:30 - 11:15

Chair: Gottardo / Duijvesteijn

Theatre Session 51

Genetic progress vs animal welfare? <i>invited</i> F. Gottardo, L. Boyle, F. Miglior, N. Duijvesteij	614
Reversing the detrimental impact of genetic selection on farm animal welfare <i>invited</i> P. Stevenson	614
The evolution of dairy cattle breeding objectives R. Finocchiaro, F. Tiezzi, M. Cassandro	615
Predicting the agility of breeding programs to adapt to future societal demands M. P. L. Calus, T. Pook, E. Hanenberg, B. C. Perez, C. Orrett, J. Ten Napel	615
Breeding goal scenarios to quantify consequences of EFSA recommendations on pig reproductive traits E. H. Hanenberg, L. Vargovic, T. Pook, E. F. Knol	616
Do pig farms reconcile sow prolificacy, pre-weaning piglet survival and weaned litter size? Typology and results of French herds <i>invited</i> S. Boulot, A. Aubry, S. Honor	616
HenTrack: Improving breeding programs with superior behavior and welfare phenotypes M. Toscano	617

Session 52. Redesigning the trajectory: the contribution of research to the development of resilient Livestock Farming Systems and their role to climate change and biodiversity

Date: Tuesday 3 September 2024; 8:30 - 12:30

Chair: Pouloupoulou / Sturaro

Theatre Session 52

Agroecological assessments as an opportunity for more resilient and sustainable livestock systems <i>invited</i> L. Merbold, S. Paunovic, S. Baumgartner, P. Ndung'u, A. Gilgen	617
Effects of Supplementation with Tannins and Saponins Blend on Methane Emissions in High-Emitting Dairy Cows R. Colleluori, D. Cavallini, G. Buonaiuto, J. De Matos Vettori, F. Ghiaccio, G. Canestrari, L. M. E. Mammi, A. Palmonari, N. Pancioli, A. Formigoni	618
Relationship between environmental impact and on-farm dairy cow welfare in Parmigiano Reggiano farms M. Berton, M. Nocetti, L. Gallo, A. Cecchinato, E. Sturaro	618
Modeling interactions within dairy farms using regular vine-copula models N. Ouachene, C. Czado, M. S. Corson, T. Senga Kiessé	619
Global forecasted scenarios of THI and HLI anomalies G. Grossi, A. Vitali, N. Lacetera	619

Measuring farm resilience attributes: The study of three small ruminant systems <i>A. Prat-Benhamou, M. Meuwissen, T. Slijper, A. Bernués, P. Gaspar-García, J. Lizarralde, J. Mancilla-Leytón, N. Mandaluniz, Y. Mena, B. Soriano, D. Martín-Collado</i>	620
How resilience attributes contribute to specific resilience at farm level? The case of small ruminants in Spain <i>J. Lizarralde, B. Soriano, L. Yanore, P. Gaspar-García, A. Prat-Benhamou, R. Ruiz, J. M. Mancilla-Leytón, Y. Mena, D. Martín-Collado, R. Ripoll-Bosch, N. Mandaluniz</i>	620
Climate Change and Livestock Production: Revisiting Strategies to Ensure Sustainable Livestock Farming Systems <i>invited V. Sejian, M. Silpa, J. Gaughan, F. R. Dunshea</i>	621
Remote monitoring of pasture and animals in extensive farming is functional to genetic improvement <i>D. Pietrucci, M. Milanese, C. Evangelista, R. Spina, B. Ronchi, U. Bernabucci, N. Lacetera, G. Chillemi</i>	621
Restoration of abandoned Alpine Summer Pastures: Insights into Vegetation, Soil Conditions, and Microbial Communities <i>S. Raniolo, C. Pornaro, E. Basso, S. Da Re, A. Squartini, M. Ramanzin, E. Sturaro</i>	622
Reciprocal help, river flooding and a “Flying Herd”. A project for the rehabilitation of Mongolian rangeland in a changing climate <i>N. Imoli, L. Battaglini</i>	622
Roles, difficulties and needs of advisors in Climate-Smart Farming Transformations. Results from focus groups in 10 different European countries <i>C. Evrat-Georgel, F. Bedoin</i>	623
On-farm measurements of enteric methane emissions: Relationships between cow traits and emission intensity <i>C. Rossi, G. Grossi, F. Cesarini, N. Lacetera, A. Vitali</i>	623
Poster Session 52	
Global prediction of heat stress-related risk in dairy cattle <i>A. Vitali, G. Grossi, N. Lacetera</i>	624
The Cyprus Bovine Breed: zootechnical characteristics of a valuable indigenous cattle breed <i>M. Kyriakou, O. Tzamaloukas, D. Miltiadou</i>	624
Evaluating the potential of methane reduction effects of different extracts from Chestnut and Quebracho in in vitro ruminal fermentation <i>F. Ghiaccio, A. Palmonari, C. G. Vecchiato, A. Federiconi, R. Colleluori, G. Canestrari, N. Panciroli, A. Formigoni</i>	625
Animal genetic resources in Western Africa to support the agroecological transformation towards sustainable peri-urban farming systems <i>G. Manassis, Z. Basdagianni, I. Bossis</i>	625
Multifunctionality of sheep grazing in marginal areas: a remote sensing approach in Eastern Italian Alps <i>S. Da Re, S. Raniolo, C. Pornaro, E. Basso, M. Ramanzin, E. Sturaro</i>	626
Genome-wide scan reveals candidate genes related to milk production and adaptive traits in Sicilian cattle breeds <i>S. Tumino, D. Marletta, G. Chessari, S. Di Bella, S. Mastrangelo, A. Guercio, A. Cesarani, A. Criscione, S. Bordonaro</i>	626

National Livestock Biobank: an initiative supporting the valorisation of the Italian Livestock genetic diversity <i>F. Luongo, L. Pascarella, C. Fontana, C. Melilli, M. Fioretti, F. Luisi, R. Negrini, D. Matassino</i>	627
Participatory workshops to design innovative mixed farming systems based on the synergy between livestock and viticulture in Burgundy <i>R. Ibdhi, W. Queyrel, O. Aguirre-Saavedra, S. Ambrosino, A. R. Jo, G. Houndafoche, M. Seignon, Y. Tanguy-Roump, C. Husson, C. Philippeau</i>	627
Landscape characterization of Italian small ruminant populations <i>A. Bionda, M. Cortellari, A. Negro, S. Grande, P. Crepaldi</i>	628
Evolution, typology and issues of pig farms in France: lessons from the 2020 agricultural census <i>C. Roguet</i>	628
Two methods for detecting roe deer fawns before and during mowing, resp. <i>J. Mačuhová, Z. Pfeiffer, T. Wiesel, S. Thurner</i>	629
A survey on young post-graduated farmers: profiles, motivations, and difficulties <i>A. L. Jacquot, F. Gondret, Y. Le Cozler, M. Le Luel, A. Petrowick, V. Landais, S. Brajon</i>	629

Session 53. Insect genetics, reproduction, physiology and behaviour

Date: Tuesday 3 September 2024; 8:30 - 12:30

Chair: Sandrock / Petersen

Theatre Session 53

Dechoriation of Honey Bee Embryos by Alkaline Solutions <i>A. G. Onal, A. Gul, Y. Z. Guzey, M. Guney</i>	630
The effect of a regional legislative act on the distribution of honey bee mitochondrial DNA lineages <i>V. Taurisano, A. Ribani, D. Sami, K. E. Nelson Johnson, G. Schiavo, V. J. Utzeri, L. Fontanesi</i>	630
A Genomic Approach for the Creation Of Isolated Mating Areas for the Conservation of Italian Ligustica and Carnica Honey Bees <i>G. Minozzi, M. G. De Iorio, G. Gandini, G. Pagnacco</i>	631
Using genomic information to monitor diversity of the Australian honeybee genetic resources <i>P. Alexandri, S. Miller, N. Chapman, E. Frost, K. Bunter</i>	631
Exploring shifts in the microbial community when rearing different genetic lines of black soldier fly in a single production facility. <i>F. Ijdema, L. Broeckx, L. Froominckx, S. Van Miert, J. De Smet</i>	632
Consecutive mating of black soldier fly males to produce full- and half sibling offspring <i>K. Jensen, S. F. Thormose, N. K. Noer, T. M. Schou, M. Kargo, A. Gligorescu, J. V. Nørgaard, R. M. Zaalberg, H. M. Nielsen, T. N. Kristensen</i>	632
A bio-economic model for estimating economic values of important production traits in the black soldier fly (<i>Hermetia illucens</i>) <i>R. Zaalberg, H. M. Nielsen, N. K. Noer, T. M. Schou, K. Jensen, S. Thormose, M. Kargo, M. Slagboom</i>	633

FLYgene: Advancing Sustainable Breeding Programs and Genomic Tools for Black Soldier Fly (<i>Hermetia illucens</i>) in Kenya and Uganda <i>G. Sahana, G. Gebreyesus, R. C. Bett, J. Kinyua, N. Roos, C. M. Tanga, C. Mwikirize, R. Akol, F. M. Khamis, H. Karstoft, K. Bjerge, C. Kunyanga, L. S. Hansen, H. M. Nielsen, M. S. Lund, G. Ssepuuya, S. Walusimbi, D. Nakimbugwe</i>	633
Exploring genetic architecture of larval body weight in Black Soldier Fly <i>A. Michenet, A. Vereijken, J. De Vos, E. Facchini, D. Bickhart, K. Peeters, E. Schmitt, K. Shrestha</i>	634
Genetic parameters for house fly larval performance in two dietary environments <i>M. D. Georgalas, L. S. Hansen, S. F. Laursen, S. Bahrndorff, J. G. Sørensen, M. Kargo, T. N. Kristensen, B. Guldbrandtsen, H. M. Nielsen</i>	634
The effect of adult's sex ratio on the reproductive output of <i>Tenebrio molitor</i> <i>C. Adamaki-Sotiraki, S. Zafeiriadis, M. Krzyżaniak, C. I. Rumbos, C. G. Athanassiou</i>	635
Response of selected full-sib yellow mealworms to diet and density modifications : a GxE analysis <i>Q. Li, P. Lesueur, K. Paul, A. Masseron, F. Gagnepain-Germain, A. Chauveau, R. Barral-Arca, M. A. Madoui, T. Lefebvre, E. Sellem</i>	635
Genetic parameters estimation in yellow mealworms: A comparison of pedigree and genomic approaches <i>K. Paul, A. Donkpegan, Q. Li, A. Masseron, F. Gagnepain-Germain, A. Chauveau, K. Labadie, S. Haddad, R. Barral-Arca, M. A. Madoui, T. Lefebvre, E. Sellem</i>	636
Genome-wide association study in <i>Tenebrio molitor</i> reveals reproduction, development and growth quantitative trait loci <i>L. Rocha Ferreira, S. Haddad, L. Panunzi, K. Labadie, Q. Li, K. Paul, T. Lefebvre, E. Sellem, M. A. Madoui</i>	636
Poster Session 53	
Comparing expected and observed relationships among a sample of Slovenian honey bees <i>L. Strachan, J. Bubnič, J. Prešern, G. Gorjanc, J. Obšteter</i>	637
Genetic resources conservation programme of the Carniolan honeybee (<i>Apis mellifera carnica</i>) of the Dobra line in Poland <i>A. Chelmińska, M. Kolasa, E. Sosin</i>	637
Morphological evolution of the female reproductive system of <i>Hermetia illucens</i> (Diptera: Stratiomyidae) after mating <i>Y. Riabtseva, B. Grodzki, M. Tejada, M. Bolard</i>	638
Small scale rearing for the development of genomic resources in black soldier fly (<i>Hermetia illucens</i> , Linnaeus, 1758) <i>G. Dufresne, M. H. Deschamps, G. Vandenberg, C. Bolduc, C. Warburton, N. Alnahhas</i>	638
Impact of Low-Quality parent and interchanged diets on Black Soldier Fly (<i>Hermetia illucens</i>) Larval Traits and Microbiome Composition <i>A. Gligorescu, S. Nazipi Bushi, A. Schramm, J. Sørensen</i>	639
Effect of broodstock breeding density on mortality and reproductive performances of <i>Tenebrio molitor</i> (L.) <i>B. F. Palumbo, M. Cullere, Y. Singh, E. Pontalti, A. Dalle Zotte</i>	639
Effects of light regime and starvation on immune parameters in house crickets (<i>Acheta domesticus</i>) <i>F. A. Lindberg, I. Waern, E. Nilsson, A. Jansson, L. Holm, E. Roman</i>	640

Session 54. Sustainable sheep and goat high-yield production systems: Management, nutrition, mechanization, health, and welfare aspects

Date: Tuesday 3 September 2024; 8:30 - 12:15

Chair: Hernández-Castellano

Theatre Session 54

- Exploring Antibiotic Alternatives for Improved Health in Goat Kids 640
K. Digiacomo, A. W. N. Cameron, B. J. Leury, F. Zamuner
- Sustainable Sheep Milk: Exploring Udder Health Traits and Antioxidant Activity 641
G. Stocco, S. Biffani, C. Cipolat-Gotet, M. Ablondi, A. Negro, A. Summer, P. Kyriakaki, A. Mavrommatis, E. Tsiplakou
- Changes in lactating dairy goat body composition 641
J. Kirkham, F. Zamuner, A. Cameron, E. Carpenter, B. Leury, K. Digiacomo
- Effect of the replacement of wheat straw by spent mushroom substrate on milk yield, composition, fatty acid profile, oxidation stability and udder health in dairy ewes during the final stage of lactation 642
A. Karageorgou, A. L. Hager-Theodorides, M. Goliomytis, I. Politis, T. Massouras, S. Papanikolaou, P. Diamantopoulou, P. Simitzis
- Camelina and cardoon cakes supplementation on blood metabolic profile and colostrum quality in dairy goats during the transition period 642
G. Meli, D. Lanzoni, V. Fumo, C. Giromini, G. Savoini, A. Buccioni, G. Invernizzi
- Impact of somatic cell score on milk composition, curd firming, and cheese-making traits of Manchega sheep 643
I. Heddi, N. Amalfitano, A. Cecchinato, A. Garzón, J. Caballero-Villalobos, M. Ramon, J. M. Perea, E. Angón, M. Cantarero, L. Jiménez, R. Arias
- Mammary gland modulation on metabolic and immune status of dairy goats and their offspring 643
invited M. González-Cabrera, A. Morales-Delanuez, A. Argüello, N. Castro, L. Hernández-Castellano
- The role of colour indexes for the assessment of species-specific and breed-specific differences in quality traits of milk from domestic ruminants 644
J. Caballero-Villalobos, J. M. Perea, E. Angón, R. Arias, E. G. Ryan, O. M. Keane, M. Cantarero-Aparicio, A. Garzón
- Impact of reproduction on longevity of ewes 644
L. S. Kierkegaard, N. C. Friggens, G. Steinheim, Ø. Holand, G. Klemetsdal, L. Puillet, B. A. Åby
- Assessment of mineral composition in sheep milk: which effects should we include? 645
J. Ramírez-Díaz, G. Stocco, C. Cipolat-Gotet, M. Ablondi, A. Summer, A. Negro, A. Lotto, S. Blotta, F. Tiezzi, S. Biffani
- Could morphological traits assist towards increasing goat milk productivity in Cyprus? 645
P. Savvides, A. C. Dimitriou, T. Christofi, G. Maimaris, L. Koniali, S. Panayidou, S. Andreou, P. Markou, G. Hadjipavlou
- Effects of age at first joining and genotype on ewe performance from 2 to 8 years of age 646
T. W. J. Keady, J. P. Hanrahan

Poster Session 54

- Doses of chromium propionate in lamb diets and their effects on metabolic parameters 646
B. M. Maioli, A. De Carvalho, D. Lázara De Almeida, M. Márcia Da Silva, P. R. Leme, S. Bonagurio Gallo
- Does dairy sheep breed influence the environmental impact of farm? 647
I. Sodi, M. Martini, S. Saia, I. Altomonte, A. Andreucci, B. Fronte, F. Pedonese, L. Giuliotti, R. Ciampolini, F. Salari
- Analysis of fattening traits of black-headed lambs in Poland in 2015-2020 assessed by the BLUP method 647
M. Puchala, A. Kawęcka, M. Pasternak
- Effect of rearing sucking lambs in mountaing areas on carcass quality and meat fatty acid profile 648
C. Vieira, B. Martínez, J. J. García, A. Benito, R. Bodas
- Effects of Cysteine on Secondary Hair Follicle Growth and Hair Dermal Papilla Cell Proliferation in vitro in Yanshan Cashmere Goats 648
Y. Zhang, J. Kang, Y. Liu
- Diurnal variation in circulating blood metabolites in lactating dairy goats 649
J. Kirkham, F. Zamuner, A. Cameron, B. Leury, K. Digiacomo
- Lambs fed Kraft lignin, ionophore and vitamin e with selenium on performance, meat quality and rumen health 649
A. De Carvalho, A. Vaz Vedovate, I. Tomaz Nascimento, V. Braun Klein, P. R. Leme, S. Bonagurio Gallo
- Particle size distribution of total mixed rations in Spanish Assaff dairy sheep farms 650
T. Manso, T. Castro, A. R. Mantecón, P. Lavín
- Doses of chromium propionate on the performance of finishing lambs 650
B. M. Maioli, A. De Carvalho, D. Lázara De Almeida, P. Roberto Leme, S. Bonagurio Gallo
- Manure management in dairy sheep farms 651
B. Gallardo, T. Manso, Á. R. Mantecón, P. Lavín
- HereForEwe: Implementation of sheep production system of minor dairy breeds through community-based breeding, genomics and phenomics: the example of Delle Langhe breed 651
A. Zanotti, G. Stocco, C. Cipolat-Gotet, A. Summer, T. Cannizzo, P. Cornale, R. Moretti, S. Sartore, S. Chessa
- Age at first lambing and ewe longevity as mitigation options in sheep production 652
B. A. Åby, L. S. Kierkegaard, S. Samsonstuen, L. Aass
- Slaughter results and evaluation of carcass quality of meat-type breed lambs in Latvia 652
D. Kairiša, L. Šenfelde, D. Bārzdriņa, I. Trapiņa, N. Paramonova, I. Miķelsone, H. Eglīte, V. Leska
- Essential oils effects in in vitro sheep proliferation and cytokine secretion 653
M. G. Ciliberti, M. Albenzio, A. Sevi, L. Frabboni, A. Della Malva, A. Santillo, M. Di Corcia, R. Marino, M. Caroprese
- Feeding management in Spanish Assaf dairy sheep farms 653
P. Lavín, B. Gallardo, A. R. Mantecon, T. Manso
- Methionine balancing diet during transition and early lactation periods increased milk yield and composition in dairy ewes improving commercial farm profitability 654
S. Richards, D. Batonon Alavo, B. Mallmann, E. Fraile, L. Bahloul

Session 55. Host physiology/genetics and microbiome interactions – The holobiont concept

Date: Tuesday 3 September 2024; 8:30 - 12:30

Chair: Kenny / Tiezzi

Theatre Session 55

- Host genes shape the lower gut microbiota of Holstein cows: evidence from sequence-based GWAS 654
L. Brulin, M. P. Sanchez, Z. Cai, S. Ducrocq, G. Even, S. Martel, S. Merlin, C. Audebert, J. Estellé, G. Sahana, P. Croiseau
- Decoding the Genetic Dialogue: Rumen Microbiome and Host Genome Interaction in Enteric Methane Emission 655
G. Sahana, Z. Cai
- Impact of microbiome on genomic predictions for methane emissions in Holstein cows 655
R. Bonifazi, D. Flossdorf, B. Gredler-Grandl, H. Honerlagen, M. N. Aldridge, M. Spoelstra, A. E. Van Breukelen, Y. De Haas, A. C. Bouwman
- Why should we care about the rumen microbiome in next animal breeding strategies 656
O. Gonzalez-Recio, C. N. Marcos, J. Lopez-Paredes, M. Martínez-Alvaro
- Cattle genetics influences the abundance of ruminal pathogenic microbes 656
R. Roehe, T. Q. Nguyen, M. D. Auffret, J. Lima, J. Mattock, M. Watson, R. J. Dewhurst, M. A. Cleveland, M. Martinez-Alvaro
- Large scale analysis of the cattle rumen microbiome in relation to methane emissions 657
D. Flossdorf, R. Bonifazi, B. Gredler-Grandl, H. Honerlagen, M. N. Aldridge, M. Spoelstra, A. E. Van Breukelen, Y. De Haas, A. C. Bouwman
- Host genetics and hindgut microbiome jointly associate with daily milk yield in Holstein cows 657
H. Lu, K. Wang, Y. Wang
- Investigation of the Interrelationship between Ruminal and Oral Microbiomes of Angus Bulls 658
U. Lamichhane, M. Dycus, J. Lourenco
- Genetic selection for pig faecal enterotypes affects host upper gut microbiota and immune traits 658
F. Blanc, C. Larzul, G. Lemonnier, N. Bruneau, C. Niort, M. N. Rossignol, C. Rogel-Gaillard, J. Estellé
- Exploring the role of microbiota on phenotype expression under different biological assumptions 659
C. Maltecca, E. Mancin, F. Tiezzi
- EU-CIRCLES project: Evolution of pig microbiota and health under different farming conditions 659
F. Correa, G. Palladino, D. Luise, D. Schicchitano, B. Giulia, S. Rampelli, P. L. Martelli, P. Trevisi
- Exploring mortality and culling causes of breeding does through gut microbiome analysis 660
I. Biada, M. A. Santacreu, N. Ibáñez-Escriche
- Rumen microbiome, methane emission and blood analytes in grain-fed bison 660
S. Poothong, B. Thomas, X. Wu, D. Yaa, L. Guan, C. Neungjamnong, Y. Montanholi
- Fecal microbiota of pregnant mice in a divergent selection experiment 661
L. El-Quazizi El-Kahia, N. Formoso-Rafferty, J. P. Gutiérrez, J. J. Arranz, C. Esteban Blanco, I. Cervantes

Poster Session 55

- The lung-gut axis during polymicrobial respiratory infections in calves holobionts: the impact of microbiota dynamics on disease outcomes 661
M. Monié--Ibanes, F. Z. Sikht, M. C. Hygonenq, G. Pot, H. Robert, J. Malsa, L. X. Nouvel, E. Baranoski, C. Citti, A. Meynadier, E. Richard, M. Ducatez, G. Meyer, N. Mach
- Optimizing Piglet Growth and Meat Quality: The effect of Dietary Additives (KMAX, Solumarin) in Gut Microbial Balance 662
M. Yu, J. Jeong, S. Mun, I. H. Kim, K. Han
- Rational Designed Microbial Consortia for Chicken: an in silico approach 662
P. Stege, D. Schokker
- Dynamic Distribution of Gut Microbiota in Pigs at Different Growth Stages 663
M. A. Park, H. J. Jang, M. Park, D. H. Kim, Y. Kim
- Unraveling the influence of the host genetic on vaginal microbiota composition in Holstein cows 663
A. A. M. Sabuj, M. . P. Sanchez, S. Ducroca, G. Even, S. Martel, S. Merlin, C. Audebert, J. Estellé, P. Croiseau, L. Brulin
- Study of holobiont resilience following symbiotic transmission disruption in two rabbit lines selected for feed efficiency 664
H. Garreau, M. Renevey, L. Cauquil, P. Aymard, V. Helies, C. Larzul, J. Ruesche, S. Combes, O. Zemb
- Both age and genetic predisposition to mastitis influence the digestive microbiota in ewes 664
L. Arnalot, A. Zened, C. Allain, R. Rupp, G. Foucras, A. Meynadier
- Ruminant microbiome data are skewed and unFAIR, undermining their usefulness for improving sustainable production 665
A. Ortiz-Chura, M. Popova, D. P. Morgavi
- Genetic-Microbiota Interplay in Laying Hens: Enhancing Vaccine Response and Reducing Antibiotic Reliance in Poultry Production 665
A. Racanati, A. Lecoer, F. Blanc, N. Bruneau, D. Gourichon, T. Burlot, F. Calenge, M. H. Pinard-Van Der Laan
- Can semen microbiome contribute to improved prediction of bulls' fertility? 666
P. Alexandre, S. Rodríguez-Ramilo, N. Mach, A. Reverter
- Spray dried plasma protein as functional protein source enhanced gut health in post-weaned pigs 666
S. K. Kar, D. Schokker, C. Van Vuure, H. Van Iersel, A. C. Harms, L. Kruijt, M. A. Smits, A. J. M. Jansman
- Reduced α -diversity of bacteria in refrigerated compared to non-refrigerated colostrum from primi and multiparous dairy cows 667
S. Scully, P. Smith, B. Earley, M. McCabe, C. Mcaloon, D. Kenny, S. Waters
- DonKeyWorld: a comprehensive study on *Equus asinus* from biodiversity management to milk nutraceutical and technological properties 667
C. Cipolat-Gotet, M. Ablondi, E. Ciani, S. Chessa, F. Tiezzi
- Relationship between performance phenotypes and rumen microbiome and liver transcriptome data of beef cattle using a systems biology approach 668
K. Keogh, D. Kenny, P. Alexandre, S. Waters, E. MCGovern, M. Mcgee, A. Reverter

Session 56. PLF for health, behaviour and welfare, Part 1

Date: Tuesday 3 September 2024; 8:30 - 12:30

Chair: Foy / Morgan

Theatre Session 56

- Automated real-time activity monitoring in infectious disease experiments with various livestock species 668
H. P. Doekes, R. De Jong, I. Adriaens, N. Stockhofe-Zurwieden
- Self-contained unit for remotely monitoring bison: ID, performance, welfare and health cues 669
B. Thomas, J. Church, J. Galbraith, Y. Montanholi
- Detection of multiple feeding behaviours in calves – a comparison of sensor positions and window sizes 669
S. Addo, M. Safari, K. A. Zipp, F. Freytag, U. Knierim
- Early prediction of declining health in small ruminants with accelerometers and machine learning 670
A. Montout, R. Bhamber, E. Morgan, C. Ioannou, T. Terrill, J. A. Van Wyk, T. Burghardt, A. W. Dowsey
- Prediction of behavior activity of donkeys at pasture using data from a tri-axial accelerometer 670
M. Congiu, P. E. Milia, S. P. Rassu, A. Cesarani, C. Dimauro
- Monitoring of nest use through RFID tracking in cage-free laying hens 671
F. Bordignon, C. Ciarelli, A. Trocino, G. Xiccato, A. Pezzuolo, F. Marinello
- ModBehav, a supervised classification algorithm to predict goat behaviour from accelerometer data 671
S. Mauny, J. Kwon, N. Friggens, C. Duvaux-Ponter, M. Taghipoor
- Exploring the retention of learning in dairy cows exposed to Virtual Fencing after 90 days of non-use 672
C. Aquilani, A. Confessore, V. Cecchini, E. Bianco, S. Bovolenta, S. Parrini, C. Pugliese
- Rumen pH changes over a lactation of dairy cows in commercial farm environments 672
V. Ambriz-Vilchis, D. Shaw, A. Macrae
- Integrating Infrared Thermography to Assess Thermal Stress and Behavior in Dairy Goats 673
N. Thomas Masebo, M. Bolcato, M. Zappaterra, V. Bocchi, B. Padalino, L. Nanni Costa
- From MIR predicted fatty acids in bulk tank milk to a herd health monitoring tool for farmers 673
C. Fastré, C. Nickmilders, D. Santschi, D. Warner, M. Bahadi, C. Bertozzi, D. Veselko, F. Dehareng, N. Gengler, H. Soyeurt
- Constitution of an international dataset on blood biomarkers in dairy cows: a preliminary study to develop milk MIR models 674
C. Grelet, L. Millot, V. Wolf, M. Lidauer, D. Santschi, F. Huot, H. Naya, A. Meikle, B. Martin, M. Coppa, J. Leblois, M. Crowe, B. Bapst, A. Köck, A. Mensching, M. Gelé, Gpluse Consortium, F. Dehareng
- In-line milk analysis: how accurate can we get? 674
B. Aernouts, J. Díaz Olivares, A. Van Nuenen, M. Gote, X. Fu, J. Xie, I. Adriaens

Poster Session 56

- A Deep-Learning Model to Identify Call-type and Individuality of Dairy Cattle 675
D. Gavojdian, M. Mincu, I. Nicolae, T. Lazebnik, A. Zamansky
- TechCare: Monitoring semi-intensive meat sheep welfare through EID and weight 675
F. Kenyon, J. Duncan, G. Mitchell, L. Andrews, C. M. Dwyer, M. Reeves, H. Mcdougall, A. Hayward, A. McLaren, A. Thomson, S. Beechener, C. Morgan-Davies

Session 57. Socio-economic approaches to address the contemporary issues of the horse industry

Date: Tuesday 3 September 2024; 14:30 - 17:15

Chair: Evans / Tapprest

Theatre Session 57

Labour: a key issue for the long-term future of French equine businesses 676
S. Boyer-Lafaurie

Self-organized equestrian users: towards services adapted to the demand 676
C. Vial, C. Eslan

Riding teachers can affect horse and rider biomechanics in the design of their lesson 677
A. Byström, A. Egenvall, M. Eisersjö, M. T. Engell, S. Lykken, S. Lundesjö Kvart

Farms with Equines in French Agriculture: Reflections on the Evolution of the Equine Sector in the 21st Century 677
J. Veslot, G. Bigot

Income prediction in riding schools and boarding stables in France – 1st assessment 678
G. Mathieu, S. Boyer-Lafaurie

Lessons Learned from Horses for School Practice 678
R. Mickelsson

Composting as a sustainable way of utilization of horse manure 679
M. Meyer, C. Eiberger, T. Schilling, D. Winter, L. E. Hölzle

Nice to know you – Effects of human expectation on horse behaviour depending on the human-horse familiarity – preliminary findings 679
M. Schiefer, U. Müller, J. Stracke

EUNetHorse - setting the base: results on characterization questionnaires at EU level 680
A. Santos, M. Fradinho, M. Leitão, A. Monteiro, A. Rousset, J. Lejeune

Italian heavy draft horse management: practices and welfare issues 680
B. Benedetti, G. Pigozzi, F. Patroncini, B. Padalino

To eat or not to eat horsemeat? - a review of cultural, ethical, and practical considerations 681
B. Luštrek, M. Šimon, A. Kaić

Production and consumption of horse meat in France: overview and perspectives 681
C. Vial

Study on winter indoor jumping championships 682
L. T. Czyszter, F. L. Bochiş

Poster Session 57

Portuguese equine production characterization: results from the EUNetHorse thematic network 682
M. Leitão, B. Rocha, M. Fradinho, A. Monteiro, A. Santos

Session 58. The role of breeding and genetics in the sustainable transformation of the livestock sector

Date: Tuesday 3 September 2024; 14:30 - 17:00

Chair: Baumung / Leroy

Theatre Session 58

The role of locally adapted breeds in the sustainable transformation of the livestock sector: examples from Italy 683

invited E. Sturaro, G. Gandini, F. Pilla, L. Buttazzoni

The role of the private (breeding) sector in sustainable transformation: an example of small scale poultry production in Africa 683

invited N. Duijvesteijn, J. Van Arendonk

Anticipating future genetic needs for French dairy and suckler cattle sectors 684

H. Lagarde, P. Martin, D. Boichard

Investigating genomic adaptation to climate in local Mediterranean sheep breeds 684

C. Persichilli, G. Senczuk, F. Biscarini, S. Mastrangelo, E. Ciani, P. Orozco-Terwengel, F. Pilla, M. Barbato

Breeding for sustainability: development of an index to reduce GHG in dairy cattle 685

invited C. Richardson, P. Amer, T. Oliveria, K. Grant, J. Crowley, C. Quinton, F. Miglior, A. Fleming, F. Malchiodi

How much animal genetic improvement can contribute to the economic and environmental multiperformance in dairy sheep farming systems? 685

A. Irunal Veedu, R. Rupp, J. Raoul, F. Douhard

Shaping the Future Towards Responsible and Balanced Breeding:Code EFABAR 686

G. Cartick, A. Granados

Breeders' vision to meet future livestock sustainability goals through novel technologies – a Delphi study 686

M. Chase-Topping, G. Gorjanc, J. Burns, I. Fletcher, D. Moran, A. Doeschl-Wilson

Native breeds for agroecological dairy farming: a farmer's perspective 687

G. Bonekamp, M. A. Schoon, J. Bal, J. J. Windig, S. J. Hiemstra

Poster Session 58

Egg production of local Spanish breeds of laying hens and their physiological stress response to heat stress 687

W. M. Rauw, M. García-Gil, O. Torres, J. Santiago-Moreno, A. Toledano-Díaz, L. Gomez-Raya

Combining GWAS via meta-analysis identifies metabolic factors involved in phenotypic plasticity for reproductive efficiency traits 688

L. F. M. Mota, L. G. D. Albuquerque, H. N. D. Oliveira

Genotype by environment interaction for milk production traits in Dutch dairy cows in conventional and organic systems 688

E. L. P. Guennoc, J. Hinken, M. G. J. Edens, M. S. Gilbert, J. Dijkstra, H. Bovenhuis

Mining big data to fit animals to climate change, improve welfare and mitigate the environmental impact of livestock productions (BIG Fit Project) 689

G. Gaspa, R. Negrini, A. Cesarani, C. Ferrari, L. Falchi, N. P. P. Macciotta

Genetic parameters of Methane emission in Danish Jersey dairy cows <i>G. Sahana, C. Manzanilla-Pech, P. Løvendahl, T. M. Villumsen</i>	689
Reducing methane emissions through crossbreeding Holstein-Friesian dairy cows with Jerseys <i>C. Dwan, B. Horan, A. Jezequel, B. Lahart</i>	690

Session 59. Milk properties for the valorization of dairy (by-products) manufacturing

Date: Tuesday 3 September 2024; 14:30 - 16:45

Chair: De Marchi / Zanon

Theatre Session 59

From Waste to Worth: Repurposing Dairy by-products as Source of Innovative Nanosystems <i>F. A. Soares, B. Salinas, S. Reis, C. Nunes</i>	690
Nano can be Big(ger): bringing added value to milk fat <i>J. Albuquerque, F. Soares, A. Granja, C. Nunes, A. R. Cabrita, A. Mira Fonseca, S. Reis</i>	691
Standardization method, testing scenario, and accuracy of the infrared prediction model affect the standardization accuracy of milk mid-infrared spectra <i>W. Lou, H. Lu, X. Ren, X. Zhao, Y. Wang, V. Bonfatti</i>	691
Assessment of the proteins from whey and its microparticulate and fermented products <i>S. Khazzar, S. Currò, L. Da Dalt, F. Fontana, S. Segato, S. Balzan, E. Novelli</i>	692
Investigating the effect of total and differential somatic cell counts on bovine milk mineral content <i>D. Valoppi, G. Stocco, A. Summer, G. Niero, M. Penasa, M. Ablondi, C. Cipolat-Gotet</i>	692
Multiplex pathogenic bacteria detection in milk with the nanoparticle-assisted porous silicon-based SERS microarray biosensor <i>D. Muthukumar, G. Shtenberg</i>	693
Are MIR calibration datasets representative enough of cow milk MIR spectra real population? <i>C. Nickmilder, J. Leblois, O. Christophe, C. Grelet, H. Consortium, H. Soyeurt</i>	693
Valorization of bioactive components in milk: exploring environmental and animal factors affecting the variability of milk minerals in dairy cattle <i>A. Zanotti, G. Stocco, A. Summer, A. Lotto, S. Blotta, S. Biffani, M. Ablondi, C. Cipolat-Gotet</i>	694
Bulk milk quality traits differ according to the ClassyFarm welfare assessment score <i>S. Sabbadin, S. Magro, A. Costa, V. Lorenzi, F. Fusi, L. Bertocchi, M. De Marchi</i>	694
Evaluation of MIR predicted milk components as biomarkers of heat stress in dairy cows using a residual approach <i>P. Lemal, M. N. Tran, C. Grelet, H. Soyeurt, M. Schroyen, N. Gengler</i>	695
Analysis of antioxidant activity in bovine milk to valorize its nutraceutical properties <i>I. Tedeschi, G. Stocco, M. Ablondi, A. Summer, G. Anagnostou, A. Skourtis, F. F. Satolias, E. Tsiplakou, M. Malacarne, C. Cipolat-Gotet</i>	695

Poster Session 59

- Evaluation of Shiga toxin-producing Escherichia Coli (STEC) in Traditional Dairy farms in Trentino 696
G. Secchi, A. Mancini, G. Iussig, E. Partel, M. Mazzucchi, I. Roner, N. Sandri, N. Cologna, M. Nardelli, M. Ramelli, E. Franciosi
- Identification of apathogenic bacteria as a reservoir for antibiotic resistance genes in bulk tank milk samples and in-line milk filters 696
J. A. Schwenker, T. Sievers, I. Staack, C. Hölzel
- Development of a sandwich ELISA for the detection of bovine A1 beta-casein 697
A. Watanabe, T. Kobayashi, A. Okamoto, D. Oka, T. Noguchi, M. Matsuyama, T. Kuramoto
- Characterization of Dual-Purpose Blue milk compared to Holstein milk based on mid-infrared spectrometry 697
H. Wilmot, S. Franceschini, N. Gengler, C. Nickmilder, H. Soyeyurt
- Does the halloumi cheese production process change the fatty acid profile of milk used? 698
M. Neofytou, D. Miltiadou, D. Sparaggis, O. Tzamaloukas
- Public awareness of iodine in human health and diet as assessed by cross cultural survey 698
M. Santinello, G. Niero, S. Censi, M. De Marchi, C. L. Manuelian, C. Mian

Session 60. Viable future dairy farming systems and products from production, feeding, environmental and consumer viewpoint, Part 2

Date: Tuesday 3 September 2024; 14:30 - 17:30

Chair: Galama / Roche

Theatre Session 60

- Assessing solutions for resilient dairy farming in Europe 699
A. Kuipers, S. Ostergaard, R. Loges, J. Zijlstra
- WELL-E: Enhancing Animal Welfare & Longevity through Artificial Intelligence and Internet of Things Dedicated to Dairy Farming 699
invited E. Vasseur, A. Baniré Diallo
- Viable future dairy farming systems: a comprehensive nutritional approach to minimize methane emission and phosphorus and nitrogen excretion 700
invited J. Dijkstra, J. T. Schonewille, S. Van Gastelen, K. Nichols, A. Bannink
- Breeding for resilience in the Netherlands and Flanders 700
invited N. Meijer, J. Bouwmeester-Vosman, M. L. Van Pelt, G. De Jong
- If you were a cow? 701
D. Pomies, B. Dumont, N. Rebout, C. Chassaing
- Mitigation of environmental impacts in dairy farming: potential synergies and trade-offs 701
M. Seiringer, S. J. Hörtenhuber, W. J. Zollitsch
- Regional feed and energy centre 702
P. Galama, N. Verdoes

Simulating environmental sustainability of Dutch dairy farms towards 2030 <i>M. De Vries, M. H. A. De Haan, A. G. Evers, P. J. Galama, J. W. Reijs</i>	702
Advancing precision extensive livestock farming through AI-based species recognition from camera trap recordings <i>R. Primi, P. Girotti, P. Viola, M. Zaccaroni, F. Spada, B. Ronchi, L. Ortenzi</i>	703
What are the limits for agricultural collectives under Geographical indications (GI) to take action in transitions? Six case studies in French cheese sector from the ADAOPT project <i>D. Neumeister, F. Bedoin, S. Dernas</i>	703

Poster Session 60

Effect of feeding a garlic-citrus extract on milk production of dairy cows and sensory perception of milk <i>R. Khurana, J. M. Bowen, L. Czeglédi, E. Török, M. Kokas, L. D. Brasso, B. M. Tas, S. A. Salami</i>	704
Effects of thermally processed linseed on meat quality traits of fattening Holstein calves <i>V. Papanikolopoulou, S. Priskas, S. Dokou, V. Fotiadou, P. Chantzi, I. Dalla, G. Arsenos</i>	704
REGENEMILK: Innovative strategies and techniques for monitoring and treatment of mastitis in local and cosmopolitan breeds <i>E. Sangalli, V. Andreoli, G. Stocco, S. Grolli, A. Summer, R. Ramoni, G. Basini, V. Conti, A. Zanotti, C. Cipolat-Gotet</i>	705

Session 61. Advances in fish nutrition

Date: Tuesday 3 September 2024; 14:30 - 16:15

Chair: Pinotti / Ottoboni

Theatre Session 61

Effectiveness of a commercial Diatomaceous earth feed additive in mitigating transport stress in Sea Bass (<i>Dicentrarchus labrax</i>) <i>A. Prete, A. Maggiolino, M. Deflorio, G. Incampo, G. Calzaretti, G. Centoducati</i>	705
Diet digestibility and growth performance of African catfish fed diets with blends of poultry PAP <i>C. Fanizza, A. Trocino, V. Stejskal, M. Prokěšová, M. Zare, H. Quang Tran, F. Brambilla, G. Xiccato, F. Bordignon</i>	706
Feed and carbon footprint in aquaculture – an industry perspective <i>U. Luzzana</i>	706
The sustainable “4 F” for rainbow trout (<i>Oncorhynchus mykiss</i>) feeding: Feedstuffs from the Fish Farmer Farmhouse <i>A. Roncarati, L. Galosi, G. E. Magi, F. Mariotti</i>	707
Environmental impact of the inclusion of alternative raw materials in diets for gilthead seabream <i>F. Bordignon, G. Vélez Calabria, S. Martínez-Llorens, A. Tomás-Vidal, F. Gabriel Acien Fernandez, A. Trocino, M. Berton</i>	707
Microplastics manifestation and their potential impact on freshwater fish species <i>F. Jabeen, M. H. Raza, A. S. Chaudhry</i>	708
Traceability and characterization of nanoplastics on novel feed/food sources: the case of microalgae <i>D. Lanzoni, M. Sarria Pereria De Passos, R. Gonçalves, S. Gioria, A. C. Pinheiro, A. Vicente, C. Giromini</i>	708

Poster Session 61

Effect of the low level dietary inclusion of queen bee larvae meal on the fatty acid profile of the fillets and livers of European seabass

709

M. V. Tignani, G. Secci, N. F. Addeo, F. Bovera, G. Parisi

Session 62. Feeding for improving the nutritional, safety and organoleptic characteristics of animal-derived foods

Date: Tuesday 3 September 2024; 14:30 - 17:15

Chair: Stergiadis / Foggi

Theatre Session 62

Effect of feeding a garlic-citrus extract on milk production and fatty acid profile of milk

709

R. Khurana, C. Resch-Zafra, L. González-González, M. P. Martínez-Diz, A. Botana, M. Veiga-López, B. Tas, S. Salami

The benefits of feeding *Himantalia elongata* to dairy cattle on nitrogen utilisation and end-product quality

710

K. Barnes, X. Chen, T. Yan, M. Hayes, S. Ormston, S. Kanathigoda, E. E. Newton, S. Stergiadis, S. Huws, K. Theodoridou

Effect of the addition of plant galactogogues in the dairy cows rations on the quality parameters and protein profile of milk

710

E. Kowalczyk-Vasilev, H. Gümüş, R. Klebaniuk, J. Fabjanowska

Does feeding hay versus grass silage impact milk composition?

711

K. Bauer, S. P. Van Den Oever, M. Schreiner, A. Haselmann, W. Zollitsch, B. Fuerst-Waltl, Q. Zebeli, H. Mayer, W. Knaus

Cheese quality from grazing sheep supplemented with agro-industrial by-products

711

V. Bolletta, E. Lilli, M. Pauselli, B. Sordini, M. Mele, G. Foggi, B. Valenti

Dairy cows' diet has a marked impact on vitamin B content in milk but less in yogurts

712

L. Auzance, B. Martin, C. Delbes, I. Verdier-Metz, M. Bouchon, G. Jan, V. Gagnaire, M. C. Michalski, M. Duplessis, M. Popova, J. Ronholm, B. Graulet

Ensiled artichoke bracts in beef cattle diet: meat quality during dry aging

712

L. Forte, A. Seccia, R. Greco, F. Giannico, G. Natrella, A. Maggiolino

The inclusion of almond hulls in lamb diets improves the fatty acid composition of intramuscular fat

713

L. Cachucho, S. P. Alves, O. Guerreiro, M. Varregoso, C. Costa, K. Paulos, J. Santos-Silva, M. T. P. Dentinho, E. Jerónimo

Feeding hazelnut skin and linseed to lambs: effect on meat oxidative stability

713

A. Bertino, M. Musati, G. Luciano, M. S. Cannone, A. Natalello, A. Priolo

Dietary pistachio skin improves lipid profile and lipid oxidation of lamb

714

F. Mangano, M. Musati, A. Bertino, M. S. Cannone, L. Biondi, M. Lanza, A. Natalello, A. Priolo, G. Luciano

Influence of a waxy corn diet and sex on growth performance, carcass characteristics and meat quality of heavy pigs

714

R. E. Amarie, S. Tinagli, M. Tognocchi, A. Serra

Chemical and physical quality traits of meat from heavy pigs fed diets with a partial to total replacement of soybean meal with spirulina powder <i>G. Don, D. Giannuzzi, A. Toscano, S. Schiavon, L. Gallo</i>	715
Dietary leucine modulate pork quality via adjusting muscle fiber type conversion and intramuscular fat deposition in Huanjiang mini-pigs <i>L. Zhang, F. Li, Y. Yin</i>	715
Poster Session 62	
Milk yield and composition of Cinisara grazing cows supplemented with a low- and a high-polyphenols faba bean varieties <i>M. Avondo, M. Ponte, M. Pipi, M. Lanza, A. Bonanno, A. Di Grigoli, S. Tumino</i>	716
Study of the effect of Fabaceae plants on the meat quality of heavy fattening pigs Złotnicka Spotted breed <i>M. Szyndler-Nędza, M. Świątkiewicz, G. Żak, M. Tyra, A. Mucha, M. Małopolska</i>	716
Effects of dietary supplementation with enriched olive cake on meat quality traits of Limousine bulls <i>M. Oteri, V. Chiofalo, G. Dipasquale, M. E. Furfaro, B. Tuvè, L. Liotta, V. Lopreiato</i>	717
Effect of incorporating protected soya lecithin in a high oleic finishing diet of oxen on fatty acid profile of subcutaneous and intramuscular fat <i>C. Vieira, A. Sarmiento, G. Giner, J. J. García, B. Martínez</i>	717
Impact of protein source on pork quality and production parameters: a comparative study of biorefined grass-clover protein and soy-cake protein for organic growing-finishing pigs <i>M. Eskildsen, E. Jørgensen, L. Stødkilde-Jørgensen</i>	718
Seasonal quality variation of Bresaola from grass-fed Angus beef <i>V. Bolletta, E. Lilli, B. Valenti, V. Roscini, M. Pauselli</i>	718
Effects of dietary supplementation of oregano essential oil to feedlot cattle on their meat quality and muscle fiber histomorphometry <i>S. Dokou, A. Tsitsos, I. Stylianaki, T. Chatzimanou, V. Economou, I. Giannenas, M. E. Filippitzi, G. Arsenos</i>	719
Effects of the incorporation of sainfoin as hay or included in the concentrate on carcass and meat quality of young bulls <i>M. Blanco, D. Villalba, E. Molina, I. Casasús, G. Ripoll</i>	719
Antibacterial activity and functional characteristics of lactic acid bacteria isolated from green tea and their application in producing dry-cured ham <i>M. H. Oh, J. H. Kim, E. S. Lee, B. M. Kim</i>	720
Effect of feed mixtures contamination with low doses of antibiotics on meat quality of broiler chickens <i>K. Połtowicz, A. Arczewska-Włosek, J. Nowak, P. Adamczyk, P. Zawisza, K. Szczepanik, M. Olszewska-Tomczyk, M. Olejnik</i>	720
The use of grape pomace in rabbit diet improves the oxidative stability of the meat <i>S. Carta, R. Chessa, R. Rubattu, F. Correddu, A. Nudda, G. Battacone</i>	721
Tomato and pepper waste in sustainable laying hens diet for improving nutritional and organoleptic characteristics of eggs <i>F. Accetta, C. Cavallo, L. Liotta, G. Pace, A. R. Di Rosa</i>	721

Fattening and slaughter characteristics and meat quality parameters of merino lambs fed with fodder with herbs 722
A. Kawęcka, M. Pasternak, M. Puchala, I. Peist

Session 63. Improving animal welfare by optimising nutrition/feeding behaviour, Part 1

Date: Tuesday 3 September 2024; 14:30 - 17:00

Chair: Trocino / Kar

Theatre Session 63

Feeding behaviour: The missing link between pig welfare and pig nutrition research 722
invited M. Holinger, F. Leiber

When do ad libitum fed lactating sows choose to eat? 723
S. C. Gorr, T. D. Parsons, C. Winckler, W. Zollitsch, C. Leeb

Piglet suckling behaviour in relation to fibre type in the maternal diet 723
M. Girard, P. Lin, C. Hildebrand

Can stocking density and feeding space influence weaned piglet performance and behaviour? 724
A. Huting, J. Van Renswoude, F. Molist

Feed taste variety within days in nursery pigs: effect on animal's preferences and performance 724
R. Palomo, C. Escobillana, D. Luna, E. Huenul, J. Figueroa

Peat pellets as enrichment material had positive effects on growth and intestinal microbiota of weaned piglets 725
H. Kettunen, J. Vuorenmaa, K. Partanen

Housing systems and dietary interventions can affect health, performance and microbiome of pigs from weaning to the growing 725
D. Luise, G. Palladino, F. Correa, F. Palumbo, G. Orazio, M. Graziosi, E. Perez-Calvo, G. Litta, G. Scicchitano, G. Babbì, A. Castagnetti, S. Rampelli, P. Martelli, P. Trevisi

Dietary GABA supplementation in nursery pigs can improve object recognition memory regardless of their coping style 726
E. Huenul, V. Vertus, K. Rochina, J. F. Pérez, S. M. Martin-Orue

Laying hen preference for different pecking blocks in floor pens depends on strain and time of day 726
V. Hipkin, A. Harlander, E. Kiarie, M. Edwards, T. Widowski

Do Mineral Pecking Blocks Support Laying Hens' Ca Appetite? 727
A. K. Rentsch, S. V. Komarova, E. G. Kiarie, A. Harlander, T. M. Widowski

Effects of reduced energy and essential amino acid diets on plumage damage and skin injuries of male slow- (Auburn) and fast- (B.U.T. 6) growing turkey strains 727
A. I. Kirn, P. A. Weindl, C. Lambertz, P. Hofmann, G. Bellof, R. Schreiter

Polyphenols influences neurotransmitter associated with well-being and allometric growth of broiler chickens 728
V. A. R. D. Castilho Heiss, C. M. Komiyama, R. G. Garcia, M. F. D. C. Burbarelli, I. C. D. L. Almeida Paz, F. C. Serpa, E. Santin

Poster Session 63

- Effects of using a sound signal as a call to feeding on the behavior and welfare of gestating sows 728
A. Blanc, C. Deroiné, C. Clouard, C. Gaillard
- Effect of a flavouring additive on cow performance in automatic milking system 729
Q. Tiqui, M. Gex Fabry, G. Desrousseaux
- Comparative Study of Ruminant Feeding: Nutritional Implications 729
C. Maduro-Dias, H. Nunes, C. Vouzela, J. Madruga, A. Borba
- Colostrum administration quickness and farmer's characteristics affect calves' survival 730
A. Costa, G. Visentin, M. Masi, Y. Vecchio, A. Goi, M. De Marchi
- Supplemental rumen-protected dry grape extract alters the metabolic response and rumen fermentation of Simmental cows during heat stress 730
A. Amato, M. Forleo, C. Cavallo, L. Liotta, E. Trevisi, A. Minuti, H. Bui, P. Engler, V. Lopreiato
- Evaluation of conventional and cow-calf bonded rearing systems in southern Germany 731
J. Kurek, T. Hautzinger, J. Harms, E. Zeiler, J. Steinhoff-Wagner

Session 64. Sustainable solutions to support and sustain gut health in monogastric livestock (with project MONOGUTHEALTH), Part 2

Date: Tuesday 3 September 2024; 14:30 - 16:15

Chair: Bee / Trevisi

Theatre Session 64

- Performances of primiparous rabbit does subjected of dietary restriction during gestation 731
V. Pinheiro, J. Teixeira, D. Monteiro
- Effects of dietary valerate glycerides on diarrhea, inflammatory status, and intestinal barrier integrity in weaning piglets infected with Enterotoxigenic Escherichia coli 732
L. Kovanda, S. Rengman, S. Tawde, J. Pos, Y. Liu
- Parabacteroides distasonis alleviates intestinal barrier injury induced by ETEC in piglets 732
J. Wang, Z. Wu, B. Tan
- Intrauterine growth restriction, defined by a high brain-to-liver weight ratio, affects fecal microbiota composition and, to a minimal extent, plasma metabolomics in pigs 733
R. Ruggeri, G. Bee, F. Correa, P. Trevisi, C. Ollagnier
- Impact of moderate CP restriction and additive combination on N balance and hindgut microbiota in pigs 733
L. Sarri, E. Fuertes, E. Pérez-Calvo, A. R. Seradj, J. Balcells, G. De La Fuente
- Microbial architecture and enterotypes for improved nitrogen utilization efficiency in fattening pigs 734
N. Sarpong, J. Seifert, J. Bennewitz, M. Rodehutschord, A. Camarinha-Silva
- Effect of dietary inclusion of a herbal extract blend on nutrient digestibility, faecal Nitrogen emission and growth performance in growing-finishing pigs 734
M. Fornós, M. Verdú, X. Soldevila, M. Balart, X. Solvas, J. A. Crespo, S. Fernández, J. Rafael

From gut to tail: The effect of a fermented herbal extract on aspects of health and (tail-in-mouth) behaviour of pigs 735
N. Noellenburg, B. Metzler-Zebeli, C. Winckler, C. Leeb

Vitamin E reduce adipose tissue fibrosis and lipid metabolism disorder in oxidized fish oil-fed pigs 735
Q. Guo, Q. Wu, J. Pan, Y. Duan, F. Li

Poster Session 64

Effect of oat milling (ground vs. flaked) and age on the fecal microbiome of piglets 736
D. Monteiro, N. Guedes, J. Teixeira, V. Pinheiro, E. Pereira

Effects of vinegar intake on piglet performances and gut health 736
V. Pinheiro, K. Bahia, J. Teixeira, M. Parreiras, E. Pereira, D. Monteiro

Effects of 20% Lactose Supplementation in Liquid Creep Feed on Piglet Growth 737
M. H. Eskildsen, E. M. H. Christensen, C. Larsen, A. P. Rasmussen, C. M. Crone, L. V. De Knecht, J. G. Madsen

The effect of Benzoic Acid supplementation on growth performance and small intestine integrity of artificially reared suckling piglets 737
C. M. Crone, A. P. Rasmussen, C. Larsen, M. H. Eskildsen, E. M. H. Christensen, L. V. De Knecht, J. G. Madsen

Session 65. PLF for health, behaviour and welfare, Part 2

Date: Tuesday 3 September 2024; 14:30 - 17:15

Chair: Morgan / Morgan-Davies

Theatre Session 65

Computational and Experimental Framework for Tracking Cow Personalities and Their Impact on Personalized Welfare 738
L. Oscar, B. Valníčková, D. Papinutti, S. Mordechay, Y. Salzer, O. Forkosh

Validation of an indoor positioning system for automated personality assessment in dairy cows 738
P. Hasenpusch, T. Wilder, K. Dannen, A. Seidel, J. Krieter, G. Thaller

Automatically monitoring dyadic relationships in dairy cows 739
B. Foris, K. Sheng, D. M. Weary, M. A. G. Von Keyserlingk

Assessing Dairy Cows' Welfare Status through Social Behavior Indicators Using an Automatic Real-Time On-Farm Positioning System 739
D. Papinutti, I. Zeev, B. Valnickova, S. Mordechay, R. Palme, O. Forkosh, Y. Salzer

Full-flock-full-pregnancy monitoring of liveweight progression in Romane meat ewes, using a walk-over-weighing system in rangelands 740
I. Llach, G. Bonnafé, C. Durand, S. Douls, I. Sanchez, B. Cloez, M. Lamarque, E. González-García

Tracking sheep indoors or on pasture using Bluetooth and UHF RFID for welfare management: feedback from trials conducted in Scotland and France 740
G. Tesnière, C. Morgan-Davies, F. Kenyon, A. McLaren, T. Waterhouse, S. Duroy, U. Jean-Louis, C. Dwyer, A. Walker, M. Reeves, J. Duncan, J. M. Gautier

Milking order of healthy and subclinically mammary infected dairy ewes in mid lactation 741
A. Recio, A. Elhadi, A. Salama, R. Costa, X. Such, J. Piedrafita, G. Caja

How to define good mothering ability using computer vision of free farrowing sows? <i>L. Van Der Zande, V. Lei, E. Grindflek</i>	741
Improvement of an algorithm performance to estimate the physical activity of group-housed sows based on videos <i>C. Gaillard, M. Simon</i>	742
Computer vision based monitoring of fattening pigs: how well do pigs behave? <i>J. Slootmans, A. Parmiggiani, D. Liu, J. Maselyne, T. Norton</i>	742
The effect of colostrum supplementation on milk intake and performance when administered at the time of a diarrhea alert <i>A. Welk, M. C. Cantor, J. H. C. Costa, J. Morrison, C. B. Winder, D. L. Renaud</i>	743
Redefining lameness assessment using crowd-sourced data <i>K. Sheng, B. Foris, M. A. G. Von Keyserlingk, T. A. Timbers, V. Cabrera, D. M. Weary</i>	743
Poster Session 65	
Genetic relatedness impact on social behavior in dairy cows within Automated Milking Systems <i>R. Moretti, E. Ponzio, L. Ozella, S. Chessa, F. Masia, E. Vrieze, P. Sacchi</i>	744
Automatic detection of lame weaner pigs by evaluating their drinking behaviour <i>P. Hesecker, N. Volkmann, G. F. Thimm, U. Hartmann, N. Kemper</i>	744
Requirements for implementing a European knowledge platform for multidimensional animal welfare assessment on farm, during transport and at the slaughterhouse <i>J. Zemzmi, C. Reverté, Y. P. Van Der Stede, S. Ashe, E. Caro, A. Velarde</i>	745
The effect of precision lighting system on laying hen welfare <i>D. Witkowska, D. Murawska, J. Baran, T. Przytarski, S. Łazarski, P. Wasielewski, A. Lemański</i>	745
Session 66. The current and future role of pasture production systems in the mitigation of and adaptation to climate change impacts in livestock farming systems	
Date: Tuesday 3 September 2024; 14:30 - 16:45	
Chair: Boland	
Theatre Session 66	
Engineering resilient grazing systems to improve adaptation to climate change and helping to mitigate its adverse effects <i>invited J. C. Dubeux, Jr.</i>	746
Carbon footprint of sheep farms in France: first results of the LIFE Green Sheep project <i>S. Throude, B. Rouillé, J. B. Dollé</i>	746
Greenhouse gas emission intensity of Irish Sheep meat: Irish Data Component of LIFE Green Sheep Project <i>L. Bragina, C. Buckley, T. W. J. Keady</i>	747
Quantifying the impact of weather environment across three timescales on lamb performance <i>P. Theron, T. Brand, S. Cloete, J. Van Zyl</i>	747

Effect of sward type on urinary nitrogen excretion of late lactation dairy cows <i>E. Wims, B. Mccarthy, J. P. Murphy, T. F. O'Callaghan, M. Dineen</i>	748
Dairy cows reduce drinking water intake when offered different fresh-cut pasture species <i>C. T. Minogue, T. M. Boland, S. Vigors, M. Dineen, N. A. Walsh, Z. C. Mckay</i>	748
Factors influencing impacts of drought on grass yields in Dutch dairy farms <i>M. De Vries, J. Van Riel</i>	749
Generation of a livestock value of grasslands for the mitigation and adaptation to climate change impacts in Chilean Patagonia <i>S. Radic-Schilling, R. Muñoz, S. Valle, P. Corti, C. Glucevic, M. Navarro, M. Gonzalez-Ronquillo</i>	749
The effect of sward botanical diversity on feed intake, growth performance and methane emissions of beef steers <i>M. O'Rourke, D. A. Kenny, A. K. Kelly, S. Waters</i>	750
Understanding impacts of scale changes on efficiency gains of pasture-based beef production systems in the Massif Central, France: a modeling approach <i>H. Nguyen-Ba, A. Van Der Linden</i>	750
Poster Session 66	
Assessing extensive pasture-based beef production in South Africa under future climate change <i>C. Magona, A. Hassen, E. Tesfamariam, C. Visser, S. Oosting, A. Van Der Linden</i>	751
Sheep grazing on peat grassland in a free-field photovoltaic system <i>D. Hamidi, F. Sieve, C. Siede, L. Wilms, L. Zinken, M. Kayser, M. Hamidi, J. Isselstein</i>	751
Preliminary survey of the quality and pastoral value of different grazing areas in the park of the Campania Region <i>M. Iacurto, R. Steri, E. Rossi, F. Perna, A. Lullo, D. Meo Zilio</i>	752
Greenhouse gas balance of livestock systems and carbon footprint of livestock products: two methodologies for assessing livestock contribution to climate change <i>J. Vayssieres, D. Sasi, M. H. Assouma, M. Vigne, A. Ickowicz</i>	752
Carbon footprint of Sardinian dairy goats reared in extensive farming systems <i>S. Sechi, M. Lunesu, G. Pulina, C. Satta, G. Battacone</i>	753
Dry matter intake and calf performance on grass pastures in monoculture and silvopastoral systems in a subhumid tropical climate, Brazil <i>J. L. Izidro, A. Mello, V. Silva, M. Cunha, M. Santos, N. Costa, S. Costa</i>	753
Carbon dynamics and greenhouse fluxes in subtropical grazing lands <i>M. Silveira, J. Vendramini, R. Bracho</i>	754
Methane production in grazing sheep in the Magallanes region as a function of type of pasture <i>M. Gonzalez-Ronquillo, L. Robles, S. Radic-Schilling, C. Glucevic, M. Navarro</i>	754
Pasture and animal production in integrated crop-livestock-forestry systems in the tropics <i>M. Sousa</i>	755

Session 67. Innovative insect application and technologies

Date: Tuesday 3 September 2024; 14:30 - 17:00

Chair: Gligorescu / Lefebvre

Theatre Session 67

- Collaborations between research and industry in insect sector: case study illustrated by a black soldier fly producer 755
invited C. Trespeuch
- StayPrime: Prolonging Larval Shelf Life for Efficient Insect Farming Integration 756
A. Gligorescu
- Automatization of abdominal color assessment in honey bees 756
J. Prešern
- Microbiome Dynamics and Waste Reduction Capabilities of Black Soldier Flies (*Hermetia illucens*) as Biosolid Consumers 757
S. Escobar-Correas, A. Ruffell, G. Wijffels, H. Koch, A. Paten, M. Morgan
- Exploitation of *Tenebrio molitor*, *Rhizopus oryzae* and *Trichoderma reesei* for the detoxification of contaminated bran with aflatoxins B1 757
E. Daniso, G. Pascon, C. Uboni, C. Conchione, S. Moret, F. Tulli
- The effect of different wet fractionation methods on the yield of *Hermetia illucens* larval fractions and the distribution of the main constituents 758
E. Gleeson, I. Fraeye, E. Pieterse
- Subcritical Solvents for the Biorefinery of Chitin from Black Soldier Fly Larvae (*Hermetia illucens*) – Expanding the Scope towards other Insect Biomass 758
E. Vervoort, R. Smets, B. Sels, M. Van Der Borcht
- Preliminary results on the control of *Fusarium* wilt on lettuce and tomato by insect frass 759
L. Alfarano, S. Bellezza Oddon, L. Gasco, M. Pugliese
- Effects of insect frass fertilizer on tomato fruits untargeted metabolomics 759
F. Gai, G. Di Cuia, M. D'Imperio, M. Gonnella, C. Medana, A. Affricano, M. Ferrara, A. Parente
- A Fly for a Fly – Frass to control cabbage root fly in cauliflower production systems in Belgium 760
J. Claeys, C. Coudron, F. Temmerman, E. Formeseyn, E. Dendauw, D. Deruytter
- Assessment of insect frass as biofertilizer for fava bean cultivation under Mediterranean climate conditions 760
S. Khuili, E. Ettaleby, A. Elgharbi, C. I. Rumbos, C. G. Athanassiou
- ### Poster Session 67
- Non-absorption of ferulic acid by the Black Soldier Fly larvae (*Hermetia illucens*) 761
M. Papin, L. Morand-Laffargue, C. Halimi, D. Sabatier, A. Sefah, E. Engel, C. Planche, P. Borel
- Agronomic potential of BSF frass in the cultivation of ryegrass using distinct soils 761
I. Rehan, I. Lopes, D. Murta, F. Lidon, P. Fareleira, C. Esteves, O. Moreira, R. Menino

Session 68. Small ruminant health and welfare aspects

Date: Tuesday 3 September 2024; 14:30 - 17:00

Chair: Campion / Almeida

Theatre Session 68

Welfare Challenges in Small Ruminants 762
invited M. Reeves

Genomic analyses of parasite resistance traits in German crossbred Merino 762
M. Schmid, R. Martin, C. Piefke, V. Stefanski, J. Bennewitz

Health traits as a way to estimate faecal egg count in dairy goats? – preliminary results 763
M. Bernau, S. Goth, H. Eßlinger, L. Hölzle, T. Schilling

Novel mRNA isoforms identified in abomasal tissue of sheep affected by *Teladorsagia circumcincta* gastrointestinal nematode 763
K. Sinhalage, S. Lam, V. Asselstine, A. Cánovas

Investigating farmers and crofters' experiences of unexplained lamb loss in the Highlands and Islands of Scotland 764
F. Mcauliffe, A. McLaren, A. Kent, F. Brülisauer, N. Sargison, D. Mccracken

A longitudinal study into predisposing factors for lamb loss and photosensitisation on a Scottish hill sheep farm 764
F. Mcauliffe, A. McLaren, S. Brocklehurst, F. Brülisauer, N. Sargison, D. Mccracken

Functional Longevity of Cyprus Chios Sheep: Insights from Reproductive Data 765
T. Christofi, S. Panayidou, G. Hadjipavlou

Assessment of Subclinical Mastitis in Cyprus Chios Sheep Using Milk Electrical Conductivity 765
S. Panayidou, G. Hadjipavlou

Metagenomic and Genome-Wide Association Analysis in Ewe Fertility: A Comprehensive Study 766
E. L. Reinoso-Peláez, M. Saura, C. González, M. Ramon, J. H. Calvo, I. Beltrán De Heredia, M. Serrano

Differences in the mammary gland transcriptomes between sheep with different SRLV infection status and TMEM154 E35K genotype 766
E. Grochowska, M. Ibrahim, P. Guz, K. Pokrzywka, Z. Cai, G. Lühken

Identification of recessive lethal mutations in sheep using homozygosity deficiency 767
S. Fabre, M. Ben Braiek

Poster Session 68

Problems related to ear-tagging goats 767
F. Tuytens, L. De Flou, B. Ampe

A pilot study of resistome characterization by using long read whole genome sequencing: from sheep faeces to soil fertilised with composted manure 768
B. Alcalá, M. S. García, J. M. González, B. Lahoz, M. Serrano, E. L. Reinoso-Peláez, T. Juan, M. P. Jimenez De Bagües, R. C. Mainar, C. Calvete, C. M. Marín, J. H. Calvo

Prevalence of gastrointestinal parasitic infections in goat flocks in the Coastal Valley of Lima, Peru 768
D. Godoy Padilla, M. Paredes Chocce, K. Robles Noriega, L. Gómez Puerta, H. Castillo Doloriert

Assessment of ovine reproduction performances under solar grazing in Belgium: a pilot study <i>V. Simon, J. M. Vandeweerd, A. Houtart, V. Carnoy, F. Posschelle, M. L. Vandeweerd, F. Hontoir</i>	769
Effect of progressive weaning on growth performance and cortisol levels of D'man lambs <i>E. Gherairi, M. Atigui, C. Chaouch Aoun, M. Brahmi, L. Doghbri, M. Hammadi</i>	769
Use of whole-genome resequencing for the study of genes associated with small ruminant lentiviruses susceptibility in two Spanish dairy sheep breeds <i>A. Suárez-Vega, M. Vrcan, P. A. S. Fonseca, H. Marina, B. Gutiérrez-Gil, J. J. Arranz</i>	770
Influence of a prepubertal dietary protein restriction on ewes' blood transcriptome in response to an intramammary inflammatory challenge <i>M. Alonso-García, A. Suárez-Vega, R. Pelayo, J. J. Arranz, B. Gutiérrez-Gil</i>	770
Correlation between genetic values for resistance to gastrointestinal nematode infection and growth traits in sheep <i>S. Cunha, F. Schenkel, Á. Cánovas</i>	771
Effect of shearing ewes during the first third of gestation on body weight and testicular development of male offspring <i>C. López-Mazz, M. Regueiro, F. Baldi, A. Bielli, G. Bancharo</i>	771
Identification of infectious abortion issues and the changes in flock performance before and after diagnosis <i>F. P. Campion, M. G. Diskin, T. Coll, C. O. Lynch</i>	772

Session 69. Epigenetics, adaptation and intergenerational transmission

Date: Tuesday 3 September 2024; 14:30 - 16:30

Chair: Kiefer / Keogh

Theatre Session 69

In utero heat stress alters calf phenotype: the role of programming <i>invited G. E. Dahl, J. Laporta</i>	772
Transgenerational effects of heat stress in dairy sheep <i>M. G. Usai, S. Casu, S. Salaris, T. Sechi, S. Miari, G. Mulas, A. Carta</i>	773
Genetic determinism of sperm DNA methylation in French Holstein cattle <i>C. Fouéré, C. Hozé, V. Costes, M. Boussaha, A. Chaulot-Talmon, F. Ali, D. Boichard, H. Kiefer, M. P. Sanchez</i>	773
Genetic evaluations in dairy cattle incorporating an epigenetic source of information <i>A. López-Catalina, A. Reverter, O. González-Recio</i>	774
Separating genomic imprinting effects and maternal effects in birth weights in Large White pigs <i>R. E. Jahnel, N. Reinsch, A. Lepori, C. Kasper</i>	774
Exploring the repertoire of regulatory regions on bovine blood cells methylome <i>G. C.m. Moreira, V. Costes, H. Kiefer, G. Foucras, H. Jammes</i>	775
Transmission of sperm DNA methylation patterns to the embryo in cattle: a genome-wide analysis <i>A. Raja-Ravi-Shankar, A. Chaulot-Talmon, O. Dubois, M. C. Deloche, A. Bonnet, S. Jean-René, L. Laffont, C. Archilla, V. Costes, C. Fouéré, C. Le Danvic, H. Jammes, V. Duranthon, H. Kiefer</i>	775

Identifying the rules for defining CpG epigenetic bovine diversity. A study on public RRBS data from sperm isolated from Montbéliarde and Holstein bulls 776
A. Stella, B. Lazzari, P. Ajmone Marsan, P. Cozzi, E. Capra

Effect of supplementation during the rearing phase on the DNA methylation of Longissimus thoracis muscle in F1 Angus-Nellore cattle at weaning 776
L. Rodrigues, M. Magistri, R. Rodrigues, Y. Madio, G. Pereira, G. Ramirez-Zamudio, O. Machado Neto, L. A. Chardulo, W. Baldassini, R. Curi

Poster Session 69

Comparison between indicine and taurine cattle DNA methylation patterns across different tissues 777
M. M. Passamonti, E. Capra, B. Lazzari, M. Milanese, G. De Paula Nogueira, J. F. Garcia, Y. T. Utsunomiya, A. Stella, P. Ajmone Marsan

Session 70. RES4LIVE: (renewable) energy for livestock, incl free communications on energy and sensors for thermal comfort of livestock

Date: Tuesday 3 September 2024; 14:30 - 17:00

Chair: Maselyne / Odintsov Vaintrub

Theatre Session 70

Energy Use in the EU Livestock Sector: A Review Recommending Energy Efficiency Measures and Renewable Energy Sources Adoption 777
B. Paris, F. Vandorou, D. Tyriss, A. Balafoutis, K. Vaiopoulos, G. Kyriakarakos, D. Manolagos, G. Papadakis

Utilizing energy auditing in intensive livestock farming facilities 778
M. Moraitis, A. Balafoutis, D. Tyriss, D. Manolagos, J. Maselyne, T. Amon, S. Benni, S. Kalogridis

Simulation model for renewable energy systems in livestock barns: three case studies 778
M. Everaert, P. Tegenaw, J. Maselyne, S. Lecompte

The AgEnergy platform – a tool to search and assess fossil-energy-free technologies and strategies 779
A. Balafoutis, M. Moraitis, M. Kaminiaris, Z. Tsiropoulos, D. Manolagos

Sustainable livestock sector under climate transition 779
A. Rontogianni, P. Grammelis

An integrated renewable energy system for the de-fossilization of a commercial swine nursery barn 780
S. Benni, C. A. Perez Garcia, M. Bovo, A. Barbaresi, F. Tinti, P. Tassinari, D. Torreggiani

Heat Pump HVAC System as Part of an Integrated RES System for the Indoor Climate Control of a Laying Hen House 780
D. Tyriss, A. Gkountas, P. Bakalis, M. Goliomytis, D. Manolagos

Geothermal energy concepts for livestock applications, analysis of energy savings, life cycle cost and animal welfare 781
H. Hoes, J. Pauwels, S. Willems

Life Cycle Impact Assessment of an Integrated PVT-BTES-Heat Pump System for a Commercial Swine Farm in Italy 781
D. Tyriss, V. Anestis, S. Benni, F. Tinti, T. Bartzanas, D. Manolagos

- Modeling of thermal status at animal level – Swine and Cattle: A Review 782
L. Rong, J. Maselyne, G. Zhang
- The effect of renewable energy transition on the thermal comfort in a pig farm – animal compartment level experimental investigation 782
P. D. Tegenaw, M. Everaert, M. Aluwé, J. Maselyne, S. Lecompte
- Compact Bio-CNG farm filling fuel production from anaerobic digestion: Hollow fibre permeation and Hybrid compression for technically and economically feasible small scale biofuel production 783
L. Wannasek, D. Tyriss, J. Hoeckner, D. May, C. Ammon, B. Amon, O. Marchand, D. Manolakos, T. Amon

Poster Session 70

- Air temperature measured by embedded sensors adopted by pig transporting vehicles in a scaled compartment model 783
L. Rong, J. K. Kristensen, S. Jung, G. Zhang, C. Kobek-Kjeldager, K. Thodberg, L. Foldager, M. S. Herskin

Session 71. Genetic evaluations: new methods, new species, new proxies

Date: Wednesday 4 September 2024; 8:30 - 11:30

Chair: Miglior / Martin

Theatre Session 71

- Weighted SNP enhances the genomic prediction accuracy for milk citrate predicted by milk mid-infrared spectra of Holstein cows in early lactation 784
Y. Chen, H. Atashi, C. Grelet, N. Gengler
- Estimation of heritabilities and genetic correlations in very large datasets using predictivities within and across traits 784
S. Tsuruta, Z. Trujano, M. K. Hollifield, D. Lourenco
- Multi-breed multi-trait single-step genomic predictions for Holstein and Jersey including crossbred animals 785
R. Bonifazi, S. Aivazidou, J. Ten Napel, M. Schrauf, G. De Jong, J. Vandenplas
- Over-time genetic correlations based on accuracy in GEBV for 18 linear type traits in US Holsteins 785
S. Tsuruta, D. Lourenco, T. Lawlor, I. Misztal
- Genome-wide association study for stature for Holstein cattle based on whole genome sequence, using a mixed linear model 786
D. Słomian, K. Żukowski, M. Skarwecka, K. Kotlarz, J. Szyda
- Exploring dynamics of breeding values under non-random mating and imprinting: A real example with Rubia Gallega breeding program 786
D. López-Carbonell, G. Gorjanc, R. C. Gaynor, J. Altarriba, L. Varona
- Genomic evaluation of litter size variability in Large White pigs 787
G. Cieleń, M. Derks, A. Boshove, E. Sell-Kubiak
- Effect of the number of sibs measured in commercial conditions on the response to selection for body weight in turbot 787
E. Morales-González, B. Villanueva, S. García-Ballesteros, J. Fernández
- Single-step genomic BLUP breeding value estimation in multi population Atlantic Salmon data 788
G. T. Gebregiorgis, T. K. Belay, B. S. Dagnachew, S. A. Boison, T. Meuwissen

Supporting the implementation of genomic selection in a guide dogs' population using simulation <i>A. A. Martin, T. Lewis, J. Schoenenbeck, P. Wiener, D. N. Clements, G. Gorjanc</i>	788
Poster Session 71	
Integrating foreign estimated breeding values into the national single-step genomic evaluation of German beef cattle breeds <i>D. Adekale, Z. Liu, R. Evans, T. Pabiou, R. Reents, D. Segelke, J. Tetens</i>	789
The effect of correlated herd effects on the variance component estimate <i>B. Cuyabano, C. Gondro, G. Rovere</i>	789
Exploring Genetic Trends in Elite Canadian Rams <i>S. Lazaro, H. Oliveira, F. Schenkel</i>	790
Impact of season and genetic line on honeybee gut microbial composition <i>F. Tiezzi, M. G. De Iorio, G. Minozzi</i>	790
Utilisation of dense longitudinal records from automatic milking to assess heat stress effects in dairy cows <i>E. Frenken, K. Brügemann, S. König</i>	791
Genotype by environment interactions for carcass traits in Icelandic sheep <i>J. H. Eiriksson</i>	791
Identifying candidate variants for cumulative egg number by analyzing 1005 fully sequenced layers <i>A. Ni, Y. Sun, H. Bovenhuis, M. P. L. Calus, J. Yuan, Y. Li, Y. Wang, J. Chen</i>	792
Using CADD scores as prior information to improve genomic prediction accuracy in pigs and mice <i>C. Fu, P. Duenk, M. Calus</i>	792
Survival Analysis of Iranian Holstein Dairy Cattle with BLUP and ssGBLUP Using Random Regression Model <i>M. Afrazandeh, A. Rashedi Dehsahraei, F. Nazari, A. Kazemi, A. Akbari Sharif</i>	793
Implementation of longevity genetic index in Italian Jersey <i>A. Fabris, F. Tiezzi, R. Finocchiaro, M. Marusi, M. Cassandro</i>	793
Estimating time-dependent genetic parameters and SNP effects for longitudinal body weights in Holstein cattle <i>Y. Chang, Z. Ma, Y. Wang</i>	794
Study of LSR, proxy for robustness of fattening pig, in several environments and the link with tail biting <i>L. Flatres-Grall, N. Friggens, I. David, G. Lenoir</i>	794
Genetic variation of HSP70.1 locus in Cinisara and Modicana cattle breeds <i>S. Tumino, L. Basiricò, A. Criscione, G. Chessari, S. Bordonaro, D. Marletta, U. Bernabucci</i>	795
Variance components and Genetic parameters for live weight in Dairy heifers in New Zealand <i>A. Ismael, L. Mcnaughton, R. Sherlock, B. Harris, V. Boerner, R. Spelman</i>	795
Single-step genome-wide association for lameness and BCS in Walloon Holstein dairy cows <i>H. Atashi, Y. Chen, H. Hu, K. Wijnrocx, N. Gengler</i>	796
Patterns of occurrence of mendelian errors in snp array genotypes in a src iberian pig population <i>K. D. Arias, N. Formoso-Rafferty, F. Sánchez-Esquiliche, L. El-Ouazizi El-Kahia, C. Ojeda-Marin, M. A. Pérez-Cabal, F. Goyache, J. P. Gutiérrez, I. Cervantes</i>	796

GWAS for productive traits in Italian Alpine and Saanen goats <i>A. Negro, A. Bionda, M. Cortellari, A. Cesarani, P. Fresi, N. P. P. Macciotta, S. Grande, S. Biffani, P. Crepaldi</i>	797
Exploring the genomic basis of shank and eggshell coloration in Italian native chicken breeds <i>F. Perini, F. Cendron, E. Lasagna, M. Cassandro, M. Penasa</i>	797
RESILTROUT investigates the trout genome to identify marker associated to resilience to diseases and heat stress <i>G. Riccioni, S. Colussi, L. Fariano, V. Valenzano, P. L. Acutis, E. Bozzetta, C. Ghittino, A. Dondo, M. Prearo, P. Pastorino, P. Ajmone Marsan, L. Colli</i>	798
Culling reasons for end of career dairy cows in northern Italy <i>F. Fusi, S. Gabriele, T. Bernardo, G. Valli, L. Bertocchi, V. Lorenzi</i>	798
Prioritizing markers for stayability in beef cattle and its impact on genomic predictions <i>N. Leite, A. Garcia, R. Veroneze, G. Menezes, D. Lourenco, F. Silva</i>	799
Genomic study of milk performance in fat-tailed and thin-tailed Mediterranean dairy sheep <i>A. Argyriadou, S. Michailidou, S. Vouraki, G. Banos, G. Arsenos</i>	799
Preliminary investigation of the reaction norm model for the milk yield in Taiwan's Dairy Herd Improvement data <i>Y. X. Lan, K. H. Lin, P. A. To, E. C. Lin</i>	800

Session 72. Methods in prediction of genetic merit and assessment of genetic diversity

Date: Wednesday 4 September 2024; 8:30 - 11:30

Chair: Egger-Danner / Tenhunen

Theatre Session 72

Including QTL information in GBLUP and machine learning models for genomic prediction <i>J. Yang, M. Calus, T. Meuwissen, Y. Wientjes, P. Duenk</i>	800
A Nonlinear Recursive Model for Predicting Calving Difficulty and Birth Weight in Cattle <i>L. Varona, D. López-Carbonell, C. Hervás-Rivero, M. Sánchez, M. Hermida, P. Martínez, J. Altarriba</i>	801
Effect of genotyping density on the detection of runs of homozygosity and heterozygosity <i>L. Falchi, A. Cesarani, A. Criscione, J. Hidalgo, A. Garcia, S. Mastrangelo, N. P. P. Macciotta</i>	801
Exploiting properties of the H-Matrix as an aid to identify Metafounders <i>C. Anglhuber, C. Edel, E. C. G. Pimentel, R. Emmerling, K. U. Götz, G. Thaller</i>	802
The effective number and profile of causative markers in GWAS <i>I. Pocrnic, D. A. L. Lourenco, I. Misztal</i>	802
Modeling unknown parents in single-step genomic BLUP: Metafounders vs. unknown parent groups in a simulated cattle population <i>J. Himmelbauer, H. Schwarzenbacher, C. Fuerst, B. Fuerst-Waltl</i>	803
Confidence intervals for validation statistics with data truncation in genomic prediction <i>M. Bermann, A. Legarra, A. Alvarez Munera, I. Misztal, D. Lourenco</i>	803

Multibreed single-step GBLUP evaluations for fertility traits in US dairy cattle <i>J. M. Tabet, D. Lourenco, M. Bermann, I. Misztal, P. Vanraden, A. Legarra</i>	804
Comparative transcriptomic profiling of mRNA isoforms linked to feed efficiency in Holstein dairy cattle <i>F. Muhammad, S. Lam, V. Asselstine, C. Baes, F. Miglior, F. Schenkel, Á. Cánovas</i>	804
Exploring modelling approaches to address the dynamic nature of animal health <i>P. Martin, G. Foucras, R. Muñoz-Tamayo, N. C. Friggens</i>	805
Poster Session 72	
The impact of truncating historical data on the prediction ability of selection candidates <i>I. Granado-Tajada, E. Ugarte</i>	805
Genetic diversity of German and Irish Beef cattle breeds <i>D. Adekale, A. Bloom, R. Evans, D. Segelke, J. Tetens</i>	806
An evaluation of using Runs of Homozygosity to detect Identity by Descent <i>O. B. Wæge, T. Druet, P. Berg, T. Meuwissen</i>	806
Screening continent-wide genomic diversity for local adaptation reveals strong signals of spatially divergent selection in European sheep <i>M. Barbato, E. Vajana, O. Selmoni, E. Somenzi, M. M. Passamonti, M. Tixier-Boichard, B. Lazzari, L. Colli, A. Stella, P. Ajmone Marsan</i>	807
Genetic markers to differentiate domestic pigs and wild boars <i>A. Koseniuk, G. Smolucha, M. Natonek-Wiśniewska, A. Radko</i>	807
The usefulness of a panel of STR markers recommended for pig identification for pork traceability <i>A. Radko, A. Koseniuk, G. Smolucha</i>	808
Species identification of cervid using common pair of primers <i>M. Natonek-Wiśniewska</i>	808
Detection of heterozygosity-rich regions in sheepdogs and cattedogs <i>A. Halvoník, N. Moravčíková, G. Mészáros, M. Chalupková, R. Kasarda</i>	809
Using genomic and transcriptomic information for complex trait prediction <i>V. Haas, R. Wellmann, M. P. L. Calus, J. Bennewitz</i>	809
Accelerating Average Information REML: An algorithm using incremental model for (co)variance component estimation in the genomic Era <i>H. Gao, E. Mäntysaari, M. Lidauer, R. Thompson, I. Strandén</i>	810
A sizable putative inversion detected in the chicken genome <i>S. Qanbari, P. Shahsavari, S. Casillas, J. Martinez-Urtaza, A. Barbadilla</i>	810
Uncovering the architecture of production-driven introgression in Cinisara cattle breed <i>V. Floridia, A. Bionda, M. Cortellari, A. Amato, V. Lopreiato, E. D'Alessandro, P. Crepaldi, L. Liotta, M. Barbato</i>	811
The deconvolution of bulk rat brain cell types using scRNA-seq data as reference <i>K. Żukowski, W. Hunter, B. Szymczyk, M. Świątkiewicz, M. Oczkowicz</i>	811
Genetic structure and hybridization between red and sika deer in northern Italy <i>M. Tolone, S. Riggio, E. Mori, S. Mastrangelo, P. Galluzzo, S. Migliore, M. Baratti, G. R. Loria, M. Ferri, M. T. Sardina, F. De Filippi</i>	812

Influence of inbreeding on fertility traits in Braunvieh and Original Braunvieh cows <i>A. Bonifazi, M. Rust, F. Schmitz-Hsu, H. Jörg, A. Burren</i>	812
Phenotypic characterisation of Sardinian local cattle breed <i>F. Sirtori, M. C. Fabbri, A. Confessore, A. Crovetto, R. Bozzi</i>	813
Dissecting the genetic basis of pigmentation anomalies in flatfish through imputed genotypes <i>D. Costas-Imbernón, S. Otero, P. García-Fernández, P. Touriñán, R. Tur, D. Chavarrías, J. Rotllant, M. Saura</i>	813
DHGLMF90: a tool for estimating genetic heterogeneity of residual variance using the double hierarchical generalized linear models <i>A. Alvarez Munera, M. Bermann, N. Ibáñez Escriche, C. Casto Rebollo, I. Misztal, D. Lourenco</i>	814
Influence of inbreeding on semen parameters in Swiss pig breeds <i>A. Burren, I. Häfliger, A. Hofer, N. Khayat-zadeh</i>	814

Session 73. Targeting ecosystem services provision by grasslands and protein self-sufficiency in cattle production

Date: Wednesday 4 September 2024; 8:30 - 11:30

Chair: Frigga / Probo

Theatre Session 73

Multicriteria performance of five grass-based cattle farms along a gradient of stocking rate <i>invited B. Dumont, F. Joly, C. Blaix, J. Bloor, M. S. Corson, O. Huguenin-Elie, H. M. Van Der Werf</i>	815
Agroecological transition may reduce the fat content of Fourme de Montbrison cheese <i>M. Coppa, M. Chabrut, A. Passel, B. Martin</i>	815
Meat production from organic suckler cattle fed on grass <i>B. Sepchat, M. Barbet, M. Kentzel</i>	816
Predation on cattle: between the wolf's responsibility and the absence of damage reports <i>M. Virapin, S. Jabouille, G. Brunschwig, E. Sturaro</i>	816
Ways to achieve protein autonomy in cattle feeding <i>invited F. Schori, I. Morel, T. Haak, O. Huguenin-Elie</i>	817
Effect of concentrate crude protein and amino acid supplementation on milk production of mid-lactation, grazing dairy cows <i>R. Van Emmenis, M. Chaize, R. Fitzgerald, M. Dineen</i>	817
Green-cut sorghum fed indoor to dairy cows: a strategy to mitigate herbage shortages? <i>E. Manzocchi, L. Viry, L. Eggerschwiler, B. Hayoz, P. Schlegel, F. Dohme-Meier</i>	818
Effect of dietary forage proportion and crossbreeding on dairy cows' feeding efficiency and methane emissions <i>S. Ormston, T. Yan, X. Chen, A. W. Gordon, K. Theodoridou, S. Huws, S. Stergiadis</i>	818
Emission measurements in a naturally ventilated dairy housing: How does the crude protein level of the diet affect ammonia and nitrous oxide emissions? <i>S. Schrader, K. Zeyer, J. Mohn, M. Zähler</i>	819

Willow (*Salix* spp) tannin-rich tree fodder: The potential to reduce methane and improve productivity of grazing beef cattle 819
J. Thompson, S. Stergiadis, O. Cristobal-Carballo, T. Yan, F. Lively, J. Gilliland, S. Huws, S. Cameron, K. Theodoridou

Poster Session 73

Virtual Fencing for alpine grazing and resource conservation: opportunities and challenges 820
A. Confessore, C. Aquilani, L. De Guttry, N. Staglianò, G. Argenti, C. Dibari, S. Rainis, C. Pugliese

Effect of silage species and concentrate crude protein level on early-lactation milk production in grazing dairy cows 820
M. Chaize, M. Egan, R. Fitzgerald, R. Van Emmenis, A. Y. Ikoyi, N. Byrne, T. F. O'Callaghan, M. Dineen

Protein self-sufficiency and nitrogen use efficiency in beef-on-dairy crossbred bulls 821
I. Morel, F. Dohme-Meier, R. Siegenthaler, B. Hayoz, C. Xavier, S. Lerch

Milk production of Holstein cows grazing fescue at different defoliation intensities 821
C. Dorao, A. Van Der Peet, D. A. Mattiauda, P. Chilibroste, G. Menegazzi

Meat quality of extensively reared beef cattle in Greece 822
V. Papanikolopoulou, S. Vouraki, S. Priskas, S. Dokou, V. Fotiadou, A. Tsitsos, I. Dalla, G. Arsenos

Toasted Faba Bean and wheat mixture as an alternative protein source in a low protein diet for dairy cattle 822
L. Vandaele, T. Van Den Bossche, J. De Boever, K. Goossens, D. Van Wesemael

Session 74. From horse welfare to social license to operate

Date: Wednesday 4 September 2024; 8:30 - 11:30

Chair: Evans / VIAL / Neveux

Theatre Session 74

Animal Welfare and Animal Production Systems, the Case of Horses 823
R. Evans

Mind the Gap: Leveraging Human Behaviour Science to improve Animal Health and Welfare 823
invited T. Furtado

The end of life of equidae in France 824
V. Deneux - Le Barh

Enhancing Health and Welfare of Non-for-human-consumption (non-DPA) Horses: An Online Investigation 824
G. Matteucci, F. Cerasoli, L. Iannetti, P. Migliaccio, M. Podaliri Vulpiani

Swedish dairy farmers' and trotting-horse trainers' perceptions of animal welfare inspections 825
F. Lundmark Hedman, I. R. Ewerlöf, J. Frössling, C. Berg

Horse welfare in semi-extensive system: the case of the Italian Catria horse breed reared for meat production 825
F. Raspa, E. Valle, C. Bordin, L. Ozella, D. Bergero, M. Tarantola, A. Necci, L. Bertocchi, N. D'Avino, M. Paniccà, P. De Palo, C. Forte

Does the dominance hierarchy in a large group of horses influence locomotor activity and area utilization? 826
G. Weidling, J. Krieter, R. Lübben, I. Czycholl

Equids welfare in Italian traditional equestrian events: comparison between 2022 and 2023 826
S. Gabriele, T. Bernardo, G. Valli, V. Lorenzi, F. Fusi, L. Bertocchi

Quantifying the effect of loading density and gender on selected blood components and carcass bruises of slaughter horses 827
N. Čobanović, M. Radaković, I. Vičić, B. Suvajdžić, N. Grković, N. Karabasil

Poster Session 74

Is observation of horses when they are outdoors adequate for detecting stereotypic individuals? 827
E. K. Jastrzębska, K. Wytrzązek, B. Earley, A. Górecka-Bruzda

The influence of selected factors on the behavior of horses outside the stable during different seasons 828
E. Jastrzębska, A. Pawłowska

Session 75. Advances in non ruminant nutrition, Part 2

Date: Wednesday 4 September 2024; 8:30 - 11:30

Chair: Alvarez-Rodriguez / Kar

Theatre Session 75

Effect of starch source in pelleted diets on growth performance of pigs 828
A. Agouros, L. Montagne, M. Le Gall, K. Quéméneur, E. Labussière, N. Quiniou

Empirical validation of implementing high energy in soybean meal: soybean oil equivalence of soybean meal in diets fed to growing pigs 829
J. Ibagón, S. A. Lee, H. Stein

Dietary fiber supplementation during gestation promotes placental angiogenesis by gut microbiota regulation of serotonin signaling pathway in sows 829
Y. Li, D. Wu, N. Everaert

Effects of high fibre on gas production and net energy in diets fed to group-housed pigs 830
S. A. Lee, D. Rodriguez, H. Stein

A review on the lysine requirements of weaned piglets 830
S. Goethals, P. Bikker, J. H. Rijpert, B. Ampe, J. W. Spek, S. Millet

Estimating the efficiency of amino acid use using chemical composition data from growing pigs 831
M. Lautrou, G. Bee

Optimal protein concentration in diets for multiparous sows during the transition period 831
J. Johannsen, M. Sørensen, T. Bruun, C. Farmer, T. Feyera

Evaluation of the soybean replacement as protein source with Mediterranean legumes in the performance of growing pigs 832
M. Rodríguez, I. Fernández-Figares, R. Nieto, J. Morales

Sustainable protein sources field peas and blue lupines replace soy protein in piglet diets 832
A. Van Enckevort, A. Sijmonsbergen, I. Van As

Metabolism of phytoestrogens in red clover and effects on sow reproduction 833
E. Vu, J. Chagas, T. Lundh, Y. Sjunnesson, M. Presto Åkerfeldt

Poster Session 75

A comparison of Devamine and traditional protein sources on the post-prandial release of blood metabolites in weaned pigs 833
M. Quinn, G. Brychkova, M. D. Scott, J. M. O'Connell

Seaweed formulation enhances sow performance through reduced stillborn piglets and improved vitality 834
M. Bouwhuis, T. Gall, S. O'Connell

The Microbial Profiling of the Boschveld Chickens Fed Sorghum-Based Diets 834
N. Nemukonden, C. A. Mbajjorgu, T. Mafuna, M. Mabelebele

Spirulina as alternative protein source in diets for gestating and lactating sows – effects on litter characteristics and piglet growth 835
K. Giller, P. Tschannen, W. Pendl, D. Kümmerlen, M. Terranova

Effect of consumption of A1 and A2 milk, biofortified or not, on weight gain and carcass yield of piglets 835
D. C. M. Fonseca, A. N. Vasconcellos, L. M. Oliveira, J. G. Oliveira, T. H. Silva, A. Saran Netto, A. M. C. Vidal

Golden mussels meal with varying particle sizes in broiler chicken diets 836
D. Jablonski, A. P. G. C. Costa, M. S. D. Pavlak, N. Rohloff Junior, G. L. S. Tesser, C. Eyng, C. Kaufmann, R. V. Nunes

Digestibility assessment of various protein sources in cat feed 836
H. J. Jang, J. H. Seo, E. R. Oh, S. H. Lee, Y. B. Park, Y. Kim

Session 76. Advances in ruminant nutrition, Part 2

Date: Wednesday 4 September 2024; 8:30 - 12:15

Chair: Stergiadis / Ranilla García

Theatre Session 76

Bioactive compound research in ruminant nutrition: From Reductionism to Holism 837
invited R. Khiaosa-Ard

The impact of probiotic live yeast in a barley grain-based diet on rumen microbiome and histology of artificially reared lambs 837
A. Mavrommatis, P. Cremonesi, M. Severgnini, C. Christodoulou, K. Petropoulos, L. Dunière, B. Castiglioni, B. Kotsampasi, C. Balaskas, E. Chevaux, E. Tsiplakou

Rutin and Quercetin Biotransformation in Ruminants Revealed by Molecular Networking 838
D. Aldian, L. D. Harisa, H. Tomita, K. Tian, A. Iwasawa, M. Yayota

Preliminary study on some innovative rumen-bypass micro-encapsulation techniques for essential oils 838
A. Maggiolino, N. Denora, A. Lopodota, A. Di Grigoli, P. Marialetizia, C. Maria Giovanna, M. Rosaria, P. De Palo

How can drinking water may be used to increase milk yield? <i>Y. Ben Meir, D. Espinoza</i>	839
Water intake and productivity responses of lactating dairy cows offered saline drinking water <i>L. Managos, S. Agenäs, M. Åkerlind, P. Peetz Nielsen, A. Jansson</i>	839
Does Exhalomics Reveal the Dynamics of Rumen Fluid Metabolites in Dairy Cows? <i>M. Z. Islam, S. Räisänen, J. Lan, Y. Li, F. Wahl, R. Zenobi, E. C. Slack, S. Giannoukos, M. Niu</i>	840
Is tributyrin a good replacement for sodium butyrate to stimulate epithelial growth in sheep? <i>S. Świerk, M. Przybyło, K. Szczepanik, P. Górka</i>	840
Identification of natural methane inhibitor based on molecular docking techniques and evaluation its effect on rumen fermentation and prokaryotic communities in vitro <i>Y. Liu, X. Li, Y. Tu</i>	841
Supplemental rumen-protected methionine and lysine increase energy-corrected milk production by early postpartum Holstein cows <i>M. M. Efil, F. C. Cardoso, L. Bahloul, J. K. Drackley</i>	841
Dietary guidelines for Zn, Cu, Mn, and Fe in bovines, by integrating net requirements, native dietary occurrence, and homeostatic regulation boundaries <i>J. B. Daniel, J. Martín-Tereso</i>	842
uNDF240 and fiber digestibility as important parameters for balancing diets: comparison of wheat hay vs. wheat straw in high producing dairy cows <i>J. De Matos Vettori, D. Cavallini, L. Mammi, I. Fusaro, A. Formigoni</i>	842
Poster Session 76	
Effects of dietary supplementation of oregano essential oil on performance, rumen microbiota and morphometrics of feedlot cattle <i>S. Dokou, A. Tsisos, I. Stylianaki, V. Economou, I. Giannenas, M. E. Filippitzi, G. Arsenos</i>	843
Rumen fermentation and predicted methane emissions from dairy cows fed <i>Ascophyllum nodosum</i> <i>N. Sari, K. Theodoridou, M. Terre, K. Kliem, S. Huws, N. Prat, P. Ray, C. Rymer, S. Stergiadis</i>	843
Effects of different feed processing forms on in vitro rumen fermentation characteristics <i>H. R. Park, D. Lee, B. Chae, I. Cheon, E. Jeong, Y. Mun, C. Kim, H. Kwon, N. J. Choi</i>	844
Effects of combination of garlic powder/attapulgit hybrid mixture and citrus by-product on performance and enteric methane production in Hanwoo steers <i>R. Bharanidharan, B. M. Tomple, R. Ibidhi, S. H. Beak, J. H. Lim, A. Jo, H. K. Kim, K. H. Kim</i>	844
Short-chain fatty acids transporters expression in ruminal epithelium of growing rams depends on the source of butyrate used in a diet <i>S. Świerk, M. Przybyło, J. Flaga, P. Górka</i>	845
Relationship between the natural 15N enrichment of plasma and feed conversion efficiency in fattening young bulls <i>D. Villalba, G. Cantalapiedra-Hijar, C. Chantelauze, I. Casasús, M. Blanco, E. Molina</i>	845
Effects of feeding rumen-protected lysine on milk performance in lactating Holstein dairy cows <i>V. Sáinz De La Maza-Escolà, G. Giovagnoni, G. Petroni, R. Paratte, G. Bonacini, A. Piva, E. Grilli</i>	846

Evaluation of plasma parameters in fattening beef cattle fed hexane vs 2-methyloxolane defatted soybean meal <i>C. J. Garcia-Vazquez, V. Menoury, M. Gauthier, L. Salis, A. Ferlay, P. Nozière</i>	846
Modulatory effects of HMTBa and sea buckthorn oil on milk fat depression in dairy sheep <i>E. Barrio, P. G. Toral, R. Gervais, M. Musati, A. Della Badia, D. R. Yáñez-Ruiz, G. Hervás, P. Frutos</i>	847
Impact of Tall Fescue defoliation intensity on energy expenditure of mid-lactation dairy cows <i>H. Bueno-Larroque^{1,2}, B. Morales, G. Menegazzi, D. Mattiauda, P. Chilibroste, M. Carriquiry</i>	847
The effect of energy and nitrogen source and their interaction on rumen fermentation and methane formation in a RUSITEC system <i>Y. X. Zhang, S. L. Amelchanka, V. Hanke, W. T. Yip, R. Peng, Y. Li, M. Niu, S. E. Räisänen</i>	848
Evaluation and development of analytical procedures to assess buffering capacity of ruminant feed buffers <i>T. Higgins, P. Quille, E. Neville, K. Regan, S. O'Connell</i>	848
An in vitro alternative to the in sacco method to determine ruminal starch degradation <i>M. P. Arias-Benavides, R. Delagarde, P. Nozière, G. Maxin</i>	849
Meta-analysis explores factors affecting milk component responses to metabolizable methionine fortified evaluated using NRC2001 <i>N. Whitehouse, L. Bahloul</i>	849
Meta-analysis explores factors affecting milk component responses to metabolizable methionine fortified evaluated using CNCPS <i>N. Whitehouse, L. Bahloul</i>	850
Energy requirements are affected by posture and activity in dairy cows <i>D. Talmón, G. Menegazzi, A. Jasinsky, M. Carriquiry</i>	850
Metabolic status of feed restricted grazing dairy cows during early and mid-lactation <i>M. Carriquiry, A. L. Astessiano, P. Chilibroste, D. Custodio, G. Ortega, M. Garcia-Roche</i>	851
Evaluating the relationship between undigestible neutral and acid detergent fiber and implications for cell wall components in forages <i>A. B. P. Fontoura, C. Heffernan, P. A. Lapierre, A. C. Benoit, M. E. Van Amburgh</i>	851
Post-grazing sward height affects resting time on pasture <i>D. Talmón, G. Menegazzi, A. Jasinsky, M. Carriquiry</i>	852
Effects of anthocyanin-rich Napier grass silage in growing goats <i>P. Paengkoum, S. Paengkoum, P. Suong</i>	852
Comparison of dietary digestibility of dairy ewes and goats during early lactation <i>M. F. Lunesu, M. Decandia, G. Molle, V. Giovanetti, R. Rubattu, A. Cannas</i>	853
The supplementation with Omega 3 fatty acids enhances the reproductive performance in dairy cattle <i>J. López-Paredes, M. Cadie, M. Puyalto, J. J. Mallo</i>	853

Session 77. Improving animal welfare by optimising nutrition/feeding behaviour, Part 2

Date: Wednesday 4 September 2024; 8:30 - 11:00

Chair: Gottardo / Kreuzer-Redmer

Theatre Session 77

- Feeding dairy cows in the morning or in the evening during the summer season: effects on milk production, feeding behavior, and rumen activity 854
L. Cattaneo, M. M. Passamonti, L. Benedetti, M. Sfulcini, F. Piccioli-Cappelli, E. Trevisi, A. Minuti
- Effects of residual sward height on grazing behaviour and milk production of dairy cows 854
G. Menegazzi, C. Dorao, D. Mattiauda, C. Genro, W. Gerrits, J. Dijkstra, P. Chilibroste
- Effect of feeding system on lying behavior of mid-lactation dairy cows 855
A. Jasinsky, D. Talmón, M. Carriquiry
- The effect of mineral-vitamin free choice blocks on transition cows' feeding behavior and health 855
G. Esposito, M. Simoni, T. Danese, G. Krabbe, R. Pitino, G. Mantovani, F. Righi
- Mineral-vitamin free choice blocks impact on productivity and oxidative status of transition and lactating cows 856
M. Simoni, T. Danese, G. Esposito, R. Pitino, G. Mantovani, P. Kyriakaki, A. Mavrommatis, E. Tsiplakou, F. Righi
- Changes in plasma metabolic profile of long-transported Charolais young bulls 856
M. Santinello, I. Lora, C. Villot, G. Cozzi, M. Penasa, E. Chevaux, B. Martin, A. Guerra, M. De Marchi
- Effects of rumen protected dry grape extract supply on milk performance, body temperature, and breathing behavior of Simmental cows during heat stress 857
A. Amato, C. Cavallo, E. Trevisi, A. Minuti, H. Bui, P. Engler, M. Forleo, L. Liotta, V. Lopreiato
- Could the inclusion of grape pomace in the diet of dairy ewes in late gestation influence the quality of colostrum and its microbiota? 857
A. Nudda, S. Carta, D. Licastro, N. P. Mangia, T. Stefaniak, J. Bajzert, G. Pulina

Session 78. Collaboration in experimental research for sustainable pig production (with PIGWEB).

Date: Wednesday 4 September 2024; 8:30 - 11:30

Chair: Bee / Millet

Theatre Session 78

- Application of individual piglet birth weight and within-litter birth weight variation as proxy predictors for pre-weaning survival 858
J. M. Mbuthia, C. Kasper, M. Zenk, G. Bee, C. C. Metges, G. Daş
- Deciphering the Impact of Feeding Behavior on Growth Performance and Nutrient Efficiency in Grower-Finisher Pigs 858
V. Halas, H. Nagyné Kiszlinger, G. Kövér, G. Bee
- Optimizing lactation performance of hyperprolific sows through *Scutellaria baicalensis* supplementation 859
D. Gardan-Salmon, A. Hamard, F. Robert, J. V. Nørgaard, T. Feyera

Piglet response to L-leucine supply during the post-weaning phase depends on piglet birth weight <i>A. Simongiovanni, C. De Cuyper, E. Kowalski, S. Millet</i>	859
Oro-caecal transit time measured with the lactose-13C-ureide breath test in pigs fed high and low fiber diets <i>M. Cavalleri, Q. L. Sciascia, S. Goers, S. Dänicke, C. C. Metges</i>	860
Bones and meat quality of pork from early and late immunocastrated male pigs <i>I. Božičković, R. Savić, D. Radojković, N. Panella-Riera, A. Brun, M. Font-I-Furnols</i>	860
The space allowance affects selected pork physicochemical traits of native Polish Pulawska pig breed <i>A. Ludwiczak, J. Składanowska-Baryza, A. Zaworska-Zakrzewska, M. Kasprzewicz-Potocka, W. Goździejewska, D. Łodyga, E. Sell-Kubiak</i>	861
People want research to improve pig welfare & health, says survey <i>J. Kleinig, J. Van Milgen</i>	861
Conceptualisation of “animal discomfort” using the domesticated pig (<i>Sus scrofa</i>) as model <i>G. Franchi, M. Bagaria, H. Boswijk, E. Fàbrega, M. Herskin, R. Westin</i>	862
Towards a self-initiated and automated judgement bias task for pigs <i>I. Reimert, J. E. Bolhuis, A. F. Ipema, M. A. Van Marwijk, S. Hintze, V. Neville, M. Mendl</i>	862

Poster Session 78

State-of-the-art heart rate sensors for grouped-housed pigs <i>B. Callens, M. Everaert, J. Maselyne</i>	863
--	-----

Session 79. Welfare issues for small ruminants

Date: Wednesday 4 September 2024; 8:30 - 11:30

Chair: Almeida / Campion

Theatre Session 79

From pen to pasture: customizing welfare protocols for small ruminants in different production systems <i>invited M. Almeida</i>	863
Effect of suckling method on the response of lambs to social isolation and weaning <i>L. Lachemot, S. Serhan, X. Such, J. Piedrafita, G. Caja, A. A. K. Salama</i>	864
Supporting breeders to better manage animal pain: the case of sheep tail docking <i>A. Aupiais, M. Doucet, D. Gautier, L. Sagot, S. Lavigne, U. Jean-Louis, N. Devriendt, P. Venet</i>	864
Ovine lameness in Ireland – An assessment of farmer management practices via survey <i>J. W. Delaney, E. T. Kelly, J. W. Angell, F. P. Campion</i>	865
The impact of lameness on the body condition score of ewes on three Irish farms <i>J. W. Delaney, E. T. Kelly, J. W. Angell, F. P. Campion</i>	865
Relationships between on-farm animal welfare assessment and milk yield in dairy sheep farms <i>L. Turini, E. Gasparoni, A. Mantino, G. Conte, A. Silvi, G. Foggi, M. Mele</i>	866
Tree shade reduces heat stress in pregnant ewes <i>K. Mafunga, K. Dzama, A. J. Scholtz, S. W. P. Cloete</i>	866

Human perception of the vocal expression of the emotions in goats 867
S. Celozzi, M. Battini, S. Ntalampiras, L. A. Ludovico, G. Presti, E. Prato Previde, S. Mattiello

Is welfare of sheep kept in marginal areas influenced by seasonal climatic condition? 867
E. Atallah, M. Comin, F. Cerasoli, G. Saluti, M. Ricci, R. Rosato, G. Centorotola, M. Podaliri, L. Iannetti, E. Dalla Costa

Poster Session 79

Development of an operational tool for assessing and managing the welfare of sheep and goats on farms in France 868
A. Aupiais, M. Marois, R. De Crémoux, U. Jean Louis, M. Legris, R. Faugeras, M. A. Billiez, X. Boivin, M. M. Mialon, D. Gautier, L. Sagot, C. Bailly, M. Berthelot

On farm animal welfare self-assessment tool for dairy goats 868
M. Romero-Huelva, A. Gomez, I. Rivelli, J. Fernandez-Alvarez, D. Yanez-Ruiz

Effects of drinking diluted seawater on behavioral and physiological responses in crossbred dairy goats under tropical condition 869
T. Nguyen, K. V. Truong, K. K. T. Nguyen, N. T. Nguyen, N. Chaiyabutr, S. Thammacharoen

The influence of shearing on the growth performance of feedlot lambs under high temperatures 869
T. Brand, P. Theron, S. Cloete, B. Van Zyl

Parity, lamb weight, and litter size influence the delivery stance of ewes: standing or lying 870
M. Regueiro, E. Jorge-Smeding, C. López-Mazz

Animal welfare and microbiological meat safety at religious and conventional slaughtering: a comparative study 870
L. Iannetti, T. Bogdanova, S. Rota Nodari, S. Amiti, G. Finazzi, G. Matteucci, V. Di Marzio, M. Ferrara, G. Centorotola, L. Di Marcantonio, S. Scattolini, V. A. Acciari, M. Podaliri Vulpiani

Session 80. Technologies for GHG emission mitigation on farm: options, opportunities and challenges

Date: Wednesday 4 September 2024; 8:30 - 11:45

Chair: Salami

Theatre Session 80

Reducing Methane Emissions: A Win-win Solution for Climate and Livestock Agrifood Systems 871
invited A. Uwizeye, D. Wisser

The integration of manure, soil, diet and animal management to reduce GHG emissions on farm 871
invited K. Johnson

New York dairy greenhouse gas mitigation: progress made and future potential 872
O. Godber, K. Czymmek, K. Workman, Q. Ketterings

Trade-offs between methane and ammonia emissions after nutritional interventions in dairy cows 872
G. Miller, C. A. Duthie, J. Newbold

Milk mid-infrared prediction of methane emission using handheld laser methane detector in smallholders' dairy cattle 873
A. Ehsani, S. Meseret, O. Mwai, R. Mrode

Assessment of methane emission on a Simmental dairy farm <i>C. Pavanello, A. Romanzin, M. Franchini, M. Corazzin</i>	873
Using GWP* to assess the livestock emission impact: the Italian case study <i>F. Correddu, M. F. Lunesu, M. F. Caratzu, G. Pulina</i>	874
Development of a Simplified Tool for Assessing Climate Change Impact in Dairy Cattle Farms <i>G. Gislon, M. Zucali, V. Ferrari, M. Marusi, A. Sandrucci, A. Tamburini, S. Mondini, R. Finocchiaro, M. Cassandro</i>	874
Development of Mitigation Engine for specialized dairy farms <i>S. H. Pishgar-Komleh, T. Vellinga</i>	875
Inclusion of a robust estimation method of carbon soil sequestration in the carbon footprint analysis of dairy sheep farms <i>M. F. Caratzu, M. F. Lunesu, F. Correddu, S. Sechi, G. Pulina</i>	875

Poster Session 80

A preliminary overview of methane emissions in the Italian dairy sector using DHI data <i>F. Luisi, G. Ferronato, M. Moliso Mekonnen, M. Fioretti, L. Pascarella, C. Melilli, R. Negrini</i>	876
Circles EU project: Slurry treatment with a protocol of bioactivators can reduce air and wastewater pollution in growing pigs <i>P. Trevisi, F. Correa, N. Secchi, S. Viridis, M. V. Graziosi, D. Luise</i>	876
Methane emissions of two contrasting pasture-based dairy systems in Uruguay <i>C. Loza, G. Menegazzi, C. Dorao, M. Cerón, D. Custodio, C. Genro, V. Ciganda, P. Chilibroste, J. Gere</i>	877
Exploring Greenhouse Gas Emissions in Sub-Saharan Africa: Are Camels a Neglected Source? <i>L. Lanzoni, J. Otte, D. Wisser, G. Tempio, G. Cinardi</i>	877
Analyzing Seasonal Emissions from Goat and Cow Manure in Cyprus <i>K. Philippou, K. Kaikiti, A. Savvides, A. Phokas, G. Themistokleous, G. Hadjipavlou, D. Sparangis</i>	878

Session 81. Safety, sustainability and welfare in the insect

Date: Wednesday 4 September 2024; 8:30 - 11:30

Chair: Deruytter / Smetana

Theatre Session 81

Decision Support System for Insects Production <i>A. Bhatia, N. Mouhrim, A. Green, D. Peguero, A. Tonda, A. Mathys, V. Heinz, S. Smetana</i>	878
Safe insect rearing on residual streams <i>E. F. Hoek- Van Den Hil, N. Meijer, A. Antonis, M. Bruins, F. Schaafstra, T. Veldkamp, M. Appel</i>	879
Determination of microplastics in reared black soldier fly larvae (<i>Hermetia illucens</i>) and yellow mealworms (<i>Tenebrio molitor</i>) using polarized light optical microscopy <i>N. Dam, G. Van Der Borg, N. Meijer</i>	879
Chemical and microbiological safety of black soldier fly larvae reared on sewage and industrial sludges <i>W. Tao, K. Van Dongen, S. Naser El Deen, D. Van De Kamer, K. Van Rozen, P. Van Wikselaar, E. Hoek Van Den Hil</i>	880
Investigating an invisible enemy: the problem of ammonia in insect farming <i>F. Boatta, C. Brouzes, A. Dignan, J. Lucas, I. Oubrier, D. Deruytter, C. Coudron</i>	880

Sustainability of complex insect production chains: from food waste to feed and food <i>S. Smetana, D. Ristic, V. Khieya, J. Petrusan, V. Heinz</i>	881
Response to mechanical stress in yellow mealworms (<i>Tenebrio molitor</i>) with regards to welfare considerations <i>T. Bailly-Bechet, E. Looren, Q. Li, K. Paul, E. Sellem, A. Rios, T. Lefebvre</i>	881
Enhancing Poultry Sustainability: Black Soldier Fly Effects on Laying Hen Welfare and Microbiota <i>A. Cattaneo, F. Cattapan, R. Malinverni, R. Rosà, D. Santori, S. Cucci, E. Macchi, I. Manenti, M. Meneguz, E. Sezzi, S. Dabbou</i>	882
Welfare assessment of managed honey bee colonies: a preliminary study <i>C. Montagnin, M. Frasnelli, F. Fusi, G. Formato, F. Mutinelli, C. Roncoroni, T. Bernardo, S. Gabriele, G. Valli, L. Bertocchi, V. Lorenzi</i>	882
Scaling Up Bioremediation of Livestock Manure Using Black Soldier Fly Larvae (<i>Hermetia illucens</i>) <i>C. Ligeiro, A. M. Machado, R. Fantatto, L. G. Guilgur, D. Murta</i>	883

Session 82. Optimization of pasture forage and by-product resources to improve sheep and goat production

Date: Wednesday 4 September 2024; 8:30 - 11:30

Chair: Tsiplakou / Rahmatalla

Theatre Session 82

By-products for small ruminants: benefits and limitations <i>invited A. Nudda</i>	883
Dehydrated sulla forage to improve sustainability of sheep milk production <i>M. Ponte, A. Di Grigoli, M. Pipi, G. Maniaci, R. Gannuscio, A. Di Trana, M. Alabiso, M. Todaro, A. Bonanno</i>	884
Carob germ: An alternative protein source in feeding lamb <i>G. Mangione, M. Musati, F. Mangano, A. Bertino, L. Biondi, M. S. Cannone, A. Natalello, G. Luciano</i>	884
Sodium bicarbonate limited milk fat depression of lactating dairy ewes fed ryegrass herbage rich in water soluble carbohydrates <i>M. A. Porcu, A. Ledda, D. Duras, A. Mattu, E. Ruggiu, S. Pinna, A. Mazza, A. Fenu, R. Rubattu, A. Cannas</i>	885
Total replacement of soybean meal with lupine seed in lamb diet: effects on growth performance <i>M. Musati, F. Mangano, A. Bertino, G. Luciano, L. Biondi, M. S. Cannone, G. Mangione, A. Natalello, M. Lanza</i>	885
Effect of feeding prickly pear by-products silage on dairy ewe's performance <i>R. Gannuscio, M. U. Hassan, G. Maniaci, M. Todaro, S. Calabrò, A. Vastolo, M. I. Cutrignelli</i>	886
Sheep grazing preferences on pastures in the Montado: effect of soil amendment and grazing systems <i>E. Carreira, J. Serrano, F. Silva, C. Gomes, J. Castro, M. Carvalho, A. Pereira</i>	886
Composition and fatty acids profile of colostrum, transition milk and mature milk in dairy ewes fed grape byproduct during late gestation <i>S. Carta, M. F. Caratzu, A. Fenu, A. Mazza, G. Cadau, A. Nudda</i>	887
Inclusion of poplar leaves and Sstems in ewes' diet: effect on milk yield and quality and oxidative status <i>M. Re, P. Barberi, G. Conte, P. Kyriakaki, A. Mavromamti, E. Tsiplakou, M. Mele, A. Mantino</i>	887

Poster Session 82

- Effect of forage source (peanut vine and extruded rapeseed stalk) on growth, nutrient digestibility, rumen fermentation parameters of fattening lambs 888
D. Yang, Y. Zheng, T. Sun, Y. Tu, T. Ma
- Carcass traits in lambs from local Shumen copper-red sheep, slaughtered at weaning in 90 days of age 888
Z. Vanchev, A. Vuchkov
- Effect of the inclusion of ensiled pomegranate by-product in the diet of dairy goats on milk production and its macro-composition 889
G. Romero, M. Gálvez-López, A. Roca, M. Ramón, C. Peris, J. R. Díaz
- Evaluation of energy content and protein value of tomato pomace for feeding ruminants 889
C. Navarro Marcos, T. De Evan, C. Fernández, M. D. Carro
- Effects of feeding almond hulls to light lambs on meat quality and fatty acid profile 890
A. Recalde, T. De Evan, A. Cabezas, M. T. Díaz Chirón, J. De La Fuente, S. López Fera, R. Roldán, M. D. Carro
- Influence of feeding agroindustrial by-products to sheep on ruminal fermentation and plasma metabolites 890
T. De Evan, D. Bueno, H. Pérez De Benito, C. N. Marcos, M. D. Carro
- Evaluation of lactic acid bacteria as additive for wet brewer's grains and citrus pulp silage 891
A. Alcamí-Aguado, J. M. Arroyo, A. Recalde, M. D. Carro
- Effect of silage from different *Festulolium* cultivars on lamb growth performance 891
C. Purwin, P. Pogorzelska-Przybyłek, M. Borsuk-Stanulewicz
- Optimizing herbage utilization in dairy sheep with a polyphenol-rich supplement 892
M. A. Porcu, A. Ledda, S. Puddu, M. E. Canu, A. Zontini, A. Cannas, A. S. Atzori
- Effects of the inclusion of different percentages of red grape pomace on productive factors, milk quality and SCC in dairy goats 892
M. Gálvez, G. Romero, E. Pérez, R. Muelas, N. Fernández, J. R. Díaz
- Baled silage long term conservation: Microbiological and physical-chemical properties 893
F. Fancello, L. Nieddu, A. Ledda, F. Ghilardelli, S. Zara, A. Gallo, A. S. Atzori
- Pasture water-soluble carbohydrates reduced milk fat concentration of lactating ewes by reducing rumen fermentations 893
F. Satta, M. A. Porcu, S. Carta, R. Rubattu, A. Nudda, A. Cannas
- Seasonal nutritional values of *Rubus fruticosus* leaves as a sustainable alternative feed for goat in mountain regions 894
K. Abid, S. Barbera, H. Kaihara, S. Glorio Patrucco, S. Tassone
- In vitro ruminal fermentation of dairy diets including dried brewers' grains 894
A. Alcamí-Aguado, J. M. Arroyo, A. Recalde, V. Jimeno, M. D. Carro
- Variability in chemical composition of barley rootlets from different malting' plants 895
J. L. Lema-Hurtado, M. D. Carro, J. M. Arroyo
- Ruminal fermentation and biohydrogenation in ewes fed with sainfoin pellets under water restriction 895
C. Baila, M. Joy, S. Pérez, J. H. Calvo, C. Calvete, S. Lobón

Effects of protein sources and microbial addition to potato waste on silage fermentation and in vitro digestibility 896
N. Douglas, M. Thamsanqa, I. Malebana, T. Langa, F. Foh

Performance from birth to slaughter of single and twins Merilin Plus® lambs under native grassland conditions 896
J. Olivera-Muzante, G. Antúnez-Tort, J. Franco, R. Delpiazzo, G. Oliveira, M. L. Adrien

Session 83. Early life nutrition and its latent impact on growth, lactational and reproductive physiology

Date: Wednesday 4 September 2024; 8:30 - 11:30

Chair: Kenny / Kelly

Theatre Session 83

Effect of early life nutrition on the growth, metabolic and carcass characteristics of beef cattle 897
invited A. Kelly, D. Kenny

Effects of undernutrition and hydroxytyrosol supplementation during the last third of gestation on growth and physiological profiles of male beef offspring 897
O. Akesolo-Atutxa, L. López De Armentia, A. Noya, G. Ripoll, N. Escalera-Moreno, J. Álvarez-Rodríguez, B. Serrano, A. Sanz

Changes in the plasma metabolome of Holstein heifers from birth to first insemination 898
K. J. Hemmert, M. H. Ghaffari, C. S. Ostendorf, S. Schuchardt, C. Koch, H. Sauerwein

Serum lipidome profiling of dairy calves fed high-fat milk replacers containing animal or vegetable fats 898
M. H. Ghaffari, J. N. Wilms, D. Caruso, H. Sauerwein, L. N. Leal

Phenotyping the trans-10 shift in the rumen of finishing lambs 899
C. Manuel, C. Xavier, F. Duarte, S. Moradi, A. Víctor, D. Soares, A. Manuel, L. Fialho, L. Cachucho, A. Silva, D. Soldado, O. Guerreiro, C. Garrine, E. Jerónimo, S. Alves, R. Bessa

A common database to study the efficiency of the mother-young pair in suckling animals 899
J. Auclair-Ronzaud, E. Peugny, B. Sepchat, C. Douine, M. Bernard, L. Wimmel, A. De La Torre

Incorporation of butyric and caproic acids into milk replacers for calves fed twice daily 900
Í. R. R. Castro, J. N. Wilms, G. B. C. Leite, M. I. Marcondes, L. N. Leal

Incorporation of butyric and caproic acids into milk replacer fed to newborn calves 900
Í. R. R. Castro, J. N. Wilms, G. B. C. Leite, M. I. Marcondes, L. N. Leal

Dietary lysine and protein for organic grower-finishing pigs 901
T. F. Pedersen, M. Eskildsen, E. T. Jørgensen, L. Stødkilde-Jørgensen

Session 84. PLF systems to face climate change and increase sustainability

Date: Wednesday 4 September 2024; 8:30 - 11:30

Chair: Lebreton / Karatzia

Theatre Session 84

- Precision Livestock Farming technologies could reduce greenhouse gas emissions on beef farms 901
L. Mcnicol, J. Bowen, H. Ferguson, J. Bell, R. Dewhurst, C. A. Duthie
- PLF-assisted quantification of carbon footprint; Preliminary analysis of Agroforestry system 902
M. Odintsov Vaintrub, P. Di Giuseppe, A. Ilari, G. Toscano
- Projection of Thermal Humidity Index (THI) and Frequency of Severe Heat Events for Broilers and Layers in the Context of Climate Change in Brittany, France 902
Y. Guyot, M. Quentin, M. Pertusa
- Coupling precision livestock farming technologies with artificial intelligence for mitigating heat stress in Mediterranean dairy cattle systems 903
X. Díaz De Otálora, D. A. Méndez, A. R. Arnau, S. Sanjuan, J. M. Calabuig, A. Villagrà, N. Hlel, F. Estellés
- Hot topic: novel weather features to quantify heat stress in dairy cows in moderate climatic conditions 903
I. Adriaens, M. J. Gote, T. Pook, I. Fodor, H. Doekes, J. Verwaeren, B. Aernouts
- Variation among individual beef cattle in methane measurements with laser methane detector 904
G. Gaspa, R. Steri, A. Albera, F. Abbona, A. Pauciullo, D. Meo Zilio
- Towards automated monitoring of ammonia emissions from naturally ventilated pig houses 904
S. Calvet Sanz, M. Jarque Durán, D. A. Méndez Reyes, B. Fajardo Viloria
- Estimation of NH₃ emission factors for pig fattening buildings thanks to Machine Learning methods and ELFE database 905
J. Thomas, N. Guingand, S. Espagnol
- Designing a thermoregulated unit for studying the impact of temperature on zootechnical and environmental performance of growing pigs 905
Y. Rousseliere, N. Guingand, J. Thomas, A. Collin

Session 85. Genetics of novel health and welfare traits

Date: Wednesday 4 September 2024; 14:00 - 18:00

Chair: Martin / Sell-Kubiak

Theatre Session 85

- From genetic correlation to causation between milk yield, mastitis and health traits in German Holstein cattle 906
H. Schneider, V. Haas, A. M. Krizanac, C. Falker-Gieske, J. Heise, J. Tetens, G. Thaller, J. Bennewitz
- Milk somatic cell transcriptome profile of high and low RFI Holstein cows and the pleiotropic effect on immunity 906
V. Asselstine, F. S. Schenkel, F. Miglior, C. F. Baes, P. Stothard, A. Cánovas
- Development of a selection index for resilience in German Holstein 907
F. Keßler, R. Wellmann, J. Bennewitz

Large scale transmission experiment reveals substantial genetic variation in both host susceptibility and infectivity affecting disease spread and survival <i>J. Prentice, C. Pooley, R. Pong-Wong, G. Marion, R. Houston, S. Cabaleiro, B. Villanueva, A. Doeschl-Wilson</i>	907
Genetic analysis of anogenital distance in dairy cattle <i>G. R. Dodd, F. Miglior, F. S. Schenkel, T. C. Bruinje, M. Gobikrushanth, J. E. Carrelli, M. Oba, D. J. Ambrose, C. F. Baes</i>	908
Analysis of aggressive behaviour in high-production dairy cows through differential expression transcriptome analysis <i>K. Żukowski, M. Herudzińska, K. Piórkowska, K. Ropka-Molik, J. M. Jaśkowski</i>	908
Combating psoroptic mange susceptibility in Belgian Blue cattle: can breeding provide a solution? <i>R. Meyermans, S. Janssens, W. Gorssen, X. Hubin, P. Mayeres, W. Veulemans, E. Claerebout, C. Charlier, N. Buys</i>	909
Development of novel traits for genetic evaluation of maternal fertility in extensively farmed beef cattle <i>F. Weik, G. Jenkins, J. Archer</i>	909
Genetic determinism of resilience to unrecorded challenges in pigs <i>T. Tusingwiire, C. Garcia-Baccino, C. Carillier, B. Ligonesche, C. Larzul, Z. Vitezica</i>	910
Comparison of the cytokine profiles after LPS injection between two lines of goats selected for functional longevity <i>T. Fassier, R. Rupp, G. Foucras, M. Ithurbide</i>	910
Using antibody response to Maedi Visna Virus as selection criterion in sheep <i>S. Salaris, M. G. Usai, T. Sechi, G. Mulas, S. Miari, S. Casu, A. Negro, C. Ligios, A. Carta</i>	911
Evaluating the influence of selection for disease resistance on the spread of infections in a simulated aquaculture population when underlying epidemiological traits are correlated <i>S. García-Ballesteros, J. Fernández, A. B. Doeschl-Wilson, B. Villanueva</i>	911
Genetic markers associated with bone properties in White Leghorn laying hens <i>K. Kurta, A. B. Rodriguez Navarro, T. Enrich-Essvein, L. Crespo-Lopez, P. W. Wilson, I. C. Dunn, B. Andersson, M. Schmutz, D. Cavero, D. J. De Koning, M. Johnsson</i>	912
A substitution in the porcine glucocorticoid receptor changes gene expression in the brain and consequently behavior <i>E. Murani, N. Trakooljul, A. Krause, E. Kanitz, K. Wimmers</i>	912
Poster Session 85	
Genetic analysis of keel bone fractures in laying hens housed in a commercial aviary <i>P. Duenk, H. Bovenhuis, B. O. Makanjuola, M. B. Patelle, S. G. Gebhardt-Henrich, C. F. Baes, M. J. Toscano</i>	913
Genetic analyses of blood metabolites and amino acids in blood serum in pigs <i>K. H. Martinsen, C. Brekke, A. Nordborg, E. Grindflek</i>	913
Prediction of energy balance of Holsteins in Japan from milk traits including fatty acids <i>A. Nishiura, O. Sasaki, T. Tanigawa, Y. Saito, R. Tatebayashi, T. Yamazaki</i>	914
Genetic analysis of temperament in Italian Simmental bulls <i>A. Cesarani, L. F. Brito, J. Hidalgo, L. Degano, D. Vicario, N. P. Macciotta</i>	914
Variance components estimation for semen parameters of boars involved in the PDO ham production in Italy <i>M. Cappelloni, M. Gallo, G. Pozzato, A. Cesarani</i>	915

Twin birth rate in German Holsteins: related to increased milk yield and fertility level? <i>L. Hüneke, C. Schmidtman, H. Alkhoder, D. Segelke, J. Heise, S. Rensing, G. Thaller</i>	915
Genetic perspectives on feeding traits in beef cattle <i>J. P. S. Valente, L. F. M. Mota, G. R. D. Rodrigues, R. C. Canesin, M. E. Z. Mercadante</i>	916
Antioxidant enzymes mRNA expression in male reproductive tract tissues of European red deer (Cervus elaphus elaphus) during rut <i>M. Koziorowska-Gilun, N. M. Neumann, A. Dziekońska, P. Gilun</i>	916
Development of a genomic evaluation for teat and udder scores in Angus cattle <i>A. Garcia, R. Mcewin, S. Miller, K. Retallick</i>	917
Variance of daily milk yield as an indicator trait in Czech Holstein cows <i>E. Kašná, L. Zavadilová, J. Vařeka</i>	917
A genome-wide association study to identify the genetic origin of dermatosparaxis in South African Drakensberger cattle <i>E. Cason, J. Van Wyk, P. Vermeulen, R. Van Der Westhuizen, J. Reding, L. Foster, F. Nesor, L. Du Preez</i>	918
A stayability approach for the longevity evaluation of Italian Holstein cattle <i>A. Fabris, F. Tiezzi, R. Finocchiaro, M. Marusi, M. Cassandro</i>	918
Impact of SNPs for Somatic Cell Count on the Presence of Mastitis Specific Pathogens in Milk <i>U. Müller, E. M. Strucken, M. Reissmann, G. A. Brockmann</i>	919
Genome-Wide Association Study on Somatic Cell Count and Health Status of Dairy Sheep <i>R. Kasarda, N. Moravčíková, M. Chalúpková, A. Halvonič, V. Tančin, K. Tvarožková, B. Gancárová, L. Vostrý, H. Vostrá Vydrová</i>	919
Serological and molecular diagnosis of Coxiella burnetii in cows from rural settlements in Brazil <i>S. Luchesi, A. Valim, A. Flaminio, A. Paes, T. Bertozzo, I. Aires, M. Mioni, M. Labruna, I. Silito, L. Gregory, M. Aleman, F. Morelli</i>	920
Litter weight gain in pigs has a moderate heritability and favorable genetic correlations to multiple breeding goal traits <i>L. B. Jensen, T. Ostensen, O. F. Christensen</i>	920
Direct and maternal genetic analysis for survival at weaning in divergent lines selected for homogeneity in mice <i>N. Formoso-Rafferty, L. El-Ouazizi El-Kahia, I. Cervantes, J. P. Gutiérrez</i>	921
Heritability of cumulative mastitis events across productive life in Austrian Fleckvieh cows <i>A. Costa, H. Bovenhuis, C. Egger-Danner, B. Fuerst-Waltl, M. Boutinaud, J. Guinard-Flament, W. Obritzhauser, G. Visentin, M. Penasa</i>	921
Embryo production efficiency in divergent lines selected for homogeneity in mice <i>L. El-Ouazizi El-Kahia, I. Cervantes, J. P. Gutiérrez, N. Formoso-Rafferty</i>	922
BERV-K1 like element and viral infection in Italian Mediterranean River Buffalo: preliminary results <i>E. D'Anza, M. Barbato, F. Ciotola, M. Pugliano, M. Riccardi, J. L. Williams, V. Peretti, S. Albarella</i>	922
TNF α expression at mRNA and protein levels in quarters adjacent to the infected with staphylococci in dairy cattle udder parenchyma <i>A. Szpryncza, M. Zalewska, M. Rzewuska, T. Sakowski, K. Pawlina-Tyszko, T. Ząbek, E. Bagnicka</i>	923

Indicators for energy balance “hidden” in historic data to improve current breeding models in cows <i>H. Honerlagen, T. Pook, M. Van Pelt, L. Zetouni, C. Orrett, B. Gredler-Grandl, C. Kamphuis</i>	923
Genetics of twinning rate in Italian Holstein cattle <i>J. S. Katende, A. Costa, M. Santinello, F. Galluzzo, M. Marusi, R. Finocchiaro, M. Cassandro, M. Penasa</i>	924
Genetics of Body Condition Score in five Italian beef cattle <i>F. Sbarra, A. Quaglia, G. Bittante, R. Mantovani</i>	924
Genetics of milkability obtained from milking machine in the local dual-purpose Rendena cows <i>A. Oian, N. Guzzo, E. Mancin, C. Sartori, R. Mantovani</i>	925
Correlations between early-in-life fertility traits and linear type traits in Holstein-Friesian dairy cattle <i>R. Handcock, C. Burke, N. Steele, S. Meier, C. Phyn, D. Garrick, M. Stephen</i>	925
Effects of low doses of antibiotics on the chicken transcriptome <i>M. Siwek, A. Dunislawska, A. Slawinska, S. Knaga, M. Olejnik</i>	926
Identification of functional SNPs causing alternative splicing events linked to subclinical intramammary infection in Holstein cattle <i>A. Vanzin, V. Bisutti, D. Giannuzzi, A. Cecchinato, L. Gallo, S. Lam, A. Cánovas, S. Pegolo</i>	926
Genetic analysis of predicted negative energy balance and its biomarkers of first-parity Holstein cows in early lactation <i>H. Hu, H. Atash, C. Grelet, K. Wijnrocx, S. Franceschini, H. Soyeurt, N. Gengler</i>	927
Effect of E35K TMEM154 variants on the genetic variability of antibody response to Maedi Visna Virus in Sarda sheep <i>S. Salaris, M. G. Usai, T. Sechi, G. Mulas, S. Miari, S. Casu, A. Negro, C. Ligios, A. Carta</i>	927
Genetic analysis of longevity in three sheep breeds <i>N. Frioni, E. Abdalla, W. Ruten</i>	928
A multi-breed genome-wide association study for temperament in three Italian beef cattle breeds <i>D. Colombi, F. Perini, F. Sbarra, A. Quaglia, R. Costilla, E. Lasagna</i>	928

Session 86. Tailored housing and management strategies from incubation to slaughter house, for poultry

Date: Wednesday 4 September 2024; 14:00 - 17:45

Chair: De Grande / Druyan

Theatre Session 86

Advances in improving chicken welfare from hatch to slaughter <i>invited M. F. Giersberg</i>	929
Perinatal management and dietary strategies improving embryonic and post-hatch development of broilers <i>invited N. Everaert</i>	929
Study of inter- and transgenerational effects of in ovo nutriepigenetic stimulation on chicken cecal mucosa transcriptome <i>E. Grochowska, M. Ibrahim, Z. Cai, P. Guz, M. Bednarczyk, K. Stadnicka</i>	930

Changes in gene expression and DNA methylation in the liver of broiler chickens after in ovo stimulation with sodium butyrate <i>A. Beldowska, A. Dunisławska</i>	930
Influence of Hypoxia During Incubation on Broiler Embryo Metabolism and Development: A Tale of Two Genetic Lines <i>A. Haron, R. Rafaeli, D. Shinder, S. Druyan</i>	931
Classification, Evaluation, and Control of Myopathies in the Broiler Chicken <i>invited M. Petracci, M. Bordini, M. Zampiga, F. Sirri, F. Soglia</i>	931
Multicriterion assessment of two scenarios designed to improve animal welfare in French conventional broiler production <i>B. Méda, M. Le Goff, A. Foreau, I. Bouvarel, L. Warin</i>	932
ProBioHuhn: Variations in the gut microbiome of three organic chicken types across different fattening periods and environments <i>Y. C. Cheng, A. Camarinha-Silva</i>	932
Synchronizing feed availability with the natural rhythm improves productivity and health in laying hens <i>G. Levkovich, R. Shmulevitch, I. Halachmi, D. Sagi</i>	933
Effect of recycled litter on broiler growth performances <i>J. Teixeira, J. L. Mourão, A. Alves, V. Pinheiro</i>	933
Poster Session 86	
Enhancing Chick Health: Exploring Egg Quality Variation and Maternal Performance in the Fayoumi Breed Raised in Tunisia <i>C. Chaouch Aoun, A. Hammouda</i>	934
Lysozyme activity and viscosity of albumen and amniotic fluid of incubated eggs stored for up to a week <i>J. Biesek, Z. Brzycka, W. Ragus, S. Właźlak, M. Adamski</i>	934
Changes in brain gene expression after in ovo stimulation by sodium butyrate during embryo development of chicken <i>A. Beldowska, B. Dunisławska</i>	935
Interaction of probiotic Bifidobacterium and Bacillus strains with intestinal cells in co-culture models for in ovo application <i>S. Zuo, K. Grudlewska-Buda, K. Skowron, G. Gardiner, P. Lawlor, K. Stadnicka</i>	935
synchronizing feed availability with the natural rhythm improves productivity and health in laying hens <i>G. Levkovich, R. Shmulevitch, I. Halachmi, D. Sagi</i>	936
Probiotic and prebiotic compounds as in ovo vaccine adjuvants <i>K. Stadnicka, G. Gardiner, P. Lawlor, K. Guinan, J. T. O'Sullivan, A. Dunisławska, N. Akhavan, K. Hryniewicz, M. Bednarczyk</i>	936
Validation of a macroscopic classification at the processing plant of breast muscles affected by growth-related abnormalities through meat quality evaluation in broilers <i>M. Bordini, E. L. Antenucci, M. Petracci, F. Soglia</i>	937
The optimal bedding for broiler health – characterization of various bedding materials for an optimal broiler environment <i>T. Liegsalz, J. Steinhoff-Wagner</i>	937

Session 87. Dairy herd management

Date: Wednesday 4 September 2024; 14:00 - 18:00

Chair: Kuipers / Maggiolino

Theatre Session 87

- Periparturient supplementation of postbiotics on lactation performance in transition dairy cows 938
G. G. Begalli, L. D. P. Maldonato, V. A. De Oliveira, L. Buraschi, A. F. Souza Lima, J. Halfen, T. Fernandes, I. Yoon, J. S. Osorio
- The influence of societal issues on representations of the breeder's profession and perceptions of change 938
M. Fuselier, E. Delanoue
- The need for tailored breeding goals by farm type and agro-ecological zone in crossbred dairy cattle in Oromia and Sidama, Ethiopia 939
M. Spoelstra, G. Dhuguma, A. Ebro, J. Ten Napel, A. Bouwman
- Cow characteristics associated with lactation performance of cows with customized lactation lengths on commercial dairy farms 939
E. E. A. Burgers, B. G. C. De Bruijn, R. M. A. Goselink, A. T. M. Van Knegsel
- Impact of Inbreeding on Dairy Cow Survival 940
S. Tenhunen, J. R. Thomasen, L. P. Sørensen, P. Berg, M. Kargo, H. M. Nielsen
- Investigation of culling of primiparous cows in Swedish herds 940
A. Edvardsson Rasmussen, W. F. Fikse, M. Lindberg
- The diversity in dairy cattle reticulorumen temperature: Exploring the influence of temperature humidity index 941
A. Shirley, P. Thomson, A. Chlingaryan, C. Clark
- Compost-bedded pack systems: the importance of tilling on manure microbial populations 941
E. Fuertes, A. R. Seradj, J. Balcells, G. De La Fuente
- Use of a Quality Cost Delivered approach in dairy cattle farm 942
G. S. Sechi, A. Cannas, A. S. Atzori
- Milk haptoglobin detection using chemiluminescence imaging with smartphone camera 942
N. R. Nirala, G. Shtenberg
- Infrared thermography in dairy goats to define health traits – preliminary results 943
S. Goth, M. Bernau
- A novel hydrogel system for ambient transport of bovine germplasm 943
K. Burton, A. Lancaster, S. Swioklo, S. Marsh, R. Stables, J. Statham
- Water Quality: Manganese in drinking water for dairy cattle 944
O. Moreira, J. Martins, R. Lucas, R. Branco
- Systematic review of serious games on livestock and how they consider sustainability 944
G. Martel, M. Grillot, S. Dernas

Poster Session 87

- Heath stress effects on milk yield, milk components and udder health in early lactation dairy cows 945
D. Gavojdian, M. Mincu, I. Nicolae
- Seasonal Patterns in Dairy Cattle Pregnancy Rates under European Temperate Conditions 945
I. Nicolae, D. Gavojdian
- Goat grazing restores plant diversity in an abandoned field by inducing photo environmental heterogeneity 946
M. Yayota, R. Yamada, A. Kuboi, S. Kato, N. Kudo
- Changes in milk constituents in dairy cows fed diets with high concentrate content 946
R. Danielsson, B. O. Rustas, Y. Shrestha, S. Hägglund, J. F. Valarcher, T. Eriksson, M. Åkerlind, H. Gonda
- Rumen fermentation parameters prediction model using mid-infrared spectra of rumen fluid collected from Simmental dairy cows 947
C. Cavallo, A. Amato, M. Forleo, A. Minuti, M. Sfulcini, V. Lopreiato, M. Tolone

Session 88. How the dairy sector copes with EU-Green deal

Date: Wednesday 4 September 2024; 14:00 - 18:00

Chair: Klopčič / Cieslak

Theatre Session 88

- Livestock farmers knowledge and attitudes regarding agroforestry planning and management 947
D. Enriquez-Hidalgo, K. Tenffen De-Sousa, M. Wright, J. R. Dittrich, M. Deniz, M. J. Hötzel, L. Cárdenas
- Environment as a challenge for intensive livestock farming 948
invited A. Kuipers, P. Galama
- Climate adaptive solutions? Public views on dairy cattle heat stress management strategies 948
L. Sirovica, B. Vandresen, D. Weary, M. Von Keyserlingk
- Cell-based food: Promises and reality 949
invited J. F. Hocquette, S. Chriki, M. P. Ellies-Oury
- Challenges related to the introduction of the EU Green Deal in Poland 949
P. Sidoruk, B. Nowak, M. Szumacher-Strabel
- Changes of Eurobarometer as a tool for collecting EU citizens' opinion on animal welfare 950
G. Riuzzi, B. Contiero, S. Segato, G. Cozzi, F. Gottardo
- Testing feeding levers to decrease the carbon footprint of dairy farms 950
P. Lambert, E. Tranvoiz
- The effect of dairy farming system on GHG emission estimations in Latvia pilot farms 951
D. Ruska, L. Berzina, L. Paura, E. Aplocina, L. Cielava
- Assessing the climate impact of Norwegian dairy production 951
M. Olsen Wedaa, S. Samsonstuen, H. Bonesmo, B. Aspehølen Åby, E. Kjesbu, M. Bergfjord, R. Okstad, E. Gribbestad Gustafsson, J. Wiik, K. Gran Bergsholm

- Assessing 'CO₂-warming-equivalent' emissions from Slovenian cattle production using GWP* 952
Ž. Pečnik, J. Verbič
- Public acceptance of microbiome management practices in dairy cows 952
A. Ait-Sidhoum, A. Stygar, F. Bedoin, J. Niemi
- Crossing grazing calendars and bulk milk analysis: is on-field validation for grass-diet in cattle possible? 953
K. Dichou, C. Nickmilder, A. Tedde, G. Conter, A. Marvuglia, H. Soyeurt

Poster Session 88

- Summarizing contributions dealing with environment and Green Deal 953
M. Klopčič, A. Kuipers
- Trade-offs between biochemical methane potential of manure and enteric methane mitigation in dairy cows fed Bovaer®10 or Acacia mearnsii 954
M. Z. Islam, S. E. Räsänen, X. Ma, T. He, C. Kunz, Y. Li, A. Leytem, M. Niu

Session 89. Free communications in animal nutrition

Date: Wednesday 4 September 2024; 14:00 - 18:00

Chair: Ottoboni / Kar

Theatre Session 89

- Lysine requirements of pigs divergent in breeding value for nitrogen efficiency 954
L. Verschuren, S. L. Thingnes, J. Merkesvik, K. Hov Martinsen, R. Bergsma, E. Grindflek
- Effect of dietary P depletion-repletion on pig bone characteristics 955
R. Palacios-Duchicela, A. Brun, M. P. Létourneau-Montminy, C. Pomar, M. Font I Furnols
- Impact of precision feeding during gestation on the productive career of sows over three reproductive parities 955
B. Sauvé, L. Cloutier, L. Galiot, F. Guay, G. Dumas, C. Gaillard, J. Y. Dourmad, A. Simongiovanni, P. Gagnon
- Impact of long-term precision feeding based on energy and lysine on the productive, economic and environmental performance of gestating sows 956
C. Ribas, N. Quiniou, C. Gaillard
- Effects of functional ingredients on intestinal health and growth performance of weaned piglets 956
S. K. Kar, E. Zaccaria, G. Binnendijk, P. Van Wikselaar, A. J. M. Jansman
- Nutraceutical Potential of Lentinula edodes' Spent Mushroom Substrate: A Comprehensive Study on Phenolic Composition, Antioxidant Activity, and Antibacterial Effects 957
F. Baptista, J. Campos, V. Costa-Silva, A. R. Pinto, M. J. Saavedra, L. M. Ferreira, M. Rodrigues, M. Almeida, A. N. Barros
- Peptidomic profile of in vitro digested hemp-based products and their effect on intestinal epithelial cells 957
D. Lanzoni, F. Grassi Scalvini, E. Petrosillo, G. Tedeschi, S. Nonnis, A. Baldi, C. Giromini
- Long-term effects of oregano essential oil supplementation in new born dairy calves 958
S. Andreas, C. Gini, F. Ceciliani, D. Gutiérrez-Expósito, N. Arteche-Villasol, A. Martini, P. Cremonesi, F. Faré, M. Hosseini Ghaffari, F. Javier Giráldez, L. Abdennebi-Najar

Production efficiency during the early postpartum of dairy cattle supplemented with live <i>Saccharomyces cerevisiae boulardii</i> live yeast <i>C. Villot, A. Bart, E. Chevaux, K. Goossens</i>	958
Detecting microplastics in feces of pig fed former food products <i>P. Lin, S. Mazzoleni, A. Luciano, M. Tretola, L. Pinotti</i>	959
Effect of microplastic on rumen metabolism <i>F. Scicutella, A. Lira De Medeiros, M. Daghigho, F. Mannelli, G. Rughetti, A. Bucciari</i>	959
Dairy cows' diet discrimination through SIFT-MS-based volatolome of different matrices <i>E. Jorge-Smeding, C. Martin, L. Volmerange, Y. Rochette, F. Violleau, N. Salah, M. Silberberg</i>	960
Application of Faecal Near Infrared Spectroscopy to Measure Nutrient Utilisation in Horses, Cattle and Sheep <i>É. Murphy, B. A. Younge</i>	960
A 7-Year Survey on corn silage nutrient composition in Po Valley (Italy) <i>R. Abbate, M. Ottoboni, A. Luciano, E. Grandi, L. Pinotti</i>	961
Poster Session 89	
Analysis of the sieve distribution of feces in dairy cows fed a starch-rich and a fiber-rich diet <i>H. Scholz, P. Kühne, M. Zschieche, T. Engelhard</i>	961
Discovery and functionality of bioactive peptides contained in the porcine intestinal mucosa hydrolysate product Palbio HP <i>S. Segarra, C. De La Torre, J. J. Bech Serra, A. Vaquero, A. Marazuela-Duque, B. Cucurull, M. De La Riva, D. Martínez-Puig, J. Velasco-Alvarez</i>	962
Impact of Precision Feeding and the "Bump Feeding" Strategy During Gestation on the Performance of Post-Weaning Pigs <i>B. Sauvé, L. Cloutier, L. Galiot, C. Pierre, F. Guay</i>	962
Glutamate simultaneously increases the lean percentage and IMF content of Shaziling pigs probably via modulating the Spirochaetae-acetic acid axis <i>Y. Duan, C. Zheng, Y. Yin, Q. Guo</i>	963
Supplemental effect of dietary Almond hull on sows' and their offspring performance <i>S. T. Wahid, G. S. Ahammad, S. Y. Jang, D. K. Kang, I. H. Kim</i>	963
The use of near-infrared spectroscopy (NIRS) to predict feed value of Alfalfa (<i>Medicago sativa</i> L.) <i>M. Oh, J. H. Woo, B. H. Lee, S. M. Jeong, S. H. Moon, K. C. Jo, H. S. Park</i>	964
Impact of Incorporating Hydrolysed Feather Meal on the Microbiota of Dogs Across Different Time Points <i>F. Balouei, R. Armone, A. Randazzo, B. Chiofalo</i>	964
Diets rich in fiber during the transition period decreases sows' constipation prior to farrowing <i>R. Carnevale, B. Muro, M. Saliba, D. Leal, C. Garbossa</i>	965
Rumen content composition as an indicator of selective grazing patterns within three native South African sheep breeds <i>W. Hough, T. S. Brand, E. Swart, J. J. Cloete, J. H. Van Zyl</i>	965
Silage Preservation Dynamics: Inoculant and Temperature Influence <i>I. Nikodinoska, E. Wambacq, G. Haesaert, C. A. Moran</i>	966

Detoxification of deoxynivalenol and its derivatives by lactic acid bacteria in whole-crop maize silage <i>I. Nikodinoska, E. Wambacq, S. Landschoot, C. A. Moran</i>	966
Effect of different Se-sources on milk biofortification: Performance and milk composition <i>F. Shiozaki, M. Serrasqueiro, D. Fonseca, T. Silva, M. Salles, A. M. Vidal, A. Saran Netto</i>	967
A multi-screening method based on ultra-high-performance liquid chromatography tandem high-resolution mass spectrometry (UHPLC-HRMS) to detect both regulated and emerging mycotoxins in different feed matrices <i>M. Lapris, M. Errico, G. Rocchetti, A. Gallo</i>	967
Effects of processing with Ozone on nutritional value of Grape pomace in sheep <i>B. Asadnezhad, R. Pirmohammadi, Y. Alijoo, H. Khalilvandi-Behrozyar</i>	968
Effect of feeding hay or sugar beet pulp containing diets to gestating and lactating gilts on piglet plasma and ileum digesta metabolite concentrations after conventional and late weaning <i>C. C. Metges, L. Grzeskowiak, E. M. Saliu, J. Schulze Holthausen, Q. L. Sciascia, J. Mbutia, G. Das, B. Kuhla, J. Zentek</i>	968
In vitro fermentation parameters of intensive beef fattening diets with sainfoin as hay or pellets in the concentrate <i>M. Joy, C. Baila, I. Casasús, S. Lobón, D. Villalba, M. Blanco</i>	969
Correlation with plasma leptin levels and body fat mass in mature beef cows grazing different herbage allowances of grasslands <i>A. Casal, P. Soca, M. Carriquiry</i>	969
Water Quality: Farmers' perception of the importance of the quantity and quality of water used for dairy cattle in Portugal <i>O. Moreira, J. Martins, R. Lucas, R. Branco</i>	970
Effect of pastures with rich tannin legumes on milk production and beef calves' performance <i>M. Lema, G. Fernandez-Turren, G. Banchemo, G. Quintans</i>	970
Apparent digestibility of cull chickpeas and whole grain of corn meal in growing pigs <i>J. M. Uriarte, H. Guemez, J. Romo, J. M. Romo, D. Jimenez</i>	971
Leucine regulates lipid deposition by promoting the secretion of adipokines and the SIRT1-PPAR γ pathway <i>L. Zhang, F. Li, Y. Yin</i>	971
Dairy and plant-based proteins as FBS alternative in muscle cell cultivation <i>T. S. Sundaram, C. Giromini, R. Rebutti, D. Lanzoni, C. Messina, F. Cheli</i>	972
NX pig-derived lactobacillus modulates host intramuscular fat deposition via branched-chain amino acid metabolism <i>M. Yang, Q. Xie, J. Wang, A. Zha, J. Chen, Q. Jiang, M. Kang, Q. Deng, Y. Yin, B. Tan</i>	972
The use of Maillard Reaction Products and reduced CP in pig finishing diets <i>M. Pons, M. Marchesi</i>	973

Session 90. Nutrition and feeding in the circular economy

Date: Wednesday 4 September 2024; 14:00 - 18:00

Chair: Alvarez-Rodriguez / Bruggeman

Theatre Session 90

- Decreasing feed-food competition by use of cereal by-products in grower-finisher pig diets 973
M. Schop, N. Kerksen, P. Bikker
- Cereal by-products in diets for weaned piglets 974
R. Gerritsen, J. Fledderus, P. Bikker
- Effect of sire type and a by-products based diet on performance and meat quality in growing-finishing pigs 974
E. Kowalski, M. Aluwé, S. Janssens, N. Buys, S. De Smet, S. Millet
- The impact of white sorghum inclusion in growing-finishing pig diets on growth performance and feed digestibility 975
F. González-Solé, R. Vinyes-Cormina, O. Cano, J. F. Pérez, D. Solà-Oriol
- Effect of two phases olive cake on diet digestibility and parameters productive in Bísara breed pigs 975
J. Paié-Ribeiro, V. Pinheiro, A. Teixeira, C. Guedes, J. Teixeira, D. Outor Monteiro, M. J. Gomes
- Effects of peat and lignocellulose on the colonic fermentation of pigs in an ex vivo simulation model 976
H. Kettunen, T. Rinttilä, J. Vuorenmaa, J. Apajalahti
- Partial or complete replacement of soybean meal with local protein sources in the diet of slow-growing broilers 976
A. Rezaei Far, J. Van Harn, S. Naser El Deen, P. Van Wikselaar, I. Fodor, T. Veldkamp
- Influence of supplementing bakery by-products and cocoa bean shells to a herbage-based diet on rumen microbiota and gas emissions of early-lactating dairy cows 977
invited M. Tretola, A. M. Reiche, J. Eichinger, R. Siegenthaler, L. Eggerschwiler, A. L. Hutten, F. Fumagalli, F. Dohme-Meier, L. Pinotti
- Evaluation of ensiled fruit wastes with crop by-products as feeds for ruminants 977
R. Khiaosa-Ard, T. Hartinger, M. Mahmood, Q. Zebeli
- Effect of feed ingredient based on processed former foodstuff in dairy cow diet: performance and environmental impact 978
M. Pavesi, L. Bava, G. Galassi, M. Battelli, G. Gambarini, A. Giorgino, S. Colombini
- Environmental impact and productivity of Reggiana dairy herds fed hay or fresh forage 978
G. Mantovani, T. Danese, M. Simoni, R. Pitino, G. Carone, I. Galasso, G. Esposito, F. Righi
- Feeding dairy ewes with a diet containing agri-food co-products: Implications on rumen metabolism 979
G. Foggi, M. Daghigho, B. Valenti, S. Tinagli, A. Silvi, L. Turini, F. Scicutella, V. Bolletta, C. Viti, A. Buccioni, M. Pauselli, M. Mele
- Utilization of orange peels as a high value secondary feedstuff for dairy sheep 979
M. A. Karatzia, V. Kotsampasi, Z. Basdagianni, S. Mai, E. M. Barampouti, E. Kasapidou
- Effect of pre and postnatal learning strategies in extinction of conditioned taste aversion for pine leaves in sheep 980
J. Figueroa, M. Quezada, L. Quezada, M. Gonzalez, R. Angulo

Poster Session 90

- Effects of olive cake and gender on the performances and hematology of fattening pigs 980
V. Pinheiro, J. Paié-Ribeiro, C. Guedes, M. J. Gomes, J. Teixeira, D. Monteiro
- Effect of dietary hybrid rye inclusion on growth performance of growing-finishing pigs 981
F. González-Solé, R. Vinyes-Cormina, O. Cano, J. F. Pérez, D. Solà-Oriol
- Bakery products in diets for weaned piglets 981
R. Gerritsen, J. Fledderus, P. Bikker
- Seaweeds: An Alternative Feed Source in Bovine Production in the Azores 982
H. Nunes, C. Dias, A. Borba
- Nutritional and functional evaluation of *Euglena gracilis*, *Porphyridium purpureum* and *Arthrospira platensis* for feed application 982
E. Petrosillo, D. Lanzoni, R. Rebucci, V. Perricone, A. Agazzi, G. Savoini, F. Cheli
- Evaluation of the in vitro Antioxidant Capacity of Microbial, Plant-based and Insect Protein Sources 983
E. Petrosillo, D. Lanzoni, C. Giromini, A. Baldi, F. Cheli
- Chemical and in vitro pineapple by-products characterization for sustainable small ruminant production 983
D. D. Kiatti, I. B. Koura, A. Vastolo, M. I. Cutrignelli, S. Calabrò
- Herbal supplementation in dairy cows' diet: impact on rumen, milk and cheese microbiota 984
G. Dallavalle, S. Massaro, J. Andersen, A. Mancini, L. Palmieri, U. Vrhovsek, A. Angeli, D. Giannuzzi, F. Tagliapietra, E. Franciosi
- Chemical characterization and phenolic content of winery and grape by-products as potential feed supplement 984
K. Simeonidis, G. Pastorelli, L. Pinotti, M. Ottoboni, E. Attard
- Effects of the inclusion of grape stem at different rates in intensive fattening cattle diets on in vitro fermentation parameters 985
C. Baila, M. Joy, I. Casasús, S. Lobón, D. Villalba, M. Blanco
- Avocado (*Persea Americana*) seed as an alternative ingredient in the diet of replacement goats. In vivo digestibility, N balance and energy balance 985
A. Sanchez Garcia, M. Romero Huelva, I. Rivelli, A. I. Martin Garcia
- The impact of incorporating avocado (*Persea Americana*) seed into the diet of replacement goats on ruminal fermentation and blood parameters 986
A. M. Sanchez-Garcia, M. Romero-Huelva, I. Rivelli, A. I. Martín-García
- Can the use of dietary oilseeds improve the nutritional and sensory properties of Podolian x Limousine meat? 986
R. Marino, M. Caroprese, A. Della Malva, A. Santillo, M. G. Ciliberti, F. Dangelo, A. Sevi, M. Albenzio
- Effects of dietary supplementation with enriched olive cake on growth, rumen fermentation, and metabolic status in Limousine bulls 987
C. Cavallo, A. Amato, G. Ferronato, V. Lopreiato, L. Liotta
- In vitro rumen fermentation of forage-based diets supplemented with hydroxytyrosol extracts 987
J. Alvarez-Rodriguez, N. Escalera-Moreno, B. Serrano-Pérez, L. López De Armentia, O. Akesolo-Atutxa, A. Sanz

Evaluation of formic acid as additive for almond hulls silage <i>A. Recalde, J. M. Arroyo, A. Alcamí Aguado, M. D. Carro</i>	988
Variability in energy content and protein value for ruminants of brewers' grains from different breweries <i>A. Alcamí-Aguado, J. M. Arroyo, V. Jimeno, M. D. Carro</i>	988
Effects of drying and pelleting on ruminal fermentation of brewers grains <i>A. Alcamí-Aguado, J. M. Arroyo, P. García-Rebollar, M. D. Carro</i>	989
Variability in chemical composition of wet brewers' grains from a single brewery plant <i>J. L. Lema-Hurtado, M. D. Carro, J. M. Arroyo</i>	989
Effect of mineral and organic fertilisation on the biodiversity and nutritional value of Azorean pastures <i>S. Teixeira, H. Rosa, J. Madruga, M. D. Silveira, A. Borba</i>	990
Nutrients recycling to soil by grazing beef cattle in Catalonia region <i>M. Terré, N. Prat, M. Vilarrassa, B. Perramon</i>	990
Effect of diet and season on Reggiana dairy cattle milk production and quality <i>M. Simoni, R. Pitino, T. Danese, G. Carone, I. Galasso, G. Mantovani, F. Righi</i>	991
Further exploration of calcium oxide to improve the quality of indigestible feeds <i>S. Terry, T. Mcallister, E. Stephens, K. Schwartzkopf-Genswein</i>	991

Session 91. Young EAAP session. Project writing: tools, opportunities and experiences

Date: Wednesday 4 September 2024; 14:00 - 14:15

Chair: Adriaens / Obsteter / Gislou

Theatre Session 91

Young EAAP session: project writing and speed dating <i>invited I. Adriaens, G. Gislou, J. Obsteter</i>	992
--	-----

Session 92. Good practices in experimental research for sustainable pig production (with PIGWEB)

Date: Wednesday 4 September 2024; 14:00 - 17:45

Chair: Bee / Millet

Theatre Session 92

Guidelines for designing pig trials on performance, digestibility, meat and carcass quality <i>C. De Cuyper, B. Ampe, R. Westin, S. Millet</i>	992
Common mistakes in experimental design and analysis of pig trials: an overview <i>invited B. Ampe, C. De Cuyper, S. Millet</i>	993
Identifying key pitfalls in experimental design of pig trials: a group discussion <i>C. De Cuyper, B. Ampe, R. Westin, S. Millet</i>	993

Improving research quality and collaboration by developing standard operating procedures <i>M. Girard, N. Le Floc'H, M. Font-I-Furnols, L. R. Moscovice, V. Ács, R. Westin</i>	994
Streamlining pig microbiome studies: Improving efficiency through reproducibility and comparability <i>S. Enokela, T. Yergaliyev, A. Camarinha-Silva</i>	994
How to score diarrhoea in piglets? Fecal consistency scoring at piglet or pen level <i>M. Aluwé, S. Millet, B. Ampe</i>	995
PIGWEB Map of European research infrastructures working on pig experimentation for farm applications <i>S. Rios, S. Bosch, P. Domingo, C. De Cuyper, S. Millet, J. Van Milgen, C. Reverté</i>	995
The strengths, weaknesses, and missing techniques or equipment of Research Infrastructures, assessed from a user's perspective <i>S. Rios, J. Van Milgen, P. Domingo, C. De Cuyper, S. Millet, C. Reverté</i>	996

Poster Session 92

Is the ABCD standard appropriate for comprehensive metadata description for pig data? <i>N. Melzer, S. Fischer, R. E. Jahnel, J. Holetschek, C. Kasper</i>	996
---	-----

Session 93. Preventive approaches to livestock diseases to reduce drug resistance

Date: Wednesday 4 September 2024; 14:00 - 17:45

Chair: Minozzi / Holinger

Theatre Session 93

Antibiotics consumption in animal production in Europe – on the path to 2030 goals <i>J. Sarraguça, M. Leitão, M. Taghouti, A. C. Gonçalves Monteiro, A. S. Santos</i>	997
Dry-off practices on dairy farms as a tool for the reduction of antimicrobial use and improvement of cow health and welfare <i>F. Gottardo, B. Contiero, L. Magrin, O. Martinic, F. Rigo</i>	997
Treated and untreated cows housed side by side in tie-stalls and their respective risk of harboring <i>E. coli</i> resistant to antimicrobials <i>B. Köchle, V. Bernier Gosselin, H. Kaspar, J. Becker</i>	998
Evaluating the effect of motivational interviewing and farmer training on effectively delivering the UK levy board mastitis control plan <i>J. Onyango, K. Burton, J. Statham</i>	998
Predicting impaired postpartum health of dairy cows with prepartum blood serum profiles <i>B. De Bruijn, S. Van Der Drift, R. De Mol, J. Van Der Werf, C. Van Weeghel, E. Bokkers, C. Van Reenen, I. Van Dixhoorn</i>	999
Effects of supplementation with vitamin E or plant extracts on redox and immune status in early lactating dairy cows <i>A. Corset, A. Boudon, A. Remot, S. Philau, M. Lemarchand, C. Mustiere, L. Le-Normand, O. Dhumez, J. F. Ricouveau, B. Graulet, P. Germon, M. Boutinaud</i>	999

Navigating antimicrobial stewardship in dairy farming: A cross-contextual study of dairy veterinarians' perspectives in Alberta, Canada and Northern Italy <i>J. Ida, E. Russell, S. Allodi, P. Buniotto, P. Moroni, D. Nydam, H. Barkema</i>	1000
Antimicrobial activity of bacteriocin producing <i>Lactobacillus</i> spp. against multidrug resistant bacteria <i>H. Smith, R. Murphy</i>	1000
The effect of feed additives on the impact of liver fluke infection in dairy cows <i>I. Van Dixhoorn, J. Verkaik, C. Van Schoote, E. Graat, L. Le Roux-Pullen</i>	1001
Effect of a natural lullion on gastrointestinal parasitism modulation in heifers <i>M. Halgrain, S. Jullian, E. Coudert, S. Point, A. Euzenot, T. Chalvon-Demersay, C. Omphalius</i>	1001
Host Defense Peptides-based nanoparticles for the treatment of Bovine Respiratory Disease <i>R. Balta-Foix, J. Seras-Franzoso, F. Andrade, D. Rafael, J. Atienza, N. Ferrer-Miralles, I. Abasolo, S. Martí, E. Garcia-Fruitós, A. Arís</i>	1002
European Swine Influenza Network (ESFLU) for the benefit of One Health <i>L. Dieste Pérez, T. Tobias, G. Simon, D. Novosel, R. Dias, S. Fereidouni, G. Richard, L. E. Larsen, G. Dauphin</i>	1002
The use of targeted selective treatment in lambs to reduce wormer resistance <i>J. Duncan, E. Gascoigne, L. Stubbings, G. Mitchell, M. Colston, M. Blyth, A. McLaren, A. Thomson, C. Morgan-Davies, F. Kenyon</i>	1003
Poster Session 93	
Comparative analysis of antimicrobial usage in Swiss farms housing pigs exclusively or cattle alongside <i>L. Fleischer, J. Becker, D. Kümmerlen</i>	1003
Effect of dietary microbial muramidase supplementation on weaned pigs' performance, health status and intestinal microbiota <i>P. Trevisi, F. Palumbo, F. Correa, A. Zurru, D. Luise</i>	1004
Addition effects of MGM-P, Quebracho Tannin Product, from weaning to finishing pig <i>Z. Yang, K. Wang, P. Shi, M. Ma, X. Li, Y. Enomoto, T. Takahashi, M. Kuwahara, J. Li</i>	1004
Development of a multi-class and multi-residue methodology through UHPLC coupled with high-resolution Orbitrap mass spectrometry to detect veterinary antimicrobials in bovine milk <i>S. Sabbadin, M. Penasa, M. De Marchi</i>	1005
Intramammary Platelet Lysate Preparation as a Dry-off Treatment Tool for Dairy Cows <i>F. Rigo, M. Soncin, A. Stefani, L. Magrin, O. Martinic, A. Barberio</i>	1005
Lactic acid fermentation - an alternative for disinfection in case of an animal epidemic? <i>I. Lehnert, T. Schilling, L. E. Hoelzle</i>	1006
Associations of Swiss national reporting system's antimicrobial use data and management practices in tie stall dairy farms <i>B. Köchle, V. Bernier Gosselin, G. A. Schnidrig, J. Becker</i>	1006

Session 94. Living labs and demonstration farms: approaches to improve sustainability of LFS globally

Date: Wednesday 4 September 2024; 14:00 - 18:00

Chair: Sturaro / Rivero

Theatre Session 94

Innovative approaches to assessing sustainability: A case study of sheep and beef systems at North Wyke Farm Platform 1007

invited M. J. Rivero, M. R. Lee

Choreographed interactions with cows on a demonstration farm to rethinking livestock subjectivity and Human-animal collaborations 1007

M. F. De Torrez, A. Farruggia, L. Daranlot, S. Mouret, P. Roux, M. Prieur, C. Sébastien

Future sustainable grazing systems at the UCD Lyons Farm Long Term Grazing Platform 1008

T. Boland, H. Sheridan, F. Monahan, P. Murphy, Z. C. Mckay, O. Schmidt, F. Godwin, A. Evans, A. Kelly

Impact of temperature on milk yield: a multiyear analysis from Harper Adams University Future Farm 1008

J. Onyango, K. Robinson, E. Harris, M. Lee

Living labs concept towards GHG emissions reduction targets, growing market access and creating industry value in Australia 1009

P. Vercoe, Z. Durmic, B. Hayes

A grazing living lab in Northern Sweden a case study 1009

M. Hetta, J. Chagas, H. Lindgren

Katanning Research Farm Demonstration of Carbon Neutral by 2030 and Natural Capital Accounting 1010

M. Curnow, J. Hardy, D. Devos

The living lab approach in the ecological transition of livestock farming: the case of the Abruzzo mountains 1010

F. Di Iacovo, L. Forzoni, S. Righi, C. Vincenzina, F. Riccioli, M. Moretti

Living labs for assessing the overall sustainability of livestock systems through Life Cycle Assessment - SOLSTICE 1011

M. Birolo, M. Petracci, N. Lacetera, M. Marconi, F. Di Iacovo, F. Bonavolontà, M. T. Verde, G. Provolo, A. Cartoni Mancinelli, E. Sturaro

INnovative Tools for Assessment and Authentication of chicken meat, beef and dairy products' QualiTies: a living lab approach 1011

R. C. Eppenstein, C. Berri, D. Berry, A. Cartoni Mancinelli, C. Couzy, C. Laithier, F. Leiber, B. Martin, E. Sturaro

The "Cheese Valley" Initiative: co-design innovations in the Pecorino Toscano DOP Value Chain 1012

M. Re, S. Burbi, P. Barberi, M. Mele, A. Mantino

Co-designing livestock-based circular agri-food systems in developing countries rural areas: The CLiMiT living lab approach 1012

T. Teixeira Da Silva Siqueira, J. M. Sadaillan, M. Feillet, M. Vigne, A. Benoist, M. Miralles-Bruneau, J. Vuattoux, M. Allix, P. Yoan, T. Donnah Razafinarivo, L. Rasolofo Irintsoa, M. Hanitriniaina Razafimahatratra, A. Barimalala, G. Parizet, J. Vayssières

LivingLab - Effluents and coproducts of the livestock activity 1013

O. Moreira, I. Rehan, R. Fragoso, H. Trindade, V. Fitas Da Cruz, D. Fangueiro, E. Duarte

Poster Session 94

- Universal bovine identification with depth cameras and deep metric learning to underpin the John Oldacre Centre dairy research platform 1013
A. Sharma, L. Randewich, W. Andrew, S. Hannuna, N. Campbell, R. Bruce, D. Enriquez-Hidalgo, M. Smith, T. Burghardt, M. Hansen, A. W. Dowsey
- Insights and experiences of two Living Labs in Tuscany (Italy) 1014
A. Silvi, G. Foggi, M. Moretti, L. Ortolani, S. Righi, A. Martino, G. Brunori, M. Mele
- Climate Farm Demo: A European-wide network of pilot farmers implementing and demonstrating climate smart solutions for a carbon neutral Europe 1014
F. Lusi, M. Giacomoni, E. Bortolazzo, S. Carè
- FERTY-Feed fertilization crops and energy: an example of co-design for the implementation of climate smart solutions in Italy 1015
D. Bochicchio, A. Zatta, S. Carè
- Steps for sustainable livestock: our multidisciplinary global farm platform journey 1015
M. J. Rivero
- Transformative rumen microbiome research for on-farm implications 1016
L. L. Guan, T. Mcallister
- Owned vs borrowed data: lessons learned from data collection on commercial dairy farms 1016
T. Klingström, I. Ohlsson, D. J. De Koning
- Promoting rotational stocking in beef cattle pastures: insights from the Alberta AgriSystems Living Lab 1017
E. Santos, G. Boffen Yordanov, B. Asante-Badu, C. Wade, E. Bork
- University of Wisconsin-Platteville (USA) Living Laboratory / Global Farm Platform 1017
D. L. Busch, K. Mahmud, A. D. Cartmill

Session 95. Insects as food & feed

Date: Wednesday 4 September 2024; 14:00 - 17:30

Chair: Boatta / Naser El Deen

Theatre Session 95

- Application of insects in poultry diets 1018
invited T. Veldkamp
- Application of less processed insect protein in broiler pelleted feed 1018
A. Rezaei Far, J. Van Harn, S. Naser El Deen, P. Van Wikselaar, I. Fodor, T. Veldkamp
- Meat quality in broiler chickens fed a mixture of *Hermetia illucens* and *Tenebrio molitor* meals 1019
I. Biasato, S. Bellezza Oddon, K. Mendez Rondo, C. Caimi, L. Gasco, A. Schiavone, A. Brugiapaglia
- Fecal Metabolome of Chicken Fed Black Soldier Fly and Yellow Mealworm-Based Diets 1019
Á. Kenéz, I. Biasato, A. Schiavone, L. Gasco
- Black soldier fly meal inclusion in broiler and turkey diets: effects on growth performances, meat quality and health 1020
C. Guidou, C. Trespeuch, F. Sirri, A. Bonaldo, F. Ceccaroni, B. Orn Smarason, M. Zampiga

- Full-fat silkworm-based diets for laying quails: impact on egg fatty acid profile 1020
Y. Singh, M. Cullere, S. Cappellozza, A. Dalle Zotte
- Evaluation of dietary inclusion of *Tenebrio molitor* larvae on gut microbiota modulation in growing pigs 1021
I. Ferri, M. Dell'Anno, A. Quiese, P. Cremonesi, F. Biscarini, M. Santoru, B. Canala, B. Castiglioni, L. Rossi
- Increasing inclusion levels of *Alphitobius diaperinus* meal in juvenile rainbow trout diets 1021
S. Bellezza Oddon, I. Biasato, L. Sanchez, L. Marengo, M. Tosco, L. Gasco
- Black soldier fly meal and dehydrated larvae inclusion in shrimp diets: effects on growth and health performances 1022
C. Guidou, C. Trespeuch, M. Costil, L. Gerardo Sisco Allen, A. C. Boutet, E. De Swaef, J. Dantas Lima, J. Alfredo Avila, F. Soller
- Nutrient uptake, growth performance, blood metabolites and bone properties of broilers fed a ration containing mineral-enriched black soldier fly larvae 1022
M. M. Seyedalmoosavi, G. Das, M. Mielenz, C. C. Metges
- Black soldier fly oil in the diet of dairy cows: effects on fatty acids of rumen digesta 1023
P. G. toral, L. Rastello, G. Hervás, L. Gasco, M. Gerbelle, M. Coppa, C. Lussiana, A. Galli, C. Guidou, C. Trespeuch, P. Frutos, M. Renna

Poster Session 95

- Different EP-BSF levels and their effect on connexins, serum reproductive hormones, cytokine expression and the laying performance of hen at different stages 1023
H. Tajudeen, S. Y. Yoon, P. Neves-Silvestre, S. H. Ha, J. Y. Mun, J. S. Kim
- Application of artificial senses to evaluate the effects of vacuum packaging on the organoleptic profile of dehydrated *Tenebrio molitor* larvae 1024
A. R. Di Rosa, M. V. Tignani, G. Secci, F. Accetta, G. Parisi

Session 96. Optimization of technical, economic, and environmental efficiency in sheep and goat production systems

Date: Wednesday 4 September 2024; 14:00 - 18:00

Chair: Cannas / Dadousis

Theatre Session 96

- Exploiting big data for small ruminants 1024
invited R. Negrini, L. Pascarella, C. Melilli, F. Luisi, M. Tolone, M. Milanesi, D. Pietrucci, M. Fioretti, L. C. Leo Consortium
- Virtual fencing vs physical fencing - grazing behaviour of goats 1025
L. Wilms, D. Hamidi, C. H. U. Lüntzel, J. Isselstein, S. Waiblinger, M. Egerbacher
- Animal counting in outdoors systems based on drones and Computer Vision: from a review to the presentation of a new framework 1025
L. Helary, A. Lebreton, E. Nicolas, T. Dechaux
- Implementing an autodrafter-weighing scale for assessing the body weight changes and grouping dairy sheep and goats during lactation 1026
G. Caja, A. Elhadi, R. Costa

Predicting dry matter intake in sheep using greenhouse gas measurements from portable accumulation chambers <i>G. F. Difford, G. Steinheim, I. Dønnem, J. Jakobsen, B. A. Åby</i>	1026
Digital tools and technologies: Irish sheep stakeholder opinions before and after training <i>B. McClearn, T. W. Keady, C. Morgan-Davies, A. McLaren, L. Grova, A. De Boer, V. Giovanetti, M. Acciaro, L. Depuille, R. Klein, A. Godo, P. Piirsalu, F. Kenyon, I. Llach</i>	1027
Budget process linked to partial indicators in dairy sheep farm <i>G. S. Sechi, A. Cannas, A. S. Atzori</i>	1027
Is there any interaction between feed efficiency and resilience in dairy ewes subjected to underfeeding? 1) Feed intake and milk yield <i>E. Barrio, P. Frutos, P. G. González-Merino, A. G. Mendoza, N. C. Friggens, P. G. Toral, G. Hervás</i>	1028
Environmental impact drivers of mixed dairy sheep farms: insights from a combined LCA and multivariate statistical analysis approach <i>M. Finocchi, A. Mantino, R. Villani, F. G. Cella, A. Cappucci, F. Vichi, G. Conte, G. Foggi, M. Mele</i>	1028
The effect of feeding a calcium peroxide feed additive to mitigate enteric methane emissions in lambs <i>G. Pugh, O. Cristobal Carballo, T. Yan, S. Huws</i>	1029
Reproductive performance of a new cervical fix-timed insemination protocol in ewes based on three doses of prostaglandin F2 α <i>J. Olivera-Muzante, F. Negrin, M. Burutaran, J. Gil, S. Fierro</i>	1029
Factors affecting differences in goat milk yield and composition between evening and morning samples <i>H. Bovenhuis, P. Wolters, C. Van Den Broek, J. Ten Napel, R. Croijmans</i>	1030
Polyphenols from Sulla (<i>Hedysarum coronarium</i>) affects rumen fluid microbiota of dairy sheep ewes <i>S. Tinagli, M. Tognocchi, R. E. Amarie, G. Foggi, A. Serra</i>	1030
Poster Session 96

Global Methane Genetics: a global program to accelerate genetic progress for reduced methane emission in ruminants

B. Gredler-Grandl¹, C. I. V. Manzanilla-Pech¹, R. Banks², H. Montgomery², R. F. Veerkamp¹

¹ Wageningen University & Research, Animal Breeding and Genomics, PO Box 338, 6700 AH Wageningen, Netherlands, ² Global Methane Hub, Antonio Bellet 314, 7500000 Santiago, Chile

Methane (CH₄) emissions have been identified as major contributor to global warming. In livestock, various CH₄ mitigation strategies are heavily researched, such as management and feeding strategies or genetic selection. Genetic selection is a reliable, cost-effective, cumulative and permanent mitigation tool. Despite several countries having started to record individual CH₄ emission of cattle and small ruminants, it is still far from routine implementation, given the currently small number of phenotypes. The Global Methane Genetics (GMG) program aims to accelerate genetic progress towards low-CH₄ emitting ruminants in the Global North and South by (1) enhancing harmonisation of recording and trait definition by shared protocols, SOP and existing data in the public domain (2) expanding methane recording and phenotype collection globally (3) developing efficient breeding programs for CH₄ reduction, and (4) implementation of routine genetic evaluations. The GMG program and global activities are centred around seven working groups, database development, new research and recording of methane emission in cattle and small ruminants and involves key livestock industry segments. The working groups are assigned to identify gaps and needs and develop research proposals for global dairy and beef cattle, small ruminants and buffalos. Specific working groups for Africa, Asia and South America address regional peculiarities in recording of CH₄ emission. The program conducts impact analysis across all working groups to show the potential of animal breeding as CH₄ emission mitigation tool.

Session 1

Theatre 2

Are the most productive, the less thermotolerant animals in low input beef cattle populations? The case of the Avileña-Negra Ibérica beef cattle breed

C. Diaz¹, M. Ramón¹, C. Meneses¹, M. J. Carabaño¹

¹ INIA-CSIC, Mejora Genética Animal, Ctra de la Coruña Km 7,5, 28010 Madrid, Spain

Climate change is imposing many distresses in livestock populations. Many studies have been performed on dairy species where trade-offs are described between production level and the susceptibility to heat stress. On the contrary, little attention has been paid to low input beef cattle populations under extensive systems. Our objective was to characterize the effect of heat stress on weaning weight (WWT) of calves and age at first calving (AFC) of cows of ANI breed, as well as to estimate trade-offs. WWT and AFC records of 55,248 and 22,779 calves and cows were used for the analysis, respectively. Average (Tave), maximum and minimum daily temperatures (°C) collected from weather stations were used as measures of heat load (HL). For WWT, lags were HL at day of weighing and average HL up to 30 d prior to weaning. For AFC, HLs were studied around conception (±30 days), assuming a gestation length of 285 days. Reaction norm models under the so called “broken-line” model were applied. Thus, we first estimated the temperature change points at which the animals began to show some response to thermal stress. The best models were those including Tave for a period of 30 d (Tave30) for WWT and 7 d post-conception (Tave7post) for AFC. Change points were 22°C for WWT and 25°C for AFC. Slopes were negative for WWT. and positive for AFC but, as modeled, the impact of heat stress on AFC was negligible. Genetic correlation between the intercept and slope of change in WWT with HL was high and positive, indicating that animals that weigh more are those coping better with heat stress. This work is funded by the EU’s Horizon Europe research and innovation programme under the grant agreement No 01059609 (Re-Livestock)

Feed efficiency, performance, and methane emissions of finishing Hereford steers with high and low residual feed intake

P. Peraza¹, C. G. Ciappesonj¹, A. La Manna¹, J. I. Velazco², E. A. Navajas¹

¹ Instituto Nacional de Investigación Agropecuaria, Av. Italia 6201, 11500 Montevideo, Uruguay, ² Universidad Católica del Uruguay, Av. 8 de Octubre 2738, 11600 Montevideo, Uruguay

Feed efficiency effect was measured by residual feed intake (RFI), on animal performance, enteric methane emission (CH₄), yield (CH₄-Y), and intensity (CH₄-I). RFI groups were defined by half standard deviation from the average, above, the efficient (LRFI), and below, the inefficient (HRFI) steers. Data from 136 Hereford steers was recorded from two RFI tests (T1, T2) during fattening, with a total mixed ratio that included a fiber source, corn grain, and a mineral supplement. In T1 67 steers were fed with sorghum silage as a fiber source, while in T2 maize silage was used with 69 animals. Feed intake was recorded with automatic feeders (Growsafe-Vytelle) in two 70d feed efficiency tests, and CH₄ was measured with GreenFeed system (C-Lock). Recruitment for CH₄ were 64% (T1, n=45) and 83% (T2, n=58). A linear regression model was used for estimating RFI, including dry matter intake (DMI), average daily gain (ADG), metabolic weight (MW), and fat thickness (FT) by ultrasound at the end of the test. The comparison of LRFI and HRFI showed non-significant differences for ADG, MW, and FT ($p > 0.05$), but LRFI steers ate less feed (10.6 vs 12.6 kg DM, $p < 0.05$). As expected, DMI and CH₄ were associated with correlations that vary between diets ($r = 0.43$ in T1 and $r = 0.33$ in T2). Efficient animals (LRFI) ate 19% lower DMI per day, with only a 6% reduction of CH₄ which was associated with higher CH₄-Y (20.5 vs 18.6 g CH₄/kgDM, $p < 0.05$), compared to HRFI animals. The CH₄-I was also lower in LRFI animals (147 vs 157 gCH₄/kg, $p < 0.05$). Improving RFI contributes to economic benefits by reducing DMI without compromising production, and with a favorable effect on CH₄ and CH₄-I.

Session 1

Theatre 4

Trait definitions for methane production in Australian beef cattle

T. Granleese², R. Hergenhan¹, S. Clark¹

¹ University of New England, Animal Science, 79 Ring Road, 2350 Armidale, Australia, ² NSW Department of Primary Industries, Grafton Primary Industries Institute, Experiment Farm Rd, 2460 Trenayr, Australia

Selection for lower methane (CH₄) emission in ruminants can be an efficient strategy to mitigate greenhouse gas emission from agriculture. Large-scale recording of CH₄ production (g/day) from beef cattle is currently occurring in Australia using GreenFeed Emission Monitors to obtain repeated measurements on grazing heifers and feedlot steers. The aim of this study was to determine the optimum trait definition for mean CH₄ production in terms of number of records per animal and minimum recording duration. After removing outliers (individual mean ± 3 SD), 82,226 records from 556 grazing heifers and 751 feedlot steers were available. The phenotypes were adjusted for diurnal pattern by subtracting the fixed effect of location-month-hour. Mean CH₄ production traits were then calculated using the within animal mean of animals with at least 1, 5, 10, 15, 20, 25 or 30 repeated measurements of 2- or 3-minute recording duration. The 14 traits were analyzed within diet by fitting mean CH₄ = population mean + breed + contemporary group + animal effect ($N(0, \sigma_a^2 \square G)$) + regressions on age (days) and trial weight (kg) + residual ($N(0, \sigma_e^2)$) using DMU. Estimated heritabilities (h^2) were 0.17-0.44 (SE 0.14-0.22) for heifers on pasture and 0.40-0.55 (0.15-0.21) for feedlot steers. The h^2 was higher in the feedlot steers when using records of at least 3-minute duration. In the grass-fed heifers h^2 was highest when animals had 10+ records of at least 3-minute duration. The recommendation is therefore to use records of animals with at least 1 record of 3-minute duration for animals recorded in a feedlot environment and at least 10 records of 3-minute duration for animals in grazing environments when calculating mean CH₄ production.

Genotype by environment interaction for growth traits in the Italian Limousine population

S. Simone¹, F. Tiezzi¹, M. C. Fabbri¹, C. Maltecca², R. Bozzi¹

¹ University of Florence, Department of Agriculture, Food, Environment, and Forestry, Piazzale delle Cascine, 18, 50144 Florence, Italy, ² North Carolina State University, Department of Animal Science, Polk Hall, 120 W Broughton, 27607 Raleigh, United States

Precisely measuring heat stress and elucidating the genetic basis of heat tolerance in animals represent key challenges in modern animal breeding. This is because environmental factors play a substantial role in influencing the growth and overall health of animals. This study aimed to investigate the genetic basis of tolerance to heterogeneous environmental conditions and the impact of heat stress on genetic parameters in the Italian Limousine beef cattle. Three growth traits were evaluated: average daily gain (ADG), weaning weight (WW), and yearling weight (YW). Environmental covariates were combined with data on animals raised in Italy between 1991 and 2022. After data editing, 108,205, 100,058, and 24,939 animals were used to analyze ADG, WW, and YW, respectively. The models included 4617, 4670, and 2048 genotyped animals for each trait counted. The presence of genotype by environment interaction (G×E) was evaluated through a multiple-trait model. Variance components were obtained, and differences were noted for the traits across diverse environments. ADG and YW additive genetic variances were lower at bad conditions, but higher estimates were obtained for WW in extreme environments. A small difference in heritability was observed among the environments for ADG, WW, and YW. Heritability for WW remained constant, whereas, for ADG and YW, reduced under harsh environmental conditions. These results suggest the possibility of obtaining different responses to selection for these traits depending on the environmental conditions. Overall, the results confirm the presence of G×E for growth traits in the studied population.

Session 1

Theatre 6

Future emission reductions deliverable by Irish beef and dairy breeding indices

D. Kenny¹, J. Sise¹, P. Amer¹, R. Evans², F. Hely¹

¹ AbacusBio Limited, P.O. Box 5585, 9016 Dunedin, New Zealand, ² Irish Cattle Breeding Federation, Ballincollig, P31 D452 Cork, Ireland

Agriculture represents the largest source of greenhouse gas emissions in Ireland, with roughly two-thirds of such emissions deriving from livestock production (i.e., enteric fermentation, manure management and artificial fertiliser application). Selection of genetically superior animals using breeding indices, alongside the cumulative and permanent nature of genetic selection and high adoption rates, is recognised by the Irish marginal abatement cost curve to deliver reduced emissions in a cost-effective manner. Results herein will present the long-term expected emissions reductions, as well as the associated industry-level economic benefits, derived from the Irish breeding indices used to select the most profitable beef and dairy replacements, and the most profitable beef animals for slaughter. A selection index theory approach, alongside variance components and index weightings provided by the Irish Cattle Breeding Federation, were used to determine index accuracies and variances, and the expected trait changes per unit change in each index. These outputs were then applied in a recursive geneflow model to estimate the industry-level economic benefits in the form of net present values of annualised benefits from genetic improvement over time. These results provide an estimate of the environmental benefits deliverable by the current breeding indices in their use to select genetically superior animals. Moreover, outputs from this study provides a point of comparison for the extent that alterations in the current breeding framework, such as increased selection intensity or the addition of new traits to indices, could deliver greater accumulation of environmental benefits.

Exploring different definitions of methane concentration phenotypes in dairy cattle

C. I. V. Manzanilla-Pech¹, A. E. Van Breukelen¹, O. Gonzalez-Recio², E. Teran², M. Pszczola³, T. Strabel³, R. F. Veerkamp¹, Y. De Haas⁴, B. Gredler-Grandl¹

¹ Wageningen University and Research, Animal Breeding and Genomics, Droevendaalsesteeg 1, 6708 PB Wageningen, Netherlands, ² INIA-CSIC, Departamento de Mejora Genetica Animal, La Coruña km 7.5, 28040 Madrid, Spain, ³ Poznan University of Life Sciences, Department of Genetics and Animal Breeding, Wolynska 33, 60-637 Poznan, Poland, ⁴ Wageningen University and Research, Animal Health and Welfare, De Elst 1, 6700AH Wageningen, Netherlands

Due to the 2030 climate targets, where the EU aims for a 55% reduction in greenhouse gas emissions, several countries are monitoring enteric methane (CH₄) from livestock. One of the mitigation options is to identify and selectively breed low-emission animals. A widely employed phenotyping method involves breath sampling, by a device commonly referred to as a “sniffer.” This device samples breath during milking, reporting CH₄ concentration in parts per million. While CH₄ concentration (MC) has been proposed as an indicator for CH₄ emissions (CH₄ g/d) due to its high correlation, there’s a lack of consensus on which phenotype should be used for estimating the breeding value. This study aims to 1) investigate 3 distinct phenotypes across three countries: a) average MC during lactation (MCavg), b) sum of the average of the 2 top values within each peak (MCsa2p), c) number of peaks (MCnop), 2) Estimate genetic parameters for these 3 phenotypes, including genetic correlations. The dataset consist as follow 132,961 records from 7,669 cows (Netherlands), 16,924 records from 3,426 cows (Spain), and 34,359 from 483 cows Poland. This work has received funding from the European Union’s Horizon Europe research and innovation programme under the grant agreement No 01059609 (Re-Livestock project) and BO-43.10-002 B1 Klimaat: Emissie reductie methaan veehouderij.

Relationships between methane emissions and milk production traits, an unfinished story

N. Gengler¹, H. Atashi¹

¹ ULiège-GxABT, Passage des Déportés, 2, 5030 Gembloux, Belgium

Conventional wisdom holds that methane emissions tend to rise with increased milk yields in dairy cows which appears to be logical as higher milk production necessitates greater feed consumption. However, even if we can assume a positive relationship between milk and feed intake, there are trade-offs between milk yield and methane production, as well as the influence of feed efficiency on methane emissions that have to be taken into account. The main aim of this study was to investigate the linearity of relationships between methane emissions and milk production traits on a genetic level as currently published variance component estimations tend to produce not always very clear results. Knowledge of this is of high importance for residual (or efficient) methane trait definitions and multi-trait production-methane models. A large database of MIR-predicted methane emissions was available for Walloon Holstein cows (1,529,282 test-day records on 229,465 first-parity cows, 1,062,013 test-day records on 151,726 second-parity cows, 642,735 test-day records on 90,484 third-parity cows). The study was based on sire-daughter groups. Using random regression single-trait three-lactation test-day models GEBV for methane ($h^2 = 0.14$ for average methane across lactations) but also for milk, fat or protein content and yields were computed for sires with at least 30 daughters (969 bulls with a mean of 108 and median of 61 daughters for methane). Mean reliability for average methane for these bulls was 0.71 ranging from 0.52 to 0.98. After grouping GEBV in 3 equal-sized classes ranging from very low to very high reference trait GEBV (milk, fat, or protein content and yields) curvilinearity in the response of methane GEBV was clearly detected. When fitting a daughter number weighted GEBV regression from methane on milk, fat, and protein yields, an adjusted R^2 of only 0.065 was observed. When letting a Stepwise algorithm find the best combination of the five milk production traits (linear and quadratic) using the AIC criteria, all variables, except protein content remained in the model (adjusted $R^2 = 0.24$). The obtained results were clear indications of nonlinear genetic relationships, but the reasons for, or consequences of these are unknown.

Estimation of heritability and genetic correlation of methane phenotypes and yield traits in the Spanish Holstein population

Methane from livestock accounts for 6.3% of anthropogenic greenhouse gas emissions. One strategy to mitigate its effects is the genetic selection of animals with low methane emissions. Sniffer device is becoming popular in this effort because it is an accurate non-invasive method, and allows large-scale recording of individual methane emission. In dairy farms, it is usually attached to the milking robots and collect the gases released during the eructation. In this study, different phenotypes of methane were compared, obtaining heritability values and genetic correlations among them and with yield traits (milk, protein and fat). Data obtained from 3426 dairy cows in 34 spanish commercial farms were analyzed to calculate meanCH₄, ratio of meanCH₄/CO₂, sum of peaks CH₄, mean of peaks CH₄, sum of max peaks and area under the curve. Further, meanCH₄ and sum of peaks CH₄ were also calculated using one measurement every 5 seconds for comparison. Methane traits showed h² ranging from 0.01 to 0.15. Genetic correlations among methane traits showed wide variability, but it was low to moderate with yield traits (-0.05 to 0.16). Definition of suitable methane phenotypes with moderate h² allows implementation of genetic selection to mitigate the methane emission in cattle. ¹ University of Florence, DAGRI, Piazzale delle Cascine 18, 50144 Firenze, Italy, ² Associazione Nazionale Allevatori della Razza Frisona, Bruna e Jersey Italiana (ANAFIBJ), Via Bergamo 192, 26100 Cremona, Italy, ³ University of Padua, DAFNAE, Viale dell'Università 16, 35020 Legnaro, Italy

Aim of this study was to investigate how productive and reproductive performance of Italian Holstein cows would be affected by selecting for improved feed efficiency and reduced greenhouse gasses emissions of young bulls. The study involved 221 candidate young bulls kept at the Genetic Centre of Italian National Breeders Association for the Holstein, Brown and Jersey dairy cattle breeds (ANAFIBJ) and phenotyped using the GreenFeed system and the Roughage Intake Control system. In addition, we included 1,686 cows from commercial farms and phenotyped for production and reproduction during routine data collection (e.g., milk yield, protein yield, days from first to last insemination, body condition score, predicted body weight). Cows were included in the analyses as full-sisters, paternal or maternal half-sisters of the candidate young bulls. All the individuals were genotyped using different SNP panels and then imputed to a medium density panel. Results showed moderate positive correlations between CH₄ and CO₂ emissions in bulls and milk, fat, protein, and lactose yield in full/half-sisters. Similar correlations were found for feed intake and feeding duration. All the correlations reached the values of 0.70 at most, suggesting the possibility to increase yield in the cows while controlling intake and carbon emissions in the young bulls. Similarly, correlations showed the possibility of improving cow fertility while also reducing feed intake and carbon emissions in the bulls.

Genetic parameters for methane production, intensity, and yield predicted from milk mid-infrared spectra throughout the lactation in Montbéliarde cows

S. Fresco^{1,2}, D. Boichard², S. Fritz^{1,2}, P. Martin²

¹ Eliance, 42 Rue de Châteaudun, 75009 Paris, France, ² Université Paris-Saclay, INRAE, AgroParisTech, GABI, Domaine de Vilvert, 78350 Jouy-en-Josas, France

Genetic selection of dairy cows against methane (CH₄) emissions requires estimating genetic parameters and correlations with milk traits. Predicting CH₄ from mid-infrared (MIR) milk spectra provides sufficient data for genomic predictions. In this study, we used 608,072 MIR milk spectra collected from 92,500 first and second parity Montbéliarde cows from 70 to 200 days in milk to predict CH₄ emissions expressed as direct CH₄ production (MeP_direct) in g/d, CH₄ intensity (MeI) in g/kg of fat- and protein corrected milk (FPCM), and as CH₄ yield (MeY) in g/kg of dry matter intake. An indirect CH₄ production (MeP_indirect) in g/d was also obtained by multiplying MeI by the observed FPCM. Bivariate random regression models were performed between first and second parity data for a given CH₄ trait or between CH₄ traits and milk traits (milk yield [MY], fat [FY] and protein [PY] yields). Methane traits were stable both within and across lactations, with average genetic correlations greater than 0.93. Average heritability estimates ranged from 0.27 to 0.44. The four CH₄ traits were genetically distinct, as their average correlations were lower than 0.41 except for the correlations of 0.74 between MeP and MeY, and the correlation of 0.53 between MeI and MeP_indirect. All three MeP_direct, MeI and MeY presented weak correlations with MY (<0.27 in average), FY (from -0.16 to 0.04 in average), and PY (from -0.07 to 0.32 in average). On the contrary, MeP_indirect was highly correlated with the three milk traits, with average correlations greater than 0.73. We recommend selecting on a combination of CH₄ traits, to avoid any strong opposition between CH₄ and milk traits.

Global warming will affect European cattle production systems, decreasing overall performance and welfare. In such a context, it is thus relevant to identify genomic regions involved in heat tolerance for production and functional traits. By combining the French bovine genetic database (focusing on French Holstein and Montbéliarde dairy cattle) with weather conditions (Safran database, Meteo-France), we estimated breeding values (BV) of animals along a temperature-humidity index (THI) gradient with a reaction-norm model. Heat tolerance traits were defined as the slope of BV at THI 70 for three traits: test-day milk yield, conception rate at first insemination, and somatic cell score. 50K SNPs from 4564 Holstein and 1737 Montbéliarde bulls were imputed to whole genome sequence using the run9 of the 1000 bull genomes project, resulting in ~13 million SNPs (R_2 Minimac ≥ 0.2 and MAF ≥ 0.01) to perform within-breed GWAS of heat tolerance for the three traits. Few genomic regions were significantly associated with heat tolerance, however these regions differed between breeds and traits. Beyond revealing novel regions associated to heat tolerance, our study also identified some regions already reported in previous studies, emphasizing their relevance. Finally, given the genetic background of heat tolerance in both production and functional traits, selection for heat tolerance should be considered. This study received funding from the European Union's Horizon 2020 research and innovation program under grant number 101000226 (Rumigen) and from APIS-GENE (CAICalor). The authors thank Meteo-France for the Safran database.

The PRIMA SCALA-MEDI project aims to characterize the genetic and phenotypic diversity of indigenous sheep and chicken breeds in the Mediterranean region and to investigate their adaptability to challenging environments. The project focuses on remote phenotyping for traits related to adaptation, genotyping, and exploring genome methylation patterns in animals raised under different environmental conditions. Data and samples have been collected from local breeds in Tunisia, Algeria, and Morocco, together with socio-economic information along sheep and chicken value chains. To date 861 sheep from 20 breeds and 767 local chickens have been genotyped with the multispecies IMAGE001v2 array that contains 8,258 SNP for chicken and 11,787 SNP for sheep. Genetic diversity, selection signatures and association to climate variables have been investigated to draft a genomic landscape of North-African sheep and chicken adaptation to harsh environments.

In recent years, breeding for heat tolerance in dairy cattle has become increasingly important to ensure good animal welfare and to reduce milk yield losses in stressful conditions such as heat waves. We here propose novel phenotypes for heat tolerance that utilize routinely generated data including automatic milking systems with daily measurements of milk yield and body weight, and monthly generated mid-infrared spectra. Within the Horizon Europe project Re-Livestock (GA No. 01059609), data from 1,478 farms including 677,318 cows from 2013 to 2021 across the Netherlands was used to estimate the effects of THI on various traits. For this, a kernel regression-based framework was developed to allow for a less rigid modelling than traditional reaction norm models including interaction effects to days-in-lactation, season, and parity. Individual heat tolerance was subsequently characterized as the relative impact of heat stress on a specific animal compared to estimated population-wide parameters, with the resulting heat resilience traits for F% and P% having an estimated heritability of 0.25 & 0.16. This subsequently results in an animal that is showing average performance at THI 50, yielding 0.36% above average F% and 0.19% above average P% at THI 70 in case it is one genetic standard deviation about population average for the respective heat resilience trait.

Genetic parameters of feed efficiency, predicted methane-related, and carcass traits during fattening period in Japanese Black cattle

¹ National Livestock Breeding Center, 1 Odakurahara, Nishigo, Nishi-shirakawagun, 9618511 Fukushima, Japan, ² National Livestock Breeding Center Ohu station, 1 Tsurunokotai, Shichinohe, Kamikita, 0392567 Aomori, Japan

The objective of this study was to estimate heritabilities for feed efficiency, predicted methane-related, and carcass traits and the genetic correlations among these traits during fattening period in Japanese Black cattle. We used a total of 649 animals, which were fattened from about 10 to 29 months of age. Throughout the fattening period, body weights (BW) were measured regularly and the feed intake for each animal was measured daily. Residual feed intake, residual BW gain, and residual intake and BW gain were calculated as feed efficiency traits. We predicted methane production, methane yield, and methane conversion rate using previously suggested equations. These traits were calculated in the first half, latter half and the total fattening periods. After the animals were slaughtered, we obtained the carcass records. A single-trait animal model for estimating heritability and a two-trait animal model for estimating genetic correlations were applied. Heritability estimates for most of the feed efficiency and predicted methane-related traits differed largely between the first and latter halves. Feed efficiency traits in the first and latter halves had high positive genetic correlations with the same trait in the total period. There were desirable genetic correlations of feed efficiency traits with predicted methane-related and carcass traits. Our results suggest that selection for feed efficiency traits in the first or the latter half of the fattening period may improve overall feed efficiency and reduce overall methane production without any unfavorable correlated responses to carcass grade.

Sequencing of the GHRL gene by NGS reveals a multi-SNP cluster associated with feed efficiency

I. Trapina¹, S. Plavina¹, N. Krasnevska¹, J. Paramonova¹, D. Kairisa², N. Paramonova¹

¹ Institute of Biology of the University of Latvia, Genomics and Bioinformatics, Jelgavas 1, LV-1040 Riga, Latvia, ² Latvian University of Life Sciences and Technologies, Department of Animal Sciences, 2 Lielā Street, LV-3001 Jelgava, Latvia

Ghrelin (GHRL) is essential for growth hormone release and energy balance regulation in vertebrates. Studying gene mutations is crucial to understanding how the GHRL genotype influences economically significant traits, such as feed efficiency indicators. The study aimed to identify GHRL polymorphisms among intensively fattened lambs in Latvian sheep breeds and explore their association with feed efficiency traits. Using NGS, the full sequence of GHRL was examined in 76 lambs, supplemented by Sanger sequencing in an additional 92 lambs. A significant cluster of 52 polymorphisms exhibited perfect linkage disequilibrium. The specific SNP group showed a statistically significant association with feed efficiency (FE), feed conversion ratio (FCR), Residual feed intake (RFI), and Residual intake and body weight gain (RIG). Rare allele genotypes were favoured for enhancing specific traits. Intensively fattened lambs with rare homozygous genotypes for all investigated SNPs, on average, demonstrated a 75.71 g higher live weight gain per 1 kg of dry material intake (DMI) and required 1.46 kg less DMI for the same weight gain than frequent allele homozygous lambs. Although requiring 0.41 kg less feed than expected lambs with the rare allele homozygous genotype had a 3-point higher RIG than those with heterozygous or frequent allele homozygous genotypes. Our findings underscore the significance of GHRL SNPs in intensive lamb fattening, suggesting their potential use in breeding to enhance Latvian sheep breeds and overall economic yield. Acknowledgements. The study was funded by the LZP-2021/1-0489 project.

On the use of mid-infrared spectra and physiological measures for the characterization of dairy cattle thermotolerance

M. Ramon¹, C. Diaz¹, T. Pook², B. Gredler-Grand², M. J. Carabaño¹

¹ INIA-CSIC, Crta. Coruña km 7.5, 28040 Madrid, Spain, ² Animal Breeding and Genomics, Wageningen University and Research, 6700AH Wageningen, Netherlands

In livestock farming, efforts to combat the consequences of climate change (CC) focus mainly on mitigating the impact of livestock on climate and reducing the impact of CC on animals. For the latter, breeding tools are presented as a promising strategy. One of the main challenges is the need to define selection criteria that allows us to characterize individual thermotolerance, thus allowing us to select for more thermotolerant animals. The present study explored the use of mid-infrared (MIR) spectra from routine milk recording schemes to discriminate heat stress vs. thermoneutral samples and to classify heat tolerant vs. heat susceptible cows. MIR data from monthly milk recordings was available for 620 dairy cows. In addition, respiration rate (RR) was measured during a heat wave on a sample of 230 cows with MIR data available. Those cows were categorized as heat tolerant or heat susceptible based on RR. A PLS-DA model was used to predict group membership using the MIR data. The prediction of the heat load group of the individuals based on MIR data resulted in relatively good accuracy when considering the average daily temperature as a measure of heat load. However, the prediction accuracy was low when attempting to characterize the thermotolerance group based on RR. To address the identification of patterns of response to heat stress in individuals according to their degree of thermotolerance, more data (MIR data and RR evaluations) are needed to characterize the degree of individual thermotolerance in a more precise way. This work has received funding from the European Union's Horizon Europe research and innovation programme under the grant agreement No 01059609 (Re-Livestock project)

A single-step genomic evaluation of maturing rate index in French beef breeds

A. Lepers^{1,2}, P. Martin², S. Taussat^{2,3}

¹ IDELE, 149 Rue de Bercy, 75012 Paris, France, ² INRAE, GABI, UMT e-bis, 78352 Jouy-en-Josas, France, ³ Eliance, 149 Rue de Bercy, 75012 Paris, France

In beef farming, one way to maximize productivity while limiting environmental impact is to select animals that develop more quickly. The maturing rate index, which tracks the proportion of adult weight the individual has reached over time, can be used to measure this precocity. A preliminary study revealed that the maturing rate index, estimated using the Brody equation, was moderately heritable. In this study, we assessed implementing genomic selection for this trait in Charolais, Limousin, Blonde d'Aquitaine, Parthenaise, and Aubrac breeds. Weight records from birth to post-weaning from commercial farms and slaughter weights from French national databases were used. For more reliability, only females slaughtered after 4 years of age with at least 4 recorded weights were kept. The final dataset included data on over 460,000 Charolais, 270,000 Limousin, 93,000 Blonde d'Aquitaine, 38,000 Parthenaise, and 7,000 Aubrac females, with respectively 8,000, 2,000, 4,000, 1,000, and 600 genotyped animals. An univariate genetic evaluation was performed using a single-step model with the HSSGBLUP software in order to estimate the breeding values for the maturing rate index. Across the five breeds, the heritability of maturing rate index ranged from 0.22 to 0.25. The genetic evaluation revealed that gaining one standard deviation of the precocity of development genomic index equated to a maturing rate index increase of 9.86% and a reduction of 1.3 months to reach half of adult weight. Routine implementation of this evaluation is anticipated in the near future, offering the opportunity to select the most precocious animals in beef farming. Furthermore, investigating correlations with other key traits targeted for selection is recommended.

Genetic relationship between young bulls' feed intake and GHG emissions measured on cows' heat tolerance measures in Italian Holstein cows

R. Finocchiaro¹, F. Tiezzi², L. Benzonj¹, J. Van Kaam¹, M. Marusi¹, R. Bozzi², M. Cassandro^{1,3}

¹ Associazione Nazionale Allevatori della Razza Frisona, Bruna e Jersey Italiana (ANAFIBJ), Via Bergamo 192, 26100 Cremona, Italy, ² University of Florence, DAGRI, Piazzale delle Cascine 18, 50144 Firenze, Italy, ³ University of Padua, DAFNAE, Viale dell'Università 16, 35020 Legnaro, Italy

Aim of this study was to analyse the breeding values for feed efficiency and greenhouse gas (GHG) emissions in relation to breeding values for heat tolerance (IHT) in young Italian Holstein bulls. For this study young Italian Holstein bulls tested at the Center of Italian National Breeders Association for the Holstein, Brown and Jersey dairy cattle breeds (ANAFIBJ) have been used. Feed intake measures were obtained using the Roughage Intake Control system (RIC) while GHG emission traits were derived from measures taken using the GreenFeed (C-Lock Inc.). Phenotypic data was provided for on 218 Holstein bulls between the age of 171 and 541 days. All bulls were genotyped using various SNP chips resulting in 69,127 SNP after imputation and editing. The Italian Heat Tolerance Index (IHT) for daily milk production was estimated using a genotypeXenvironment approach and the temperature-humidity index (THI) considered the interaction with the animal. A single-trait repeatability linear animal model, considering a pre-estimated heritability of 0.16 was used. Data were available for 159 to 202 days of age young bulls. Spearman rank correlation was used to relate the genomic breeding values between the two set of traits. Results showed a weak favourable relationship between IHT and CO₂ emissions (-0.17) and CH₄ emissions (-0.08). Results showed a negligible relationship between IHT and feed intake measures, with all correlations being close to zero.

Identification of functional SNPs linked to feed efficiency in Canadian Beef cattle

S. Lam¹, L. Guan^{2,3}, G. Plastow², Á. Cánovas¹

¹ University of Guelph, Department of Animal Biosciences, Centre for Genetic Improvement of Livestock, 50 Stone Road East, N1G 2W1 Guelph, Canada, ² University of Alberta, Department of Agriculture, Food and Nutritional Science, Livestock Gentec, 116 St and 85 Ave, T6G 2R3 Edmonton, Canada, ³ The University of British Columbia, Faculty of Land and Food Systems, 248-2357 Main Mall, V6T 1Z4 Vancouver, Canada

Beef production contributes to approximately 2.4% of Canada's total Greenhouse Gas emissions. Improving beef cattle feed efficiency (FE) may lead to improved energy partitioning and resource use, thereby improving sustainability. Our objective was to identify novel functional SNP markers linked to FE in Canadian beef cattle using RNA-Sequencing (RNA-Seq) of rumen tissue collected from 48 beef cattle [n=16 Angus, n=16 Charolais, n=16 Kinsella (Composite Hybrid including Angus, Charolais, Galloway, Hereford, Holstein, Brown Swiss, and Simmental)] selected for extreme FE phenotypes. In total, 11 key regulatory genes (MYH1, MYL2, MYLPP, TNNC2, EIF4B, RHOD, TCEANC, CKM, ENSBTAG00000040518, SERPINB2, and USP43) were significantly differential expressed (DE) between extreme Residual Feed Intake (RFI) groups (low-RFI n=8, high-RFI n=8 per breed) using CLC Genomics Workbench (FDR<0.05; |FC|>2). Using an optimized RNA-Seq variant calling pipeline using STAR and BCFtools, a total of [total (unique to low-RFI, unique to high-RFI)] 75 (36, 39), 78 (42, 36), and 53 (35, 18) uniquely fixed functional SNPs were located within coding regions of these 11 functional candidate genes, in low- and high-RFI animals in the Angus, Charolais, and Kinsella breeds, respectively. Considering all functional SNPs uniquely identified in low- or high-RFI groups for all breed comparisons, the majority of SNPs were identified in MYH1, EIF4B, and SERPINB2 genes, which function together in highly metabolically demanding biological processes (P<0.05) related to muscle contraction, system, and filament function processes. Using RNA-Seq to identify key regulatory genes and associated functional SNPs linked to FE may uncover important genetic markers that influence the regulation of FE in beef cattle.

Is methane emission the same trait genetically in young bulls and lactating dairy cows?

B. Heringstad^{1,2}, K. A. Bakke²

¹ Norwegian University of Life Sciences, Department of Animal and Aquacultural Sciences, Faculty of Biosciences, 1432 Ås, Norway, ² Geno Breeding and A.I. Association, Storhamargata 44, 2317 Hamar, Norway

It is of interest to examine whether methane (CH₄) emission is the same trait genetically in young bulls and in lactating dairy cows. The aim was therefore to estimate the genetic correlation between CH₄ emissions for Norwegian Red young bulls and cows in lactation. Measures of CH₄ from GreenFeed (GF) was available from Geno's test station for young bulls and from 15 GF units installed in commercial dairy herds. Data from the years 2020 – 2023 were included and after edits we had a dataset with 771 989 GF visits from 1 482 cows, and from the test station we had 112 071 GF visits from 244 young bulls, measured at 11-12 months age. Each young bull had on average 40 days with CH₄ data. Each visit at the GF provides an estimate of the animals daily CH₄ emission. The traits analyzed were gram CH₄ per cow or bull per day, computed as the average of the individual visits each day. The mean (standard deviation) of daily CH₄ for cows and young bulls were 406 (108) and 222 (46) gram CH₄, respectively. A bivariate linear animal repeatability model was used to estimate (co)variance components. The estimated heritability (standard error (s.e.)) of CH₄ emissions was 0.39 (0.04) for cows and 0.49 (0.15) for young bulls, and the estimated genetic correlation (s.e.) between the two traits was 0.63 (0.22). The large s.e. reflects that the genetic correlation was estimated based on information from few animals and should therefore be interpreted with caution. The results suggests that phenotyping future young AI bulls is valuable for genetic evaluation of methane emission in Norwegian Red, even if CH₄ emission is not exactly the same trait genetically in young bulls and lactating cows.

Genetic evaluation for feed efficiency in German Holsteins

E. Abdalla¹, J. Heise¹, S. Rensing¹, Z. Liu¹, H. Alkhoder¹, L. Polman¹, R. Reents¹

¹ IT Solutions for Animal Production (VIT), Heinrich-Schroeder-Weg 1, 27283 Verden, Germany

Genomic evaluation was developed for feed efficiency for German Holsteins and the first official release is April 2024. The data set consists of 327,408 weekly records of dry matter intake (DMI), body weight (BW) and energy-corrected milk (ECM); collected from 13,914 cows over the first three parties from six countries as part of the resilient dairy genome project. Each parity was divided into four equal lactation stages and then a single-trait three-parities animal model was utilized to estimate variance components. These estimates were used to derive the random regression coefficients using the covariance function approach. Subsequently, a single-step random regression model was implemented. The herd-test-week, regression on inbreeding and the calving age class by week of lactation were the fixed effects. Random effects included permanent environmental and additive genetic animal. The averages of the first parity weekly heritability estimates were 0.19, 0.30 and 0.48 for DMI, ECM and BW, respectively. The lowest genetic correlations of DMI between lactation weeks were 0.65, 0.52 and 0.70 for parities 1 to 3, respectively. The genetic correlations of DMI between the three parities were higher than 0.79. Body weight change (BWC) estimated breeding values (EBV) were derived from the BW EBV. Feed saved (FS), which is EBV for feed efficiency (DMI in kg), was estimated as $ECM\ EBV \times 0.4 + BWC\ EBV \times 4.5 - DMI\ EBV$. The genetic correlations of FS with the milk production index RZM and other main indices in the total merit index were around zero. The FS genetic standard deviation was 247 kg per 305 days in milk, which is roughly 3.5% of DMI. Breeding for feed-efficient cows will enhance the profitability and sustainability of the dairy cattle industry in Germany.

Investigating Methane and Carbon Dioxide Emissions in Hanwoo Steers: Implication of Age and Genetic Traits

J. Berdos^{1,2}, S. H. Kim¹, C. M. Ncho¹, A. R. Son¹, M. Miguel¹, K. C. Nam¹, S. S. Lee¹

¹ Suncheon National University, Animal Science and Technology, Jungangro 255, 57922 Suncheon, South Korea, ² Tarlac College of Agriculture, Animal Science, Camiling, 2306 Tarlac, Philippines

This study explores the effects of age and genetic traits on methane (CH₄) and carbon dioxide (CO₂) emissions in Hanwoo steers, a breed of cattle native to Korea. Forty-eight steers were categorized by age (10-month-old vs. 13-month-old) and genetic traits (Q=quality grade vs. G=yield grade), resulting in four groups: 10Q (BW= 293 ± 29.50 kg), 10G (BW= 321 ± 27.45 kg), 13Q (400 ± 33.98 kg) and 13G (424 ± 38.82 kg). Steers were fed a 60:40 forage-to-concentrate ratio adjusted for their age difference. Greenhouse gas (GHG) emissions, specifically CH₄ and CO₂, from Hanwoo steers were monitored using the GreenFeed unit. Results demonstrated significant age-related effects on CO₂ emission (g/d), CH₄/CO₂ (0.06 CH₄L/d), and CH₄/CO₂ (0.10 CH₄L/d) (P<0.0001, for all). Age and genetic traits influenced dry matter intake, and metabolic weight (P<0.01, for both). Spearman correlation analysis revealed positive correlations between the group and BW (r=0.84, P<0.0001) and CO₂ emission (g/d) (r=0.87, P<0.0001). Moreover, CH₄ emission (g/d) correlated strongly with CH₄ yield (g/d/kg) (r=0.93, P<0.0001) and CH₄ intensity (g/d/kg BW^{0.75}) (r=0.93, P<0.0001), indicating mutual influence. These findings highlight the importance of understanding age-genetic trait interactions in GHG emissions from Hanwoo steers for developing strategies to mitigate livestock production's environmental impact while enhancing animal productivity and welfare.

Impact of Temperature-Humidity Index on Milk Production in Crossbred Dairy Cows

R. Cheji¹, G. Molina², V. Landi³, W. Mancuso⁴, P. R. Marini^{1,5}

¹ UNCAus, Comandante Fernández 755, 3700 Saenz Peña, Argentina, ² UNC, Félix Aldo Marrone 746, 5000 Córdoba, Argentina, ³ University of Bari, Piazza Umberto I, 1, 70121 Bari, Italy, ⁴ INTA EEA, Ruta 11 Km 12,5, 3101 Paraná, Argentina, ⁵ UNR, Ovidio Lagos 1000, 2170 Casilda, Argentina

The aim of this study was to evaluate the influence of thermal stress, estimated through the environmental Temperature and Humidity Index, on the productivity in triple-cross breed primiparous cows in Argentina. Retrospective data from 1635 heads spanning the years 2009 to 2020 were analyzed. Three different breed groups resulting from Holstein x Jersey crosses, incorporating semen from Brown Swiss, Guernsey, and Montbeliarde breeds. The THI 60-days in before its birth (bb) and after its birth (ab) during. A day with thermal stress was defined as one with at least 7 continuous hours of THIH ≥ 72 during the spring and summer seasons. Stressed was defined if it experienced at least 10 consecutive days of DTS. The dependent variables investigated were milk yield (MY305) and the age at first calving of the cows (C_AFC). The latter pattern was categorized into three clusters (cat I: < 24; cat II: 24 < cat II < 30; cat III: > 30, months). To analyze the impact of heat stress on MY305, a mixed linear model was applied. Fixed effects included C_AFC, BG, Stress_ab, Stress_bb, their two-way interactions and Stress_bb- Stress_ab- RG interaction, while year and month of cow's calving were considered random effects. Significant differences were observed in MY305 for C_AFC (p=0.00179), RG x C_AFC interaction (p=0.00016), and Stress_ab x C_AFC interaction (p=0.0242297). These findings highlight substantial variations between Cat_I - Stress_ab (4074 ± 352) and Cat_I - Non Stress_ab (5239 ± 138) in thermal stress. In conclusion, the impact Stress ab on the milk production of different dairy genotypes.

Modelling the environmental and genetic effects of climate conditions on the growth of a local cattle breed
E. Rulli¹, R. Mantovani¹, E. Mancin¹, G. Gomez-Proto¹, C. Sartori¹

¹ *University of Padua, DAFNAE, Viale dell'Università, 16, 35020 Legnaro, Italy*

Managing heat stress in cattle is a major challenge in the current era of climate change. The aim of this study is to evaluate the effect of Temperature Humidity Index (THI) in relation to body weight (BW) and average daily gain (ADG), and exploring potential genotype-by-environment (GxE) interactions in the local Italian Rendena breed. Phenotypic data from performance tests (PT) of 1792 bulls conducted since 1985 were used. Individual ADGs were computed from monthly weightings, resulting in a final dataset of approximately 10 observations per young bull of ADG and BW. Moreover the overall ADG of PT was considered. Climatic data from the specific PT area were extracted from the NASA and OPEN-METEO services databases. From this data the average THI, the average maximum THI and the mean THI for specific risk time slots (10AM-6PM, 12PM-5PM and 12PM-3PM) were computed and linked to each monthly ADG and BW, and incorporated into the model. In terms of the models, in addition to genetic effects, we included THI, cow calving order, performance period, season, test group and random individual. THI was also incorporated as a random slope within random regression models. Then, the inclusion of pedigree information allowed to estimate additive variance and possible GxE interactions for the traits under investigation. A significant negative influence on traits was observed along with the increasing of THI, or its risk levels if THI is considered as factor. The heritability for overall ADG and BW was respectively around 0.3 and 0.19 on average. We also identified a small but existing effect of GxE on the total genetic variance. Given the importance of the traits in defining the productive capacity in cattle, a proper knowledge of the effects of climate variables as THI is a key to obtain an effective genetic improvement. The study highlighted the importance of evaluating inclusion of THI in routine estimations of ADG. The Authors acknowledge the National Breeders Association for Rendena Breed (ANARE) for data and the PNRR project DM118/2023 for funding.

Exploring potential GxE interactions in the lifetime performance of suckling ewes

M. Hiltbold¹, R. Trépos², F. Douhard¹

¹ *GenPhySE, Université de Toulouse, INRAE, ENVT, 24, Chemin de Borde Rouge, 31326 Castanet-Tolosan, France,* ² *MIAT, Université Fédérale de Toulouse, INRAE, 24, Chemin de Borde Rouge, 31326 Castanet-Tolosan, France*

Prolific ewes produce more lambs per time and are often preferred by breeders. Yet, in grazing systems, those ewes might not be able to cope with feed resource limitations that are increasing in frequency, severity and duration with climate change. To explore the effects of possible feed constraints at different prolificacy potentials, we simulated the ewe's lifetime lamb production in two contrasting pasture scenarios using a mechanistic model of energy acquisition and allocation between functions. Each ewe genotype was defined by several parameters controlling energy acquisition and allocation, including the prolificacy potential. In the favorable scenario, grass regrowth was maintained high during summer, whereas it was strongly impacted by drought in the unfavorable scenario. In both scenarios, ewes with higher prolificacy potential weaned on average more lambs over their life. Most ewes living long also weaned more lambs. There was no clear trade-off between ewe longevity and prolificacy. In very prolific ewes, the number of lambs weaned during lifetime was more strongly correlated between environments ($r = 0.69$ to 0.78) compared to less prolific ewes ($r = 0.26$ to 0.43). Those correlations suggest that ranking of ewes in one scenario did not match well the ranking in the other, especially at lower prolificacy potential. However, a high prolificacy potential was not enough to ensure a high and robust lifetime performance. The best prolific ewes in the favorable scenario showed a wide range of performance in the unfavorable scenario. Generally, the best ewe genotypes combined a high prolificacy potential with a balanced energy acquisition and allocation strategy that allowed them to both maintain their body reserves and to mitigate the higher lamb mortality observed in large litters. Although our model suggests the existence of GxE interactions, further analyses integrating real data will be needed to assess the genetic component of energy allocation strategies.

Genetic diversity of South American Criollo cattle adapted to a wide range of environmental conditions

Collins Drive, 55121 Eagan MN, United States

In South America, cattle breeds were introduced from the Iberian Peninsula soon after the New World discovery. Over centuries of human colonization, these cattle dispersed throughout the continent and adapted to diverse climates and husbandry practices. Later on, other taurine breeds imported from Europe, and indicine breeds from India and Pakistan enriched the genetic landscape of the continent. The original Iberian are still reared in extreme environments. We explored the molecular diversity and climate adaptation of 979 criollos from 18 breeds across eight countries and 10 agro-ecological zones. A total of 24,831 SNPs were used for assessing genetic diversity, population structure, selection signature and climate adaptation of criollo cattle. Results revealed notable heterogeneity within populations, highlighted significant gene flow, admixture events from various source populations and genomic region having adaptive value.

Simplified workflow for faster genotyping-by-sequencing using partial combinatorial dual barcodes and optimized analysis pipeline

A. Burrell¹, K. Gujjula¹, S. Chadaram¹, J. Lavoie¹

¹ Thermo Fisher Scientific, R&D, 2130 Woodward Street, 78744 Austin, United States

Targeted Genotyping by Sequencing (GBS) is a robust and cost-effective method for marker-assisted breeding and selection. Targeted GBS provides a scalable workflow, allowing for thousands of markers to be analyzed in up to thousands of samples per day. As GBS use expands, demand increases for higher throughput, faster turnaround, and increased multiplexing capability in GBS workflows. To achieve higher throughput with less material and greater ease of use, we propose a new library prep workflow using partial combinatorial barcodes for use with the Ion GeneStudio™ S5 System that not only increases available barcodes with less material, but also achieves complete, normalized libraries for a minimum of 3072 samples in less than a day. Additionally, we propose an analysis workflow optimized for ~6000 samples to be sequenced and genotyped in less than 24 hours using a single Ion GeneStudio™ S5 System. These optimizations enable completion of genotyping of ~30,000 samples within a 5-day week. Here we report early testing results showing high quality results achieved using this novel workflow and analysis pipeline.

Assessment and distribution of Runs of Homozygosity and their relation to water stress in the Rasa aragonesa sheep breed

S. Pérez-Redondo¹, C. Calvete¹, M. Joy¹, A. Dominguez¹, S. Lobón¹, J. H. Calvo^{1,2}

¹ Centro de Investigación y Tecnología Agroalimentaria de Aragón-IA2 (CITA-IA2), Avd. Montañana 930, 50059 Zaragoza, Spain, ² ARAD, Avd. Ranillas 1-D, 50018 Zaragoza, Spain

Heat stress and scarcity of drinking water for animals is a characteristic feature in the semi-arid region where the Rasa Aragonesa sheep breed is reared, especially during summer months with high temperatures. The aim of this study was to estimate the number, length, and frequency of runs of homozygosity (ROH) in Rasa Aragonesa ewes and identified genomic regions with a high ROH frequency using the 680k Illumina AgResearch Sheep HD chip. Moreover, we sought to identify ROHs associated to water restriction and heat stress in animals with different response to these stresses. In total, 201 ewes were subjected to total water restriction for 5 days, experiencing heat stress conditions during 55% of the experiment. Blood samples were collected at day 0 and 5 for haematological and metabolite measurements. Wool samples were taken at day 0 and 4 weeks later (28d). Hierarchical clustering was performed based on the variation of the blood and wool traits. The PLINK software was used for quality control (QC), while detectRuns package was used to detect ROH with the sliding-window option and establishing 1 Mb as the minimum length of a ROH. Hierarchical clustering predicted 4 clusters: 1) fat mobilization ewes (n= 56), 2) high-stressed ewes (n= 9), 3) low-stressed ewes (n= 106), 4) stressed ewes (n= 31). Furthermore, two main clusters were found based on low (cluster 1 – 2) or high dehydration (cluster 3 – 4). After genotype QC, 531,212 SNPs were retained. A total of 2130 ROH exceeding 1 Mb were detected in the whole data, with an average number of ROHs and length in each animal of 10.6 and 4.13 Mb, respectively. Most of the ROH were less than 5 Mb (70%). The inbreeding coefficient (FROH) was 0.025. Cluster 3 and 4 showed the highest and lowest average number of ROHs with 11.18 and 8.22 (with an average length of 7.07 and 3.60 Mb), respectively. Nine and 22 regions were found to contain ROH hotspots when analysing the whole dataset, and the high and low dehydration clusters, respectively. Candidate genes that could be related to water stress were identified within these genome regions.

Economic values for organic dairy cattle production systems in Denmark

H. M. Nielsen¹, J. Rind Thomassen², S. Østergård³, L. P. Sørensen², M. Kargo^{1,2}

¹ Aarhus University, Center for Quantitative Genetics and Genomics, CF Møllers Alle 3, 8000 Aarhus, Denmark, ² VikingGenetics, Ebeltoftevej 16, 8960 Randers SØ, Denmark, ³ Aarhus University, Department for Animal and Veterinary Sciences, Blichers Alle 20, 8830 Tjele, Denmark

Denmark is among the world-leading countries in organic dairy production. However, all breeding material for dairy cows originates from conventional dairy production, where organic cows are selected based on the Nordic Total Merit index. This may be a problem since organic production differs from conventional production in e.g. use of antibiotics, feeding, usage of reproductive technologies such as multiple ovulation and embryo transfer, and prices for feed and milk. If we use cows and bulls selected based on the index for conventional production, we may therefore not obtain the optimal genetic gain from an organic point of view. Implementation of a specific organic breeding goal will also make it possible to market organic products with an organic breeding profile. The aim of this study was to define a breeding goal based on economic models and preferences of consumers, dairy companies, and farmers. In this first part of this study, we defined production systems and traits for organic dairy production. Economic values were derived using the SimHerd bio-economic model, which models a dairy cattle production system in detail. We used data from the Danish Red dairy breed since this breed is already aiming for being suited for organic production in the future. We expect that the organic breeding goal will have more emphasis on climate impact and animal welfare compared to the conventional current one.

Modelling the transition from conventional to genomic selection in German Merino sheep breeding by stochastic simulations

R. Martin¹, T. Pook², J. Bennowitz¹, M. Schmid¹

¹ Institute of Animal Science, University of Hohenheim, Garbenstr. 17, 70599 Stuttgart, Germany, ² Animal Breeding and Genomics, Wageningen University & Research, P.O. Box 388, 6700AH Wageningen, Netherlands

Selection in the German Merino sheep breeding program is currently based on a pedigree BLUP breeding value estimation (BVE). A simulation study was conducted using the R-package MoBPS to simulate the German Merino breeding scheme. Different selection strategies based on a single-step GBLUP BVE were compared to a reference scenario with pedigree-based BVE. Real genotype data of German Merino was used to create a population specific simulation. A health and a production trait were simulated with selection based on a selection index with equal weights for the two traits. Scenarios were simulated in which a preselected share of the top 25% (top 50%) of male lambs was genotyped. In a further scenario, all male lambs were genotyped. Genetic gain increased with increasing numbers of available genotypes, however, marginal gains decreased. Genotyping the top male 25% already led to +13% in genetic gain, whereas genotyping all males led to an increase of +23% compared to the reference scenario. Further scenarios were simulated in which, additionally to all male, the top 25% (top 50%) or all female lambs were genotyped. Genotyping female lambs significantly increased genetic gain (+31% to 33%) but without significant differences between the proportions of genotyped females. Results confirmed the potential of genomic selection for German Merino sheep and showed that even a certain proportion of genotyped male lambs can already lead to significant improvement. This study might be used as a base for discussions on how to implement genomic selection into the breeding program.

Only 100% to share - breeding objectives revisited for improved sustainability and animal welfare

B. Fuerst-Waltl¹, A. Willam¹, C. Egger-Danner², C. Fuerst²

¹ University of Natural Resources and Life Sciences, Vienna, Gregor-Mendel-Str. 33, 1180 Vienna, Austria, ² ZuchtData EDV-Dienstleistungen GmbH, Dresdner Str. 89, 1200 Vienna, Austria

Performance traits have long been the focus of livestock breeding programs. Genetic selection and management improvements have resulted in remarkable phenotypic and genetic gains in many populations worldwide. However, in order to overcome the one-sided breeding for performance with its increasingly negative effects on fitness, more and more functional traits have found their way into breeding goals. For example, in many dairy and dual-purpose cattle populations, total merit indices combine a large number of different traits, including those related to production as well as to fertility, health, survival or feed efficiency to name a few. Despite the typically low heritabilities and mainly negative genetic correlations with production traits of the latter, genetic gains can also be achieved for these traits if they are given appropriate weight in the breeding objectives. An increasing number of auxiliary traits, e.g. from automation, and the use of genomic evaluation are making this even more feasible. To meet the demands for improved animal welfare and sustainability, a larger number of traits or trait complexes will likely need to be considered in future breeding objectives. Greenhouse gas emissions to reduce environmental impact and resilience to climate change are certainly among them. They are linked to sustainability, efficiency, animal welfare and potentially product quality. The choice of additional traits, but also their weighting in the indices, is more challenging if at least a stable genetic trend is to be expected for each of them. Moreover, different stakeholder groups may have different preferences. How do we deal with this dilemma?

Stratified mating quota: a novel approach to effectively reduce the inbreeding rate

M. J. Steensma^{1,2}, H. P. Doekes¹, T. Pook¹, M. F. Derks¹, N. Bakker², B. J. Ducro¹

¹ Wageningen University & Research, Animal Breeding and Genomics, P.O. Box 338, 6700 AH Wageningen, Netherlands, ² Koninklijke Vereniging "het Friesch Paarden-Stamboek", Lavendelheide 13, 9202 DP Drachten, Netherlands

Maintaining genetic diversity is important to keep a population (genetically) healthy. To do so, the FAO recommends to limit the inbreeding rate to below 1% per generation, and preferably below 0.5%. However, many breeds show high inbreeding rates, due to small population sizes and popular sire effects. In such breeds, strategies are needed to reduce the inbreeding rate in a practically feasible way. We stochastically simulated the effect of breeding strategies in MoBPS software, using pedigree and/or genotype data of the Friesian horse population. We used the Friesian horse as a case study, which is a breed that suffers from consequences of too high inbreeding rates, has a high pedigree depth and – since recently – has genotype data available. Here, we suggest a novel approach, stratified mating quota, where each sire was assigned a mating quorum (of max 60, 80, 100, or 120 offspring per sire per year) based on its mean kinship. Among the simulated breeding strategies, stratified mating quota was the most promising and feasible approach to further limit the inbreeding rate below 0.5%. For the calculation of mean kinship, we considered the impact of genotype data (70K SNP chip) on the assigned mating quota. We calculated genomic relationships between breeding sires (n=72) and foals born in 2023 (n=2,886) and compared this to their pedigree-based relationships. By applying stratified mating quota in the Friesian horse in practice, and by promoting this approach for other breeds, we aim to further reduce the inbreeding rate in (genetically) small populations.

Session 2

Theatre 5

Using alternative relationship matrices for genomic prediction and managing genetic diversity

X. Yu¹, P. Berg¹, T. Meuwissen¹

¹ Norwegian University of Life Sciences, BIOVIT, Oluf Thesens vei 6, 1433 Ås, Norway

Modern breeding should make fast genetic progress to feed a growing world population, and also maintain the genetic diversity of the selective populations to meet future economic, environmental and societal demands. Optimum contribution selection (OCS) is considering both. It aims to maximize the breeding efforts, whilst constraining the rate of inbreeding. Before the genome era, only the numerator relationship matrix (NRM) from pedigree was available for inbreeding management. Genomic information has provided more measures of genetic relationships. The objectives of this study are to compare genetic improvements and diversity management in a long-term breeding program, using various relationship matrices as tools. Stochastic simulation software was developed to mimic a cattle population. Visible chip SNP, as well as invisible QTL and reference SNP were sampled to form a base population. NRM, the genomic relationship matrix (GRM), and IBD relationship matrix (IRM) were used to estimate breeding values, and/or as relationship constraints for optimum contribution selections. We conclude that using IRM for diversity management performed best in maintaining population diversity. IRM diversity management yielded least inbreeding, least loss of alleles across the genome and, most genetic and genic variance, and most potential for future breeding. The final allele reduced frequency of low minor allele frequency loci, making them less prone to fixation by genetic drift. The diversity maintained also provides more resources for later genetic progress. OCS schemes generate >25% more genetic progress than non-OCS schemes over 20 generations of selection in our simulations.

Study of genetic progress in the context of disconnection between two originally connected populations

M. Wicki^{1,2}, A. Legarra³, J. Raoul^{1,2}

¹ INRAE, INP, UMR 1388 GenPhySE, 24 chemin de Borde Rouge, 31326 Castanet-Tolosan, France, ² Institut de l'Elevage, 24 chemin de Borde Rouge, 31321 Castanet-Tolosan, France, ³ Council on Dairy Cattle Breeding, 4201 Northview Dr, 20716 Bowie (Maryland), United States

Genetic progress of breeding programs is highly dependent on the size of reference populations and the relatedness between reference populations and selection candidates. Thus, for selection programs of small size, segregation of the population into several subpopulations could have significant consequences on selection efficiency. Organic farming may lead to organic farms breaking away from the conventional scheme to form a distinct breeding scheme. The aim of our study is to investigate, on the basis of stochastic simulations, the impact of such separation. We simulated a dairy scheme with 5,400 females mated to 90 males and a trait of heritability 0.30. After several cycles of pedigree-based and then genomic selection, the population split into two subpopulations, still under a common evaluation, with different ratios: 50/50, 60/40 and 80/20. We studied the evolution of F_{st} , accuracy of predictions and genetic progress over generations. We observe a faster genetic divergence in the case of unbalanced separation (F_{st} from 0.01 to 0.05 and to 0.08 for the scenario 50/50 and 80/20 respectively). Splitting the population has a negative effect on the genetic gain for the smallest population compared to the population without separation: 0.321 (0.044) against 0.335 (0.020) and 0.316 (0.030) against 0.327 (0.020) respectively for the scenarios 80/20 and 60/40. We do not find any difference in the case of balanced splitting.

Session 2

Theatre 7

A comparison between phenotypic and genotypic strategies of crossbred individuals in a crossbred scheme of laying chickens

M. Sánchez Díaz¹, L. Varona¹, N. Ibáñez Escriche², D. López Carbonell¹, D. Caveró³

¹ Facultad de Veterinaria, Universidad de Zaragoza, Calle Miguel Servet, 177, 50013 Zaragoza, Spain, ² Institute for Animal Science and Technology, Universitat Politècnica de Valencia, Camino de Vera S/N, Edificio 7G, 46022 Valencia, Spain, ³ H&N International GmbH, Am Seedeich 9, 27472 Cuxhaven, Germany

The laying hen industry significantly contributes to the global food supply. The major companies in the sector have many pure lines that cross to be able to adapt to the needs of the market. However, information from commercial crosses might be underutilized in breeding programs. This study aims to assess the extent to which incorporating crossbred information can enhance evaluations and determine the optimal phenotyping and genotyping scenario. To achieve this, a simulation of a standard layer breeding scheme was conducted using the AlphaSimR program. Genetic evaluations of this scheme were then carried out using the BLUPF90+ software tool. Correlations between actual breeding values and those estimated were analyzed for various genotyping and phenotyping scenarios for crossbred hens. The results revealed a remarkable increase in correlation when hens were individually phenotyped and genotyped. However, the challenges associated with the collection of this information, particularly phenotyping, make this scenario difficult to implement nowadays. Alternatively, acquiring individual genotype and cage means, which is more cost-effective and offers improved precision to a lesser extent, could be a viable option. Future perspectives of this study may include exploring other traits with different heritabilities and correlations, conducting a cost/benefit analysis by mimicking a real-world situation, and investigating response to selection over multiple generations rather than precision alone.

Selection for antagonistic traits must balance diversity in terms of genetic correlation

B. Cuyabano¹, S. Aguerre², S. Mattalia²

¹ INRAE, GABI, Domaine de Vilvert, 78350 Jouy-en-Josas, France, ² Idele, UMT eBIS, Domaine de Vilvert, 78350 Jouy-en-Josas, France

Genetic parameters have long been considered as static in genetic evaluations. The principle of ignorable selection ensures that multi-generational predicted breeding values are as accurate as possible, given (co)variance parameters estimated at a base population. It is widely known that selection leads to a loss of genetic diversity, i.e. a decrease in genetic variances, a phenomenon well known as Bulmer effect. However, the Bulmer effect dissipates after a few generations, and genetic variances are rather stabilized, being most changes then due to random drift. While losses of genetic diversity due to losses in genetic variances has been well studied by quantitative geneticists, consequences of changes in genetic correlations on genetic diversity are little explored. The influence of genetic correlations on diversity is of particular concern when dealing with negatively correlated traits. While selection for two antagonistic traits ensures genetic gains for both, in a medium-to-long-term such selection may favor individuals at the border of the bivariate distribution of the negatively correlated breeding values, drastically reducing genetic diversity with respect to their capacity of trade-off regulation. The medium-to-long-term consequence of this loss in genetic diversity is that mutual genetic gains for both traits of interest may no longer be a possible option in a breeding program. This risk of loss of genetic diversity can be controlled by adequately balancing the breeding goals for the traits involved, and with a simulation study we observed that this balance is strongly dependent on the traits h^2 . This project has received funding from the European Union's Horizon 2020 Programme for Research & Innovation under grant agreement n°101000226.

New insight in genomic inbreeding assessment in domestic animals

M. Shihabi¹, L. Vostry², V. Cubric-Curik¹, M. Ferenčaković¹, I. Curik¹

¹ University of Zagreb, Faculty of Agriculture, Svetošimunska 25, 10000 Zagreb, Croatia, ² Czech University of Life Science Prague, Kamýcka 129, 16500 Prague, Czech Republic

The assessment of inbreeding is one of the most important indicators of genetic variability. The common method for calculating genomic inbreeding is Runs Of Homozygosity (ROH) based inbreeding coefficient (FROH). Despite the potential of ROHs to provide a regional approach to inbreeding assessment, this aspect remains largely unexplored, as all studies have focused solely on entire chromosomes or the entire genome. Thus, in this study, we analysed regional inbreeding variation on each chromosome to see exactly where inbreeding is more pronounced and in which regions there are large differences between the sexes. To do this, we presented three case studies for three different domestic species: Cattle (79 females and 33 males; Illumina BovineHD SNP Chip), Dogs (128 females and 148 males; Illumina CanineHD BeadChip) and Sheep (101 females and 102 males; Illumina OvineHD BeadChip). For each species, regional FROH were estimated separately in males and females using SVS and RZooROH software. Regions of large inbreeding differences were detected in all three cases, with much greater variability observed on the X chromosome than on the autosomes. Our results suggest that greater precision can be achieved in monitoring inbreeding at the regional level, further contributing to breeding management, particularly in terms of tracking inbreeding depression for various important traits.

Prediction of hidden individual inbreeding depression load in French dairy sheep

S. Antonios¹, S. T. Rodríguez-Ramilo¹, A. Legarra², J. M. Astruc³, L. Varona⁴, Z. G. Vitezica¹

¹ INRAE, GenPhySE, 24 ch. de Borde Rouge, 31326 Castanet Tolosan, France, ² CDCB, 4201 Northview Drive, 20716 Bowie MD, United States, ³ Institut de l'Élevage, 24 ch. de Borde Rouge, 31321 Castanet Tolosan, France, ⁴ Universidad de Zaragoza, Instituto Agroalimentario de Aragón, C. de Pedro Cerbuna, 50013 Zaragoza, Spain

As well as lethal mutations, other (usually unknown) recessive conditions that are not lethal are carried by individuals, in what is known as load. Individual variability exists in this load of unknown deleterious alleles. It is possible to define and estimate a polygenic individual Inbreeding Depression Load (IDL). Each individual possesses parts of inbreeding coming potentially from different ancestors. Using these parts, a linear model then predicts the IDL of the individuals, which is an additive trait that is expressed only in inbred individuals. The objective of this work was to estimate the genetic variance of IDL for milk yield in 3 dairy sheep breeds: Basco-Béarnaise (BB), Manech Tête Noire (MTN) and Manech Tête Rousse (MTR). A total of 658,731, 541,180 and 2,168,454 records of milk yield from 178,123, 151,863 and 596,586 females of BB, MTN and MTR, respectively, were included. Pedigrees included 190,276, 166,028 and 633,655 animals in BB, MTN and MTR, respectively, born between 1985 and 2021. Estimates of IDL genetic variance clearly indicate variability of IDL for milk yield among ancestor families in MTN and MTR. The existence of IDL genetic variance was not conclusive in BB. The correlation between additive genetic value and the IDL was -0.01. Results confirm the presence of heterogeneity in the IDL among individuals. Animals with less load could be selected to avoid inbreeding depression in future generations and undesirable matings can be discarded.

Session 2

Theatre 11

Genotype by environment interaction and response to selection for milk production traits in Lacaune sheep

S. Vouraki^{1,2}, S. Priskas¹, A. Argyriadou¹, P. D. Carvalho¹, J. M. Astruc³, G. Lagriffoul³, R. Rupp⁴, G. Banos⁵, G. Arsenos¹

The objective was two-fold (i) to investigate genotype by environment (G×E) interaction for milk yield and composition in purebred Lacaune sheep reared in Greece and France and (ii) to compare potential genetic gain from selection across and within countries. A total of 1,658 Lacaune ewes from four intensive farms in Northern Greece and 4,859 Lacaune ewes from 186 semi-extensive farms in Southern France were used. Ewes in the two countries were daughters or granddaughters of the same rams. Individual ewe daily milk yield was recorded monthly and milk samples were collected to assess chemical composition. Total milk yield and milk component (fat and protein) content were calculated. (Co)variance components were estimated using ASReml software. Results showed a strong genetic correlation for milk yield (0.86±0.13) and protein content (0.88±0.12) between the two countries suggesting no presence of G×E interaction. Regarding fat content, a moderate correlation was found (0.59±0.21) indicating some degree of sire re-ranking. Our analyses suggest that a joint genetic evaluation of Lacaune sheep in Greece and France is feasible. Simulations showed that sire selection across countries based on a joint genetic evaluation may increase genetic gain up to 68.17% and 0.16% in Greece and France, respectively, compared to selection within country. This work was funded by SMARTER Horizon 2020 project (772787).

How dual-purpose is dual-purpose? The balancing act between fattening and laying performance:
An index to describe dual-purpose poultry

H. Pluschke¹, P. Thobe², S. Lombard³, M. Reverchon⁴, S. Steinfeldt⁵, K. Germain⁶, D. Werner¹, A. Collin⁷

¹ Thünen Institute of Organic Farming, Trenthorst 32, 23847 Westerau, Germany, ² Thünen Institute of Farm Economics of Farm Economics, Bundesallee 63, 38116 Braunschweig, Germany, ³ ITAB, 9 rue André Brouard, 49100 Angers, France, ⁴ SYSAAF, Centre INRAE, Val de Loire, 37380 Nouzilly, France, ⁵ Aarhus University, Department of Animal Science, Blichers Alle 20, 8830 Tjele, Denmark, ⁶ INRAE UE EASM, Le Magneraud, 17700 St Pierre d'Amilly, France, ⁷ INRAE, Université de Tours, BOA, 37380 Nouzilly, France

Commercial poultry production systems with specialized laying or meat strains are criticized by society and are associated with ethical and animal welfare problems. As the rearing of males of layer lines, an alternative to the resulting ban on killing of male chicks in several EU countries is resource-intensive, dual-purpose poultry can be an alternative. Especially integrated organic production systems can benefit, if the production of eggs and meat from the same genotype can be managed efficiently. For this, productive performance profiles of dual-use poultry genotypes need to be defined and evaluated. In the framework of the EU Horizon 2020 project PPILOW novel dual-purpose genotypes were evaluated under organic farming conditions. The aim of this contribution is to investigate the potential of these tested dual-purpose genotypes, evaluated as a unit in the context of poultry genotypes and how this is reflected in their economic performance. A dual-purpose index (DPI) was used, reflecting the joint performance of a dual-purpose unit as proportion of the performance of commercial hybrids and is set to 1 for dual-purpose genotypes. Higher values indicate a higher proportion of laying performance, lower values indicate a higher proportion of fattening performance. The DPI of the novel dual-purpose genotypes tested in PPILOW ranged from 1.29-1.97. The analysis serves as basis for further research to define and distinguish between single and dual-purpose types and from a business case perspective, to add value via successful on-farm implementation. This project is funded by the EU Horizon 2020 program (N°816172), carried out in collaboration with SYSAAF, Novogen, Hendrix Genetics, Aarhus University, INRAE, ITAB

Inbreeding depression for litter size in a mice population divergently selected for environmental variability of birth weight

C. Ojeda-Marín¹, I. Cervantes¹, N. Formoso-Rafferty², J. P. Gutiérrez¹, S. T. Rodríguez-Ramilo³

¹ UCM, Facultad de Veterinaria, 28040 Madrid, Spain, ² UPM, E.T.S.I.A.A.B, 28040 Madrid, Spain, ³ INRAE, GenPhySE, 31326 Toulouse, France

The aim of this study was to estimate inbreeding depression (ID) from genomic data in the first birth litter size (LS) in two divergent mice lines selected for high variability (H-Line) and low variability (L-Line) of birth weight. A total of 1380 females of 26 selection generations were genotyped with a high-density SNP array. After applying filtering criteria, 545,656 SNPs were used for analyses. LS data of 732 L-Line and 648 of H-Line animals were used. Runs of homozygosity inbreeding (FROH) and homozygosity by descent inbreeding (FHBD) were calculated. FROH and FHBD were divided in 9 length (FROH1-2Mb to FROH≥32Mb) and age (FHBD2 to FHBD512) classes. FROH were calculated in the 19 autosomes (CHR). All the inbreeding coefficients (Fs) were standardized by the mean F of the 1st generation. The ID was calculated as the regression coefficient of LS on the different adjusted Fs. The age of the female at birth in days and the female's mother litter size were included as continuous fixed effects. PLINK v1.9, RzoRoH R package and "lm" function of R environment were used. FROH and FHBD produced significant ID in H-Line (-4.70 and -5.09) and L-Line (-4.47 and -4.55). Purge effect (P) was detected for FROH 1-2Mb (59.40) in H-Line, while ID was detected for FROH≥32Mb (-7.27) in L-Line, and P for FROH1-2Mb (44.46) and FROH4-8Mb (17.37). FHBD8 (-3.08) and FHBD256 (21.8) had significant effect in L-Line. ID was detected in CHR13 in H-Line and CHR1, CHR9 and CHR11 in L-Line. The length and the age of the ROH and HBD determined the ID and the P that were different between lines. For future research in candidate regions, CHRs 1, 9, 11 and 13 were indicated.

Genome-wide variability and selection signatures in autochthonous Spanish cattle breeds

P. E. Milia¹, A. Cesarani¹, C. Diaz², C. Meneses², J. C. Parejo³, N. P. P. Macciotta¹, C. Dimauro¹

¹ Università degli studi di Sassari, Viale Italia 39a, 07100 Sassari, Italy, ² INIA-CSIC, Ctra. de La Coruña, km 7.5, Moncloa-Aravaca, 28040 Madrid, Spain, ³ Fac. veterinaria, UEX, Plaza de Caldereros s/n, 10071 Càceres, Spain

Morucha (MOR) and Avileña-Negra Ibérica (ANI) are two local Spanish cattle breeds appreciated for their high-quality meat production. Their subpopulations, Negras (MORB) and Cardenas (MORC) for MOR, Jarda (JAR) and Bociblanca (BOC) for ANI, can be distinguished by their coat color. Since phenotypic differences are mainly due to genome variability, the aim of this work was to investigate the genetic diversity among ANI and MOR subpopulations. With this purpose, 1352 animals (263 MORB, 629 MORC, 127 JAR and 333 for BOC) were genotyped with the Affymetrix BeadChip Microarray HD. After quality control, 33408 common SNP were retained. Genomic data were analyzed by using univariate (Wright fixation Index, FST) and multivariate approaches. For the latter, the stepwise discriminant analysis (SDA) and the canonical discriminant analysis (CDA) were applied. The highest weighted FST value (0.052) was found between BOC and MORB, that belong to the two different breeds. On the contrary, the lowest values were found between BOC and JAR (both Avileña-Negra Ibérica) and between MORC and MORB (both Morucha). The CDA was able to significantly separate MOR and ANI using only 27 SNP selected in the SDA. On the other hand, MORB and MORC, JAR and BOC, were significantly discriminated using 82 and 29 markers, respectively. Gene discovery was carried out by using the genomic regions highlighted by the two approaches. This study was able to determine the genetic difference between the analyzed breeds and among subpopulations within each breed.

Networks of inbreeding in two lines of mice divergently selected for environmental birth weight variability

C. Ojeda-Marin¹, J. P. Gutiérrez¹, N. Formoso-Rafferty², I. Cervantes¹, S. T. Rodríguez-Ramilo³

¹ UCM, Facultad de Veterinaria, 28040 Madrid, Spain, ² UPM, E.T.S.I.A.A.B., 28040 Madrid, Spain, ³ INRAE, GenPhySE, 31326 Toulouse, France

The partial correlations and the information theory allow to distinguish when the association between two variables is independent from the association with a third variable. Therefore, the objective of this study was to apply partial correlations and information theory to the inbreeding coefficients (Fs) of mice selected for high variability (H-Line) and low variability (L-Line) of birth weight to detect spurious correlations. A total of 1518 individuals of 26 selection generations were genotyped with a high density SNP array. After applying filtering criteria, 545,656 SNPs were used for analyses. Pedigree inbreeding coefficient (FPED), genomic inbreeding derived from different genomic matrices (FNEJ, FL&H, FVR1, FVR2 and FYAN), from runs of homozygosity (FROH) and from homozygosity by descent probabilities (FHBD) were calculated. All the inbreeding coefficients were adjusted by the mean F of the 1st generation. Pearson's correlations and first order partial correlations were computed between all the Fs. The tolerance level was calculated using the information theory to determine if a partial correlation was significant. ENDOG v4.9, PLINK v1.9, RzoRoH R package, PCIT, Cytoscape v 3.10.1 and own code in R were used. Correlations were between 0.84 (FPED-FVR1) and 1.00 (FNEJ-FL&H) in both lines. The FVR2 correlations were not significant with FNEJ, FL&H, and FHBD. FPED, FYAN, FVR1 and FROH presented statistically significant correlations with all the rest of coefficients in both lines. The partial correlations and the information theory showed that Fs performance was the same in both selected lines and that FVR2 were less informative with respect to the other Fs.

Population dynamics of potentially harmful haplotypes: pedigree evidences

K. D. Arias¹, I. Fernández¹, J. P. Gutiérrez², I. Álvarez¹, F. Goyache¹

¹ SERIDA, Deva, 33394 Asturias, Spain, ² UCM, Dpto. Producción Animal, 28040 Madrid, Spain

Low-frequency haplotypes, never observed in homozygous state in a population, could be informative on potentially harmful alleles (candidate alleles). Although their identification is challenging, little is known about the dynamics of potentially lethal haplotypes. A pedigree of the highly endangered Gochu Asturcelta pig breed, including 471 individuals belonging to 51 different families with at least 5 offspring each, was genotyped using the Axiom PigHDv1 Array (658,692 SNPs). Analyses were performed on four different Cohorts (BP=10; G12=52; G23=281; G3=128), defined according to pedigree depth, and at the Whole Population (WP) level. The 4,470 Linkage Blocks identified at the BP using PLINK v1.9 gathered a total of 16,981 alleles in the WP. Up to 5,466 (32%) haplotypes were statistically considered candidate alleles, of which 3,995 (73%) had one copy only. The number of alleles and candidate alleles varied across Cohorts according to sample size. Up to 4,610 of the alleles identified in the WP (27% of the total) were present in one Cohort only. Parentage analysis identified a total of 67,742 parent-offspring incompatibilities. The number of mismatches varied according to family size. Segregation analyses informed that most potential candidate alleles appeared de novo in the pedigree. Only 17 candidate alleles were identified in the boar, sow, and paternal and maternal grandparents and were considered segregants. The occurrence of low-frequency haplotypes is likely to be caused by Allele-Drop-In events due to SNP calling errors. Only fully segregant candidate alleles should be considered potentially harmful alleles. Work partially funded by grants PID2019-103951RB/AEI/10.13039/501100011033 and PRE2020-092905 (KDA).

Occurrence of haplotypes in low frequency is not explained by recombination and CNV regions only

K. D. Arias¹, I. Fernández¹, J. P. Gutiérrez², I. Álvarez¹, F. Goyache¹

¹ SERIDA, Deva, 33394 Asturias, Spain, ² UCM, Dpto. Producción Animal, 28040 Madrid, Spain

Linkage Blocks (LB) were defined as strong linkage disequilibrium stretches flanked by genomic areas with higher recombination rates (ρ). The identification of LB is subject to large variation depending on the methods used, the availability of a base population (BP), genetic factors, and population events. A pedigree of the highly endangered Gochu Asturcelta pig breed, including 471 individuals, was genotyped using the Axiom PigHDv1 Array (658,692 SNPs). LB were identified at the BP using PLINK v1.9. Parameter ρ was estimated in 50 kb windows using the R package FastEPRR. Relationships between LB, ρ hotspots, and 344 CNV regions were ascertained using the intersect function of Bedtools. Mean ρ estimated for the whole typed population was 2.2 ± 3.9 cM/Mba total of 212 LB (gathering 5.7% of the total number of alleles identified) overlapped with at least one window with ρ 2.5 s.d. above the mean (ρ hotspots). Furthermore, a total of 177 LB, gathering 804 different alleles (4.7% of the total number of alleles identified; 4.5 alleles per LB) overlapped with 72 different CNV regions. Only six different LB, located on SSC2, SSC6, and SSC11, gathering a total of 45 different alleles (7.5 alleles per LB), overlapped with both ρ hotspots and CNV regions. Although the role of recombination in the occurrence of new haplotypes within LB cannot be neglected, in our data the overlap of the LB identified with genomic areas potentially considered recombination hotspots is low and, therefore, recombination cannot explain by itself the excess of new alleles identified. The occurrence of Allele-Drop-in events causing the identification of new haplotypes within LB should be explored. Work partially funded by grants PID2019-103951RB/AEI/10.13039/501100011033 and PRE2020-092905 (KDA).

Genomic partitioning of inbreeding depression in Jersey cattle

C. Maltecca¹, F. Tiezzi², J. Jiang¹

¹ North Carolina State University, Animal Science, 120 W Broughton Dr., 27607 Raleigh, United States, ² University of Florence, Department of Agricultural, Food, Environmental and Forestry Sciences and Technologies, Via Gaetano Donizetti, 6, 50144 Florence, Italy

Inbreeding depression (ID), the reduction of survival and reproduction in inbred offspring, has been widely observed across almost all experimental, natural, and domesticated populations. Despite numerous research studies and experiments conducted on the mechanism of ID, its genetic and molecular basis remains elusive. Our idea intends to partition the effects of ID in the dairy cattle genome by specific annotations and investigate any significant disproportional effects of ID within certain annotations on the mean values of the traits of interest. We performed ID partitioning for four reproduction traits and three productive traits of 256,268 genotyped Jersey cattle from the U.S. CDCB (Council on Dairy Cattle Breeding) database. After quality control, we mapped 60,774 SNP chip variants onto six functional annotation categories (i.e., CDS, promoter, intron, UTR, GERP constrained elements, and remaining). We estimated the effects of ID attributed to each functional annotation category by performing a multivariate regression of phenotypes onto annotation-specific inbreeding terms and correcting relatedness with GRM. For the trait CCR (Cow Conception Rate), significant enrichment of ID was detected in Promoter with a P-value of 0.041, and the enrichment of ID (δk , defined as the ratio between the contribution of annotation k to ID over the expected contribution of annotation k to ID) of 20.250. For EFC (Early First Calving), significant enrichment of ID was detected in Promoter with a P-value of 0.019 and δk of 24.434. For milk yield, significant enrichment of ID was detected in CDS, Promoter, UTR, and intronic regions, with P-values of 0.007, 0.026, 0.004, 0.0002, and δk of 5.362, 4.273, 7.356, 1.647, respectively. It was also detected in the same genomic regions for milk fat, with P-values of 0.002, 0.005, 0.036, 0.0003, and δk of 5.768, 4.945, 5.513, 1.614, and in CDS, Promoter, and intronic regions for milk protein, with P-values of 0.0005, 0.002, 0.001, and δk of 6.404, 5.282, 1.526. Our research can help better elucidate the molecular basis of inbreeding depression in dairy cattle.

Impact of the DGAT1 mutation in a Bos Taurus x Bos Indicus crossbred population in India

M. A. Touchard¹, Y. Gaundare², S. Jadhav², V. Dhanikachalam², V. Podtar², N. Punde², T. Shirsath², A. Joshi², K. Bhawe², S. Joshi², M. Swaminathan², M. Boussaha¹, V. Ducrocq¹

¹ INRAe, Animal Breeding and Genetics, GABI 211, 78350 Jouy-en-Josas, France, ² BAIF Development Research Foundation, Pune, 412 202 Maharashtra, India

The DGAT enzyme (diglyceride O-acyltransferase) plays a key role in the milk fat synthesis of cows. DGAT1 is a gene known to have a mutation in the Holstein breed (K232K / K232A) in North America and Europe, leading to a reduction of fat % with the A allele (Grisart et al., 2002). However, such a reduction is not pertinent in India, where milk from Bos Indicus is strongly preferred because of its fat content. With the support of the Bill and Melinda Gates Foundation, the Indian NGO Bharatiya Agro Industries Foundation (BAIF) has created a crossbred population of Bos Taurus x Bos indicus cattle to induce sustainable genetic progress. Our study based on about 3000 genotyped crossbred cows in 6 Indian states shows that about half of them carry one copy of the mutation and about 20% two copies, leading to a decrease of fat% of about 4%, compared to the pure Bos indicus cattle. However, this undesirable evolution can be easily reversed by selecting young genotyped crossbred AI bulls not carrying the K232A mutation.

Footprints of balancing selection in the genome of Original Valachian sheep

N. Moravčíková¹, R. Kasarda¹, A. Halvoník¹, M. Chalupková¹, L. Vostrý², H. Vostrá-Vydrová², I. Pavlík³

¹ Slovak University of Agriculture in Nitra, Tr. A. Hlinku 2, 94976 Nitra, Slovakia, ² Czech University of Life Sciences, Kamýcká 129, 16500 Praha - Suchbátka, Czech Republic, ³ National Agriculture and Food Centre, Research Institute of Animal Production, Hlohovecká 2, 95141 Lužianky, Slovakia

The aim of this study was to detect potential footprints of balancing selection in the genome of Original Valachian sheep renowned for its ability to thrive in rugged landscapes of mountain environments and by its historical significance in the traditional Slovak agricultural landscape. In harsh environments, such as mountain regions, balancing selection could play a key role in shaping the genetic diversity of breeds by facilitating their adaptability to challenging conditions and preserving their resilience over generations. We tested the genomic data of 78 ewes and 18 rams of Original Valachian sheep genotyped by GGP Ovine50k chip. Tajima's D statistic was used to find genomic regions under balancing selection, where positive D values suggest an excess of intermediate frequency variants, possibly due to balancing selection, while negative values indicate directional selection. Tajima's D values were calculated in 250 kb sliding windows, with candidate regions defined by the top 1% of positive D values. Across autosomes, 100 potential footprints of balancing selection were identified. Autosomes 3 and 6 showed the highest number of signals with average D values of 3.70 and 3.72, respectively. Subsequent gene enrichment analysis showed that protein-coding genes inside detected regions on autosomes 3 and 6 are included in various KEGG pathways, such as Toll-like receptor signalling pathway. This research was supported by the projects APVV-20-0161, APVV-17-0060, DS-FR-22-0016 and 8X23019.

How directional artificial selection has shaped the genome of Italian heavy pig breeds

J. Vegni¹, G. Schiavo¹, M. Ballan¹, S. Bovo¹, F. Bertolini¹, L. Buttazzoni², M. Gallo³, L. Fontanesi¹

¹ Animal and Food Genomics Group, Division of Animal Sciences, Department of Agricultural and Food Sciences, University of Bologna, Viale Giuseppe Fanin 46, 40127 Bologna, Italy, ² Consiglio per la ricerca in agricoltura e l'analisi dell'economia agraria (CREA), Via Salaria 31, 00015 Monterotondo (Roma), Italy, ³ Associazione Nazionale Allevatori Suini, Via Nizza 53, 00198 Roma, Italy

The breeding programs of the Italian heavy pig breeds (Italian Duroc, Italian Landrace and Italian Large White) started in 1990, having as main objectives the needs of the Italian dry-cured ham protected designation of origin (PDO) value chains. This directional selection was based on several traits that substantially improved performance, reproduction and carcass traits of the three breeds while maintaining the meat quality for seasoning. Because of the selection, the genetic background of the three breeds diverged from the cosmopolitan Duroc, Landrace and Large White breeds used in other production systems. In this study, we monitored how this selection acted at the genomic level on the Italian heavy pig breeds. About 13,000 pigs of the three Italian breeds, born over almost four decades, were genotyped with a high-density SNP array. Over time changes of single marker and haplotype frequencies were evaluated, using a logistic regression model. A total of about 350-500 haplotypes in the three breeds significantly changed their frequency providing a picture of the genomic regions that were indirectly modified by the directional artificial selection programs operating over this period. Acknowledgements: Funded by the Programma di Sviluppo Rurale Nazionale (PSRN) SUIS-2, co-funded by the European Agricultural Fund for Rural Development of the European Union and by the MASAF.

Influence of inbreeding on reproduction traits in Swiss pig breeds

A. Burren¹, N. Khayatzadeh², I. Haefliger², H. Joerg¹¹ Bern University of Applied Sciences, School of Agricultural, Forest and Food Sciences, Laenggasse 85, CH-3052 Zollikofen, Switzerland, ² SUISAG, Allmend 10, CH-6204 Sempach, Switzerland

In the present study, the relation between inbreeding coefficient and reproductive traits of proportion of piglets below 1 kg (PB1, n=28'891), piglets survival during suckling (PS, n=35'487), number born alive (NBA, n=36'477), proportion of stillborn piglets (PSB, n=97'062) and days weaning to oestrus at first litter (WO, n=27'834) were studied in Swiss pig breeds. The data were recorded over 17 years from 2002 to 2018 in Swiss Large white (SLW) and Swiss Landrace (SLR) pure lines as well as F1-crossbreeds sows (SLW x SLR). The relation between inbreeding and reproductive traits PB1, PS, NBA and WO has been investigated by a linear mixed model. The proportion of stillborn piglets (PSB) was modeled using a mixed model and binomial distribution. For the traits PB1, PSB and NBA, the fixed effects of blood proportion, age at farrowing, type of insemination, litter month, litter year, piglet breed group, inbreeding coefficients of sow, boar and piglet, and random effects of boar, sow and farm were included in the model. For traits PS and WO, the effects of number of piglets suckled and suckling duration are additionally considered, and the type of insemination is omitted. Since only first litters are considered for the WO trait, there were no random effects for boars and sows in the model. The number of piglets born alive decreased as sow inbreeding increased (-2.35 ± 1.01 , p-value=0.02). For the trait PB1, none of the three inbreeding coefficients was significant. However, when inbreeding is divided into categories, the percentage of underweight piglets was significantly lower in inbred piglets than in non-inbred piglets. The piglet survival during suckling was significantly influenced by piglet inbreeding (-0.09 ± 0.03 , p-value=0.00). The weaning interval increased by 5.47 days when sow inbreeding increased by 1% (p-value=0.026). Regarding the percentage of stillborn piglets, a significant effect of piglet inbreeding was observed (odds ratio = 2.26; p-value=0.00). The results are consistent with other studies and show that the inbreeding of sow and piglet influence the reproductive traits.

Rapid, low-input, targeted NGS workflow for DNA methylation in dogs

A. Burrell¹, K. Gujjula¹, J. Lavoie¹, S. Chadaram¹, A. Hatch¹, G. Yavas¹, L. Pickle¹¹ Thermo Fisher Scientific, R&D, 2130 Woodward Street, 78744 Austin, United States

DNA methylation is an epigenetic process involved in the regulation of mammalian gene expression. Methylation primarily occurs by the modification of cytosine bases in CpG (cytosine-phospho-guanine) dinucleotides. In canine biology, CpG markers have been associated with cancers, disease processes, development genes, and in age determination. We have developed a fast, flexible next-generation sequencing workflow for characterizing and quantitating methylation of specific markers in the canine genome. To test feasibility of our workflow we identified 100 CpG markers associated with canine aging, lifespan, weight, and height. A primer panel was designed to target approximately 200bp amplicons surrounding the markers of interest. The panel was designed to target both the Watson and Crick strands of DNA. The sequencing workflow consisted of an initial bisulfite conversion using as little as 10ng of DNA input. Library preparation was then completed using the Thermo Fisher Scientific AgriSeq™ HTS Library Kit. Template prep and sequencing were performed on the Genexus™ Integrated Sequencer, a highly automated system that performs all post-library manipulations without manual intervention. After sequencing, the analysis pipeline provided DNA methylation calls on both Watson and Crick strands at single base resolution and methylated:unmethylated ratios for each targeted CpG marker. The performance of the workflow was evaluated by serially diluting a fully methylated canine control DNA sample into a fully unmethylated sample at the following ratios: 100%, 75%, 50%, 25%, and 0% methylation to demonstrate the accuracy of DNA methylation quantitation across a range of inputs. The workflow was completed in 2 days, end-to-end, and generated highly accurate quantitative results with as little as 10ng of DNA input. The workflow can be adapted for any CpG markers of interest using custom-designed primer pools from the Thermo Fisher Scientific White Glove team highlighting the flexible and customizable nature of the workflow.

SMARTER-database: a tool to explore genomic diversity in small ruminants

A. Stella¹, A. Manunza¹, B. Servin², R. Rupp², P. Cozzi¹

¹ Institute of Agricultural Biology and Biotechnology, National Research Council, via corti 12, 20133 Milan, Italy, ² GenPhySE, INRAE, Castanet-Tolosan, Castanet-Tolosan 31326, France

We present the SMARTER-database, a collection of tools and scripts to standardize genomic data and metadata of small ruminant populations. With a focus on reproducibility, our system prioritizes consistency and reliability in data integration. Genotypes are standardized to the same coding convention and to the most recent reference genome assembly version, in order to facilitate seamless comparison of samples from different sources. Data access is granted to users through the SMARTER-backend using R packages or the web interfaces, while genotypes are available over FTPS. Currently, the SMARTER database tracks genomic information on approximately 12,000 sheep and 6,000 goats, with nearly 80% and 60% of samples possessing GPS coordinates of sampling sites of sheep and goats, respectively.

Efficient calculation of linkage analysis based genomic relationship matrices for optimum contribution selection.

T. Meuwissen¹, X. Yu¹, P. Berg¹

¹ NMBU, BIOVIT, Box5003, 1432 Ås, Norway

In the pre-genomics era, inbreeding was based on pedigrees and estimated as the probability of Identity-by-Descent (IBD) at neutral loci unlinked to loci under selection. However, with genomic selection for genome-wide dense marker panels unlinked neutral loci hardly exist anymore. With genomic data, we can see what happens at the DNA level and a multitude of genomic measures of inbreeding have been developed. Some inbreeding measures are based on homozygosity, such as runs of homozygosity and excess of homozygosity, causing allele frequency changes towards 0.5 in optimum contribution selection (OCS). Other inbreeding measures are based on genetic drift, which favor the loss of rare alleles over a substantial increase of their frequency in OCS schemes. We argue that measures of inbreeding need to be based on IBD, such as the pedigree relationship matrix A , because diversity management based on IBD is neutral with respect to allele frequency changes. Genomic information can be included in the A matrix using linkage analysis (Gla). This linkage analysis approach was originally proposed by Fernando and Grossman for a single or few marker loci but is computationally extremely demanding for current dense SNP panels and large national data sets. Moreover, the Fernando and Grossman approach would calculate the Gla relationship matrix for all animals in the pedigree instead of only for genotyped animals such as the genomic relationship matrix (GRM) does. Depending on our needs, the latter may be computationally wasteful. Here we develop a linkage analysis approach to calculate the Gla relationship matrix using 50k SNP genotypes for 10,311 young genotyped cows in a pedigree of 393,129 Norwegian Red Cattle. We compared the estimated relationships to the GRM, the A matrix and the inbreeding coefficients to those obtained from Runs of Homozygosity.

Characterisation of grazing dairy cows differing in how they utilise their ingested nitrogen

E. Tavernier^{1,3}, *L. Delaby*², *I. C. Gormley*³, *M. O'Donovan*¹, *D. Berry*¹

¹ Teagasc, Department of Animal Bioscience, Animal and Grassland Research and Innovation Centre, Teagasc, Moorepark, P61 P302 Fermoy, Ireland, ² INRAE, UMR Physiologie, Environnement et Génétique pour l'Animal et les Systèmes d'Élevage, Institut Agro, 35590 Saint-Gilles, France, ³ School of Mathematics and Statistics, University College Dublin, Belfield, D04 V1W8 Dublin 4, Ireland

Excessive nitrogen loss for agriculture can contribute to pollution. Selecting cows that efficiently use nitrogen (i.e., cows that can utilise nitrogen intake in milk, growth, and pregnancy more effectively) while also excreting (relatively) low quantities of nitrogen can help mitigate this issue; genetic variability in both traits is known to exist. Nitrogen use efficiency and the quantity of nitrogen excreted was available from 491 lactations from 184 grazing dairy cows, totalling 1,249 weekly estimates. Linear mixed models were used to compute animal solutions for both nitrogen utilisation and nitrogen excretion and these were jointly used to classify the cows as sustainable if their nitrogen use efficiency was better than average while also excreting less nitrogen than the average. Conversely, cows were classified as undesirable if their nitrogen use efficiency was worse than the average while excreting more nitrogen than the average. Performance metrics were computed for both classes using linear mixed models. The sustainable cows were 20 kg lighter (SE = 5 kg), ate 53 grams of nitrogen less per day (SE=12 grams of nitrogen/day), and produced 190 grams more protein per day (SE=87 grams/day) than the undesirable cows. Neither milk urea nitrogen nor milk yield differed by class. This study suggests a potential solution for more sustainable grazing dairy milk production.

Feed, nitrogen and phosphorus-use efficiency in organic and conventional dairy farming systems in The Netherlands

*M. G. J. Edens*¹, *J. W. Peek*¹, *E. L. P. Guennoc*², *H. Bovenhuis*², *M. S. Gilbert*¹, *J. Dijkstra*¹

¹ Wageningen University & Research, Animal Nutrition, De Elst 1, 6708 WD Wageningen, Netherlands, ² Wageningen University & Research, Animal Breeding and Genomics, Droevendaalsesteeg 1, 6708 PB Wageningen, Netherlands

Enhancing feed efficiency (FE), nitrogen use efficiency (NUE), and phosphorus use efficiency (PUE) is pivotal for sustainable dairy cattle production. We evaluated FE, NUE, and PUE using Annual Nutrient Cycling Assessment data from 109 organic (OF) and 856 conventional farms (CF) in the Netherlands during 2018-2021, in which CF were selected based on proximity to OF, breed (>80% Holstein-Friesian) and herd size (>50 cows). For each farm and year, NUE and PUE were calculated by comparing farm outputs (milk and meat) to inputs (feed) at herd level (youngstock, dry and lactating cows) and farm outputs (milk, cattle, and sold crops and forages) to inputs (cattle, feed, fertilizer, and N fixation and deposition) at farm level. Data were analysed with a mixed model, including farm type (OF or CF), year (2018 to 2021) and soil type (sand, clay, peat, or mix) and all interactions between farm type, year and soil type as main effects, with farm as repeated effect. Preliminary results show that CF had higher FE (1.16 vs. 1.02 kg FPCM/kg DM) than OF. Furthermore, CF had higher PUE at herd level (35.9% vs. 31.1%), while PUE did not differ between CF and OF at farm level, except for a higher PUE of CF on mixed soil in 2018 (81.4% vs. 70.2%). Lastly, CF showed higher herd NUE (25.1% vs. 23.8%), but lower farm NUE (33.9% vs. 39.5%) than OF across all soil types, except for peat soil where no differences were found. Enhancing knowledge on dairy farming management strategies, dependent on efficiency metrics, may help to decrease excretion of N, P and other pollutants to the environment and decrease the amount of feed used to produce milk.

Carbon footprints result from livestock production in Poland based on NPC tools from CCCFarming project - limitations and perspectives

M. Szumacher-Strabel¹, P. Sidoruk¹, M. De Vries², D. Ruska³, K. N. L. Naglis-Liepa³, P. R. Hargreaves⁴, R. M. Rees⁴, X. Vergé⁵, P. Robin⁵, P. Galama², V. Juskiene⁶, A. Kuipers²

¹ Poznan University of Life Sciences, Department of Animal Nutrition, Wolynska 33, 60-637 Poznan, Poland, ² Wageningen Livestock Research, De Elst 1, 6708 WD Wageningen, Netherlands, ³ Latvia University of Life Sciences and Technologies, Liela Street 2, LV-3001 Jelgava, Latvia, ⁴ SRUC, Scotland's Rural College, West Mains Rd., EH9 3JG Edinburgh, United Kingdom, ⁵ INRAE, UMR SAS, 65 rue de St-Brieuc, 35042 Rennes Cedex, France, ⁶ Lithuanian University of Health Sciences, Žebenkos 12, LT-82317 Baisogala, Lithuania

The use of accounting tools for estimating greenhouse gas (GHG) and ammonia (NH₃) emissions from dairy farms is of increasing importance for monitoring environmental performance and identifying effective mitigation strategies. In the EU project, Climate Care Cattle Farming Systems ('CCCfarming') three GHG accounting tools were used: ANCA, AgreCalc, CAP2ER. In Poland – one of the project participants – eight selected farms representing a country-wide variety of housing systems, management practices, breeds, feeding, and land were used. One large farm with 1437 cows and the smaller one's with 10 to 100 cows were monitored. Average milk production per cow was 9241 kg (from 5600 in small 10 cows-farm and in ecological to 15 000 in intensive production farms) in all analyzed farms. Compared with the other farms from the other CCCfarming project countries, based on NPC tools, GHG emission intensity in Poland was one of the highest (1620 g CO₂eq/kg FPCM). The average GHG emission intensity in Polish farms was 1.44 kg CO₂eq/kg FPCM whereas in the other project countries from 0.94 to 1.08 kg CO₂eq/kg FPCM. However, it should be emphasized that the implemented NPC tools were adapted to Polish conditions and were not always easy to use, therefore, the results obtained for other countries such as Latvia, or Lithuania may systematically differ. We can however conclude that the emission reduction strategies proposed in the project, e.g. covering slurry tanks or nutritional strategies, can significantly reduce emissions from Polish dairy farms. Project CCCfarming National Centre for Research and Development (SUSAN/II/CCCFARMING/03/2021)

Session 3

Theatre 4

The duration of outdoor stay affects the urinary and faecal nitrogen excretion in dairy cows

S. Arango¹, L. Bailoni¹, N. Guzzo¹, V. Trabacchin¹, E. Bianco³, E. Simonetti³, E. Zerbini⁴, S. Rainis³, C. Sartori²

¹ University of Padova, BCA, Viale dell'Università 16, 35020 Padova, Italy, ² University of Padova, DAFNAE, Viale dell'Università 16, 35020 Padova, Italy, ³ ERSA, Via Sabbatini 5, 33050 Udine, Italy, ⁴ ERSA, Directorate of Agriculture and Food Resources, Forestry and Fishery, Valorisation of the Quality of the Productions, Via Sabbadini 31, 33100 Udine, Italy

Access to outdoor areas enhances animal welfare in dairy cows. The time and duration of the stay is critical in order to prevent excessive land nitrogen deposition. The objective of this study was to assess nitrogen (N) excretion in urine and faeces of dairy cows during daily outdoor stays of 2 and 4 hours. The experiment was carried out at the Paolino d'Aquileia Institute (Cividale del Friuli, Udine, Italy), which features a free-stall equipped with an automatic milking system. Six (6) Italian Simmental lactating cows were selected based on lactation number (2.0±1.4) and lactation stage (103±35 DIM). Animals were fed a TMR based on grass-silage and alfalfa hay. Using a 3×3 Latin square design with 3 periods of 2 weeks each, the cows were grouped into 3 categories: confinement inside a free-stall all day (CTR), 2-hour daily outdoor access (11:30 a.m. – 1:30 p.m.) (O2), and 4-hour daily outdoor access (O4). The O4 group had two exit times per day: morning from 9:00 to 11:00 a.m. (O4a) and afternoon from 2:00 to 4:00 p.m. (O4b). Urine and faeces, produced during the outdoor stays, were collected, weighed and sampled for N analysis using the Kjeldahl method. Fresh faecal weight, N content in faeces, total N output of faeces and overall N excretion (urine and faeces) were significantly (P<0.01) higher in O4a compared to O4b (3.82 vs 2.17 kg, 2.16 vs 1.69% DM, 13.16 vs. 7.08 g, and 27.97 vs. 16.16 g resp.). O2 group showed intermediate values compared to O4a and O4b. To conclude, due to lower fecal output and reduced concentrations of N in urine and faeces, the optimal time for access to outdoor areas appear to be in the afternoon, specifically between 2:00 and 4:00 p.m. Considering the limits of EU Directive 91/676, the number of cows per hectare could potentially increase from 17 to 22 and 29 respectively for morning, midday and afternoon outdoor outings throughout the year.

The characterization of microbiome and resistome in feces and slurry of dairy cows in different livestock production systems

I. Nejjam¹, A. Varsaki¹

¹ Centro de Investigación y Formación Agrarias (CIFA), C/ Héroes 2 de Mayo, 27, 39600 Muriedas-Cantabria, Spain

The application of manure or slurry to agricultural land is considered an environmentally friendly method of waste disposal (Wen et al., 2019); it allows providing the essential nutrients to the soil and enhancing its quality, improving the yield and quality of crops and pastures, and additionally reducing the use of mineral fertilizers. However, because of the huge antimicrobial use in dairy cows and other livestock (Köchle et al., 2024), these effluents are implicated in the transmission of antimicrobial resistance (AMR) bacteria into aquatic, terrestrial and atmospheric ecosystems (Sura et al., 2015; McNab et al., 2007 and McEachran et al., 2015) which threatens public health on a global scale (WHO, 2014). Here lies the importance of characterizing the microbiome and resistome composition in feces and slurry of dairy cows, comparing three livestock production systems (intensive, conventional grazing; and organic grazing). To achieve these objectives, 18 dairy cattle farms (six farms per production system) were selected in Cantabria, Spain; to whom a questionnaire on general farm characteristics, herd management, effluent management and health management practices was conducted. In addition, 300 feces samples and 90 slurry samples were collected from first-calving Holstein cows and piles of accumulated slurry respectively. All samples were analysed in the CIFA laboratory both for physicochemical and molecular analysis. The metagenomics DNA were quantified and, their quality and integrity were evaluated. The sequencing process was realized using MinIon Mk1C and following SQK-LSK109 protocol of ONT (Oxford, UK). The bioinformatics tool used is the SQM pipeline. The preliminary results showed that the mean read length is 2 731 bp with a median read quality of 14.34 and N50 of 6 935 bp. Metagenomes studied are mostly composed of bacteria (84%), followed by archaea (4%) and viruses (<1%). The most abundant metagenomes in feces are *Methanobrevibacter* sp. YE315, *Bifidobacterium pseudolongum* and *Bifidobacterium angulatum*. In slurry, the most abundant metagenomes are *Nostoc* sp. C057, *Escherichia coli* and *Pseudomonas nitroreducens*. In feces, we found 30 gen groups of AMR and in slurry samples 67.

Theatre 6

Response of early and late lactation dairy cows to diets differing in levels of human edible ingredients

A. Cushnahan¹, C. P. Ferris¹

¹ Agri-Food and Bioscience Institute, Large Park, BT26 6DR Hillsborough, United Kingdom

Twenty early lactation (EL) cows and 20 late lactation (LL) cows (65 and 220 days in milk) were used in a 2 period (4 weeks duration) changeover design experiment. Four treatments were examined in a 2×2 factorial design comprising two lactation stages (EL and LL) and two concentrate types differing in human edible fraction (HEF) (human edible, HE) and low human edible (IN). HE was predominantly cereal and soyabean meal based, while IN included significant quantities of feeds like wheatfeed, rapeseed meal and distillers dark grains. Concentrates were formulated to be isoenergetic and isonitrogenous. Diets were offered as a PMR (57% grass silage:43% concentrate, DM basis). A standard concentrate (0.5 kg/day) was offered at each milking. Data (from week 4 of each period) were analysed using linear mixed model (REML estimation method) methodology with Cow and Period fitted as random effects and a factorial arrangement of Lactation stage and Concentrate type fitted as fixed effects. Pairwise differences between the levels of the effect were compared using Fisher's Least Significant Difference test. HEF of HE and IN were 0.506 and 0.184 respectively. Concentrate type had no effect on total DM intake (HE, 21.1; IN, 20.6 kg/day, P=0.228) or milk yield (HE, 30.3; IN, 30.3 kg/day, P=0.833). Cows offered HE produced milk with a higher protein content (33.5 g/kg) than cows offered IN (32.5 g/kg) (P<0.001). Irrespective of stage of lactation, calculated edible Feed Conversion Rate (eFCR)(MJ edible output/MJ edible input) was greater for cows on IN than HE (EL-HE, 1.27; EL-IN, 3.31; LL-HE, 1.09, LL-IN, 2.70; P=0.001). In conclusion reducing the HEF in a concentrate had no impact on the DM intake and milk yield of early and late lactation cows but improved eFCR.

Reduced climate change impact of milk achieved with introduction of faba bean in dairy cows' diet

S. Hietala¹, A. Vanhatalo⁴, K. Kuoppala³, T. Kokkonen⁴, A. Reinikainen², K. Vikki², A. L. Välimaa⁵

¹ Natural Resources Institute Finland, Bioeconomy and environment, Paavo Havaksen tie 3, 90570 Oulu, Finland, ² Natural Resources Institute Finland, Bioeconomy and environment, Latokartanonkaari 9, 00790 Helsinki, Finland, ³ Natural Resources Institute Finland, Production systems, Tietotie 2 C, 31600 Jokioinen, Finland, ⁴ University of Helsinki, Department of Agricultural Sciences, Viikinkaari 1, 00790 Helsinki, Finland, ⁵ Natural Resources Institute Finland, Production systems, Paavo Havaksen tie 3, 90570 Oulu, Finland

The impact of substituting typically used imported rapeseed meal (RS) with domestic faba bean (FB) was studied at dietary concentrate levels of 45% and 35% on grass silage (GS) based Finnish dairy cows' diets. The climate change impact (CF) of milk was assessed using life cycle assessment (LCA), using both (a) the IPCC method and (b) the specific methods developed for Finnish conditions, according to Hietala et al. (2021). For each diet the LCA model was adjusted for the diet composition (incl. crop cultivation and nutritional values), milk yield and composition. Milk yield was converted to fat and protein corrected milk (FPCM, IDF 2015). For the FB diets, feed cultivation was modelled including crop rotation and pre-crop effects (i.e., N fertilization, crop yields) as presented by Kuoppala et al. (2024). The number of calvings was assumed to be 3, the slaughter age 1825 d and the slaughter weight 268 kg, for all diets. The RS diets (45RS, 35RS) included 4000 and 4413 kg DM of GS year⁻¹. Corresponding amounts of RS were 650 and 469 kg DM, whereas the amounts of FB substituting RS were 826 and 595 kg DM (45FB, 35FB). All diets were completed with barley and oats in the ratio of 1:1. Increasing the GS and the FB in the diet led to lower FPCM yield. 45RS resulted in 10735 kg FPCM year⁻¹. Substituting FB for RS reduced FPCM by 2% and increasing GS proportion decreased FPCM by 6 to 8%. Lowest CF of FPCM resulted from 45FB with 1.25 (a) / 1.17 kg CO₂eq (b). 45RS and 35FB both resulted 2-3% higher CF and 35RS performed worst with 4-5% higher CF. The introduction of FB led to lower FPCM, yet the environmental performance of feed cultivation was improved with higher rate, overcoming the impaired milk yield.

Session 3

Theatre 8

System level impacts of environmental and social economic optimization-expert analyses of different countries

P. Galama¹, B. Rees²

¹ Wageningen UR, Livestock Research, De Elst 1, 6700AH Wageningen, Netherlands, ² Scottish Rural University College, SRUC, W Mains Rd, EH9 3JG Edinburgh, United Kingdom

The European Climate Care Cattle project provided an evaluation of farm systems optimizing socio-economic and environmental outcomes. To achieve this we have utilised research outputs from different work packages and used a workshop of project partners of eight countries to provide expert analysis to evaluate management options for improving the environmental outcomes of European dairy farming. A structured questionnaire was prepared that divided the management of the farm into the following groups: Livestock management, Pasture and soil management, Housing design and manure management, and Energy. The project participants were allocated to each group in accordance with their expertise and region. Also, a limited number of four suitable farm systems were evaluated (Intensive, Extensive, Organic and Visionair) for each region. The various management and farm systems were in a stepwise procedure scored on outcomes related to productivity, the environment and their attractiveness to the region. The systems vary between regions in Europe in order to support locally appropriate farming. This study has highlighted the important role that management interventions have in delivering efficient, productive and low emission dairy production across Europe. Milk produced in European dairy systems already achieve high levels of efficiency when compared with global baseline, however it is also recognised that more needs to be done to reduce current levels of emissions in order to meet ambitious climate change mitigation targets. No single intervention will achieve this, but our study has shown that changes to livestock management, pasture management, housing, energy use and manure management can have beneficial and additive effects on productivity and environmental outcomes. The carbon footprints of real dairy farms across Europe indicate that the variability within regions is often larger than that between regions highlighting the opportunity for management interventions to influence environmental outcomes.

N, P and C efficient use and circularity

J. Roche^{1,2}¹ Chief Science Advisor, Ministry for Primary Industries, Charles Ferguson Building, 6011 Wellington, New Zealand, ² University of Auckland, 22 Princes street, 1010 Auckland, New Zealand

Circularity in nutrient management is an approach aimed at mitigating some of the environmental effects of agriculture, by curtailing nutrient losses through recycling and reutilisation. The global food system contributes 20-30% of anthropogenic greenhouse gases and contributes to fresh and estuarine water body degradation as well as biodiversity loss. Anything that reduces these negative effects is to be commended. Nutrient circularity has focussed specifically on the efficient use of nitrogen (N) and phosphorus (P), because of their recognised importance in food production and their role in ecosystem degradation when improperly managed, and, carbon (C), because of its role in climate change. Agricultural N is sourced from fertiliser, mostly (estimated to be responsible for approximately half of the world's food supply), animal waste, or from fixation of atmospheric N into ammonium by N-fixing bacteria. Phosphorus is generally sourced from finite rock deposits, which are spatially isolated from both food production and consumption locations. Nutrient circularity strategies can enhance nutrient-use efficiency and reduce reliance on non-renewable resources. Adopting sustainable land management practices, like agroforestry and carbon sequestration initiatives, and encouraging changes to consumption patterns to increase natural fibre use in lieu of synthetics (eg wool for carpets, timber for building) may mitigate climate impacts as well as other pollution externalities (eg nano- and microplastic pollution). Areas suitable for food production are often spatially removed from centres of population and, in some cases, sources of nutrient inputs, limiting circularity initiatives. A drive for circularity cannot be allowed to significantly reduce efficient food and fibre production in population sparse areas to encourage food and fibre production in less efficient regions close to centres of human and animal populations. With a growing global population and pressing food and nutrition security needs, agricultural production must be undertaken where it is most nutrient and C efficient. This requires a strong rules-based trade system without barriers to trade.

Session 3

Theatre 10

New York dairy farms: their whole-farm nitrogen and phosphorus balances and greenhouse gas footprints
O. Godber¹, K. Czymmek^{1,2}, K. Workman^{1,2}, Q. Ketterings¹¹ Cornell University, Nutrient Management Spear Program, Ithaca, 14853 New York, United States, ² Cornell University, PRO-DAIRY, Ithaca, 14853 New York, United States

New York (NY) has over 620000 dairy cows on almost 2800 farms producing more than 7 million Mg of milk per year, making it the fifth largest dairy producing state in the United States. For 36 large (>350 cows), commercial NY dairy farms, the Cornell University Whole-Farm Nutrient Mass Balance (NMB) calculator was used to calculate nitrogen (N) and phosphorus (P) NMBs, and Cool Farm Tool was used to estimate greenhouse gas emission intensity (GHGei) for the 2022 calendar year. Farm size ranged from 350 to 6000 head of predominantly Holstein cows with animal densities between 1.76 and 4.85 animal units/ha, average fat and protein corrected milk (FPCM) yield of 12.7 Mg FPCM/cow/year and an average of 63% homegrown feed. Total FPCM production was 870000 Mg, representing approximately 12% of total NY milk production in 2022. Balances for N ranged from 9 to 287 kg N/ha (weighted average = 151 kg/ha) and 0.4 to 14.6 kg N/Mg FPCM (weighted average = 7.7 kg N/Mg FPCM). Balances for P ranged from -18 to 30 kg P/ha (weighted average = 12 kg P/ha) and -0.9 to 1.6 kg P/Mg FPCM (weighted average = 0.6 kg P/Mg FPCM). The GHGei ranged from 0.63 to 1.06 kg carbon dioxide equivalents (CO₂e)/kg FPCM (weighted GHGei = 0.81 kg CO₂e/kg FPCM). These results show good management of both N and P for these NY dairy farms, although opportunities remain for improvement. Both N and P weighted balances per Mg FPCM meet the feasible limit set for NY dairy (8.8 kg N and 1.1 kg P/kg FPCM), indicating high FPCM production efficiency. Weighted balances per ha meet the feasible limit set for P (13 kg P/ha), but exceed the feasible limit for N (118 kg N/ha). For GHGei, current performance reflects the high proportion of good quality homegrown feed, careful nutrient management and use of manure treatment systems such as covered liquid slurry storages and anaerobic digesters on these dairy farms. These results represent a considerable proportion of NY's 2022 FPCM production. However greater participation by smaller farms with less intensive milk production is necessary to draw conclusions on NY's dairy industry as a whole.

Potential use of drones and ICT in livestock farming to deal with environmental sustainability

V. Becciolini¹, M. Merlini¹, A. Mattia¹, G. Rossi¹, L. Conti¹, M. Barbari¹

¹ University of Florence, Department of Agriculture, Food, Environment and Forestry (DAGRI), via S. Bonaventura 13, 50145 Florence, Italy

The need to improve environmental sustainability and reduce nutrient losses in livestock farming is driving the adoption of ICT-based tools in animal production. The utilization of advanced sensor networks, data analytics and precision farming techniques holds the promise of enabling real-time, granular monitoring of both animal and environmental performances. Integrating ICT with intelligent decision support systems would, therefore, optimize resource utilization while minimizing the environmental impact of farming activities. The objective of this study was to offer insights into the potential use of drone-based techniques and ICT in the environmental assessment of farms. This was based on the findings of a literature analysis and the results of a research project focused on developing a drone-based system for identifying on-farm gas and dust emissions. The system incorporated prototype multi-sensor systems for measuring CH₄, CO₂, NH₃, PM_{2.5}, and PM₁₀ at ground level and during flight. A real-time system for collecting, storing, and visualizing data was developed. Additionally, modelling tools for quantifying and mapping emissions were selected and tested. The results of this study showed that, despite the existence of theoretical models and sensor technologies enabling the rapid measurement, estimation, and mapping of gas and dust emissions at the farm level, the system requires optimization to ensure reliable results. The development of effective ICT tools relies significantly on lightweight and highly accurate sensors. Additionally, it involves testing and selecting suitable methods for quantifying emissions in environments marked by multiple sources of emissions and turbulence.

Session 3

Theatre 12

Reducing slurry temperature to lower NH₃, N₂O and CH₄ emissions from fattening housing

N. Guingand¹, Y. Rousseliere¹, J. Thomas¹, A. Collin¹

¹ Ifip-institut du porc, 9 Boulevard du Trieux, 35740 Pacé, France

The aim of this study was to determine the influence of low slurry temperatures on gaseous emissions and to compare two manure cooling systems. The study was conducted on three fattening rooms each housing 54 pigs between 30 and 110 kg. For the three rooms, the design was strictly the same in term of type of floor (fully slatted floor), feeding strategy (biphase – 16 and 15% of crude protein) and ventilation management (diffuse ceiling, under-floor extraction, identical ventilation set). One room (MCSb) was equipped with a manure cooling system (MCS) with pipes fixed to the bottom of the pit. In the second one (MCSf), the cooling pipes were fixed on a raft floating on the surface of the slurry. The last room was the reference (Ref) with no cooling system. Pigs were individually weighted. Feed and water consumptions were daily recorded. Ambient and slurry temperature (three different heights in the pit) were recorded each hour. Slurry volume per room was frequently measured and sampled for analysis. NH₃, N₂O, CH₄ and CO₂ concentrations were semi-continuously measured with a photoacoustic analyser (Innova 1512, Lumasens Technologies Inc.). Carcass performance were also individually recorded (meat rate, fat and muscle thickness). No significant effect was observed on pig performance (average daily gain, feed conversion ratio) and carcasses. Concerning gaseous emissions, NH₃ was reduced by 20% in the MCSb room and less than 10% in the MCSf room. No effect was observed on N₂O. The reduction of CH₄ was around 70% in the MCSb room and less than 30% in the MCSf room. Reducing slurry temperature can be efficient on NH₃ and CH₄ emissions but the efficiency of the MCS with pipes fixed on the bottom was greater than the floating system.

Response of grazing dairy cow production to different grass swards under varying nitrogen fertiliser rates
 M. H. Bock^{1,4}, Z. C. Mckay¹, L. Delaby², D. Hennessy³, B. Mccarthy⁴

¹ University College Dublin, School of Agriculture and Food Science, Belfield, D04 V1W8 Dublin, Ireland, ² INRAE, Institut Agro, 16 Le Clos Domaine de, 35590 Saint-Gilles, France, ³ University College Cork, School of Biological, Earth and Environmental Sciences, Distillery Fields, North Mall, T12 CY82 Cork, Ireland, ⁴ Teagasc, Animal and Grassland Research, Moorepark, P61 C996 Fermoy, Ireland

A grazing study was undertaken in 2022 and 2023 to determine if white clover inclusion in a grass sward could decrease nitrogen (N) fertiliser rates while maintaining a similar production to a grass-only sward under a high N fertiliser rate. The grazing study compared two sward types under two rates of N fertiliser. The four treatments were a grass-only sward receiving 150 kg N/ha (GO-150) or 225 kg N/ha (GO-225) and a grass-white clover sward receiving 150 kg N/ha (GC-150) or 75 kg N/ha (GC-75). Lactating dairy cows were randomised and blocked into treatments by breed, parity, and calving date (n=112). Each treatment group was stocked at 2.57 cows/ha and rotationally grazed 20 paddocks. Grass measurements were taken before and after grazing. Milk yields were recorded daily and milk composition was measured once per week. Statistical analysis was undertaken using mixed models with fixed effects including treatment, paddock, year, and block for grazing data and treatment, breed, parity, and year for milk data. The GO-225 and GC-150 had a similar (P=0.71) total herbage dry matter production. Cows grazing the GC-150 treatment had greater total milk solids (fat + protein) yield (P < 0.05; -20 kg/cow) than cows grazing the GO-225 treatment and tended to have greater total milk solids yield (P = 0.058; -19 kg/cow) compared to cows grazing the GO-150 treatment. The results show a reduction of 75 kg N/ha and the inclusion of white clover can achieve similar herbage and milk production as a grass-only sward with higher N inputs.

Session 3

Theatre 14

White clover's positive impact in perennial ryegrass swards with reduced nitrogen inputs on milk production and nitrogen use efficiency

Á. Murray¹, H. Irish^{1,2}, L. Delaby³, M. O'Donovan¹, D. Hennessy²

¹ Teagasc, Animal and Grassland Research and Innovation Centre, Moorepark, Fermoy, Co. Cork, P61C996 Fermoy, Ireland, ² University College Cork, School of Biological, Earth and Environmental Sciences, Distillery Fields, North Mall, Cork, T23 N73K Cork, Ireland, ³ INRAE, Institut Agro, Physiologie, Environnement et Génétique pour l'Animal et les Systèmes d'Élevage, Saint-Gilles, France, F-35590 Saint-Gilles, France

To reduce cost inputs and environmental impacts of inorganic nitrogen (N) use, there is renewed interest in the incorporation of legumes, white clover in particular in grazing systems. The objective of this study was to reduce chemical N fertiliser input to temperate grass-based milk production systems by incorporating white clover into grassland swards and in turn increase farm gate N use efficiency (NUE). Three grazing treatments were used for this study; grass-only swards receiving 200 kg N/ha (Gr200) and grass-white clover swards receiving 100 (C1100) or 150 kg N/ha (C1150) annually. Twenty cows were assigned to each treatment and swards were rotationally grazed at a stocking rate of 2.5 cows/ha. In the first year of the study, cows grazing the grass-white clover treatments had greater production in terms of milk yield (+257 kg) and milk solids yield (+35 kg) and NUE (+23%) compared with Gr200 treatment. The grass-white clover swards produced 5,858 kg milk and 515 kg milk solids (kg fat + protein) per cow. There was no treatment effect on herbage production, 14.8, 14.9 and 14.9 tonnes DM/ha for Gr200, C1150 and C1100 systems respectively. This significant increase in milk production suggests the inclusion of white clover in grazing systems can be effectively used to increase milk production and reduce N fertiliser inputs and their environmental impacts.

Analysis of nitrogen fertilizer efficiency in rotational grazing: Impact on the quality and productivity of *Lolium multiflorum* Lam. Forage

C. Maduro-Dias¹, M. Machado¹, H. Nunes¹, A. Borba¹, J. Madruga¹, P. Monjardino¹

¹ Universidade dos Açores, Rua Capitão João d'Ávila, 9700-042 Angra do Heroísmo, Portugal

Pastures play a crucial role in sustaining dairy production, particularly in temperate climates where animals can graze year-round. This study aimed to assess *Lolium multiflorum* Lam pasture quality, productivity, and production costs. Conducted on a farm in São Miguel Island, it compared conventional nitrogen fertilizer with controlled-release nitrogen fertilizer at two levels (320 and 160 kg N/ha), alongside a control group. An annual assessment aimed to discern potential agronomic and economic advantages of controlled-release fertilizer. Using a 5×5 Latin square design, the study had five treatments: high fertilization with conventional fertilizer, high with controlled-release, intermediate with conventional, intermediate with controlled-release, and a control. Results showed fertilizer type did not significantly impact forage productivity or quality, but nitrogen levels significantly affected them. Higher nitrogen doses increased dry matter and crude protein. Fiber characteristics remained relatively stable across most cuts, although higher nitrogen application led to elevated levels of NDF and ADF without affecting ADL. Furthermore, nitrogen use efficiency consistently exceeded 70%, regardless of fertilizer type or quantity. Regarding cost per kilogram of dry matter and crude protein, control groups and conventional fertilizers were more economically efficient than controlled-release. This highlights fertilization's importance in dairy production and the need for economically viable choices. While conventional fertilizers proved cost-effective, controlled-release options lacked comparable economic benefits.

Session 3

Poster 16

Variation of in vitro utilisable crude protein in different red clover accessions

M. Vaga¹, D. Parsons², S. J. Krizsan³

¹ Swedish University of Agricultural Sciences, Department of Applied Animal Science and Welfare, Skogsmarksgränd, 90736 Umeå, Sweden, ² Swedish University of Agricultural Sciences, Department of Crop Production Ecology, Skogsmarksgränd, 90736 Umeå, Sweden, ³ Inland Norway University of Applied Sciences, Department of Agricultural Sciences, Campus Blæstad, 2322 Hamar, Norway

Red clover silage is widely used for dairy cows, especially in organic farming due to its higher CP content and lower fertilizer requirement compared to most grasses. However, high polyphenol oxidase (PPO) mediated protein complexing, which protects proteins from degradation during ensiling could also affect protein degradation in the rumen. Twenty-three diploid and 22 tetraploid red clover accessions, including two check cultivars of each, from genetic selection experiment at Lännäs, Sweden, were screened for the in vitro utilisable CP value estimated for 16 h rumen retention time (uCP16). Wilted red clover was chopped and ensiled in 1 L vacuum bags with acid-based silage additive added at a rate of 6 ml/kg. Mean DM content of silages was 240 g/kg (SD=32). Tetraploid accessions had higher ($P<0.001$) NDF concentration than diploids, 333 vs 295 g/kg DM, respectively. Mean concentration of CP and uCP16 in diploid accessions were 199 (SD = 11.5) and 168 (SD=7.3) g/kg DM, and in tetraploids 183 (SD=9.5) and 169 (SD=8.4) g/kg DM, respectively. No differences in CP and uCP16 between experimental and check cultivars was measured. uCP16 was highly correlated ($R=0.81$) with CP concentration, however four silages had 2.1-3.9% higher (P values between 0.01-0.06) uCP16 concentration despite no differences in CP concentration. These results imply that protein value varies between red clover accessions, and further results are warranted to evaluate the effect of PPO mediated quinone complexing on protein value.

Success with better calves starts well before birth

M. Winters¹

¹ Agriculture & Horticulture Development Board (ADHB), Animal Health & Welfare, Middlemarch Business Park | Siskin Parkway East, CV3 4PE Coventry, United Kingdom

Breeding tools to help breed better calves have significantly enhanced over recent years. It may seem obvious, but breeding replacement calves only from the best females, and mating them to the best bulls will significantly improve the quality of calves born on farm, but can equally create issues if not adopted correctly. Dead calves have an immediate negative impact on the carbon balance of the herd whereas live but poor calves also impact the herd over time. There are many genetic tools available now for producers to use, and this paper will highlight and explain the various genetic indexes available to breed for success and address the additional breeding tools that should be used to maximise opportunities such as genomics and sexed semen. With an industry under pressure to improve efficiencies as well as welfare and its green credentials, the breeding decisions made today will have to be right to ensure success for the herd of the future, since those calves will be in the herd for the next 6.5 years on average, and their genetics will persist in subsequent generations. Latest statistics from the UK industry, which are likely mirrored elsewhere, indicate that dairy farmers have been quick at responding to new signals and information. Use of genomic young bulls now stands at about 70% of all dairy insemination, and female genomic testing has risen to about 20% of all calves born in 2023. The use of sexed semen to further accelerate gains is at well over 75% of dairy breedings, resulting in over 50% of insemination in the dairy herd taken up by beef sires. Genetic trends indicate good progress across a range of traits and will help us with breeding a healthy crop of calves. But are there areas we can do even more in the future? This paper will propose some.

Session 4

Theatre 2

Adequate milk feeding of dairy calves

H. M. Hammon¹, L. N. Neal²

¹ Research Institute for Farm Animal Biology (FBN), Metabolic Health, Wilhelm-Stahl-Allee 2, 18196 Dummerstorf, Germany, ² Trouw Nutrition, Research and Development, P.O. Box 299, 3800 Amersfoort, Netherlands

Calf growth and development depend on adequate milk intake. Lifting traditional milk restriction in calves has been causally associated with beneficial effects on growth, health and future performance. In this critical early life period, nutrition triggers plasticity of development, ultimately leading to an altered adult phenotype. Although rumen function accelerates with limited milk intake (approximately 6 L milk/day), calf development does not accelerate. Adequate, i.e., ad libitum milk feeding, means an intake of up to 20% of bodyweight as milk per day. Holstein calves possess the ability to digest 12-15 litre of milk daily. Growth performance and organ maturation are improved when calves are allowed to drink greater amounts of milk. Accelerated growth development in calves fed adequately with milk was confirmed by stimulation of the somatotrophic axis, indicating the initiation and continuation of anabolic processes. Adequate milk feeding has an immediate positive effect on feeding behaviour in calves. Calves fed only 6 litres of milk per day showed permanent hunger. Calves with adequately high milk intake may be more resistant to infectious diseases, leading to a reduction in calf loss during the neonatal and preweaning periods. Although elevated milk feeding delays rumen development by reducing solid feed intake, rumen growth is not impaired, and forestomach digestion matures better when more time is spent on the weaning process, and weaning should start later in life. This weaning protocol corresponds to the natural situation in beef calves and avoids hunger and discomfort. Improving calf feeding management will contribute to successful calf rearing by meeting calf demands and raising robust and resilient animals.

Growth performance of calves fed milk replacer or dams milk during the first week of life

A. M. Vorndran¹, J. Steinhoff-Wagner¹

¹ Technical University of Munich, Professorship of animal nutrition and metabolism, Liesel-Beckmann-Straße 2, 85354 Freising, Germany

Milk contains many different bioactive compounds especially after parturition which have been shown to play an essential role in calf development, and especially postnatal gut development. The hypothesis was that during the first week of life a switch from the more nutrient dense milk to a commercial milk replacer (MR) results in less growth performance. To test the hypothesis twenty calves of the brown swiss breed were separated from their dams directly after birth and housed individually for the first week of life. They were fed twice daily with nipple buckets with unlimited milk amounts from their dam. Upon the 7th feeding ten animals were randomly chosen to transition to MR feeding with 150 g of MR per liter (13% dry matter). The other ten animals continued to receive their dams milk. The animals were weighed at the beginning of the experiment, before the 7th feeding and at the end of the experiment. Performance parameters were calculated for the whole week and statistically analysed for differences in group means using a t-test. All animals consumed high amounts of milk and there were no differences between the treatments ($p = 0.62$). The mean daily growth rate of > 1 kg for both treatment groups showed that all animals achieved satisfactory growth. Calves switched to MR feeding showed less average daily gain than the milk fed ($p = 0.004$). Also, when expressed relative to birthweight MR fed calves showed less relative body weight gain throughout the week than milk fed calves ($p < 0.001$). During the first week of life, calves fed their dams colostrum with subsequent milk feeding showed superior weight gain compared to calves fed colostrum and consecutive MR feeding.

Session 4

Theatre 4

Evaluating early life feeding strategies on the development and health of pre-weaned surplus calves

J. Echeverry Munera^{1,2,3}, S. Marti³, M. A. Steele², M. Devant³, J. Martin-Tereso¹, L. N. Leal¹

¹ Trouw Nutrition, R&D, Stationsstraat 77, 3800 AG Amersfoort, Netherlands, ² University of Guelph, Department of Animal Biosciences, 50 Stone Rd E, N1G 2W1 Guelph, Canada, ³ IRTA, Ruminant Production Program, Torre Marimon, 08140 Caldes de Montbui, Spain

This study examined early-life interventions and their impact on health and development in Holstein-Friesian surplus calves. In the first 12h after birth, 80 bull calves (43.1 ± 3.56 kg BW) were fed either 2L (100g of IgG, F) or 6L (300g of IgG, S) of colostrum replacer (CR). Upon arrival at the facility, serum IgG was measured and calves were blocked based on CR protocol, arrival date, age, and BW. Within each block, calves were randomly assigned to one of two milk replacer (MR) feeding: Moderate (Mod; ~8L) or Low (Low; ~4L). In total, there were 4 treatments resulting from the 2×2 factorial design: F-Mod, F-Low, S-Mod, S-Low ($n=20$ /trt). Calves were individually housed and received their MR allowance twice daily in teat buckets. Calves had ad libitum access to straw and water during the entire study, and on d22, a calf pelleted starter was offered. On d42, 10 calves/trt were euthanized. Intakes, and fecal score were measured daily, and BW was measured weekly. Data were analysed by PROC MIXED in SAS accounting for the fixed effects CR, MR, time, and their interaction, as well as the random effect of block. Time entered the model as a repeated statement. Serum IgG was greater in S calves ($S=19.6$ vs. $F=9.4$ g/L). Overall, Mod calves had higher BW despite CR treatment ($P < 0.01$). Fecal consistency was impacted by CR ($P < 0.01$) and MR ($P < 0.01$), with S and Low calves having better consistency. Moreover, F-Low calves had the highest number of treatments for diarrhea ($P=0.04$), while F calves had the most treatments for fever ($P < 0.01$). At d42, calves receiving Mod levels were on average 13.2 kg heavier than Low calves ($P < 0.01$). Increased fresh tissue weights were observed in the small and large intestine of Mod calves ($P < 0.05$), regardless of CR treatment. These findings highlight the importance of considering both colostrum and MR feeding levels in calf nutrition to optimize growth, development, and health during early life.

Observations on neonatal calves' urine excretion during the first week of life

A. M. Vorndran¹, J. Steinhoff-Wagner¹

¹ Technical University of Munich, Professorship of animal nutrition and metabolism, Liesel-beckmann-Straße 2, 85354 Freising, Germany

Proteinuria is known to occur shortly after birth in calves, since the kidneys are partly immature. Therefore, low molecular weight proteins can be found in the postnatal urine. This study aimed to investigate urine excretion patterns in neonatal calves with regard to a change in feedstuff. Twenty brown swiss calves were separated from their dams at birth and housed individually for the first week of life. All were fed their dams colostrum for 6 feedings following either transition milk (n=10) provided twice daily with unlimited volume or calves were transitioned to milk replacer (MR) (n=10) from the 7th to the 14th feeding onward. Urine was quantitatively collected using canisters. The weight of milk ingested and urine excreted was then divided and the ratio statistically analysed using a two factorial ANOVA with time and treatment as fixed factors. The urine excretion of newborn calves exhibited a polynomial trend, gradually tapering off towards an asymptote where the volume of urine excreted approached approximately half the amount of milk ingested by the end of the week. Directly after birth, the ratio of ingested milk and excreted urine is very broad with only small amounts of urine excreted compared to the amount of milk ingested. From the 7th feeding onward a significant effect of treatment on the milk-urine ratio was found (p=0.04) where the ratio was more narrow for MR fed calves. Neonatal calves show a high fluid disappearance rate immediately after birth, indicating a dehydration. This state rapidly disappears within the first days and towards the end of the first week, nears a constant excretion of urine of about half the amount of milk ingested.

Session 4

Theatre 6

Predicting pre-weaned dairy calf weight from morphometric measurements

Mendo Afonso, 147, 4990-706 Refóios do Lima, Portugal, ⁴ Independent Researcher, Rua dos Amores, 7000-407 Évora, Portugal

Regular weighing of dairy calves is an essential management practice for dairy farmers that contributes to health, welfare, and overall productivity within the dairy operation. Weighing calves may not be feasible due to logistical constraints. Thus, alternative methods that can still help monitor calf growth are valuable. This study aimed to develop a body weight (BW) predictive model for pre-weaned calves using morphometric measurements (MS). From 4 dairy farms, 209 Holstein-Friesian calves aged from 1 to 90 days (188 females; 53 males) were included in this study. Calves were weighed with a digital scale, and heart girth (HG), abdominal girth (AG), withers height (WH), hip height (HH), and body length (BL) were measured. Regression models were run with all MS, considering sex and farm. The predicted weight was compared with BW using Bland-Altman plots and ICC. To increase applicability, a web application (WAp) was developed to allow farmers to easily apply the developed equations. BW ranged from 18.5 to 129.5 kg (54.6±15.6 kg). All MS were correlated with BW and showed a linear or quadratic relationship with BW. HG had the highest correlation with BW (r=0.97). Sex of the calf and farm significantly influenced the relationship between MS and BW. A quadratic model with HG and HH had the best fit (R²=0.97). An overall quadratic model with HG alone showed very similar results (R²=0.96) and was better in agreement measurements than models separated by sex. This model had a better relationship between predictive ability and feasibility and was included in the WAp.

Ultrafiltration enhances the passive immunity properties of low-quality colostrum

T. Jarltoft^{1,2}, C. Jessen¹, T. Larsen¹, P. Raunda³, M. Vestergaard¹

¹ Aarhus University, Department of Animal and Veterinary Sciences, Blichers Allé 20, 8830 Tjele, Denmark, ² SAGRO I/S, Majsmarken 1, 7190 Billund, Denmark, ³ SEGES Innovation, Agro Food Park 15, 8200 Aarhus, Denmark

An insufficient availability of high-quality colostrum contributes to a high prevalence of failure in passive transfer of IgG in calves, having negative impact on calf health and long-term productivity. This study aimed to investigate whether ultrafiltration using vibration-shear technology, enhances the passive immunity properties of low-quality colostrum. A total of 25 colostrum samples were divided into five groups based on their initial IgG concentration: IgG-Grp I: 10.0-19.9, IgG-Grp II: 20.0-29.9, IgG-Grp III: 30.0-39.9, IgG-Grp IV: 40.0-49.9, and IgG-Grp V: 50.0-59.9 g/L of IgG. Colostrum was ultrafiltrated by a 30 kDa membrane, using a Sani Membrane VibroETM-LE system, involving a vibration device inducing turbulence at the membrane surface. Two treatments, non-processed colostrum (NPC) and ultrafiltrated colostrum (UFC) and the five IgG groups were included in the experiment. The effect of ultrafiltration on the composition of colostrum was analyzed using a linear mixed model, considering colostrum processing (NPC vs. UFC), IgG-Grp and their interaction as fixed effects, and colostrum batch included as a random effect. An average volumetric concentration factor of 1.77 was achieved. A significant interaction was observed between colostrum treatments and IgG grp for Brix%, IgG, protein, and fat concentrations, with the largest increase in IgG-Grp I (100, 138, 111, and 60%, respectively). In contrast lactose decreased. Colostrum with IgG > 20 g/L seemed most suitable to reach high-quality status (i.e., IgG > 50 g/L). This result allows for feeding of ultrafiltrated low-quality colostrum to newborn calves, ensuring successful passive immunity transfer.

Impact of growth rate of dairy heifers on long term performance: a quantile regression analysis

M. Lamérand¹, B. Ampe¹, E. Canniere², K. Goossens¹, L. Vandaele¹

¹ ILVO, Animal Science, Scheldeweg 68, 9090 Melle, Belgium, ² Inagro, Ieperseweg 87, 8800 Rumbeke-Beitem, Belgium

Heifers symbolize the future of dairy farms. Their development during the rearing period can be influenced by multiple factors. Although literature suggests that development or growth rate may impact production performance during later life, on farm growth monitoring is mostly incomplete (limited number of weighing times). This challenges the evaluation of the relation between growth and performance for on field data. Therefore, we used a quantile regression analysis to evaluate the impact of growth rate on 1st lactation performance. First, on 30 Flemish dairy farms all heifers were weighted and measured quarterly for 2 years. Second, fertility and milk performance were collected by the dairy herd improvement data. Third, a 10% quantile was designated by the nearest 10% regression line for each measurement of a heifer. During further analysis, the mean quantile of a heifer, representing the growth rate, was correlated with her fertility and milk production data using in total 13.500 on farm follow-up measurements. The 25% greatest growers (>P75) calved 1.1 month earlier in comparison with 25% weakest growers (<P25) (P<0.001). The >P75 heifers produced 960 kg more milk (305D production) during 1st lactation than <P25 (P<0.001). Fat and protein content were 0.08% (P=0.004) and 0.03% (P=0.003) lower in >P75 heifers, respectively. However, due to the higher milk quantity, the impact on content was economically negligible. In conclusion, heifers with a higher growth rate have an earlier age at first calving and a higher production, which is possible related to a better udder development. Quantile regression analysis (here used for the first time) is a very comprehensive way to evaluate the impact of growth rate on production performance of dairy heifers.

Tube ventilation systems for optimizing stable climate in calf barns

I. Mösenbacher-Molterer¹, E. Zentner¹, C. Schmied-Wagner², J. Neumayer³

¹ HBLFA Raumberg-Gumpenstein, Institute Animal, Technology and Environment, Raumberg 38, 8952 Irtding-Donnersbachtal, Austria, ² Austrian Centre for Animal Husbandry and Animal Welfare, Veterinärplatz 1, 1210 Wien, Austria, ³ Vet.Smart Steirertech, Industriezentrum Straß 5, 8472 Straß in der Steiermark, Austria

Modern housing systems have to fulfill the individual needs of calves. These systems are inextricably linked to year-round, safe and optimised ventilation of the barns. Calves and young cattle in particular have limited thermoregulatory behaviour that need to be taken into account for a better health status. In this context the year-round suitability of two automatic controlled vet.smart.tubes with FN035 and FN045-EC fans (Ziehl-Abegg) were examined in a barn for 45 calves and young stock (FV x RF). The conditioning showed significant effects in SPSS between outside temperature ($M=27.51$ °C) and air temperature in the surrounding of the calves ($M=21.43$ °C) from July to September 2022 in a daily, 10 minute measuring interval from 12 to 6 pm ($p<.001$, $n=1\ 627$) with a middle flow rate inside the tube of 2.03 m/sec. and 0.29 m/sec. in the calf environment to avoid heat stress. The calves vitality remained consistently high due to a perfect management (removal of manure and renewing deep straw bedding once a week; watercleaning of all boxes every third week), a high amount of whole milk (start 14 l/d) and optimization by tube ventilation. Contrary expectations the animals coped very well in the months January to March 2023 despite low temperatures in daily 24h measurements (minimum=-13.10 °C in the supply air, $M=0.91$ °C and a minimum of -7.70 °C in the calf environment, $M=3.18$ °C, $n=9\ 073$) by avoiding draught and very low amounts of carbon dioxide and ammonia in the barn. The positive effect of the constant air circulation ($M=0.59$ m/sec. inside the tube and 0.23 m/sec. in the barn) was seen in an optimized relative humidity ($M=61.95$ % around calves to 72.27 % outside, $p<.001$) for a hygienic housing environment. During the entire case study there was only one calf showing illness (lung disease). In cooperation with the Austrian Centre for Animal Husbandry and Animal Welfare the tested tube ventilation system can be recommended for calves and young stock under clearly specified installation and operating conditions.

Session 4

Theatre 10

Relationship between growth parameters of heifers at various stages of rearing and milk production in first lactation

A. Garus-Piętak¹, W. Jagusiak², J. Kański¹, Z. Kowalski¹, Z. Lach³, P. Górka¹

¹ University of Agriculture in Krakow, Department of Animal Nutrition, Biotechnology and Fisheries, al. Mickiewicza 24/28, 30-059 Krakow, Poland, ² University of Agriculture in Krakow, Department of Animal Genetics, Breeding and Ethology, al. Mickiewicza 24/28, 30-059 Krakow, Poland, ³ Ośrodek Hodowli Zarodowej Osiećiny Sp. z o. o., ul. Włocławska 2, 88-220 Osiećiny, Poland

The aim of the study was to determine whether body weight (BW) and average daily gain (ADG) at various stages of rearing affect first lactation milk yield (1MY). Data on BW at birth (BW1), weaning (BW2), 6 (BW3) and 12 months of age (BW4) and ADG between those BW control points (ADG1, ADG2 and ADG3, respectively) of replacement heifers were received from one dairy operator (Ośrodek Hodowli Zarodowej Osiećiny Sp. z o. o.; Osiećiny, Kuyavian-Pomeranian Voivodeship, Poland). Data on pedigree and 305-d milk in 1MY for each animal was obtained from FEDINFO Polish National Milk Recording System. Prior to analysis, genetic effect of each animal was removed from the data set. BW data and ADG in each phase of rearing were regressed against 305 day 1MY, in order to test for linear and quadratic relationship between those variables. 1MY tended ($P = 0.08$) to increase quadratically with increasing BW1, increased ($P < 0.01$) quadratically with increasing BW2 and increased ($P < 0.01$) linearly with increasing BW3. 1MY increased ($P < 0.01$) quadratically with increased ADG1 with no further positive impact on observed when ADG was greater than 1 kg/day, increased ($P < 0.01$) linearly with increased ADG2, and decreased ($P < 0.01$) quadratically with increasing ADG3 with the lowest 1MY observed when ADG was ~ 1.2 kg/day. The relationship between BW and ADG of heifers and 1MY is not linear at all stages of rearing.

Selection for the price of young calves in Italian Simmental breed

L. Degano¹, D. Vicario¹, M. Wenter², A. Cesariani³, N. Macciotta³

¹ ANAPRI, Via Ippolito Nievo 19, 33100 Udine, Italy, ² Federazione Sudtirolese Allevatori Razze Bovine, Via Luigi Galvani 38, 39100 Bolzano, Italy, ³ University of Sassari, viale Italia 39a, 07100 Sassari, Italy

Italian Simmental (IS), Pezzata Rossa Italiana, is a dual-purpose cattle breed, that counts about 90.000 cows registered in its official Herdbook. Selection for beef purpose is based on data collected on young bulls in performance test and the muscling score that is registered by technicians on primiparous milking cows. The selling of calves is a source of revenue for farmers. A tool to select animals for the commercial quality of the calves is not currently available. Kovieh Cooperative is an important wholesale cattle organization operating in Bolzano province (Trentino–Südtirol region, northeast Italy). Kovieh collects purebred and crossbred calves from several dairy herds and sells them individually during public auctions every week. Body weight at sale (BW), price per kg, and the economic value of the calves were collected and registered. The aim of this study was to estimate genetic parameters for the price per kg, which can be considered as a measure of the quality of IS purebred calves. After data editing, 51,825 records of calves' price sold between 10 to 40 days of age were available. Age at sale, BW of calves, and price per kg were 25.9±6.9 days, 70±9.0 kg, and 5±0.69 €/kg, respectively. The model accounted for the auction date, seller, age at calving of the mother, sex, and age at sale (covariate) as fixed, and for direct and maternal as random effects. Heritability for direct genetic effects was 0.21±0.01. The maternal component explained about 2% and there was no correlation between the two genetic effects. Considering these genetic parameters, a genomic evaluation for the quality of IS based on data from auctions could be feasible.

Session 4

Theatre 12

Effects of undernutrition and hydroxytyrosol supplementation during last third of pregnancy on the immune status of suckler cows and their calves

L. López De Armentia¹, A. Noya¹, J. L. Alabart¹, N. Escalera², B. Serrano-Pérez², O. Akesolo-Atutxa¹, J. Ferrer¹, A. Sanz¹

¹ CITA de Aragón-IA2 (UNIZAR), Av. Montañana 930, 50059 Zaragoza, Spain, ² University of Lleida, Av. Rovira Roure 191, 25198 Lleida, Spain

We aimed to determine the effect of hydroxytyrosol (HT, antioxidant from olive leaves) on immune status of undernourished pregnant cows and their offspring. From 28th gestation week (w) to calving (w40), 136 cows were allocated to four groups (feeding (100 vs 60% requirements) x HT (Control vs HT, for 0 and 178 mg HT/kg uni-feed). Calves were fed dam colostrum and milk. Colostrum samples were collected in Period 1 (0-12h postpartum (pp)) and 2 (12-24h pp). Blood samples were collected in dams (w37 gestation and Period 1) and calves (48h pp and 1 month pp). Immunoglobulin concentrations were determined (Bovine IgG and IgM ELISA, Bethyl, Montgomery, USA). Data were analysed with a mixed linear model with feeding, HT, gestation week and dam age as fixed effects, and dam as random effect. IgM and IgG in cows (plasma and colostrum) and offspring (plasma) were not influenced by feeding level. HT inclusion (HT vs Control) increased colostrum Ig in Period 2 (2.1 vs 1.5 ng/mL for IgM; 73.6 vs 56.4 ng/mL for IgG; P<0.05). Dam age (< 10 vs. >10 year old) affected dam Ig (2.2 vs 1.8 ng/mL IgM, P<0.05; 20.9 vs 27.2 IgG; P<0.001) and calf IgM (0.5 vs 0.4 ng/mL, P<0.05). Ig decreased throughout the study (P<0.001): from w37 to calving in dam plasma IgG; Period 1 to 2 in colostrum (IgM, IgG); 48h to 1 month pp (IgM, IgG) in calves. In short, HT inclusion increased IgM and IgG in colostrum in Period 2, being a strategy to avoid critical Ig decrease in colostrum during the first hours after calving and ensure optimal transfer of passive immunity from dam to calf. Undernutrition and hydroxytyrosol supplementation during the final third of gestation modulate immune response and redox balance in newborn beef calves

N. Escalera-Moreno¹, J. Álvarez-Rodríguez¹, M. J. Martín-Alonso¹, D. Villalba¹, E. Molina¹, L. López De Armentia², A. Sanz², B. Serrano-Pérez¹

¹ University of Lleida, Av. Alcalde Rovira Roure, 191, 25198 Lleida, Spain, ² CITA-Aragón-IA2 (UNIZAR), Av. de Montañana, 930, 50059 Zaragoza, Spain

Hydroxytyrosol (HT) is a polyphenol present in olive leaves that can enhance antioxidant capacity and may mitigate the negative impact of prepartum maternal nutrient restriction in beef cattle. This study assessed the effects of maternal undernutrition (100% vs. 60% of nutritional requirements) and HT supplementation during the last third of pregnancy (Control vs. HT, 178±36 mg/kg of feed) on the whole blood gene expression of key markers related to redox balance and immune response in their offspring during the first week of life. Blood samples were collected from 43 calves in Tempus blood RNA tubes (Applied Biosystems) at week 1 after birth. Gene expression of SOD1, CAT, GPX1, NRF2, NFKB, TLR4, and TNF α was analysed using qPCR. A general linear model including fixed effects (nutrition and HT supplementation) and their interactions was used to compare gene expression with JMP software. A higher CAT and GPX1 expression were observed in calves born from HT-cows compared to those born to Control-cows ($P < 0.05$). Meanwhile, higher TNF α expression was observed in the calves born to 60%-cows compared to 100%-cows ($P < 0.05$). Our results suggest that maternal HT supplementation enhances antioxidant defences responsible for the control of intracellular H₂O₂ levels of the newborn offspring. In addition, maternal undernutrition increased proinflammatory cytokines and therefore might contribute to immune disturbances postnatally. Overall, undernutrition and HT supplementation modulated immune response and redox balance in newborn beef calves. Funded by PID2020-113617RR-C21/22 FETALNUT.

Interplay between pre-partum nutrition and hydroxytyrosol supplementation on calf behavior

N. Escalera-Moreno¹, L. López De Armentia², A. Sanz², A. Noya³, I. Blanco-Penedo¹, E. Molina¹, B. Serrano-Pérez¹, J. Álvarez-Rodríguez¹

¹ University of Lleida, Animal Science, Av. Rovira Roure, 191, 25198 Lleida, Spain, ² CITA de Aragón - IA2 (UNIZAR), Animal Science, Av. Montañana, 930, 50059 Zaragoza, Spain, ³ University of Zaragoza - IA2, Animal Production and Food Science, Miguel Servet, 177, 50013 Zaragoza, Spain

Pre-partum maternal diet restriction and polyphenol supplementation may have carry-over effects on neonatal calf behavior. The role of dietary restriction (100 vs. 60% of the cow nutrient requirements during the last 3 months pre-partum) and hydroxytyrosol (HT) addition (0 vs. 178±36 mg/kg of feed) on beef calves' behavior was evaluated. Twenty-nine (± 7)-day old calves ($n=48$) from four pre-partum maternal dietary treatments (100%-CTR, 100%-HT, 60%-CTR, 60%-HT) were housed in individual pens, with visual and olfactory contact, between suckling periods (08:00-14:00h). Each pen was provided with a warm milk replacer and water bucket with nipple. Observations were performed in three 1-h sessions (9:00-10:00; 10:30-11:30; 12:00-13:00). Calf posture and behavior was recorded by scan sampling every 2 min. The data were analyzed with non-parametric Wilcoxon tests; means were separated with a t-Student test. Calves from 60%-HT cows remained lying for shorter than calves from 100%-HT (33.0 vs. 42.4±2.47 min/h, $p < 0.05$). This led to lower inactive time in 60%-HT than in 60%-CTR (29.7 vs. 37.6±2.41 min/h, $p < 0.05$), more time spent on oral or olfactory manipulation of the pen fixtures (8.2 vs. 5.1±0.97 min/h, $p < 0.05$) and higher number of vocalizations per session (1.5 vs. 0.3±0.37, $p < 0.05$). The 60%-HT calves explored for longer the milk and water bucket than the 100%-HT calves (2.1 vs. 0.6±0.41 min/h, $p < 0.05$), but calves did not perform any nutritive activity therein. In conclusion, maternal nutrient restriction, together with HT supplementation, enhanced calf response to environmental stimuli. Funded by PID2020-113617RR-C21.

Effects of polystyrene nanoparticles on bovine oocyte in vitro maturation

B. Merlo¹, A. M. Volsa¹, P. M. Gugole¹, E. Iacono¹

¹ University of Bologna, Department of Veterinary Medical Sciences, via Tolara di Sopra 50, 40064 Ozzano Emilia (BO), Italy

Oocyte in vitro maturation (IVM) is a critical process in assisted reproductive technologies and is highly susceptible to external environmental factors. The aim of this study was to investigate the effects of polystyrene nanoparticles (PS-NPs) on bovine oocyte nuclear and cytoplasmic maturation. Cattle immature oocytes, obtained from abattoir ovaries, were divided into 5 groups, and matured for 22 h in presence of 0-5-50-100-200 µg/ml of PS-NPs (size 100 nm). Exp. 1: after IVM, oocytes were stained with Hoechst 33342 to evaluate nuclear maturation rate. Exp. 2: after IVM and in vitro fertilization (IVF), oocytes were stained with Hoechst 33342 to assess cytoplasmic maturation. Exp. 3: after IVM, oocytes were stained with CellTracker Blue or H2DCFDA to determine intracellular levels of glutathione (GSH) and reactive oxygen species (ROS) respectively. Data were compared using Chi Square test or GLM and Dunnett post-hoc (IBM SPSS Statistics, significance at P<0.05). A higher rate of matured oocytes was observed in PS0 (62.6%), PS5 (56.9%), and PS50 (59.4%) than in PS100 (31.7%), and PS200 (35.0%), and the degeneration rate was increased in PS200 (20.0%) than in PS0 (9.3%), PS5 (8.3%), and PS50 (6.6%), while PS100 (13.9%) showed intermediate values. No differences were observed in IVF parameters and GSH or ROS levels. These results show that 100 nm PS-NPs at 100 and 200 µg/ml can inhibit bovine oocyte nuclear maturation and induce oocyte degeneration. Although there is still lack of information about the size and concentration of PS-NPs present in mammal tissues and organs, their accumulation along the food chain and ease of penetration are well documented. In conclusion, PS-NPs might be considered a threat for female fertility.

Effects of undernutrition and hydroxytyrosol during last third of pregnancy on newborn vitality and cortisol levels of cow-calf pair

L. López De Armentia¹, A. Noya¹, J. Ferrer¹, N. Escalera², B. Serrano-Pérez², G. Quintans³, O. Akesolo-Atutxa¹, A. Sanz¹

¹ CITA de Aragón-IA2 (UNIZAR), Av. Montañana 930, 50059 Zaragoza, Spain, ² University of Lleida, Av. Rovira Roure 191, 25198 Lleida, Spain, ³ INIA, Ruta 8, km 281, 33000 Treinta y Tres, Uruguay

Undernutrition in late pregnancy is a common scenario in extensive systems. Hydroxytyrosol (HT) is a polyphenol present in olive leaves with antioxidant properties. We aimed to determine effects of undernutrition and HT supplementation on newborn vitality and cortisol levels of pregnant Parda de Montaña (Pa) and Pirenaica (Pi) cows and their offspring. Cows (n=109) were allocated to 4 groups (feeding level (100 vs 60% requirement) x HT (0 vs 178 mg HT/kg unifeed)) from the 28th week (w) of gestation to calving (w40). A calf vitality test was performed at birth. Cortisol was determined in blood samples in dams (gestation w37; lactation w1) and calves (w1; w4 of age). A chi-square test for vitality (feeding, HT, breed, type of calving, calf sex, dam age) and a mixed linear model for cortisol (feeding, HT, breed, time as fixed effects, animal as random effect) were performed. Dystocia reduced calf rate with optimal attitude (68 vs 99%; P<0.001), strong finger suckling reflex (73 vs 91%; P<0.05), optimal mucous color (73 vs 94%; P<0.01) and non-protrusive tongue (70 vs 98%; P<0.01). Undernutrition increased cortisol levels in calves (27.6 vs 19.2 nmol/L; P<0.01) but not in dams. Cortisol was higher at calving in dams (12.4 vs 17.5 nmol/L, for w28 and w40) and calves (31.9 vs 14.9 nmol/L; P<0.001). Cortisol values were greater in Pi dams (16.8 vs 13.1 nmol/L; P<0.05) and calves (27.0 vs 19.8 nmol/L; P<0.01). In short, undernutrition in last third of pregnancy increased cortisol levels only in calves. Calves from dystocic parturitions showed the weakest vitality. Funded by PID2020-113617RR-C21 FETALNUT. Research group A25-23R.

Serum and salivary immunoglobulins associations in newborn calves

F. Silva^{1,2,3}, E. Lamy², L. Hernández-Castellano⁴, S. Silva¹, J. Cerqueira^{1,3}, J. Ramalho², M. González-Cabrera⁴, P. Caetano², E. Carreira², L. Martins², A. Pereira², C. Conceição²

This study aimed to evaluate the association between serum and salivary immunoglobulins (Igs) in newborn calves (n=20). Saliva and blood samples were collected at birth (D0; before colostrum intake) and at day 1 (D1), 2 (D2), and 7 (D7) after birth to determine total protein (TP), IgG, IgA, and IgM. Body weight (BW) was recorded at birth. Colostrum samples were collected for chemical composition and Igs analysis. Salivary Igs were positively correlated with each other. In brief, serum IgG at D1 was positively correlated with serum IgA at D1 (r = 0.58), D2 (r = 0.49), and D7 (r = 0.53) and in turn, serum IgA at D1 and D2 was positively correlated with salivary IgG at D2 (r = 0.52 and 0.55, respectively). In conclusion, there is an association between serum and salivary Igs in newborn calves. The absence of a statistical significant correlations between serum and salivary IgG and the low to medium correlations between serum and salivary Igs could be related to the heterogeneity of the transferred immunoglobulin mass per unit of BW that occurred in this study, to differences in the salivary flow rate between calves and to a possible time-dependent secretion of immunoglobulins from serum to saliva.

Not much is known about the concentration of the immunoglobulins (Igs) in fluids other than blood in newborn calves. This study aimed to analyse the concentration of Igs in serum and saliva of calves during the first week of life. Saliva and blood samples were obtained from 20 calves at birth (D0) and at day 1, 2 and 7 after birth (D1, D2, and D7, respectively) to determine total protein (TP), IgG, IgA, and IgM concentrations in serum and saliva. A mean of 3.8±0.64 L of colostrum was administered within the first 6h after birth (96±73 min). Total protein in serum and saliva, and all Igs increased after colostrum intake, gradually decreasing in the following days. Salivary IgA was the highest at D0 (32.14 ug/mL) compared with other salivary Igs, showing the presence of mucosal immunity at a very early age in life. Salivary IgG concentration was the highest at D1 (104.95 ug/mL), decreasing rapidly at D2 (42.07 ug/mL). Salivary IgM concentration was lower compared to IgG or IgA. Nevertheless, it had a significant increase at D1 (5.21 ug/mL).

Impact of diarrhea and respiratory diseases in calves on reproductive performance in dairy breed heifers
M. Gicquel¹, A. Gaigeard², L. Danjou¹, F. Guillaume¹, S. Saille², S. Meier³

¹ SYNETICS France SAS, Research & Development, 4 rue Éric Tabarly, 35530 Noyal-sur-Vilaine, France, ² INNOVAL développement, Innovation, 4 rue Éric Tabarly, 35530 Noyal-sur-Vilaine, France, ³ SYNETICS Germany GmbH, Osterkrug 20, 27283 Verden (Aller), Germany

The most prevalent diagnoses in calves on dairy farms are diarrhea and respiratory diseases. These diseases not only have a negative impact on animal well-being but also have an economic impact for the dairy farms, resulting in treatment costs, retarded growth and increased time attending to sick calves. The occurrence of health problems early in life and during the rearing period might subsequently have an impact on performance, e.g. development and reproduction. This study aims to determine the influence of calf diseases at the age of first breeding. Therefore, data from Holstein Friesian and Normande calves from birth to the age of first artificial insemination (AI) were examined. More than 79,000 recorded health events were reported between 2005 and 2024 from 2,829 herds located in the Northwest of France. Health data were transmitted to INNOVAL and SYNETICS from the GENOSANTE network. A total of 10 investigated symptoms were grouped in diarrheal illness (diarrhea, neonatal diarrhea, cryptosporidiosis, coccidiosis), respiratory disease (flu, cough, bronchopneumonia, pneumonia) and umbilical hernia. In calves up to 2 months of age, diarrheal illnesses and umbilical hernia were the most prevalent diseases. Respiratory diseases occurred in all age groups but were particularly influenced by seasonal effects. The latest results on the impact of respiratory and diarrheal diseases in early calf life on age at first AI will be presented.

Pilot study to identify stress level at cow-calf separation after a few days of contact

N. Palladini¹, B. Serena¹, A. Tamburini¹, L. Bava¹

¹ University of Milan, Celoria 2, 20133 Milan, Italy

Calf separation from its mother at birth represents a hot topic due to the implications on public opinion. In 2023 the EFSA report indicated to keep the calf with the dam for a minimum of 1 day after partum. It is necessary to understand whether a short period of contact has positive or negative effects on calves and cow, in terms of separation stress. Cortisol hormone can be a good indicator of physiologic status after a potential stressful event. Three calves and two cows were selected to identify basal cortisol level during no stressful condition. At the third days after birth, during which cows and calves were kept together, saliva samples were collected from 11 dam and 18 female calves, 20 minutes after the separation. Hair samples were collected from different calves' bodies areas, to identify the variability of cortisol concentration depending on body region. An enzyme immunoassay (SALIMETRICS ASSAY #1-3002) was performed to assess cortisol concentration in saliva samples and hair, after an extraction procedure. The identified basal level of cortisol was 0.10 µg/dl for cows and 0.20 µg/dl for calves. The average cortisol concentration in saliva was 0.13 ±0.06µg/dl for cows and 0.19 ±0.22µg/dl for calves, median value was 0.12 µg/dl for cows and 0.11 µg/dl for calves. The high variability for cortisol level of calves shows individual physiological effect, particularly for young animals even though separation a few days after birth seems to be non-stressful. The cows' samples showed numerous values above the basal cortisol level, however, the values were not high and probably attributable to separation procedures. The hair of calves showed high variability in the cortisol concentration of the different body regions, with tail and nose having higher cortisol concentrations than the dorsal zone.

Keeping up with changing standards: A survey on how Canadian farmers currently rear dairy calves

E. R. Russell¹, M. Vonkeyserlingk¹, D. Weary¹

¹ The University of British Columbia, Faculty of Land and Food Systems, 2357 Main Mall, V6T1Z4 Vancouver, Canada

Decades of research has helped inform 'best practices' on how to care for dairy calves, but little is known about how these practices are adopted on commercial farms. Moreover, new regulations regarding the care of dairy cattle in Canada will require changes to calf rearing management on farms. The aims of this study were to describe the rearing practices of dairy calves and the methods used assess calf growth on farms in British Columbia (BC), Canada. All 437 dairy farms in the province were invited to participate in an online survey distributed from June-December 2023. A total of 63 responses were received (representing 14.4% of the farms in BC). The average milking herd size was 166.7 + 172.1 cows, and the primary breed was Holstein (84.1%). Participants reported that on average 2.8 + 1.5 employees were responsible for the daily care of pre-weaned calves. Our results showed that 63.5% of participants housed calves individually, 25.4% socially housed calves in groups of two or more and, 11.1% of farms housed calves with a combination of individual and social housing pre weaning. The mean maximum milk allowance offered was 9.4 + 2.8 L/d with 87.1% offering >8 L/d. Teat feeding was used on 71.7% of farms with 16.3% using automated milk feeding systems and two responses reported feeding calves via the dam or nurse cows. Weaning age averaged 75.8+16.3 d, with calf age being the primary indicator to determine weaning. About half (52.4%) of farms reported measuring pre-weaning growth, where 31.7% of farms reported to have a target growth rate, only one participant stated that they had access to a scale. These results suggest that dairy farms in BC are following science-based recommendations by providing calves with increased milk rations. In addition, some farms have adopted social housing, albeit further research is needed to facilitate the transition to social housing by the 2031 regulatory deadline. Finally, our findings underscore the considerable room for improvement in monitoring calf growth; improved tracking of calf performance is likely to help farmers make better weaning decisions, including when and how to wean calves from milk onto solid feed.

Enriching colostrum IgG concentration by ultrafiltration has no negative effects on in vitro cell viability and wound healing capacity

T. Jarltoft^{1,2}, S. Purup¹, M. Vestergaard¹, Y. Yue¹

¹ Aarhus University, Department of Animal and Veterinary Sciences, Blichers Allé 20, 8830 Tjele, Denmark, ² SAGRO I/S, Majsmarken 1, 7190 Billund, Denmark

An insufficient availability of high-quality colostrum contributes to a high prevalence of failure in passive transfer of IgG in calves, having negative impacts on calf health. By vibration-shear ultrafiltration technology, the IgG concentration in low-quality colostrum can reach high-quality levels (i.e., IgG > 50 g/L). However, ultrafiltration of colostrum carries the potential risk of compromising its bioactivity, consequently impacting the development of the juvenile intestine and its capacity of wound healing. The objective was to assess the bioactivity of non-processed colostrum (NPC) and colostrum enriched in IgG through ultrafiltration at 5 (UFC-5) or 30 kDa (UFC-30) molecular weight cut offs. This was accomplished by evaluating their impact on cell viability and wound healing capacity by using a fetal small intestinal cell line model. A total of six colostrum samples of each were included. Cells were treated with whey fractions of NPC, UFC-5, and UFC-30. Cell viability and wound healing capacity were evaluated by alamarBlue™ assay and xCELLigence real time technology, respectively. The effects were analysed by a linear mixed model with colostrum treatment, whey concentrations and their interactions as fixed effects and concentration nested within treatment nested within samples and assays as random effects. The UFC-5 showed higher cell viability than UFC-30 (201 vs 164%), with no difference observed between NPC and UFC. All colostrum treatments stimulated wound healing, with no difference between treatments. Considering this, it would be preferable to use a 5 kDa rather than a 30kDa MW cut-off for IgG-enrichment of colostrum by ultrafiltration.

Saccharomyces cerevisiae fermentation products supplementation to dairy calves: effects on growth, metabolism, and immune status

M. Sfulcini¹, V. Lopreato², A. Zontini³, I. Yoon⁴, L. Cattaneo¹, F. Piccioli-Cappelli¹, E. Trevisi¹, A. Minuti¹

¹ Università Cattolica del Sacro Cuore, via Emilia Parmense 84, 26122 Piacenza, Italy, ² Università di Messina, Viale Palatucci, 13, 98168 Messina, Italy, ³ Cargill Animal Nutrition and Health, Via Cappuccini, 7, 29017 Fiorenzuola d'Arda, Italy, ⁴ Diamond V Inc., 2525 60th Ave SW, 52404 Cedar Rapids, IA, United States

To evaluate the effect of supplementing *Saccharomyces cerevisiae* fermentation products (SCFP) on calf growth, metabolism, and immune status, 18 Holstein female calves were allocated to 2 treatments: control (CTR; n=9; no supplementation) or supplemented group (SCFP; n=9; 1 g/d of SmartCare®, Diamond V, in milk replacer plus 5 g/d of NutriTek®, Diamond V, from 5 to 70 d in the starter). Calves were weaned at d 60 and feed intake was recorded up to d 70. Body weight (BW) was measured until d 160, and blood samples were collected regularly until d 70 for the assessments of metabolic profile, plasma volatile fatty acids, and polymorphonuclear cells (PMN) phagocytosis. Data were analyzed using a mixed model for repeated measures. Compared with CTR, SCFP had increased post-weaning growth, with greater average daily gain from d 70 to 100 (+57%; P<0.01) and BW from d 100 to 160 (~9 kg more; P<0.04). SCFP tended to have greater plasma β -hydroxybutyrate at d 60 (P=0.06) and urea at d 70 (P=0.08) and had higher plasma concentration of acetate and propionate (P<0.05), suggesting an increased rumen activity. The latter might reduce weaning stress. Plasma myeloperoxidase was higher in SCFP at d 70 (P=0.04), as well as PMN phagocytosis at d 60 and 70 (P=0.03), indicating improved immune system functionality. In conclusion, supplementing SCFP improved the metabolic and immune status of dairy calves and supported the post-weaning growth.

Effect of age, undernutrition and hydroxytyrosol supplementation on metabolic stress markers during the last third of gestation in beef cattle

N. Escalera-Moreno¹, J. Álvarez-Rodríguez¹, M. J. Martín-Alonso¹, D. Villalba¹, E. Molina¹, L. López De Armentia², A. Sanz², B. Serrano-Pérez¹

¹ University of Lleida, Avda. Rovira Roure, 191, 25198 Lleida, Spain, ² CITA Aragón - IA2 (UNIZAR), Av. Montañana, 930, 50059 Zaragoza, Spain

Undernutrition in late pregnancy is a common scenario in beef herds. Hydroxytyrosol (HT), a polyphenol present in olive leaves, has been shown to improve antioxidant capacity. The aim of this study was to assess the effects of undernutrition (100% vs. 60% of requirements) and HT supplementation (Control vs. HT, 178±36 mg/kg) during the last term of pregnancy on whole blood gene expression of redox and energy metabolism markers in beef cattle. Blood samples were collected from 56 cows at week 37 after mating. Gene expression of SOD1, CAT, GPX1, NRF2, ALOX5, SCD, and IGF-R was analysed by qPCR. A general linear model including fixed effects (nutrition, HT supplementation and cow age (<8 vs. ≥8 years)) and their interactions was used to compare gene expression with JMPPro software. A higher SCD expression was observed in 100% than 60%-cows, while higher ALOX5 expression was observed in HT than control cows (P < 0.05). Lower SCD expression would indicate impaired lipogenic activity in 60%-cows, whereas ALOX 5 upregulation could imply the activation of a prompt termination of the inflammatory stress during the peripartum in HT cows. In <8-year-old cows, there was an increase in NRF2 and IGF-R expression, along with a decrease SOD1, CAT, and GPX1 expression compared to ≥8-year-old cows (P < 0.05). Our results suggest that older cows exhibit higher metabolic flexibility and higher antioxidant status than younger cows during peripartum period. Overall, cow age, undernutrition and HT supplementation influenced metabolic stress markers during peripartum period in beef cattle. Funded by PID2020-113617RR-C21/22.

Interesting genes and effect of inbreeding depression over traits with economic and productive importance in Rubia Galega beef cattle breed

N. Mejuto-Vázquez¹, C. Hervás-Rivero², R. Rodríguez-Bermúdez¹, P. Martínez¹, M. Hermida¹, D. López-Carbonell², J. Altarriba², L. Varona²

¹ Universidad de Santiago de Compostela, Facultad de Veterinaria, Av. Carvallo Calero, 27002 Lugo, Spain, ² Universidad de Zaragoza, Instituto Agroalimentario de Aragón (IA2), C. de Miguel Servet, 177, 50013 Zaragoza, Spain

The Rubia Gallega (RG) is a Spanish autochthonous beef cattle breed primarily found in the autonomous region of Galicia. Previous research has identified a remarkable inbreeding depression effect linked to economically important traits. This study seeks to build upon prior research by examining the association between inbreeding effects on four economically significant traits (Calving Interval – CI -, Age at First Calving – AFC -, Birth Weight – BW -, and Weight at 210 days –W210-) with the presence or absence of Runs of Homozygosity (ROHs) across the autosomal chromosomes. The goal is to deepen our understanding of the consequences of inbreeding in the RG population and its impact on these traits, as well as to identify genes or genomic regions linked to desirable or undesirable inbreeding effects. The data set consist of genotypes with 57,490 single nucleotide polymorphisms (SNPs) from 4,878 individuals. All of them are recorded for BW, and we dispose of phenotypic data from 3,503, 3,315 and 3,285 of them for AFC, CI and W210, respectively. ROHs were identified utilizing the “consecutiveRUNS.run” function of the R package “detectRUNS,” with parameters categorized by length (in Mb): [1, 2], (2, 4], (4, 8], (8, 16], and >16. Subsequently, a matrix was created indicating whether each SNP was situated within an ROH for each animal. A t-test was then conducted to assess the significance of the effect of SNP presence within an ROH, following BLUP analysis performed by the BLUPF90+ software. A total of thirteen regions within BTA were identified as significantly associated with inbreeding effects. Notably, these include BW (2, 3, 6, 11, 13, 28), AFC (1, 2, 4, 5, 7), and W210 (2, 14, 21 – two regions -), while no significant regions were observed in IC. Among the genes located within them, the MSTN (Myostatin), CREB5 (CAMP Responsive Element Binding Protein 5) and FABP4 (Fatty Acid Binding Protein 4) can be highlighted.

Poster 26

Bovine faecal biomarkers of intestinal inflammatory process: calprotectin and lactoferrin, a comparative study

Y. Saco¹, N. Crusellas-Vallorquina¹, R. Pato¹, R. Peña¹, S. Martí², L. Pisoni², M. Devant², A. Pelegrí-Pineda¹, A. Bassols¹

¹ Autonomous University of Barcelona, Veterinary Clinical Biochemistry, Bellaterra, 08193 BARCELONA, Spain, ² IRTA, Ruminant Production Program, Caldes de Montbui, 08140 BARCELONA, Spain

Inflammation of the gastrointestinal tract impairs its functionality causing diarrheas that compromise calves' health and growth. In inflammatory conditions, calprotectin and lactoferrin are released to the intestinal lumen and their determination in faeces is used as biomarkers of inflammation in the gastrointestinal tract. The objectives of the present work were: a) validation of an ELISA assay developed for the measurement of lactoferrin in milk for its use in calves' faeces, b) study the influence of the water content of faeces on fecal calprotectin (fCAL), previously validated for calves, and fecal lactoferrin (fLF), and c) correlation between fLF and fCAL. The analytical validation was performed following the ASVCP Guidelines. Spearman's correlation coefficient was used to evaluate the influence of faecal water content and correlation between both biomarkers. Analytical validation achieved good results for both faecal biomarkers. A very strong correlation was observed between fCAL concentration in fresh and dry faeces ($r = 0.903$, $p < 0.01$) while a moderate correlation was observed for fLF ($r = 0.648$, $p < 0.01$). Correlation between both biomarkers was moderate in fresh faeces ($r = 0.514$, $p < 0.01$) and in dry faeces ($r = 0.561$, $p < 0.01$). In conclusion, a) the lactoferrin ELISA kit is valid for its use with calf faecal samples, b) fLF concentration is more influenced by faeces moisture than fCAL concentration, and c) both proteins can be proposed as good biomarkers of intestinal inflammation, since analytical procedures were satisfactory.

Effects of goat willow's tannin profile on in vitro methane production and rumen fermentation

This study assessed the effect of high-procyanidin (HPC) and high-prodelphinidin (HPD) goat willow (GW) on in vitro gas, methane (CH₄) and volatile fatty acid (VFA) production when included at 20% DM basis. Diets included grass silage (GS), HPC (96% PC in tannins), HPD (73% PD in tannins); with the addition of polyethylene glycol (+PEG; 1.7:1 tannin:PEG) or without. Diets were incubated for 72h at rumen fluid:medium at 1:9 v/v in triplicate. Gas pressure (psi transducer) and CH₄ concentration of gas (gas chromatography) were measured throughout. DM degradability (DMD) and VFA concentrations were assessed at 72h. Data were analysed by linear mixed models using treatment as fixed factor and batch run (1-3) as random factor. HPC, HPD, HPC+PEG, HDP+PEG diets had lower (P<0.001) DMD (697, 683, 677, 680, g/kg DM), and 72h production of cumulative gas (120, 113, 144, 133 ml) and CH₄ (9.1, 9.1, 10.6, 11.0 ml), than GS (754 g/kg DM, 163.7, 15.7 ml). GS produced more (P<0.001) VFA and acetic acid (70.0, 42.2 mM) than the four GW diets (60.4-67.8, 35.2-39.7 mM respectively), and less (P<0.001) butyric acid (4.5 mM) than HPD (7.7 mM). Adding GW reduced in vitro CH₄ production, partly due to tannins.

Effects of ten freshwater microalgae on in vitro ruminal methane production and digestibility

Y. Li¹, M. Bagnoud², Y. Zhang¹, C. Kunz¹, S. Dubois², R. Peng¹, F. Wah², M. Niu¹

¹ ETH Zürich, Animal Nutrition Group, Eschikon 27, 8315 Lindau, Switzerland, ² Agroscope, Food Microbial Systems Research Division, Schwarzenburgstrasse 161, 3003 Bern, Switzerland

This study aimed to evaluate the effects of 10 freshwater microalgae, namely, *Auxenochlorella protothecoides* (Ap), *Chlamydomonas pulvinata* (Cp), *Chlorella luteoviridis* (Cl), *Chlorella variabilis* (Cv), *Euglena mutabilis* (Em), *Parachlorella kessleri* (Pk), *Scenedesmus acuminatus* (Sa), *Stichococcus bacillaris* (Sb), *Tetradesmus obliquus* (To) and *Tetraselmis gracilis* (Tg), on in vitro ruminal methane (CH₄) production and nutrient digestibility using Hohenheim Gas Test. Microalgae were cultured in CO₂ incubator at 2% CO₂, light at 115 mmol/m².s in a 16:8 day/night cycle at optimal temperature of each strains. The Ap, Cp, Cl, Cv, Em, Pk, Sa, Sb, To and Tg possess crude protein contents of 17.2, 46.3, 40.2, 44.0, 42.5, 42.5, 42.3, 38.5, 37.0, 61.0 and 27.0%DM, a PUFA content of 59.0, 37.3, 69.1, 38.0, 42.3, 55.5, 40.5, 48.7, 35.3 and 33.2% of total fatty acids, respectively. The microalgae were tested at 15% replacement in a basal diet (Control) of 40%DM grass silage, 40% maize silage, 15% hay and 5% concentrate. Data was analyzed in mixed model in R. Ruminal CH₄ production was reduced by 15.4, 13.5, 17.4, 11.3, 9.70, 16.4, 10.0, 13.5, 11.2 and 12.2% (P < 0.05) for Ap, Cp, Cl, Cv, Em, Pk, Sa, Sb, To and Tg, respectively, compared to Control. In vitro organic matter digestibility was reduced by 3.31, 5.17, 5.14, 3.44, 2.67, 5.37, 2.76, 4.87, 2.55 and 3.29%pt (P < 0.05) for Ap, Cp, Cl, Cv, Em, Pk, Sa, Sb, To and Tg, respectively. Incorporating microalgae in ruminant diets has the potential to reduce enteric CH₄ emissions, further investigation is needed.

In vitro rumen fermentation characteristics of insect processed proteins compared to a conventional protein source

M. Ottoboni¹, I. Mateos², C. Saro², N. Merino², L. De Matos¹, L. Pinotti¹, M. J. Ranilla Garcia²

¹ University of Milan, Dipartimento di Medicina Veterinaria e Scienze Animali, Via dell'Università 6, 26900 Lodi, Italy, ² Universidad de León, Departamento de Producción Animal, Campus de Vegazana S/N, 24007 Leon, Spain

This research aimed to evaluate the nutritional composition, in vitro digestibility, and gas production kinetics of Black Soldier Fly and *Tenebrio molitor* processed proteins compared with soybean meal f.e. as a reference raw material. Nutritional characterization and in vitro ruminal fermentation tests were performed to determine in vitro short-chain fatty acids production, the gas production profile and methane production. Black Soldier Fly (BSF) and *Tenebrio molitor* (TM) were both full fat meal with a mean protein content of 41 and 61 % respectively and the soybean meal had 45 % of crude protein. Total gas production (value expressed in mL as mean \pm SD) was lower for both Black Soldier Fly (27 \pm 4.5) and *Tenebrio molitor* (23 \pm 3.3) processed proteins compared to soybean meal (77 \pm 2.1). Similarly, differences have been observed in the case of short-chain fatty acids production which was higher when soybean meal was used as substrate than with BSF and TM (4398, 1827 and 1676 μ mol, respectively). However, when considering fatty acid molar proportion differences were observed only in case of propionate, isobutirate, isovalerate, and valerate. Interestingly methane production (value expressed in μ mol as mean \pm SD) was lower for insect processed proteins (BSF 70 \pm 15; TM 59 \pm 4.5) compared to soybean meal (282 \pm 7.6). Obtained results indicated that insect processed proteins hereby tested were characterized by low fermentation profile, thus it might speculate that they could represent a valid by pass protein source.

Screening of Mediterranean agro-industrial by-products on in vitro ruminal fermentation

B. Mora¹, A. Torrent¹, A. Vastolo², S. Calabrò², M. I. Cutrignelli², E. Barbier³, H. Hoste⁴, V. Niderkorn¹

¹ Université Clermont Auvergne, INRAE, VetAgro Sup, UMRH, Route de Theix, 63122 Saint Genès Champanelle, France, ² University of Napoli Federico II, Department of Veterinary Medicine and Animal Production, Via Federico Delpino, 80137 Naples, Italy, ³ MG2MLX, La basse haye, F-35220 Châteaubourg, France, ⁴ INRAE, ENVT, UMR IHAP, 23 Chem. des Capelles, 31076 Toulouse, France

The utilization of polyphenol-rich agro-industrial by-products for ruminant diet would be a sustainable and circular option to mitigate pollutant emissions. In this study, 16 by-products sourced from Greece, Italy, and France were evaluated at 10% inclusion level in a basal diet using an in vitro ruminal fermentation assay. Dry matter degradability (DMD), gas production (CH₄, CO₂), volatile fatty acids (VFAs), and ammonia (NH₃) concentrations were monitored. A mixed-model ANOVA test was utilized to assess the effects of each by-product relative to one another. Additionally, a Dunnett post hoc test was conducted to compare the by-products against the control, comprised solely of the basal diet. Results revealed significant compared to control diet reductions in CH₄ production with French grape, Italian hazelnut, and Greek pomegranate by-products (p<0.001). French grape, Italian and Greek pomegranate led to an increased CO₂/CH₄ ratio (p<0.01) and decreased NH₃ production (p<0.05) compared to control diet. In addition, the French grape by-product significantly reduced DMD (p<0.05), without affecting VFAs production. Furthermore, this by-product demonstrates a decrease in CH₄ and NH₃ production (p<0.001) compared to the control. These findings suggest a shift in fermentative pathways from CH₄ to CO₂, affecting methanogenic microorganisms. Despite the lower DMD observed, the French grape by-product emerges as the best candidate for mitigating pollutant emissions.

Effect of the use of *Lactiplantibacillus plantarum* strain 5BG and of a commercial mix of polygalacturonase and glucanase on the quality of artichoke bracts silage

R. Greco¹, M. Ferrara², P. De Bellis², F. Giannico¹, G. Mulè², A. Maggiolino¹, P. De Palo¹

¹ University of Bari, Veterinary Medicine, SP per Casamassima, 70010 Valenzano, Italy, ² Institute of Sciences of Food Production, CNR-ISPA, Via Amendola, 70126 Bari, Italy

The study aims to evaluate the viability of ensiling artichoke bracts by the addition of a bacterial strain, *Lactiplantibacillus plantarum* 5BG(LP), and a commercial mix of polygalacturonase and glucanase, Vinotaste®(PGE). The artichoke bracts (AB) were obtained in a unique batch and split in 10 subsamples. Five experimental treatments were applied (2 subsamples per treatment) i) 10⁸ cfu of LP per g of AB(5BG); ii) 10⁸ cfu of LP per g and 1.6 g of PGE per kg of AB (5BG+E); iii) 1.6 g of PGE per kg of AB (E); iv) 10⁷ cfu of LP per g of AB(5BGL); v) 910 ml of distilled water (C). All the inocula were homogeneously sprinkled on each sample before ensiling. Each aliquot was compressed in plastic silos, hermetically closed, and stored at room temperature for thirty days. The fresh and ensiled AB were analyzed for chemical gross composition. In vitro digestion test (Daisy II, Ankom) for the apparent digestibility evaluation and in vitro gas production (Ankom Gas Analyzer) were carried out. Raw and ensiled samples were used also for microbiota analysis. The data set was processed by an ANOVA model, while metagenomics results were used for a PCA analysis. The 5BG, 5BG+E, and 5BGL theses led to a reduction in total gas production (P<0.05). Moreover, microbiota modifications during AB fermentation showed a clear cluster of the microbial diversity among the theses with LP than the ones without. Apparent digestibility was not affected by the treatments. The use of the LP strain showed to be an effective strategy for the production of AB silage, able in reducing enteric methane production without impairing apparent in vitro digestibility

Effect of conservation length on fermentation characteristics of teff as alternative forage for Mediterranean livestock farming systems

R. Primi¹, R. Spina¹, F. Luziatelli², M. Ruzzi², U. Bernabucci¹, F. Manganello¹, C. Evangelista¹, F. Lazzari¹, R. Ruggeri¹, F. Rossini¹, A. Benelli², R. Moscetti², A. Brunetti¹, I. Bottoni¹, S. Ceci¹, G. Fabbri¹, P. P. Danielli¹, B. Ronchi¹

¹ Università degli Studi della Tuscia, Dipartimento di Scienze Agrarie e Forestali, Via San Camillo de Lellis, snc, 01100 Viterbo, Italy, ² Università degli Studi della Tuscia, Dipartimento per la Innovazione nei Sistemi Biologici, Agroalimentari e Forestali, Via San Camillo de Lellis, snc, 01100 Viterbo, Italy

This study aimed to investigate the silage process of teff (*Eragrostis tef*) as a C4 drought-resistant forage for Mediterranean livestock farming systems. Moxie® (Barenbrug Co.) seeds were sown in central Italy after the durum wheat harvest, and the forage was cut after 70 days at approximately 30% dry matter content. Following chopping to about 4 cm, the fresh forage was ensiled in 20 L plastic silos fitted with a gas-release-only lid. The silos were opened at 30 and 60 days. The silages were analysed for water activity, chemical profile, microbial count, and aerobic stability. The earlier opening allowed for the maintenance of higher water activity, dry matter, crude protein, fat, starch, and yeast content. A longer conservation period increased buffering capacity, ADL, non-structural carbohydrates, and *Lactobacillus* spp. The length of ensiling did not affect other parameters such as weight loss, pH, ash, crude fiber, NDF, ADF, aerobic stability, and mold content. The results of this experiment suggest that a shorter ensilage period (30 days) does not lead to qualitative deterioration, and key storage parameters (pH, aerobic stability) are not altered. Meanwhile, higher levels of crude protein, fat, and starch are maintained. Teff can be useful in the event of forage shortages, as it can be sown even after the main cultivation in mid-summer, can be ensiled when haying is at risk (late summer-early autumn), and it can be fed to animals after a short conservation period. Funding: This study was carried out within the Agritech National Research Center and received funding from the European Union Next-GenerationEU (PIANO NAZIONALE DI RIPRESA E RESILIENZA (PNRR) – MISSIONE 4 COMPONENTE 2, INVESTIMENTO 1.4 – D.D. 1032 17/06/2022, CN00000022).

Understanding gastrointestinal tract transcriptomic adaptations in dairy cattle during lactation reveals molecular tissue and stage specific adaptations

R. Baldwin¹, Y. Gao², G. Liu¹, L. Ma², L. Fang³, C. J. Li¹

¹ USDA/ARS, AGIL, 10300 Baltimore Rd., 20705 Beltsville, United States, ² University of Maryland, Animal and Avian Sciences, 8127 Regents Drive, 20742 College Park, United States, ³ Aarhus University, Center for Quantitative Genetics and Genomics, Norde Ringgade 1, DK-8000 Aarhus C Aarhus, Denmark

To accurately predict maintenance requirements in lactating dairy cattle it is necessary to consider the dynamics of visceral organ tissue mass and metabolism in response to stage of lactation as they have an outsized role in nutrient use efficiency. We used next-generation sequencing and transcriptomic profiling of rumen, duodenum, and colonic epithelia sampled throughout the lactational cycle (Dry and 3, 14, 28, 45, 120, 220, and 305 days in Milk). Biopsies collected from cows were subjected to global transcriptomic profiling to identify tissue and stage-specific gene expression, time series clustering of RNA-seq data, co-expression of gene network analysis, as well as tissue-specific expression patterns, functional enrichment and cell type deconvolution. Striking changes in immune function gene expression begin to occur in the rumen and colon tissues as soon as day 3. Duodenal gene expression changes are associated with both immune function as well as nutrient transport, which is consistent with the rapid increase in nutrient demands for the cow. In the transition period (d 14), all three tissues exhibited specific changes in nutrient transport-related gene expression. Using a serial sampling approach enabled direct comparison of gene expression patterns within and among tissues during different phases of lactation and lends insight into the tissue-specific characteristics of these important gastrointestinal tissues across the lactation cycle.

Nutritional value of *Nannochloropsis oceanica* for post-weaning piglets

A. Chaves¹, D. Ribeiro¹, C. Martins¹, M. Maia², A. Fonseca², A. Cabrita², R. Bessa³, A. Almeida¹, J. Freire¹

¹ Instituto Superior de Agronomia, Universidade de Lisboa, LEAF - Linking Landscape, Environment, Agriculture and Food Center, Associated Laboratory TERRA, Tapada da Ajuda, 1349-017 Lisboa, Portugal, ² School of Medicine and Biomedical Sciences, University of Porto, REQUIMTE, LAQV, ICBAS, Rua Jorge Viterbo Ferreira, 228, 4050-313 Porto, Portugal, ³ Faculdade de Medicina Veterinária, Universidade de Lisboa, CIISA - Centro de Investigação Interdisciplinar em Sanidade Animal, AL4AnimalS - Associate Laboratory for Animal and Veterinary Sciences, Avenida da Universidade Técnica, 1300-477 Lisboa, Portugal

The identification of novel or underexploited feed resources to be used as alternatives to conventional feedstuffs constitutes an urgent matter towards increased sustainability of the animal feeding sector. Microalgae, like *Nannochloropsis oceanica* (NCO), due to its interesting composition, rich in protein, lipids, and minerals, could be a viable option for this, specifically for monogastric feeding. This study aimed to estimate the nutritional value of spray-dried NCO biomass to better understand the applicability of this microalga in weaned piglet feeding. Piglets were individually housed in metabolic cages and randomly assigned to 4 dietary treatments (n=6): control, 5, 10 and 15% dietary incorporation of NCO as a replacement of the basal diet. The experiment lasted two weeks (with a previous adaptation period of 4 days). Feed intake was equalized between diets and monitored daily. Faeces and urine were collected and weighed. Regression estimates of NCO total tract apparent digestibility (TTAD) values were obtained using a mixed model. The TTAD of dry matter (DM), crude protein (CP) and ether extract obtained were 725 ± 36.4, 711 ± 75.9 and 513 ± 83.9 g/kg, respectively. Digestible energy, metabolizable energy and digestible CP were calculated and its values were 12.7 MJ/kg DM, 12.4 MJ/kg DM and 177 g/kg DM, respectively. Further research should be targeted to understand how to use the NCO biomass properties in piglet nutrition.

Growth performance and carcass traits of heavy pigs fed diets with a partial to total replacement of soybean meal with spirulina powder

L. Gallo¹, G. Don¹, D. Giannuzzi¹, A. Toscano¹, S. Schiavon¹

¹ University of Padova, DAFNAE, Viale Università 16, 35020 Legnaro (PD), Italy

We evaluated the effects of a partial to full replacement of soybean meal (SBM) with Spirulina in the diets for heavy pigs, as a novel protein source. The study involved 88 gilts and barrows, allotted into 4 groups (2 pens/group) which received a control diet (C) based on cereals and SBM or one of 3 diets formulated by replacing nearly 33% (SP1), 66% (SP2) or 100% (SP3) SBM with Spirulina. The feeds were isoenergetic, isoproteic and isoaminoacidic. A mild feed restriction was applied, and feed allowance increased from 2.3 kg at the start (52 ± 4 kg body weight – BW) to 3.2 kg/d at the end of the trial (175 ± 6 kg BW). Growth performance, feed intake, gain to feed ratio, and the weight of carcasses, loins, hams and lards have been analyzed according to a linear mixed model including the fixed effects of sex and diets and their interaction, and the pen within diet as random effect. Palatability of diets was not depressed by the inclusion of SP, and pigs of the different groups had very similar feed intake. Growth rate and gain to feed ratio averaged 894 ± 40 g/d and 0.341 ± 0.016 g/g, respectively, and growth parameters were comparable ($P > 0.10$) across groups. Also carcass and commercial cuts weights were unaffected by diet. Therefore, the replacement of SBM with spirulina did not exert any effect on growth and carcass traits of growing pigs. The effects of such a replacement on meat quality should be addressed. This study was carried out within the Agritech National Research Center and funded by European Union Next-GenerationEU (PIANO NAZIONALE DI RIPRESA E RESILIENZA (PNRR) – MISSIONE 4 COMPONENTE 2, INVESTIMENTO 1.4 – D.D. 1032 17/06/2022, CN00000022).

Soybean meal fermentation: is it worth investigating in Europe? A review

V. Heuzé³, E. Tormo¹, I. De La Borde^{1,2}, P. Carré², G. Tran³

¹ Terres Univia, 11 rue de Monceau, 75008 Paris, France, ² Terres Inovia, 11 rue Monge-Parc industriel, 33600 Pessac, France, ³ Association Française de Zootechnie, Campus AgroParisTech Paris-Saclay, 22 place de l'Agronomie, 91120 Palaiseau, France

From 2020 to 2023, we systematically reviewed soybean meal processing to enhance animal feed quality for land livestock (ruminants, pigs, poultry). Fermentation emerged as a promising method. Of the total of 49 articles identified, 42 were from Asia (China (30), South-Korea (3), Taiwan (3), Iran (3), Thailand (1), Sri Lanka (1), Saudi Arabia (1)), 3 from Europe (Poland (2), Denmark (1)) and America (USA (2), Mexico (1)), and 1 from Africa (Egypt). Fermented soybean meal (FSBM) was mainly (32 articles) evaluated in diets for weaned piglets and broilers. FSBM was mainly produced by solid-state fermentation (with 1 to 3 fermentation steps). *Bacillus* and *Lactobacillus* bacteria, often combined, were mainly used. There was a wide range of experimental protocols: each article had its own process for producing FSBM, and the inclusion rates of FSBM in the diets varied from 2 to 35%. The authors tested the inclusion of FSBM as a full/partial replacement of conventional soybean meal (CSBM) or animal protein diet to assess its alleged positive effects on diet composition, ANFs content, nutritional value, animal performance, health, microbiota, and quality of animal products. However, few papers tested the environmental and economic impact of FSBM diets. The conclusions of the articles were by far and large positive, confirming the benefits of FSBM over CSBM and animal-based diets for all livestock species. The positive effects were more noticeable in pigs than in poultry: in pigs, FSBM improved health, performance, nutritive value and product quality in 87%, 83%, 82% and 82% of the tests respectively, while these numbers were lower in poultry (75%, 82%, 57% and 61%). These results are certainly promising and it would be valuable to explore the potential of FSBM in European contexts, focusing on its nutritional and performance benefits, and also on its economic and environmental impact. The value of FSBM in ruminants, which has been little studied in Asian articles, could be further explored, particularly by considering strains of micro-organisms that are more cellulolytic for fermentation.

Extruded or Enzyme-Treated *Chlorella vulgaris* in Broilers Diets: Effects on Performance and Digesta Viscosity
 A. Mendes^{1,2,3}, C. Martins¹, D. Carvalho¹, O. Madacussengua¹, M. Spinola^{2,3}, M. Costa^{2,3}, J. Pestana^{2,3}, J. Ferreira^{2,3},
 A. Fontes^{2,3}, A. Almeida¹, J. Prates^{2,3}, M. Lordelo¹

¹ LEAF - Linking Landscape, Environment, Agriculture and Food Center, Associated Laboratory TERRA, Instituto Superior de Agronomia, Universidade de Lisboa, Tapada da Ajuda, 1349-017 Lisboa, Portugal, ² CIISA - Centro de Investigação Interdisciplinar em Sanidade Animal, Faculdade de Medicina Veterinária, Universidade de Lisboa, Avenida da Universidade Técnica, 1300-477 Lisboa, Portugal, ³ AL4Animals - Associate Laboratory for Animal and Veterinary Sciences, Avenida da Universidade Técnica, 1300-477 Lisboa, Portugal

This study explores the impact of incorporating microalga *Chlorella vulgaris* (MCV), an alternative protein source to soybean meal, into broiler diets either untreated, enzyme-supplemented, or extruded, on animal performance and digesta viscosity. One hundred and twenty male Ross 308 broilers, from 7 to 35 days of age, were divided into four dietary treatments with 10 replicates each: CTR (maize and SBM), CV (20% MCV), CVenz (CV diet + 0.3% pancreatin) and CVExt (20% extruded MCV), with ad libitum feeding for 28 days. Performance parameters were determined and, at day 35, organ sizes, digesta viscosity and carcass yield were measured. All data was analysed with ANOVA, using SAS software. Key findings include that feed intake and average daily gain reduced across all MCV diets compared to CTR, yet CVenz and CVExt diets improved carcass yield relative to the CTR. CVenz diet yielded body weights and feed conversion ratios comparable to CTR, underscoring its potential for maintaining growth performance despite high levels of MCV inclusion. Digesta viscosity was not significantly affected by diet, suggesting the physical and enzymatic treatment methods employed did not detrimentally impact gut health. Organ weights and lengths varied with treatment, with CVenz and CVExt diets resulting in lower liver weights and changes in gastrointestinal tract lengths, indicative of physiological adaptations to the diets. Overall, this research highlights the feasibility of using enzyme-treated MCV as a sustainable protein source in broiler diets without compromising performance or gut health.

Evaluation of different algae for ruminant feeding

C. N. Marcos¹, A. De Las Heras-Molina², T. De Evan¹, C. Gómez-Serrano³, M. Terré⁴, S. Pérez-Garnelo⁵
¹ ETSIAAB, Producción Agraria, Av. Puerta de Hierro, 2, 28040 Madrid, Spain, ² Veterinary, UCM, Animal Production, Av. Puerta de Hierro, s/n, 28050 Madrid, Spain, ³ UA, Chemical Engineering, C. Sacramento, s/n, 04120 Almería, Spain, ⁴ IRTA, Ruminant Production, Torre Marimon, 08140 Caldes de Montbui, Spain, ⁵ INIA-CSIC, Animal Reproduction, Av. Puerta de Hierro, 18, 28040 Madrid, Spain

Algae are microorganisms that can be used as a source of nutrients in ruminant feeding. However, evaluation of microalgae can be challenging due to its microscopic size. The aim of this work was to evaluate the in vitro dry matter (DM) degradability (IVDMD) of various algae using ANKOM F58 bags. The chemical composition of five microalgae (*Tetraselmis* spp. (TE), *Tisochrysis lutea* (TI), *Scenedesmus almeriensis* (SC), *Nannochloropsis gaditana* (NA) and *Arthrospira* spp. (AR)) and one macroalgae (*Ulva* spp. (UL)) was analyzed. Three F58 bags with each algae sample were incubated with buffered sheep ruminal fluid from 3 sheep for 12 h to determine the IVDMD. In addition, algae were incubated in flasks for 12 h to measure gas production. The nitrogen (N) content was 70.9, 66.3, 96.2, 67.1, 110 and 68.6 g/kg DM, the ether extract (EE) content was 172, 268, 151, 122, 159 and 143 g/kg DM, and the ash content was 288, 185, 66.5, 206, 78.1 and 170 g/kg DM for TE, TI, SC, NA, AR and UL, respectively. The gas produced after 12h was 31.3, 18.8, 22.4, 42.7, 65.5, and 22.8 mL/g DM, and the IVDMD was 26.5, 47.4, 34.8, 41.0, 58.7, 37.3% for TE, TI, SC, NA, AR and UL, respectively. The IVDMD significantly and positively correlated with gas production ($r=0.61$; $n=16$). Some feed fractions are degraded and produce amounts of gas during in vitro trials. Adjusting this gas production for N, EE and ash content through linear regression, the correlation with the IVDMD was close to 1 ($r=0.98$). These results suggest F58 bags can be used to evaluate algae.

In vitro evaluation of discarded carrot and pepper as feed ingredients for ruminants

N. Merino^{1,2}, M. Ottoboni³, L. G. De Matos³, I. Mateos^{1,2}, C. Saro^{1,2}, M. J. Ranilla^{1,2}

¹ Universidad de León, Campus Vegazana, s/n, 24071 León, Spain, ² Instituto de Ganadería de Montaña (CSIC-Universidad de León), Finca Marzanas, 24346 Grulleros, Spain, ³ Università degli Studi di Milano, Department of Veterinary Medicine and Animal Science, via dell'Università 6, 26900 Lodi, Italy

Spain leads as the top producer of fruits and vegetables in the EU. Discards and leftover materials from harvesting and processing processes represent a significant part of this production and, after nutritive evaluation, they could be incorporated into the diet of ruminants. Chemical composition and in vitro rumen fermentation characteristics of carrot (CAR) and pepper (PEP) were assessed in this study. 0.5 g samples of both vegetables and barley as reference feed were placed into serum bottles containing 50 mL of buffered ruminal fluid and incubated for 24 h at 39°C. Total gas production, volatile fatty acids (VFA) and CH₄ production and pH were measured. Chemical composition of CAR, PEP and barley was, respectively, 10.1, 9.56 and 94.6 % DM (% of fresh matter); 92.9, 92.1 and 98.4 % OM, 8.08, 12.7, and 12.2 % CP, 0.79, 2.94 and 1.60 % EE, 41.6, 34.1 and 3.05 % sugars, and 12.4, 15.6 and 12.5 % NDF (% DM). Total gas production was significantly higher for CAR (P<0.05) compared to PEP and barley (96.5, 88.2 and 90.1 mL/bottle, respectively). Total VFA production was significantly higher for CAR than barley (4688 and 3920 µmol/bottle; P<0.05) with intermediate values for PEP (4378 µmol/bottle). Acetate molar proportion was similar for all substrates (P>0.05) but molar proportion of propionate was higher for CAR and PEP compared to barley (P<0.05). Consequently, acetate/propionate ratio was lower in CAR and PEP than in barley (1.97, 2.13 and 2.77, respectively). Methane production and methane/VFA ratio were not significantly different between substrates (P>0.05), with a methane production of 339.5, 335.7 and 304.0 µmol/bottle and a methane/VFA ratio of 0.073, 0.077 and 0.078 mol/mol for CAR, PEP and barley, respectively. Both vegetables appear to be an alternative in ruminant feed, replacing traditional feed such as barley in the ration. Further studies are needed to assess the effective inclusion of these vegetables into ruminant diets. Funding from the Spanish State Research Agency (AEI) and the European Regional Development Fund (Project PID2021-124648OB-C22) is gratefully acknowledged

In vitro evaluation of discarded leek as feed ingredients for ruminants

N. Merino^{1,2}, M. Ottoboni³, L. G. De Matos³, I. Mateos^{1,2}, C. Saro^{1,2}, M. J. Ranilla^{1,2}

¹ Universidad de León, Campus Vegazana, s/n, 24071 León, Spain, ² Instituto de Ganadería de Montaña (CSIC-Universidad de León), Finca Marzanas, 24346 Grulleros, Spain, ³ Università degli Studi di Milano, Department of Veterinary Medicine and Animal Science, via dell'Università 6, 26900 Lodi, Italy

Sulfur compounds present in plants may modulate ruminal fermentation and some of them appear to inhibit methane production. Chemical composition and in vitro rumen fermentation characteristics of discarded leek (LEE), a vegetable rich in sulfur compounds, were assessed in this study, compared to a reference feed (alfalfa hay, ALF). Samples (0.5 g dry matter) of substrates were incubated in serum bottle with 50 mL of buffered ruminal fluid for 24 h at 39°C. Total gas production, volatile fatty acids (VFA) and methane production and pH were measured. Chemical composition of LEE and ALF was 7.65 and 95.8 % dry matter (% of fresh matter); 87.68 and 92.27 % organic matter; 18.29 and 20.48 % crude protein; 1.77 and 1.37 % fat; 19.20 and 7.1 % sugars; 22.56 and 31.56 % neutral detergent fiber; 18.31 and 22.98 % acid detergent fiber; 4.53 and 4.94 % lignin (% of dry matter). Total gas production was significantly different, being higher with LEE than ALF (74.3 and 59.5 mL/bottle). Total VFA production was significantly higher for LEE compared to ALF (3825 and 3275 µmol/bottle). No differences were found in molar proportions of acetate, propionate and butyrate (P>0.05) and consequently acetate/propionate ratio was similar for both substrates (2.72 and 3.12 for LEE and ALF, respectively). There was no difference in methane production between LEE and ALF (178 and 145 µmol/bottle respectively). Additionally, CH₄/VFA ratio was similar for both substrates (0.046 and 0.044 mol/mol, respectively). In conclusion, LEE seems to be an alternative to be included as feed ingredient in ruminant diets although no effect in CH₄ production was observed when compared in vitro with alfalfa hay. Additional research is required to assess the optimal incorporation of this vegetable into ruminant diets. Funding from the Spanish State Research Agency (AEI) and the European Regional Development Fund (Project PID2021-124648OB-C22) is gratefully acknowledged

Use of sunn hemp as forage for beef cattle

J. Vendramini¹, J. Lazarin¹, M. L. Silveira¹, H. Da Silva¹, H. De Oliveira¹, J. Garzon², D. Cook³, D. Gardner³, R. Cooke⁴, P. Moriel¹

¹ University of Florida, Range Cattle Research and Education Center, 3401 Experiment Station, 33865 Ona, United States, ² University of Maine, Cooperative of Extension, 168 College Ave, 04469 Orono, United States, ³ USDA-ARS, Poisonous Plant Research Laboratory, 1150 E 1400 N, 84341 Logan, United States, ⁴ Texas A&M University, Department of Animal Science, Olsen Blvd Suite 133 2471, 77843 College Station, United States

Sunn hemp (*Crotalaria juncea* L.) is a warm-season annual legume and has been widely used as cover crop in the world. Livestock producers have interest in using sunn hemp as forage due to superior biomass accumulation and nutritive value; however, sunn hemp has pyrrolizidine alkaloids, which may negatively affect forage quality. The experiment was conducted at the UF/IFAS Range Cattle Research and Education Center, Ona, FL from April to May 2021. Treatments were calves receiving sunn hemp or stargrass (*Cynodon nlemfuensis* Vanderyst) hay distributed in a randomized complete block design with 12 replicates. Calves were supplemented with concentrate at 1.3% BW daily (18% CP and 78% TDN). Twenty-four Angus crossbred calves were weaned with 90±14 kg BW and grazed annual ryegrass (*Lolium multiflorum* Lam) with 1% BW concentrate supplementation for approximately 60 d. Subsequently, calves were randomly distributed and assigned to experimental units (pen) with initial BW of 184±10 kg. ‘Crescent Sunn’ sunn hemp hay was harvested approximately 49 d after seeding when 75% of the plants were initially flowering. The average concentration of pyrrolizidine alkaloids from sunn hemp was 58 µg/g DM. Early-weaned calves receiving stargrass had greater ADG than sunn hemp (0.5 vs. 0.4 lb/d), and had greater forage DM intake (1.2 vs. 1.0% BW) and total DM intake (2.5 vs. 2.3% BW). Conversely, diets with sunn hemp had greater *in vivo* DM digestibility than stargrass (68 vs. 62%). There was no difference between treatments on parasite egg count (mean = 45 eggs/3 g feces) and coccidia egg count (1 log₁₀ eggs/g feces). Early-weaned calves receiving sunn hemp consumed 0.25 g pyrrolizidine alkaloids/d; however, there was no detectable amount (<0.05 µg/g DM) of pyrrolizidine alkaloids in the feces. The presence of pyrrolizidine alkaloids in sunn hemp may be the potential cause of decreased early-weaned calves forage intake and animal performance.

Session 5

Assessment of the potential of BSF meal in broiler chicken feed

A. Monteiro¹, T. Mariano¹, S. Botelho¹, A. Santos¹

¹ FeedInov CoLab, Av. Prof.Doutor Vaz Portugal, 2005-424 Vale de Santarém, Portugal

The use of insect meal in animal feed is an opportunity to reduce the pressure on the production systems of raw materials for animal feed, especially of protein sources, significantly reducing the “Food vs Feed” competition and leveraging a new sector with great potential. This study is being conducted under the Mobilizing Agenda InsectEra, project number AAC n°02/C05-i01/2022. The aim of this study is to evaluate the added value of BSF meal in broiler feed, considering zootechnical performance and animal health. Commercial broilers (n=320) were allocated to four experimental groups in 2 stages of animal growth (phase 1: P1 and phase 2: P2) according to the following: 1 control C) and three treatments (T1, T2 & T3) considering 2 different insect meal incorporation rates according to the following: T1 – 2,5% (P1), 2,5% (P2); T2 – 5% (P1), 5% (P2) and T3 – 5% (P1), 2,5% (P2). The broilers were housed in experimental pavilions that mimic industrial ones, respecting all current welfare standards, namely area per animal, temperature, light intensity and photoperiod. Each pavilion had automatic drinking fountains and a feeder for permanent access to water and food, respectively. Each experimental treatment had 4 replicas (pavilions) and each pavilion had 20 animals. Measurements were made at the beginning, at day 18, when the feed was changed (phase 1 to phase 2), and at the end of the trial. The parameters measured were: Individual weight of the birds; average daily weight gain; average daily feed intake per bird on a weekly basis; average daily intake; feed conversion ratio; mortality and morbidity. The intestinal health of the animals was also assessed by measuring the length of caecae, small intestine and its sections and the size of the intestinal villi.

Intercropping cash and forage crops to improve the land equivalent ratio of Mediterranean organic cereal-based systems

D. Scordia¹, M. Oteri¹, F. Calderone¹, F. Gresta¹

¹ University of Messina, Department of Veterinary Sciences, Viale Palatucci, 96168 Messina, Italy

This work was part of the joint research project “RE-FARM”, whose main objective is to combine regenerative agriculture methods with proximal sensing to enhance productivity, crop quality, and ecosystem services of wheat-based farming systems in south Italy and Texas, USA. In the first year (2023), a field trial was set-up in an organic farm located in Sicily, Italy. Durum wheat (*Triticum durum* Desf.) sole crop (control) was compared with durum wheat intercropped with forage legumes, with the aim to reduce weed pressure and nitrogen requirement, to increase grain yield and protein content, to extend the biological cycle of legume species for forage production and to improve the land equivalent ratio (LER). Three Mediterranean forage legumes (*Trifolium subterraneum* L., *Medicago polymorpha* L., and *Lotus corniculatus* L.), were selected based on predominant winter growth, different growth habits and life cycle length. Focusing on forage performances, results indicated that intercropped forage species differed in term of dry matter (DM) yield, DM content at harvest and biological cycle length. At the wheat harvest in July, the DM yield was significantly higher in T. subterraneum than M. polymorpha and L. corniculatus (1.65 Mg ha⁻¹ vs 0.35 and 0.30 Mg ha⁻¹, respectively). Accordingly, intercropping allowed to improve the LERs, which were higher than one (i.e., that of the T. durum sole crop). The DM content was the highest in M. polymorpha, as it reached senescence phase already in the second decade of June. T. subterraneum had a DM content of 51±4.9% as it did not complete the cycle at harvest. L. corniculatus was still at the flowering at the moment of wheat harvest, and its DM was only 21.8±1.9%. Overall, this study showed that intercropping can be a suitable agroecological practice to enhance the LER and to provide both forage and grains from organic cereal-based systems. Acknowledgements: This work was supported in part by the Italian Ministry of Foreign Affairs and International Cooperation”, grant number US23GR18 (RE-FARM project, CUP: J43C23000110001).

Nutritional quality of feed resources used by smallholder dairy farmers in the Northern Province of Rwanda
M. A. Mukasafari^{1,2}, M. Mutimura³, E. Wredle², H. Gonda²

¹ University of Rwanda, Animal Production, Box, 57 Nyagatare, Rwanda, ² Swedish University of Agricultural Sciences, Applied Animal Science and Welfare, Box 7024, 750 07 Uppsala, Sweden, ³ Rwanda Agriculture and Animal Resources Development Board, Animal Resources Development, Box, 5016 Kigali, Rwanda

Improving the nutritional quality of dairy cow diets in Sub-Saharan Africa can uplift small-scale farmers' livelihoods. This study aimed to assess the nutritional quality of feeds used by smallholder farmers (SHF) in the Northern Province of Rwanda through chemical analyses and in vitro gas production. A total of 218 feed samples were collected from 178 households. Twenty different feeds were identified and classified as cultivated forages (CF, 4), natural pastures (NP, 5), crop residues (CR, 9), and fodder trees (FT, 2). The most utilized feed resources were NP (51%) and CF (46%), followed by CR (23%) and FT (2%). *Pennisetum purpureum*, and assorted grass were the prevalent feeds used by the SHF (42%, and 32% respectively). Crude protein (CP) and fibre (NDF) contents were on average 10.5±1.2 and 53.6±12.5 in CF, 9.4±1.8 and 57.0±8.6 in NP, 11.1±4.2 and 53.7±12.5 in CR, and 29.7±7.2 and 40.1±13.7 in FT, respectively. Among all feeds, FT as *Sambucus nigra* had the highest content of CP (34.8%), and metabolisable energy (ME; 10.7 MJ/kg DM), compare to crop residue in banana pseudo-stem (CP; 4.4% and ME; 5.0 MJ/kg DM). *S. nigra* and *Calliandra calothyrsus* (24.6% CP) could be good supplementary feeds for those with lower nutritional quality. This study contributes to defining possible interventions and strategies to improve feed management practices, enhancing productivity and resilience of SHF in Rwanda. The study is part of the “Undernutrition” project, funded by the Swedish International Development Cooperation Agency in partnership with the University of Rwanda.

Cu, Zn, and Mn sources effect on 48 hour in-vitro fermentation and CH₄ production

C. B. Peterson¹, G. M. Boerboom², J. S. Heldt¹, K. E. Griswold¹, J. Johnston³

¹ Selko® USA, 3905 Vincennes Rd. Suite 100, 46268 Indianapolis, United States, ² Nutreco Nederland BV, Selko Feed Additives, P.O. Box 299, 3800 AG Amersfoort, Netherlands, ³ Fermentrics Technologies Inc., 961 Campbell Drive, McNab-Braeside, K7S0E1 Ontario, Canada

The objective of the trial was to evaluate copper (Cu), zinc (Zn), and manganese (Mn) mixtures from various sources on 48 hour in-vitro fermentation. Supplemental trace minerals (STM) calculated to be 125 Cu, 750 Zn, and 500 Mn (mg/d), for a lactating dairy cow consuming 25 kg DM with a 120 L rumen volume and scaled to fit a 250 mL vessel. Treatments were split into two runs with 6 replicates per treatment: Run 1: Control (C1, no trace mineral), Sulfate (SO₄), Selko® IntelliBond® (IB), Nutrilock® Chemlock (NC), Phibro Vistore™ (PV). Run 2: Control (C2, no trace mineral), SAM Nutrition (SN), Orffa Excential Smart (OE), and Ecotrace Glycinate (EG). Data were analyzed as a complete randomized design with PROC MIXED in SAS (SAS Institute Inc, Cary, NC). Significance equaled $P \leq 0.05$ and tendency at $0.05 < P \leq 0.20$. In Run 1, NC ($P = 0.014$) resulted in higher apparent organic matter disappearance (aOMD) while other treatments were not significantly different (NSD). However, NC ($P = 0.049$) and PV ($P = 0.029$) treatments also reduced apparent microbial biomass production (aMBP). In contrast, IB tended to increase aMBP ($P = 0.10$). For CH₄/OMD, IB, PV, and NC generated lower levels ($P < 0.05$) and SO₄ was NSD. In Run 2, EG resulted in less aOMD ($P < 0.001$), and OE ($P = 0.075$) and SN ($P = 0.189$) tended to result in less aOMD. SN ($P < 0.001$) and OE ($P < 0.001$) had less aMBP, and EG tended to have less aMBP ($P = 0.16$). For CH₄/OMD, EG tended ($P = 0.11$) to generate higher levels and all others NSD. STM mix showed an incredibly varied fermentation effect, with the IntelliBond mix resulting in a mitigation of negative impacts.

Factors affecting the in vitro kinetics of total gas and methane in dairy cows using Gas Endeavor System

R. Iqbal¹, J. Bisello¹, S. Arango¹, N. Guzzo¹, F. Tagliapietra², L. Bailoni¹

¹ University of Padova, B.C.A, Viale Università 16, Legnaro (PD), 35020 Padova, Italy, ² University of Padova, DAFNAE, Viale Università 16, Legnaro (PD), 35020 Padova, Italy

In ruminants, methane is a product of rumen fermentation, playing a significant role in greenhouse gas (GHG) emissions and dietary energy loss in cows. This study aimed to investigate the factors effecting total gas production (GP) and methane kinetics in different physiological stages of dairy cows (lactating: LC and dry: DC) using different buffer solutions (Menke: MS and Van Soest: VS). Gas Endeavor, an automatic gas flow measuring system (BPC Instruments, Lund, Sweden), was used to estimate GP and CH₄ in two runs. One gram of LC and DC diets was incubated with 150 mL of buffered rumen fluid (inoculum) using MS and VS buffer solutions and rumen fluids from LC and DC. Fermentation lasted for 24h at 39°C. Data were analyzed using linear fixed model with three factors: physiological stage, buffer solution and run. As expected, significant differences were observed in GP between physiological stages of cows (442 vs 288 mL/g of DM for LC and DC resp.; $P < 0.05$) and buffer solutions (345 vs 395 mL/g of DM for MS and VS resp.; $P < 0.05$). Similarly, the percentage of CH₄ in GP differed significantly for the physiological stages (15.3 vs 23.9 %; $P < 0.001$) and buffer solutions (21.0 vs 18.1 %; $P < 0.05$). The kinetics of GP and CH₄ exhibited their maximum rates between 6-7 hours of incubation (42.9 and 10.9 mL/g of DM resp.) Similarly, the kinetics of GP was significantly ($P < 0.005$) higher (17.61 mL/g of DM/hour) than that of methane (3.01 mL/g of DM/hour) considering both physiological stage and buffer solutions. In conclusion, physiological stage of cows and use of different buffer solutions were important factors in GP and CH₄ production. Furthermore, Gas Endeavor proves to be an innovative and suitable system for assessing both total gas and methane kinetics in real-time during in vitro rumen fermentation, that would be useful to evaluate nutritional strategies aimed to mitigate GHG emissions in ruminants. Funded by the project: PNRR, "National Research Centre for Agricultural Technologies – Agritech" – CN2, Missione 4, Componente 2, Investimento 1.4, CUP C93C22002790001

Impact of low-density polyethylene microplastic on ruminal degradability of feeds

S. Glorio Patrucco¹, K. Abid¹, S. Barbera¹, H. Kaihara¹, S. Tassone¹

¹ University of Turin, Department of Agricultural, Forest and Food Sciences, Largo Paolo Braccini 2, 10095 Grugliasco, Italy

The primary plastic utilized in farms is low-density polyethylene (LDPE), often identified as a foreign object in the rumen of slaughtered cattle and in the form of microplastic (MPs, <5mm) both in ruminant feeds and their body tissues. Despite its widespread presence in farms, there is a notable absence of studies examining its potential impact on the ruminal degradability of feeds. This research endeavored to examine the influence of LDPE as MPs, on the in vitro rumen degradability of feeds. In 3 farms, 3 most used feeds were collected: mixed hay (Hy), corn silage (Cs), and concentrate (Cn). Feeds, dried at 60°C for 24h and ground (1mm sieve), were prepared in bags containing 0.5g on dry weight of feed, and incubated in a rumen fluid derived from Piemontese bulls. Three runs were performed. Four jars were added with 4 levels of LDPE (0, 0.5, 0.9, and 1.4% on rumen-buffer solution). Each jar contained 3 bags for each feed and each farm, for a total of 27 bags. They were incubated for 48h in the Ankom DaisyII with 400mL of filtered rumen fluid, and 1600mL of buffer solutions for jar. Results showed that LDPE at all levels did not affect feed degradability. Ruminal degradabilities (%), for 0 to 1.8% of LDPE, were: 47.6±8.92, 47.7±8.96, 49.2±8.72, and 48.5±8.76% in Hy; 59.1±3.97, 59.1±5.13, 59.1±4.86, and 59.7±4.24% in Cs; 69.2±5.80, 70.0±4.38, 71.6±5.28, and 71.6±6.35% in Cn. These results provide valuable insights into the resilience of the rumen degradation process in the face of exposure to LDPE. Future studies are needed to investigate the effects of other MP polymers to provide a deep understanding of the impacts of MPs pollution on ruminant nutrition.

Rumen contents from slaughtered cattle and sheep to study in vitro degradation of selected feeds

A. Chaudhry¹

¹ Newcastle University, Natural and Environmental Sciences, Agric Building, NE1 7RU Newcastle upon Tyne, United Kingdom

Rumen degradation studies are needed to evaluate various feeds before their use to formulate nutritionally balanced diets for ruminant animals. However, the use of surgically modified animals for this purpose is highly regulated, laborious, and undesirable. Thus, suitability of rumen fluid (RF) from freshly slaughtered cattle (RFC) or sheep (RFS) was tested as a non-invasive alternative to estimate in vitro degradation of 12 feeds representing 6 concentrates and 6 grasses. Representative samples of concentrates and grasses were collected, dried and ground through a 1 mm sieve before their separate incubations with buffered RFC or RFS. Factorial studies were used to anaerobically incubate about 0.4g of each feed separately with 40 ml of either RFC or RFS for various times from 0 to 72 hours at 39°C. The undegraded residues were washed and dried to calculate degradation of each feed at each time before deriving constants and effective degradability (ED) by using a curve fitting model. The ED of dry matter (EDDM) or crude protein (ECPD) for RFS were comparable to those for RFC. While the degradability values differed ($P < 0.05$) depending on the feed and RF types, the values for forages and feeds compared well with those for fistulated animals. The feed ranking by degradability estimates was remarkably similar for RFS and RFC. Strong correlations were found between the two inocula ($R_2 = 0.86$ for EDDM and 0.74 for ECPD). The ECPD values for feeds in this study using RFS or RFC matched well with the reported literature values as well. This study showed that RF obtained from freshly slaughtered sheep or cattle could equally be used to replace RF obtained from fistulated animals for the in vitro incubation of feeds to estimate degradation of ruminant feeds.

Reducing lactating cows dietary sodium to reduce environmental cost of dairy farms

D. Espinoza^{1,2}, S. Mabeesh², Y. Ben Meir¹¹ Agricultural Research Organization, Ruminant Science, HaMaccabim 68, 7505101 Rishon LeZion, Israel, ² The Hebrew University of Jerusalem, Animal Science, Herzl st., 7610001 Rehovot, Israel

This study aimed to examine the effect of reducing dietary sodium by reducing dietary NaHCO₃ or NaCl on lactating cow's intake, yield, and well-being. Excess dietary Na increases excretion in manure and washing water from the milking parlor. The Na can reach water reservoirs or open land, impairing their quality and harming the environment. We hypothesize that dietary Na can be reduced from ~0.47% to 0.31% of diet DM while supplying sufficient Na for health and production. The literature review supports this hypothesis; however, because Na can be added to the feed as NaHCO₃ or NaCl, it was necessary to evaluate the effect of Na concentration and its origin. After two weeks adaptation to group and individual feeding regime, 42 multiparous mid-lactating cows were blocked to groups of 3 according to days from calving, body weight, and yield, and each triplet randomly assign to one of the following treatments: (1) CON (typical lactation diet with 0.46% Na with added NaHCO₃ and NaCl); (2) NHC (0.31% Na with added NaHCO₃); and (3) NC (0.31% Na with added NaCl) for 5 weeks while recording DM intake, body weight, milk and milk solids (fat, protein, lactose) yield, lying time, activity (pedometer), and ruminal pH. Week 5 was dedicated to urine and fecal samples to analyze digestibility and mineral balance. Data were analyzed using the mixed-model procedure with treatment, day, and treatment*day as a fixed effect, cow as a random effect, and daily data as repeated measures modeled as AR(1). Regardless of reducing NaHCO₃ or NaCl, the model did not reveal a significant effect of dietary Na concentration on DM intake or energy-corrected milk yield that was 29.5, 31.2, 30.5, and 42.0, 41.1, and 41.3 kg/d for treatments 1, 2, and 3, respectively. However, higher dietary Na resulted in higher milk protein % (3.34 vs. 3.25) and a tendency ($p = 0.08$) to higher milk fat % (3.82 vs. 3.62) but not yield. Overall, reducing dietary to 0.31% will minimize the environmental cost of dairy farms without impairing production. Additional study is warranted before lowering dietary Na concentration below this.

Replacing hexane by 2-methyloxolane for defatting soybean meal does not impair fattening performance of beef cattle supplemented with methionine

C. García-Vázquez¹, V. Menoury¹, P. Faure², L. Salis¹, A. Ferlay¹, P. Noziere¹, G. Cantalapiedra-Hijar¹¹ UCA, INRAE, VetAgroSup, UMR Herbivores, Saint Genès Champagnelle, 63122 Theix, France, ² INRAE, Herbipôle, Saint Genès Champagnelle, 63122 Theix, France

Chemical fat extraction for producing soybean meal (SBM) uses solvents like extraction-grade hexane (Hex). Concerns over health risks from n-hexane residues have motivated the exploration of alternatives like 2-methyloxolane (2-meOx), a bio-based solvent derived from agricultural by-products. However, differences in processing techniques between Hex and 2-meOx SBM may lead to varying nutritive values, potentially impacting animal performances. The aim of this study was to evaluate the performance of beef cattle fed grass silage diets with 2-meOx compared to hexane-extracted SBM, with or without supplementation of rumen-protected methionine (RPM). Thirty-six young Charolais bulls (248 ± 21.7 days) were studied during three consecutive 70d-feed efficiency tests until slaughter. Treatments resulted from a factorial design crossing two types of SBM (Hex vs 2-meOx) with 2 levels of RPM (supplemented or not). DM intake did not differ significantly among the four treatments for any of the three 70-day efficiency tests ($P > 0.05$). Diets supplemented with RPM promoted higher average daily gain and feed conversion efficiency during the initial 70-day feed efficiency test, particularly in diets containing 2-meOx (SBM x RPM interaction; $P \leq 0.02$). Additionally, carcass weight, whole-body protein deposition, and nitrogen use efficiency increased with RPM supplementation, especially in diets containing 2-meOx (SBM x RPM interaction; $P \leq 0.005$). Our results highlight the potential of using 2-meOx as a bio-based solvent for SBM production in beef cattle diets but suggest a higher methionine deficit compared to Hex SBM.

2-methyloxolane can replace hexane for defatting soybean meal fed to cows without affecting dairy performance, rumen volatile fatty acid proportions and major fatty acid secretion in milk

V. Menoury¹, P. Nozière¹, G. Leday², J. Engel², A. Ferlay¹

¹ Université Clermont Auvergne, INRAE, VetAgro Sup, UMR Herbivores, Theix, 63122 Saint-Genès-Champagne, France, ² Wageningen University & Research, Biometris, PO Box 16, 6700AA Wageningen, Netherlands

There are toxicity concerns regarding the use of hexane as a defatting solvent for soybean meal (SBM). 2-methyloxolane (2-meOx), a biobased solvent, could be an alternative but its use requires process adjustments. We aim to ensure that these adjustments do not affect the SBM feeding value for dairy cows. In a 4 × 4 treatments Latin-square experiment, 16 dairy cows received a diet supplemented with progressive substitution of hexane-defatted SBM by 2-meOx-defatted SBM: 100% hexane, 67% hexane + 33% 2-meOx (33% 2-meOx), 33% hexane + 67% 2meOx (67% 2-meOx), and 100% 2-meOx. The diet contained 16% SBM (on DM basis), 417 g NDF, 200 g starch, and 27 g crude fat per kg DM. We measured individual intake, dairy performance, rumen fluid volatile fatty acids (VFA) proportions, and milk fatty acid (FA) profile. Equivalence tests were used with equivalence margins defined as ± 5% of the estimated marginal mean of 100% hexane. Conclusions were drawn using the EFSA terminology. Dry matter intake and FA profile were equivalent among diets. FA intake was more likely equivalent than not. Rumen major VFA proportions were equivalent while those of minor VFA were likely lower, especially with the 67% 2meOx diet. Milk yield, fat concentration, fat yield, and FA profile were equivalent or more likely equivalent than not, except for C18:3 n-3 proportion which was likely reduced with 33% 2meOx and likely increased with 67% 2-meOx and 100% 2-meOx. Overall, 2-meOx can replace hexane for defatting SBM without affecting dairy performance, rumen major VFA proportions and major FA secretion in milk.

Session 6

Theatre 8

Effects of pre- and postpartum dietary management on performance in dairy cows

M. V. Sanz-Fernandez¹, D. J. Seymour¹, R. Rauch¹, J. B. Daniel¹, J. Doelman¹, J. Martín-Tereso¹

¹ Trouw Nutrition R&D, Stationsstraat 77, 3811MH Amersfoort, Netherlands

The current study evaluated the effect of prepartum dietary energy content, postpartum protein content, and their interaction on performance and metabolic health in lactating dairy cows, in a 2×2 factorial design. Comparable studies were performed at two locations, including 60 and 48 Holstein cows in study 1 (the Netherlands) and study 2 (Canada), respectively. Prepartum treatments were a low energy diet (LED; ~85% NEL requirements) or a high energy diet (HED; ~130% of NEL requirements) fed for 21d prior to calving. Postpartum treatments were an average protein diet (APD; ~15.5% CP) or a high protein diet (HPD; ~18.5% CP) fed for 70 days post-calving. At implementation, the energy content of the prepartum diets were significantly lower in study 2 (9 and 6% for LED and HED, respectively). Relative to LED, feeding HED increased prepartum energy intake by 63 and 72% (P < 0.01) in studies 1 and 2, respectively. In study 2, feeding a HPD increased milk fat content in LED cows but decreased it in HED cows, resulting in a significant pre- by postpartum treatment interaction (P < 0.01). There were no other interactions. In study 1, feeding HED tended to increase milk fat content (4%; P = 0.06) and increased (P < 0.01) milk urea (8%) and body condition score (BCS; 3.2 vs. 2.9) in the first 9 weeks of lactation. In study 2, feeding HED increased (P ≤ 0.05) DMI (5%), milk (6%) and protein (5%) yields, and BCS (3.1 vs. 2.9); and tended to increase (P = 0.07) fat- and protein-corrected milk (6%) and body weight (4%), in the first 9 weeks of lactation. Feeding HPD increased milk urea in both studies (P < 0.01; 34 and 68% in studies 1 and 2, respectively). In conclusion, changes in prepartum dietary energy levels had the largest impact on early lactation performance.

Resilience to acute underfeeding in dairy ewes diverging in feed efficiency: rumen dimethyl acetal composition

P. G. Toral¹, S. Alves², R. J. B. Bessa², P. Frutos¹, G. Hervás¹

¹ Instituto de Ganadería de Montaña (IGM, CSIC-ULE), Finca Marzanas, 24346 León, Spain, ² CIISA, AL4AnimalS-ULisboa, Av. Universidade Técnica, 1300-477 Lisboa, Portugal

Certain lipids have been suggested as biomarkers of rumen function. This has encouraged the study of odd- and branched-chain fatty acids, but few data are available on dimethyl acetals (DMA), which are microbial lipids containing vinyl (alk-1-enyl) ether chains. Because rumen function may have a key role in feed efficiency (FE) and in the resilience to nutritional challenges, in this study we compared the pattern of variation in DMA in the rumen of dairy ewes phenotypically divergent for FE and subjected to a severe nutritional challenge (i.e., acute underfeeding). To estimate FE, intake and performance were recorded daily for 3 weeks in 40 Assaf sheep fed ad libitum a total mixed ration. Then, the highest (H-FE) and the lowest (L-FE) feed efficiency ewes (n=9/group) were fed only straw for 3 days. Before, during and 10 days after the challenge, ruminal fluid was collected using a stomach tube and DMA composition (as % of total DMA) was determined by GC-FID and GC-MS. A very dynamic pattern of variation was found: the challenge caused drastic reductions ($P < 0.001$) in the concentration of 7 DMA (e.g., DMA iso 15:0, 16:0, and t11- and c9-18:1), and increases in other 13 DMA (e.g., DMA iso 14:0, 15:0, anteiso 15:0 or 18:0). The DMA anteiso 13:0 could only be quantified during the challenge. All DMA recovered their initial value on day 10 after the challenge, and temporal changes in DMA did not differ between H-FE and L-FE. Overall, rumen DMA composition of ewes was very dynamic over time, but no relationship with FE was detected. Acknowledgments: PIE202340E068 (CSIC) and PID2020-113441RB-I00 (MCIN/AEI/Spain).

Session 6

Theatre 10

How does lamb feeding management during early life and high-cereal finishing affect the rumen trans fatty acid profile at weaning and the end of the fattening period?

L. Fialho^{1,2,3}, O. Guerreiro^{1,4}, S. Alves^{2,3,5}, R. Bessa^{2,3,5}, E. Jerónimo^{1,4}

¹ Alentejo Biotechnology Center for Agriculture and Agro-food/IPBeja, Beja, 7801, Portugal, ² Center for Interdisciplinary Research in Animal Science (CIISA), Lisboa, 1300, Portugal, ³ Associate Laboratory for Animal and Veterinary Sciences (AL4animals), Lisboa, 1300, Portugal, ⁴ Mediterranean Institute for Agriculture, Environment and Development (MED) & Institute for Global Changes and Sustainability (CHANGE), Beja, 7801, Portugal, ⁵ Faculdade de Medicina Veterinária, Universidade de Lisboa, Lisboa, 1300, Portugal

The aim of this work was to evaluate the effect of the pre-weaning feeding management on the rumen fatty acid (FA) profile of lambs finished with a high-cereal diet. After birth, 32 lambs and their dams were divided into 4 groups: lambs without their mothers and fed with milk replacer (M); lambs and ewes together in the pasture (P); dehydrated lucerne pellets (F); or concentrate for lactating ewes (C). Hay was provided in C and F groups. At weaning, lambs were housed in pairs (according to initial diet) and received a high-cereal concentrate and straw (ca 10%) until slaughter. Freeze-dried rumen contents, collected at weaning and slaughter, were directly transesterified and FA methyl esters were analyzed by gas chromatography. Data of C18 FA, expressed as % of total C18 FA, were analyzed using SAS, considering the effects of pre-weaning diet (D), phase (P, weaning vs end of fattening) and interaction DxP. Regardless of pre-weaning feeding management, the total biohydrogenation intermediates ($P=0.009$) and 18:1t10 ($P<0.001$) increased during fattening period. At weaning, M lambs had lower 18:1t11 proportions than other lamb groups (DxP, $P=0.018$), while at slaughter the 18:1t11 did not differ among groups. The 18:1t10/18:1t11 ratio was lower in P lambs and higher in M lambs than in other lambs at weaning, and until slaughter increased in C, F and P lambs and remained unchanged in M lambs (DxP, $P=0.043$). These results are useful to understand how pre-weaning feeding management influence the occurrence of t10 shift in lambs finished with high-cereal diets. Funding: Portuguese Foundation for Science and Technology (FCT) under projects UIDB/00276/2020 (CIISA), LA/P/0059/2020 (AL4AnimalS), UIDB/05183/2020 (MED), LA/P/0121/2020 (CHANGE), and PhD grant awarded to LF (2020.04456.BD).

Micronutrient Supply, Developmental Programming, and Strategic Supplementation

J. S. Caton¹¹ North Dakota State University, Animal Science, 1230 Albrecht Blvd, 5810 Fargo ND, United States

Developmental programming is the concept that various stressors, including compromised nutrient supply, during developmental can result in both short and long-term changes in offspring. Large animal models of developmental programming demonstrate that perturbed maternal nutrition; including global under and over-nutrition, macronutrients, and micronutrient supply, including amino acids, vitamins, and trace elements can alter gestational development and offspring outcomes. Data indicate that strategic supplementation of micronutrients (Met, Arg, Se, folate, vitamin B12, choline, cobalt, sulfur and others) can alter placental function and fetal nutrient supply. Specifically in the offspring, multiple visceral tissues, metabolism, growth, and reproduction are impacted by strategic supplementation and/or compromised nutrition. Data demonstrate that compromised maternal nutrition and strategic supplementation alters transcript abundance, metabolomic profiles, and multiple metabolic pathways. The mechanisms underpinning developmental programming are driven by epigenetic events, which depend on one-carbon metabolism and specific micronutrient supply. The concept of developmental programming is strongly supported by data from ruminant animal models. Compromised maternal nutrition is a stressor driving programming events. Genomic and metabolomic changes in offspring are precipitated by altered maternal nutrition and during critical windows of development. The underlying mechanisms of developmental programming involve epigenetic events. Evidence suggests that strategic supplementation of micronutrients potentially mitigates negative aspects of developmental programming. Future research needs include; enhanced understanding of the mechanisms, practical relevance to production systems, impacts on animal health, and interrelationships with the host microbiome. Strategic micronutrient supplementation and precision nutrition approaches to fostering positive and mitigating negative aspects of developmental programming should improve efficiencies and sustainability in ruminant livestock production systems.

Session 7

Theatre 1

How can the seasonal climate changes influence horse's health and welfare in the extensive farming system?

E. Atallah¹, F. Cerasoli², M. G. Riva¹, V. Antognoli¹, G. Saluti², F. Castellani², A. Manucci², G. Centorotola², M. Podaliri², L. Iannetti², E. Dalla Costa¹¹ Università degli Studi di Milano, Dipartimento di Medicina Veterinaria e Scienze Animali, Via dell'Università, 6, 26900 Lodi, Italy, ² Istituto Zooprofilattico Sperimentale dell'Abruzzo e del Molise "G. Caporale", Via Campo Boario, 1, 64100 Teramo, Italy

Keeping horses in marginal areas may trigger a transition towards more sustainable animal husbandry practices, resulting in favorable outcomes for the environment and animal welfare. The present study aims to describe how welfare and health condition of horses kept in marginal areas can be influenced by environmental and climatic conditions. A total of 90 horses (average age: 13.1±0.27 years) were recruited from seven stables in Italian marginal areas. The AWIN welfare assessment protocol was applied by two trained observers to monitor horses' welfare in summer and winter. The proportion of each score of animal-based indicators were calculated. During the winter, the percentage of horses with a suboptimal body condition score was slightly higher (62.9 %) compared to the summer (59.3 %). Altered hair coat condition (17.2 %) and cough presence (1.1%) were higher in the winter with, respectively, 9.9 % and 0 % in the summer. However, alopecia (19.7%), skin lesions (10.9%) and swollen joints (11.7%) were higher in the summer, while in winter they were 4.5 %, 4.5% and 4.8% respectively. Human-horse relationship was similar in summer and winter with over 80% of horses showing positive signs when approached by humans. The results suggest that different climatic conditions can affect the health of horses kept in marginal areas, thus affecting their welfare. Further data collection should aim to enlarge the time frame of monitoring, allowing a more comprehensive evaluation of the impact of different climate conditions on horse welfare.

Omic evaluation of resilience and adaptation to the combination of heat and exercise stressors in horse athletes

S. Mecocci¹, F. Beccati¹, E. Chiaradia¹, M. Pepe¹, F. Passamonti¹, E. Porzio¹, A. Paris¹, G. Chillemi², K. Cappelli¹

¹ University of Perugia, CRCS, Department of Veterinary Medicine, Via S. Costanzo, 4, 06126 Perugia, Italy, ² University of Tuscia, DIBAF, Via Camillo De Lellis, 01100 Viterbo, Italy

Endurance race is one of the most challenging disciplines for horses which can induce metabolic imbalance especially if combined with sub-optimal temperatures. Incremental field standardized exercise tests (fSETs) are valuable systems for horse training and fitness evaluation. This research aimed to address molecular features of resilience and adaptation to a combination of heat and exercise-induced stresses in horses through the NGS approach. Six Arabian horses, stabled and homogeneously trained at the Italia Endurance Stable & Academy (Perugia, Italy), were monitored during fSETs in summer and winter, collecting blood samples before and after each fSET. Total RNA was extracted from serum and sequenced with Illumina® technology. Lactatemia and hematocrit levels significantly increased in summer vs. winter. From NGS data, a set of differentially expressed small RNAs were obtained and a protein-protein interaction network for targets of micro RNAs (miRNAs) was built. On this, a gene ontology (GO) enrichment analysis was carried out highlighting, in summer vs. winter, enriched terms related to: innate immune response, protein kinase activity and DNA methylation (for targets of up-regulated miRNAs); cellular response to cytokine stimulus, NF-kappa B signaling and signal transduction (for targets of down-regulated miRNAs). These preliminary results should be considered in outdoor sports, in animals as in humans, since the horse athlete is an optimal model to study exercise-related physical disorders sharing, with human athletes, poor performance syndromes, overtraining and potentially lethal consequences if the physical effort is associated with thermal stress.

Session 7

Theatre 3

Agonistic interactions at straw racks in group-housed horses

N. Puttkammer¹, F. Hildebrandt², J. Krieter², I. Czycholl¹

¹ University of Copenhagen, Department of Veterinary and Animal Sciences, Grønnegårdsvej 8, 1870 Frederiksberg, Denmark, ² Kiel University, Institute of Animal Breeding and Animal Husbandry, Olshausenstraße 40, 24118 Kiel, Germany

As group housing of horses can be associated with an increased injury risk especially at limited resources, the aim of this study was to allow first scientifically based recommendations regarding positioning and design of straw racks. In a HIT active stable with 50 to 62 horses kept in one group, occupancy, feeding distance, prevalence of agonistic interactions (ais) as well as the percentage of feeding disturbances at two different straw racks were analyzed. Equine behavior was recorded for 6h/day on 15 summer and 15 winter days. Using generalized linear mixed models, considering the fixed effects rack, fresh straw supply and the interaction of observation day and time period delivered the best prediction for the number of feeding events/h and the prevalence of ais/h. Here, both racks differed significantly ($p < 0.05$) with twice as many feeding events/h, but threefold more ais/h respectively twice as many ais/horse at the larger rack, where conspecifics fed side by side. 65% of the harmless and 92% of the potentially harmful ais led to feeding disturbances. The latter made up 25% of all ais in total with no significant differences between both racks. Also feeding distances did not differ when quantified as number of free openings between two conspecifics (2.2 +/- 1.3) and we recommend an animal:rack opening ratio of at least 1:3. However, horses preferred to feed simultaneously with the rack edge in-between them at the smaller rack 1, so that regarding the head region, the actual animal distances were smaller there. Besides, the investigation of further straw racks and farms is essential to allow general statements, especially as our study proves many influencing factors.

Milking procedure and frequency: what influence on mares and foals behaviour?

J. Auclair-Ronzaud¹, M. Bouchet¹, L. Wimmel¹, S. Henry²

¹ IFCE, 1 Impasse des Haras, 19370 Chamberet, France, ² University of Rennes, University of Caen Normandy, UMR 6552 EthoS, CNRS, 35042 Rennes, France

The aim of this study was to assess the impact of the 2hrs deprivation of suckling in foals (i.e. equipped with a muzzle) and of mares' milking frequency on the behaviour of both partners. We studied 23 multiparous mares divided in 3 groups: 8 non-milked mares as control (C); 8 mares milked once after 2 hrs (1M); 7 mares milked twice, once per hr (2M). Mares were milked at week 5 of lactation. Mares and foals were observed at pasture at weeks 4 and 6 using classical ethological methods to assess the quality of mother-young relationships (mare-foal distances, time with the dam as closest neighbour and frequency of suckling). They were observed during the milking procedure: after the muzzle's fitting and during the 2hrs of waiting, during milking and after the muzzle's removal. Before milking, we scored agitation in mares (agonistic behaviours), as well as frustration in muzzled foals (suckling attempts). Both were probably due, out of the situation (preventing from suckling/nursing), to the spatial and forage limitations within the waiting zone. Right after the muzzle's removal, almost all foals suckled without maternal opposition, confirming the procedure-induced frustration. However, no deleterious effects were scored in 1M and 2M groups when observed at pasture at week 6 (e.g. no shorter mare-foal distances or stronger mutual social preferences compared to the C group and week 4). Foals appeared to easily cope with the procedure probably as they were allowed to stay all along with their mothers. To conclude, the use of a muzzle appears to be a practice to promote in milk production industry. Nevertheless, further research is needed to determine the consequences of the repeated use of the muzzle associated with deprivation of suckling.

Session 7

Theatre 5

Effect of antioxidant supplementation on faecal microbiota of horses at different exercise levels

A. Ramírez^{1,1}, S. Gómez Acata¹, O. Gaona-Pineda¹, L. Falcón Álvarez¹, A. Ramírez^{1,1}

¹ National University of Mexico, Av. Universidad 3000, 04510 Mexico, Mexico

Diets rich in cereals can alter the horse digestive system, microbiota, fermentation patterns, and cause colic or laminitis. Although vitamin E (E) and selenium (Se) are antioxidants, Se improves fermentation in the rumen. Thus, our objective was to evaluate the effect of supplementation with Se (Se yeast) and E (α -tocopheryl) on the fecal microbiota of horses in moderate activity. Horses (n=24; 450 kg, 5-15 years) that had not been exercised the month prior to the study were used, housed, randomly assigned to 4 treatments in a factorial arrangement (2 Se \times 2 E, levels; LSe, 0.1; HSe, 0.3 mg Se/kg DM; LE, 1.6; HE, 2 IU E /kg BW; NRC, 2007). The treatments were: LSeLE, HSeLE, LSeHE, HSeHE. Since the daily basal ration was poor in Se, <2 μ g, and E, 14.4 IU/kg DM, supplementation (for 63 days) completely provided both nutrients. Feces were taken before treatments (1 w), after 4 weeks of supplementation and after 4 weeks of moderate exercise. Metagenomic analysis of the microbiota used the V4 hypervariable region of the 16S rRNA (Caporasso et al., 2011; Gaona et al., 2019). Purified rRNA amplicons were pooled and sequenced (Illumina MiSeq platform; Yale Genome Analysis Center, CT, USA). Sequences were analyzed with QIIME 2 2018.6 (Bolyen et al., 2018); a quality protocol was applied (Callahan et al., 2016). Taxonomy was assigned to ASVs (Rognes et al., 2016) against the SILVA database (132-99% OTU release, region 515-806, taxonomy L7) with a percentage identity of 0.95. The feature table was reduced to 32,184 ASVs per sample. Alignment was performed (Katoh et al. (2002). Alpha diversity was calculated (Shannon, Simpson and Observed otus; complement qiime alpha diversity). Phylogenetic β -diversity analysis was measured using weighted unifrac (Lozupone et al., 2007) and visualized (principal coordinate analysis (PCoA); complement qiime core-metrics-phylogenetic diversity at 32,184 ASV per sample). Preliminary results showed that microbiota α -diversity was affected by Se and exercise. Firmicutes was the main phylum in all treatments and weeks. Conclusion: the use of Se in the diet as well as physical activity modifies the fecal microbiota of horses.

A possible mathematical approach to predict forage digestibility from faecal particle size distribution in horses

T. Danese¹, F. Martuzzi², M. Simoni¹, E. Valle³, F. Righi¹

¹ Parma University, Department of Veterinary Science, Strada del Taglio, 43122 Parma, Italy, ² Parma University, Department of Food and Drug, Strada del Taglio, 43122 Parma, Italy, ³ University of Turin, Department of Veterinary Science, Largo Paolo Bracciani 2, 10095 Grugliasco, Torino, Italy

The relationship between forages' total tract apparent dry matter digestibility (ttDMD) and faecal particle size (FPS) was studied to develop a tool to predict forage digestibility in horses. The FPS and ttDMD of 6 horses, fed 6 different forages (4 cuts of fescue, perennial ryegrass/clover mix, and straw) were studied by a 6×6 Latin square design. Each period lasted 16 days (14 days of adaptation). Forage chemical composition was assessed by NIRs. Faecal and forage acid insoluble ash content were used to estimate ttDMD. The FPS was determined by wet sieving using a set of 6 sieves (from S1 to S6) of different mesh sizes (6.50, 4.60, 2.36, 1.18, 0.6, 0.15 mm). Horse and forage ttDMD's effects on FPS distribution by sieves were studied by GLM. Linear regressions and correlations between faecal residues on each sieve and the sieves' mesh were exploited to generate a mathematical tool to predict digestibility from FPS distribution. The FPS were unaffected by horse. Higher ttDMD were associated with larger FPS, with perennial ryegrass/clover and straw (ttDMD 74.44 and 44.57 %) leading to smaller and larger faecal particles. Strong correlations were found between ttDMD and S1 and S2 ($r = 0.639$ and $r = 0.668$; $P \leq 0.001$). The angular coefficient of the linear function between faecal residues on each sieve seems a promising tool for forage digestibility prediction from FPS ($r^2 = 0.041$). Thus, the determination of faecal residues of sieves of different mesh size can be used as an indirect tool to rank forage digestibility.

Session 7

Theatre 7

Effect of phytochemicals on cyathostomins ecological interactions

J. Malsat¹, A. Chereau², F. Guégnard², D. Serreau², A. Gesbert³, F. Reigner³, N. Mach¹, G. Fleurance^{4,5}, A. Williams⁶, G. Sallé²

¹ INRAE, 23 chemin des Capelles, 31076 Toulouse, France, ² INRAE, Centre INRAE Val de Loire, 37380 Nouzilly, France, ³ INRAE, Unité Expérimentale de Physiologie Animale de l'Orfrasière, 37380 Nouzilly, France, ⁴ INRAE, UMRH, 63122 Saint-Genès-Champanelle, France, ⁵ IFCE, Pôle développement, innovation et recherche, 63122 Saint-Genès-Champanelle, France, ⁶ Department of Veterinary and Animal Sciences, Grønnegårdsvej 15, 1870 Frederiksberg C, Denmark

The emergence of cyathostomin isolates resistant to anthelmintics requires alternative control strategies, such as bioactive forages and their secondary metabolites. Their use in the field raises however questions about their effect on parasite ecological interactions. Here, we quantified the in vitro activity of two plant-derived extracts i.e. carvacrol and cinnamaldehyde, and established how increasing concentrations affected larval cyathostomin community structure in vitro using metabarcoding. *Cyathostomum pateratum*, *Cylicocyclus ashworthi*, and *Cylicocyclus nassatus* were the most abundant species in the absence of any treatment. Alpha diversity remained constant whatever ivermectin concentrations surpassing IC90, while species richness decreased significantly with pyrantel and plant extracts. However, absolute abundances of *C. nassatus* and *C. ashworthi* remained high at the highest concentrations of carvacrol, cinnamaldehyde and pyrantel, suggesting a lower sensitivity of these species. These results indicate that carvacrol and cinnamaldehyde selectively reduced the development of cyathostomin species, without infecting *C. pateratum*, *C. nassatus* and *C. ashworthi*. However, unlike the other two species, the chemical drugs were active on *C. pateratum*. While these phytochemicals display in vitro efficacy, they may reshape cyathostomin communities in the field.

Session 7

Theatre 8

Possibilities and prerequisites for digital-technical systems in horse husbandry

L. T. Speidel¹, U. Dickhoefer², D. Winter¹

¹ Nuertingen-Geislingen University, IAAR, Neckarsteige 6-10, 72622 Nürtingen, Germany, ² Kiel University, Hermann-Rodewald-Strasse 9, 24118 Kiel, Germany

Digitalisation and mechanisation promise far-reaching changes on animal farms. Although horses are the predominant livestock in many German metropolitan regions and most of the work processes associated with horse husbandry are carried out manually, there has been little research into digitalisation and mechanisation on horse farms. This study therefore investigated which digital-technical applications (e.g. for manure removal, feeding, communication, health and safety monitoring) currently exist on horse farms and which prerequisites are required for establishing the systems. For this, an online survey was conducted with 451 stakeholders on horse farms in Germany via Google Forms. Results show that (in % of total participants) cameras for safety (30.8 %) and health monitoring of horses (22.6 %) as well as customer communication systems (24.8 %) and farm management software (13.7 %) were most frequently mentioned as existing. Other technologies, such as digitally controlled automated feeding-systems for roughage (7.3 %) and concentrate feed (9.3 %), automation of manure removal (3.3 %) and digital monitoring of stable air parameters (2.2 %) were stated by less than 10 % of the participants. The type of housing (group or individual housing), a stable internet connection and the willingness of farm managers to invest have a particular influence on the use of digitally supported systems. Digital technology was used more frequently on farms with a reliable internet connection and a division of horse husbandry into functional areas. The benefits of the systems for all those involved (horses as well as farm managers and employees) should be clearly communicated and the appropriate use should be reviewed on an individual farm basis.

Session 7

Theatre 9

Air quality welfare factors in horse husbandry - Dusk pollution and digital technology

H. Unsel¹, E. Gallmann², D. Winter¹

¹ Hochschule für Wirtschaft und Umwelt Nürtingen-Geislingen, Angewandte Agrarwissenschaften, Neckarsteige 6-10, 72622 Nürtingen, Germany, ² Universität Hohenheim, Zentrum für Tierhaltungstechnik, Garbenstr. 9, 70599 Stuttgart, Germany

Background: The digital measurement of stable air parameters is crucial in modern horse husbandry. By monitoring parameters such as temperature, humidity, ammonia content and dust concentration, the risk of respiratory diseases for horses linked to stable conditions can be reduced. These technologies offer the opportunity to quickly recognize deviations from ideal conditions and react accordingly. Material and methods: We focused on analyzing particulate matter concentrations in three specific areas: inside the stable, in the outside air and in the immediate vicinity of the horses' nostrils. Three simultaneously measuring particulate matter sensors were used, with one of the sensors being attached directly to the horse's holster. Air velocity, humidity and temperature were digitally recorded. Particulate matter emissions, such as oats and watered milled hay cobs, roughage, including loose hay and hay offered in hay nets, were investigated. The particulate matter effects of straw and steamed straw were also investigated. Results: The highest concentrations of particulate matter occurred when feeding oats. Milled and moistened hay cobs showed low particulate matter levels. A significant level of particulate matter was recorded when hay was used in hay nets. A remarkable 75% reduction in particulate matter was at steamed hay. Conclusion: These results underline the importance of feed preparation methods in minimizing exposure to particulate matter in horse husbandry and provide valuable insights for the development of strategies to improve air quality in stables.

Evaluation of shelter design on equine rhythmicity

S. Rey¹, H. R. Nasser², M. Cockburn¹¹ Agroscope, Animals, Products of Animal Origin and Swiss National Stud, Haras national suisse HNS Les Longs-Prés, 1580 Avenches, Switzerland, ² Agroscope, Digital production group, Rte de la Tioleyre 4, 1725 Posieux, Switzerland

Nowadays, the assessment of equine well-being commonly involves observing equine behavior, body language, acoustic signals, and physiological indicators. Another approach for assessing an animal's welfare involves investigating rhythmicity. Rhythmicity, which represents the synchronization of an organism with its environment over a 24-hour period, is less susceptible to temporary factors. Consequently, the analysis of rhythmic patterns may serve as an objective indicator of animal welfare. One can calculate a rhythmicity index called DFC (Degree of Functional Coupling) from temporal data, such as daily locomotor activity. The present study aims to assess how different intrinsic motivations to rest affect horses' rhythmicity. Twenty horses divided into four groups and housed in a paddock trail group housing system were studied during four winter months. All horses could move freely and had free access to water and the littered resting area (shelter). Horses were fed with an automatic feed dispenser, which gave them access to hay three times per day for two hours each. Further, all horses were able to access straw which was provided in the shelters. We investigated the effect of four different shelter design treatments on rhythmicity: closed shelter (wood shelter with three exits), large entrance (single large entrance along one long side of the wood shelter), sand (wooden shelter with three exits and addition of sand in front of the shelter), and large entrance + sand (single large entrance along one long side of the wooden shelter and addition of sand). Each group of animals experienced each of the treatments for four weeks (2 weeks of habituation followed by 2 weeks of data collection) following a Latin square design. All horses were equipped with an accelerometer during the data collection period. The DFC and lying behaviour were computed from this temporal data. Statistical analysis has been performed with a linear mixed effect model. We observed changes in DFC within horses and across treatments. The whole results will be presented during the conference.

Session 7

Theatre 11

Time-controlled hay racks in group-housed horses: What ratio of horses to feeding places is appropriate?

M. Baumgartner¹, M. Erhard², M. Zeitler-Feicht³¹ Agroscope, Swiss National Stud Farm, Federal Department of Economic Affairs, Education and Research, Les Longs-Prés 2, 1580 Avenches, Switzerland, ² Chair of Animal Welfare, Ethology, Animal Hygiene and Animal Husbandry, Ludwig-Maximilians-University Munich, Department of Veterinary Sciences, Veterinärstr. 13/R, 80539 Munich, Germany, ³ Technical University of Munich, Chair of Organic Agriculture and Agronomy, TUM School of Life Sciences, Liesel-Beckmann-Str. 2, 85354 Freising, Germany

Automated feeding systems offer numerous advantages. Nevertheless, practical experience shows that individual distances at time-controlled hay rack for horses are frequently undercut and aggression can therefore increase. In the present study, the minimum animal-to-feeding-place ratio (AFR) was investigated at time-controlled hay racks, which would ensure sufficient individual distance between the horses. Using ethological and physiological parameters of 28 horses in a group housing system, four treatments were assessed on two observation days each: an AFR of 1:1.2 (20% more feed-throughs than horses), 1:2 (twice as many feed-throughs as horses), 1:3 (three times as many feed-throughs as horses) and C (individual feeding in the grooming area with familiar conspecifics). The order of treatments was randomized, with one treatment per day and at least one day of wash-out phase between treatments, thus extended over a period of 3 weeks (C, 1:3, 1:1.2, C, 1:1.2, 1:3, 1:2, 1:2). Horses were used to daily fluctuation of the group composition, as horses were taken out of the group for riding by their owners every day and at different times, even during feeding. A preliminary test was conducted to habituate the horses. The horses showed less aggressive behavior when there were three times as many openings as horses at the time-controlled hay racks compared to 1:1.2 and 1:2 (lineal mixed model: $F(3,4) = 7.411$; adjusted $R^2 = 0.733$; $p(\text{AFR}_{1:2}) = 0.06$, $p(\text{AFR}_{1:3}) = 0.02$, $p(\text{AFR}_C) = 0.01$). Salivary cortisol levels during feeding decreased less with low AFR ($p(\text{AFR}_{\text{metric}}) = 0.02$). The results indicate that at least three times as many feeding places as horses must be available for the investigated time-controlled hay racks so that the horses can maintain their individual distance. Further studies are required to validate the results.

Thermographic Images as a Diagnostic Tool for Equine Headshaking Syndrome

Equine headshaking syndrome in horses consists of spontaneous, uncontrollable movements of the horse's head and neck in the absence of external stimulus. Stress-related causes as well as inflammations, amongst others of the N. trigeminus have been discussed. At the same time, thermographic imaging is being increasingly used in veterinary and animal sciences with regard to the detection of stress, negative emotional states and inflammations. Therefore, we analysed whether thermographic imaging could serve as a diagnostic tool for equine headshaking syndrome, following the hypothesis that causes are stress-related or linked to inflammations and therewith detectable via thermographic imaging. 223 thermographic images were gathered of 17 horses experiencing idiopathic headshaking and 13 control horses during standardised riding tests. Statistical analysis was performed to examine the variance in eye temperature pre- and post-riding. For this analysis, a mixed model was created for thermographic images, which included the difference in eye temperature before and after riding. The model included the fixed effects breed (horse, pony), sex, presence of headshaking as well as the rider (owner, external) and the covariable environmental temperature. Descriptive statistics revealed that the inner eye temperature increased by 0.13 degrees after riding. Out of 135 images captured for the left eye, a higher eye temperature was observed after riding, while 88 images displayed a lower eye temperature post-riding. No significant differences were observed in thermographic images between headshakers and control horses. In order to be able to use thermographic images, interference factors must be taken into account. These include standardised distances and recording angles, lighting conditions, weather influences and other environmental factors. Standardisation proved to be difficult in this study due to the long observation period and thus different climatic conditions. The use of thermography proved to be impractical and showed no effect in the experiment.

Theatre 13

Anatomical bridles, do they really alter and reduce pressure distribution on the horse's head?

R. Clarke¹, G. Cross¹, M. Entwistle¹, M. Leftheriot¹

¹ University Centre Myerscough, Equine, St Micheal's Rd, Bilsborrow, Preston, UK, PR3 0RY Preston, United Kingdom

Various bridle designs, like the "anatomical bridle", are commercially available. Many manufacturers claim reduced poll pressure and improved equine performance, without convincing scientific evidence. Ill-fitting tack such as over tight nose bands and head pieces that cause pressure points can influence unwanted behaviours and physiological detriment such as head shaking and restricted blood flow to key facial structures. This study aimed to investigate the impact of two bridle designs, a standard Cavesson and Anatomical Bridle, on headpiece (HP) and noseband (NB) pressures. Multiple long reining trials were conducted at University Centre Myerscough using Tekscan pressure sensing technology to compare HP and NB pressures between bridles and different exercises. Higher peak pressures ($P < 0.05$) were recorded with the cavesson across the HP compared to the NB, with the anatomical bridle demonstrating the opposite. Peak pressures under the HP and NB were highest when working on a half-circle compared to a straight line ($P < 0.05$); lowest peak pressures were recorded under the HP on a full circle, whilst lowest NB pressures were recorded a straight line ($P < 0.05$). Regarding different paces, highest peak pressures were recorded in walk under the NB ($P < 0.05$). These results suggest that there may be an overall pressure exerted by any bridle across the facial structures of the horse and dependent on bridle design, their pressure distribution is altered accordingly. Further study is needed with a larger sample of horses, but these results indicate that horses may require individualised assessments for bridle fit and design.

The possibilities of using genomic information in the selection of horses for meat production

M. Šimon¹, A. Kaič², B. Luštrek¹, K. Potočnik¹

¹ University of Ljubljana, B, Department of Animal Science, Groblje 3, 1230 Domžale, Slovenia, ² University of Zagreb, Faculty of Agriculture, Department of Animal Science and Technology, Svetošimunska 25, 10000 Zagreb, Croatia

Horsemeat, valued for its nutritional superiority over beef, faces cultural and ethical barriers to acceptance. Despite its benefits, genomic research on horsemeat production remains sparse, with no QTLs specifically identified. Our study aims to bridge this gap by prioritizing SNP markers on the GGP Equine chip associated with meat production traits, focusing on orthologous genes from cattle. We identified 30 genes within QTLs for dressed carcass muscle weight and dressed carcass muscle-to-bone ratio in cattle, leading to the identification of 22 horse orthologous genes, all located on chromosome 3, in a syntenic block rich with growth-related QTLs in horses, such as body weight, size, and chest circumference. Considering variant consequences, genomic evolutionary rate profiling scores, and the potential location of regulatory elements, we identified several SNP markers with potential impacts on protein function and gene transcription, including within genes like ADGRA3, LGI2, PCDH7, PI4K2B, PPARGC1A, SEPSECS, and SLIT2. These genes are implicated in key biological processes such as fatty acid synthesis, metabolic pathways, mineral absorption and metabolism, and fetal growth, underlining their potential in enhancing meat production traits. The objective of our research is to design the structure of a database, incorporate various data into the database, and develop technical applications that will enable the systematic improvement of meat production traits, like methodologies applied in cattle research. The data and applications for the use of the results will be organized within the Digitization of Livestock Databases (DigŽiv) project, funded by the Recovery and Resilience Plan and the Ministry of Agriculture, Forestry and Food, to support routine selection work for both breeders and professional services. Additionally, the principles of this approach will be applicable to other traits and other species. Validation through real data and comprehensive genetic analyses, including GWAS and Genomic BLUP, are essential for incorporating these findings.

Session 7

Poster 15

Influence of head hair whorls on behavioral measurements assessed with infrared thermography and behavioral surveys

A. Encina^{1,2}, M. Valera², M. Ligeró², E. Bartolomé², M. J. Sánchez-Guerrero²

¹ Real Asociación Nacional De Criadores De Caballos Pura Raza Española, Cortijo Cuarto, 41014 Sevilla, Spain, ² Universidad De Sevilla, Departamento Agronomía, Ctra. De Utrera, Km 1, 41005 Sevilla, Spain

Pura Raza Español horse (PRE) is a worldwide breed, with a calm and noble character, used for Dressage performance. During the sport events, horses are exposed to several environmental stimuli that could affect their sport performance due to the stress developed. Hair whorls (HW) are described as changes in the hair pattern and the association between their location and equine temperament has been reported. The aim of this study was to assess the influence of HW on the equine behavior measured with eye temperature (ET) and a behavioural survey. ET was assessed with infrared thermography and collected from 98 PRE while performing a dressage exercise. A total of 18 horses showed an average of 1.38 HW in forehead, 59 showed an average of 1.22 between the eyes and 37 PRE showed an average of 1.15 HW below the eyes. During the dressage exercise, 3 ET samples per animal were obtained one hour before (BE), just after (JAE) and one hour after (AE) the exercise. To evaluate effort and recovery levels, a previous ET variation (PETI=JAE-BE) and a later ET variation (LETI=JAE-AE) were calculated. The influence of HW on the effort (PETI) and recovery (LETI) stress suffered by the PRE was studied with a multiple trait unifactorial GLM test, and a post-hoc Tukey's Test. Results showed significant differences in PETI for presence (-0.39C°) or absence (1.07 C°) of forehead HW. The correlation between effort stress and the number of above HW was -0.35. Thus, horses with HW in forehead showed a lower effort stress. Two behavioral survey variables, learning and cooperation, showed a significant Spearman rank correlation (0.21 and 0.22, respectively) with the HW between the eyes. These results are preliminary and require further research, but we believe they will be of great interest to breeders, especially those who participate in competitions.

Inter- and transgenerational impacts of in ovo nutriepigenetic intervention on chicken male gonadal transcriptome

M. Ibrahim¹, E. Grochowska¹, M. Bednarczyk¹, K. Stadnicka²

¹ Bydgoszcz University of Science and Technology, Department of Animal Biotechnology and Genetics, Mazowiecka 28, 85-084 Bydgoszcz, Poland, ² Nicolaus Copernicus University, University Department of Oncology, Lukasiewicza 1, 85-821 Bydgoszcz, Poland

This study aims to explore for the first time the intergenerational and transgenerational impacts of in ovo injection of bioactive substances on gene expression in male gonads of green-legged partridge-like chickens over three generations. Synbiotic PoultryStar® (Biomim) and epigenetic factor choline were injected in ovo on the 12th day of egg incubation. Three groups were established in generation F1: 1/control (C, 0.9% physiological saline); 2/ synbiotic (S, 2mg/embryo); 3/ synbiotic combined with choline (SCH, 2mg/embryo of synbiotic and 0.25mg/embryo of choline). In the F2 and F3 generations, groups S and SCH were divided into two groups each: A/ single injected in F1; B/multiple injected in each successive generation. At 21 weeks post-hatching, cockerels in F2 and F3 were sacrificed and gonadal tissues were sampled. RNA was extracted for transcriptomic sequencing on Illumina Novaseq 6000 (PE 150). Repeated injections of synbiotic and choline influenced gene expression in gonads compared to the control and synbiotic alone in both F2 and F3 generations. Comparisons between analogous groups across generations showed enriched KEGG pathways particularly in downregulated pathways such as metabolic pathways, pathogenic infection pathways, and pathways associated with cancer, following repeated administration of synbiotic and choline. Protective regulatory mechanisms in gonads through those pathways can be suggested. A comprehensive understanding of the impact of the nutriepigenetic substances on gonadal tissues and their potential for transgenerational inheritance will be concluded based on ongoing analysis across all groups. This research was supported by the National Science Centre, Poland (grant no. 2020/37/B/NZ9/00497).

Weaning is a critical moment of the pig productive cycle, and finding robustness-linked traits to improve robustness at weaning is crucial. With this objective, 218 piglets were weighted at birth (BWd0) and d25 (BWd25) and d42 of age (BWd42). Occurrence of diarrhoea was collected one week after weaning at d34. Faecal DNA microbiota was analysed by 16S sequencing from faecal swabs collected at d4, d25 and d34. Analysis of performance data using generalized linear model revealed the variables ($P < 0.05$) BWd0 associated with Average Daily Gain from birth to d25 (ADG0_25), and from d25 to d42 (ADG25_42). On gut microbiota data, PERMANOVA analyses of beta-diversity revealed associations between microbiota composition and host variables at the three time points. BWd0 was significantly associated with the microbiota of piglets at d4. Microbiota at d25 was associated with ADG0_25 and diarrhoea. Finally, microbiota at d34 was linked to diarrhoea and ADG25_42. In agreement, differential abundance analysis revealed groups of ASVs (Amplicon Sequence Variants) linked to several variables at each timepoint. At d4, 2 ASVs belonging to Clostridia class were positively linked to ADG0_25. At d25, 2 ASVs belonging to Clostridia class were negatively linked to diarrhoea. At d34, 118 ASVs were positively (47% belonging to Clostridia and Bacteroidia classes) and negatively (29% belonging to Clostridia class) associated to ADGd25_42. Overall, our study reveals potential early-life microbiota predictors linked to diarrhoea and ADG, which may confer to piglets a higher robustness to weaning.

Intestinal health status and dietary spray dried porcine plasma inclusion on faecal calprotectin and performance in weaned piglets

J. Suppi¹, E. Llauroadó-Calero¹, P. Aymerich², A. Pelegrí-Pineda³, Y. Saco³, A. Bassols³, D. Solà-Oriol¹

¹ Universitat Autònoma de Barcelona, SNI BA, 08193 Barcelona, Spain, ² Vall Companys Grupo, Dpt. Nutrició, 25191 Lleida, Spain, ³ Universitat Autònoma de Barcelona, SBCV, 08193 Barcelona, Spain

Calprotectin (Cal) is a protein released by neutrophils in response to intestinal inflammation, which could be used as inflammation biomarker during post-weaning period. The aim of this study was to set the calprotectin levels in two Intestinal Health status (IH) and the impact of plasma inclusion on intestinal inflammation. Two farms were selected regarding their IH, one with a High-IH (HIH) and other with Low-IH (LIH), involving 294 and 380 piglets [(LD x LW) x Pt], respectively. Animals were distributed into 12 pens by BW and randomly assigned to a diet with 4% plasma (P; SDPP 80% CP) or control (C; plain diet) during the pre-starter phase (PS). Feed intake was monitored in the PS, while piglets' growth throughout the nursery period. At day 3 and 10 post-weaning, faeces were collected from the average BW piglet per pen and calprotectin was quantified using a Bühlmann fCAL turbo test. Results were analysed as a 2x2 factorial arrangement through an ANOVA test with R software. An interaction between diet and IH showed a higher BW and ADG, and lower FCR at the end of the PS for P-LIH compared to C-LIH piglets and C-HIH compared to P-LIH ($P < 0.05$). However, BW, ADG and FCR were not affected by P in the HHS farm ($P = 0.9$). No interaction was observed for Cal ($P > 0.1$). On days 3 and 10, higher Cal levels were observed in LIH than HIH ($P < 0.001$), and the plasma inclusion reduced Cal levels regardless the IH ($P \leq 0.05$). To conclude, the Cal levels suggest a lower intestinal inflammation and higher performance in HIH than LIH. In addition, plasma inclusion may improve intestinal health in weaned pigs.

Session 8

Theatre 4

In pursuit of a self-assembling protein decoy to counter Enterotoxigenic Escherichia coli F4+ strains causing piglet post-weaning diarrhea

T. Rossi¹, P. Trevisi³, P. Costantini¹, M. Calvaresi², A. Carboni², A. Danielli¹

¹ University of Bologna, Pharmacy and Biotechnology, Via Francesco Selmi 3, 40126 Bologna, Italy, ² University of Bologna, Chemistry "Giacomo Ciamician, Via Francesco Selmi 2, 40126 Bologna, Italy, ³ University of Bologna, Agricultural and Food Sciences, Viale G. Fanin 46, 40126 Bologna, Italy

Post-weaning diarrhea (PWD) can cause severe losses in industrial pig farming. It is frequently caused by enterotoxigenic Escherichia coli (ETEC), expressing F4 or F18 fimbriae that bind to the intestinal microvilli of the piglets after weaning. Concerns about the emergence of antimicrobial resistance contamination have been raised globally due to the excessive use of antibiotics and zinc oxide to treat PWD. Therefore, alternative approaches to treat ETEC and preventing PWD are urgently needed. This work explores the use of self-assembling nanoparticles as decoys to counter intestinal adhesion of ETEC F4+ to microvilli. mi3, an icosahedral self-assembling protein, consisting of 60 monomers that form the mi3 scaffold, is bioengineered to display anti-ETEC F4 single domain antibody fusions at the N-terminus of each monomer. The expression of the recombinant protein was optimized and purification of protein by Size Exclusion Chromatography and validated by immunoblotting and Atomic Force Microscopy. In vitro tests showed that the anti-ETEC F4-mi3 nanoparticles bind ETEC bacteria and trigger its accumulation up to 5% of aggregation, leading to their incapability of binding intestinal microvilli. These promising results were confirmed by microscopy assays and through western blot analysis and will be further tested and optimized. Currently, also other nanobodies recognizing different F4 fimbrial epitopes are tested.

Oral alternatives for intramuscular iron administration in suckling pigs

S. Goethals¹, K. Hertogs², K. Buyse¹, K. Hooyberghs³, N. Buys³, S. Janssens³, J. Van Meensele¹, S. Millet¹

¹ ILVO, Scheldeweg 68, 9090 Melle, Belgium, ² INAGRO, Ieperseweg 87, 8800 Rumbeke-Beitem, Belgium, ³ KU Leuven, Department of Biosystems, Center for Animal Breeding and Genetics, Kasteelpark Arenberg 30, box 2472, 3001 Leuven, Belgium

Piglets are routinely supplemented with intramuscular iron dextran injections to prevent anemia. However, this method is labor-intensive and not without risk. Our study compared the standard iron injection with various oral supplementation methods to evaluate their effects on hemoglobin (Hb) levels at weaning and growth performance during lactation and post-weaning. A total of 650 piglets from 46 litters was allocated to five treatments: standard intramuscular injection (IM), three iron-rich dry feeds provided ad libitum during the first two weeks after birth (O1: 10-12% Fe₂O₃, O2: 22.5% FeSO₄.H₂O, O3: 24% iron mixture) and a fifth treatment involving a blend of O3 with applesauce that was individually administered (O3 APPLE). The Hb levels at weaning of the piglets that received the O3 (6.7 ± 1.3 mmol/L) and O3 APPLE (7.7 ± 0.7 mmol/L) treatment did not differ significantly from the IM piglets (7.3 ± 0.9 mmol/L). The two other oral iron supplements resulted in significantly lower mean Hb levels with 4.8 ± 1.2 and 6.0 ± 1.3 mmol/L for O1 and O2, respectively. In the first period post-weaning (weeks 4-6), piglets of the O3 APPLE group had a higher growth rate (176 ± 69 g/d) compared to O1 (104 ± 89 g/d, p = 0.008) and O3 (122 ± 72 g/d, p = 0.04), but not significantly different from IM or O2. However, considering the overall lactation and nursery phases, growth was not affected by the iron treatments. In summary, the results indicate that orally administering iron can achieve an iron status comparable to that achieved by standard injection.

Session 8

Theatre 6

Effect of authorized level of Zn supplied in three different forms on the physiology and performance of piglets weaned at different age

C. Negrini¹, D. Luise¹, F. Correa¹, S. Viridis¹, M. Mazzoni², A. Romeo³, A. Monteiro³, P. Trevisi¹

¹ University of Bologna, Department of Agro-Food Sciences and Technologies, Viale Fanin 46, 40127 Bologna, Italy, ² University of Bologna, Department of Veterinary Medicine, Via Tolara di Sopra 50, 40064 Ozzano dell'Emilia, Italy, ³ Animine, 10 Rue Léon Rey Grange, 74960 Annecy, France

This study aims to assess the effect of three sources of zinc (Zn) and weaning age on piglets' performance and gut health status. At weaning, 96 pigs were arranged in a 2×3 factorial design including weaning age: Early (E, 21 days) or Normal (N, 26 days) and ~120 mg/kg in feed of the Zn from 3 sources: Zn sulphate (CO), Zn Glycinate (Gly) and potentiated form of Zinc Oxide (Hi). Piglets were weighed at weaning (d0) and weekly until d21. On d8 and d21, 48 piglets (one piglet/replicate) were slaughtered and jejunum tissue was collected for genes expression and morphology analysis. Data were analysed using a linear mixed and ANOVA model including diet, weaning age and their interaction as fixed factors and litter of origin as random factor. Weaning age affected the body weight through the entire study (P<0.001), resulting higher in N piglets. The interaction between diet and weaning age tended to affect the gain to feed ratio at d7-d21 (P= 0.07) which tended to be higher in EHi compared to the EGly (P= 0.09). Villus height and villus height to crypt depth ratio (VH:CD) tended to be affected by the weaning age at d8, resulting higher in the N group (P<0.10). GPX-2 expression was higher in NGly compared to NHi at d21 (P= 0.02). At d21, crypt depth was lower in EHi than ECO (P = 0.02); VH:CD was higher in EHi compared to ECO (P= 0.04). The administration of the potentiated form of ZnO had the same effects as Zn Glycinate, contributing to reduce the piglets' detrimental effect on weaning on gut homeostasis.

Uncovering the genetic background of porcine congenital splay leg syndrome in piglets

J. De Kort¹, W. Gorssen¹, R. Meyermans¹, S. Janssens¹, N. Buys¹

¹ KU Leuven, Department of Biosystems, Center for Animal Breeding and Genetics, Kasteelpark Arenberg 30, 3001 Leuven, Belgium

Porcine congenital splay leg syndrome (PCS) is the most common congenital disorder in pigs and the leading cause of lameness in newborn piglets. Animals affected by PCS exhibit a splayed position of the hindlimbs, reducing their ability to stand and walk. Despite the transient nature of the disorder, mortality can reach up to 50% due to overlying and starvation. Although the condition has a significant impact on pig farming, the genetic background remains unknown. In this research, a genome-wide association study (GWAS) was conducted on 1224 Piétrain boars, genotyped on the GGP Porcine 50K medium density SNP chip. For these boars, data was collected on 12700 crossbred litters (Piétrain sire, hybrid dam) which were scored for the number of PCS piglets per litter. After quality control 43320 SNPs remained available for further analysis. Two strategies for GWAS were performed with the PLINK software. First, boars were divided into 'cases' (n=39) and 'controls' (n=650) based on their number of offspring and the prevalence of PCS. Second, a quantitative GWAS approach was used. The subsequent study revealed two significant regions on chromosomes SSC4 and SSC14 with signals reaching significance up to 10⁻¹⁰. Moreover, a literature review on these loci identified strong candidate genes related to muscle physiology. These candidate genes are consistent with the prevailing notion that PCS correlates strongly with a delayed muscle development. Although additional research is necessary to validate these initial findings, this study provides a promising foundation for further exploration. In this manner, we have progressed another step towards elucidating the genetic underpinnings of PCS.

Session 8

Theatre 8

Interobserver reliability of different methods to evaluate sows' body condition

R. Carnevale^{1,3}, K. Segers¹, N. Nollet², A. Cools^{1,2}, G. Janssens¹, S. Millet³

¹ Ghent University, Salisburylaan, 133, 9820 Merelbeke, Belgium, ² INAGRO, Ieperseweg, 87, 8800 Rumbeke-Beitem, Belgium, ³ ILVO, Scheldeweg, 68, 9090 Melle, Belgium

Maximizing production and ensuring sustainability are two central goals of modern pig farming, and in order to achieve that is crucial to prioritize an adequate body condition of sows. It's crucial to routinely evaluate the body condition of sows to ensure a higher percentage of females are maintained in their optimal physical state. Different methods are available to measure sows' body condition and in the literature, there is no consensus of which method is the most reliable. The aim of this trial was to compare methods to assess sows' body condition between different observers. The methods used were the caliper, a mode A ultrasound (Lean-meter; Renco, Minneapolis, MN, USA) and visual body score (ranging from 1 – 5). For the measurements, 22 sows of different gestational ages were chosen and 8 observers performed the measurements in all the sows. The coefficient of variation was calculated for each method and individually for each sow. An average of the coefficient of variation for each method was then calculated. The difference between the accuracy of the method was analyzed by ANOVA and statistical significance was set at $p < 0.05$. There was no difference ($p > 0.05$) between the coefficients of variation of the caliper (CV = 7.7%) and the ultrasound mode A (CV = 5.3%) and both were lower ($p < 0.05$) from the visual body score (CV = 18.8%). Factors that may have influenced the results include observer bias and the level of observer training. Addressing the latter might require additional focus, particularly in subjective assessment methods. Objective methods, that are not interfered by, have a better precision to measure sows' body condition.

The secret of each sow: exploring the impact of sow and litter features on within-litter uniformity
K. Hooyberghs¹, S. Goethals², W. Gorssen¹, L. Chopard¹, R. Meyermans¹, N. Aerts¹, S. Millet², S. Janssens¹, N. Buys¹
¹ KU Leuven, Department of Biosystems, Center for Animal Breeding and Genetics, Kasteelpark Arenberg 30, box 2472, 3001 Leuven, Belgium, ² ILVO, Scheldeweg 68, 9090 Melle, Belgium

Variation in piglet body weight causes challenges in nowadays pig farming. Lower litter uniformity is associated with a higher occurrence of lightweight piglets and increased pre-weaning mortality. This study aimed to explore different metrics for quantifying within-litter uniformity, as well as to investigate associations between sow- and litter-specific factors and within-litter uniformity. We analyzed data from 610 litters of hybrid sows mated to Piétrain boars where 9,319 piglets were individually weighed at birth. Six different metrics were used to score within-litter uniformity: coefficient of variation (CV), standard deviation, average Z-score, range in weights, percentage of piglets < 0.8kg and < 1kg. Pearson correlations between these metrics were all positive and ranged from 0.22 to 0.83. The uniformities of consecutive parity litters are correlated ($R=0.27-0.43$), except between 4 and 5. Moreover, we found that CV of birth weight was associated with parity, number of pigs born alive, percentage of mummies, percentage of stillborns and service year. The positive association between CV and the proportion of mummies ($p=0.001$) and stillborns ($p<0.001$) suggests that fetal deaths or uterine environment changes linked to mummies may decrease litter uniformity. Additionally, 16% of the total variability in CV% can be attributed to differences between individual sows. Our results indicate that it might be feasible to quantify the uniformity of a litter by only recording the number of lightweight pigs and that within-litter variation can be linked to the features of each individual sow.

Effect of top-dressed arginine supplementation in different gestation periods and seasons on the colostrum composition and productive performance of sows and piglets
S. Virdis¹, D. Luise¹, F. Correa¹, L. Laghi¹, F. Palumbo¹, C. Negrini¹, G. Orazzo¹, M. V. Graziosi¹, U. Rolla², P. Trevisi¹
¹ University of Bologna, Department of Agricultural and Food Science, V.le Fanin 46, 40127 Bologna, Italy, ² Martini S.p.A., Via Emilia 2614, 47020 Budrio di Longiano, Italy

This study aimed to evaluate the effect of supplementing 21.8 g/day of top-dressed arginine (Arg) at different gestation periods and seasons on the productive performance and colostrum of sows. A total of 320 sows were divided into 4 groups during 2 seasons (summer or winter): a control group (CO) fed a standard diet and 3 groups supplemented with 21.8 g/day Arg either during the first 35 days (EARLY35), or the last 45 days (LATE45), or during all gestation (COM). Colostrum was collected and analysed for composition, Igs concentration and metabolomic profile. Individual piglet body weight (BW) was recorded at birth, d6, d28 and 14 days post-weaning. Data were analysed using a GLM model including diet, season and parity as fixed factors. Interaction between diet and season was not significant. EARLY35 group had a lower percentage of stillborn and low-birth BW piglets than the other groups ($p<0.05$). COM group had a higher percentage of crushed piglets than CO group ($p<0.001$). LATE45 group had a higher percentage of high-birth BW piglets than the other groups ($p<0.001$). No difference in colostrum composition was observed, while Arg groups had less IgG than CO group ($p<0.001$). CO group had a higher concentration of colostral UDP-GlcNAc than Arg groups ($p<0.05$), which had reduced creatine and related metabolites. In conclusion, 21.8 g/day of on top-dressed Arg had a negative effect on the productive performance of the sows when given throughout gestation, while Arg supplementation during the first 35 days of gestation led to reduction in the percentage of stillborn and low-BW piglets.

Impact of replacing diet soybean with spirulina on blood metabolic profile of heavy pigs

A. Toscano¹, D. Giannuzzi¹, G. Don¹, S. Schiavon¹, L. Gallo¹

¹ Università di Padova, DAFNAE, Viale dell'Università 16, 35020 Legnaro, Italy

This study evaluated the feasibility of replacing dietary soybean (SBM) with spirulina (SP) on a set of blood metabolites in 88 gilts and barrows housed in 8 pens. Pigs were assigned to 4 diets (2 pens/diet): a commercial control diet based on SBM and cereals and 3 diets where SBM was replaced at 33, 66 and 100% (SP100) with SP. Blood samples were collected from all the pigs before the administration of SP (T0) and 145 days later, at the end of the trial (T1). Data were analysed i) keeping T0 and T1 separated according to a mixed model including sex and diet as fixed effect, and pen within diet as random effect, and ii) including in the model also the fixed effects of the blood sampling period and its interaction with diet, and the animal random effect. Diet did not affect blood metabolites both in T0 and in T1. When considering T0 and T1 together, the interaction period x diet was significant only for metabolites associated to hepatic overload and oxidative stress. Concentration of albumin, antioxidant rate and γ -glutamyl transferase increased regardless of treatment. Conversely, aspartate transaminase exhibited a lesser increase with the SP100 diet compared to C after the fattening period. Overall, the changes in blood metabolites were not related with the increase in SP content in the diet. Our results indicated that the dietary replacement of SBM with SP did not impact blood metabolic and inflammatory indicators, suggesting a good adaptation of pigs to the novel protein source.

Session 8

Theatre 12

Effect of soybean reduction and crude protein restriction on the performance of fattening pigs

M. Graziosi¹, D. Luise¹, F. Correa¹, S. Viridis¹, F. Palumbo¹, F. Soglia¹, M. Petracchi¹, C. Negrini¹, G. Biagi², P. Trevisi¹

¹ UNIBO, Agro-Food Sciences and Technologies, Viale Fanin 46, 40127 Bologna, Italy, ² UNIBO, Veterinary Medicine, Via Tolara di sopra 50, 40064 Ozzano dell'Emilia, Italy

Imported soybean contributes to the environmental impact of the EU pig production. This study aimed to assess the impact of the reduction of soybean meal (SBM) and crude protein (CP) content on the performance of Italian heavy pigs. At housing, 1930 pigs with an average body weight (BW) of 36 kg were divided in: i. control group (CO), fed a standard diet; ii. treated group (TRT), fed a diet formulated to reduce SBM by 31%, 67% and 69% (replaced by sunflower and pea) in the 3 feeding phases (FP) and 1.2% CP in the last feeding phase. From 251 pigs, individual BW, Average Daily Gain (ADG), feed intake and Gain to Feed ratio (G:F) were recorded and faecal ammonia (NH₃) was determined from 20 pigs/group. Welfare indicators were monthly recorded. At slaughter (BW=180 kg), carcass and meat quality (L. lumborum muscle) were assessed. A linear mixed model (diet and sex: fixed factor; pen: random factor) was adopted. The TRT diet improve the overall ADG ($p=0.04$) and G:F ($p=0.01$), reduced FI ($p<0.0001$). The lesions score index at d102 was reduced ($p=0.03$) and promoted Methanobrevibacter (d94; $\text{padj.}=0.013$) and Clostridium sensu stricto (d181; $\text{padj.}=0.001$). Diet did not affect faecal NH₃, carcass composition and meat quality traits. In conclusion, replacing ~56% of SBM with more sustainable feed ingredients combined with a CP restriction is a promising strategy to formulate finishing diets with a reduced environmental impact.

Analysis of the effects of temporary outdoor access during the fattening phase on pig welfare, health and growth

A. Jahoui^{1,2}, S. Gavaud¹, J. Lion¹, K. Haurogné¹, F. Guiraud³, T. Terrasson³, B. Lieubeau¹, C. Tallet², J. Hervé¹

¹ Oniris, INRAE - IECM, 101 Route de Gachet, 44300 Nantes, France, ² INRAE, Institut Agro Rennes Angers - PEGASE, 16 Le Clos Domaine de La Prise, 35590 Saint-Gilles, France, ³ INRAE - GenESI, La Gouvanrière, 86480 Rouillé, France

In the European Union, less than 1% of pigs are raised with access to outdoor areas. In this study, we analysed the effects of giving pigs temporary access to a pasture during the fattening phase on their welfare, health, and growth. We followed 300 pigs in 3 batches, reared in a conventional barn either without any outdoor access (O-) or with access to a pasture twice a week in the mornings, from D76 to D150 (O+). We measured at different timings their growth, stress level and immune competence and assessed body lesions. Pigs were weighed on D70, D133 and D150. We measured the level of salivary cortisol on D104 and D150. Monocytes, neutrophils and lymphocytes were counted from a blood sample on D135. On D150, we quantified IgA levels in saliva and scored body lesions. Linear mixed models were used to evaluate the effects of outdoor access and sex on these variables. According to preliminary data obtained on 2 batches, outdoor access had no impact on growth. On D104, O+ pigs exhibited lower salivary cortisol levels than O- pigs. On D135, we observed that both male and female O+ pigs displayed higher number of monocytes than O- pigs. In contrast, the neutrophil-to-lymphocyte ratio was higher in O+ females only. Finally at slaughter, the levels of salivary cortisol and IgA were significantly lower for O+ pigs, which also displayed fewer body lesions than O- pigs. Our results suggest that outdoor access had a positive impact on pig welfare, health and growth. Altogether, our study should provide new knowledge for a better understanding of the consequences of outdoor access on the pigs.

Session 8

Theatre 14

Effects of different olive cakes inclusion in the diet of the Bísaros pigs on the chemical composition and fatty acids profile of Biceps Femoris muscle

J. Paié-Ribeiro¹, V. Pinheiro¹, A. Teixeira², C. Guedes¹, M. J. Gomes¹, J. Teixeira¹, O. M. Divanildo¹

¹ CECAV-UTAD, Quinta de Prados, 5001-900 Vila Real, Portugal, ² Centro de Investigação de Montanha (CIMO), Instituto Politécnico de Bragança, Campus de Santa Apolónia, 5300-253 Bragança, Portugal

Significant quantities of olive cake (OC) are generated by the olive oil industry, and their utilization in animal feed presents economic and environmental interest. This study aimed to evaluate the impact of different olive cakes (OC) in the diet of Bísaro pigs on the chemical composition and fatty acid profile of the biceps femoris muscle. Forty Bísaro pigs (castrated males and females; growing-finishing) were distributed across 5 treatments: Control, 10% inclusion of crude OC, Two-Phases OC, Exhausted OC, and Exhausted OC +1% olive oil (CD, COC, TPOC, EOC, and EOCCO, respectively). The diets significantly influenced the moisture content (%) of this muscle ($P < 0.05$), with the TPOC group presenting the highest moisture content (74.20) and the CD group the lowest (70.41). Protein content (%) was also significantly altered ($P = 0.0002$), with the CD group (20.91) being statistically different from the groups with OC incorporation (mean of 22.61). The heme pigments content (mg/g) was also significantly affected ($P = 0.041$) by the different diets, being predominantly higher in the COC group (2.33) and lower in the EOC and EOCCO groups (mean of 1.86). The levels of ash, total fat, and collagen were not affected ($P > 0.05$). The total MUFA content showed significant differences ($P < 0.001$) between treatments, being significantly higher in the CD group (57.36), intermediate in the COC, EOC, and EOCCO groups (mean of 55.79), and lower in the TPOC group (51.52). The total PUFA content was significantly higher ($P < 0.001$) in the TPOC group (12.21) and lower in the other groups. The same effect is observed in the PUFA/SFA ratio, with the highest content in the TPOC group and lower in the other groups. The SFA content did not show significant effects ($P > 0.05$). These results suggest that OC can be utilized in Bísaro pig feed without compromising the chemical characteristics and fatty acid profile of the meat.

In vitro metabolic footprint and interaction with intestinal cells of candidate probiotic and prebiotics for poultry

S. Zuo¹, K. Grudlewska-Buda¹, K. Skowron¹, W. Studziński², P. Kosobucki², K. Guinan³, J. T. O'sullivan³, K. Stadnicka¹

² Bydgoszcz University of Science and Technology, Department of Food Analysis and Environmental Protection, Seminaryjna 3, 85-326 Bydgoszcz, Poland, ³ Bioatlantis Ltd., Clash Industrial Estate, V92 RWV5 Tralee, Ireland

Early microbiome modulation in birds can be managed already prior to hatch, by in ovo applications, but the bioactive compounds needs a careful validation prior to in vivo application. Metabolic footprint of candidate probiotics in intestinal cells in vitro was used to explain the molecular mechanism of their action in chicken intestinal cells. This study consisted of two parts: 1/ the selected candidate probiotic footprint was analyzed during culture with addition of selected prebiotics. 2/ the interactions of probiotic with intestinal cells were studied under co-culture conditions. To study the metabolic footprint, *Bifidobacterium lactis* NCC2818 was cultured at 37°C for 24 hours in a medium containing 2% [v/v] of two preselected prebiotic compounds. The supernatant samples (n=6 per each prebiotic) were subject to metabolites analysis by gas chromatography-mass spectrometry (GC-MS). Differential metabolite analysis showed changes in specific organic acids. The metabolic pathway enrichment analysis showed that metabolic pathways such as amino acid metabolism, energy metabolism, and two-component signal transduction systems were activated. Moreover, when interacting with intestinal cells, *B. lactis* was found to have a positive effect on the barrier function of intestinal cells. These results will be used to track the in vitro identified metabolic footprints in the in vivo study, in which the same probiotic was administered in ovo. The proposed in vitro methods can be practically used to explore and evaluate the potential candidate poultry probiotics, prior to in ovo application. The research was supported by National Science Centre Poland grant 2019/35/B/NZ9/03186(OVOBIOM).

Selecting good gilts is vital for farm productivity. A younger age at puberty correlates to better reproductive outcomes. This experiment aims to study if maternal treatment with antioxidants improves prepuberal ovary development of the offspring. Fifty Iberian sows were differentially supplemented from day 85 of gestation until weaning: control (C; 30 mg VE/kg feed); vitamin E (VE; 100 mg VE/kg); hydroxytyrosol (HT; 30 mg VE+1.5 mg HT/kg) and both antioxidants (VEHT; 100 mg/kg VE+1.5 mg/kg HT). Gilts were weighted at birth, during lactation and at weaning. At 110 days old, 10 gilts from each of the experimental groups were weighted and surgically castrated. The ovaries were measured and the number, size and density of follicles were studied histologically. ANOVAS were performed in R 4.3.2. Maternal treatment was used as a factor, whereas in repeated measures the gilt was a covariable in repeated measures. Gilt weights differed among treatments at birth (higher in VE and HT; $p=0.078$) and at day 20 of lactation (higher in HT and VEHT; $p=0.05$). Ovaries from VE gilts showed larger surfaces than the other groups ($p=0.06$), and thus had decreased follicle density ($p<0.05$). However, groups without VE supplementation had higher % of small follicles ($p<0.05$) that could imply lower ovary development. Thus, preliminary data suggest a long-term effect of offspring prepuberal ovarian functioning according to maternal antioxidant supplementation. The research was funded by the Spanish Agencia Estatal de Investigación.

Farm animal health and welfare at the heart of agroecological livestock system priorities: proposed research questions to contribute to this objective

X. Fernandez¹

¹ INRAE, Département Physiologie Animale et Systèmes d'élevage, Nouzilly, 37380 Nouzilly, France

The aim of this communication is to summarize a collective, interdisciplinary vision of the advances in knowledge needed, at different scales, to contribute to the transformation of livestock systems with health and welfare at the core while considering the other components of sustainability. We emphasize the need to consider health in a broader perspective and to deepen the question of positive emotional experiences regarding welfare while presenting positive interactions and some conflicts between the two. Ex. when improving welfare by providing a more stimulating environment such as outdoor access the risk of infectious disease may increase. Jointly improving health and welfare of animals raises different questions along the production chain. At the animal level: long-term links between better welfare and physiological balance, the role of microbiota, the psycho-neuro-endocrine mechanisms linking positive mental state and health, and the trade-off between the physiological functions of production, reproduction and immunity should be explored. At the farm level, in addition to studying the relationships at the group level between welfare, health and production, we support the idea of co-constructing innovative systems with livestock farmers, as well as analyzing the cost, the acceptability and the impact of improved systems on their working conditions and well-being. At the production chain or territory levels questions include: studying the best strategies to improve animal health and welfare while preserving economic viability, labelling of products and consumers' willingness to pay, the consequences of heterogeneity in animal traits on the processing of animal products, the spatial distribution of livestock farming and the organization of the production and value chain. Citizens' knowledge of livestock farming should be improved and more constructive exchanges between breeders, livestock professionals and citizens developed. We emphasise a interdisciplinary and transdisciplinary approach, involving all stakeholders, including public decision-makers, in a participatory research process. Note: our numerous co-authors will be acknowledged during the presentation

Session 9

Slow and local or fast and global – examining business opportunities to advance good welfare practices in organic and outdoor farming

J. Niemi¹, M. Väre¹, P. Thobe², A. Collin³

¹ Natural Resources Institute Finland (Luke), Kampusranta 9, 60320 Seinäjoki, Finland, ² Thünen-Institute, Institute of Farm Economics, Bundesallee 63, 38116 Braunschweig, Germany, ³ INRAE, Université de Tours, BOA, , 37380 Nouzilly, France

Although organic and low-input outdoor pig and poultry farming systems enable a high degree of expression of natural behavior by the animals, these farming systems still have challenges regarding their economic viability and practices that compromise animal welfare. Consequently, some of the variants of these systems go beyond the minimum standards of EU organic farming, and hence offer products of upgraded animal welfare. The objective of this study was to co-develop best practice business models that could be used to valorize welfare improvements in organic and low-input outdoor pig and poultry farming in Europe. The data for the study were collected by surveys and workshops organized in 9 European countries within the PPILOW project. The data were analyzed by using the business model canvas and the market opportunity navigator. In addition, costs, benefits and disadvantages of improvement options were examined. The value proposition is the central element of a business model and it provides guidance on how value is generated and how the selected approach is superior to alternative approaches. The developed business models focus on premium organic meat and eggs, which apply a set of welfare-improving measures that respond to ethical and animal welfare concerns related to pigs and poultry throughout their lifespan, enhance animal health, reduce animal antibiotic use and enable greater exploration of outdoor areas. Different strategies to enter the market were identified. The benefits and disadvantages of traditional and short supply chain were examined in the context of organic and low-input outdoor production. Novel revenue generation models such as subscription-based models and online-based sales will be considered. These approaches may involve features that increase the price to be asked from the market, but also make it more challenging to copy the business idea. The PPILOW project has received funding from the European Union's Horizon 2020 Research and Innovation Programme under grant agreement N°816172.

Behaviour and health of entire male pigs in a semi-natural habitat

H. Zobrist¹, B. Fröh¹, M. Garcia¹, M. Holinger¹

¹ Research Institute of Organic Agriculture FiBL, Livestock Sciences, Ackerstrasse 113, 5070 Frick, Switzerland

Entire male pigs in commercial housing systems are known for their increased agonistic and sexual behaviour. In wild boars, young males remain with the family group for about a year, then live in bachelor groups for approximately another year. The behaviour of domestic entire male pigs in family groups under semi-natural conditions has not been described to date. We therefore observed the behaviour of young pigs (Swiss Large White) in a 1.9 ha enclosure including pasture and forest. The social group consisted of three sows and their 41 piglets. Three months after birth, the group of piglets was reduced to 12. Pigs were observed once per week during four hours from an age of one month until slaughter at about 5.5 months. Our protocol included scan and continuous sampling through direct observations. We observed a higher frequency of head knocks between males or between males and females compared to between females. Fights were mostly observed between males, and rarely involved females. Mounting behaviour was performed nearly exclusively by males, with an observed drift in preference of the recipient: While in the beginning the recipients were similarly males and females, males mounted females significantly more than other males after three months of age. The prevalence of skin lesions was low and similar between males and females. In total 3 female and 3 male pigs were assessed as lame at least once. No penile injuries were observed at slaughter. These observations made under semi-natural conditions are in accordance with the described behaviour of entire males in housing systems.

MNS University of Agriculture, NA, NA, 60000 Multan, Pakistan, ⁵ University of Camerino, School of Biosciences and Veterinary Medicine, Via Circonvallazione, 93/95, 62024 Matelica, Italy

A protocol for measuring welfare in dromedary camels kept under pastoralism was developed, drawing from that one for dromedary camels kept in intensive systems. We aimed to apply the protocol and assess the welfare of dromedary camels in Pakistan. A total of 44 welfare indicators (animal-, resource-, and management-based indicators) aligning with animal welfare principles ('Good Feeding,' 'Good Housing,' 'Good Health,' and 'Appropriate Behavior') were gathered into two assessment levels: 'Caretaker-Herd level' and 'Animal level'. Data were collected in 2023 in the Punjab province. A total of 54 herds/1186 camels, of which 510 (495 females and 15 males; average age: 5-6 years old) at Animal-level, were evaluated. The indicators were scored and aggregated to obtain Principle Aggregated Indexes (PAIs) and a Total Welfare Index (TWI). Using PAIs, 4 herds were classified as excellent, 42 satisfactory, 8 unsatisfactory. Good feeding and Good housing were the most problematic PAIs. TWI varied from 55.7 to 82.2, and using a traffic light classification, 12 herds were green, 22 orange, and 20 red. As expected, camels kept under pastoralism had a higher welfare than that reported in the literature for intensive systems. However, it was still possible to suggest guidelines for the improvement of those herds with criticalities. This is a first step to proposing welfare standards for camels.

Ensuring good animal welfare in extensive farming systems: lessons from dairy farmers in Canterbury, New Zealand

K. Alvåsen¹, K. Bicknell²

¹ Swedish University of Agricultural Sciences, Clinical Sciences, Ulls väg 26, 75007 Uppsala, Sweden, ² Lincoln University, Global value chains and trade, PO Box 85084, 7647 Lincoln, New Zealand

Animal welfare is consistently identified as one of the most important, yet challenging issues for dairy farmers globally. Farmers in countries such as New Zealand, where systems are pasture-based and calving is seasonal, face a unique set of challenges associated with environmental stressors, access to adequate nutrition and disease management. To gain insights into current practices aimed at ensuring good animal welfare in extensive farming systems, in-person interviews were conducted with 5 dairy farm managers in Canterbury, New Zealand, in March 2023. The semi-structured interviews were based on 8 questions and lasted for 1-1.5 hours. The interviews were audio recorded and transcribed to facilitate thematic analysis. Five overarching themes emerged: “preventive herd health management”, “shelter”, “youngstock management”, “handling” and “feeding”. Under the first, farmers emphasized the importance of proactive measures like strategic grouping of cows and strict biosecurity to avoid introducing infectious diseases. They underscored the significance of early disease detection and the use of technological tools to facilitate this. Shelter was a recurring topic. While one farmer believed that cows could cope with all weather conditions, others stressed the importance of providing protection from adverse weather, particularly during calving. The discussion on youngstock management centered on collecting newborn calves, drenching routines and the lack of a male calf market. In terms of handling of cows, emphasis was placed on the necessity of well-managed walking tracks and the importance of employing patient staff to minimize stress during droving and milking. Lastly, issues around providing sufficient high-quality feed, particularly in the winter, were discussed. These findings provide valuable insights on the wide range of tasks performed to promote animal health and welfare on New Zealand dairy farms and add to our understanding of how producers using extensive farming systems can continue to adapt to increasingly strict welfare standards.

Organic pig production in mixed free-range systems: the ROAM-FREE project

D. Bochicchio¹, L. Deiana¹, A. Wibe², B. Blomstrand², T. Ruud², R. Helliwell², M. Koesling², A. G. Kongsted³, M. Štukelj⁴, M. Spinu⁵, A. Vasiu⁵, A. Williams⁶, A. C. Pedersen⁶, H. Mejer⁶, S. Thamsborg⁶

¹ CREA, Via Beccastecca 345, 41018 San Cesario sul Panaro, Italy, ² NORSØK, Gunnars vei 6, N-6630

Tingvoll, Norway, ³ Aarhus University, Nordre Ringgade 1, 8000 Aarhus C, Denmark, ⁴ Univ. Ljubljana, Kongresni trg 12, 1000 Ljubljana, Slovenia, ⁵ Univ. Agri. Sci. Vet. Med., Calea Mănăştur 3-5, 400372 Cluj-Napoca, Romania, ⁶ Univ. Copenhagen, Nørregade 10, PO Box 2177, 1017 Copenhagen, Denmark

Background. Organic free-range systems combining pig production with pasture, cash crops, trees or other livestock may support self-supply of feed and biodiversity. However, such systems are challenging in terms of e.g. biosecurity, monitoring of animals, and land use. Objectives. Describe and analyze challenges and benefits in mixed free-range pig production across Europe. Methodology. The study included farms with different characteristics: Farms pigs + cattle and/or sheep (2 in Slovenia, 5 in Italy, 10 in Romania); Farms pigs on pastures with 10-30% tree cover (2 in Denmark); Farms pigs with cash crops and forest pasture (respectively 5 farms and 1, both in Norway) Farms were regularly visited, farmers interviewed, productivity recorded, welfare assessed and samples collected. Results. Outdoor pig rearing can provide improved animal welfare and increase job satisfaction. Farmers assessment viewed environmental benefits vague with pigs requiring careful management. Pathogenic, potentially zoonotic and resistant bacteria (e.g. E. coli, Pseudomonas) were shared between cohabitating sheep and pigs (SLO) but not amid sheep, cattle, and pigs (RO), welfare and immunity being influenced rather by raising pattern than cohabitating species. Pregnant and lactating sows were infected heavily with nodular worms while finishers had moderate levels of large roundworm (Ascaris), despite regular treatments (DK, RO). We expect that ROAM-FREE will reveal benefits and challenges in a variety of mixed systems and thus form basis for knowledge-based practical guidelines to improve existing free-range pig production.

On-farm animal welfare assessment in slaughter pigs across different production systems in four European countries

M. L. V. Larsen¹, L. J. Pedersen¹, Consortium mEATquality¹, T. Rousing¹

¹ Aarhus University, Department of Animal and Veterinary Sciences, Blichers Allé 20, 8830 Tjele, Denmark

In the mEATquality project (European Union grant no. 101000344), on-farm interviews and direct animal and system data collection was conducted to document aspects of animal welfare. Animal welfare assessments were performed on 80 herds across four countries: Denmark, Italy, Poland, and Spain (n=20 per country) and five production systems: Intensive, indoor, conventional (IIC, n=31); Intensive, outdoor run, conventional (IORC, n=4); Intensive, outdoor run, organic (IORO, n=11); Extensive, conventional (EC, n=24); Extensive, organic (EO, n=10). The herds were selected to reflect the variety of herds found in the respective countries with more intensive herds in Denmark and Poland, and more extensive herds in Italy and Spain. One major difference between the production systems was the amount and type of outdoor space with IIC herds by definition having no outdoor space, IORC and IORO herds mainly having access to concrete runs with a maximum outdoor space allowance of 1.33 m²/pig in Denmark and 193 m²/pig in Italy, and the EC and EO herds mainly having access to paddocks or pasture with a maximum outdoor space allowance of 53 m²/pig in Poland, 200 m²/pig in Denmark, 2,174 m²/pig in Italy and 84,000 m²/pig in Spain. Cooling systems also clearly varied with degree of extensification with intensive herds providing the pigs with sprinklers or showers, and extensive herds providing more natural cooling sources such as wallowing, river, ponds, pools, and shadow huts. Although the majority of herds provided no cooling facilities at all. Multiple other differences arising with extensification of the production will be presented at the conference, including differences between the production systems in resource and management indicators.

Session 9

Theatre 8

Navigating the complexity of boar taint detection: Advancing towards a castration-free future for piglets

L. Morgan¹, T. Ignat¹, M. Font-I-Furnols², N. Panella-Riera², R. I. D. Birkler¹

¹ PigO FoodTech, 71 Hagefen, 7079500 Qidron, Israel, ² IRTA-Food Industries, Finca Camps i Armet, 17121 Monells, Spain

Most piglets are still surgically castrated in order to prevent boar taint, an undesirable odour, which can be noticed mainly during and after cooking. The two main compounds related to boar taint are androstenone and skatole, with existing analytical methods to detect them. While these methods are not feasible for boar taint detection on the slaughterline, the human nose (sensory method) is the most commonly used. One of its problems, is the accuracy and repeatability, since there is a biological variation in the chemical fingerprint that the human nose detects as boar taint. One objective of this study, as preparation for the PIGWEB TNA grant, was to examine the overlap between the objective and subjective measures and to create a combined model for boar taint detection. 4,000 boars were tested by the human nose on slaughter lines in commercial abattoirs; 2.1% of them were marked as tainted. All tainted backfat samples, as well as an additional 80 samples, were randomly chemically analysed and human nose tested by two additional trained panellists. The agreement between the two additional panellists was 24.3% only. 23.2% of all samples had androstenone or skatole above the selected sorting level (1500 µg/g and 250 µg/g, respectively). 5.0% of all samples had high levels of both. In total, only 3.4% of all samples had high androstenone, high skatole and were classified as tainted by the panellists. These results represent the importance of measuring both compounds as well as the untargeted chemical fingerprint. A novel model (based on advanced optics and AI) was created to take all these considerations into account.

Automated monitoring of pig and chicken welfare at the slaughterhouse – tracing back to farm, transport and slaughter

F. Tuytens¹, J. Maselyne¹, & Awish-Consortium¹

¹ ILVO, Scheldeweg 68, 9090 Melle, Belgium

The EU aWISH project focuses on automated monitoring of animal-based indicators at slaughterhouses for documenting the welfare of broilers and pigs during each phase of production (farm/transport/slaughter). The project is centered around six European pilots – a slaughterhouse with a local research partner, associated farms and technology providers – where technologies are developed and validated. Pig pilots are located in Austria, the Netherlands, Serbia and Spain, broiler pilots in France and Poland. Eighteen technologies measure various indicators for pigs (ear lesions, skin lesions, tail length, tail lesions, blood parameters, stress vocalisation, tear staining, stunning effectiveness, environmental parameters, body weight, lung lesions, liver lesions, food consumption, meat quality) and broilers (hock burn, footpad lesions, catching damage, back scratches, stress vocalisations, activity, stunning effectiveness, environmental parameters, on-farm welfare assessment). Technologies are mainly installed in the slaughterhouse, some on-farm or on-truck, and some require human observations. An overview will be given of the installation of technologies, their status of development and which animal welfare aspect they are measuring. Via a data platform and online user interface, feedback on relevant individual and aggregated indicator scores is provided to those responsible per production phase. Data will also be used to document animal welfare improvements and their socio-economic and environmental impacts. This project will make a significant contribution to the objective assessment and improvement of pig and broiler welfare throughout Europe.

Session 9

Theatre 10

Reliability of different behavioral tests as welfare indicator for dairy cows

P. Hasenpusch¹, T. Wilder¹, C. Straßburg¹, S. Menke¹, J. Krieter¹, G. Thaller¹, I. Czynchol²

¹ Christian-Albrechts-University, Institute of Animal Breeding and Husbandry, Olshausenstraße 40, 24098 Kiel, Germany, ² University of Copenhagen, Institute of Veterinary and Animal Sciences, Grønnegårdsvej 8, 1870 Frederiksberg C, Denmark

Human animal relationship (HAR) tests have the potential to reflect an important part of animal welfare on farm. To serve as welfare indicator, HAR-tests need to be reliable. Reliability of five different HAR-tests was therefore assessed by two trained observers who visited eleven commercial dairy farms in lower saxony. All farms were visited thrice, whereby visits were a week apart. At each visit, a novel object test (NOT: disinterested, interested, touched object, latency to contact), a voluntary human approach test (VHAT: latency to contact), a lie pass test (LP: disinterested, interested, stood up when passed) and an avoidance distance test (AD: flight reaction or touched by human, performed twice in different places) were conducted. Spearman correlation (rs) and intra class correlation (ICC) were used to assess the reliability of measurements between observers and between visits. Interobserver reliability of AD measurements were excellent (ICC and rS between 0.97 and 0.94). Reliability of NOT and LP categories varied from standing up (ICC and rS of 0.96) and touching the object (ICC 0.99, rS 0.98) to interest (0.92 and 0.90) in the NOT and (0.67 and 0.68) in the LP. ‘Disinterest’ was least reliable with rS of 0.45 in both tests and ICC of 0.65 in the NOT and 0.40 in the LP. Test-retest reliabilities were unacceptable (ICC and rS between 0 and 0.4). Low test-retest reliability can be explained by a small number of random animals chosen each visit. Exact influencing effects will be analyzed in the ongoing of the study.

Welfare protocols for rabbits

*M. Almeida¹, S. Silva¹**¹ Veterinary and Animal Research Centre (CECAV), Associate Laboratory of Animal and Veterinary Science (AL4Animals), University of Trás-os-Montes e Alto Douro, 5000-801 Vila Real, Portugal*

In recent years, there has been a shift towards developing more standardized animal welfare assessment protocols, like the Welfare Quality® and the Animal Welfare Indicators (AWIN) projects. These projects have produced protocols aimed to be flexible and adaptable, allowing them to be used with different farm animal species. Nevertheless, due to a low economic impact or the limitations of its geographical distribution, the welfare assessment of rabbits in commercial production was left out of both projects, even though this species are primarily reared in intensive systems. In 2011, there's a first attempt at creating a welfare protocol for on-farm commercially housed rabbits, through observation and scoring methodologies. This first approach was mainly based on the Welfare Quality project and available literature, as well as expert knowledge. Several authors have adapted this work ever since, which is now mostly used to evaluate farms in Spain and Portugal. In 2022, the EBENE protocol for does and growing rabbits is introduced in France, following the same principles but with more practical presentation and approach. At the same time in Italy, a protocol based on Classyfarm is developed. Most of the recent versions of welfare assessment protocols for rabbits have a lower number of indicators in common and a lack or severe decrease in behavioural assessments, which poses an obvious problem. There is still a need for more research in indicator validation, feasibility and repeatability. In this work, we analyze and compare each protocol proposal recently designed for rabbit production. This work was supported by the projects UIDB/00772/2020 (Doi:10.54499/UIDB/00772/2020) funded by the Portuguese Foundation for Science and Technology (FCT).

Session 9

Theatre 12

Behaviour of laying hens of two genotypes in a cage-free system enriched with hay bales

*C. Ciarelli¹, F. Bordignon¹, G. Pillan¹, G. Xiccato¹, A. Trocino^{1,2}**¹ University of Padova, DAFNAE, Viale dell'Università 16, Legnaro, 35020 Padova, Italy; ² University of Padova, BCA, Viale dell'Università 16, Legnaro, 35020 Padova, Italy*

Environmental enrichment can play a positive role in cage-free systems by allowing hens to diversify their behavioural repertoire and reducing aggression among animals. Our study evaluated the effect of the enrichment with hay bales in an aviary system on the behaviour of 1,800 laying hens (Hyline Brown and Lhomann White) from 50 to 53 weeks of age. Behaviours, expressed as the percentage of hens observed on the floor, were scored through a 10-sec scan every 30 min per hour (05:30-20:30) and observations were grouped per day-time interval, i.e. early, midday, afternoon, and evening. Data were submitted to ANOVA with genotype, enrichment, and time interval (not discussed here) as main effects, and pen as a random effect. As for the enrichment, the presence of hay bales increased the number of hens on the floor and the rate of those interacting with the enrichment at the expenses of hens performing dustbathing, sitting, or walking. As for the genotype, a higher number of brown hens was recorded on the floor, with a higher rate of them sitting-inactive and preening compared to white hens which performed more dustbathing, interactions with hay bales, ground-pecking, and piling ($P < 0.01$). In conclusion, hay bales attracted hens and reduced the expression of some comfort behaviours; white hens were more active and showed more risky behaviours such as piling compared to brown hens. Acknowledgements: This study was carried out within Agritech National Research Center and was funded by the European Union – NextGenerationEU (PNRR – Missione 4 Componente 2, Investimento 1.4 – D.D. 1032 17/06/2022, CN00000022), and by Unimpresa, University of Padova (call 2019).

Improvement of the welfare of Iberian cull sows fattened through the immunocastration

J. García-Gudiño¹, F. Hernández-García¹, M. Izquierdo¹, I. Blanco-Penedo²

¹ CICYTEX, Animal Production, 06187 Guadajira, Spain, ² UdL, Department of Animal Science, 25198 Lleida, Spain

To enhance the sustainability of Iberian traditional pig production, it is suggested to fatten Iberian cull sows using the natural resources of the dehesa ecosystem. However, during the fattening period, hierarchical aggressions between entire sows may occur due to oestrus, as well as unwanted pregnancies by wild boars in free-range systems. To mitigate these issues, this study aimed to evaluate the performance and welfare of entire and immunocastrated Iberian cull sows during the fattening period. The study was conducted on 36 multiparous Iberian sows at the CICYTEX experimental farm. One group of 18 sows remained entire, while the other group of 18 sows was immunocastrated using Vacinsinzel® before the fattening phase. After the immunocastration protocol, both groups were fattened in the dehesa using natural resources. The animal welfare of both groups was assessed every five weeks (4 assessments) using the Welfare Quality® protocol. Monthly body weight (BW) measurements were taken, and blood samples were collected for analysis of progesterone and estradiol (ELISA). Statistical analyses were conducted using SAS®. Regarding animal welfare, differences were only observed between the two experimental groups at the end of the fattening period according to the Welfare Quality® protocol. Expression of positive social behaviours was found to be more frequent in immunocastrated Iberian cull sows. Analysis of progesterone and estradiol confirmed the effectiveness of immunocastration. There were no significant differences in BW and average daily gain between the two experimental groups. In conclusion, immunocastration is an optimal management tool to improve the welfare of Iberian cull sows.

Poster 14

Impact of outdoor farming on pig welfare: insights from a study in Italy

L. Deiana¹, S. Santini¹, D. Bochicchio¹

¹ CREA, Via Beccastecca 345, 41018 San Cesario sul Panaro, Italy

The current scientific position on animal welfare promotes farming systems that allow the free manifestation of the species ethogram. For pigs, access to the open air and to grazing areas represents an added value in terms of welfare as a place in which they can express their rooting behavior. This study focuses on five Italian organic farms where pigs are raised outdoors, and grazing is a part of the daily ration. The aim was to investigate how farms organized grazing and free-ranging activities in relation to animal welfare assessed using the app PIG LOW. Furthermore, we have identified the risk factors for parasitic infestation connected to each situation and the related parasitic condition of the animals. The objective was to obtain information on management practices that promote animal welfare and to understand whether and how these influence parasitic infections in pigs. The study was conducted as part of the European ROAM-FREE project in spring 2023. The PIG LOW app was used to evaluate various aspects of animal behavior and environmental conditions during visits to five Italian organic farms where pigs were raised outdoors. This method allowed them to objectively evaluate animal welfare and understand the management practices in place. The results indicate that outdoor farming systems can enhance the welfare of pigs by enabling them to engage in their natural behaviors. Despite the higher risk of parasitic infestation in outdoor environments, the study suggests that appropriate management practices can effectively mitigate these risks. Another fundamental aspect was the pigs' confidence with humans. In most farms, the animals did not exhibit fear towards humans: this shows that the animals feel relaxed and safe, without any sense of danger, which is an excellent outcome from a welfare perspective.

Could a low input/low output forage-based system be the solution for future organic dairy production? An exploration of the concept of a LILO production system

A. Hägglund¹, K. Alvåsen¹, N. Fall¹, R. Danielsson², P. Tidåker³

¹ Swedish University of Agricultural Science, Department of Clinical Sciences, Box 7050, 750 07 Uppsala, Sweden, ² Swedish University of Agricultural Science, Department of Applied Animal Science and Welfare, Box 7050, 75007 Uppsala, Sweden, ³ Swedish University of Agricultural Science, Department of Energy and Technology, Box 7050, 75007 Uppsala, Sweden

Dairy production has been strongly affected by increased prices for inputs, such as energy, fertilizers and high-quality concentrate feed. Meanwhile, the demand of organic dairy milk has been on the decline since 2016, which has led to a reduced financial return for organic producers. Organic dairy production is normally more costly than conventional, as the inputs usually are more expensive due to the need of them to be certified as organic. As the feeding costs account for the largest part of the inputs in dairy production, it is important to explore alternatives. By implementing a forage based, low-input/low-output (LILO) strategy in organic dairy production, the costs of input would be lowered, mainly by decreasing the use of concentrate feed and replace it with high-quality roughage combined with home-grown grains. This would not only preserve organic production, but also potentially benefit animal health and welfare as well as several crucial ecosystem services and leave more room to grow human-edible feed for humans. The first step is to untangle what the concept of a LILO system is in a Swedish perspective, in terms of the composition of a herd's feed ration. We will explore this by using existing information on forage consumption, type of forage and grazing at farm level. This is a part of a larger research project on how LILO systems affect animal health and welfare, farm economy and the climate footprint.

Session 9

Poster 16

First evaluation of the CLASSIFYFARM welfare assessment protocol applied in extensive farming systems in Central Italy

R. Primi¹, V. D'Onofrio¹, A. Macciocchi², G. De Vittoris¹, G. Saralli³, T. Galli³, C. Di Giovannantonio², B. Ronchi¹

¹ Università degli Studi della Toscana, Dipartimento di Scienze Agrarie e Forestali, Via San Camillo de Lellis, snc, 01100 Viterbo, Italy, ² Agenzia Regionale per lo Sviluppo e l'Innovazione dell'Agricoltura del Lazio, Area Tutela Risorse e Vigilanza, Produzioni di Qualità, Via Lanciani, 38, 00162 Roma, Italy, ³ Istituto Zooprofilattico Sperimentale del Lazio e della Toscana "M. Aleandri", Via Appia Nuova, 1411, 00178 Roma, Italy

According to European regulations and the Animal Health and Veterinary Drugs Directorate of the Italian Ministry of Health, Classifyfarm serves as a welfare assessment protocol for categorizing livestock farming based on risk levels. On-farm assessments encompass biosafety, farm management, barn structure, animal-based measures (ABMs), as well as hazard and alarming systems. To assess the strengths and weaknesses of extensive rearing in Central Italy, we conducted evaluations on 20 farms situated in the agroecological systems of the Lazio region. These farms primarily raise autochthonous cattle, horses, sheep, and goat breeds. The results offer crucial insights into farm structure and management. Notably, the biosafety section poses challenges for small-scale ones due to their limited herd size and building capacity. Consequently, we emphasize the need for a more tailored questionnaire within the Classifyfarm system, accommodating the unique characteristics of extensive farming. This adaptation is essential for drawing appropriate conclusions about overall categorization. This necessity becomes more pronounced given the association of Classifyfarm usage with public subsidies (Ecoschemes, the national label SQBNA, regional Rural Development Programmes), and the potential future mandate for its implementation. Such a requirement may pose a significant challenge for small-scale and extensive agricultural activities, potentially resulting in the abandonment of these practices. This, in turn, could lead to the loss of substantial local economies and associated ecosystem services. Funding: Activity carried out with the contribution of the Rural Development Program (PSR) Lazio 2014-2022, Operation Type 10.2.1 'Conservation of plant and animal genetic resources in agriculture,' CUP: F85E22000480009.

Season effects on somatic cell count as an indicator for mastitis in Romanian Spotted cows

D. E. Ilie¹, A. E. Mizeranschi¹, C. V. Mihali¹, R. I. Neamt¹, L. T. Cziszer^{1,2}¹ Research and Development Station for Bovine, Calea Bodrogului 32, 310059 Arad, Romania, ² University of Life Sciences Timisoara, Calea Aradului 119, 300645 Timisoara, Romania

Udder health is of high importance for both animal welfare and for economic considerations in regard to milk quality and quantity. The aim of this study was to establish the season pattern during a three-year period of somatic cell score (SCS) in the first 3 lactations of Romanian Spotted cows. A total number of 376 animals with 4429 test-day milk records were used. The values of somatic cell count (SCC) were recorded every 28 days and then transformed to SCS. To determine the season pattern on SCS, a linear mixed effects model was built incorporating pedigree data, using the “lme4qt1” R package. Parity (lactation rank), days in milk, year and season of test day were included as fixed effects, while the animal was used as random effect. Cows in the second (L2) and third lactation (L3) had a significantly higher SCC compared to those in first lactation (L1), resulting in an increase of 0.49 units in SCS between L1 and L2 ($p < 0.01$) and 0.75 units between L2 and L3 ($p < 0.01$), suggesting that higher lactation ranks are associated with higher risks of mastitis. A significant effect of season was observed on SCS and mastitis frequency ($p < 0.05$). Thus, spring was associated with an increased ($p < 0.01$) SCS by 0.25 units compared to summer and by 0.23 units compared to autumn. Also, summer and autumn had higher frequency of healthy cows compared to spring (63.2% and 60.4% vs. 56.2%). There was no significant effect of winter on either SCS and mastitis frequency. These results show an effect of season on SCS. This research was funded by the project ADER 7.1.9/2023.

Session 9

Poster 18

Environmental enrichment in rabbit generations: Impact on behavior and performance

G. K. Nakamura¹, D. Alencar¹, K. G. Silva¹, L. B. Costa¹, R. R. Daros¹¹ Pontifícia Universidade Católica do Paraná, Graduate Program in Animal Science, Imac. Conceição, 155, 80215901 Curitiba, Brazil

Pre and post-natal life experiences of offsprings may impact adulthood and subsequent generations phenotype. Here, we assessed the impact of environmental enrichment during the pre and postnatal phases of rabbits' behavior and performance. In a 2×2 factorial experiment, 16 New Zealand rabbit does were randomly allocated into four treatment groups. During the prenatal phase (0 to 27 days of age), and lactation phase the does were housed in either enriched or conventional cages resulting in four experimental treatments: enriched-enriched (E-E), enriched-conventional (E-C), conventional-enriched (C-E), and conventional-conventional (C-C) housing. Conventional cages measured 80 x 60 x 40 cm, while enriched cages were eight times larger that included hiding spots, two-floor levels, vertical stretching space, and box with wood shavings. After weaning, all kits were moved to conventional cages. For performance we evaluated litter size, number of weaned kits, birth weight, and weaning weight. Two female kits per litter were randomly selected and tested on open field, novel object, and social interaction tests at 90 days of age. The results indicate that only the enrichment during the postnatal phase influenced the outcomes. C-C had on average 8.2±1.2 kits per litter, while E-E had fewer kits (4.2±1.2; $P = 0.03$). C-E and E-C did not differ from C-C. Weaning weight and birth weight showed no differences among the treatments. There were differences in the open field and social interaction tests for C-C compared to C-E but not compared to others. C-C explored less quadrants (15.4±3.01) and had fewer fights (0.0±0.83) compared to C-E (20.9±2.96; $P = 0.07$) and (3.5±0.82; $P < 0.01$), respectively. Therefore, results suggest environment enrichment in postnatal phase impact on behavior and performance of rabbits.

Animal welfare: perceptions and practice evolution in the broiler production in France – A pilot study

C. Lesimple¹, T. Petit¹, C. Dezetter¹

¹ ESA, Animal Production, 54 rue Rabelais, 49000 Angers, France

Over the last decades, animal welfare has become a major societal issue, especially regarding farm animals' breeding conditions. Production systems, in particular those involving highly impoverished environments, must evolve, and breeders are facing new challenges. In France the standard poultry production and the inherent restricted breeding conditions is under scrutiny. As part of a larger research project about the improvement of animal welfare in standard poultry production, the aim of this study was 1- to determine how breeders perceive the interrogations around animal welfare and the improvement propositions, and 2- to identify the improvement strategies they implemented on farm. Semi-directive interviews were conducted with 26 French breeders to characterise the farms, determine their knowledge and interests in terms of animal welfare, identify their perception of the solutions proposed to improve broiler welfare and identify their welfare improvement strategies. Most breeders (76%) had a negative perception of the institutional discourse around animal welfare, mainly because of the lack of economic valorisation of animal welfare friendly practices (38% of the breeders). In contrast, the practical actions aiming at improving animal welfare on-farm were mainly positively perceived, from the participation to professional training to the introduction of enrichment items (e.g. straw bales, pecking objects) (46%: "important", 21%: "improved image"). All the breeders involved in our study included at least 1 enrichment object in their facilities in the last year, and 61.5% included 4 to 5 enrichment items, including an access to daylight. This preliminary study offers a positive insight on the breeders' willingness to address and take over the animal welfare subject, when properly supported.

Session 10

Theatre 1

Livestock are more than food: welcome and introduction

F. O'Mara², M. R. Lee¹

¹ Harper Adams University, Newport, TF10 8NB Shropshire, United Kingdom, ² Teagasc, Oak Park, R93 XE12 Carlow, Ireland

This joint Animal Task Force – EAAP Livestock Farming Systems symposium explores the non-food contribution of livestock. In most farming systems, livestock's main function is food production, but they provide many other products and services such as fibre, hides and skins, energy, manure for fertilisation, feed, insulation of houses, functional components beyond basic nutrition, compounds used in medicine (e.g. insulin, heparin and hyaluronic acid), biodiversity and landscape management (e.g. fire prevention), traction, and contributions to culture, mental wellbeing as well as being an integral part of vibrant rural communities across most of Europe and beyond. In the context of climate change, measurement of the use of animal resources in all its components is a key question, and it is important to take all the products and services provided by livestock into account when assessing their contribution versus their environmental impact. The multiple products provided by livestock limit the value of comparisons with other foodstuffs using single factor assessments as often carried out in life cycle analysis exercises. All these non-food uses, in addition to food, contribute to the closing of the biological cycle, and are key points to reduce waste and valorise the contribution of animal production to the circular bio-economy. Some of them, like manure and drug production are alternatives to the use of fossil resources and contribute significantly to improving the climate balance of animal production. Animal by-products also contribute significantly to land use efficiency where alternative plant-based products would utilise land which could have otherwise been used to produce food directly (e.g. processed animal-protein versus soya). The theme covers all the species and involves all the actors including production, industry, and the co-product valorization sector. The topic aligns closely with EU policies such as the Green Deal and Farm to Fork strategy, the Bio-economy Strategy, Animal By-products legislation, food waste reduction targets, and the Sustainable Food Systems framework.

Role of livestock in circular bioeconomy systems

T. Mcallister¹, B. Amorn⁴, L. Tag², P. Becquet³

¹ Agriculture and Agri-Food Canada, Sustainable Production Systems, 5403 1st Ave South, TIJ 4B1 Lethbridge, Canada, ² FAO, Livestock Environmental Partnership Program Sustainable Production Systems, Viale delle Terme di Caracalla, 00153 Rome, Italy, ³ APHAIA, Grand Est, 2438651 Mulhouse, France, ⁴ Leibniz Institute for Agricultural Engineering and Bioeconomy, Max-Eyth-Allee 100, 14469 Potsdam, Germany

Adopting circularity is key to sustainable food production systems. Livestock are increasingly scrutinized for their greenhouse gas emissions and broad environmental footprint, with their role within the circular bioeconomy often overlooked. To address this, the FAO Livestock and Environmental Assessment and Performance Partnership program convened a panel of 36 experts from 24 countries to develop guidelines to integrate circular bioeconomy principles into the environmental assessment of livestock supply chains. Life cycle assessment and food systems modeling can assess the circularity of livestock systems, but they do not consider all possible indicators. Livestock promote circularity by utilizing plant-based by-products from food and plant oil processing as feed. If not feed, many of these by-products would likely be combusted as fuel, biodigested or landfilled. Besides milk, meat and fibre, livestock produce an array of co-products used in the pharmaceutical, cosmetic, textile and chemical industries. Rendered co-products from meat processing are valuable sources of energy, protein, and minerals. Bio-energy technologies can capture energy from manure and other residues, and recycle organic matter and nutrients back to soils. Circular bioeconomy policies and regulations are key to ensuring that circularity practices offer an overall benefit to food supply chains. These practices need to be assessed regionally so that livestock production practices promote circularity in a manner that minimizes the environmental footprint while optimizing the delivery of ecosystem services from agricultural systems. Besides, assessing these practices will generate the data needed to inform the development of livestock food systems through a circularity lens.

Session 10

Theatre 3

Beyond edibles: unveiling the full socio-economic value of animal production through non-food products in circular economy designs

L. Cembalo¹

¹ University of Naples Federico II, Department of Agricultural Sciences, Via Università 100, 80055 Portici, Italy

The increasing awareness of the environmental footprint of livestock farming, alongside concerns regarding animal welfare and the health implications of excessive meat consumption, has galvanized a reevaluation of dietary norms globally. As the urgency to mitigate these impacts grows, the quest for sustainable dietary alternatives to meat becomes paramount. This research proposes to explore the comprehensive effects of transitioning towards diets with reduced meat content, evaluating not only the environmental but also the economic, social, and cultural dimensions of sustainability. A critical but often overlooked aspect of reducing meat consumption is the circular economy engendered by livestock farming by-products. For instance, animal manure plays a vital role in agriculture, serving as an organic fertilizer, while the leather industry, highly reliant on animal hides, underscores the economic significance of meat production by-products. Cultural factors also play a pivotal role in dietary choices. The challenge lies in balancing respect for cultural heritage with the imperative for sustainable consumption patterns. As alternatives to meat gain traction, understanding their potential impacts on cultural practices becomes crucial. Moreover, the sustainability impacts of meat alternatives across their life cycles remain under-researched. Questions persist regarding the environmental, social, and economic ramifications of scaling alternative protein sources. For instance, the cultivation of certain crops for alternative proteins could entail significant land use, water consumption, and possibly, the displacement of traditional farming practices. This research aims to offer a comprehensive analysis of the costs and benefits associated with reducing meat consumption, drawing on the latest research to map out the multifaceted dimensions of sustainability involved. By examining the economic circularity stemming from livestock by-products, alongside the social and cultural implications of dietary shifts, the goal is to present a holistic view of what a sustainable dietary future might entail.

Genetic determinism of quality of lamb leather in Lacaune dairy sheep breed

L. Drouilhet¹, E. Dugas¹, F. Woloszyn¹, F. Plisson-Petit¹, J. Gayraud², J. C. Duchêne³, J. Frayssignes⁴, A. Gille⁴, S. Brenot⁵, D. Allain¹, H. Larroque¹

Surgères, France

Enhancing the economic valorization of by-products from dairy farming, such as skins and wool, serves as an important element in ensuring the economic sustainability of sheep farming. However, achieving this improved valorization necessitates a comprehensive understanding of the factors influencing the quality of these by-products. Lacaune lamb skins have long been esteemed for their exceptional quality. Over the past few decades in France, however, the quality of this leather has declined, primarily attributed to the increasing prevalence of two skin defects: pinhole and straw-like bushiness. To explore the genetic determinism of these defects and their potential correlation with wool traits, approximately 1400 Lacaune lambs from 72 rams underwent phenotyping for the two skin defects and four wool traits. The pinhole defect exhibited a high heritability (0.59 ± 0.07) and demonstrated a strong genetic correlation with the predicted core bulk of the wool ($rg = 0.54 \pm 0.08$). The straw-like bushiness defect displayed a lower heritability (0.25 ± 0.06) and was found to be correlated with the mean fiber diameter ($rg = 0.41 \pm 0.15$). In an initial study, the two skin defects exhibited either null or only weak genetic correlations, most often favorable, with milk production traits (milk yield, fat and protein contents). A genome wide association study revealed for the pinhole defect one major signal on chromosome 3 close to a cluster of keratin genes.

Session 10

Theatre 5

A systemic description of the dairy value chain's contribution to inclusive sustainable development in highland

A. Ceppatelli¹, C. Pozo², C. Bonnet², M. Vogg³, P. Strankman³, L. Wedderburn³, E. Sturaro¹

¹ University of Padova, DAFNAE, Viale dell'Università 16, 35020 Legnaro, Italy, ² CIT Formosa, CONICET,

Universidad Nacional De Formosa, 3600 Formosa, Argentina, ³ HIGHLANDS.3 Consortium, Viale dell'Università 16, 35020 Legnaro, Italy

The present research, conducted in the framework of the HIGHLANDS.3 project (H2020, MSCA-RISE) aims to investigate on the benefits of the dairy value chain beyond food provision, and their contribution to inclusive sustainable development in highland. A transdisciplinary team interviewed 15 cases related to the dairy value chain across four highland regions in Europe: Alps, Carpathians, Pyrenees, and Massif Central. Actors interviewed were farmers, cooperatives, retailers and associations. A system thinking approach was adopted to process data. For each case were identified the factors contributing to inclusive sustainable development in highland, then clustered within similar topics. Then, a comparative analysis identified commonalities and differences between the cases. A causal loop diagram (CLD) was constructed for each region and another CLD integrating the regional data. The CLDs were then interrogated to identify subsystems and potential points of leverage, to enhance the sustainability of the system and to identify differences and similarities across the regions. The results indicate that dairy value chain in mountain areas provides multiple benefits beyond food production. They include enhanced ecosystem services, strengthened local communities, added value products, protected local resources and strengthened farm families. Activities like cooperation, diversification of activities and local commercialization contribute to strengthen the local community. Differences between the cases included traditional practices (transhumance), re-use of by-products and action to reduce the environmental impact.

What is the performance of a low-input sheep flock integrated into an agroecological field crop system?

M. Benoit¹, T. Boistard¹, O. Brodin², D. Marcon¹, L. Sagot³, J. Boucherot¹

¹ INRAE, P3R, 18390 Osmoy, France, ² Chambre d'Agriculture, route d'Orléans, 18230 Saint-Doulchard, France, ³ IDELE-CIIRPO, Le Mourier, 87800 Saint Priest-Ligoure, France

The association of animals and crops is a way of strengthening the sustainability of farming systems. For two years, we tested the association of 180 ewes with field crops grown without synthetic pesticides, on an experimental farm. The most fundamental point was to graze the intercrops planted after crops had been harvested. To achieve this, lambing was planned in September, and the great majority of lambs were fattened exclusively on these resources from November until their sale in April. The flock was kept in complete free-range conditions. Productivity results were high, with an average 1.45 ewe productivity and lambs carcass weight rather high (18.4kg). The use of concentrates (both for ewes and lambs) was limited to 3.4 kg per kg of carcass produced, compared with 9.6 kg for conventional sheep-crop farming systems. This technical performance translates into high economic and environmental performance: €126 gross margin per ewe (vs. €95 in reference), 24.3 EqCO₂/kg carc. (vs 31.6 in ref), and 65 MJ/kg carc. (vs 92). However, this performance could be improved as it is penalized by two points: the relatively high level of nitrogen fertilization, in view of crop yields, and the high proportion of lambs reared on artificial milk and then fattened with concentrates (24% of lambs), linked to the very high prolificacy. We consider these results to be promising. Not only does this system deliver excellent economic and environmental performance, it also meets the demands of the industry, with sales at the end of winter. However, we still have to overcome the cultural and organizational obstacles associated with setting up sheep flocks on specialized crop farms.

Session 10

Theatre 7

Livestock manure for fertiliser and biofuels

H. Bjarne Møller¹

¹ Aarhus University, Department of Biological and Chemical Engineering, Blichers Allé 20, 8830 Tjele, Denmark

Livestock manure is a very important resource of plant nutrients and contains large amount of organic material that can be converted to energy and fertilizer (digestate). At the same Livestock manure is a major source of the greenhouse gases (CH₄ and N₂O) and a source of nitrogen and phosphor pollution. The emissions can be mitigated by production of biogas through anaerobic digestion (AD) of manure, mostly together with other biowastes, which can substitute fossil energy and thereby reduce CO₂ emissions and postdigestion GHG emissions (Møller et al. 2022). The nutrient value in digestate can be improved and replace significant amounts of mineral fertilizers and improve soil fertility. In countries like Denmark almost all biogas plants use co-digestion and the biomass used for AD is highly variable between biogas plants. Almost all AD plants use around 75% of the biomass as manure. The feeding of animals and the stable system plays a large role for the quality of the manure for AD and the environmental impacts. Furthermore, additives like lipids used to reduce enteric fermentation in dairy cows plays a role for the energy yield and environmental impacts (Møller et al. 2014). The digestate products and its value as fertilizer depends on the biomass used and the biogas technology. In general, the fertilizer value can be improved by AD but the ammonia emission potential of digestate applied in the field is higher than that from cattle slurry and pig slurry because of the higher pH of the digestate. However, there are several technologies available to reduce losses of ammonia. The current knowledge on energy potential, climate impact and nutrient value of digestate from different types of animals, feeding of the animals and biogas technologies will be presented. Cow's Milk – Going beyond basic nutrition to harness functional components

*P. Cotter*¹

¹ *Teagasc, Teagasc Food Research Centre, P61 C996 Fermoy, Ireland*

Milk protein consists of ~80% casein and ~20% whey proteins. These whey proteins include alpha-lactalbumin, beta-lactoglobulin, lactoferrin, glycomacropeptide, serum albumin, lactoperoxidase, immunoglobulins and other components that possess a variety of different health promoting functionalities, i.e., go beyond basic nutrition. The functionality of milk can be further optimised through processing to enrich some of the aforementioned functional components in whey, through enzymatic hydrolysis of milk to reveal new functionalities (such as cryptic peptides) or fermentation (generating yoghurt, kefir and other potentially health promoting products). Associated benefits arising from the consumption of such functional ingredients can include, for example, the control of weight, appetite, inflammation, hypertension, stress as well as prebiotic effects and benefits arising from modulation of the gut microbiome.

Session 10

Theatre 9

Evolving standards: ethical perspectives on animal welfare in agroecology

J. Goracci^{1,2}

¹ *Tenuta di Paganico Farm, Via della Stazione, 10, 58045 Paganico (GR), Italy,* ² *Italian Agroforestry Association, Via Frattesina, 8, 35040 Masi (PD), Italy*

Animal welfare (AW) is a crucial aspect of the EU's Farm to Fork strategy, which seeks to expedite the shift to sustainable food systems through integrated food policies. Agroecological farming encompasses extensive, circular, and mixed farming models that safeguard biodiversity, recycle nutrient, regenerate, and preserve local resources and knowledge, and promote a holistic interaction between nature, animals, and humans. However, there are still many challenges to overcome. For instance, horizontal legislation lacks a clear definition of "factory farming" and there is a shortage of EU standards to ensure the AW of farmed animals. The current situation is impeding the transition phase and creating uncertainty in a livestock system that is frequently in crisis, and characterised by ageing, abandonment, and low economic marginality. Attempts have been made to bridge this gap, but often through the implementation of top-down measures that aim to standardise and unify biodiversity, resulting in detrimental spillovers on the safeguarding of heritage breeds and small-scale farms particularly in marginal areas. This approach of imposing "one size fits all" solutions should be avoided, and a more nuanced and context-based approach is needed. Coherent, and effective examples of policies tailored to the "farmers' first" concept have to be followed more closely, e.g. i) a new evaluation system where "animal-based" parameters would become the cornerstone of an on-farm AW assessment in different farming contexts, and in all regions; ii) a participatory approach to livestock selection with a direct animal assessment carried out by farmers for qualitative traits could shift breeding goals towards functional rather than production traits; iii) fostering technical solutions able to represent agroecology as productive and profitable food production system even without requiring massive subsidies: a transition from sustainable intensification to sustainable extensification of agriculture is needed, through a process of ecological increase; iv) a large scale deployment of the "One Welfare" approach as an horizontal framework to promote AW in connection with human welfare, social justice, and environmental conservation.

Session 10

Growth performance of black soldier fly (*Hermetia illucens*) reared on substrate mixtures from regional agricultural and food production side-streams

T. Freimuth¹, M. Mielenz¹, G. Das¹, L. Hüther², S. Dänicke², C. C. Metges¹

¹ *Research Institute for Farm Animal Biology (FBN), W.-Stahl-Allee 2, 18196 Dummerstorf, Germany,* ² *Federal Research Institute for Animal Health, Bundesallee 37, 38116 Braunschweig, Germany*

Larvae of the black soldier fly (BSFL) can convert feed and food residues into high quality protein and lipids. The aim of this study was to develop biomass residues mixtures (BRM) from regionally available plant and animal residues. The BRM, named after the main protein source (high fish (HIFI), low fish (LOFI), *Silphium perfoliatum* (SIPE), pork slaughter (SLRE) and canned fish (CAFI) residues) were nutritionally characterized and contained 14-21% CP, 8-15% CL and 22% NDF. The BRM were adjusted to 30 % DM and growth performance was compared with a positive control (chicken feed, CF) and a standard fly diet (Gainesville diet, GD). All substrates were fed (5 kg FM/box (40*30*17cm), n=6, N=42) to 5-day-old BSFL (5dof) until first prepupa were present. Then nutrient contents of BSFL and frass were determined and data were analysed statistically (Proc mixed, Tukey-Kramer, SAS). The fattening period was longest for SLRE, CAFI, SIPE (18 d), intermediate for HIFI, LOFI, CF, and shortest for GD (14 d). The numbers of larvae harvested for CF, GD, HIFI, LOFI, SIPE were similar to numbers of 5dof. Individual body mass was lowest for GD (113 mg), intermediate for BRM (HIFI 178 mg), and highest for CF. Larvae mass/box was in ascending order SLRE, CAFI, GD, SIPE, LOFI, HIFI, CF (951 g/box). Overall, CF performed best, followed by HIFI and LOFI. Surprisingly, growth on SIPE was better than on CAFI and SLRE, despite of lower CP. Concluding, nutrient digestibility and physical properties of the BRM could explain the differences, but this requires additional research. Funding: Federal Ministry of Education and Research, FK 031B0915L6.

Fortification of circular substrate for black soldier fly with zinc and/or selenium: effect on growth performances

A. Moradej¹, M. Ottoboni¹, C. Jucker³, S. Savoldelli³, S. Malabusini³, A. Luciano¹, L. Pinotti^{1,2}

Zinc (Zn) and Selenium (Se) are essential trace elements for livestock. To ensure an adequate intake is achieved, several supplementation sources have been studied. Emerging and innovative sources, such as Zn and Se-enriched insects, could be useful for their potential use in animal nutrition. The purpose of this work was to study the effects of including Zn and/or Se in the rearing substrate of black soldier fly larvae (BSFL), where a lack of information regarding growing performance effect was identified. In this study, BSFL were reared on five different substrates: a control substrate (CTR diet) of plant-ingredients (Gainesville diet); Okara and Potato Waste based substrate (OPW); OPW-Zn fortified with 150 mg/kg of Zn; OPW fortified with 0.3 mg/kg of Se; and OPW-Zn+Se fortified with 150 mg/kg of Zn + 0.3 mg/kg of Se. All experiments were carried out under dark condition, at 26 °C with 60% relative humidity and the growth performance of the resulting larvae and prepupae were observed. The mean larval weight was not influenced by treatment ($P>0.05$). In contrast, the CTR group showed significantly higher larval biomass yield at the end of the trial ($P<0.05$). The number of resulting larvae and their survival rate were not influenced by the treatment ($P>0.05$). These results suggest the possibility of use these substrates. However, more studies are necessary to determine the effects on reproductive performance of BSF adults as well as their proximate composition. Funded by Agritech National Research Center, spoke 8

Optimal balance between protein and carbohydrate in industrial diet for black soldier fly larvae (*Hermetia illucens*)

J. De Montigny^{1,2}, C. Brouzes¹, F. X. Boulanger¹

¹ Agronutris, R&D Department, 18 Rue du Négoce, 31650 Saint-Orens-de-Gameville, France, ² Université Paris-Saclay, AgroParisTech, 22 place de l'Agronomie, 91120 Palaiseau, France

Black soldier fly larvae (BSFL), *Hermetia illucens*, can efficiently convert organic substrates into insect biomass, which is suitable for livestock feed. The performance of BSFL depends on the macronutrient composition of their diet, and especially on protein (P) and carbohydrate (C) content. This study uses a geometric approach to determine the effect of different ratios between P and C concentrations in semi-industrial diets formulated with cereals and tubers by-products typical from North-East of France. Seventeen oligidic diets varying in their P and C concentrations were formulated, with C+P concentrations ranging from 25% to 65% and C:P ratios from 1:1 to 4:1. These diets were used to feed the BSFL for seven days. The impact on the feed conversion ratio (FCR), protein and lipid content of 14-day-old larvae (14 DOL) was assessed. Initial feed provided and frass were also analyzed to account for estimated digestibility of P and C. Our results indicate that BSFL performance is more affected by C+P concentrations than C:P ratios. The best-performing diets for minimizing FCR were those with a C+P concentration superior to 45%, while the 14 DOL protein plus fat content was maximized with diets containing approximately 50% C+P and a C:P ratio between 2:1 and 4:1. These findings complement existing literature by studying semi-industrial diets with a narrower range of P and C, and accounting for macronutrient digestibility. They confirm the significance of the diets P and C content in optimizing BSFL performance at an industrial scale. Future research should explore optimal ratios different types of carbohydrates and amino acids to further optimize BSFL performance.

Evaluating amino acid requirements of neonatal black soldier fly larvae

Amino acid (AA) requirements of black soldier fly larvae (BSFL) during the early nursery phase remain poorly understood. We conducted a feeding trial including a semi-artificial low-protein nursery diet (NC) that was complemented with 20 free AA to reach 18% protein content (PC) and to simulate the AA profile of a commercial laying hen feed (RC). In 12 additional treatments, relative to PC levels, either Arg, Ile, Lys, Met, Thr, or Trp contents were reduced by 31-46% via leaving out respective free AA or individually supplemented to 131-146% (-AA vs. +AA treatments). Each treatment was triplicated with 10,000 freshly hatched (naïve) BSFL and restrictively provisioned with 10 mg dietary dry matter per larva. Growth was most delayed with NC and -Lys. Conversely, -Met and -Trp responses were similar to PC while growth curves for -Arg, -Ile and -Thr were intermediate. Adding Met, Thr, Trp, and Ile did not improve performance over PC, but +Lys and +Arg both steeped growth, resulting in fastest readiness for fattening. All single -AA treatments needed 1-5 days more than respective +AA treatments to reach critical larval live weights (~10 mg). For the actual basal diet, we conclude that neonate BSFL growth is first limited by Lys and co-limited by Arg, Ile and Thr, whereas Met and Trp seem indifferent.

Amino acid requirements of the black soldier fly larvae (*Hermetia illucens*)

I. E. Berggreen¹, M. L. Schøn¹, J. V. Nørgaard¹, K. Jensen¹

¹ Aarhus University, Department of Animal and Veterinary Sciences, Blichers Alle 20, 8830 Tjele, Denmark

The nutritional requirement of black soldier fly larvae (BSFL; *Hermetia illucens*) is important for optimizing production of BSFL and assess the applicability of different feedstuffs based on chemical content. However, little is known about the amino acid (AA) requirements. The current study explored if the AA profile of chicken feed is the optimal for BSFL. The optimal AA concentrations were tested for ten AA that are essential for mammals: Met, Lys, Ile, Leu, Phe, Thr, Trp, Val, Arg, and His. A diet containing chicken feed, carbohydrate mix, cellulose, crystalline AA mix, mineral mix, and agar served as basal diet with 15.2% crude protein. The AA profile from the crystalline AA mix resembled that of chicken feed, except for the AA to be evaluated. Experiments took place in a climate chamber with a temperature of 27±1°C and relative humidity of 55±10%, in 370 mL plastic containers, containing 100 g experimental diet and 123 larvae. Larvae were 6 days old at the experiment start, and the experiment lasted for eight days. Each treatment had seven replicates. A dose-response experiment was carried out on each of the ten AA, investigating growth and survival at seven different concentrations of the AA. Addition of Met, Arg, and His did not improve larval growth, indicating the lowest tested concentration of 1.75g Met, 5.12g Arg, and 2.00g His/kg DM were sufficient for optimal growth. Only for Thr, larvae exhibited greater weight gain when exposed to a concentration higher than those currently found in chicken feed (6.49 g/kg DM). Val supported optimal larval growth at concentrations equal to chicken feed (7.62 g/kg DM). For Lys, Ile, Leu, Phe, and Trp, the concentrations resulting in highest larval weight was lower than in chicken feed (6.99 g/kg DM, 5.72 g/kg DM, 8.01 g/kg DM, 5.04 g/kg DM, and 1.47 g/kg DM, respectively).

Growth performance of black soldier fly larvae on high fibrous residual streams pretreated by composting and fungi

T. Veldkamp¹, E. Hoek - Van Den Hil², P. Van Wikselaar¹, E. De Lange², L. Francuski³, R. Zheng³, S. Naser El Deen¹
¹ Wageningen Livestock Research, De Elst 1, 6700 AH Wageningen, Netherlands, ² Wageningen Food Safety Research, Akkermaalsbos 2, 6708 WB Wageningen, Netherlands, ³ Protix, Van Konijnenburgweg 86, 4612 PL Bergen op Zoom, Netherlands

High volumes of high-fiber residual streams are often used in biomass energy plants. Alternatively, these could be used in substrates to grow black soldier fly larvae (*Hermetia illucens*; BSFL). Therefore, this study aimed to assess the growth performance and safety of BSFL reared on reed, grass, Japanese knotweed, and nature straw after composting and inoculation with fungi. Pilot experiments were performed to select the most promising combinations for a large-scale study. In pilot 1 growth performance was determined in 41 combinations of residual streams with 50 BSFL per treatment (25 g of substrate; n=1). Composted nature straw whether or not with fungi, and composted reed, grass, and Japanese knotweed were the most promising treatments and selected for pilot 2 with 200 BSFL per treatment (100 g of substrate; n=3). Survival of the larvae was close to or over 90%. The yield was the highest with composted nature straw as a substrate as it resulted in an average fresh larval weight gain of 26 mg in a six-day larval period. The growth performance of the tested residual streams was low compared to chicken feed as reference substrate (larval weight gain of 111 mg), indicating a low nutritional value. In follow-up experiments, the additional value of the side streams will be tested as a structure ingredient in substrates consisting of chicken feed to study possible stimulating effects on the growth performance of BSFL.

Fat chemical characteristics of the Black soldier fly larvae fed different diets

M. Tognocchi¹, S. Tinagli¹, G. Foggi¹, A. Serra¹, M. Mele¹, G. Conte¹

¹ University of Pisa, Department of Agriculture, Food and Environment, via del Borghetto 80, 56124 Pisa, Italy

Black soldier fly larvae (BSFL) can transform organic wastes into an enriched nutritional biomass useful in animal feeding. So, BSFL may be useful to increase sustainability of animal derived food. However, little information is available about the effect of diet on the fat nutritional value of BSFL. The aim of this work was to study the effect of five diets (based on meat or fruit or vegetable substrates or a mix of them and control) on fatty acid (FA) profile of triglycerides, phospholipids, and sterols. The dietary effect was estimated on two BSFL populations obtained in two different facilities located in Greece (GRE) and Italy (ITA)UNIFI. The diet affected all the lipid fractions examined. Independently of diet, the larval fat was characterized mainly of lauric acid and other saturated FA. In general, UTH larvae contained a higher level of total lipids and saturated FA and a lower percentage of unsaturated FA. BSFL fed control and fruit diets showed higher level of lipids and saturated FA, while the presence of meat in the diet increased the level of C20:4n6, C20:5n3 and C22:5n3. The C18:2e9t11 was also detected, especially in fat from larvae fed vegetable and fruit diets. The results confirmed that BSFL accumulate phytosterols in their lipid fraction. The sterol content between the two populations was significantly different, with a higher percentage in GRE larvae. Finally, BSFLs showed high plasticity in the lipid profile according to both the substrate and the population adopted. Nutritional characteristics of the BSFL may be shaped by modifying the substrate, in order to obtain tailored technological and feeding features.

Fatty acid profile of black soldier fly larvae reared on winery by-products

*M. Renna*¹, *C. Lussiana*², *L. Livorsi*², *M. Mele*³, *G. Conte*³, *L. Gasco*²

¹ University of Turin, Dept. Veterinary Sciences, L.go Braccini 2, 10095 Grugliasco, Italy, ² University of Turin, Dept. The black soldier fly (BSF) is attracting interest for its ability to convert organic waste and by-products into high-value feeds. This study aimed to assess the effect of using, as rearing substrate, grape pomace (GP) from a red (Bequet, B) and a white (Moscato, M) variety on the fatty acid (FA) profile of BSF larvae (BSFL). The two GP were analysed for their proximate composition and phenolic fractions, while both GP and BSFL were analysed for their FA profile. The M-fed BSFL showed a higher total lipids (TL) content than the B-fed ones ($P < 0.05$). The contents of saturated ($P < 0.001$) and monounsaturated FA ($P < 0.05$) were higher, while those of branched-chain and polyunsaturated FA ($P < 0.001$) were lower in M-fed than B-fed BSFL. Interestingly, we detected the presence of conjugated linoleic acid (CLA) in GP (0.10 and 0.16 g/100 g TL in B and M, respectively), most probably as the consequence of the presence of lactic acid bacteria, which possess linoleate isomerase activity, involved in malolactic fermentation. In B-fed BSFL, we then observed a bioaccumulation of CLA up to 2.95 g/100 g TL, while levels remained considerably lower in M-fed BSFL (0.05 g/100 g TL). Several hypotheses can be postulated for such results, among which the presence of Stearoyl Co-A desaturase enzyme in BSFL and the presence of lactic acid bacteria in BSFL gut. In a circular economy perspective, winery by-products could be valorised within BSFL rearing media with the aim of obtaining BSFL enriched in FA of potential nutraceutical interest. (Supported by AgriTech National Research Center – PNRR CN 00000022).

Efficiency of rearing yellow mealworms (*Tenebrio molitor* L.) on fibre-rich composted and mycoremediated residual streams

*S. Naser El Deen*¹, *E. F. Hoek* – *Van Den Hil*², *P. Van Wikselaar*¹, *E. De Lange*², *N. Steeghs*³, *T. Veldkamp*¹

¹ Wageningen Livestock Research, De Elst 1, 6700 AH Wageningen, Netherlands, ² Wageningen Food Safety Research, Akkermaalsbos 2, 6708 WB Wageningen, Netherlands, ³ Ynsect, Harderwijkerweg 141B, 3852 AB Ermelo, Netherlands

Yellow mealworms (YM) have gained attention for their potential applications across various domains (food, feed, biotechnology, and waste management). They can transform organic waste, including food scraps and agricultural by-products into valuable products. This study aimed to assess the efficacy of rearing YM on low-value, high-fibre organic residual streams. Reed, grass, Japanese knotweed (JK) and nature straw were either ensiled, composted and inoculated with fungi or pasteurised and inoculated with fungi before being tested in two pilot experiments (50 YM/treatment) to identify optimal combinations for a subsequent large-scale experiment. In pilot 1, growth performance was evaluated across 44 combinations after 33 days of incubation. Composted JK exhibited better growth performance in terms of survivability (92%) and weight gain (5mg/larva) compared to the other treatments. In pilot 2, wheat bran (WB), corn starch and pea protein were incorporated to enhance the nutritional content of JK, while considering the effect of particle size through shredding. Thirteen treatments, including WB and ensiled JK as controls, were assessed in triplicates. The YM survival rate was high (>85%) across most treatments. However, larvae reared on JK:WB mixtures (10:90 and 30:70 ratios) displayed the highest weight gain (95 and 90 mg/larva respectively) and low FCR (~2 g:g). Conversely, the composted JK treatment without additives yielded lower larval weight gain (24 mg/larva). Thus, the inclusion of JK to WB may have likely improved the dietary structure but did not significantly augment nutrient provision.

New life for rice by-products through yellow mealworm bioconversion

A. Resconi¹, S. Bellezza Oddon¹, Z. Loiotine¹, R. L. Passaro¹, K. Y. Mendez Rondo¹, L. Gasco¹, J. Bacenetti², I. Biasato¹

¹ University of Turin, Largo Paolo Braccini 2, 10095 Grugliasco, Italy, ² University of Milan, via Celoria 2, 20133 Milano, Italy

Tenebrio molitor (TM) is commonly reared on substrates with high dry matter (DM) content, thus including rice by-products (i.e., rice hull, rice husk, green grains, broken rice). However, information about the suitability of rice by-products as TM substrate are still limited. This study aims to evaluate the effects of rice by-products-based diets on growth and bioconversion efficiency of TM larvae. Five isonitrogenous (18% crude protein [DM]), isolipidic (3% ether extract [DM]) and isoenergetic (18 MJ/Kg [DM]) diets were tested (5 replicates/diet, 10000 3-week-old larvae/replicate, 0.26g/larva): C (control diet; feed waste, breeding waste, dry distillery stillage, coffee silvery film and hazelnut film), WR1 (10.5% of white rice by-products), WR2 (26.5% of white rice by-products), PR1 (17% of parboiled rice by-products), and PR2 (42.5% of parboiled rice by-products). Larval weight was recorded at the beginning of trial and every week. Specific growth rate (SGR), feed conversion ratio (FCR), survival, efficiency of conversion of digested food (ECD), and sieveability percentage (SP) were calculated at the end of larval growth (growth $\leq 50\%$). Data were analysed using SPSS software. Diet did not influence survival and development time ($P > 0.05$). However, all the rice by-products-based diets led to higher final larval weights and SGR than C group ($P < 0.05$). The lowest ECD was observed in WR1 and C larvae ($P < 0.001$), but both displayed the highest SP ($P < 0.001$). Lower FCR was also observed in WR2-fed larvae in comparison with C diet ($P < 0.05$). In conclusion, rice by-products are able to improve growth performance and bioconversion efficiency of TM larvae, with white rice being preferable in terms of SP. The research was supported by Fondazione Cariplo (newRIFF project).

Optimizing the reproduction of *Tenebrio molitor*

D. Deruytter¹, J. Claeys¹, C. L. Coudron¹

¹ Inagro, Insect Research Centre, Ieperseweg 87, 8800 Rumbeke-Beitem, Belgium

Numerous publications already indicate that *Tenebrio molitor* can be a great source of sustainable animal protein for both feed and food. However, in general these papers refer to environmental sustainability and not economic sustainability. The latter is often difficult due to a lack of specialized knowledge and equipment resulting in fairly high investment or operational costs. One of the ways to lower the costs is to improve the reproduction ensuring that less space and resources have to be allocated to this part. At the Insect Research Centre several experiments were performed in order to improve the reproductive output. In a first experiment the particle size of the feed of the adults was assessed. This parameter may affect the density of the feed and therefore the way beetles can borrow in the feed, layer thickness and 'air' gaps. It was observed the particle size of the feed had a major impact on the egg production with smaller particle size resulting in a higher output. In a second trial the effect of the size of the beetles (male and female) on the reproduction was assessed both on the willingness to mate and on the reproductive outcome. In a third trial the sex ratio and the possibility for multiple copulations was assessed. Preliminary results indicate that the beetle size has less of an influence than anticipated, while the sex ratio and multiple copulations did significantly alter the number of offspring. The combined results of these experiments will improve the reproductive output and decrease the space and time allocation.

Comparative larval growth of *Alphitobius diaperinus* populations on various substrates

G. V. Baliota¹, N. Steeghs², C. I. Rumbos¹, C. G. Athanassiou¹

¹ *University of Thessaly, Department of Agriculture and Rural Environment, Phytokou, 38446 N. Ionia, Greece,*

² *Ynsect SAS, 1 Rue Pierre Fontaine, 91000 Évry-Courcouronnes, France*

The lesser mealworm, *Alphitobius diaperinus* (Panzer), is a promising species for mass production due to its potential as a nutritious source for feed and food. Nonetheless, there is still plenty of room for improvement regarding its production. For instance, traditional livestock animal production typically involves the utilization of strains or breeds with favorable production characteristics for intensive farming. However, in the case of *A. diaperinus* the effect of the genetic material has not yet been thoroughly evaluated. To this end, the larval growth of two wild populations from Turkey and USA, one laboratory and one wild population from Greece, and two populations from commercial rearing facilities in the Netherlands was comparatively evaluated in laboratory trials. All populations were evaluated in flour of 100% wheat bran, rice hulls or sunflower seeds. The results indicated considerable differences among the populations with regard to their larval development, as well as to their feed conversion efficiency parameters. The study aims to highlight the significance of selecting *A. diaperinus* populations with specific traits to improve the overall efficiency of the farming systems. The research work was partially supported by the Hellenic Foundation for Research and Innovation (HFRI) under the 4th Call for HFRI PhD Fellowships (Fellowship Number: 11297) and by the COST Action <Improved Knowledge Transfer for Sustainable Insect Breeding (Insect-IMP), CA22140>, supported by COST (European Cooperation in Science and Technology).

Black soldier fly: progress and challenges

A. Van Huis¹

¹ *Wageningen University & Research, Droevendaalsesteeg 1, 6708 Wageningen, Netherlands*

Most insect-derived products are used as petfood and the rest as aquafeed, and poultry and pig feed. This to replace fishmeal or soybean meal, the use of which is questioned because of sustainability reasons. Plant proteins are often used but there are nutritional problems. The black soldier fly (BSF) can be reared on a wide range of organic side streams. Ninety percent of all BSF publications are from the last six years. BSF larvae naturally produce a diversity of antimicrobial peptides to protect themselves from the environment full of microorganisms in which they live. These peptides exert a positive impact on animal health and can be used as potential antibiotic replacements. In mass rearing, BSF's immune system can be influenced through the microbiome. Up till now hardly any disease has been reported for BSF. Companies select BSF strains to convert certain waste streams efficiently. Abiotic factors can influence the protein and fat content of BSF, while waste streams can influence the fat but not the protein content. Depending on the aquaculture species, up to 100% full fat or defatted BSF meal can replace fishmeal. In poultry and pig feeds, 10% of plant protein sources can be replaced. Live BSF larvae also promote the natural foraging behavior of poultry (reduced feather picking) and pigs (reduced tail biting). In pet food, inclusion of BSF meal may have health hypoallergenic effects. In the European Union, regulatory frameworks for insect-derived products are slowly becoming more conducive. BSF fats can be used as biodiesel or fuel, in cosmetics (skincare products), and as surfactants, and protein for making bioplastics. BSF is increasingly used for bioremediation purposes. Left-over substrates (frass and exuvia) can be used as fertilizer, crop protection agent, and for drought control. Nanoplastics can move up the food chain, with BSF larvae as intermediate. The price of BSF meal is still too expensive but is expected to go down. Innovations are being expected in automation of production techniques, optimization of bioconversion (efficient interaction between microbes in the insect gut and feed substrate), disease management, selection of effective strains, food safety issues and processing.

Assessing the optimal carbon-to-nitrogen ratio to improve black soldier fly larvae production for future use as animal feed

T. Thiabching¹, S. Okrathok¹, C. Pukkung¹, M. Sirisopapong¹, S. Khempaka¹

¹ Institute of Agricultural Technology, School of Animal Technology and Innovation, Suranaree University of Technology, 30000 Nakhon Ratchasima, Thailand

The global livestock production industry is expanding as the world population increases, resulting in a high demand for animal feed. In particular, protein sources such as soybean meal and fish meal are becoming increasingly scarce and costly annually. Therefore, studies to find a sustainable alternative feed source to reduce reliance on limited resources, such as black soldier fly larvae (BSFL) are of great interest. However, BSFL still exhibit several limitations that require additional research for a comprehensive understanding, particularly in optimizing the essential nutrients for their growth. The aim of this study was to investigate the optimal carbon-to-nitrogen ratio (C/N ratio) for BSFL. Cassava pulp and layer manure were selected as carbon and nitrogen sources, respectively. A batch of 5-day-old BSFL was divided into eight groups, each comprising six replicates. The experimental diets are as follows, Group 1 : control group (commercial chicken feed, 21% CP), while groups 2 through 8 were subjected to varying C/N ratios of 10:1, 15:1, 20:1, 25:1, 30:1, 35:1 and 40:1, respectively. The BSFL were reared until the prepupae stage, with observations initiated from the appearance of the first pupae in each treatment group, followed by harvesting the next day. The results indicated that feeding the BSFL at a 15:1 of C/N ratio revealed the most optimal productive performance. Moreover, it showed positive results in waste-to-biomass conversion rate and waste reduction rate ($P < 0.05$). This suggests that the optimal ratio of C/N ration for BSFL growth is at 15:1. Future research should focus on investigations into the use of 15:1 C/N ration with other alternative materials.

Promoting insect farming sustainability with the utilization of oilseed presscakes as nutrient-rich feed for *Tenebrio molitor* larvae

C. Chrysanthopoulou¹, C. Adamaki-Sotiraki¹, C. Rumbos¹, C. Athanassiou¹

¹ University of Thessaly, Department of Agriculture, Crop Production and Rural Environment, Phytokou Str., 38446 Volos, Greece

Coupled with the valorization of agricultural byproducts, insect farming aims to fulfill the principles of circular economy. In this context, recent research has focused on the utilization of a variety of agricultural byproducts as insect feed, in order to close the loop in the food chain by repurposing agricultural waste. However, the potential of oilseed presscakes, the byproduct of oilseed processing, has not been thoroughly investigated yet. This study investigates the efficacy of utilizing oilseed presscakes as feeding substrates for larvae of the yellow mealworm, *Tenebrio molitor*. The tested presscakes derived from the production of pumpkin, sunflower, cannabis, linseed, thistle, walnut, almond, and sesame and all had a high protein, lipid and energy content. For the bioassay, 50 early-instar larvae were introduced in vials (7.5 cm diameter) and fed with each of the presscakes, while agar served as moisture source. Larval survival and growth were evaluated until the emergence of the first pupa. The feed conversion ratio (FCR) and the total development time were also determined. The results demonstrate the potential of oilseed presscakes as valuable feeding substrates that can provide balanced nutrition for *T. molitor* larvae. Furthermore, this research underscores the sustainability of insect-based protein production systems within the circular economy framework. Financial support for this research has been provided by PRIMA, a program supported by the European Union, under grant agreement No 2231, project CIPROMED (PRIMA Call 2022 Section 1 Agri-food IA).

Performance and bioconversion of black soldier fly across different content of fiber and protein in the substrates

A. Hosseindoust¹, S. R. Park¹, S. D. Choi¹, P. Neves-Silvestre¹, H. Tajudeen¹, J. S. Kim¹

¹ Kangwon National University, Department of Animal Industry Convergence, 1, Kangwondaehak-gil, 24341 Chuncheon, South Korea

This study investigates the bioconversion efficiency and nutrient accumulation in black soldier fly (BSF; *Hermetia illucens*), focusing on the effects of feeding on two levels of fiber (low, 9.2; high 18.5) and three levels of crude protein (low 13.5%, medium 20%, high 26.5%) within a 3×2 factorial arrangement. Results showed that BSF reared on high fiber showed higher survival rate, substrate consumption, and higher lipid yield, as well as lower bioconversion, protein conversion, and protein yield. The weight, length, protein yield, and lipid yield were greater in medium and high protein than low protein. The analysis did not show significant differences in dry matter, ether extract, ash, and chitin content. The content of gross energy in harvested BSF was higher in high fiber diets. The content of CP was higher in BSF fed high or medium protein levels compared with the low protein. Amino acid profiling revealed increased concentrations of isoleucine, leucine, phenylalanine, threonine, tryptophan, alanine, aspartate, glycine, proline, serine, and tyrosine in high fiber treatment. Isoleucine, leucine, tryptophan, alanine, glycine, proline, tyrosine was higher in BSF fed high or low protein levels compared with medium. Fatty acid analysis indicated that the ratio of C12:0, C14:0, C15:0, and C20:1 was higher in BSFs fed higher fiber treatment compared with low fiber treatment, while C18:4 was lower in the low fiber treatment. There was no significant difference in the fatty acid analysis in the protein level treatment. In conclusion, BSF fed higher fiber and protein levels emerged as a superior substrate for enhancing performance and the bioconversion potential of black soldier fly.

Session 11

Poster 17

Nutritional profiling and efficiency of black soldier fly bioconversion across different substrates and developmental stages

S. H. Ha¹, A. Hosseindoust¹, S. R. Park¹, S. A. Park¹, S. D. Choi¹, J. S. Kim¹

¹ Kangwon National University, Department of Animal Industry Convergence, 1, Kangwondaehak-gil, 24341 Chuncheon, South Korea

This study investigates the bioconversion efficiency and nutrient accumulation in black soldier fly (BSF; *Hermetia illucens*), focusing on the effects of feeding on two different substrates (tofu by-products and food waste) and harvesting at two developmental stages (larvae and prepupae) within a 2×2 factorial arrangement. Results showed that BSF reared on tofu by-products significantly outperformed those on food waste in terms of weight gain. Additionally, harvesting at the prepupae stage resulted in enhanced weight, length, width, and substrate utilization, although larvae harvested BSF exhibited higher survival rates. In terms of bioconversion metrics, BSF fed on tofu by-products demonstrated greater protein conversion efficiency, protein and lipid yield. However, lipid conversion was greater in BSF consuming food waste. The conversion efficiencies and yields for protein and lipids were higher when BSF were harvested at the prepupae stage, whereas larval stage harvesting showed greater overall bioconversion rates. Harvesting at the prepupae stage led to higher levels of crude protein, ether extract, and chitin. Amino acid profiling revealed increased concentrations of ile, leu, trp, ala, and pro in BSF fed tofu by-products, with greater thr, trp, ala, ser, and tyr in prepupae-stage. Fatty acid analysis indicated that C10:0, C12:0, C14:0, C14:1, C18:3n3, and C20:1 was higher in BSF consuming tofu by-products. Additionally, the saturated fatty acids, C12:0, C15:0, C17:0, C18:1 were more abundant in BSF harvested at the prepupae stage. The BSF meal derived from tofu by-products showed higher gross energy, and meals from prepupae-stage BSF had enhanced gross energy, crude protein, and chitin content, along with a distinct fatty acid profile favoring C12:0, C18:3n3, C22:6n3, and higher levels of saturated fatty acids. The MDA content was significantly lower in BSF meals from prepupae after 14 and 28 days of storage, suggesting better lipid stability. In conclusion, tofu by-products emerged for enhancing protein and lipid yields, while the prepupae stage offered advantages in nutrient density and shelf stability of the harvested biomass.

Fatty acid composition of *Hermetia illucens* larvae grown on different expired wet pet-food

G. Secci¹, L. F. Pulido Rodriguez¹, M. V. Tignani¹, A. C. Lira De Medeiros¹, N. F. Addeo², F. Bovera², G. Parisi¹

¹ University of Firenze, Department of Agriculture, Food, Environment and Forestry, via delle Cascine 5, 50144 Firenze, Italy, ² University of Napoli Federico II, Department of Veterinary Medicine and Animal Production, via Delpino 1, 80137 Napoli, Italy

The present study compared the effects of four different discarded pet foods (for cats) on *Hermetia illucens* fatty acid compositions of neutral (NL) and polar lipids (PL). We used: 1) broiler feed as a control diet (CTRL); 2) salmon mousse (SLM); 3) chicken mousse (CHK); 4) beef mousse (BF). Each diet was put into 9 plastic containers (n=9); each one had 2.5 kg of substrate and 1,200 five-day-old larvae. At 22 days old, larvae were separated from the frass, fasted for 24 hours, frozen, and then chemically analyzed. Total lipids (TL) were extracted, and then NL and PL were separated by solid-phase extraction. Each lipid fraction was methylated to obtain the fatty acid (FA) profile by gas-chromatography. A one-way ANOVA was run to highlight statistical differences. Results showed that SLM larvae had the highest TL content (26.17 g/100 g of dry matter). Saturated fatty acids (SFAs) prevailed over other FA categories, with a substrate effect observed. Specifically, BF, CHK, and SLM larvae had a lower content of SFAs and a higher content of monounsaturated FA (MUFAs) compared to the CTRL larvae. SFAs were preferentially stored in NL, while MUFAs were stored in PL. SLM pet food slightly enriched the larvae in n-3 polyunsaturated FAs, which were mainly stored in PL. In conclusion, *Hermetia illucens* can represent a promising avenue to avoid incineration or landfill disposal of waste, but emphasis on the accumulation site of essential fatty acids should be considered.

Session 11

Poster 19

Effects of herbs dietary inclusion on growth performance and nutrient composition of *Tenebrio molitor* larvae

A. Moradei¹, T. Spranghers³, D. Deruytter⁴, M. Ottoboni¹, L. Pinotti^{1,2}

¹ University of Milan, Veterinary medicine and animal sciences, Via dell'università 6, 26900 Iodi, Italy, ² CRC I-WE, Via festa del perdono 7, 20122 Milano, Italy, ³ VIVES university of applied sciences, Centre of expertise for agro- and biotechnology, Wilgenstraat 32, 8800 Roeselare, Belgium, ⁴ Inagro, Insect Research Centre, Ieperseweg 87, 8800 Rumbeke-Beitem, Belgium

Mealworm larvae (MW, *Tenebrio molitor*) are able to convert grain byproducts (i.e. bakery waste) into high-quality biomass, which can be processed into animal feed. Since moderate inclusion of several herbs may occur in some bakery waste material, this study examined the effects of herbs dietary inclusion on growth performance and nutrient composition of *Tenebrio molitor* larvae. The MW larvae were reared on wheat bran (control diet), or supplemented with four different herbs, namely, basil, oregano, rosemary and thyme supplemented in two concentrations (0.125% and 2% dry matter). All experiments were conducted under light condition, to counteract the meal moths, at 27°C with 60% relative humidity for five weeks. Growing performance parameters were recorded during the trial and nutritional composition was analysed on resulting larvae. The growth performance showed no differences between groups. Considering the DM content, no differences were observed among groups. In the case of protein content, greater inclusion of herbs resulted in lower protein levels. Regarding the fat level, only the inclusion of oregano led to lower content compared to the control group. Concluding the dietary inclusion in MW larvae of selected herbs up to 2% did not affect growth performance. However, some minor detrimental effects have been observed in the case of fat content in larvae receiving oregano. Further studies are needed for understanding the observed effects.

Prospects of breeding programs for small ruminant breeds in the Mediterranean region

A. Carta¹, G. Hadjipavlou², C. Ligda³

¹ *Agris Sardegna, Genetics and Biotechnologies, Loc. Bonassai, 07100 Sassari, Italy*, ² *Agricultural Research Institute, Animal Production Section, Aglantzia, 1516 Lefkosia, Cyprus*, ³ *ELGO-DIMITRA, Veterinary Research Institute, Thermi, 57001 Thessaloniki, Greece*

Sheep and goat farming is widespread throughout the Mediterranean region with systems that vary from intensive with improved breeds to extensive with local breeds well adapted to the environment in areas not suited to intensive agriculture otherwise destined for depopulation. The attempts made since the 1990s to develop modern breeding schemes have achieved significant results for few dairy breeds that have spread in less favorite areas, as purebred or crossbreds, not always with appreciable outcomes. For most local breeds, the difficulties of overcoming the laboriousness of selection tools (phenotype recording, artificial insemination, single sire mating) have severely limited their effectiveness. Over the last decade, the need to organize the genetic management of local breeds has emerged with even greater force, not only to improve their economic sustainability and therefore mitigate the risk of extinction of some of them, but also to preserve their genetic potential for adaptation to climate change. At the same time, the advent of new genomic technologies and the constant reduction in the cost of their application makes a change in the traditional “large scale recording-artificial insemination” paradigm possible. An overview of the state of the art of breeding schemes is provided focusing on the potential of new genomic technologies for both genetic improvement and conservation of genetic variability. Particular focus is given on the development of shared strategies and methodological approaches throughout the Mediterranean region to respond to common environmental, economic and social challenges.

Session 12

Theatre 2

Derivation of economic weights for sheep breeding goal traits considering production system characteristics

J. Oberpenning¹, K. Brügemann¹, S. König¹

¹ *University of Gießen, Animal Breeding and Genetics, Ludwigstr. 21B, 35390 Gießen, Germany*

The implementation of modern sheep breeding programs implies the development of new breeding goals considering novel functional traits. Theoretically, breeding goals should be specific for the respective populations and production systems. The aim of this study was to derive economic weights for sheep breeding goal traits considering characteristics of the herds, environments and social-ecological effects. Herd-environmental characterisations considered 13 traits from 25 surveyed farms. The application of different clustering methods (agglomerative hierarchical, partition around medoids and fuzzy) allocated the herds to 3 main groups. Major group differences were due to the effects of the farm type, production focus and herd size. The ongoing contingent valuations based on the “willingness to pay” for breeding goal traits indicated the importance of the traits maternity and parasite resistance in all clusters, with weighting percentages of 8,06% to 13,5%, respectively. The traits maternity and suitability for landscaping were especially important in cluster 3, which represents a large number of farms neglecting commercial meat production. Validations for the derivation of economic weights were performed through bio-economic modelling approaches, and applying the software “EcoWeight”. With the additional distinction between direct and maternal effects, the highest relative economic importance was derived for survival rate (direct component 24%, maternal component 31%). Sensitivity analyses highlighted the importance of meat prices on economic weights, especially for survival rate. In contrast to the bio-economic approach favoring the weighting of production traits, contingent valuations emphasized functionality.

Intra-island patterns of genetic divergence in Cyprus Chios sheep: minimizing genetic background noise to enable more precise genetic improvement

G. Maimaris¹, A. C. Dimitriou¹, L. Koniali¹, T. Christofi¹, P. Markou¹, S. Andreou¹, S. Panayidou¹, P. Savvides¹, G. Hadjipavlou¹

¹ Agricultural Research Institute, Animal Production, P.O. Box 22016, 1516 Nicosia, Cyprus

The effects of climate change, the ongoing global economic crisis, and the rapidly shifting geopolitics, particularly in Eastern Europe, indicate the need for food security and hence the Primary Production Sector's importance. Being on the southeastern border of Europe, the island of Cyprus experiences limited feed production mainly due to unfavorable environmental conditions, while at the same time facing a constant increasing demand for sheep and goat milk. This requirement is a result of both the expanding local population and the recent registration of Halloumi cheese as a product with Protected Designation of Origin, for which, Cyprus is bound by EU regulation, to increase the product's goat/sheep composition to 51% by 2029. Towards this objective, the Agricultural Research Institute, coordinates a four-year project to genetically improve the local Cyprus Chios sheep in terms of total milk yield and quality characteristics. Exploiting publicly available genome-wide SNP data from circum-Mediterranean sheep breeds, a 100-subset of SNPs was proven to effectively identify individuals belonging to the local breed. Aiming to minimize the genetic background noise on current improvement efforts on the focal Chios breed, the same tool was used to assess the within breed genetic diversity and admixture profiles, including >5000 samples from 24 farms in our downstream analyses. Generated results indicate unexpectedly high genetic divergence between examined farms, highlighting the importance of estimating the genetic profile of each population before targeted reproduction. At the same time, gene flow routes are in line with geographic proximity and known exchanges of males were revealed. Research findings are anticipated to promote more precise genetic improvement and facilitate subsequent GWAS analyses and improve farm management practices, such as control of inbreeding.

Genomic analysis of dominance and inbreeding effects on milk production traits in Pag sheep

C. Rochus¹, M. Špehar², A. Kasap³, Z. Barać⁴, J. Ramljak³, I. Pocrnic¹

¹ University of Edinburgh, Roslin Institute, Easter Bush Campus, EH25 9RG Midlothian, United Kingdom, ² Croatian Agency for Agriculture and Food, Svetošimunska 25, 10000 Zagreb, Croatia, ³ University of Zagreb, Faculty of Agriculture, Svetošimunska, 10000 Zagreb, Croatia, ⁴ Ministry of Agriculture, Grada Vukovara 78, 10000 Zagreb, Croatia

Local breeds are reservoirs of genetic diversity and have phenotypic characteristics that could be an important resource for meeting future challenges to livestock systems. For example, Pag sheep are a local Croatian breed adapted to a Mediterranean island with a marginal grazing system, raised for milk (mainly used for cheese) and lamb production. Sustainable selection programmes for small local breeds like Pag sheep, may need to consider the effects of dominance and inbreeding. Our aim was to estimate additive and dominance genetic variances and genomic inbreeding for milk traits (milk, fat and protein yields and somatic cell score). We had genotype data (50K SNPs) for 2134 animals, while 1744 ewes had milk records. We detected runs of homozygosity (ROH) with plink 1.9 to estimate genomic inbreeding (FROH). The four single-trait models with additive and dominance effects, including FROH as a covariate to account for directional dominance, were fitted both via the Bayesian method and REML as implemented in BLUPF90 software. Our results revealed stable additive variance across different models. In contrast, dominance variance varied across models, and was significantly impacted by whether or not the FROH covariate was in the model. Dominance variance accounted from 10-30% of genetic variance across models and traits. In conclusion, SNPs allow us to estimate dominance variance and inbreeding in small populations, which can contribute to the knowledge needed to develop sustainable genomic selection programmes in such populations.

Evaluation of crossbreeding potential in heavy suckling lambs obtained by crossbreeding Sarda dairy ewes with Dorper rams

M. F. Lunesu¹, A. Fenu¹, A. Mazza¹, R. Rubattu¹, M. R. Mellino¹, S. Carta¹, G. Battacone¹, A. Nudda¹

¹ University of Sassari, Dipartimento di Agraria, Viale Italia 39a, 07100 Sassari, Italy

The aim of this study was to evaluate the growth performance, carcass characteristics and meat quality of lambs obtained by crossbreeding Sarda dairy ewes with Dorper rams. Twenty single-born Dorper x Sarda (DS) lambs (9 males, 11 females) and 19 single-born Sarda (S) lambs (10 males, 9 females) were used. Lambs were fed exclusively with maternal milk until slaughtering at 11 weeks of age and with a body weight (BW) of 20 ± 0.28 kg of (mean \pm SD). During the trial, BW was measured twice a month for estimating average daily gain (ADG). At slaughter, carcass measurements, pH and colour traits were recorded. Proximate composition, fatty acid (FA) profile, cooking and drip losses, and consumers perception were evaluated. Almost all data were analysed by a PROC GLM procedure to test the differences between the genetic type, sex, and their interactions. The ADG did not differ between S and DS lambs and between males and females. The S carcasses had a higher fat content and rib fat thickness compared to DS lambs. Intramuscular fat of DS lambs had a higher content of 22:5n-3, 22:6n-3, branched-chain FA, and odd- and branched chain FA. Both DS and S lamb meats presented no distinguishable quality characteristics from consumers perception. In conclusion, crosses between dairy Sarda breed, and the meat Dorper breed seems a valuable opportunity to improve meat value and accessibility, although the commercial viability of producing this new type of lamb remains to be determined. Acknowledgements: research funded by PROBOVIS project (PSR Sardegna 2014–2020; sottomisura 16.2) and RESTART-UNINUORO project (Regione Autonoma della Sardegna; FSC 2014–2020).

Using genotypes from Australia's numerically smaller sheep breeds to expand the genomic reference population

P. Alexandri¹, P. Gurman¹, K. Gore¹, R. Macarthur-Onslow¹, D. Brown¹

¹ University of New England, Animal Genetics and Breeding Unit, University Campus, 2351 Armidale, Australia

Genetic evaluation of animals with different population ancestry needs to deal with differences in their founder populations or breeds. To accommodate these differences allele frequencies from different genetic groups can be used to correct the genomic relationship matrix to reduce breed and group structure. The majority of the Australian sheep population is comprised of animals originating from 11 major breeds. However, smaller breeds are also used to create crossbred animals for different breeding objectives. To properly include these animals into a multi-breed genetic evaluation, the allele frequencies of smaller and often missing breeds need to be included into the allele frequencies of the wider population. This work investigated the use of genotypes from smaller breeds and crossbred populations that are currently not included in the Australian national genetic evaluation (LAMBPLAN) because reference populations for imputation and inclusion in breed adjusted genomic relationship matrices have not been established. Genotypes from 50,999 animals originating from fifteen numerically smaller meat, wool and maternal sheep breeds were combined in a genetic analysis to investigate population structure and diversity within and across breeds and define breed composition. Results are expected to increase the number of animals included in the genetic evaluation and improve prediction accuracy in Australian crossbred populations.

Phenotypic and genetic parameters of lactation persistency and milk yield of patch-faced Maritza sheep breed
P. Zhelyazkova¹, D. Dimov², H. Grosu³

¹ *Breeding Association of Maritza Sheep Breeds, K. Velichkov 69, blvd, 4000 Plovdiv, Bulgaria,* ² *Agricultural university, Department of Animal Sciences, Mendeleev 12, blvd, 4000 Plovdiv, Bulgaria,* ³ *University of Agricultural Sciences and Veterinary Medicine, Animal Science Faculty, 59 Mărăști Boulevard, District 1, 011464 Bucharest, Romania*

The aims of this study were to estimate the phenotypic and genetic parameters of lactation persistency (LP) and milk yield (MY) in sheep. For this purpose, a database of 643 lactation records for 351 ewes of the Patch-faced Maritza sheep breed for the period 2018-2023 was used. Pedigree file included 586 animals, of which 351 ewes had records, as daughters of 35 rams. Each lactation record per ewe included 5 test day milk yield (TDMY) records during the milking period (MP). Lactation persistency was calculated as the ratio of average TDMY to maximum TDMY over the course of MP for each ewe, expressed as %. The average suckling period (SP) was 70.79 days (± 16.61), average MY per 150 daily MP was 115.57 L (± 34.43). Average daily MY was 770.49 mL (± 229.25) and average maximum TDMY – 1271.10 mL (± 447.63). The average LP was 62.43 % (± 9.70). Variance components of LP and MY were estimated by using two types of animal models: A single trait repeatability animal model (AM) for each trait and a simultaneous two trait repeatability AM. All analyses were performed in an R software environment. The SP was included as a regression and the age of the ewe was included as a fixed effect. Additionally, flock and farming year were concatenated as common fixed effect in the models. In the simple repeatability AM, the heritability (h^2) of LP was 0.112 ± 0.020 and the repeatability (rw) was 0.141 ± 0.040 . The heritability of MY was 0.220 ± 0.025 and rw was 0.315 ± 0.060 . Regression of SP on LP was 0.0022 but for MY -0.360. For the two traits, a simultaneous two trait repeatability AM, the h^2 of the LP was 0.092 ± 0.018 and the rw was 0.132 ± 0.038 and h^2 of MY was 0.208 ± 0.024 and rw was 0.276 ± 0.057 . Phenotypic and genetic correlations between LP and MY were respectively -0.047 and 0.038. Regression of SP on LP was 0.0022 but on MY was -0.357. The lack of genetic correlation between LP and MY indicates that selection for high milk yields may not result in high persistency.

Session 12

Enhancing breeding programs for local breeds in challenging environments: insights and innovations

S. Savoia¹, A. Schurink¹, S. Kumar², B. Santos², T. Byrne¹, P. Amer²

¹ *AbacusBio International Limited, Roslin Innovation Centre, EH259RG Edinburgh, United Kingdom,* ² *Abacus-Bio Limited, PO Box 5585, 9058 Dunedin, New Zealand*

In harsh environments, the value of genetic advancements may be overshadowed by environmental fluctuations, making it more difficult to discern incremental improvements and harder to justify investing in breeding programs. In such scenarios, expanding performance recording becomes imperative to monitor the impact of management interventions, mitigate the risks associated with inbreeding, and provide the supply chain with useful information. Initiatives such as the sheep and goat community-based breeding programs in Ethiopia and India (Mesha project) show that flexible but robust data tools play a pivotal role in supporting breeding efforts in challenging socio-technical and environmentally harsh contexts. In scenarios where small ruminants are essential assets for smallholder farmers, these animals offer a means to alleviate poverty and provide manageable income streams. Production efficiency gains in these small ruminant populations will also reduce the greenhouse gas emissions intensity associated with the products, and enhance the social and ecosystem services they provide. Novel sustainable approaches that extend beyond the traditional national systems focused on breed purity, can deliver multifaceted benefits beyond genetic improvement. The potential use of composite or cross-breeds is a promising avenue for enhancing productivity and resilience. By addressing these challenges and leveraging innovative strategies, breeding programs can be optimized in harsh environments, fostering resilience and sustainable development in farming communities worldwide. This approach can promote sustainable growth and development in smallholder farming communities, and beyond.

Genomic insights into Milk Coagulation Properties and Curd Firmness in Pag Island Sheep: a Genome-Wide Association Study

F. Oštarić¹, M. Ferenčaković², L. Vostry³, N. Amalfitano⁴, G. Bittante⁴, I. Držaić², V. Cubric-Curik², V. Brajković², I. Curik², N. Mikulec¹

Efficient cheese production relies on optimal milk coagulation, which is a key factor for cheese quality. In this study, focussing on the largest dairy sheep population in Croatia, the Pag Island Sheep, a Genome-Wide Association Study (GWAS) was conducted to identify polymorphic variants associated with traditional milk coagulation properties (MCP) and new curd firmness over time (CFT) model parameters. These parameters are obtained from a mathematical model that, differently from the traditional MCP, uses all the information yielded by the instrument. Our analyses were based on 1173 milk samples, all analysed with the Formagraph instrument, and genetic data from 291 animals genotyped with the GeneSeek® Genomic Profiler™ Ovine 50k using the BLUPF90 family programme and the GRAMMAR method. While considerable influence of the polygenic component was observed, our analyses identified specific single nucleotide polymorphisms (SNPs) that contribute significantly to MCP variation. This is the first GWAS in “Western Balkan sheep breeds”, providing crucial insights for the genetic improvement of Pag Island Sheep to increase the efficiency of cheese production. Funding: “Potential of microencapsulation in cheese production” (KK.01.1.1.04.0058), Operational Programme Competitiveness and Cohesion 2014–2020 and “Pheno-Geno-IP-2022-10-6914” funded by Croatian Science Foundation.

Estimation of genetic parameters for fertility and prolificacy in the Lacaune meat sheep population carrying a hyperprolific gene

E. Cobo¹, L. Bodin¹, J. Raoul^{1,2}

¹ INRAE GenPhySE, 24 chemin de Borde Rouge, 31326 Castanet-Tolosan, France, ² Idèle, Chemin de Borde Rouge, 31320 Auzerville-Tolosane, France

Numerical productivity, a key economic criterion in meat sheep farming, is influenced by ewe fertility (FERT) and prolificacy (PROL). This study looked at these two production traits and two of their main factors of variation: the method of reproduction (on induced oestrus, IO, and on the first natural return oestrus, NRO) and the genotype of the FecL hyperprolific gene. The dataset covered the reproductive records of 20,770 Lacaune meat ewes from the Ovi-Test breeding company, 90% and 58% of which had a recorded sire and FecL gene genotyping, respectively. Between 2010 and 2020, 68,652 matings resulting in 49,248 lambings were analysed. The aim of this study was to first confirm the effect of genotype on prolificacy in our dataset. Subsequently, we assessed the effect of genotype on fertility and estimated the genetic parameters of FERT and PROL traits. The genetic evaluations were performed using Asreml software based on a BLUP animal models: a two-trait model PROL_IO and PROL_NRO and two single-trait models for FERT_IO and FERT_NRO. The estimated effect of FecL gene was similar to previous study (+ 0.5 lamb per litter for heterozygous carriers compared to non-carriers) but had no significant effect on fertility. The estimations of animal genetic variances for the two traits on IO or NRO were low but in line with the literature: for prolificacy, $\sigma^2_{a_IO} = 0.046$ and $\sigma^2_{a_NRO} = 0.043$; for fertility, $\sigma^2_{a_IO} = 0.007$ and $\sigma^2_{a_NRO} = 0.007$. The heritabilities of PROL_IO and PROL_NRO were 0.06 and 0.09 respectively, with a genetic correlation of 0.95. The heritabilities of FERT_IO and FERT_NRO were 0.04 and 0.03 respectively.

Early-life trait effects on the reproductive performance of Cyprus Damascus goats

L. Koniali¹, S. Andreou¹, T. Christofi¹, G. Hadjipavlou¹

¹ Agricultural Research Institute, Animal production, P.O.Box 22016, 1516 Nicosia, Cyprus

Goat reproductive performance, as assessed by traits such as pregnancy to first breeding, age at first kidding, kidding interval, litter size, litter survival as well as kids weaned by the dam, is a major determinant of productivity and economic viability of caprine rearing systems. A number of studies have previously attempted to define both genetic and non-genetic factors associated with reproductive traits in various goat breeds around the world. However, a lack of goat breed-specific information and kid-rearing benchmarks may limit farmers' ability to select the best animals to keep as breeding stock as well as to control aspects that affect the herd's overall fertility, fecundity, prolificacy, and future farm productivity. We performed a retrospective analysis based on individual goat data that are systematically recorded in the Cyprus Damascus goat herd maintained in the Agricultural Research Institute, Cyprus, to test the potential effect of early-life characteristics (birth weight, birth type, kidding season, kidding year, pre- and post-weaning weight and growth rates, and the rearing system used before weaning) on reproductive performance component traits of Cyprus Damascus goats. The study cohort included 34 mating seasons covering a period of 17 years (2005-2022). Descriptive statistics followed by multivariate analyses were conducted to evaluate intrinsic and extrinsic factors that could be used to predict 1) pregnancy to first breeding, 2) age at first kidding, 3) kidding interval, 4) litter size at birth, 5) litter size at weaning and 6) survival rates of kids at birth and at weaning. Heritability estimates were determined based on available pedigree information. The findings would not only aid in the selection of breeding goats with desirable characteristics, but they would also be useful in future genome-wide association studies to investigate genetic effects and theories based on these discoveries.

Session 12

Poster 12

Benefit of including female genotypes in the reference population of French Lacaune dairy sheep, a simulation study

B. De Laet¹, P. Arzac¹, J. Raoul^{2,3}

¹ UPRA Lacaune, Carrefour de l'agriculture, 12026 Rodez CEDEX, France, ² INRAE, Animal Genetics, 24 chemin de Borde rouge, 31326 Castanet-Tolosan, France, ³ IDELE, Animal Genetics, CS 52637, 31321 Castanet-Tolosan, France

In the French Lacaune dairy sheep breeding program, genomic selection is presently based solely on a male reference population. The benefit of including female genotypes is questionable. This study evaluates, using a deterministic gene flow model, the increase in genetic gain and economic implications of enhancing the accuracy of genomic Estimated Breeding Values (GEBV) through genotyping of ewes. Over a 20-year period, the genotyping of females has not proven economically viable at the nucleus level, regardless of the gain in genomic EBV accuracy. The consideration of ewe lambs as elite dam candidates consistently improved outcomes due to a reduction in the generation interval. However, profitability at the nucleus level remained very low or even non-existent depending on the genotyping cost considered. Extending the cost-effectiveness analysis to the broader Lacaune population (including nucleus and commercial flocks) yielded superior economic results, regardless of the magnitude of genomic EBV accuracy gains. Nevertheless, profitability remained unattainable at moderate accuracy enhancements. Given the logistical challenges and limited profitability, widespread genotyping of ewes seems inappropriate in the current situation. A necessary reduction in genotyping costs, coupled with co-products such as parentage verification and management of specific alleles, is deemed necessary to make large-scale ewe genotyping economically viable.

Genetic diversity of related sheep breeds Sarda and Pag

L. Falchi¹, C. M. Rochus², M. Špehar³, J. Ramljak⁴, A. Kasap⁴, N. P. P. Macciotta¹, A. Cesarani¹, I. Pocrnic²¹ University of Sassari, Viale Italia 39a, 07100 Sassari, Italy, ² University of Edinburgh, Easter Bush Campus, EH25 9RG Edinburgh, United Kingdom, ³ Croatian Agency for Agriculture and Food, Svetošimunska 25, 10000 Zagreb, Croatia, ⁴ University of Zagreb, Svetošimunska 25, 10000 Zagreb, Croatia

Genetic diversity of sheep is endangered, mostly by the replacement of local breeds with commercial breeds. However, local breeds are adapted to unique environments, rustic, resilient, a reservoir of genetic diversity, and could help with meeting challenges due to climate change and market demand fluctuations. Two examples of local island sheep in the Mediterranean region are the Sardinian White (Sarda) and Pag breeds. Sarda sheep are widely found in Italy, while Pag sheep are a Croatian breed that likely had historical introgression of Sarda. Our aim was to study the genetic structure of these Sarda and Pag breeds to highlight differences and common genomic regions, that might indicate environmental adaptations. Using 50K SNP data from 825 Sarda and 2683 Pag, runs of homozygosity (ROH) were detected using detectRUNS in R, and F_{ST} analysis was done using PLINK. Sarda ($F_{ROH}=0.07\pm 0.04$) had more inbreeding than Pag ($F_{ROH}=0.04\pm 0.05$), probably due to lower selection pressure on the latter. A total of five ROH segments were shared between the two breeds. We identified 367 SNPs with a $F_{ST} > 3$ SD from the chromosomal mean or that had a F_{ST} in the top 99th percentile. The analysis of genes mapped on shared ROH segments or close to significant SNPs could help understand the history of these two breeds and how past introgression contributed to today's Pag sheep.

Session 12

Poster 14

Using cryptorchid rams to induce a ram effect in a flock of ewes and successful insemination upon natural heat

C. Nassif^{1,2}, L. Mara², F. Chessa², F. Melis², M. Gallus², A. Ledda¹, M. Dattena², A. Cannas¹¹ University of Sassari, Department of Agriculture, Viale Italia 39a, 07100 Sassari, Italy, ² Agricultural Research Agency of Sardinia (AGRIS), Department of Animal Science, Loc. Bonassai, 07100 Sassari, Italy

The use of hormones for animal synchronization is facing increasing restrictions. Using aprons on fertile rams or vasectomizing them is challenging from an animal welfare standpoint. However, artificial insemination is still an important tool for genetic improvement and creating genetic links among flocks. Cryptorchid rams are characterized by undescended testicles, which cause azoospermia while maintaining near normal levels of testosterone. Moreover, these rams were shown to successfully detect females in heat. The objective of this study is to assess the capacity of these rams to induce a ram effect on an ewe flock, detect those that go in heat and check the success of artificial insemination after natural heat. Four cryptorchid Sarda rams were introduced to 31 Sarda ewes. At day 14, rams were removed, and one was reintroduced 4 times a day from day 16 until day 25 to detect ewes in heat. Out of 31 ewes, 22 (70.97%) responded to the ram effect with subsequent heat signs. Eleven ewes were arbitrarily chosen and inseminated 24 hours after heat detection with chilled semen (400 million sperm/dose, conserved at 4°C and used within 24 hours). Out of these ewes, 5 gave birth (45.45% fertility rate). These results show that cryptorchid rams can induce a ram effect, detect ewes in heat and are a safe and reliable tool to induce a natural heat upon which artificial insemination can be performed. This natural technique can substitute the use of hormonal treatments, thus satisfying consumer welfare demands. They can also replace the use of vasectomized rams or the aprons on fertile rams leading to an improved animal welfare.

Quantitative-genetic characterization of wool quality traits in German Merino

N. Zimmermann^{1,2}, M. Schmid², J. Bennewitz², W. Pflanz¹

¹ Faculty of Agriculture Food and Nutrition, University of Applied Sciences Weihenstephan-Triesdorf, Markgrafenstr. 16, 91746 Weidenbach, Germany, ² Institute of Animal Science, University of Hohenheim, Garbenstr. 17, 70599 Stuttgart, Germany

The estimated breeding value (EBV) for wool in German sheep breeding programs is based on a subjective assessment of the fleece. There is no possibility to select for improved fiber quality yet. As global wool prices have gone down, prices for German wool went down close to zero. Criticism from the industry is that the quality is not defined and the fiber diameter is too large and fluctuating. We are now carrying out quantitative-genetic analyses of wool quality traits, i.e. traits derived from fiber measures, in German Merino sheep in order to create the basis for EBVs and a breeding program to improve wool quality. Better quality should improve the use and thus the producer prices of German wool as a regional product on the domestic market. In this study, wool samples (shoulder, back, loin) were taken from more than 2,000 breeding dams and sires of German Merino sheep in southern Germany (1,680 animals were also genotyped using 50K-SNP chips). The phenotypes were recorded via optical measurements using an ofda2000, recognized by the International Wool and Textile Organisation. Descriptive statistic procedures were then conducted in order to get an overview on the phenotypes, which have never been observed in a comparably large sample in this breed. Population-specific parameters and heritability were estimated for several wool quality traits by means of mixed linear models. In line with the literature, the study shows the potential of breeding for improved wool quality. However, further research is required before an implementation in the German Merino breeding program.

Evaluation of milk quantity and quality traits using BLUP models and longitudinal lactation records of a Cyprus Damascus Goat population

S. Andreou¹, L. Koniali¹, S. Panayidou¹, G. Hadjipavlou¹

¹ Agricultural Research Institute, Animal Production, P.O.Box 22016, 1516 Lefkosia, Cyprus

Small ruminant breeding is of great financial and environmental importance around the world. The Damascus goat is of Syrian origin and was imported in Cyprus in early 20th century in order to increase milk and meat yield and has since been genetically improved and become a local breed. The Agricultural Research Institute (ARI) is the core research center in Cyprus for ruminant genetic improvement. Research interest of the ARI Animal Production unit focuses on the genetic improvement of the Cyprus sheep and goat populations under the AGRICYGEN project and a connected measure within the Cyprus Recovery and Resilience Plan (RRP) (NextGenerationEU). Currently, selection of high producing animals in Cyprus is achieved by combining pedigree information with selection indices for the evaluation of phenotypes on growth rate in young animals and milk production capacity of their ancestors. Our recent pilot study implementing BLUP models on lactation records collected between 2008-2022 from 1104 ARI Cyprus Damascus goats, enabled the estimation of milk trait breeding values and the evaluation of current methods used in the selection scheme. The study revealed high heritability and genetic trends for annual milk yield, fat and protein content for the 1st lactation of Cyprus Damascus goat. Therefore, within the present study, analysis will expand on all lactation periods using ASReml package on R studio to evaluate our goat population for milk performance during their lifespan. Lifelong production is crucial and needs to be considered for successful animal breeding. In the future, the study will be further expanded to pursue genome-wide association studies (GWAS) for milk traits, including data from private Cyprus Damascus goat flocks, as part of an Aid Scheme under the Cyprus Resilience and Recovery Plan, funded by the European Commission.

Adoption of computer vision algorithms to monitor respiratory rates in dairy cattle

P. Curti¹, A. Souza², D. Pinto¹, A. Ruiz¹, L. Kobayashi¹, J. Balieiro¹, A. Castanheira¹, E. Souza², F. Renno³, R. Ventura¹
¹ *Bioinformatics and Animal Breeding Lab, BioMa Tech, FMVZ - University of São Paulo, Animal Nutrition and Production, 255, Av. Duque de Caxias Norte, 13635-900 Pirassununga, Brazil,* ² *Institute of Mathematics and Computer Sciences, ICMC - University of São Paulo, Computer Sciences, 400, Av. Trab. São Carlense, 13566-590 São Carlos, Brazil,* ³ *Dairy Cattle Research Lab, LPBL, FMVZ - University of São Paulo, Animal Nutrition and Production, 255, Av. Duque de Caxias Norte, 13635-900 Pirassununga, Brazil*

The respiratory rate in dairy cows is a crucial parameter to be monitored, given its potential use as input data to detect early disease and track heat stress and reproductive performance from a herd-level perspective. Computer Vision (CV) is a multidisciplinary field of study that enables computers to extract information by analyzing images and videos in various scenarios, by developing algorithms typically included in the artificial intelligence domain. The objective of our investigation is to adopt Spatiotemporal Convolution techniques to monitor the respiratory rates of cows during milking in a herringbone parlour. Video files were recorded over six months, fragmented into 30-second segments, and subsequently annotated manually, counting the number of respirations and identifying animal movement. This resulted in 695 annotated videos used to train the CV model. The modified version of the video ResNetR(2+1)D architecture with R(2+1)D convolutional blocks achieved an accuracy of 93.2% and a Mean Absolute Percentage Error (MAPE) of 21.8% for frame sequence classification and respiratory rate regression, respectively, on our validation dataset. Our results are promising, encouraging further investigation, using a larger dataset comprised of animals from different herds across a whole year.

Session 13

Theatre 2

A novel method to differentiate and profile ruminal vs. breath volatile organic compounds for metabolic assessment in dairy cows

M. Barrientos-Blanco¹, M. Islam¹, R. Peng¹, S. Räisänen¹, F. Wahl², R. Zenobi³, S. Giannoukos³, M. Niu¹
¹ *Animal Nutrition Group, ETH Zürich, Lindau, 8315 Lindau, Switzerland,* ² *Food Microbial Systems Research Division, Agroscope, Bern, 3003 Bern, Switzerland,* ³ *Analytical Chemistry Group, ETH Zürich, Zürich, Zürich, 8093 Zürich, Switzerland*

Frequent eructation in ruminants blends exhaled ruminal and breath volatile organic compounds (VOC), limiting breathomics applicability for metabolic assessments in dairy cows. The aim of this study was to develop a protocol (SOP) to differentiate the origin of exhaled VOC. Samples from 30 multiparous lactating Holstein cows were analyzed. Exhaled VOC in breath (Br; blood borne metabolites) and exhalome (Ex; a mixture of ruminal eructation and Br) were sampled using a GreenFeed (GF). Methane (CH₄) levels and eructation events served as the marker to distinguish Br vs. Ex. Samples were analyzed using gas chromatography (GC, n=138) and secondary electrospray ionization mass spectrometry (n=738). Logarithmic transformation on Br over Ex mean ratio and fold change (FC) were calculated to differentiate metabolite's origin. Our results revealed CH₄ concentration 76% higher in Ex compared to Br (556 vs. 137 ppm, respectively). Based on our findings, a SOP was proposed using CH₄ GF readings >250 ppm for Ex and a threshold of <150 ppm CH₄ for Br sampling. Implementing this SOP, we identified ruminal VFAs in the Ex (P < 0.01) with a differentiation of FC > 0.5. TCA cycle precursors were identified in Br (P < 0.01) with a differentiation of FC > 0.2. Our study established a method to differentiate Br and provided evidence of the potential to implement breathomics as a non-invasive tool for conducting metabolic assessment in ruminant research.

Development of an HPLC method for the quantification of allantoin, creatinine and uric acid in Holstein cows' urine

E. Visentin¹, S. Magro¹, S. Sabbadin¹, G. Niero¹, M. De Marchi¹

¹ University of Padova, Department of Agronomy, Food, Natural resources, Animals and Environment, Viale dell'Università 16, 35020 Legnaro, Italy

Many phenotypes related to heat stress can be identified in cows' urine, including compounds from protein metabolism, such as urea, creatinine, uric acid and allantoin. This study aimed to qualitatively and quantitatively determine allantoin, creatinine, and uric acid in Holstein cows' urine through reverse-phase HPLC. A total of 21 commercial herds located in Northern Italy were visited, and 1,275 individual urine and milk samples of Holstein Friesian cows were collected during morning milking. Cows produced on average 35.20 kg/d of milk, with 3.75% of fat and 3.40% of protein. Aliquots of 1 mL of each urine sample were centrifuged at 13,000xg for 15 min at room temperature. The supernatant was diluted in the proportion 1:10 with ultrapure water and filtered using a 0.22 µm syringe filter. Analysis of allantoin, creatinine, and uric acid was carried out using HPLC station (Agilent Technologies, Santa Clara, SA) equipped with reversed-phase analytical column C18 (Poroshell 120 EC-C18, Agilent Technologies). Linear gradient elution was carried out with a solution of 10 mM potassium dihydrogen phosphate. Among the studied analytes, allantoin showed the greatest concentration, averaging 3071.10 µg/mL, followed by creatinine and uric acid, averaging 505.91 and 225.05 µg/mL, respectively. The strongest Pearson's correlations were observed between allantoin and creatinine ($r = 0.76$; $p < 0.001$). Uric acid was moderate-to-low positively correlated with allantoin ($r = 0.31$; $p < 0.001$), and creatinine ($r = 0.28$; $p < 0.001$). Creatinine negatively correlated with milk yield ($r = -0.18$; $p < 0.001$) and weakly positively correlated with milk protein content ($r = 0.10$; $p < 0.05$).

The volatolomic signature differs between primiparous and multiparous cows across different matrices

E. Jorge-Smeding^{1,3}, C. Martin¹, L. Volmerange², Y. Rochette¹, F. Violleau², N. Salah³, M. Silberberg¹

¹ INRAE, Rue de Theix, 63122 St-Genès-Champanelle, France, ² INP Purpan, 75 Voi du Toec, 31076 Toulouse, France, ³ Phileo by Lesaffre, 25800 Ch de Vallesvilles, 31600 Seysses, France

Non-invasive phenotyping of cattle is becoming of increasing importance to develop new tools to study and individually manage farm animals. We explored the effect of the dairy cows' parity on the volatolomics of several non-invasive matrices such as breath, ruminal liquid, urine, faeces and sweat. Ten primiparous (PRIM, 73 ± 11 days in milk, 22.3 ± 3.31 kg/d milk yield, 618 ± 41 kg BW, 1.5 ± 0.20 BCS) and 6 multiparous (MULT, 2nd lactation, 23.0 ± 1.59 kg/d milk yield, 76 ± 11 days in milk, 642 ± 49 kg BW, 1.4 ± 0.20 BCS) Holstein cows were fed ad libitum a high-fibre diet (53% FDN, 12% CP) during 5 weeks. Cows were sampled at the end of weeks 4 and 5, and the samples were stored until analysis (-80°C) except for breath, which was stored at room temperature and analysed within 24h after sampling. Samples were thawed (37°C, 10 min), heated (45°C, 30 min) and their headspace analysed through selected-ion flow-tube mass spectrometry (SIFT-MS) in full mode scan (positive and negative ions). The parity effect on the volatolome was explored through Partial-least square discriminant analysis considering weeks 4 and 5 independently. The breath volatolome discriminated the parity only in week 4 ($R_2Y=0.96$, $Q_2=0.83$) being the best discrimination model. The faeces did not yield any valid model. The rest of the matrices always yielded a valid model, with acceptable predictive ability observed for ruminal liquid on week 4 ($Q_2=0.59$), and urine ($Q_2 = 0.58$) and sweat ($Q_2 = 0.59$) on week 5. Our results suggest that metabolic and digestive differences between primiparous and multiparous lactating cows were caught by the volatolome of these matrices, and so future studies should consider the effect of the parity.

Individual response of dairy cattle to heat waves: phenotypic and genotypic characterization

R. Cresci^{1,2}, A. Cesarani², N. P. P. Macciotta², A. S. Atzori²

¹ University School for Advanced Studies IUSS Pavia, Piazza della Vittoria 15, 27100 Pavia, Italy, ² University of Sassari, Agricultural Sciences, Viale Italia 39A, 07100 Sassari, Italy

This study aimed at evaluating the impact of heat stress exposure on milk production patterns in terms of milk decline and recovery, and length of stress. Individual daily data were collected from 1176 cows in seven herds located in Arborea (OR, Italy). The farms were equipped with automatic milking systems and the data spanned from January 2022 to August 2023. In correspondence with heat waves occurrence, percentage of milk lost (MYI), milk recovered (MYr), and the stress duration length (SL) in respect to previous performances, were estimated using a linear regression model, with farm and parity as predictor variables. Cows were genotyped with a medium density SNP bead chip. Heritability (h^2) for the three traits was estimated. A GWAS was also performed. Statistically significant differences ($p < 0.001$) were observed in MYI, SL, and MYr metrics among the seven herds. The MYI ranged between $-29.95 \pm 1.57\%$ and $-6.96 \pm 1.77\%$, SL between 12.4 ± 0.39 and 14.0 ± 0.30 days, MYr between $+17.63 \pm 1.51\%$ and $+3.68 \pm 1.53\%$, respectively. Parity significantly affected SL ($p < 0.001$) and MYr ($p < 0.05$). First and third calving cows showed the highest SL (13.0 ± 0.27 days), whereas cows at fifth calving exhibited the lowest (12.7 ± 0.39 days), respectively. Moreover, fifth parity cows showed displayed the highest MYr of $+15.7 \pm 2.03\%$, whereas fourth parity exhibited the lowest MYr of $11.3 \pm 1.74\%$. Two SNP were associated with MYI (located on BTA14 and BTA19), one with MYr (CBTA23) and 29 with SL. The estimated h^2 values for MYI, SL, and MYr were 0.08 ± 0.05 , 0.07 ± 0.04 , and 0.04 ± 0.03 , respectively, with corresponding repeatability of 0.15, 0.12, and 0.11.

Session 13

Theatre 6

Supplementing Bovacillus to weaned beef steers during a 90-day grazing period

R. Cooke¹, S. Mackey¹, F. Cooke¹, A. Pickett¹, K. Harvey², B. Karisch², B. Cappellozza³

¹ Texas A&M University, Animal Science, 2471 TAMU, 77843 College Station, United States, ² Mississippi State University, Animal and Dairy Sciences, 335 Wise Ctr Dr., 39762 Starkville, United States, ³ Chr Hansen A/S, Kogle Allé 6, 2970 Hørsholm, Denmark

This experiment compared performance, health, and physiological responses of beef steers receiving a *Bacillus subtilis* probiotic during a 90-day grazing period. Steers ($n = 240$) were obtained from an auction yard and transported to the experimental facility. Steer shrunk body weight (BW) was recorded at arrival (day -1). This value was averaged with BW recorded on day 0 to represent initial BW (237 ± 1 kg). On day 0, steers were ranked by initial BW and allocated to 1 of 24 pastures (4-hectare pastures; 10 steers/pasture). Pastures were randomly assigned to receive daily supplementation with dried distillers' grains at 1% of BW containing either: 1) *B. subtilis* ingredient (BOV; 2 g/steer daily of Bovacillus™; Chr Hansen A/S, Hørsholm, Denmark) or 2) no additive (CON). Steers received treatments from day 0 to 90 while housed in pastures containing stockpiled native grass forage. Steers were assessed for bovine respiratory disease (BRD) signs daily. Blood samples were collected, and BW recorded on days 0, 14, 28, 56, 90. Shrunk BW was recorded on day 91 for average daily gain calculation (ADG). Treatment x day interactions were detected ($P < 0.05$) for plasma concentrations of cortisol and parainfluenza type 3 (PI3) antibodies. Steers receiving BOV had greater cortisol on day 56 ($P < 0.01$) and also greater ($P < 0.01$) PI3 antibodies on day 90 compared to CON. No treatment differences were detected ($P = 0.97$) for BRD incidence, although steer mortality + removals for health complications were greater in CON compared to BOV (5.0 vs. 0.0%; $P = 0.01$). Body weight and ADG did not differ between treatments ($P \geq 0.24$). Total liveweight change per pasture was greater in BOV compared to CON (645 vs. 501 kg liveweight change/pen; $P = 0.04$). Despite lacking difference for incidences of BRD or physiological responses, an increased number of BOV steers completed the trial. Therefore, *B. subtilis* supplementation increased overall production liveweight in weaned beef steers during a 90-d grazing period.

Development of a proxy to estimate individual daily DMI of Belgian Blue bulls using fecal NIR spectra

L. Le Gall¹, V. Decruyenaere¹, E. Henrotte², F. Gueret³, N. Lorant⁴, M. Khamassi⁵, A. Vanlierde¹

¹ CRA-W, Animal production Unit, 5030 Gembloux, Belgium, ² Inovéo SCES, Research and Development, 5590 Ciney, Belgium, ³ Dumoulin SRL, Animal nutrition, 5300 Seilles, Belgium, ⁴ CRA-W, Agricultural systems Unit, 6800 Libramont, Belgium, ⁵ ULG-GxABT, Animal Sciences Department, 5030 Gembloux, Belgium

Optimizing feed efficiency of Belgian Blue (BB) bulls is one of the aims of the “Blanc Bleu Vert” project (SPW Research funding-Wagralim) to help the beef sector to reach European climate objectives. To reach this goal, the aim of this study is to develop an indirect and robust tool applicable in routine settings (proxy) to predict individual dry matter intake (DMI) using fecal near-infrared spectrometry (NIR). Spot samples of feces were collected from 288 BB fattening bulls (aged from 9 to 20 months) every 3 weeks and their feed intake was measured daily (7.9 ± 1.4 kg DMI/day) resulting in a total of 861 combinations of reference data. Using partial least squares (PLS) regression, different combinations were tested regarding the DMI values considered in parallel with each spectrum: daily or average DMI from 1 to 7 days before fecal sampling. Furthermore, weight, abdominal perimeter, and diet information were considered individually or combined as predictive values in addition to spectral information. At this stage, the reference dataset exhibits a lack of variability, with only one breed represented, animals at the same physiological stage, and all receiving the same dry diet. Consequently, the statistical results are unconvincing (SEC=1.1 kg DMI/day). In the coming months, new reference data will be collected regularly from 94 additional BB fattening bulls (culard or crossbred) fed dry or fresh diets (based on corn and/or grass silage). This expanded variability in the calibration set is expected to enhance the robustness of the prediction model.

Session 13

Theatre 8

Early post-mortem discrimination between grass- and grain-fed beef cattle using muscle lipid biomarkers

D. S. Antonelo^{1,2}, M. E. O. Santos¹, L. R. Oliveira², W. Maccalman², C. F. Ramires³, J. C. C. Balieiro²

¹ Lipid Marker Omics Sciences, Rua Ines Rizi, 195, 13638407 Pirassununga, Brazil, ² University of Sao Paulo, Rua Duque de Caxias Norte, 225, 13635900 Pirassununga, Brazil, ³ Purdue University, 3rd St, 47907 West Lafayette, United States

The aim of this study was to create a muscle lipid-based biomarker panel to discriminate between grass-fed and grain-fed beef cattle early post-mortem. Carcasses from grass-fed ($n = 27$; from 30 to 35 mo age) and grain-fed ($n = 34$; from 20 to 24 mo age) Nellore (*Bos Indicus*) bulls were obtained at a commercial slaughterhouse. Longissimus thoracis muscle (11th rib level) samples were collected at 30 min post-mortem for further lipidome analysis using multiple reaction monitoring (MRM)-profiling. Principal component analysis (PCA) and clustered heatmaps were performed. Moreover, receiver operating characteristic (ROC) curve analysis was performed to create a predictive model for evaluating the performance of putative biomarkers. Out of the 1366 ion transitions (MRMs) scanned, 300 had intensities of at least 1.3-fold higher than the blank and were considered for statistical analysis. The PCA and clustered heatmap analyses revealed distinct clusters between the muscle lipidome from grass- and grain-fed cattle. Based on the ROC curve, a model was created to predict the animals' feeding regimen, which obtained a maximum predictive accuracy of 96.2% using only 15 putative biomarkers, misclassifying only 2 out of the 61 samples. Muscle lipidome from grass- and grain-fed beef cattle has a very discriminating profile, which allowed creating a highly predictive model to discriminate them during early post-mortem. Therefore, this chemical test can be used as a definitive tool to exclude any possibility of fraud/adulteration in relation to the animals' feeding regimen, increasing the reliability of the grass-fed beef certification.

Continuous monitoring of glycaemia to detect variations in intermediary metabolism during night and day cycles in growing pigs

C. Xavier^{1,2}, C. H. Malbert³, S. Brajon¹, F. Gondret¹

¹ INRAE, Institut Agro, PEGASE, Le Clos, 35590 Saint-Gilles, France, ² Agroscope, Swine Research Unit, Posieux, 1725 Fribourg, Switzerland, ³ INRAE, Aniscan, Le Clos, 35590 Saint-Gilles, France

Monitoring time-course variations in glycemia is important to depict energy metabolism which allows the animal to cope with challenges. The aim of this study was to monitor continuously glycemia in growing pigs to depict inter-individual variations in intermediary metabolism along day and night cycles. For that, smart glucose sensors estimating interstitial glycemia at 5 minutes interval as a substitute for circulating glucose concentrations, were secured on the neck of female pigs (n = 7; Pietrain x (Large White x Landrace), 50 kg live weight) that were housed in individual cages during 5 days and fed twice a day. Two meal test procedures were applied during the trial, one with a high-starch diet and the other one with a high-fat diet. Spearman correlations were used to explain glycemia of the day by glycemia of the night. On average, there were 3.2 + 1.8 (mean + SD) hyperglycemic peaks and 3.3 + 0.8 hypoglycemic peaks during the day, and 1.6 + 0.5 hyperglycemic peaks and 2.0 + 0.9 hypoglycemic peaks during the night when pigs had no access to feed. When pigs were fed the high-starch diet, the number of nocturnal hyperglycemic peaks was negatively correlated with the number of diurnal hypoglycemic peaks ($r = -0.93$, $p < 0.01$). Duration of hyperglycemic peaks in the night tended to be positively correlated with duration of hyperglycemic peaks during the day ($r = 0.75$; $p = 0.08$). Peak glucose concentration in the night was positively correlated with the duration of diurnal hypoglycemic excursions ($r = 0.82$, $p = 0.03$). Peak glucose concentrations during the night were lower when pigs were fed a high fat diet than those observed when pigs were fed the high starch diet (135 mg/dL vs 155 mg/dL on average, $p < 0.05$). Overall, this study opens new perspectives to synchronize feeding frequency with day/night cycles to optimize energy use in precision feeding. The PigWeb project has received funding from the European Union's Horizon 2020 under the Grant Agreement N° 101004770.

Session 13

Theatre 10

Faecal microbiota and stillbirth rate in sows

T. L. Nowland¹, R. J. Moore², T. T. H. Van², K. J. Plush³

¹ SARDI, Aquatics and Livestock Sciences, University of Adelaide Roseworthy Campus, 5371 Roseworthy, Australia, ² RMIT University, School of Science, Bundoora, 3083 VIC, Australia, ³ SunPork Group, Eagle Farm, 4009 QLD, Australia

Stillborn piglets are of increasing concern for the pork industry, with losses ranging from 5-20% (Langendijk & Plush, 2019). The gut microbiota has been shown to contribute to sow productivity, including stillbirth (Wang et al. 2019). Microbiota manipulation via in-feed probiotics may reduce stillbirths, however further research is needed to identify which bacteria to target. The aim of this study was to identify potential microbial drivers for stillbirth in sows. Faecal samples from 87 sows were collected on entry into conventional farrowing crates, 4.1 ± 0.1 days prior to farrowing. Parity was recorded, and sows were characterised as having given birth to none, one, or more stillborns. DNA from the faecal samples was subjected to 16S rRNA gene amplicon analysis. Sequence data was processed to ASVs in QIIME2 and analysed and visualised with MicrobiomeAnalyst (<https://www.microbiomeanalyst.ca/>). Sows with stillborn piglets had significantly lower microbial diversity than those sows with no stillborns ($P < 0.05$). Tepidbacter genera were more abundant in sows with stillborn piglets, while Megasphaera and Dialister were more abundant in sows that had no stillborns. Megasphaera and Dialister were in highest abundance at parity 3 and declined slightly by parity 6, with larger variability between sows. These bacteria are candidates for the development of an in feed probiotic to enable a targeted approach for reducing stillbirth. References: Langendijk & Plush. 2019. *Animals* 9:885./ Wang et al. 2019. *Theriogenology* 136:131-137.

Prediction of the daily nutrient requirements of gestating sows based on behavioural sensor data and machine-learning algorithms

M. Durand¹, C. Largouët³, L. Bonneau³, J. Y. Dourmad², C. Gaillard²

¹ Mixscience, RID, 35172 Bruz, France, ² PEGASE, INRAE, Institut Agro, 35590 Saint Gilles, France, ³ Institut Agro, Univ Rennes1, CNRS, INRIA, IRISA, 35000 Rennes, France

Precision feeding is a strategy for supplying feed as close as possible to each animal's nutrient requirements. Usually, the nutrient requirements of gestating sows are provided by a model using input data such as sow characteristics as well as an estimation of future farrowing performances. New sensors and automations have been developed on pig farms over the last decade, generating large amounts of data. This study proposes to predict daily nutrient requirements, using data measured by sensors recorded on 73 gestating sows. Considering various digital farm configurations (for example electronic feeders and drinker stations), we explore and evaluate the performance of nine machine-learning algorithms to predict the daily metabolizable energy and standardized ileal digestible lysine requirements for each sow. Their prediction results were compared to those predicted by the InraPorc model, a mechanistic model designed for precision feeding of gestating sows. The higher correlation coefficient values for lysine (0.99) and for energy (0.95) were obtained for scenarios involving automatic feeder system alone or combined with another sensor. For the scenarios using data from the automatic feeder only, the root mean square error was lower with gradient tree boosting (0.91 MJ/d for energy and 0.08 g/d for lysine) compared to those obtained using linear regression (2.75 MJ/d and 1.07 g/d). The results of this study show that the daily nutrient requirements of gestating sows can be accurately predicted using data provided by sensors and machine-learning algorithms. This paves the way for simpler solutions in precision feeding.

Comparison of stress markers for measuring heat stress of meat type ducks

S. J. Lim¹, S. N. Chun², K. Y. Yang¹, C. H. Kim¹, J. H. Jeon¹

¹ National Institute of Animal Science, Animal Welfare Research Team, 1500, Kongjwipatjwi-ro, Iseo-myeon, 55365 Wanju-gun, South Korea, ² Animal and Plant Quarantine Agency, Animal Protection & Welfare Division, 177, Hyeksin 8-ro, 39660 Gimcheon-si, South Korea

Heat stress is a major concern in the poultry industry because it is closely related to productivity and animal welfare. Therefore, research on measuring heat stress and developing appropriate indicators must be conducted. This study aims to perform a comparative analysis of the effect of rearing seasons on stress markers [corticosterone (CORT), Heat shock protein 70 (Hsp70), H/L ratio] in meat-type ducks. The treatments were categorized into summer and fall. A total of 100 ducks were used for this study. Stress markers were analyzed in the blood and feather. All data were statistically analyzed using the independent t-test procedure of SAS. Blood Hsp70 levels were higher in fall (1.56 ± 0.63) than in summer (1.36 ± 0.44) ($p > 0.05$), but it was no significant difference. And blood CORT levels were significant higher in fall (1634.07 ± 967.96) than in summer (946.53 ± 632.00) ($p < 0.05$). The H/L ratio was higher in summer (1.31 ± 0.69) than in fall (1.06 ± 0.86) ($p < 0.05$). Feather CORT levels tended to be higher in summer (6.73 ± 2.47) than in fall (6.60 ± 2.37) ($p > 0.05$), but it was no significant difference. And feather Hsp70 level was significantly higher in summer (0.46 ± 0.16) than in fall (0.20 ± 0.13) ($p < 0.0001$). Blood CORT is highly affected by capture and sampling time, it can be difficult to interpret the CORT measurement under some circumstances. Feather Hsp70 is a long-term stress marker and is more sensitive to heat stress than blood. The H/L ratio is influenced by injuries or diseases. Therefore, it should be determined multiple times in other areas of the body to enhance accuracy. Among other stress markers used, feather Hsp70 was assumed to be the most sensitive indicator of heat stress. The data can be used as basic for developing high-temperature stress indicators and complementary research.

A meta-analysis assessed factors affecting milk components and intake in response to metabolizable methionine fortification using INRA 2007

L. Bahloul¹, S. Lemosquet², C. Loncke³

¹ CERN, Adisseo France S.A.S., 03600 Commentry, France, ² INRAE, Agrocampus Ouest, PEGASE, 16 le Clos, 35590 Saint-Gilles, France, ³ Université Paris-Saclay, INRAE, AgroParisTech, UMR MoSAR, 22 place de l'Agronomie, 91120 Palaiseau, France

We aim to establish response equations on milk fat contents (MFC), yield (MFY), and milk yield (MY) to digestible methionine (MetDi) supplementation as Smartamine M or MetaSmart and to identify secondary influencing factors. Meta-analysis was applied on 25 peer reviewed papers. Dairy cows consumed 20.3 ± 4.1 kgDM, 172 ± 18.2 g CP/kgDM, 1643 ± 70 MJ NEL/kg DM and $2.35 \pm 0.34\%$ MetDi. Models showed a 0.7 %MetDI increase resulted in a 0.12% MFC ($R^2=0.91$, RMSE=0.10) and 84 g/d MFY ($R^2=0.97$, RMSE= 52.1) increase. Within-study slopes of models were negatively impacted by fermented OM (FOM; $P<0.01$), starch degradability (dSt) and IleDI ($P<0.1$) and positively by lactation stage, DMI and fat content ($P<0.05$) for MFY, and were positively impacted by DMI, and NEL ($P<0.1$) for MFC. For a same MetDI, MFC increased in early lactation with DMI, starch, and decreased with NDF, dSt, FOM, ThrDI, ValDI, IleDI and GlyDI contents ($P<0.01$). Models showed also an increase of 0.48 kg milk/d ($R^2=0.98$, RMSE=0.99) and 0.49 kg DM/d ($R^2=0.98$, RMSE=0.57) by increasing 0.7%MetDI. Within-study slopes were positively impacted by lactation stage ($P<0.05$) and negatively by FOM ($P<0.01$) for MY model and positively by concentrate and ProDI ($P<0.1$) for DMI model. For a same MetDI, MY increased with DMI, fat content and decreased with NDF, dSt, FOM, ThrDI, ValDI, IleDI, PheDI and GlyDI contents ($P<0.01$), and DMI is increased by NEL and decreased by dSt and FOM ($P<0.01$). Predicting dairy cows' responses to MetDi and understanding influencing factors is feasible, enhancing comprehension and aiding dietary formulation improvements.

Moo-ving forward: AI's role in transforming dairy calf care

M. Cantor¹

¹ Pennsylvania State University, Dept of Animal Science, 109 AVBS Building University Park, 16802 State College, United States

Diarrhea and Bovine Respiratory Disease complex (BRD) are the leading causes of morbidity and mortality for dairy calves so timely disease detection tools are needed. This presentation explores precision livestock farming technologies (PLF) and artificial intelligence (AI) to detect clinical disease status in dairy cattle. Feeding behavior data recorded from robotic milk feeders/concentrate feeders, activity behavior from pedometers, and temperature monitoring technologies will be reviewed as strategies to identify sick calves. Furthermore, this presentation explores different PLF alerts for sick calves, including averages of sick animals vs. individual calves as disease detection strategies. Last, this presentation covers machine learning, AI, and PLF as a disease detection strategy for calves. Briefly, Cantor and colleagues have observed that PLF technologies can capture a pre-clinical calf for diarrhea and BRD, as well as if a calf will recover or not from antibiotic treatment for BRD. Furthermore, feeding non-antimicrobial treatments (e.g., colostrum replacer 0.13 kg/d for 3 days by bottle) to older calves that deviated from their baseline feeding behavior measured by a robotic milk feeder reduced the hazard of BRD status. Specifically, control calves had a 2.4 greater hazard of BRD within the next 15 days compared to colostrum calves (95% CI: 1.3-4.3). They have also observed that machine learning techniques and AI are powerful classifiers: a KNN algorithm had 96% accuracy for labeling BRD calves using pedometer and robotic milk feeder data at -5 days before clinical diagnosis. Since most producers cannot afford multiple PLF systems, an economic AI scenario was also considered. Even with budget sensitive algorithms, using one PLF system improved BRD detection accuracy and labeled BRD sooner compared to manual labor only. However, not all PLF technologies are equal. Cantor emphasizes that PLF and AI can improve calf care, but validation studies and alerts must be disease specific. Future research should develop a PLF BRD alert, and test additional non-antimicrobial intervention strategies for calves.

New directions on precision management for dairy cows

C. Gaillard¹, J. Abarnou¹, O. Martin²

¹ Institut Agro, PEGASE, INRAE, 16 Le Clos, 35590 Saint Gilles, France, ² INRAE, AgroParisTech, UMR 791 MoSAR, 75005 Paris, France

Individualized feeding strategies have been explored to improve dairy cows' energy status. However, rules for precise and short-term adjustments at the individual scale still need to be defined. In a recent study, this individual concentrate adjustment was done weekly based on body weight gain without affecting the performance of the animals during the first fourth months of lactation. However, cows' metabolic status affected their performance and should be integrated in the decision rules of concentrate distribution. It can be predicted accurately during the first days of lactation based on three blood metabolites (glucose, BHB, NEFA). Moreover, studies suggested that delaying insemination after peak lactation could enhance pregnancy rates and reduce the number of inseminations per gestation. Health risks associated with peak lactation as well as management costs could be reduced as the number of calvings per cow per year decreases. Simulations suggested that especially primiparous could benefit from this strategy to optimize performance and that late insemination could improve cow longevity. To predict the consequences of combined reproductive and feeding strategies, prediction models are essential. The InSiliCow model can serve as digital twin to simulate dairy cow's lifetime performance. It has been evaluated on different breeds, parities, lactation durations and feeding strategies. An on-going project is aiming at improving it and using it to identify optimal feeding and reproductive strategies to enhance cow performance and welfare, considering available technologies. This involves determining the energy content, level, and frequency of ration adjustments, as well as variables for adjusting rations and insemination timing.

Session 14

Theatre 3

Improved monitoring with historical data, expert knowledge and context measures integration applied to dairy cow heat stress

I. Adriaens¹, H. P. Doekes³, M. Gote², B. Aernouts², J. Verwaeren¹

¹ Ghent University, Data Analysis and Mathematical Modelling, Coupure Links 653, 9000 Gent, Belgium, ² KU Leuven, Biosystems, Kleinhoefstraat 4, 2440 Geel, Belgium, ³ WUR, Animal Breeding and Genomics, Droevendaalsesteeg 4, 6708PB Wageningen, Netherlands

Optimizing animal health and welfare is crucial to improve animal production sustainability. Digitalization offers elegant opportunities to improve livestock monitoring with limited (human) resources. The complexity of the animals and their production context are the main bottlenecks to achieving valuable results. We propose maximizing data use and optimizing decision making in livestock monitoring by integrating different data sources and modelling techniques. Specifically, our project aims to develop solutions for animal monitoring by explicitly considering (1) historical data, (2) expert knowledge, and (3) context and control measures. We apply these to dairy cow heat stress, using multiple years of activity and milk yield data from 11 farms (BE, NL, IT) with a Lely milking robot and the nearby weather. Historical data are considered by assuming (animal-individual) prior time series trajectories and distributions. Expert knowledge is integrated via smart feature design, e.g. including time lags and recovery capacity from warm temperatures. Context and control measures are entered in the modelling explicitly, thereby distinguishing between herd and individual effects. With this methodology, we found that up to 61% of the daily individual variability in milk yield and activity can be explained by outdoor climatic conditions, and that the inclusion of time-lagged and recovery features is essential to reveal individual-cow sensitivity to heat stress. This method can be used on farm to predict heat stress sensitivity or design precision phenotypes.

Integrating IMU wearable sensor data for enhanced PLF in dairy calves

D. Foy¹, M. Brause¹, T. Smith¹, J. Reynolds²

¹ AgriGates LLC, PA, 19146 Philadelphia, United States, ² Western University College of Veterinary Medicine, CA, 91766 Los Angeles, United States

The growth of wearable sensors in Precision Livestock Farming (PLF), highlights the need to understand the data output fundamentals and values they produce once integrated with other data. Using raw output recording at 10Hz produces 864,000 records per day, thereby providing the ability to gain deeper insight and analysis. Working with four 20-hour recordings from neck-based Inertial Measurement Units (IMUs) on two, four-week-old calves, the primary objective was to assess state-based annotation (lying vs standing) with raw data outputs and identify its value for Machine Learning (ML) model development. The IMU raw data was annotated marking start and end times, with synchronized video footage and appended to the sensor data. After annotating states of IMU data, rolling 1, 5, and 10-second cumulative movement summaries were appended to improve ML model development. The model trained on three datasets using Python's scikit-learn library's Random Forest Classifier and tested on the fourth dataset to predict states. Preliminary results average 93.1% accuracy (correctly predicted states over total observations within the test dataset) with the limited test data. Artificially slowing the recording frequency to 1Hz and 0.1Hz lowered accuracy to 87.2% and 86.0%, respectively. Reducing the data to the 3 acceleration axes output, the accuracies were 80.9% (10Hz) 80.1% (1Hz) and 79.5% (0.1Hz). Growing the library of annotated data will improve model development as future research with other ML approaches and will benefit from larger raw output datasets. This method displays the value of IMU wearable sensor raw data outputs integrated with video-based annotation for use in PLF behavioral research.

Session 14

Theatre 5

Designing a local-level data space platform as a strategic approach to reduce human-wildlife conflicts in rural Italy

M. Odintsov Vaintrub¹, P. Di Giuseppe¹, D. Chavez², O. Corcho³

¹ Regrowth s.r.l.s, Contrada Specola, 64100 Teramo, Italy, ² Universidade De Santiago de Compostela, Grupo de Sistemas Intelixentes, Rúa Lope Gómez de Marzoa, 15782 Santiago de Compostela, Spain, ³ Universidad Politécnica de Madrid, AI.nnovation Space, Rectorado A, Ramiro de Maeztu 7, 28040 Madrid, Spain

Human-wildlife interaction is a key aspect of landscape management, posing significant challenges encompassing issues such as biosecurity, hunting regulations, and farm damage. Currently, these challenges are fragmented across different public administration offices, making coordination extremely difficult. This study utilizes human-centric feedback to design and deploy an AI-driven platform to bridge the information gap. Based on stakeholder analysis, a data space platform was designed aiming to enhance real-time monitoring of field situations and provide early feedback on implemented policies. The stakeholder analysis involved semi-structured interviews (n = 12), which were transcribed, evaluated using direct semantic methods and scored for keywords and prioritization of challenges. Their analysis revealed a highly fragmented nature of decision-making within public administration, with different offices holding divergent viewpoints and interests. Therefore, a data space design was chosen, which relies on decentralized data gathering to ensure data sovereignty for individual offices. Additionally, gradual onboarding of data sources was developed to simplify early-stage validation. In conclusion, the design process for an AI-driven data space for relevant administration problems involved both human-centric and technical assessments of suitable AI methods. Such solutions have the potential to significantly streamline the decision-making process in the management of complex human-wildlife interactions at the landscape level.

Quantifying beef cattle grazing behaviour using Sentinel-2 data in South Africa's Strandveld region

W. Hough¹, C. J. Harmse², T. S. Brand^{1,3}, J. H. Van Zyl¹

¹ Stellenbosch University, Department of Animal Sciences, Stellenbosch University, 7602 Stellenbosch, South Africa, ² Northern Cape Department of Agriculture, Environmental Affairs, Land Reform and Rural Development, Eiland Research Station, 8801 Upington, South Africa, ³ Western Cape Department of Agriculture, Directorate: Animal Sciences, Elsenburg, 7607 Stellenbosch, South Africa

Remote sensing has become an increasingly popular tool to monitor grazing behaviour and aid in rangeland management and conservation. It is well-known that vegetation quality and composition influence livestock grazing behaviour. This study evaluates various vegetation indices, including the Near Difference Vegetation Index (NDVI), for predicting beef cattle grazing behaviour in South Africa's Strandveld region. Six Bonsmara (*Bos taurus indicus*) and six Nguni (*Bos taurus africanus*) cows were each fitted with a LoRa (GPS/UHF) collar and placed on the natural vegetation of Nortier Research Farm, Western Cape, South Africa. GPS coordinates of cattle locations were recorded for 12 months. Statistically significant spatial clustering of GPS data was identified through Optimized Hot Spot Analysis. Hot- and cold spots were identified, indicating that cattle preferred certain paddock areas. In contrast, others were visited significantly less frequently. Hotspots were statistically compared to values extracted from Sentinel-2 imagery using various vegetation indices. It was observed that NDVI data on vegetation quality could not fully explain cattle grazing behaviour and that other Sentinel 2-derived indices needed to be considered when attempting to explain and predict grazing behaviour. Remote sensing technologies are valuable tools for rangeland management; however, a one-size-fits-all approach cannot be followed, and various indices must be evaluated for different vegetation types.

LiDAR technology as a contactless tool for quantitative analysis of body condition score in beef cattle

S. Marchegiani¹, S. Chiappini², M. Pasquini¹, A. Ragaini¹, M. F. Trombetta¹, E. Marcheggiani¹, S. Ceccobelli¹

¹ Università Politecnica delle Marche, Department of Agricultural, Food and Environmental, Via Breccia Bianche 10, 60131 Ancona, Italy, ² Università Politecnica delle Marche, Department of Construction, Civil Engineering and Architecture, Via Breccia Bianche 12, 60131 Ancona, Italy

Body condition score (BCS) is a crucial aspect of livestock management being a key indicator of productivity, health and welfare of animals. Modern contactless techniques are constantly being implemented for an increasingly effective BCS assessment. Light Detection and Ranging (LiDAR) uses laser scanning and point-to-point matching to construct 3D shapes that accurately represent the animal's body pattern. Therefore, LiDAR represents an opportunity for a cost-effective and accurate shape computation. The current research aims to assess LiDAR technology's reliability in beef cattle. LiDAR tool by both mobile phone and unmanned aerial vehicle will be used to get 3D point cloud of beef cattle, deriving the critical parameters to estimate BCS. Simultaneously, the BCS will be evaluated by a breed classifier following the standard method. The outcomes from both methods will be compared to assess the performances and accuracy of the contactless LiDAR approach. 3D data processing for animals will be improved and specific algorithms will be developed to facilitate the automatic discrimination between the BCS classes and also exploring the possibility of computing animals' weight in the future. A more reliable, accurate, and timely predictions of cows' BCS can improve some critical aspects of beef cattle farming, such as farm management, genetic evaluations, and animal welfare, bringing significant advantages for farmers.

Early lactation body condition and milk production affects fertility performance in dairy cows

D. Meuwissen¹, M. J. Gote¹, I. Adriaens^{1,2}, B. Aernouts¹

¹ KU Leuven, Biosystems, Kleinhoefstraat 4, 2440 Geel, Belgium, ² Ghent University, Data Analysis and Mathematical Modelling, Coupure Links 653, 9000 Ghent, Belgium

Improving dairy cow fertility is difficult, as it is a complex trait that depends on the animal's physiological status, health, and production performance. How a cow navigates through her transition period at the start of lactation, has been shown to affect fertility performance later in the lactation. With sensors that can reveal physiological status over time at a high frequency, we can study the complex relationships between early lactation health and production, and fertility performance. In this study, we use an extensive dataset from 17 commercial dairy farms that are equipped with an automatic milking system, a milk progesterone monitoring sensor and, for 5 out of 17 farms, a body condition score (BCS) camera. Meaningful features were derived from the early lactation BCS and milk production time series. These features describe for example changes in BCS during the dry period and early lactation, total milk yield and milk yield variation. Random forest regression models were used to link the BCS and milk production features to fertility performance traits derived from the milk progesterone time series. Based on the fertility trait and features included in the model, the r^2 ranged between 0.05 and 0.15. We found that a prolonged postpartum anestrus period was associated with a stronger decrease in BCS during early lactation. A prolonged period from calving to successful insemination was associated with high cumulative milk yield and high milk yield fluctuations during early lactation. These insights can be used to better understand the factors that jeopardize dairy cow fertility.

Session 14

Theatre 9

Digital and precision livestock farming (PLF) technologies: gaps between sheep and goat farmers' needs and existing solutions

C. Morgan-Davies¹, A. McLaren¹, L. Grova², V. Giovanetti³, L. Depuille⁴, T. W. J. Keady⁵, B. Mccllearn⁵, R. Klein⁶, A. Godo⁷, I. Halachmi⁷, P. Piirsalu⁸, I. Llach⁹, J. M. Gautier⁴, F. Kenyon¹⁰

Galway Athenry, Ireland, ⁶ UNIDEB, Egyetem Ter 1, 4032 Debrecen, Hungary, ⁷ ARO, The Volcani Centre, 7505101 Rishon LeTsiyon, Israel, ⁸ EULS, Fr.R. Kreutzwaldi 1, 51006 Tartu, Estonia, ⁹ INRAe, SELMET, 34000 Montpellier, France, ¹⁰ MRI, Bush Loan, EH260PZ Penicuik, United Kingdom

Sm@RT is an EU Horizon 2020 funded project, involving Estonia, France, Hungary, Ireland, Israel, Italy, Norway and UK, to encourage uptake of digital and PLF technologies by sheep and goat farmers. In a series of national and international workshops in the 8 countries, 166 different needs and challenges regarding technology use were identified by sheep and goat farmers. Sixty potential solutions were collated by the project partners, with some solutions addressing more than one need and production type (meat sheep, dairy sheep and dairy goats). In total, 18 needs were not addressed as follows: 3 for reproduction, 4 for health/welfare, 3 for herd monitoring, 2 for feeding/grazing, 4 for milking, and 2 for fattening. During a final international workshop, additional solutions were identified by over 80 stakeholders to address those gaps although not all were available on the market or directly adapted. Only two gaps relating to milking were not addressed. Between existing technologies and upcoming prototypes, most sheep and goats farmers' needs for technology use on farms can be answered. However, barriers to uptake and cost-benefit analysis, amongst others, should also be considered.

Using accelerometers for goat activity monitoring

M. Bonneau¹, L. Faillot¹, W. Troupe³, L. Riaboff²

¹ INRAE, ASSET, Domaine Duclos, 97170 Petit-Bourg, Guadeloupe, ² INRAE, GENPHYSE, INPT, 31326 Castanet-Tolosan, France, ³ INRAE, PTEA, Domaine Gardel, 97170 Petit-Bourg, Guadeloupe

Monitoring animal activity is crucial for welfare, health, and has potential future economic impact. Although the cost of accelerometers remains high, they prove particularly useful when the objective is to monitor the activity of animals raised in groups in a research setting. The aim of our study was to develop an algorithm to predict animals' activity based on Ax3 accelerometers from Axivity, known for their impressive battery life and lack of time synchronization issues. We established an experimental pasture covering approximately 150m², where 4 to 5 adult goats grazed freely for 1 to 2 days. The animals were equipped with accelerometers attached to their horns. CCTV cameras were used to film the animals during the experiment, allowing for manual labeling of their behavior afterward. A total of 35 behaviors were considered, including generic actions such as ruminating or grazing, as well as more specific behaviors like grooming or fighting. The animals' activities were manually labeled from 72.44h of video footage using Boris. For the behavior, we try a deep-learning approach based on LSTM. We proposed a waterfall model, i.e. an iterative LSTM model, with different sequence lengths, adapted to the each tested behavior. For prediction, we only considered 5 behaviors: displacement, grazing, ruminating, other and resting. The recall was 52.9%, 99.4%, 92.9%, 79.2%, and 95.5%, while the precision was 70.8%, 99.1%, 89.8%, 86.7% and 96.2%. The effectiveness of the method was lower for shorter behaviors, partly due to the challenge of perfectly synchronizing video and accelerometer data.

IntelliRAS – some results from a project on precision fish farming in recirculation aquaculture systems

L. Foldager^{1,2}, V. M. Thorup¹, M. Pastell³, M. Frandsen⁴, B. Bang Jensen⁵, M. A. Krogh¹

¹ Aarhus University, Animal and Veterinary Sciences, Blichers Allé 20, 8830 Tjele, Denmark, ² Aarhus University, Bioinformatics Research Centre, Universitetsbyen 81, 8000 Aarhus, Denmark, ³ Natural Resources Institute, Production Systems, Latokartanonkaari 9, 00790 Helsinki, Finland, ⁴ OxyGuard International A/S, Farum Gydevej 64, 3520 Farum, Denmark, ⁵ Norwegian Veterinary Institute, Epidemiology, Arboretveien 57, 1433 Ås, Norway

IntelliRAS, “Intelligent farming and health control in land-based recirculating aquaculture systems” (2021-2024), is a Nordic project including three research institutes and a Danish company producing and selling probes measuring e.g., dissolved oxygen (DO; amount of oxygen accessible to the fish) and CO₂ concentration in aquaculture systems. The overall aim is to enable farmers producing salmonids in recirculation aquaculture systems (RAS) to move from experience-based to knowledge-based decision making; precision fish farming (PFF). PFF was introduced in 2018 to facilitate a more sustainable production regarding production margins, environmental impact, health, and welfare in intensive aquaculture. Here we focus on monitoring and predicting mortality and consider tools for management that may enable earlier and less radical preventive changes in feeding. The methods considered are quality control charts of daily mortality counts, forecasting of CO₂ and DO based on sensor data time series, and use of generalised dynamic linear models. The main data are from a Danish land-based freshwater trout farm with 12 tanks, 2 with additional sensors measuring DO, CO₂ and temperature in the water. Moreover, we have production data from ~15 Danish RAS trout farms. Preliminary analyses showed CO₂ to be in moderate positive correlation with feed fed but uncorrelated with mortality, which had positive moderate correlation with temperature.

Optimizing Disease Risk Classification: A Data-Integrative Approach

C. Matzhold¹, K. Schodl¹, C. Egger-Danner¹¹ ZuchtData EDV-Dienstleistungen GmbH, Dresdner Straße 89/B1/18, 1200 Vienna, Austria

In this study we apply a data integrative modelling approach and machine learning (ML) techniques to advance the classification of dairy cows at health risk. Central to our approach is the optimization of the balance between static and dynamic information and an evaluation of the interplay between model inputs and disease classification performance. By synthesizing insights from previous research on farm and livestock risk models, we minimize reliance on static traits by highlighting the most important traits, improving the application of an integrative approach to disease risk modeling. Analyzing data from 342 farms and 24,663 dairy cows, our study integrates over 350 static features, including farm management strategies and genetic information, alongside dynamic features such as DHI milking records and AMS data, and health diagnostic outcomes. A variety of machine learning techniques, such as XGBoost and RF, are applied to identify the best classification model. Preliminary findings demonstrate the efficacy of the XGBoost model in predicting lameness, achieving a high degree of sensitivity (0.81) and specificity (0.94), culminating in an F1 score of 0.78. This underscores the potential of employing advanced ML techniques in the precise identification and management of health risks in dairy cows. The study represents a further step towards the development of a data-integrative approach to disease risk modeling that supports farmers in their decision-making process.

Assessing the future uptake of digital tools and technologies by sheep and goat farmers in the meat and dairy industries

A. McLaren¹, L. Grøva², A. De Boer², T. W. Keady³, B. Mcclern³, G. Valeria⁴, M. Acciaro⁴, L. Depuille⁵, R. Klein⁶, A. Godo⁷, P. Piirsalu⁸, F. Kenyon⁹, I. Halachmi⁷, I. Llach¹⁰, C. Morgan-Davies¹

¹ SRUC, Hill and Mountain Research, West Mains Road, EH9 3JG Edinburgh, United Kingdom, ² NIBIO, 6630 Tingvoll, Norway, ³ Teagasc, Athenry, Galway, Ireland, ⁴ AGRIS Sardegna, S.S.291 Km 18,600, 07100 Sassari, Italy, ⁵ IDELE, Campus INRAE, 31321 Castanet Tolosan, France, ⁶ UNIDEB, Egyetem Ter 1, 4032 Debrecen, Hungary, ⁷ ARO, The Volcani Centre, 7505101 Rishon LeTsiyon, Israel, ⁸ EULS, Fr.R. Sm@RT, an EU Horizon 2020 funded project, aims to improve the understanding, awareness and uptake of digital tools and technologies available to small ruminant farmers. To assess factors influencing the rate and peak level of uptake, stakeholder groups in the 8 Sm@RT countries (Estonia, France, Hungary, Ireland, Israel, Italy, Norway, UK) used the Adoption and Diffusions Outcome Prediction Tool (ADOPT) (<https://adopt.csiro.au/home.aspx>). Questions were in 4 categories; characteristics of the tool/technology; characteristics of the farming population; advantage of using the tool/technology; and learnability. To date, sessions have been completed on 20 different tools/technologies presented by the project as possible solutions to needs identified previously. For example, predicted rate and peak level of uptake for an EID stick reader (across 4 different countries) ranged from 9-24 years and 72-97% of the population. Overall results indicate that answers given relating to what proportion of the population will need new skills/knowledge, and the proportion of farms that could benefit from the tool/technology, are influential in terms of rate and peak level of uptake respectively.

Web platform for technical and economic comparisons of environmentally beneficial practices and investments in pig, poultry, and cattle farming

P. Levasseur¹, V. Blazy², L. Jarrige De La Sizeranne³, S. Bourrin⁴

¹ IFIP-Institut du porc, 9 boulevard du Trieux, 35740 Pacé, France, ² ITAVI, Rue Maurice le Lannou, 35000 Rennes, France, ³ IDELE, 8 route de Monvoisin, 35650 Le Rheu, France, ⁴ FRCUMA Ouest, 19b Boulevard Nominoé, 35740 Pacé, France

In the context of reducing the environmental impacts of livestock farming, IFIP-Institut du porc, supported by six partners, has developed a web platform for technical and economic comparisons of environmentally beneficial practices and investments in pig, poultry, and cattle farming. The main objective of this tool is to guide farmers towards the most competitive environmental practices, e.g. those with the best efficiency/cost ratio. A second objective is to create national benchmarks for updated costs. The aspects considered include storage, treatment, and spreading of livestock effluents (slurry, manure, digestate); reduction of ammonia emission; techniques for reducing energy consumption and producing renewable energy. In practice, farmers create an account on this platform and fill in a technical description form of the service or investment made on one of the mentioned items and the cost invoiced to them. Participation in the program allows each farmer to compare their costs to a similar group and identify the reasons of the observed differences. Filters, consisting of the main technical descriptions (capacity of the unit, installed power, number of animals or mass of manure involved, etc.), allow the farmer to specify or broaden the reference population to which they compare themselves. To initiate the system, the technical and economic data of more than 40 farmers on one or more aspects have been integrated into the tool.

CowBase: a Python package for streamlining data management in dairy farming

M. J. Gote¹, M. Ceccarelli³, D. Meuwissen¹, L. D'Anvers¹, B. Aernouts¹, I. Adriaens^{1,2}

¹ KU Leuven, Biosystems Department, Kleinhoefstraat 4, 2440 Geel, Belgium, ² Ghent University, Department of Data Analysis and Mathematical Modelling, Coupure Links 653, 9000 Gent, Belgium, ³ University of Bologna, Department of Agri-Food Science and Technology, Viale Fanin 50, 40127 Bologna, Italy

With the increased implementation of automatic milking systems (AMS) and the trend toward larger farms, translating data into useful information has become crucial in the dairy sector. Although there is increasing research on understanding and analyzing dairy data, the absence of standardized practices among research groups and the time-consuming nature of building proper data structures present significant challenges. In response, we present CowBase, a Python package designed to streamline data management from AMS and weather stations. The first two of five modules extract data from an AMS farm backup or directly from an on-farm database, with current implementation for both DeLaval and Lely systems. The third module allows for data selection and contains functions for robust data processing, optimizing data tables for research purposes, and correcting for data discrepancies. Finally, the fourth module generates and writes to a new data structure, supporting various database systems such as PostgreSQL, MySQL, and SQLite. In the last package, a database connection class for Python is given. Testing and validation of CowBase were done on data collected in projects within the Livestock Technology group at KU Leuven, resulting in a database of 60 dairy farms, with data from back to 2005, facilitating over 10 PhD projects and collaborations. By providing a comprehensive solution for data management in dairy farming, CowBase aims to improve efficiency, facilitate collaboration, and advance research in the field.

Improving conception rates for farms with a milk progesterone sensor

The use of milk progesterone (P4) has become the gold standard in dairy cow fertility management as it allows to accurately identify the optimal insemination window based on the detection of luteolysis preceding ovulation. On-farm P4 devices (OPD) measure and monitor the milk P4 of individual cows, thereby generating luteolysis alerts (LA) and estimating the optimal insemination window. Currently, a multi-process Kalman filter is used by the OPD to process the raw P4 data and reduce false LA. This filter introduces a time lag on the LA which depends on measurement frequency and the rate of change in P4 during luteolysis. The variation in this time lag is currently not considered in the optimal insemination window. In this study, we use an extensive dataset from 17 commercial dairy farms equipped with OPD. Conception rates for inseminations that are performed earlier, timely or later respective to the advised insemination were evaluated in function of the associated time lags. Results indicate that, when the time lag was longer than 24 h, conception rates can improve with 13% when inseminating earlier than advised. Likewise, when the time lag was shorter than 8 h, the conception rate increased 17.5% if the farmer inseminated later than advised. Our results suggest that farmers using OPD could increase their conception success by compensating a longer time lag on the LA with a shorter interval from alert to insemination. This will improve the fertility performance on those farms, which can positively impact the farm's sustainability.

Genotyping complex structural variants using a Chicken Pangenome reference

D. Bickhart¹, E. Rice^{2,3}, L. Frantz³, W. Warren^{2,4}

¹ Hendrix Genetics, Spoorstraat 69, 5831 CK Boxmeer, Netherlands, ² Bond Life Sciences Center, 1201 Rollins St, 65211 Columbia, MO, United States, ³ Ludwig-Maximilians-Universität, Faculty of Veterinary Medicine, Geschwister-Scholl-Platz 1, 80539 München, Germany, ⁴ University of Missouri, Department of Animal Sciences, 920 East Campus Dr, 65211 Columbia, MO, United States

Genomic structural variants (SV) comprise a sizeable proportion of the variable genome, but have remained difficult to characterize with short-read DNA sequencing technologies. It is necessary to still estimate the prevalence and impacts of these types of variants, so improvements in the efficacy of sequencing or the analysis of sequencing reads are required to assess the diversity of SVs in each species. Using a recently published Chicken Pangenome resource, we present the use of Pangenome graphs as a medium to efficiently identify SVs using short-read sequencing data. The Chicken pangenome graph was derived from 30 long-read chicken genome assemblies, with one previously published assembly (Huxu) of near telomere-to-telomere quality. The input assemblies provided excellent representation of the structural diversity of the Chicken genome when compared to previous studies, as a similar length of deleted sequence (19.2 Mbp previous; 19.7 Mbp Pangenome) and 3-fold higher length of inserted sequence (6.74 Mbp; 18.5 Mbp) were identified in the graph when compared to the bGalGal1b linear reference assembly. Having established that the graph was structurally representative, it was used as a reference to genotype complex structural variants, such as the K locus, in 100 sequenced chicken individuals. K locus genotypes were consistent with the phenotypes of the sequenced birds; however, the use of the graph revealed that 20% of birds with the late-feathering allele do not have a characteristic ev21 insertion in the locus, suggesting further structural plasticity at this locus. The use of a high resolution pangenome graph promises to improve the accuracy and throughput of SV detection in non-model organisms by resolving complex features that are recalcitrant to easy interpretation. If properly representative of the structural diversity of a species, a pangenome graph could allow for routine genotyping of SVs from cost-efficient short-read DNA sequencing.

Construction of a cattle pangenome for 14 French dairy and beef breeds provides new insights into their genetic diversity

The current cattle genome reference assembly, based on a single Hereford cow fails to capture the whole spectrum of genetic variations within the species. Structural variations (SVs), defined as genomic variations longer than 50 nucleotides, can have a potential impact on both complex and Mendelian phenotypic variations. However they are difficult to detect using only standard approaches of either short or long-read sequence mapping to the current bovine genome assembly. Thanks to the recent advances in long-read sequencing technologies coupled with the development of appropriate bioinformatics tools, it's now possible to construct de novo genome assemblies for a large number of animals across various cattle breeds. It also offers the opportunity to study a broader range of both small and more complex genome-wide variations. Using these technologies, we have produced a comprehensive cattle pangenome incorporating genetic diversity from 64 high-quality de novo assemblies representing 14 French bovine dairy and beef breeds. We applied a combination of complementary approaches to characterize a wide spectrum of SVs and we report the identification of several megabases of novel genome sequences that are absent in the current cattle genome reference assembly. Further work is currently in progress to investigate the gene content of these non-reference sequences. This work was conducted in the SeqOccIn project, funded by the Occitanie region, FEDER, and Apis-Gene. Valentin Sorin's PhD is supported by INRAE.

Session 15

The current method of constructing a genome reference assembly through sequencing the entire genome of just one or a very small number of individuals falls short in capturing the complete spectrum of genetic diversity within most species, including ovine. In addition, the exploration of genomic structural variations (> 50 nucleotides) is constrained when relying solely on short-read sequences aligned to these genome reference sequences. Nevertheless, due to the rapid advancements in sequencing technologies and bioinformatics tools, it is now possible to generate long-read sequences and create de novo genome assemblies for numerous animals, thereby enabling the commencement of pangenomic studies within these species. In this study, we integrate long and short read sequences to build de novo assemblies and haplotype-resolved assemblies for 11 distinct ovine breeds. Employing various methodologies, we established a pangenome and subsequently investigated a wide range of structural variations within the species. We identified several additional megabases of genome sequences absent in the current reference genome assembly and we are currently investigating gene content of these non-reference sequences. This research was conducted as part of the SeqOccIn project, funded by the Occitanie region, FEDER, and Apis-Gene. Valentin Sorin's PhD is supported by INRAE.

Translocations associated with gonadal hypoplasia and colour-sidedness are common in northern Swedish cattle breeds

J. Hinken¹, T. Vanhala¹, M. Gòdia², M. Johnsson¹, A. M. Johansson¹

¹ Swedish University of Agricultural Sciences, Dept of Animal Biosciences, Box 7023, 75007 Uppsala, Sweden,

² Wageningen University and Research, Animal Breeding and Genomics, P.O. Box 338, 6700 AH Wageningen, Netherlands

The problem of gonadal hypoplasia, which can cause fertility problems, has been known in Swedish Mountain cattle (Fjällko) for almost 100 years. In the mid 20th century it was discovered that the inheritance was recessive with reduced penetrance and that the hypoplasia was associated with having a lot of white colour. Despite breeding efforts in Sweden during many years to reduce the prevalence of gonadal hypoplasia, the problem still occurs. Five Swedish cattle breeds, including Fjällko, show the phenotype of colour-sidedness which is caused by either a translocation and duplication from chromosome 6 to chromosome 29 (known as Cs29), or an additional translocation allele where part of Cs29 has been translocated back to chromosome 6 (Cs6). Besides the colour-sidedness, Cs29 is associated with gonadal hypoplasia. In this study, we used WGS data from 30 cattle of Swedish local breeds, as well as multiplex breakpoint PCR genotyping of additional cattle from different time periods to investigate Cs29 and Cs6. Analyses of the depth of coverage allowed us to detect the elevated depth of coverage created by Cs29 and Cs6. Within-sample allele frequencies, based on the depth of reads supporting each SNP allele located in the regions affected by the translocations, also support the inferred genotypes. We detected the Cs29 allele in all five Swedish breeds where colour-sidedness occurs. The allele frequencies of the Cs29 translocation ranged between 0.22 up to 0.57. We also detected Cs6 in four breeds. The genotyping of new samples showed that both translocations still occur in rather high frequencies.

University of Guelph, Department of Pathobiology, 50 Stone Road East, N1G 2W1 Guelph, Canada

This study aimed to identify insertion and deletions (INDELs) responsible for alternative splicing in Rideau x Dorset crossbred sheep with different immune profiles under natural exposure to gastrointestinal nematodes (GINs) using RNA-Sequencing. High (H) and medium (M) acute stress responders with the highest and lowest worm burden, after natural exposure to GIN, were selected for liver RNA extraction (H; n=5 and M; n=6). In addition, GIN-unexposed lambs (U; n=4) were used as immunological controls. Sequence reads were aligned to the annotated Oar_rambouillet_v.2.0 ovine reference genome. Quality control and variant discovery analysis were performed using CLC Bio Genomics workbench. Functional consequence analysis to identify INDELs leading to amino acid changes and splice site events (SSEs) were performed. Genes were recovered from Ensembl BioMart using the list of INDELs. Unique INDELs with SSEs for H, M, and U groups (162, 244, and 161, respectively) and shared (372) among groups were identified. Among them, 4 INDELs with SSE uniquely identified in the M group were located within the NLRC5, SIGLEC1, CFD, and STAT6 genes related to the immune system. Significant enriched metabolic pathways (FDR<0.05) were identified using the list of INDELs with SSEs for each group using Reactome. The cross-presentation of soluble exogenous antigens (endosomes) and NIK noncanonical NF-κB signalling pathways were identified in the M group. These results can help to better understand the mechanisms responsible for sheep's immune response to GIN.

SNP-based identification of Robertsonian translocation 1;29 in 32 Italian cattle breeds

M. Cortellari¹, A. Bionda¹, L. Liotta², P. Parma¹, P. Crepaldi¹

¹ Milan University, Dipartimento di Scienze Agrarie e Ambientali, Via Celoria 2, 20133 Milan, Italy, ² Messina University, Dipartimento di Scienze Veterinarie, V.le Palatucci 13, 98168 Messina, Italy

Robertsonian translocation 1;29 (rob(1;29)) is a chromosomal anomaly impacting cattle fertility. Screening programs have reduced its prevalence over time, but rely on cytogenetic analyses, expensive and requiring fresh blood. This work uses routine SNP data to explore the genomic region involved in rob(1;29) and identify carriers within Italian cattle breeds. The study encompassed SNP data for about 1000 individuals from 32 Italian breeds, 172 of which also karyologically tested. Supplementary analyses were conducted on SNP data routinely collected by nine breed associations for 1700 animals. FST analysis identified a region within the initial 6 Mb of BTA29, which includes the centromeric region implicated in the translocation. Principal component analysis and haplotype examination of this region proved to effectively detect heterozygous and homozygous carriers of rob(1;29). The study demonstrates SNP data's efficacy as a swift, precise, and cost-efficient tool for broad rob(1;29) screening, advocating for specific SNPs' inclusion in common cattle genotyping panels. The presence of a common haplotype among all identified rob(1;29) carriers supports a shared ancestry theory. Lastly, our analyses unveil the presence of carriers in previously untested breeds, with elevated prevalence -validated by karyological analysis- and the presence of homozygous individuals in the Cinisara, a breed of Podolian origin, which could serve as a model for investigating this translocation. Acknowledgements: The Authors are grateful to the BOVITA project and ANABIC, ANABORAPI, and ANAPRI associations for sharing their data.

Determining differential splice junction usage in the suckling lamb adipose transcriptome by comparing perirenal and tail fat

M. Alonso-García¹, B. Gutiérrez-Gil¹, P. A. Fonseca¹, R. Pelayo¹, J. J. Arranz¹, A. Suárez-Vega¹

¹ Universidad de León, Animal production, Campus de Vegazana, s/n, 24007 León, Spain

Our study exploits transcriptomic data from perirenal and tail fat depots in suckling lambs (n = 8) to characterize alternative splicing (AS) events and differential isoform expression (DEI) in adipose tissue. Understanding isoforms' impact on adipose tissue development and fat deposition could offer valuable insights into metabolic regulation of the different fat depots analysed. We identified 4,446 differentially expressed genes (DEGs), with 2,156 overexpressed in perirenal fat and 2,290 in tail fat. Differential exon usage analysis unveiled 428 DEIs affecting 386 annotated genes, with exon skipping (~ 40%) and alternative transcription start sites (~ 35%) being predominant AS events. Of the DEIs within DEGs, structural changes were diverse, including alterations in intron structures, exon numbers, and genomic positions of open reading frames. Functional enrichment analysis identified significant Gene Ontology terms, including "vascular-associated smooth muscle cell apoptotic" potentially associated to the role of adipose tissue on metabolic regulation. Notably, peroxisome proliferator-activated receptor gamma (PPARG) gene was upregulated in fat tail, highlight the role of this depot in fat accumulation. However, two DEIs were more expressed in perirenal tissue, indicating nuanced regulatory mechanisms which should be further explored. Overall, our study elucidates significant differences in AS events and isoform expression between the perirenal and tail fat depots in suckling lambs, underscoring the complexity of adipose tissue regulation.

Exploiting WGCNA to analyse the suckling lamb liver transcriptome profiles of males and females

M. Vrcan¹, A. Suarez-Vega¹, P. A. S. Fonseca¹, M. Alonso-García¹, J. J. Arranz¹, B. Gutierrez-Gil¹

¹ University of León, Faculty of veterinary, Animal production, Av. Facultad de Veterinaria, 25, 24004 León, Spain

Suckling lamb meat is one of the most relevant products of the Mediterranean dairy sheep industry. The liver, with a central role in macronutrient metabolism and homeostasis, may influence livestock carcass quality. Transcriptome sequencing, or RNA-Seq, can help us to understand the complexity of eukaryotic transcriptomes, whereas Weighted Gene Coexpression Network Analysis (WGCNA) appears as a valuable approach to unraveling the complex relationships between gene expression patterns and quantitative phenotypic traits. Thus, the present study aims to exploit the potential of WGCNA to better understand the link between liver transcriptome profiles and quantitative traits related to carcass quality in male and female suckling lambs. WGCNA identified 26 and 27 modules in males and females, respectively, and the correlation between module eigengenes and carcass traits revealed two modules in males significantly associated with the studied traits, the green module for %muscle ($r^2 = -0.88$, $p = 0.02$) and the pink module for %cavitary fat ($r^2 = -0.84$, $p = 0.04$). No significant female-related modules were identified. The green module, negatively correlated with the %muscle, was enriched in GO terms related to hypoxia and response to stress. Hypoxia has been reported to inhibit muscle growth and cell differentiation, highlighting the importance of hypoxia/stress-related processes concerning muscle. The pink module, negatively correlated with %cavity fat, was significantly enriched in GO terms related to vascularization, which is shown to be a crucial process in adipogenesis. The results here reported highlight sex-dependent differences in the liver transcriptome between sexes associated with the molecular mechanisms underlying carcass traits and underscore the importance of hypoxia and vascularization in regulating muscle and fat deposition for male suckling lambs.

The genotypes of Myostatin gene are associated with weight gain indicators of intensively fattened lambs of Latvian sheep

I. Trapina¹, S. Plavina¹, N. Krasnevska¹, J. Paramonovs¹, D. Kairisa², N. Paramonova¹

¹ Institute of Biology of the University of Latvia, Genomics and Bioinformatics, Jelgavas 1, LV-1040 Riga, Latvia, ² Latvian University of Life Sciences and Technologies, Department of Animal Sciences, 2 Lielā Stree, LV-3001 Jelgva, Latvia

MSTN, a member of the TGF β superfamily, negatively affects skeletal muscle growth and controls muscle development. Feed costs make up a significant portion of daily costs in sheep farming. Improving feed efficiency or carcass yield of lambs can reduce costs and increase income. Genetic variations of MSTN can be used in Marker association selection in animal husbandry. The study aims to search for genotypes of multi-locus of MSTN in association with weight gain indicators in Latvian sheep. Genomic DNA of 76 controlled, intensively fattened lambs from six Latvian breeds were sequenced MSTN. Variable 24 loci were identified and genotypes of multi-locus of promoter and exon 1, intron 1 and 2, and 3'UTR region were associated with fattening indicators. Nine genotypes and five haplotypes were detected based on the four SNPs in promoter and exon 1. In introns 1 and 2 were found nine and five SNPs, respectively, forming 14 and 10 genotypes, and 9 and 8 haplotypes, but in 3'UTR were four variable loci forming seven genotypes and four haplotypes. SNPs from the 3'UTR region were significantly associated with lamb birth weights, dry matter intake, average daily weight gain during feeding, and percentage of carcass weight to live weight of lambs. Genotypes from intron 1 were found in association with the percentage of carcass weight. Our results indicate that MSTN SNPs in the intron 1 and 3'UTR regions are important for intensive lamb fattening. Their use in breeding can improve Latvian sheep breeds and economic yield. Acknowledgements. The study was funded by the LZP-2021/1-0489 project

Estimating haplotype and mutation effects in the context of genome sequence via ancestral recombination graphs

G. Mafra Fortuna¹, J. Obšteter², A. Moškrič², G. Gorjanc¹

¹ The University of Edinburgh, The Roslin Institute, Easter Bush, EH259RG Edinburgh, United Kingdom, ² The Agricultural Institute of Slovenia, Animal Science, Hacquetova ulica 17, 1000 Ljubljana, Slovenia

Genomic prediction with whole-genome sequence data is challenging due to high computational cost and limited increase in accuracy but it has the opportunity to capture causal mutations and their effects in the context of the genome sequence for biological discovery. To overcome the challenges, we developed a statistical model that leverages local tree structure in an ancestral recombination graph (ARG). ARGs describe genetic variation in the sampled genomes with past mutation, recombination, and branching/coalescence events. We parameterise the difference between ancestor-descendent haplotype values by the effect of the mutation(s) between the haplotypes (=branch effects). Thus, haplotype values equal the sum of all branch effects from the tree root to the haplotype. This makes the mutation effects sequence-dependent, capturing local epistasis and ancestry-specific effects. The tree structure generates a recursive and sparse model via conditional distributions of ancestor-descendant haplotype values, allowing efficient calculations via generalised Cholesky decomposition of variance and precision matrices between haplotype values. We demonstrate the model with a sample of cattle mtDNA and associated real/simulated phenotypes. Since mtDNA is non-recombinant, we work with a single ARG spanning the entire genome. Results show how our mutation-event-aware model differs from the standard variant-allele-dosage model and generates more accurate estimates of mutation effects and haplotype values in different genetic backgrounds. Extending the model to recombining genomes still imposes a significant computational challenge and is ongoing research.

Genomic prediction using functional annotations and QTL features in dairy and beef cattle breeds

P. Croiseau¹, F. Mollandin¹, A. Rau¹, M. P. Sanchez¹, D. Boichard¹

¹ Université Paris-Saclay, INRAE, AgroParisTech, GABI, Domaine de Vilvert, 78362 Jouy en Josas, France

Existing Bayesian genomic evaluation methods such as BayesRC can account for biological annotations but not more than one annotation per SNP. However, when a SNP is associated with multiple sources of functional annotation, it is not straightforward to identify the most relevant annotation for a trait of interest. To handle multi-annotated SNPs, the BayesRC π approach assigns a multi-annotated SNP to its optimal annotation and within a specific effect class (null, small, medium or strong effect). These strategies were tested in two dairy breeds (Montbéliarde and Normande) and one beef breed (Charolaise). Four different annotation classes were considered (50K chip, GWAS, GWAS meta-analysis, genomic features) for a total of around 100,000 and 50,000 SNPs in the dairy and beef breeds, respectively. The traits of interest were milk, protein, and fat yields, protein and fat contents in dairy cattle, and weight at 18 months, thickness of bones, muscular and skeletal development in beef cattle. Although assuming different variance priors in a BayesR model led to a significant improvement in the accuracy of genomic predictions for a number of traits, incorporating annotation classes via the BayesRC and BayesRC π models did not result in any additional gain. However, the posterior distribution of SNPs in the different effect classes (null, small, medium or strong) strongly differed between models, with the SNPs having a strong biological annotation being more frequently assigned to the medium and strong effect classes with the BayesRC π model than with the BayesR model. This suggests that the biological information is useful in identifying SNP with strong effects, which may favour more robust prediction equations over time.

A genome-wide association study to identify novel genomic regions associated for aviary with winter garden usage by laying hens

K. Hoeksema¹, C. Baes^{2,3}, S. Gebhardt-Henrich¹, M. Petelle¹, M. Toscano¹, B. Makanjuola²

¹ University of Bern, Center for Proper Housing: Poultry and Rabbits (ZTHZ), Division of Animal Welfare, Burgerweg 22, 3052 Zollikofen, Switzerland, ² University of Guelph, Centre for Genetic Improvement of Livestock, Department of Animal Biosciences, 50 Stone road East, N1G 2W1 Guelph, Canada, ³ University of Bern, Institute of Genetics, Bremgartenstr.109A, 3012 Bern, Switzerland

The health and welfare of a laying hen in an aviary system is often expressed through the frequency of movement within the aviary. However, the usage of the zones within the aviary by the hens is not fully known, but connections between zone and production have been made. Recent studies have shown that duration spent in different zones within the aviary is heritable. Therefore, the objective of the current study is to identify genomic regions or single nucleotide polymorphisms (SNP) associated with the use of different zones by hens in the aviary using a genome-wide association study. For this study, 1,106 Dekalb white laying hens (Hendrix Genetics) were genotyped using a 60K SNP array and were monitored daily for 290 days, where each visit and duration in the different zones were recorded, culminating in 937,740 records. Hens were kept in an aviary system with 5 different zones, a top level tier, nest box tier, lower level tier, floor littered area and an outdoor winter garden area. The current study aims to further provide insight into the genetic contribution for different zone usage by laying hens, highlighting potential genes associated with the traits and allowing further understanding into selecting for these behaviour traits. Ultimately, this will help to improve the welfare of animals within the aviary by selecting potential genomic regions responsible for the usage of different zones in the aviary.

Detecting NGT Products: The Role of the GenEdit Database

F. Debode¹, V. Gelhay¹, G. Cartik², A. Granados², E. Clark³, H. Mbaya³, J. Hulin¹

¹ CRA-W, Life Sciences, chaussée de Charleroi 234, 5030 Gembloux, Belgium, ² FABRE TP, rue de Trèves 61, 1040 Brussels, Belgium, ³ The Roslin Institute, University of Edinburgh, Easter Bush, Midlothian, EH25 9RG Scotland, United Kingdom

The advent of new genomic techniques (NGTs) such as genome editing has revolutionised the ability to precisely edit and change the genetic code of animals. This has stimulated the launch of European initiatives aimed at further exploring the functionality of the genes of farmed animals (genotype-to-phenotype research, such as the EuroFAANG projects), developing new breeding strategies to help ruminants adapt to climate change (RUMI-GEN), or developing innovative methods to detect NGT products (DETECTIVE). One of the tasks of the DETECTIVE project is to gather information on the proposed innovations to determine their origin, the associated traits, the most frequently modified genes, and the importance of modifications. This will help define detection strategies and develop methods to distinguish NGT products from conventional ones. For this purpose, we developed the GenEdit database, based on an open-source Shiny application, which currently gathers information on 1,158 genome-edited (GE) organisms, including 314 GE animals. Among the methods used to edit animals, the CRISPR-Cas technique is overwhelmingly dominant (86%), followed by TALEN (8%) and ZFN (4%). The 10 most modified animals, in ranked order, are pigs, cattle, sheep, goat, tilapia, chicken, rabbit, Atlantic salmon, and catfish. The most listed modifications have biomedical applications (xenotransplantation), improve resistance to diseases and to biotic stresses (mainly viruses but also bacteria), increase muscle mass (mainly linked to a modification of the myostatin gene), and modify milk composition (reduction of allergenic compounds, increase in anti-stress compounds or fatty acid content).

The Genome sequence of the Nguni Sheep, *Ovis aries*

L. T. Nesengani¹, S. Mdyogolo¹, T. Ebenezer², A. Djikeng^{1,3}, T. Masebe¹, A. Muigai⁴, J. Rees¹, N. Mapholi¹

Nguni Sheep are indigenous to the Southern Africa region. They are common within the small holder and poor resources farmers. They are well adapted to a different agroecological regions. The genomic selection for Nguni sheep has been a challenge as there is no high-quality reference genome for African indigenous Sheep. The objective of the study is to generate long reads reference genome of the African indigenous sheep. DNA samples were collected and sequenced using PacBio HiFi and Omni C. Assembly was carried out using the vertebrate genome project pipelines which allows to generate error-free, near gapless reference-quality genome assemblies. The genome size is 2.97 gb with the homozygosity of 99.8% and heterozygosity of 0.236 % with the estimated homozygous read coverage of 32x. The BUSCO analyses had 97.4% complete BUSCOs, 1.3 % fragmented BUSCOs, 1.3 % missing BUSCOs and a total of 3354 BUSCO groups searched. The total number of scaffolds is 823 with the scaffold N50 of 96,736,211 and scaffold L50 of 9. The genome assembly will serve as a baseline information to create a full reference genome for Nguni Sheep which will allow better genomic selection practice.

Whole Genome Sequencing of Aosta cattle to assess breed genomic diversity

F. Bernini¹, M. Vevey², V. Blanchet², A. Bagnato¹, M. G. Strillacci¹

¹ Università degli Studi di Milano, Department of Veterinary Medicine and Animal Science, Via dell'Università 6, 26900 Lodi, Italy, ² Associazione Nazionale Bovini di Razza Valdostana, Fraz. Favret 5, 11020 Aosta, Italy

The dual purpose Aosta cattle breeds are composed of the Aosta Red Pied (ARP) and the Aosta Black Pied – Chestnut, with the subgroup of Hérens ancestor's Chestnut individuals, (ABCH). This cattle breeds have been raised in the Aosta valley since the 5th century without introgression from other breeds. Their farming practices make them adapted to the harsh summer pasture mountain environment. WGS data were produced for the first time in this population providing a unique source of genomic information to map possible alleles related to their capability to cope with mountain harsh environmental conditions. For this study 45 bulls, born between 2018 and 2022, have been Illumina re-sequenced at an average coverage depth of 20X (15 bulls) to 30X (30 bulls) and aligned against the ARS-UCD1.2 cattle reference genome using BWA aligner. Variants have been called with SAMtool, BreakDancer and CNVnator software's. An average of 628,686,387 raw reads have been produced with an average mapping rate of 98.9% for each sample. On average a total of 6,085,595 SNPs with 45,904 exonic variants, 1,881,945 intronic ones and a ts/tv factor of 2.25 per sample have been found. Additionally, an average of 803,381 InDels 20,956 SVs and 8,022 CNVs per sample were identified. The exonic CNVs were 811 and 753 the intronic ones, with 2372 duplication and 5650 deletion events. Genes annotated within SV and CNVs have been classified for their function with Cytoscape software. Local genetic resources are crucial for poultry sustainability around the world. Their characterization and conservation are thus capital for poultry sector. This study aims to characterize genomic diversity of local chicken populations in three countries from North Africa. A wide-scale sampling has been done considering geographic diversity over the three countries and 368 individuals from Morocco, 286 from Algeria, and 115 from Tunisia have been considered and genomic data have been produced using IMAGE001 v2 DNA array (10K SNPs). Genetic diversity within and among location and countries was assessed through different approaches: heterozygosity, inbreeding, Fst, ancestry, PCA, and phylogenetic analysis. Heterozygosity was moderate, 0.41 in Morocco, 0.46 in Algeria, and 0.42 in Tunisia. Furthermore, Fst results showed no clear differentiation between the 3 countries. The obtained values are closely clustered, from 0.0108 between Moroccan and Algerian chickens to 0.0122 between Tunisian and Algerian chickens. While, PCA analysis showed genetic similarity. On the other hand, ancestry results showed a strong admixture, particularly evident between the populations of Morocco and Algeria. In addition, Treemix analysis aligned with previous sNMF findings, indicating diverse ancestral populations and genetic mixing events within each country, irrespective of geographical proximity. These findings suggest that neutral genomic diversity within local chickens in the Western part of North Africa is adequate and further studies in selection signatures associated to local adaptation would help conceiving management plans for conservation in this region. Keywords: Chicken, local genetic resources, Genetic diversity, Population structure, North Africa, conservation.

A genomic-based approach to redefine herd book information in two local cattle breeds

*G. Schiavo*¹, *S. Bovo*¹, *F. Bertolini*¹, *A. Ribani*¹, *V. Taurisano*¹, *S. Dall'Olio*¹, *M. Bonacini*², *L. Fontanesi*¹

¹ University of Bologna, Animal and Food Genomics Group, Division of Animal Sciences, Dept. of Agricultural and Food Sciences, Viale G. Fanin 46, 40127 Bologna, Italy, ² Associazione Nazionale Allevatori Bovini di Razza Reggiana (ANABORARE), Via Masaccio 11, 42124 Reggio Emilia, Italy

Reggiana and Modenese are autochthonous cattle breeds of the North of Italy. Their milk is mainly used to produce breed branded Protected Designation of Origin Parmigiano-Reggiano cheeses. As in most local breeds, pedigree records in Reggiana and Modenese herd books are not always complete. In this study, we applied a few approaches to verify and complete pedigree information: opposing homozygotes (OH) that identifies parentage inconsistencies in candidate parent-offspring pairs; methods that apply Identity by Descent (IBD). Pedigree information was evaluated on a total of 3400 Reggiana and 630 Modenese cattle (which represent about 3/4th and 2/3rd of the respective breed populations), using genotyping data obtained from the GGP Bovine 150k single nucleotide polymorphism array. PLINK, and KING software and ad hoc scripts provided pairwise comparisons of the genotyped cattle. By comparing OH and IBD approaches and estimating the genotyping error rate, a threshold of inconsistent OH SNPs to correct a record and to infer up to 2nd or 3rd relationship degree was defined. These methods made it possible to correct and complete Herd Book information in the two breeds. These approaches will improve conservation strategies in Reggiana and Modenese breeds. Acknowledgements: Funded by the Programma di Sviluppo Rurale Nazionale (PSRN) Dual Breeding 2, co-funded by the European Agricultural Fund for Rural Development of the European Union and by the MASAF.

Effects of indirect genetic effects on fish breeding programs

G. Rovere¹, F. Phocas¹¹ Université Paris-Saclay, INRAE, AgroParisTech, GABI, Domaine de Vilvert, 78350 Jouy-en-Josas, France

Indirect genetic effects (IGE) have been reported in aquaculture despite incipient applications in commercial breeding programs. Although competitive-aggressive behavior has been frequently reported in fish, there is some evidence of neutral and collaborative behavior as well. We studied the potential impact of IGE determining social behavior in French fish breeding programs, using simulation of three independent traits: one phenotypically measurable and two latent ones that modulated the social interactions (SI) between individuals and their outcome to the observed phenotype. Three scenarios of SI, competition (C-), neutral (N), and collaborative (C+), were assessed. SI occurred between individuals physically close and with probability equal to a logit of the sum of their respective responses for the latent variables. This probability was used as a parameter to sample from a Bernoulli distribution to determine whether the interaction occurred. We studied 3 selection strategies based on a partial-factorial mating plan of 200 parents crossed into 10 groups of 10 females with 10 males. Parents were selected (1) among 2000 phenotyped candidates from all mating groups (IN), (2) as the best group for the observed phenotype (G), or (3) as the less-variable phenotypic group (Gv). Selection strategy G had the highest phenotypic and genetic gain for all SI scenarios, followed by IN for scenarios N and C+, and Gv for scenario C-. G and IN had similar results across SI scenarios, while phenotypic and genetic gain decreased from C- to C+ with Gv. Information on the favorable or unfavorable SI affecting commercial traits in a population under selection is thus important for defining relevant breeding strategies.

Theatre 4

Selection for protein digestibility in pigs

R. Bergsma¹, H. Lei², K. Hov Martinsen³, Q. Hui⁴, A. Rodas-Gonzalez⁴¹ Topigs Norsvin, Meerendonkweg 25, 5216 TZ 's Hertogenbosch, Netherlands, ² Topigs Norsvin Canada Inc., Oak Bluff, MB R4G 0C4 Winnipeg, Canada, ³ Norsvin, Storhamargata 44, NO-2317 Hamar, Norway, ⁴ University of Manitoba, Department of Animal Science, 12 Dafoe Road, MB R3T 2N2 Winnipeg, Canada

Protein efficiency in animal production will become increasingly important. Cost of protein as a feed ingredient will increase as will the cost for N-emissions. Genetic selection for improved apparent total tract protein digestibility (ATTDP) might help in reducing feed costs and reducing the environmental impact of pig husbandry. ATTDP can be calculated applying Near Infra-Red technology (NIR) on both feed and fecal samples and is a heritable trait. In a Norwegian study a strong genetic correlation between ATTDP and feed intake from 40 to 120 kg was found (-0.54 ± 0.11), which raises the question what is the potential added value of genetic selection for ATTDP? At the central boar testing facility of Topigs Norsvin in Canada, 307 fecal samples were collected on selection candidates of a sire and dam line, prior to off-test. Together with a feed sample, these fecal samples were chemically analyzed and used to develop a calibration curve for NIR equipment to be able to define ATTDP. This calibration curve was applied on fecal samples of 1705 animals in the same facility, with an average ATTDP of 78.4%. Genetic parameters were estimated for ATTDP, DFI and FCR. Low-protein diets affect ileal amino acid digestibility in growing and finishing pigs, in such a way that animals become more efficient at limiting SID Lysine levels. A correction factor, based on estimated protein deposition and feed intake one week prior to fecal sampling, was developed. This study shows the potential of selection for increased ATTDP because it is a moderately heritable trait ($h^2 = 0.27 \pm 0.07$) with reasonable genetic variance ($\sigma^2_A = 5.97$). The genetic correlations with DFI and FCR were small (-0.15 ± 0.17 and -0.21 ± 0.19 respectively). A genetic variance of 5.97 indicates that mass selection could easily yield more than 1% improvement per generation. The low genetic correlations indicate that genetic selection on ATTDP has the potential to add genetic gain over and above selection on DFI and/or FCR.

Genetic variability for key biomarkers involved in body reserves dynamics in meat ewes

A. Nyamiel¹, E. González-García², D. Marcon⁴, C. Durand³, A. Tesnière², D. Hazard¹

¹ INRAE UMR1388 GENPHYSE, Université de Toulouse, ENVT, 31326 Castanet-Tolosan, France, ² SELMET, INRAE, CIRAD, Institut Agro Montpellier, Univ Montpellier, 34060 Montpellier, France, ³ INRAE UE321, La Fage, 12250 Roquefort-sur-Soulzon, France, ⁴ INRAE UEP3R, Bourges, 18390 Osmoy, France

The use and accretion of body reserves (BR) is a biological mechanism in ruminants to cope with negative energy balance and improve animals' adaptation. The aim of the present study was to understand the genetic background of BR dynamics using plasma biomarker profiles (NEFA, non-esterified fatty acids; BHB, β -hydroxybutyrate; T3, triiodothyronine; INS, insulin) in Romane ewes reared under two contrasting farming systems (FS; indoor, IND, n = 173; extensive, OUT, n = 486). Primiparous and multiparous ewes were monitored at three to five key physiological stages (PhySt: mating, M; mid-pregnancy, P; 2 weeks pre-lambing; bL; 3 weeks post-lambing; aL; weaning; W). The cov(ariance) components were estimated with the AIREML method with a repeatability animal model in the BLUPF90+ family. Parity, cohort, line for feed efficiency, litter size, and FS were fixed effects, while ewe, the permanent environment of the ewes, and residuals were random effects. Heritabilities for NEFA, BHB, T3, and INS ranged from 0.12 to 0.30, 0.07 to 0.14, 0.17 to 0.26, and 0.05 to 0.32, respectively, depending on PhySt (standard errors, SE 0.03 to 0.04). Genetic correlations between the PhySt ranged from 0.07 to 0.86, 0.41 to 0.9, 0.44 to 0.86, and -0.06 to 0.94 for NEFA, BHB, T3, and INS, respectively (SE, 0.06 to 0.14). Further analyses are in progress to estimate genetic correlations between biomarkers and identify associated QTL. In conclusion, genetic levers could be used to improve the adaptation of ruminants through BR dynamics. [Funding with iSAGE project 679302]

Although more than 150 breeds and 53M donkeys (*Equus asinus*) are recognized worldwide, there is no commercial SNP array for this species. The ddRAD-seq technique was used to characterize the population structure of nine Italian donkey populations. More than 418M reads were generated and demultiplexed to obtain 1.90 million reads per sample, 60K raw markers and a filtered panel of 27K SNPs across the 30 autosomes. The outcomes highlighted the informativeness of the markers, the separation of populations based on their genetic origin or geographical proximity and showed low to moderate levels of inbreeding and admixture. The success of conservation plans was highlighted for some breeds. ROH islands mapped immune-response and local adaptation genomic regions, consistent with the rusticity and adaptability of the species. A panel of genome wide SNPs offers the possibility of comparative studies among breeds of different geographic ranges to provide insights into the origin and evolution of the species.

Comparison of milk-related traits' heritability evaluated by functional controls vs Automatic Milking Systems
R. Moretti¹, E. Ponzo¹, S. Chessa¹, F. Masia², E. Vrieze², P. Sacchi¹

¹ *University of Turin, Department of Veterinary Sciences, largo Paolo Braccini 2, 10095 Grugliasco, Italy,* ² *Lely International, Farm Management Support, Cornelis van der Lelylaan 1, 3147 PB Maassluis, Netherlands*

Heritability (h^2) is one of the key attribute to be studied in order to assess the potential use of a trait in genomic selection. By definition, h^2 is relative to the specific animal population in which it is evaluated and is highly influenced by the measurements of the phenotypes involved. Therefore, the technologies used to record data should be carefully selected. Milk-related traits are measured by monthly milk composition analyses (MCA) in which different phenotypes (i.e., milk yield, somatic cell count, and fat percentage) are measured and are therefore considered as a gold standard measurements. Nowadays, however, Automatic Milking Systems (AMS) are increasingly available in commercial dairy farms and can record the same traits as the functional controls on a daily basis. The measurement technology is, however, not the same. In this study we compared the h^2 evaluated on different milk-related traits measured by functional controls and AMS in 5 Holstein Friesian dairy farms in a 6.35 years' time period (18,813 observations, 1810 cows). Correlations between the same milk-related trait measured with both MCA and AMS were calculated. Lastly, pedigree-based h^2 of the studied traits from the two different strategies was evaluated (using the breedR package for R) and then compared for each couple of traits. Milk yield h^2 was similar comparing the two measurement technologies (28% AMS vs 25.3% MCA). Differently, h^2 of the other milk-related traits differed when estimated on data from the two involved technologies. The results obtained in this preliminary study confirmed the importance of the methods used in phenotypes recording.

Polygenic selection in Finnish Ayrshire cows

K. Sarviaho¹, P. Uimari¹, K. Martikainen¹

¹ *University of Helsinki, Agricultural Sciences, Koetilantie 5, 00014 Helsinki, Finland*

Finnish Ayrshire (FAY) belongs to Nordic Red breeds. With 70,000 cows in national milk recording, FAY is the second most common dairy breed in Finland. Since 2011, genomic information has been included in the breeding value evaluation and currently, the FAY breeding program is based on genomic selection. Generation proxy selection mapping (GPSM) identifies SNP markers that are strongly associated with a given proxy, e.g., birth date and is one of the few methods that are robust to distinguish selection from the random genetic drift. We identified statistically significant allele frequency changes resulting from genomic selection in FAY females using the GPSM. There were 64,148 heifers and cows born between 2009–2020 and genotyped for 43,641 SNPs. The proxy (AGE) was calculated as the period, full years, from January 2009 to the birth month of the individual. Proportion of variance (PVE) in AGE explained by genome-wide SNPs was estimated by univariate variance component estimation with AGE as the dependent variable. PVE was calculated as, where and are random polygenic and residual effects, respectively. In addition, to detect SNPs with significant changes in allele frequency over time, we conducted a univariate genome-wide association of AGE. PVE in AGE explained by genome-wide SNPs was 0.78 (SE 0.003) and was significantly greater than 0 ($P < 0.001$). There were 54 significant SNPs that have been under selection in FAY females. The SNPs were located across all autosomal chromosomes, excluding chromosomes 4, 5, and 15. Certain SNPs were located at genomic regions where selection signatures have previously been identified in FAY. The results of this study may be used to validate effects of genomic selection in FAY.

Phenotype-Genotype Linkage through Modern Data Logging: Developing a Protocol Application for Animal Research

M. Volk¹, D. Hinrichs¹

¹ University of Kassel, Animal Breeding Section, Nordbahnhofstr. 1a, 37213 Witzenhausen, Germany

Objectives in animal breeding are increasingly moving away from absolute performance traits towards lifetime performance and animal health. It has been found that breeding purely for performance is usually negatively correlated with relevant health traits. In addition, there is growing recognition of the value of locally adapted breeds and small populations because they evolved in these regions and have been bred there. The agricultural use of these populations is very interesting. There is currently no freely available digital tool for livestock owners to efficiently record and manage data to scientifically prove the aforementioned advantages. The free Animal-Record application, available for Android smartphones is programmed to be backwards-compatible with smartphones used worldwide. Users can create accounts and farms, add multiple breeds and animals, and record various actions and information for each animal. For ease of use, animals can be recognized using the barcode on the ear tag or by NFC code. Furthermore, it includes an offline mode for areas with limited network coverage; data can be entered without internet connection and is then synchronized later. The secure server of the University of Kassel hosts the phenotypic data, linked with available genotypic data, enabling the calculation of animal breeding figures which can be displayed in the app on request. Further research is needed to examine the advantages and disadvantages of locally well-adapted breeds and small populations. The Animal-Record application is a digital tool that allows livestock owners to efficiently record phenotypic data. The data is stored securely and, if available, automatically linked to genotypic data. With the appropriate software, the linked data can be used for research.

Session 16

Theatre 10

Development of an analytical tool for animal genetic progress assessment based on gEBVs and results of its on-farm implementation

Y. Tavyrikov¹, Y. Pekov¹, D. Iakovishina¹, A. Dekin¹, A. Vasina¹

¹ Breedi B.V., Wilhelmina van Pruisenweg 35, 2595AN Hague, Netherlands

When dealing with animal genetic progress, it is essential to consider retrospective animal breeding values, genomic data, and historical herd performance. All this information allows to improve the quality of breeding decisions and provides insights into the impact of different herd management strategies. We report on the development and use of an advanced herd genetic progress analytical tool for dairy cattle that have been tested on farms for three years. Our report shows how such analytical approaches improve breeding processes and overall genetic gain for the farms that used them. We also overview how the tool utilizes genomic breeding values calculated with ss-GBLUP model, pedigrees and genotypes to build retrospective herd genetic progress reports, such as different breeding groups analysis and comparison and analytics of used bulls within a herd. As well as show an approach to calculate different herd development scenarios based on retrospective breeding data and how future herd genetic gain will change depending on different breeding strategies utilized. This allows farmers to gain insights into herd management processes such as cattle sales and purchase impact, animal culling impact, and the effect of used bulls on the specific herd or the entire population. Results of an on-farm implementation showed that this analytics enables farmers to identify weak herd management practices and improve decision-making processes in dairy cattle breeding to obtain better genetic gain.

Beef-on-Dairy leads to increased longevity of Holstein cows

L. Hüneke^{1,2}, J. Heise¹, S. Rensing¹, C. Schmidtman¹

¹ Vereinigte Informationssysteme Tierhaltung w.V., Biometrie, Heinrich-Schröder-Weg 1, 27283 Verden, Germany, ² Christian-Albrechts-University Kiel, Institute of Animal Breeding and Husbandry, Hermann-Rode-wald-Straße 6, 24118 Kiel, Germany

Studies show a strong genetic progress in longevity of German Holsteins, however the phenotypic trend is only moderate. This discrepancy between phenotypic and genetic longevity is often explained by management decisions, such as rearing all female dairy calves, which are later used for the replacement of older cows. Consequently, high replacement rates are resulting in early culls of cows. Since 2017, farmers have increasingly been using beef semen on dairy cows (Beef-on-Dairy, BoD). As a result, the number of female dairy calves for replacement is reduced and cows stay longer in the herd. The phenotypic longevity should then be higher in herds with less female dairy calves. To proof this hypothesis, over 18,000 herds in Germany were clustered into groups based on the proportion of female dairy calves born in 2020/2021. The average longevity of cows culled in 2022/2023 (replaced by calves born 2020/2021) was compared. There was no difference in genetic level (EBV longevity) between the groups of farms. Herds with < 40% female dairy calves (low number of replacement heifers) had an average longevity of 1330 days, whereas herds with > 55% (high number of replacement heifers) had lower average longevity (1193 days). This difference of approx. 150 days longevity indicates that many cows are culled early due to management decisions rather than for health reasons. The increasing use of BoD is one of the main reasons for less replacement heifers in herds and thus drives farmers to keep their cows longer. The achieved genetic potential is mainly limited by management and could result in higher phenotypic longevity when cows are given the chance to stay longer in a herd.

Session 16

Theatre 12

Assessing genome complementarity in beef-on-dairy crosses through selection scans, runs of homozygosity and genomic variation

D. Lindtke¹, S. Lerch¹, I. Morel¹, M. Neuditschko¹

¹ Agroscope, Animal Production, Tioleyre 4, 1725 Posieux, Switzerland

Crossing dairy cows with beef breeds can improve offspring performance due to increased meat yield and heterosis-related fitness gains. However, crossing might also diminish traits that were previously selected in the dairy breed, such as adaptation to local environments. To assess genome complementarity in crossbreds, we use low-pass sequencing data of 181 Brown Swiss (BSW) dairy cows, 34 Angus, Limousin and Simmental beef bulls, and 301 of their F1 crosses. For each beef breed, we compare genome-wide patterns of runs of homozygosity (ROHs) and genetic variation at loci putatively under selection in BSW, and test association of the identified candidate mutations with several growth- and carcass-related phenotypes in F1s. While some islands of long ROHs remain at common and breed-specific genomic positions in F1s, suggesting shared selection pressures between beef breeds and BSW, genome-wide ROHs are substantially reduced in F1s compared to BSW. Nevertheless, very few candidate genes under selection in BSW are nearly fixed for coding genetic variation in BSW and simultaneously have high frequencies of alternate variants in the investigated beef sires, as expected with BSW-specific selection pressures. Dosages of beef-specific alleles at these genes affect economically important traits. As all alleles remain polymorphic across beef breeds, genotype-informed selection of mating pairs may be used to modulate desired phenotypes. Together, our results suggest that fattening performances of beef-on-dairy cattle can be optimized through the selection of beef bulls without affecting genomic composition at the majority of candidate genes under selection in BSW, by simultaneously decreasing the potentially negative effects of past inbreeding.

Milk yield, weight gain, feed intake, and feed efficiency in second lactation Holstein x Red Dairy Cattle F1 crossbreds compared to Holstein and Red Dairy Cattle

L. Hein¹, J. Clasen², M. Vestergaard³, M. Kargo^{1,4}

¹ Aarhus University, Center for Quantitative Genetics and Genomics, C. F. Møllers Allé 3, 8000 Aarhus, Denmark, ² Simherd A/S, Niels Pedersens Alle 2, 8830 Tjele, Denmark, ³ Aarhus University, Department of Animal and Veterinary Sciences, Blichers Alle 20, 8830 Tjele, Denmark, ⁴ Viking Genetics, Ebeltoftvej 16, 8960 Randers, Denmark

Holstein (HOL), Red Dairy Cattle (RDC) and F1 crossbreds (F1) at the Danish Cattle research Center (DKC) fed the same total mixed ration were compared for feed efficiency (FE). Data originated from 12 HOL, 9 RDC and 12 HOL x RDC F1 crossbred 2nd parity cows. The cows were born in August and September 2019 and have been observed in the crossbreeding experiment at DKC since the age of one month. All cows had information on daily feed intake, body weight and milk yield. Monthly recording of fat and protein percentages were used to calculate daily energy-corrected milk (ECM), protein, and fat yield from 5 to 180 DIM. Because not all cows had consecutive observations for 180 DIM, the data was grouped in three periods: 5-60 DIM, 61-120 DIM and 121-180 DIM. 10 HOL, 8 RDC and 8 F1 had data up to 180 DIM. SAS GLIMMIX were used to predict daily ECM and milk yield, body weight, and dry matter intake (DMI). Feed efficiency was calculated as ECM/DMI ratio and protein efficiency (PE) as (kg protein yield + kg of protein in body weight change)/DMI ratio. Holstein had the highest ECM yield and DMI in all three periods and RDC the lowest. Heterosis for ECM for F1 ranged between 3% (5-61 DIM) and -2% (121-180 DIM), and for DMI -3% (5-61 DIM) and 3% (61-120 DIM). In all three periods, F1 had the highest average daily gain (ADG). F1 had the highest FE in the first period with a heterosis of 5%, while heterosis was -1% in the 2nd and 3rd period. PE was highest for F1 in all three periods (0.12, 0.22 and 0.32). During the first 180 DIM, F1 had a higher PE and ADG compared to HOL. In the first 5-61 DIM, F1 had the highest FE while HOL had the highest FE during 121-180 DIM. This indicating that that the F1 tend to utilize the food to weight gain to a greater extent than the purebreds do.

Session 16

Theatre 14

Performance of purebred dairy cows and crossbreds between Swedish Red, Swedish Holstein, Jersey, and Montbéliarde in Swedish herds

S. Liedgren¹, W. F. Fikse², K. Nilsson¹, E. Strandberg¹

¹ Swedish University of Agricultural Science, Department of Animal Biosciences, P O Box 7023, 75007 Uppsala, Sweden, ² Växa, Box 288, 75105 Uppsala, Sweden

This study aimed to compare crosses between Swedish Red (R), Holstein (H), Jersey (J), and Montbéliarde (M) to purebred R, H, and J for fertility, calving, production, and survival traits. The main focus was on F1 crosses between either H or R on one hand and J or M on the other hand, but also 3-breed crosses were studied. There were 2,154,241 observations for cows that calved between 2005 and 2020. The data set was separated into two parity groups (1st and 2nd) and analysed by using a mixed linear model. Fertility interval traits and number of inseminations were improved in the F1 crosses with J compared with pure R or H, more clearly so in the first parity. In parity 2 the difference was sometimes not significant. The significant improvements of fertility interval traits in parity 1 for F1 crosses with M compared with pure R or H were generally smaller than for crosses with J. The results for calving difficulty and stillbirth for Jersey crosses were clearly influenced by the levels for the purebred J. Because J was better than R and especially H for calving difficulty, F1 crosses with J were also better than R and H, respectively, but not significantly better than pure J. J had the highest stillbirth rate so crosses with R and H generally significantly decreased stillbirth rates compared with J, however, not to the extent to make F1 crosses better than purebred R or H. For M, F1 crosses were not better than pure R or H for calving difficulty or stillbirths. F1 between J and H (JH) had higher 305-day fat yield than H, but lower milk and protein yields. MH had higher fat and protein yields than H and MR had higher 305-d milk and protein yields than R.

Heritability and Genetic Correlations of Resilience Indicators in Beef Cattle

J. N. S. G. Cyrillo¹, G. R. Rodrigues², V. T. Rezende³, R. C. Canesin¹, J. P. S. Valente², M. E. Z. Mercadante¹

¹ Institute of Animal Science, Rod. Carlos Tonani, km 94, 14.174-000 Sertãozinho, Brazil, ² São Paulo State University, Rod. Paulo Donato Castellane S/N, 14.884-900 Jaboticabal, Brazil, ³ University of São Paulo, Av. Duque de Caxias, 225, 13.635-900 Pirassununga, Brazil

This study aims to estimate heritability and genetic correlations for standardized weight at 550 days of age (P550) and resilience indicators related to environmental challenges during the growth phase in Nelore heifers. Data from the Institute of Animal Science belonging to three selection lines were used: NeC, under stabilizing selection for yearling weight (YW); NeS, selected by the highest selection differential for YW and NeT, selected by the highest YW and smallest RFI. The dataset comprised 2,871 heifers and 18,783 weighing records from birth to YW (565 ± 50 days of age). Different growth models were accessed including repeated measures, Brody, logistic and orthogonal Legendre polynomials. The residues were used to calculate resilience indicators: natural logarithm of variance (LnVar), autocorrelation (rauto) and skewness. The BLUPF90+ program was used. The model included fixed effects of selection line (NeC, NeS, NeT), year (1981-2019) and month (9-11) of birth, cow age as a covariate and genetic additive as a random effect. The repeated measures model was the best to described growth. W550, LnVar, rauto and skewness presented h^2 of 0.48 ± 0.03 , 0.38 ± 0.04 , 0.12 ± 0.03 and 0.10 ± 0.03 , respectively. The rg were 0.52 ± 0.06 (P550 x LnVar), -0.23 ± 0.11 (P550 x rauto) and 0.55 ± 0.12 (P550 x skewness). The h^2 of resilience indicators revealed sufficient genetic variability for inclusion in genetic improvement programs. The findings demonstrate the importance of incorporating resilience indicators into breeding strategies to enhance productivity of beef cattle.

Session 16

Poster 16

Genomic-based genetic parameters for resilience indicators and pregnancy in beef cattle

J. N. S. G. Cyrillo¹, G. R. D. Rodrigues², V. T. Rezende³, J. P. S. Valente², M. E. Z. Mercadante^{1,2}

¹ Institute of Animal Science, Rod. Carlos Tonani, km 94, 14.174-000 Sertãozinho, Brazil, ² São Paulo State University, Rod. Paulo D. Castellane S/N, 14.884-900 Jaboticabal, Brazil, ³ University of São Paulo, A. Duque de Caxias, 255, 13.635-900 Pirassununga, Brazil

This study aimed to estimate genetic parameters for pregnancy (PREG) and resilience indicators associated with environmental disturbances in Nelore heifers. Animals from three selection lines were utilized: NeC, under stabilizing selection for yearling weight (YW); NeS, selected by highest selection differential for YW; and NeT, selected by highest differential for YW and lower RFI. Data included 3,072 heifers and 24,548 weight records (WR) from birth to first breeding season (742 ± 68 days of age). Growth was estimated with sixth-order Legendre orthogonal polynomials model. Residuals were used to calculate resilience indicators: natural logarithm of variance (LnVar), autocorrelation (rauto), and skewness. Genotypes from 3,226 animals and 383,856 SNPs were used. Gibbs sampling was used to estimate h^2 and rg with GIBBSF90 and POSTGIBBSF90 software. The analysis included 1,500,000 iterations, burn-in of 150,000 and thinning of 10, considering a threshold model for PREG. Systematic effects were selection line (NeC, NeS and NeT), year (1981-2020) and month (9-11) of birth, cow's age as covariate and genetic additive as random effect. The h^2 for PREG, LnVar, rauto and skewness were 0.07 ± 0.04 , 0.42 ± 0.03 , 0.29 ± 0.03 and 0.10 ± 0.02 , respectively. The rg were -0.26 ± 0.09 (PREG x LnVar), -0.24 ± 0.09 (PREG x rauto) and -0.16 ± 0.10 (PREG x skewness). The negative genetic correlations between PREG and all resilient indicators suggest that heifers with less impact (LnVar), fast recovery rate (rauto), and null influence (skewness) of environmental disturbances have a higher probability of becoming pregnant.

Estimation of genomic inbreeding coefficients based on SNP markers in Serbian Holstein cows

S. Trivunović¹, D. Stanojević², L. Štrbac¹, N. Gligović², M. Despotov¹, M. Šaran¹, D. Janković¹, R. Đedović²

¹ University of Novi Sad, Faculty of Agriculture, Animal Science, Trg Dositeja obradovića 8, 21101 Novi Sad, Serbia, ² University of Beograd, Faculty of Agriculture, Zootechnics, Nemanjina 6, 11080 Beograd-Zemun, Serbia

In the traditionally breeding schemes inbreeding is calculated based on genealogy data, and the accuracy of the estimates depends on the depth and reliability of the data in the pedigree. With the availability of SNP markers, it became possible to calculate genome based inbreeding coefficient with the aim of determining homozygosity on markers. In order to estimation of genomic inbreeding coefficients, a total of 1,600 Serbian Holstein cows were genotyped with a GGP Bovine 100K SNP array. Data quality control showed that 1,591 cows had a call rate above 90%, while 3,958 SNPs had a minor allele frequency below 0.01, which is why they were excluded from further analysis. Individual inbreeding was calculated using the `-het` function within the PLINK software package. Among 629 (39,5%) cows, the presence of identical markers from both the paternal and maternal sides was determined, indicating inbreeding, which had a maximum value of $F_x=0.223$, while the average value for this number of individuals was $F_x=0.023$. Additional research and genotyping of a larger number of cows are needed in order to estimate population inbreeding. Acknowledgments: This research is funded by Ministry of Science, Technological Development and Innovation of the Republic of Serbia (Contract No. 451-03-65/2024-03/200117). The data used in this research were collected during the realization of PROMIS project: 'A Bioinformatics Approach to Dairy Cattle Breeding Using Genomic Selection', No. 6066512, funded by the Science Fund of the Republic of Serbia.

CapraGEN project: managing genetic variability in Alpine and Saanen goats through genomic approach

C. Ferrari¹, C. Punturiero¹, A. Delledonne¹, R. Milanese¹, M. G. Strillacci¹

¹ University of Milan, DIVAS, via dell'Università 6, 26900 Lodi, Italy

The economic importance of goats in European agriculture is rising due to increased demand for dairy products. Italy is acknowledged as a repository of genetic resources for caprine species, with 37 breeds as documented by National Goat and Sheep Breeder Association. CapraGEN project, titled "Application of genomics in dairy goat farming", aims to understand variability within flocks and the genetic relationships of goats farmed in Lombardy region. A total of 950 Alpine and Saanen goats were sampled and genotyped using the GeneSeek Genomic Profiler (GGP) Goat 70k. Principal component analysis (PCA) illustrates the graphical representation of how individuals and flocks cluster based on their genotype. Among the genomic tools and methodologies aimed at characterizing animal biodiversity, the examination of runs of homozygosity (ROH) stands out as one of the most valuable approaches. ROH length, ROH islands and FROH are indeed proposed as useful markers for estimating the timing of the associated inbreeding event. In this study we analyzed ROH length, their distribution, the presence of ROH island and the derived inbreeding values (FROH) in 950 goats. A total of 32,089 ROH were identified with an average of 33.81 ROH per animal. The average FROH calculated for ROH longer than 16Mb was 0.021 for Alpine and 0.029 for Saanen, suggesting a recent inbreeding event in both breeds. For both breeds, we assessed the presence of ROH islands, defined as genomic regions containing ROH of varying lengths. Within these regions, Alpine goats exhibited SNPs shared by at least 25% of the population on chromosome 6. In Saanen goats, peaks on chromosome 11 were identified, but shared by only 15% of the population. The analysis of ROH distribution within each flock, the presence of ROH islands, together with the level of inbreeding and evolution across generations revealed the presence of different management practices. Funded by EAFRD Rural Development Program 2014–2020, Management Authority Regione Lombardia – OP. 16.1.01, Project ID n. 202202380565 – 'Operational Group EIP AGRI'; <https://ec.europa.eu/eip/agriculture/en/eip-agriprojects/projects/operational-groups>.

Genome-wide scan for lethal haplotypes in Nellore cattle

G. R. D. Rodrigues^{1,2}, L. F. M. Mota¹, J. N. S. G. Cyrillo², P. I. Schmidt¹, J. P. S. Valente^{1,2}, L. G. Albuquerque¹, M. E. Z. Mercadante^{1,2}

¹ São Paulo State University, A. Paulo Donato Castelane, 14884-900 Jaboticabal, Brazil, ² Institute of Animal Science, R. Carlos Tonani, 14160-900 Sertãozinho, Brazil

The genome-wide scan has enabled the identification of lethal recessive alleles that are the major genetic causes of harmful effects on production traits. Hence, this study aims to identify lethal haplotypes based on the absence of homozygous haplotypes in Nellore cattle. A total of 2,446 animals were genotyped with medium density assay (GGP 50K and 75K SNPs), and 780 animals were genotyped with Illumina BovineHD panel (770K SNPs). Animals genotyped with medium density were imputed to the HP panel using FImpute v.3 considering the ARS-UCD1.2 Bos Taurus genome assembly, and a total of 612,154 autosomal SNP markers remained for analysis. The haplotypes were constructed using the sliding windows method implemented in findhap.f90 software and was classified as lethal when attending the following criteria: haplotype frequency higher than 2%, expected number of homozygous carriers greater than 1, and probability of observing 0 homozygous carriers lower than 0.6. The ENSEMBL software was used to search for genes harboring the regions of lethal haplotypes. A total of 45 genomic regions were identified as potential candidates for lethal haplotypes. The haplotype with the highest frequencies of heterozygous carriers and 0 homozygous was located on BTA15, with a frequency of 11.39% and 735 carriers (22.04 – 22.78 Mb). The lethal haplotypes regions harbored candidate genes related to the major functions of the immune system, metabolic functions related to energy homeostasis, and embryonic development. Identifying these genomic variants is essential for designing mating strategies and avoiding the spread of lethal alleles in the Nellore population. Funding: FAPESP (#2017/10630-2 and #2023/11176-4) and CAPES (Finance Code 001).

AgriseqPI 1.0 & AgriSeqRI 1.0: Reporting utilities for SNP based parentage determination and testing for traits and disorders with Targeted Genotyping by Sequencing panels

S. Chadaram¹, A. Burrell¹, K. R. Gujjula¹, C. Carrasco¹, S. Daly², S. Udumudi³, N. Anjuri³, V. H. Kema³, A. Udumudi³
¹ Thermo Fisher Scientific, Agribusiness, 2130 Woodward Street, 78744 Austin, United States, ² Thermo Fisher Scientific, Agribusiness, 6 Allée des Ecoreuils · Parc Tertiaire Bois-Dieu, 69380 Lissieu, France, ³ ATS Gene-Tech Pvt Ltd, Genetics and Genomics Laboratory, 8-2-293/174/A25, Opposite KBR Park, Road No. 14 Banjara Hills, 500034 Hyderabad, India

The AgriSeqPI is a bulk report generation plugin primarily developed for SNP based parentage and identity analysis using the AgriSeq™ Targeted Genotyping by Sequencing (T-GBS) parentage panels for canine, feline, bovine, equine, ovine, caprine run using the Torrent Suite™ Software (TSS). The reporting plugin is based on the ISAG rules and guidelines for parentage determination using SNP markers. End users can generate individual reports for each sample on a sequencing run using AgriSeqPI. Similarly, The AgriSeqRI is a bulk report generation plugin primarily developed for the AgriSeq™ Traits and Disorders panels for canine, feline, bovine, equine, ovine, caprine run using the Torrent Suite™ Software (TSS). End users can generate individual reports for each sample on a sequencing run using AgriSeqRI. AgriSeqPI and AgriSeqRI can be run manually or automatically via plan run after a sequencing run is completed on Ion Torrent. Both plugins retrieves the genotype data from Torrent Variant Caller (TVC) and AgriSum Toolkit and outputs a comprehensive report for each sample for all markers in each panel. The AgriSeqPI report adheres to the ISAG parentage determination guidelines and includes sample, reference, panel (test) details, and a summary of the results. The AgriSeqRI outputs a comprehensive report for all genetic disorders and associated trait markers for each species. The report includes sample, reference, panel (test) details, and a summary of the results. In addition, information including the condition, genotype (reference and variant allele), inheritance type, and OMIA reference, is provided for each marker. A brief explanation of the genetic trait, breed specificity, genetics and inheritance gathered from several publicly available publications are also reported. For Research Use Only. Not for use in diagnostic procedures.

Resilience indicators in beef cattle selected for high performance

S. F. M. Bonilha¹, G. R. D. Rodrigues², V. T. Rezende³, R. C. Canesin¹, J. P. S. Valente², M. E. Z. Mercadante¹, J. N. S. G. Cyrillo¹

¹ Institute of Animal Science, Rod Carlos Tonani km 94, 14174-000 Sertãozinho, Brazil, ² São Paulo State University, Rod Paulo D Castellane SN, 14884-900 Jaboticabal, Brazil, ³ University of São Paulo, Av Duque de Caxias 255, 13635-900 Pirassununga, Brazil

This study aims to evaluate the effects of selecting for yearling weight (YW) on resilience capacity of Nellore heifers in response to environmental disturbances. Data from Institute of Animal Science selection lines were used: Control Nellore (NeC), selected by zero-selection differential for YW, Selection Nellore (NeS), selected by the highest selection differential for YW and Traditional Nellore (NeT) selected by higher YW and lower RFI. Heifers were weighted from birth to yearling (565±50 days), resulting in 18,783 weight records from 2,871 animals. Five growth models were fitted: repeated measures, Brody, logistic and fifth- and sixth-order Legendre orthogonal polynomials. Weight deviations were used to calculate resilience indicators: natural logarithm of variance (LnVar), autocorrelation (rauto), and skewness. Adjusted means were compared by Tukey test considering fixed effects of selection line (NeC, NeS, or NeT), year (1981-2019), and month (9-11) of birth. Repeated measures model was the best for describing growth. NeC showed the lowest mean for LnVar at 5.69±0.03, while NeS and NeT had 6.09±0.02 and 6.12±0.02, respectively (P<0.05). NeS and NeT had mean of 0.04±0.01 for rauto and NeC 0.07±0.01 (P<0.05). Skewness means were -0.08±0.02, 0.06±0.02 and 0.14±0.02, for NeC, NeS and NeT, respectively (P<0.05). Nellore heifers selected for higher YW are more susceptible to environmental disturbances (higher LnVar). However, demonstrate fast recovery (lower rauto), and experience less negative impact from environment (positive skewness). Selection for growth traits may have implications for resilience of *Bos indicus* heifers.

Genetic background of beef-on-dairy calving ease

A. O. Garcia^{1,3}, J. B. Cole², A. A. Mikush², S. Tsuruta³, S. E. F. Guimarães¹, I. Misztal³, D. Lourenco³

¹ Universidade Federal de Viçosa, Animal Science, Av PH Rolfs, 36570 Viçosa, Brazil, ² URUS Group LP, Crossroads Dr, 53718 Madison, United States, ³ University of Georgia, Animal and Dairy Science, River Rd, 30605 Athens, United States

A recent practice in dairy herds is to breed females not selected as replacement heifers to beef bulls. This increases the market value of the surplus calves sold for beef purposes. Some beef breed associations have built selection indices for that, which include mainly carcass traits. Calving ease (CE) is also an important trait, given that some beef breeds produce high-birth-weight calves. This study investigated the genetic background of CE for beef bulls bred to dairy cows. We analyzed 1.2 million CE records (easy=1 and difficult=2) in the first three lactations from Holstein and Jersey cows inseminated with Angus, Charolais, or Simmental semen. We compared single-trait linear and threshold models with age of the cow as a covariable; sex of the calf, dam-sire breed interaction, and year-season as fixed effects; and herd-year, animal, and maternal effects as random. Calving difficulty incidences (%) were 12.2 (7.9), 11.9 (5.7), and 13.1 (16.2) for Holsteins (Jerseys) inseminated with Angus, Charolais, and Simmental bulls. Direct and maternal heritabilities for the linear (threshold) model were equal to 0.014±0.003 (0.030±0.004) and 0.19±0.003 (0.25±0.005), respectively. Maternal heritabilities were greater than direct in both models and were more similar to those found in beef breeds than dairy breeds. Linear or threshold models may provide similar EBV ranking. Although direct heritabilities were low, there is genetic variability for calving ease, and accounting for this trait when selecting beef bulls can help reduce the incidence of difficult calving when they are bred to dairy cows.

The use of cooperative herds in the promotion of genetic resources of cold-blooded horses in Poland
A. Chelmińska¹, B. Smulska¹, G. Polak¹, E. Sosin¹, J. Wójtowicz¹

¹ National Research Institute of Animal Production, Department of Farm Animal Conservation and Horse Breeding, Krakowska 1, 32-083 Balice, Poland

Genetic resources conservation programmes for cold-blooded horses of the Sokolski and Sztumski types have been implemented since 2008. In 2023, after 15 years, the number of mares increased from the initial 228 mares to 1801 in the Sztumski type, and from 339 mares to 1468 in the Sokolski type. Due to the increasing number of horses, to preserve the environment's influence on the breed's development, and traditional utilisation of cold-blooded horses, in 2023 a change was introduced to the conservation program. For herds located outside the historical region, the term "cooperative herd" was introduced, and the activities that promote the use of horses by the provisions of the conservation program have been obligated. The following were desirable: working use in agricultural and forestry works, promotion through participation in regional events, milk production and processing, use as a leisure horse, hippotherapy, and agritourism. In total, 35 herds provided documentation confirming the different utilisation of horses. The most significant number of herds, as many as 18, use horses for work in agriculture or forestry, 17 herds take part in regional events, 2 herds produce milk from mares, and 8 herds provide hippotherapy, horse riding, or agritourism. Some of the herds (11) carry out several types of use. Cold-blooded horses, participating in cultural events such as harvest festivals, are integral to the local tradition. Hippotherapy, horseback riding, and agritourism can provide opportunities for business growth and employment for young people. This promotes the sustainable use of genetic resources and raises awareness among people about the importance of the conservation of animal genetic resources

Genome-wide association study for milk and blood indicators of hyperketonemia in Holstein dairy cattle
S. Magro¹, G. Visentin², A. Costa², J. T. Van Kaam³, R. Finocchiaro³, M. Marusi³, M. Cassandro^{1,3}, M. De Marchi¹

¹ University of Padova, Department of Agronomy, Food, Natural resources, Animals and Environment, Viale dell'Università, 16, 35020 Legnaro, Italy, ² Alma Mater Studiorum University of Bologna, Department of Veterinary Medical Sciences, Via Tolara di Sopra, 43, 40064 Ozzano dell'Emilia, Italy, ³ Associazione Nazionale Allevatori della Razza Frisona, Bruna e Jersey Italiana, Via Bergamo, 292, 26100 Cremona, Italy

At the onset of lactation, specialized dairy cows commonly experience negative energy balance that often results into hyperketonemia (HYP) or even clinical ketosis. HYP diagnosis relies on the blood level of β -hydroxybutyrate (BHB), which is known to be the major and most stable ketone body in cows' biological fluids, including milk. Recently, in fact, mid-infrared (MIR) spectroscopy prediction models for blood BHB concentration from milk spectra have been developed. Although characterized by moderate accuracy, MIR-predicted blood BHB is useful for selective breeding. We identified genomic regions associated with milk BHB and MIR-predicted blood BHB in Italian Holstein cattle to disclose potential overlaps and divergences. A single-step genome-wide association study was performed using the 2 phenotypes after log₁₀-transformation collected in lactating cows within the 35th day in milk. The 8,277 cows with phenotypes available were genotyped with various SNP panels, so data were imputed up to approximately 70,000 SNP. After conventional quality controls, 63,408 markers located in autosomes (BTA) were left. The blood BHB significant regions were located in BTA 6, 11, 14, and 25, while those of milk BHB were in BTA 11. For blood BHB, the signals with the highest P-value were in the gene PAEP (BTA 11) and DGAT1 (BTA 14). For milk BHB, the most significant signal was found within the gene FNBPI (BTA 11). Our results provide new information about the underlying biology and molecular mechanisms associated with HYP in Holstein cows.

An association study with dairy traits confirms the importance of three SNPs for the assisted selection in the Mediterranean river buffalo

A. Paucillo¹, G. Gaspa¹, Y. Zhang², Q. Liu³, G. Cosenza⁴

¹ University of Torino, Largo P. Braccini 2, 10095 Grugliasco, Italy, ² China Agricultural University, 17 Qinghua Donglu, 100193 Beijing, China, ³ Foshan University, 18 Jiang-wan-yi-lu, 528225 Foshan, China, ⁴ University of Napoli, Via Università 100, 80055 Portici, Italy

The search for DNA polymorphisms enhancing dairy animal genetics spans over 40 years, notably in cattle, identifying key alleles in casein and DGAT1 genes for milk traits improvement. Despite advanced genomic tools and precise phenotypic records, similar signs of progress have not been made in river buffaloes yet. This study aimed to explore the effects of four SNPs in CSN1S1 (AJ005430:c.578C>T), CSN3 (HQ677596:c.536C>T), SCD (FM876222:g.133A>C), and LPL (AWWX01438720.1:g14229A>G) genes on six milk traits (daily milk yield, dMY; protein yield, dPY; fat yields, dFY; fat %, dFP; and protein %, dPP; somatic cell score, SCS; and urea, MU) in a representative buffalo population. Genotyping was conducted on 800 buffaloes, and milk traits were recorded monthly from 2010 to 2021. Associations between SNPs and milk traits were analyzed using 15,742 milk test day records from 680 buffalo cows. Three out of four SNPs showed associations with various traits. CSN1S1 was associated with increased dMY ($p=0.022$), dPY ($p=0.014$), dFY ($p=0.029$), and SCS ($p=0.032$). CSN3 positively correlated with SCS ($p=0.005$) and milk urea ($p=0.04$). LPL demonstrated favourable effects on dMY ($p=0.028$), dFP ($p=0.027$) and dPP ($p=0.050$). Conversely, SCD showed no associations. This study represents the first confirmation of the importance of these genes in Mediterranean river buffalo breeding programs, providing valuable insights for preselecting young bulls for breeding.

Exploring the resilience of an intensive Holstein farm in Lombardy, Italy

C. Punturiero¹, A. Delledonne¹, A. Bagnato¹, M. G. Strillacci¹

¹ University of Milan, DIVAS, via dell'Università, 6, 26900 Lodi, Italy

The resilience of farm animals is a key to maintain productivity, longevity, and welfare, thereby ensuring the economic profitability and sustainability of livestock production. This is particularly pertinent in highly productive breeds like Friesian Holsteins. Longitudinal data on physiological traits like milk yield, feeding, and rumination time can serve as proxies for inferring resilience in farmed cows. In this study, we investigated resilience indicators in 848 cows milked in an intensive farm equipped with 9 automatic milking systems (AMS). A total of 1153 lactation curves were analyzed, with 848 first parity cows, and 533, 252, and 78 second, third, and fourth parity cows, respectively, resulting in a total of 434,679 observations. For each animal and lactation, residuals of daily milk yield were calculated after determining the best-fitting model. These residuals were then used to compute two resilience indicators: the natural logarithm-transformed variance (LnVar) and lag-1 autocorrelation (rauto) of daily yield residuals. The extreme phenotypes identified on the basis of these indicators were cross-validated with somatic cell count (SCC) data and pharmacological treatments provided by the farmer. The heritabilities of LnVar and rauto were estimated as well as the genetic correlations of these indicators with traits included in the selection indexes. This research sheds light on resilience dynamics in herds and underlines the potential of longitudinal data in the assessment of animal welfare and productivity under different environmental stressors. This study was carried out within the Agritech National Research Center and received funding from the European Union Next-GenerationEU (PIANO NAZIONALE DI RIPRESA E RESILIENZA (PNRR) – MISSIONE 4 COMPONENTE 2, INVESTIMENTO 1.4 – D.D. 1032 17/06/2022, CN00000022). This manuscript reflects only the authors' views and opinions, neither the European Union nor the European Commission can be considered responsible for them.

Exploring the sustainability aspects of innovative livestock systems in Europe

E. Diaz Vicuna¹, N. Adams², L. Smith^{2,3}, C. Forte¹, A. Hesse⁴

¹ University of Turin, Veterinary Sciences, Largo Paolo Braccini 2, 10095 Grugliasco (TO), Italy, ² University of Reading, School of Agriculture, Policy and Development, Whiteknights, Box 237, RG6 6AR Reading, United Kingdom, ³ Swedish University of Agricultural Sciences, Biosystems and Technology, Lomma, Box 190, SE-234 22 Lomma, Sweden, ⁴ Swedish University of Agricultural Sciences, Applied Animal Science and Welfare, Skara, Box 234, SE-532 23 Skara, Sweden

In pursuit of increased sustainability, the current European animal farming sector presents a growing number of diverse and innovative livestock systems applying specific types of innovation. Our aim was to provide a sustainability assessment (SA) of these systems to highlight common elements, strengths and weaknesses, and to provide policy recommendations for the promotion of a more sustainable European livestock sector. The SA was performed with the Public Goods tool, a multi-level assessment tool adapted within the PATHWAYS Horizon 2020 Project. Data was retrieved from 106 livestock farms specialized in different animal species (dairy and beef cattle, pigs, poultry), located in nine different EU nations and distributed in 13 national groups, practice hubs (PHs). Each PH was organized around a theme of innovation in practice. The study resulted in composite indicators of performance in each dimension for each PH. Correlations among the indicators were evaluated, and the performances of the farms compared. Environmental indicators correlated in a predominant positive way with social ones, but presented a higher amount of negative correlations with the economic indicators. Monogastric farms tended to perform similarly, whereas ruminants' farms had a wider spread. The study provides an overview of the relationships between various aspects of sustainability and a present-day frame of some of the most advanced European realities.

Adopting low carbon practices: a cost-effective strategy for French dairy farms

E. Castellan¹, M. Gregoire², N. Gaudilliere³, L. Benoist⁴, F. Tattevin⁵, T. Perez⁶

¹ IDELE, 54-56 avenue Roger Salengro, BP 80039, 62051 St Laurent Blangy, France, ² CNIEL, 42 rue de Chateaudun, 75314 Paris Cedex 9, France, ³ ELIANCE, 149 rue de Bercy, 75595 Paris Cedex 12, France, ⁴ Chambre d'agriculture de l'Indre, 24 rue des Ingrains, 36000 Châteauroux, France, ⁵ Seenovia, 141 boulevard des Loges, 53940 Saint-Berthevin, France, ⁶ Chambre d'agriculture France, 9 Avenue George V, 75008 Paris, France

Dairy farming is facing major environmental challenges, and specifically its impact on climate change. The uptake of mitigation actions is not easy and needs to be motivated. One argument is the possible positive link between economy and low carbon practices. To verify this hypothesis the Carbon€co project aims to cross analyze economics and environmental farms data from two French databases: CAP'2ER® and COUPROD®. CAP'2ER® tool evaluates environmental performances while the COURPOD® tool calculates production costs. 232 farms were identified with both an environmental evaluation and a production cost for the same year (from 2017 to 2022). The cross database was ranked according to greenhouse gases (GHG) emissions and divided into 3 classes (with significant difference): average (1,05kg eqCO₂/L), 1st decile (0,83 kg eqCO₂/L) and last decile (1,36kg eqCO₂/L). Results showed differences of economic indicators between the average and the 1st and last decile. The feed system cost was cheaper between 1st decile and average (difference of 26€/1000L). Differences are explained firstly by mechanization cost, secondly by grass and forages production costs, and lastly by the feed cost. Technical data show a better efficiency between input and output. This study confirms that environmental efficient dairy farms have also improved economical results. This can be used to engage more dairy farmers within carbon emission reducing projects.

Life Cycle Assessment of different poultry production systems around Europe: mEATquality project
 C. Reyes-Palomo¹, S. Sanz-Fernández¹, J. Marchewka², P. Sztandarski², A. Jaszczyk², M. Solka², H. Louton³, L. Quirin³, L. Vogt⁴, C. Díaz-Gaona¹, V. Rodríguez-Estévez¹

¹ Universidad de Córdoba, Ctra. Madrid-Cádiz Km. 396, 14071 Cordoba, Spain, ² Institute of Genetics and Animal Biotechnology, Postępu 36A, 05-552 Jastrzebiec, Poland, ³ University of Rostock, Justus-von-Liebig-Weg 6, 18059 Rostock, Germany, ⁴ Naturland – Association for Organic Agriculture e.V., Kleinhaderner Weg 1, 82166 Graefelfing, Germany

One of the main objectives of the H2020 mEATquality project is to generate information about producing more sustainably through extensive husbandry practices, meeting animal welfare and environmental concerns. The main tool used for the environmental sustainability of the farms evaluated is Life Cycle Assessment (LCA). This LCA study collects data from 60 fattening broilers farms from 2 countries (Germany, and Poland) and covers diverse models and husbandry practices, ranging from large intensive farms to small, organic, and free-range ones. The manure handling emissions were calculated using Tier 2 equations from IPPC guidelines. The not differentiable emissions, such as energy consumption, were assessed by economic approach, and environmental impacts were calculated with AGRIBALYSE® database. The limit of the system are “cradle to gate”. The carbon footprint (CF) obtained for 42 days old broilers from conventional systems was 1.40 ± 0.02 kgCO₂eq kg live weight⁻¹, with feeding representing 88% of emissions; while in organic systems broilers achieved 80 days of live with a CF of 2.67 ± 0.94 kgCO₂eq kg live weight⁻¹, and the feeding representing 47% of emissions. Besides that, different CFs of those systems, productive performances, levels of extensification and handling practices show different environmental impacts within farms and allow to differentiate systems and farms. This project has received funding from the European Union’s Horizon 2020 research and innovation program under Grant Agreement No 101000344.

Life cycle assessment of two common dairy cattle farming systems in an Alpine area
 G. Fichter¹, S. Hörtenhuber³, T. Zanon¹, G. Peratoner², W. Zollitsch³, M. Gauly¹

¹ Free University of Bolzano, Faculty of Agricultural, Environmental and Food Sciences, Piazza Università 5, 39100 Bolzano, Italy, ² Laimburg Reserach Center, Laimburg, 6, 39040 Auer, Italy, ³ BOKU - University of Natural Resources and Life Sciences, Institute of Livestock Sciences (NUWI), Gregor-Mendel-Straße 33, 1180 Wien, Austria

Recently, ruminants and especially dairy farming is increasingly criticized for being inefficient in terms of environmental sustainability and because of its GHG emissions. Consequently, the aim of this study was to assess the environmental impact of two dairy farming systems, both commonly found in the alpine province of South Tyrol, Italy, applying LCA methodology. An intensively managed production system is compared with a forage-based production system. Overall, the environmental impacts were quantified focussing on four different impact categories: Global Warming Potential (GWP100), Acidification Potential (AP), Marine Eutrophication Potential (MEP), and Land Use (LU, m₂ and Pt, with the latter additionally considering the Soil Quality Index). Besides being attributed to one kg of milk (fat and protein corrected milk, FPCM), these impact categories were also related to one m₂ of farm area. Furthermore, the net protein (NP) provision was calculated for both farming systems, to provide a broader context of dairy farming, in terms of food supply and food-feed competition. The results provide an evaluation of different environmental aspects of two diverse, yet commonly found alpine dairy farming systems with the aim to illuminate the environmental sustainability in dairy farming within a broader context and to increase at the same time the societal acceptance of such livestock systems.

Quick sustainability scan calculator for intensive and extensive broiler farms

S. Sanz-Fernández¹, C. Reyes-Palomo¹, J. Marchewka², P. Sztandarski², A. Jaszczyk², M. Solka², H. Louton³, L. Quirin³, L. Vogt⁴, C. Díaz-Gaona¹, V. Rodríguez-Estévez¹

¹ *Universidad de Córdoba, Ctra. Madrid-Cádiz Km. 396, 14071 Córdoba, Spain,* ² *Institute of Genetics and Animal Biotechnology, Postępu 36A, 05-552 Jastrzebiec, Poland,* ³ *University of Rostock, Justus-von-Liebig-Weg 6, 18059 Rostock, Germany,* ⁴ *Naturland – Association for Organic Agriculture e.V., Kleinhaderner Weg 1, 82166 Graefelfing, Germany*

One of the objectives of the H2020 mEATquality project is to support the development of techniques to assess the sustainability of broiler production; aiming to improve it by implementing the best practices while assessing its environmental, social, and economic impacts. Thus, two quick sustainability scan calculators were developed with those aims: one for intensive and one for extensive broiler farms. The calculators are based on the evaluation of 10 aspects related to poultry management: 1) certifications; 2) water management; 3) feed; 4) waste and residues management; 5) energy efficiency; 6) socio-economic contribution to the territory; 7) farm associated businesses; 8) animal handling; 9) management of pastures, soil and biodiversity; 10) stocking rate. The last two aspects evaluated only in extensive farms. Each of these aspects receives a score according to its importance and contributes in a different proportion to a final score (with a maximum of 100 points), which is organized into 3 categories: environmental, social, and economic impact. These calculators are designed for easy use (answers are just yes or no), with 61 and 53 questions for extensive and intensive farms, respectively. These calculators were used to evaluate 60 farms from Poland and Germany. Intensive farms achieved average scores of 81.6, 70.8, and 79.6 points in the environmental, social, and economic impact categories, respectively; while extensive farms achieved average scores of 79.3, 72.0, and 78.0 points in the same categories. These calculators are useful as a self-assessment tool for farmers, allow comparisons between farms (benchmarking), identify the weak points of each farm, enable participatory certification, and help to provide confidence to consumers. This project has received funding from the EU Horizon 2020 research and innovation program under Grant Agreement No 101000344.

A case study on carbon neutrality of Podolian beef productions in the marginal area of Southern Italy

E. Sabia¹, C. Pacelli¹, A. Di Trana¹, R. Paolino¹, A. Coppola¹, A. Braghieri¹

¹ *University of Basilicata, School of Agricultural, Forest, Food, Environmental Sciences, via dell'Ateneo Lucano, 85100 Potenza, Italy*

Podolian cattle represent a local breed, traditionally raised on pasture and woodland in southern Italy. The present study aimed in assessing the environmental impact and carbon neutrality of Podolian farms with different productive efficiency. Two farms were analysed: Podolian more efficient (PME) farm, with a total area of 200 ha, including 190 ha of permanent pasture and 10 ha of meadow hay, rearing 110 cows and 50 young bulls slaughtered at 18 months, with live weight (LW) of 550 kg and production efficiency of 138 kg of LW at slaughtered per hectare per year; Podolian less efficient (PLE) farm, with a total area of 220 ha, including 170 ha of permanent pasture and 50 ha of woodland, rearing 80 cows and 35 young bulls slaughtered at 18 months with LW of 500 kg, and production efficiency of 80 kg of LW at slaughtered per hectare per year. Carbon footprint (CF) expressed in kg CO₂-eq, was evaluated by Life Cycle Assessment (LCA) methodology, with a 100y horizontal time; the functional unit (FU) was 1 kg of LW. Carbon sequestration (CS) was also assessed. PLE farm showed higher CF than PME farm (33.8 vs 23.1 kg CO₂-eq per FU, respectively). When considering the CS on pastures, the PLE was able to reduce the CF by 75%, while the PME achieved a reduction of 72%. The PLE also achieved a higher carbon storage value and reached carbon neutrality by preserving 4.8 ha of undisturbed woodland, whereas the PME should have dedicated 4.0 ha of land to the forest in order to achieve the same benefit for carbon neutrality. The PLE farm, despite the lower efficiency, thanks to the presence of the forest, showed carbon neutrality compared to the PME farm per kg LW.

Animal Welfare Status in Dairy Cattle Farms of the Parmigiano Reggiano Consortium

M. Odini¹, G. Esposito², G. Cappelli³, M. Nocetti³, A. D. Whetton⁴, N. Geifman⁵, C. Dadousis⁵

¹ University of Parma, Department of Food and Drugs, Parco Area delle Scienze 48/A (Sciences and Technology Campus), 43124 Parma, Italy, ² University of Parma, Department of Veterinary Science, Via Taglio, 8, 43100 Parma, Italy, ³ Consorzio del Formaggio Parmigiano Reggiano, Via Kennedy, 18, 42124 Reggio Emilia, Italy, ⁴ University of Surrey, Veterinary Health Innovation Engine (vHive), Schools of Veterinary Medicine and Biosciences, Daphne Jackson Road, GU2 7AL Guildford - Surrey, United Kingdom, ⁵ University of Surrey, School of Health Sciences and vHive, 30 Priestley Rd, GU2 7YH Guildford, United Kingdom

Farms within the Parmigiano Reggiano Consortium (PRC; Italy) assess cattle welfare (CW) using the ClassyFarm system. This is based on scores derived for 105 parameters by a veterinarian, these are transformed into 5 CW scores (CWS; % score) focusing on the following areas: A – Business and Personnel management, B – Structures and Equipment, C – Animal Based Measures, D-Biosecurity, and E-Total Welfare. Leveraging these data, we compared cattle welfare in free- and tie-stall housing systems in farms within the PRC. ClassyFarm CWS data, collected in 2022 from 329 tie- and 649 free stall-farms were analyzed. The average milk yield was 30.46 and 25.33 kg in the free and tie stall systems, with an average number of cows of 299 and 86, respectively. For both housing systems, CWS were above 60% (the suggested sufficient threshold). Average total welfare was 74 and 77 for the tie and free stall systems respectively. Pearson correlations among the CWS ranged between 0.15 to 0.74 (Area A – and E), with the latter highlighting the importance of area A on cattle welfare. Across all CWS areas, free stalls outperformed the tie stalls. Principal component analysis (PCA) on the CWS didn't differentiate between the two systems. However, a PCA conducted on the 105 parameter detail separated the two housing systems. Our analysis showed overall better cattle welfare status in the free housing system compared to tie stalls.

Effect of extensification factors on broiler welfare and meat quality

I. De Jong¹, J. Van Der Eijk¹, S. Yigitturk², S. Erasmus²

¹ Wageningen University and Research, Wageningen Livestock Research, PO Box 338, 6700 AH Wageningen, Netherlands, ² Wageningen University and Research, Food Quality and Design, PO Box 17, 6700 AA Wageningen, Netherlands

We studied whether factors related to extensiveness of broiler production had a beneficial effect on welfare and meat quality. Trial 1 (T1) (Hubbard JA757 birds) comprised stocking density (SD) (21 vs. 39 kg/m²) and roughage provision (n=4 pens/treatment combination). Trial 2 (T2) comprised environmental enrichment and breed (fast, Hubbard JA987 vs. slow, Hubbard S757N) (n=5 pens/treatment combination; SD=30 kg/m²). Measurements were equal for both trials: performance, behaviour, fearfulness, play at three similar body weights; welfare indicators and meat quality (texture and colour) at slaughter. In T1, reduced SD broilers showed more foraging (P<0.05) and less resting (P<0.01); had better gait scores; were cleaner; had less footpad dermatitis and hock burn (P<0.001). Roughage had minimal effects. There were no effects on texture and colour of the meat. In T2, the slow-growing breed showed more active and foraging behaviour; had better gait, footpad dermatitis, hock burn and cleanliness scores (P<0.05). For meat texture, the slower-growing breed had higher (P<0.001) BMORS shear force values (11.0 ± 1.18 N), meaning tougher meat, than the fast-growing breed (8.5 ± 0.23 N). Color values were also affected by genetics (P<0.001). Enrichment increased play (P<0.05) and the b* (yellowness) value of the meat (P<0.05) as well as the interaction of enrichment and genetics (P<0.05) on the b* value. This implies that the breed may have a different impact on how the enrichment affects the yellowness of the meat. Thus, reducing stocking density and a slow-growing breed had most beneficial effects on welfare. However, only genetics and enrichment influence the texture and color of the meat.

Consumer expectations for beef in the French region Auvergne-Rhône-Alpes

S. Chriki^{1,2}, J. Normand³, F. Noël³, V. Payet¹, J. F. Hocquette²

¹ Isara, 23 rue Jean Baldassini, 69364 Lyon, France, ² INRAE, VetAgro Sup, UMR1213 Herbivores, Theix, 63122 Saint-Genès Champanelle, France, ³ Institut de l'Elevage, Agrapôle, 23 rue Jean Baldassini, 69364 Lyon, France

In France, beef consumption has been decreasing for many years. The reasons are the (i) controversial image of beef (its environmental impact, the competition between feed and food, the respect of animal welfare), (ii) the modification of consumption patterns (decrease of daily time dedicated to cooking and eating), (iii) its high price, and finally (iv) its variable sensory quality. Thus, consumers are not always satisfied with the organoleptic quality of beef. In this context, an online survey within the project OABov-AURA (2022-2024) was carried out to study consumer expectations regarding the intrinsic and extrinsic qualities of beef in the region Auvergne-Rhône-Alpes (AURA) (the 2nd largest beef cattle breeding region in France). Of those surveyed, 48% reported having reduced their meat consumption in recent years (compared to 42% who reported no change). The two main reasons for the decline in beef consumption are health (52% of responses) and ethics (44%) issues. The majority of consumers (51%) said that eating beef for pleasure was their first motivation, and are not disappointed with raw (83%) or cooked (54.5%) beef. Origin (44%), proximity (38%) and the presence of signs of quality and origin (SIQO) (34%) are the most important extrinsic criteria (% of respondents who answered “very important”). However, taste (62%), tenderness (59%) and freshness (58%) are the most important intrinsic criteria of beef for the respondents. Consumers also prefer meat that is bright red (72%) and rather fatty (64%). In conclusion, it is important that consumers in the AURA region have access to a varied supply of meat in butcher shops, of French origin and under quality signs.

Session 17

Theatre 10

Consumer preferences for cheeses derived from the milk of goats reared under different farming systems

V. Korelidou¹, A. I. Gelasakis¹, I. Bossis², T. Moschakis³, E. Jamieson⁴, P. Refinetti⁴, C. Montagnese⁵, A. Pennachio⁵, M. Anastasi⁶, A. Giusti⁶

¹ Agricultural University of Athens, Department of Animal Science, School of Animal Biosciences, Iera Odos 75, 11855 Athens, Greece, ² Aristotle University of Thessaloniki, Department of Agricultural Sciences, School of Agriculture, Forestry and Natural Resources, 54124 Thessaloniki, Greece, ³ Aristotle University of Thessaloniki, Department of Food Science and Technology, School of Agriculture, Forestry and Natural Resources, 54124 Thessaloniki, Greece, ⁴ Rem Analytics, Rte de l'Île-au-Bois 1A, 1870 Monthey, Switzerland, ⁵ National Research Council of Italy, Piazzale Aldo Moro 7, 00185 Roma, Italy, ⁶ Cyric Research and Innovation Centre, 72, 28th October Avenue, Office 301, 2414 Engomi, Nicosia, Cyprus

The study aimed at investigating the consumers' possible preferences for cheeses made with milk from goats reared under either intensive or extensive farming systems. Two types of cheeses were assessed; a semi-hard goat cheese with surface mould (cheese A) by consumers recruited in Italy, Switzerland, and the Netherlands (nA= 297), and a white goat cheese preserved in brine (cheese B) by consumers recruited in Greece (nB= 194), to record and analyze their preferences. Each panel, blind-tasted two cheeses each made by either milk derived from extensively or intensively reared goats. An overall preference for both types of cheeses produced by the milk of extensive farms was recorded (59.9% and 53.6% for cheeses A and B, respectively). Cheese A derived from the intensive farm was preferred by 25.3% (19/75), 35.6% (31/87), 49.2% (31/63) and 52.8% (38/72) of individuals aged <25, 25-40, 40-55, and >55, respectively. For cheese B, the respective values were 44.9% (44/98), 38.9% (21/54), 69.6% (16/23) and 47.4% (9/19). Regarding cheeses derived from the intensive farms, cheese A was preferred by 49.7% (76/153) of men and 30.1% of women (43/143), and cheese B by 32.0% (24/75) of men and 55.5% of women (66/119). Consumers' preferences displayed remarkable variations with regard to the cheese type, the farming system, and the consumer's gender and age. This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 101000216.

Identification of breast defects in broilers with short-wave pocket near-infrared spectrometer

C. L. Manuelian¹, S. Magro², A. Goi², J. C. Parisse³, A. Travel⁴, C. Berri⁵, M. De Marchi²

¹ *Universitat Autònoma de Barcelona, G2R, Dept. Animal and Food Science, Travessera dels Turons, 08193 Bellaterra, Spain,* ² *University of Padova, DAFNAE, Viale dell'Università 16, 35020 Legnaro, Italy,* ³ *LDC, Rue Saint-Laurent, 72302 Sablé sur Sarthe, France,* ⁴ *ITAVI, L'Orfrasière, 37380 Nouzilly, France,* ⁵ *INRAE, UMR BOA, Centre de Tours, 37380 Nouzilly, France*

Chicken breast meat is the most popular animal protein source, but three novel myopathies have been described in broilers over the last decade known as wooden breast (WB), white striping (WS) and spaghetti breast (SB). This study assessed the potential of a pocket-sized near-infrared (NIR) spectrometer to predict WB, WS and SB in broilers. A total of 4313 breasts from Ross 308 strain chicks were scanned with the pocket-sized NIR device from 740 to 1070 nm. Each spectrum was matched with the defects information, and a partial least square discriminant analysis was conducted with external validation. Results revealed that breast defects reduced the sample's absorbance. Neither the spectrum first derivative nor wavelength selection improved the models' accuracy compared to the raw spectrum. The highest balanced accuracy was obtained for detecting WS (0.80), followed by WB (0.75) and SB (0.51). All models achieved remarkably high sensitivity (>0.89), indicating their proficiency at identifying samples without defects. On the other hand, the specificity was low (<0.64). In conclusion, models developed using raw absorbance can be used without any additional mathematical treatments to identify samples without defects. Further studies are suggested to confirm if positive samples are genuinely affected by a myopathy. Funded EU H2020 101000250-INTAQT.

Session 17

Theatre 12

Does breeding for A2 cows alter milk yield and composition?

S. Serhan¹, C. L. Manuelian¹, A. A. K. Salama¹, G. Caja¹, X. Such¹

¹ *Universitat Autònoma de Barcelona, Group of Ruminant Research, Dept. Animal and Food Science, Travessera del Turons, 08193 Bellaterra, Spain*

This study aimed to investigate the effect of β -Casein (CN) family variants A1 and A2 along with κ -CN (AA, AB, AE, BB, BE, and EE) and β -lactoglobulin (β -LG; AA, AB, and BB) genotypes on milk yield (MY) and composition (protein, fat, and SCC) in Holstein Friesian cows. Data on monthly controls were retrieved from 2016 to 2022 from 6 farms. The final dataset included 23,088 observations from 1,233 cows, and values beyond the mean \pm 3 standard deviations were considered outliers. Data were analyzed using PROC MIXED in SAS ver. 9.4. Fixed effects were β -CN, κ -CN, and β -LG genotypes, farm, days in milk (DIM), parity, calving season, calving year, and the interaction of β -CN with all fixed effects except for κ -CN and β -LG. Animal nested within farm was considered as random effect. Results indicated that farm, DIM, parity, season, and year of calving affected all milk traits ($P < 0.05$) except SCC between farms. Family variants A1 and A2 of β -CN did not impact milk yield or composition. The κ -CN genotype AA resulted in lower ($P < 0.05$) milk protein content ($3.36 \pm 0.01\%$) compared to AB ($3.41 \pm 0.01\%$) and BB ($3.44 \pm 0.02\%$). The β -LG genotype influenced fat content, where AA ($3.59 \pm 0.04\%$) had lower ($P < 0.05$) values compared to AB ($3.65 \pm 0.04\%$) and BB ($3.67 \pm 0.04\%$). In conclusion, breeding for A2 cows does not impair milk yield or composition. Funded by grant PID2019-110752RB-I00 and the Ministerio de Ciencia Innovación y Universidades and supported by the Frisian Federation of Catalonia (FEFRIC).

Lipid oxidation and physical quality characteristics of beef as affected by storage condition

M. Tognocchi¹, S. Tinagli¹, R. E. Amarie¹, F. Narra¹, A. Serra¹

¹ *University of Pisa, Department of Agriculture, Food and Environment, via del Borghetto 80, 56124 Pisa, Italy*

The study was funded under the National Recovery and Resilience Plan (NRRP), of Italian Ministry of University and Research funded by the NextGenerationEU. The trial was aimed at studying three different preservation systems on the physical and nutritional characteristics of beef (sirloin cut). We compared two mixtures of modified atmosphere, MAP1, 80% O₂ – 20% CO₂, and MAP2, 60% O₂ – 20% CO₂ – 20% N₂, and vacuum conservation (skin, S). After packaging, beef was stored at 4 °C and sampled at three different periods; 7, 10, and 15 days. Samples were analyzed for pH, color, content of myoglobin, oxymyoglobin and metmyoglobin, water holding capacity (WHC), tenderness (shear force), lipolysis extent, profile of the volatiles organic compounds (VOCs) by SPME GC-MS technique, content of Malonaldehyde (MDA) by TBARS test, and the cholesterol oxidation products (COPs) by means of GC-FID. Results showed that storage systems and storage times significantly affected either the lipid's oxidation and some physical features of beef. TBARS test showed that the skin method was the best storing system in limiting fatty acid oxidation (0.16 vs 0.61 and 0.64 mg MDA/kg beef in S, MAP1 and MAP2, respectively). The brightness of the sirloin samples was lower for S than for MAP1 and MAP2. Regarding the storage time, lipid oxidation mainly occurred during the first 10 days of storage. MDA doubled from 7 days (0.33 mg/kg) to 10 days (0.66 mg/kg), when it reached a plateau. This trend was similar for color parameter (chrome and hue angle). In conclusion, the skin packaging was effective for limiting the lipid oxidation but was slightly worse than MAP in terms of color protection.

Session 17

Poster 14

Potential use of a pocket near-infrared spectroscopy device to directly discriminate local chicken meat

N. Stoppani¹, C. L. Manuelian³, S. Sciuto², E. E. Cappone¹, M. Gariglio¹, P. Acutis², A. Schiavone¹, D. Soglia¹

¹ *Università degli Studi di Torino, Dipartimento di Scienze Veterinarie, Largo Paolo Braccini, 2, 10095 Grugliasco, Italy,* ² *Istituto Zooprofilattico Sperimentale del Piemonte, Liguria e Valle d'Aosta, Via Bologna, 148, 10154 Torino, Italy,* ³ *Universidad Autònoma de Barcelona, G2R Department of Animal and Food Sciences, Plaça Cívica, 08193 Bellaterra, Spain*

The application of portable near-infrared (NIR) spectroscopy devices for analysing animal-derived products has recently increased. However, its efficiency within the poultry industry remains uncertain. This study aimed to evaluate the feasibility of a pocket-size NIR device to discriminate poultry meat. A total of 105 birds from 5 chicken breeds were enrolled in the study (Robusta Maculata; Bionda Piemontese (BP), cockerel and capons; Bianca di Saluzzo; Millefiori Piemontese; Eureka). Spectra were acquired directly on fresh thigh and breast muscles using a pocket-size NIR device working in reflectance from 740 to 1070 nm every 1 nm. Principal component analysis (PCA) and partial least square regression discriminant analysis (PLS-DA) were performed on the spectra using “stats” and “caret” packages of R software. Spectra pre-treatment were applied with “waves” package. In PLS-DA model, the dataset was split into a calibration (70%) and a validation (30%) set. Results revealed that PCA and PLS-DA models were able to distinguish chicken parts with a high accuracy (>99%). Despite the models were not able to discriminate among breeds, the PLS-DA correctly separated BP cockerel from capons (>97% accuracy). In conclusion, pocket-size NIR can be used to rapidly detect chicken parts as well as meat from entire and castrated animals.

Feasibility of near-infrared spectroscopy to predict dry matter digestibility in broilers

O. Tej¹, E. Albanell¹, I. Kaikat¹, J. F. Pérez¹, C. L. Manuelian¹¹ *Universitat Autònoma de Barcelona, Department of Animal and Food Sciences, Campus Bellaterra, 08193 Bellaterra, Spain*

Improving feed digestibility efficiency is critical to minimize nutrient losses and reduce environmental impact but its determination by wet chemistry limits their applicability. This study assessed the potential of near-infrared spectroscopy (NIRS) to predict Yb, Ti and dry matter digestibility (DMD) in broilers calculated from Yb, Ti, and polyethylene glycol (PEG). A total of 192 fecal samples were collected from 576 male Ross 308 strain chicks supplemented with TiO₂ (2 g/kg), Yb₂O₃ (50 mg/kg), and PEG (5 g/kg). Reference values for Yb and Ti were obtained through a coupled plasma optical emission spectrometer. PEG content was estimated through an ad-hoc NIRS prediction model. Samples' spectral information was collected every 2 nm from 1100 to 2500 nm. Reference data were matched with the spectral information to develop modified partial-least square prediction models with an external validation. The obtained coefficients of determination in external validation and the ratio of performance to deviation (RPD) were 0.67 and 2.00 for Yb, respectively, and 0.73 and 2.28 for Ti, respectively. The prediction models for DMD_{Yb} were highly unreliable (RPD = 1.93), whereas DMD_{Ti} model could be used for rough screening purposes (RPD = 2.41). However, DMD based on PEG-predicted content underlined the limitations of the calibration model developed with feces obtained during the adaptation period of the animals, where they received a different diet than the one during the experimental period. In conclusion, NIRS could be adequate as an initial screening tool for Yb and Ti content determination, and DMD based on Ti.

Session 17

Poster 16

Health status of Skopelos goats and its impact on milk yield

V. Korelidou¹, A. I. Kalogianni¹, G. Arsenos², A. I. Gelasakis¹¹ *Agricultural University of Athens, Department of Animal Science, School of Animal Biosciences, Iera Odos 75, 11855 Athens, Greece*, ² *Aristotle University of Thessaloniki, Faculty of Veterinary Medicine, School of Health Sciences, 54124 Thessaloniki, Greece*

The objective was to assess health status of Skopelos goats and its impact on milk yield. A total of 286 purebred adult goats were used. Their genetic background was the same but were raised in two different farms under different systems (intensive and extensive). Goats were randomly selected and prospectively monitored for two consecutive lactations. In both farms, daily milk yield (DMY) of individual goats was recorded every 50 days. Each goat was also subjected to detailed clinical examination for animal-based health indicators. A mixed linear regression model (SPSS v.26) was used to estimate fixed effects of age, farm, stage of lactation, year of sampling, body condition score (BCS), and occurrence of specific health issues on DMY; random effect of individual animal was considered. The most prevalent health issues in the intensive system were: i) udder asymmetry (16-52%), ii) body abscesses (8-36%), and iii) swollen mammary lymph nodes (1-34%). In the extensive system were: i) anaemia (5-50%), ii) udder asymmetry (11-48%), and iii) poor hair coat quality (7-47%). Across systems, lameness, contagious ecthyma, udder fibrosis, and udder asymmetry were associated with a significant decrease in DMY by 0.25 kg (18.2%, $p < 0.05$), 0.19 kg (14.1%, $p < 0.05$), 0.13 kg (9.5%, $p < 0.001$), and 0.09 kg (6.6%, $p < 0.001$), respectively. Age, farm, and stage of lactation were consistently associated with DMY across all cases ($p < 0.001$). In conclusion, udder health problems prevailed in both farms with negative consequences in milk production. Hence, results underpin the importance of regular monitoring udder health status and efficient management. This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No101000216.

Addressing the challenges of the European dairy beef production system

M. Devant¹

¹ IRTA, Ruminant Production, Torre Marimon S/N, 08140 Caldes de Montbui, Spain

The EU dairy beef production system is based on raising calves born in dairy herds, either non-replacement heifers or males, that are fattened for meat. The dairy beef production system is comprised of up to 11 million calves per year and potentially contributes to at least 40% of the beef meat produced, with expectations for future growth. The system is mainly categorised as 1), unweaned calves at slaughter (white veal), and 2), fattening of calves after the weaning period as rosé veal, young bulls, steers etc. These calves have been considered a by-products ('surplus calves') at the dairy farms, and there are critical emergent drivers and trends which indicate that there is a need for an autonomous dairy beef specific discussion space for facilitating its transition to a more responsible and sustainable production. It is evident that more dialogue is required concerning different aspects of the current production systems. The main challenges are environmental impact, calf genetics (pure Holstein or crossbred calves), improving the beef traits of calves from the dairy herd, inappropriate feeding at early ages, suboptimal transportation (of unweaned calves; from farm to slaughterhouse or to third countries for slaughter), and overuse of antimicrobials masking deficient management and nutritional practices that otherwise would result in unacceptable levels of morbidity and mortality. Finally, novel farming approaches and models will be required to meet present and future demands. Models will seek to address different developments (business models) and constraints and will integrate all parts of the value chain, including pathways for the better integration of females in dairy beef farming.

Session 18

Theatre 2

Longitudinal retrospective study of intake recovery and growth in unweaned dairy beef calves subjected to fasting, transport, and entire commercialization at farm arrival

S. Marti¹, L. Pisoni¹, M. Blanch², A. Bassols³, Y. Saco³, J. Pujols⁴, M. Devant¹

¹ IRTA, Ruminant Production, Torre Marimon, 08140 Caldes de Montbui, Spain, ² Lucta S.A., Innovation Division, Campus UAB, 08193 Bellaterra, Spain, ³ UAB-Faculty of Veterinary Science, Department of Biochemistry and Molecular Biology, Campus UAB, 08193 Bellaterra, Spain, ⁴ IRTA, CReSA, Campus UAB, 08193 Bellaterra, Spain

Data from 387 unweaned male dairy beef calves enrolled in 6 studies from 2020 to 2023 were used to evaluate the impact of fasting, transport, and overall commercialization (marketing and transport) on intake recovery and growth (ADG) at farm arrival. Calves were distributed in 4 treatments according to the different managements applied in the previous studies: calves from a sole dairy farm that were not fasted neither transported (CTR), calves from a sole dairy farm that were fasted between 9 and 19 h but were not transported (FAS), calves from a sole dairy farm that were transported and fasted for 19 h (TRA), and multi-origin calves commercially marketed and transported for 9 h (COM). At arrival at the rearing farm (day 0), calves were allocated individually, and body weight (BW) was recorded. Calves were fed milk replacer twice daily, and they had ad libitum access to concentrate and water. Concentrate (CI) and milk replacer (MRI) intake were recorded daily. Finally, BW was recorded on day 7. Data were analyzed with mixed models. An interaction ($P < 0.01$) between treatment and time was observed for CI. On day 0 CTR, FAS and TRA had similar CI, while COM had the lowest CI. On d 1, all treatments decreased CI except CTR. On day 7, while FAS and TRA recovered CI to similar levels than CTR calves, COM calves had 50% less CI compared with the other groups. The COM calves had the lowest ($P < 0.01$) ADG compared with CTR, FAS and TRA calves. In conclusion, the entire commercialization process of unweaned dairy beef calves impairs intake recovery and growth at farm arrival.

Total protein and hemoglobin levels of veal calves at arrival are associated with antibiotic use and mortality

A. Willemsma¹, I. Carvalho¹, M. Van De Vosse¹, P. Mölder¹

¹ Denkvit Nederland B.V., R&D, Tolnegenweg 65, 3781 PV Voort, Netherlands

Adequate supply of colostrum, vitamins and trace elements at the dairy farm is crucial to enhance calf resilience at the fattening farm. Total protein (TP) is a good indicator of colostrum intake in calves beyond 14 days old. Blood hemoglobin (Hb) is a marker of iron supply coming from a premix which also supplies vitamins and trace elements having a role in supporting immunity. The objective of this prospective cohort study was to examine the correlation of TP and Hb level of calves with antibiotic use and mortality. The dataset contained weight (W), TP and Hb level at arrival and individual antibiotic use and mortality during fattening of 10923 calves arriving from January 2021 and April 2023. TP (n=2856) and Hb (n=10923) was determined in blood samples by spectrophotometry within one week after arrival at the farm. Data analysis showed positive correlations between TP, Hb and W (Pearson's R=0.18, P<0.05). TP negatively associated to mortality ($X^2=45.1$, df=8, P<0.001) and individual antibiotic treatment rate ($X^2=63.4$, df=8, P<0.001). Antibiotic treatment rate was reduced when TP>70 g/L and increased when TP <58 g/L. Mortality was significantly higher when TP<52 g/L. Hb was negatively associated with antibiotic treatment rate ($X^2=15.5$, df=7, P=0.03) and mortality ($X^2=27.6$, df=7, P<0.001). More antibiotic use was seen when Hb<5.5 mM and less mortality was observed when Hb>6.5 mM. Calves' weight, TP and Hb at arrival are positively correlated with one other and each individual parameter is negatively correlated with antibiotic use and mortality in the fattening period. This shows potential to use veal calf integration data to optimize colostrum and feeding management for surplus calves on dairy farms which has a positive effect on health and welfare later in calves' live.

Session 18

Theatre 4

A proteomics-machine learning approach to unravel the impact of protozoan infection on calves' intestinal morphology and development

M. Bonnet², F. Dengler³, L. Bachmann^{1,4}, W. Liermann¹, C. Helm⁵, R. Ulrich⁵, C. Delling⁶, H. M. Hammon¹

¹ Research Institute for Farm Animal Biology, (FBN), 18196 Dummerstorf, Germany, ² INRAE, Université Clermont Auvergne, 63122 Saint-Genès-Champanelle, France, ³ Institute of Physiology, University of Veterinary Medicine, 1210 Vienna, Austria, ⁴ Faculty of Agriculture and Food Science, University of Applied Science, 17033 Neubrandenburg, Germany, ⁵ Institute of Veterinary Pathology, Leipzig University, 04109 Leipzig, Germany, ⁶ Institute of Parasitology, Leipzig University, 04109 Leipzig, Germany

This study aimed to investigate the effect of *Cryptosporidium parvum* (*C. parvum*) infection on calves' intestinal mucosa at the molecular level using a proteomics approach combined with machine learning (ML) analysis. Newborn male Holstein-Friesian calves were orally infected (n = 5) or not (control group, n = 5) with *C. parvum* oocytes on day 2 of life. Total proteins were extracted from jejunum samples of slaughtered calves on day 8 post-infection and subjected to label-free quantitative proteomics. Differentially abundant proteins (DAP) between the infected and control groups were identified using random forest supervised ML algorithm in R and used for gene ontology analysis in STRING. Among the top 30 identified DAP, there was a decrease in abundance of villin 1 (VIL1), plastin 1 (PLS1), ezrin (EZR), catenin beta-1 (CTNBN1), usher 1C (USH1C), and cluster of differentiation 36 (CD36). Infection-reduced DAPs are located at the villus brush border and annotated to biological pathways including regulation of microvillus length, brush border assembly, and intestinal absorption of carbohydrates and fatty acids. This study provides a deeper understanding of a hierarchy in the molecular interactions that disrupt villus structure and absorption capacity which may interfere with calves' intestinal development in response to *C. parvum* infection.

Portable nanosensor for rapid detection and characterization of botulinum neurotoxins in cattle

N. D. Kumar¹, G. Shtenberg¹

¹ ARO, Volcani Institute, Institute of Agricultural Engineering, HaMaccabim Rd. 68, 7505101 Rishon LeZion, Israel

Clostridium botulinum toxins (BoNTs) are the primary cause of botulism, exhibiting the highest potency among bacterial toxins and posing a significant threat to both humans and animals. These toxins effectively block the release of acetylcholine, resulting in paralysis and, ultimately, death. However, the current method of using the mouse lethality bioassay as a gold standard test for diagnosis has certain limitations. In this study, we have successfully developed a reflective-based biosensor capable of detecting serotype B (BoNT-B) and serotype C (BoNT-C) toxins. This biosensor employs a competitive immunoassay approach combined with the evaluation of the toxins' endopeptidase activity. To determine the proteolytic activity of BoNT B and C, we utilized synaptosomal-associated protein (SNAP-25B) linked to a vesicle-associated membrane protein (VAMP-2) as the BoNT peptide substrate. The thermal oxide layer (SiO₂) surface was modified with specific toxins to enable the selective, sensitive, and real-time detection of target analytes. The biochemical reactions occurring on the oxide layer or the detachment of peptide fragments from the oxide layer amplified the reflectivity signals of each interferometer. The biosensor developed in this study demonstrates a low-level limit of detection of 0.43 pg mL⁻¹ for BoNT-B and 1.24 pg mL⁻¹ for BoNT-C. Further, the developed method was validated to confirm the specificity and selectivity of the designed platform against the respective toxins. Additionally, the capability of the developed probe was verified using extracted toxins, allowing for the accurate quantification of their concentration in the sample.

Effects of milk supplementation with different levels of soy protein isolate on growth performance and health indicators of the Holstein calves

V. Yekani¹, H. Khalilvandi-Behroozyar¹, R. Pirmohammadi¹, M. Donyadoost-Chelan², M. Hosseini Ghaffari³

¹ Urmia University, Animal Science, 11 km of the Sero road, Urmia, West Azerbaijan, 5756151818 Urmia, Iran, ² Kimiya Danesh Alvand, R&D, Karaj, 5756151818 Karaj, Iran, ³ University of Bonn, Institute of Animal Science, Katzenburgweg 7 - 9 53115 Bonn, 53111 Bonn, Germany

Protein is the most expensive and important nutrient to support efficient growth in young calves. In most cases, newborn calves are offered milk at around 10% of their BW and free access to a concentrate mix containing 18-22% crude protein (CP). Calculations showed that young calves suffered from a metabolizable protein (MP) deficiency of about 20-40 g/day, but even a higher CP content cannot meet the MP requirement, mainly due to the low intake of starter feed in the first days of life. We hypothesized that the addition of highly digestible protein sources in milk may compensate for MP deficiency. This study investigates the effects of supplementing milk with soy protein isolate (SPI) on growth performance, health, and inflammatory markers in dairy calves. A total of 36 Holstein calves were randomly allocated to the experimental groups (0, 20 and 40 g/d SPI). Supplementation lasted from 3 to 21 days, but measurements continued until weaning. During the supplementation period, calves fed SPI did not reduce their milk or starter intake, but DM and CP intake was increased. Protein supplementation early in life affected calf performance, and total DMI and ADG were improved by SPI. Calves fed 40 g SPI per day achieved the highest weaning weight (83.7 kg), the highest height at withers (96.4 cm), the best feed efficiency (0.67) and the fewest days with diarrhea. The values of the inflammatory markers decreased, but the malondialdehyde value was not affected by SPI. In conclusion, the performance of pre-weaned calves can be improved by adding SPI to the milk.

Impact of breed and colostrum intake on serum IgG, growth, health, and blood lymphocyte profiles in preweaning dairy and crossbred bulls

H. Mccarthy¹, M. Kovacs¹, T. Chapelain¹, J. Leão², D. Renaud¹, M. Steele¹

¹ University of Guelph, 50 Stone Rd East, N1G2W1 Guelph, Canada, ² SCCL, 30 Molaro Pl, S7K6A2 Saskatoon, Canada

This study aimed to explore the effect of colostrum intake and breed on IgG kinetics, health, growth, and blood lymphocyte profiles in Holstein and Holstein-Angus crossbred bulls. Calves (n=40; 10/breed/trt) were assigned to 1 of 2 trt for the 0h and 12h meals: LOW (2.5g of IgG/kg BW) or HIGH colostrum (5g of IgG/kg BW). Calves were then fed milk replacer at 6% BW twice daily until weaning from d49 to 70. Water and starter were provided ad libitum. Blood samples were taken every 2h from 0 to 24h, at 36h, and 48h to assess serum IgG concentrations. Fecal and respiratory health was scored twice daily to estimate disease incidence. Blood was collected from a subset of calves (n= 20) on d14, 35, and 84 for lymphocyte isolation and staining with monoclonal antibodies against several $\gamma\delta$ T and B cell subsets and analyzed by flow cytometry. Calves were weighed weekly to calculate average daily gain (ADG). Data were analyzed in SAS 9.4. Serum IgG was increased ($P < 0.01$) in the HIGH calves and there was no impact ($P = 0.17$) of breed, yet crossbred LOW calves had increased ($P = 0.04$) serum IgG when compared to Holstein LOW calves. No breed or trt differences were detected ($P > 0.10$) for ADG, days with diarrhea or respiratory disease. The proportion of IgM+ B cells expressing CD21 and CD32 tended to be greater ($P = 0.08$ and 0.05 ; respectively) in the HIGH calves, whereas LOW calves tended to have a higher proportion ($P = 0.08$) of $\gamma\delta$ T cells expressing WC1.1. However, breed did not impact ($P > 0.10$) lymphocyte profiles in the blood. These results suggest that increasing colostrum intake increases serum IgG and impacts blood lymphocyte profiles; however, breed had no effect on serum IgG, ADG, health or lymphocyte profiles.

Genetic parameters for calf resilience and milk feeding traits recorded by automated milk feeding machines and their relationship with bovine respiratory disease in North American Holstein calves

L. F. Brito¹, J. Graham¹, L. Gloria¹, J. Boerman¹, M. Taghipoor²

¹ Purdue University, Department of Animal Sciences, 270 S. Russell Street, 47907 West Lafayette, United States,

² Université Paris-Saclay, INRAE, AgroParisTech, UMR Modélisation Systémique Appliquée aux Ruminants, 91120 Palaiseau, France

The primary objectives of this study were to: 1) investigate the genetic background of milk feeding traits and bovine respiratory disease (BRD) in North American Holstein calves; and, 2) derive novel indicators of calf resilience based on variability in calf milk consumption. Data from 14,749 calves was collected daily over a period of 6 years and daily milk consumption and per-visit milk consumption, daily sum of drinking duration, drinking duration per-visit, daily number of rewarded visits, and total number of visits per day were recorded over a 60-d pre-weaning period. Additional traits were derived from these variables, including total consumption and duration variance, feeding interval, drinking speed, and pre-weaning stayability. The number of times a calf was treated for BRD was also evaluated. We compared repeatability and random regression models (RRM) to estimate genetic parameters for various traits. We observed low heritability estimates for feeding traits based on the repeatability models (e.g., daily milk consumption = 0.09; daily number of rewarded visits = 0.020), which improved with RRM (e.g., daily milk consumption = 0.46 [0.050, 0.680]; daily number of rewarded visits = 0.120 [0.030, 0.450]). Moderate negative genetic correlations between BRD treatment and feeding traits suggest potential for genetic improvement in disease resilience. We modelled and evaluated deviations in observed and predicted daily milk consumption trajectories as indicators of resilience to environmental perturbations. Parameters such as amplitude, perturbation time, recovery time, and deviation velocities were calculated to quantify the degree and duration of perturbations. We observed heritability estimates ranging from 0.16 to 0.52. This study provides key insights of the genetic background of early in-life traits in dairy cattle, which can be used for selecting animals with improved resilience, health outcomes, and performance.

Prevalence and distribution of foot lesions in French slaughter dairy and beef young bulls housed in indoor feedlot

S. Ishak^{1,2}, R. Guatteo², A. Lehébel², N. Brisseau², A. R. Entraygues¹, M. Gall¹, A. Duvauchelle Waché¹, A. Relun²

¹ French Livestock Institute, 149 Rue de Bercy, 75012 Paris, France, ² Oniris/Inrae/BIOEPAR, 101 Route de Gachet, 44300 Nantes, France

Nearly half of beef calves and 14% of dairy calves in France are reared indoors as feedlot cattle, where lameness is increasingly reported, especially towards the end of the fattening period. The objective of this study is to assess the prevalence and distribution of foot lesions at the end of the finishing period in French dairy and beef young bulls. A cross-sectional study was conducted in three regions with the highest proportion of feedlot cattle slaughtered in spring and autumn 2024. A total of 2102 animals were included in the study, representing various breeds: Charolais (56.8%), Limousin (11.7%), Blonde d'Aquitaine (6.9%), mixed breed (16.2%), Holstein Friesian (3%), and other breeds (5.4%). The 4 feet of each animal were trimmed and examined post-mortem by three trained professionals, with foot lesions categorized by type, severity, and location based on the ICAR Claw Health Atlas and national scoring methods. Descriptive analysis was conducted to estimate feet-, animal-, and within-batch-level prevalence, describe the severity and location of foot lesions, and estimate the distribution (e.g., breed, geographical area, etc.) of foot lesions. Preliminary results show that 34% of animals had at least one painful foot lesion, potentially indicating lameness. The most common painful lesions were stage M2 of digital dermatitis (affecting 17% of all animals) and level 2 of white line disease (present in 15% of animals). These findings might help raise awareness among stakeholders about the importance of lameness in young bulls, identify potential risk factors, and thus suggest possible control measures.

Updating preliminary study of multiphase diet for dairy beef cattle

P. Guarido Lopez¹, M. Benaouda², L. Llonch³, S. Marty³, M. Devant³, L. Tedeschi¹

¹ Texas A&M University, Animal Science, 474 Olsen Blvd, 77845 College station, United States, ² Institut AgroDijon, Animal Science, 26 bd Docteur Petitjean, 21079 Dijon, France, ³ Institut de Recerca i Tecnologia Agroalimentàries, Ruminant Production Program, Torre Marimon, 08140 Caldes de Montbui, Barcelona, Spain

Crossbreeding between beef and dairy cattle has become a common practice in the dairy industry. However, there exists a lack of data and comprehensive calculations of the nutritional requirements for these crossbred animals, which hinders the implementation of effective precision nutrition techniques and limits the advancements in feed efficiency and sustainability within this specific production system. This study aimed to address this gap by investigating the nutritional requirements of crossbred dairy beef animals (i.e., F1 of dairy cows inseminated with beef breeds) and evaluating the application of multiphase diets as a precision nutrition technique. A preliminary analysis demonstrated the efficacy of multiphase diets in improving production costs, N excretion, and feed efficiency in cattle by changing dietary energy and protein concentration at three different points of the animals' growth. The current study expands the previous analysis by assessing a larger population of animals (n=16,445) in which we evaluated BW, ADG, and DMI with a particular focus on younger individuals (101-506 kg BW). To calculate the changing points, we first estimated the dietary density of protein required by dividing the metabolizable protein (MP) required by the observed DMI. Then, we performed regression analyses to adjust the data according to a reference diet (88 g MP/kg DM). Results showed a quadratic regression [$0.0248 - 0.631 \times BW + 0.00064 \times (BW^2)$], which fitted (the root of the mean square error of 34.68 kg) the MP required in the diet across the BW. The changing points were found at 353 and 436 kg BW, corresponding to 102 and 81 g MP/kg DMI, respectively. This result suggests that changing the diet at these points may improve the feed efficiency of dairy beef cattle.

Carbon footprint of Holstein bull calves fed two different total mixed rations from 4 to 12 months

L. Mogensen², M. Vestergaard¹

¹ Aarhus University, Dept Anim & Vet Sci, Foulum, 8830 Tjele, Denmark, ² Aarhus University, Dept Agroecology, Foulum, 8830 Tjele, Denmark

Despite the climate impact of rosé veal calf production is lower than most other beef types, it is still warranted that we find new ways of improving the climate impact of this production. The objective was to estimate the carbon footprint (CF) of rosé veal production when calves were fed two different feed rations. 64 Holstein male calves were fed and raised similarly from birth to 4 months, after which 32 calves were fed a corn-cob-silage-based TMR (YEL) and 32 calves were fed a grass-clover-based TMR (GRE) until slaughter at 12 months of age. YEL TMR also included barley, rape seed meal, and sugar beet pellets. GRE TMR also included barley, fava beans, and rape seed. Crude protein level was reduced twice during rearing. Feed intake (DMI and NEI) was similar for GRE and YEL. ADG from birth to slaughter and carcass weight were higher (268 vs 261 kg) for GRE vs YEL ($P < 0.03$). Tabulated values for CF of the various feedstuffs were used in the Life Cycle Assessment (LCA). Animals' methane production were measured in open-circuit respiration chambers at 8 months of age. The contribution of feedstuffs to CF of meat including soil C sequestration was 7% lower for GRE vs YEL. The contribution of manure was slightly lower for GRE vs YEL, but the contribution from enteric methane was 12% higher for GRE vs YEL. Total CF was 2861 vs 2858 kg CO₂e per calf produced. When CF was expressed per kg carcass, GRE was 3% lower (10.7 vs 11.0 kg CO₂e). Overall, this LCA confirms that rosé veal calf production has a low CF compared to other beef systems. The feeding effect shows that even a marked increase in enteric methane with one feeding can lead to a similar CF per kg meat if the contributions from feed, manure and C-sequestration counterbalance this.

Session 18

Theatre 12

Innovative sustainable organic beef production system where quality replaces quantity

L. Mogensen¹, T. Kristensen¹, M. Therkildsen¹, I. A. Christiansen², K. F. Jørgensen³, C. Kramer³, B. V. Andersen¹, T. Dorca-Preda¹, M. Vestergaard¹

¹ Aarhus University, Foulum, 8830 Tjele, Denmark, ² Innovation Centre for Organic Farming, Skejby, 8200 Aarhus N, Denmark, ³ Center for Free Range Livestock, Randers, 8900 Randers, Denmark

The GroBEat project proposes an innovative organic beef production system that offers a diversity of beef products (A, B, and C), is based on offspring from dairy cows, and which scores high on animal welfare, biodiversity and climate thus addressing specific criteria of major importance for the consumers. Furthermore, the high level of meat- and the sensory quality together with the storytelling of the system address that "less is more", which is supposed to facilitate healthier eating habits, while ensuring wellbeing, and providing the organic dairy sector with improved credibility for 'license to produce'. The GroBEat production system is based on steers and includes calf rearing by a foster cow for up to 6 months, use of low energy density roughage during winter, and utilizes extensive pasture for weaned steers. The system takes advantage of the variation in growth capacity between animals by slaughtering 1/3 of the best performing calves at 8 mo as high value rosé veal (A), another 1/3 of the steers at 16 mo as young beef (B), and the last 1/3 of the steers at 26 mo as mature beef (C). This gives three well characterized products compared with the current one product from intensive conventional rosé veal production and the traditional organic beef from steers slaughtered at 24-26 mo. The A steers were slaughtered at 347 kg LW, the B steers at 544 kg LW, and the C steers at 732 kg LW. The A steers spent 126 days, the B steers 267 days, and the C steers 367 days of their life on pasture. The A steers had the highest feed efficiency and the C steers the lowest. However, when considering the feed intake by the foster cow, feed efficiency of the A and B system did not differ. In the A system, 71% of the feed intake was assigned to the foster cow, 32% in the B system, and 20% in the C system. Finally, the system was evaluated both from a farmer perspective focusing on feed efficiency and economic return per animal and feeding day and from a society perspective focusing on carbon footprint and biodiversity per kg carcass using LCA.

Novel administration of meloxicam to surgically castrated bull calves via medicated lick blocks

S. Rudd¹, D. Van Der Saag¹, S. Lomax²

¹ Sydney School of Veterinary Science, The University of Sydney, 2570 Camden, Australia, ² School of Life and Environmental Sciences, The University of Sydney, 2570 Camden, Australia

Livestock husbandry procedures such as surgical castration inflict long-term pain and inflammation, highlighting the animal welfare and production concerns. Pain relief products available to producers including topical anaesthetics (TA) and non-steroidal anti-inflammatory drugs (NSAIDs) are limited to peri or post-operative administration, failing to address procedural pain, and lasting only 24-72 hours. Forty Bos taurus calves were randomly allocated to treatment groups: meloxicam lick block (ML), subcutaneous meloxicam (M), no meloxicam (NC), or sham castration (PC). ML calves had 19 hours of access to the medicated lick blocks prior to castration. M calves were administered 0.5mg/kg of meloxicam subcutaneously immediately prior to castration. Blood samples were collected from ML and M calves via jugular venepuncture for plasma meloxicam concentration (PMC) analysis. Weight, scrotal temperature and diameter, wound healing, and behaviour were measured. Meloxicam lick blocks reduced weight loss and increased locomotion and eating. On all days except the first, PMC was greatest in ML calves ($P < 0.001$). The loss of weight was minimised in ML calves compared to M and NC calves ($P = 0.044$). Eating increased in ML calves immediately after castration and was reduced when the medicated block was removed ($P < 0.001$). Locomotion was greatest in ML calves ($P = 0.018$). There was a trend for scrotal diameter to be less in ML calves compared to M ($P = 0.069$). The administration of meloxicam via medicated lick blocks enabled pre-emptive and long-term analgesia. This project highlights potential for feed-based delivery of analgesia in numerous species.

Theatre 14

Sustainability, Animal Welfare and Surplus Calves in the Australian Dairy Industry: Perspectives from the public – a focus group study

S. Bolton^{1,2}, B. Vandresen¹, M. Von Keyserlingk¹

¹ The University of British Columbia, Animal Welfare Program, 2357 Main Mall, V6T 1Z6 Vancouver, Canada, ² The University of Melbourne, Melbourne Veterinary School, 142 Royal Parade, 3052 Parkville, Australia

Citizens are becoming increasingly disconnected from food production. Despite this, many people still hold strong values about how food is produced. The aim of this study was to attain an in-depth understanding of Australian public attitudes towards sustainability and animal welfare, as well as early life killing of surplus calves; an issue commonly identified as being out of step with public values. We conducted three, 3 hour focus group sessions, each with 7 Australians who varied in age, gender identity, income, and frequency of consumption of dairy products. Thematic analysis of the semi-structured discussions resulted in four key themes, each with underlying sub-themes: (1) sustainability, including concepts and behaviors seen as 'sustainable', consumer influence, and personal importance; (2) animal agriculture, including attitudes to farmers, and farming practices; (3) personal reflections, including emotions, ethical considerations, and knowledge and expectations; and (4) animal products, including consumption, alternative proteins, and health. Participants' attitudes towards sustainability and the consumption of animal products varied according to the different ethical lenses through which they viewed the topics, and alignment or otherwise with their personal values. Understanding and correcting where food animal production practices fail to align with the evolving core values of the public provides opportunities to preserve the social sustainability of animal agriculture into the future.

The use of gamma-glutamyl transferase as potential biomarker of colostrum consumption to evaluate the maternal antibody interference with subcutaneous and intranasal vaccines against BRD in unweaned dairy beef calves. An exploratory field study

C. García-Vázquez¹, L. Llonch¹, A. Bassols², Y. Saco², J. Pujols³, M. Campas⁴, M. Devant¹, S. Martí¹

¹ IRTA, Ruminant Production, Torre Marimont, 08140 Caldes de Montbui, Spain, ² UAB-Faculty of Veterinary, Science Biochemistry and Molecular Biology, building V, 08193 Bellaterra, Spain, ³ IRTA, CRESA, Campus UAB, 09193 Bellaterra, Spain, ⁴ IRTA, Marine and Continental Waters, Carretera de Poble Nou km 55, 43540 La Rapita, Spain

A total of 203 unweaned male calves were used to evaluate the use of gamma-glutamyl transferase (GGT) as biomarker of colostrum consumption on the maternal antibody interference with subcutaneous and intranasal vaccines against BRD in unweaned calves. At arrival to farm (day 0) calves were blood sampled to analyze GGT, IgG2, and IgM. After that, all calves received metaphylaxis against BRD using either subcutaneous (SC) or intranasal (IN) vaccines. Fourteen days after (day 14), another blood sample was collected to perform the same analysis. Data analysis was performed using Pearson's correlation with IgG2₁₄ IgM₁₄ and GTT₀ and mixed effects models with vaccine type (VT), GGT₀ categorized (GGT₀) based on previous data (high-GGT ≥ 65 IU/L; low-GGT < 65 IU/L), and its interaction. The interaction between the GGT₀ and VT was not significant; however, low-GGT₀ calves tended to have greater (P = 0.11) IgM₁₄ concentration compared with high-GGT₀, and in IN vaccinated calves IgM₁₄ serum concentration did not increase (P < 0.01) compared with SC calves. In SC vaccinated calves, a negative correlation between GGT₀ and IgG2₁₄ (P < 0.001; r₂ = 7.8%; 95% CI -0.44, -0.1), and IgM₁₄ (P = 0.03; r₂ = 3.2%; 95% CI -0.37, -0.02) was observed, however the coefficient of determination was very low. These results highlight the potential use of serum GGT at arrival as a biomarker of colostrum consumption to identify potential maternal immunity by vaccine interference and better design effective vaccination strategies.

Session 18

Poster 16

Evaluation of milk replacer acidification according to the cattle origin as a feeding strategy during pre-weaning period on diarrhea incidence and performance in dairy beef calves

M. Verdú¹, X. Soldevila¹, M. Villarte², D. Villalba², G. De La Fuente², J. Cucurull¹

¹ BonÀrea Agrupa, Animal Nutrition and Feed Industry, c/Ponent, 5, 25210 Guissona, Spain, ² Universitat de Lleida, Departament de Ciència Animal, Av. de l'Alcalde Rovira Roure, 191, 25198 Lleida, Spain

Acidification of milk is a practical way to reduce diarrhea incidence and improve performance. This study aimed to investigate the effects of milk replacer acidification (MRA) depending on cattle origin (market vs. local) on pre-weaning performance and incidence of diarrhea in dairy beef calves. A total of 48 male calves (47 ± 6.6 kg of body weight and 24 ± 8.3 days of age) were used and allocated to treatments according to cattle origin (market vs. local) and feeding of MRA (acid vs. non), and they were weaned at 35 days of age. MRA was prepared to a target pH of 5.2-5.4 using formic and lignosulfonic acids. Calves were fed 2 L of milk replacer twice daily (125 g/L as fed) and had ad libitum access to concentrate and water. Animal body weight and feed consumption were recorded weekly. Fecal consistency was assessed daily using a 4-point scale; diarrhea was defined as fecal score ≥ 3. A subset of 20 calves was systematically selected for fecal sampling at days 0, 14 and 35 of study. Fecal samples were analyzed for enterotoxigenic Escherichia coli F5, Cryptosporidium parvum, Clostridium perfringens, rotavirus, and coronavirus using Bio-X immuno-chromatography test strips. Calves coming from market origin tended (P = 0.07) to show a greater incidence of Clostridium infection on day 35. No differences were observed in fecal score and days of diarrhea. There was an interaction (P < 0.05) between MRA and cattle origin in feed conversion rate with the acidification being more effective in calves from market. Thus, the efficacy of MRA was subject to the cattle origin.

Effect of a phytogetic feed additive (POWERJET®) on calves' growth performance and intestinal permeability
M. Verdú¹, X. Soldevila¹, J. Cucurull¹, A. Pérez², J. Grau², M. S. Gómez²

¹ *BonÀrea Agrupa, Animal Nutrition and Feed Industry, c/Ponent 5, 25210 Guissona, Spain,* ² *ADM, Animal Nutrition Spain, C/ Clavo N°1. Pol. Ind. Santa Ana, 28522 Rivas Vaciamadrid, Spain*

The use of phytogetic feed additives has increased in animal nutrition to reduce the use of antibiotics and to improve zootechnical performance thanks to the combination of their active ingredients. The aim of the present work was to evaluate the efficacy of POWERJET® (PJ), a mixture of two plant extracts and their bioactive compounds with well-known antioxidant and anti-inflammatory properties in the Pharmacopoeia, on performance and intestinal permeability in milk-fed dairy beef calves. A total of 48 Holstein male calves (53 ± 3.6 kg of body weight, and 25 ± 9.5 days of age) were enrolled in a 2 x 2 factorial design, with the inclusion of PJ in milk-replacer at a dose of 2,000 g/t and in concentrate at a dose of 500 g/t. Calves were housed individually in boxes with straw bedding. Animals were fed following a milk-replacer program for 28 days (2 L twice daily, 125 g/L as fed), and had ad libitum access to concentrate and water. The trial lasted 56 days with two periods of 28 days each (pre- and post-weaning). Milk replacer intake and health status were recorded daily and concentrate intake and body weight weekly. Fecal consistency was assessed daily using a 4-point scale; diarrhea was defined as fecal score ≥ 3 . Blood samples were collected on days 0, 14 and 35 of study to determine the serum level of occludin protein as an indicator of intestinal permeability. No differences were observed in fecal score. Concentrate supplementation with PJ in comparison with no PJ tended ($P = 0.08$) to reduce serum levels of occludin (98.1 vs. 113.7 ± 9.60 ng/mL), reflecting a better preservation of the integrity of the intestinal epithelium. Calves fed milk replacer with PJ tended ($P = 0.08$) to improve feed efficiency during pre-weaning period (0.39 vs. 0.31 ± 0.032 kg/kg). This improvement was numerically observed over the study with PJ in milk replacer and concentrate (0.44 vs. 0.40 ± 0.028 kg/kg; $P > 0.10$). Thus, PJ inclusion in milk replacer and concentrate is a promising approach to ameliorate performance in dairy beef calves.

Session 18

Poster 18

Use of foster cows to produce rosé veal of spring-born dairy calves in an organic setting

M. Vestergaard¹, T. Kristensen¹, L. Mogensen¹, B. V. Andersen¹, I. A. Christiansen², K. F. Jørgensen³, C. Kramer³, M. Therkildsen¹

Most non-replacement calves born by organic dairy cows are sold to conventional rosé veal fattening. Due to a requirement of milk-feeding until 3 months (mo) of age, grazing, and at least 60% roughage in the fattening ration, very few calves are raised and slaughtered as organic, and only a few traditional steers slaughtered at 2½ years of age are produced within the organic system. Thus, currently no rosé veal of organic origin is available. Our aim was to develop and test a novel organic beef production concept producing three types of beef; 8-mo rosé veal (reported in this abstract), medium red beef from 16 mo-steers, and red beef from 26 mo-steers. The hypothesis was that performance as well as meat quality would be as good as similar types of conventional beef. To produce organic rosé veal we utilized culled dairy foster cows to rear the calves. A total of 24 Holstein cows each received two spring-born ½-mo old Holstein bull calves. Following successful bonding indoor and castration at 1 mo, cow-calf-pairs were grazing a grass-clover sward for 4 mo, and housed in the autumn. The 8 best-performing cow-calf pairs continued, and the 16 calves had access to the same TMR as the foster cows, were weaned at 6½ mo, and were slaughtered at 8.2 mo (ORG). There were no health-related issues with the calves. ADG from birth to slaughter was 1.23 kg/d, and carcass weight was 180 kg. Carcass, meat and eating quality was compared with 10 conventional 9-mo rosé veal calves (CONV, 211 kg carcass). EUROP conformation (ORG 3.2 vs CONV 3.6) and fatness (2.6 vs 2.4) were similar. Meat quality (intramuscular fat and colour measures: L*, a*, and b*) was similar. However, ORG had more intense taste and was more tender than CONV (both $P < 0.05$) with no difference in juiciness and smell. The study shows that it is possible to produce a high-quality rosé veal product in an organic setting.

Can cakes rich in polyunsaturated fatty acids substitute palm oil and reduce methane emissions in dairy beef calves fed high-concentrate diets? In vitro screening

M. Devant¹, L. Llonch¹, S. Martí¹, G. Verge², J. Riera³, C. Medinyà⁴, J. Cucurull⁵, A. Pérez², B. Fernández⁶

¹ IRTA, Ruminant Production, Torre Marimon, 08140 Caldes de Montbui, Spain, ² IRTA, Animal Production, Mas Bové, 43120 El Morell, Spain, ³ NANTA S.A., Tres Cantos, 28760 Madrid, Spain, ⁴ SINUAL S.L, Sallent, 08650 Barcelona, Spain, ⁵ bonArea Agrupa, Guissona, 25210 Lleida, Spain, ⁶ IRTA, Sustainability in biosystems, Torre Marimon, 08140 Caldes de Montbui, Spain

The aim of this study was to evaluate the rumen in vitro CH₄ production of concentrates containing different protein sources (PS) when partially replacing palm oil by different cakes (CK) rich in polyunsaturated fatty acids (PUFA). Concentrates' PS were: T1 = 8% soybean meal; and T2 = 15% dried distillers' grain. Palm oil (CTR, 4% and 3.5% for T1 and T2, respectively) was partially substituted (1%) by canola cake (CO; 6.5%), sunflower cake (SU; 14.5%) or camelina cake (CA; 11.5%), thus 8 types of concentrates were tested. Samples were grinded at 1-mm and used in an in vitro digestibility assay. The rumen liquid obtained at a slaughterhouse was strained through a cheesecloth and placed into pre-warmed thermal flasks at 39°C. Two incubation sets were done in parallel and in triplicate: two sampling points lasted 24 and 48 hours to calculate the DM digestibility; a third sampling point lasted 12 days to monitor the CH₄ production. Data were analyzed using a mixed effects model. Net volume of CH₄ per degraded DM did not differ between PS and CK (P=0.14), neither among CK, PS, and time (P=0.17). However, a tendency (P=0.09) was observed for PS where T1 tended to produce lower net volume of CH₄ per degraded DM than T2 (10.9 vs. 11.6 ± 0.45 ml/g, respectively). Partial substitution of palm oil by different cakes rich in PUFA did not reduce rumen in vitro CH₄ emissions.

Poster 20

Effect of substituting palm oil by sunflower oil in fattening dairy beef bulls fed high-concentrate diets on performance and enteric methane emissions

L. Llonch¹, S. Martí¹, M. Devant¹

¹ IRTA, Ruminant Production, Torre Marimon, 08140 Caldes de Montbui, Spain

The aim of this study was to evaluate the substitution of palm oil by sunflower oil in dairy beef bulls fed high-concentrate diets on performance and enteric CH₄ emissions. Ninety-four bulls (399 ± 9.3 kg BW, and 271 ± 4.0 days of age) were group-housed in 6 pens and fed concentrate and straw separately, both ad libitum. Concentrate offered to bulls differed in the fat source: 1) CT (n=46), 3.5% palm oil; and 2) SU (n=48), 3.5% sunflower oil. The study lasted 42 days. Individual feed intake was recorded daily. Bulls were weighed every 2 weeks. Enteric emissions were recorded daily with CH₄ and CO₂ sniffers based on an infrared technology installed in each concentrate feeder and pen. Total daily CH₄ production (g/day) was estimated based on Madsen et al. (2010). Data were analyzed using a mixed effects model. No differences were observed in average daily gain (1.83 vs. 1.85 ± 0.141 kg/day, P = 0.87; CT vs. SU, respectively) and concentrate intake (7.48 vs. 7.48 ± 0.420 kg DM/day, P = 1.00; CT vs. SU, respectively). A significant time by treatment interaction was observed in enteric gasses emissions data with no clear pattern. Overall, mean CH₄ concentration per visit (73.0 vs. 91.6 ± 19.73 ppm, CT vs. SU, respectively; P=0.40); mean CO₂ concentration per visit (1442 vs. 1990 ± 576 ppm, CT vs. SU, respectively; P=0.39); ratio of CH₄ to CO₂ (0.050 vs. 0.046 ± 0.0100 ppm, CT vs. SU, respectively; P=0.80), and daily CH₄ production (184 vs. 175 ± 22.2 g CH₄/day, CT vs. SU, respectively; P=0.72) did not differ among treatments. When palm oil was substituted by sunflower oil in fattening dairy beef bulls fed high-concentrate diets, animal performance was not impaired and only a numerical enteric CH₄ emission decrease was observed.

Can algae rich in polyunsaturated fatty acids reduce methane emissions when substituting palm oil in dairy beef calves fed high-concentrate diets? In vitro screening

L. Llonch¹, S. Martí¹, G. Verge², J. Riera³, C. Medinyà⁴, J. Cucurull⁵, A. Pérez², B. Fernández⁶, M. Devant¹

¹ IRTA, Ruminant Production, Torre Marimon, 08140 Caldes de Montbui, Spain, ² IRTA, Animal Production, Mas Bové, 43120 El Morell, Spain, ³ NANTA S.A., Tres Cantos, 28760 Madrid, Spain, ⁴ SINUAL S.L., Sallent, 08650 Barcelona, Spain, ⁵ bonArea Agrupa, Guissona, 25210 Lleida, Spain, ⁶ IRTA, Sustainability in Biosystems, Torre Marimon, 08140 Caldes de Montbui, Spain

The aim of this study was to evaluate the rumen in vitro CH₄ production of concentrates containing different protein source (PS) when partially replacing palm oil by different algae (AG) rich in polyunsaturated fatty acids (PUFA). Concentrates' PS were: T1 = 8% soybean meal; and T2 = 15% dried distillers' grain. Palm oil (CTR; 4% and 3.5% for T1 and T2, respectively) was partially substituted (1%) by *Nannochlorepis* (NA; 6.7%), *Chlorella* (CH; 9%), or *Tetraselmis* (TET; 13%), thus 8 types of concentrates were tested. Samples were grinded at 1-mm and used in an in vitro digestibility assay. The rumen liquid was obtained at a slaughterhouse. Two incubation sets were done: two sampling points lasted 24 and 48 hours to calculate the DM digestibility; a third sampling point lasted 12 days to monitor the CH₄ production. Data were analyzed using a mixed effects model. An interaction ($P < 0.01$) between PS and AG was observed in net volume of CH₄ per g of degraded DM; while no differences were observed for T1 (6.69, 6.30, 6.23, 6.31 ± 0.640 ml/mg; CTR-T1, NA-T1, CH-T1, TET-T1, respectively); in T2, CH-T2 produced greater net volume of CH₄ per g of degraded DM than the other T2 treatments, and NA-T2 produced lower net volume of CH₄ per g of degraded DM than TET-T2 (5.51, 4.79, 7.60, 6.06 ± 0.640 ml/mg; CTR-T2, NA-T2, CH-T2, TET-T2, respectively). Partial substitution of palm oil by different algae rich in PUFA did not reduce rumen in vitro CH₄ emissions.

Carcass traits of Lidia breed heifers: preliminary results

M. Cantarero¹, E. Angón¹, J. Claros², L. Jiménez², J. Caballero¹, J. Perea¹

¹ Universidad de Córdoba, Producción Animal, Campus Rabanales, Ctra. N-IV, km 396, 14071 Córdoba, Spain, ² CERSYRA-IRIAF, Avenida del Vino s/n, 13300 Valdepeñas, Spain

The Lidia breed of cattle is an autochthonous breed of Spain which grows extensively associated with a particular agrosilvopastoral ecosystem known as 'dehesa'. In this breed meat production has always been of secondary importance and has therefore been little investigated. Due to the challenges facing livestock farming with local breeds, and specifically the Lidia livestock systems, this work aims to make a first approximation to the characterization of the carcass of females of this breed. A total of 200 heifer carcasses (24-48 months old) from 10 farms (20 animals per farm) were analyzed. Animals followed a standard production cycle of the Lidia breed. Measures were obtained 24 hours post-mortem, on the left half-carcass and a descriptive statistical analysis was applied using XLStat software. The variables analyzed were: carcass weight, EUROP conformation and fatness score, morphometry (carcass length and depth, leg length and girth), pH₂₄, colour in CIELab* space of the M. rectus abdominis and subcutaneous fat and tissue composition of the 6th rib. The carcass of Lidia heifers was characterized by a lower weight, conformation and fatness compared to other breeds. Morphometry was similar to other local breeds and pH₂₄ was optimal. The colour of muscle and subcutaneous fat presented was darker, reddish and yellowish compared to carcasses commonly found in slaughterhouses. Tissue composition revealed a high bone content and medium lean and fat portions. The pasture-based production system, the high age at slaughter and the special rusticity and idiosyncrasy of this breed reflect the results found.

The 11th Modelling Nutrient Digestion and Utilization in Farm Animals (MODNUT) Workshop amidst the majestic Swiss Alps

M. Lautrou¹, S. Lerch¹, A. Cannas², J. Dijkstra², M. D. Hanigan², E. Kebreab², R. Muñoz-Tamayo², A. Remus², I. A. M. A. Teixeira², N. Mehaba¹

¹ Local organizing committee of ModNut, Agroscope, Rte de la Tioleyre 4, 1725 Posieux, Switzerland, ² International Committee of ModNut, ND, ND International, Switzerland

From 8 to 11 September 2025 will be held at Engelberg (Obwald, Switzerland) in the heart of Swiss Alps, the 11th workshop on modelling Nutrient Digestion and Utilization in Farm Animals (MODNUT). The local committee from Agroscope (Swiss centre of excellence for agricultural research) and international committee invite you to join the worldwide community of animal nutrition modelers. MODNUT occurs since 1979, when it started in United Kingdom, and since was held in North and South America, Oceania and Europe. Next year we will bring together researchers and active participants in the field of animal nutrition modelling, to share their findings and interact in the peaceful and studious atmosphere of Swiss Alps. The program will feature keynote lectures and topical sessions from basic static to intricate dynamic modeling across different levels of organization (cellular to farm), using mechanistic or empirical approaches. The 11th MODNUT will be followed by a one-day satellite workshop (12 September), with a focus on modelling processes and methodology including initiation to modelling software and practical examples applied to animal nutrition. Abstracts of this edition will be compiled in an Animal – Science proceedings issue, with the opportunity for presenters to publish a peer-review paper in a special issue of *Animal* (the international journal of animal biosciences) at special rate. The scientific program will be complemented by social activities to enhance networking opportunities and discover Swiss landscape and culture. We look forward to seeing you next year in Engelberg!

Session 19

Theatre 2

From the biochemical pieces to the nutritional puzzle: using meta-reactions in teaching and research

J. Van Milgen¹

¹ PEGASE, INRAE, Institut Agro, Le Clos, 35590 Saint-Gilles, France

We now live in an era where metabolic data are increasingly available. These data can be analysed using novel techniques (e.g., artificial intelligence) but it does not alleviate scientists to use “human intelligence”. The objective of this study was to extract information of a database of biochemical reactions with a method and tool to make nutritional biochemistry more accessible to nutritionists. A system of more than 300 meta-reactions (i.e., the outcome reaction of a series of connected individual reactions) was constructed covering a wide range of metabolic pathways for macro- and micro nutrients. Meta-reactions were constructed by identifying metabolic nodes, which are inputs or outputs of a metabolic system or that serve as connection points between meta-reactions. Complete metabolic pathways can be constructed by combining and balancing meta-reactions using a simple Excel tool, which has been used in teaching (e.g., to illustrate how much ATP can be synthesized from glucose, either directly or indirectly via storage and mobilization or via transfer). For research, nutrient balance data of the mammary gland of a dairy cow were used to construct a plausible pathway of nutrient metabolism of the mammary gland. The results highlighted the importance of the synthesis of proline from arginine and the concomitant synthesis of urea by the mammary gland. It also raised the question whether the availability of metabolic pathways or glucose uptake would be the more limiting factor for the synthesis of NADPH required for fatty acid synthesis. The availability of an open database of biochemical reactions, the concept of meta-reactions, and the provision of a tool allow users to acquire a more comprehensive and integrated view of metabolism and may raise issues that may be difficult to identify otherwise.

Hybrid local and global sensitivity analysis: Evaluation of dairy cow response predicted through INRA 2018 feeding system according to feed characteristics

S. Jeon¹, T. Senga Kiese², S. Lemosquet³, P. Nozière¹

¹ INRAE, UMR Herbivores, VetAgro Sup, 63122 Saint-Genès-Champanelle, France, ² INRAE, UMR SAS, Institut Agro, 35000 Rennes, France, ³ INRAE, UMR PEGASE, Institut Agro, 35590 Saint Gilles, France

Two sensitivity analysis (SA) approaches were applied to the INRA 2018 feeding system to identifying the contribution of feed characteristics to the variation of the predicted animal responses. The SA has been performed in ruminant fields mainly by regression-based approaches that assume monotonicity of models. However, because INRA 2018 feeding system has complex models including interaction between feed characteristics, monotonicity cannot be secured. Thus, we applied not only differential-based local SA but also a variance-based global SA to evaluate our system. Five feed characteristics identified to affect animal responses prediction were chosen as input variables: organic matter digestibility (OMd), gross energy (GE), crude protein, and effective degradability and true digestibility of nitrogen. For the simulations, six reference diets for 2nd parity lactating cows at week 14 of lactation have been formulated. Overall, the relative sensitivities to input variables were consistent between both approaches. However, the sensitivity was different for dry matter intake (DMI) and milk protein yield (MPY) between diets. With grass hay-based diets, DMI appeared less sensitive to marginal variations in inputs with local SA, but showed a large interaction among input variables in global SA, while MPY showed the opposite trend. Regardless of the diet, the interactions took in mainly OMD and GE, the input variables that have the greatest impact on the energy/protein ratio that regulates DMI and MPY in the model. This work showed the advantages of a hybrid approach with two SA methods for analyzing ruminant feeding systems.

Session 19

Theatre 4

Predictive modelling of dry matter intake in lactating dairy cows based on routinely available variables

N. Mehaba¹, S. Schrade¹, F. Dohme-Meier¹, L. Eggerschwiler², P. Schlegel¹

¹ Agroscope, Ruminant Nutrition and Emissions, Route de la Tioleyre, 4, 1725 Posieux, Switzerland, ² Agroscope, Group Research mandates animal, Route de la Tioleyre, 4, 1725 Posieux, Switzerland

Predicting dry matter intake (DMI) is crucial for farm management. The study aimed to develop a model based on readily available variables on a dairy farm. The data set collected in barn, between November and March for respectively 2015 to 2021, included 6202 weekly averaged daily observations in 413 lactations from 273 Holstein cows. Data were analyzed using R Statistical Software (v4.1.2; R Core Team 2022). A correlation analysis was performed to identify the best predictive variables. We identified five animal-related and two diet-related variables as the most correlated to DMI. Afterwards, a model was developed using backward regression from a full model consisting 7 variables. After removing non-significant variables (days in gestation, metabolic body weight, and dietary net energy of lactation), the selected predictive variables (mean \pm SD) were the following: parity 2.5 ± 1.6 ; Week of lactation (WOL) 14.9 ± 10.9 ; energy corrected milk (ECM) 33.7 ± 7.6 kg/d and neutral detergent fiber (NDF) 354 ± 59 g/kg DM. The metrics used for the evaluation were the root mean squared prediction error (RMSPE), its decomposition, and a concordance correlation coefficients (CCC) analysis was performed. The resulting prediction equation was $DMI(kg/d) = 16.86 - (0.18 \times Parity) + (0.24 \times ECM(kg/d)) - (0.02 \times NDF(g/kg DM)) + (0.29 \times WOL) - (0.005 \times WOL_2)$ (RMSPE = 1.45 kg, 7.16% and CCC = 0.90). Where parity is equal to 1 for multiparous and 0 for primiparous. In conclusion, our study successfully developed a predictive model for dry matter intake (DMI) in lactating dairy cows using easily accessible variables in dairy farms.

Dynamic sensitivity analysis of a mathematical model describing the effect of the macroalgae *Asparagopsis taxiformis* on methane production in a rumen in vitro continuous system

P. Blondiaux¹, T. Senga Kiessé², M. Eugène³, R. Muñoz-Tamayo¹

¹ *Université Paris-Saclay, INRAE, AgroParisTech, UMR MOSAR, 91120 Palaiseau, France,* ² *INRAE, Institut Agro, UMR SAS, 35000 Rennes, France,* ³ *Université Clermont Auvergne, INRAE, VetAgro Sup, UMRH, F-63122 Saint-Genes-Champanelle, France*

Mathematical models have been developed to better understand rumen fermentation and methane (CH₄) production. The influence of input parameters (IP) of these models have been often assessed by analysis static sensitivity analyses (SA). We hypothesized that dynamic SA can be useful to inform on optimal experiments aimed at quantifying the mechanisms that drive CH₄ production. We used as case study a dynamic model representing rumen fermentation under in vitro continuous conditions. It describes the effect of *Asparagopsis taxiformis* (AT), a potent CH₄ inhibitor. We computed the Shapley effects (Owen, 2014) over time of 15 IP of the model to quantify their contribution to CH₄ (mol/h) variation. Two AT treatments were compared: a low treatment (LT: 0.25% DM of AT) and a high treatment (HT: 0.50% DM of AT). The IP studied were hydrolysis rate parameters (k_{hyd}, h⁻¹) of 3 polymer components in the diet, kinetic rate parameters (k_m, mol substrate/(mol biomass h) and K_S, mol/L) of 3 soluble substrates in the rumen, and parameters describing AT effects on fermentation (p). The hydrogen utilizers microbial group with IP K_S,H₂ contributed to more than 50% of CH₄ variation over time for control (0% DM of AT) and LT. For HT, IP p₂, which models the direct effect of AT on methanogens, showed a high influence (> 30%) over 2 time periods, highlighting a shift of the pathways impacting CH₄ variation over time. Further work is ongoing to exploit dynamic SA for designing optimal strategies using AT for CH₄ mitigation.

Theatre 6

Using risk analysis to compare the accuracy of enteric methane emissions models of dairy cattle

P. Blondiaux¹, E. H. Cabezas-Garcia², T. Senga Kiessé³, R. Muñoz-Tamayo¹, K. F. Reed², M. Eugène⁴

¹ *Université Paris-Saclay, INRAE, AgroParisTech, UMR MOSAR, 91120 Palaiseau, France,* ² *Cornell University, Department of Animal Science, 14850 Ithaca, NY, United States,* ³ *INRAE, Institut Agro, UMR SAS, 35000 Rennes, France,* ⁴ *Université Clermont Auvergne, INRAE, VetAgro Sup, UMR Herbivores, F-63122 Saint-Genes-Champanelle, France*

Many predictive models of enteric methane (CH₄) emission of dairy cattle were developed to help design effective mitigation strategies. Studying the precision and accuracy (Acc) of these models can provide recommendations on which model to use in specific situations. The precision indicates the confidence of a model in its prediction. While, the Acc indicates how far a prediction is from the true observed value. The Bayesian inference is useful to study them, as a prediction is represented by a probability distribution. This allows to compute the probability of a model prediction to be below a CH₄ emission (g/d) threshold. We developed 7 Bayesian models with data from de Ondarza et al., (2023) using predictors from Niu et al., (2018). The risk analysis was applied on 9 diet scenarios, determined by three levels (low, median and high) of dry matter intake (DMI, kg/d), ether extract content (EE, %DM) and neutral detergent fiber content (NDF, %DM) in the diet. The probability of models to predict the true CH₄ value of each scenario was compared to assess model Acc. Models using only DMI as predictor were the best and the addition of NDF improved their Acc. While, the addition of EE impacted negatively their Acc, except for high EE scenario (6.1 %DM). Considering NDF digestibility with DMI led to the highest Acc for median DMI and low and median EE scenarios. While, it showed the lowest Acc for low DMI and high EE and NDF scenarios. Further work is needed to enlarge the diet scenarios to study a wider range of variability.

Byproducts in Ruminant Feeding: Exploring their Mitigating Effects on Enteric Methane Emissions

T. Akinropo¹, J. S. Adjassin¹, D. Morgavi¹, M. Eugène¹¹ INRAE, UMR1213 Herbivores, Saint-Genès-Champanelle, 63122 Theix, France

The increase in the availability of by-products (BPs) emanating from the processing of food to meet the growing population in different countries of the world has necessitated its exploration as feed resources in ruminant feeding. As part of the mandate of the ERA-NET joint call on circularity “INTEGRITY, ID – 83” project to evaluate different BPs of several origins and their level of inclusion in ruminant feed to enhance nutrient circularity and sustainability in the context of climate change. The specific objectives of this study were (i) to categorize identified BPs based on their chemical composition and their potential enteric methane mitigating effects and (ii) to develop specific methane prediction models. A database was created through a literature review using web search online databases (Science Direct, Web of Science) for articles from 2000 to 2024 using several keywords (methane, in vivo, GHG, BPs). The BPs were categorized into clusters using clustering analysis (k-means) based on similarities in dietary chemical composition (Ether extract, EE%; Crude protein, CP%; Neutral detergent fibre, NDF%, Starch, STA%). The elbow method at the flattening point with the lowest within-cluster sum of squares (WCSS) was used to determine the optimal number of clusters. The database contained 33 publications and 33 trials including 24 BPs fed to ruminants (n = 61 records) at different levels of inclusion. Methane was measured using SF6 (n = 10), Greenfeed (n = 10), Respiratory chambers (n = 34), and indirect calorimetric system (n = 7). The BPs were categorized into four clusters namely byproducts with (i) high Starch (27.1%), mid EE (13.9%), low CP (13.8%), and NDF (17.9%) [n = 1, Rice bran] (ii) high EE (51.6 ± 5.7%), mid CP (18.0 ± 1.77%) and NDF (26.0 ± 15.5%), low STA (0.25 ± 0.035%) [n = 2, Algal meal, Whole cracked rapeseed meal] (iii) high CP (37.8 ± 7.5%), mid STA (6.53 ± 1.42%) and NDF (24.3 ± 10.1%), low EE (7.10% ± 5.5) [n = 9, Soybean meal, Canola meal, etc.] (iv) high NDF (46.5 ± 15.5%), mid CP (12.5 ± 4.55%) and EE (8.3 ± 5.02%), low STA (2.13 ± 2.63%) [n = 12, Coconut kernel, soybean hulls, etc.]. Further work is needed to develop an enteric methane model integrating the level of inclusion (% of the whole diet’s chemical composition) of BPs

Session 19

Hybrid Intelligent Mechanistic-Dynamic Models: Mathematical Animal Nutrition Models to Predict Enteric Methane Emissions of Grazing Beef Cattle

H. Menendez¹, J. R. Brennan¹, A. S. Atzori³, P. Guarnido Lopez^{1,2}, L. O. Tedeschi²¹ South Dakota University, Animal Science Department, 711 N Creek Dr, 57703 Rapid City, United States, ²Texas A&M University, Animal Science Department, 474 Olsen Blv, 77845 College Station, United States, ³

University of Sassari, Agricultural Sciences, Viale Italia 39a, 07100 Sassari, Italy

Rapid advances in animal data collection have been occurring for beef cattle grazing systems using precision livestock technology (PLT). Extensive rangeland systems lacking the physical (electricity) and communication (wi-fi) infrastructure required to operate PLT now utilize portable pasture-based systems, such as real-time weighing and enteric emissions monitoring, precision supplementation, virtual fencing, and behavior tracking. Mobile systems capture enteric emissions in the U.S. cow-calf sector. However, capturing continuous real-time individual animal data is challenging and does not reflect sub-daily changes in emission rates for individual animals. Interpolated or aggregated values may also fail to capture the dynamics of grazing systems (forage quantity and quality), management (rotational, continuous), animal classes (calf, heifer, cow), phases (growing, pregnant), and differences in feed and gain efficiency levels. Modeling is required to estimate emission rates at a regional scale more accurately. We propose a Hybrid Intelligent Mechanistic Model (HIMM) approach that leverages current principles to dynamic precision system modeling (PSM). Artificial Intelligence (AI) was used for the integration of covariates that contribute to individual changes in CH₄ from ~130 yearling Angus steers grazing native rangeland and monitored using a suite of precision technologies (real-time weighing, tracking, enteric emissions monitoring) and climate data. The AI model was then connected to a dynamic rumen kinetics model to create a HIMM model that predicts individual hourly enteric emission rates with acceptable accuracy and precision. Utilizing HIMM approaches will play a critical role in balancing the power of big data and AI with the mechanistic-dynamic modeling approaches that maintain the fundamental biological feedback linkages within grazing systems.

Systemic modelling application in animal science: archetypes for teaching and research in animal nutrition
 A. S. Atzori¹, B. Atamer Balkan¹, H. Menendez², B. Turner⁵, A. Gallo⁴, L. O. Tedeschi³

¹ Univ. of Sassari, Agricultural Science, Viale Italia 39a, 07100 Sassari, Italy, ² South Dakota State Univ., Animal Science, 711 N. Creek Drive, 57702 Rapid City, United States, ³ A&M University, Animal Science, Kleberg Center, 77843-2471 College Station, United States, ⁴ Catholic univ. of Sacred Heart, DIANA, Via E. Parmense 84, 29122 Piacenza, Italy, ⁵ A&M Univ., Agriculture, Agribusiness, and Environmental Science, Kingsville, 78363 Kingsville, United States

Systems perspectives and system dynamics (SD) have been used in decision-making and teaching in many fields. Their use in dairy nutrition and management, remains limited and, for the most part, unheard of. This work aims to present essential feedback thinking structures and behaviors, collectively known as archetypes in SD, but specifically designed for dairy applications. The models of feedback thinking are graphically illustrated using causal loop and stock-and-flow diagrams to show the ability of SD to contribute to complexity understanding in the field. Qualitative modelling was devoted to showing the role of loops in nutritional systems and the “Loop Dominance” concepts to explain and understand the feedback roles in determining the behavior of the system variables over time. Quantitative modeling was devoted to showing well-known structures that exhibit characteristic exponential, goal-seeking, oscillating, overshooting, or combined behaviors. The models have been built as the “System Herd”, from the example of the “System Zoo” draft of 1993 and from the book “Limits to Growth” published in 1972, by Donella Meadows. Simple structures were developed referring to one stock model (with examples on microbial population, passage rate, and feed intake) and two stock models (with interactions among pasture – grass or intake – reserves, digestive system descriptions, ruminal dynamics). Small complex models were explicitly built with emphasis on the effects of delays and accumulations and emerging behavior from multiple system elements. Examples from Agent-Based Modeling showed how to model emerging behavior from groups of individuals. These models represent a primary archive of basic structure operating under expected behavior with potential relevant role in SD teaching and applications for the animal science field.

Session 19

Theatre 10

Enhancing Agricultural Sustainability: An Optimization Model for Crop Rotation and Diet Formulation in Dairy Farms under European Union Common Agricultural Policy (EU CAP)

Y. Gong¹, A. Bellingeri², F. Fumagalli³, G. Sechi⁴, A. Atzori⁴, F. Masoero³, A. Gallo³, V. Cabrera¹

¹ University of Wisconsin–Madison, Madison, 1701 Observatory Dr, 53706 Madison, United States, ² Ferrero Mangimi S.p.A, Via Fornace, 15, 12060 Farigliano, Italy, ³ Catholic University of the Sacred Heart, Largo Fra Agostino Gemelli, 1, 20123 Milano, Italy, ⁴ University of Sassari, Piazza Università, 21, 07100 Sassari, Italy

In pursuit of agricultural sustainability, the European Union Common Agricultural Policy advocates for effective crop rotations. However, crop planning complexities, particularly for dairy farmers, are pronounced due to intertwined diet formulation. Our model is applied to a case study of a North Italian dairy farm (300 hectares, 45 fields, 1007 animals) to assess the impacts of three environmental policy scenarios aimed at mitigating enteric methane emissions: 1) MULTI: a multi-objective optimization that balances between economic gains and methane emissions; 2) TAX: applying taxation on methane emissions; and 3) RED: setting explicit methane reduction targets. Results revealed intrinsic trade-offs between economic returns and methane emissions across all scenarios. Adjusting the economic–environmental weighting factor resulted in a decrease in net revenue from 3167 to 1623 €/cow/yr, alongside a reduction in methane emissions from 131 to 117 kg/cow/yr. Methane mitigation prompted dietary changes, leading to diets with higher dry matter (from 47% to 65%), crude protein (from 14% to 16%), starch (from 21% to 23%), and reduced neutral detergent fiber (from 42% to 32%). This study underscores the potential of concurrently optimizing crop rotation plans and nutritionally balanced animal diets. By integrating both economic and environmental considerations, it offers valuable insights for dairy farmers, policymakers, and the broader agricultural community.

Assessment of amino acid requirements by crossbreed and sex of growing pigs based on sequential measurements of body weight and feed intake

N. Quiniou¹, M. Launay²

¹ IFIP-Institut du Porc, 9 Bd du Trieux, 35740 Pacé, France, ² Choice Genetics - Groupe Axiom, Rue Maryse Bastié, 35170 Bruz, France

Individual body weight (BW) and cumulated feed intake per pen (CFI) were measured every 3 weeks between 69 and 155 d of age from 196 offsprings (either entire males (EM) or gilts (G)) born from a batch of Large White x Landrace sows inseminated with boar semen from two commercial lines (Choice, P81 or P90). Pigs were divided into pens (7 pigs each) according to crossbreed, sex, and initial BW. They were fed ad libitum with iso net energy diets (9.75 MJ NE/kg), providing 1.00 g standardized ileal digestible lysine per MJ NE during the first 6 weeks, and 0.90 g/MJ thereafter. Based on average BW and CFI obtained at different ages, 4 (sex × crossbreed) growth curves and feed curves were obtained using the InraPorc® software calibration procedure. Between 30 and 116 kg BW, average daily feed intake (EM: 2.52 vs. G: 2.62 kg/d, P=0.001), body weight gain (1119 vs. 1063 g/d, P<0.001), and feed conversion ratio (FCR; 2.27 vs. 2.47, P<0.001) differed significantly between sexes but not between crossbreeds. The corresponding growth profiles were similar for P81-F and P90-F, but different for ME: P81-ME being later maturing pigs than P90-ME. Subsequently, the amino acid (AA) requirement of P81-ME could be met with the same Phase-1 diet as G (0.89 vs. 0.95 g/MJ for P90-ME), and with the same Phase-2 diet as P90-ME (0.77 vs. 0.70 g/MJ for G). The study illustrates the usefulness of a nutritional model for estimating AA requirements of growing pigs from on-farm data and shows that similar average growth performance can be associated with different changes in requirements as BW increases, which is crucial to consider when designing optimized feeding strategies to improve pig efficiency.

OCalM: A new dynamic model to simulate the fate of calcium and phosphorus in laying hens

B. Méda¹, E. Pampouille², T. Burlot³, M. J. Duclos¹, C. Guerini⁴, M. Quentin², A. Narcy¹, Y. Guyot²

¹ INRAE, Université de Tours, BOA, 37380 Nouzilly, France, ² ITAVI, Institut Technique de l'Aviculture, 75009 Paris, France, ³ NOVOGEN, Le Vau Ballier, 22960 Plédran, France, ⁴ CCPA, ZA Le Bois de Teillay, 35150 Janzé, France

The daily formation of eggshell is associated with several digestive and metabolic mechanisms. In order to design adapted mineral feeding strategies, we developed a dynamic model simulating calcium (Ca) and phosphorus (P) fluxes in laying hens over their productive career. According to diet characteristics and feed intake, digestive fluxes are first simulated, considering two different forms (fine vs. coarse) of dietary Ca in crop and gizzard. In the intestine, Ca and P are subsequently absorbed to the plasma, with a large increase in Ca absorption during eggshell formation. At the metabolic level, fluxes to/from the bone depend on egg requirements. Thus, after oviposition, Ca can be stored in the bone (accretion), while bone Ca can be mobilized when requirements for eggshell are important. This phenomenon especially occurs at night when feed is not available, thus liberating P which is excreted in the urine. These fluxes are then simulated over the animal's career, taking into account the evolution of laying parameters over time (laying rate, oviposition time). Finally, a "flock" module was added by considering three animal "profiles" ("good", "average" and "poor" layers). Simulations for different levels of coarse Ca in the feed are proposed, stressing out the importance of supplying Ca in a form allowing a progressive absorption over time, especially at night. However, the simulations confirm the role of fine Ca in replenishing bone reserves, especially just after oviposition. This model represents a new tool for nutritionists to design mineral feeding strategies preserving bone health in laying hens with long productive careers and limiting P excretion.

Evaluation of a mechanistic model predicting phosphorus and calcium requirements for bone mineralization of growing broilers

M. Reis³, A. Narcy¹, N. Sakomura⁴, I. Bouvarel⁵, C. R. Angel², M. P. Létourneau Montminy⁶

¹ INRAE, UMR BOA, 37380 Nouzilly, France, ² U Maryland, College Park, 20742-2311 College Park, United States, ³ Trouw Nutrition, El Viso de San Juan, 45215 Toledo, Spain, ⁴ UNESP, Via de Acesso Paulo Donato Castellane, 14884 Jaboticabal, Brazil, ⁵ ITAVI, UMR BOA, 37380 Nouzilly, France, ⁶ Laval University, 2425 rue de L'Agriculture, G1V0A6 Quebec, Canada

As a non-renewable resource essential for both plants and animals, phosphorus (P) dictates our capacity to feed the world. To parsimoniously use it for meat production, a better understanding of the fate of dietary P by growing broilers is necessary. We therefore developed a first model to estimate the metabolic fate of calcium (Ca) and P in broiler chickens. Following inversion modelling principles, this model was inverted to predict requirement. Phosphorus requirements is the sum of the maintenance requirement and the amount that should be absorbed to reach soft tissue ash and bone ash potential. Requirements are the amount of Ca and P that must be absorbed to maximize the growth of soft and bone tissues, so those in “digestible” form. Different steps of model evaluation were performed. First, a global sensitivity analysis was performed. Then, the model was compared with requirement of Ross 308 and those of Rostagno et al. (2017). Also, the accuracy of the predicted requirements has been assessed in two trials. The sensitivity analysis for digestible P and Ca requirement showed that protein maturity ratio represented about 20%, while percentage of Ca in body ash represented 75% of the total variation observed. This shows the high requirement of these mineral for bone tissue. The results showed that the current model predict P and Ca requirements that are lower than Ross 308 especially in finishing period (about 22% for P and 7% for Ca) and lower than Rostagno (about 16 and 32% difference for P and Ca). Using this modeling approach, requirements can be defined based on different criteria of interest that depend on production objectives (e.g., profitability, animal welfare, and environment). Validation trials are ongoing and will allow adjusting the model before it could be used by nutritionists to dynamically predict the concentrations of those minerals in the feed of broiler chickens.

Session 20

Effects of dietary supplementation with cocrystals of thymol and carvacrol on quality, nutrient composition, and oxidative stability of broiler meat

Y. Li^{1,2}, S. Jiang¹, W. Yang¹

¹ Shandong Agricultural University, Department of Animal Science and Veterinary Medicine, Daizong Street 61, 271018 Tai'an, China, ² KU Leuven, Department of Biosystems, Kasteelpark Arenberg 30, 30001 Haverlee, Belgium

Consumer demand for high-quality meat has become a rising trend. This study investigated the potential application of cocrystals of thymol and carvacrol in broilers for high-quality meat production. Eight hundred 1-day-old chicks were assigned to four groups fed the diets supplemented with 0, 10, 15, and 20 mg/kg Crystal EO® (CEO) containing 25% cocrystals of thymol and carvacrol in a 42-d feeding trial. Results showed that compared with the control group, dietary CEO supplementation significantly decreased muscle fiber diameter ($P < 0.05$) and significantly increased muscle fiber density, glycogen content, L^*45 min value, and proportion of α -linolenic acid of breast muscle ($P < 0.05$); dietary 10 and 15 mg/kg CEO significantly decreased lactate content, MDA concentration, cooking loss, shear force, and thrombogenicity index ($P < 0.05$), and significantly increased the proportion of lauric acid of breast muscle ($P < 0.05$); dietary 15 and 20 mg/kg CEO significantly increased glucose content, total superoxide dismutase, and total antioxidant capacity levels of breast muscle ($P < 0.05$). Especially, citrate synthase activity, free radical scavenging capacity, pH24h and a^*45 min values, and cystine content of breast muscle were also significantly higher in 15 mg/kg CEO group than those in the control group ($P < 0.05$). Moreover, all the variations changed significantly demonstrated linear and/or quadratic effects as dietary CEO supplementation increased ($P < 0.05$). Collectively, dietary CEO supplementation improved meat quality and nutritional values and enhanced antioxidant capacity of broiler meat, with 15 mg/kg CEO having the greatest effect.

Replacing Vitamin E in Broiler Diets with Polyphenolic-Rich Greek Vinification By-Products

A. Mavrommatis¹, P. Kyriakaki¹, S. Koulocheri¹, A. Pappas¹, E. Tsiplakou¹

¹ Agricultural University of Athens, Animal Science, Iera odos 75, 11855 Athens, Greece

Grape pomaces from Savatiano, a native Greek *Vitis vinifera* white variety were collected after the vinification process. Grape pomaces were dried naturally and then the polyphenolic extract (GPE) was obtained using a methanol-water solution in ultrasonic and then was encapsulated. Wine lees were also derived after the wine-making process of a Greek *Vitis vinifera* variety. The resulting solid precipitate of wine lees after processing was used as a feed additive rich in yeast cell walls (WLYW). One hundred sixty, 1-day-old, Ross 308 broilers were allocated to 4 experimental treatments of 4 floors of replicate pens each. In the T1 group, vitamin E was adjusted to 75% of requirements while 0.1% of GPE containing 25 mg/kg feed polyphenols and 0.2% WLYW were included. In the T2 group, vitamin E was adjusted to 50% of requirements while 0.2% of GPE containing 50 mg/kg feed polyphenols and 0.2% WLYW were included. In the T3 group, vitamin E was excluded from the feed (0% of requirements) while 0.4% of GPE containing 100 mg/kg feed polyphenols and 0.2% WLYW were included. Finally, a Control (CON) group including 100% vitamin E requirements (80, 65, and 55 IU/kg feed in the starter, growing, and finishing phases, respectively) was allocated. Body weight, feed intake, and feed conversion ratio were recorded on the first day of the experimental period and at the end of each growing phase. At the age of 35 days, 12 broilers per treatment were randomly selected and sacrificed. Oxidative status, antioxidant capacity, and antioxidant enzymatic activities were assessed in blood and tissues. Carcass traits and meat quality were also assessed. Immuno-oxidative-related gene expressions were also determined in the liver, spleen, and bursa of Fabricius.

Session 20

Theatre 3

Modulation of broiler gut microbiota by dietary particle size, exogenous phytase and calcium concentration

I. Rubio-Cervantes^{1,2}, S. Wolfrum¹, M. Rodehutschord^{1,2}, A. Camarinha-Silva^{1,2}

¹ Institute of Animal Science, University of Hohenheim, Emil-Wolff-Str. 10, 70599 Stuttgart, Germany, ² HoL-MiR – Hohenheim Center for Livestock Microbiome Research, Leonore-Blosser-Reisen Weg 3, 70599 Stuttgart, Germany

Particle size (PS) and calcium (Ca) concentration of feed affect the pH in the gut, which can modify exogenous phytase (EP) effects. Our goal was to investigate how PS, EP and Ca concentration impact gut microbiota. Eight experimental diets were formulated; the factors were PS fine (PF) and coarse (PC), Ca (4.9 g/kg and 7.2 g/kg) and EP (0 and 1000 FTU/kg). A total of 560 Ross 308 broilers were distributed into 56 metabolic units at 7 days of age and randomly assigned to each diet. On days 22 and 23, the birds were slaughtered, and the gizzard, ileum, and ceca samples were collected and pooled on a pen basis. DNA extraction was followed by 16S rRNA gene target sequencing. PC decreased α -diversity in the gizzard and increased it in the ceca compared to PF. In the ceca, EP and higher Ca led to an increase in α -diversity. A core community of 13 amplicon sequence variants (ASV) was found in the gizzard, ileum and ceca, and it represented more than 80% of the relative abundance in the gizzard and ileum and 30% in the ceca. Six of these ASV had significantly higher abundance in the PC group compared to PF in the ileum and ceca. Positive correlations that remained unaltered by the studied factors were found, i.e. *Lactobacillus-Limosilactobacillus* in the gizzard and ileum, *Clostridia* UCG 014-*Clostridia* vadinBB60, and *Eisenbergiella-Erysipelatoclostridium* in the ileum and ceca ($p < 0.05$). The results emphasize the effects of PS on diversity and community interactions in the ceca. EP and Ca increased the diversity of the ceca.

Effects of Saccharomyces Cerevisiae hydrolysate on Growth performance and gut health of broilers

M. Comi¹, J. Lin², H. J. Zhang², A. Agazzi³, V. Perricone³

¹ Università Telematica San Raffaele, Department of Human Science and Quality of Life Promotion, Via di Val Cannuta, 247, 00166 Roma, Italy, ² Feed Research Institute, Chinese Academy of Agricultural Sciences, N°. 12 Zhongguancun South St., Haidian District, 100081 Beijing, China, ³ Università degli Studi di Milano, Medicina Veterinaria e Scienze Animali, via dell'Università, 6, 26900 Lodi, Italy

S. cerevisiae hydrolysate (SCH) is a promising alternative to antibiotics, due to its content of nucleotides, B-vitamins, amino acids, and polysaccharides. However, it is not clear how SCH modulates growth performance and health in broilers. This study evaluated the effects of SCH in wheat-based diets on growth performance, immune function, and intestinal health in broiler chickens. A total of 300 one-day-old male broilers were randomly assigned to 2 dietary treatments (C, basal diet; T, basal diet + SCH) and enrolled in a 42 days trial. Growth performance and intestinal health parameters were determined. Data were analyzed using one-way ANOVA and means were separated using Duncan's multiple range test (SAS). SCH significantly increased BW, ADG, and ADFI (d 1-42, $P < 0.05$). Villus height and the ratio of villus height to crypt depth of jejunum and ileum at day 28 and 42 were improved by SCH diet ($P < 0.05$). SCH down-regulated the mRNA expression of IL-1 β , IL-6 and TLR-2, and up-regulated ZO-1 and Occludin ($P < 0.05$). 16S rRNA analysis revealed that SCH altered cecum microbiota, increasing alpha diversity and the abundance of Bacteroidetes, while reducing Firmicutes. Taken together, SCH in wheat diets can stimulate the growth of broiler chickens by regulating the intestinal immunity and barrier function, improving the intestinal morphology, and relieving the intestinal inflammation, which may be related to the enhancement of bacterial diversity and the changes of intestinal microbial composition.

Session 20

Theatre 5

Carnosine in broiler diet: A promising nutritional strategy to reduce the prevalence of breast muscle myopathies

A. Askri^{1,2}, L. Saucier^{1,2,3}, N. Alnahhas^{1,3}

¹ Université Laval, Department of Animal Science, 2425 rue de L'Agriculture, G1V 0A6 Québec, Canada, ² Université Laval, Institute of Nutrition and Functional Foods, 2440 Bd Hochelaga, G1V 0A6 Québec, Canada, ³ Université de Montréal, Swine and Poultry Infectious Diseases Research Center, 3200 Sicotte Street, J2S 2M2 Québec, Canada

The aim of this study was to assess the impact of dietary carnosine supplementation on growth performance, meat yield, quality and the occurrence of breast muscles myopathies. A total of 1,080 one-day-old male Ross 308 chicks were divided into two treatment groups with 12 replicates of 45 birds per each: 1) a control group that received a standard diet (Ctr) and 2) an experimental group that received carnosine supplemented at 500 mg/kg (Carno). Growth performance was assessed at the end of each growth phase. After slaughter, carcass and meat quality traits were evaluated. Muscles samples were taken to measure oxidation parameters and the antioxidant capacity. Breast muscle myopathies were visually assessed on 250 breasts per group. Results showed that carnosine incorporation in broiler diet did not alter production traits. Similarly, carcass yield, yield of carcass cuts and technological quality traits did not differ between groups. Interestingly, the carnosine supplementation significantly reduced the prevalence of white striping ($P < 0.001$), wooden breast ($P < 0.001$) and the co-occurrence of these two myopathies ($P < 0.001$). Furthermore, carnosine supplementation increased ($P < 0.001$) the antioxidant potential while malonaldehyde ($P = 0.30$) and carbonyl ($P = 0.80$) concentrations remained similar in groups. In conclusion, carnosine supplementation in broiler diet could be a promising solution for reducing the incidence of breast muscle myopathies and consequently minimizing economic losses in the poultry industry.

The effect of a phytogetic on broiler performance and feed costs in normal and reduced energy diets

M. De Kock¹, M. Verdú², S. Van Kuijk¹, X. Soldevila², G. Farré²

¹ Selko B.V., Station Straat 77, 3811 MH Amersfoort, Netherlands, ² bonÀrea Agrupa, Animal Nutrition and Feed Industry, Traspalau 8, 25210 Guissona, Spain

Phytogenics, specific plant metabolites, have demonstrated positive effects on metabolism, gut inflammation, and animal performance. Animal feed costs are a significant challenge in profitable broiler production. It is hypothesised that phytogenics can improve growth performance in commercial diets and sustain growth performance in a diet with lower energy levels to reduce overall feed expenses. The trial was executed by BonÀrea Agrupa, with 3,072 1-day-old broiler chickens (ROSS 308) housed in groups of 132 birds/pen with similar body weight (41 ± 0.64 g), 8 pens/treatment. Three different dietary treatments were applied, with T1 being the control diet, T2 being the control diet with 25 ppm Fytera Perform (FP), a micro-encapsulated blend of clove, cinnamon, and oregano (Selko B.V., Tilburg, The Netherlands), and T3 being a diet formulated for lower energy and costs with 25 ppm FP. Data were analysed using a mixed-effects model with repeated measures. The results reported are for the entire production period (36 days of study). The body weight of T2 (2232.83g) and T3 (2247.70g) were higher compared to T1 (2192.48g) (SEM 12.93g, $P=0.02$). The average daily gain was significantly ($P=0.02$) increased in T2 (60.89 ± 0.357 g) and T3 (61.30 ± 0.357 g) compared to the control (59.76 ± 0.357 g). Daily feed intake was highest in T3 (94.11 ± 0.492 g) compared to T1 (91.04 ± 0.492 g) and T2 (92.35 ± 0.492 g) and feed conversion ratio was significantly ($P<0.01$) higher in T3 (1.54 ± 0.004) compared to T2 (1.51 ± 0.004) and T1 (1.53 ± 0.004). The feed cost per g growth was lowest in T3 (0.555 ± 0.0015 €/g growth) followed by T2 (0.559 ± 0.0015 €/g growth) and T1 (0.560 ± 0.0015 €/g growth) ($P=0.07$). In conclusion, FP improved growth performance in broiler chickens, with the diluted low energy/costs diet + FP resulting in similar growth as the control diet but at a lower cost.

Session 20

Theatre 7

Effects of yeast nucleotides administration via drinking water on broiler chickens

V. Perricone¹, S. Sandrini¹, N. Irshad¹, C. Lecchi¹, Y. Dadi¹, L. Aidos¹, P. Cremonesi², B. Castiglioni², F. Biscarini², G. Savoini¹, A. Agazzi¹

¹ University of Milan, Department of Veterinary Medicine and Animal Sciences, Via dell'Università 6, 26900 Lodi, Italy, ² Institute of Agricultural Biology and Biotechnology, Via Einstein, 26900 Lodi, Italy

Nucleotides actively participate in numerous biological processes and can become conditionally essential in periods of rapid growth or illness. This study aimed to evaluate the effect of yeast nucleotides (YN) administration via drinking water on growth traits and intestinal health of broiler chickens. 480 one-day-old chickens were enrolled in a 42-day trial and allocated to three experimental groups of 8 replicates each, where YN were included in the drinking water at a rate of 90 (T1) or 180 (T2) g/ton of water. The control group (CTR) received no supplementation of YN. Growth traits were evaluated on d 0, 10, 21, and 42. At d21 and 42, three animals per replicate were sacrificed; jejunum samples were collected for morphology and gene expression evaluation, while ceca content was collected for microbiota analysis. Multiple means were compared by one-way ANOVA (GraphPad Prism); $P<0.05$ was considered statistically significant. YN improved body weight at d21 and 42 ($P<0.05$). Average daily gain was increased in the period 10-21d ($P<0.05$) and over the entire trial ($P<0.05$). At d21, both T1 and T2 showed an improved villus:crypt ratio than CTR ($P<0.01$); a similar trend was observed also for villus height in T2 ($P=0.07$). T2 showed decreased mucus thickness at d21 compared to CTR ($P=0.03$). Analysis of microbiota and gene expression of tight junction and immune-related genes are currently being performed, which could help to better elucidate the role of YN in supporting gut health and performance of broiler chickens. Acknowledgment: this study was carried out within the Agritech National Research Center and received funding from the European Union Next-GenerationEU (PIANO NAZIONALE DI RIPRESA E RESILIENZA (PNRR) – MISSIONE 4 COMPONENTE 2, INVESTIMENTO 1.4 – D.D. 1032 17/06/2022, CN00000022). Vertical transmission of gut bacteria in chickens and the implications of growing chicks in the absence of adults

E. Mills¹

¹ Hebrew University of Jerusalem, Animal Sciences, Department of Animal Sciences, Robert H. Smith Faculty of Agriculture, Food, and Environment, The Hebrew University of Jerusalem, 7610001 Rehovot, Israel

The gut microbiota performs a number of functions for the host, including converting plant derived nutritional fibers into short chain fatty acids (SCFA) which the host utilizes as an energy source, protecting the host from gut pathogens, and affecting the maturation and functioning of host systems, such as the intestinal, immune and neural systems. Thus, early establishment of the gut microbiota is required for optimal functioning of the microbiota. In nature a main mechanism for the transfer of gut bacteria from one generation to the next is the direct interaction between parents and offspring. However, in commercial settings chicks never meet an adult. To characterize vertical transmission, in conditions in which chicks are grown in the absence of adults, and to determine if the egg was a vehicle for vertical transmission, we compared the fecal microbiome of broiler breeder hens and their progeny till the age of two weeks. We found that most bacterial strains found in the hens did not appear at all in chicks up to two weeks of age. Furthermore, most strains common with the hens which did appear in chicks had a low incidence among the chicks. Thus, the gut microbiota of hens does not efficiently transmit in commercial settings. That been said, a few bacterial strains common with the hens were good colonizers of chicks. To conclude, vertical transmission in commercial poultry grown separately from hens likely exists but is not efficient, possibly resulting in impairment of microbiota function. To understand if microbiota functions were affected, we exposed newly hatched chicks to the gut content of adults which contains many bacterial strains. We found many adult bacteria colonized the chicks. We also found host gene expression in cecal tissue as well as in the bursa was different in treated chicks compared to control chicks. Furthermore, SCFA levels were much higher in treated chicks, implying treated chicks were better utilizing their feed. Thus, growth in the absence of adults has an impact on commercial chicks. Future work is needed to identify specific bacterial strains that positively impact chicks for development as probiotics.

Session 20

Development of eco-friendly feeding approaches in poultry. Assessment of different dietary zinc sources

A. Sarmiento-García², O. Olgun¹

¹ Agriculture Faculty, Selçuk University, Department of Animal Science, Alâeddin Keykubat Campus Arduçlı Mh. Yeni İstanbul Cd. No: 375, 42003, 42130 Selçuklu, Turquia, Turkey, ² Facultad de Ciencias Agrarias y Ambientales, Universidad de Salamanca, Área de Producción Animal, Departamento de Construcción y Agronomía, C/ Filiberto Villalobos, 37007 Salamanca, Spain

Zinc (Zn) supplementation is a usual poultry feeding strategy since it can improve certain aspects of avian production. However, a Zn dietary excess can result in environmental damage, as the fraction that is not absorbed is excreted in the faeces. The purpose of this study is to determine the most suitable dietary zinc source by comparing the effects of Zn in the form of sulphate (Zn-S), glycine (Zn-G), and hydroxychloride (Zn-H) on quail performance, egg production, mineral excretion and mineralization of bone. A total of 75 female quails (10 weeks old) were randomly distributed into 3 groups (5 replications/5 females quails). Treatment groups were set up by adding Zn-S and Zn-H as the inorganic form and Zn-G as the organic form of zinc to the corn-soybean basal diet (34.14 mg/kg Zn) to obtain 50 mg/kg of Zn. The feeding experiment lasted for 12 weeks. Performance parameters and egg production were not impaired by the Zn source ($P>0.05$). Most of the minerals assessed in the tibia were higher ($P<0.01$) in quails fed with Zn-H compared to those received Zn-G and Zn-S which could be reflected in an improvement of bone health. Lower levels of mineral excretion were observed in Zn-G and Zn-H groups compared to Zn-S. It can be stated that Zn-H or Zn-G supplementation could be an interesting strategy to reduce mineral excretion without affecting performance compared to Zn-S. However, further studies are needed to clarify the differences between Zn-G and Zn-H supplementation on bone health.

The inclusion of microalga *Dunaliella salina* in the diet of laying hens: effects on production performance and egg quality

O. Madacussengua¹, M. Lordelo¹, A. Almeida¹, R. Mendes¹, C. Martins¹, B. Tavares¹, D. Carvalho¹, T. Guerra², A. Pagarete³

¹ Universidade de Lisboa, Instituto Superior de Agronomia, Tapada da Ajuda, 1349-017 Lisbon, Portugal, ² Algikay, Algae Based Solutions, SA., Povoia de Santa Iria, 2625-106 Lisbon, Portugal, ³ Microalgae Solutions, Algés, 1495-069 Lisbon, Portugal

Dunaliella salina is a microalga known for being a rich source of protein and carotenoids. This feedstuff has the potential to improve the productive performance and quality of table eggs. Additionally, *Dunaliella salina* can be produced locally with fewer resources. The study involved 32, 58 weeks old, H&N Brown Nick laying hens, monitored over a 7-week period. The hens were divided into four homogenous groups of 8 replicates with 4 levels of inclusion: 0, 1, 2.5 and 5% *Dunaliella salina*. The study assessed productive performances and egg physical characteristics of the eggs. Data were statistically analyzed using the One-Way ANOVA procedure of SAS with Tukey Test to identify the significant differences between means. The results indicated that the incorporation of *Dunaliella salina* did not significantly affect egg production and feed conversion ratio ($p > 0.05$). However, it was observed that the addition of 1% and 5% negatively impacted feed intake and egg weight, respectively ($p < 0.05$). The main physical quality parameters of the eggs, such a Haugh units, shape index, yolk index, egg surface area, shell index, shell thickness, and specific gravity were not affected by the addition of microalgae ($p > 0.05$), however, there was a negative impact on albumen pH ($p < 0.05$). The inclusion of *Dunaliella salina* in the diet led to an increase in both the redness (a^*) and yellowness (b^*) of egg yolks ($p < 0.05$). These findings indicate that the incorporation of *Dunaliella salina* in the diets of laying hens may affect some performance parameters, but not affect egg quality. Keywords: Egg quality, laying hens, microalgae, *Dunaliella salina*.

Unveiling the Immunomodulatory Potential of Probiotic *Bacillus* Strains in Chicken Peripheral Blood Mononuclear Cells

Evonik Operations GmbH, RD & Innovation Nutrition & Care, Kantstraße 2, 33790 Halle, Germany, ⁴ University of Veterinary Medicine, Center for Animal Nutrition and Animal Welfare, Veterinärplatz 1, 1210 Wien, Austria

Feeding probiotic *Bacillus subtilis* DSM 32315 (BS) and *B. velezensis* CECT 5940 (BV) enhances chicken health and performance, possibly through immune modulation. We investigated their effects on chicken peripheral blood mononuclear cells (PBMCs) via transcriptome profiling and cytokine array. Both treatments significantly altered gene expression, with BS affecting four immune pathways and BV affecting five. In both BS-treated and BV-treated PBMCs, the expression levels of T cell marker genes CD4, CD25, and CD28 were elevated ($p < 0.05$ for CD4, $p < 0.01$ for CD25, and $p < 0.05$ for CD28). Additionally, the expression of T cell-associated CC chemokine ligand 5 (CCL5) was increased in both BS and BV-treated PBMCs ($p < 0.05$), while the expression of pro-inflammatory IL16 decreased ($p < 0.01$). Furthermore, BS treatment resulted in an increased expression of anti-inflammatory cytokine gene IL10 ($p < 0.01$), whereas IL10 expression was not affected by BV treatment. The concentrations of cytokines in the culture supernatants remained unchanged in both treatments. Additionally, both BS and BV treatments led to an increase in the expression of avian β -defensin 1 (AvBD1) compared to the control ($p < 0.01$ for BS and $p < 0.05$ for BV). These findings suggest that both BS and BV treatments modulate immune responses in PBMCs, potentially enhancing immune function and host defence mechanisms.

Chicken immune cell assay to evaluate the immune-modulating effect of grape by-products

M. Manoni¹, F. Larsberg², L. Pinotti^{1,3}, S. Kreuzer-Redmer⁴

Agro-industrial by-products offer sustainable and cost-effective alternatives to traditional feedstuffs. Grape by-products (GP) come from winery and are known to be rich in phenolic compounds. We evaluated the immunomodulatory effect of GP on chicken immune cells by isolating peripheral blood mononuclear cells (PBMC) from chicken blood and exposing them to various GP forms. Original GP (oGP) was digested *in vitro* using the INFOGEST protocol to obtain digested GP (ivdGP). Phenolic compounds were extracted from oGP using a water:ethanol solution, yielding extracted GP (extGP). We measured total phenolic content in oGP and extGP with a colorimetric Folin assay. Chicken PBMC were treated for 24 h with oGP, ivdGP, and extGP, and immunophenotyping was applied using flow cytometry. The extGP treatment increased the proportion of dead cells but significantly enhanced CD4+CD25+ and CD8+CD25+ T cells activation, suggesting that extGP induced T cell activation without promoting proliferation. No significant changes were observed in CD4 and CD8 T cell activation with other treatments, nor did any treatment significantly affected B cells. To conclude, only extGP enhanced CD4 and CD8 T cell activation among the tested GP forms, highlighting its potential immunomodulatory role in chicken PBMC immune response. This suggests that specific GP forms can influence the immune system, providing insights for their use for poultry nutrition and health management.

Session 20

Theatre 13

Investigating the impact of Sodium Butyrate on gene expression profiles in chicken intestinal organoids

E. Pietrzak¹, S. Knaga¹

¹ Bydgoszcz University of Science and Technology, Department of Animal Biotechnology and Genetics, Mazowiecka 28, 85-039 Bydgoszcz, Poland

The advent of animal organoid technology presents significant research avenues in zootechnical and veterinary sciences. Of particular interest is the utilization of intestinal organoids, known as enteroids, in investigating host-microbiome interactions. Butyrate, a metabolite produced by probiotic bacteria and one of the short-chain fatty acids, holds potential to influence intestinal tissue integrity and its secretory functionality. The objective of this experiment was to culture *ex vivo* chicken intestinal organoids, stimulate them with sodium butyrate, and evaluate changes in transcript levels of genes associated with intestinal barrier function and immune response. Jejunal crypts were isolated from ROSS 308 chicken embryos (n=12) at day 18 of embryonic development. The crypts, containing intestinal stem cells, were purified, suspended in culture medium, and embedded in Matrigel. On the fifth day of *in vitro* culture, sodium butyrate was added to the culture medium at two concentrations: control-none, SB1–0.5mM, and SB2–1mM. After 24 hours, RNA was extracted from the organoids, and relative gene expression analysis was performed. Genes examined included interleukins (IL-6, IL-8, IL-17) and genes associated with intestinal barrier function (Cadherin, Tight Junction Associated Protein, Claudin 2, Mucin 2, Villin, Occludin). Kruskal-Wallis test was conducted to analyze the data, and intergroup comparisons were made using the Two-stage linear step-up procedure of Benjamini, Krieger, and Yekutieli test. The SB2 group exhibited a significant increase in pro-inflammatory cytokines IL-6 and IL-17, alongside a decrease in IL-8 levels with both doses. Additionally, two tight junction-related genes, OCLN and CLDN 2, were significantly upregulated with the higher dose of sodium butyrate. These preliminary findings indicate the effective stimulation of chicken intestinal organoids with sodium butyrate, as evidenced by alterations in mRNA levels of genes involved in inflammatory responses and tight junctions. Financially supported by the Minister of Science under the program “Regional Initiative of Excellence” (RID/SP/0017/2024/01) and National Science Centre (Poland) by grant 2023/07/X/NZ9/00241

Supplemental effect of *Aspergillus oryzae* phytase on growth performance, nutrient digestibility, and health parameters in Ross 308 broilers

S. Y. Jang^{1,2}, J. H. Park^{1,2}, S. B. Cho^{1,2}, D. K. Kang^{1,2}, I. H. Kim^{1,2}

¹ Dankook University, Department of Animal Biotechnology, 119 Dandae-ro, Dongnam-gu, 31116 Cheonan-si, South Korea, ² Smart Animal-Bio Institute (SABI), 119 Dandae-ro, Dongnam-gu, 31116 Cheonan-si, South Korea

In feedstuffs of plant origin, phosphorus is present in both organic and inorganic forms. Most of the organic phosphorus in plant ingredients is bound to complex structures called phytate (Myo-inositol hexakisphosphate), the mixed salt of phytate. Though earlier studies showed a beneficial effect of adding exogenous phytases to swine and poultry, to date very limited studies have been presented on adding novel bacterial 6-phytase (Ronozyme HiPhos) expressed in *Aspergillus oryzae* to broilers. Therefore, we conduct this study to examine the effect of phytase on the overall performance of the broiler. Ross 308 (n=1512) chicks (48.05 ± 0.52 g) were allocated to four treatment groups with 21 replicates of 18 birds/pen. The test treatments included a basal diet (CON) and the CON diet enriched with 0, 500, 1000, and 1500 FTU/kg *A. oryzae* phytase. Experimental data were analyzed using the GLM procedure of SAS and the Linear, quadratic, and cubic test was used to determine the significance between treatment means (P<0.05). During starter (days 1-9), grower (9-21), and overall period (days 0-32) broilers fed a diet supplemented with 1500 FTU/kg of *A. oryzae* phytase demonstrated higher (P<0.05) body weight gain and feed intake compared to CON. However, there was no difference observed in nutrient digestibility, organ weight, footpad, and intestine lesion score. In conclusion, adding 1500 FTU/kg of *A. oryzae* phytase to a broiler diet would be beneficial to enhance their growth performance by releasing phytate-bound nutrients.

Session 20

Poster 15

Growth performance, nutrient digestibility and intramuscular fatty acid composition of chickens fed Camelina Cake

V. Juskiene¹, R. Juodka¹, R. Leikus¹, G. Kadziene¹, D. Stankeviciene¹, R. Nainiene¹, A. Urbšys¹, R. Juska¹

¹ Lithuanian University of Health Sciences, Animal Science Institute, R. Zebenkos 12, LT-82317 Baisogala, Lithuania

The objective of the study was to investigate the influence of different amounts of camelina cake in chicken feed on their growth performance, nutrient digestibility and meat fatty acid composition. The base part of the control group (C) diet consisted of corn and soybean meal, while in the diets of the experimental groups the soybean meal was replaced by 5% camelina cake in the CAM5 group and 10% in the CAM10 group. Study results showed that the growth performance indicators of CAM5, CAM10 groups chickens did not differ from the C group. Although the digestibility of dry matter (P ≤ 0.01), organic matter (P ≤ 0.01) and protein (P ≤ 0.05-P ≤ 0.01) was lower in the CAM5 and CAM10 groups, the inclusion of camelina cake positively impacted meat fatty acid composition. We found significantly higher levels of various beneficial fatty acids in CAM5 and CAM10 groups: the muscles of the chickens of experimental groups contained 2.49 – 3.80 (P ≤ 0.01) -linolenic, 1.7 – 2.67 eicosapentaenoic (P ≤ 0.01), 1.83 – 2.28 docosapentaenoic (P ≤ 0.01), 1.73 – 2.17 docosahexaenoic acids (P ≤ 0.05-P ≤ 0.01), 1.72 – 2.47 total LC n-3 PUFA (P ≤ 0.05-P ≤ 0.01) and 2.29 – 3.36 total n-3 PUFA (P ≤ 0.01) times more than in the muscles of the control group. Also, significantly better n-6/n-3 and linoleic /linolenic ratio, as well as thrombogenic index, were found in the both experimental groups (P ≤ 0.01). The optimal n-6/n-3 PUFA ratio was determined in CAM10 group and according to the European Commission Nutrition Claims, the meat of chickens grown in the CAM10 group can be classified as a source of Omega-3 fatty acids based on the ALA content.

Silvafeed® ATX efficacy in improving performance of broiler chickens

V. A. R. D. Castilho Heiss¹, C. M. Komiyama¹, R. G. Garcia¹, M. F. D. C. Burbarelli¹, B. B. Przybulinski¹, J. R. F. Vieira¹, J. B. Lancini²

¹ Federal University of Grande Dourados, Rodovia Dourados a Itahum, 79825-070 Dourados, Brazil, ² Silvafeed, Rua Serafim Enoss Bertoso, 89806-040 Chapecó, Brazil

This study aimed to determine the effect of dietary Silvafeed® ATX levels (SilvaTeam – Itália) on performance and carcass yield of broiler chickens. 1,280 day-old Ross AP91 male broilers were distributed in four treatments (40 chickens/pen; 8 pens/treatment): (Control) and three levels of the Silvafeed® ATX: 250, 500, 1,000 g/t. Corn/soybean treatments diets were fed a pre-starter 0-7d, starter 8-21d, grower 22-35d and finisher 36-42d. Feed intake (FI), body weight gain (BWG), feed conversion ratio (FCR) and production efficiency index (PEI) were measured on day 42. At 42 d two birds per pen were selected for slaughtering and to measure carcass yield and its parts. The statistical assumptions for normality were verified and data were submitted to analysis of variance and significant estimates were subjected to regression analysis. FI showed a decreasing linear curve, which decreased with increasing Silvafeed® ATX levels. BWG showed a maximum gain point at the level of 664 g/t. FCR equation showed a better point at the level of 763 g/t and the maximum point of efficiency production index was 514 g/t of Silvafeed® ATX. There was no significant difference for the diet addition of Silvafeed® ATX on carcass yield. Results indicated that addition of Silvafeed® ATX supplied in the diet from 1 to 42 days of age contributes to improve broiler's performance according production efficiency index.

Session 20

Poster 17

Influence of L-Glu and L-Gln supplementation in broilers subjected to an Eimeria challenge on performance
E. Kim¹, S. Lecuelle², A. Simongiovanni², E. Kiarie¹, W. Lambert²

¹ University of Guelph, Department of Animal Biosciences, 50 Stone Rd E, N1G 2W1 Guelph, Canada, ² Metex Animal Nutrition, 32 rue Guersant, 75017 Paris, France

Dietary glutamate (L-Glu) supplementation was shown to improve growth performance in broiler under sanitary challenge and glutamine (L-Gln) improved performance by maintaining an optimal antioxidant status and immune function. L-Glu and L-Gln being closely linked metabolically, a supplementation of both amino acids may have a synergistic effect and would modulate growth performance and resiliency of broiler under Eimeria infection. This trial aimed to study broiler chicken response to L-Gln and L-Glu supplementation during an Eimeria challenge. A total of 1800 male day-old Ross 708 chicks were allocated to six treatments (12 replicate pens per treatment): 1) negative control (NC), 2) positive control (PC): NC+anticoagulants, 3) NC + 5g/kg L-Gln (100Gln), 4) NC + 3.3g/kg L-Gln + 1.65g/kg L-Glu (66Gln+33Glu), 5) NC + 1.65g/kg L-Gln + 3.3g/kg L-Glu (33Gln+66Glu) and 6) NC + 5g/kg L-Glu (100Glu). At day 10, half of the pens were challenged with oral gavage of 1mL of an Eimeria culture while the others received equal volumes of 0.9% saline. Performance data (body weight gain (BWG), feed intake (FI) and feed conversion ratio (FCR)) were subjected to a one-way ANOVA with diet as fixed factor for the pre-challenge period and a two-way ANOVA with fixed effects of diet, challenge and their interaction using a mixed model with the pen as random effect. The interaction was removed from the model if not significant ($P>0.05$). During the pre-challenge period, birds receiving PC diet and all supplemented diets with Gln and Glu had improved BWG and FCR compared to birds fed with NC. During the challenged period, challenge had a strong and significant effect on performance with challenged birds having decreased BWG, FI and increased FCR compared to unchallenged birds. No interaction was found between dietary treatment and challenge. For the overall period (0-35d), the birds fed PC and 33Gln+66Glu had a significant better FCR compared to the birds receiving NC, the other Gln/Glu combinations being intermediate. In conclusion, results demonstrated that the combination 33Gln+66Glu performed as well as the PC and better than the NC, whatever the challenge.

Production results and carcass characteristics of Cherry Valley broiler ducks fed with halloysite

S. Wlazlak¹, M. Banaszak¹, J. Biesek¹

¹ Bydgoszcz University of Science and Technology, Department of Animal Breeding and Nutrition, Mazowiecka 28, 85-084 Bydgoszcz, Poland

The study aimed to assess the production results and carcass characteristics of broiler ducks fed with 1% halloysite added to the feed throughout the 42 days of rearing. Ducks (100 males and 100 females) were divided into 4 groups according to sex—control groups – CM and CF, and experimental groups – ZM and ZF. In the experimental groups, broiler ducks were fed with 1% halloysite. The birds' body weight (BW) and feed intake (FI) were controlled, and production efficiency indicators were calculated. Analyses of the chemical composition of feed were performed. On day 42, the birds were slaughtered. The carcasses with offal (heart, liver, gizzard) were plucked and gutted. After cooling the carcasses, dissection was performed. Each part of the carcass was weighed. The data were processed using Statistica statistical software. Mean values and standard error of the mean were calculated. Tukey's test with $P \leq 0.05$ verified the significance of differences. In groups where halloysite (HM, HF) was used, significantly lower birds' BW was observed throughout the entire rearing period ($P \leq 0.05$). Broiler ducks in the experimental groups were characterized by significantly higher FCR from the 1st to 28th day of rearing ($P = 0.003$). The highest liver weight was found in the HM group. Lower pectoral muscle weight was demonstrated in the HM group compared to CF and HF ($P = 0.009$). The use of 1% halloysite in feed had no beneficial effect on selected production results, possibly due to its ability to limit dietary protein availability. The research was carried out as part of project No. UMO-2021/43/D/NZ9/01756, financed by the National Science Center (Poland).

Session 20

Poster 19

Assessment of Natural Silicate-Based Minerals Effects on Compound Feed Pelletizing Processes

M. Hankare¹, A. Vigh¹, C. Careme¹

¹ Imerys Talc Europe, 2 Place Edouard Bouillère, 31100 Toulouse, France

The aim of this study was to assess the effects of the inclusion of several natural silicate-based minerals during poultry compound feed processing, and more specifically on pellet durability index (PDI, %) and specific energy consumption (kWh/t). The tested minerals included three grades of bentonite (Bent_A, Bent_B and Bent_C), two grades of diatomite (Diat_A and Diat_B), two grades of moler (Mol_A and Mol_B) and one grade of kaolin (Kao_A). A wheat based broiler feed (19.8 % CP, 40.0 % starch, 5.5 % fat, 12.2 MJ/kg ME) was pelletized without any mineral (CON) or with the incorporation of 1.0 % DM of the different minerals. The pelletization of the feed was carried out with a pilot scale press (Amandus Kahl, Germany) using a fixed flat die (4.0 mm diameter), with the conditioner temperature set at 60°C. The PDI was measured using the Eurotest device (Sabe, France), while the specific energy consumption was estimated based on the press power (kW) and pellet output (kg/h). The PDI was significantly ($P < 0.001$) affected by the inclusion of minerals, the highest PDI was registered with Diat_B when compared to CON (72.0, 72.8, 72.8, 74.6, 81.0, 75.1, 76.7, 75.9 and 72.5 % for Bent_A, Bent_B, Bent_C, Diat_A, Diat_B, Mol_A, Mol_B, Kao_A and CON, respectively). The specific energy consumption was also affected by the inclusion of the different minerals, with Diat_B showing the lowest consumption when compared to CON (13.7 and 15.2 kWh/t). Based on these results it can be concluded that the inclusion of natural silicate-based minerals in a high-fat content broiler feed during processing could improve pellet quality while having a positive effect on energy consumption during production. Nevertheless, further trials are recommended in order to assess the effect of mineral inclusion in upscaled industrial production.

Effect of dietary micelle quercetin on growth performance, egg production, and blood profile in Hy-line brown laying hens

S. Y. Jang^{1,2}, G. S. Ahammad^{1,2}, I. H. Kim^{1,2}

¹ Dankook University, Department of Animal Biotechnology, 119 Dandae-ro, Dongnam-gu, 31116 Cheonan-si, South Korea, ² Smart Animal-Bio Institute (SABI), 119 Dandae-ro, Dongnam-gu, 31116 Cheonan-si, South Korea

Quercetin (QR) is commonly known as oak essence and naturally occurring polyhydroxy flavonoid found in fruits and vegetables. It exhibits a positive impact on egg-laying performance. Previous studies pointed out that QR acts as a potential alternative to antibacterial drugs however the implementation of Micelle form of quercetin (MQ) in poultry diet is still limited. Therefore, this study aims to assess the impact of MQ on growth and egg production performance in Hy-Line brown layers. For 12 weeks, laying hens (n=288) were randomly assigned to one of three test treatments: basal diet (CON) and CON diet supplemented with 0%, 0.03%, and 0.06% MQ. Each treatment has 8 replicates of 12 hens. Growth performance, egg production, and blood profile data were analyzed using the GLM procedure of SAS, and the Linear and quadratic test was used to determine the significance between treatment means ($P < 0.05$). Laying hens fed a graded level of MQ considerably enhanced ($p < 0.05$) egg production, feed intake, and egg weight at the end of week 12. In addition, layers diet supplemented with MQ showed increased ($p < 0.05$) haugh unit (HU), eggshell strength, and eggshell thickness at weeks 8 and 12. Moreover, HQ supplementation reduces the Aspartate aminotransferase (AST), alanine aminotransferase (ALT), alkaline phosphatase (ALP), and cholesterol levels in layers. In conclusion, the current findings suggest that the addition of 0.06% of MQ supplementation in the laying hens' diet would be beneficial to enhance their egg production performance and certain aspects of blood profile parameters.

Session 20

Poster 21

Dietary incorporation of Zinc-Beta glucan improves immune status, gut microbial composition, egg quality, and mitigates gas emissions in laying hens' diets

S. Y. Jang^{1,2}, S. T. Wahid^{1,2}, S. Cho^{1,2}, D. K. Kang^{1,2}, I. H. Kim^{1,2}

¹ Dankook University, Department of Animal Biotechnology, 119 Dandae-ro, Dongnam-gu, 31116 Cheonan-si, South Korea, ² Smart Animal-Bio Institute (SABI), 119 Dandae-ro, Dongnam-gu, 31116 Cheonan-si, South Korea

Beta-glucan has a variety of biological activities, including immune role enhancement, anti-infection, and glucose regulation. Previous studies reported that β -glucan supplementation has boosted immune cell activation in broilers' gut. Besides, some reports showed that supplementation of zinc could alleviate the negative effects of egg quality in laying hens. However, information regarding the positive effects of adding Zinc-Beta glucan additive on laying hen's performance is still unknown. Therefore, this study aims to explore the effects of dietary administration of zinc-beta glucan (ZB) on productivity, nutrient digestibility, gas emissions, blood profile, and microbiome analysis in laying hens' diets. A total of 192 Hy-line brown laying hens (1918.5 ± 0.52 g) were assigned to 4 distinct treatments for 12 weeks: TRT1, basal diet (control); TRT2, basal diet + 0.25% antibiotic; TRT3, basal diet + 0.05% ZB; TRT4, basal diet + 0.1% ZB. The addition of ZB (0.1%) to the hen diets resulted in increased ($P < 0.05$) egg weight, eggshell strength, eggshell thickness, and lymphocyte levels in the blood. The addition of ZB improved ($P < 0.05$) alpha and beta diversity in laying hens. Furthermore, taxonomic distribution analysis showed highly abundant phyla Firmicutes and Bacteroidetes and reduced ($P < 0.05$) pathogenic bacteria in ZB group layers. The findings suggest that ZB may enhance the immune status and egg quality while reducing gas emissions in laying hens by altering the gut microbial composition.

The supplementation of a mixed- phytase and xylanase product on older laying hens for improved phosphorus retention and ileal phosphorus digestibility

H. Walker¹, K. Bauer², D. Cvejić², J. D. Keegan³, J. Taylor-Pickard¹, I. Nikodinoska³, C. A. Moran⁴

¹ Solutions Deployment Team, Alltech (UK) Ltd., Ryhall Road, PE9 1TZ Stamford, United Kingdom, ² Klifovet GmbH, Geyerspergerstr. 27, 80689 München, Germany, ³ Alltech's European Bioscience Centre, Sarney, Summerhill Road, A86 X006 Dunboyne, Ireland, ⁴ Alltech SARL, Rue Charles Amand, 14500 Vire, France

Laying hens require phosphorus (P) for various biological functions, often supplied in excess as inorganic forms in diets. This practice, though inefficient and contributing to water pollution, can be addressed by incorporating enzymes in poultry diets. Enzymes enhance the availability of phytate-bound P in plant-based poultry diets, reducing the need for inorganic P. This study examined the effect of phytase and xylanase on P digestibility in laying hens. Novogen Brown Classic layers (n=314) were fed a control diet (T1) or a diet with an added with both phytase and xylanase (T2). Diets were provided for 12 days after which the excreta from each pen were collected for an additional three days to determine total retention and ileal digestibility of P and gross energy. Productivity parameters were also recorded over the course of the study. The amount of P detected in the excreta of the control group was higher ($P<0.05$) than the amount detected in the enzyme supplemented group. Both P retention and P ileal digestibility were higher ($P<0.001$) in the enzyme supplemented birds. Gross energy digestibility was higher ($P<0.001$) in the enzyme supplemented birds for both the total tract and ileal samples. There were only numerical improvements, not significant, in the layer productivity parameters. This study showed that the enzyme supplement can improve total retention and ileal digestibility of P and gross energy in older layers.

The effect of different calcium sources on eggshell mineral content and breaking strength in laying hens

O. Demehin¹, M. Bouwuis¹, K. Kozłowski², S. O'connell^{1,3}

¹ Celtic sea minerals, Strand Farm, Carrigaline, P43 NN62 Cork, Ireland, ² Department of Poultry Science and Apiculture, Faculty of Animal Bioengineering, University of Warmia, 10-718 Olsztyn, Poland, ³ Shannon applied biotechnology centre, Munster technology university, Clash road, V92 CX88 Tralee, Ireland

According to a 2014 study, 10-15% of eggs are lost due to eggshell quality before or during egg collection. An insufficient mineralisation (e.g. calcium) during the period of eggshell formation is speculated to be associated with poor eggshell quality. In this study, the effect of different blends of marine mineral complex (MMC) and limestone fed to laying hens were compared for mineral content and breaking strength of eggshell. A total of 448 hens (Species; Hy-line brown, 40 weeks old) were divided in a completely randomised design into 6 treatment groups with 74/76 hens per treatment. Six treatments were formulated with basic laying hens feed containing feed grade limestone (control; T1), or Coarse MMC (low dose; T2), Coarse MMC (high dose; T3), commercial MMC (T4), fine MMC (low dose; T5) and fine MMC (High dose; T6). The treatments had a significant effect ($p<0.05$) on breaking strength at week 4, 12, and 16. Breaking strength of eggshells from T4 group was 43N, 41N, 40N and 37N, while T1 was 41N, 37N, 37N and 36N at week 4, 12, 16 and 20 respectively. The treatments showed no significant effect on calcium and magnesium, but significantly ($p<0.05$) increased phosphorus (P) and Strontium (Sr) content of the eggshells. T2, T3, T4, T5 and T6 improved Sr content of the eggshells by 10%, 15%, 22%, 15%, and 20%, respectively and P content by 7%, 4%, 6%, 10% and 10%, respectively. Overall, the data demonstrates that the inclusion of MMC in laying hen diets improved breaking strength and mineralisation of eggshells.

Dietary Arginine Supplementation as a Mitigative Strategy Against Mycotoxin-Induced Adverse Effects in Laying Hens

S. Y. Yoon¹, H. Tajudeen¹, P. Neves-Silvestre¹, J. Y. Mun¹, S. H. Ha¹, J. S. Kim¹

¹ Kangwon National University, Department of Animal Industry Convergence, 1, Kangwondaehak-gil, 24341 Chuncheon, South Korea

This study investigates the impact of dietary arginine (Arg) supplementation on counteracting the adverse effects induced by mycotoxins in laying hens. The research involved 240 laying hens, each with an initial average body weight of 1.66 ± 0.06 kg. These hens were divided into four groups, with six replicates per group and ten hens per replicate over a period of four weeks. The dietary treatments consisted of a non-toxin control diet containing 1.1% Arg (NT1.1) and mycotoxin-exposed diets supplemented with varying Arg levels: 1.1% (TX1.1), 1.2% (TX1.2), and 1.3% (TX1.3). The findings revealed no significant differences in egg production parameters such as egg weight, egg mass, and feed intake among the groups. However, a trend towards increased egg mass was observed in the NT1.1 group compared to the TX1.1 group. Similarly, there were no differences in shell color, thickness, hardness, albumin height, or Haugh unit, although yolk color tended to be higher in the NT1.1 group. Organ weight analyses showed no differences for the heart, spleen, and kidney, but a tendency for reduced liver weight was noted in the NT1.1 group. Additionally, no significant changes were observed in villus height or crypt depth in the jejunum and ileum, though the NT1.1 group showed a tendency for increased duodenal villus height. Toxin exposure led to up-regulation of interleukin-6 (IL-6) and tumor necrosis factor-alpha (TNF- α) in liver tissue. Similarly, interferon-gamma (INF- γ) and toll-like receptor-4 (TLR-4) gene expressions were elevated in the liver of the TX1.1 group. Muscle tissue analysis indicated increased IL-4 expression in toxin-exposed groups, with IL-6 and INF- γ also showing heightened levels in the TX1.1 and TX1.3 groups and the TX1.1 and TX1.2 groups, respectively. TLR-4 expression was specifically up-regulated in the TX1.2 group muscle tissue. The TNF- α expression significantly increased in the jejunum of the TX1.1 group compared to both the NT1.1 and TX1.2 groups. In conclusion, dietary supplementation with Arg appeared to mitigate liver damage and enhance the immune response in laying hens exposed to mycotoxins.

Session 20

Poster 25

Evaluation of the Efficacy of a Yeast Mannan Product on the Performance of Laying Hens

J. Taylor-Pickard¹, D. Currie², J. Keegan³, C. Moran⁴

¹ Alltech European Bioscience Centre, Solutions Deployment Team, Sarney, Summerhill Road, A86 X006 Dunboyne, Ireland, ² Roslin Nutrition Ltd., Gosford Estate, EH32 0PX Aberlady, United Kingdom, ³ Alltech European Bioscience Centre, Regulatory Department, Sarney, Summerhill Road, A86 X006 Dunboyne, Ireland, ⁴ Alltech SARL, Regulatory Department, Rue Charles Amand, 14500 Vire, France

Animal feed additives containing the mannan-rich fraction (MRF) extracted from the cell wall of *Saccharomyces cerevisiae* have been shown to improve productivity in various production animals. Productivity gains have been attributed to the ability of MRF to bind pathogenic microorganisms. As a result, including MRF in a layer diet can increase the microbiome diversity, helping maintain gastrointestinal integrity and improving nutrient utilisation. A feeding trial was designed to understand further the effects of MRF supplementation on layer hen productivity. A total of 256 28-week-old laying hens were allocated to one of 64 cages, and each treatment was replicated 32 times. Each cage contained four birds. The birds were fed either a diet with MRF (T1) or a negative control diet (T2). For birds fed the T1 diet, the MRF was fed at 800 g/tonne from 28 to 34 weeks of age and 400 g/tonne after 34 weeks of age. Observations included body weight, feed intake, egg production and quality and feed conversion efficiency (FCE). General health and mortality were also monitored daily. During weeks 0 to 4, 4 to 8 and 0 to 24, total egg weight (g/cage), egg numbers, egg mass, egg production and FCE were significantly greater in birds fed the T1 diet than in the T2 control diet. There were no significant differences between T1 and T2 diets in the bird live weight at the end of the experimental period. No changes in the bird's live weight between the start and end of the trial were observed. There were no significant differences between T1 and T2 diets in the percentage of cracked, soft-shell or dirty eggs. At day 168 of the study (end of the study), shell thickness was significantly greater in the T1 diets relative to the T2 control diet, and yolk colour was greater in the T2 control diet relative to the T1 diet. These results indicate that including MRF in standard commercial diets can improve a variety of layer hen productivity parameters.

Overview of heat stress management in fattening pigs: impact, influencing factors, and control strategies

L. De Prekel^{1,2}, D. Maes¹, A. Van Den Broeke², M. Aluwé²

¹ University Ghent, Unit of Porcine Health Management, Salisburylaan 133, 9820 Merelbeke, Belgium, ² Flanders Research Institute for Agriculture, Fisheries and Food (ILVO), Scheldeweg 68, 9090 Melle, Belgium

Heat stress in livestock production has gained significant importance in the last decade in Europe, mainly due to more frequent extreme weather conditions such as heatwaves resulting from climate change. These environmental conditions impact the welfare, health, and performance of livestock. Pigs are particularly sensitive to higher ambient temperatures due to their poor ability to sweat and pant. With only a few functional sweat glands and a subcutaneous adipose tissue layer hindering heat dissipation, pigs primarily rely on respiratory heat loss for thermoregulation. During the talk, an overview will be given of the various factors that influence the thermoregulation in pigs such as body weight, physiological status, genetics, climate, and environmental conditions. Next, we review the effects of heat stress on behavior, physiology, and performance of fattening pigs. Finally, we present the results of heat stress-reducing measures in pigs based on studies conducted during the last 3.5 years, including feeding strategies, management measures (e.g. stocking density and boar-line) and climate adaptations (e.g. increasing air movement and high-pressure fogging). These studies were conducted in the framework of the Vlaio LA project Coolpigs titled 'Heat plan for the Flemish pig industry' (project number HBC.2019.2877).

Antioxidant-enriched or energy-dense diet in heat stressed fattening pigs

L. De Prekel^{1,2}, D. Maes¹, A. Van Den Broeke², M. Aluwé²

¹ University Ghent, Unit of Porcine Health Management, Salisburylaan 133, 9820 Merelbeke, Belgium, ² Flanders Research Institute for Agriculture, Fisheries and Food (ILVO), Scheldeweg 68, 9090 Melle, Belgium

Antioxidants are considered potential mitigators of heat stress-induced damage. Additionally, modifying feed composition, specifically lowering crude protein (CP), aims to reduce internal metabolic heat production. This study investigated the impact of an antioxidant-enriched or energy-dense (E-dense) diet on heat-stressed fattening pigs. 192 mixed-sex fattening pigs were randomly assigned to a control, an enriched, or an E-dense diet. Dietary treatments were administered (ad libitum) when pigs reached ± 80 kg. The control diet comprised 15% CP, 3.6% crude fat, 0.4 mg/kg inorganic selenium (Se), and 100 ppm vit E; the enriched diet contained the same chemical composition but was supplemented with 0.2 mg/kg inorganic Se, 0.2 mg/kg selenomethionine, 200 ppm vit E, 200 ppm vit C and 0.1% betaine; the E-dense diet featured 13.6% CP, 6.6% crude fat, and increased energy and lys content. A one-week heat wave was induced when pigs were 20 and 22 weeks old. Antioxidant-enrichment of the diet resulted in a tendency to increased daily gain over the 6-week trial compared to the control group (891 vs. 925 g/day, $P = 0.090$). Over the entire trial, the E-dense group had a higher feed conversion ratio than the control group (2.95 vs. 2.67, $P = 0.006$). Carcass traits revealed increased fat thickness of 0.9 mm in the E-dense group ($P = 0.035$), along with lower lean meat content of 1.1% ($P = 0.002$). The meat of the enriched group displayed elevated vitamin E and Se levels ($P < 0.001$). Overall, the nutritional strategies did not significantly prevent physiological heat stress parameters, but supplementation of antioxidants could slightly ameliorate daily gain over the entire trial.

A dietary phytogetic solution mitigates heat stress indicators in pigs

A. Morales¹, P. Sakkas³, M. Soto¹, N. Arce¹, N. Quilichini², M. Cervantes¹

¹ ICA, Universidad Autónoma de Baja California, 21100 Mexicali, Mexico, ² DELTAVIT, Z.A. du Bois de Teilay, 35150 Janzé, France, ³ Faculty of Veterinary Medicine, Aristotle University, 54124 Thessaloniki, Greece

This study aims to corroborate if enhancements in performance and reductions in body temperature in heat-stressed (HS) pigs, supplemented with a 0.2% Capsicum spp.-based phytogetic solution (PHY) (Morales et al., 2023), are associated with changes in thermal tolerance markers. Forty-two pigs were assigned to three treatments: thermoneutral pigs on a control diet (TN-C), and pigs subjected to HS fed either PHY-supplemented (HS-PHY) or control diets (HS-C). After a 8-day experimental period, serum antioxidant enzyme activity, intestinal histomorphology, gene expression of HSP90 in the liver and muscle, and myosin in muscle were assessed. Superoxide dismutase activity was lower in HS-C pigs vs. TN-C and HS-PHY pigs ($P < 0.05$), being similar between TN-C and HS-PHY groups. Catalase activity was similar in TN-C and HS-C pigs, but higher in HS-PHY pigs compared to HS-C pigs ($P < 0.05$). HS-C pigs had shorter jejunum villi and deeper crypts than both HS-PHY and TN-C ($P < 0.01$). Expression of HSP90 in the liver was tentatively higher in both HS-C and HS-PHY pigs compared to TN-C pigs ($P > 0.10$). In muscle, HSP90 expression was significantly higher in HS-C pigs than in both TN-C and HS-PHY pigs ($P < 0.05$), but similar between TN-C and HS-PHY pigs ($P > 0.10$). Muscle myosin expression was lower in HS-C compared to TN-C ($P < 0.05$), with no difference between HS-PHY and TN-C pigs ($P > 0.10$). In conclusion, dietary PHY supplementation enhanced anti-oxidant enzyme activity, reduced HSP90 expression in Longissimus dorsi muscle, and elevated jejunal villus height compared to HS-C pigs, reaching levels akin to TN-C pigs, explaining the restored growth previously observed in HS-PHY pigs.

Session 21

Theatre 4

Maternal supplementation with betaine or amino acids during lactation improves the viability of Iberian piglets under heat stress

R. García-Contreras¹, I. Fernández-Figares¹, M. Lachica¹, F. Sánchez-Esquiliche², L. Ramírez², F. Gómez-Carballar², R. Nieto¹

¹ Estación Experimental del Zaidín (CSIC), Nutrition and Sustainable Animal Production, C/ San Miguel, 101, 18100 Armilla (Granada), Spain, ² Sánchez Romero Carvajal Jabugo, Jabugo, 21290 Jabugo (Huelva), Spain

Lactating sows are highly vulnerable to heat stress due to the elevated metabolic heat generated during milk production. This can result in decreased feed intake, lower milk yield, impaired reproductive performance and a slowed piglet growth rate. The effects of supplementing lactating Iberian sows from day 70th of pregnancy onwards with betaine (BET; $n=16$) or amino acids (AA; $n=15$; arginine and valine) as nutritional strategies to mitigate heat stress was evaluated against a non-supplemented group (C; $n=16$). Average maximum and minimum temperatures were 32.3 and 23.4 °C, respectively. At birth and weaning, body weight (BBW and WBW, respectively), abdominal (AC) and thoracic circumference (TC) and total length (L) of each piglet were recorded. The BBW was higher in C piglets compared to AA and BET groups ($p < 0.001$). Moreover, piglets from the C group were longer and had larger AC than piglets from treated sows ($p < 0.05$). However, despite starting from litters with lower BBW than in the C group, no WBW differences were observed between groups at weaning, and AA piglets showed higher AC and TC than C piglets ($p < 0.05$). When using BBW as covariate, piglets body gain during lactation tended to be higher in AA and BET pigs compared to C pigs ($p = 0.070$). No significant differences on sow body weight changes during lactation were detected between groups. These results could indicate beneficial effects of supplementing lactating sows with amino acids or betaine. Further studies are required to confirm these results. Funded by Spanish Ministry of Science and Innovation (PID2021-125059OB-I00).

Heat stress effects on the gut microbiome profile of Iberian purebred and Duroc x Iberian crossbred weaned piglets

A. Heras-Molina¹, J. M. García-Casco^{1,2,3}, E. Gomez-Izquierdo⁴, J. Gómez-Fernández⁴, H. Laviano¹, F. García², C. Óvilo², M. Muñoz²

¹ UCM, Avda Puerta de Hierro s/n, 28040 Madrid, Spain, ² INIA-CSIC, Carretera de la Coruña km 7.5, 28040 Madrid, Spain, ³ Centro de I+D en cerdo Ibérico INIA-CSIC, Carretera EX101 km 4,7., 06300 Zafra, Spain, ⁴ Centro de Pruebas de Porcino-ITACYL, Ctra. Riaza-Toro, sn, 40353 Hontalbilla, Spain

Heat stress (HS) can adversely affect swine gut health by altering the microbiota profile, influencing the host's stress response, which can be different according to distinct genetic backgrounds. We investigated the impact of HS on the gut microbiome of weaned piglets from two distinct genotypes: Iberian purebred (IB) and Duroc x Iberian crossbred (DUIB). Forty pigs (20 per genotype) were individually housed in 20 pens and exposed to thermoneutral conditions (22°C) for one week, followed by a week under HS conditions (30°C), in two consecutive batches. Fecal samples were collected before HS (T0), two days after (T2), and seven days after HS (T7). Sequencing of the 16S rRNA gene and subsequent bioinformatic analyses showed significant differences in alpha and beta diversity across different time points and genotypes. Differential abundance analyses revealed one genus differentially abundant between T0 vs T2, 14 genera between T0 vs T7 and 17 genera between genetic backgrounds. Particularly, DUIB pigs exhibited a higher abundance of *Clostridium_sensu_stricto_1* compared to IB, only under HS, indicating a distinct HS response. The findings suggest a potential higher resilience to HS of the gut microbiome in IB compared to DUIB pigs. This work has received funding from the European Union's Horizon Europe research and innovation programme under the grant agreement No 01059609 (Re-Livestock project).

Maternal resveratrol improves sow's performance and the intestinal health and weight gain of suckling piglets under high summer temperature

H. Xiao¹, X. Yang¹, L. Wang¹, Z. Jiang¹

¹ Institute of Animal Science, Guangdong Academy of Agricultural Sciences, 1 Dafeng 1st street, 510640 Guangzhou, China

High summer temperatures affect the reproductive performance of sows. The present study aimed to investigate the effects of dietary resveratrol supplementation under high summer temperature on the reproductive performance of sows. Sows were fed either a control diet or a diet with 300mg/kg resveratrol during gestation and lactation. The results showed resveratrol supplementation increased litter weight. Resveratrol supplementation increased the abundance of IgA, IgG, and IgM in colostrum and intestinal sIgA levels of suckling piglets. Furthermore, we found that maternal resveratrol improved suckling piglets' intestinal morphology and affected the properties of exosomes-derived miRNAs in sow colostrum, as well as the genes targeted by differentially produced miRNAs. miRNAs are concentrated in the tight junction pathway, and the expression of intestinal tight junction proteins in suckling piglets increased. Our correlation analysis demonstrated the positive associations among significantly differential intestinal microbiota, intestinal sIgA production and SCFA concentrations, as well as the positive relation between the total daily weight gain and intestinal health of suckling piglets. Taken together, our findings indicated that maternal resveratrol supplementation could enhance the growth performance and intestinal health of piglets in a high temperature environment, which might be associated with the immunoglobulin and exosomes-derived miRNA in colostrum of sows.

Thermal adaptation in chicks: epigenetic regulation of resilience and vulnerability

N. Meiri¹, P. Malini¹, T. Kisliouk¹

¹ ARO, The Volcani Center, Institute of Animal Science, 68 Ha Maccabim Road, 7505101 Rishon LeZion, Israel

Stressful events during the embryonic or early life periods in chicks might lead to stress resilience or vulnerability throughout life and might be transmitted to the next generation. Here we demonstrate that heat stress during the critical developmental period of thermal-control establishment affects both body temperature and the expression of CRH in the hypothalamic paraventricular nucleus, later in life. CRH and body temperature increased during the heat challenge in chicks trained to be vulnerable to heat, whereas they decreased in chicks that were trained to be resilient. Accordingly, DNA CpG methylation (5mC) and hydroxymethylation (5hmC) at the CRH intron, which we found to serve as a repressor element, displayed low 5mC% alongside high 5hmC% in resilient chicks, and vice versa in vulnerable ones. In a second effort, we addressed the question of whether behavioral traits are heritable. A major obstacle in demonstrating transgenerational inheritance in mammals originates from the maternal environment's effect on offspring phenotype. To overcome this challenge, we used ovo embryonic heat conditioning of first-generation chicks and assessed the effect on their untreated offspring. We demonstrate heredity of both heat and immunological resilience, confirmed by a reduced fibril response in untreated offspring to either heat or LPS challenge. Furthermore, we demonstrate an association between epigenetic mechanisms and trait heritability, by genome-wide DNA-methylation analysis in the anterior preoptic hypothalamus of untreated offspring. Finally, we demonstrate a possible role for chromatin architecture in epigenetic heritability. Conclusively, we suggest a multilevel epigenetic regulation for stress responses and trait heredity.

Trend analyses revealed increasing heat stress situations in German regions with intensive turkey production

N. Volkmann¹, B. Sake¹, N. Kemper¹, J. Schulz¹

¹ University of Veterinary Medicine Hannover, Foundation, Institute for Animal Hygiene, Animal Welfare and Farm Animal Behaviour, Bischofsholer Damm 15, 30173 Hannover, Germany

Climate change can affect performance and health of livestock through the development of heat stress (HS). This study analysed trends of HS in German regions of dense turkey populations using enthalpy (h) values calculated from weather data of the past 50 years. Data from 15 weather stations provided by the German Weather Service were collected in the summer period and analysed retrospectively. Data contained the daily h maximum which was categorised to a HS class for poultry (HS0: <50 kJ/kg = no HS, HS1: 50-<58 kJ/kg = mild HS, HS2: 58-<67 kJ/kg = moderate HS, HS3: ≥67 kJ/kg = severe and extreme HS). For each region, the maximum daily h values achieved were assigned to the HS classes and their frequencies were determined. Trend lines for HS were created and their gradients specified. Finally, significant increases in the HS trend line gradients over 50 years were analysed (Mann-Kendall test). At all locations, h values between 11.8 and 83.6 kJ/kg were recorded. Classification into HS levels over all locations and years revealed the following frequencies: 78.7% of h values were assigned to HS0, 15.5% to HS1, 5.2% to HS2 and 0.6% to HS3. The gradient of all trend lines (over all regions and years) for all HS classes ≥ HS1 was positive and all gradients of the respective trend lines in the HS classes were significant. The presented study showed that the trend towards periods without HS (HS0) led to fewer days from year to year. However, in the HS classes ≥ HS1 with at least moderate HS, a significant increase of days with HS inducing h values was predicted. Thus, it can be expected that turkey production will face greater challenges in coping with HS in future.

The potential of in ovo-fed amino acids to alleviate the detrimental effects of heat stress on broiler chickens
M. Yehia¹, V. Ouellet¹, N. Alnahhas¹

¹ *Université Laval, Animal Science, 2425 rue de l'Agriculture, G1V 0A6 Quebec, Canada*

This study aimed to investigate the effect of in ovo-fed L-Leucine, L-Methionine, L-Cysteine, and their combinations on the performance, body temperature, and oxidative stress parameters of finishing broilers kept under heat stress (HS) or thermoneutral (TN) conditions. Treatments included a control (52 µL of sterile diluent/egg), T1 (1 mg of L-leucine/egg), T2 (3 mg of L-Methionine + 2 mg of L-Cysteine/egg), and T3 (0.4 mg of L-leucine + 1.6 mg of L-Methionine + 1.6 mg of L-Cysteine/egg). Treatments were in ovo fed through injection into the amniotic sac on embryonic day 18 (52 µL/egg). T3 increased ($P < 0.05$) body weight (BW) and decreased ($P < 0.05$) feed conversion ratio during the starter phase. Interestingly, males, but not females, from the in ovo-fed groups exhibited higher BW ($P < 0.05$) during the grower phase compared to the control group. During the HS phase, T2 and T3 decreased ($P < 0.05$) birds' facial temperature. Moreover, they were also the least affected by HS regarding feed intake and mortality. However, the BW of heat-stressed birds was not influenced by the treatments. In addition, in ovo-fed AA reduced ($P < 0.05$) lipid peroxidation products in both plasma and liver samples under both TN and HS conditions compared to the control group. In conclusion, in ovo-fed amino acids have the potential to improve thermotolerance, reduce oxidative damage, and alleviate the impact of heat stress on the performance of finishing broiler chickens.

Impacts of betaine and feed restriction on blood parameters in heat-stressed laying hens

R. De Baets¹, K. Buysse¹, G. Antonissen², E. Delezie¹

¹ *ILVO, Animal Sciences Unit, Scheldeweg 68, 9090 Melle, Belgium*, ² *Ghent University, Department of Pathology, Pharmacology and Zoological Medicine, Salisburylaan 133, 9820 Merelbeke, Belgium*

Poultry are highly sensitive to heat stress (HS) due to their insulating feathers and lack of sweat glands. HS could negatively affect the performance, egg quality, and health of laying hens. We studied betaine supplementation (BET) and/or applying feed restriction (FR) to mitigate the effects on blood parameters. We distributed 448 brown and 448 white hens over 4 treatments in 128 cages ($n=16$), during 6 weeks. All hens were reared under thermoneutral (TN) conditions for 21 days, followed by cyclic HS conditions ($32^{\circ}\text{C}\pm 2^{\circ}\text{C}$; RH 45–55%; 6h daily). The first week was considered acute heat stress (AHS) followed by chronic heat stress (CHS). Treatments (T1-4) were only provided during HS and were applied as a 2×2 factorial design with FR and BET. FR was applied for 4h in T1 and BET was supplemented in the drinking water in T2 (0.55 g/L). T3 received a combination of FR and BET and the control T4 was given normal drinking water and a standard diet. Blood was collected from 1 hen/replicate on days 11 (TN), 25 (AHS) and 39 (CHS). $p\text{CO}_2$ was significantly decreased during AHS and CHS in both laying hen breeds. Additionally, base excess and HCO_3^- were reduced and remained low until the end of HS. Interestingly, pH and $i\text{Ca}$ were not affected during AHS and CHS. Glucose initially increased during AHS but normalized during CHS. Na did not change and K only decreased in brown hens; hematocrit only decreased in white hens. Hyperventilation resulted in decreased $p\text{CO}_2$ with compensatory decreased HCO_3^- . pH and $i\text{Ca}$ were not affected and would emphasize the buffering mechanisms preventing alkalosis. Our results indicate that HS was experienced, however, metabolic responses were mild and not affected by BET or FR.

Impact of on-farm temperature on feed intake in Duroc pigs

T. Okamura¹, M. Tomiyama², M. Kimata², K. Ishii¹

¹ Institute of Livestock and Grassland Science, NARO, 2 Ikenodai, 3050901 Tsukuba, Japan, ² CIMCO Corporation, 2-35-13, Kameido, 1360071 Koto-ku, Japan

Although it is necessary to take heat stress caused by the feeding environment into account when genetic analyzing feed intake of pigs, there are few reports showing the relationship between feed intake and on-farm heat environment in field data. The aim of this study was to reveal the relationship between the daily maximum temperature in pig barn and daily feed intake in test period. The data was consisted of 17,757 records from 259 male Duroc pigs. The maximum daily temperature in the pig barns was calculated from the data installed in the pig barns. The daily maximum temperatures ranged from 21°C to 38°C. Using the daily maximum temperatures from the day of feed intake measurement up to 9 days before that, the plateau-linear regression model including first and second order age of pigs as covariate was used to estimate the fitness of the model by comparing the fit of the data for each day. In addition, the parameters of the best plateau-linear regression model were estimated. The results showed that the maximum daily temperature in the pig barn on the day of the feed intake measurement was better fitted by the plateau-linear model than the other days. The regression model indicated that daily feed intake decreased at temperatures above 24.9°C, decreasing by 49 g for every 1°C. These results indicate that the on-farm heat environment of pigs is an important factor when genetic analyzing feed intake, and that using the maximum daily temperature in the pig barn on the day of measurement in the plateau-linear model makes it possible to take these factors into account in the analysis.

Session 21

Poster 12

Effects of mineral interactions on oxidative stress in lactating sows subjected to heat stress

J. Y. Mun¹, A. Hosseindoust¹, S. H. Ha¹, S. A. Park¹, S. Y. Yoon¹, J. S. Kim¹

¹ Kangwon National University, Department of Animal Industry Convergence, 1, Kangwondaehak-gil, 24341 Chuncheon, South Korea

This study investigated the effects of dietary minerals at different levels on reproductive performance, stress level, inflammatory response, antioxidant status, milk composition, and intestinal microbiota of lactating sows during high ambient temperature. The sows were divided into eight treatments according to a 2×4 factorial arrangement including two levels of Zn and Cu (ZC100, 100 mg/kg of Zn, and 20 mg/kg Cu; ZC150, 150 mg/kg of Zn and 25 mg/kg Cu) and four levels of Fe, Mn, and Se (FMS; NRC recommendation; FMS150, 150% of NRC recommendation; FMS200, 200% of NRC recommendation; and FMS300, 300% of NRC recommendation). A lower loss of both BW and backfat during lactation was observed in the FMS300 and FMS200 compared with NRC and FMS150. An increase in piglet survivability was observed in the FMS200 group compared to the FMS150 and NRC groups. Total superoxide dismutase (SOD) and Mn-SOD were increased in the FMS200 and FMS300 compared with the FMS. An increase in Se, Mn, and Fe levels in the milk was observed in the FMS200 and FMS300 compared with the FMS. The serum composition showed higher Se, Mn, and Fe levels in the FMS200 and FMS300 compared with the FMS. Conversely, a decrease in serum Zn levels was observed in the FMS200 and FMS300 compared with the FMS, while the Cu levels remained unaffected. The abundance of Proteobacteria phylum was significantly higher in the NRC group than in the FMS300 group. A higher abundance of Clostridium_sensu_stricto_1 genus was found in the NRC treatment compared to FMS300. In conclusion, increased Fe, Mn, and Se in sow diets improved weight loss and raised antioxidant levels. Yet, caution is warranted due to potential adverse effects on serum and milk Zn, which could impact litter growth.

Effect of heat stress on genetic evaluations for maternal traits in Iberian pigs

J. M. García Casco¹, P. Palma Granados¹, L. Ramírez Hidalgo², F. Sánchez Esquilche², M. Muñoz Muñoz¹

¹ INIA-CSIC, Iberian Pig R&D Center - Animal Breeding, Ctra Ex101, km 4.7, 06300 Zafra, Spain, ² Sánchez Romero Carvajal, Ctra San Juan del Puerto s/n, 21290 Jabujp, Spain

The effect of heat stress on the reproductive performance of the Iberian sow can affect traits such as the farrowing rate or the weaning-mating interval. Since 2011, a selection program for Iberian pigs has been running, aiming to produce dry-cured products of supreme quality, which includes a maternal genetic index based on the number of piglets born alive (NBA) and litter weight at 21 days of age (LW21). The objective of this work has been to verify whether the high temperatures affect NBA and LW21. The Temperature-Humidity index (THI) has been calculated in 18,312 litters born from 2011 to 2024, at the mating day, days 23, 46, 69 and 92 after mating, farrowing day, and days 10 and 21 of lactation. THI was calculated using the average (THI_a) and the maximum (THI_m) daily temperature and humidity. Data were analyzed with models that included the type of the boar (Duroc or Iberian), the parity order (1 to 6) and the THI value, grouped into 18 (<9 to >24) or 25 (<11 to >33) levels for THI_a and THI_m, respectively. The results showed that for NBA there was no specific pattern for high THI values, in any of the days analyzed. However, for LW21 there was a decrease in performance at elevated temperatures, whether with THI_a or THI_m, with the best fitting model being THI_a at farrowing day. The grouping of the data into a fixed effect with two levels (THI_a<21 and THI_a>20), and its inclusion in the BLUP-animal genetic evaluation model, resulted in an estimate of -0.986 kg for THI_a>20. In conclusion, for future genetic evaluation a climate adjustment is not necessary for NBA, but it is for LW21, applying specific models for each trait.

Heat stress effects on the growth and metabolism profile of Iberian purebred and Duroc x Iberian crossbred weaned piglets

A. Heras-Molina¹, J. García-Casco^{2,3}, E. Gómez-Izquierdo⁴, J. Gómez-Fernández⁴, H. Laviano¹, C. López-Bote¹, S. Astiz², C. Óvilo², M. Muñoz²

¹ UCM, Avda Puerta de Hierro s/n, 28040 Madrid, Spain, ² INIA-CSIC, Ctra. Coruña km 7.5, 28040 Madrid, Spain, ³ INIA-CSIC, Ctra EX101 km4,7, 06300 Zafra, Spain, ⁴ ITACYL, Ctra. Riaza-Toro, sn., 40353 Hontalbil-la, Spain

Heat stress (HS) is a major concern in pig industry. Rustic breeds like the Iberian pig are more resilient to HS than commercial breeds. We investigated the impact of HS on the metabolic profile and enzyme concentration in Iberian purebred (IB) and Duroc x Iberian crossbred (DUIB). Forty pigs (20 per each genotype) were individually housed in 20 pens and exposed to thermoneutral conditions (22°C; TN) for one week, followed by a week under HS (30°C), in two consecutive batches. Weight was measured at the beginning and ending of the TN period and at the end of HS period to calculate average daily weight gain (ADWG), fractional growth rate (FGR) and feed conversion ratio (FCR). Blood samples were collected before HS (T0) and two days (T2), and seven days (T7) after the start of HS in the morning and the afternoon. FGR was higher during HS than TN, but increased more in IB than DUIB pigs. Glucose metabolism decreased in T2, while lipidic metabolism in IB pigs and protein metabolism in DUIB pigs were increased in T7. Enzymes related to tissue damaging increased more with HS in IB than DUIB pigs possibly related to the higher oxidative stress status previously studied in the IB pig. Thus, HS stress affected both IB and DUIB animals' metabolism and stress but differently between breeds. This work has received funding from the European Union's Horizon Europe research and innovation program under the grant agreement N°01059609 (Re-Livestock project).

Heat tolerance in Polish local pigs: preliminary results of metabolomics analysis of blood

E. Sell-Kubiak¹, M. Pszczola¹

¹ *Poznan University of Life Sciences, Department of Genetics and Animal Breeding, Wołyńska 33, 60-637 Poznań, Poland*

The heat tolerance becomes an urgent issue in livestock farming. It is assumed that the local breeds have a higher resilience to the rapid changes in the temperature, especially the heat waves. Here we evaluate the blood parameters (standard and metabolomic) in Polish local pig breed. In total 23 sows and boars were used: 11 females from Złotnicka White breed with body weight ~140kg, 6 females from Złotnicka White x Złotnicka Spotted cross (body weight ~150kg), and 6 males came from Złotnicka White x Złotnicka Spotted cross (body weight ~150kg). The pigs were kept on a small farm in Poland (52°36'50"N 17°20'30"E) and fed standard commercial diet for fatteners with unlimited access to water. The barn did not have controlled environment. The blood was collected by the veterinarian on the evening of 19th June and morning of 20th June 2023. Frozen plasma was sent to Metabolom USA for metabolomic analysis (data to be obtained). The statistical analysis of the blood parameters was done in R statistical package. The significant differences between morning and evening samples were observed only for free fatty acids and eosinophils levels. Between breeds the differences were significant for alanine aminotransferase, aspartate aminotransferase, magnesium, percentage of lymphocytes, erythrocytes, hematocrit, hemoglobin, hemoglobin concentration. In case of sexes the differences were between aspartate aminotransferase, alkaline phosphatase erythrocytes, hematocrit, hemoglobin, hemoglobin concentration. Further investigation is needed to evaluate those results and correlate them with metabolomics. This project was financed by the European Union grant no. 101059609.

Breed Differences in Semen Quality Characteristics in Commercial Boars

N. Lewis¹, J. A. Calderon Diaz², C. R. G. Lewis², P. Ellis¹

¹ *University of Kent, Biosciences, Giles Ln, CT2 7ND Canterbury, United Kingdom,* ² *PIC Europe, PIC, Carrer Pau Vila 22, 08174 Sant Cugat del Valles, Spain*

This study investigated differences in semen quality parameters in 6 commercial pig breeds. Boar age, rest days between collection, progressive motility (PM), motility (MO), concentration (CO), and volume (VOL) from CASA data was recorded on 3908 boars from 6 different breeds (Duroc=1731, Hampshire=158, Landrace=693, Large White=269, Pietrain=212 and Synthetic Line =845) between January and June 2023. Boars were housed in 30 boar studs from 9 countries. 20 semen collections per boar were needed for inclusion in the study yielding a total of 94372 records. Data was analysed using mixed model equations including semen quality characteristics as predicted variables, breed, collection weekday, and collection month as fixed effects, boar age and rest days as covariates, linear and quadratic covariates and boar nested within stud as a random effect. Weighted least square means were calculated for unbalanced groups. Breed differences were observed for all semen parameters ($P < 0.05$). Lower PM ($77.4 \pm 2.07\%$), MO ($88.5 \pm 0.84\%$), CO (0.27 ± 0.025) and higher VOL (364.2 ± 26.33 ml) were observed for Hampshire pigs and they differed from the rest of the breeds ($P < 0.05$). PM differ between Landrace and Synthetic Line pigs while MO was higher for the Synthetic Line than for Landrace and Duroc pigs ($P < 0.05$). CO was higher for Duroc and Landrace pigs than for Large White and Synthetic Line pigs. VOL differed between all breeds except for Pietrain pigs. Results demonstrate differences in major parameters impacting semen production and quality which ultimately impacts the number of offspring an individual boar can influence. Our results highlight the need to continue to understand within and between breed differences as new breeding technologies are developed.

On the genetics of farrowing duration in pigs

M. S. Lopes^{1,2}, H. S. Wendling², E. Grindflek^{1,3}, E. F. Knol¹

¹ Topigs Norsvin, Meerendonkweg 25, 5216TZ Den Bosch, Netherlands, ² Topigs Norsvin, Visconde do Rio Branco 1310, 80420 Curitiba, Brazil, ³ Norsvin, Storhamargata 44, 2317 Hamar, Norway

In the last decades, genetic progress for litter size in pigs has substantially evolved, and consequently, farrowing duration (FRD) has increased. Prolonged FRD is associated with a higher number of stillbirths and impacts the required labour per sow during farrowing and colostrum intake of the newborn piglets. FRD is a difficult-to-measure trait due to the high labour demand and, therefore, it is not commonly available. To our knowledge, most of the previous studies on FRD evaluated data on a few hundred sows and the genetic parameters for this trait have not yet been reported. The goal of this study was to investigate the genetic background of FRD using a large commercial dataset. The genetic parameters for FRD are reported here and a genome-wide association study is currently being carried out. The evaluated data consisted of 14902 litters of 4581 purebred Large White sows from one farm located in Brazil. The data was collected between 2020 and 2023 as part of the routine data collection of the farm that counts with employees in the farrowing room at all times. The time of birth of each piglet was individually recorded and the FRD was defined as the time between the birth of the first and the last piglet. The genetic parameters were estimated with an additive linear model using ASReml v3. The fixed effects were population mean, type of litter (purebred/crossbred), farrowing room, year-week, parity number of the sow, average birth weight of the piglets and litter size. The random permanent, additive and residual effects were also fitted in the model. The average FRD and litter size in this dataset were 216±110 minutes and 15.0±2.7 piglets, respectively. Population mean, year-week, parity number of the sow and litter size were the only significant fixed effects ($P < 0.001$). A heritability of 0.07±0.01 was estimated and the permanent effect accounted for 0.03±0.01 of the total phenotypic variance. A clear linear relationship between litter size and FRD was also observed. Although the heritability of FRD was low, this study brings new insights that may contribute to the genetic improvement of this trait.

Session 22

Dam parity is associated with reproductive performance in primiparous sows

J. A. Calderon Diaz¹, S. Casiro¹, I. Huerta¹, C. R. G. Lewis¹

¹ PIC Europe, Sant Cugat del Valles, 08174 Barcelona, Spain

This study aimed to investigate associations between early life reproductive performance indicators and the dam parity the female was born into. Data was collected between 2019 and 2023 in 11 European L03 PIC commercial multipliers. Lifetime performance records were available on 44909 females born from sows parity 1 (n=30144), 2 (n=10227), 3 (n=3320), and 4+(n=1218). Data included lifetime daily gain at off-test (c. 165.5 ± 20.53 days of age; LDG), age at first mating, age at successful mating, age at first farrowing, P1 total born (TB) and born alive (BA) piglets, P1 wean-to-service (WSI) interval and P1 non-productive days (NPD). Data was analysed using univariable generalised linear mixed models with dam parity included as fixed effect and contemporary group (i.e. farm, year and month when entering the herd) as random effect. A Gamma distribution was fitted to WSI and NPD. Females born from P1 sows had lower LDG, and higher age at first and successful mating, age at first farrowing and WSI ($P < 0.001$) and lower TB (-0.3 piglets) and BA piglets (-0.2 piglets; $P < 0.001$) when compared with other parity groups. NPD was similar between females born from P1 and P2 sows and higher to those born from later parity sows ($P < 0.001$). There were no observed differences ($P > 0.05$) between sows P2-P4+ in any of the other studied traits. Results suggest that selecting replacement gilts born from gilt litters could have a significant impact on reproductive performance variation and overall farm efficiency. As with gilts making up 25% of the breeding herd, selection of replacements from gilt litters is unavoidable., our results emphasise the need to implement targeted gilt development programs to maximise their productive life

Validation of a Piétrain sire breeding program on crossbred piglets' vitality and congenital defects

W. Gorssen¹, C. Winters², R. Meyermans¹, L. Chapard¹, K. Hooyberghs¹, J. Depuydt³, S. Janssens¹, N. Buys¹

¹ KU Leuven, Department of Biosystems, Center for Animal Breeding and Genetics, Kasteelpark Arenberg 30, 3001 Leuven, Belgium, ² ETH Zürich, Animal Physiology, Institute of Agricultural Sciences, Universitätstrasse 2, 8092 Zürich, Switzerland, ³ Vlaamse Piétrain Fokkerij vzw, Aardenburgkalseide 254, 9990 Maldegem, Belgium

Decreasing mortality and the prevalence of congenital defects in the farrowing house is important in pigs. Tackling these issues will lead to both economic gains and an improved animal welfare. We validated a Piétrain sire breeding program for piglet vitality and congenital defects using two datasets. First, the breeding organization collected data on 14186 crossbred litters (Piétrain sire, hybrid dam) on piglets' vitality (V), number of piglets born death (NBD), number of porcine congenital splay leg syndrome (PCS) and scrotal hernia (SH) piglets, and preweaning mortality (PWM). Second, a similar, independent test (4561 litters) was performed by ILVO (Flanders research institute for agriculture). Validations were done by correlating mean phenotypic values and breeding values for the 384 common boars between both datasets. Breeding values were estimated by a genetic sire-dam model with ssGBLUP and the blupf90 software. Heritabilities were low for V (9.5%), SH (12.2%), PCS (14.1%), PWM (13.8%) and NBD (5.5%). The phenotypical correlations were significantly >0 for V (rp=0.25) and PCS (rp=0.33), but not for SH (rp=0.06), PWM (rp=0.03) NBD (rp=-0.08). Correlations of breeding values were positive for V (rg=0.22), SH (rg=0.05), PCS (rg=0.47) and PWM (rg=0.40), but not for NBD (rg=-0.10). Our findings show that breeding Piétrain sires for vitality and congenital defects can improve vitality and decrease the prevalence of congenital defects in crossbred piglets. Further research is needed to optimize the program for survival traits.

Session 22

Theatre 5

Genetic trends in the lysine requirements of growing-finishing pigs and reproductive sows, due to genetic trends in production traits

P. Knap¹

¹ Genus-PIC, Lorbeerrosenweg 10, 30916 Isernhagen, Germany

The requirements for SID lysine due to lean tissue growth rate (LTGR) in growing-finishing pigs were quantified based on data from the literature. The same was done for those requirements due to LTGR, due to protein deposition in mammary tissue, uterine tissue, fetal tissue and placental tissue, and due to colostrum and milk protein synthesis in gestating and lactating sows. These processes were expressed in terms of LTGR, litter size, piglet birth weight, preweaning survival rate, litter weaning weight and teat number. The 2013-2023 genetic trends of those traits in the PIC-L02, PIC-L03, PIC-L65 and PIC-L800 populations were estimated, and converted to genetic trends in lysine requirement. Based on this, the daily SID lysine requirement of Camborough (i.e. PIC-L02 × PIC-L03) sows increases by 0.47 g/d (i.e. by 2 % of the current mean level) per year: 0.10 g/d per year and 0.37 g/d per year for gestational and lactational processes, respectively. The daily SID lysine requirement of growing-finishing progeny of Camborough sows and either PIC-L65 or PIC-L800 boars increases by 0.09 g/d (i.e. by 0.6 % of the current mean level) per year.

Genetic Effects on Weight in Growing Piglets (prae iPig project)

E. M. Strucken¹, E. M. Saliu², J. Schulze Holthausen², L. Grześkowiak², J. Zentek², G. A. Brockmann¹

¹ Humboldt-Universität zu Berlin, Züchtungsbiologie und molekulare Genetik, Invalidenstr. 42, 10115 Berlin, Germany, ² Freie Universität zu Berlin, Institut für Tierernährung, Königin-Luise-Str.49, 14195 Berlin, Germany

The prae iPig project aims to understand various aspects influencing growth, resilience, and health in sows and piglets. We looked at the genetic effects on weight in growing piglets. The weight of suckling piglets of 21 primiparous sows was recorded. Piglets had access to the sows feed in addition to creep feed. Piglets were weighed at birth and on days 3, 7, 14, 21, and 28. All sows and 94 piglets were genotyped with the PorcineSNP80v1_HTS_20033000_A1 SNP chip. Unmapped SNPs or SNPs on the X or Y chromosome were removed to reduce a loss of power due to multiple testing; SNPs with a GC score >0.7 and a SNP call-rate >0.9 were retained, leaving 47,745 SNPs. During quality control, 5 piglets were removed for various reasons. A mixed linear model was fitted to the data including the Weibull function to model piglet growth, and the sows used as a random effect. Variables with a significant effect on the weight data included: experiment (2 separate trials), piglet sex, litter size, and weekly sow weight. No significant SNP effects were found across test-days; but several regions of interest were identified when analyzing test-day data individually. Three regions reached Bonferroni corrected significance: on chromosome 2, 2 markers at 40,681,608 and 83,569,250 bp; on chromosome 6, two markers at 111,277,681 and 112,819,536 bp; and on chromosome 12, 5 markers between 13,818,106 – 32,527,645 bp. A larger region on chromosome 6 includes multiple consecutive markers with p-values <0.0001 for several test-days (bp-positions are based on 10.2 assembly).

Session 22

Theatre 7

Differentially expressed genes in Piétrain sired pigs when feeding a high-fat high-fibre diet

E. U. Nwosu¹, B. Chakkingal Bhaskaran¹, R. Meyermans¹, E. Kowalski^{2,3}, W. Gorssen¹, S. Janssens¹, S. Millet², M. Aluwe², S. De Smet³, N. Buys¹

¹ K U Leuven, Department of Biosystems, Center for Animal Breeding and Genetics, Kasteelpark Arenberg 30, Box 2472., 3001 Leuven, Belgium, ² ILVO, Scheldeweg 68, 9090 Melle, Belgium, ³ Ghent University, Laboratory for Animal Nutrition and Animal Product Quality, Coupure Links 653, 9000 Ghent, Belgium

The Piétrain is a Belgian pig sire breed that is primarily selected for superior carcass quality and efficient feed conversion, hence commonly fed nutrient-dense high-grain diets. However, at present, it is unclear how Piétrain-sired progeny might cope with byproduct-based feeds that are higher in fibre and fat compared to conventional feeds that are nutrient-dense high-starch. Therefore, we investigated the effect of a dietary shift on gene expression in hypothalamus, colon and ileum tissue of 15 week-old pigs. Thirty-two pigs were included in a 2x2x2 experiment with diet (control, CON, vs. high-fibre high-fat, HFF), sex (castrated male vs. female), and genetic background (high vs. low estimated breeding value (EBV) for feed intake) as factors. Pigs were fed with CON feed until 14 weeks, thereafter separated into two groups, and fed for one week until euthanasia on the CON feed (n=16) or the HFF feed (n=16). Quantseq was performed on total RNA samples followed by differentially expressed gene (DEG) analysis using DESeq2 in R. Comparing CON with HFF feed, 20 DEGs were identified in the hypothalamus, whereas for sex, 18 DEGs were detected in colon tissue and 19 in ileum tissue. When comparing low with high EBV for feed intake, 13 DEGs were found in colon tissue and 9 in ileum tissue. These results will provide insight into the genes that are involved in the regulation of the metabolism of byproduct-based feeds.

Sires of low ad libitum-residual feed intake progeny have no undesirable effects on growth performance, gain composition and carcass traits of restricted-fed heavy pigs

S. Faggion¹, L. Gallo², S. Schiavon², P. Carnier¹

¹ Università degli studi di Padova, Department of Comparative Biomedicine and Food Science, viale dell'Università, 16, 35020 Legnaro, Italy, ² Università degli studi di Padova, Department of Agronomy, Food, Natural Resource, Animals and Environment, viale dell'Università, 16, 35020 Legnaro, Italy

We assessed the impact of sire classification for ad libitum residual feed intake (RFI) on feed efficiency, growth performance, tissue accretion, gain composition, carcass, and fat quality traits in restricted-fed heavy pigs. The experiment involved 420 purebred pigs from the Goland C21 sire line, offspring of 23 sires, which were fed ad libitum or restricted, and tested between 96 and 168 kg. RFI was estimated as the residual of a model accounting for empty body weight, body lipid and body protein mass, which were estimated from measures of body weight and backfat depth. The 23 sires were classified into low-RFI (LRFI), high-RFI (HRFI) or average-RFI (MRFI) based on their effects on RFI of the ad libitum-fed progeny. Ad libitum-fed offspring of LRFI sires showed increased feed efficiency and reduced feed intake, with no differences in gain composition or carcass traits. Restricted-fed progeny of LRFI sires exhibited reduced energy and feed intake while maintaining similar growth rates compared to HRFI group. Moreover, LRFI group showed slightly higher fat cuts % ($P < 0.1$), ham weight % ($P < 0.05$), and significantly higher ($P < 0.01$) ham subcutaneous fat quality (-4% iodine number, -8% linoleic acid, +5% stearic acid content) than HRFI group. Hence, a reduction in RFI is not expected to adversely affect growth performance, gain composition, carcass, and ham quality traits in restricted-fed heavy pigs.

Session 22

Theatre 9

Impact of selection for birth weight uniformity in meat quality traits in SRC Iberian pigs

J. P. Gutierrez¹, N. Formoso-Rafferty², F. Sánchez-Esquiliche³, A. Márquez³, M. Muñoz⁴, J. M. García-Casco^{4,5}, I. Cervantes¹

¹ University Complutense, C/Seneca, 2, 28040 Madrid, Spain, ² University Politecnica, ETSIAAB, 28040 Madrid, Spain, ³ Sánchez Romero Carvajal, Jabugo, 21290 Huelva, Spain, ⁴ INIA-CSIC, Dpto Mejora Genetica, 28040 Madrid, Spain, ⁵ INIA-CSIC, 5 Centro de I+D del cerdo Ibérico-Zafra, 06300 Badajoz, Spain

Since 2022 an experimental design with discrete generations and the first parturition of the sows is being performed in a Sánchez Romero Carvajal Iberian pig population. Generation 0 and 1 has been elapsed since then. The objective of this study was to analyse the data of this selection experiment focused on increase in the uniformity of piglet's birth weight (BW) and evaluate the impact in meat quality traits. Two replicates per generation have been performed. A total of 502 first litters belonging to nulliparous sows were used with a total of 3224 piglets BW. A heteroscedastic model was used to select animals, including mother age, piglet sex, litter size at birth and replicate as systematic effects. Genetic effects (mean and variability) were assigned to the mother. The litter effect was included as random effect. The pedigree contained 2699 animals. The following meat quality traits were studied in 187 sows: carcass, ham, weight, loin weights, loin intramuscular fat content and backfat composition of 12 fatty acids. The genetic coefficient of variation on BW was 0.56, with a genetic correlation between birth weight and its residual variance of -0.27, but not significantly different from 0. Regarding quality traits, the correlations with predicted breeding values for birth weight environmental variance ranged between 0.21 (daily gain in Montanera and loin weight) to -0.13 (Oleic + Linoleic, %). First results on generation 0 indicates that none of the quality traits routinely measured will be negatively affected by the selection towards BW uniformity

Differential Cold Adaptation Mechanisms: Adipose Tissue Subpopulation Variances in Tibetan and Bama Pigs
J. Liu¹, T. Liu¹, C. Chen¹, C. Tao¹, J. Zhao¹, Y. Wang¹

¹ Institute of Animal Science, Chinese Academy of Agricultural Sciences, No. 2 Yuanmingyuan West Road, Haidian District, 100193 Beijing, China

Thermogenic beige adipocyte displays a remarkable ability in mammals to adapt to cold environments, but the underlying cellular mechanisms remain unclear, especially in pigs that lack functional UCP1. Here, we observed a high number of beige adipocytes in adipose tissues from Tibetan pigs (cold-tolerant) compared to Bama pigs (cold-sensitive) after short-term cold exposure (4 °C for 3 days). Through single-nucleus RNA sequencing of adipose tissues from both pig breeds at room temperature, we discovered two cell subpopulations that were specific to Tibetan pigs, PDGFR α +EBF2^{High} and ADIPOQ+HIF1A^{High}. PDGFR α +EBF2^{High} cells were characterized as potential beige precursors, while ADIPOQ+HIF1A^{High} cells were found to highly express thermogenic-related genes. Despite the disappearance of the lipogenic subpopulation and the appearance of the lipolytic and the thermogenic subpopulations observed in both pig breeds upon cold treatment, Tibetan pigs exhibited stronger cellular and molecular responses compared to Bama pigs. Remarkably, cold-induced de novo beige adipogenesis and white adipocyte browning were observed in Tibetan pigs, while Bama pigs relied more heavily on white browning. Moreover, BMP7, which was highly expressed in PDGFR α +EBF2^{High} subpopulation, positively regulates porcine beige thermogenic capacity. Collectively, our data offers a comprehensive and unprecedented perspective on the heterogeneity and plasticity of adipose tissues of pigs and broadens the understanding of beige biology in mammals.

Exploring the potential of genetic selection for enhanced pork belly quality

Z. Mozduri¹, G. Plastow¹, B. Kemp², M. Juarez³

¹ Livestock, Dept. of Agriculture, Food and Nutritional Science, University of Alberta, 2-31 General Services Bldg, T6G 2H1 Edmonton, AB, Canada, ² Genesis Inc., 101 2nd St., R0H 0Y0 Oakville, MB, Canada, ³ Agriculture and Agri-Food Canada, Lacombe Research and Development Centre, 6000 C and E Trail, T4L 1W1 Lacombe, AB, Canada

Pork belly accounts for ~15% of chilled carcass weight, nowadays often representing the most valuable primal cut in North America (\$/cwt). Packers and international buyers prefer fairly thick and firm bellies, as these have a higher processing yield and profitability potential. However, historic genetic selection towards lean carcasses has led to thinner pork bellies and firmness issues. While the potential to enhance certain pork belly dimensional traits has been reported, limited research has focused on quality traits, such as firmness. The multifactorial nature of belly firmness complicates selection for belly quality. However, genomic evaluation and selection could provide further opportunities. In this study, traditional and novel phenotypic traits were evaluated in carcasses from 1,500 commercially produced and genotyped crossbred pigs. Heritabilities for most belly specific traits were moderate to high, showing potential for genetic selection. Positive phenotypic and genetic correlations were observed between objective belly firmness measurements and fat content/thicknesses in both the loin and the belly primals, total belly thickness, subjective firmness scores, as well as backfat saturated fatty acid content. On the other hand, belly firmness was negatively correlated to carcass and individual primal lean meat yield, polyunsaturated fatty acid content, and backfat iodine value. Genome-wide association analysis revealed specific genomic regions with potential to enhance selection for belly quality traits. These results indicate that pork belly quality can be improved by including direct and correlated traits in selection objectives in pig breeding programs.

Sire selection for infrared prediction of ham weight-loss during dry-curing affects green ham traits, and measured ham weight-loss in heavy pigs

K. Ivanov¹, V. Bonfatti¹, S. Faggion¹, L. Gallo², S. Schiavon², P. Carnier¹

¹ University of Padova, Department of Comparative Biomedicine and Food Science, Viale dell'Università 16, 35020 Legnaro, Italy, ² University of Padova, Department of Agronomy, Food, Natural Resource, Animals and Environment, Viale dell'Università 16, 35020 Legnaro, Italy

Excess ham weight loss (WL) during dry-curing results in a reduction of sellable product and compromises the quality of dry-cured hams. Early predictions of 12-month WL (pWL), based on infrared spectroscopy, exist and are highly genetically correlated with measured WL. However, effects of selective breeding for pWL on measured WL and other quality traits have never been validated. This study aimed to assess the effects of selective breeding for pWL on carcass, green ham quality traits, and WL measured at 18 months of dry-curing in a selection experiment. Estimated breeding values (EBV) for pWL were obtained for 70 sires of the Goland C21 line using an animal model and BLUPF90. The 6 top (low pWL EBV) and 6 bottom (high pWL EBV) sires were selected for mating with PIC Camborough® sows and produced 349 pigs in total. Pigs were raised according to Protected Designation of Origin dry-cured ham specifications, and slaughtered at 9 months of age and 166.1 ± 15.9 kg body weight. Thighs were further processed for dry-curing. Compared to the progeny of the bottom sires, offspring of the top sires exhibited significantly lower WL after 12 and 18 months of dry-curing ($P < 0.05$), and increased ham subcutaneous fat depth ($P < 0.01$). In conclusion, selective breeding for pWL proved to be effective in reducing WL and increased ham quality in the subsequent generation.

Session 22

Poster 13

Association between feed efficiency traits and disease resistance genes in pigs

K. Ishii¹, T. Okamura¹, M. Tomiyama², M. Kimata²

¹ Institute of Livestock and Grassland Science, NARO, 2 Ikenodai, 3050901 Tsukuba, Japan, ² CIMCO Corporation, 2-35-13, Kameido, 1360071 Koto-ku, Japan

It is possible to genetically enhance resistance to disease by selecting for genotypes of genes that are effective in suppressing disease. However, there are few reports on the association between disease resistance gene genotypes and feed efficiency in pig, and the impact of selection by these genes on feed efficiency has not been revealed. In this study, we examined the association between SNP polymorphisms of disease resistance genes and feed efficiency traits. Phenotypes were feed conversion ratio (FCR), average daily feed intake (ADFI), and average daily gain in test period (ADG) for 118 male Duroc pigs. Two SNPs in NOD1, one SNP in NOD2, and one SNP in NLRP3 were used as SNPs for disease-resistance genes. The effects of SNPs were tested using a linear model including the season at the end of the test (4 levels) and the genotype or additive and dominant effects of each SNP. Results showed that no SNPs had a significant effect on FCR and ADG. For ADFI, the genotypes and additive genetic effect of the SNP (G1992A) in NOD1 were significant ($P < 0.05$). This gene is involved in the recognition of peptidoglycan, a bacterial component, and individuals homozygous for the gain-of-function allele had significantly increased ADFI compared to heterozygous individuals. The results suggest that selection for disease-resistance genes has little negative effect on feed efficiency in pigs.

A study on the effect of not approved semen doses on fertility traits

I. Andersen-Ranberg¹, A. H. Gaustad¹, R. M. Godinho²

¹ Norsvin/Topigs Norsvin, Storhamargata 44, 2317 Hamar, Norway, ² Topigs Norsvin, Research Center B.V., Meerendonkweg 25, 5216 TZ 's-Hertogenbosch, Netherlands

Large sets of data derived from thousands of individual sperm measurements are routinely provided by CASA (Computer Assisted Sperm Analysis) System in the Norwegian Artificial Insemination (AI) center to produce Duroc and Landrace semen doses. The assessment of the quality of an ejaculate is the first step in semen production to ensure high quality of the AI doses used in the customers' herds. It is of high importance to ensure that quality of ejaculates, since increased number of rejected ejaculates would lead to decreased efficiency at the AI station and loss of genetic progress. In this experiment, inseminations were conducted with 4092 approved and 448 not approved semen doses between April 2021 and December 2022 on purebred sows in ten different nucleus herds. Not approved semen presented somewhat lower thresholds for tail defects, proximal and distal droplets than what is usual in the production of AI doses. Motility was within normal range. The effect of approved or not approved semen (1/0) and three different morphology traits on field fertility traits (farrowing rate, total number born and stillbirth) were analyzed by using ASReml. Results shows no effect of approved or not approved semen and morphology traits on the fertility traits in field, except a small effect of distal droplets on farrowing rate for the Duroc breed. This circumstance allows considering utilizing semen doses of somewhat inferior quality for some of the morphology traits than what is conventionally deemed as standard.

Session 23

Theatre 1

Keel bone lesions in laying hens: occurrence and risk factors

A. Trocino¹, G. Di Martino²

¹ University of Padova, Department of Agronomy, Food, Natural resources, Animals and Environment (DAF-NAE), University of Padova, Legnaro, Italy, Viale dell'Università 16, 35020 Legnaro (Padova), Italy, ² Istituto Zooprofilattico Sperimentale delle Venezie, Viale dell'Università, 35020 Legnaro, Italy

In Europe, farms for laying hens are housing the highest number of caged animals, whereas a transition towards cage-free systems is expected based on the Initiative of the European Citizens "End the Cage Age" and the corresponding Resolution of the European Parliament to provide hens with more possibility of movement, besides other improvements with respect to animal welfare. On the other side, navigation ability of laying hens in alternative systems, with special reference to multi-level aviary systems, may be associated to collisions with equipment and other animals which can produce injuries to animals where and if other risk factors are present. In fact, the latest Scientific Opinion of EFSA about the welfare of laying hens on farm has identified several highly-relevant welfare consequences for these animals based on severity, duration and occurrence, with bone lesions at the top of the list. Among these latter, keel bone fractures have been proved to produce negative states such as pain, distress, and/or discomfort, whereas less data are available on the occurrence of keel bone deviations and their impact on animal welfare and health. In this context, the present contribution aims to provide an overview of the available data about the occurrence of keel bone fractures and deviations in laying hens kept in different rearing systems, discussing the ontogenetic, management and housing factors that have been identified as risk factors, and, finally, to provide information about the animal-based indicators both on farm and slaughterhouse.

Effects of a Bacterial Compound on Litter to reduce Footpad Lesions in Broilers

L. Galosi¹, A. R. Attili¹, A. M. Tambella¹, G. Rossi¹, L. Biagini¹, F. Gigli¹, M. Guarino², G. M. Provolo², R. Falconi¹, G. Castiglione¹, A. Roncarati¹

¹ University of Camerino, School of Biosciences and Veterinary Medicine, Via Circonvallazione 93-95, 62024 Matelica, Italy, ² University of Milano, Department of Agricultural and Environmental Sciences - Production, Landscape, Agroenergy, Via Celoria 2, 20133 Milano, Italy

A trial was performed in broilers to reduce Footpad lesions (FPL) that often affects flocks' welfare. A total of 89,200 Ross308 chickens (39±3g) were housed in 2 sheds (C, control; T, treated) at the same environmental conditions. Females were housed in the first part of each shed, and males in the second and third part. A bacterial bedding conditioner (EazyBed Pro, Lallemand, France) was applied on litter in T. In C no treatments were carried out. Females were slaughtered at 36 days (T: 1528±195g; C: 1562±188g) and males utilized the whole space until 43 days (T: 2696±296g; C: 2737±364g). At 20 days and before capture, 30 birds living in each part of the shed were randomly selected and, from both pads, the perimeter shape of each lesion was recorded. Shape measurements were obtained in cm², using the imitoMeasure application (Imito AG, Swiss). For bacteriological and mycological culture, litter was sampled at different depths, pooling 9 samples/part, at the same timepoints. At slaughtering, 12 legs for each group were randomly selected for histological examination, characterizing the severity of lesions. At 20 days, FPL were not observed in birds. At 35 days, lesions measured in T (0.57 ± 0.08cm²) were significantly lower than in C (1.47±0.14cm²; p<0.0001). At 42 days, lesions measured in T (0.65±0.18cm²) were significantly lower than in C (1.76±0.34 cm²; p=0.049). In litter collected in T, Gram negative bacteria (p=0.0015) and Staphylococcus spp. (p=0.0386) significantly decreased (CFU/g), in particular in the second part of the shed (p=0.0098, p=0.0131 respectively). No significant differences were recorded for fungal flora. In T, broilers showed a total histological score significantly lower than in C (p=0.0002), in particular in males (p<0.0001). The use of the compound positively affects width and severity of FPL, supported by bacteriological analysis that showed a reduction of the total charge of bacteria commonly involved in the condition.

Session 23

Theatre 3

Effects of genotype and husbandry system on pododermatitis and plumage soiling in organic turkey production

D. Haug¹, R. Schreiter², B. Thesing¹, L. Rathmann³, C. Lambertz⁴, P. Hofmann⁵, M. Erhard⁶, G. Bellof¹, E. Schmidt¹
¹ Weihenstephan-Triesdorf University of Applied Sciences, Am Staudengarten 1, 85354 Freising, Germany, ² HenControl, Poultry Consulting, 09390 Gornsdorf, Germany, ³ Bavarian State Estates, Mainbernheimer Str. 101, 97318 Kitzingen, Germany, ⁴ Research Institute of Organic Agriculture, Kasseler Straße 1a, 60486 Frankfurt, Germany, ⁵ Bavarian State Research Center for Agriculture, Mainbernheimer Str. 101, 97318 Kitzingen, Germany, ⁶ Ludwig-Maximilians-Universität, Veterinärstr. 13R, 80539 München, Germany

Effects of different genotypes and husbandry systems with 100% organic feeding on foot pad dermatitis (FPD) and soiling in turkeys were studied. Non-beaktrimmed male turkeys of a slow-growing genotype (Auburn (A), n=256) and a fast-growing genotype (B.U.T. 6 (B), n=128) were raised at two research stations indoors during rearing (8 weeks). Twelve pens were equipped either without environmental enrichment (EE) at station 1 (H1-, n=144) and with EE (pecking stones, elevated seating platforms, silage feeding) at station 2 (H2+, n=240). During the fattening period (9 to 20 weeks) half of the animals per pen of H2+ were relocated to a free-range system (H3-MS, n=104), while animals of H1- remained in the indoor system. Four-weekly, FPD was scored from 0 (=no damage) to 4 (=severe damage) and soiling at back, breast and butt from 0 (none) to 3 (severe). The high prevalence of FPD (51%) and soiling (breast area: 68.8%) was affected by genotype, husbandry and age (p<0.001). Genotype A, which was scored worse than B (p<0.001), showed the worst FPD in H3-MS (p<0.001). For soiling at breast, genotype B was scored worse than A (p<0.001). Investigated traits did not differ between free-range access and indoor systems. In conclusion, strategies to optimize free-range systems and selection for better footpad health in organic turkeys are needed.

Incomplete Milking for metabolic relief of dairy cows

*R. Joest¹, K. .. Südekum¹, U. Müller¹*¹ *University of Bonn, Institute of Animal Science, Katzenburgweg 7, 53115 Bonn, Germany*

The metabolic challenge related to high milk production may be augmented by various stressors. We herein aimed to test whether temporally lowering milk yield (MY) by incomplete milking (IM) may reduce metabolic stress in multiparous Holstein cows during peak to mid lactation. The IM was implemented using a software-module which enabled automated early cluster removal according to an individual pre-defined amount of milk. In the 1st IM-phase, MY was gradually decreased for 5 d by 9%/d. In the 2nd IM-phase, the reduced level (~40%) was held constant for further 5 d. Before and after IM, IM cows (n=17) were milked equally as the CON cows (CON; n=18; milk flow-based cluster removal at <0.3 kg/min). Two wk before, during and 2 wk after IM, daily MY, fatty acid (FA) concentration in serum, cytobacteriological and other analyses in milk were assessed weekly. Linear mixed-models and t-tests were used for data analysis. The IM reduced daily milk withdrawal from 39.8±7.2 kg/d to 24.9±4.4 kg/d (~40% reduction) in the IM group, whereas, during the same period, MY in the CON group did not change (~38.0 kg/d). Due to lesser milk withdrawal, the low FA concentration in the IM group (0.17±0.14 mM) was further reduced to 0.07±0.04 mM (P<0.01) during IM, but FA concentrations in the CON group did not change (0.15±0.15 mM). However, somatic cell count remained on a low level in both groups (IM: ~26.3×10³ cells/mL, CON: ~33.3×10³ cells/mL). In the wk after IM, MY in the IM group (34.6±5.8 kg/d) tended to be less than in the CON group (38.3±6.9 kg/d; P=0.09). Thereafter, no difference in MY was observed. The IM applied lead to metabolic relief and may be considered for maintaining and improving health in dairy cows during stressful conditions such as ketosis or heat stress.

Influence of incomplete milking on the metabolic and oxidative stress status in early-lactating cows with high lipolysis

*U. Müller¹, R. Joest¹, K. H. Südekum¹, S. Häußler¹*¹ *University of Bonn, Institute of Animal Sciences, Katzenburgweg 7, 53115 Bonn, Germany*

To meet the high energy demands around calving, high-yielding cows mobilize body fat and can experience metabolic and oxidative stress. We hypothesized that temporary incomplete milking (IM) can positively affect the metabolism in early-lactating cows with high lipolysis. Multiparous Holstein cows (n=46) were allocated to a control (CON) or an IM group. Before and after the IM phase (week (wk) 2 and 3 postpartum (pp)), both groups were milked conventionally (cluster removal at <0.3 kg milk/min). During IM, the IM cows were milked up to a defined milk quantity (IM:~32 kg/d, CON:~11% more). Fatty Acids (FA), β-hydroxybutyrate (BHB), and Reactive Oxygen Metabolites (dROM) measured in serum were obtained weekly in the first 7 wk pp. However, the CON and IM group did not differ in their metabolic status. Based on their FA concentrations, we further classified cows within the first 2 wk pp: FA >800 μM (CON-high: n=5, IM-high: n=5) or FA <800 μM (CON-low: n=18, IM-low: n=18). Data (presented as mean±SE) were analyzed using mixed models and post hoc tests. Lesser FA values even at wk 4 pp in IM-high cows (374±88 μM) compared to CON-high cows (888±352 μM; P=0.02), indicate decreased lipolysis due to IM. The subsequent 1.7-fold increase of FA values at wk 5 pp in IM-high cows (P=0.03) may reflect the rising energy demand after the IM period. Compared to CON-high cows, IM-high cows had lower BHB values at wk 4 pp (IM-high: 632±76 μM; CON-high: 2,059±948 μM; P<0.01) and also at wk 5 and 6 pp. The dROM values in IM cows remained constant. In conclusion, the metabolic response of early-lactating cows to IM varies. Cows with elevated FA values seem to profit from the treatment.

Insights into Mastitis Management: Unveiling the Drivers and Goals Behind Swedish Dairy Farmers and Veterinarians Decision-Making

N. Lind¹, H. Hansson¹, U. Emanuelson², C. J. Lagerkvist¹

¹ Swedish University of Agricultural Sciences, Department of Economics, Box 7013, 75007 Uppsala, Sweden,

² Swedish University of Agricultural Sciences, Department of Clinical Sciences, Box 7054, 75007 Uppsala, Sweden

Mastitis, a prevalent health issue in dairy farming, poses significant economic challenges for farmers and raises public health concerns related to antibiotic use for treatment. Previous studies have highlighted low adherence to veterinarian advice as a common issue. To address and control the situation farmers can adopt preventive animal health management measures to control disease incidence and to prevent further spread on the farm once identified. However, there is limited understanding of the reasoning influencing farmers' adoption of specific control measures and whether their choices differ from the advice and reasoning provided by veterinarians facing similar situations. In this study, we explore the drivers and motivations of both farmers and veterinarians, shedding light on the rationale behind their management behaviours aimed at reducing and controlling mastitis incidence on the farm and the goals driving these behaviours. Based on goal-system theory, our study design explores the motivational basis for the adoption of control measures when the somatic cell counts (SCC) exceed a certain endogenous reference point decided by the farmer. We further explore the advice veterinarians would provide in a comparable situation. For this, 30 randomly selected Swedish dairy farmers and 27 veterinarians were interviewed using the Laddering technique to unfold the stage-dependent goal-means chains when handling mastitis outbreaks. This study provides insights into the complexities faced by both farmers and veterinarians offering a deeper understanding of the motivations possibly influencing adherence to veterinarians' advice. It highlights the necessity of tailoring animal health recommendations to align with farmers' motivations, emphasizing the need for individualized approaches to handle mastitis on each farm.

Theatre 7

Impact of early life experiences on the development of ear necrosis in weaned pigs

L. Markland^{1,2}, K. O'Driscoll¹, F. Leonard², L. Boyle¹

¹ Teagasc Moorepark, Pig Development Department, Animal & Grassland Research & Innovation Centre, P61P302 Fermoy, Ireland, ² University College of Dublin, School of Veterinary Medicine, Stillorgan Road, Belfield Dublin, Ireland

Ear necrosis (EN) is a major welfare concern but there is poor understanding of the risk factors and causes. As stress is potentially implicated we investigated the effect of handling during lactation and mixing at weaning on EN development post-weaning. A total of 509 piglets were born to 37 sows over two replicates, and housed in farrowing crates. At farrowing, sows were blocked by parity and weight and their litters randomly assigned to either CONTROL (n = 238 piglets; 18 litters) or HANDLED (n = 271 piglets; 19 litters) treatments. Control piglets were handled 3 times during lactation: weighing at birth, processing (teeth and tail clipping) at ~5 days of age, and weighing 1d before weaning [~27 days of age]. Handled piglets were weighed an additional 5 times during the same period at intervals of 3 days. At 28 d of age, piglets were blocked by weight and sex and weaned into pens of 8-12 piglets. A 2×2 factorial design was used, so that half of the litters within each lactation treatment were weaned as INTACT litters (18 pens, n=206 piglets) and half were MIXED with piglets from ≥3 litters (18 pens, n=204 piglets). Pigs were individually assessed for fight lesions at 24h post-weaning (0-6, with score increasing with severity), and fight lesions on both ears were counted. Pigs were inspected for EN weekly from weaning until transfer to finisher accommodation (~75 d of age; 0-5, with score increasing with severity), then individually weighed at transfer. Data were analysed using SAS v9.4. There was no effect of either treatment on weaning or transfer weight ($P > 0.05$). Mixed pigs had higher fight lesion scores and a greater number of fight lesions on the ears ($P < 0.001$), but there was no effect of pre-weaning treatment on fight lesion scores ($P > 0.05$). There was no effect of pre-weaning or post-weaning treatment on EN severity ($P > 0.05$). The data suggests that under the conditions of this study, neither frequent handling nor mixing influenced growth or EN. Despite more aggression induced skin lesions in Mixed pigs, it seems that lesions caused by fighting are not risk factors for EN.

Identifying risk factors of piglet mortality at birth, before and after weaning

B. Garré^{1,2}, D. Maes², M. Aluwé¹

¹ ILVO, Scheldeweg 68, 9090 Melle, Belgium, ² Ghent University, Department of Internal Medicine, Reproduction and Population Medicine, Salisburylaan 133, 9820 Merelbeke, Belgium

Increasing piglet mortality represents a significant challenge for many pig farmers today. Stillbirth rates range from 5-10%, pre- and post-weaning mortality from 10-15%, and 1-4%, respectively, with some farms experiencing much higher rates. Effective measures to reduce piglet mortality rely on correctly identifying underlying causes and risk factors. While literature addresses various risk factors individually, understanding the intricate relationships among these factors is equally crucial. Therefore, a comprehensive literature review was conducted to summarize the main non-infectious and infectious risk factors related to piglet, sow and environment, along with their interconnections. Scientific articles were selected using Google Scholar, focusing on terms such as stillborn piglets, pre- and postweaning risk factors of piglet mortality, nest building and lying behavior of the sow. Key non-infectious sow factors influencing piglet mortality include breed, aggression, high piglet mortality in previous litter(s), post-partum dysgalactia syndrome, gestation and farrowing period, while infectious factors include PRRSV infections and fever-inducing diseases. Non-infectious piglet factors include poor fetal development, low birth weight, birth order, large within-litter variation, anatomical abnormalities and low weaning age/weight, whereas infectious factors involve diarrhea, meningitis, arthritis, skin disorders and systemic infections. Complex relationships exist within and between these factors. For instance, mortality rates of low birth weight piglets (< 1 kg) vary depending on birth order, ranging from 8% for the first 7 piglets born to 75% for subsequent ones. Whereas the combination of heavy piglets and young sows is more likely to result in farrowing complications and consequently higher mortality rates. With the goal of reducing piglet mortality, the PIGLIFE-project was launched. A comprehensive survey, based on this literature review, will be conducted on 60 farms to identify high-impact risk factors in a holistic manner. Furthermore, PLF tools (camera and RFID systems) will be developed to monitor farrowing, suckling behavior and feed intake in weaned piglets.

Session 23

Theatre 9

Environmentally enriched housing reduces disease severity in pigs after co-infection, with stronger effects when applied from birth than from weaning

B. De Bruijn¹, I. Van Dixhoorn¹, J. Bolhuis¹, N. Stockhofe-Zurwieden¹, M. Kluivers¹, J. Rebel¹

¹ Wageningen University & Research, De Elst 1, 6708 WD Wageningen, Netherlands

We investigated whether enrichment affects disease susceptibility of pigs studied in a co-infection model of Porcine Reproductive and Respiratory virus (PRRSV) and *Actinobacillus pleuropneumoniae* (APP). Pigs were either conventionally (CCH) or environmentally enriched housed (EEH) from birth onwards, or switched from CCH to EEH postweaning (CEH). At 60 days of age, 10 pigs per treatment were infected with PRRSV followed by APP infection on day 68. On day 71, lung morphology was studied to assess disease severity. Clinical manifestations and whole blood cell (WBC) counts and types, blood cell phenotypes and function of leucocytes were determined. Six additional pigs per treatment were euthanised before co-infection and bronchial-alveolar fluid (BALF) was tested. Results were analysed using mixed models. After weaning, EEH pigs had higher WBC and LPS treatment of whole blood cells revealed higher IL1 β and TNF α concentrations than CCH and CEH pigs. BALF of EEH pigs tended to contain relatively more macrophages than that of CCH and CEH pigs. In response to co-infection, EEH pigs had less exudative lung components of inflammation and the proportion of pigs with lung lesions tended to be lower than in CCH, with CEH in between. In conclusion, enriched housing reduced disease susceptibility to PRRSV-APP co-infection. In CEH pigs the response to the co-infection tended to decrease as compared to CCH pigs, but to a much lower extent as compared to EEH pigs. This indicates that enrichment from weaning is less effective in decreasing disease susceptibility than enrichment from birth.

Relationship between animal-based on-farm indicators and meat inspection data in pigs

J. Witt¹, J. Krieter², K. Büttner³, T. Wilder², M. Hasler⁴, R. Bussemas⁵, S. Witten⁵, I. Czycholl⁶

¹ ISF GmbH, An der Mühlenau 4, 25421 Pinneberg, Germany, ² Institute of Animal Breeding and Husbandry, Kiel University, Olshausenstraße 40, 24098 Kiel, Germany, ³ Unit for Biomathematics and Data Processing, Giessen University, Frankfurter Straße 95, 35392 Giessen, Germany, ⁴ Lehrfach Variationsstatistik, Kiel University, Hermann-Rodewald-Straße 9, 24118 Kiel, Germany, ⁵ Johann Heinrich von Thünen Institute, Trenthorst 32, 23847 Westerau, Germany, ⁶ Department of Veterinary and Animal Sciences, University of Copenhagen, Grønnegårdsvej 8, 1870 Frederiksberg C, Denmark

The aim was to validate slaughterhouse indicators (SI) collected during meat inspection as an alternative to on-farm animal welfare indicators. The assessments of 12 on-farm and 7 SI of 628 pigs from 3 different farms were combined into 3 indices, differentiated between on-farm and slaughterhouse: 1) limb health, 2) other organ health, and 3) respiratory health. Firstly, agreement parameters at animal level were calculated to ascertain whether the same welfare or health issues were identified on-farm and at slaughterhouse, taking the production period into account. Acceptable agreement was determined for the farrowing and fattening period, but not for the rearing period. A more detailed analysis shows a poor agreement 8 weeks and an acceptable agreement 4 weeks before slaughter. This indicated the SI pneumonia, pleuritis and pericarditis as possible estimators of fever and deviant behavior on-farm and the SI bursitis and joint inflammations as possible estimators of lameness. Secondly, the connection of slaughterhouse findings on the individual on-farm health indices was investigated; a significant influence of the farm on the limb and respiratory indices was determined. In general, some suitable SI were identified but a complete substitution of on-farm welfare assessment is not possible.

Session 23

Theatre 11

Identifying barriers and facilitators to implementing veterinary telemedicine in swine, poultry, and bovine production using a COM-B approach

A. Guintard¹, L. Lefèvre², S. Assié¹, M. Delsart³, N. Millar⁴

¹ Oniris, CHUV, 101 route de Gachet, 44300 Nantes, France, ² Chambre d'agriculture des Pays de la Loire, Route d'Aviré, 49500 Segré-en-Anjou-Bleu, France, ³ ENVA, 7 Av. du Général de Gaulle, 94700 Maison-Alfort, France, ⁴ Université de Montréal, 3200 Rue Sicotte, QC J2S 2M2 Sainte-Hyacinthe, Canada

Efficient management plays a crucial role in reducing livestock diseases. Veterinary telemedicine, using communication technologies, offers innovative remote management solutions. Understanding farmers' and veterinarians' needs and constraints is vital for its future successful implementation. Therefore, four focus groups gathered the perspectives of farmers and veterinarians from both the bovine and monogastric sectors. Using the COM-B model of behaviour change, data was analyzed to identify barriers and enablers to the adoption of veterinary telemedicine. Farmers and veterinarians expressed consensus on two main benefits of telemedicine development: (1) the potential time saved travelling enabling quicker response to farmers' demands, not to mention the positive impact on the environment and (2) the desire for a holistic vision of health, including enhanced monitoring and analysis of health data. However, five major barriers remain: (1) disparities in the proficiency and availability of sensors and data across farms, (2) concerns about the loss of human interaction, (3) concerns about regulation of practices, (4) concerns regarding the value of remote services and (5) concerns about data and image hacking. Overall, both farmers and veterinarians demonstrate interest in how telemedicine could improve animal health and working habits, aligned with the goal of enhancing livestock health. However, they unanimously agree that barriers must be overcome to successfully implement veterinary telemedicine for livestock.

Implementation of sustainable parasite control strategies on extensively managed sheep farms

E. Geddes¹, C. Morgan-Davies², A. McLaren², P. J. Skuce¹, J. M. Duncan¹, N. Sargison³, F. Kenyon¹

¹ Moredun Research Institute, Pentlands Science Park, EH26 0PZ Edinburgh, United Kingdom, ² SRUC, West Mains Road, EH9 3JG Edinburgh, United Kingdom, ³ The Royal (Dick) School of Veterinary Studies, University of Edinburgh, EH25 9RG Edinburgh, United Kingdom

Extensive farming systems play an important role in sheep production across Europe yet face many innate management and production challenges compounded by narrow economic margins which threaten their sustainability. Gastrointestinal nematodes pose a significant challenge to the productivity, health and welfare of grazing ruminants. While traditionally extensive sheep farms were not regarded as having significant parasite challenge, previous work has demonstrated a production limiting challenge and anthelmintic resistance, indicating the need for sustainable control strategies. However, current strategies are not optimised for extensive production systems. Optimised parasite control plans were developed and trialled for two years on nine extensive sheep farms. To measure their impact and practicality, production data and longitudinal parasitological data including faecal egg counts, anthelmintic efficacy testing and molecular species identification were collected. Semi-structured interviews were also conducted to capture management and socioeconomic-related impacts. Although solutions applied on farm were unique, they had similar core themes including increased evidence-based decision making, strategic use of anthelmintic and improved grazing management. Reduced anthelmintic use and improved lamb performance were observed, with farmers motivated to continue implementing these solutions beyond the project end. Implementation of sustainable strategies on extensive farms is thus achievable, however flexibility is required to fit individual management systems.

Feed intake, growth performance and gut health parameters of broiler chickens are positively affected by the supplementation of chestnut tannins in a dose-dependent manner

C. Techer¹, Q. Pagé¹, W. Lambert¹, A. Mayer², E. Berwanger², J. Fernandes³

¹ MIXSCIENCE, 2 avenue Ker Lann, 35170 Bruz, France, ² SALUS Animal Nutrition, Avenida Marginal SP-340, Pista Norte KM 141, 2 Distrito Industrial, 13833-591 Santo Antônio de Posse - SP, Brazil, ³ UFPR – Federal University of Paraná, R. XV de Novembro, 1299, 80060-000 Curitiba, Brazil

Chestnut tannins may be a good alternative to the use of antibiotic growth promoters (AGP) thanks to their antioxidant and anti-inflammatory properties in broilers. To verify this hypothesis, 2,580 Cobb 500 broilers were subjected to 6 dietary treatments from 0 to 42 days: Uninfected Untreated Control (UUC), Infected Untreated Control (IUC), Infected Treated Control (ITC, with addition of salinomycin) and 3 treatments infected and supplemented with 3 levels of chestnut extract (KingBrown at 500g/T, 1kg/T or 2kg/T; named after KB0.5, KB1 and KB2). All broilers infected were challenged with a Necrotic Enteritis model. At 42d, individual live weights were significantly affected: UUC was significantly higher than IUC, ITC and KB2, while KB0.5 and KB1 were intermediate. For 0-42d FCR, ITC was significantly lower than IUC and UUC while KB0.5, KB1 and KB2 were intermediate. The ADG and ADFI were quadratically affected by KB supplementation with optimal concentrations between 0.5 and 1.0kg/T. The I See Inside (ISI) scoring, combining 9 gut health indicators confirmed the expected effects of the challenge on gut health with IUC having the worst score (9.2), then ITC (7.47) and UUC (6.32). Regarding the KB treatments, the lowest score was obtained with KB2 (5.55) while the other KB treatments were intermediate. In conclusion, low doses of KB supplementation tended to improve broiler performance under challenged conditions and could be an alternative to partially replace AGPs.

Use of infrared thermography for predicting the infectious etiology of subclinical bovine mastitis in a robotic milking system using machine learning

L. F. Zafalon¹, R. C. M. Santana¹, M. V. Santos³, T. C. Alves¹, A. R. Garcia¹, S. C. M. Niciura¹, F. D. Caracuschanski²

¹ Embrapa, Embrapa Southeastern Livestock, 13560970 São Carlos, Brazil, ² São Paulo State University, FCAV, 14884-900 Jaboticabal, Brazil, ³ University of São Paulo, Department of Nutrition and Animal Production, 13635-900 Pirassununga, Brazil

This study assessed the potential of infrared thermography for predicting bacterial pathogens causing subclinical mastitis in pasture-raised cows using machine learning techniques in an automatic milking system. Eighty-nine lactating cows underwent thermographic analyses of their mammary glands over six months. Values (°C) corresponding to the mean, minimum, and maximum temperatures of the udders were recorded. Supervised machine learning techniques were used to predict mastitis and its infectious etiology using infrared thermography. Mixed binomial and multinomial logistic regression models were utilized. *Staphylococcus chromogenes* was the most frequently isolated microorganism (36.3%), followed by *S. aureus* (13%) and *Streptococcus dysgalactiae* (13%). The multinomial logistic regression technique showed high sensitivity (>0.95) in the identification of *S. aureus*, *S. uberis*, and *S. dysgalactiae* species. The AUC ROC for predicting the infectious etiology of subclinical bovine mastitis using infrared thermography was 0.90. Moreover, the SCC was significant in predicting mastitis caused by *S. aureus*, *S. uberis*, and *S. dysgalactiae* species. Infrared thermography demonstrated potential as a predictor of subclinical bovine mastitis due to *S. aureus*, *S. uberis*, and *S. dysgalactiae* in extensive cow rearing, a style traditionally seen as incompatible with robotic milking. The use of combined machine learning logistic models can optimize the identification of pathogens causing mastitis in bovine herds. Grant 2020/16240-4, São Paulo Research Foundation (FAPESP).

Prevalence and characterization of rib injuries in dairy cows: a neglected welfare issue of dairy production

J. M. Pankratz¹, I. C. Colaço Bez¹, J. L. Sviech Ratim¹, D. A. Duarte Santana¹, R. D. Ollhoff¹

¹ Pontifícia Universidade Católica do Paraná, Graduate Program of Animal Science, School of Medicine and Life Science, Imaculada Conceição street, 1155, 80215-901 Curitiba, Brazil

Overcrowded feeding areas, cramped stalls, inadequate cubicles, and slippery floors may lead to rib fractures in dairy cows. Despite the pain, these injuries are often overlooked by managers and technical staff. This study sheds light on this neglected injury to promote greater awareness within a context of animal welfare and the interaction of dairy holstein cattle with their environment. Data were collected in a dairy cattle farm, Gralha Azul Experimental Farm of the Pontifical Catholic University of Paraná – PUCPR, located at Fazenda Rio Grande, in the state of Paraná, southern Brazil. A description of the anatomic localization of the bone callus (affected side, rib, and position on the rib) was provided. A cohort of 72 cows, with an average age of 3.8 years and 2.7 lactations, underwent examination through palpation. Remarkably, 59.72% (n=43) of the cows exhibited rib fractures. Correlations were found for: age, regarding left medial fractures (R=0.306, P=0.007), and right ventral fractures (R=0.229, P=0.045); and lactations, regarding right (R=0.236, P=0.0395) and left (R=0.293, P=0.010) medial injuries. Additionally, a correlation was identified between right (R=0.245, P=0.032) and left (R=0.245, P=0.032) ventral injuries. Lesions were predominantly observed in cows with an average of 2.9 lactations. There was no correlation found between: dorsal and ventral fractures; nor dorsal and ventral injuries individually; nor age. Rib fractures, often unnoticed, impact cows' welfare over time. Older cows, more susceptible to fractures, face an increased risk of hipocalcemia and claw lesions, exacerbated by slippery floors, leading to falls and additional rib fractures.

Fertility and health traits of dairy cows on farms with short versus long productive lifespan profiles

A. Bieber¹, M. Lozano-Jaramillo¹, M. Walkenhorst¹, R. Eppenstein¹

¹ Research Institute of Organic Agriculture, Ackerstrasse 113, 5070 Frick, Switzerland

We compared fertility traits, health indicators and health management routines of Swiss dairy farms characterized by short versus long productive lifespans (SPL versus LPL). We analysed herdbook data from 142 Swiss dairy farms (n=142), farm questionnaire data (n=67), veterinary treatment data (n=64 farms) and data obtained during farm visits (n=30). LPL farms had a better fertility performance, i.e. lower number of inseminations per heifer, shorter average number of days open and shorter calving intervals. Number of antibiotic veterinary treatments due to fertility and other problems (i.e. others than fertility, udder or locomotion problems) were by tendency lower on LPL farms, while other veterinary medical treatments did not differ by productive lifespans. Although average somatic cell score and proportions of test day records with elevated somatic cell counts were significantly higher on LPL farms, udder health indicators remained within a healthy range and increases were not accompanied by higher treatment incidences for clinical mastitis. Moreover, the deterioration of udder health parameters was smaller than what could have been expected due to the age difference between contrasting lifespans. Locomotion scores and lameness incidence did not differ by productive lifespan profile. Cow health management routines did not significantly differ between farms of contrasting lifespan profiles, apart from a slightly higher proportion of LPL farms practicing abrupt drying off. We conclude that a longer productive lifespan is not at the expense of health, even if the SCC level increased with age. A focus on fertility, udder and claw health is crucial when aiming at a long productive lifespan.

The influence of sample size on fitting the true flock prevalence in animal welfare assessment impressively presented

L. Jung¹, B. Kulig², B. Schäfer³, S. Addo¹, D. Hinrichs¹

¹ University of Kassel, Animal Breeding, Nordbahnhofstr.1a, 37213 Witzenhausen, Germany, ² University of Kassel, Agricultural and Biosystems Engineering, Nordbahnhofstr.1a, 37213 Witzenhausen, Germany, ³ STAT-CON GmbH, Schulstr. 20, 37213 Witzenhausen, Germany

Data about the prevalence of health indicators give important information about animal welfare in a flock. Therefore, a number of protocols were developed. As a consequence of time needed for the assessments and the stress level for the animals, the sample size has to be limited. Animal welfare protocols like the Welfare Quality® Protocol, AWIN® or the KTBL® were developed, recommending the scoring of 50 up to 100 to 150 animals/flock. The aim of the present study was to systematically calculate sufficient high sample sizes for flocks of 50, 100, 200 up to 10,000 animals with acceptable margins of error of 1 to 10 % and confidence intervals of 90 to 99 %. Secondly, we simulated how the accuracy of the assessed prevalence changes when it deviates from the expected prevalence that was used for sample size calculation. In a last step, we additionally simulated the influence of detection bias due to observer or method errors. In the simulated data, an observation refers to a nonspecific but theoretically binominal trait. Analyses were conducted with JMP 15. Results presented in nice figures and tables show impressively the range of possible assessed prevalence for specific sample- and flock sizes and in how far the median differs significantly from the median of the true flock prevalence. We show e.g. that even in a small flock with 400 animals and an expected prevalence of 30% (CI= 95%) a sample size of 179 animals is needed what is more than the 50-150 recommended in the assessment schemes. Another example we present: an expected prevalence of 1%, in a population size of 400, leads to a sample size of 16. But what if the detected prevalence is 10%? The margin of error would be around 15%, what means the true prevalence could lay between >0 up to 25%. We think, the awareness of these ranges is important, not only for scientific investigations, but also for the practical case when reward or sanction systems are to be introduced on the basis of prevalence.

Introducing blood gas and ionogram analysis in swine farms for diagnostic and studies : sows reference values and practical aspects

M. Couteau¹, M. Chabane², E. Cantaloube¹, M. Delsart², V. Prodhomme¹, C. Guilloton¹, P. Y. Moalic³

¹ Chêne Vert Conseil Vétérinaire, Swine, 2 rue Blaise Pascal ZA Bellevue II, 35220 Châteaubourg, France, ² Ecole Nationale Vétérinaire d'Alfort, Livestock, 7 av. Général de Gaulle, 94700 Maisons-Alfort, France, ³ Bio Chêne Vert, R&D, rue Blaise Pascal ZA Bellevue II, 35220 Châteaubourg, France

The acid-base balance in sow can be influenced by various factors, including feeding behavior, electrolyte balance, heat stress, and respiratory diseases. Disorders related to acid-base balance may be suspected in cases of well-being, performance and health problems such as lameness, sudden death, prolonged farrowing, and apathy. Additionally, nutritional and rearing strategies are evaluated in the field based on animal performance. Blood parameters could help evaluate the influence of certain controlled variables, and detect bias. Objectives: In the initial phase, our goal was to develop practical recommendations to ensure reliable results in terms of sampling and sample management. Then, the final objective was to determine, de novo, reference values for sows. Materials and Methods: We utilized the CLSI guidelines, adapted by the ASVCP. A direct sampling survey was conducted to establish de novo reference values for sows in early gestation, 5 days before and 5 days after farrowing. We included 12 French standard farms with indoor housing on concrete slatted floors and a diet consisting of commercial feed. These farms demonstrated high productivity results and sow mortality rates below 10%. Point-of-care analyzer was used on the farms. Results: The blood gas and ionogram analysis conducted on the farm yielded reliable results, provided that several pre-analytic requirements were met. A total of 440 healthy sow results were selected to determine the reference values. As a result, reference values have been established.

Session 23

Fecal biomarkers in piglets: assay validation

A. Pelegrí-Pineda¹, Y. Saco¹, R. Pato¹, R. Peña¹, J. Suppi², E. Llauradó-Calero², D. Solà-Oriol², A. Bassols¹

¹ Autonomous University of Barcelona, Veterinary Clinical Biochemistry, Bellaterra, 08193 Barcelona, Spain, ² Autonomous University of Barcelona, Animal and Food Science, Bellaterra, 08193 Barcelona, Spain

Weaning is a stressful event that contributes to intestinal and immune system disorders in piglets, being an important problem in the swine industry worldwide. Measuring inflammatory biomarkers in fecal samples could be a good method to carry out a non-invasive diagnosis. The purpose of this study is to validate different analytical methods for assay biomarkers to predict intestinal inflammatory processes in pigs. Adenosine deaminase (ADA), alpha-1-antitrypsin (AAT), Calprotectin, immunoglobulin A (IgA), lactoferrin, lipocalin-2 (LCN-2), neopterin and myeloperoxidase (MPO) are potential biomarkers suitable for intestinal inflammatory disorders. Different kits and methods were evaluated following the recommendations of the American Society for Veterinary Clinical Pathology (ASVCP guidelines). Immunoturbidimetric assay for calprotectin, ELISA assays for LCN-2, IgA, neopterin and AAT and enzymatic colorimetric methods for ADA and MPO were adapted to fecal samples. Human specific kits were tested for calprotectin, lactoferrin, neopterin and ADA. Calprotectin, LCN-2, IgA, MPO and ADA achieved good accuracy obtaining an intra and inter-assay CV < 20%, recovery between 80-120% and $r^2 > 0,97$ for linearity under dilution. However, neopterin, lactoferrin and AAT did not reach satisfactory results due to low concentration samples and poor results in linearity study. Analytical validation is the first step in the development of new potential biomarkers of intestinal health. This will allow their use to monitor health status and welfare in weaning piglets.

Influence of pastoral management on the conservation of the cultural landscape and biodiversity of mountain pastures

M. Probo¹, C. Pauler¹

¹ *Agroscope, Grazing Systems, la tioleyre 4, 1725 Posieux, Switzerland*

Mountain pastures are among the richest ecosystems in terms of plant and animal diversity. Moreover, they provide food, offer essential regulating ecosystem services to society (e.g., soil carbon storage, water purification, wildfire prevention) and are most valuable for tourism. Mountain agro-ecosystems are characterized by small-scale variability of abiotic factors (e.g., altitude, aspect, slope, bedrock). However, these systems are not natural, but the result of human pastoral management carried out for millennia. Traditional management has utilized the different feeding behavior of a variety of livestock species and breeds, as well as their specific impact on vegetation (e.g., trampling, nutrient and seed transport). Herd management techniques, animal selection and stocking rates, grazing periods and frequencies have been adapted to ensure sustainable use of the fodder resource. In recent days, traditional management is challenged by socio-economic and structural changes: direct payment policies influence management decisions, an increasing pressure of large predators complicate grazing, and climate change affects management conditions by altering pasture yield and its seasonal growth. In face of these changes, farmers have to newly define what site-adapted management means. Thereby, they have to avoid over- and underuse: in underused areas, wood succession leads to a loss of pastureland, biodiversity and appealing landscape. Management intensification, on the other hand, causes degradation, erosion, nutrient leaching and also decreasing biodiversity. However, new technologies, enhanced knowledge transfer and result-oriented policies have the potential to promote new site-adapted management strategies to maintain mountain pasture ecosystems.

Theatre 2

Trends in the association of herbivores and pigs in the Massif Central

C. Roguet¹, S. Honor¹, H. Rapey², B. Dounies³

¹ *IFIP, Economics, La Motte au Vicomte, BP35104, 35651 LE RHEU, France,* ² *INRAE, UMR Territoires, 9 Avenue B. Pascal, 63170 AUBIERE, France,* ³ *Association Porc Montagne, Cité régionale de l'Agriculture, 9 allée P. de Fermat, 63170 AUBIERE, France*

The Massif Central in France is a mountainous and grassland territory, primarily dedicated to grazing livestock. On 15% of the national area, it concentrates 54% of the country's dairy sheep, 37% of the beef cattle, 33% of the meat sheep, 19% of the goats, 11% of the dairy cattle, 6% of the chickens and 5% of the pigs in 2020 according to the agricultural census. Out of 39,065 farms with a significant livestock (excluding farmyards) in 2020, 2,155 have granivores, mostly associated with herbivores. More precisely, 75% of pig farms have herbivores, beef cows in 62% of cases and milk cows in 24%. But these mixed farms have declined more sharply than the specialists over the last 10 years. This raises multiple concerns within the pig sector which has strong roots in this territory (quality signs, slaughterhouses, gastronomy, etc.). The APOR THE multi-partnership action-research program is interested in pig farms in the Massif central. A recent analysis carried out using individual data from the 2020 agricultural census, compared to 2010, showed that the decrease in the number of pig farms (-28% in 10 years) comes from a sharp decline in the pig-dairy association (-45%) and to a lesser extent in pig-beef cattle association (-25%). As a result, our drawn typology showed a large proportion of pig farms with beef cattle in 2020. Other results specify the extent of the changes in the herbivore-granivore association between 2010 and 2020. Our communication will enlighten the trends and the future of these mixed animal farms which remain essential for the agricultural and local economy of several sectors of the Massif and other mountain areas.

Contribution of livestock in organic agriculture development: a study on nitrogen flows in expansion scenarios in France

F. Vergely¹, A. Wilfart¹, J. Aubin¹, S. Harchaoui¹

¹ INRAE, Institut Agro Rennes-Angers, 65 Rue de Saint-Brieuc, 35000 Rennes, France

The European Green Deal has established a goal of achieving a minimum of 25% of the EU's agricultural land under organic agriculture (OA) by 2030, compared to 9.9% currently. Nitrogen has been identified as the main limiting factor for the expansion of OA. Biological nitrogen fixation (BNF) by legume crops is the main nitrogen input available to OA supporting the entire OA agri-food system either through crop rotation or livestock integration. However, the contribution of organic and conventional livestock on the growth of OA, influenced by OA regulations, is barely addressed in the scientific literature. Here we examine the role of livestock in OA in the circularity of nitrogen of the agri-food system, in particular from grassland to cropland and its role on the proportion of animal proteins in human diets. We calibrated the ALPHA nitrogen budget model (Chatzimpiros and Harchaoui, 2023) based on national statistics and survey data to assess current nitrogen flow metabolism at the national scale for the case of France. We simulated various scenarios to achieve the 25% OA target, taking into account key variables including the proportion of ruminant and monogastric, feed composition and feed import, manure management efficiency and crop rotation strategies. In 2021, French OA demonstrated a 78% nitrogen self-sufficiency, with BNF contributing for 50% of nitrogen inputs. The remaining 22% of external inputs were evenly split between imported feed and conventional manure. The paper presents contrasting nitrogen circularity scenarios for OA that highlight the dynamics between organic and conventional livestock farming in terms of land use, self-sufficiency, food production and protein content in human diet.

The representations and attractiveness of livestock farming professions under the influence of societal issues. The French situation in a European perspective

A. C. Dockes¹

¹ Institut de l'Élevage, 149 rue de Bercy, 75595 Paris cedex 12, France

Livestock farming is the subject of a socio-technical controversy based on different levels of uncertainty. These relate to environmental and climate issues, animal condition, human and animal health, and, more generally, farming models and ethics. This controversy, which began in the 1980s, continues today. Even though livestock farmers have a rather good image, the general public, who know little about the realities of livestock farming, nevertheless have high expectations about livestock farming practices and models. Farmers, for their part, although aware of the challenges facing society, and sometimes proactive in taking these issues into account, often feel accused and questioned in their ways and even in their professional legitimacy. In this paper we will firstly present the current state of the societal controversy in France and Europe and propose 5 profiles of citizens described according to their expectations of livestock farming and their consumption of animal products. "We will secondly describe how farmers perceive this controversy, with those who share part of the criticism and are developing alternative models, those who feel that better communication should enable a compromise solution to be found, and those who feel under attack and react mainly negatively to questioning. By combining these representations with attitudes to change, we propose 4 livestock farmer profiles. We will thirdly present the effects of the controversy on the attractiveness of the profession, in particular its image in the general public and in the vocational universities, the conditions under which it is practised and the profiles of those who set up in business. In a fourth part we'll look at the various types of action taken by farmers and the industry: quality scheme initiatives, individual or collective communication campaigns, adaptation of farming practices and systems. Finally we will conclude with a discussion of the avenues to be explored to build a social consensus around livestock farming.

Life cycle and ecosystem services assessments provide opposite evaluations of the food and non-food contributions of livestock farming systems

F. Joly¹, P. Roche², J. Dewulf³, H. M. Van Der Werf⁴, L. Boone³

¹ INRAE, UMR Herbivores, 63122 St-Genes Champanelle, France, ² INRAE, UMR Recover, 13182 Aix-en-Provence, France, ³ Ghent University, Coupure Links 653, Ghent, Belgium, ⁴ INRAE, SAS, 35000 Rennes, France

Life cycle assessment (LCA) and ecosystem services assessment (ESA) are often used for environmental evaluation. LCA is commonly applied to agro-ecosystems to assess the negative environmental impacts of food production (e.g. emissions of CO₂-eq.), whereas ESA is applied to assess the positive contributions of agro-ecosystems, such as the supply of regulating ecosystem services (e.g. pollination or erosion prevention). Here, we applied both frameworks to a selection of twelve contrasting French meat-production systems, including two ruminant species (sheep and cattle) and two monogastric species (chickens and pigs). The LCA indicated that ruminant systems had more negative impacts than monogastric systems, which is a well-known result. For example, the production of one kg of human edible protein emitted in average 280 kg CO₂-eq for ruminants, and 32 kg CO₂-eq for monogastrics. This result is due, in particular, to the methane emitted during the rumination process. Oppositely, ruminant systems can supply more regulating ecosystems services than monogastric systems. The mean respective scores related to these services were 2.42 and 1.15, respectively. This result is due to the presence of semi-natural habitats such as grasslands in ruminant systems. Our results show the opposition between the rating of food production by LCA, and the rating of non-food contributions by ESA. Our study stresses the need to reconcile these frameworks, as they can guide decision-making in opposite directions.

Session 24

Theatre 6

Beyond the Pigs: Socio-Economic Impacts of African Swine Fever (ASF) on Indigenous Breeds in Bulgaria and Eastern EU

G. Angeloni^{1,2}, E. Lazzaro^{1,2}, A. Cristalli², R. Doneva³, D. Dimitrova^{4,5}

¹ IZS delle Venezie, V.dell'Università 10, 35036 Legnaro, Italy, ² VSF Italia, V.dell'Università 10, 35036 Legnaro, Italy, ³ Association for Breeding and Preserving East Balkan Swine, 3 Simeon Veliki Blvd., 9700 Shumen, Bulgaria, ⁴ Institute of Biodiversity and Ecosystem Research, Bulgarian Academy of Sciences, 2 Mayor Yuriy Gagarin Str., 1113 Sofia, Bulgaria, ⁵ Slow Food Bulgaria, 9 Pierre De Geytre St. bl. 3, 1113 Sofia, Bulgaria

The study aimed to assess the impacts of ASF outbreaks on indigenous pig breeds, focusing on East Balkan swine (EBS), which represents Bulgaria's last local pig breed. Conducting extensive fieldwork, interviews with farmers and veterinarians (overall number=32), and a workshop with various EU stakeholders (>100 participants), the study explored the effects of ASF on EBS and backyard farmers in Bulgaria. The findings revealed the extensive destruction of backyard farms during the epidemic and a near-total loss of EBS herds. EBS farmers identified trade restrictions (77.8%) as the most significant consequence; 66.7% of EBS farmers reported direct impacts, but only 60% of affected farms received subsidies, often insufficient to cover their losses (60% of their income came from meat selling that is still forbidden for EBS farmers). ASF was confirmed as a major challenge for other local breeds like Bazna Pig (RO) and Mangalitz (HU), even if significant disparities in financial support and implementation of preventive measures emerged when comparing different EU realities. The study emphasized ASF's long-term risks, including disruptions to local economies, loss of cultural heritage, biodiversity reduction, and increased land abandonment. Comparisons among European realities revealed significant disparities in measures, such as financial support to local breeds. There is a pressing need for strengthened collaboration among veterinary authorities and rural development stakeholders, aligning with EU green policies during sanitary crises. Tailored policies and regulatory adjustments are essential to preserve animal biodiversity, traditional breeding farms, and linked economies. Finally, there are currently no clear indicators to quantify the economic, social, and cultural value of EU indigenous breeds, reflecting the multifaceted roles of livestock.

Biopolymers of animal origin: production, properties and applications

V. Khutoryanskiy¹

¹ University of Reading, Reading School of Pharmacy, Whiteknights - PO box 224, RG66AD Reading, United Kingdom

In the pursuit of sustainable and biocompatible materials for pharmaceutical, biomedical and cosmetic applications, biopolymers derived from animal sources have emerged as promising candidates. These biopolymers offer unique properties, including biodegradability, biocompatibility, and low toxicity, making them valuable in various formulations. Gelatin, collagen, chitosan, and hyaluronic acid are among the most important industrially relevant biopolymers derived from by-products of animal industry. These biopolymers have diverse range of pharmaceutical, biomedical and cosmetic applications. For example, gelatin is an important pharmaceutical material used for manufacturing of hard and soft capsules as well as suppositories. Collagen is commonly used as a dressing in wound management as well as a matrix for tissue engineering. Chitosan-based formulations exhibit mucoadhesive properties, enabling targeted drug delivery to mucosal surfaces such as the gastrointestinal tract, the eyes and nasal cavity. Hyaluronic acid-based products offer visco-supplementation in osteoarthritis treatment, lubrication in ophthalmic solutions, and hydration in dermal fillers. Some animal-derived biopolymers such as heparin and insulin have specific pharmacological activities. Heparin is used as a blood anticoagulant and insulin is a hormone that is used in the management of diabetes mellitus. In some cases, these materials could be chemically modified further to impart additional properties, for example, adhesive properties of gelatin could be significantly improved by introducing unsaturated functional groups through reaction with crotonic, itaconic, and methacrylic anhydrides. Methacrylated gelatin is also commercially available as a material for producing hydrogels for tissue engineering. Mucoadhesive properties of chitosan could be altered by grafting short-chained non-ionic polymers; these derivatives could be used to formulate mucus-penetrating nanoparticles for drug delivery. This talk will provide an overview of animal-derived biopolymers, describe some of the methods used for manufacturing these materials, highlight their applications in pharmaceuticals, biomedical, and cosmetic industries, as well as discuss the challenges associated with the use of materials of animal origin.

Theatre 8

Valorization of a waste from food industry: bovine hide to leather

S. Zanchin², G. Zorzi¹

¹ UNIC, Via Brisa, 3, 20123 Milano, Italy, ² Hide S.p.A., Via Piave 11/13 Curtarolo, 35010 Padova, Italy

From cattle's slaughtering process, great amounts of hides are obtained as by-product. Excluding the small portion used by edible gelatine industries, the majority of that undergoes tanning operations resulting in genuine leather, nowadays in an increasingly sustainable way (1). Raw hides not intended to become leather or edible gelatine must be destroyed. Taking into account the ratio between the weights of raw hide and whole animal, this fraction is very low, while considering the economic value of leather compared to that of cattle's food derivatives, leather is high value-added final manufacture product. Hide's tanning is one of the first examples of circular economy. A waste is used as a raw material for another industrial sector to create valuable products, placed on several markets, e.g. shoes, leather goods, garments, upholstery, car interiors. Recently, a number of leather substitutes emerged, some of them claimed as "sustainable-vegan leather". However studies show that, at the moment, genuine leather is far superior on the basis of different aspects:– Renewable carbon percentage in leather, as the starting point is livestock, is on average higher than alternatives (2)– Most of the alternatives is made by synthetic polymers and fibers, those manufacture starts from fossil resources (3)– Taking into account the technological and mechanical properties, leather surpasses several substitute materials (3): leather goods last longerReferences:1) Kanagaraj, J., Panda, R. C., & Kumar, V. (2020). Trends and advancements in sustainable leather processing: Future directions and challenges—A review. *Journal of Environmental Chemical Engineering*, 8(5), 1043792. Cross-analysis of crop-livestock integration, sustainability and biodiversity on 10 French experimental farms
G. Martel¹, J. Pourias², J. Bernier^{1,2}

¹ UMR BAGAP, INRAE, Institut Agro Rennes Angers, ESA Angers, 55 rue Rabelais, 49000 Angers, France, ² Chambre d'Agriculture de Bretagne, Avenue Borgnies Desbordes, 56000 Vannes, France

Over the past 60 years, crop rotations have been simplified and now these systems have environmental, social and economic limitations. Putting crop-livestock interactions back at the heart of food production systems is a possible avenue for improvement. This study tried to evaluate the link between the level of crop-livestock interaction (CLIL) and farm performances in terms of biodiversity and, more generally, sustainability. The IDEA4 (Farm Sustainability Indicator, version 4) and BIOTEX (Biodiversity for the Farm) methods associated with NiCC'El (Crop-Livestock Interaction Level) enable this exploration. These methods have been implemented on 10 french experimental farms and scores were analyzed using Kruskal-Wallis tests. Of the 10 farms, 4 are classified as low CLIL, 3 as intermediate CLIL and 3 as high CLIL. As the farms do not have profitability as their primary objective, the economic dimension is often the limiting factor in IDEA4. The CLIL is significantly correlated with the score for the socio-territorial dimension, and a positive correlation trend is observed with the agroecological dimension. Quality and diversity of products sold, feed and fertilization autonomy, sobriety in the use of resources and reduction of impacts on ecosystems are thus more favorable in farms that have high CLIL. In BIOTEX evaluations, high CLIL farms fare better than low CLIL farms in terms of crop and grassland management, but seem to contribute less to land-use diversity. All these tools complement each other, but the time required to collect the data needed to carry out these diagnoses is a limiting factor when considering extending this study to a large number of commercial farms

Session 24

Theatre 10

Bee friendly livestock systems

L. Garcia¹, J. C. B. Dubeux¹, M. A. Bernardini¹, A. Cuminal², W. Piwowarek³

¹ University of Florida, North Florida Research and Education Center, 3925 Hwy 71, 32446 Marianna, United States, ² University of Auburn, Bee lab, Bee lab Rd, 36849 Auburn, United States, ³ University of Florida, Entomology and nematology Department, 1881 Natural area Dr, 32611 Gainesville, United States

The introduction of legumes and brassicas into grasslands increases floral resources that benefit pollinators, native wildlife, and a range of ecosystem services with positive economic consequences. The objective of a couple of studies was to assess bee species presence in a multi-species forage trial and a grazing trial at North Florida. Thirty plots of 1.8 x 3 m with 0.9 of allies between them. Emergence traps were set over the 30 plots during the last week of April to June for two years. Every week the traps were moved inside the same plot and the insects collected were placed in vials with 70% alcohol for posterior identification. The flower counting and the soil cover percentage were performed every two weeks from April to June, and once per month, a 5 min pollinators visual surveys were performed. In the grazing trial, three treatments—grass with N fertilizer, no fertilizer, and a mixture of grasses with legumes—were each replicated three times. Bowl traps were deployed for 24 hours once per month over 2 years. In the multispecies trial bee abundance and richness were notably higher in the grass-legume system. Visual survey results indicated a significant effect of the year: in the first year, there was a statistically significant difference between treatments and the control ($P < 0.05$), as well as among the number of functional groups. However, in the second year, treatments did not significantly differ from the control. In the grazing trial, the abundance of bees was notably higher in the grass-legume system compared to the Grass+N system ($P = 0.01$). Additionally, a significantly greater density of flowers was observed in the grass-legume system compared to Grass+N ($P < 0.05$). In conclusion, these studies demonstrate that well-managed grasslands play a crucial role in enhancing landscape structure and flower resources, thereby offering stability to bee communities.

Theatre 11

Closing remarks

M. R. Lee¹, F. O'Mara²

¹ Harper Adams University, Newport, TF10 8NB Shropshire, United Kingdom, ² Teagasc, Oak Park, R93 XE12 Carlow, Ireland

Since 2013, the ATF-EAAP Special Session during the EAAP Annual Meeting aims to bring together animal science with practice of animal production and connect researchers, policy makers, industry representatives and societal organisations. Every year, a different topic is addressed during this half-day session. Once again, and for the 4th time, the EAAP Livestock Farming Systems Study Commission and the ATF Special Session have joined into a one-day symposium. The theme is Livestock are more than food. The discussion will continue in November in Bussels during the ATF the symposium.

Session 25

Theatre 1

Formulating balanced diets with local agricultural by-products from Greece as sustainable feed ingredients of *Tenebrio molitor* larvae

F. Kokonaki¹, C. Adamaki-Sotiraki¹, C. I. Rumbos¹, C. G. Athanassiou¹

¹ University of Thessaly, Laboratory of Entomology and Agricultural Zoology, Department of Agriculture, Crop Production and Rural Environment, Phytokou Str., 38446 Volos, Greece

Agricultural by-products hold many advantages as potential insect feeding substrates. Taking into account the growing demand for insects as alternative proteins, through the valorization of by-products as insect feedstocks, waste management is promoted. However, to meet the nutritional requirements of farmed insects, composed diets combining diverse ingredients should be designed. In this context, the present study evaluates local agricultural by-products from Greece stemming from the production of triticale, oat, barley, cotton cake, lupin, hempseed, and rice as diet ingredients for *Tenebrio molitor* larvae. Briefly, four distinct groups of isoproteic and isolipidic diets were formulated, each group varying in protein content from 17 to 25% and lipid content from 4.1 to 4.8%. Within each group, different diets were designed, incorporating the aforementioned by-products at various percentages. Through this approach, we aimed to explore the synergistic effects of different agricultural residues on insect growth and development. In a first trial, the growth and performance of 50 newly-hatched larvae fed with the different diets was evaluated in lab scale. In a second trial, the diets that performed best were evaluated in pilot scale with 10,000 larvae. The results showed that diets with balanced ingredients deriving from local agricultural by-products are suitable as feeding substrates for *T. molitor* promoting larval growth and sustainable insect farming. This research is supported by the EU-PRIMA program project ADVAGROMED (Prima 2021 – Section 2).

Yellow mealworm larvae fed on Italian by-products

S. Bellezza Oddon¹, I. Biasato¹, Z. Loiotine¹, A. Resconi¹, L. Gasco¹

¹ *University of Turin, Department of Agricultural, Forest and Food Sciences, Largo Paolo Braccini, 2, 10095 Grugliasco, Italy*

To improve sustainability in yellow mealworm rearing, the utilization of by-products needs enhancement. For this purpose, various by-products were collected: wheat groats, wafer dough, dry distillery stillage, coffee silvery film, rice by-products, Christmas dessert, breeding and feed waste. These by-products were used to formulate 3 iso-proteic, -lipidic, and -energetic diets (TM1, TM2 and TM3), and wheat bran was tested as a control (C). The trial was conducted on a large scale (10000 larvae/replicate and 4 replicates/treatment) starting from 4 weeks old (WO) larvae. The sampling operations was performed every week until the difference in the percentage of larval weight between two consecutive sampling was lower than 50%. At the end of the trial, the number of larvae was estimated, and the biomass was weighed to calculate survival rate and feed conversion ratio (FCR). A sample of larvae was collected for chemical analyses (dry matter, DM; crude protein, CP; ether extract; ash and chitin). Data were analysed by One-Way ANOVA (SPSS, V20.0.0). No differences in terms of weight were observed from 5 to 7 WO larvae, while the C, TM2 and TM3 larvae reached higher weight than TM1 at 8 and 9 WO ($p < 0.01$). Dietary treatment did not influence the survival rate and FCR. Larvae fed on C diet showed the lowest DM and the highest CP ($p < 0.01$). Both C and TM3 larvae showed a larger amount of ash than the other diets ($p < 0.01$). The TM1 and TM2 larvae were fatter than C and TM3 groups ($p < 0.001$), which were statistically different ($p < 0.001$). No difference in terms of chitin was detected. In short, the TM3 diet, characterized by the inclusion of rice by-products, demonstrated greatest performance in both growth and chemical composition.

WP2 – Local agricultural by-products as substrate for insects: results in Portugal

R. Antunes¹, R. Fantatto¹, C. Ligeiro¹, D. Murta¹

¹ *Entogreen - Ingredient Odyssey S.A, R. Eng. Albertino Filipe Pisca Eugénio 140, 2005-079 Várzea, Portugal Santarém, Portugal*

The ADVAGROMED WP2 aims to valorize local agricultural by-products that have no economic value for small farms and agri-food industries in Italy, Greece, Portugal, Spain, and Morocco, which could be exploited as insect feeding substrates. Four by-products were selected for insect diet trials based on their availability throughout the year: white melon, broccoli, olive pomace, and wheat bran. Diets were designed using linear model software to obtain different by-product mixtures with a relative moisture level of 70% and a crude protein content (~5%) comparable to a control diet composed of Gainesville compound feed. Juvenile Black Soldier Fly (BSF, *Hermetia illucens*) larvae were inoculated in boxes (40×60 cm) in three replicates per diet and allocated in the environmentally controlled room. The bioconversion period was monitored daily, and the environmental conditions were adjusted accordingly over time. The following parameters were determined for each diet: total larval weight (fresh), individual larval weight, feed conversion ratio (FCR), and survival rate. Based on performance results (1.8 kg/box of larvae, 78.98 mg per larva, 77% survival rate, 7.53% FCR), diets composed of melons and olive pomace were selected to feed the BSF larvae, aiming to produce fresh larvae (and frass) for use in WP3 by the SERIDA partner. Moreover, surveys are being conducted to outline the reality in Portugal regarding the availability and utilization of by-products and other potential insect rearing substrates. The objective is also to design strategies for the storage of these by-products to ensure their availability for insect production, thereby laying the groundwork for the growth of a new bioindustry in Portugal.

Effect of different diets on the larvae growth performance of Black Soldier Fly « *Hermetia illucens* »

In the search for new sources of ecologically sustainable feed, numerous research studies have demonstrated the alternative role that the larvae of the black soldier fly *Hermetia illucens* could play in animal nutrition. Our study was carried out with the aim of researching potential diets of high nutritional value of agricultural by-products collected at Ain Taoujdate, and testing their effects on the growth performance of larvae. The selected by-products were apple, pumpkin, beetroot, eggplant and gainsville. The by-products, were prepared at the required moisture (70%). The trial consists of grinded by-products of 5 diets. The juvenile larvae were incubated in a growing room (26°C and 70% of humidity). The daily weight, length, width, survival, total amount and dry matter of larvae was registered. Our results showed that larvae are growing fast using gainsville, eggplant and moderately with beetroot. These three diets showed high values in terms of survival rate and dry matter of larvae.

Session 25

Theatre 5

Effect of agro-industrial by-products-based diet on the gene expression of antimicrobial peptides in *Tenebrio molitor* L. (Coleoptera: Tenebrionidae) larvae

V. Candian¹, S. Bellezza Oddon¹, I. Biasato¹, L. Gasco¹, R. Tedeschi¹

¹ University of Turin, Department of Agricultural, Forest and Food Sciences, Largo Paolo Braccini 2, 10095 Grugliasco, Italy

Several researches confirm that the exploitation of agricultural by-products for insect rearing could offer a possibility for considerable reduction of the production cost, whereas it contributes to the enhancement of the sustainability profile of insect production. Potential rearing substrates are often evaluated taking into account their influence on larval survival, growing performance and substrate reduction capacity. However, variations in diet composition could also influence insect immune responses and therefore their susceptibility to entomopathogens. In the frame of the ADVAGROMED project, the effect of the diet on the gene expression of antimicrobial peptides (AMPs) was evaluated in *Tenebrio molitor* L. (Coleoptera: Tenebrionidae). Analyses were performed on mature larvae reared on wheat bran, used as a control diet, and on three agro-industrial by-products-based diet containing: i) wheat groats, wafer dough, vinasse, coffee silvery film, breading waste and feed waste; ii) wafer dough, breading waste, feed waste and panettone; iii) rice husk, rice chaff, rice middlings, breading waste and feed waste. AMPs encoding gene expression levels were evaluated through RNA extraction and RT-qPCR analyses. The gene expression of three AMPs (one Cecropin, one Coleopterecin and one Tenecin) was assessed. The influence of diet on the expression of different AMPs was observed in our trials highlighting the importance of considering this aspect during diet formulation in large-scale productions. Diets that are not favourable to the immune system could be supplemented with products that act positively on the insect immune responses (supported by ADVAGROMED PRIMA project).

WP3 – The use of live insect larvae as feed ingredients for local poultry strains

*I. Biasato*¹, *S. Bellezza Oddon*¹, *R. García*², *I. Giannenas*³, *A. El-Yacoubi*⁴, *C. Athanassiou*³, *C. Rumbos*³, *R. Antunes*⁵, *D. Murta*⁵, *L. Gasco*¹

Eng. Albertino Filipe Pisca Eugénio 140, 2005-079 Várzea, Portugal

The WP3 of the ADVAGROMED project aims to investigate animal performance, welfare and health, and product quality of local poultry breeds reared in four Mediterranean countries (Italy, Greece, Spain and Morocco) and fed live insect larvae as feed ingredients of diets formulated using local raw materials. *Hermetia illucens* (HI) and *Tenebrio molitor* (TM) live larvae will be included at 5 and 10% (on dry matter) of the daily feed intake of the birds, by partially or completely replacing a feed mix (characterized by high-quality, highly digestible, and less sustainable ingredients) that will mimic (being isonitrogenous and isonergetic and containing similar amino acid contents) their nutritional profile. Two egg-type (Bionda Piemontese [Italy, fed TM live larvae] and Pita Pinta [Spain, fed HI live larvae]) and meat-type (Black-Bronze turkey [Greece, fed TM live larvae] and Beldi chicken [Morocco, fed HI live larvae]) strains will be reared (6 replicates/diets, 10 birds/diet) for 12 weeks (egg-type strains) or 60 days (meat-type strains), and bird productive performance (growth indices, egg production rates, and carcass traits) will be recorded. Animal welfare (by means of plumage status, behaviour, and corticosterone analyses) and health (in terms of blood and postmortem investigations) will also be considered, along with physico-chemical quality and consumer acceptance of the final products (eggs and meat).

Session 25

Theatre 7

Responses of Pita pinta laying hens fed live black soldier fly (*Hermetia illucens*) larvae in Northern Spain

*R. Rosa-García*¹, *R. Antunes*², *M. Menéndez-Miranda*¹, *L. Royo*¹, *A. Somoano*¹, *D. Murta*², *F. Vicente*¹, *A. Perez-Arcoiza*¹

The use of insects as bioconverters of local by-products to feed laying hens could be an efficient alternative to reduce the use of imported feedstuffs and their associated environmental impact. However, little is known about their potential for poultry production systems based on autochthonous breeds. Within the ADVAGROMED project, the animal performance, welfare, health, and product quality of Pita pinta laying hens fed live *Hermetia illucens* (HI) larvae were studied. Three treatments (control, H5 and H10) with 3 replicates and 10 birds/replicate were applied for 12-weeks. HI live larvae were added at 0% (control), 5% (H5) and 10% (H10) of the expected bird daily feed intake, by partially or completely replacing it by a feed mix that mimicked their nutritional profile (but with less sustainable ingredients). Egg production and physico-chemical quality, animal welfare (plumage status and corticosterone levels), and health status (blood and faecal parameters) were assessed in three periods (T0, T1 and T2). Preliminary analyses showed no differences in life weight of Pita pinta hens, egg shape index and eggshell thickness between treatments. Egg shell weight was lower in H10 eggs than in the other treatments in T1. The highest values of Haugh Units and yolk index were found in control and H10 eggs respectively during T1. This study provides important information about the potential role of live larvae as feed ingredients for sustainable local poultry productions.

Insect frass and poultry manure: a novel circular economy approach for sustainable vegetable production in the Mediterranean regions. The PRIMA project ADVAGROMED experiences

The goals of the ADVAGROMED is to integrate organic fertilizers such as insect frass (IF) and poultry manure (PM) into sustainable agricultural practices to enhance local agro-biodiversity. The project aims to achieve several objectives, including testing insect-derived products as biofertilizers, evaluating their effects on plant growth and soil fertility, and developing guidelines for their use in Mediterranean agriculture. Agronomic trials have been conducted in growth chambers and open fields by various project partners distributed in different Mediterranean countries. We tested the impact of IF and PM on the crops performance and nutritional characteristics of local varieties (Brassicaceae, Solanaceae, Asteraceae, Fabaceae, Poaceae, Amaryllidaceae). The tests conducted in growth chambers and in vitro revealed a potential phytotoxic effect of both IF and PM at high doses. The results from field trials indicate that the use of IF and PM allows for yields similar to those obtained with chemical fertilizers, without compromising the quality of tomatoes (°Brix, titratable acidity, and mineral content). In addition, an increase in various productivity indicators has been observed in peppers. Supported by PRIMA 2021 ADVAGROMED project.

Session 25

Theatre 9

The effect of added insect frass as a soil amendment in the NPK content of two pepper varieties

G. Thalassinou¹, N. Papadimitriou¹, V. Antoniadis¹, E. Levizou¹, C. Rumbos¹, C. Athanassiou¹

¹ University of Thessaly, Department of Agriculture, Crop Production and Rural Environment, Phytokou Str., 38446 Volos, Greece

Insect frass is a waste material high in organic C and bioavailable macronutrients, like N, P and K. In a 3-month pot experiment, we tested frass from *Tenebrio molitor* larvae and poultry manure as soil amendments in the cultivation of two pepper plant varieties, “Bachovitiki” and “Florinis”. Frass was added at 0.5 and 1%, and poultry manure (PM) at 2.5 and 5% to two different soils (one of light texture-Larissa, and one of medium texture-Velestino). There were also two control treatments, one negative (NC; no additions) and one positive control (PC; inorganic fertilizer). This experimental design resulted in 240 pots (6 treatments × 2 soils × 2 pepper varieties × 10 replicates) of a capacity of 10 L each. We found that leaf N content increased significantly in both soils and in both pepper varieties with added frass and PM. Irrespective of the soil, N at NC was ca. 2% and it increased significantly in the highest PM rate of 5% to the levels of 3.3% in Bachovitiki and 2.6% in Florinis (in the sandy Larissa soil); similar was the case in the loamy Velestino soil. This shows that the rate of increase of N in pepper leaves was variety-dependent rather than soil-dependent (i.e., there were no considerable differences among the two soils when same frass and PM treatments were compared). As for P, it was 1.5‰ at NC in the Larissa soil in both varieties, while it was 2.5‰ in the more fertile Velestino soil. Although P uptake was soil-dependent, with added frass and PM the P levels increased significantly in both soils and in both varieties, reaching 3‰ for both varieties in Larissa and 4‰ (Bachovitiki) and 4.5‰ (Florinis) in Velestino. Similar were the trends for K: at NC pepper leaves contained K in the range of 2.5-3% in Larissa and 3-3.5% in Velestino, indicating the sufficient levels of available K in both soils even at NC, probably due to the over-fertilization of these agricultural soils. We conclude that both frass and PM had a positive effect in the nutrition of the two tested pepper varieties in the two soils with varying texture. This research is supported by the EU-PRIMA program project ADVAGROMED (Prima 2021 – Section 2).

Hermetia illucens frass and Pita pinta laying hens manure as biofertilizers for Asturian crops: effects on seed germination and growth

A. Perez-Arcoiza¹, C. S. E. Souza², I. Feito¹, G. Gonzalez¹, R. F. P. Antunes³, R. Rosa-García¹

The demands for crops, goods and services boost the use of fertilizers with adverse environmental impacts. Alternative local fertilizers are essential to reduce costs and improve soil health. The ADVAGROMED project explores the effects of frass (F) from *Hermetia illucens* rearing and manure (M) from Pita pinta hens fed with live *H. illucens* larvae on seed germination and seedling growth of *Brassica oleracea* L. var *Viridis*, *Lactuca sativa* L., and *Phaseolus vulgaris* L. var *Verdina* in Asturias, Spain. Four biofertilizers were tested: F and 3 types of M from hens fed with 0%, 5% and 10% larvae addition to their diet, respectively. Ten liquid extracts, from 10% to 100% concentration were prepared from each biofertilizer (pre-treated at 70°C/1 hour) with distilled water (ratio 1/10, w/v) and filtration pore size of 0.8µm. Three replicate petri dishes per treatment were sown with 25 or 15 seeds for *L. sativa*/*B. oleracea* and *P. vulgaris*, and kept at 24°C, 70% RH, 12-hour photoperiod for 7 days. The number of germinated seeds were recorded daily whereas radicle and hypocotyl length were measured after 7 days. Germination index, germination percentage, coefficient of velocity of germination, seed vigor index, mean germination time and T50 were calculated. The four biofertilizers up to 30% concentration improved all germination indexes without surpassing tolerance limits for all species. F and M met nitrogen demands, suggesting they are viable organic alternatives for these crops.

In the context of current climate change, farming methods exploring to decrease their environmental impact are increasingly sought after in recent years. Insect frass was recently used as a sustainable biofertilizer with multiple benefits for crop cultivation. Our investigation aimed to assess the effect of insect frass of black soldier fly on the growth of barley crop in Morocco. Field trials were carried out in Ain Taoujdate, where physicochemical analysis of the soil was released. Based on N content in the insect frass and the rate of N used as reference for barley crop, 6 treatments were used: insect frass at the rate of 1.42, 2.85, 5.7, 11.4 t/ha, negative and positive controls. Morphologic, agronomic and physiologic parameters were measured, including seed germination, plant growth, yield, plant height, flowering dates, dry matter of roots and shoots, number of leaves, leaf area, content in N/P/K and chlorophyll). The aim of our study is to demonstrate the useful rate of application of insect frass for the optimal barley growth under Moroccan climate conditions.

Insect Frass Fertilizer: A Green Solution for Tomato and Brassica Microgreens

M. D'Imperio¹, G. Di Cuia¹, A. Marzulli¹, F. Baruzzi¹, M. Ferrara¹, G. Mulè¹, M. Gonnella¹, F. Gai¹, A. Parente¹

¹ National Research Council, Institute of Sciences of Food Production, Via Amendola, 70125 Bari, Italy

In the near future, a significant increase in insect production is expected, leading to substantial quantities of frass-based residues. Within the framework of the circular economy and agricultural sustainability, these residues can serve as organic fertilizers in agricultural settings, substituting mineral fertilizers, or find utility in controlled environments like greenhouses and vertical farms, where they can be used as cultivation substrates and rich sources of nutrients. This research aimed to assess the impact of frass from *Hermetia illucens* (H) and *Tenebrio molitor* (T) on the nutritional composition of tomato, mizuna and rapini microgreens, in open field (tomato) and growth chamber (microgreens). In both vegetable productions, the utilization of frass exhibited no discernible effects on yield or visual quality. In tomato, the application of T frass didn't induce variations in nutritional parameters in comparison with those observed for the control samples (color, °Brix, titratable acidity, mineral elements). In mizuna cultivated with H frass, there was an increase in mineral content such as Fe (28%) and Zn (147%) compared to the control peat, thereby offering potential health benefits for consumers. Moreover, no contamination by *Salmonella* spp. and *Escherchia coli* or heavy metals was detected in the microgreens. Preliminary results here reported suggest the possible application of frass in different horticultural production in both open field and greenhouse environments. Supported by PRIMA2021 Advagromed project.

Metagenomic insights into the effect of frass fertilizer application on rhizosphere microbial community: the case study of Italian turnip

G. Di Cuia¹, M. D'Imperio¹, G. Mulè¹, M. Gonnella¹, F. Gai², A. Parente¹, M. Ferrara¹

¹ Institute of Sciences of Food Production, CNR, via G. Amendola, 70126 Bari, Italy, ² Institute of Sciences of Food Production, CNR, Largo Paolo Braccini, 10095 Grugliasco, Italy

The intensification of current agricultural practices and production systems is a primary cause imputable for the deterioration of soil quality, erosion, organic matter depletion and decline of soil biodiversity. Organic fertilization is proven to be useful in preserving and enhancing soil microbial communities. Considering the rising of insect farming in the near future, integrating insect frass, as organic fertilizer, into sustainable agricultural practices could enhance and preserve local agro-biodiversity. This research aimed to evaluate the impact of frass, derived from *Tenebrio molitor*, and poultry manure fertilizer application on rhizosphere microbial community of *Brassica rapa* local variety through metagenomics. An open field experiment was set from October 2023 to February 2024 using different fertilizers: chemical fertilizer, organic fertilizer, *Tenebrio molitor* frass, poultry manure and their mixtures. Metagenomic analysis was conducted on rhizosphere samples for each treatment and compared with uncultivated soil sample, in order to evaluate microbial changes during the cultivation period. Statistical comparison among taxonomic categories was performed using STAMP software. Differences between groups were analyzed using Welch's t-test ($p < 0.05$), and the Benjamini–Hochberg false discovery rate (FDR) method ($q < 0.05$) was used. Results indicate that the application of insect frass poultry and manure fertilizer is able to modulate the rhizosphere microbial community. Supported by PRIMA2021 Advagromed project.

Social LCA of a small-scale insect-fed broiler farm

D. Ristic^{1,2}, V. Khieya¹, S. Smetana^{1,3}

¹ German Institute of Food Technologies (DIL e.V.), Prof.-von-Klitzing-Str. 7, 49610 Quakenbrück, Germany, ² University of Natural Resources and Life Sciences (BOKU), Institute of Food Technology, Muthgasse 18, 1190 Vienna, Austria, ³ University of Veterinary Medicine, Institute of Food Quality and Food Safety, Bischofsholer Damm 15, 30173 Hannover, Germany

Application of social LCA (SLCA) is challenging due to the lack of standardization. This research aims to contribute to standardization of SLCA in small-scale farming of black soldier fly larvae (BSFL) farm, and small-scale broiler farm which supplements the broiler feed with live BSFL. For both the insect farm and broiler farm 2 scenarios were considered (with predominantly manual production, and predominantly automated) with 2 additional scenarios for the broiler farm (with and without BSFL supplementation). The study followed the cradle-to-farm gate approach. The grading of social risks was done by assigning a grade between 1 (committed) and 5 (not assessed – unreliable sources) to each of the previously defined 8 categories. Following this methodology, it was observed that the introduction of insects did not have a significant impact on SLCA, increasing the results by 0.12 and 0.13 points for manual and automated broiler rearing, respectively. On the other hand, a clear positive impact of automation was observed, leading to a difference of 1.07 points in the case of BSFL rearing, 0.72 points in the case of BSFL-supplemented broilers, and 0.73 in the case of control broilers. The decisive categories were Health & Safety (which included the risk of allergenicity of handling insects), Working hours and Equal opportunities/Discrimination. It can be concluded that, while BSFL inclusion did not lead to a decisive change, an improvement of the social sustainability of insect and broiler farming can be achieved through an increase in the level of automation.

Session 25

Poster 15

ADVanced AGROecological approaches based on the integration of insect farming with local field practices in MEDiterranean countries. The PRIMA project ADVAGROMED

In intensive agricultural and animal production systems, the primary contributors to biodiversity loss are the conversion of natural habitats into agricultural land and the extensive application of chemical inputs (fertilizers and pesticides). The incorporation of agroecological methods into existing agricultural systems presents a sustainable approach to safeguard and enrich endangered farming biodiversity while simultaneously boosting ecosystem services. To enhance the resilience of agro livelihood systems, ADVAGROMED seeks to create an innovative and comprehensive food system based in agro-ecological principles and circular economy practices. By-products from local agricultural processes are used to grow insects, resulting in two distinct products: 1) insect frass, serving as a bio-product to enhance soil fertility, provide plant protection benefits, and boost soil microbial biodiversity, thereby reducing the reliance on mineral fertilizers and chemical pesticides; and 2) live larvae, used as feed for local poultry breeds to optimize animal performance, health, and product quality, consequently decreasing dependence on imported feeds.

Local agri-food wastes and by-products in Asturias (NW Spain): current situation and potential role as substrates for insect rearing

R. Rosa-García¹, M. Menéndez-Miranda¹, I. Feito¹, S. Baizán¹, A. Martínez¹, F. Vicente¹, A. Perez-Arcoiza¹, G. García¹

¹ Regional Agrifood Research and Development Service (SERIDA), Ctra. AS - 267, PK 19, 33300 Villaviciosa, Spain

The agri-food sector in Asturias (NW Spain) could generate by-products of interest for insect rearing, although their suitability depends on diverse factors. The objective of this work linked to the ADVAGROMED project was to identify, select, quantify and characterize a portfolio of these local by-product sources for insect feed. The identification was based on information gathered from official databases and reports of previous related projects, followed by a review of the main regional agrarian productions, their location and socioeconomic context. Additional wastes (i.e. from gardening) or marine algae (fresh or by-products from its processing) were added to the preliminary inventory. The selection was based on: economic or cultural importance of the productive sector, quantity, location, availability over time, accessibility and homogeneity. A total of 24 by-products and other potential sources for insect feed were selected from the following productive sectors: kiwi, blueberry, horticulture production, bean, cereal, cider, animal feed, algae and gardening. Subsequent surveys to the most relevant agri-food companies/producers were performed to quantify and contextualize these sources. Data about parameters such as their geographical distribution, quantities, availability, current usage and storage/treatment strategies were collected. Moreover, the nutritional composition (moisture, crude protein, lipids, crude fiber and ashes) of each source was assessed to complete its characterization. Algae and cider residues/by-products may be of special interest due to their quantity, location, and availability throughout the year.

Theatre 1

The state of camel genetics: recent phenotyping approaches and genetic findings

H. Alhaddad¹, B. H. Alhajeri¹

¹ Kuwait University, Biological Sciences, Shedadeyah Campus, 13060 Safat, Kuwait

Dromedary camels are domestic animals of exceptional adaptive traits, functional and production attributes, and aesthetic phenotypes. Nonetheless, these phenotypes, especially heritable ones, are poorly documented and rarely characterized for genetic studies. Despite the recent development of genomic resources for dromedaries such as reference genome and SNP arrays, the limiting factor for fruitful genetic studies remains “the phenotype”. Therefore, the objective of this talk is to (1) provide a modern image-based phenotyping approach for dromedaries to document and describe categorical and continuous traits, and (2) report recent genetic findings on discrete aesthetic traits within the show-camels of the Arabian Peninsula, ‘Mezayen’ camels. We developed mobile-phone application, *Samplease*, to systematically collect detailed sample information, pedigree records, and photographs. Using over 500 photographs of collected camel samples and using a geometric morphometrics framework, we characterized categorical traits including: coat colors, hair lengths, crimp-types, ear and mouth attributes, nasal bridge curvatures, and overall head shapes. We further utilized the images to perform image-based geometric morphometrics to investigate body shape and size variation (e.g., hump shape and position) as means to phenotype external discontinuous traits. These phenotyping efforts enabled the identification of two variants within *FGF5* in relation to hair length variation and fiber quality. Furthermore, genome-wide association studies were conducted on the characterized phenotypes, particularly the categorical ones, and phenotype-associated regions were identified and awaits molecular analysis and validation. Our developed tools and adopted phenotyping approach can readily be applied to other camel populations to unravel possibly more and different phenotypic variations and enable more genetic discoveries.

The relevance of camel research and development for One Health

*P. Burger*¹

¹ *University of Veterinary Medicine, Research Institute of Wildlife Ecology, Savoyenstrasse 1, 1160 Vienna, Austria*

One Health is an integrated, unifying approach that aims to sustainably balance and optimize the health of people, animals and ecosystems.” (www.who.int). For biodiversity conservation and public health newly emerging zoonotic disease outbreaks pose serious risks. Pathogens are omnipresent and by definition detrimental to their hosts, thus exerting high selection, which can result in reciprocal adaptation between the antagonists, an evolutionary arms race. Metagenomic next generation sequencing (mNGS) is a pathogen-agnostic detection method, and in combination with open-source platforms well suited to identify pathogens from genomic data. mNGS is a powerful tool to simultaneously retrieve One Health genomic information of (i) the host including its immune genes and microbiome, and (ii) pathogens present in the collected samples. In my presentation I will give examples of host immune response to emerging disease, e. g., dromedaries to Middle-East Respiratory Syndrome Corona Virus (MERS – CoV) infection. I will also give a preview about our current pathogen detection by screening Illumina short reads. Finally, I will show the importance of camels in the One Health context.

Session 26

Theatre 3

Recent discoveries in two milk proteins genes (CSN1S2 and LALBA) revealed useful markers for gene's assisted selection in camels

N. Letaief¹, G. Gaspa¹, A. Paucillo¹

¹ *University of Torino, Dipartimento di Scienze Agrarie, Forestali e Alimentari, Largo Paolo Braccini, 2, 10095 Grugliasco, Italy*

Milk proteins are widely recognized for their high quality and digestibility. In this study, the coding genes of two major milk proteins, α s2-casein encoded by the CSN1S2 gene, and α -lactalbumin encoded by the LALBA gene were characterized in Old and New World camelids. Promoters and coding regions of these genes were sequenced and analyzed using molecular techniques and bioinformatics. Notably, a mutation was identified in the 3'-untranslated region (UTR) of the CSN1S2 in dromedary camels, at position g.15110G>T. This mutation was found to affect microRNA binding sites with a potential impact on miRNA 4662-3p, involved in mammary function. Furthermore, a novel mutation g.3639C>G was identified in the exonic region of CSN1S2 in Bactrian camels, resulting in an amino acid variant at position 36 (p.36Ile>Met) of the mature protein. In the LALBA gene, interesting polymorphisms at the promoter and exon levels were observed in South American Camels, potentially affecting gene expression and protein structure. The most notable polymorphisms were: g.112A>G, characterized by a positive impact on the LALBA promoter activity and its expression in alpaca milk and; g.1229A>G, resulting in an AA substitution (p.78Ile>Val) and two α -lactalbumin variants named A and B. Overall, this research provides significant insights into the genetic diversity and functional implications of milk protein genes in camels and offers a better understanding of camel genetics. Moreover, the identified polymorphisms offer potential applications for association studies with milk protein yield, facilitating future advancements in camel breeding and dairy industry practices.

Genome-wide Association Study of Hair Shape Variation in Dromedaries from Kuwait

H. Alhaddad², S. Bruno¹, K. Akbar², E. Ciani¹

¹ University of Bari "Aldo Moro", Department of Biosciences, Via Orabona 4, 70125 Bari, Italy, ² Kuwait University, Department of Biological Sciences, Shedadeyah campus, 13060 Shedadeyah, Kuwait

Within the frame of the Eleventh Illumina® Agricultural Greater Good Initiative, we designed and developed a medium-density Illumina® SNP array including 56K SNPs that is now commercially available. Genotypes from this subset of loci were obtained for a total of 22 Kuwaitis dromedary samples for which hair crimp type phenotypes were available (8 wavy vs 14 straight). Here, we present the preliminary results from a PLINK-performed case/control association test on the above-mentioned dataset, in order to identify genetic factors underlying the hair shape variation. Our analysis identified a supported genomic region on chromosome 3 spanning a range of about 157 kb and including three genes (HOMER1, TENT2 and CMYA5) putatively associated with the investigated phenotype. Of particular interest, HOMER1 emerges as a primary candidate due to its known involvement in the stimulation of the mTor/Akt pathway via a calcium-dependent mechanism. Notably, this pathway was found to be implicated in curly hair traits in other species, including the Mangalitzta pig, Chinese goats, and mice. These preliminary results provide novel insight into the molecular mechanisms underlying the hair shape variation in dromedaries. Further investigations are needed to validate the role of our candidate genes in determining the observed phenotype.

Session 26

Theatre 5

Case/Control Association Study on Trypanosome Infection in Algerian Dromedaries: Unraveling Genetic Determinants

S. Bruno¹, I. Meghelli², E. Ciani¹, A. Sharaf³, S. B. S. Gaouar²

¹ University of Bari, Department of Biosciences, Biotechnologies and Environment, Via Orabona, 4, 70125 Bari, Italy, ² University of Tlemcen, Department of Biology, 22 rue Abi Ayad, Fg. Pasteur, 13000 Tlemcen, Algeria, ³ Ain Shams University, Genetic Department, Shubra Al Kheimah, 11241 Cairo, Egypt

Among livestock species, dromedaries are particularly susceptible to trypanosome infections, resulting in substantial economic losses and compromising health and welfare of the affected animals, as well as a potential threat for human health. To date, the genetic factors underlying susceptibility or resistance to trypanosome infection in these animals remain poorly understood. We performed a preliminary case/control association study to identify genetic loci associated with trypanosome infection in Algerian dromedaries by leveraging genotyping and phenotypic data from 107 animals. The infection status had been defined based on PCR assays. The dataset was first pruned to extract only autosomal markers, then quality-checked by PLINK to filter out SNPs and individuals based on individual and locus missingness and minor allele frequency. Subsequently, we detected and removed a total of 13 outlier samples, thus obtaining a final working dataset including 80 animals (20 cases vs 60 controls) and 45,138 SNPs. Overall, we performed seven case/control association tests using different sub-samples of the control cohort. We identified several significant genomic regions including genes putatively associated with trypanosome infection. Out of them, two included the genes DIS3L2, COPS7B (chr5) and UBE2K (chr2) which were previously found to be involved in trypanotolerance in goats. These preliminary results provide novel insight into the genetic basis of trypanosome infection in dromedaries, paving the way for further studies to validate the observed signals.

Glycosylation dependent cell adhesion molecule, first genetic diversity investigation in dromedary camels
N. Letaief¹, G. Gaspa¹, A. Pauciullo¹

¹ *University of Torino, Dipartimento di Scienze Agrarie, Forestali e Alimentari, Largo Paolo Braccini, 2, 10095 Grugliasco, Italy*

Given its relatively lower selection pressure compared to other livestock species, the dromedary camel presents potential opportunities for further improvement in its economic and resilience traits. In this context, there is increasing interest in genetic investigation of economically related traits, particularly with the identification of genetic markers for future association studies. Therefore, the main objective of this study was to explore the genetic variation of the camel GlyCam-1 gene, which codes for the GlyCAM1, a major whey protein in camels. DNA from 10 dromedary camels was extracted from collected blood samples using the standard phenol-chloroform method. The entire gene and its promoter were first amplified and then sequenced using the Sanger method; followed by a bioinformatic analysis. GlyCam-1 gene consists of 4 exons and 3 introns, spanning 2379 bp. The Open Reading Frame (ORF) codes for 155 amino acids, and the translation stop codon is located between nucleotides 130-137 of exon 4. The polyadenylation signal (AATAAA) is also located in exon 4, 95 bp downstream from the stop codon. A total of 15 polymorphic sites were identified: 2 in the promoter region, 4 in the exonic regions and 9 in the introns. Among the identified single nucleotide polymorphisms (SNPs), the 4 mutations detected in the exons were synonymous (g.708C>T, g.744T>C, g.1485C>T and g.3008A>G). A preliminary analysis of transcription factors binding sites evidenced the influence of the SNPs g.234C>A and g.563 C>T on the transcription factors (TF). Further analysis is required to investigate the potential effects of all identified mutations on splicing process and expression levels.

Fragility and challenges in the development of the camel milk sector worldwide

B. J. Faye¹, G. Konuspayeva²

¹ *CIRAD, ES-UMR SELMET, Campus International De Baillarguet, 34398 Montpellier, France,* ² *Al-Farabi University, Food biotechnology, Avenue Al(Farabi 71, 050040 Almaty, Kazakhstan*

In less than 30 years, camel milk has evolved from a “gift economy” to a “market economy” in most camel countries. This important change contributed to the development of the camel milk production worldwide which has been multiplied by 9 since 1961 vs 2.3 for cow. However, with an estimated production of 4.12 million tons in 2022 (under-estimated), camel milk is representing 0.44% of the milk consumed worldwide (0.18% in 1961). Nowadays, on average 21.3 % of the camels are lactating (cows :18%). Moreover, the main part of the camel milk is still self-consumed by pastoralists: for example, 75% in Africa, 60% in Saudi Arabia. The introduction of camel milk into market is partly linked to climatic changes, to the necessity to provide milk in large cities from Middle East or Africa, and to the “health effect” attributed to this product. The consequences for the camel milk commodity channel were the trend to the intensification and “periurbanization” of the dairy camel farming systems, the development of milk processing for making long shelf-life products (as fermented, pasteurized or cheese) and the conquest of international market with the emergence of camel milk powder value chain. The development of a camel milk sector in western countries (USA, Australia, and Western Europe) has also to be emphasized. However, this development is fragile due to different factors: (i) the price differential with cow milk; (ii) the low milk productivity of camel; (iii) the weak structure of the commodity channels; (iv) the distance of production zones from consumption basin in many countries. Despite this fragility, a growth of the camel milk sector by 6-8% annually is expected for the next decennia.

Alpacas in Austria: Survey on current situation on management and breeding

L. Bauer-Feiertag¹, B. Fuerst-Waltl¹, M. Braito², M. Wurzinger¹

¹ University of Natural Resources and Life Sciences, Institute of Livestock Sciences, Gregor-Mendel-Strasse 33, 1180 Vienna, Austria, ² University of Natural Resources and Life Sciences, Institute of Sustainable Economic Development, Feistmantelstrasse 4, 1180 Vienna, Austria

In Austria, there has been an increasing interest in alpacas in recent years. According to official data, around 10,000 animals (alpacas and llamas) are currently kept, and a further upward trend can be observed. Nevertheless, very little is known about the interests of the keepers, breeding objectives and general husbandry conditions. Therefore, this study aims to provide an initial overview of the current situation of alpaca production in Austria. Hence, an online survey was developed, and members of the Austrian Alpaca Association were invited to participate. The topics addressed were reasons for keeping alpacas, herd sizes, management practices, breeding strategies and questions related to the association. Out of 245 members, 101 persons completed the entire survey. 93 respondents indicated that they keep their animals as a secondary activity. Income is generated through sales of fibre products and breeding animals, but also activities (walking tours, etc.) were frequently mentioned. The majority keep Huacaya alpaca, and only ten respondents also have Suri alpacas. The herd size varies between 2 and 85 animals, with an average of 17. Body conformation, fibre quality and pedigree information are the three most important criteria for choosing a breeding male. 69% of the respondents confirmed their interest in participating in a structured breeding program and collecting systematic performance data, but only one-third were willing to pay for this service. The farmers keep up to date with the latest alpaca management news via the association and through seminars or online research.

Lessons learned from the intensification of milk production in dromedaries and how it advances the camel dairy industry in arid, semi-arid countries

P. Nagy¹, J. Juhasz¹

¹ Emirates Industry for Camel Milk and Products, Farm and Veterinary Department, Medinat Hind 3, 294236 Dubai, United Arab Emirates

Camels are the fifth most important dairy animals and are an important food source in arid and semi-arid regions. Despite this fact, the intensification of the camel dairy industry only started 15 to 20 years ago. Such production systems are not widespread, although, it is expected to grow in the coming decades. One of the most important constraints is the lack of funding. Intensive camel milk production requires an initial investment, which has to include a continuous water and electricity supply, a regular and reliable feed source, as well as well-trained professionals and veterinary service, a processing facility and reliable access to markets. Unfortunately, today these requirements are difficult to meet in most arid and semi-arid countries where camels are kept naturally. However, if the above conditions are available, dromedaries can be integrated efficiently into an intensive production environment. Such a production can offer many advantages. Primarily, it allows the efficient and cost-effective production of high quality, raw camel milk that is suitable for further processing and meets the quality requirements of the consumers of the 21st century. At the same time, it also ensures that the animal health and animal welfare requirements of the species are met by complying to national and international guidelines, statutory requirements and standards. In addition, intensive production allows the development of selective breeding programs, the use of assisted reproduction and the establishment of so-called nucleus farms where high genetic potential dromedaries are concentrated. The experience gained in such farms can improve production in semi-intensive systems and can also enhance the breeding programs by using high genetic value males for mating. The aim of this presentation is to review our experience on the present status and challenges related to the intensification of camel farming in arid and semi-arid countries.

Study on anatomical structures of the dromedary udder

A. Mueller², U. Wernery¹, J. Kinne¹, P. Nagy³, J. Juhasz³, M. De Bont⁴, C. Booth⁴, P. Azmanis⁵, A. Appelt¹, T. Witte²
¹ Central Veterinary Research Laboratory, P.O. Box 597, 0000 Dubai, United Arab Emirates, ² Vetmeduni Vienna, Clinic for Ruminants, Veterinärplatz 1, 1210 Wien, Austria, ³ Emirates Industry for Camel Milk Products, Al Ain Road- Um Nahad 3 area, 0000 Dubai, United Arab Emirates, ⁴ Dubai Camel Hospital, Al Marmum-Al Ain Road, 0000 Dubai, United Arab Emirates, ⁵ Dubai Falcon Hospital, Al Saada St, Zaabeel 2, 0000 Dubai, United Arab Emirates

With climate change and the scarcity of the food supply, dromedaries are becoming interesting food suppliers in non-arid regions of the world. Especially their milk, which is also described as the “white gold of the desert”, has excellent nutritional properties. The aim of the present study was to examine the mammary gland of dromedary camels using measurements, injection casts, frozen sections, ultrasonography, endoscopy and radiography. Ultrasonography and endoscopy are easy to perform in the field and feasible to diagnose pathological conditions of the mammary gland. For this purpose, 25 udders from camel carcasses, that arrived at CVRL in Dubai for pathological examination were examined. Also 49 udders were obtained from a local slaughterhouse for further examinations. These udders were analyzed using ultrasonography and radiography, with and without contrast medium, cast with injection of resin, gelatine or paraffin and frozen sections of native or casted udders were examined. Additionally, 11 lactating dromedary camels were selected for ultrasonographic udder examination. The injection casts and frozen section of the udder of the dromedaries shows a separation between the two teat canals and the two glandular complexes of each quarter. The structure of the teat and the parenchyma shows that the dromedary has specific anatomic structures which are important to know for application of machine milking and for improving udder health. The results of our examination showed that the ultrasonographic and endoscopic examination is a feasible tool for non-invasive diagnostics as well suitable for diagnostics in non-sedated animals. The examinations of camels restrained in a chute were easy to perform. However, additional examinations are necessary to evaluate pathological ultrasonographic and endoscopic images of the udder and teat of camels.

Insights into Dromedary Camel Pregnancy: Practical Applications of Dromedary Placenta Anatomy in Abortion Prevention Strategies

M. Chemin¹, U. Wernery², P. Nagy³, J. Juhasz³, M. Sobczak-Filipiak¹, M. Kulka¹

¹ Warsaw University of Life Sciences, Institute of Veterinary Medicine, Department of Pathology and Veterinary Diagnostics, ul. Nowoursynowska 159, building 24, 02-776 Warsaw, Poland, ² Central Veterinary Research Laboratory, Za'abeel 2, P.O. Box 597 Dubai, United Arab Emirates, ³ Emirates Industry for Camel Milk & Products, Umm Nahad, PO Box 294239 Dubai, United Arab Emirates

Dairy farming of dromedary camels comes with significant challenges, including high abortion rates causing substantial production losses. Investigating the cause of these abortions is essential to achieve sustainable milk yields. Factors such as animal husbandry, nutrition, and epidemiology play crucial roles in their prevention, but despite optimal conditions in some farms, high abortion rates persist, encouraging focused research on other factors. The placenta serves as a portal for maternal-foetal nutrient and gas exchanges. Understanding this organ's composition and function is thus essential to improve pregnancy outcomes. Over the course of a year, we collected and studied aborted placentae and fetuses. We also included two uteruses of pregnant dromedary camel carcasses and studied the anatomy of these healthy placentae. This study provides a comprehensive description of the anatomy of the dromedary camel placenta, characterized by its diffuse, epitheliochorial nature, and goes over the main pathologies found as well as their impact on foetal development. Understanding the structures of the placenta is essential to grasp the adaptative mechanisms that enable camels to thrive in challenging habitats. Furthermore, this study compares the clinical picture of healthy placentae taken from dromedary carcasses with placentae obtained from aborted fetuses. Doing so, we aim to improve the understanding, diagnosis and prevention of abortion. This approach bridges the gap between anatomical knowledge and clinical practice, facilitating a deeper understanding of camel reproductive health management in arid regions. All samples were collected with the kind help and support of Central Veterinary Research Laboratory, Dubai, U.A.E and Camelicious, Dubai, U.A.E

Effect of pasteurization and simulated digestion on insulin content of camel milk

R. S. Aljumaah¹, M. Ayadi^{1,3}, M. M. Abdelrahman¹, A. M. Matar¹, M. Alshaiikh¹, G. Caja², A. A. K. Salama²

¹ King Saud University, Animal Production, P.O. Box 2460, 11451 Riyadh, Saudi Arabia, ² Universitat Autònoma de Barcelona, Group of Ruminant Research (G2R), Animal and Food Science Department, Av. dels Turons, 08193 Bellaterra, Spain, ³ University of Jendouba, Department of Animal Biotechnology, Higher Institute of Biotechnology, 9000 Beja, Tunisia

Several factors may affect insulin (INS) content in camel milk. The objective was to evaluate the effect of pasteurization and simulated human digestion on INS content of camel milk. Milk pools representing early lactation (4 to 60 DIM), late lactation (180 to 210 DIM), and bulk commercial milk were used. Milk was pasteurized at 72°C for 15 sec and then placed on ice. Raw and pasteurized pools were exposed to stomachal and intestinal digestion (INFOGEST). INS was determined using an ELISA kit at 450 nm. The statistical model contained the effects of the pasteurization, milk pool, and digestion; the appropriated interactions; and the residual error. INS levels in early (0.57 µg/L), late (1.21 µg/L), and bulk (1.93 µg/L) milks differed ($P < 0.001$). INS values in raw (1.28 µg/L) and pasteurized (1.19 µg/L) milks also differed ($P < 0.05$). On average, INS values decreased ($P < 0.001$) from 1.24 to 0.23 µg/L during the stomach digestion. Although initial INS values were 8% lower in the pasteurized milk than in the raw milk, the concentration of INS remaining after the stomach digestion tended to be greater ($P < 0.10$) in pasteurized milk (0.32 µg/L) than in raw milk (0.14 µg/L). On average, only 19% of milk INS remained available for intestinal digestion. By the end of the intestinal digestion, remaining INS concentrations were neglectable (0.0003 µg/L; $P < 0.001$). Overall, pasteurization decreased INS concentration, but it protected INS during stomach digestion. Since INS disappeared during intestinal digestion, the antidiabetic effect of camel milk could be related to other bioactive peptides. Funded by the Saudi National Science, Technology, and Innovation Plan (Project #13-AGR1159-02).

Adaptive evolution patterns in the genome of dromedary camels

H. Bahbahani¹

¹ Kuwait University, Biological Sciences, Sh. Sabah Al-Salem Campus, 7351 Kuwait, Kuwait

The genome of dromedary camels is a target of different evolutionary forces that may shape its diversity pattern. These forces are mainly attributed to the historical utilization of this species in transportation and trading, as well as their adaptation to the harsh environmental conditions they experience. In this research project, we have analyzed whole genome sequence data of dromedary camel populations from the Arabian Peninsula for two main purposes: 1) assess their genetic diversity and relationship, 2) investigate their genome for signatures of positive selection. To achieve the first goal, Principal Component and admixture analysis were conducted and revealed high genetic homogeneity among the dromedary populations analyzed. A degree of genetic distinction was also observed associated with their geographical distribution, with a substantial level of genetic admixture. Using the de-correlated composite multiple signals (DCMS) approach, which combines the signals from different analyses, a total of 36 candidate regions harboring 87 genes were specified to be under positive selection. A haplotype block and frequency analyses on these regions revealed a total of 185 blocks encompassing 1,340 haplotypes overlapping these regions. Approximately 2% of these haplotypes were found to be prevalent. These candidate regions, and their haplotypes, can be considered as primary favorable genetic elements in the dromedary genome that need to be conserved to maintain the genetic diversity of this well-adapted species.

Genetic parameters of fibre density in alpacas

A. Cruz^{1,2}, A. Burgos², A. Yucra², R. Morante², G. Gutierrez-Reynoso¹, M. Quispe³, E. Quispe⁴, J. P. Gutierrez⁵

¹ UNALM, Avda La Molina s/n, 12056 Lima, Peru, ² Inca Tops SA, Avda, Miguel Forga 348, 04011 Arequipa, Peru, ³ Maxcorp, Av. Ruiseñores 866, 65650 Lima, Peru, ⁴ Natural Fiber's Tech, Jr. Málaga, 12056 Lima, Peru, ⁵ University Complutense, Seneca 2, E-28040 Madrid, Spain

Fleece weight determines the income of the producer. Fibre diameter is the most commonly used selection criterion in alpacas, and this leads to an undesirable response in fleece weight due to the positive genetic correlation between them. However, higher fibre density increases the number of fibres compensating their lower weight, leading to heavier fleeces. Fibre density can be addressed by a subjective scoring method from 1 to 5, but also by a density quantification device (Fiber-DEN), where a 1 cm² area is shaved at the midline level and the skin dyed, differentiating very clearly the fibre follicles in white alpacas. This study aims to estimate the genetic parameters of hair duct number (HD), total fibre number (TF) and HD/TF ratio (RT) measured by Fiber-DEN and their relationship with the main textile traits such as fibre diameter (FD), medullation percentage (PM), greasy fleece weight (GFW), subjective density score (DE) and staple length (SL). A total of 402 fibre-DEN records of white Huacaya alpacas aged 1 to 16 years were used along with 8763 (FD and PM), 5752 (DE) and 11271 (GFW and SL) records for other traits. The pedigree consisted of 15 360 animals. The heritabilities were 0.40, 0.47 and 0.37 respectively for HD, TF and RT, and 0.31, 0.28, 0.16, 0.34 and 0.05 for FD, PM, GFW, DE and SL. The relevant genetic correlations between fibre-DEN traits and others were -0.50 for HD-FD and TF-FD, 0.36 and 0.43 respectively for GFW-TF and GFW-RT, and 0.50 for DE-GFW. DE and TF might be used as selection criteria to simultaneously reduce FD and increase GFW in a genetic improvement program, the latter being more costly

Time budgets in stabled dairy dromedary camels

C. Chaouch Aoun^{1,2}, M. Atigui¹, M. Brahmi^{1,3}, E. Gherairi^{1,2}, W. Ben Salem⁴, M. Hammadi^{1,5}

¹ Institut des Régions Arides, Université de Gabès, Laboratoire d'Élevage et de Faune Sauvage, Route du Djorf Km 22.5, 4119 Médenine, Tunisia, ² Université de Gabès, Faculté des sciences de Gabès, Cité Erriadh, 6072 Gabès, Tunisia, ³ Université de Sousse, Institut Supérieur Agronomique de Chott Mariem, Chott Mariem, 4042 Sousse, Tunisia, ⁴ Office d'Élevage et des Pâturages, Alain Savary, 1082 Tunis, Tunisia, ⁵ Ecole doctorale Science, ingénierie et société, Université de Gabès, Cité Erriadh, 6072 Gabès, Tunisia

Time budgets is used to determine the amount of time camels allocate to different behaviors throughout the day and can be a useful tool to evaluate animals' welfare and management systems. This work investigated the time budgets activities and their implications on the welfare of intensively managed dairy camels. Nine clinically healthy Maghrebi camels (aged 11.7 ± 1.9 years, weighing 437.8 ± 12.0 kg and 72.6 ± 7.1 DIM) housed in a loose stall barn were monitored for 6 consecutive days. Major behavioral activities such as standing, lying, walking, feeding, rumination, milking, as well as other activities like coprophagy, suckling, and sleeping, were continuously recorded. The mean duration of these activities was calculated to obtain the time budget. Results showed that camels spent most of their time in a standing position feeding ($P < 0.0001$). Specifically, camels were standing for 54% of their time and lying down for 38%. Data revealed that the main behavioral activities expressed were feeding (35.5%) followed by rumination (24.5%). Walking activity remained low throughout the day, representing only 2% of the total time budget of stabled camels. No common stereotypic behaviors were recorded; however, coprophagy was detected and recorded 10.3 ± 1.7 min/day. These results suggest that time budgets should be taken into consideration to improve management conditions and welfare status in stabled dairy camels.

Dairy cows' diversity of responses to heat stress: between resilience and adaptation

E. Vanbergue¹, L. Brun-Lafleur¹, P. Massabie¹, M. Prezelin², B. Vaillant², V. David¹

¹ Institut de l'élevage, 149 rue de Bercy, 75012 Paris, France, ² Ferme expérimentale Les Trinottières, La futaie, 49140 Montreuil sur le Loir, France

In a context of global warming, there is a need for implementing multi-criteria evaluation of dairy cows' physiological and behavioral adaptation to chronic and acute heat stress to 1/ provide references and facilitate decision-making process in herd management and 2/ specify the phenotyping strategy in genetic selection. To this end, thirty-six Holstein cows in late lactation/gestation, producing 22.5 (\pm 1.5) kg/d of milk, have been monitored during summer in Western France. Environmental conditions were described with Temperature Humidity Index (THI). Behavioral and physiological indicators recorded were ruminal temperature, time spent panting, resting, ruminating, and eating, milk production and composition, plasma non-esterified fatty acids, cortisol, and thyroxine, and colostrum immunoglobulins. K-means clustering algorithms identified 3 groups of cows according to their response to acute heat stress (average daily THI superior to 74 during 4 consecutive days). Group A was composed of cows with low milk losses (-0,5kg/d) and a slight increase of ruminal temperature (+0,24°C), group B was composed with cows with low milk losses (-0,5kg/d) and a higher increase of ruminal temperature (+0,36°C) and group C was composed of cows with higher milk losses (-2kg/d) and higher increase of ruminal temperature (+0,36°C) and was characterized by higher milk fat and protein content during lactation. Group A, B, and C presented variable panting and/or eating/ruminating behavior adaptations. No difference in any of the other indicators measured was shown between groups. This project has received funding from the European Union's Horizon 2020 Programme for Research & Innovation under grant agreement n°101000226.

Genetic mechanism of brain-gonad axis regulating sex differentiation in sex-biased zebrafish families

S. Hosseini¹, A. R. Sharifi¹, B. Brenig¹

¹ University of Göttingen, Department of Animal Sciences, Burckhardtweg 2, 37077 Göttingen, Germany

The hypothalamic-pituitary-gonadal axis is a well-known neuronal reproductive axis in vertebrates that triggers reproduction by activating the endocrine machinery. The brain is a key factor that combines environmental stimuli with physiological responses to direct gonadal fate in fish species whose sex determination is influenced by the environment. Changes in the expression of sex steroid hormones in response to environmental stressors lead to sex reversal, resulting in a male-biased (MB) or female-biased (FB) population. The zebrafish brain exhibits sex-specific differences at hormonal and transcriptional levels and is highly plastic even after sexual maturity. In this study, we investigated the transcriptional profiles of the zebrafish brain in an MB and an FB family exposed to high ambient temperature to gain new insights into the genetic mechanism of the brain-gonad regulatory axis that leads to sex ratio disequilibrium in response to elevated temperature. For this purpose, RNA-Seq was performed on brain tissue from 45 males and females in the control and high-temperature groups from two sex-biased families. The results showed a high number of significantly differentially expressed genes (SDEGs) in each gonad type in the MB versus FB family in the control group. Interestingly, the number of SDEGs was considerably reduced when the animals were exposed to high ambient temperature. A similar trend was observed in testes versus ovaries within each family type, with the number of SDEGs being higher in the MB family than the FB family in both temperature groups. Our study provides new insights into the importance of the brain-gonad axis as a transducer of environmental stimuli that cause sex ratio imbalance under rapid global warming.

Physiological and Productive responses to a natural short-term heat wave in Holstein Friesian and Brown Swiss lactating cows

A. Maggiolino¹, A. Aloia¹, E. Trevisi³, U. Bernabucci², C. Lecchi⁴, V. Landi¹, P. De Palo¹

¹ University of Bari, S.P. per Casamassima km 3, 70010 Valenzano, Italy, ² University of Tuscia, Via San Camillo de Lellis, 01100 Viterbo, Italy, ³ University Cattolica of Piacenza, via Emilia Parmense, 29122 Piacenza, Italy, ⁴ University of Milan, via dell'università, 26900 Lodi, Italy

The aim of the study was to assess the different adaptative physiological and productive responses of Brown Swiss (BS) and Holstein Friesian (HF) lactating cows to a natural summer 4-days heat wave. Forty multiparous BS (n=20) and HF (n=20) dairy cows were involved, balanced for DIM, ECM Yield and BCS. The barn was provided with sprinklers and fans that were switched off for 4 consecutive days. The moment before turning off the cooling systems, at 4 AM was considered the thermal comfort condition (TC; THI = 63.4). The end of the 4th day, at 3 PM, was considered the heat stress condition (HS; THI= 81.3). Respiration rate (RR), rectal (RT), skin, eye, muzzle and vaginal temperatures were collected at 4 AM, 3 PM and 8 PM each day. Blood samples were collected at TC and HS. Biochemical, oxidative and inflammatory profiles were detected. Milk yield (MY) and quality were recorded. A GL Model was applied, considering as fixed effects breed and heat stress. RT increased each day from 4 AM to 3 PM in both breeds, and HF showed greater values ($P < 0.01$) during the whole trial. While these changes were more marked in HF, it is noteworthy that they are capable of more effective recovery and return to physiological levels during nighttime hours. BS did not change MY, whilst in HF cows MY decreased ($P < 0.05$) day by day. However, metabolic and inflammatory patterns did not show differences among the breeds. These results emphasize the necessity for additional research to comprehensively grasp the underlying differential mechanisms between the breeds.

Session 27

Theatre 4

Effects of Heat Stress on energy and protein metabolism in Iberian and crossbred pigs

L. Sarrí¹, É. Labussière², J. Balcells¹, G. De La Fuente¹

¹ Universitat de Lleida - AGROTECNIO, Av. Alcalde Rovira Roure, 191, 25198 Lleida, Spain, ² INRAE, 3P, 16 le Clos, 35590 Saint-Gilles, France

When pigs are exposed to heat stress (HS), their feed and water intake experience opposite adjustments, and their productive performance and protein and energy metabolism are reduced in order to maintain body temperature in normal ranges. In addition, the intense genetic selection focused on increasing lean tissue in modern breeds, aggravate this condition because of heat production (HP) associated with protein deposition, compared to other rustic and well-adapted breeds such as the Iberian (IB). Therefore, in order to analyze the mechanisms that allow the IB pigs to better adapt to HS conditions, we performed a 2×2 factorial design-experiment using 11 commercial crossbreeds (CO; Pietrain \times Landrace \times Large White) and 11 IB pigs, exposed to thermoneutral (TN; 23.5°C) and heat stress (HS; 33.5°C) temperatures during a total of 28 days. The last 6 days, pigs were housed individually in respiration chambers to accurately measure their feeding and water behavior, and nitrogen and energy balance from gas exchanges. Data were analyzed using the PROC MIXED procedure of SAS with temperature (T), breed (B) and their interaction ($T \times B$) as fixed effects. The pig was considered as experimental unit. As expected, preliminary results of this study show the adverse effects of HS on BW and growth in both breeds ($P < 0.05$), explained by lower feed intake (-1.23kg/d on average for the 2 breeds $P < 0.01$). This strategy to reduce HP (-360kJ/kg BW^{0.60} per day; $P < 0.01$) resulted in lower lipogenesis, as indicated from the decreased respiratory quotient under HS ($P < 0.01$). However, IB pigs had higher respiratory quotient indicative for a higher lipid synthesis in both TN and HS conditions than CO pigs. In addition, the increased water consumption during HS was less pronounced in IB (+5.7L/d) than in CO pigs (+15.5L/d; $P = 0.01$), which also resulted in much lower urine production. This research was supported by the Spanish Ministry of Science and Innovation (grant PID2021-127949OB-100). The PIGWEB project has received funding from the EU Horizon 2020 research and innovation program (grant agreement No 101004770).

Can we breed cattle with more efficient rumen microbiome?

L. L. Guan¹, T. Mcallister², Á. Cánovas³

¹ University of British Columbia, Faculty of Land and Food Systems, 2205 East Mall, V6T 1Z4 Vancouver, Canada, ² Agriculture and Agri-Food Canada, Lethbridge Research and Development Centre, 5403 1st Avenue South, T1J 4B1 Lethbridge, Canada, ³ University of Guelph, Department of Animal Biosciences, 50 Stone Road East, N1G 2W1 Guelph, Canada

Milk and meat from ruminants have reduced malnutrition and improved prosperity in many societies. However, ruminant production is facing significant challenges in terms of improving feed efficiency (FE) and reducing its environmental footprint. Recent research has revealed that variations in the composition and function of the rumen microbiome can directly and/or indirectly influence several phenotypic traits in cattle such as FE, methane emissions, metabolic health, milk and meat quality. This presents an opportunity for rumen microbiome interventions to improve productivity, health and reduce the environmental footprint of cattle production. More and more evidence revealed the individualized rumen microbiome and host genetics could be one of the factors influencing the colonizing of selective rumen microbes. Here, we reported the identified heritable rumen bacteria in both beef and dairy cattle. Some of the traits of the host that influence the composition and function of the rumen microbiome appear to be heritable. The extent of this heritability is also influenced by host genetics and has implications for cattle production-related traits. Moreover, we showed that heritable rumen bacteria exhibited a high degree of maternal similarity as compared to those that were nonheritable. Our findings illustrated that both the host and rumen microbiome cattle production and such traits associated with the rumen microbiome could be passed from parents to offspring. The identified genotypes may potentially serve as markers for breeding cattle for optimal rumen function.

Characterization of physiological responses in Rasa Aragonesa ewes under water restriction

S. Pérez^{1,2}, C. Calvete^{1,2}, M. Joy^{1,2}, A. Dominguez¹, J. H. Calvo^{1,2,3}, S. Lobón^{1,2}

¹ Centro de Investigación y Tecnología Agroalimentaria de Aragón (CITA), Animal Science, Avda. Montañana 930, 50059 Zaragoza, Spain, ² Instituto Agroalimentario de Aragón-IA2 (CITA-Universidad de Zaragoza), Calle Miguel Servet, 177, 50013 Zaragoza, Spain, ³ ARAID, Av. de Ranillas 1D, 50018 Zaragoza, Spain

The aim of this study was to characterise the effect of water restriction on ewes. Two hundred and two Rasa Aragonesa ewes were subjected to total water restriction for 5 days. Intake, body weight (BW) and body condition score (BCS) were measured daily during the 5 days of restriction, as well as temperature and percent humidity. Blood samples were collected just prior to the challenge (0d), and at the end of the study (5d) for haematological and metabolite measurements. Wool samples were taken at day 0 and 4 weeks later (28d). Variation in blood and wool traits was also calculated for each animal. Dry matter intake, BW and BCS were decreased during the trial. Mixed model statistical analysis indicated that all haematological and metabolite levels changed during the water restriction period except for plasma cortisol. Principal component analysis (PCA) and hierarchical clustering were performed with variation traits between 0d and 5d (blood samples) and 0d and 28d (wool samples) to identify different responses among ewes. Four clusters were identified: 1) fat mobilization ewes (n= 56; wool cortisol increase and low increase neutrophils-to-lymphocytes ratio (NLR)) with low dehydration but highest fat mobilization; 2) high-stressed ewes (n= 9; very high plasma cortisol increase) with low dehydration; 3) low-stressed ewes (n= 106; low plasma cortisol and low NLR increase) with minor fat mobilisation but high dehydration; 4) stressed ewes (n= 31; high NLR increase) with higher dehydration. In general, the Rasa aragonesa ewes exhibit a high tolerance to water stress (C1 & C3 = 162 ewes; 80%) but with different adaptation responses.

Links between gills genes expressions during moderate heat stress and resistance to acute hyperthermia using rainbow trout isogenic lines

H. Lagarde¹, D. Lallias¹, M. Marchand¹, F. Phocas¹, L. Goardon², M. Bideau², F. Guyvarc'H², L. Labbé², S. Pouil¹, M. Dupont-Nivet¹, I. Leguen³

Sizun, France, ³ INRAE/IFREMER/CNRS, MARBEC, Chemin de Maguelone, 34250 Palavas-es-flots, France

In aquaculture, acute hyperthermia resistance is a trait of interest in climate change context. However, acute hyperthermia resistance, measured in laboratory conditions as time to loss of equilibrium when exposed to high temperature, is a trait whose underlying physiological mechanisms are not fully understood. It is important to understand these mechanisms to assess the usefulness of acute hyperthermia resistance trait as a predictor of fish ability to adapt to climate change. In the present study, we investigated links between resistance to acute hyperthermia and gene expressions in gills of rainbow trout exposed to heat stress. For this purpose, we phenotyped 6 rainbow trout isogenic lines for acute hyperthermia resistance and 82 genes gills expressions. Expressions were analysed before and after exposition to moderate heat stress (11°C to 23°C in 1H30 then 30 min at 23°C). Genes studied were chosen to represent several physiological functions such as metabolism, immunity, etc. Genes whose expressions were significantly differently expressed between isogenic lines resistant to acute hyperthermia and isogenic lines sensitive to acute hyperthermia were considered as genes potentially involved in acute hyperthermia resistance. Resistant lines differential gene expressions between the beginning and the end of the heat stress were higher for genes associated with O₂ transportation and innate immunity and lower for those associated with active ion transportation and gill permeability. This suggests that energy allocation during heat stress is different between resistant and sensitive fish.

Time-dependent molecular adaptation of immune and platelet function to heat stress in PBMC of Holstein dairy cows

F. Koch¹, B. Kuhla¹, C. Kühn^{1,2,3}

¹ Research Institute for Farm Animal Biology (FBN), Wilhelm-Stahl Allee 2, 18196 Dummerstorf, Germany, ²

Friedrich-Loeffler Institute, Südufer 10, 17493 Greifswald, Germany, ³ University of Rostock, Justus-von-Liebig-Weg 6, 18059 Rostock, Germany

Dairy cows adapt to environmental heat by reducing feed intake, milk production and increasing peripheral blood flow to the skin. However, there is evidence that chronic heat initially stimulates a systemic inflammatory response that impairs the immune competence of dairy cows. The study aimed to elucidate the time-dependent effects of moderate chronic heat stress in peripheral blood mononuclear cells (PBMC) of Holstein cows. Twenty German Holstein cows (166±11 days in milk) were kept in a climate chamber under thermoneutral conditions (16°C; 63% relative humidity (RH) with a temperature-humidity index (THI) of 60 for 6 days (d) and fed a total mixed ration ad libitum. Subsequently, 10 cows were exposed to 28°C (heat stress – HS; with 52% RH; THI 76) for 6 d, whilst 10 cows were further kept at thermoneutral conditions (CON). Blood samples were collected at 24 hours (h) and at 6 d after HS for PBMC isolation. Isolated RNA was utilized for RNA sequencing (Illumina HiSeq2500) and analyzed for differentially expressed genes and pathway enrichment analysis (KEGG). Comparing 24 h versus 6 d revealed an upregulation of pathways related to platelet activation, fluid shared stress and arteriosclerosis which may be related to HS-induced microvascular injuries or changes in hematocrit as a consequence of prolonged HS. The activation of leukocyte transendothelial migration, ECM-receptor interaction, neutrophil extracellular trap formation and HIF-signaling pathway may indicate an activation of the peripheral immune response and oxygen delivery to maintain homeostasis after prolonged heat stress.

How does ewe age affect reproductive performance relative to rainfall conditions?

P. Theron¹, T. Brand^{1,2}, S. Cloete¹, J. Van Zyl¹

¹ University of Stellenbosch, Animal Sciences, Private Bag XI, Matieland, 7600 Stellenbosch, South Africa,

² Western Cape Department of Agriculture, Directorate: Animal Sciences, Private Bag XI, Elsenburg, 7600 Stellenbosch, South Africa

Livestock producers will have to explore various management and mitigation strategies to maintain production levels in the face of adverse weather conditions and a changing climate. It is well-documented that ewe age affects reproductive performance, but it is unclear whether this phenomenon can be utilised to mitigate adverse environmental effects. This study was therefore carried out to determine whether certain age groups are better adapted to reproduce under specific rainfall regimes. Historical rainfall data collected on Tygerhoek Research Farm, Western Cape, South Africa between 1975 and 2018 was used to classify years as dry, below average, average, above average and wet. Ewe performance for conception, number of lambs born, number of lambs weaned, average birth weight and average weaning weight was calculated for each age group (2-6 years) across all years and within rainfall classes. Age group performance for each trait in each rainfall class was then compared to the overall trend. Overall, reproduction rate was maximal at three to four years of age and this trend was largely consistent across rainfall classes. Weaning weight was also highest in three- and four-year-old ewes. Birth weight increased with age, except in wet years, when no discernible trend was present. In dry years however, there was a clear trend for weaning weight to increase as ewes aged. Hence it is concluded that flock age structure cannot be used as a tool to mitigate environmental impacts if the age structure is already optimal for reproduction.

Sperm mitochondrial gene-dependent activity mediated the stress capacity in young and old Holstein bulls

K. Anwar¹, G. Thaller¹, M. Saeed-Zidane¹

¹ Institute of Animal Breeding and Husbandry, Group of Molecular Genetics Christian-Albrechts University, Olshausenstraße 40, 24098 Kiel, Germany

Mitochondria are key for stress resilience as all types of stresses are found to influence the mitochondrial DNA copy number (mtDNA-CN). However, the cross-talk between mtDNA-CN and stress tolerance in spermatozoa remains unclear. Therefore, this study aims to identify the mtDNA-CN and the expression levels of all mtDNA protein-coding genes (13 genes) in bovine sperm cells throughout the year. Accordingly, the semen from four old and four young Holstein bulls was collected during the four seasons. The DNA and total RNA were isolated from sperm cells. Mitochondrial DNA copy number (mtDNA-CN) was performed using a qPCR-based method using the isolated DNA. The RNA was subjected to cDNA synthesis followed by the mRNA expression analysis using qPCR. The data were statistically analyzed using the Student's t-test and one-way ANOVA analyses. Our findings revealed that compared to old bulls, the mtDNA-CN of young bulls was relatively higher in winter and summer but lower in spring and autumn. At the transcriptional level, old bulls' spermatozoa exhibited relatively higher expression levels of the ND4L, ND6, COX1, and CYTB genes in winter and the ND4 gene during the spring. However, young bulls' spermatozoa showed high expression levels for the ND1, COX2, ATP6, ND3, COX3, and ND2 genes in winter, and for the ND1, ATP6, ND4L, ND5, COX3, and ND6 genes in spring. Moreover, the ND1, COX2, ATP6, ND4L, ND4, ATP8, ND3, COX3, and ND6 genes in summer, and the ND1, ATP6, ND4L, ND4, COX3, ND6, COX1, ND2, and CYTB genes in autumn were upregulated in young bulls' spermatozoa. In conclusion, sperm mtDNA-CN indicated a correspondence with differential expression patterns in a gene-dependent manner in old and young bulls' sperm cells.

Modeling the changes in daily rumination time and milk yield to detect the onset of heat stress in lactating dairy cows

A. M. Serviento¹, Y. Chang², G. Guo³, A. Wang², K. Wang¹, H. Zhang², D. E. Rico⁴, Y. Wang², M. Niu¹

¹ Institute of Agricultural Sciences, ETH Zurich, 8006 Zurich, Switzerland, ² College of Animal Science and Technology, China Agricultural University, 100193 Beijing, China, ³ Beijing Sunlon Livestock Development Co., Ltd., Tongzhou, 101115 Beijing, China, ⁴ CRSAD, Deschambault, G0A 1S0 Quebec, Canada

Determining the temperature-humidity index (THI) threshold for the onset of heat stress (HS) can serve as a decision-making tool in HS management in dairy cows. While HS thresholds are usually based on milk yield (MY) losses, other physiological changes may appear at lower THI. The study aimed to determine HS thresholds of daily rumination time (RT) and MY of cows based on THI according to parity and lactation stage. Daily RT and MY were collected from 915 Chinese Holstein cows [533±74.7 min RT/d; 37.9±8.93 kg MY/d (mean±SD)]. Daily THI in the barn ranged from 25.6 to 84.8. Two data sets were used to compare parity (PRIMI or MULTI), and, only for multiparous cows, lactation stage (EARLY, PEAK, MID, or LATE at 1-40, 41-60, 61-160, or 161-305 days in milk, respectively). The effect of daily THI on RT or MY was analyzed using a generalized additive mixed model. Pointwise slopes of the fitted means were calculated. The threshold was considered as the THI when RT or MY started to decrease ($P < 0.05$). Above THI 58.8, RT decreased for PRIMI and MULTI by 3.56 and 4.35 min/d/unit THI, respectively). Only MULTI decreased MY above THI 65.0 (-0.078 kg/d/unit THI). As for lactation stage, EARLY, PEAK, MID, and LATE decreased RT above THI 57.0, 57.6, 59.4, and 61.7 by 3.89, 4.08, 5.02, and 3.14 min/d/unit THI, respectively. Only MID decreased MY above THI 66.4 (-0.195 kg/d/unit THI). Management strategies should be applied before THI exceeds 57-59 since HS can already have negative effects on the cows even without apparent production losses.

Session 27

Poster 12

Rumen-protected dry grape extract supply during natural heat stress improves the whole-blood immune response of Simmental cows

M. Forleo¹, A. Amato¹, C. Cavallo¹, E. Gugliandolo¹, L. Liotta¹, E. Trevisi², A. Minuti², H. Bui³, P. Engler³, V. Lopreiato¹

Heat stress causes detrimental effects on the immune system and affects inflammation of dairy cows. To mitigate this negative response, recently different nutritional strategies were adopted. We aimed to assess the effects in mid-lactating Simmental cows of NorGrape® BPO (a rumen protected dry grape extract rich in water-soluble polyphenols) on immune response during heat stress. Thirty cows were blocked by DIM, parity, and MY and randomly enrolled in 2 groups: treated (BPO; 15) and control group (CTR; 15). In the BPO group, each cow received 470 mg/d of NorGrape mixed with corn meal and top-dressed onto TMR for 35 d during summer. Blood samples were collected at 0, 17, 31 and 35 d for the inflammatory and oxidative stress response and at 35 d for phagocytosis. Data were analyzed by PROC GLIMMIX of SAS. Circulating neutrophils and monocytes were higher in BPO cows than CTR cows after 35 d of treatment ($P < 0.05$). In addition, neutrophil phagocytosis efficiency was greater in BPO than CTR cows at 35 d (39.32 vs 32.08±2.32%; $P = 0.03$). Likely due to the greater phagocytosis, BPO group had levels of plasma advanced oxidation protein products than CTR group ($P < 0.05$). These results support the use of grape extract rich in water-soluble polyphenols as effective approach to help mitigate oxidative stress in heat-stressed cows and to enhance a better immune response through an improved neutrophil function and higher circulating neutrophils and monocytes.

Individual variability in trajectories of key plasma biomarkers involved in body reserves dynamics in meat ewes

A. Nyamiel¹, E. González-García², D. Marcon⁴, C. Durand³, A. Tesnière², D. Hazard¹

¹ INRAE, UMRI 1388 GENPHYSE, Université Toulouse, ENVT, 31326 Castanet-Tolosan, France, ² INRAE-CIRAD, SELMET, Institut Agro-Univ. Montpellier, 34060 Montpellier, France, ³ INRAE, UE321 La Fage, 12250 Saint-Jean Saint-Pauluzon, France, ⁴ INRAE, UEP3R Bourges, 18390 Osmoy, France

The mobilization and accretion of body reserves (BR) constitute one of the key mechanisms in ruminants for resilience and adaptation. A better understanding of inter-individual variability for candidate proxies of such mechanism is required before their use in breeding strategies. Primiparous and multiparous ewes were monitored during successive productive cycles in two contrasting farming systems (FS, indoor vs extensive) at five key physiological stages (Mating; mid-Pregnancy; 2 weeks Pre-Lambing; 3 weeks Post-Lambing; Weaning) for plasma biomarkers (NEFA, non-esterified fatty acids; BHB, β -hydroxybutyrate; T3, Triiodothyronine; INS, insulin). Unsupervised cluster analysis was done to investigate the variability in BR biomarkers trajectories. Overall mean trajectories for biomarkers followed BR dynamics throughout cycles and were mainly characterized by increases and decreases in NEFA, BHB, T3 and INS levels during BR mobilization and accretion phases, respectively. For each biomarker, two to three clusters of ewes were found depending on the parity and/or the FS. Trajectories between clusters differed in the levels and/or the shape. One of the major discrepancies between clusters was levels and/or time point when peaks of biomarkers were observed during BR mobilization. Higher individual variability in biomarkers was thus particularly observed around lambing. Genetic contribution in such variability for BR biomarkers was also investigated before considering these traits for breeding purpose. [Funding with H2020 iSAGE project 679302].

Differences Between Swiss Dairy Breeds in the Relationship Between Milk Urea Nitrogen and Urine Nitrogen Excretion

A. Burren¹, M. Terranova², M. Kreuzer³, T. Kupper¹, S. Probst¹

¹ Bern University of Applied Sciences, School of Agricultural, Forest and Food Sciences HAFL, Länggasse 85, 3052 Zollikofen, Switzerland, ² ETH Zurich, AgroVet-Strickhof, Eschikon 27, 8315 Lindau, Switzerland, ³ ETH Zurich, Institute of Agricultural Sciences, Eschikon 27, 8315 Lindau, Switzerland

The aim of this study was to model the major substrate for ammonia emissions, urinary nitrogen excretion (UN; g/day), based on an easy-to-determine proxy. One such proxy could be the milk urea nitrogen content (MUN; mg/dL). We therefore investigated urinary nitrogen and milk urea nitrogen values from 21 different feeding experiments performed with 162 Brown Swiss (BS), 348 Holstein (HO), 44 Jersey (JE) and 50 Swiss Fleckvieh (SF) cows. The relationship between the coefficients of UN and MUN was investigated using linear mixed models. The final model included the fixed effects MUN, body weight (BW), breed and the interactions MUN \times breed and BW \times breed, as well as experiment as random effect. The model also considered the heteroscedasticity. The coefficient of determination of the final model was high ($R^2 = 0.812$). The regression coefficients and highest posterior density intervals for MUN were 7.28 (5.42;9.02), 10.41 (9.16;11.65), 9.00 (6.20;11.94) and 11.79 (9.15;14.25) g/day for the UN increase per mg/dL for BV, HO, JE and SF, respectively. The estimated regression coefficients for BW and highest posterior density intervals were 0.09 (-0.01;0.19), 0.17 (0.11;0.27), 0.51 (0.21;0.80) and 0.28 (0.03;0.53) for BV, HO, JE and SF, respectively. The estimated marginal means \pm standard errors for UN (g/d) were 117 ± 12 , 147 ± 12 , 119 ± 14 and 135 ± 14 for BV, HO, JE and SF, respectively. These results are consistent with other studies and show that the MUN content of the milk, to be determined in tank milk samples, is a useful tool for predicting UN in lactating dairy cows. However, the results also show that the predictive model must consider breed and BW. This procedure enables improvement of the accuracy of mass flow models to estimate ammonia emissions which are based on the nitrogen excretion of livestock at the beginning of the manure management chain.

European Network on Livestock Phenomics (EU-LI-PHE): boosting phenotyping in livestock

Phenomics in livestock is focused on the systematic description of the animal phenome, referred to as the physical and molecular traits of an animal. EU-LI-PHE is a Europe-centred multidisciplinary, interconnected and inclusive network of experts aiming to boost scientific collaboration, catalyse developments, and transfer of livestock phenomics concepts and applications to improve the sustainability of the European livestock production sector. EU-LI-PHE is focused on i) phenotyping technologies and infrastructures for applications in livestock phenomics, ii) novel approaches and methods for genome to phenome integration in livestock species, iii) computational resources and data analysis methods needed for this big data discipline, iv) the regulatory framework and the societal vision for livestock phenomics and v) the development of a training environment for the benefit of the next generation of researchers in this field.

Session 28

Theatre 2

Structured resilience phenotyping using big dairy data

J. I. Ohlsson¹, T. Klingström¹, L. M. Tamminen², M. Johnsson¹, A. Englund³, J. Svensson³, R. Ginlund³, M. Zhou³, D. J. De Koning¹

¹ Swedish University of Agricultural Sciences, Department of Animal Biosciences, Box 7023, 75007 Uppsala, Sweden, ² Swedish University of Agricultural Sciences, Department of Clinical Sciences, Box 7054, 75007 Uppsala, Sweden, ³ Uppsala University, Faculty of Science and Technology, Box 256, 75105 Uppsala, Sweden

Part of the challenge in breeding for increased resilience is defining the phenotypes of resilience traits in livestock. Resilience indicators based on lactation curves are being developed and their genetic basis is under investigation. Increased adoption of robot milking systems and other smart farming equipment means that a broad spectrum of real-time cattle data is produced on modern dairy farms, which can be combined with regional weather data to discover phenotypes of climate response in dairy cattle. The SLU infrastructure for cattle data, Gigacow is continuously gathering PLF data including feed intake, milk yield, and health events from 15 Swedish commercial dairy herds since 2019. This information is crosslinked per cow with the national cow database Kokontrollen, and 50k SNP genotypes from the Nordic Cattle Genetic Evaluation. Uppsala University students in collaboration with SLU used SLU Gigacow milk yields normalized against Wood's Lactation Curve in generalized additive models to show negative impacts on milk yield from increased mean temperature and mean THI. With SLU Gigacow lactation curves and corresponding weather data, it is possible to detect depressed lactation in individual cows, and link it to genotype by GWAS. This serves as a proof-of-concept of a systematic approach to livestock genotyping, similar to the process in human disease genetics. Automated data collection produces signals, which are associated with genetic factors, and a structured phenotype can be defined, including the data sources necessary to detect it and investigate its heredity. A structured phenotyping approach would both accelerate and empower resilience research to fully utilize the expanding range of data provided by modern smart farms.

Large-scale phenotyping through milk infrared spectroscopy for enhancing resilience in dairy cattle: the contribution of LEO 'Livestock Environment Opendata' project

A. Cecchinato¹, M. A. Ramírez Mauricio¹, L. F. Macedo Mota¹, L. Gallo¹, S. Schiavon¹, S. Pegolo¹, E. Trevisi², M. Nocetti³, E. Sturaro¹, R. Negrini², D. Giannuzzi¹

¹ University of Padova, DAFNAE, Viale dell'Università, 35020 Legnaro (Padova), Italy, ² Università Cattolica del Sacro Cuore, DIANA, Via E. Parmense, 29122 Piacenza, Italy, ³ Consorzio del formaggio Parmigiano Reggiano, Via J. F. Kennedy, 42124 Reggio Emilia, Italy

This study aimed to explore the potential of the Fourier-transform infrared (FTIR) spectra stored during milk recording schemes for large-scale phenotyping of blood biomarkers associated with metabolic stress and resilience, including hepatic enzymes, ceruloplasmin (CP), total reactive oxygen metabolites (ROMt), and paraoxonase (PON). Blood metabolites were predicted (p) using FTIR spectroscopy with equations previously developed on an independent calibration dataset (1,351 cows, 5 herds). Calibration equations were then applied to a population database of 1,355,730 test-day FTIR milk spectra (176,174 cows, 966 multibreed farms), collected by the Breeders Association of Emilia Romagna region (ARA, Reggio Emilia, Italy) and made available by the Italian Breeders Association (Rome, Italy) through the LEO project. All predictions were analyzed using a linear mixed model. Days in milk was a relevant source of variation for the traits of concern ($P < 0.01$), with pPON showing opposite direction over lactation compared to pCP and pROMt, thus confirming their contrasting effects on inflammation/oxidation status. Traditional mountain farms exhibited higher levels of pPON compared to 'modern' farms with total mixed rations ($P < 0.01$). About breed effect, Holstein Friesian cows displayed the highest levels of pPON and lowest level of pCP and pROMt across all farming systems. These new phenotypes are promising for animal welfare monitoring and breeding purposes to address metabolic stress and improve resilience in dairy cows.

Session 28

Theatre 4

Ensemble Learner Enhances Prediction Accuracies for Extreme Body Condition Classes in Jersey Dairy Cattle in a 3D Image High-Throughput System

R. Stephansen¹, G. Gebreyesus¹, G. Sahana¹, J. Lassen^{1,2}

¹ Aarhus University, Center for Quantitative Genetics and Genomics, C.F. Møllers Allé 3, 8000 Aarhus C, Denmark, ² VikingGenetics, Ebeltoftevej 16, 8960 Randers, Denmark

High-level management of dairy herds relies on monitoring the body condition, but routine evaluation is limited, prompting exploration into cost-effective alternatives. We aimed to establish a reliable body condition prediction for Jersey cows with input from the 3D camera system CFIT (Viking Genetics, Denmark). We collected 2,167 body condition score (BCS) records from 794 Jersey cows. In total 691 prediction features were derived from top-down 3D images, defining contours on the cow's back. We implemented two data splitting approaches: 1) 7:3 random split, 2) herd cross-validation. Using LazyRegressor in Python, we observed Bayesian Ridge and Lasso Regression were the two top model choices. The models were tested with and without weights on class frequencies, and an ensemble prediction was formed by combining weighted and unweighted predictions. Evaluation metrics were F1-Score and accuracy on exact and 0.5-unit deviation, using rounded predictions. A linear model ($BCS = \alpha + \beta \times \text{predicted BCS}$) was used to evaluate bias (α) and inflation (β). The ensemble learner outperformed the component models. In the 7:3 split, overall accuracy reached 55.1% and 96.5% for exact and 0.5-unit deviation. F1-Score was improved in the highest BCS classes (exact: 0 to 31%; 0.5-unit: 0 to 68%). The ensemble learner exhibited superior performance in α and β (0.09 & 0.97) compared to the component models (α : 0.55-0.87; β : 0.68-0.82). Herd cross-validation showed a modest ~6%-unit reduction in prediction accuracy. Our findings shows the feasibility of predicting BCS in Jersey cows using a 3D camera system, with the potential to enhance management decisions in Jersey cows.

Phenotyping of beef calves BW and morphological scores based on 3D imaging and AI

T. Dechaux¹, Y. Do¹, M. El Jabri¹, E. Deste¹, C. Allain¹, L. Delattre², C. Gillé-Perrier³, M. Bruyas⁴, A. Lebreton¹

¹ Institut de l'Élevage, 149 rue de Bercy, F-75595 Paris, France, ² 3D ouest, 5 Rue Louis de Broglie, F-22300 Lannion, France, ³ Races de France, 149 rue de Bercy, F-75595 Paris, France, ⁴ Eliance, 149 rue de Bercy, F-75595 Paris, France

Into the PHENO3D project, we validated a new 3D device adapted to high-throughput on-farm phenotyping (Do et al., 2024). This enabled development of an AI that predicts weight and linear scores from the 3D image provided by the scanner. The linear scoring resulted on 2 synthetic scores: the muscular conformation (MUS), and the size of the animal relating to skeletal development (SKE). Currently, these linear scores are done visually by certified technicians. To achieve these objectives, 1194 Charolais calves from 4 to 12 months and from 90 to 620 kg were scanned in 14 farms. Most of them were scanned 2 times resulting in 2110 3D images. Reference measures were collected on animals: each calf was weighed (BW on an electronic scale) and linear scored by 3 trained technicians. For BW and linear scores prediction, 1818 and 1575 images were respectively split into train (80%) and test (20%) subsets. For BW, MAE was 12.1 kg (4.2%). The quality of the linear scores' prediction was assessed in the same way that current technicians are yearly evaluated: a spearman correlation with a reference (homogeneity), a spearman correlation between two scoring sessions (reproducibility). For SKE, the homogeneity and reproducibility were respectively $r=0.76$ and $r=0.87$. For MUS, the homogeneity and reproducibility were respectively $r=0.79$ and $r=0.81$. The performances of the linear scoring models are superior to the average performance of the technicians in their yearly certifications. The performances of the AI on the Charolais breed gives the green light to multiply our models on the 9 other beef breeds linear scored today.

Molecular phenotyping through metabolomic analyses in pig breeds

M. Bolner¹, S. Bovo¹, G. Schiavo¹, G. Galimberti², F. Bertolini¹, A. Ribani¹, M. Gallo³, S. Dall'Olio¹, L. Fontanesi¹

¹ University of Bologna, Agricultural and Food Sciences, Viale G. Fanin 46, 40127 Bologna, Italy, ² University of Bologna, Statistical Sciences, Via delle Belle Arti 41, 40126 Bologna, Italy, ³ Associazione Nazionale Allevatori Suini, via Nizza 53, 00198 Roma, Italy

The animal phenome can be defined as the ensemble of the physical and molecular traits of an animal. The molecular traits can be further dissected into different layers of internal phenotypes, also including many metabolites. Here we analysed ~800 metabolites detected from an untargeted metabolomic platforms on plasma of ~700 Italian Large White and ~300 Italian Duroc pigs to identify metabolites that could be useful to characterise the two breeds. Animals were sib-tested pigs, included in the selection programmes of Italian heavy pigs run by the Italian Pig Breeders Association (ANAS), raised in the same genetic station, and slaughtered at nine months of age when they reached about 160 kg live weight. After quality control, univariate, multivariate and machine learning analyses were used to identify metabolites that could discriminate the two breeds. Combining information from these approaches, a total of ~100 metabolites were identified (including ~1/3 amino acids and ~1/3 lipids among others). The selected metabolites clearly separated the two pig breeds. The observed differences for these molecular phenotypes can describe genetic differences between Italian Large White and Italian Duroc pigs. Acknowledgments: This study has received funding from the European Union's Horizon Europe research and innovation programme under the grant agreement No. 01059609 (Re-Livestock project).

Integrating genomic information in metabolomic networks to dissect molecular phenotypes in pigs

¹ *University of Bologna, Animal and Food Genomics Group, Division of Animal Sciences, Dept. of Agricultural and Food Sciences, Viale G. Fanin 46, 40127 Bologna, Italy*, ² *Associazione Nazionale Allevatori Suini, Via Nizza 53, 00198 Roma, Italy*

The complexity of an organism arises from the interplay of different molecular layers (e.g. the genome, transcriptome, proteome, and metabolome) that generate biological processes and pathways that, in turn, define the animal phenotype. In this study, we combined metabolomics and genomics to explore and gain knowledge on the interplay between these two layers using systems biology approaches. For these aims, we used both genome (~60,000 SNPs) and plasma metabolome information (~1,000 metabolites obtained from targeted and untargeted platforms) from ~1,000 Italian Large White and Italian Duroc pigs. Metabolomics data were used to reconstruct pathways through two network generation approaches, i.e. correlation networks and Gaussian graphical models. Then, genome-wide association studies were carried out to identify genetic loci influencing metabolites (mQTL). A first comprehensive catalog of mQTL was obtained, including a few hundreds of putative causative genes. These loci were subsequently studied and used to inform metabolite networks. The inclusion of mQTL in the metabolic pathways improved the estimation and generation of simple correlation networks and revealed relationships between known and unknown metabolic features. These results provided a first picture of genetic factors and metabolic interactions affecting the pig metabolism. Acknowledgements: This study has received funding from the European Union's Horizon Europe research and innovation programme under the grant agreement No. 01059609 (Re-Livestock project).

Novel resilience indicators based on egg production in laying hens

*I. Fodor*¹, *P. Duenk*¹, *B. Visser*², *D. Janssen*², *M. P. L. Calus*¹, *M. Van Der Sluis*¹, *C. Kamphuis*¹

Breeding for heat tolerance aims to minimize the impact of heat waves on production and welfare of livestock. Here, we aimed to define new phenotypes based on perturbations in egg production of laying hens, which can be later used as indicators for heat tolerance. We analysed 1.8 million daily egg production records of laying hens housed in 4,806 cages on two farms over approximately one year. We quantified perturbations at cage level as the deviation of daily egg laying rate (LR, %) from the expected laying rate, where the expected laying rate of each cage was estimated using the Adams-Bell curve. We estimated the phenotypic correlations of several potential resilience indicators, including the natural logarithm of the variance (LnVar) of the LR, cumulative sum of the downward deviations from expected production, and the persistence of egg production. Between 35 and 60 weeks of age, higher variance (expressed by LnVar) of the egg laying curve was phenotypically correlated with larger cumulative deviations from expected production ($r=0.717$), less eggs produced ($r=-0.445$), and lower persistence of egg production ($r=-0.397$). That is, more resilient laying hens (i.e., hens with more consistent egg production over time) produced closer to their expected production, laid more eggs, and maintained high production for a longer period of time. We also observed larger deviations from the expected laying rate at higher indoor temperatures, but weather and production stage effects were not clearly separable in the dataset at hand. In the next step, we are going to link these novel indicators to heat tolerance using the data of multiple farms over several years.

Towards a 24hr chicken surveillance system

J. Geibel^{1,2}, H. Schomburg³, O. Sanders³, C. Reimer^{1,2}, S. Weigend^{1,2}

¹ Friedrich-Loeffler-Institut, Institute of Farm Animal Genetics, Höltyst. 10, 31535 Neustadt, Germany, ² University of Goettingen, Center for Integrated Breeding Research, Carl-Sprengel-Weg 1, 37075 Göttingen, Germany, ³ Friedrich-Loeffler-Institut, Institute of Animal Welfare and Animal Husbandry, Dörnbergstr. 25/27, 29223 Celle, Germany

Increasing demands for animal welfare in livestock production require the inclusion of behavioral data into future laying chicken breeding programs. This is accompanied by challenges of data recording in cage-free layer systems and increasingly labor-intensive requests for animal control by authorities, which settles the raising need for automated 24hr animal monitoring systems. RFID based chicken tracking was shown to allow for accurate animal identification, but at low resolution and thus biasing measures of animal movement. In contrast, computer vision models allow accurate detections of moving animals, but tracks are usually lost at points of occlusion or disturbances, thus hardly allowing animal identification over a long period. To overcome those limitations, we currently develop a combined real-time monitoring system through video tracking and animal identification based on sparsely placed RFID antennas for our research flocks. For an initial test set-up, three low-frequency RFID antennas (30*80cm) were placed in a pen on two levels, stocked with eight hens and a rooster. Chickens were detected, using a custom-trained YOLOv8n (640*640px) object detection model based on 10fps videos (F1 score of 0.96 at a confidence of 0.8), followed by assigning tracks to the predictions by SORT algorithm. Further, the most likely chicken was assigned to the tracks by minimum average squared distance to antennas with RFID signals. This resulted in increasing the average length of tracks from 1.9min (47min max) to an average track length with an id assigned of 8.2min (153min max). However, using the Rooster as a positive control currently results in 48% correct classifications only, thus requiring further updates of the assignment algorithm in identification of track switches and closing of gaps between assigned tracks. Nevertheless, those intermediate results are promising to soon allow for an accurate 24h monitoring of laying chickens, which will leverage the information of future research trials.

A tracking tool for monitoring activity in broilers

J. Tarres¹, J. P. Sanchez¹

¹ IRTA, Animal Breeding and Genetics, Torre Marimon, 08140 Caldes de Montbui, Spain

An important percentage of the resources used by a growing animal is spent on physical activity. It has been shown that selection for reducing residual feed intake has led to less active animals. Our purpose with this communication is to inform the poultry researchers community about the development of a new computer vision system to track and quantify the physical activity of chicken. We have used MaskR-CNN library to perform the instance segmentation in order to detect all the visible chickens in frame, MaskR-CNN produces a table with the coordinates of each chicken. In a second step, the detected chickens were tracked across frames using Simple Online and Real-Time Tracking (SORT). This initial demonstration was done with a mobile phone camera, recording 20 one-minute videos of 848 x 478 pixels at 30 frame per seconds (fps), at a high of approximately 1.70 meters. The animals were in a commercial broiler farm with a total of 17,000 Ross broilers with an approximated density of 17 animals per square metre. For the detection a model trained on images from rabbits was used as starting point, this model was re-trained just with 16 frames on which all the observed chickens were annotated, 50-60 individuals per image. Three additional images, having approximately 55 chickens each were reserved for validating the detections. The mean Average Precision of pixels assignation to the chicken class in the validation set was 0.92. Due to this high accuracy, tracking performance was high even when videos were cut to 10 fps, but the performance was considerably better when the quality of the videos was maintained at 30 fps. These results indicate that group tracking to measure physical activity of a group of chicken is feasible even at high density, further training rounds and a proper definition of physical activity metrics are needed

Computer-vision based analysis of turkey locomotion

Z. Wang¹, H. Doekes¹, P. Langenhuizen², B. Visser³, P. De With², P. Bijma¹

¹ Wageningen University and Research, Animal Sciences, Droevendaalsesteeg 1, 6708PB Wageningen, Netherlands, ² Eindhoven University of Technology, Technology Department of Electrical Engineering, P.O. Box 513, 5600 MB Eindhoven, Netherlands, ³ Hendrix Genetics Research, Technology & Services B.V., Spoorstraat 69, 5830 AC Boxtmeer, Netherlands

Accurate measurement of livestock locomotion is crucial across various domains, including optimizing herd management practices, early detection of health issues, and understanding behavioral patterns for enhanced productivity. However, conventional data collection methods encounter limitations in terms of cost and scalability. Recent advancements in computer vision offer a promising solution for large-scale, automated, non-intrusive, and cost-effective phenotyping of locomotion. In our study, we implemented a video-based system to track over 300 turkeys within a 120 m² pen, employing multiple cameras covering the entire area. We segmented days of videos into five-minute clips and randomly sampled 280 clips to derive locomotion parameters. First, we applied our previously developed multi-camera tracking algorithm to track the turkeys. Second, we derived locomotion parameters from the detected tracks. This included estimating the speed and turning angle distributions of individual turkeys, and assessing the time each turkey spent on resting (defined as speeds < 0.5 m/s lasting for more than 2 seconds) or moving. Additionally, we determined the time each turkey spent on feeding based on detecting its RFID-tag (Radio Frequency Identification) in the feeder. Furthermore, at the population level, we analyzed the distribution of animals within the pen, offering insights into social dynamics and space utilization. The results revealed significant individual differences in locomotion parameters and time budgets. Notably, despite being kept in the same environment, the results suggested that these traits may have a genetic basis. Overall, we developed a video-based approach for locomotion measurement and found substantial individual differences in locomotion parameters and time budgets among turkeys. Consequently, we gained valuable insights into individual behavior, social dynamics, and space utilization, facilitating informed and effective livestock management and breeding practices.

Inertial measurement unit technology for gait detection: a comprehensive evaluation of gait traits in two Italian horse breeds

V. Asti¹, A. Sabbioni¹, M. Vasini², M. Ablondi¹

¹ University of Parma, Department of Veterinary Science, Str. dell'Università, 12, 43121 Parma PR, Italy, ² Italian Breeding Association for Equine and Asinine Breeds, Via XXIV maggio, 44/45, 00184 Roma, Italy

The shift from agricultural to leisure and sports purpose of the horse breeding sector led to a decrease in local breeds' population size, due to a loss of their original breeding purposes. Most of the Italian breeds thus must adapt to modern market demands, and gait traits are suitable phenotypes to help this process. Inertial measurement unit (IMU) technology can help to objectively detect them. This work aims to investigate gait traits based on an IMU sensor through i) the evaluation of which environmental factors and biometric measurements influence the IMU measures, ii) the repeatability, and iii) the correlation with judge evaluations. The Equisense Motion S® was used to collect phenotypes on 135 horses, Bardigiano (101) and Murgese (34) and the data analysis was conducted using R (v.4.1.2). Analysis of variance (ANOVA) was employed to assess the effects of biometric measurements, and environmental factors on the traits. Variations in several traits depending on the breed were identified, highlighting different abilities among Bardigiano and Murgese horses. Repeatability of horse performance was assessed on a subset of horses, with regularity and elevation at walk being the traits with the highest repeatability (0.63 and 0.72). The positive correlation between judge evaluations and sensor data indicates judges' ability to evaluate overall gait quality. The predictability of judge evaluations was assessed via a support vector machine model (SVM). High accuracy (ranging between 0.62 to 1.00) was shown, despite challenges posed by an unbalanced number of observations per subjective classes of evaluation and a limited number of animals. In conclusion, integrating IMU technology offers valuable insights into horse performance evaluation, with implications for breeding and training. Michela Ablondi is co-financed by the European Union – NOP Research and Innovation 2014-2020 art. 24, par. 3, A) Law 30/12/2010, n. 240 and of the D.M. 10/08/2021 n. 1062.

LIPH4SAS (« Livestock Phenotyping for Sustainable Agroecological Systems »): a national research infrastructure for livestock phenotyping

J. P. Bidanel¹, M. Loucif², Y. Billon³, S. Ingrand⁴

¹ INRAE, Animal Genetics, UMR GABI, 78350 Jouy-en-Josas, France, ² INRAE, UMR GABI, 78350 Jouy-en-Josas, France, ³ INRAE, Animal Genetics, Domaine du Magneraud, 17700 Le Magneraud, France, ⁴ INRAE, Animal Physiology and Livestock Systems, Site de Theix, 63122 St-Genès-Champagnelle, France

The LIPH4SAS research infrastructure is dedicated to livestock phenotyping and enables experiments, phenotyping and biological sampling for the animal research community, with a view to promoting the transition to more sustainable agricultural and food systems based on agroecological principles. LIPH4SAS comprises eight experimental units, of which four are dedicated to ruminants, two to pigs and two to trout. It also includes a platform dedicated to the in-depth study of livestock physiology and a structure responsible in charge of data management and the development of phenotyping tools. LIPH4SAS has large facilities (2,000 cattle, 4,500 sheep/goats, 7,000 pigs ...), including many valuable genetic resources (original populations, selected lines, homozygous trout lines, etc.), managed in a variety of geographical areas and breeding systems. It provides skills and tools for detailed and multi-scale phenotyping (surgery, in and ex vivo imaging, respiratory chambers, etc.) and horizontal phenotyping on large groups of animals (slaughterhouses, equipment for measuring growth, feed intake and efficiency, body composition, behavior and health, product quality, greenhouse gas emissions, etc.). The aim of LIPH4SAS is to provide a global service that promotes interaction between scientific communities, harmonizes practices to ensure the highest level of expertise as possible and ethics in animal experimentation and welfare, encourages innovation in animal science and facilitates access to Fair data.

Exploring the potential of an image analysis mobile app to estimate horse body morphometric measurements

C. Bordin¹, M. Greppi¹, T. Danese², V. Asti², M. Ablondi², F. Raspa¹, E. Valle¹

¹ University of Turin, Largo P. Braccini 2, 10095 Grugliasco, Italy, ² University of Parma, Via Taglio 8, 43100 Parma, Italy

The ability to measure an animal directly from images without physically taking measurements could prove to be a valuable tool for studying its growth pattern and morphometry. This study aims to employ an image analysis mobile app to estimate body measurements (BM) from pictures. A total of 18 BM were directly measured from six horses (dBM). Subsequently, the same horses were systematically photographed, and the identical set of 18 BM was measured indirectly from their images (iBM) by three operators, using an image analysis mobile app (ImageMeter®). Statistical analysis was conducted using JMP v16, with normality assessed through the Shapiro–Wilk test. Inter and intra assay coefficients of variation (CVs) were calculated between operators. A Bland–Altman test was applied to check the agreement between operators, and between dBM and iBM. The reproducibility of this technique was demonstrated by the mean inter and intra-assay CVs (6.4% and 7.9%, respectively), and by the agreement obtained between operators, which resulted in a bias of 0.8±0.8 cm and limits of agreement ranging from -2.7 to -2.4 cm. Moreover, a promising result was obtained regarding the precision of iBM when compared to dBM (bias of -3.9±1.3 cm, limits of agreement from -0.5 to -7.3 cm). The most accurate measurement was obtained with the ear's length, estimated with a precision of -0.2±0.3 cm (limits of agreement from 0.6 to -0.9 cm). Overall, the use of ImageMeter® represents a promising tool for researchers and breeders to estimate indirectly BM. Further studies on larger samples are needed to improve the methodology also considering the genetic implications

Phenotool: An information-sharing platform for livestock phenotyping methods and tools

M. Loucif¹, G. Pairault^{1,2}, Y. Billon³, S. Ingrand⁴, J. P. Bidanel¹

¹ INRAE, UMR GABI, 78350 Jouy-en-Josas, France, ² Eliance, 149 rue de Bercy, 75012 Paris, France, ³ INRAE, AG Division, 17700 Surgères, France, ⁴ INRAE, UMRH, 61322 ST-Genès-Champanelle, France

Animal phenotyping has undergone profound evolution in recent years with the development of high-throughput equipment, increasingly non-invasive sensors, the rise of "omics" technologies, and the use of artificial intelligence for image or sound analysis. The Phenotool platform has been developed with a twofold objective: 1) to present all the phenotyping equipment available within the LIPH4SAS research infrastructure; 2) to present the most important phenotyping tools available or under development for key traits related to the agroecological transition of livestock farming, mapped as part of a working group of the GIS Avenir Elevages, a French Think Tank dedicated to the future of livestock production. Phenotool consists of a web interface (www.phenotool.fr), developed under WordPress CMS, which allows online consultation of a database containing the main information available on phenotyping equipment. It offers an advanced search system allowing users to filter equipment according to the species investigated, the traits to be measured, or the geographical location. It also provides detailed information on each instrument listed, such as its description, technical specifications, and specific training materials for each instrument. Phenotool aims to facilitate access to information in the rapidly developing field of livestock phenotyping. By promoting the sharing of resources and knowledge, it should contribute to the emergence of new collaborations and innovative projects.

Feature identification for fattening pig body weight prediction: insights from correlation analysis

J. Sloomans^{1,2}, J. Maselyne², T. Norton¹

¹ KU Leuven, Kasteelpark Arenberg 30 - bus 2472, 3001 Leuven, Belgium, ² ILVO, Burgemeester Van Gansberghelaan 115, 9820 Merelbeke, Belgium

Body weight is both a production parameter and a general health indicator for fattening pigs. Monitoring the body weight can therefore provide essential insights in pig production. Nowadays, pig body weight monitoring is either done by visual observation or by weighing devices on the group level. However, in order to go to individual pig health, welfare and productivity monitoring a more comprehensive understanding of body weight related parameters is required. In this study, the correlation of a range of feeding and drinking related features with the pig body weight was investigated. All features were calculated on the individual pig level for 4 fattening rounds of 60 pigs each (n=240 pigs) between 2018 and 2019, based on RFID, weight scale and flow meter sensor data. The correlation of pig body weight was largest with the following feed related features: average feed intake per visit in the last 24h (spearman correlation at optimal lag (r)=0.73 , lag=0), total feed intake in the last 24h (r=0.72 , optimal lag=-13), average duration of feeding visits in the last 24h (r=0.30 , lag=0), maximum duration of a feeding visit in the last 24h (r=0.16 , lag=-9) and feed intake in the last hour (r=0.11 , lag=-23). While correlation of pig growth (pig body weight increase) was largest, although small, with number of visits to the feeder in the last hour (r=0.19 , lag=0) , total feed intake in the last hour (r=0.16 , lag=0), total feed intake in the last 24h (r=0.06 , lag=0), average duration of visits in the last 24h (r=0.05 , lag=-1) and average feed intake per visit in the last 24h (r=0.04 , lag=0). These insight will be used further to develop a predictive model for pig body weight at the individual level.

Animal Science and Production in Italy

N. P. P. Macciotta¹, M. Mele², B. Ronchi³, G. Pulina¹

¹ *Università degli Studi di Sassari, Dipartimento di Agraria, Viale Italia 39, 07100 Sassari, Italy,* ² *Università degli Studi di Pisa, Dipartimento di Scienze Agrarie, alimentari e agro ambientali, via del Borghetto 80, 56124 Pisa, Italy,* ³ *Università degli Studi della Tuscia, Dipartimento di Scienze Agrarie e Forestali, via San Camillo De Lellis snc, 01100 Viterbo, Italy*

The Italian Livestock industry is characterized by a marked regional distribution of species, breeds, and farming systems that reflects the wide geographical and climatic varieties of the Country, and socio-cultural contexts. Main livestock species farmed in Italy in 2023 (in millions of live animals) are cattle (5.4), sheep (5.9), goats (1.0), pigs (8.1), poultry (147.1). Other peculiar species are dairy buffaloes (0.44), rabbits (11.6), equine (0.48), and bees. In the Northern part of the Country specialized farming systems of pigs, poultry, dairy and beef cattle, can be found, together with the traditional semi-extensive alpine system based on local breeds. Dairy sheep and beef cattle are typical of the central Italy, together with a peculiar dairy buffalo industry. Small ruminants are the prevailing systems in Southern Italy. The gross income of the livestock industry represents the 29% of the agri-food industry. The livestock industry is supported by national breed Associations (AIA, FEDANA), agencies of the Government, organizations of farmers and producers' consortia. Italy owns a large number of PDO or PGI products (316 food products, 526 wines), most of which are of animal origin and that contribute to the 'Made in Italy' brand that is widely acknowledged all around the world. The structure of the Italian Animal Science research is mostly by Universities, the CREA of the Ministry of Agriculture, the CNR and regional Agencies of research. Most of Italian animal scientists are associated in the Italian Association for Animal Science and Production (ASPA).

Theatre 2

Scientific perspectives on the sustainable development of our relationship with farm animals

L. J. Keeling¹

¹ *Swedish University of Agricultural Sciences, Applied Animal Science and Welfare, Box 7068, 751 05 Uppsala, Sweden*

The scientific study of animal welfare emerged from societal concerns about the housing and management of farm animals. It is now a well-established discipline, encompassing fundamental investigations around the concept of 'animal welfare' and applied studies on welfare problems under commercial conditions. Assessing animal welfare has become a key area of scientific study, with the animal welfare indicators identified in such research increasingly included in quality assurance schemes. This trend is likely to continue, hopefully with greater harmonisation of indicators and a better use of the gathered data. However, focusing solely on monitoring the welfare of food-producing animals as a regulatory measure overlooks the broader context of our relationship with farmed animals. Our relationship is multifaceted and extends beyond the chain linking the animal to the farmer and the end consumer. Modern animal welfare science is embracing this complexity, as clearly demonstrated by the numerous interdisciplinary collaborations with nutritionists, geneticists, engineers, economists and others working within the broad area of animal production. Despite this, we still seem to be missing the bigger picture. One possible reason is that we are not looking back at the evolutionary history of these animals as a way to gain new scientific insights to help us in the future. Taking a scientific perspective, this presentation endeavours to reassesses our relationship with farm animals by considering their welfare within the framework of sustainable development. The interconnectedness of human, animal and environmental health is already highlighted in the One Health approach and the related One Welfare concept. The integration of animal welfare considerations with global challenges such as climate change, food security and antimicrobial resistance is increasingly recognised. Yet progress is painfully slow. A potential barrier seems to be that improved farm animal welfare is considered part of the problem, rather than part of the solution. By reassessing our relationship with farmed animals in a wider context, it becomes clearer that efforts to improve animal welfare can contribute even towards achieving the UN sustainable development goals.

Perspectives from the Animal Advocacy Movement

E. Nalon¹¹ Eurogroup for Animals, rue Ducale 29, 1000 Brussels, Belgium

Societal awareness of the plight of farmed animals and the ethical implications of their treatment is growing in the European Union, as shown by the success of the recent European Citizens' Initiatives (ECI) "End the Cage Age". This was one of three ECIs on animal welfare to gather more than 1 million signatures one after the other (the other two were "Save Cruelty-Free Cosmetics" and "Fur Free Europe"). End the Cage Age sent a strong political signal that the use of close confinement in animal production is no longer acceptable to the general public. Similarly, the Special Eurobarometer on Animal Welfare published in 2023 showed that more than eight in ten Europeans want farmed animals to be better protected. While market-driven animal welfare initiatives, such as the Better Chicken Commitment, can rapidly gain traction globally, policy-making is slow in addressing evolving ethical concerns. However, a heightened awareness of the needs of animals is reflected in the European Commission's proposal for stricter rules on the breeding and trading of dogs and cats, based on the five domains model. Although the Commission has delayed most of its legislative proposals on farmed animals, we anticipate that all future animal welfare legislation will be based on the five domains framework. To achieve a treatment of farmed animals that genuinely respects their complex needs, it will be necessary to reduce their numbers. This will imply rethinking our diets and how we produce food. The animal advocacy movement has joined a global call for a more ethical and sustainable food system that pays full regard to animal welfare, protects and regenerates the environment, and promotes human health and dignity.

Session 29

Theatre 4

Industry Insights

C. Cucurella¹¹ European Livestock and Meat Trades Union, 81A, Rue de la Loi, 1040 Brussels, Belgium

Operators and representatives of the sectors linked to farmed animals (farmers, livestock traders, food industry, etc) state very often that the welfare of animals is a main interest for all the links of the production chain. Despite this statement would sound cliché, this sentence is completely true. Healthy well treated animals provide safe and high-quality products for human nutrition. It is a prerequisite for the sector represented by UECEV. While farmers have learnt and applied practices with the objective of providing safe products and doing huge efforts to meet societal expectations in terms of animal health and welfare, citizens and consumers seem to demand improvement of conditions of farmed animals even though their knowledge on animal farming is scarce. We need to look into the role of animal farming in society and vice versa, and to reflect on how to reconcile the views of the different parts of society regarding livestock activity and ensure that we have a broad vision of the objectives of livestock farming. Education is necessary to understand how food products arrive to our tables and how food of animal origin is obtained, and to understand that farming animals is a fundamental activity for our society. European primary educational programmes should include subjects on agriculture and farming, so the new generations know how to grow crops and how to obtain food from animals while respecting them and taking care of them. On the other hand, all the future progress in benefit of animals at all stages of their productive life must be done on sound basis of scientific knowledge.

The Consumer-Citizen Dilemma of Animal Welfare amid Farmer Protests and Agricultural Policy Failures
A. Spiller¹

¹ *Georg-August-University of Goettingen, Department for Agricultural Economics and Rural Development, Platz der Göttinger Sieben 5, D-37073 Göttingen, Germany*

Meat consumption sparks numerous controversies, leaving hardly anyone indifferent. Re-assessing our relationship with livestock is thus a pivotal task for both animal science and agricultural economics, as the sector's social license to operate is under scrutiny. Notably, contrary to long-term trends, meat consumption has recently declined in several countries, a phenomenon termed 'peak meat'. In Germany, meat consumption has decreased by approximately 10 kg per capita annually over the past decade. Initially, the animal husbandry, meat, and dairy industries grappled with animal welfare issues. However, there has been a notable increase in attention and willingness to adopt changes in recent years. Despite this shift, market success has been limited, prompting discussions on the limitations of a market-driven approach to farm animal welfare, commonly referred to as the "consumer-citizen gap". The issue is further complicated by the need to reduce animal husbandry volumes to meet environmental and climate protection goals. This dual pressure of declining sales, increased price competition, and substantial social transformation demands has created a challenging business environment. Given this context, the feasibility of driving such a transformation through market forces alone is increasingly questioned. In Germany, for instance, new concepts have been proposed, relying either on the governance of major food retailers or on comprehensive political regulation and funding to facilitate animal welfare improvements. However, both approaches have only been partially implemented and have faced significant resistance from farming communities. Drawing from his experience as the head of the German Commission for the Future of Agriculture, the author explores various options for a forward-thinking transformation policy that ensures the economic viability of livestock farming while addressing the pressing issues of animal welfare, environmental sustainability, and social acceptance.

Session 29

Theatre 6

Influence of early nutrition and nutritional programming on performance and physiological parameters of pigs

C. C. Metges¹

¹ *Research Institute for Farm Animal Biology, Wilhelm-Stahl-Allee 2, 18196 Dummerstorf, Germany*

Nutrition is one of the most important environmental influence and has a massive impact on the expression of the genetic architecture and thus the formation and function of the phenotype, not only acutely but also chronically. Especially in early life of pigs, i.e. the periparturient transition between the parenteral and the enteral route of nutrient supply but also around weaning when maternal milk is replaced by solid feed, are critical phases during which the animals are particularly sensitive to nutrition challenges. It is a concern that piglets born to hyperprolific sows have an increased risk of dying before weaning and might benefit from better nutrition. To ensure a healthy start in life that allows the utilisation of genetic growth and development potential as efficiently as possible, but also to promote animal welfare and reduce stress it is crucial to understand nutritional effects and their mechanisms in early life. It is important to know whether and how early nutritional effects carry over into later life, a concept known as early or nutritional programming, and whether this knowledge can be used to favourably influence pig health and performance. On this basis, nutritional strategies can be developed for dams and their offspring to improve the health and milk production of the mother on the one hand, and to promote early feed intake and improve the intestinal maturation of the offspring. Together with European partners, the Research Institute for Farm Animals Biology (FBN) in Dummerstorf, Germany, has contributed to this mission over the last 25 years. This review provides an overview of the relationship between pre- and early postnatal nutrition of pigs and the growth, physiological functions and health of the offspring and highlights some of the challenges for future pig farming. Funding: European Union; German Federal Ministry of Education and Research; German Federal Ministry of Food and Agriculture; German Research Foundation (DFG)

How to reduce enteric methane from dairy cows

P. Lund¹, C. Børsting¹, G. Giagnoni¹, M. Kjeldsen¹, M. Larsen¹, M. Maigaard¹, M. Nielsen¹, D. Olijhoek¹, M. Thorsteinsson¹, W. Wang¹, M. Weisbjerg¹

¹ Aarhus University, Dep. of Animal and Veterinary Sciences, Building 8841/C20, 8830 Tjele, Denmark

Enteric methane constitutes a predominant part of the carbon footprint of milk and the use of feed additives and manipulation of the nutrient composition of the diet are ways to reduce the emission of methane. The use of feed additives such as 3-nitrooxypropanol, nitrate and different types of seaweed have been shown to reduce enteric methane emission from dairy cows, but the concurrent effects on feed intake and milk production have in some cases been negative. Increased inclusion of fat in the diet reduces enteric methane emission primarily due to the dilution of the content of fermentable organic matter in the diet. Also increased inclusion of concentrate at the expense of forages high in fibre is a way to reduce the emission of enteric methane. Strategies related to changes in diet composition should always be accompanied by an evaluation of the effect on the carbon footprint of the diet.

A holistic approach for monitoring the environmental sustainability of the Italian Holstein cattle population R. Finocchiaro¹, L. Benzoni¹, G. Visentin², M. Dorigo³, F. Tiezzi⁴, M. Marusi¹, J. Layton¹, A. Bracchi⁵, G. Bonacina⁵, Z. Maddalena⁶, G. Gilson⁶, M. Cassandro^{1,7}

A holistic approach for monitoring the environmental sustainability is implemented by ANAFIBJ. Since 2015 a wide range of environmental strategies to record data and to develop tools that meet community and farmer needs on mitigation climate change were developed. An ANAFIBJ pipeline was developed to incorporate new traits into the routine database. A consortium with various stakeholders for recording routine environmental traits for Holstein female population has been created. Methane emission records, milk-spectral records, ruminal content, and microbiota composition, collected from key individuals on the population, will feed into the central ANAFIBJ data flow system. Life Cycle Assessment (LCA) has been developed and inserted in a farmer tool for Holstein dairy herds. A “green passport” report was generated to summarize the innovative phenotypes records for each animal. Each tool plays a pivotal role in allowing farmers across the country to assess the environmental impact of their herd and inform decisions regarding herd management.

Measuring the Environmental Impact of a Local Cattle Breed via DHI Longitudinal Data

The Agerolese cattle is a native breed of Southern Italy, primarily raised for milk production for the PDO cheese "Provolone del Monaco" (PMPDO). According to Taste Atlas, PMPDO is ranked as the 21st most renowned cheese globally, with a turnover of 3.7 million euros in 2022. The PDO region spans 163 km², encompassing mountains and coastal landscapes, where managing water, pastures, and anthropogenic pressures are current challenges. Animal diets must comply with the production regulation of PMPDO based on local pastures supplemented with GMO-free proteic fodder and hay. The current population consists of about 500 caws distributed in 30 herds. Besides the milk and cheese quality, the value of such a local breed is also represented by the ecosystemic services deployed, cultural heritage, and adaptation to the environment. Here, we quantify the environmental impact of the Agerolese breed, measuring the enteric methane emission based on Tier 2 DHI longitudinal data and IPCC 2019 equations. The average daily milk yield was 16.2 ± 3.4 kg d⁻¹, with 3.84 ± 0.29 and 3.39 ± 0.22 fat and protein percentage, respectively. The overall enteric methane emission averaged 0.03 ± 0.008 kg CH₄ kg FCM yield⁻¹, in line with other national or cosmopolite dairy breeds under more intensive selection programs.

Comparison of different residual carbon dioxide formulations for selection of feed efficient dairy cows

A. Chegini¹, E. Negussie¹, A. R. Bayat¹, T. Stefanski¹, M. H. Lidauer¹

¹ Natural Resources Institute Finland (Luke), Tietotie 4, 31600 Jokioinen, Finland

Selecting dairy cattle for feed efficiency is a typical research area. Residual feed intake (RFI) has become the common metric for the evaluation of individual's feed utilization efficiency. A similar metric could be defined as residual carbon dioxide production (RCO₂). It has been found that expected feed intake, obtained by regressing dry matter intake (DMI) on energy sinks, may not be biologically plausible and this probably could be also the case for expected carbon dioxide production (CO₂). The objective of this study was to compare different RCO₂ and RFI formulations that are calculated using different partial regression coefficients for energy sinks which are obtained either from regression on energy sinks or from different energy requirement standards. Repeated daily GreenFeed measurements of CO₂ (n = 49155) and DMI records from 82 primiparous Nordic Red dairy cows were used. Three types of RCO₂ and RFI formulations were calculated. The first was by fitting a multiple linear regression (RCO₂MLR and RFIMLR) whereas the second and third were extracted from Finnish energy requirement formulation (RCO₂FIN and RFIFIN) and National Research Council 2021 (RCO₂NRC and RFIN-RC), respectively. Correlations between different RCO₂ and RFI formulations ranged from 0.37 to 0.46, implying that different formulations lead to selection of different animals. Correlation between RCO₂ and RFI was highest when the formulations were based on the Finnish energy requirement formulation and lowest when formulations were based on the estimated partial regression coefficients. Selection based on RCO₂ formulations would lead to improvement in energy conversion efficiency albeit with slightly lower rate compared to selection based on RFI formulations.

Circadian variation and animal-wise association between methane and a new feed efficiency trait in Nordic Red dairy cows

E. Negussie¹, A. Chegini¹, T. Stefanski¹, A. Bayat¹, M. Lidauer¹

¹ Natural Resources Institute Finland, Tietotie 4, 31600 Jokioinen, Finland

Animal-based methane (CH₄) mitigation via improved feed utilization efficiency (FE) requires identification of accurate FE metrics and estimation of its associations with other traits. One potential FE metric in dairy cows is residual carbon dioxide (RCO₂) but its associations with CH₄ output traits is unclear. Besides, currently most averages of CH₄ are estimated from spot-samples of 3 to 30 min over a period of time. This may affect prediction of CH₄ and understanding the circadian variability is essential. The objectives were to assess the circadian variability of CH₄ emission and estimate the association of CH₄ phenotypes with FE metrics. Data was from 137 primiparous Nordic Red dairy cows of Luke's Jokioinen research farm and included 51,977 repeated records. CH₄ and CO₂ were measured using 2 Greenfeed devices. Data was edited and CH₄ production, intensity and yield were derived. The FE metric RCO₂ was defined as a difference between actual and predicted CO₂ output. Circadian variation of CH₄ was estimated by fitting a model containing time of measurement as a fixed effect. Animal correlations were calculated. The correlations between CH₄ phenotypes and RCO₂ ranged from 0.51 to 0.69 and ranged from 0.21 to 0.33 with residual feed intake. Significant circadian variability with five marked elevations of CH₄ was observed: one in the morning and four in the afternoon and late evening. The high and positive animal correlations between RCO₂ and CH₄ output traits indicate the potential of RCO₂ metric for improving FE whilst reducing CH₄ emission. The high circadian variability indicate caution in quantifying CH₄ emission for a given period based on too sparsely taken spot samples.

Session 30

Theatre 6

Correlation between mid-infrared-based predicted methane production and milk urea in Walloon Holstein dairy cows

H. Atashi¹, Y. Chen¹, N. Gengler¹

¹ TERRA Teaching and Research Center, Gembloux Agro-Bio Tech, University of Liège, Pass. des Déportés 2, 5030 Gembloux, Belgium

Nitrogen (N) losses to the environment and greenhouse gas emissions (GHG) as methane (CH₄) and nitrous oxide are two of the main environmental concerns of dairy cattle farming. The low level of N utilization of dairy cows results in approximately 60% of ingested N being excreted as urinary urea (UU). Although UU is difficult to measure, milk urea (MU), a correlated trait with UU, can be measured at a low cost and is included in most milk recording systems. Accurate measurements of CH₄ production require complex and expensive techniques; however, milk mid-infrared (MIR) data have been proved as a fast and cheap method for predicting daily CH₄ produced by individual cows. Genetic selection is a useful tool for reducing N and CH₄ emissions in dairy cattle but requires estimating the genetic correlation between the trait of interest and the traits present in the current breeding goals. This study aims to estimate genetic parameters for MU and CH₄ in Walloon Holstein cows. The data was collected from 2006 to 2022 on 229,465 first-parity Holstein cows (1,529,282 test-day records) distributed in 1,530 herds. The MIR-based predicted methane emission (PME, g/d) and predicted methane emission intensity (PMI; PME/ kg of milk) were used. The PMI was then log-transformed to be normally distributed (LMI). Random regression test-day models were used to estimate genetic parameters through the Bayesian Gibbs sampling method. The means (standard deviation (SD)) of PME, LMI, and MU were 324.3 (68.20) g/d, 2.67 (0.38), and 25.38 (8.02) mg/dl, respectively. Mean heritability estimates for PME, LMI, and MU were 0.13 (0.04), 0.25 (0.05), and 0.21 (0.02), respectively. Genetic correlations estimated between PME, LMI, and MU with milk yield, fat and protein percentages (MY, FP, PP) ranged from -0.12 (MY) to 0.42 (FP), -0.89 (MY) to 0.57 (FP), and 0.01 (PP) to 0.05 (MY), respectively. The mean genetic correlations estimated between MU and PME (-0.02; SD = 0.05) and LMI (-0.03; SD = 0.06) were close to zero indicating no association between these traits. The results demonstrated large variations for PME, LMI, and MU encourage the implementation of selection for environmentally friendly cows.

Estimating Direct and Maternal Effects on Residual Metabolizable Energy Intake in Holstein Calves

R. E. Jahnel¹, K. Hoeksema¹, B. O. Mankanjuola¹, C. M. Rochus¹, F. Miglior^{1,2}, F. S. Schenkel¹, M. A. Steele³, C. F. Baes^{1,4}

¹ University of Guelph, Centre for Genetic Improvement of Livestock, Department of Animal Biosciences, 50 Stone Rd E, N1G 2W1 Guelph, Canada, ² Lactanet, 660 Speedvale Ave W, N1K 1E5 Guelph, Canada, ³ University of Guelph, Centre for Nutrition Modelling, Department of Animal Biosciences, 50 Stone Rd E, N1G 2W1 Guelph, Canada, ⁴ University of Bern, Institute of Genetics, Vetsuisse Faculty, Hochschulstrasse 4, 3012 Bern, Switzerland

The two the largest expenses in the dairy industry are the animals' feed and the rearing of heifers. While in many countries feed efficiency in lactating cows has already been integrated into the genetic evaluation, studies in dairy calves are still scarce. Because maternal effects are known to influence important traits measured early in life, they may play an important role in dairy calf feed efficiency. The objective of this study was to estimate genetic parameters of feed efficiency in pre-weaned dairy calves and investigate the significance of maternal genetic effects on feed efficiency. Residual metabolizable energy intake (RMEI) of 471 Canadian Holstein calves in two time periods (RMEI1: first month of age; RMEI2: second month of age) was used as a measure for feed efficiency. Statistical analysis using animal models including maternal effects was performed with ASReml. Maternal effects significantly (p -value= 0.04) improved model fitting of RMEI1, with high negative genetic correlations between direct and maternal effects (-0.88 ± 0.02). Without considering maternal effects, heritability estimates for RMEI1 and RMEI2 were 0.19 ± 0.11 and 0.32 ± 0.12 , respectively. RMEI1 the direct heritability was 0.15 ± 0.13 , the maternal heritability was 0.27 ± 0.12 and a total heritability of 0.02. The estimated genetic correlation between RMEI1 and RMEI2 (0.77 ± 0.36) indicated that RMEI in the two periods may be considered separate traits. Further studies with more animals and herds, as well as an investigation on the potential relationships with other important traits should be carried out to understand whether and how RMEI could be incorporated in selection decisions. Despite the limited dataset used in this study, moderate heritability estimates indicate that selection for more feed efficient calves is possible.

Session 30

Theatre 8

Genetic relationships between methane emissions, dry matter intake, bodyweight, and milk yield of dairy cows

A. Van Breukelen¹, M. Aldridge³, Y. De Haas², R. Veerkamp¹

¹ Wageningen University & Research, Animal Breeding and Genomics, P.O. Box 338, 6700AH Wageningen, Netherlands, ² Wageningen University & Research, Animal Health and Welfare Group, P.O. Box 338, 6700AH Wageningen, Netherlands, ³ University of New England, Animal Genetics & Breeding Unit (A joint venture of NSW Department of Primary Industries and University of New England), Elm Avenue, NSW 2351 Armidale, Australia

Animal breeding is recognized as an effective strategy to mitigate methane (CH₄) emissions from dairy farming. However, CH₄ is challenging to record and genetic correlation estimates between CH₄ and other breeding goal traits are scarce, while they are essential to construct balanced selection indices and to pinpoint possible indicator traits. The aim of this study was to estimate genetic relationships between CH₄ emissions, dry matter intake (DMI), bodyweight (BW), and milk yield traits in Dutch dairy cows. Enteric CH₄ emissions were recorded with sniffers in the feeding bins of milking robots on 7,749 cows from 72 farms. Data on DMI (3,526), BW (3,783), and milk traits (3,879) were available on cows measured at WUR farms. Genetic parameters were estimated, using bivariate restricted maximum likelihood models with an H-1 relationship matrix in ASReml. The genetic correlation between CH₄ and DMI was moderate and was 0.21 ± 0.12 , and the correlation between CH₄ and BW was low (0.06 ± 0.11). Genetic correlations between CH₄ and milk production traits were positive, and were: 0.25 ± 0.12 for milk yield, 0.07 ± 0.11 for protein percentage, and 0.18 ± 0.10 for fat percentage. The preliminary results show that there are moderate undesired correlations between CH₄ and production traits, which should be considered in future breeding programs.

The potential of residual feed and energy intake as direct selection traits for Fleckvieh cows

S. J. Burn¹, B. Fuerst-Waltl¹, C. Egger-Danner², G. Terler³, A. Steinwider³, W. Zollitsch¹

¹ University of Natural Resources and Life Sciences Vienna, Department of Sustainable Agricultural Systems, Gregor-Mendel-Str. 33, 1180 Vienna, Austria, ² ZuchtData EDV-Dienstleistungen GmbH, Dresdner Str. 89, 1200 Vienna, Austria, ³ Federal Agricultural Research and Education Centre Raumberg-Gumpenstein, Altirnding 11, 8952 Irnding-Donnersbachtal, Austria

In order to select for higher feed efficiency, direct and indirect traits need to be defined, which can be implemented into existing breeding programs. Direct traits can either be residual or ratio traits, with residual traits considered more suitable for genetic evaluation. The aim of this study was to develop a model for residual feed (RFI) and energy intake (REI) as direct efficiency traits for Austrian Fleckvieh cows (dual-purpose Simmental). Furthermore, RFI and REI were compared for their suitability to describe efficiency. Performance data of the research farm of the Federal Agricultural Research Centre in Raumberg-Gumpenstein were used to develop models for RFI and REI. A total of 19 Fleckvieh cows with overall 68 lactations were included in the analyses. The final models used for comparison included the most important energy sinks (i.e., milk production, maintenance, body weight change). Their predictive power for the actual feed or energy intake was moderate ($R^2 = 0.50-0.60$). When comparing RFI and REI models, the REI models had a slightly better fit. Larger data sets are needed, however, to further validate the models and to decide if RFI or REI is better suited for genetic evaluation.

Session 30

Theatre 10

Genetic correlation between body weight and methane emission in Norwegian Red

K. A. Bakke¹, B. Heringstad^{1,2}

¹ Geno AI & Breeding Association, Storhamargata 44, 2317 Hamar, Norway, ² NMBU, Department of Animal and Aquacultural Sciences, P.O. 5003, 1430 Ås, Norway

Body weight of dairy cows is of particular interest as selection for increased milk production leads to larger animals which comes with a cost. Increased automatization of herds has enabled frequent recording of body weight in lactating cows. Our aim was to analyse body weight (BW) in Norwegian Red cows genetically, and to estimate genetic correlation to daily methane (CH₄) emissions. Data was available from commercial herds with weight scale for BW and GreenFeed for CH₄ measures installed. Records from 2019 to 2024 were available from 25 farms with GreenFeed and among these 9 herds contributed with data on BW for lactating cows. Quality control and data edits left us with 260 132 and 220 932 records on daily BW and CH₄ from 1 960 cows, respectively. 410 cows had records on both traits. Traits investigated were average daily BW (Kg) and average daily CH₄ (gram per day). We used a bivariate linear animal repeatability model with common herd testday, permanent environment, and additive genetic effect of animal as random effects. The (co)variances were estimated using the DMU package. Heritability (standard error) of BW and CH₄ was 0.58 (0.05) and 0.39 (0.04), respectively. The estimated genetic correlation between the traits was 0.50 (0.09). Our results confirms that body weight is a highly heritable trait, and there is an unfavorable genetic correlation between BW and daily methane production in Norwegian Red, thus increased body weight would also increase level of methane.

Describing feed efficiency using metabolomic data in pigs

F. Bertolini¹, S. Bovo¹, M. Bolner¹, G. Schiavo¹, M. Cappelloni², M. Gallo², L. Fontanesi¹

¹ University of Bologna, Department of Agricultural and Food Sciences, viale Fanin 46, 40127 Bologna, Italy, ² Associazione Nazionale Allevatori Suini, via Nizza 53, 00198 Rome, Italy

Feed conversion ratio (FCR) is commonly used to determine production efficiency in pigs. However, the basic biological mechanisms of this complex trait are still largely unexplored. In this study, we aimed to describe FCR in Italian Large White pigs using metabolomic data. For 691 pigs, FCR random residuals (FCR-RR), untargeted plasma metabolomic data (constituted by about 1000 metabolites) and high-density single nucleotide polymorphisms were available. We first identified two extreme groups of pigs (100 with the lowest and 100 the highest FCR-RR) and compared their metabolomic data using Sparse Partial Least Squares Discriminant Analysis and Boruta algorithm. With the combination of these two approaches, we identified 12 metabolites that could discriminate the two extreme groups of pigs. These metabolites were involved in a few metabolomic pathways, including fatty acid oxidation, carnitine, alanine, and histidine metabolism. Genomic heritability of the selected metabolites ranged from 0.11 to 0.35. The obtained results can contribute to identify molecular proxies useful to describe feed efficiency and develop new breeding strategies in pigs. Acknowledgments: This study has received funding from the European Union – NextGenerationEU under the National Recovery and Resilience Plan (PNRR) – FEEDTHEPIG, proposal code P2022FZMJ9 – CUP J53D23018310001 and from the European Union’s Horizon Europe research and innovation programme under the grant agreement No. 01059609 (Re-Livestock).

Session 30

Poster 12

Network analysis unraveled the complex interactions in the rumen microbiome associated with methane emission in dairy cattle

X. Ye¹, G. Sahana¹, M. Lund¹, B. Li², Z. Cai¹

¹ Aarhus University, Center for Quantitative Genetics and Genome Research, CF Møllers Allé 3, 8000 Aarhus, Denmark, ² Scotland's Rural College, Roslin Institute, EH25 9RG Edinburgh, United Kingdom

Methane emissions from ruminants, particularly dairy cattle, represent a significant source of greenhouse gas (GHG), contributing to climate change. This study employed Weighted Gene Co-expression Network Analysis (WGCNA) to investigate the complex interactions within the rumen microbiome that influence methane emissions. By integrating rumen microbiome sequencing data with methane emissions measurements from 750 Holstein cattle, we employed a quality-based bioinformatics pipeline to identify microbial communities and their associations with methane production. Meanwhile, our findings highlight the crucial role of both archaeal and bacterial communities in methane emissions, revealing specific microbial modules (MEblue, MEyellow, METurquoise, and MEBrown), interactions (Clostridium–Clostridium–Prevotella-RF39-Clostridium) and different taxa (archaeal genera VadinCA11, Methanobrevibacter, and Methanosphaera; bacterial taxa Bacteroidales, Ruminococcaceae, Prevotella, Treponema, Clostridium, Anaeroplasma, CF231, and Succinogenes) significantly correlated with methane emissions. Methanobrevibacter, and Methanosphaera, archaeal phylum Euryarchaeota, are known for their methanogenic capabilities and predominant abundance for archaeal communities. In addition, bacterial genera like Prevotella, and Clostridium can produce volatile fatty acids (VFAs) and hydrogen, which can be substrates for methanogenesis in archaeal communities. The application of network analysis provided a systematic understanding of the microbiome-methane emission relationship, providing its potential as an innovative approach to study microbiome-trait association in cattle.

Investigating microbiability and microbiome-wide association analysis across diverse gut sections in growing-finishing pigs fed nitrogen- and phosphorus-restricted diets

B. Bonhoff¹, C. Große-Brinkhaus¹, W. Seel², E. Tholen¹

¹ University of Bonn, Institut of Animal Science, Endenicher Allee 15, 53115 Bonn, Germany, ² University of Bonn, Institute of Nutritional and Food Sciences, Katzenburgweg 7, 53115 Bonn, Germany

The reduction of nitrogen and phosphorus (N/P)-excretion can be achieved by improved feeding strategies and/or by breeding more nutrient efficient pigs. In this context, our project aims to quantify the effects of N/P-restricted feeding systems and to estimate the heritability (h^2) and microbiability (m^2) effects on feed N/P-related traits. One open question is the role of different gut sections (jejunum, ileum, caecum, and colon) related to the composition of the microbiome and its impact on different efficiency traits. In total, 208 samples of 4 gut sections (jejunum, ileum, caecum, and colon) obtained from 52 crossbred pigs were collected and amplicon sequencing (16S rRNA) was performed. Significant differences for microbial families and genera were observed between small and large intestine in terms of alpha and beta diversity. In general, the estimates for h^2 were higher compared to the estimated of m^2 . The microbiome of small intestine influenced the expression of N/P-digestibility, while high m^2 values for two feed efficiency traits were observed in large intestine. For nearly all other traits, m^2 values were zero. Additionally, a microbiome-wide association study revealed a high number of gut specific amplicon-sequence variants (ASVs), with very small effects on 5 efficiency traits. This might be due to the small number of observations. In conclusion, the results of this study revealed gut specific microbial variance affecting efficiency traits. The study was supported by funds of the MULNV (project-no. 41.2019.03) and of the LANUV (project-no. 17-02.04.01-08/2019), North Rhine-Westphalia, Germany.

Genetic architecture of feed efficiency traits in American mink

P. Davoudi¹, D. Ngoc Do¹, S. Colombo¹, B. Rathgeber¹, M. Sargolzaei^{3,4}, Z. Wang², G. Plastow², Y. Miar¹

¹ Dalhousie University, Department of Animal Science and Aquaculture, 62 Cumming Dr, Bible Hill, NS, B2N 4H5 Truro, Canada, ² University of Alberta, Livestock Gentec, Department of Agricultural, Food and Nutritional Science, 2-31 General Services Bldg, T6G 2H1 Edmonton, Canada, ³ University of Guelph, Department of Pathobiology, 50 Stone Road East, Guelph, Ontario, Canada, N1G 2W1 Guelph, Canada, ⁴ Select Sires Inc., 11740 US-42, Plain City, OH, 43064 Plain City, United States

Optimizing feed efficiency (FE) in American mink is crucial, as it holds the key to substantial cost savings within mink production systems. The study aimed to estimate genetic parameters for various FE and their component traits, while also revealing the genetic background underlying these key traits. Phenotypic data from 2,288 American mink in two Canadian farms were recorded with genotypes obtained using an Affymetrix 70K single nucleotide polymorphism (SNP) array. In addition, the characteristics of copy number variations (CNVs) and runs of homozygosity (ROH) islands within the genome of American mink were identified by analyzing the whole-genome sequencing data of 100 individuals. Moderate heritabilities and favorable genetic correlations among FE traits in American mink support their inclusion in genetic/genomic selection. A total of 34,652 ROH segments were identified across all individuals. Predominantly, shorter segments (0.3–1 Mb) constituted approximately 84.4% of all ROH throughout the genome. Within these segments, 63 ROH islands were identified. Identifying a total of 164,733 CNVs consisting of 144,517 deletions and 20,216 duplications, the study merged overlapping CNVs to form 5,378 CNV regions (CNVRs). This collectively covered 47.3 Mb (1.9%) of the mink autosomal genome. Through association analyses using the mixed linear model, 42 SNPs were found to have significant associations with six FE traits. Enrichment analyses of candidate genes overlapped with identified CNVRs, ROH, and significant SNPs revealed several pathways related to growth, lipid metabolism, and immune response. Overall, this study provides valuable insights into the genetic architecture of FE traits and identifies potential candidate genes associated with these complex traits, which can be implemented into breeding programs.

Effect of paternal breeding values for residual feed intake on reproductive performance of Hereford heifers
T. Devincenzi¹, M. Lema¹, L. Del Pino¹, E. A. Navajas¹

¹ *Instituto Nacional de Investigación Agropecuaria, Avda. Italia 6201, 11500 Montevideo, Uruguay*

Feed efficiency (FE) is a key trait for animal production. Residual feed intake (RFI) is the most explored FE trait due to its moderate heritability and independence of animal performance. Estimated Breeding Values (EBVs) for FE in Hereford are available in Uruguay, and a comprehensive investigation of the associations of FE with other traits, including reproductive performance is ongoing. We investigated some reproductive traits of 347 Hereford heifers born in springs of 2017 to 2020 from sires of high and low EBVs for RFI and raised in grazing conditions. Animals were classified into two groups according to their paternal FE-EBV. These EBVs are based on RFI but expressed as feed saved, implying that lower RFI leads to large feed savings (high FE, H, 12 sires, mean EBV=107, range:103-115; n=212, and low FE, L, 7 sires, mean EBV=93, range:82-98). At 25m of age, and previous an estrus synchronization with Prostaglandin, the ovarian cyclicity (OC) was assessed by ultrasonography, and the presence of corpus luteum was registered. Artificial insemination (AI) was performed twice a day 12h after estrus detection for 15d. Heifers were exposed to bulls for 70d on a 1:45 ratio, 25d after the beginning of AI. Pregnancy was assessed 45d after the end of the breeding season. The OC and pregnancy frequencies of H and L heifers were compared with GLIMMIX procedure of SAS using a binomial distribution. The statistic model included EBV group and year as fixed effects. Paternal FE-EBV did not significantly affect neither OC (H 59% vs L 47%, P=0.0894) nor pregnancy (H 92% vs L 99%, P=0.9247). These results indicate non unfavorable impact of improving FE on heifer's reproductive performance, although additional traits are being studied.

Deep phenotyping of feed efficiency in individual dairy cattle using longitudinal and average feed quality data

N. Adhikari¹, A. Van Der Linden², B. Gredler-Grandl¹, R. F. Veerkamp¹

¹ *Wageningen University and Research, Animal Breeding and Genomics group, Droevendaalsesteeg 1, 6700 AH Wageningen, Netherlands,* ² *Wageningen University and Research, Animal Production Systems group, De Elst 1, 6700 AH Wageningen, Netherlands*

Feed efficiency of dairy cows is a trait affected by multiple components. These inner, invisible components of individual cows are named deep phenotypes. Deep phenotypes were assessed in a pilot study using the mechanistic model LiGAPS-Dairy and a genetic algorithm. The pilot study, however, used average feed quality (FQ) data at herd level, which is expected to reduce the accuracy of deep phenotypes. Therefore, the objective was to investigate whether deep phenotyping improved by using individual, longitudinal FQ data compared to average herd FQ data, which was tested in two datasets: TGEN and LELY. From each dataset, multiparous Holstein cows (n =110) with ≥ 5 weekly records for FQ (digestibility and DVE: intestinal degradable protein) and ≥ 10 weekly records for the measured phenotypes dry matter intake, liveweight, and milk yield were selected. Deep phenotype accuracy was reflected by the sum of errors between simulated and measured phenotypes. For all cows, the model was run with FQ from the pilot project (RUN1), the average herd FQ of the dataset (RUN2), the average FQ per individual cow in the dataset (RUN3), and individual, longitudinal FQ data with interpolated missing FQ values (RUN4). The sum of errors improved considerably for TGEN data moving from RUN1 to RUN4: -147.40, -72.23, -70.93, -53.87. For LELY less improvement was seen from RUN2 to RUN4 (-97.30, -98.79, -95.83). Also, RUN1 (-88.45) gave unexpectedly the best fit using LELY data. Whether the better model fit for TGEN might stem from the estimated DVE values or the frequency of FQ recordings is being investigated. In conclusion, using individual longitudinal records improved deep phenotyping compared to herd or cow's averages.

Cosmopolitan and local Italian beef cattle breeds uncover common patterns of heterozygosity related to fitness traits

M. C. Fabbri¹, F. Tiezzi¹, A. Crovetto¹, C. Maltecca^{1,2}, R. Bozzi¹

¹ Università di Firenze, Dipartimento di Scienze e Tecnologie Agrarie, Alimentari, Ambientali e Forestali, Piazzale delle Cascine, 18, 50144 Firenze, Italy, ² North Carolina State University, Department of Animal Science, Polk Hall, 120 W Broughton Dr, NC 27695 Raleigh, United States

The investigation of heterozygosity is less common compared to the study of homozygous patterns. However, Heterozygous Rich Regions may harbor significant loci for immune response, survival rate, and fertility traits. For this reason, the heterozygosity patterns characterization was conducted in five beef cattle breeds, which included two cosmopolitan breeds (Limousine and Charolais) and three local breeds (Sarda, Sardo Bruna, and Calvana). A high degree of heterozygosity using a consecutive runs approach was identified. Several regions exhibited recurrent heterozygosity peaks and were consistently found on specific chromosomes across all breeds, specifically autosomes 15, 16, 20, and 23. The cosmopolitan, Sardo Bruna, and Calvana breeds also displayed peaks on autosomes 2 and 21. Forty-two top runs shared by more than 25% of the population were identified. These genomic fragments encompassed 18 genes, two of which are directly linked to male fertility, four are associated with lactation, two genes play roles in survival and immune response, and a region related to growth and carcass traits was detected in Limousine. The study revealed particular segments of the cattle genome linked to various functional traits. Unexpectedly, heterozygous regions are common across cosmopolitan and local breeds. The genes identified have potential applications in breeding programs and conservation studies to investigate the phenotypes associated with these heterozygous genotypes.

Session 31

Estimating effective population size from genomic rates of coancestry and inbreeding

R. López De La Torre¹, J. Fernández¹, E. Morales-González¹, M. Á. Toro², A. Caballero³, B. Villanueva¹

¹ INIA-CSIC, Ctra de la Coruña km 7.5, 28040 Madrid, Spain, ² UPM, Universidad Politécnica de Madrid, 28040 Madrid, Spain, ³ CIM, Universidade de Vigo, 36310 Vigo, Spain

Effective population size (N_e) is a key parameter in quantitative genetics and evolutionary biology. Commonly, estimates of N_e are derived from rates of coancestry and inbreeding. Although traditionally these rates have been obtained from pedigree data, they can also be obtained from genomic data in order to increase the accuracy of the estimates. Using stochastic simulations, this study aims at assessing N_e estimates derived from a range of genomic measures of coancestry (f) and inbreeding (F) by comparing them with true identity-by-descent (IBD) values. Genomic measures included those described by Li and Horvitz (fLH1, FLH1), VanRaden (fVR1, FVR1, fVR2, FVR2) and Yang and colleagues (fYA1, FYA1, fYA2, FYA2). Three management strategies – Random Contribution (RC), Equalized Contribution (EC) and Optimal Contribution (OC) – were considered. For all strategies, N_e estimates derived from f were closer to IBD values than those derived from F . Additionally, N_e estimates based on f measures were more stable and accurate than those based on F measures, as coefficients of variation across replicates were lower and correlations with the true values were higher. Under strategies RC and EC, all f measures led to N_e estimates close to the true values. The highest correlations between N_e estimates with the true values were observed when using fYA2 and fVR2, and the lowest when using fLH1. The optimization of contributions under OC, led to a N_e lower than the true value, particularly when using fLH1. Also, correlations with the true values were very low for any estimator. The study highlights the importance of choosing appropriate estimators for evaluating the evolution of N_e when managing breeding programs.

Genomic analysis of diversity and population structure of baroque horse breeds in Czech Republic and Slovakia

H. Vostra-Vydrova¹, N. Moravcikova², R. Kasarda², M. Shihabi³, V. Brajkovic³, B. Hofmanova¹, V. Cubric-Curik³, L. Vostry¹, I. Curik³

¹ CZU Prague, Kamycka 129, 16500 Prague, Czech Republic, ² SPU Nitra, Tr. A. Hlinku 2, 94976 Nitra, Slovakia, ³ University of Zagreb, Faculty of Agriculture, Svetošimunska cesta 25, 10000 Zagreb, Croatia

The Old Kladruber and the Lipizzaner are two old Baroque horses adapted to Central European conditions with a common history. The origin of both breeds goes back to the 16th century. In the course of the common history of these two breeds, a certain exchange of genetic material took place, mainly between these two breeds, but also with other horse breeds. Our main objective in this analysis was to assess the conservation status, population structure and admixture of the Old Kladruber Horse (OKCZ) and Lipizzaner (LIPCZSK) breeds in the Czech Republic and Slovakia. We also estimated the genetic relatedness of these breeds with other Baroque horses and neighbouring horses. The analysis included 233 horses of the OKCZ breed (the subpopulations with grey and black coats), 73 horses of the LIPCZSK breed and 230 horses of other breeds (mainly warmblood breeds). The analysis was based on 51,166 autosomal SNPs genotyped with the GGP Equine 70k chip. In general, the observed genetic diversity (heterozygosity and haplotype richness) was close to the values observed in other breeds. On the other hand, genomic inbreeding coefficients (FIS and ROH-based inbreeding) were relatively high. While the estimates of the current effective population size of the Old Kladruber horse were 48 individuals (for the grey and black varieties) and Lipizzaner were 67 individuals, the estimates of the historical effective population size showed a significant decrease ten generations ago. The estimated contemporary effective population size demonstrates the need for careful monitoring of genetic diversity. Our results will thus contribute to breeding and conservation strategies for these breeds. This study was supported by the projects GACR 24-14325L and APVV-20-0161.

Identifying genetic loci influencing body weight in the endangered dual-purpose German Black Pied (DSN) cattle breed

P. Korkuc¹, M. Reißmann¹, G. A. Brockmann¹

¹ Humboldt-Universität zu Berlin, Albrecht Daniel Thaer- Institute for Agricultural and Horticultural Sciences, Animal Breeding and Molecular Genetics, Invalidenstr. 42, 10115 Berlin, Germany

The German Black Pied (DSN, “Deutsches Schwarzbuntes Niederungsrind”) is an endangered dual-purpose breed counting approximately 2,500 DSN herdbook cows. Previous genetic studies on DSN have largely focused on milk production traits and disease resistance. This study focused on growth traits within the DSN breed with measurements at different growth stages: at birth and at the average age of 3 weeks, 2 months, and 1.5 years. Employing imputed whole-genome sequencing data of 565 DSN bulls and linear mixed models, we identified five loci associated with birth weight on BTA 2, 5, 8, 12, and 18 and one locus associated with body weight at the average age of 3 weeks on BTA 11. Interestingly, the locus on BTA 5 for birth weight was in the vicinity of the gene MGST1 locus which we identified previously for milk fat content in DSN cows. For the other identified loci, we found no overlap with loci associated with milk performance traits. This suggests that in dual-purpose DSN cattle, genes with a significant impact on growth or milk production are largely unlinked, meaning they are inherited independently. Our research not only identified unique genetic loci associated with growth but also explored the interplay between growth and milk production. These insights offer a foundation for developing a conservation and breeding strategy that maintains the DSN breed’s dual-purpose character, ensuring its long-term viability and utility in both dairy and meat production.

The benefits of genomics in small populations: case study of type traits in the Dual-Purpose Blue cattle breed
K. Wijnrocx¹, H. Wilmot^{1,2}, S. Vanderick¹, G. Glorieux³, N. Gengler¹

¹ ULiège - GxABT, Passage des Déportés, 2, 5030 Gembloux, Belgium, ² FNRS, Rue d'Egmont, 5, 1000 Brussels, Belgium, ³ Elevéo asbl, rue des Champs Elysées, 4, 5590 Ciney, Belgium

The Dual-Purpose Blue (DPB) is a small cross-border breed from Belgium and the North-East of France. This local breed was preserved by breeders for its robustness and ease to handle. Several transboundary projects have resulted in the development of common genetic evaluations for this breed, including the estimation of (genomically enhanced) estimated breeding values ((G)EBV) for linear type traits. Once in a year, EBV and associated reliabilities (REL) are obtained using a multiple-trait animal model and then, subsequently used in a pseudo single-step GBLUP with Bayesian integration to obtain GEBV and associated genomically enhanced REL (GREL). This study aimed to assess the gain in REL for type traits of DPB when genomic information is added. Phenotypes included 23 traits, 18 individual and 5 overall traits (udder, development, feet and legs, muscularity, rump). All traits were scored from 1 to 9, except for stature, which was measured. In total, 10,360 records were used, with 2,195 animals being genotyped. Pearson correlations were computed between EBV/GEBV, and REL/GREL. Resulting correlations between EBV/GEBV, and REL/GREL were very high for all type traits (0.96-0.99). In general, REL enhancement for genotyped animals was observed, ranging on average from 0.07 to 0.13 points across traits, which is in line with our expectations. Specifically for genotyped bulls, REL enhancement ranged on average from 0.11 to 0.14 (maximum from 0.29 to 0.35) across traits. This clearly indicates the benefits of the use of genomic data, even in a small population, which will allow better selection decisions.

Genetic analysis of calf survival in a critically endangered antelope (Nanger dama mhorh)

S. Domínguez¹, I. Cervantes², E. Moreno¹, J. P. Gutiérrez²

¹ Estación Experimental de Zonas Áridas, Ctra. de Sacramento s/n, 04120 La Cañada de San Urbano, Spain, ² Faculty of Veterinary, UCM, Department of Animal Production, Avda. puerta de Hierro, s/n, 28040 Madrid, Spain

Mhorh gazelle (Nanger dama mhorh) is a Sahelo-Saharan antelope that is currently extinct in the wild. Its captive breeding program provides an important tool for rearing sustained populations, with offspring survival playing a critical role. The aim of this study was to determine the genetic parameters of perinatal (PS) and weaning survival (WS) of mhorh gazelle calves, and to investigate the possibility of using these fitness traits as breeding objectives in the conservation program. Up to 2185 calf survival records from the studbook were used in the analysis. All genetic parameters were estimated via mixed linear models within a Bayesian frame and using the TM program. The predictive value of the different models was compared using the logCPO value. The calf model had the best fit with data for the PS and the calf-permanent model for the WS. Heritabilities estimated for the direct genetic effect were moderate, 0.279 for PS and 0.157 for WS. The maternal environmental component in the WS was 0.048. Calves of multiparous dams had a higher PS, but there were no significant differences in WS depending on the number of calving. For both traits, male calves had a lower probability of survival than females, and offspring born from young and old gazelles were less likely to survive. High inbreeding coefficients of the calf reduce PS and high inbreeding of the dam make descend WS. Neither PS nor WS were affected by the maternal genetic effect, so mating strategies in the conservation program should focus on the direct genetic effect to increase the potential of the population to respond to selection on offspring survival rather than on the maternal contribution.

Towards a generic measure of genetic relatedness of populations

J. Ten Napel^{1,2}, J. Windig^{1,2}, M. Schoon^{1,2}, M. Spoelstra^{1,2}, S. J. Hiemstra^{1,2}

¹ Wageningen University & Research, Animal Breeding & Genomics, PO Box 338, 6700 AH Wageningen, Netherlands, ² EURC - Endangered Animal Breeds, PO Box 338, 6700 AH Wageningen, Netherlands

The extent to which two breeds are genetically one population is important for deciding whether endangered breeds should be managed and conserved separately. Examples are transboundary breeds, different varieties within a breed or endangered breeds with a regular influx of breeding stock from another breed. Real-life cases vary in population size, pedigree depth, history and exchange of breeding stock. Our objective is to develop a generic measure of genetic relatedness between populations to support decision making in conservation of endangered breeds. One of the methods is the average relatedness between breeds (a_{ij}) and within breeds (a_{ii} and a_{jj}). The kinship distance ($a_{ii} + a_{jj} - 2a_{ij}$) is directly related to the drift variance ($(a_{ii} + a_{jj} - 2a_{ij}) * \text{VarG}$) of traits. It indicates how much a trait drifts in the same direction in two related populations due to random genetic drift. Genetic drift variance between related populations (GDVB) is lower than between unrelated populations. We propose to use retained GDVB as an objective measure of uniqueness of populations. It is calculated as the estimated GDVB as a fraction of the GDVB if these populations were unrelated. Between Dutch and Belgian draught horse populations, retained GDVB gradually reduced to 55% between 1970 and 2020. The proposed measure can be estimated from pedigree, genomic information or both. If this is not available, the development of retained GDVB over time can be approximated with simulation using the details of both breeding populations. A generic measure allows national coordinators for animal genetic resources to use more objective criteria regarding the uniqueness of breeds.

Derogations in breeding programmes for endangered breeds according to EU animal breeding legislation (EU 2016/1012)

H. Göderz^{1,4}, L. Balzar^{1,4}, J. Wider^{1,4}, C. Danchin^{2,4}, M. Spoelstra^{3,4}, M. Schoon^{3,4}, S. J. Hiemstra^{3,4}

¹ Bundesanstalt für Landwirtschaft und Ernährung, Deichmanns Aue 29, 53179 Bonn, Germany, ² Institut de l'Élevage, Cedex 12, 75595 Paris, France, ³ Wageningen University & Research, PB, 6708 Wageningen, Netherlands, ⁴ European Union Reference Centre for Endangered Animal Breeds, PB, 6708 Wageningen, Netherlands

The main tasks of the European Union Reference Centre for Endangered Animal Breeds (EURC-EAB) include working on harmonised methods for the preservation of endangered livestock breeds and informing breed societies and competent authorities on those matters. An important instrument for the facilitation of breeding those breeds are the specific derogations in breeding programmes for endangered animal breeds and hardy sheep breeds, of which breeding organisations can take advantage of according to (EU) 2016/1012. The survey conducted by the EURC-EAB showed, that 66% of the participating breed societies with breeding programmes for endangered breeds have already implemented such derogations. The most frequently used derogations are the upgrading of male progeny to the main section of the herd book, followed by restricting breeding with purebred breeding animals and implementing lower criteria for performance recording and genetic evaluation in comparison to mainstream breeds. The vast majority (87%) of the corresponding breed societies described the derogations as helpful and 65% stated the process of implementation as easy. Nevertheless, 16% of the breed societies reported about specific problems in the implementation process. The presentation will give a detailed view on the survey results concerning the derogations and concrete examples of different types of derogations used by breed societies from EU Member States.

Simulation of genetic rescue from a gene bank using a complex load structure

C. Reimer^{1,2}, J. Geibel^{1,2}, T. Pook^{2,3}, S. Weigend^{1,2}

¹ Friedrich-Loeffler-Institut, Institute for Farm Animal Genetics, Höltystraße 10, 31535 Neustadt, Germany, ² University of Goettingen, Center for Integrated Breeding Research, Carl-Sprengel-Weg 1, 37075 Göttingen, Germany, ³ Wageningen University and Research, Animal Breeding and Genomics, Droevendaalsesteeg 1, 6700AH Wageningen, Netherlands

The main focus of conservation breeding and especially gene-banking is to safeguard genomic variation of farm animals. Genetic rescue with semen from a gene bank restores lost variation, but holds the risk to reintroduce already purged deleterious variation from a formerly large population into a then endangered population with consequently low effective population size. We modeled six scenarios of populations that start with an initial size of 1000 individuals and are moderately selected for a performance trait for 60 generations. All populations experience a severe decrease in population size (from 1000 to 800, 600, 400, 200 and 50, respectively) between generation 18 and 26. The population is rescued in generation 61 with gene bank semen from before and after the decline, and randomly mated for another 30 generations. Deleterious load was modeled as a composite of homozygously lethal and moderate variants. The first generations showed a severe decrease of litter size due to deleterious load which was alleviated by purging before the populations went into the size bottleneck. Directly after, the smaller scenarios litter size dropped again, before it leveled around generation 60. Purging was more efficient in smaller populations, removing nearly all lethal alleles, while a basic load, made up from low-effect alleles persisted. Rescue with gene bank animals led to a reduction in litter size in all cases. Litter size depression in scenarios 200 and 50 was stronger than the initially modeled depression of about 12 %. We found that this was also due to reintroduced lethal alleles. Moderately deleterious mutations went more often into fixation after rescue, as selection against them was less effective than in the more diverse population in the beginning, and contributed to a basic load compromising litter size permanently. Especially in the smallest scenario rescue with animals from generation 26 carried about 50 % of load in fixed alleles.

Sheep along the trading routes: what may we tell from their demographic history? A case study from Hungary

A. Manunza¹, J. Ramirez-Diaz¹, B. Guldbrandtsen², A. A. Schönherz³, P. Cozzi¹, S. Kusza⁴, G. Sahana⁵, A. Stella¹
¹ National Research Council, Institute of Agricultural Biology and Biotechnology, Via Alfonso Corti 12, 20133 Milan, Italy, ² University of Copenhagen, Department of Veterinary and Animal Sciences, Grønnegårdsvej 15, 1870 Frederiksberg, Denmark, ³ Aarhus University, Department of Animal and Veterinary Sciences, Blichers Alle 20, 8830 Tjele, Denmark, ⁴ University of Debrecen, Centre for Agricultural Genomics and Biotechnology, Böszörményi út 138, 4032 Debrecen, Hungary, ⁵ Aarhus University, Center for Quantitative Genetics and Genomics, C. F. Møllers Allé 3, 8000 Aarhus, Denmark

Sheep (*Ovis aries*) has played a major role in farming for food, textiles, and clothes since their domestication (ca. 11,000 years ago). Subjected to intense transportation, sheep have a complex demographic history. We examine genetic diversity and historical demography of sheep breeds from Hungary and neighbouring areas. We analysed a total of 763 animals from 39 breeds, using genotyping data from the SMARTER database. Genetic diversity, population structure and individual genetic components analyses revealed a clear split in two subpopulations for the Hungarian Racka breed, maybe related to the different colour variants, and a low level of admixture for both Hungarian Racka and Tsigai. Several breeds showed introgression from Merino or Texel and gene flow between domestic breeds and their wild relatives. Historic trends in effective population size and runs of homozygosity revealed recent bottlenecks, confirming previous results and in agreement with documented demographic changes. Overall, our results provided clues on the possible events related to their early arrival in this area: the inferred admixture events, spanning from the Bronze Age to early Middle Ages, suggested bi-directional gene flow in several waves of contact.

First insights in the genetic structure of Cyprus's indigenous cattle

A. C. Dimitriou¹, A. Spyrou², G. Hadjipavlou¹

¹ Agricultural Research Institute, Animal Production, P.O.Box 22016, 1516 Nicosia, Cyprus, ² The Cyprus Institute, The Science and Technology in Archaeology and Culture Research Center (STARC), Konstantinou Kavafi Street, 20, 2121 Nicosia, Cyprus

Indigenous Cyprus cattle significantly influenced local agricultural development, dietary changes, and cultural heritage. Two native morphotypes, exhibiting all zebu characters, were reported from well-defined geographic regions of the island. The “Mesaoria” type occurs in the central-eastern part of the island, with a larger body size and a thinner coat compared to the “Paphos” type occurring in the south-western part. Considering the Cypriot, diverging from the primary production, economic model as well as the low growth rate and milk productivity compared to genetically improved breeds, the local population was until recently threatened with extinction as the total number of individuals from the 1960s to 2008 decreased by 97%. Nevertheless, thanks to the joint efforts of committed cattle breeders and governmental subsidy programs, this hardy and well-adapted breed has maintained a constant population size of ~1200 individuals over the last decade. Herein, we aimed to conduct a comprehensive evaluation of the local breed, whose results would lead to the genetic characterization and hence promote ongoing and future conservation efforts. For this purpose, genome-wide SNPs were retrieved using the Illumina Bovine 777K array from 96 individuals sampled across the island. Population genetic metrics examine the genetic divergence of the native types as well as the genetic structure of the sampled population and their relationship with commercial, genetically improved cattle breeds on the island. Beyond conservation of biodiversity, ecosystem services, and sustainable agriculture, the preservation of this breed is essential for Cyprus's cultural heritage.

Session 31

Theatre 12

Exploring genomic selection opportunities in Italian local cattle breed

E. Mancini¹, C. Sartori¹, A. Bagnato², M. G. Strillacci², F. Bernini², G. Schiavo³, S. Bovo³, L. Fontanesi³, R. Mantovani¹

¹ University of Padova, DAFNAE, Viale Dell'Università 16, 35020 Legnaro (PD), Italy, ² University of Milan, DIVAS, Via Università 6, 26900 Lodi, Italy, ³ University of Bologna, Animal and Food Genomics Group, Division of Animal Sciences, Dept. of Agricultural and Food Sciences., Via Giuseppe Fanin 46, 40127 Bologna, Italy

Here we assessed the impact of genomic selection (GS) on 4 Italian local cattle breeds: Rendena (REN), Reggiana, Alpine Grey, and Valdostana. Our objectives were i) to compare current models (PBLUP) with GS for milk yield, and ii) to evaluate potential gains due to GS. To integrate SNP data with production records, we included phenotypic data >2010. Imputation achieved an average accuracy of 95%, and genomic EBVs (gEBV) were estimated with ssGBLUP. PBLUP and ssGBLUP were compared using a LR approach, with young animals serving as validation cohort. Across all breeds, ssGBLUP consistently outperformed (i.e., in REN 0.31 vs. 0.45 of accuracy for PBLUP and ssGBLUP, resp.). Notably, ssGBLUP showed higher accuracy in gEBVs, particularly in young bulls. Comparing current progeny testing to scenarios involving selection of young bulls on gEBVs, we observed greater genetic gains with GS, along with a reduction in inbreeding due to a larger pool of reproducers. This study highlights the favourable application of GS in local cattle breeds. Acknowledgements: Funded within the “Agritech” – Next-Generation EU PNRR – Missione 4 Comp. 2, Invest. 1.4 – D.D. 1032 17/06/2022, CN00000022. Genome-wide approaches reveal novel genetic markers potentially involved with Visna Maedi virus infection in Valle del Belice sheep

S. Riggio¹, M. Tolone², G. Sottile³, S. Tumino⁴, B. Portolano¹, A. M. Sutura², M. T. Sardina¹, A. Cesarani^{5,6}, S. Mastangelo¹

¹ University of Palermo, Scienze Agrarie Alimentari e Forestali, Viale delle Scienze, 90128 Palermo, Italy, ² University of Messina, Scienze Chimiche, Biologiche, Farmaceutiche, ed Ambientali, Viale Ferdinando Stagno d'Alcontres, 98166 Messina, Italy, ³ University of Palermo, Scienze Economiche, Aziendali e Statistiche, Viale delle Scienze, 90128 Palermo, Italy, ⁴ University of Catania, Agricoltura, Alimentazione e Ambiente, Via Valdisavoia, 95123 Catania, Italy, ⁵ University of Sassari, Agraria, Viale Italia, 07100 Sassari, Italy, ⁶ University of Georgia, Animal and Dairy Science, 425 River Rd, 30602 Athens, United States

Visna/Maedi virus (VMV) is a complex production-limiting ovine lentiviral disease characterised by long immunological, clinical latencies and chronic progressive inflammatory pathology. Multiple genomic regions associated with infection were reported indicating genetic complexity. In this study, a combined genome-wide approach (GWAS, Fisher's test and FST) using a high-density SNP array has been performed, comparing VMV-infected (n=78) and non-infected (n=66) individuals of the Valle del Belice sheep breed. The serological tests showed minimal variations in seroprevalence across the eight investigated herds, averaging at 26%. The comparison among the results revealed two association signals: on OAR03 close to the GRIN2B gene and on OAR05 close to the TMEM232 gene. The GRIN2B gene plays a role in pain response, synaptic transmission, and receptor clustering, while TMEM23 is involved in the development of immune-related disorders. The results highlighted new aspects of the genetic complexity related to the resistance/susceptibility to VMV in sheep. Additional analysis would be necessary to validate our findings.

ARDI2: Towards the consolidation of joint work in research, development and innovation in sheep

C. Pineda-Quiroga¹, I. Granado-Tajada¹, J. M. Astruc⁴, F. Fidelle⁵, Z. Vitezica³, S. Rodriguez-Ramilo³, I. Beltran De Heredia¹, M. Lasarte², E. Ugarte¹

¹ NEIKER, Campus Agroalimentario de Arkaute, 01192 Arkaute, Spain, ² ASLANA, Calle Aintziburu, 31170 Iza, Spain, ³ INRAE, Chemin de Borde-Rouge-Auzeville, 31326 Castanet Tolosan, France, ⁴ IDELE, Rue de Bercy, 75012 Paris, France, ⁵ CDEO, Route Ahetzia, 64130 Ordiarp, France

Historically, the exploitation of the indigenous and similar dairy sheep breeds Latxa and Manech has been separated over time, and has led to the implementation of independent breeding schemes. The need to move towards the unification and the common management of the breeding programs was addressed in a previous POCTEFA project called ARDI, where work was carried out around the weaknesses, exchange of information and comparison of methodologies. As a result, the European Aggrupation of Economic Interest ARTALDEAN was created between Spanish and French farmers with the aim of support and strengthen the common management of the genetic programs. The aim of the new project ARDI2 is make of ARTALDEAN a reference organization for the implementation of common genetic actions on both populations. New models of international genomic evaluation will be defined, methodologies of diversity analysis to evaluate how genetic exchanges have been influenced the genetic variability will be evaluated, and traits related to sustainability will be defined. In addition, the incorporation of new technologies to the data recording will be studied, and different production systems will be considered. It is expected that results of ARDI2 support the strengthening of the dairy sheep sector in the Pyrenees and promote the competitiveness of Latxa and Manech breeds.

GEREMES: a project to improve the genomic insight on the resilience background in Mediterranean sheep breeds

S. Mastrangelo¹, G. Senczuk², A. Cesarani^{3,4}

¹ University of Palermo, Viale Scienze, 90128 Palermo, Italy, ² University of Molise, Via A. De sanctis, 86100 Campobasso, Italy, ³ University of Georgia, 425 River Rd, 30602 Athens, United States, ⁴ University of Sassari, Viale Italia, 07100 Sassari, Italy

The ability of breeds to cope with not optimal environmental conditions is important for the livestock sector, especially in the regions of the World already affected by the climate changes. This is the case of the Mediterranean area, where the agriculture is already limited by climate change. Sheep breeds represent an ideal model to analyse the environmental adaptation for livestock species. Thus, it would be important to identify some indicators of resilience and climate adaptation. Based on these considerations, the project entitled “Genomic study of the resilience background in Mediterranean sheep breeds” with GEREMES as acronym aims to identify genomic regions associated with environmental adaptation. The main objectives are: i) to study the genome of sheep raised in different environmental conditions, to highlight genomic regions associated with these features; ii) to identify resilience indicators through machine learning and multivariate approaches; iii) to compare the genotypic data of local sheep raised in South Italy with cosmopolitan and with breeds from the North of Europe. We will use a multi-disciplinary approach combining quantitative genetics, population genomics, phenotypic and environmental data. The impact of this proposal encompasses important aspects hinged on many current topics that require urgent attention such as the use of integrated and sustainable natural resources, provide innovative knowledge to address the issues related to climate change and the maintenance of local biodiversity, with consequent conservation of traditional multifunctional landscapes.

Session 31

Insight into the genetic composition of the South African Bonsmara breeds using whole-genome sequencing data

D. Alberts¹, E. Van Marle-Köster¹

¹ University of Pretoria, Animal Science, Cnr Lynnwood Road & Roper Street, 0028 Pretoria, South Africa

The Bonsmara is numerically the largest beef breed in South Africa and are present in stud breeding, commercial cow-calf operations, and feedlots. The breed makes use of an upgrading system, implying unknown base composition. South African cattle breeds such as the Bonsmara present an important source of genetic variation as it's an adapted breed with high meat quality. The objectives of the study were to assess the genomic diversity and population structure of the Bonsmara, Afrikaner and Shorthorn cattle that were base breeds in the development. Whole genome sequence data of the Afrikaner (n = 42), Bonsmara (n = 43) and Shorthorn (n = 20) were run through GATK's Best Practices pipeline and a jointly called vcf file was produced. Following standard quality control with the PLINK v2.0 software, a total of 367 764 autosomal single nucleotide polymorphisms were retained for further downstream analysis. The average heterozygosity values for the animals were highest in the BON (0.379), followed by the AFR (0.329) and the SHH (0.305). Moreover, the inbreeding coefficients for the animals were 0.154, 0.026 and 0.174 for the AFR, BON and SHH, respectively. Genomic structure analysis revealed that the BON have an admixed genome between the AFR and SHH, confirming the development of the breed. Hereford cattle were also used as a base breed, but no sequence data was available for this study. AFR cattle has been using BON in selection programmes and genetic infusion was clearly visible in some of the AFR cattle. A comprehensive genomic characterization of the Bonsmara and its base breeds using WGS data is necessary to detect genome level diversity and ancestry, and to assess breed composition over time.

Genomic evaluation for persistence of lactation in Girolando cattle

M. V. G. B. Silva¹, J. C. C. Panetto¹, R. Negri², S. Kluska³, P. I. Otto⁴, M. A. Machado¹, E. Ferreira Junior³, J. A. Cobuci⁵, D. S. Daltra³

¹ Embrapa, Dairy Cattle Research Center, Rua Eugenio do Nascimento, 610, 36038-330 Juiz de Fora - MG, Brazil, ² Sao Paulo State University, Avenida Brasil, 56, 15.385-007 Ilha Solteira - SP, Brazil, ³ Brazilian Association of Girolando Breeders, Rua Orlando Vieira do Nascimento, 74, 38040-280 Uberaba - MG, Brazil, ⁴ Federal University of Santa Maria, Av. Roraima, 1000, 97105-900 Santa Maria - RS, Brazil, ⁵ Federal University of Rio Grande do Sul, Av. Paulo Gama, 110, 90040-060 Porto alegre - RS, Brazil

Genomic evaluations were carried out using 784,093 test day milk yield records from first lactation Girolando cows spanning from 1998 until 2021. The aim was to identify a suitable model for future lactation persistence genomic evaluations. Genomic breeding values were predicted using random regression models with different Legendre polynomial functions through the best genomic unbiased linear predictor in a single step (ssGBLUP) approach. Following this, ten different measures of lactation persistence were evaluated. The model employing fourth-order Legendre polynomials, along with fixed effects of contemporary groups and heterozygosity, was identified as the best fit to the data based on the goodness-of-fit criteria. Heritability estimates for persistence ranged from 0.08 to 0.69. Genetic correlations between persistence and 305-day milk yield records varied from low to high magnitude (-0.04 to 0.96). The average genomic estimated breeding values (GEBV) of sires for the different persistence measures ranged from -41.46 to 249.70 kg. In conclusion, the measure of persistence represented by the sum of GEBVs considering the period from 55 to 270 days of lactation, obtained as GEBVs deviations at 50 days of lactation, should be preferred in genomic genetic evaluations for this trait in the Girolando breed.

Session 31

Poster 18

Genetic Characterization and Pathway Analysis of Carcass Weights in a Jeju Native Black×Hanwoo Crossbred Population

M. Won¹, Y. K. Kim¹, S. M. Sin¹, T. H. Kim², H. B. Park^{2,3}

¹ National Institute of Animal Science, Subtropical Livestock Research Institute, 593-50, Sallokbuk-ro, 63242 Jeju, South Korea, ² Kongju National University, Department of animal Resources Science, 54, Daehak-ro, Yesan-eup, 32439 Yesan-gun, South Korea, ³ Kongju National University, Resource Science Research Institute, 54, Daehak-ro, Yesan-eup, 32439 Yesan-gun, South Korea

Jeju Island, which boasts a unique environment due to its isolation, has historically seen the Jeju Native Black (JNB) cattle playing an indispensable role in the island's agrarian society. Despite facing endangerment during Japanese occupation and agricultural modernization, the JNB population surged from 31 in 1994 to 1,611 in 2016; however, the current population stands at 1,087. This study investigates genetic traits crucial for the preservation of JNB, utilizing a genome-wide association study and examining biological pathways in a Jeju-huekhanwoo (JHH, Jeju Native Black×Hanwoo) Cattle. The analysis, based on 39,055 SNP markers from 256 JHH cattle, identifies six quantitative trait loci (QTLs) associated with carcass weights on *Bos taurus* chromosomes 3, 5, 6, 10, and 13. The genes EIF2B3 and HECTD3 on BTA3, SOX5 on BTA5, ENSBTAG00000064813 on BTA6, ENSBTAG00000064392 on BTA10, and KLF6 and PHACTR3 on BTA13 were identified as positional candidate genes for these QTLs. Moreover, the identified positional candidate genes linked to carcass weights were enriched in pathways related to lysine degradation, axon guidance, tryptophan metabolism, glycerolipid metabolism, fatty acid metabolism. Future verification studies of these identified SNPs and positional candidate genes in other cattle populations hold the potential to provide valuable insights into the genetic architecture of carcass weights within Jeju Native Black cattle and Hanwoo-related populations.

Selection signature analyses revealed multiple genomic regions associated with milk production in Girgentana breed

A. Criscione¹, S. Ben-Jemaa², G. Chessari¹, S. Riggio³, G. Cammilleri⁴, A. Lastra⁴, A. Cesarani⁵, M. T. Sardina³, S. Bordonaro¹, S. Mastrangelo³

¹ Università degli Studi di Catania, Via Valdisavoia, 95123 Catania, Italy, ² Université de Carthage, Rue Hédi Karray, 2049 Ariana, Tunisia, ³ Università degli Studi di Palermo, Viale delle Scienze, 90128 Palermo, Italy, ⁴ Istituto Zooprofilattico Sperimentale della Sicilia "A. Mirri", Via Gino Marinuzzi, 90127 Palermo, Italy, ⁵ Università degli Studi di Sassari, Viale Italia, 07100 Sassari, Italy

The Girgentana goat is an ancient Sicilian breed with distinctive morphological, adaptive and production traits. In this study, the integrated haplotype score (iHS) was used to detect within-population selection signatures in a sample composed of 205 Girgentana animals. Then, the haplotypes from these individuals were compared with those from other Italian goat breeds (5 from Southern and 8 from Northern Italy) to detect genomic regions under divergent selection, using Rsb approach. After editing, 536 animals and 48,744 SNPs were available. Multidimensional scaling and the individuals' Neighbor joining tree revealed a clear separation of three major clades coinciding with Girgentana, the Northern and Southern Italian breeds. A total of 14 genomic regions were detected: three within the Girgentana (iHS) and eleven from the comparisons Girgentana vs Northern and Girgentana vs Southern breeds (Rsb). The largest overlap between the two approaches was on chromosomes 1 (110 – 112 Mb) and 5 (38 – 40 Mb). Among the several selection sweeps, worth noting the region on chromosome 6 mapping to the casein genes (CSN2, CSN1S1, CSN3) known to be involved in milk quality. Other selection signatures mapped genes associated with body size, reproduction, and immune resistance. The results presented here provide a foundation for detecting mutations that underlie genetic variation of economic important traits for breed.

Genomic analysis of longevity with productive and reproductive traits in Girolando cattle

M. V. Silva¹, E. Kern², R. Negri³, S. Kluska⁴, P. Otto⁵, M. Martins¹, J. C. Panetto¹, D. Dalto⁴

¹ Embrapa Dairy Cattle, Rua Eugenio do Nascimento, 610, 36038-330 Juiz de Fora, Brazil, ² Federal Rural University of Rio de Janeiro, Km 07, Zona Rural, BR-465 23890-00, 23890-000 Seropédica, Brazil, ³ Sao Paulo State University, Avenida Brasil, 56,, 15385-007 Ilha Solteira, Brazil, ⁴ Brazilian Association of Girolando Breeders, Rua Orlando Vieira do Nascimento, 74, 38040-280 Uberaba, Brazil, ⁵ Federal University of Santa Maria, Av. Roraima, 1000, 97105-900 Santa Maria, Brazil

The objective of this study was to estimate (co)variance components, heritability and genetic associations between different measures of longevity, productive and fertility traits in Girolando cattle using genomic selection. Phenotypic, pedigree and genotype records were obtained from the Brazilian Association of Girolando Breeders. A sample of 24,993 animals was genotyped with chips of different densities. Longevity measures related to the productive life of the cow, as well as productive and fertility traits were evaluated. The analyses were carried out using the AIREMLF90 software. Heritability estimates for measures of longevity, productive and reproductive traits ranged from 0.06 to 0.31, 0.06 to 0.13 and 0.03 to 0.03, respectively. Genetic correlations between longevity measures and productive traits ranged from 0.02 to 0.31, while genetic correlations between longevity measures and reproductive traits ranged from 0.00 to 0.13. Productive traits showed a greater genetic association with longevity measures compared to reproductive traits, suggesting that genetic improvements obtained in milk production can lead to longer retention of cows in the herds. Longevity measurements were found to be significantly influenced by the environment, indicating a low potential for response to selection. Therefore, they should be combined with other traits in an index to achieve greater genetic gains.

Calvana breeding scheme using genomic information and optimal contribution selection

M. C. Fabbri¹, R. Bozzi¹¹ *Università degli studi di Firenze, DAGRI, Via delle Cascine, 5, 50144 Firenze, Italy*

In conservation programs for endangered breeds, recording genealogies is essential for managing population inbreeding. Recently, the management of inbreeding, and consequently the management of matings, can be carried out through genomic information. These two different approaches have different limitations and opportunities. The present study aims to evaluate the differences in genetic diversity resulting from using either pedigree or genomic data to manage matings in the Calvana cattle breed, considered to be at high risk of extinction. Genealogical information on the Calvana breed was obtained from ANACLI. Moreover, 218 Calvana animals (35 males, 183 females) were genotyped with GeneSeek GGP-LDv4 33k; then, the genomic relationship matrix was created using the VanRaden method (2008). Breeding plans were developed using EVA software v.3.0 using the pedigree relationship matrix (P) and the genomic relationship matrix (G). Four scenarios were developed: two for the pedigree approach and two for the genomic one. All females were used in each scenario, while the maximum number of matings for each bull was set to 6 (Ped6, Gen6) and 20 (Ped20, Gen20). All candidate bulls (35) were selected as breeders, and no significant differences were found in the average inbreeding of the progeny between the four scenarios (min 0.0046 and max 0.0052). Using pedigree or genomic relationship matrix leads to differences in the number of matings per sire: it became higher when increasing at 20 the maximum number of matings for each bull. The different approaches resulted in quite different specific combinations between males and females: 97 out of the 183 matings differed between Ped6 and Gen6, and 93 out of the 183 matings differed between Ped20 and Gen20. To improve breeding plans, it is desirable to genotype a more significant part of the population to produce more accurate inbreeding estimates obtained by an improved genomic relationship matrix. This study was carried out within the Agritech National Research Center (Spoke 7) and received funding from the European Union Next-GenerationEU (PIANO NAZIONALE DI RIPRESA E RESILIENZA (PNRR) – MISSIONE 4 COMPONENTE 2, INVESTIMENTO 1.4–D.D. 1032 17/06/2022,CN00000022)

Session 31

Genomic characterization of the Montanina cattle

M. Cortellari¹, A. Bionda¹, M. Barbato², V. Florida², V. Chiofalo², N. A. Virga^{3,4}, C. Cavallo², P. Crepaldi¹, L. Liotta²¹ *Milan University, Dipartimento di Scienze Agrarie e Ambientali, Via Celoria 2, 20133 Milan, Italy*, ² *Messina University, Dipartimento di Scienze Veterinarie, V.le Palatucci 13, 98168 Messina, Italy*, ³ *Palermo University, Dipartimento di Scienze Agrarie, Alimentari e Forestali, Viale delle Scienze, 90128 Palermo, Italy*, ⁴ *Meat and Agribusiness Chain Research Consortium, V.le Palatucci 13, 98168 Messina, Italy*

Here we provide the first genomic investigation on Montanina, an ancient local dual-purpose Sicilian (Italy) cattle. Montanina is typically reared using extensive systems and adapted to the harsh mountainous environment. However, anecdotal knowledge of crossbreeding with cosmopolitan breeds to improve profitability exists. After quality checks, 925 animals from 37 Italian and French cattle breeds, including 35 Montanina individuals from three farms, were genotyped using medium-density SNPchips. The inbreeding levels were determined through Runs of homozygosity-based statistics. Population structure was analyzed through multidimensional scaling (MDS), Admixture, and Reynolds and identity-by-state (IBS) distances. We recorded low levels of inbreeding comparable among the three Montanina populations. Both IBS and MDS identified an intermediate position of Montanina between beef-selected breeds and other Sicilian breeds. By investigating the ancestry components in higher detail, we identified Limousin as the main source of introgression in Montanina. Further, we recorded lower levels of introgression in one of the three sampled farms. Our results reflect the selection history of the breed, including the acknowledged crossbreeding with Limousin bulls, aimed at increasing meat yield. These findings provide instrumental insights into the Montanina's genetic structure, diversity, and history, to guide breeding efforts balancing productivity and breed originality preservation. Work supported by CoRFilCarni through the BIOSAVE project.

Evaluation of genetic diversity in beef cattle breeds of Centre-Italy

E. Mancin¹, C. Sartori¹, F. Sbarra², A. Quaglia², E. Rulli¹, G. Gomez-Proto¹, R. Mantovani¹

¹ *University of Padova, DAFNAE, Viale dell'Università 16, 35020 Legnaro (PD), Italy,* ² *ANABIC, Strada del Vio Viscioloso 21, 06132 Perugia, Italy*

The value of the beef cattle breeds of Central Italy lies in their distinctive genetic heritage, as they are part of the Podolian breeds, characterized by unique white-grey coat and high rusticity, with origins that are subjected to debate. Additionally, their intrinsic connection with the culture and economy of their rearing area further emphasizes their significance. The genetic diversity of these breeds has not totally discovered yet, and the present work aims to analyse some new insights on this issue, thanks to the availability of medium density (33k) SNP genomic information on Chianina (CH, n=4,800), Marchigiana (MRC, n=4,700), Romagnola (RO, n=2,300), Maremmana (MRM, n=1,100), and Podolica (PO, n=2,900). The hierarchical structure of the populations and genetic distances were examined using the Admixture software. Selection signatures were then investigated by identifying runs of homozygosity (ROHs) for each breed (DetectRuns, R Package). ROHs were then used to calculate genomic inbreeding and identify genes within or near to the ROH regions. Results revealed that each breed represent a unique genetic pool. However, rustic breeds, MRM and PO, share a closely related genetic background, while MRC includes part of the genetic variability observed in CH and RO. ROHs were identified across various chromosomes, including 5, 7, 13, 18, and 21, encompassing genes associated with age at the first parity, docility, sexual maturation, regulation of RNA expression, and immunity defense against pathogens factors crucial for individual fitness. These findings shed the light on the genetic factors underlying the high rusticity of these breeds, a main factor of their evolutionary success. This work has been realized thanks to the iBeef2 project – PSRN Sottomisura 10.2 2014-2020.

⁴ *University of Wageningen, Postbus/POBox 338, 6700AH Wageningen, Netherlands*

Italy's indigenous turkey populations origins tracing back to the early specimens from the Spanish colonies in Central America. Notably, the turkeys' introduction to Italy in 1520 and their rapid proliferation, particularly in the south, underscore their integration into Italy's agricultural and culinary heritage. Other bone remains suggest that it was also used for food starting from 1600, so much so that it is found described in culinary recipes of the time. We conducted a genome-wide analysis of 5 small turkeys' nucleus (a total of 72 samples) reared in marginal area of Lecce (Puglia) and Potenza (Basilicata). DNA will be extracted and sequenced (12X). Data from other 11 local Italian population have been utilized: comparative analysis of 11 local Italian turkey populations: Brianzolo, Bronzato, Colli Euganei, Ermellinato di Rovigo, Ibrido Commerciale, Narragansett, Nero Italiano, Parmense and Romagnolo. Our findings, based on the genetic diversity indices—expected heterozygosity, observed heterozygosity, minor allele frequency, and inbreeding coefficient, reveal distinct genetic clusters, suggesting unique population structures and historical lineage continuity. The Fis values (0.275 +/-0.245) suggest a high level of inbreeding or as the results of the PCA and Admixture would suggest, a strong isolation effect between the herds. By understanding the genetic makeup of these indigenous breeds, we pave the way for informed conservation strategies, ensuring the preservation of Italy's rich agricultural biodiversity for future generations. This study is part of the activities financed by the BIO.ZOO.CARE project: “PSR Puglia 2014-2022. Misura 10 – Pagamenti agro-climatico-ambientali. Sottomisura 10.2 – Operazione 10.2.1”

Next-Generation sequencing errors lessens the estimation of recent inbreeding

L. Gomez-Raya¹, W. M. Rauw¹, O. Torres¹, M. G. Gil¹, R. Peiro¹

¹ INIA-CSIC, Dept Animal Breeding, Ctra de la Coruña km 7.5, 28040 Madrid, Spain

Recent inbreeding is detected by identifying long stretches of homozygosity in Runs of Homozygosity (ROH). Next Generation Sequencing (NGS) improves the accuracy in the estimation of the length of ROH but it is prone to errors. Some 1.2 million of sequence errors are expected in a genome of 1.2 Gb (*Gallus gallus*) at a sequencing error rate of 0.1%. A large number of those errors will fall within ROHs, consisting of changes from homozygous to heterozygous bases and a breakdown of larger ROHs into smaller fragments. DNA from 20 hens of the autochthonous breed of laying hens Castellana Negra from the Conservation program at INIA-CSIC El Encin (Spain) were sequenced. After assembling with reference genome GRCg6a, inbreeding coefficients (total ROHs over total number of sequences) ranged from 0.31 to 0.47. There were 328,741 ROH fragments with 67 ROHs larger than 1Mb, and 96.4% of all ROH were 100kb or less. This abundance of small ROH fragments suggests that sequencing errors may reduce the estimation of recent inbreeding (large ROH fragments). We modeled sequencing errors as a Poisson process in which an error has a probability of happening at a constant rate across the genome. In this model, inter-arrival times are the length of the ROHs, which follows an exponential distribution. Fitting an exponential distribution to the length of ROHs of the 20 hens gave a rate of 0.005 (9.4e-06). This analysis only includes ROHs with polymorphic SNPs.

Bayesian Genome-wide Association Study of udder-type traits in Alpine Grey Cattle

G. Gomez Proto¹, E. Mancin¹, E. Rulli¹, C. Sartori¹, R. Mantovani¹

¹ University of Padua, DAFNAE, Viale dell'Università 16, 35020 Legnaro, Italy

The morphological conformation of udder and teat structure, given its high medium heritability, can serve as a proxy trait to select cows more resistant to mastitis. However, the biological implications regarding the connection between udder health, mastitis infection, and milk production have been thoroughly investigated. This gap of knowledge is even more pronounced in less specialized breeds. The study aimed to detect associations between genomic regions and udder-type traits in the local Alpine Grey cattle. After imputation, we used a 110K single nucleotide polymorphism (SNP) markers panel to profile the genotype of 1,194 individuals to investigate udder depth, fore udder strength, fore udder length, suspensory ligament, teat position rear view, and teat length. A single marker regression model corrected by population structure was used to test the associations of each SNP. De-regressed EBVs of the target phenotypes were calculated on 36,309 animals using a mixed linear model. Bayesian GWAS was performed by using the de-regressed EBVs of genotyped individuals. Utilizing the UCSC Genome Browser, we inspected the genomic position of selected markers using a Bayes factor greater than 100 as a threshold, assessing marker's relationship to genes or other functional DNA elements. The genomic regions associated with udder-type traits were spread on BTA1, BTA10, BTA12, BTA16, BTA17, and BTA18. The results led to the detection of well-known and novel genes for milk production (e.g., C4BPB, PEX14), mastitis resistance (e.g., PIAS1, TLR2), and mammary epithelial development (e.g., TBX3, SPRY1). The biological pathways of these genes have been also investigated. Further studies should also consider the relationships with other production and fitness traits. Acknowledgements: Funded within PSRN – Dual Breeding 2 (J51J1800000005), and within the “Agritech” – Next-Generation EU PNRR – Missione 4 Comp. 2, Invest. 1.4 – D.D. 1032 17/06/2022, CN00000022.

Italian deli meats quality perspective with focus on best practices and commitments towards a new business model

D. Calderone¹

¹ *Associazione Industriali delle Carni e dei Salumi - ASSICA, Milanofiori - Strada 4 Palazzo Q8, Rozzano, Italy*

ASSICA, the Industrial Association for Meat and Deli Meats, is the national trade association representing pork slaughter and processing companies. Italian Deli Meats are an international success: Data for 2023 show record exports both in terms of quantity and value. These figures underline the economic and qualitative value of this agri-food sector. With no less than 43 types of PDO and PGI-certified Deli Meats, the industry is also Europe's record holder for protected products. The quality of pig meat has evolved over time under the influence of several genetic, environmental and food factors. Thanks to selection and research in the field of animal nutrition it has been possible to further improve the nutritional profile of pig meat making it more and more adequate to meet the needs of modern lifestyles. As a consequence, it is true that Italian deli meats available on the market are no longer as they used to be, but they are better: Less fats and more proteins; Less Salt; More Vitamins and Mineral salts. Furthermore, ASSICA is now setting new environmental, economic and social objectives to develop the sector while respecting its distinctive traditions. ASSICA with IVSI (Institute for the promotion of the Italian Deli meats) has already presented the «2022 sustainability programme» – and is now working on the 2024 update – of the Italian deli meats sector for companies to improve their contribution to the achievement of the Sustainable Development Goals. This publication is the first collection of best practices, corporate and association commitments and actions towards sustainable development, and a further and tangible step in the path that ASSICA is building together with Member Companies to promote an entrepreneurial approach based on sustainability, understood in all its meanings (environmental, economic and social). Indeed, what is underway is a process of acquiring awareness and consequent actions, based on a cultural step-change where sustainability is a business opportunity and not a burden, as a requirement to remain competitive on the market. The evolution of this approach means considering sustainability as one of the central factors, values, of present and future corporate strategies.

Understanding the development of intramuscular fat in cattle – a mini review

J. F. Hocquette¹, D. W. Pethick²

¹ *INRAE, Université Clermont Auvergne, VetAgro Sup, UMR1213 Herbivore, Theix, 63122 Saint-Genès Champanelle, France,* ² *Murdoch University, Murdoch, 6150 WA, Australia*

Intramuscular fat (IMF), also known as marbling, results from adipocyte proliferation and expansion within connective tissue and vascular seams of muscle. The stored triacylglycerol has a positive influence, even at moderate levels, on the sensory properties of beef. The expression is heavily influenced by the extend of muscle growth given that IMF is the ratio of [fat]/[fat + muscle]. So, younger animals, more muscular breeds and entire males have lower IMF levels due to muscle development diluting fat accretion. In addition, muscle groups with more aerobic muscle fibres have generally increased level of IMF. A key enabler of IMF expression is genetic selection for this trait specifically, rather than for fat deposition at other sites such subcutaneous fat. There is consistent evidence that IMF adipocytes are different to those found at other depots with the cells being smaller, metabolically less active and typically showing a preference for glucose and lactate as a fat precursor rather than acetate. Consistent with this, is the role of feeding high energy diets (typically containing starch from cereal grains) to improve the expression of IMF. However, nutritional manipulation of IMF independently from other fat depots has proved more problematic with typically total carcass fatness also increasing along with IMF; although manipulating the Vitamin A axis has shown some promise. There is an increased expression of IMF in older cows at a given total body fatness and muscularity which may relate to fat turnover favouring IMF over many calving cycles. The higher IMF in cows is an opportunity to value-add selected cuts to meet consumer expectations. A French premium beef brand was launched to better value IMF.

Transforming chemical intramuscular fat% into MSA and AUS-MEAT marbling scores and potential application in the Australian beef industry

S. Stewart¹, G. Gardner¹, G. Tarr²

¹ Murdoch University, School of Agriculture, 90 South Street, Murdoch, 6150 Perth, Australia, ² The University of Sydney, School of Mathematics and Statistics, City Road, 2006 Sydney, Australia

Meat Standards Australia (MSA) and AUS-MEAT marbling score are key determinants of carcass value in the Australian beef industry and are well recognised traits in national and international markets. However, with the emergence of objective measurement technologies there are opportunities to grade beef carcasses using objective traits such as chemical IMF%. The challenge is that this abrupt change to MSA model inputs and AUS-MEAT grading practices would cause significant disruption to the beef industry. A proposed solution is to develop an industry approved equation to convert IMF% into MSA marbling and AUS-MEAT marbling scores. These converted marbling values would then seamlessly integrate into existing grading and marketing systems, whilst being underpinned by an objective, gold standard trait. Carcasses ($n = 5513$) from industry experiments across 7 years (2017 – 2023) were graded for MSA marbling and AUS-MEAT marbling and sampled for chemical intramuscular fat (IMF%). Using this data, equations were derived to convert IMF% to MSA marbling (IMF%-MSAMB) and AUS-MEAT marbling (IMF%-AUMB). When validated the IMF-MSAMB model described 91% of the variation in MSA marbling (Residual Standard Error (RSEV) = 57.9), with a slope of 0.90 and negligible bias of -0.54. Similarly, IMF-AUMB described 88% of the variation in grader AUS-MEAT marbling scores (RSEV = 0.68) with a slope very close to 1 (0.94) and little bias (0.06). Industry-wide implementation of this equation is currently being considering in Australia. This would enable grading technologies to be calibrated and validated against chemical IMF% whilst minimising industry disruption.

Session 32

Theatre 4

Prediction of consumer palatability in beef using visual marbling scores and chemical intramuscular fat percentage

G. Tarr¹

¹ The University of Sydney, School of Mathematics and Statistics, Carslaw F07, 2006 Sydney, Australia

With development of objective technologies that can predict chemical intramuscular fat percentage (IMF%), there is a need to understand the relationships between existing marbling traits, IMF% and eating quality. This presentation will report on an analysis of historical carcass data ($n = 9641$ observations) from the Meat Standards Australia (MSA) industry research dataset and included MSA grading data, chemical IMF% data and weighted composite eating quality scores (MQ4). Several analyses were performed to assess the prediction of eating quality by MSA marbling, *M. longissimus thoracis et lumborum* (striploin) IMF% and cut specific IMF%. Results demonstrated that there was similar precision between chemical IMF% ($R_2 = 0.32$, RSE = 11.8) and MSA marbling ($R_2 = 0.28$, RSE = 11.9) in the prediction of grilled 14 day aged striploin MQ4. These results support the development of objective technologies that predict chemical IMF% in parallel with MSA marbling for carcass grading and the prediction of eating quality.

Flavour drives consumer eating quality acceptability as intramuscular fat increases in Australian lamb

S. Moyes¹, G. Gardner¹, D. Pethick¹, L. Pannier¹

¹ Murdoch University, 90 South Street, 6150 Murdoch, Australia

Untrained consumer-determined overall liking, flavour, tenderness and juiciness are highly correlated due to consumers' inability to discriminate between these traits. Overall liking is an indicator of a consumer's overall product acceptability; hence, overall liking is considered to reflect flavour, tenderness and juiciness attributes. Increasing intramuscular fat (IMF) improves all eating quality traits, principally juiciness and flavour. Carcasses with a higher loin IMF% are juicier and more flavoursome; therefore, these traits could be expected to contribute more to the overall acceptability. The knuckle, loin, outside, rump, topside, leg, rack and shoulder were collected 24 hours post-slaughter from 3119 lambs. Each cut was assessed for overall liking, flavour, tenderness and juiciness on 100-point scale lines (100=best) by untrained consumers. Chemical IMF% was determined for the loin. Consumer responses (n=108410) were arbitrarily split based on IMF at 2.0-4.0, 4.1-6.0, 6.1-8.0 and <8.0%. Within each IMF category, data was divided into five subgroups balanced for IMF%. Within each subgroup, a linear model was used to predict overall liking, with flavour, tenderness, and juiciness simultaneously included as independent variables. Relative weight analysis then determined the contribution of each variable to the prediction of overall liking. The mean of the relative weights for each of the five subgroups was calculated and compared between IMF categories via a one-way analysis of variance. Flavour was the highest contributor to overall liking within each IMF category, improving ($P<0.05$) from 43.4 to 47.3% across the 10.8% IMF range. This was associated with a decline ($P<0.05$) in the contribution of tenderness (29.1-26.5%). The contribution of juiciness to overall liking was not affected ($P>0.05$) by IMF. The increasing importance of flavour between IMF categories has occurred over a relatively small IMF% range of as little as 4%. This implies that the contribution of flavour to eating quality may become more important as future genetic selection broadens the range of IMF% in lamb.

Session 32

Theatre 6

Effects of live yeast and selenium supplementation on rumen parameters in long-transported Charolais bulls
M. Santinello¹, I. Lora², C. Villot³, G. Cozzi², M. Penasa⁴, E. Chevaux³, B. Martin³, A. Guerra⁴, M. De Marchi⁴

¹ University of Padova, Department of Medicine (DIMED), Via Giustiniani, 2, 35128 Padova, Italy, ² University of Padova, Department of Animal Medicine, Production and Health (MAPS), Viale dell'Università, 16, 35020 Legnaro (PD), Italy, ³ LALLEMAND SAS, Rue des Briquetiers, 9, 31702 Blagnac, France, ⁴ University of Padova, Department of Agronomy, Food, Natural resources, Animals and Environment (DAFNAE), Viale dell'Università, 16, 35020 Legnaro (PD), Italy

Long-distance transport and receiving at fattening units are stressful for beef cattle. This study tested live yeast and selenium supplementation (Se) on 80 Charolais bulls transported from France to Italy. The bulls were randomly divided into Yeast and Control groups (40 animals each). Yeast group bulls received live *S. cerevisiae* CNCM I-1077 and Se-enriched yeast nutritional boluses before leaving France, and yeast in their diet in Italy. Rumen parameters (rumination, temperature, and pH) were monitored every 10 min using sensors in 60 bulls evenly distributed between the two groups. The reticulo-rumen pH was normalized, and daily mean, amplitude, standard deviation, and incidence of sub-acute ruminal acidosis (SARA) were summarized for the first and fourth weeks. Rumen indicators at the receiving to the fattening unit were analysed with a linear mixed model, considering supplementation group, age, day, and truck as fixed effects, and bull nested within pen as random effect. Yeast stabilised the rumen environment by limiting daily pH amplitude, standard deviation, and the inter-animal variability around transportation. The incidence of SARA was reduced in the Yeast group during the first week. Ruminal temperature was not impacted by the supplementation, but live yeast increased rumination time after the first month. Maintaining stable ruminal conditions is crucial for the well-being of beef cattle during diet transitions at fattening units. Supplementing cattle with live yeast before transportation could help them cope with ruminal stress upon arrival.

An evaluation of muscle cut, maturation and meat quality of beef using Rapid Evaporative Ionisation Mass Spectrometry (REIMS) analysis

L. Perkins¹, W. Jia¹, T. Rowe³, R. Polkinghorne², P. Nicholas-Davies⁴, A. Koidis¹, N. Scollan¹

¹ Queen's University Belfast, School of Biological Sciences, Chlorine Gardens, BT95DL Belfast, United Kingdom, ² Birkenwood Pty Ltd, Blandford, Australia, - Blandford, Australia, ³ Castell Howell Foods Ltd and Celtica Foods Ltd, Castell Howell Foods Ltd and Celtica Foods Ltd, - Crosshands, United Kingdom, ⁴ Institute of Biological, Environmental and Rural Sciences, Aberystwyth University, - Aberystwyth, United Kingdom

Rapid Evaporative Ionisation Mass Spectrometry (REIMS) is a rapid ambient analytical technique. Applications of REIMS include determination of biological tissue, food fraud and more recently meat quality parameters of beef. Determination of beef muscles, maturation period as well as the sensory quality using consumer taste panels and the Meat Standards Australia (MSA) grading system is currently unknown. Therefore, the aim of this study was to use REIMS and advanced chemometric modelling to uniquely connect REIMS data from four raw beef muscles, maturation, consumer sensory scores and MSA grading. Beef samples (N=149) from four muscles, were collected from 31 carcasses, processed with two hang methods, after 7- and 21-day maturation post-slaughter. Carcasses were MSA graded, and consumer taste panels were conducted at 18 different locations. Beef samples were burned using a monopolar electrosurgical "iKnife" attached to the REIMS system (Waters REIMS source (Waters Corporation, Wilmslow, UK); a Xevo G2-XS QToF Mass spectrometer (Waters Corporation, Wilmslow, UK). Data were performed in sensitivity mode with continuum data acquisition in negative ionisation mode REIMS data was extracted using the Abstract Model Builder software and analysed using Simca software. REIMS analysis successfully identified four beef muscles, in addition to 7- and 21-day maturation. Consumer taste panel results and MSA grading scores were also positively discriminative using REIMS. This study has demonstrated that REIMS can detect and categorise unique chemical fingerprints related to muscle, maturation, and sensory quality of beef.

To characterize beef eating quality and its relationship to marbling and lipids, 31 young grass-fed crossbred Angus x Salers were used in this study. Three muscles (longissimus dorsi, triceps brachii, and internal abdominal obliques) were used for sensory evaluation and REIMS analysis. Results indicated that grass-fed crossbred Angus x Salers produced lean meat of "better than average" palatability. Although no significant correlation was observed between beef sensory quality and marbling/lipid levels, however, lipid molecules were the primary component detected by REIMS, REIMS showed great potential to classify beef sensory quality and grades (i.e., higher flavor liking vs. lower flavor liking; satisfactory vs. unsatisfactory) with accuracies up to 99%. In addition, REIMS has indeed potential for predicting visual-measured marbling and gas chromatography measured lipid and/or FA levels, with varying efficacy due to distinct REIMS fingerprinting. Overall, REIMS classification results may be more robust with larger sample sizes and wider variances.

A cuts-based Meat Standards Australia grading system for sheepmeat

L. Pannier¹, T. Pleasants², G. E. Gardner¹, G. Tarr³, A. Ball⁴, P. Mcgilchrist⁵, D. W. Pethick¹

¹ Murdoch University, Western Australia, 6150 Murdoch, Australia, ² Pleasants Analytics, Hamilton, 3214 Hamilton, New Zealand, ³ The University of Sydney, New South Wales, 2006 Sydney, Australia, ⁴ Rural Analytics, New South Wales, 2350 Armidale, Australia, ⁵ University of New England, New South Wales, 2350 Armidale, Australia

A new cuts-based Meat Standards Australia (MSA) eating quality grading system is being developed. This system requires objective measurements of carcass traits acquired at processing that describe eating quality variation. Previous studies have identified these carcass traits to be intramuscular fat % (IMF%), lean meat yield (LMY), and hot carcass weight (HCWT). To develop the model, data was collected from 3106 lambs of which 11040 cuts were sampled. Consumer tasting sessions (n=312) were carried out with 18720 untrained consumers who scored samples for tenderness, juiciness, flavour liking and overall liking on a scale from 0 (worst) to 100 (best). Loin, topside, outside, rump and knuckle cuts were grilled, whereas the rack, leg, shoulder, and knuckle cuts were roasted. A discriminant analysis of the 4 eating quality traits defined their combined weightings within a single meat quality score. A linear model was then fitted to predict this score, using IMF%, LMY, and HCWT as covariates and cut as a fixed effect. Results indicated that eating quality was predicted with an accuracy of 75% (grill) and 72% (roast), though great individual consumer variation exists. The model will allow allocation of cuts according to eating quality grades.

Exploring the meat quality of Lidia heifer meat: preliminary results

M. Cantarero¹, E. Angón¹, J. Claros², L. Jiménez², I. Garzón¹, J. Perea¹

¹ Universidad de Córdoba, Producción Animal, Campus Rabanales, Ctra. N-IV, km 396, Spain, 14071 Córdoba, Spain, ² CERSYRA-IRIAF, Avenida del Vino s/n, 13300 Valdepeñas, Spain

Extensive systems with local breeds play a crucial role in preserving resources and ecosystems, as well as producing meat with unique characteristics. These attributes are in line with the current demands of European meat consumer. However, these models face challenges such as lack of profitability or substitution by more productive livestock alternatives. It is in this context that the study of Lidia breed meat arise. This is an autochthonous Spanish breed developed in an extensive system linked to the “dehesa” ecosystem. The meat of these animals has always been considered a secondary product, which is why there is an important scientific gap. In this work we intend to carry out a first analysis of the instrumental quality of the meat of Lidia breed females. A total of 200 heifers (24-48 months old) of the Lidia breed from 10 farms (20 animals per farm) were used. The animals followed a standard production cycle. From each animal the m. Longissimus thoracis, corresponding to the 12th-13th thoracic vertebrae, was obtained and the meat was vacuum aged under refrigerated conditions for 21 days. The variables analysed were pH, colour in CIELab* space, water holding capacity (thawing, drip, pressure and cooking losses) and texture (maximum shear force, WBSF test). Descriptive statistical analysis was applied using XLStat software. Lidia heifers showed an optimal pH, dark, red and moderately yellow meat colour. Acceptable water holding capacity and acceptable to intermediate tenderness were observed. The results found show that meat from Lidia breed heifers could meet industry and consumer demands.

Characterisation of Meat Quality Attributes in Different Cattle Breeds: Implications for Labelling and Consumer Choice

L. Grispoli¹, E. Costanzi¹, C. Truzzi², M. Tassinari¹, B. Cenci Goga¹

¹ *Ispesione degli Alimenti, Medicina Veterinaria, Via San Costanzo, 4, 06126 Perugia, Italy,* ² *Metro SpA, Via XXV Aprile, 23, 20097 San Donato Milanese (MI), Italy*

Consumer preferences for beef are increasingly driven by the desire for high hygienic, nutritional, and organoleptic quality. This paper investigates the impact of cattle breed on key quality attributes—colour, marbling, and tenderness—central to consumer choice. Six different bovine breeds were taken into consideration: German Red Pied (n = 63), Piemontese (n=117), Chianina (n=63), Angus (n=63), Friesian (n=18) and a Polish cross breed (n=63). The cut of meat analysed was the entrecôte, or boneless rib, obtained from the muscles located between the fifth and eighth rib of the loin. Colorimetric assessments, marbling evaluations, fatty acid profiling, and tenderness measurements, were conducted on meat cuts from each breed. Results revealed significant variations in colour, marbling, and tenderness among breeds. Statistical analysis of the data was carried out using StatView 5.0.1 software (SAS Institute, Cary, NC, USA) for the analysis of variance (ANOVA) with Fisher PLSD (protected least significant differences). Chianina, Friesian, and the Polish crossbreed exhibited distinct colour characteristics, with Chianina displaying notably brighter meat. Angus emerged as the most marbled breed, while Chianina and Piemontese showed lower marbling. Total lipids content correlated with visible marbling. Fatty acid composition varied, with Angus having higher omega-3 percentages. Tenderness assessments identified Angus and Friesian as the most tender breeds. The study's findings contribute to a proposed grading scale for colour, marbling, and tenderness, offering potential labelling infographics to assist consumers in making informed choices based on individual preferences and needs. These insights underscore the importance of breed-specific information on labels to enhance consumer understanding and facilitate more informed purchasing decisions.

Theatre 12

Evolution of animal and meat research over the past 50 years

Y. Cui¹, J. F. Hocquette¹

¹ *INRAE, Clermont Auvergne, Université Clermont Auvergne, VetAgro Sup, UMR1213 Herbivores, Theix, 63122 Saint-Genès Champanelle, France*

This work aims to study the evolution of research in animal and meat sciences from 1974 to 2023. The Web of Science database was used to count the number of scientific articles published per 5 year period in these fields. In practice, the following keywords were used: 1) cattle, pig, poultry or sheep for animal science; 2) beef, pork, poultry meat or sheep meat for meat science. Results were analyzed according to “Web of Science categories” or “country/region”. In animal science, “Veterinary sciences” and “Agriculture dairy animal science” categories have been dominant over time, with a relative decline in both cattle and poultry, unlike to the stable trends in sheep and pig. “Food science technology”, “Microbiology” and more recently (from 1999) “Environmental science” categories have gained importance in all species. In meat science, “Food science technology” is the leading category for pork and beef (about 40-60% and 20-30% respectively), “Agriculture dairy animal science” is the leading category for poultry meat and sheep meat (about 40%) and “Veterinary sciences” is the second one for sheep meat and occupies a lower position in other species. Over 50 years, the USA has led research across all areas, except sheep meat, ranking second behind Australia. China emerged in all fields after 2004, reaching top positions in 2019-2023 with the exception of beef. Similarly, research in Brazil developed earlier and has developed roundly since then. Canada is also a major actor except for sheep and sheep meat, while Germany and England have been players in all animal sciences. Overall, this work provides valuable insights into evolving trends and offers guidance for future research directions in animal and meat research.

Meat quality for once-calved heifers and heifers of Holstein-Friesian × Limousine crossbreds

Z. Nogalski¹, M. Sobczuk-Szul¹

¹ University of Warmia and Mazury in Olsztyn, Department of Animal Nutrition, Feed Sciences and Cattle Breeding, Oczapowskiego 5, 10-719 Olsztyn, Poland

In Poland, approx. 200 thousand heifers are slaughtered annually. In view of the reduction in the population of calves which are suitable for fattening, a certain solution is to use the so-called once-calved heifers for the production of calves. Young growing cows, as compared with adult suckler cows, convert more feed energy to body weight gain, and therefore, for biological reasons, the technology of the use of once-calved heifers is very effective. The objective of the study was to compare the meat quality of heifers (n=16) and once-calved heifers (n=15) of Holstein-Friesian × Limousine crossbred slaughtered at the age of 18 and 28 months, respectively. The once-calved heifers at the age of 15 months, were bred with semen of Limousine bulls and following the calving they fed 100 days their offspring and then they were slaughtered. Meat of once-calved heifers contained more intramuscular fat, was darker ($P \leq 0.01$), and exhibited a higher water-holding capacity and lower cooking loss ($P \leq 0.05$) as compared with heifers' meat. In sensory evaluation meat of heifers was more tender ($P \leq 0.01$) and tastier as compared with once-calved heifers' meat ($P \leq 0.05$). Gestation and nursing had a negligent effect on the content of functional components in the meat of once-calved heifers, in comparison with the meat of heifers. In conclusion, due to the possibility for obtaining additional offspring and only a slight reducing in the sensory value of the meat quality, it is recommended to use heifers originating from commercial crossbreeding as the once-calved heifers. „Funded by the Minister of Science under „the Regional Initiative of Excellence Program”.

Session 32

Poster 14

Impact of immunocastration on meat quality and muscle transcriptome of Angus × Nellore cattle

S. Pereira Junior², F. Soares¹, R. Ribeiro¹, H. Souza¹, J. Galvão¹, W. Baldassini¹, R. Curi¹, L. A. Chardulo¹, M. R. Chiarratti², O. Machado Neto¹

¹ São Paulo State University, School of Veterinary Medicine and Animal Science, 3780 Universitaria Ave, 18610034 Botucatu, Brazil, ² Universidade Federal de São Carlos, Departamento de Genética e Evolução, Rodovia Washington Luis, km 235, 13565905 São Carlos, Brazil

Intramuscular fat, also known as marbling fat, stands out as one of the most appreciated and desired attributes in meat, being positively correlated with its pricing. Twelve F1 Angus × Nellore steers (six non-castrated males and six immunocastrated males) were fed for 230 days in a feedlot and slaughtered at 16 months of age. The hypothesis of the study was that non-castrated male cattle would have meat quality equivalent to that of immunocastrated steers. The chemical composition of Longissimus thoracis was analyzed as well as the muscle transcriptome profile. Significant genes identified by gene coexpression analysis in the CeTF package of software R were considered transcription factors, and those with counts in all samples from one sex class and no counts in the other were considered exclusive. Immunocastrated steers showed greater deposition of intramuscular fat (non-castrated – 2.9% and immunocastrated – 6.5%; $P < 0.01$). There was no significant difference between groups for genes involved in lipogenesis, such as PPARG, FASN and ACACA ($FDR > 0.05$); however, the genes CPT1C (0.188) and SCP2 (0.003), involved in the β -oxidation of fatty acids, were identified as exclusive in non-castrated males. On the other hand, immunocastrated males showed higher expression of the genes PLIN1 (0.346) and FABP4 (0.565), responsible for the differentiation of adipocytes, identified as exclusive and transcription factors, respectively. Therefore the greater accumulation of marbling fat comes from the lower lipid oxidation and greater differentiation of fat cells.

Investigating tissue specific differences in the adipogenic cascade in bovine preadipocytes differentiation

*B. Soret¹, J. A. Mendizabal¹, A. Arana¹, L. Alfonso¹**¹ Public University of Navarre, Agronomy, Biotechnology and Food, Campus Arrosadia, 31006 Pamplona, Spain*

Adipose tissue development in farm animals can be modified by production factors, but it is not clear how to optimize marbling without increasing the total body fat mass. Regarding beef cattle, it is of interest a minimum intramuscular (IM) fat content to produce high quality meat while not increasing other adipose depots so feed efficiency does not decrease. But these are opposed goals as total body fat in the different depots is positively correlated. As adipocytes show tissue specific biological features, identifying depot specific traits leading to distinct adipose tissue development could favour those objectives. A bovine in vitro model of primary IM and subcutaneous (S) preadipocytes derived from 18 months old steers was used to investigate the expression of genes of interest in the adipogenic, antiadipogenic and lipogenic pathways, which were analysed in order to identify possible depot specific distinct features during differentiation. The induction of the genes of interest occurred in S adipocytes, in general, before in the time course than in the IM cells and the order of magnitude of the fold-change gene expression over undifferentiated cells was higher in S adipocytes. This was the case for PPARG and CEB-PA, master adipogenic regulators, while the key antiadipogenic factor WNT10B showed none or little variation; NR2F2, that could modulate both pathways, only was upregulated in S adipocytes. The downstream target genes FABP4 and LPL (exogenous fatty acids uptake) were upregulated in S and IM cells but ACACA and FASN (de novo fatty acid synthesis) were upregulated in S adipocytes. Those results suggest that NR2F2 and de novo fatty acid synthesis could be involved in the lower and retarded differentiation of IM adipocytes.

Session 32

Poster 16

On-farm preconditioning affects cattle stress, immune, and respiratory microbiota responses after transportation and feedlot placement

*T. Alexander¹, S. M. Uddin¹, K. Schwartzkopf-Genswein¹, J. Ortiz Guluarte¹, O. Lopez-Campos¹, D. Holman¹**¹ Agriculture and Agri-Food Canada, 5403 1st Avenue S., T1J 4B1 Lethbridge, Canada*

Preconditioning programs are used to mitigate bovine respiratory disease (BRD) in feedlots, but limited information exists on how they affect immunity and respiratory microbiota. Objective: to test the effects of preconditioning on cattle stress response, immunity, and respiratory bacteria. Methods: farm calves were enrolled into preconditioning (PC, N=50; three immunizations, low-stress weaning) and non-preconditioning (Non-PC, N=50; single immunization, abrupt weaning) groups. Three weeks after weaning (or day of abrupt weaning for Non-PC), calves were transported to a feedlot and comingled with market calves. Nasopharyngeal (NP) swabs were collected before transportation, at feedlot arrival, 2, 6, 14, and 32 days after feedlot arrival, and before treatment if diagnosed with BRD. Blood was collected before and after feedlot placement. The 16S rRNA gene was sequenced from NP swabs and cortisol was quantified in blood. Pathogen-specific IgG or IgA in blood and swabs, respectively, were measured against Mannheimia haemolytica and Histophilus somni. Bacterial, immune, and stress variables were analysed in R studio. Results: cortisol did not change in PC calves ($P>0.05$), but increased after transportation in non-PC animals ($P<0.05$). Compared to non-PC calves, the PC group had increased *M. haemolytica*-specific IgG and IgA at feedlot arrival ($P<0.05$), while *H. somni* immunity did not differ. Morbidity due to BRD was 44% and 50% in PC and non-PC groups, respectively. In BRD cases, the dominant genera were Histophilus (26.4%), Mycoplasma (24.9%), Moraxella (7.2%), and Pasteurella (6.0%). The non-PC cattle had elevated Pasteurella, Histophilus, and Moraxella, compared to PC animals ($P<0.05$). Conclusions: preconditioning reduced stress response and the abundances of several BRD-associated genera in calves. Increased on-farm vaccination frequency improved host immunity at feedlot arrival, however the effect was variable for different pathogen targets. Overall, preconditioning enhanced respiratory health when calves experienced management stressors. However, improved vaccine efficacy may expand protection further.

Use of a commercial feed supplement based on diatom earth and yeast products on oxidative status and in vitro immune response in buffaloes during peripartum

A. Maggiolino¹, E. Casalino¹, T. Latronico², G. M. Liuzzi², M. F. Sgarro¹, P. De Palo¹

¹ University of Bari, s.p. per Casamassima km 3, 70010 Valenzano, Italy, ² University of Bari, Via Orabona, 70125 Bari, Italy

The aim of this study is to evaluate the effect of a commercial feed additive based on diatomaceous earth and hydrolyzed yeasts on health status, milk quality and immune response of buffalo cows during the transition period. Eighty healthy Italian Mediterranean buffaloes were included in the trial, subdivided in two groups: a group received the additive (n = 40) while the control group (n=40) received a placebo. Blood samples were collected from each buffalo at -60d (60 days from the expected calving), -30d (30 days before the expected calving), 0d (calving), +15d, +30d, and +60d (respectively 15, 30 and 60 days in milking). Biochemical, oxidative, antioxidant and enzymatic profiles were evaluated. Moreover, acute phase proteins, reactive proteins and Interleukine plasma levels were determined. Peripheral blood mononuclear cells (PBMC) and monocytes were isolated and viability, reactive oxygen species (ROS) and reactive nitrogen species (RNS) detection were performed on PBMC and monocytes. The additive administration did not affect both colostrum immunoglobulin and milk yield and composition during the early lactation period. It enhanced the total antioxidant capacity and enzyme activity, while no differences were observed in oxidation products. Despite higher enzyme levels in plasma, this didn't necessarily correspond to significantly increased enzymatic activity, but rather indicated a higher potential. The transition period in buffaloes differs notably from what reported in literature for cows, probably due to the absence of common postpartum production diseases in dairy cows and lower metabolic challenges linked to lower milk production in buffaloes.

Effects of a nutritional supplement in Italian Mediterranean Buffalo exposed to heat stress

F. Petrocchi Jasinski¹, C. Evangelista², R. Steri³, M. Iacurto³, C. Petricca³, L. Basiricò¹, D. Meo Zilio³, U. Bernabucci¹

¹ University of Tuscia, Department of Agriculture and Forests Sciences, Via San Camillo de Lellis snc, 01100 Viterbo, Italy, ² University of Tuscia, Department for Innovation in Biological Agro-Food and Forest Systems, Via San Camillo de Lellis snc, 01100 Viterbo, Italy, ³ Council for Agricultural Research and Economics, Via salaria 31, 00015 Monterotondo, Italy

Heat stress (HS) has a negative impact on the production and quality of milk, on reproduction and on health of dairy ruminants including buffalo. To alleviate HS some strategies are available such as cooling systems. Otherwise, nutritional strategies can be a useful tool for improving animal wellbeing, milk yield and quality in buffaloes exposed to HS conditions. In this context this study aimed at investigating the effect of RuFO[®] supplement in lactating buffalo exposed to HS. Three groups of 19 buffaloes each were used: control group (C) received the basal total mixed ration (TMR), T1 and T2 received TMR supplemented with 100g/head/d and 200g/head/d of RuFO[®], respectively. The experiment started in early June and ended in early September for a total of 93 days. Individual milk yield (MY) was daily recorded, and milk samples were analyzed every two weeks. TMR and feces samples were taken and analyzed, nutrient apparent digestibility (DIG) was calculated, and animal behavior was constantly monitored by ear tag sensors. Data were processed by a nested design ANOVA in which "sampling" and "group" were set as fixed factor, and "buffalo" were set as random factor and nested into "group". T1 had higher MY with lower content of somatic cells and improved rheological parameters. DIG was improved in T1, and T1 spent more time in rumination and eating. In conclusion, the administration of 100g/head/d can be suggested as an adequate quantity of Rufo[®] that help animals to counteract HS and improved MY and quality.

Feasibility of visible/near-infrared spectroscopy to predict the chemical composition of feces and total-tract apparent nutrients digestibility in lactating buffaloes

A. Guerra¹, M. Simoni², V. Longobardi³, A. Goi¹, G. Mantovani², T. Danese², G. Neglia³, M. De Marchi¹, F. Righi²

¹ University of Padova, Department of Agronomy, Food, Natural Resources, Animals and Environment, Viale dell'Università, 35020 Legnaro, Italy; ² University of Parma, Department of Veterinary Medicine, Via del Taglio 8, 43100 Parma, Italy; ³ University of Napoli Federico II, Department of Veterinary Medicine, Animal Production, Via Federico Delpino 1, 80137 Napoli, Italy

The potential of near-infrared spectroscopy (NIRS) to predict chemical composition of feces and nutrient total-tract apparent digestibility (TTD) in lactating buffaloes was evaluated. Individual fecal samples (n = 147) were collected in 5 farms during the BIG project (ANASB 2021). Animals were fed silage-based total mixed rations, which were sampled 2 days prior to fecal collection. Nutrients were estimated using both uNDF and AIA as internal markers (determined on diets and feces). Strong correlations (r) were observed between TTD of EE (0.96), hemicellulose (0.83), NDIN (0.91), ADIN (0.76), NB3 (0.93), NFC (0.86), and starch (0.91) estimated using uNDF and AIA as markers. To validate the NIRS prediction models, the dataset was divided into a calibration set (75%) and a validation set (25%) for external validation. Average accuracies, indicated by the coefficient of determination in external validation (R₂ExV), were achieved for fecal N, CP, and aNDF content, while excellent predictions were obtained for TTD of ADIN (0.90) estimated using uNDF as internal marker. Additionally, similar accuracy in predicting TTD was observed for EE calculated from uNDF (0.89) and for EE calculated from AIA (0.86). Results demonstrated the effectiveness of NIRS technology to predict many traits relate to quality composition and nutrient digestibility of fecal allowing the evaluation of nutrients status of animals. This research was funded by MIPAAF – DISR 07 – PSR 2014/2020 BIG” Prot. N. 0215513 11/05/2021.

Session 33

Theatre 4

Influence of an Automatic milking system on milk yield and quality in Italian Mediterranean buffaloes

R. Matera¹, A. Calanni Macchio¹, F. D'Acerno¹, M. T. Verde², F. Bonavolontà², S. Lauriola³, G. Neglia¹

¹ Federico II University, Department of Veterinary Medicine and Animal Production, Via Federico Delpino 1, 80137 Naples, Italy; ² Federico II University, Department of Electrical Engineering and Information Technology, Nicolangelo Protopisani, 70, 80125 Naples, Italy; ³ Azienda Sanitaria locale, NA, NA, NA Foggia, Italy

Scientific research on the use of automated milking system (AMS) in Italian Mediterranean buffaloes (IMB) is still limited. The aim of this study was to compare conventional milking and AMS, focusing on differences in milk yield (MY), quality and somatic cells count (SCC). The trial was carried out in a farm in Caserta province, equipped with both AMS and conventional milking. At calving, 100 IMB heifers were randomly assigned to two experimental groups: AMS Group (AG, n=50) and Conventional Group (CG, n=50). For each animal, daily MY was recorded, and a milk sample was collected monthly to determine fat percentage (FP), protein percentage (PP) and SCC. Statistical analysis was carried out using repeated measures ANOVA (SPSS Inc., Chicago, IL, USA). A higher (P<0.01) MY (1.05 kg/day) was recorded in AG compared to CG group, probably due to the higher number of milkings (2.34 vs 2 milkings/day for AG and CG respectively). Total production throughout lactation was 2,320.6 vs 2,036.4 kg in AG and CG, respectively (+12.2%). With regard to milk quality, no statistically significant differences were recorded in FP (8.24±0.7 vs 8.09±0.7) and PP (4.77±0.4 vs 4.80±0.3). On the contrary, AG had significantly lower SCC (P<0.01) than CG (49.92±15.5 vs 153.09±57.3, respectively). In conclusion, AMS in IMB exhibits a better efficiency compared to the conventional milking system.

Transcriptomic characterization of buffalo's extracellular vesicles from colostrum and milk: cargo comparison for potential applications

S. Mecocci¹, D. Pietrucci², M. Milanese², S. Capomaccio¹, L. Pascucci¹, C. Evangelista³, L. Basiricò³, U. Bernabucci³, G. Chillemi², K. Cappelli¹

¹ University of Perugia, S. Costanzo, 06126 Perugia, Italy, ² University of Tuscia, DIBAF, Camillo de Lellis, 01100 Viterbo, Italy, ³ University of Tuscia, DAFNE, Camillo de Lellis, 01100 Viterbo, Italy

Recently, much interest has been raised in the characterization of signaling molecules carried by extracellular vesicles (EVs), particularly enriched in milk (mEVs). EVs can cross biological barriers, resist acidification in the gastric environment, and exert modulation of the immune system, mainly through their microRNA (miRNA) content. This work aimed to characterize the small-RNA cargo of colostrum EVs (colosEVs) and mEVs of Italian Mediterranean buffalo through next generation sequencing (NGS). Seven subjects were selected for one sample collection of colostrum (first milking after parturition) and milk (day 50 of lactation). ColosEVs and mEVs were isolated through differential centrifugations, an EDTA treatment and ultracentrifugations, and total RNA was extracted and Illumina sequenced. The main difference was the amount of EV in the two samples, with colostrum showing 10 to 100-fold higher content than milk. For both types of samples, miRNA was the most abundant RNA class (95% for colosEVs and 96% for mEVs) and three lists were identified: a) shared most expressed, b) colosEV-specific, c) mEV-specific. For each list, targets were retrieved and a protein-protein interaction (PPI) network was built. The gene ontology (GO) enrichment analysis highlighted many terms related to the epigenetic, transcriptional and translational regulations, including protein phosphorylation for both colosEV and mEV miRNAs. Many biological processes related to immune modulation were found for both biological samples. Moreover, for sample-specific miRNA targets, ColosEV enriched terms were related to “cell differentiation” and “microvillus assembly”, while mEV showed biological processes for “cardiac and blood vessel development” and “mitochondria”. The whole message carried by the EVs from the two matrices is similar, but we observe a great difference in the amount of EVs, since colostrum shows a higher content than milk.

Session 33

Theatre 6

Prediction of blood parameters of buffaloes from the milk mid-infrared spectra

S. Magro¹, S. Esposito², G. Neglia², G. Niero¹, M. De Marchi¹

¹ University of Padova, Department of Agronomy, Food, Natural resources, Animals and Environment, Viale dell'Università, 16, 35020 Legnaro, Italy, ² Federico II University, Department of Veterinary Medicine and Animal Production, Via Federico Delpino, 1, 80137 Napoli, Italy

Blood metabolic profile testing allows for monitoring metabolic health and nutritional status. Still, conducting extensive blood analyses on a large scale is not feasible due to high costs, labour, and animals' stress. In this context, utilizing Fourier-transform mid-infrared (FT-MIR) spectra of milk to predict blood traits may present an effective opportunity. The present study aims to test the ability of milk FT-MIR to predict blood traits using milk spectra collected from the same buffalo. Blood and milk samples were collected from 310 buffaloes in different stage of lactation reared in 9 farms in the Southern Italy. The concentration of non-esterified fatty acids (NEFA), triglycerides, cholesterol, low-density lipoprotein (LDL), high-density lipoprotein (HDL), glucose, urea, total protein, albumin, globulins, creatinine, aspartate aminotransferase (AST), alkaline phosphatase (ALP), glutamic oxaloacetic transaminase (GOT), glutamic pyruvic transaminase (GPT), gamma-glutamyl transferase (GGT), creatine kinase (CK), lactate dehydrogenase (LDH) and total bilirubin (TBIL) were measured in blood through reference analysis. Milk samples were scanned with a MilkoScan and FT-MIR spectra were collected. Spectral data were divided into a calibration set (70%) and a validation set (30%) for external validation. In external validation, coefficients of determination ≥ 0.60 were achieved for urea, triglycerides, NEFA, LDL and TBIL concentrations. Although FT-MIR models cannot be considered accurate enough for punctual determination, the predictions of blood parameters can be considered for the screening of the herd and for genetic purposes at population level.

Cortisol concentrations in different matrices: predictive potential and relationship with productive level, lactation stage and parity in dairy buffaloes

A. Cotticelli¹, F. Aragona¹, T. Peric², I. Pividori², A. Salzano¹, V. Longobardi¹, G. Campanile¹

¹ University of Naples, Department of Veterinary Medicine and Animal Production, Via Delpino 1, 80137

Naples, Italy, ² University of Udine, Department of Agricultural, Food, Environmental and Animal Sciences, Via Sondrio 2, 33100 Udine, Italy

Cortisol is a biomarker related to hypothalamic-pituitary adrenal (HPA) axis activity. Plasma and milk cortisol concentrations provide short term evaluations about the HPA axis activity while hair can be used for the retrospective assessment of cortisol levels. This research aimed at studying the relationship among cortisol in blood, milk, whey and hair with parity, days in milk (DIM) and productive classes and to study their predictive potential. Multiparous (n=30) and primiparous (n=38) buffaloes were assigned to 4 productive classes, according to equivalent corrected milk (ECM) ($ECM < 15.85$; $15.86 < ECM < 17.57$; $17.58 < ECM < 19.74$; $ECM > 19.75$), and 3 classes of DIM (< 90 DIM; $91 < DIM < 150$; > 150 DIM). Cortisol levels were measured by RIA method. Parity did not show an effect on cortisol concentrations. The catabolic stage of lactation (up to 90 DIM) was characterized by higher cortisol concentrations in milk compared to the second anabolic (beyond 150 DIM). Plasma cortisol concentrations were higher at the catabolic and the first anabolic stage (91 to 150 DIM) compared to the second anabolic ($P=0.022$ and $P=0.009$ respectively). Buffaloes beyond 150 DIM differed from those below 90 DIM ($p < 0.001$) and between 91 and 150 DIM ($p < 0.05$) in hair. Hair cortisol concentrations were negatively correlated to mature equivalent milk yield ($p < 0.05$). Finally, the whey showed a potential to predict the concentrations of cortisol in whole extracted milk ($R^2=0.31$).

Theatre 8

Characterization of buffalo faecal microbiome depending on ration concentrate level

C. Evangelista¹, D. Pietrucci¹, M. Milanese¹, L. Basiricò², F. Gabbianelli¹, U. Bernabucci², G. Chillemi¹

¹ University of Tuscia, Department for Innovation in Biological Agro-Food and Forest Systems, via san camillo de lellis, 01100 Viterbo, Italy, ² University of Tuscia, Department of Agriculture and Forests Sciences, via san camillo de lellis, 01100 Viterbo, Italy

The microbiome communities of the gastrointestinal tract (MCTGI) of ruminants plays an essential role in animal health and productivity. It is well known that diet has the greatest influence on MCTGI, with the potential to alter the microbial diversity. The aim of this study was to evaluate the effect of different concentrate level rations on the microbiota composition of buffalo faeces. Faeces samples (FS) were collected from 10 dairy buffalo farms in Lazio region (Italy) once a month, for 6 months. FS were collected and DNA was extracted using Faecal DNA MiniPrep kit (Zymo Research). Libraries were prepared on V3-V5 region of 16S gene and sequenced on Miseq with PE 300bp output. In addition, samples of Total Mixed Ration (TMR) were collected and analysed. Bioinformatic analysis was performed using QIIME2 pipeline. Sequences were clustered into Amplicon Sequence Variant (ASVs) using DEBLUR, and the taxonomic assignment was conducted using the GreenGenes2 database. Statistical analysis (i.e. β -diversity metrics and identification of differentially abundant species) was done with DESeq2. Results about TMR composition show high variability in the rations. Considering a different forage-concentrate ratio (F:C) from high ($\geq 80:20$) to low ($\leq 70:30$), the metagenomics preliminary results highlight some significant differences. In rations with low F:C there is a greater abundance of amylolytic and lipolytic species (i.e. *Clostridium bormimense* and *Anaerovibrio lipolyticus*). In conclusion, ration composition influences the microbial communities also in buffalo faeces.

Assessment of infrared spectroscopy for the quantification of protein fractions in buffalo milk

E. Visentin¹, G. Niero¹, A. Guerra¹, R. Matera², V. Longobardi², G. Neglia², M. De Marchi¹

¹ *University of Padova, Department of Agronomy, Food, Natural resources, Animals and Environment, Viale dell'Università 16, 35020 Legnaro, Italy,* ² *Federico II University, Department of Veterinary Medicine and Animal Production, Via Federico Delpino 1, 80137 Napoli, Italy*

Despite the subject of cow milk proteins have been extensively addressed, there still is a lack of studies investigating detailed protein profile in buffalo milk. The aim of this study was to qualitatively and quantitatively determine protein fractions in buffalo milk. An additional aim was to assess the effectiveness of mid-infrared spectroscopy to predict milk protein composition. Individual milk samples of Italian Mediterranean buffaloes (n = 401) were collected in 7 commercial herds located in the area of Mozzarella di Bufala Campana PDO (south of Italy). Traditional milk quality traits (fat, protein, casein and lactose, %), pH and urea content (mg/dL) and spectral data were obtained using MilkoScan FT6000 (Foss Electric A/S, Hillerød, Denmark). Detailed milk protein composition (α S1-, α S2-, β -, and κ -casein, α -lactalbumin and β -lactoglobulin) were determined by reversed-phase HPLC. Within sample, the concentration of each protein fraction was matched with the corresponding spectrum. Chemometric analyses were carried out using WinISI 4 software (Infrasoft International, Port Matilda, PA) applying a 5-fold cross-validation. Results showed moderate accuracies of the mid-infrared spectroscopy to predict different protein fractions, with a coefficient of determination in cross validation (R^2) from 0.34 (β -lactoglobulin) to 0.60 (β -casein). In perspective, further research should be addressed to improve the accuracy of near-infrared spectroscopy models by increasing the number of samples in calibration, or considering alternative chemometric approaches.

Session 33

Theatre 10

Biosecurity correlation with Antimicrobial Use and Animal Welfare in buffalo farm evaluated by ClassyFarm System

D. Vecchio¹, F. Scali², A. M. Maisano², F. Fusi², V. Lorenzi², G. Di Vuolo¹, C. D. Ambra¹, M. Serrapica¹, G. Cappelli¹, C. R. Romeo², C. Lecchi³, L. Bertocchi², A. J. Zanella⁴, E. De Carlo¹

¹ *IZSM, CReNBuf, Via Salute, 80055 Portici, Italy,* ² *IZSLER, CReNBa, Via Bianchi, 25124 Brescia, Italy,* ³ *Università degli Studi di Milano, Dipartimento di Scienze Veterinarie ed Animali, Via dell'Università, 26900 Lodi, Italy,* ⁴ *Faculdade de Medicina Veterinária e Zootecnia da USP, CESBE, Av. Duque de Caxias Norte, 13635-900 Pirassununga, Brazil*

Biosecurity in ruminant production is often an overlooked area, instead, it is a key aspect of the interactions among the animal production systems, the environment, and human health in a One-Health approach. ClassyFarm is an integrated system for categorising farms according to the risk assessment methodology. ClassyFarm gathers and processes data related to biosecurity, animal welfare (AW), and antimicrobial usage (AMU). It can be applied to several livestock species, including water buffalo, for which biosecurity is evaluated on 15 items. The assessment of AW includes 63 non-animal-based measures (N-ABMs) and 17 animal-based measures (ABMs). The N-ABMs are divided into 'Management' (32 items) and 'Housing' (31 items). Total and partial scores are expressed in percentages. AMU was estimated using the Defined Daily Animal Dose for Italy (DDDAit). The Biosecurity & AW were assessed on 382 buffalo farms, with an average size of 374 heads. The mean overall AW score was $76.9 \pm 9.8\%$ and the Biosecurity was $68.9 \pm 15.3\%$ and DDDAit 0.40. Statistical analysis was performed by Spearman's rank correlation using GraphPad Prism 8.0.1. Biosecurity and AW were positively correlated ($\rho=0.42$; $p < 0.001$). A positive correlation was observed between Biosecurity and both 'management' ($\rho=0.61$; $p < 0.001$) and 'housing' ($\rho=0.36$; $p < 0.001$). No correlation was found between AMU, Biosecurity and AW respectively, likely due to the low levels of AMU found. The low AMU values confirm the peculiarity of buffalo breeding, a strong point to be exploited in communication. Knowing the Biosecurity and AW levels, their relationship and critical point in animal farms, represent a tool to plan the strategic priorities of human resources and investments, to increase the Farmers' awareness and the health, and ethical sustainability of the farm.

A new version of buffalo SNP array to support Mediterranean breed genomic improvement

M. Milanese¹, D. Pietrucci¹, L. Picarone¹, G. Vignali¹, G. Cosenza², M. Gomez³, G. Chillemi¹

¹ University of Tuscia, Department for Innovation in Biological Agro-Food and Forest Systems - DIBAF, Via San Camillo de Lellis, snc, 01100 Viterbo, Italy; ² University of Naples "Federico II", Department of Agricultural Sciences, Piazza Carlo di Borbone, 1, 80055 Portici, Italy; ³ Associazione Nazionale Allevatori Specie Bufalina - ANASB, Via Petrarca, 42-44, 81100 Caserta, Italy

Domestic water buffalo is an important worldwide species, despite the smaller population in comparison with bovine. Two types of buffalo are recognized: swamp and river. The former are populations supporting people in many developing countries for draft purposes. The latter are breeds mainly selected for milk production. In Italy, Mediterranean (MED) river breed is bred, from which the famous “Mozzarella di Bufala Campana” is obtained. Recently, the breeding association ANASB published the first genomic breeding index for MED. However, the use of the current buffalo array (ABA1) has limitations (eg, number of usable markers and their density), because its aim was for biodiversity characterization and not genomic selection in MED. In the framework of the GENO-BU project, thus, a specific MED version of the Axiom Buffalo array was developed. The markers included in the ABA1 were validated using previously genotyped MED animals; compatibility with the ABA1 and IMAGE array was considered, and SNPs associated with milk characteristics were prioritized. Finally, 72,223 SNPs were retained. New markers were identified using short and long reads (ONT) sequences from MED animals (unpublished data kindly provided by F. Salvatore and G. Paoletta, CEINGE, Napoli, Italy, within the GENOBU project), to optimize the array density and fill the almost 123k spots available. The data were aligned to the most recent MED reference sequence to identify new variants, using state-of-the-art bioinformatic pipelines. Markers from Y chromosome, together with SNPs from candidate genes affecting functional traits (eg, casein cluster), were also included. The final number of markers included in the new version is 122,646, reaching 21.8±7.7 kbp average marker distance.

Session 33

Theatre 12

Influence of udder type traits on stayability in the Italian Mediterranean buffalo

D. Altieri¹, Y. Gombia², N. Piscopo¹, F. Carnovale³, M. Neri², R. Di Palo¹

¹ FEDERICO II UNIVERSITY, MVPA, VIA DELPINO, 1, 80147 NAPOLI, Italy; ² ANASB, Via Petrarca, 42-44, 81100 CASERTA, Italy; ³ Estonian University of Life Sciences, Institute of Veterinary Medicine and Animal Sciences, Kreutzwaldi 1, 51014 Tartu, Estonia

In previous studies, stayability has been found to be a useful tool to assess longevity in Mediterranean Italian Buffalo. Animal longevity has been shown to correlate with type traits in dairy cows and in dairy buffaloes, as long as milk production increases thanks to genetic selection. In buffaloes, morphology was found to influence stayability up to parity 7, after which milk production was the discriminating trait. A wide thorax, properly angulated and with a good diameter, together with a longer trunk, allows higher production without compromising the health status of the animal, leading to greater longevity. A correct rump conformation, wide in both fore and hindquarters and only slightly angulated, also allows greater longevity, probably due to its involvement in reproductive events. The aim of this study was to correlate longevity with the udder traits measured by ANASB for IMB. The ANASB dataset including 49,667 animals born between 2005 and 2018, with type trait evaluations carried out between 2010 and 2021 was used. Data preparation and all statistical analyses were performed using the R programming environment v.4.3.0 (R Core Team, 2023). The R package lme4 (Bates D, 2015) was used to run a mixed effects logistic regression model using the 'glmer' function, including milk yield, all type traits for udder conformation included in the ANASB type trait evaluation, age at first calving as fixed effects, and the interaction of herd-year of evaluation-inspector as a random effect. The morphological traits that were found to have a significant influence on stayability, especially at parity 1 to 5, were mainly udder depth with an inverse relationship and mean ligament strength with a positive relationship. However, milk production was always the most important trait for culling. Acknowledgements: This study was supported by 10.2 of the National Rural Development Programme (PSRN)-Biodiversity 2014–2020, BIG project Prot. N. 0215513 CUP ANASB: J29J21003720005.

How old is too old? Effects of parity in dairy water-buffalo on milk and reproduction efficiency

M. Mincu¹, I. Nicolae¹, A. Bota², D. Gavojdian¹, T. Constantin¹

¹ Research and Development Institute for Bovine, Sos. Bucuresti-Ploiesti km 21, 077015 Balotesti, Romania, ² Research and Development Station for Buffalo, Strada Campului nr. 2, 507195 Sercaia, Romania

Longevity of dairy water-buffaloes is not well documented to-date, with some reports mentioning that cows remain fertile and are able to sustain new lactations even after 18 years of age. The aim of the current research was to evaluate the effects that parity has on production and reproduction performances in dairy water-buffalo cows. Therefore, a study-herd of 56 Romanian buffalo breed multiparous cows were monitored at the Research and Development Station for Buffalo Sercaia, with an average parity of 6.42 ± 0.40 , ranging between 3rd and 15th. Three age groups were set-up, as follows: YOU – parities III-V (n= 24), MID – parities VI-VIII (n= 20), and OLD – parities IX and above (n=12). Data on milk yield during the first 100 days of lactation (100DIM), milking ejection rate (MER), body condition score (BCS) and calving intervals (CI) were evaluated using the Mann Whitney U non-parametric test. Milk yield varied between 788.0 ± 119.0 and 882.0 ± 105.0 kg/100DIM among groups, with no effects ($p > 0.05$) of the parity. Similarly, MER and BCS were not influenced ($p > 0.05$) by the parity of the buffalo cows, with averages ranging between 0.43 ± 0.07 and 0.52 ± 0.08 kg/min and between 6.2 ± 0.34 and 7.0 ± 0.26 , for MER and BCS, respectively. Moreover, contrary to our expectations, the YOU group had an average CI of 535.2 ± 78.6 days, compared to the shorter CI intervals of 476.1 ± 69.1 and 471.8 ± 47.3 days, for the MID and OLD group, respectively. Current results outline that older water-buffalo cows maintain both appropriate fertility and productivity throughout latter parities.

Poster 14

Accuracy of a fast low-priced device based on 2D image analysis in predicting body weight of Italian Mediterranean buffalo

D. Meo Zilio¹, G. Bianconi², C. Petricca¹, P. Negretti³, F. Petrocchi Jasinski⁴, C. Evangelista⁵, R. Steri¹

¹ CREA, Animal Production and Aquaculture, Salaria 31, 00015 Monterotondo (RM), Italy, ² CRF, Antonio Silvani 130, 00139 Rome, Italy, ³ Orisha s.r.l., Luigi Pirandello 10, 82100 Benevento, Italy, ⁴ University of Tuscia, DAFNE, S. Camillo de Lellis, 01100 Viterbo, Italy, ⁵ University of Tuscia, DIBAF, S. Camillo de Lellis, 01100 Viterbo, Italy

Body weight (BW) is important in the productive and reproductive management of the Italian Mediterranean buffalo (IMB). Identifying anomalous variations promptly allows for the early detection of metabolic disorders or deficiencies. Traditional method implies human labor and is time consuming and stressful for animals. BW can be also measured by image analysis (IA). The present study was performed to evaluate the precision of a rapid tool, based on IA, in BW prediction of IMB when compared to official method. Fifty-five lactating buffaloes (first to sixth parity) were weighed using a livestock scale in the morning, prior to feeding. Meanwhile, using a mobile device, equipped with a laser telemeter to carry out continuous measurements from a distance, a body lateral image was acquired and processed by an App for BW assessment. The surface area of all lateral profile was calculated and used in predicting BW using a previously developed equation (modified). High correlation ($r = 0.95$ $p < 0.0001$) was found between predicted and measured BW. Regression App prediction on measured BW ($y = 0.98x + 16.71$ $R^2 = 0.90$, $p < 0.0001$) showed a slope coefficient very close to one and an average measurement error of 2.5% (RMSE = 18.45). Residuals analysis did not show any systematic error. In conclusion a rapid and accurate measure of morphometric traits for BW prediction may be easily obtained either by generic operators or automatized systems, during the routine operations.

Analysis to the microbiome of buffalo milk and mozzarella cheese using next generation sequencing techniques

C. Ferrari², L. Basiricò², U. Bernabucci², M. Ruzzi¹

¹ University of Tuscia, DIBAF, Via San Camillo de Lellis, snc, 01100 Viterbo, Italy, ² University of Tuscia, DAFNE, Via San Camillo de Lellis, snc, 01100 Viterbo, Italy

Milk and dairy products are a fundamental component of the human diet due to their digestibility and high nutritional value. In recent years, the development of molecular techniques, such as Next-Generation Sequencing (NGS), has dramatically increased our knowledge of the composition and structure of the microbiomes of raw milk and milk-derived products. The Amaseno (FR) valley is known for producing mozzarella and typical cheeses from buffalo milk. The metagenomics analysis carried out on the buffalo milk samples from three dairy farms for one year showed that the structure and composition of the buffalo milk microbiome were strongly influenced by farm management and seasonal trends (temperature and humidity). The analysis also revealed the presence of lactic acid bacteria with technological and beneficial traits belonging to the genera *Lactococcus*, *Streptococcus*, and *Lactobacillus*. The NGS analysis on mozzarella samples showed an increased relative abundance of *Streptococcus thermophilus* and *Lactobacillus crispatus*-affiliated taxa. *S. thermophilus* could play an essential role in the cheese-making process by providing peculiar sensory properties due to the production of aromatic compounds. At the same time, *L. crispatus* might have potential probiotic activities. Our data indicate that microbiome analysis is a valuable tool to characterize the milk and mozzarella's microbial community by highlighting the presence of taxa with dairy properties that benefit human health.

Effect of seasonality and farm management on the buffalo's milk lipidome

L. Basiricò², P. Bonini³, C. Evangelista¹, U. Bernabucci², M. Ruzzi¹

¹ University of Tuscia, DIBAF, Via San Camillo de Lellis, snc, 01100 Viterbo, Italy, ² University of Tuscia, DAFNE, Via San Camillo de Lellis, snc, 01100 Viterbo, Italy, ³ OloBion SL, Av. Dr. Marañón, 8, 08028 Barcellona, Spain

The milk characterization using untargeted lipidomics based on mass spectrometry techniques can provide valuable information on the total lipid profile, the temporal variations in the composition and characteristics of the lipid fraction, and the association between these variations and environmental factors. This study evaluated the association between different feeding management and seasons to bulk milk lipidome in 8 buffalo farms from the same geographical area (Amaseno, Italy). Milk samples were collected from January to November and amended with 2-bromo-2-nitropropane-1,3-diol as a biocide and preservative. The data analysis allowed us to identify biomarkers that helped evaluate the impact of seasonality and farm management on lipidome. Different lipid extraction protocols were used, including liquid-liquid extraction and solid phase extraction, showing how the result, in terms of the number of detectable chemical fingerprints, was strongly affected by sample preparation. With the optimized protocol, the buffalo milk lipidome was shown to consist of approximately 515 compounds (10% greater than that of the bovine milk lipidome). The chemometric analysis demonstrated that the macroscopic differences among the buffalo milk samples resulted from 8 compounds belonging to 7 distinct classes. In contrast, the micro-differences among milk samples referred to a group of 16 compounds, 12 of which belong to the class of chain triglycerides between C8 and C20.

Influence of breeding techniques during the dry period on welfare in buffalo species

A. Cotticelli¹, L. Borzacchiello¹, G. Pacelli¹, G. Bifulco¹, M. Giombolini², T. Peric², G. Neglia¹

¹ University of Naples, Department of Veterinary Medicine and Animal Production, Via Delpino 1, 80137

Naples, Italy, ² University of Udine, Department of Agricultural, Food, Environmental and Animal Sciences, Via Sondrio 2, 33100 Udine, Italy

The aim of the study was to evaluate the influence of two rearing techniques on welfare status of Italian Mediterranean buffaloes (IMB) during the dry period. Twenty IMB were selected and shared in two groups according to parity and milk yield (MY): Group P was kept under extensive conditions and group S in barn. Blood samples for biochemical analyses and hair samples for cortisol measurement were collected monthly, from April to September. In addition, daily temperature and relative humidity were recorded to calculate the Temperature Humidity index (THI). At the end of the dry period, individual MY and milk quality were evaluated monthly. Significant differences were observed between group P and S for total protein (8.19 and 7.52 g/dl, $P < 0.01$), triglycerides (20.77 and 28.75 mg/dl, $P < 0.01$) and urea (45.89 and 38.43 mg/dl, $P < 0.05$). Cortisol concentrations tended to differ ($p < 0.10$) between group P and group S (7.73 and 4.51 pg/mg, respectively). Group P showed a higher milk yield compared to group S (11.19 vs 10.64 kg/die, $p < 0.01$), and lower fat concentration (7.80 vs 8.37 %, $p < 0.05$). THI was negatively correlated to triglycerides and cholesterol (-0.36 and -0.39 respectively, $p < 0.001$), and positively to cortisol and LDH (0.38 and 0.33 respectively, $p < 0.001$). In conclusion, providing physical exercise during the dry period seems to have a positive influence of on fitness and MY during the subsequent lactation, so more research is needed possibly recruiting a larger number of buffaloes.

Session 33

Enhancement Center, Thessaloniki, 57011 Thessaloniki, Greece, ⁴ Livestock Cooperative of Greek Buffalo Breeders, Kerkini, 62055 Serres, Greece, ⁵ University of Ioannina, Kostakioi, 47100 Arta, Greece

The objective was to assess the characteristics and the potential of dual-purpose water buffalo (*Bubalus bubalis*) farms in Greece towards production of high-quality meat and milk. We provide suggestions and objective solutions to ensure farm sustainability emphasizing animal health, welfare, and product marketability. Phenotypic data are collected from a representative number of animals. Meat quality is assessed through pH, moisture, fat and protein content, fatty acid profile, color, water holding capacity, and morphometric analysis of skeletal muscles. Milk quality is assessed through microbiological and physicochemical analyses. Based on the latest census (2023), the national herd comprised 6,740 animals kept on 38 farms; an increase of 53% compared to 2014. Age and sex structures comprise 589 females and 436 males <6 months, 979 females and 831 males between 6-24 months and 3,367 females and 538 males >24 months old. The focus of farms is meat production. Over the last 3 years, the average number of animals slaughtered was 838, aged between 18-24 months, and produced carcasses of 220-250 Kgs. About 18% of farms also produce milk sold to local dairies or used for homemade dairy products. The average lactation period is 150±10 days. About 20% of the breeders apply an intensive rearing system for the animals sent to slaughter. Preliminary results provide useful insights into the meat and milk quality produced by existing buffalo farms in Greece. This work is funded by Bubalis project (Measure 16:Cooperation, Project code M16ΣYN2-00193).

The use of coproducts to mitigate the environmental footprint of pigs and broiler chicken production

S. Cisse¹, H. Bui¹, J. Laurain¹, M. E. A. Benarbia¹

¹ Nor-Feed SAS, R&D, 3 rue Amédéo Avogadro, 49070 Beaucozéz, France

Mitigating livestock's environmental footprint is an important pillar for building sustainable animal production. This could be done by improving feed efficiency thanks to the use of feed additives. This study aimed to assess the environmental impacts of the use of a commercial citrus extract feed additive (CEFA) in swine and broiler chicken farming. Life-cycle assessment (LCA) was applied to assess the impact of manufacturing and distributing one 25 kg bag of CEFA and its use in broiler and swine productions. Results showed that most of the impact of CEFA manufacturing came from the production of CEFA ingredients, accounting for 70% of the impact generated. The remaining 30% effect was divided between transportation to the customer (25%), CEFA packaging (3%), and CEFA manufacturing and production loss (2%). Moreover, the use of CEFA in pigs and broiler production was shown to improve environmental indicators such as climate change, land occupation, and water consumption, compared to standard conditions without CEFA. Indeed, CEFA supplementation allowed to enhance growth performances, hence reducing the required amount of consumed feed to achieve the same level of growth. Consequently, this helped reduce environmental issues from animal feed ingredients' agriculture. To be more specific, the use of one 25 kg bag of CEFA led to a reduction of 6 tons of CO₂ equivalent emitted along the life cycle of poultry production and 5 tons in the case of fattening pigs. The inclusion of CEFA in the diet also led to a reduction in the land use footprint by 0.7 hectares and reductions in water consumption by 201 m³ and 82 m³ for broiler and swine production, respectively. The LCA thus showed the interest in using this CEFA in swine and broiler chicken diets to mitigate the environmental impacts.

Session 34

Methane emissions from beef fed different protein sources and a forage-based diet

C. Christodoulou¹, K. E. Kliem¹, M. D. Auffret², D. J. Humphries¹, J. R. Newbold³, N. Davison¹, P. Kirton¹, L. Smith^{1,4}, S. Stergiadis¹

¹ University of Reading, School of Agriculture, Policy and Development, Earley gate, RG6 6EU Reading, United Kingdom, ² Agrifirm, Baarleveldstraat 8, 9031 Drongen, Belgium, ³ Scotland's Rural College, Dairy Research & Innovation Centre, Barony Campus, Parkgate, DG1 3NE Dumfries, United Kingdom, ⁴ Swedish University of Agricultural Sciences, Biosystem & teknologi, SE-234 22 Lomma, Sweden

This study assessed the effect of different dietary protein sources (soyabean, SB; brewers' spent grains, BSG; local field beans, BNS) on methane (CH₄) emissions of beef cattle fed a 70:30 forage:concentrate basal diet, and also compared with a 100% pasture-fed beef system (PAS). 16 Holstein × Angus growing steers were allocated to four experimental diets (SB, BSG, BNS, PAS; four animals each) for 16 weeks. Every 4 weeks animals were transferred in digestibility stalls (for nutrient balance measurements) within respiration chambers (for CH₄ emission measurements) for 4 days. During the chamber measurement periods, dry matter intake (DMI, kg/day) and gross energy intake (GEI, MJ/day) did not differ between groups (P>0.05). PAS steers had lower CH₄ production (g/day; P<0.001) and CH₄ yield (g/kg DMI, P=0.001; MJ/MJ GEI, P=0.005) compared with the three concentrate-fed groups. Faeces and urine energy outputs (expressed as % GEI) were higher (P<0.001) in PAS steers compared to the concentrate-fed beef. There were no significant differences (P>0.05) in the studied parameters between the three concentrate-fed groups. The lower CH₄ production and yield in pasture-fed steers could indicate potential environmental benefits associated with pasture-based beef systems, but the higher energy loss in faeces and urine demonstrates potential inefficiencies in energy utilisation.

Effect of dietary protein concentrations on feeding efficiency and methane emissions of dairy cows across lactation

S. Ormston¹, T. Yan², X. Chen², A. W. Gordon³, K. Theodoridou⁴, S. Huws⁴, S. Stergiadis¹

¹ University of Reading, School of Agriculture, Policy and Development, RG66EU Reading, United Kingdom, ² Agri-Food and Biosciences Institute, Hillsborough, BT26 6DR Belfast, United Kingdom, ³ Agri-Food and Biosciences Institute, Statistical Services, BT9 5PX Belfast, United Kingdom, ⁴ Queen's University Belfast, Institute for Global Food Security, BT9 5DL Belfast, United Kingdom

This study assessed the impact of dietary CP level (g/kg DM: Low, LCP, 122; Medium, MCP, 151; High, HCP, 181) on productivity, feeding efficiency and methane production (CH₄) of Holstein-Friesian cows across lactation. 12 primiparous and 12 multiparous cows were allocated to 3 diets (LCP, MCP, HCP) in a randomised blocked design throughout lactation (1–305d). During early (70–90d), mid (150–170d) and late (230–250d) lactation, 6-day digestibility measurements were performed in metabolism units, followed by 3-day gas exchange measurements in respiration chambers. Data was analysed by a linear mixed model with repeated measures using CP level (LCP, MCP, HCP), stage of lactation (early, mid, late), parity (primiparous, multiparous) and their interactions as fixed effects. Regression equations were developed to identify relationships between diet CP content and measured variables. MCP and HCP cows had higher energy-corrected milk yield (ECMY; 25.7 and 27.8 kg/day), ECMY/dry matter intake (DMI) (1.40 and 1.42 kg/kg) and milk energy/DMI (4.33 and 4.39 MJ/kg DM) than LCP cows. Regression analysis showed that milk yield was quadratically increased beyond 150 g CP/kg DM, with a peak shown at 170g CP/kg DM, but this also depends on lactation stage. The HCP group had higher energy digestibility (0.74 MJ/MJ) than the LCP (0.72 MJ/MJ) and MCP (0.72 MJ/MJ). CH₄/ECMY was higher for LCP (17.9) than MCP (14.8) and HCP (14.5) cows.

Session 34

Theatre 4

Dietary crude protein reduction in poultry diets allows to decarbonize poultry meat and egg production with different levels of expected benefits across segments

M. Durand¹, A. Mathiaud¹, C. Raybaud¹, P. Moquet¹, W. Lambert¹

¹ MIXSCIENCE, RID, 35172 Bruz, France

Feed accounts for around 75 % of the environmental impact of the poultry meat and egg production, regardless of the production method. This study aimed to compile recently conducted poultry experiments with the same goal and methodology: studying the impact of reduced dietary crude protein (CP) levels on growth and laying performance as well as measuring the benefits in terms of carbon footprint. Five different trials were compiled and compared across broiler genetic lines (Ross 308, JA 787, S757N) and segments (broiler, turkey, duck, and brown-laying hen). Dietary CP reduction was achieved in all segments by gradually replacing imported soybean meal by cereals, and feed-grade amino acids (AA) controlled at least at the assumed requirement. Dietary digestible Lysine (dLys) supply was constant for all treatments within each experiment. With this protocol, it was possible to reduce dietary CP in diet formulation, expressed as mg dLys/ point of dietary CP as low as: 55 to 63, 49 to 58, 45 to 54, 47 to 57, 56 to 61, and 41 to 50, for Ross 308 broiler, JA 787 broiler, S757N broiler, duck, turkey, and laying hen, respectively. Based on growth performance, meat yields and egg performance, the lowest reachable levels of dietary CP reduction, without impacting performance were: 63, 52, 45, 56, 45 mg dLys/pt CP for Ross 308, JA 787, S757N, turkey and laying hen respectively. It is possible to reduce dietary CP in all segments and species, but the level of nutrient density reachable differed within the broiler segment, and between species. By reducing dietary CP, reducing imported soybean meal and implementing MatriCIEL® calculations, it was also possible to reduce carbon footprint (in kg CO₂eq/kg meat or egg) by 2–15 % for Ross 308 broilers and by 4–10 % for layers.

Effect of fresh hemp and savory leaves on feed intake and rumen fermentation: in vitro and in vivo trials

S. Massaro¹, N. Amalfitano¹, D. Giannuzzi¹, F. Tagliapietra¹

¹ University of Padova, DAFNAE, Viale dell'Università, 16, 35020 Legnaro (PD), Italy

The pharmaceutical and herbal sectors produce large amounts of by-products, potentially usable in dairy cows' nourishment. In this contest, fresh hemp leaves (*Cannabis sativa* L.; HL) and savory leaves (*Satureja hortensis* L.; SL) were tested in vitro and in vivo to evaluate their impact on rumen fermentations. As first step, HL and SL fermentation properties were compared with grass hay using an in vitro gas production (GP) system. Then, 6 lactating cows in a 3×3 Latin Square design were fed in vivo with HL and SL with a dosage of 3 kg DM/d to evaluate the impact on feeding behaviour and rumen fermentations. Finally, the microbial activity of individual rumen fluids (RF), collected at the end of each period of the in vivo trial, was evaluated again in vitro. All RF samples were analysed for pH, volatile fatty acid (VFA), and ammonia. For the in vitro trials, GP kinetics and gas composition were also measured. First, in vitro results showed that, compared to grass hay, HL exhibited a higher degradability, a slower GP kinetic and an increased acetic+butyric/propionic (ABP) ratio, CH₄ production (mL/g DM) and intensity (% v/v). Conversely, SL showed a lower degradability and GP, a higher ABP ratio and a lower CH₄ production and intensity. For the in vivo and the later in vitro trials, HL reduced the feed intake and slightly increased propionic and valeric acids in the RF, whereas SL was favourably accepted by the cows but did not affect rumen fermentations. Our findings highlighted the feasibility of utilizing these herbs in ruminant feeding, but further investigations are required to assess the impact of higher quantities, particularly on long-term intake. Research funded by the projects: UNIPD 2021, BIRD213117

Effect of β-mannanase on growing-finishing pig performance, economics, and carbon footprint

A. Huting¹, M. L. Augé², Q. Bringas², F. Molist¹

¹ Schothorst Feed Institute, R&D, Meerkoetenweg 26, 8218 NA Lelystad, Netherlands, ² Elanco Animal Health, Avda. de Bruselas 13, 28108 Alcobendas, Spain

It is speculated that β-mannanase (MAN) can improve nutrient efficacy, though studies that evaluated the efficacy of MAN on performance of growing-finishing (GF) pigs didn't reduce the energy (E) content of the experimental diets to test this concept. The objective of this experiment was to evaluate the effect of MAN (Hemicell™ XT; Elanco AH, Indianapolis, IN) on performance, carcass characteristics, economic viability (IOFC), and carbon footprint in GF pigs fed a diet lower in NE (-35 kcal NE/kg). It was hypothesized that treatments (T) would perform similarly. The trial consisted of T1 the control diet (CD) and T2) the CD + MAN (133 g/ton). A starter diet was fed between 25-50 kg (CP 16.8%, SID Lys 10.3 g/kg, T1: NE-value 2450 or T2: 2415 kcal/kg), a grower diet between 50-85 kg (CP 14.7%, SID Lys 8.65 g/kg, T1: 2400 or T2: 2365 kcal/kg), and the finisher diet between 85-120 kg (CP 13.4%, SID Lys 7.50 g/kg, T1: 2350 or T2: 2315 kcal/kg). The diets contained palm kernel expeller and soybean hulls to achieve a β-mannans content commonly present in EU diets. The difference in NE was created by the removal of animal fat (-34%). Each T had 12 replicates consisting of 8 GF (male:female ratio 1:1). Pigs weighed 25.4 kg (SD=1.27) at d0. Pigs were individual weighed at each diet transition and the day before slaughter. Feed intake was recorded during each phase. Treatment did not significantly influence pig performance or carcass characteristics (P>0.05). T2 resulted in a profit of €0.49 per pig and could reduce the carbon footprint by ≥1.00%. The results indicate that MAN whilst in a diet with a lower E content does not negatively influence performance and may result in a lower carbon footprint and reduced production costs.

Exploring Kaempferol 3-O-Glucoside as a Potential Feed Additive: In vitro Assessment for Mitigating Methane Emissions in Livestock Nutrition

A. Vastolo¹, M. Formato², S. Piccolella², S. Calabrò¹, S. Pacifico², M. I. Cutrignelli¹

¹ University of Napoli Federico II, Veterinary Medicine and Animal Production, Via Federico Delpino 1, 80137 Napoli, Italy; ² University of Campania Luigi Vanvitelli, Department of Environmental, Biological and Pharmaceutical Sciences and Technologies, Via Vivaldi 43, 81100 Caserta, Italy

The aim of this study was to evaluate by in vitro gas production technique the supplementation of pure kaempferol 3-O-glucoside, a metabolite abundant in the leaves of *Fagus sylvatica* L. Different dose levels of pure compound (0, 5, 50 and, 500 µM/g as feed) supplemented to a standard diet were tested in vitro with buffalo rumen liquor evaluating gas production (OMCV), organic matter digestibility (OMD) and fermentative end-products (pH, volatile fatty acids, VFA) after 120 h of incubation. Effects on methanogenesis, organic digestibility and volatile fatty acids production were evaluated after 24 h of incubation. Fermentation liquor after 0, 24 and 120 h of incubation was analysed through UHPLC-ESI-QqTOF-MS/MS analysis to follow the molecule biotransformation. The polynomial contrasts were used to observe differences between the doses (0, 5, 50, and 500 µM/g). Among the different tested dose levels, 50 µM/g resulted as optimal in terms of OMD, OMCV with a reduction of methane production after 24 h of incubation. The supplementation of 50 µM/g did not significantly modify OMD after 120 h, providing a significative increase of acetate and valerate. The fermentation kinetics significantly increase at 5 and 50 µM after 120h. The metabolomic analysis of the compound in fermentation fluid suggested the occurrence of rumen biotransformation during incubation period. In conclusion, kaempferol 3-O-glucoside inclusion in livestock diets modulates ruminal fermentations, suggesting its potential as a feed additive for methane mitigation.

Quantifying methane emissions and animal performance from zero-grazed beef steers supplemented with *Ascophyllum nodosum* via a water-based delivery system

A. Casey¹, S. Vigers¹, T. Boland¹, F. Godwin¹, J. O'Sullivan², M. O'Donnell³

¹ University College of Dublin, School of Agriculture and Food Science, Belfield, D04 V1W8 Dublin, Ireland; ² BioAtlantis, Clash East, V92 RWV5 Tralee, Ireland; ³ TerraNUTRITECH, Moone, Athy, R14 YV25 Kildare, Ireland

Quantifying baseline methane emissions from grass-fed beef production is vital in generating an accurate Irish agricultural inventory. In addition, identifying a suitable strategy to administer a methane mitigating additive at pasture is crucial in reducing agricultural emissions. Therefore, this study aimed to quantify methane emissions from grass-fed steers and examine the impact of *Ascophyllum nodosum* seaweed extracts delivered via a water-based delivery system. Forty-five beef steers were assigned to three dietary treatments in a complete randomized block design. Diets, comprising of zero-grazed grass offered ad-lib once a day, included either no seaweed (CTR), 1% of dry matter intake (DMI) of seaweed 1 (SW1) or 4% DMI of seaweed 2 (SW2) delivered through the water. Methane was continuously measured using GreenFeed (GEM) with DMI measured in weeks 5 and 10. GEM visits per animal averaged 240 with a mean 4.44 visits/d and duration of 04:37 mins/visit. Steers had a DMI of 7.34 ± 0.83 kg/d, average daily gain (ADG) of 1.46 ± 0.28 kg/d and methane output of 207.32 ± 17.52 g/d, methane yield of 29.11 ± 2.86 g/DMI and methane intensity of 146.74 ± 26.22 g/ADG. Seaweed supplementation had no effect on any measured parameters (P >0.05). To conclude, the methane emissions and performance of beef steers offered zero-grazed grass was quantified with no effect of seaweed supplementation. This study identifies the potential for water-based delivery systems to provide methane mitigating additives in pasture-based systems.

Effect of rape seed fat and saturated fat on milk production and enteric methane, when added to diets with different ratios between grass-clover and maize silage

C. F. Børsting¹, S. Lashkari¹, M. H. Kjeldsen¹

¹ Aarhus University, Dep. Animal and Veterinary Sciences, Blichers Allé 20, 8830 Tjele, Denmark

The study aimed to assess the impact of supplementing rape seed fat or saturated fat to diets with different grass-clover:maize silage ratios on enteric methane (CH₄), and milk production. The design was a 4×4 Latin square with 4 treatments and 4 Holstein cows over 4 periods of 21 days. The last 4 days of each period dry matter intake (DMI), milk yield, milk composition, and enteric CH₄ were measured in respiration chambers. All diets comprised 59% silage DM, with 2 silage ratios (either 80:20 or 20:80 grass-clover: maize silage), and either rape seed fat or saturated fat (45:45:10 palmitic:stearic:oleic acid), resulting in 51 g fatty acids (FA)/kg DM. Starch content was higher in high maize diets (249 g/kg DM) than in low maize diets (183 g/kg DM). No significant interactions were found. Significant effects were observed for silage ratio and fat source on DMI, milk fat% and Energy Corrected Milk (ECM). High maize increased DMI, reduced CH₄/kg DMI, lowered milk fat%, and resulted in the lowest ECM yield. Rape seed fat led to reduced DMI, lowered milk fat%, and the lower ECM yield. Due to reduced milk fat%, a combination of high maize silage and 51 g FA/kg DM partly from rape seed does not seem to be a feasible CH₄ mitigation strategy, despite the lowered methane yield.

Session 34 Theatre 10

Mango and Avocado Byproducts as Feed Ingredients and Additives in Ruminant diet

H. Jalal¹, E. Sucu², M. Giammarco¹, G. Vignola¹, M. Z. Akram³, I. Fusaro¹

¹ University of Teramo, Veterinary Medicine, Dipartimento di Medicina veterinaria, 64100 Teramo, Italy, ² Bursa Uludag university, Animal Science, Nilüfer/Bursa, 16059 Bursa, Turkey, ³ KU Leuven, Department of Biosystems, KU Leuven, 3001 Leuven, Belgium

The intensification of food-feed competitions and environmental concerns has driven research into unconventional feed sources for optimizing ruminant feeding. In this study, we explored the potential use of mango peel (MP), mango seed (MS), mango seed coat (MSC), avocado peel (AP), and avocado seed (AS) in two experiments. Experiment 1 evaluated the feed potential of these fruits byproducts by assessing their chemical composition, in vitro true digestibility, gas production, and volatile fatty acid production. In vitro true digestibility was determined using the Ankom DaisyII incubator. Among the various byproducts, MP and AP exhibited higher total phenolic content ranging from 121.50 to 243.69 (mg GAE/g) and antioxidant capacity from 342.92 to 366.63 (mg TE/g), indicating their potential to positively influence the rumen ecosystem. MP, MS, and AS showed higher digestibility (86.4–89.5%), increased gas production, and elevated metabolizable energy (8.41–9.59 MJ/kg DM), while MSC and AP exhibited lower values. Acetate-to-propionate ratio, a key methane indicator, was higher in AS (3.97), MSC (3.76), and MS (3.53), and lower in AP and MP (3.05 and 3.08, mmol/l respectively). Experiment 2 was conducted to assess the effectiveness of incorporating mango and avocado by-products extracts (20 mg) as feed additives, in comparison to alfalfa hay utilized as a control basal diet (200mg DM) across all groups. The findings demonstrated that the AS extract group exhibited the highest 24-hour gas production (47.3 ml/0.2 g DM) when compared to both the control and other extract groups (42.1 to 42.5 ml/0.2 g DM). MP and AP extracts significantly reduced acetate to propionate ratio compared to control and other extracts ($P < 0.001$). Furthermore, the extract groups exhibited a lower ammonia nitrogen concentration compared to the control. In conclusion, MP, MS, and AS show promising results as feed ingredients. Peel extracts of mango and avocado emerge as feed additives, modulating rumen fermentation parameters effectively.

Effect of *Cymbopogon citratus* on Enteric Methane Emission and Energy Partitioning in Growing Beef Cattle
*M. F. Vázquez-Carrillo*², *M. González-Ronquillo*¹, *R. Zaragoza-Guerrero*¹

¹ *Universidad Nacional Autónoma de México, Faculty of Veterinary Medicine and Animal Science, Instituto Literario #100, 50000 Toluca, Mexico,* ² *Universidad Nacional Autónoma de México, Faculty of Veterinary Medicine and Animal Science, Av. Universidad 3000, Ciudad Universitaria, Coyoacán, 04510 Mexico City, Mexico*

Globally, cattle production systems dominate the agricultural sector CH₄ emissions with 64-78% (2.3 to 2.8 Gt CO₂ eq-1). Therefore, it is necessary to develop natural and sustainable CH₄ mitigation strategies for cattle production systems, particularly for developing countries. Evidence suggests lemongrass, *Cymbopogon citratus* (CC), can reduce enteric CH₄ production. The objective of the present study was to evaluate the anti-methanogenic effect of increasing the supplementation levels of CC on the dry matter intake (DMI), digestibility, CH₄ production, and partitioning of the gross energy intake in growing beef heifers fed with a diet high in forage (68.6% forage: 31.4% concentrate). An experiment was conducted using Holstein × Charolais heifers distributed in a 4 × 4 Latin square design. The experimental treatments were: (1) control diet (CO), (2) CO + 30 g CC DM/d, (3) CO + 60 g CC DM/d, and (4) CO + 90 g CC DM/d. A reduction of 22.4% in methane yield (CH₄ g/kg DMI) and a reduction of 21.2% in the Y_m factor was observed with the 30 CC treatment ($p \leq 0.05$). However, no significant differences ($P > 0.05$) were observed for the total daily CH₄ production, DMI, nutrient digestibility, and gross energy intake partitioning in the heifers. Therefore, we concluded that the 30 g CC DM/d supplementation reduced the CH₄ yield without affecting the animal performance. However, the anti-methanogenic properties of *Cymbopogon citratus* deserve more investigation.

Theatre 12

Including dried algae in dairy cow diets decreases emissions, yield and intensity of enteric methane
*C. Benchaar*¹

¹ *Agriculture and Agri-Food Canada, Sherbrooke Research and Development Centre, 2000 College Street, J1M 0C8 Sherbrooke, Canada*

This study assessed the effects of supplementing dairy cow's diet with dried algae on enteric CH₄ emissions and milk production of Holstein cows. Sixteen multiparous lactating cows (DIM = 162 ± 29.5) were used in a completely randomised block design. The experimental period consisted of 5 weeks preceded with 3 weeks of covariate. Cows were fed (ad libitum) a total mixed ration not supplemented (Control), or supplemented (0.25% of dry matter) with dried algae (Synergraze Inc., Calgary, Alberta, Canada). The dried algae contained 4.65 mg/g bromoform. Intake of DM (DMI) and CH₄ production (4 days; respiration chambers) were determined during the covariate period, at the beginning (week 1), and after 35 days (week 5) of feeding the algae whereas, milk production and milk were determined weekly (including covariate period). Data were analysed (MIXED Procedure, SAS) using the repeated statement adjusted for the covariate. Significant effect was declared at $P \leq 0.05$. The interaction between the experimental treatment and sampling week was not significant for CH₄ production, DMI, or milk production. Algae supplementation had no effect on DMI (25.9 kg/d), milk production (39.3 kg/d), or milk fat (3.79%) and milk protein (3.36%) percentages. In contrast, compared with the control, feeding algae reduced ($P < 0.01$) enteric CH₄ emissions (g/d) by 45%. Consequently, methane yield (g CH₄/kg DMI) decreased from 19.3 g/kg to 10.6 g/kg and CH₄ emission intensity (g CH₄/kg energy-corrected milk) from 12.47 g/kg to 6.53 g/kg upon diet supplementation with algae. This study shows that including algae at 0.25% of DMI caused a marked reduction in CH₄ yield and CH₄ emission intensity by 45% and 48% respectively, without adversely affecting DMI or milk yield.

Phenotypic traits related to methane yield in dairy cows

M. H. Kjeldsen¹, T. De Evan Rozada¹, S. J. Noel¹, A. A. Schönherz¹, A. L. F. Hellwing¹, P. Lund¹, M. R. Weisbjerg¹

¹ Aarhus University, Animal and Veterinary Sciences, Blichers Alle 20, 8830 Tjele, Denmark

Dairy cows vary in CH₄ yield (CH₄ per kg of dry matter intake (DMI)) and the trait has some heritability. Knowledge of the phenotypic traits related to variation in CH₄ yield is essential for proper use of this variation to decrease methane emission from dairy production e.g. by breeding. Cows (16 Danish Holstein) were surgically fitted with a rumen cannula in connection with the drying off after 1st, for use in 2nd lactation. The experiment included digesta sampling for determination of nutrient digestibility, rumen fermentation and microbiome pattern, rumen evacuations for rumen pool size and fiber kinetics, and methane measures in respiration chambers. A 2×2 cross-over design with 2 treatments and 2 periods of 28 days was used. Treatments were diets with either 35% or 63% forage. Forage consisted of 80% grass-clover silage and 20% maize silage, and concentrate of 61% barley, 30% rapeseed meal, and 9% dried beet pulp, all on DM basis. Mineral and vitamin supplements were the same across diets. The cross-over design allowed extraction of the random cow effects (RCE) using a mixed model in R. The RCE of measured variables were related to RCE for methane yield using simple linear regression and Pearson correlations. Methane yield RCE (g/kg DMI) was positively correlated to RCE for organic matter digestibility ($r = 0.64$, $P < 0.01$), RCE for rumen ventral concentration of acetic acid ($r = 0.56$, $P = 0.02$) and RCE for rumen relative abundance of the methanogen *Methanomassilicoccus* ($r = 0.52$, $P = 0.04$), but not correlated to rumen pool size. Breeding for cows with a lower CH₄ yield might render cows less efficient in digesting feed, unless also digestibility and efficiency measures are included in the breeding program.

Effects of high-fat oats, rapeseed cake, and 3-NOP on milk production and methane emissions of dairy cows

P. Fant¹, G. Mantovani², M. Vadroňová³, M. Ramin¹

¹ Swedish University of Agricultural Sciences, Department of Applied Animal Science and Welfare, Skogsmarksgränd, 90183 Umeå, Sweden, ² University of Parma, Department of Veterinary Science, Via del Taglio 10, 43126 Parma, Italy, ³ Czech University of Life Sciences, Department of Microbiology, Nutrition and Dietetics, Kamýcká 129, 16500 Prague, Czech Republic

The objective was to examine the effects of high-fat oats (HF-oats), cold-pressed rapeseed cake (cpRSC), and 3-nitrooxypropanol (3NOP) on milk production and CH₄ emissions in Nordic Red dairy cows. We enrolled 24 lactating cows, divided into blocks, in a cyclic change-over design replicated in 4 periods of 28 days each. Diets comprised barley or the HF-oats variety Fatima as energy source and rapeseed meal (RSM) or cpRSC as protein source. Diets were fed with or without 3NOP supplementation at 60 mg/kg DMI. The forage to concentrate ratio was 60:40 with grass silage as sole forage. Gas emissions were measured by the GreenFeed system. Data were analyzed in SAS by the MIXED procedure as a 2×2×2 factorial design. Dietary treatment did not affect DMI. Milk and ECM yields were higher ($P < 0.01$) when feeding HF-oats instead of barley (41.3 vs. 38.9 kg ECM/d, respectively). Supplementation with 3NOP decreased ($P = 0.02$) milk yield by 1.2 kg/d, but did not affect ECM. We observed an interaction effect ($P = 0.05$) of energy and protein source on CH₄ yield (g/kg DMI) and CH₄ intensity. Feeding HF-oats + cpRSC decreased CH₄ intensity by 8.5% compared with barley + cpRSC (7.6 vs. 8.3 g/kg ECM, respectively), but feeding HF-oats + RSM decreased CH₄ intensity by 15.0% compared with barley + RSM (8.0 vs. 9.4 g/kg ECM, respectively). Supplementation with 3NOP decreased ($P < 0.01$) CH₄ intensity by 31.3%. In conclusion, combining HF-oats, cpRSC, and 3NOP mitigates enteric CH₄ emissions, but the effects are not additive.

Repeatability of enteric methane measurements using GreenFeed systems on upland pastures

*M. Bouchon*¹, *M. Coppa*³, *Y. Rochette*², *C. Pichon*¹, *R. Chadaigne*¹, *B. Martin*², *C. Martin*²

¹ INRAE, HerbiPôle, Theix, 63122 Saint-Genès-Champanelle, France, ² UCA, INRAE, VetAgro Sup, UMR Herbivores, Theix, 63122 Saint-Genès-Champanelle, France, ³ University of Turin, Dept. Agricultural, Forest and Food Sciences, Via Verdi 8, 10100 Turin, Italy

Plant diversity of mountain pasture has been shown to reduce enteric methane (CH₄) production in vitro. In 2023, we set up an in vivo experiment to measure enteric CH₄ emission using GreenFeed (GF) systems and dairy performances of 28 grazing dairy cows on mountain pasture. After 3 weeks of being fed fresh grass indoor, they were taken out to extensively managed pasture for 9 weeks. Cows were allowed to graze large areas (from 1 to 3.5 ha), and 2 GF equipped with solar panels were accessible near the water trough. As lower frequency of animal visits to the GF at pasture than indoor was expected, our aim was to determine the minimum number of consecutive CH₄ spot measurements (CSM) to achieve a good repeatability of CH₄ data. As expected, the average number of visits per animal and per day (d) was 2.6 ± 0.42 vs 0.7 ± 0.24 during indoor vs grazing periods. Five to 20 CSM were randomly chosen within the set of available data per animal per period (indoor vs outdoor) and the draws were repeated 10 times. The analysis was repeated 5 times to evaluate the consistency of the results across draws. Results showed that a minimum of 15 CSM acquired in 12 and 29 d was necessary to achieve a similar repeatability of 0.53 and 0.50 indoor vs at pasture, respectively, with a low variability across repetitions and no effect of the interval between first and last CSM. If performances of GF measurement indoor or in small plots of intensive pasture are documented, it is the first time at our knowledge that their performances were studied under extensive grazing conditions on natural grasslands in Europe.

Session 34

Poster 16

Quebracho condensed tannins fed to dairy goats: effect on milk fatty acids and their use for CH₄ prediction

*M. Battelli*¹, *F. Scicutella*², *G. M. Crovetto*¹, *A. Buccioni*², *L. Rapetti*¹

¹ University of Milan, Department of Agricultural and Environmental Sciences, via Celoria 2, 20133 Milan, Italy, ² University of Florence, Dipartimento di Biotecnologie Agrarie sez. Scienze Animali, via delle Cascine 23, 50144 Florence, Italy

The aims of this study were: I) to test the effect of different levels of dietary inclusion (0, 2, 4, 6%) of condensed tannins (CT) extract from quebracho (QE, 71% CT) on goat milk fatty acids (FA), II) develop prediction equations for CH₄ emission of goats using milk FA. A repeated 4×4 Latin square design was applied using 8 goats housed in respiration chambers where CH₄ emission was measured. The diets were composed by a dry basal ration plus a cereal meal supplement containing the different levels of QE. Milk was analysed for FA by gas chromatography. The effect of QE on FA composition was statistically tested with a mixed procedure, considering as fixed effects the experimental square, period, and treatment, with the animal selected as random effect. Multivariate analysis was performed using the stepwise procedure. Only variables with P<0.1 entered the model, and variables with P<0.05 were retained in the final model. The inclusion of QE increased polyunsaturated FA and the ratio cis-9 14:1/(14:0 + cis-9 14:1), considered the best proxy of the desaturation activity of mammary Stearoyl Co-A desaturase enzyme. Multivariate analysis resulted in equations: CH₄ (g/kg DMI) = $37.7 (\pm 2.97) - 2.87 (\pm 1.15) \times C6:0 - 129 (\pm 19.3) \times trans-6,8\ 18:1 + 40.6 (\pm 10.1) \times trans-12\ 18:1 + 11.9 (\pm 4.26) \times cis-11\ 18:1 - 7.76 (\pm 1.96) \times cis-9, cis-12, cis-15\ 18:3 - 85.4 (\pm 27.0) \times cis-5, cis-8, cis-11, cis-14, cis-17\ 20:5$ (adjR² = 0.88), and CH₄ (g/kg FPCM) = $19.3 (\pm 2.38) - 5.21 (\pm 1.21) \times trans-11\ 18:1 + 19.3 (\pm 6.47) \times cis-9\ 10:1 - 9.54 (\pm 3.76) \times cis-11\ 18:1$ (adjR² = 0.83). Milk FA showed a good potential to predict CH₄ emissions in goats.

Dietary incorporation of Zinc-Beta glucan improves immune status, gut microbial composition, and mitigates gas emissions in weaning pigs

S. T. Wahid^{1,2}, S. Cho^{1,2}, M. H. Oh², K. Han², D. K. Kang^{1,2}, I. H. Kim^{1,2}

¹ Dankook University, Department of Animal Biotechnology, 119 Dandae-ro, Dongnam-gu, 31116 Cheonan-si, South Korea, ² Smart Animal-Bio Institute (SABI), 119 Dandae-ro, Dongnam-gu, 31116 Cheonan-si, South Korea

Zinc oxide (ZnO) is currently used as a dietary supplement to support gut homeostasis during the standard 'abrupt' weaning practices in commercial pig production. Besides, glucans are used as broad-spectrum immunopotentiators to improve gastrointestinal (GI) health milieu by increasing mucosal barrier functions and contributing to increased animal growth. However, a mechanism through which glucan supplementation of pig food formula improves pig growth performance is unknown. Thus, this study aimed to explore the potential effects of dietary administration of zinc-beta glucan (ZB) on productivity, nutrient digestibility, gas emissions, blood profile, and microbiome analysis in weaning pigs. A total of 160 weaned piglets (6.38 ± 0.36 kg) were randomly assigned to four treatment groups for 6 weeks. The test treatments were: TRT1, basal diet (control); TRT2, basal diet + 0.25% antibiotic; TRT3, basal diet + 0.05% ZB; TRT4, basal diet + 0.1% ZB. Feeding weaning pigs with 0.1% ZB reduced NH₃ emissions and increased lymphocyte levels in the blood. The addition of ZB improved ($P < 0.05$) alpha and beta diversity in weaning. Furthermore, taxonomic distribution analysis showed highly abundant phyla Firmicutes and Bacteroidetes and reduced ($P < 0.05$) pathogenic bacteria in ZB group pigs. The findings suggest that the inclusion of 0.1% ZB would be beneficial to enhance the immune status and reduce the gas emissions in pigs by altering their gut microbial composition. This study provides valuable insights into ZB supplementation as a novel strategy to improve gut health and performance in pigs through dietary modification.

Enterococcus gallinarum Reduce Methane Production in Rumen Fermentation In Vitro

M. A. Park¹, D. J. Lim¹, S. Park¹, S. Son¹, S. Choe¹, D. H. Kim^{1,2}, Y. Kim¹

¹ Center for Industrialization of Agricultural and Livestock Microorganisms, Department of Research and Development, 241 Cheomdangwahagro, 56212 Jeongeup-si, South Korea, ² Jeonbuk National University, Department of Bioactive Material Sciences, 567 Baekje-daero, 54896 Jeonju-si, South Korea

CH₄ is a major end product of anaerobic fermentation in the rumen and a greenhouse gas and reduction of CH₄ emissions is desirable. This study was conducted to isolate and identify Enterococcus strains and to determine their reduction of CH₄ emissions activities. Enterococcus strains were isolated from rumen fluid samples from Korean Holstein cow. Enterococcus strains were identified as Enterococcus gallinarum using 16S rRNA gene sequencing and the NCBI BLASTn program. The generated CH₄ concentration was significantly lower in the Enterococcus gallinarum treatment groups after 24 h of incubation in rumen fermentation in vitro ($P < 0.01$). Ruminant contents were obtained from cannulated Holstein cow with body weight of 600 ± 47 kg that was fed twice a day with feed concentrate and rice straw at a 2:8 ratio. The inoculant was prepared by mixing the rumen fluid with a McDougall's buffer medium (pH 6.9) in a 1:2 rumen fluid:buffer ratio. Enterococcus gallinarum strains (1%) was then anaerobically inoculated into serum bottles and incubated in a shaking incubator at 39°C with horizontal shaking at 100 rpm. The in vitro fermentation parameters were monitored for 24 h. Gas samples were analyzed for CH₄ using gas chromatography with TCD-Methanizer-FID. The one-way analysis of variance (ANOVA) was used to analyze statistical differences among multiple groups using Tukey's honestly significant difference (HSD) test as the post-hoc test. These findings indicate that Enterococcus gallinarum has potential as a direct-fed microbial additive for decreasing CH₄ production.

Insights into Effects of Combined Capric and Lauric Acid on Rumen Microbial Composition

M. Vadroňová^{1,2}, A. Šťoviček¹, K. Jochová^{1,2}, A. Výborná², Y. Tyrolová², D. Tichá^{1,2}, M. Joch^{1,2}

¹ Czech University of Life Sciences, Department of Microbiology, Nutrition and Dietetics., Kamýčká 129, 16500 Prague, Czech Republic, ² Institute of Animal Science, Department of Nutrition and Feeding of Farm Animals, Přátelství 815, 10400 Prague, Czech Republic

Previously, the combination of low doses of capric acid (C10) and lauric acid (C12) showed the potential to decrease methane (CH₄) emissions from cattle, but also negatively affected nitrogen utilization in the rumen. However, its mode of action on rumen microbiota is not clear. Therefore, the objective of this study was to investigate the combined effects of C10+C12 on rumen microorganisms. Briefly, eight Holstein cows were randomly assigned into two groups in a cross-over design and were fed two diets based on silage with the addition of either 100 g of stearic acid per cow/d (control), or 50 g of C10 combined with 50 g of C12 per cow/d (C10+C12). The composition of microbiota in the rumen fluid was assessed using NGS. The data from NGS was explored through downstream analysis in R and Python, including statistical analysis using Wilcoxon signed-rank test. Alpha diversity indices and the ASV counts were not affected ($P>0.05$) by C10+C12. The relative abundance (RA) of Archaea was not affected ($P>0.05$) as well, which suggests that decrease in methanogenesis could be caused by some other mechanism than the direct effect on RA of Archaea. The most significant effect of C10+C12 was on the RA of Clostridia, which increased ($P<0.05$), and RA of Prevotella, which decreased ($P<0.05$). Prevotella are controversial and diverse microorganisms, in some studies connected with lower CH₄ emissions, and in some research associated with high CH₄ yield. The increased representatives of Clostridia may have increased ammonia concentrations because some members of this class are hyper-ammonia producing bacteria.

Poster 20

Enhancing Ruminant Fermentation Efficiency: Mitigating Methane Emissions through Persistent Peroxide Addition

A. Bartle¹, C. Thorn¹, P. Abberton¹, S. Mills¹, S. O'Connor¹, M. McDonagh¹, V. O'Flaherty¹

¹ Microbial Ecology Laboratory, Microbiology, School of Biological and Chemical Sciences and Ryan Institute, University of Galway, University Road, Galway, H91 TK33 Galway, Ireland

Agricultural methane accounts for approximately 20% of all greenhouse gas emissions. Peroxide compounds have been demonstrated to effectively reduce methane emissions from ruminants. This study explored the effects of persistent vs pulse dosed Hydrogen Peroxide (H₂O₂) and Calcium Peroxide (CaO₂) to reduce CH₄ production and increase animal performance in an in vitro rumen model. Batch rumen incubations in 1-L Schott bottles were prepared with rumen fluid and anaerobic buffer. Batch incubations were continuously fed over a 48-hour duration with a liquid substrate. The effect of persistent peroxide compound addition over time was compared to a pulse dose (once per day), whilst maintaining the same total peroxide concentration over the 48-hours. Rumen fermentation dynamics were monitored for biogas production, methane concentration, oxidation-reduction potential (ORP), volatile fatty acids (VFA's), chemical oxygen demand (COD) and microbial consortium. Methanogenic archaea function best in an ORP environment of $-300 > x < -600$ mV. Persistent peroxide addition had longer lasting elevated ORP levels and enhanced inhibition of methanogenic archaea for longer periods compared to the one-time pulse treatment. When adding small amounts of 3% H₂O₂ frequently throughout the first 12 hours of 48-hour experiments, 58% reductions were seen in treated vs control groups along with a higher VFA accumulation which may be due to hydrogen being driven towards VFAs and not CH₄. Chemical Oxygen Demand (COD) levels were similar in treated vs control suggesting digestibility was unaffected. Overall, H₂O₂ and CaO₂ showed promise in reducing methane and altering fermentation in an in vitro model.

Performance evaluation and enteric methane emission in bovines treated with natural Fator P additive

L. Fernandes¹, L. Ferreira¹, W. Araújo¹, A. D'Aurea¹, G. Moura², V. Fonseca², A. Maia²

¹ Premix Company, Research, Development and Innovation, Rua Milton José Robusti, 75, 14021-613 Ribeirão Preto, Brazil, ² São Paulo State University, Laboratory of Animal Biometeorology, Prof. Paulo Donato Castellane, 14.884-900 Jaboticabal, Brazil

Zootechnical additives in bovines diet modulate the fermentation ruminal and is essential to increase the efficiency of productive and sustainable. The use of natural additives, require research that validates the effectiveness in productivity and reduction of enteric methane emissions. The Fator P is natural additive, compound by symbiotic and fatty essential acids, as a substitute of tradition additives. The aim was value the methane enteric emission of animals treated with and without the Fator P, in gases collected through respirometric masks and analyzed by chromatography gas. Were used 24 animals of Nelore breed, ages between 18 and 24 months, average weight of 500kg, conditioned for the experimental routine. After adaptation, the animals received 2,5% of corporal weight in dry matter (DM) in diet compound of 50% of concentrated and 50% of roughage. Two groups were divided (group control and Fator P) based on methane gas (CH₄) evaluated in the pre-initial phase. The results, expressed in grams (g) of CH₄ per kilogram (kg) of DM ingested, of difference between control group (15,271g CH₄ / kg DM) and Fator P (13,286g CH₄ / kg DM) showed a reduced in 1,985g CH₄ / kg DM ingested (p value = 0,0349*). In carbonic gas equivalent (CO₂ eq), the difference can be up to 45,7g / kg DM ingested. Considering the average dairy gain (ADG) of 1,318kg and 1,171kg respectively, the Fator P group and control, the difference of CO₂ eq / kg of ADG was to 851,5g less for Fator P group, showing that this additive improves the productive and sustainable efficiency of livestock farming.

Utilizing a Feed Additive to Mitigate Methane Emissions from Dairy Cows: On-Farm Trial Employing Methane Laser Detector

E. Senatore^{1,2}, G. Foggi¹, A. Silvi¹, M. Schiera¹, G. Mattera¹, A. Mantino^{1,2}, M. Mele^{1,2}

¹ University Of Pisa, Department of Agriculture, Food and Environment, Via Del Borghetto, 80, 56124 Pisa, Italy, ² University of Pisa, Centre of Agro-environmental research "Enrico Avanzi", Via Vecchia di Marina, 6, 56122 San Piero a Grado (PI), Italy

Novel strategies to modulate methane emissions from ruminants, such as ruminal manipulation with feed additives, are crucial for reducing environmental impact of livestock. At the same time, adopting smart technologies for methane measurement allows to evaluate the on-farm efficacy of feed additives. The current study employed the Laser Methane Detector (LMD) to assess the effects of a feed additive composed of tannins and essential oils. Twelve Holstein cows were randomly allotted to control diet (CON) or control diet with feed additive (FAD), in order to obtain 10 mid-lactation cows for group, balanced according to milk yield (20.3±3.2; 21.4±3.2 L), weight (693±68; 689±48 kg), days in milk (145±61; 145±55), and parity (2.0±1.1; 2.0±0.9). Additive administration was top dressed and lasted 10 weeks. Individual methane emission was measured using LMD in week 0 and from weeks 6 to 10, six times per week for five minutes each. Methane data were analyzed with a linear mixed model incorporating treatment, period, and animal as random effect. Generally, methane emissions varied across weeks but remained consistent between treatments. At week 10, no significant differences were observed, 403.1±11.8 and 412.8±13.7 g/d, for CON and FAD respectively. Methane emission per liter of milk also showed no variation, 24.96±1.1 and 26.25±1.7 g/L, for CON and FAD. Further analysis of daily methane emission trends is on-going to explore the impact of supplementation on emissions patterns.

In vitro and in vivo assessment of a blend of chestnut and quebracho tannins on rumen fermentation, methane production and digestibility in ruminants

E. Ramos-Morales¹, I. Rivelli¹, E. Soussan², M. García², S. Danesh², R. Rauch², P. Lund³, D. Yanez-Ruiz¹

¹ CSIC, EEZ, Profesor Albareda, 1, 18008 Granada, Spain, ² Nestlé Research, Rte du Jorat 57, CH-1000 Lausanne, Switzerland, ³ Aarhus University, Blichers Alle 20, DK-8830 Tjele, Denmark

The objective of this work was to assess in vitro and in vivo the potential of a blend of chestnut and quebracho tannins (CQT) to modify rumen fermentation, methane (CH₄) production and total tract apparent digestibility. First, a 24-h in vitro batch culture experiment was conducted using rumen fluid from 4 cows to test 4 levels of inclusion of CQT (1, 1.5, 2 and 4 % of diet) to evaluate effects on production of gas, volatile fatty acids (VFA) and CH₄. Second, an in vivo trial was conducted to evaluate the effect on CH₄ production and digestibility using 32 adult sheep that were randomly allocated to one of the following experimental groups (n=8): control and CQT added at 0.225, 0.450 and 0.675 % of diet DM. Animals were adapted to the diets for 14 days, then the production of CH₄ was determined using open-circuit respirometry chambers during 3 consecutive days and total tract digestibility estimated using Manganese as internal marker in feed and faeces. Inclusion of CQT significantly (P<0.001) reduced the production of CH₄ in vitro (6.95, 6.12, 6.02, 5.69 and 5.27 ml CH₄/g DM incubated, respectively, for control and the four levels of CQT) without affecting (P>0.05) total gas production or total VFA concentration. In vivo, the inclusion of the blend did not modify DM intake, total tract digestibility, or CH₄ emissions. To clarify the inconsistency between in vitro and in vivo results, the effect of inclusion level, basal diets characteristics and treatment periods merits further investigation.

Can almond hulls reduce in vitro ruminal methane production?

T. De Evan¹, A. Recalde¹, C. Fernández², R. Jiménez¹, S. Calero¹, M. D. Carro¹

¹ Universidad Politécnica de Madrid, Departamento de Producción Agraria, ETSIAAB, Ciudad Universitaria, 28040 Madrid, Spain, ² Instituto de Ciencia y Tecnología Animal, Universidad Politécnica de Valencia, 46022 Valencia, Spain

Almond hulls (AH) are the main by-product of almond production and are frequently used in dairy ruminant feeding, but information on its effects on enteric CH₄ production is controversial. This study aimed to assess the in vitro ruminal fermentation and CH₄ production of diets for dairy ruminants including increasing amounts of AH. The AH sample included in the diets contained (as dry matter (DM) basis) 7.70, 7.37, 34.7 and 12.1% of ash, crude protein (CP), neutral detergent fiber (NDF), and total sugars, respectively. Four experimental diets having similar CP (16.6%) and NDF (37.0%) content (DM basis) were formulated: a control diet without AH, and 3 diets including 8, 16 and 24 of AH (fresh matter basis). All diets contained 40% alfalfa hay, and the AH partially substituted corn grains, wheat bran, and sugar beet pulp in the control diet. Diets were fermented in vitro with buffered sheep ruminal fluid for 24 h to measure fermentation parameters (pH, volatile fatty acids (VFA), NH₃-N) and CH₄ production. Increasing the AH level reduced linearly (P ≤ 0.026) the production of gas, total VFA and CH₄, the concentrations of NH₃-N and the molar proportion of butyrate, but increased final pH (P < 0.001; linear). These results indicate a reduction of diet fermentability by including AH. In fact, the ratio CH₄ / total VFA was similar for all diets (P = 0.642 and 0.376 for linear and quadratic effects, respectively), confirming that the observed reduction in CH₄ production was due to decreased ruminal fermentability of the diets containing AH. The results indicate that the used AH did not contain antimethanogenic compounds.

Anti-methanogenic feed additives in pasture-based dairy systems

*H. Costigan¹, B. Lahart¹, L. Shalloo¹, C. Dwan¹, V. O'Flaherty²**¹ Teagasc, Animal and Grassland Research and Innovation Centre, Moorepark, Fermoy, P61 P302 Co. Cork, Ireland, ² University of Galway, Department of Microbiology, College of Science and Engineering and Ryan Institute, University Road, H91 TK33 Co. Galway, Ireland*

Additives been widely proven to reduce enteric methane (CH₄) by ~ 30% when mixed throughout a total mixed ration fed to cows in indoor production systems. However, there has been limited research to-date on feed additives in pasture-based systems. In order for additives to have practical application in grazing systems they must be capable of being fed through in-parlour feeders so they can be supplemented twice daily during milking without increasing workload on farms. At present, the most effective feed additives are sensitive to heat and pressure and, as such, unsuited to their incorporation within concentrate pellets during the pelleting process. However, a novel calcium peroxide (CaO₂) based feed additive, which is reported to effectively reduce enteric methane when fed twice daily to beef steers on a grass silage based diet, is capable of withstanding pelleting without detriment to additive efficacy. A study was undertaken to evaluate the methane mitigation potential of CaO₂ when fed to grazing dairy cows in late lactation. Treatment cows were supplemented with CaO₂ twice daily at morning and evening milking, while control cows received no additive supplementation. Methane was measured using Green-Feed units, and milk production, body weight and body condition score were monitored to determine the effect of additive supplementation on productivity. There was no effect of CaO₂ supplementation on CH₄ output, however, there was an interaction between treatment and parity such that the additive was more effective in parity one and parity two animals compared to those in parity three.

Session 34

Poster 26

The Effect of Ensiling Alfalfa with Acacia (*Robinia pseudoacacia*) Tree Leaves and Sugar Beet Molasses on Silage Fermentation Quality, In-vitro Ruminal Fermentation and Methane Production*M. U. Hassan¹, M. Gül¹**¹ Atatürk University, Department of Animal Nutrition and Nutritional Diseases, Üniversite, Atatürk Üniversitesi Kampüsü, Yakutiye, 25030 Erzurum, Turkey*

Agroforestry plant leaves notably woody perennials, are widely used to feed animals in many regions of the world, particularly in the tropics. This study also demonstrated a socio-economic and climate viable impact of ensiling alfalfa with agroforestry leaves. Acacia is a fast-growing leguminous tree that produces a huge mass of leaves rich in protein (30.43%) and condensed tannins (12.5%), as a waste which can be utilized as a ruminant feed source. In fact, alfalfa is difficult to ensile because it contains a low level of water-soluble carbohydrates, high buffering capacity, prone to extensive proteolysis and nutrient losses. In this study, supplementation of alfalfa silage (AAS) with acacia leaves and molasses significantly decreased NH₃-N production and butyric acid content while increasing the acetic acid and dry matter contents of the silage. In the Hohenheim technique, 5% molasses (M5) increased the net gas production, improved the in vitro dry matter degradability and true NDF degradability; meanwhile, reduced the organic matter degradability during daisy incubation of alfalfa silage compared to the control. Moreover, the addition of acacia leaves with three different levels significantly lowered CH₄ production, total VFAs, and ruminal NH₃-N (an indicator for N excretion & environmental pollution) concentrations in a dose-dependent way. The results illustrated that lower level of acacia leaves (3%) in combination with molasses (5%) applied prior to ensiling alfalfa were more useful in reducing silage pH and ruminal NH₃-N ($p < 0.001$), improving the relative feed value and quality ($p < 0.001$), metabolizable and net energy lactation of AAS ($p < 0.001$) without any adverse effect on degradability parameters compared to control.

Temporal effects of botanicals on total gas and methane production in ruminal fermentation in vitro
*F. Ferrero*¹, *B. Tugnoli*², *V. Sáinz De La Maza-Escolà*², *R. Majer*², *F. Ghiaccio*¹, *A. Federiconi*¹, *A. Palmonari*¹, *A. Formigoni*¹, *A. Piva*^{1,2}, *E. Grilli*^{1,3}

¹ *Università di Bologna, Via tolara di Sopra, 40064 Ozzano dell'Emilia, Italy*; ² *Vetagro S.p.A., Via Porro 2, 42124 Reggio Emilia, Italy*; ³ *Vetagro Inc., East Monroe Street Suite, 60603 Chicago, United States*

The purpose of this study was to evaluate the temporal effect of botanical additives on gas production in the automated Gas Endeavour® in vitro system of ruminal fermentations. Three different natural identical compounds were selected: anethol (ANT), carvacrol (CAR), and thymol (THY) were tested in triplicate at 100 ppm and with 8 replicates at 250 ppm. A control group was included in both studies. Rumen fluid, obtained from non-lactating Holstein cows, was used as inoculum for a 24h in vitro fermentation. Measurements of total gas and methane production were taken every hour. Accumulated 24h data were analyzed using a two-way ANOVA and hourly data as a repeated measurement with multiple comparison as a post-hoc analysis. At 100 ppm CAR, THY and ANT tended to reduce methane production ($P < 0.15$). At 250 ppm, total gas was reduced starting at h 5 (Treatment x time, $P < 0.05$) with -66,63%, -63,88%, and -70,69% reduction (respectively for ANT, THY, and CAR) at h 24 compared to control. Similarly, methane reduction started at h 3 (Treatment x time, $P < 0.05$) with -50,25%, -32,03%, and -71,43% reduction (respectively for ANT, THY, and CAR) at h 24 compared to control. We conclude that, at 250 ppm concentration, ANT, THY and CAR were able to significantly reduce total gas and methane production within the first hours of in vitro fermentation, in particular carvacrol showed the greatest effect.

High throughput in vitro screening of natural essential oils, rumen buffers, and plant extracts for enteric methane mitigation in cattle

I. Hodge^{1,2}, *P. Quille*², *M. Ayyachamy*¹, *S. O'Connell*¹

¹ *Marigot Ltd., Shanbally, Ringaskiddy, P43 E409 Cork, Ireland*; ² *Munster Technological University, South Campus, Clash, Tralee, V92 CX88 Kerry, Ireland*

Ruminant dietary additives were investigated for enteric methane (CH₄) mitigation and their effects on rumen fermentation characteristics post in vitro supplementation. Essential oils, natural compounds, and rumen buffers were compared at optimum dosages with commercial products via high-throughput screening as a follow-on study from a meta-analysis review of potential feed additives that employ diverse enteric methane-mitigating approaches. Investigated feed additives included *Allium sativum* extracts garlic oil (GO), and garlic powder (GP), *Asparagopsis* (ASP), calcareous marine algae (CMA), calcareous marine algae fortified with magnesium oxide (CMA.MgO), essential oils (EO), and *Yucca schidigera* plant extract (Yucca). Screening of potential additives at optimum dosage revealed promising effects on rumen parameters, total gas, CH₄ levels, and volatile fatty acid (VFA) profiles. Rapid high-throughput screening of feed additives reveals the greatest potential for rumen buffers and their combination with essential oil at their lowest optimum dosages. There were significant decreases among treatments CH₄ levels when compared to an average of controls with potential for on-farm mitigation with the CMA.MgO rumen buffer, and *Allium sativum* derivatives GO and GP in combination with the CMA rumen buffer. Instances of increased total VFA concentrations with Yucca, and rumen buffers CMA and CMA.MgO reveal their potential to increase ruminants' primary energy source while also mitigating the energy loss linked to enteric CH₄ production. Ruminant feed additives CMA.MgO, GO, and Yucca display potential for improved rumen productivity based on VFA profiles, and greater CH₄ mitigation when compared to a commercially available blend of EOs designed for mitigating enteric CH₄, following 24 hours of in vitro rumen simulation. Maintenance of rumen fermentation parameters while inducing mitigation of harmful greenhouse gas CH₄ reveals promise for calcareous marine algae sourced rumen buffers as CH₄ mitigators.

Effect of using essential oils blend on performance in dairy cows

M. Agovino¹, C. Moran¹, C. Necula¹, H. Warren¹, K. Spengler²

¹ Alltech Biotechnology Centre, Summerhill Road, Co. Meath Dunboyne, Ireland, ² Agolin SA, Rte de la Picarde 20, 1145 Bière, Switzerland

The study investigated the effects of supplementing lactating dairy cows with Agolin Ruminant®, an essential oil blend, on dairy cow performance. A total of 187 Holstein dairy cows were allocated to two dietary treatments based on parity, days in milk (DIM), and milk yield (MY). The control group (n=94; parity 2.14, DIM 121, MY 36.55kg) received basal total mixed ration (TMR), while the Agolin group (n=93; parity 2.16, DIM 120, MY 34.74kg) received basal TMR supplemented with Agolin Ruminant® at a dosage of 1g per cow per day. The trial lasted 12 weeks, including a 3-week adaptation period and a 9-week experimental phase (from July to October, 2023). Measurements included daily group milk yield and composition, as well as weekly manure sieving on a subset of animals from each group. Additionally, a subgroup of 14 cows per treatment group was selected for individual measurements of weekly milk yield and composition (fat, protein, lactose, urea, and somatic cell count), ensuring parity, DIM, and milk yield balance. Average MY was 33.63Kg in the control group vs 34.76Kg in the treated group (+1.13Kg, p<0.001). Average Fat Protein Corrected Milk (FPCM) was 33.6Kg in the control vs 34.41Kg in the treated group (+0.81Kg, p<0.01). Average fat yield was 1.33Kg in the control vs 1.37Kg in the treated group (p<0.001). The results in the subgroup analysis are as follows: +1.71Kg of milk in the treated group, p<0.1 (34.01Kg in the control vs 35.72Kg in the treated group). +2.79Kg of FPCM in the treated group, p<0.01 (33.86Kg control vs 36.65Kg treated). +6.8% fat% in the treated group, p<0.1 (3.98% in the control vs 4.25% in the treated group). Furthermore, improved manure scores suggested enhanced diet digestion in the treated group. The farm's emissions have been calculated using a comprehensive model, Alltech E-CO₂, which suggests that Agolin supplementation could decrease emissions intensity by 6% to 12% compared to the control scenario. This reduction is primarily attributed to an increase in FPCM. In conclusion, Agolin Ruminant® supplementation appears to be a promising strategy for simultaneously enhancing dairy production efficiency and mitigating methane emissions.

Culture and growing conditions has an impact on methane mitigation properties in red algae

M. Angellotti¹, M. Lindberg¹, S. J. Krizsan², R. Danielsson¹

¹ Swedish University of Agricultural Sciences, Applied Animal Science and Welfare, Alma allé 8, 75007 Uppsala, Sweden, ² Inland Norway University of Applied Sciences, Agricultural Sciences, Campus Blæstad, 2322 Hamar, Norway

The study, conducted in partnership with a Swedish algae cultivation company, aimed to assess the methane inhibiting potential of *Asparagopsis* spp. (AS) under various cultivation conditions. Six land-based algae cultures and two wild-harvested batches were tested in vitro using a common dairy cow diet composed of 60:40 silage:concentrate on DM. The algae, constituting 0.5% of dietary OM, were incubated with rumen fluid in serum bottles. All treatments, including a control diet (CON) and blank bottles, were conducted in triplicate and repeated in two runs. An automated in-vitro gas production system continuously recorded gas levels every 12 minutes throughout the incubation period of 48 hours. Gas samples were injected into a star 3400 CX series gas chromatograph (Varian Chromatography, USA), at five different time points; 2, 4, 8, 24 and 48 hours of incubation and were used in calculations to predict in vivo methane production. Statistical analysis, accounting for the random bottle effect and incorporating fixed effects for run and treatment, was used to assess significance. The predicted in vivo methane production from the 48-hour gas analysis of the CON was determined to be 48.1 (± 4.0) mL/g OM. Significant treatment effects (P<0.001) were observed in four of the cultured algae, reducing methane production by 21%, 23%, 25%, and 83% respectively. The other tested algae did not show any significant impact on methane production. This research contributes to enhance knowledge about red algae strategies for sustainable methane reduction in livestock by showing that different strategies of cultivation results in different methane inhibiting capacity.

Freshly cut grass-clover vs. grass-clover silage and grass-clover pulp silage for organic growing-finishing pigs
M. Eskildsen¹, E. Jørgensen¹, L. Stødkilde-Jørgensen¹

¹ AU Viborg, Department of Animal and Veterinary Sciences, Blichersalle 20, 8830 Tjele, Denmark

This study assessed the impact of feeding organic growing-finishing pigs with freshly cut grass-clover versus grass-clover silage and grass-clover pulp silage from 30-115 kg. The experiment also measured the impact of reducing the protein content in concentrates by 10%. The study involved 270 pigs, and production parameters, such as daily gain, feed consumption, feed efficiency, meat percentage, blood parameters, meat quality, and eating quality, were assessed. Design: The experiment was performed at the Organic Platform at AU-Viborg, with 270 DLY or LYD pigs of DanBred-origin. The rearing period from 30-115 kg lasted 13-14 weeks. Each pig received 200 Scandinavian Feed Units (FU) of concentrate and approximately 20 FU of roughage. Key results include: Pigs from 85-115 kg had a daily intake of 870 g/d of fresh grass-clover, corresponding to 5% of the daily SID lysine requirement and 13% of the daily CP requirement. Grass-clover silage resulted in a daily intake of 335 g from 85-115 kg., which corresponds to 1.15% of the daily SID lysine requirement and 4.7% of the daily CP requirement from 85-115 kg. No differences were observed in acidity, harshness, meat flavour, metallic taste, bitterness, juiciness, chew resistance, chewing time or pork tenderness between roughages or protein levels. Grass pulp silage can be utilized as well as normal grass-clover silage, and pigs willingly consume it. There is a large individual variation in the consumption of roughage between organic pigs. During summer, the SID lysine content in concentrate can be reduced by 10% from 7.0 g/FU to 6.3 g/FU with simultaneous provision of fresh grass without negatively affecting productivity.

Variation of zinc release from phytate by phytase is dependent on the level of dietary Zn supplementation in pig: a meta-analysis

J. Labarre^{1,2}, P. Schmidely², C. Loncke², M. P. Letourneau-Montminy¹

¹ Laval University, Animal Science, 2425 rue de l'Agriculture, G1V0A6 Québec, Canada, ² Université Paris-Saclay, INRAE, AgroParisTech, UMR MoSAR, 22 place de l'Agronomie, 91120 Palaiseau, France

Phytic phosphorus is known as an antinutritional factor impairing microminerals absorption in pig, such as zinc (Zn) leading to Zn output in the environment. Zinc homeostasis is maintained with the regulation of Zn absorption and endogenous intestinal excretion. Previous studies have shown the positive effect of phytase on Zn digestibility in low Zn diet. This study quantifies the interaction between dietary Zn level and exogenous phytase on apparent total tract digestibility (ATTD) of Zn, and plasma Zn concentration using a meta-analytic approach. A total of 30 studies conducted between 1994 and 2021 were included. The meta-analysis was conducted using a mixed effect model in R studio. The meta-design illustrated that increasing adaptation period to the diet decreased the ATTD of Zn ($P < 0.001$). Therefore, observations were weighted by duration of adaptation period to the diet. The study was limited to data under 250 mg/kg of Zn. Phytase has positive effect on ATTD of Zn ($P = 0.001$; $RMSE = 2.56$) but the interaction between phytase and study effect shown a large variability of the response ($P < 0.001$; CV (%): 167 % of mean slope). However, behind variability, a negative interaction between Zn and phytase ($P = 0.04$) exist. Inclusion of 500 FTU/kg of phytase in two diets containing 40 mg/kg or 120 mg/kg de Zn increased the ATTD of Zn of 15.6% and 5.5% respectively. The same interaction was found between dietary Zn and phytase on plasma Zn concentration ($P = 0.02$). This result reflect the well-known zinc homeostasis mechanisms that allow the pig to adapt its utilization based on the dietary Zn levels.

The combination of an alternative zinc source and low ABC-4 diets can replace the high levels of ZnO in nursery piglet diets

J. Riedmüller¹, J. E. G. Faccin², S. Durosoy³, Y. J. Manaig³, J. Zentek¹, J. M. Derouchey², J. T. Gebhardt², R. D. Goodband², J. C. Woodworth², M. D. Tokach²

¹ Freie Universität Berlin, , 14195 Berlin, Germany, ² Kansas State University, , 66506 Manhattan, United States, ³ Animine, , 74960 Annecy, France

High zinc levels in piglet diets promote growth and reduce post-weaning issues, yet the high ABC-4 value of Zn (21,863 meq/kg) can increase stomach pH and impair nutrient utilization. Recent formulations have reduced ABC-4 values (200 to 300 meq/kg) as an alternative to high ZnO diets, without impairing piglet performance. This study evaluated a novel zinc source, HiZox® (HZ), in low ABC-4 diets. Using 240 male piglets (DNA 200 × 400, BW 5.90 ± 0.05 kg) in a two-phase feeding regimen, the treatments were: Negative Control (NC, 150 ppm Zn HZ), Positive Control (PC, 3,000 ppm ZnO (phase 1) and 2,000 ppm ZnO (phase 2), Low HiZox with 500 ppm (phase 1) and 300 ppm (phase 2) Zn HZ, and High HiZox with 800 ppm (phase 1) and 500 ppm (phase 2) Zn HZ. Growth performance and fecal scores were assessed using GLIMMIX procedure of SAS, revealing that, in phase 1, High HiZox improved ADG and BW at d10. Moreover, increasing HZ levels quadratically improved ADG, ADFI, and F/G. During phase 2, although no significant differences were observed, there was a tendency for a quadratic increase in ADFI with increasing HZ levels. Overall, there was a tendency for higher ADG with High HiZox, while increased HZ levels quadratically improved ADG and ADFI. There were no significant differences on fecal DM and consistency among treatments. In conclusion, the use of HZ as an alternative to high ZnO maintains comparable performance and fecal consistency while enhancing growth performance, making it an effective replacement for high dietary ZnO in nursery piglet diets when combined with the lower ABC-4 concept.

Nursery pigs kept in poor sanitary housing conditions benefit from diets with low buffer capacity

T. Hulshof¹, H. Van Hees¹, L. Fabà¹

¹ Trouw Nutrition, R&D, Veerstraat 38, 5831 JN Boxmeer, Netherlands

Protein digestion and pathogen survival in digesta are controlled by a low stomach pH which is hypothesized to reduce post-weaning diarrhea. This is especially important in nursery pigs because they lack the capacity to secrete sufficient hydrochloric acid in their stomach and even more important in poor sanitary housing conditions (PSC). We aimed to determine the dose-response relation between dietary buffer capacity (BC) and growth performance of nursery pigs kept in PSC. A total of 4 treatments were included: (1) BC290, (2) BC370, (3) BC450, and (4) BC530 mEq/kg. Wheat-barley based diets were fed during d0 (weaning) to d14 followed by one common diet (BC of 550 mEq/kg) until d38. Differences in BC were established by changing calcium sources and organic acids. Each diet was offered to 20 pens with 3 pigs (23 ± 1 days old and 6.8 ± 1.3 kg at weaning) per pen. The PSC were established by lowering environmental temperature by 2°C relative to the standard curve and spreading ~1.5 kg manure/pen from a previous batch of nursery pigs on d0, 4, 7 and 12. Daily body weight gain (DG) and feed intake (FI) were determined on d14 and 38 and feed efficiency (DG:FI) was calculated. Data were analyzed using mixed models using polynomial orthogonal contrasts to examine linear and quadratic responses. Results showed a negative linear effect for FI (P_{linear}=0.05) and DG (P_{linear}=0.09) d0-14 without affecting feed efficiency (P_{linear}>0.05). The effect was caused by a greater DG and FI for BC290 compared to the other diets (183 vs 160 g/d and 206 vs 184 g/d, respectively). There was a carry-over effect into the second phase resulting in a 3% higher BW (P_{model}=0.16) on d38 for pigs fed BC290. Thus, pigs kept in PSC appear to benefit from a diet with low BC.

Effect of zinc on phosphorus and calcium digestibility in post-weaning pigs: a meta-analysis

J. Labarre^{1,2}, *P. Schmidely*², *C. Loncke*², *M. P. Letourneau-Montminy*¹

¹ Laval University, Animal Science, 2425 rue de l'Agriculture, G1V0A6 Québec, Canada, ² Université Paris-Saclay, INRAE, AgroParisTech, UMR MoSAR, 22 place de l'Agronomie, 91120 Palaiseau, France

Phosphorus (P) is essential to support growth and bone mineralization but has to be supplied close to requirements to minimize P output in the environment. In pig, microbial phytase is commonly used to degrade phytic phosphorus (PP) but in-vitro data indicated that Zn may inhibit P release from PP while in-vivo data indicated pharmacological zinc (Zn) to decrease P apparent total tract digestibility (ATTD). The aim of this study was to quantify the effects of dietary Zn concentration on P and calcium (Ca) ATTD in post-weaning. From a systematic literature search (March – July 2023), a meta-analysis was carried out on 16 publications reporting 47 treatments that have measured P and Ca ATTD. The meta-analysis was conducted using a mixed effect of the experiment in R. The X variables tested were plant and microbial phytase, dietary Zn, and PP. Plant phytase had no effect. Increasing the dietary Zn decreased the P ATTD ($P < 0.001$; RMSE=0.28), the concentration of P in the plasma ($P = 0.01$; RMSE=3.46), and Ca ATTD ($P < 0.001$; RMSE=0.26). As expected, there is a positive effect of microbial phytase on P ATTD ($P < 0.001$) and Ca ATTD ($P < 0.001$), but not for plasma P. Also, interaction was found between Zn and phytase ($P = 0.001$). The current results showed that high Zn level reduced P and Ca ATTD with impacting the efficiency of phytase. For Ca ATTD, the reduced absorption with high Zn supply may be also due to competition for channels in the enterocytes of the small intestine. However, for P ATTD the mechanism remains unclear and need further research, but it is possible that Zn binds to phytic phosphorus and also prevents the action of intestinal phytase.

Effect of full matrix application of a novel phytase without or with a multi-enzyme complex containing xylanase, β -glucanase, amylase and protease on performance of piglets

*R. Lizardo*¹, *H. Quesada*¹, *A. Ghane*², *G. Nguyen*², *E. Vinyeta*², *D. Velayudhan*², *Y. Dersjant-Li*²

¹ IRTA, Monogastric Nutrition, Reus-El Morell road, Km 3.8, E-43120 Constantí, Spain, ² IFF, Danisco Animal Nutrition, Willem Einthovenstraat 4, 2342BG Oegstgeest, Netherlands

An experiment was conducted to evaluate the application of energy and nutrient matrix of a novel consensus phytase variant (PhyG) in combination with a multi-enzyme complex (MEC) on performance of piglets after weaning. Growth performance (ADG), feed intake (ADFI), feed efficiency (FCR) and cost savings were used as response criteria. In total, 234 piglets with 8.20 kg body weight (BW) were used. They were distributed into 13 complete blocks of sex and BW, and allocated in 78 pens for a 34-d trial. Intra-block pigs were randomly distributed to 3 treatments corresponding to control diets (0.40 and 0.33% digestible P in prestarter and starter phases, respectively), a PhyG treatment with diets supplemented with 1500 FTU/kg of PhyG and reduction of dig P, Ca, dig AA and net energy based on the phytase contribution, or a third PhyG+MEC treatment supplemented with the same PhyG dose and MEC (providing 4000 U/kg Xylanase, 200 U/kg β -glucanase, 100 U/kg α -Amylase, and 2000 U/kg Protease), with corresponding matrix value for both phytase and MEC. Diets were based on maize, soybean meal and rice by-products, and wheat middlings and soybean hulls were used to adjust major nutrient content of feed formulas. Production cost savings were determined applying EU costs of raw materials. Overall, an ADFI, ADG and FCR of 703 g/d, 502 g/d and 1.402 were observed, respectively. The enzyme treatments with matrix application showed similar feed intake, growth performance or feed efficiency during the prestarter and starter phases ($P > 0.1$). A reduction of 4.0 and 6.6% reduction on feed cost per piglet raised, or 5.7 and 7.2% reduction per kg of BW produced was determined due to PhyG or PhyG+MEC supplementation, respectively. It can be concluded that application of the nutrient full matrix concept of a novel PhyG phytase and MEC allows to maintain performance and resulted in cost savings on postweaning piglet production.

Kinetics of bone mineralization and allometric changes in response to calcium and phosphorus deficiency in broiler chickens

F. Piterson¹, A. R. Alfonso Avila², M. D. P. Reis³, A. Narcy⁴, M. P. Létourneau-Montminy¹

¹ Département des sciences animales, Université Laval, 2325 Rue de l'Université, G1V 0A6 Québec, Canada, ² Centre de recherche en sciences animales de Deschambault, 120A chemin du Roy, G0A 1S0 Québec, Canada,

³ Trouw Nutrition R&D, El Viso de San Juan, 45215 Toledo, Spain, ⁴ INRAE, Université de Tours, BOA, 37380 Nouzilly, France

Data on growth performance and bone mineralization response to different dietary supplies of calcium (Ca) and phosphorus (P) in broilers is important for developing recommendations that avoid P overfeeding to minimize P excretion. The aim of this study was to evaluate the effect of different levels of Ca and non-phytate P (nPP) on the growth performance and kinetics of soft tissues and bone deposition into the skeleton of broilers. A total of 360 Ross 308 broilers were randomly divided into each of 10 replicate cages of the three dietary treatments. During each experimental phase (0 to 9d, 10 to 21d and 22 to 35d), broilers were fed a control diet (C), a moderate (M) or a low Ca and nPP diet (L), formulated to contain, respectively, 100%, 85% and 75% of the estimated of Ca and of nPP requirements to maximize bone mineralization coming from a recent mechanistic model. Bone mineral content (BMC) was measured in one bird per cage (always the same) anesthetized at the end of each feeding phase by dual-energy X-ray absorptiometry. Allometric regression analysis was performed to predict BMC in relation to BW. Growth performance and lean mass in the L vs H diet was not different at d-9, tended to be lower at d-21 ($P < 0.09$) and were lower at d-35 ($P < 0.01$). Birds fed both deficient diets (L and M) had reduced BMC (respectively, -20% and -14%; $P=0.012$) vs birds fed H diet at d-35. Daily BMC deposition did not differ among L and M diets, while it tended to be higher for H diet (9 to 21d, $P=0.098$; 22 to 35d, $P=0.079$). Similarly, the slope of the allometric regression of the whole-body BMC in the H diet was 16 and 18% higher than in L and M diets ($P < 0.01$), respectively. These findings suggest that modifying dietary Ca and nPP while keeping similar ratio affects growth performance and bone mineralization in the same extent which will important to consider for requirements assessment.

Session 35

Theatre 7

Assessment of new phytase products through an in-vitro digestion model alongside a broiler chicken trial

M. Mireaux¹, F. Richard¹, F. Czernikar², F. Robert¹

¹ DELTAVIT - CCPA GROUP, R&D, ZA du Bois de Teillay, 35150 Janzé, France, ² Artémis Laboratoire, R&D, ZA du Bois de Teillay, 35150 Janzé, France

Phytases are widely used enzymes in animal nutrition for their ability to break down phytic acid, the main storage form of phosphorus (P) in plants, making it available to monogastric animals. A new generation of phytase products is offered by suppliers, necessitating comparative evaluation against older or competitor products for practical application. This study aimed at assessing five phytases (4 new products) in a broiler trial and through an in-vitro model. Ten-day old Ross 308 male broiler chickens were randomly assigned to 3 control groups with increasing available P (aP) levels: 0.14, 0.29 and 0.43 (NC, NC+, PC) and 5 groups (A to E) with different phytases added to the NC, each tested at 1.5 times the recommended dose. On day 28, 12 birds per group were euthanized for bone analysis. Additionally, phytases were evaluated using a three-step in-vitro digestion simulation model at 5 doses (0, 250, 500, 750 and 1000 U/kg). Dose response curves were modeled using the equation $Y=a(1-be(-kx))$. Increasing aP level linearly increased bone ash and P content ($P < 0.001$). Group C showed significantly higher bone P content compared to NC ($P < 0.05$). Bone ash was significantly increased compared to NC in groups A, C and D ($P < 0.05$) but not significantly in group B nor E. Enzymes increased bone P content by 3.35 to 10.05 % and ash by 5.56 to 8.88 % compared to NC with a slightly different hierarchy between products. The in-vitro results showed good correlation ($R^2=0.67$) with in-vivo bone P content. The in-vitro model is a valuable initial assessment tool for new phytase products, necessitating additional in-vivo evaluation, particularly for extra-phosphoric effect on growth performance.

In vitro prediction of calcium and phosphorus availability in monogastric feed using marine sourced calcium and limestone

O. Demehin¹, T. Higgins¹, M. Bouwhuis¹, S. O'Connell²

¹ Celtic Sea mineral, Strand Farmhouse, Carrigaline, P43 NN62 Cork, Ireland, ² Shannon applied biotechnology centre, Munster technology university, Clash Road, V92 HD4V Tralee, Ireland

Phytate is the principal storage form of phosphorus (P) in feed material and has been shown to reduce mineral availability due to the chelating effect of its phosphate groups. Optimal utilization of nutrients and the reduction of interactions that reduce digestibility by monogastric livestock can provide significant improvements in production efficiency. The aim of this study was to predict calcium (Ca) and phytate P availability in vitro with different Ca sources. A series of digestion simulations were performed using different Ca sources and levels, different commercial phytases and varying inclusion rates with phytate as the only P source. In vitro results demonstrated that 78%, 5%, 9%, and 15% (w/w) phytate P was available in simulations with coarse limestone (D50 ;166µm), fine limestone (D50; 9.22µm), feed grade limestone (D50; 26.3 µm) and a marine mineral complex (MMC) rich in calcium (D50; 33.4 µm), respectively using technical grade phytase. Use of 2 different commercial phytases and varying inclusion rates (3 rates) affected available P ($P<0.05$). A 30% increase in available P was recorded in a diet simulation containing a blend of feed grade limestone (0.15%), MMC (0.4%), and monocalcium phosphate (MCP) (0.4%) compared to a control diet of feed grade limestone (0.55%) and MCP (0.4%) only. Both diets contained an equal phytate amount. Differences in the amount of precipitated Ca-phytate was visible. Overall, the in vitro data demonstrated an inverse relation between available Ca and P. The MMC Ca source reduced interactions between the nutrient sources allowing the phytase to catalyse the release of P more efficiently.

Impacts of Saccharomyces yeast postbiotics on intestinal response and growth of nursery pigs

S. W. Kim¹, M. E. Duarte¹

¹ North Carolina State University, 116 Polk Hall, Campus 7621, 27695 Raleigh, United States

The small intestine is the main site for the digestion of feeds and absorption of nutrients, but also responsible for immune protection from the external stressors. Upon weaning, feed intake can cause mucosal inflammation, and oxidative damages resulting in mucosal damages and repairing in the jejunum. This study aimed to determine the efficacy of postbiotics derived from Saccharomyces yeast on the intestinal health of newly weaned pigs. Thirty-two newly weaned pigs (16 barrows and 16 gilts) at 21 days of age (6.05 ± 0.24 kg body weight) were assigned into 2 dietary treatments based on a randomized complete block design, with initial body weight and sex serving as blocks. The dietary treatments were a control and a group supplemented with Saccharomyces yeast postbiotics (SYP, 175 g/ton feed). The pigs were fed for 35 days. At the end of each phase, the pigs and feed disappearance were individually weighed to determine growth performance parameters. Fecal score was recorded from day 3 of the experiment. After 35 days of feeding, the pigs were euthanized, and intestinal mucosa was collected from the jejunum to assess immune status and oxidative stress. Jejunal tissue was also collected to measure the expression of genes associated with intestinal barrier markers, cell proliferation and apoptosis. Data were analyzed using SAS 9.4. The SYP did not influence the growth performance of nursery pigs. However, SYP reduced ($P<0.05$) the fecal score from 4-7. The SYP did not affect the production of inflammatory cytokines and oxidative damage products whereas it tended to increase the gene expression of IFN- γ ($P=0.071$) and mTOR ($P=0.080$), decrease the gene expression of BAX1 ($P<0.05$), tended to decrease the gene expression of SGK1 ($P=0.066$), increased ($P<0.05$) cell proliferation in the crypts (Ki-67 positive cells), and tended to increase the villus height ($P=0.078$) and crypt depth ($P=0.052$) in the jejunum. Saccharomyces yeast postbiotics reduced diarrhea of newly weaned pigs and provided protection to the jejunal mucosa by promoting cell proliferation, and reducing the expression of genes associated with apoptosis.

Effect of hydrolyzed yeast from *Kluyveromyces fragilis* replacing high-dose zinc oxide on growth performance, diarrhea incidence and intestinal health of weaned piglets

C. Yin¹, M. Comi², W. Chen¹, V. Perricone³, W. Sun¹, Y. Pi¹, Y. Li¹, A. Agazzi³, X. Li¹, X. Jiang¹

¹ Key Laboratory of Feed Biotechnology of Ministry of Agriculture and Rural Affairs, Institute of Feed Research, Chinese Academy of Agriculture Sciences, Zhongguancun South Street 12, 100081 Beijing, China, ² Department of Human Science and Quality of Life Promotion, Università Telematica San Raffaele, Via di Val Cannuta 247, 00166 Rome, Italy, ³ Department of Veterinary Medicine and Animal Science (DIVAS), University of Milan, Via Dell'Università 6, 26900 Lodi, Italy

High-dose zinc oxide (ZnO) has been using as a substitute for in-feed antibiotics due to its positive effects on the development and intestinal health of weaned piglets, while it would cause serious environmental pollution and limitation of mineral absorption. Hydrolyzed yeast from *Kluyveromyces fragilis* (HK) is rich in a variety of nutrients without toxic and harmful compounds, which have received increasing attention due to their superior physiological properties. In our study, 2 experiments were conducted to investigate the effect of optimal dose of HK as a novel alternative to high-dose ZnO on growth performance, diarrhea incidence and intestinal health of weaned piglets. In experiment 1, one hundred weaned piglets were randomly allotted to 4 groups with 5 replicates in a 21-day experiment. Piglets were fed with basal diet (NC), NC + 2g/kg zinc oxide (PC), NC + 7.5g/kg HK (HK1), or NC + 10g/kg HK (HK2). Dietary HK at 10 g/kg alleviated diarrhea incidence of piglets that might be attribute to the improved plasma antioxidant efficiency and immune status and the regulated fecal microbial community, and could be alternative to the high-dose ZnO. In experiment 2, a total of 160 weaned barrows were randomly allotted into 4 treatments, with a 2×2 factorial design that compared ZnO [sham (-) or ZnO (+)] inclusion under different dietary treatments [basal diet (NC) or NC + 10 kg/t hydrolyzed yeast (HK)]. HK supplementation improved the growth performance and reduced the diarrhea incidence of weaned piglets, which may be attributed to the increased antioxidant and immune levels, reduced intestinal inflammatory response, enhanced intestinal barrier function, improved intestinal tissue morphology, and regulated intestinal microbiota.

Session 35

Theatre 11

In vitro and in vivo evaluation of L-Lysine solid lipid microcapsules for swine

C. Bonnici¹, M. F. Marchesi¹, R. Majer², G. Gallina³, A. Piva^{1,2}, E. Grilli^{1,4}

¹ University of Bologna, DIMEVET, via Tolara di Sopra, 40064 Ozzano dell'Emilia, Italy, ² Vetagro SpA, via Porro, 42124 Reggio Emilia, Italy, ³ Vetspin Srl, via Toscanini, 40055 Villanova di Castenaso, Italy, ⁴ Vetagro Inc., E. Monroe St., 60603 Chicago, United States

The aim of the study was to evaluate gastric bypass, intestinal slow release, and bioavailability of L-Lysine encapsulated in solid lipid microcapsules (L-SLMs), compared to free L-Lysine, in swine. The pharmacokinetics profile of L-SLMs was characterized in vitro and validated in vivo. In vitro, the release of L-Lys from SLMs was evaluated incubating a 0.5 g sample at 40°C first in gastric phase (pepsin buffer, pH=1.5; 2h) and then in intestinal phase (pancreatin buffer; pH=7.5; 8h). L-Lys quantification was performed via Kjeldahl method. In vivo, 12 weaner piglets (BW=15 ± 2 kg) were fed corn meal and divided in 3 groups (n=4) receiving an oral dose of either saline solution (placebo), free L-Lys at 0.17 g/kg BW (control) or L-SLMs at 0.38 g/kg BW (treatment), which provided the same amount of L-Lys. Plasma samples were collected before oral administration and hourly until 24h. L-Lys was quantified by LC-MS/MS. Data were analyzed using Two-Way ANOVA, with differences considered significant at P<0.05. In vitro, the gastroprotection of L-Lys from SLMs was 84% at 2h, while the intestinal release was 80% at 8h. In vivo, free L-Lys showed a plasma peak concentration of 1054.10 µM after 1h and completely disappeared after 8h. Conversely, L-SLMs displayed a plasma peak concentration of 1184 µM at 3–4h, and then the hematic L-Lys concentration gradually decreased to 0 until 24h. The bioavailability was higher for L-SLMs compared to free L-Lys (AUC=7902 µM×h and 3175 µM×h, respectively). Overall, the administration of L-Lys in SLMs has the potential to guarantee intestinal slow release and enhanced bioavailability of L-Lys compared to not protected L-Lys.

Effect of a botanical-based feed additive in vitro on cultured enterocytes and in vivo on weaned piglets challenged with F4+ enterotoxigenic *Escherichia coli*

A. Bonetti¹, B. Tugnoli¹, A. Piva^{1,2}, A. Middelkoop³, F. Molist³, E. Grilli^{2,4}

¹ *Vetagro SpA, via Porro, 42124 Reggio Emilia, Italy*, ² *University of Bologna, DIMEVET, Via Tolara, 40064 Ozzano Emilia, Italy*, ³ *Schothorst Feed Research, Meerkoetenweg, 8218 Lelystad, Netherlands*, ⁴ *Vetagro Inc., E. Monroe St., 60603 Chicago, United States*

The aim of the study was to evaluate a botanical-based feed additive (BOT) both in vitro on cultured enterocytes and in vivo in weaner piglets orally challenged with F4+ enterotoxigenic *E. coli* (ETEC). In vitro, Caco-2 cells were treated with BOT and infected with 5×10^7 CFU of ETEC (BOT+); enterocytes integrity, and ETEC adhesion and translocation were measured. Unchallenged (CTR-), challenged (CTR+), and antibiotic (colistin, COL+) controls were included. In vivo, 30 F4-susceptible weaner pigs were divided in 3 groups (n=10): positive control (CTR+, no treatments); control with colistin in water (COL+); treatment receiving BOT, microencapsulated in lipid matrix, at 2 kg/MT (BOT+). On d9, each pig was orally challenged with 3×10^9 CFU of ETEC. Body weight (BW), fecal score, and ETEC shedding were recorded until d23. Data were analyzed with ANOVA (in vitro) or ANCOVA (in vivo, covariate: d0 BW), with differences significant at $P < 0.05$ and tendencies at $P \leq 0.1$. In vitro, integrity of CTR+ enterocytes was significantly reduced (26% of starting value), while BOT+ kept it at around 80%, in line with CTR- and COL+. Moreover, BOT+ reduced ETEC adhesion and translocation across enterocytes by $1 \log_{10}$ (CFU/mL) ($p < 0.05$). In vivo, despite BOT+ led to higher overall fecal ETEC shedding vs CTR+ and COL+ ($P < 0.001$), no differences were observed in fecal scores, and BOT+ tended to improve BW compared to both CTR+ and COL+ at d14 (+1.1 kg) and d23 (+1.5 kg). BOT protected enterocytes during ETEC infection in vitro and may support growth of ETEC-challenged piglets.

Session 35

Poster 13

Evaluation of dietary selenium nanoparticles and curcumin nanospheres on growth, feed utilization and fecal gas emissions in weaned piglets

M. Moniruzzaman¹, T. Min¹

¹ *Jeju National University, Department of Animal Biotechnology, Daehak-ro 102, 63243 Jeju, South Korea*

We investigated the dietary supplementation of selenium nanoparticle (SeNP) and curcumin nanosphere (CN) based on growth, feed utilization and fecal gas emissions in weaned piglets. A total of 108 weaning pigs (Duroc × [Yorkshire × Landrace]) with an average initial body weight of 6.50 ± 1.03 kg were randomized into 9 dietary groups in triplicate pens (4 pigs in each pen). Dietary treatment groups were as follows: 1) CON, basal diet; 2) T1, basal diet + SeNP (0.3 mg/kg); 3) T2, basal diet + SeNP (0.5mg/kg); 4) T3, basal diet + CN (0.5 ml/kg); 5) T4, basal diet + CN (1.0 ml/kg); 6) T5, basal diet + SeNP (0.3 mg/kg) + CN (0.5ml/kg); 7) T6, basal diet + SeNP (0.5 mg/kg) + CN (0.5ml/kg); 8) T7, basal diet + SeNP (0.3 mg/kg) + CN (1.0 ml/kg); 9) T8, basal diet + SeNP (0.5 mg/kg) + CN (1.0 ml/kg). All data were processed by Duncan's multiple range test using the General Linear Model procedure of SAS (2013) to test the significance between the means ($P < 0.05$). At the end of 21-day feeding trial, T8 treatment group was significantly higher in body weight than CON treatment group ($P < 0.05$). During the entire experiment period, T7 and T8 groups were significantly higher in average daily gain than CON group ($P < 0.05$). There was no significant difference in dry matter, nitrogen and energy utilization during the entire study period. At the end of experiment (21 day) pig feces in CON group was significantly higher in ammonia (NH₃) than T3, T5 and T6 treatment group ($P < 0.05$). Overall, the results demonstrated the potential of dietary supplementation of CN and SeNP as a nanobiotechnology tool as well as effective feed additive in terms of improving performance and reducing fecal ammonia emissions in weaned piglets.

The use of levan in laying hens nutrition - influence on the microflora of the gastrointestinal tract

D. Konkol¹, M. Kuźmińska-Bajor², Z. Lazar², E. Popiela³, M. Korczyński¹

¹ Wrocław University of Environmental and Life Sciences, Department of Animal Nutrition and Feed Sciences, Chelmońskiego 38C, 51-630 Wrocław, Poland, ² Wrocław University of Environmental and Life Sciences, Department of Biotechnology and Food Microbiology, Chelmońskiego 37, 51-630 Wrocław, Poland, ³ Wrocław University of Environmental and Life Sciences, Department of Environment Hygiene and Animal Welfare, Chelmońskiego 38C, 51-630 Wrocław, Poland

Levan is an exopolysaccharide which, thanks to its prebiotic properties, can potentially be used as a feed additive in poultry nutrition. The aim of the study was to determine the effect of the addition of various levels of levan on the development of the microflora of the gastrointestinal tract of laying hens. The experiment was conducted on 120 Lohmann Brown laying hens. The birds were divided into 5 experimental groups (8 replications (cages), 24 hens in each group). Group C (control) did not receive any levan supplement. The L0.1 group received 0.1% levan in the feed mixture, the L0.25 group – 0.25% levan in the feed mixture, the L0.5 group – 0.5% levan in the feed mixture, and the L1 group – 1% levan in the feed mixture. The experiment lasted 90 days. At the end of the experiment, 8 hens from each group were euthanized and the contents of the jejunum and cecum were collected for microbiological analyses. Analyses were made of the number of bacteria of the genera *Lactobacillus*, *Bifidobacterium*, *Clostridium* and those belonging to the Enterobacteriaceae family. The analysis of the obtained results showed a lower number of bacteria of the *Bifidobacterium* genus in the cecum of birds from the C group. In turn, in the case of *Clostridium* bacteria, a reduction in the number of birds with these bacteria found in their intestinal contents was demonstrated in all groups that received levan added to the feed compared to the C group. The content of the jejunum showed a reduction in the number of bacteria from the Enterobacteriaceae family in birds from groups that received levan supplement in the feed. Therefore, it can be concluded that the use of levan in the laying hens nutrition has a positive effect on the development of probiotic microflora while inhibiting the development of pathogens.

Session 35

Poster 15

Mint oils: ability to perform in vitro anti-inflammatory and their antimicrobial effect

M. Hejna^{1,2,3}, L. Kovanda², L. Rossi³, Y. Liu²

¹ Institute of Genetics and Animal Biotechnology of the Polish Academy of Sciences, Department of Biotechnology and Nutrigenomics, Jastrzębiec, Postępu 36A, 05-552 Garbatka, Poland, ² University of California, Davis, Department of Animal Science, 4302 Meyer Hall, One Shields Ave, 95616 Davis, CA, United States, ³ Università degli Studi di Milano, Department of Veterinary Medicine and Animal Sciences - DIVAS, Via dell'Università 6, 26900 Lodi, Italy

Mint oils (MO) due to bio-active molecules with anti-inflammatory and antibacterial properties are being explored to counteract with antibiotic overuse in swine. The aims were to test peppermint (PMO) and spearmint (SMO) oils via (i) measuring in vitro anti-inflammatory effects with macrophage (PAM) cells, (ii) testing the antimicrobial activity against swine pathogen, *Escherichia coli* ETEC F18+ (EC). Briefly, PAMs were harvested from the bronchial lavage and seeded (10⁶ cells/mL). After 24 h (37°C, 5% CO₂), cells were treated with MOs or lipopolysaccharide (LPS) with 2 × 5; 2 doses of LPS (0 or 1 µg/mL) and 5 doses of MOs (0, 25, 50, 100, 200 µg/mL). The supernatants were collected to measure Interleukin-1 beta (IL-1β). Besides, a culture-based EC assay was performed to evaluate the inhibitory activity of PMO and SMO in doses (0, 1.44, 2.87, 5.75, 11.50, 23.0 mg/mL). Overnight-grown EC were treated and measurement (OD₆₀₀, 60 min interval), data were converted (CFU/mL) and analyzed (SAS 9.4). Treatment with PMO and SMO significantly inhibited (p<0.05) IL-1β secretion from LPS-challenged PAMs in a dose dependent manner. Also, EC growth inhibitory results revealed that PMO and SMO inhibited (p<0.05) the growth of EC at different concentrations. Results showed that PMO and SMO had anti-inflammatory activities in vitro and antimicrobial activities against EC, which indicates MO may be candidates to decrease antibiotic overuse.

Update on the use of slow-growing chicken genotypes for conventional and alternative farming systems in the EU

C. Castellini¹

¹ *University of Perugia, DSA3, Borgo 20 Giugno, 74, 06100 Perugia, Italy*

There is a growing interest in the use of slow growing (SG) and dual-purpose genotypes in alternative (organic, free range) and conventional farming systems in the EU. The reason for this positive trend originates from the increasing attention of public opinion and regulatory agencies toward animal welfare and qualitative traits of production. Although it is crucial to harmonise criteria and procedures in EU, these genotypes are characterised in different EU countries and bodies (e.g. European Chicken Commitment) with different approaches. Many of these approaches consider only the performance of chickens (e.g. daily weight gain), even if the assessment of functional traits in challenging conditions, such as adaption to environmental stress, locomotion activity, animal welfare and health, and immune response should be analysed in detail. Comprehensive information on this topic are recent and several discrepancies in both literature and commercial circumstances render the characteristics of production and the result obtained very different along EU. Although SG, in conventional and alternative systems, are widely used, a whole assessment is lacking. Indeed, the comparison of genetic strains in various farming systems which implies deep changes in input, output and side effects, should be done using multicriteria tools, able to simultaneously measure the effect of a given alternative on a panel of traits. The lecture will analyse the current knowledge on the relation between the main traits implicated in the chicken adaptation to a farming system developing a “one welfare” approach capable to compare animal welfare, quality, sustainability and environmental impact at the same time.

In organic poultry production, dual-purpose chickens are favored to avoid the killing of male chicks and the uneconomical rearing of cockerels from layer lines. We hypothesize that crossbred offspring of local chicken breeds and high-performing broiler or layer hens provide genotypes suited for dual-purpose use. The project RegioHuhn is based on three local chicken breeds, Altsteirer, Bielefelder, and Ramelsloher, taking into account the regionality. Both purebreds and crossbreds were tested for their suitability as dual-purpose chickens. Assessing traits related to welfare and robustness is part of the parallel project ÖkoGen. Crosses provided a variation of genotypes suited for dual-purpose use, with the broiler crosses reaching 55-57% higher meat yield, while layer crosses doubled laying performance compared to local breeds. Animal welfare indicators showed breed-specific variation, which is also reflected in the crosses, e.g. Bielefelder layer crosses showed better feather scores and less keel-bone damage than broiler crosses. Breed-specific differences were found in an infection trial with *Ascaridia galli*, e.g. the Bielefelder had the lowest antibody response and the highest worm burden.

The biodiversity of local poultry breeds: characterisation of two Tuscany breeds to save them from extinction
F. Mannelli¹, I. Galigani¹, L. Versino¹, M. Biagi Arroyo¹, L. Fantechi¹, M. Daghighio¹

¹ *Università degli Studi di Firenze, Dipartimento di Scienze e Tecnologie Agrarie, Alimentari, Ambientali e Forestali (DAGRI), Piazzale delle Cascine, 18, 50144 Florence, Italy*

The safeguarding and valorization of local poultry breeds may contribute to the sustainability of animal production. The characterization of morphological and productive traits is the preliminary step for the preservation of biodiversity and utilization of marginal lands. The Mugellese chicken is a dwarf breed with a medium neck, broad shoulders, long and horizontal wings, wide, and well-developed breast (especially in the hen) with a typical brooding capacity. On the contrary, the Valdarnese Bianca breed is considered the only original Italian meat-type breed of the national genetic heritage with a long neck, broad shoulders, long and horizontal wings, and long legs and shanks. Both these breeds show frugality, resilience, and resistance to diseases and are particularly suitable for free-range farming. Throughout a 1-year observation, the Mugellese and Valdarnese bianca breeds were characterized for morphological, productive, and reproductive traits and at the end of the trial, for caecal microbial community profile. Data confirmed the morphology of both breeds and their good egg production and growth performances. The main characteristic traits detected were: egg deposition for Mugellese that lay 65.75% of the egg during March–April and the remaining 51.86% in August–September; and growth performance for Valdarnese Bianca that showed a final weight of 1911.33 ± 231.44 g with a feed conversion ratio of 5.62 ± 0.24 . The characterization of the caecal microbial community by high-throughput sequencing of the 16S rRNA gene suggested that the composition of gut microbiota is different in the two breeds.

Multiperformance of slow-growing and dual-purpose strains in organic chicken production: learning from the PPILOW project

Societal expectations about poultry welfare are increasing, in particular regarding the access of birds to an outdoor run. This possibility to express natural behaviours outdoors can challenge animals in terms of health and welfare, affect animal performance and impact on their environment. Slow-growing strains of chickens are currently used in organic production systems, and dual-purpose strains are now available to avoid the culling of layer male chicks. In the frame of the Poultry and Pig Low-input and Organic production system's Welfare (PPILOW) project, the multiperformance of slow-growing chickens and of males of dual-purpose strains was studied in organic chicken systems. The investigated variables focused on range use, health and welfare indicators, environmental impacts, animal and economic performance, and meat quality. Results showed that a large variability in range use exists, and that many variables can be linked to this indicator. The PPILOW project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement N°816172.

What do dual purpose cockerels feed on in the range area?

S. Hübner¹, D. Werner¹

¹ Thünen Institute, Institute of Organic Farming, Trenthorst 32, 23847 Westerau, Germany

Since the regulation (EU) 2018/848, it is mandatory to provide free range access to cockerels in organic animal husbandry systems. We are investigating different free range systems for their influence on the intake of components of the outdoor run and if age affects the feed preferences by analyzing crop and gizzard contents. In three experimental runs 2022 – 2023, we compared 4 types of range. In the SRC system, cockerels are given access to a strip of poplars with adjacent patches of arable grass (1). In the hedge system, cockerels were given access to an area with a strip of forage hedge and adjacent patches of pastured grassland (2). For each system, control groups were assigned to arable grass (3) or pastured grassland (4) without woody plants. Per run, 400 cockerels (Bresse Gauloise x New Hampshire) were housed in 8 groups of 50 cockerels each. The cockerels were slaughtered at the age of 12, 15 and 18 weeks without fasting and between 2 and 10 birds per slaughter date and group were selected for crop analyses. The crop and gizzard were removed during the regular slaughter process and frozen until further analyses. So far 253 crops and gizzards have been excavated. In animals from pastured grassland, the proportion of longer plant fibers of total stomach content was higher (12 wk: 37.8 ± 11.4 %, 15 wk: 34.7 ± 13.3 %, 18 wk: 29.0 ± 14.2 %) than in cockerels on arable grassland (12 wk: 24.5 ± 10.1 %, 15 wk: 17.1 ± 6.2 %, 18 wk: 11.8 ± 5.4 %). The presence of woody plants did not have an influence therein. Conversely, the proportion of grit was higher in the groups on arable grassland. The variability between individuals was high and requires a high number of samples. The average gizzard content was 33.0 ± 7.8 g (12 wk), 38.6 ± 11.6 g (15 wk) and 42.4 ± 13.3 g (18 wk). The results indicate that dual-purpose cockerels take more than 10 % of their daily feed intake from material of the outdoor run but pastured grassland might require a provision of grit to enhance digestion.

Session 36

Theatre 6

An index for adaptability evaluation of slow-growing chicken genotypes reared in free-range system

S. Mattioli¹, L. Menchetti², E. Angelucci¹, A. Cartoni Mancinelli¹, A. Dal Bosco¹, L. Madeo³, D. Chiattelli¹, F. Di Federico¹, C. Castellini¹

¹ Perugia University, Agricultural, Environmental and Food Science, Borgo 20 Giugno 74, 06125 Perugia, Italy, ² Camerino University, School of Biosciences and Veterinary Medicine, Via Circonvallazione, 93/95, 62024 Matelica, Italy, ³ Experimental Zooprophyllactic Institute of Umbria and Marche, Via San Costanzo, 06124 Perugia, Italy

The chickens adaptability to extensive rearing system (ERS) needs the evaluation of natural behaviours, kinetic and foraging attitude, resistance to environmental stress without leaving out economic traits. It should be necessary to find a simple and exhaustive way to define the chicken's adaptability to ERS. With this aim, this research proposed a provisional adaptability index constituted by few and simple variables that may be analysed also in field context. Four hundred Slow-Growing chickens of 4 different strains (Red JA57, Naked Neck, Lohmann Dual and an Italian crossbreed-Robusta Maculata and Sasso hens) were reared in ERS for 81d. In 30 chickens hematological, behavioral, productive and qualitative traits were determined. The 206 variables collected were first reduced to 27, considering the easy of application, cost-effectiveness and scientific value and classified into 4 pillars (behaviors, body condition, meat quality, in vivo health and welfare). Then, an iterative process including discriminant, principal component, and reliability analyses was performed to finally select 6 variables: meat lipid oxidation, carcass yield, feather condition, comfort behaviours, and blood polyunsaturated fatty acids. Results showed that the index can discriminate the different genotypes in terms of adaptability, showing the trends LD>C-B≥NN>RJ, however, the application in the field should be evaluated. This project has received funding from the European Union's Horizon 2020 research and innovation programme under GA n°816172.

Application of Quality of Life approach to evaluate the behavior of four slow growing chicken genotypes reared in free range

A. Cartoni Mancinelli¹, D. Chiattelli¹, L. Menchetti², A. Trocino³, C. Ciarelli³, C. Castellini¹

¹ University of Perugia, Department of Agricultural, Food and Environmental Sciences, Borgo XX Giugno 74, 06121 Perugia, Italy; ² University of Camerino, School of Biosciences and Veterinary Medicine, Via Raffaele Fidanza, 15, 62024 Matelica, Italy; ³ University of Padua, Department of Agronomy, Food, Natural Resources, Animal and Environment, Viale dell'Università 16, 35020 Legnaro, Italy

The “Quality of Life” (QOL) represents a new approach that combines the traditional behavioral assessment with the evaluation of the animal’s affective states in a long observation time. Thus, the QOL could be a powerful tool to investigate how animals cope with the environment on the base of the engagement of positive behaviors. The purpose of this study was to compare the behaviors of four slow-growing chicken genotypes reared in free-range conditions by applying the QOL approach. A total of 400 one-day-old chicks belonging to different chicken genotypes (A, NN, CB and LD) were housed in 8 pens with access to pasture area. From 42 to 81 days of age 10 videos/genotype of two hours length were recorded and analyzed by two expert observers using 10-minute sampling intervals. The behavioral variables were classified into positive and negative affective states and indicators of their balance were calculated. Uni- and multivariate statistical techniques were used while the frequency of the behaviors occurrences was categorized by data binning. Results showed that in all the genotypes studied the percentage of positive affective state was higher than the negative ones. However, LD by showing the highest frequency of “sheltering” associated with the lowest frequency of “grass pecking” behavior evidenced a poor interaction with the outdoor area. Nevertheless, the highest frequency of “dust bathing” and “scratching” in the LD genotype balanced the low occurrence of other positive behaviors. Conversely, NN birds were very active and showed the highest occurrences of positive affective states. Further studies are needed to develop a strong QOL methodology to better classified the behaviors into positive and negative affective states and to find a specific indicator to evaluate their balance.

Session 36

Productive performance and nitrogen excretion of fast-, medium- and slow-growing chicken genotypes fed diets varying in protein-to-energy ratio

M. Zampiga¹, M. Petracci¹, R. Piscitelli¹, F. Volpe¹, F. Ceccaroni², F. Sirri¹

¹ Alma Mater Studiorum - University of Bologna, Department of Agricultural and Food Sciences, Via del Florio 2, 40064 Ozzano dell'Emilia, Italy; ² Gesco S.C.A., Via del Rio 400, 47522 San Vittore di Cesena, Italy

The use of chicken genotypes with slower growth rate for meat purpose has recently gained renewed interest mostly because of animal welfare and product quality reasons. However, limited information is currently available on the impact of nutritional strategies to optimize their productive and sustainability traits. Therefore, a trial was carried out to evaluate the productive performance and nitrogen excretion of fast- (FG), medium- (MG) and slow-growing (SG) chicken genotypes, chosen according to their average daily weight gain (>70, 40-50, and 30-40 g/bird/day, respectively), when fed either a conventional basal diet (CON) formulated to meet the nutritional requirements of the FG genotype, or the same diet with reduced crude protein-to-metabolizable energy ratio (-10% crude protein; LOW), which is representative of commercial diets used for slower-growing chickens. A total of 1,800 one-day-old chicks (600 for each genotype) were allotted in 36 floor pens following a 3 x 2 full-factorial experimental design (i.e. 3 genotypes x 2 dietary treatments; 300 chicks/group). Body weight and feed consumption were recorded on a pen basis at the end of each feeding phase (13 and 27 days) and at slaughtering (35, 56, and 84 days for FG, MG and SG, respectively) to calculate growth performances. At processing, birds were also individually weighed to assess body weight uniformity. Nitrogen excretion was estimated through the indirect method as the difference between nitrogen input and nitrogen body retention. According to the results of a two-way ANOVA, the genotype as well as the administration of LOW diet had a significant effect on performance parameters, particularly on feed conversion ratio. The ongoing evaluation of nitrogen excretion will provide information on the impact of feeding LOW diets to genotypes with different growth potential. Overall, these results can enlarge the knowledge about the effects of nutritional strategies on productive performance and sustainability traits of slower-growing chicken genotypes.

Feather's transcriptome analysis in local chickens fed with two different diets: a possible marker to study lipid metabolism

N. Stoppani¹, F. Raspa¹, E. Fiorilla¹, S. Maione¹, C. Mugnai¹, A. Schiavone¹, D. Soglia¹

¹ Università degli Studi di Torino, Dipartimento di Scienze Veterinarie, Largo Paolo Braccini 2, 10095 Grugliasco, Italy

Gene expression in feathers is mainly linked to regenerative behavior for physiological needs and in response to trauma. Growth control, morphogenesis and differentiation are the main mechanisms characterizing feathers. Lipid metabolism in chickens is typically studied in liver, abdominal fat, and breast muscle. In this study we analyzed the feathers' expression profile in 60 Bionda Piemontese chickens fed with two different lipid content diets: a low diet (LL, ether extract (EE)=3.6%) and a high diet (HL, EE=9.3%). The aim was to evaluate the possibility in using feathers to study marker genes linked to lipid metabolism. We collected the growing feathers at 150 days of age, 15 males and 15 females/diet. Total RNA was extracted with FastGene® RNA Premium Kit and evaluated for its quantity (Qbit®, RNA Broad-Range Assay Kit) and integrity (RIN, Agilent 2100 Bioanalyzer). 100 ng, RIN ≥ 7 , were sent to AZENTA (Azenta Life Sciences, US) for whole RNA profiling. Different expression analysis was performed using RaNA-Seq software. Results showed a higher expression in the apolipoprotein A1 (APOA1) (p-value = 0.01, log2FC = 1.69) in males fed with HL diet. This was not observed in females. APOA1 is the central constituent of HDL (high-density lipoprotein) and its function is to promote the efflux of cholesterol from peripheral tissues to the liver. The high expression in male chickens fed with HL diet indicates that the excess of cholesterol intake from the diet leads male chickens to overexpress APOA1 to maintain a proper cholesterol homeostasis. In conclusion, this work showed the possibility to use feathers to investigate gene expression in live chicken and identify APOA1 as marker for lipid metabolism study.

Session 36

Poster 10

Suitability of commercial crossbred dual-purpose male chicks for capon production

D. Murawska¹, M. Gesek², D. Witkowska¹, J. Błażej-Grabowska¹

¹ University of Warmia and Mazury in Olsztyn, Department of Animal Welfare and Rerearch, Oczapowski Str. 5, 10-719 Olsztyn, Poland, ² University of Warmia and Mazury in Olsztyn, Department of Pathological Anatomy, Oczapowski Str. 13, 10-719 Olsztyn, Poland

The elimination of day-old cockerels of layer breeds poses a problem for the poultry industry. The poultry producers show limited interest in raising male chicks of dual-purpose breeds for meat but these chickens could be used for capon production. The aim of this study was to determine the effect of age and surgical caponization on the selected growth parameters of dual-purpose cockerels. The experiment was performed on 160 crossbred dual-purpose Rosa 1 chickens. The birds were raised to 24 wk of age and fed commercial diets ad libitum. From 16 wk of age, at 4-wk intervals, 8 intact cockerels and 8 capons were selected randomly and slaughtered. At 8 wk and 16, 20 and 24 wk of age, blood samples were collected to determine testosterone levels. The results are presented as means and the SEM. The significance of differences in mean values between age groups was determined by Duncan's test. Average plasma testosterone levels in cockerels reached 0.13 ng/ml at 8 wk of age (castration). Testosterone concentration increased to 2.53 ng/ml in roosters at 24 weeks of age and was significantly higher than in capons (0.15 ng/ml, $P < 0.05$). Final BW weight was affected by caponization and age. Capons had higher BW than cockerels and significant differences were noted in wk 20 ($P < 0.05$) and in wk 24 ($P < 0.05$). Caponization had no effect on the total lean meat content of the carcass ($P = 0.627$), but differences were found between the weights of breast muscles and leg muscles. The weight of breast muscles was higher in capons than in cockerels, 16, 20 and 24 wk ($P < 0.05$). Cockerels had higher leg muscle weight than capons, and significant differences were noted in wk 16 ($P < 0.05$) and in wk 20 ($P < 0.05$). In the present study, caponization had a beneficial influence to an increase in BW or the weights of major parts of muscles. Acknowledgements: Funded by the Minister of Science under „the Regional Initiative of Excellence Program”

Exploring the influence of alternative feed ingredients on meat production and quality in a slow-growing autochthonous chicken breed

M. Gariglio¹, E. E. Cappone¹, V. Bongiorno¹, C. Bianchi¹, V. Zambotto¹, A. Schiavone¹

¹ University of Turin, Veterinary Sciences, Largo Paolo Braccini 2, 10095 Grugliasco, Italy

The intensification of poultry farming represents a key issue towards a more sustainable future. Poultry biodiversity is essential in promoting sustainable and high-quality farming systems. This study aims at evaluating meat yields, quality, and color of an autochthonous slow-growing chicken breed, Bianca di Saluzzo (BS), fed with alternative ingredients to replace soybean meal. A total of 96 male BS of 39 days of age were allotted in 12 pens (6 replicates/treatment) and assigned to 2 different feeding programs. The control group (C) was fed a standard commercial corn-soybean meal diet (AME (MJ/kg) 11.8; CP 18.1) while the experimental group (EXP) was fed an experimental diet with the complete replacement of soybean meal with alternative ingredients (pea protein, field bean, barley, maize gluten) (AME (MJ/kg) 11.9; CP 18.1). At 147 and 174 days of age, 12 birds/treatments were slaughtered. Hot and chilled carcass, and organs (spleen, liver, heart), breast and thigh muscles weights were recorded, and the corresponding yields (% live weight) were calculated. Proximate and fatty acids composition was evaluated on the breast meat. Data were analyzed by a Generalized Linear Mixed Model (RStudio, $P \leq 0.05$). No differences were found in slaughtering performance between the two treatments and the two slaughtering age. On the contrary, higher levels of yellowness in both breast and thigh meat were found for the EXP treatment compared to the C group. Finally, the results of proximate and fatty acid composition highlighted no significant differences between the treatments. Overall, the results were comparable between birds fed with alternative ingredients and those on a commercial diet, indicating the feasibility of this approach to promote sustainability of poultry products.

Genetic characterization of Collo Nudo Italiana and Millefiori Piemontese chicken breeds through high-density SNP genotyping

F. Cendron¹, F. Perini¹, E. Lasagna², D. Soglia³, A. Schiavone³, M. Cassandro^{1,4}, M. Penasa¹

¹ University of Padova, Department of Agronomy, Food, Natural resources, Animals and Environment, Viale dell'Università 16, 35020 Legnaro (PD), Italy, ² University of Perugia, Department of Agricultural, Food and Environmental Sciences, Borgo XX Giugno 74, 06121 Perugia, Italy, ³ University of Torino, Department of Veterinary Sciences, Largo Paolo Braccini 2, 10095 Grugliasco (TO), Italy, ⁴ Federazione delle Associazioni Nazionali di Razza e Specie, Via XXIV Maggio 43, 00187 Roma, Italy

This study aimed to assess the genetic variability of two indigenous breeds, Collo Nudo Italiana (CNI) and Millefiori Piemontese (MP), and evaluate their variability in the context of Italian local chicken biodiversity. Forty-eight individuals per breed, comprising both males and females, were genotyped through Affymetrix Axiom 600k Chicken Genotyping Array. Both CNI and MP exhibited high expected heterozygosity (0.672 ± 0.117 and 0.565 ± 0.119 , respectively) and observed heterozygosity (0.654 ± 0.139 and 0.601 ± 0.119), and low coefficient of inbreeding (-0.004 ± 0.066 and 0.149 ± 0.405). Multidimensional scaling, phylogenetic tree, and admixture analyses allowed to contextualize CNI and MP with other chicken breeds, including 19 local breeds and 4 commercial hybrids. Results showed that CNI is close to the commercial hybrids, whereas MP is closely associated with Mericanel della Brianza, Bianca di Saluzzo, and Bionda Piemontese local breeds. The present study characterized CNI and MP breeds using high-density chip, also in the framework of Italian chicken biodiversity, and findings are useful for conservation purposes. This work was funded by MASAF (project "TuBAVI-2", PSRN 2014-2022, Sottomisura 10.2).

How does the diversification of farming methods in Europe influence the main indicators of the technological and sensory quality of chicken meat?

*E. Baéza*¹, *M. Petracci*², *S. De Smet*³, *R. Eppenstein*⁴, *M. Bourin*⁵, *A. Cartoni Mancinelli*⁶, *E. Kowalski*³, *C. Berri*¹

The H2020 INTAQT project (grant agreement n°101000250) is based on the 'One Quality' concept, which encompasses the various facets of intrinsic product quality (nutritional, safety and sensory) as well as the quality of production systems (i.e., economic, environmental and societal sustainability). Its aim is to provide the knowledge and tools needed to characterize, authenticate and improve the quality of products from the diversity of European livestock farms. It focuses on three products – beef, dairy and chicken – which account for around 65% of the economic value of animal products in Europe. Thanks to an extensive network of 90 farms in France, Belgium, Italy, Switzerland and Poland, we have been able to assess the impact of 18 European farming systems on the intrinsic quality of chicken breast and thigh meat. The farming systems studied were both conventional and organic, and covered a continuum of practices from the most intensive to the most extensive, with the use of fast- or slow-growing genotypes (including dual-purpose strains), giving access to more or less enriched environments (including free-range rearing). We propose here to present the first results obtained for the classic indicators of meat quality such as ultimate pH, color, drip and cooking loss, proximal composition, tenderness after cooking and processing yields. These initial results will be supplemented by additional measurements of nutrients or hazardous elements, microbes and shelf life, as well as sensory analysis and consumer testing. Our long-term objective will be to develop multi-criteria quality assessment tools, as well as decision-making tools to guide the evolution towards more sustainable farming practices for the animal, the environment and the consumer.

Session 37

Theatre 1

Getting weaned pigs off to a great start: What we have learned to reduce stress and improve performance

*J. C. Woodworth*¹, *M. D. Tokach*¹, *R. D. Goodband*¹, *J. M. Derouchey*¹, *J. T. Gebhardt*¹, *K. N. Gaffield*¹

¹ Kansas State University, Department of Animal Sciences and Industry, 224 Weber Hall, KS 66502 Manhattan, United States

One of today's biggest challenge in the US swine industry is achieving optimal performance and livability in the post-weaning period. Research from our team has demonstrated that genetics, management, and nutrition all play a role in reducing stress and improving post-weaning performance. Modern genetics that are selected for later maturity in order to improve finishing pig performance exhibit more stress around weaning and have lower post-weaning feed intake and nursery growth performance compared to early-maturing lines. Increased wean age and offering creep feed are pre-weaning strategies that can improve post-weaning performance and livability. Mat feeding and some sensory attractants utilized immediately after weaning have resulted in reduced post-weaning weight loss and nursery removals and mortalities. Sow nutrition plays a role in offspring performance and live yeast probiotics added in lactation diets has resulted in heavier weaning weights and better post-weaning performance. Currently, the US swine industry is able to take advantage of high levels of ZnO in nursery pig diets. However, we continue to conduct research in diets without high ZnO and have identified nutritional strategies that lead to beneficial effects on performance and livability that are similar to those observed when high ZnO is fed. Reducing the acid-binding capacity (ABC-4) of nursery diets by lowering limestone and other ingredients that bind acid as well as adding acidifiers to phase 1 and 2 diets to reach an ABC-4 value of 200 and 250 meq/kg, respectively, has resulted in improved growth performance and livability. Lowering crude protein with the use of feed-grade amino acids can improve fecal dry matter and growth performance can be maintained as long as the SID Lys:CP ratio does not exceed 6.5%. Optimal post-weaning growth performance, livability, and reduced stress can be achieved but a multifaceted approach must be utilized that considers genetic, management, and nutritional influences on health and well-being of pigs.

Effects of early socialisation on growth, health and welfare of piglets raised on commercial farms

S. Gavaud¹, C. Perrier¹, A. Nalovic², J. Lion¹, A. Jahoui¹, V. Müller², D. Marchand², C. Belloc³, B. Lieubeau¹, J. Hervé¹

¹ Oniris, INRAE, IECM, 101 Rte de Gachet, 44300 Nantes, France, ² Réseau Cristal, EPIDALIS, 13 Bd Denis Papin, 35500 Vitré, France, ³ Oniris, INRAE, BIOEPAR, 101 Rte de Gachet, 44300 Nantes, France

Nowadays, conventional breeding systems are being questioned by public opinion that asks for systems more respectful of animal welfare. Socialisation of suckling piglets might be an appropriate method towards this objective. In this context, we compared the growth, welfare and health of pigs, reared on 5 commercial farms with or without socialisation from the age of 14 days (D14). Frequent visits were made until slaughter to record piglet behaviour and to detect any clinical signs, body and tail lesions. Piglets were weighed on D28 and D40. Salivary cortisol was measured on D28, and hair cortisol on D40 to assess stress levels. Linear mixed models were used to evaluate the effects of socialisation on these variables. According to preliminary data obtained from 4 farms (320 pigs), the socialised piglets showed more exploratory behaviours and positive social interactions than the controls immediately after mixing on D14. After weaning on D28, they still exhibited more frequent positive social behaviours than controls and their body lesions were of lower severity, associated with reduced salivary cortisol concentrations. Nevertheless, we observed lower weight gain during the lactation period for socialised piglets, whose weight on D14 tended to be inferior to the ones of control piglets. On D40 and D68, the frequency of positive social interactions remained higher in the socialised group while control piglets displayed more negative social interactions. Socialisation therefore appears as a possible way of improving piglet welfare although several questions remain especially regarding the impact on the sows.

Spray dried plasma improves piglets' performance and gut function in the first week post-weaning

Z. W. NgAng'A^{1,2}, J. Tarradas¹, R. Beltrán-Debón², J. Polo³, D. Torrallardona¹

¹ Institute of Agrifood Research and Technology (IRTA), Animal Nutrition, Centre Mas Bové, 43120 Constantí, Spain, ² Universitat Rovira i Virgili, MoBioFood Research Group, c/Marcel·lí Domingo n°1, 43007 Tarragona, Spain, ³ APC Europe, S.L.U., 08403 Granollers, Spain

Spray dried porcine plasma (SDPP) exhibits potential in reducing the adverse effects of weaning stress in piglets. This study evaluated the efficacy of SDPP to improve performance and gut barrier function in weaning pigs. Ninety animals were randomly distributed into 18 pens (5 pigs/pen; randomised block design with 9 blocks of initial BW; 2 treatments). Between 0-14d post-weaning, piglets were offered pre-starter feed with either soy protein concentrate (62 g/kg; Control) or SDPP (50 g/kg). Between 14-35d all piglets were offered a commercial starter feed. Pigs' individual BW and pen FI were recorded at 0, 7, 14 and 35d of trial. Faecal consistency was assessed using a 5-category score system. At 7d, blood plasma and bile samples were obtained from one piglet per pen for the ELISA quantification of calprotectin, citrulline, and sIgA as biomarkers of inflammation, intestinal function, and mucosal unspecific defence, respectively. Data was analysed by ANOVA using the GLM procedure in SAS. During the first week of trial, SDPP piglets improved FI (215 vs 280 g/d), ADG (132.8 vs 205.3 g/d) and G:F ratio (0.61 vs 0.74) relative to the Control ($P < 0.05$). Over the whole trial, SDPP also improved piglet's ADG and BW. No effect on faecal scores was observed. Calprotectin, sIgA, and citrulline levels were not affected by dietary treatments. It is suggested that the administration of SDPP during the pre-starter phase improves piglet's performance although the specific biomarkers analysed in the current study were not able to explain any beneficial effects on gut barrier function.

Effects of maternal probiotic, and/or piglet dietary tryptophan supplementation pre-weaning, on gene expression in the pre-weaned pigs stomach

D. P. Kiernan¹, J. V. O'Doherty¹, M. Ryan¹, T. Sweeney¹

¹ University College Dublin, Belfield, D04 V1W8 Dublin, Ireland

The stomach plays a crucial role both in digestion and in the functioning of the innate immune system and its immaturity poses a significant concern during the post-weaning period. Maternal probiotic supplementation can benefit the sow and also her offspring through maternal transmission. However, little is known about how probiotics may affect the stomach directly or influence its development in young pigs. Tryptophan (Trp), an amino acid known to stimulate acid secretion activity, may potentially enhance stomach function in the pre-weaned pig. A 2×3 study was conducted to investigate the effects of maternal probiotic supplementation, and/or increased piglet Trp on creep intake and on the expression of a panel of genes essential to the functioning of the fundic gland region of the stomach, at weaning. On D85 of gestation, 48 sows were grouped by parity and backfat and assigned to one of two groups: 1) basal or 2) basal + *Bacillus subtilis* and *Bacillus amyloliquefaciens*. On D8 post-farrowing, litters were further divided, and assigned to one of three creep diets resulting in six groups (n=8 litters/group): T1) B17 (basal sow diet+0.17 Trp:lysine creep); T2) B21 (B+0.21 Trp:lysine creep); T3) B25 (B+0.25 Trp:lysine creep); T4) P17 (probiotic sow diet+0.17 Trp:lysine creep); T5) P21 (P+0.21 Trp:lysine creep); T6) P25 (P+0.25 Trp:lysine creep). A total of 48 pigs were sacrificed at weaning (one per litter), and a mucosal sample was collected from the fundic gland region. Gene expression was measured by qPCR and analysed using SAS. Maternal probiotic supplementation tended to increase creep feed intake (P<0.1) and upregulated genes related to acid secretion (ATP4A, CLIC6, HRH2, HDC, CCKBR, CHRM3), enzyme production (CHIA, PGA5), ghrelin production (GHRL) and mucus production (MUC6), in the fundic gland region (P<0.05). Increasing levels of tryptophan in creep feed had no effect on gene expression in the fundic gland region (P>0.05). In conclusion, further research is warranted to determine if maternal probiotic supplementation increased the expression of genes related to acid secretion directly and/or indirectly via increased creep intake.

The leucine-derived gut microbiota metabolite isovalerate enhances the epithelial barrier function in cell monolayers derived from pig ileum organoids

M. Beaumont¹, C. Lencina¹, E. Jones¹, A. Simongiovanni², T. Chalvon-Demersay²

¹ Université de Toulouse, INRAE, ENVT, GenPhySE, 24 chemin de Borde Rouge, 31320 Castanet-Tolosan, France, ² Metex Animal Nutrition, 32 rue Guersant, 75017 Paris, France

Introduction: Metabolites produced by the gut microbiota are key regulators of the gut barrier function. The objective of this work was to evaluate the dose-dependent effects of butyrate and branched-chain fatty acids on the epithelial barrier function by using an innovative model of cell monolayers derived from pig ileum organoids. Materials and methods: Monolayers derived from porcine ileum organoids were treated for 48h with butyrate, isovalerate, isobutyrate and 2-methylbutyrate (1, 3 and 5mM). Epithelial barrier function was assessed by transepithelial electrical resistance (TEER) measurement and gene expression was analyzed by qPCR. Results: Butyrate (>1mM) and isovalerate (>3mM) enhanced the epithelial barrier function, as indicated by increased TEER. Butyrate and isovalerate modulated epithelial innate defense system as indicated by the enhanced gene expression of the antimicrobial peptide SLPI and of the cytokine CXCL8 while the expression of the pro-inflammatory enzyme PTGS2 was reduced. Butyrate and isovalerate also upregulated the expression of genes indicating differentiation of enterocytes (FABP6, ARG2) and enteroendocrine cells (CHGA), while reducing the expression of the stem cell makers OLFM4. In contrast, isobutyrate and 2-methylbutyrate had no effect on the epithelial barrier. Conclusion: Our results show that isovalerate, the leucine-derived metabolite, enhances the epithelial barrier function in cell monolayers derived from pig ileum organoids. Therefore, promoting the production of isovalerate by the gut microbiota in vivo could be a novel strategy to promote gut health in pigs.

The impacts of resistant potato starch and *Lactiplantibacillus plantarum* on growth and health of post-weaned pigs

K. R. Connolly¹, T. Sweeney¹, J. V. O'Doherty¹

¹ University College Dublin, Belfield, D04 V1W8 Dublin, Ireland

Lactiplantibacillus plantarum (Lacto) is a probiotic, while resistant potato starch (PS) is a prebiotic that promotes bacterial short chain fatty acid production. This study aimed to examine the effects of supplementing resistant potato starch and *Lactiplantibacillus plantarum*, individually or combined, on the growth and health of weaned pigs. The 96 weaned pigs were sorted into 4 groups and fed for 35 days: (1) control diet (C); (2) C+1% PS; (3) C+2×10⁸ CFU/g of Lacto; (4) C+2×10⁸ CFU/g of Lacto+1% PS (LactoPS). A faecal score (FS) system of 1-5 was used to monitor the incidence of diarrhoea (1=very hard, 5=very loose). There was a Lacto effect ($P<0.05$) on daily gain (DG) and final body weight (FBW), with Lacto inclusion reducing DG (458 vs 527, SEM 0.017) and FBW (18.6 vs 20.4, SEM 0.437) compared to non-Lacto diets. There was a PS X Lacto interaction on daily feed intake (FI) and FS; the addition of Lacto reduced FI compared to the C diet (764 vs 852, SEM 0.025), but combining Lacto and PS had no effect on FI compared to the PS diet (785 vs 774, SEM 0.025). The addition of PS reduced FS compared to the C diet (2.17 vs 2.50, SEM 0.027), while combining PS and Lacto had no effect on FS compared to the Lacto diet (2.17 vs 2.17, SEM 0.027). There was no effect ($P>0.05$) of dietary treatment on FCR. Combining *Lactiplantibacillus plantarum* and resistant potato starch had no benefit on growth or faecal scores over individual supplementation. However, potato starch acts as a potential post-weaning anti-diarrhea in post weaned pigs.

Impact of Deoxynivalenol in a Nutritional Calcium Depletion and Repletion Protocol in Piglets

B. Sauvé¹, F. Guay¹, M. P. Létourneau-Montminy¹

¹ Laval University, Animal Sciences, 2425 de l'Agriculture St, G1V 0A6 Québec, Canada

The contamination with deoxynivalenol (DON) has been shown to modify calcium (Ca) metabolism in pig, but the underlying mechanism remains unclear. This study evaluated the effect of DON contamination, with variable Ca levels in feed, on phosphorus (P) and Ca utilization by pig. A total of 64 piglets (15.7±0.7 kg) received one of 4 treatments during a first 13-day phase: control (DON-) or DON-contaminated treatment (DON+, 2.7 mg/kg) with either a low Ca (Ca-, 0.39%) or normal Ca level (Ca+, 0.65%) with a constant digestible P level (0.40%). During a second 14-day phase, all piglets were fed a similar diet containing 0.65% Ca and 0.35% P without DON contamination. Growth performance, apparent total tract digestibility (ATTD), retention coefficient (RC) of Ca and P and bone mineral content (BMC, with dual-X-ray) of one pig per pen were evaluated. After 13 days of depletion diet in phase 1, DON did not impact growth performance. The BMC was increased in Ca+DON+ piglet, but the opposite was observed, where Ca-DON+ presented the lowest BMC (DON×Ca, $P<0.001$). The P ATTD was higher for Ca-DON+ piglet (DON×Ca, $P<0.01$), but their RC of P was lower (DON×Ca, $P<0.001$). The Ca ATTD was higher for DON+ ($P<0.001$), but the RC of Ca was higher for Ca-DON- only (DON×Ca, $P<0.01$). After 14 days of repletion diet in phase 2, the Ca- piglets recovered their BMC deficit in DON-, but not those receiving DON+ (-12%; DON×Ca; $P=0.06$). The Ca- piglets also had increased Ca ($P<0.05$) and P ($P=0.06$) RC. The ATTD of P and Ca in Ca+DON- piglet was lower but was increased in DON+ regardless of Ca level (DON×Ca, $P<0.05$). Overall, a 13-day Ca deficiency in piglet exposed to DON increased Ca and P digestibility, but not their utilization efficiency, which prevented piglets from recovering their BMC deficit after repletion.

Welfare is the best medicine: Management strategies to prepare piglets for weaning

L. Boyle¹

¹ Teagasc, Pig Development Department, Animal and Grassland Research and Innovation Centre, Moorepark, 961x383 Fermoy, Co. Cork, Ireland

Weaning is the most stressful experience in a piglet's life. Traditionally under conventional production systems piglets are simultaneously separated from their mother (and often their siblings), experience a change in diet form and frequency and are moved to a novel environment often with unfamiliar piglets with which they must fight to establish a dominance hierarchy. This occurs at a time when the digestive and immune system are immature which increases the pigs susceptibility to growth checks, disease and antibiotic treatment. In addition to nutritional strategies there are several underutilised management strategies to reduce stress and improve pig welfare. These are characterised by preparing the pigs behaviourally and socially for the transition to the weaner stage and separating the stressors temporally. Firstly, minimising cross fostering, though challenging with large litters, is crucial to ensuring resilient pigs at weaning. EFSA's recent scientific opinion supports the End the Cage Age Initiative to ban the use of farrowing crates for sows and piglets. Free lactation crates promote faster piglet growth to weaning mediated through more space and better opportunities to learn feeding behaviour from the mother. Where sows can 'get-away' from their piglets they can initiate weaning by reducing nursing frequency and thereby accustom piglets to gradual separation from the dam. Co-mingling of suckling litters introduces piglets to unfamiliar conspecifics prior to weaning thereby eliminating their need to fight at weaning and reducing associated injury. It also enables piglets to learn appropriate social skills and to fine tune them at a younger age. Finally, providing piglets with better opportunities to satisfy their behavioural needs to play and explore the environment through provision of environmental enrichment during the suckling period reduces their likelihood of developing damaging behaviours post-weaning. Respecting pigs biological and behavioural evolution ensures good welfare which is the best preventative medicine in addressing performance and health problems for piglets caused by weaning.

Theatre 9

The effect of increased energy and amino acid levels in lactation diets on the performance of sows' piglets

S. Millet¹, S. Goethals¹

¹ ILVO, Scheldeweg 68, 9090 Melle, Belgium

During lactation, it is important for sows to consume sufficient energy for milk production. In the current study, we aimed to investigate the effect of lactation feed type on the growth performance of the sow's piglets. A group of 52 sows was divided over 2 treatment groups: 26 received a standard European feed (9.25 MJ NE, 8 g SID Lys/kg) and 26 a concentrated feed high in energy and essential amino acids (10 MJ NE, 10 g SID Lys/kg) from one week before expected farrowing date until weaning. Sows were fed restrictedly until farrowing. Then feed provision was gradually increased until ad libitum feed intake from d11 in lactation. All piglets were followed until weaning and a selection (10 per sow) until 9 weeks of age. The difference in feed type was reflected in milk composition with lower fat levels (8.1 ± 1.4 vs $8.9 \pm 1.4\%$) and higher urea levels (1012 ± 115 vs 907 ± 118 mg/L) in milk of sows receiving the standard diets. The piglets from the control group tended to be heavier at birth (1.50 ± 0.21 vs 1.35 ± 0.17 kg, $P=0.056$), but no significant effect on weaning weight was observed (7.5 ± 1.2 vs 7.2 ± 0.7 kg $P=0.327$). After weaning, the selection of piglets from the control group showed higher feed intake (537 ± 78 vs 509 ± 87 g/d, $P=0.043$) and faster gain (409 ± 65 vs 386 ± 68 g/d, $P=0.048$) compared to these from the sows receiving the concentrated diets. It can be concluded that no beneficial effect of concentrated lactation diets on the sow's offspring was observed.

Conventional farrowing crates vs. Loose housed system. Effects on performances of sows and piglets

S. Querido^{1,4}, M. Parreiras^{1,2,3}, V. Pinheiro^{1,2,3}, D. Monteiro^{1,2,3}

¹ UTAD, Zootecnia, Vila Real, 5001-801 Vila Real, Portugal, ² CECAV, Vila Real, 5001-801 Vila Real, Portugal, ³ Al4Animals, Vila Real, 5001-801 Vila Real, Portugal, ⁴ Grupo Querido, Benedita, 2475-147 Benedita, Portugal

Housing systems of sows during lactation are change from crates towards a non-restrictive systems, to improve sow welfare, but the loose farrowing systems can increase piglet mortality. In this work we carried out two trials with lactating sows and weaning piglets, 48 + 480 and 44 + 456. The two experimental treatments were the use of Conventional farrowing crates (CV) compared to Loose housing system (LS) where the sow was released 3 days after farrowing. The weight of the sows before farrowing, after farrowing and at weaning (only in the 1st trial) were measured. 24 hours after birth, the litters were placed with 14 piglets. The piglet weight at 24h, weaning (28 days) and at the end of the rearing period (63 days), the dead piglets (crushed or other causes) and the interval between weaning and estrus of sows, fertility and farrowing rates in the next cycle were also registered. The weight of sows did not differ between treatments. Also the piglets weights at diferente ages and the number of weaned piglets did not differ between the two systems. After the opening of the crates, the average number of dead crushing piglets was lower in conventional crates (0.07 vs. 0.35; $P < 0.05$), with no differences in other causes (0.22 vs. 0.39). The average weights of piglets at the beginning and at the end of rearing period, the ADG, the mortality rates and piglets removed did not differ. In the following cycle the interval between weaning and estrus, fertility and farrowing rates did not differ between sows. The farrowing system did not affected the piglets performances but increase their mortality by crushing after the opening of the crates. Funding: This work was also supported by the projects UIDB/00772/2020 (Doi:10.54499/UIDB/00772/2020) funded by the Portuguese Foundation for Science and Technology (FCT).

Poster 11

Effects of uncutting piglets tails on tail biting

S. Querido¹, M. Vieira-Pinto^{1,2,3}, M. Parreiras^{1,2,3}, D. Monteiro^{1,2,3}

¹ UTAD, Qt Prados, 5001-801 V Real, Portugal, ² CECAV, Qt Prados, 5001-801 V Real, Portugal, ³ Al4Animals, Qt Prados, 5001-801 V Real, Portugal

Tail docking is a common practice in almost all the intensive farms of pigs in Portugal and most EC countries. However, with the increasing concern for animal welfare it's no longer possible to perform it routinely as a preventive measure to tail biting. Thus, the main objective of this work was to evaluate the effects of undocked pigs (UP; n=510) and docked pigs (DP; n=510), from weaning to the end of the rearing period and fattening period on tail biting. In the rearing phase the piglets were housed in groups of 17 animals/pen (2.04m x 2.53m; 0.30m²/piglet). In the fattening a total of 953 animals entered the study (480 DP and 473 UP) were housed in groups (19 to 20 animals/pen (3.77m x 4.12m; 0.78 to 0.82m²/animal). The weaning pens had a full slatted floor in plastic and the fattening pens had a full slatted floor in concrete. In both phases, feed and water were distributed ad libitum in a "tube-o-mate" feeder between each 2 pens, with 2 drinkers. Environmental enrichment in weaning pens was achieved by placing a rope with knots and a wooden log. During the fattening phase, in each pen, a drag chain and a two wood logs. During the rearing phase, 21 UP (4.12%) and 0 DP were removed due to biting ($P < 0.0001$). For other reasons, 13 UP (2.55%) and 11 DP (2.16%) were removed ($P = 0.6795$). During the fattening phase, 17 UP due to tail biting (3.59%) and 0 DP were removed ($P < 0.0001$). Due to other causes, 11 UP (2.33%) and 4 DP (0.83%) animals were removed ($P = 0.0642$). In both phases and for all causes, 62 UP (12.16%) and 15 DP animals (2.94%) were removed ($P < 0.0001$). DP did not show any bite outbreak during their lifetime and 68.6% (350) of UP had at least one outbreak, and 34 (9.7%) were bitten a second time. Of the 350 animals affected by tail biting, 236 were victims during the rearing phase (67.4%) and 114 during the fattening phase (32.6%). In the breeding phase, 21/30 pens (70%) and, in the fattening phase, 20/24 pens (83.3%) of UP were affected. This study warns of the problem of abandoning this practice without proper precaution, even controlling the risk factors associated with tail biting as much as possible, the differences between groups throughout life were quite significant.

WelFarmers: The best practices in welfare for pigs

A. Quinn¹, P. Ferrari², J. Lorente³

¹ Teagasc, Animal & Grassland Research and Innovation Centre, Pig Development Department, Moorepark, Fermoy, P61 C997 Cork, Ireland, ² University of Bologna, Department of Economics and Agricultural Engineering, Research centre for animal production, Piazzale delle Cascine, 18-50144 Firenze, Italy, ³ 333 Corporate, C/Domenech Casamira, 3, 17500 Ripoll, Girona Spain, Italy

The WelFarmers project, included in the Horizon Europe Program commenced on the 1st of January 2024 and will be on-going for three years. Pig farmers, research centres and higher education institutions are working together from 8 different EU countries (Spain, France, Ireland, Portugal, Denmark, Finland, Romania and Italy) that represent more than 50% of the pig herd in the EU. This project is setting up eight national innovation networks and four Europe-wide networks of pig farmers, advisors, veterinarians and researchers to address the following challenges; Loose housing of lactating sows Production of pigs with non-docked tails Avoiding pain in castration Space allowance and flooring for growers and finishers The most urgent innovation needs and challenges will be identified in a bottom-up approach and the network will collect and evaluate good practices that meet these needs. The selected best practices will be disseminated through a series of communication and dissemination activities to reach pig farmers in the eight participating countries and in Europe.

Session 38

Theatre 2

Is it possible to end piglet castration forever?

L. Morgan¹

¹ PigO FoodTech, 71 Hagefen, 7079500 Qidron, Israel

There is no debate that surgical castration of piglets is unethical and impairs animal welfare. Surgical castration is a painful procedure, with long term negative implications on animal welfare, health, mortality and growth rate. Apart from the higher animal welfare, the feed conversion rate of entire males is higher than castrated by 15-20%. Feeding costs are about 55% of the growing costs of pigs, and therefore are crucial for cost-effective production. In addition, among other reasons, reduced feed intake results in reduced production of greenhouse gas emissions (for example nitrogen excretion is about 15% lower). Still, about 65% of the piglets globally are surgically castrated. The EU has been aiming to ban piglet castration since 2018. The main reason for castration is to prevent boar taint, bad odour of cooked meat, in a small percentage of the pigs. The main obstacle to banning castration and raising entire males is the lack of an efficient on-line automated system for sorting tainted meat at the abattoir. Different methods have been developed and failed to serve as an on- slaughterline solution. To date, there is one at-line method that has been commercialized. The optimal analytical method for boar taint detection needs to meet several requirements. Recently, advanced optics and artificial intelligence showed a promising direction in on-line detection of boar taint. An inexpensive, environmentally friendly solution for the pork industry, might enable ending piglet castration forever

The influence of fibre sources on tail damage in docked pigs

K. Plush¹, S. Small¹, S. Tritton¹, L. Staveley¹, R. Hewitt¹, E. Clayton², D. D'Souza¹

¹ SunPork Group, 1/6 Eagleview Place, 4009 Eagle Farm, Australia, ² NSW Department of Primary Industries, Wagga Wagga Agricultural Institute, 2650 Wagga Wagga, Australia

Dietary fibre is cited as having a role in preventing tail biting in pigs, but greater tail directed behaviour has been reported with increased fibre levels. Rats fed high fibre diets are more anxious and aggressive and have increased circulating lactic acid. Lactic acid should not be the end product of gut fermentation but dysbiosis in fermentation in young animals is more likely and coincides with risk periods for tail biting. We hypothesised that pigs fed diets with increased soluble, fermentable carbohydrates would have higher levels of tail damage. Nine week old, mixed sex pigs (n= 288, 20.3 ± 0.24 kg) were moved into 12 pens and allocated to one of three weaner diets (14 MJ/kg DE); Control- wheat/barley base (3.2% CF, 10.9% NDF, 4.0% ADF), Soy hulls- wheat/soy hulls base (6.0% CF, 14.6% NDF, 4.6% ADF) and Beans- wheat/faba bean base (3.7% CF, 10.8% NDF, 4.9% ADF). On d14, pigs were weighed and inspected for body injuries and tail damage or biting. Data were analysed with sex and diet as fixed effects and pen as a random term. Linear regression was applied to weight data, negative binomial regression to score data, and binary logistic regression to tail damage incidence. There was no significant difference between treatments in weight. Injury score tended to be higher in treatment diets (Soy hulls 1.2 ± 0.10, Beans 1.2 ± 0.10) compared with Control (0.9 ± 0.10; P = 0.087). There was no difference in incidence of tail damage or biting. We did not identify a link between increased dietary fibre and tail biting. However, the trend for higher injury score in the high fibre groups warrants investigation. In future work, faecal and circulating lactic acid will be measured, as well as behavioural tests that quantify anxiety.

Session 38

Theatre 4

Tail lesions monitoring in weaned undocked tail pigs

A. Zoratti¹, G. Chiarelli¹, A. Zuliani², M. Corazzin¹, E. Piasentier¹

¹ University of Udine, Dept. of Agricultural, Food, Environmental and Animal Sciences, Via delle Scienze 206, 33100 Udine, Italy, ² Azienda Sanitaria Universitaria Friuli Centrale, Dept. of Prevention, Veterinary service – Area C, Udine, Via Pozzuolo 330, 33100 Udine, Italy

This study aimed to evaluate the presence of tail lesions in undocked tail pigs and their evolution from post-weaning to delivery to the fattening farm. More than 60 cycles and 2 thousand weaners were examined across 8 farms, with observations conducted, by the farm veterinarian, at 3 different times post-weaning (7 days, 1 month and 2 months after weaning). The number and the severity of tail lesions have been noted as well as the pigs that were moved to the hospital pens and the losses. The statistical model considered the random effect of the "farm" factor and, in the trend analysis (repeated measures model), the "survey" within-cycle factor. The tail lesions had a peak in the middle of the monitored period, when 17.8% and 7.3% of the 8-week old weaners showed minor and severe injuries, respectively. The animals delivered to the fattening farm were 90.7% of the total original weaners, however, among them, 17.8% were animals recovered from the hospital pens or tail lesioned. The frequency and severity of tail lesions were significantly affected by the farm factor. The results achieved, despite the diversity of the phenomenon in the farms under study, have demonstrated a high incidence of biting in weaners. These findings highlight the importance of the monitoring carried out and the extreme intricacy of the "queue management" problem, especially considering the current production costs and the consequent need to optimise production results while ensuring pig welfare. The study was conducted in collaboration with Associazione Regionale Allevatori of Friuli Venezia Giulia and Veneto.

The effect of stocking density on performance, lesions and soiling

M. Aluwé¹, E. Kowalski¹, L. De Prekel^{1,2}, A. Van Den Broeke¹, S. Millet¹

¹ ILVO, Animal Science Unit, Scheldeweg 68, 9090 Melle, Belgium, ² UGENT, Unit of Porcine Health Management, Salisburylaan 133, 9820 Merelbeke, Belgium

Providing more space per pig ensures less competition at the feeder, less negative social interactions, and better use of functional space (eat, rest, defecate). This study aimed to evaluate the effect of reduced stocking density on performance, skin and tail lesions and soiling. A total of 177 pigs (Topigs TN70 x Belgian Piétrain) were randomly divided into three treatment groups: a stocking density of 1.3m²/pig (SD1.3, n=14 pens), of 1.0m²/pig (SD1.0, n=12 pens) and 0.8m²/pig (SD0.8, n=10 pens). Both half and fully-slatted pens were included. All pens had a total pen surface of 4.88 m², so the SD1.3, SD1.0, and SD0.8 pens had 4, 5 and 6 fattening pigs, respectively. Sex (barrows and gilts) was balanced within the pen. The trial started at 10 weeks of age (22.6±2.5kg) and ended at slaughter (116.6±12.6kg). Pigs were provided a commercial two-phase diet with a shift at 16 weeks of age. Individual animal weight and feed intake per pen were measured to calculate average daily gain (ADG), feed intake (ADFI) and feed conversion ratio per phase and overall. Carcass quality results were collected at slaughter. Skin and tail lesions as well as soiling of the floor and pigs were scored on 4 time points throughout the fattening period. Performance results and carcass quality were not significantly different between the different stocking densities. The minimal required surface (A) for the pigs at 116.6 kg (W) corresponds with 0.86m² ($A=k*W^{0.667}$, with $k=0.036$ if temperature is below 25°C) (EFSA, 2003), and was thus only compromised for SD0.8 at the end of the fattening period. Pen soiling was significantly higher in the pens with half-slatted floors compared to fully-slatted floors at the last time point, with no significant difference according to stocking density. Skin soiling did not differ over time nor between stocking densities, but was overall higher in half-slatted floor pens.

Session 38

Light spectrum was found to affect pig behaviour and ultraviolet B (UVB) light improved vitamin D status, however, it is unclear how these affect welfare. We studied the effects of light spectrum and UVB light on growing-finishing pigs' health and behaviour. Four light spectra were tested; warm white LED light (2594 K), forest daylight LED (4336 K), cool white LED (6235 K) and fluorescent tubes (3787 K). In each spectrum, half of the pigs received UVB light and the other half did not. The health of 224 pigs from 2 batches in 4 rooms of 4 pens was assessed weekly for tail and ear biting lesions, conjunctivitis, tear stains, body lesions, bursitis and lameness. At slaughter, blood was sampled for vitamin D analysis and the presence of post mortem abnormalities on carcasses was checked. Pigs' exploration, social interactions, play and damaging behaviour were observed biweekly for 40 minutes from videos using a 0-1 sampling method. Data were analysed using generalised linear mixed models including light spectrum and UVB and as random effects batch, room, pen, observation week and pig. Effect of light spectrum depended on the week for tear stains, conjunctivitis, body lesions and bursitis (all $p<0.05$). UVB exposure improved vitamin D status ($p<0.001$), and its effect depended on the light spectrum for ear lesions ($p<0.05$). Social behaviour was affected by a UVB and week interaction ($p<0.01$), and the effect of light spectrum on exploration tended to depend on the UVB ($p=0.076$). No light spectrum or UVB effect was found for other health, behaviour and post mortem indicators. These preliminary results show that light spectrum can influence some aspects of pig welfare.

Use of an outdoor run by group-housed sows in the mating area depending on weather conditions

S. Geisler¹, A. Van Asten², N. Kemper³, I. Traulsen¹

¹ Christian-Albrechts-University Kiel, Institute of Animal Breeding and Husbandry, Hermann-Rodewald-Straße 6, 24118 Kiel, Germany, ² Chamber of Agriculture of North Rhine-Westphalia, Centre for Agriculture Haus Düsse, Ostinghausen, 59505 Bad Sassendorf, Germany, ³ University of Veterinary Medicine Hannover, Foundation, Institute for Animal Hygiene, Animal Welfare and Farm Animal Behaviour, Bischofsholer Damm 15, 30173 Hannover, Germany

In 2021, the EU Commission announced its intention to phase out fixation for sows in estrus by 2027, while in Germany the housing standards are currently being changed to group housing. One modification to meet these standards is the addition of an outdoor run in the mating area. Therefore, a total of 263 sows were observed in 15 batches (9 sows/pen) using a camera system (first 4 days after weaning) on a commercial sow farm with a free-access outdoor run. The system continuously recorded the entire area of the outdoor run, allowing it to monitor the sows' visitation patterns. A weather station tracked hourly weather data. First results showed that in a batch with average weather conditions (T: 11.8 °C, hum: 78.4%, rain: 3.1 mm, solar radiation: 153 W/m²), peak visitation times were observed between 07:00 and 17:00, with a high number of visits recorded on the day of weaning ($p < 0.05$). Younger sows showed a higher number of visits compared to older sows ($p < 0.05$). Temperature ($p < 0.001$) and solar radiation ($p < 0.001$) influenced visits, while precipitation showed no significant effect. Further steps are to investigate the impact of extreme weather conditions on sow behavior and outdoor run use to provide insights into optimizing housing conditions for estrus sows. This study is funded by the German Federal Ministry of Food and Agriculture (BMEL) and granted by the Federal Office for Agriculture and Food (BLE; grant number 28N305603).

Study of the attractiveness and longevity of enrichment materials and wood species in a blocked farrowing house and a large gestation group setting

A. Poissonnet¹, L. Parra-Sourdeau¹, V. Courboulay¹

¹ IFIP - French Pig&Pork Institute, Animal Husbandry, 9 Boulevard du Trioux, 35740 PACE, France

Two trials were conducted at the IFIP experimental station to provide farmers information to choose suitable equipment. The first trial lasted four weeks was performed in a blocked farrowing house with three groups of 24 sows each. For each group, four solutions were tested: a chewable cylinder, wooden slats fixed to the floor (named octopus), a wooden slat and a natural rubber object fixed in front of the sow. Each week, the objects were rearranged to ensure that all sows in the group were exposed to all four enrichment materials. Behaviour was monitored twice a week using scan sampling for two hours each time, and the rate at which the materials degraded was measured by weighing them. During the observation, the octopus were used 8.9% and the rubber object 10.3%. It is significantly more than the other objects (the chewable cylinder : 3.9% ; wooden in the front of the sow : 5.7%). Additionally, there was greater interindividual variability in the use of the rubber object than that of the octopus. These objects were preferred due to their size, composition, and accessibility, which were better suited for expressing investigative behaviours. The second trial was performed in a dynamic group of 72 pregnant sows to compare the attractiveness and durability of slats made from four wood species: Scots pine, maple, beech, and oak. The trial lasted for three months, during which the duration that sows used each type of slat was measured weekly during a continuous two-hour and a half observation period. The degradation rate of the wood species was assessed based on how frequently the wooden slats needed to be replaced. Scots pine was used on average 80.2% of the observation. It is significantly more than maple (16.1%), beech (20.5%) and oak (19.8%). All objects were mainly chewed. As Scots pine is softer, it degraded more rapidly, which required six times more frequent replacement.

Evaluating the impact of enrichment material in farrowing pens on sow and piglet performance

M. Cupido^{1,2}, *S. Mullan*², *L. Boyle*¹, *K. O'Driscoll*¹

¹ *Teagasc, Pig Development Department, Moorepark, P61 P302 Cork, Ireland,* ² *University College Dublin, School of Veterinary Medicine, Belfield, D04 V1W8 Dublin 4, Ireland*

Farrowing crates (FC), common in Ireland, are used to protect against piglet mortality and ease handling, but limit the sows' expression of natural behaviour due to restricted movement and often minimal enrichment. Loose manipulable material could provide an outlet for nesting behaviour prior to farrowing, and investigatory behaviour during lactation, improving sow welfare. However, it is important that any associated gut fill does not lower sow feed intake, which could have negative effects on milk yield, back-fat, and piglet performance. This study investigated the impact of providing three loose materials to sows in conventional FC; Straw (n = 12), Haylage (n = 14), and Hay (n = 14), and a control (Rope; n = 14). Sow performance, feed intake, and tear stain scores, and piglet average daily gain (ADG) and weaning weights were evaluated. Loose material was provided via a metal box attached to the side of the feed trough for oral extraction, and refilled twice daily if at least half empty. In the Rope pens, a hessian rope was hung on the side of the FC, within easy reach of the sow's mouth. Fifty-four healthy sows, balanced by weight, backfat and parity, were assigned to a treatment one day prior to entering the farrowing room. Sow feed intake was recorded daily during lactation, and locomotion and back-fat scores taken at weaning. Tear stain scores were taken prior to farrowing, one week post-farrowing, and at weaning. Piglets were weighed at birth and weaning to calculate ADG. None of the measurements taken were affected by treatment. Thus providing loose material in the farrowing pens throughout lactation did not appear to inhibit feed intake due to gut fill, or impair sow or piglet performance.

Session 38

Theatre 10

Positive effect of nesting material on crushing losses in free farrowing pens with short-term fixation

*J. Wahmhoff*¹, *N. Kemper*², *A. Van Asten*³, *I. Traulsen*¹

¹ *Christian-Albrechts-University Kiel, Institute of Animal Breeding and Husbandry, Hermann-Rodewald-Straße 6, 24118 Kiel, Germany,* ² *University of Veterinary Medicine Hannover, Foundation, Institute for Animal Hygiene, Animal Welfare and Farm Animal Behaviour, Bischofsholer Damm 15, 30173 Hannover, Germany,* ³ *Chamber of Agriculture of North Rhine-Westphalia, Centre for Agriculture Haus Düsse, Ostinghausen, 59505 Bad Sassendorf, Germany*

Aim of this study was to investigate the effect of organic nesting material on piglet crushing. The study was carried out on a farm in Northern Germany where farrowing systems with a short-term fixation (2 days a.p. until approx. day 7 p.p.) and a pen area of 7.0 m² were installed. In 11 batches, the sows were provided with straw (n = 67) as nesting material in a permanently accessible rack from gestation day 112 until birth. Jute bags were offered in the control pens (n = 71). Results show that the straw group has significantly lower total crushing losses and crushing losses within the first three days p.p. compared to the control group (jute bags: 7.37%/6.15 %, straw: 5.91%/3.34 %). It is also striking that in the straw group only about half of the crushing losses occurred within the first three days p.p., whereas in the control group almost all crushing losses happened during this period. These data suggest that offering straw influences the event of crushing losses, resulting in a continuously decreasing risk of crushing. This is probably the result of a change in the behavior of the sows in connection with the supply of straw, which is currently being verified using video recordings. This work is funded by the German Federal Ministry of Food and Agriculture (BMEL) based on a decision of the Parliament of the Federal Republic of Germany, granted by the Federal Office for Agriculture and Food (BLE; grant number 28N305603)

Can black soldier fly live larvae improve postweaned piglets' welfare?

S. Belperio¹, G. Martelli¹, M. Meneguzzi², E. Nannoni¹, D. Ventrella¹, N. I. Vannetti¹, N. Govoni¹, L. Sardi¹

¹ University of Bologna, Department of Medical Veterinary Sciences, Via Tolara di Sopra 50, 40064 Ozzano Emilia, Italy, ² BEF Biosystems, Strada di Settimo 224/15, 10156 Torino, Italy

We tested the effects of black soldier fly (BSF) live larvae administration on some growth and welfare indicators of weaned piglets. Forty-eight piglets were distributed in pens of 6 and allotted either to control (C, kept in standard commercial conditions) or to live larvae group (LL, receiving 300-600g/pen/day of BSF LL as a supplement). The trial lasted 40 days. Growth parameters were recorded and behaviour was video recorded every 10 days. Body and tail lesions were assessed using the Welfare Quality protocol and hair cortisol was quantified as a chronic stress indicator. Data were submitted to ANOVA using the group as a fixed effect and the pig as a random effect. Average daily gain was 0.53 in C and 0.52 kg in LL, average lesion and tail scores were 0.58 and 0.12 in C, and 0.23 and 0.00 in LL ($P > 0.05$). Video analysis showed that LL piglets spent 14% of the observed time interacting with larvae, reducing time spent at the feeder (16.6 vs. 21.9%, $P < 0.001$), interacting (neutral interactions 5.1 vs. 8.7%, $P < 0.01$; aggressive interactions 2.3 vs 3.5%, $P < 0.05$), manipulating the enrichment (hanging wooden or chains, 1.2 vs. 2.3%, $P < 0.05$) and biting the tail of their pen mates (0.0 vs. 0.5%, $P < 0.05$) compared to C. Hair cortisol was tendentially lower in LL (8.1 vs. 10.9 pg/mg, $P = 0.051$). Pending more extensive behavioural observations, our results indicate that BSF LL administration can improve animal welfare by shifting the exploratory behaviour from the body of pen mates and pen equipment to larvae. No significant effect in terms of lesion score reduction was observed, but hair cortisol showed tendentially lower chronic stress levels. Supported by EU grant n°J83C22000830005-AGRITTECH research programme.

Session 38

Poster 12

Effects of deck height during transport of weaners: in-vehicle conditions and clinical indicators

L. Foldager^{1,2}, K. Thodberg¹, G. Chen³, J. K. Kristensen⁴, L. D. Jensen¹, M. Kaiser¹, C. Kobek-Kjeldager¹, L. Rong³, M. S. Herskin¹

¹ Aarhus University, Animal and Veterinary Sciences, Blichers Allé 20, 8830 Tjele, Denmark, ² Aarhus University, Bioinformatics Research Centre, Universitetsbyen 81, 8000 Aarhus, Denmark, ³ Aarhus University, Civil and Architectural Engineering, Inge Lehmanns Gade 10, 8000 Aarhus, Denmark, ⁴ Aarhus University, Electrical and Computer Engineering, Blichers Allé 20, 8830 Tjele, Denmark

We aimed to examine if deck height affected in-vehicle conditions (temperature and CO₂ concentration as indicators of ventilation) when weaners are transported at stocking densities corresponding to EU-regulation, and to examine consequences in terms of mortality, weight loss, and post-transport skin lesions for pigs at 20-25 kg. We performed two field trials consisting of 32 semi-controlled journeys under conditions modelling commercial Danish practice; half of 8 and 23 h, respectively, run in warmer and colder periods from June 2021 to March 2022. Deck heights of 60 vs 80 cm (trailer) and 70 vs 90 cm (truck) were compared. We collected a mixture of sensor time series, GPS records, weather data from a public online source, clinical examination of focal animals, and various information on settings like opening of ventilation shutters and animal stocking density. Data were analysed by (generalised) linear mixed effects models. Lower deck height had only sporadic and minor effects on the indicators examined. Horizontal differences in temperature and CO₂ concentration were detected among vehicle compartments. In the colder period, large differences were found between study sensors placed close to the pigs and embedded temperature sensors placed in the outer wall of the vehicle. Thus, the livestock driver may be misinformed by information from embedded sensors and left with limited chances of adjusting conditions; being examined further by a follow-up study.

Determination of social interactions in a group of gestating sows based on location, posture and orientation
A. Blanc¹, M. De La Bourdonnaye¹, V. Courboulay², A. Poissonnet², N. Quiniou², J. Thomas², C. Gaillard¹
¹ INRAE, Institut Agro, PEGASE, 35590 Saint-Gilles, France, ² IFIP - Institut du porc, 9 boulevard du Trieux, 35700 Pacé, France

To study social interactions, it is necessary to identify individuals, their posture and their relative proximity. More precisely, the orientation of the two protagonists in relation to each other through 3-point vectorization (snout, neck, tail) provides information about the valence of the interaction (positive or negative). A study was carried out to assess the value of this approach for detecting positive and negative social interactions. Two pens of 13 gestating sows were studied during two consecutive gestations, with 3 cameras installed above each pen. For each pen and gestation, videos collected from 00:00 (feeding time) to 02:00, on days 30 and 103 were manually analysed. The number of interactions and their valence (positive vs. negative) were collected continuously, as well as the location in the pen, the posture of both sows involved and their orientation during the interaction (snout-snout, snout-tail...). The valence of the interaction was analysed using a generalized linear mixed-effect model with location, orientation and posture of both sows as fixed effects. Positive interactions were mainly observed in resting areas ($P < 0.001$) and negative interactions mainly in the feeding area ($P < 0.05$). Positive interactions were more of snout-snout and snout-tail (sniffing the ano-genital area) types, and negative interactions were more of head-head and head-body types ($P < 0.001$). Recipient sows were more lying during positive interactions than during negative ($P < 0.01$). These results suggest that variables such as location, orientation and posture provide useful information about the valence of interactions. Work is currently underway to develop automatic detection of these parameters using image analysis.

Strategies for minimizing dust in straw-based-systems for pigs
I. Mösenbacher-Molterer¹, M. Kropsch¹, E. Zentner¹, B. Heidinger¹, C. Auinger²
¹ HBLFA Raumberg-Gumpenstein, Institute Animal, Technologies and Environment, Raumberg 38, 8952 Irdning-Donnersbachtal, Austria, ² Schauer Agrotec GmbH, Passauer Straße 1, 4731 Prambachkirchen, Austria

Dust concentrations in straw-based systems for pigs repeatedly cause respiratory problems due to increased dust levels. To determine the reduction potential, an automated litter and dust removal technology was tested in a multi-year trial in a functionally separated animal welfare stable for fattening pigs. The values of reducing dust allow conclusions about the good effectiveness of straw dedusting using a Strohmatic Welfare system as well as the additional dosage of an oil-containing substance using a low-pressure spray system. Through extensive monitoring over a period of 1.5 years, seasonal trends were recorded. The daily course of the dust mass concentration and the number of dust particles is in any case influenced by the activity of the animals as well as the frequency and type of littering processes. Particle counts tended to be higher in fall/winter (reduced air rate, air moisture content), with statistical significance in terms of season and particle counts. The number of particles was clearly distinguishable under different measuring conditions (manual litter with/without oil, automated litter and dedusting with/without oil, automated litter without dedusting). To test a new type of straw dedusting (Strohmatic Light) and the influence of oil spraying on dust pollution (AirCleaner low-pressure oil spray system) in the room air, a comparison of variants over several days was carried out in a follow-up measurement in a dislocated stable building for fattening pigs. The excellent effect of the oil application was once again confirmed. In summary, the avoidance and binding of dust is seen as an indispensable component in the lying area. In terms of labor management, innovation and automation in the animal sector, as well as to mitigate quality defects in bedding materials, the best available technology is clearly a mixture of oily substances and simultaneous automation of the bedding process to prevent respiratory diseases caused by particulate matter in humans and animals.

Building sustainable systems at the era of farm-to-fork and agroecology: Unraveling the interplay of quality attributes of animal-source foods

B. Lebret¹, M. Gagaoua¹, C. Van Baelen¹, S. Prache²

¹ PEGASE, INRAE, Institut Agro, 35590 Saint-Gilles, France, ² INRAE, Université Clermont Auvergne VetAgro Sup, UMRH, 63122 Saint-Genès-Champagnelle, France

The quality of animal-source foods includes safety, commercial, sensory, nutritional, technological, convenience attributes and societal image. The latter, also referred to as extrinsic quality, covers ethical, cultural and environmental dimensions related to animal farming and product's processing. All these attributes can be improved, but also impaired, along the value chain from the farm (breed/genotype, farming system and practices) through slaughtering and processing conditions, up to consumption. Some antagonisms between quality attributes have been identified in pork, lamb and poultry. For example, grazing is favorable to image and lamb meat nutritional quality, but increases the risk of off-flavors. Solutions are sought to overcome these tensions. In organic pig farming, feeding can help solve the issue between animal welfare (avoiding males' castration) and sensory quality (reducing boar taint risk). There are also synergies between farming practices. For instance, combining breeding and feeding strategy improves sensory and nutritional quality of pork, while reducing its environmental impact through the relocation of feed resources. The interactions between animal genotype, farming and processing practices are also the root for the high sensory quality and typicality of Geographical Indications products. Quality of animal-source foods is thus part of, and a lever towards sustainable livestock systems. Quantitative assessments of antagonisms and/or synergies among quality attributes, using multi-criteria approaches from a Global Quality perspective, are pivotal to identify pathways for sustainable systems.

Session 39

Theatre 2

Dairy Milk vs Plant-Based Milk Alternatives: Exploring Fat Nutritional Indices in Retail Products

G. Papatzimos¹, Z. Basdagianni², M. A. Karatzia³, P. Mitlianga⁴, E. Kasapidou¹

¹ University of Western Macedonia, Department of Agriculture, GR, 53100 Florina, Greece, ² Aristotle University of Thessaloniki, Aristotle University of Thessaloniki, School of Agriculture, Department of Animal production, GR, 54124 Thessaloniki, Greece, ³ HAO-Demeter, Research Institute of Animal Science, GR, 58100 Paralimni, Greece, ⁴ University of Western Macedonia, Department of Chemical Engineering, GR, 50100 Kozani, Greece

While milk remains a dietary staple, the popularity of plant-based milk alternatives (PBMA) is increasing. Limited data on nutrient profile at retail level and few comparative studies prompted research on nutritional indices in dairy milk (cow and goat) and PBMA. Samples included 7 cow milk, 8 goat milk, and 14 PBMA (7 almond, 4 oat with seeds/nuts, 1 rice with coconut, 1 pistachio). Fatty acid composition was assessed as follows; polyunsaturated to saturated fatty acids ratio (PUFA/SFA), atherogenicity index (AI), thrombogenicity index (TI), and hypocholesterolemic to hypercholesterolemic fatty acid ratio (h/H). Differences between groups were determined using ANOVA test. Significant differences ($P > 0.001$) among the groups (cow, goat, PBMA) were observed across all indices. PUFA/SFA ratio exceeded the recommended value of 0.45 in PBMA (1.86) whereas it was very low in cow and goat milk (0.06 for both). PBMA exhibited lower AI (0.56) compared to dairy milk, which approached the recommended value of 3 (2.66 for cow, 2.45 for goat). Similarly, PBMA had lower TI (0.48) compared to dairy milk, which surpassed the recommended value of 3 (3.55 for cow, 3.23 for goat). The h/h ratio was notably higher in PBMA (8.45), while cow and goat milk showed lower values (0.55 and 0.62, respectively). Despite better nutritional indices, ongoing research is crucial as the commercial variety of PBMA is continuously expanding. Additionally, a comprehensive assessment of the nutritional value of PBMA necessitates research on parameters such as mineral and vitamin content, as well as anti-nutrient factors.

Case study of the market situation of calves from Alpine dairy farms and the effect of dams' grazing during the last three months of gestation on auction parameters

T. Zanon¹, L. Degano³, M. Gauly¹, P. Sartor², G. Cozzi²

¹ Free University of Bolzano, Faculty of Agricultural, Environmental and Food Sciences, Piazza Università 5, 39100 Bolzano, Italy; ² University of Padova, Department of Animal Medicine, Production and Health, Viale dell'Università, 16 35020 Legnaro (PD), 35100 Padova, Italy; ³ Associazione Nazionale Allevatori Bovinidi Razza Pezzata Rossa Italiana - A.N.A.P.R., Via Ippolito Nievo, 19, 33100 Udine, Italy

The main aim of the study was to assess the recent evolution of cattle breeding in Alpine areas based on the number, quality and price of calves sold at local auctions in the South Tyrol region over the last decade, as case study. In addition, the effect of grazing during dam's late gestation on calves' auction quality was investigated to assess whether the inclusion of pasture in Alpine production system has an impact on auction parameters of calves beside its well-known positive effects on cattle welfare and the environment. Similarly, to other geographical areas, the study revealed that the numbers of crossbred calves (especially from specialised dairy breeds) has increased over the last years also in the Alpine area, because of more targeted breeding plans with an intensive use of beef bulls' semen. Further, purebred calves from dual-purpose breeds (Simmental, Alpine Grey, Pinzgauer) received a higher remuneration in terms of price and market value at auction than purebred calves from specialised Holstein Friesian and Brown Swiss cows. A part of these animals could be available to support an innovative alpine meat supply chain which, if grass-fed, could further strengthen the current landscape maintenance service provided by the mountain livestock husbandry. Dams grazing during the last 90 days of gestation had a limited negative effect on calves' liveweight and quality traits at auctions.

Session 39

Theatre 4

Truly superior? Consumer ratings of meat from an endangered German pig breed

A. Olschewsky¹, D. Hinrichs¹, D. Mörlein²

¹ University of Kassel, Animal Breeding Section, Nordbahnhofstraße 1a, 37213 Witzenhausen, Germany; ² University of Göttingen, Department of Animal Sciences, Kellnerweg 6, 37077 Göttingen, Germany

The endangered German Angler Saddleback pig (AS) is said to have a high palatability of the meat for its increased carcass fatness as compared to modern genotypes while scientific evidence is low. Therefore, this study sought to reveal consumers' appreciation of AS meat versus more commercially (CO) used breed types. All pigs were fattened at a performance testing station until an average slaughter weight of 102 kg. AS had outdoor access, received a restricted diet reduced in energy and protein, and were offered silage daily. CO had no outdoor access and received a standard diet. Upon electrical stunning, pigs were slaughtered and loin muscles of eight pigs per breed type were dissected 24 hours post mortem. A total of 81 consumers each received two products of both AS and CO to rate their liking of appearance, taste and overall liking using nine-point hedonic scales. Samples were served monadically in a blocked, randomized order. First, 4×4 cm pieces of only lean meat (LM) of both breed types were served followed by steaks (SK) with adjacent subcutaneous fat standardized to about 1 cm. Samples were fried to a core temperature of 70 °C using contact grills. On average, overall liking was higher for CO than for AS ($p=0.01$). Appearance of LM was rated better than SK ($p<0.01$). In contrast, taste liking was neither affected by breed type, type of presentation nor their interaction. Overall, these results do not support that AS meat is unanimously superior. Consumers' depreciation of visible fat is considered a marketing challenge for fatty breeds like AS. Additional analyses that also account for consumer demographics and attitudes towards pork might further explain these preliminary findings.

Informing about higher levels of animal welfare increases sensory consumer liking of pork

N. Gier¹, R. Harms¹, D. Moerlein²

¹ Heinrich-Heine-Universität Düsseldorf, Universitätsstraße 1, 40225 Düsseldorf, Germany, ² Georg-August-Universität Göttingen, Kellnerweg 6, 37077 Göttingen, Germany

This double-blind consumer (n=300) study confirms that, labeling livestock husbandry levels positively affects consumers' sensory perception even when the meat is physically identical and experiment-related confounding factors are ruled out. Herein, loin steaks were obtained from pigs (same breed, same diet) raised under different conditions according to the German husbandry level system (haltungsform.de) HL1 (conventional) vs. HL3 (outdoor access). Four within-subject conditions were randomly tested: a blind-tasting of HL1 vs. HL3 (control pure, CP), a blind-tasting with both products being HL3 (control identical, CI), an informed-tasting with correctly labeled HL1- and HL3-products (control original, CO), and an informed-tasting with both products being HL3 but labeled as HL1 vs. HL3 (placebo, PL). Prior to tasting, participants received information on pig husbandry levels to ensure a common level of knowledge. Liking was recorded for various sensory attributes (appearance, odor, taste, palatability, aftertaste, overall impression) using 9-point hedonic scales. In result, both blind tastings (CP and CI) revealed no significant difference in any attribute indicating similarity between meat from different husbandry levels when undisclosed. Yet, when the actual husbandry level of the meat being tasted was informed about (CO), consumer liking for the HL3-meat compared to the HL1-meat was higher ($p \leq .001$) with the difference potentially caused by factual product differences. While the placebo condition (PL) eliminated this confound the higher ($p \leq .001$) liking of HL3-(vs. HL1) meat persisted. This marketing placebo effect of labeling livestock farming conditions on consumer liking of meat is potentially moderated by individual morality. Overall, the findings demonstrate the importance of credence quality attributes such as livestock farming conditions and animal welfare for consumers' perception of quality. Hence, husbandry systems ensuring higher levels of animal welfare are considered a chance for increased consumer appreciation of animal products.

Session 39

Theatre 6

Implementing sustainability frameworks on product level- exploring the usability

A. Woodhouse², B. Aspeholen Åby¹, H. Fjerdingsby Olsen¹

¹ Norwegian University of Life Sciences (NMBU), Elizabeth Stephansens v. 15, 1433 Ås, Norway, ² NORSUS Norsk institutt for bærekraftsforskning AS, Stadion 4, 1671 Oslo, Norway

Social and environmental sustainability are inherently complex and interconnected. They involve multiple dimensions, such as economic development, social equity, human rights, environmental conservation, and cultural preservation. Developing a framework that adequately addresses the diverse and interrelated aspects of both social and environmental sustainability can be challenging. Several methodologies for assessing both environmental and social sustainability exist such as SAFA, INSPIA, SAI for farm level. The product level frameworks have not been implemented in practice on a large scale and have not been extensively evaluated. Hence our aim was to explore the usability of two relevant frameworks adaptable on product level. The framework selection was based on multiple selection criteria, including the integration of environmental and social metrics and proven real-world application. Subsequently, these frameworks were applied in case studies of Norwegian milk and Norwegian greenhouse-grown tomatoes. Our findings highlight the introduction of new biodiversity-related metrics and the incorporation of new social considerations. However, challenges related to context-specificity and cultural diversity as data availability and quality emerged as crucial factors in assessing food sustainability at the product level. Additionally, our findings underscore the necessity for a common scale or standard to facilitate comparisons among food products within and across categories.

Economic sustainability and resilience of extensiveness in fattening pig farms

L. Giglio¹, P. Ferrari¹¹ CRPA Research Centre for Animal Production, Agricultural Engineering and Economics, Viale Timavo 43/2, 42121 Reggio Emilia, Italy

The modern consumer expects more and more quality food animal origin, which they generally associate with extensive farming systems. This perception exists for all species, but it is particularly strong for pigs, which in most cases are housed in intensive farming systems. Within the mEATquality project, innovative strategies were developed to meet new societal demands, environmental requirements and economic needs of entrepreneurs. The project proposes and follows a step-by-step analysis strategy considering the extensiveness factors of pig production as a key point. These data were collected from conventional, free-range and organic farms and processed using standardised sustainability assessment protocols. Data collected from farms in Denmark, Italy, Poland and Spain provided a general description of the farm, highlighted key environmental and animal welfare issues and provided economic and productivity information on the farm. The economic protocol was useful to collect fundamental information to understand the economic performance and its variability according to the different degree of extensiveness of pig farms. To this end, a set of economic indicators was calculated, such as production costs, feed costs per head, farm income per labour unit, returns on capital and technical efficiency of the production process. In addition, the economic resilience of the pig farms was assessed, based on specific qualitative indicators, designed to describe the 'power' of the entrepreneur within the value chain, his entrepreneurial skills, training and innovation willingness and the resilience of farm resources.

Session 39

Theatre 8

Green willow biomass as feed source for pigs

A. G. Kongsted¹, S. Ugilt Larsen¹, L. Dinesen Jensen¹, K. Horsted¹, M. Eskildsen²¹ Aarhus University, Agroecology, Blichers alle 20, 8830 Tjele, Denmark, ² Aarhus University, Animal and Veterinary Sciences, Blichers alle 20, 8830 Tjele, Denmark

Background: Farmers integrate trees such as willows (*Salix* spp.) into outdoor pig systems to enhance animal welfare, carbon sequestration, nutrient capture, and biodiversity. However, the potential for these trees to support feed self-sufficiency has been overlooked. While previous research has demonstrated the nutritional advantages of green willow biomass for ruminants, its suitability for pigs has not been thoroughly investigated. Objective: To investigate green willow biomass as a feed source for fattening pigs and gestating sows. Methodology: Willows were coppiced during the dormant season, and the regrowth of shoots with leaves were either a) directly foraged by fattening pigs as fresh matter from May to July or b) harvested in June, ensiled, and subsequently fed to gestating sows during the following winter season. Green willow biomasses were analyzed for dry matter (DM), metabolic energy (ME), crude protein (CP), and amino acid content (including lysine and methionine). Additionally, pigs' performance (e.g. live weight and back fat gain) and voluntary intake of willow biomass were assessed. Results: The fresh and ensiled green willow biomass showed DM contents ranging from 21% to 28%. CP content (of DM) varied from 13% in silage (a mixture of leaves and shoots harvested in June) to 26% in leaves harvested in May. Preliminary findings suggest high palatability of willow biomass when foraged directly or harvested/ensiled early in the growing season (May-June). Conclusion: Green willow biomass is a potential protein source for pigs. Future research should prioritize strategies aimed at exploiting the multifunctional role of trees within outdoor pig systems while supporting farm feed self-sufficiency.

Organic pig farming: from feeding strategy to meat organoleptic quality

C. Van Baelen¹, E. Vossen², L. Montagne¹, A. Prunier¹, S. De Smet², B. Lebre¹

¹ PEGASE, INRAE, Institut Agro, 35590 Saint-Gilles, France, ² Ghent University, Laboratory for Animal Nutrition and Animal Product Quality, B-9000 Ghent, Belgium

Pig diet is one of the major factors from farm to fork determining pork quality attributes, including organoleptic traits (appearance, texture, flavour and odour). An experiment was conducted with 77 organic uncastrated male pigs (Piétrain x Large White) in two batches in time, each divided in two groups. One group received a control diet (C) corresponding to the organic specifications. The other group received a test diet (Bio+), mainly based on French raw materials, containing more fibre (Faba bean) and omega-3 fatty acids (linseed, camelina) and had access to forage. Each group was reared in one pen in the same building on deep straw bedding with free outdoor access and fed ad libitum until slaughter. Meat was analysed by a trained sensory panel and by SPME-GC-MS to identify the main odor-active volatile compounds. Meat was lighter ($P < 0.05$) and had a more intense red colour ($P < 0.1$) in Bio+ than in C pigs. Meat from Bio+ pigs had a lower aromatic persistence ($P < 0.05$), whereas odour intensity, tenderness and juiciness did not significantly differ between the groups. None of the samples were qualified as boar tainted by the panellists. Identified volatile compounds belonged to aldehydes, hydrocarbons, alcohols and ketones. Of the 29 compounds identified, 10 had a prevalence of over 50%, with the same proportion in C and Bio+ pigs. Only two compounds, benzaldehyde (almond odour) and heptanal (fatty odour) were found in all samples. Finally, the Bio+ diet influenced some sensory properties but did not modify the odour, flavour or aromatic profile of pork. A joint analysis of the volatile profile and sensory data is planned as part of the global-quality approach.

Land use efficiency to protein production of French dairy cattle contrasted in their feeding systems

M. Allix^{1,2}, B. Rouillé², R. Baumont¹

¹ INRAE, UMR Herbivores, 63122 Saint-Genès-Champagnelle, France, ² Idele, Monvoisin, 35650 Le Rheu, France

Livestock production occupies 56% of agricultural land in France and raises the question of efficient land use, as a component of environmental sustainability. The Land Use Ratio (LUR) is the ratio of the potential for plant protein production on land used for livestock production, both on-farm and off-farm for purchased feed, to the animal protein produced on the same land. A LUR of less than 1 indicates that animal production is more efficient than crop production. Two ways of expressing the quality of plant and animal protein in the LUR calculation have been proposed: 1) using total digestible protein (van Zanten et al., 2016), 2) using the edible fraction of plant and animal proteins and their respective digestible indispensable amino acid score (DIAAS) (Hennessy et al., 2021). The LUR was applied to 12 case studies of French dairy farms with different feeding systems: grass-based, mixed and maize-based. Animal protein production was compared with a 6-year crop rotation: wheat, maize, faba bean, rapeseed, wheat and lupin. Grass-based systems use more land per kg of protein produced than mixed and maize-based systems (78.6 ± 13.6 , 53.0 ± 11.4 and 33.6 ± 5.4 m².kg⁻¹, respectively). However, because they use a high proportion of non-arable grassland (66% of the total area used), grass-based dairy systems are more efficient for protein production than mixed and maize-based systems (LUR according to van Zanten of 0.91 ± 0.62 , 2.69 ± 1.37 and 2.29 ± 0.63 , respectively; LUR according to Hennessy of 0.37 ± 0.26 , 0.98 ± 0.46 and 0.81 ± 0.22 , respectively). Dairy systems with a high proportion of non-arable grassland are more efficient at producing human-usable protein than crops (LUR < 1 according to both methods of calculations). Moreover, considering the quality of proteins through the edible fraction and the DIAAS score, which indicates the suitability of the amino acid profile of proteins, significantly reduces LUR values of dairy cattle systems (LUR < 1 according Hennessy) and therefore improves their land use efficiency assessment. This may influence the comparison between animals and crops in sustainability assessment.

Characterization of small egg producers in the O'Higgins region, Chile

P. Toro-Mujica¹, F. Gálvez¹, J. Aldana¹, P. Lisboa¹

¹ Universidad de O'Higgins, Instituto de Ciencias Agroalimentarias, Animales y Ambientales, Ruta I-90, Km 1, 3070000 San Fernando, Chile

A survey was conducted to evaluate the perception of egg quality and small egg production farms in the O'Higgins region. This survey involved 91 farmers and included 27 questions in three sections: i. Sociodemographic characteristics, ii. Farms characteristics, and iii. Egg quality. The analyses involved an ANOVA test, the comparison of means for quantitative variables, frequency tables, and Chi2 tests for qualitative variables. Among the farmers, 81.3% were women with an average age of 57±12 years. No significant differences were found between the ages of women and men. No significant differences in the educational level were found due to gender; however, a relationship was observed with age ($p < 0.001$), indicating that younger farmers had a higher percentage of professional education. On average, farms maintained 186±280 layers, with 54.4% having fewer than 100 laying hens. Daily production averaged 136±230 eggs, with a laying percentage of 77.9±46.6%. Regarding marketing, 40% of producers exclusively sold at home, while 72% made additional sales at free fairs, warehouses, local markets, or supermarkets. Hens were housed in cages in 4.3% of the farms, while 78.5% used balanced rations, 31% employed temperature control, and 49.5% used light management. Size was the most used variable to classify eggs, followed by freshness. Farmers prioritized characteristics associated with egg quality, including shell cleanliness, egg flavor, and freshness, while yolk color was less important. The prevalence of female producers and their relatively advanced age should be taken into account when considering policies and activities for the agricultural development of egg production in the region.

Session 39

Theatre 12

Farm level economic effects of introducing forage crop silage in the feed regimen to fattening pigs

M. Presto Åkerfeldt^{1,3}, E. Owusu Sekyere², J. Friman³, S. Zira¹, H. Hansson²

¹ RISE, Dept. Agriculture & Horticulture, Ultunaallen 4, 75651 Uppsala, Sweden, ² SLU, Dept. Economics, Box 7013, 75007 Uppsala, Sweden, ³ SLU, Dept. Applied Animal Science and Welfare, Box 7024, 75007 Uppsala, Sweden

Introducing biomass from locally produced rotational grass-clover by adopting an alternative feed strategy in pig diets reduce the climate impact and have the potential to improve farm profitability. However, the size of this potential in practical pig farming is not yet well studied. The economic effects of including forage crops in the pig diets of a typical conventional and organic pig production in Sweden was therefore evaluated. A farm simulation model was built for assessing the farm level economic effect of including forage crop silage in the pig diets as part of a total mixed ration (TMR) in a typical conventional and organic pig farm in Sweden. A partial budgeting framework with stochastic elements was used to analyse the farmers' decision-making on the farm income. Results showed that despite an observed increase in investment and operational cost, farmers attain some increment in net income in both the conventional and organic systems. The increase in net income was 13% and 34% higher than the increase in investment and operational cost for including silage in the conventional and organic systems respectively and was associated with extra income obtained for high lean meat content, reduced cereal feed intake and surplus silage sold. Giving these potential economic gains, investments in the conventional and organic pig farming system could be expected since there is private economic reason for farmers. Reflecting the high initial investment costs for reconstructing or adapting the building and feeding system to fit the new feeding regime, investment support from public policy for the reconstruction of pig housing needs to be considered.

Evaluation of milking attitude and milk quality in native Ciuta sheep breed

A. Lopez¹, B. Marcolli¹, M. Greco¹, S. Mattiello², V. M. Moretti¹, F. Bellagamba¹

¹ Università degli Studi di Milano, Department of Veterinary Medicine and Animal Science, Via dell'Università, 6, 26900 Lodi, Italy, ² Università degli Studi di Milano, Department of Agricultural and Environmental Sciences, Via Celoria, 2, 20133 Milano, Italy

The Ciuta sheep is a small, local breed native to the Central Italian Alps. While primarily raised for meat production, there is historical documentation of its traditional use for cheese production. This aspect could provide valuable insights into the sustainable utilization of this local breed in Alpine farms. Consequently, this study aimed to characterize for the first time the quality of Ciuta's milk. The experiment was conducted at one sheep farm located in Valtellina, Lombardy. A flock comprising 11 ewes and their lambs was utilized and housed in a single barn equipped with a catch feeder. All ewes were subjected to the same management system, involving lambing in late December-January followed by lamb suckling until the initiation of the trial (February), when ewes were at 49 ± 8 days of lactation on average. The ewes were manually milked once a day in the morning, and following the morning milking, lambs were allowed to remain with their mothers until late afternoon. Throughout the day, the flock grazed on native pasture, while during the night, they were housed in shaded open pens. Additionally, the ewes were provided with local hay ad libitum and supplemented with 200g/sheep/day concentrate during milking. Sheep behaviour was recorded during milking sessions twice a week, aligning with the days designated for milk sample collection. Furthermore, udder conformation scores, encompassing udder suspension, udder height, and teat placement, were documented for each ewe. Milk production was recorded and individual samples of milk was dispatched to the accredited laboratories of ARAL (Regional Association of Farmers) for compositional analysis, conducted in accordance with official methods (ISO 9622:2013, IDF141). Additionally, the fatty acid profile of milk samples was determined by gas chromatography in our laboratory. Preliminary findings revealed average values of 3.9g/100g for fat, 5.5g/100g for protein (including 4.1g/100g of casein), 4.8g/100g for lactose, 91.7×10^3 somatic cell count (SCS), and 35.6 mg/dl for urea.

Milk production in Rubia Gallega suckler cows: estimation methods and correlation with morphological and anatomical measurements

T. Moreno¹, C. Montes², S. Crecente³

¹ Centro de Investigaciones Agrarias, Aptdo.10, 15080 A Coruna, Spain, ² Centro de Investigaciones Agrarias, Aptdo.10, 15080 A Coruna, Spain, ³ Centro de Investigaciones Agrarias, Aptdo.10, 15080 A Coruna, Spain

Milk production in Rubia Gallega suckler cows: estimation methods and correlation with morphological and anatomical measurements Moreno¹, T., Montes¹, C., Crecente¹, S. ¹Centro Investigaciones Agrarias de Mabe-gondo-AGACAL. Apdo 10.15080 A Coruña *teresa.moreno.lopez@xunta.es The selection of cows with good maternal aptitude, such as adequate milk production, should be one of the priority lines in the development of beef herds with suckler cows in pasture-based production systems, in order to obtain calves with proper fat deposition and unique meat quality characteristics. The milk production was measured in Rubia Gallega cows using two methods (weigh-suckle-weigh: WSW and mechanical milking: MM) during their lactation period (from 115-185 days of calves' age) and while they were on pasture supplemented with grass and corn silage from 1st-March-15th April, and after that on exclusive pasture. In WSW and MM methods, calves were separated from the dams the day before, remaining without suckling for 18 hours. At the WSW method, calves were weighed before, then reunited with their mothers for 30 min for suckling, and weighed again afterward. For MM method, a portable milking machine was used. The milk production is expressed in kilograms from the liters measured in each milking, using a conversion factor of 1.030 (BOE n°332) for weight to volume. The highest milk production was recorded in April and early May (6.43kg MM and 5.58 kg WSW, p-value=0,07), coinciding with calving intervals between 140 and 170 days, and the lowest were recorded in late May and June (5.95kg MM and 5.38kg w-s-w, p-value=0,15). Both methods showed a similar production estimation. The better correlations between the milk production and the morphological measurement, zoometric index and udder measurements were with the bistiliac breadth (0,54MM and 0,44WSW), dactyl-thoracic index (0,55MM and 0,72WSW), and teat caliber (0,43MM and 0,3WSW), respectively (confidence interval 95%, Pearson's correlation test).

Total phenolic content and antioxidant profile – A comparative study between retail goat and cow milk
G. Papatzimos¹, P. Mitlianga², M. A. Karatzia³, Z. Basdagianni⁴, E. Kasapidou¹

¹ University of Western Macedonia, Department of Agriculture, GR, 53100 Florina, Greece, ² University of Western Macedonia, Department of Chemical Engineering, GR, 50100 Kozani, Greece, ³ HAO-Demeter, Research Institute of Animal Science, GR, 58100 Paralimni, Greece, ⁴ Aristotle University of Thessaloniki, School of Agriculture, Department of Animal production, GR, 54124 Thessaloniki, Greece

Milk contains essential nutrients like proteins, calcium, fatty acids, vitamins, and bioactive compounds such as antioxidants. However, detailed information on the antioxidant capacity of milk is still lacking. The study investigated differences in the total phenolic content (TPC) and antioxidant profile between cow and goat retail fluid milk produced in Greece. Full fat samples from conventionally produced cow (n=36) and goat (n=36) milk were collected monthly for one year from three major food retailers. Both cow and goat samples were sourced from the same manufacturers. Milk samples had a seven-day shelf life, and the pasteurization procedure was standardized to prevent variations in the antioxidant profile resulting from interactions between antioxidants and different industrial heat-treatment procedures. TPC, Free radical scavenging activity (DPPH), Reducing Power Activity (FRAP) and Reducing Power Activity (ABTS) were determined. Differences between milk types were assessed with independent T-tests. Highly significant differences ($P < 0.001-0.01$) were observed between the two types of milk in all examined parameters, with higher values found in cow milk compared to goat milk. Most profound differences were found in TPC (0.64 vs 0.36 mg GAE/mL in cow and goat milk respectively). The findings are related to differences in the feeding regime and husbandry practices between cow and goat dairy production systems. Valorisation of the triple attitude in Ciuta sheep through the characterization of productions: the VAL3CIUTA project

A. Lopez¹, V. M. Moretti¹, S. Mattiello², C. Mazzocchi², F. Bellagamba¹

¹ Università degli Studi di Milano, Department of Veterinary Medicine and Animal Science, Via dell'Università, 6, 26900 Lodi, Italy, ² Università degli Studi di Milano, Department of Agricultural and Environmental Sciences, Via Celoria, 2, 20133 Milano, Italy

The VAL3CIUTA project aims to enhance the triple purpose (milk, meat, wool) of the Ciuta sheep, an autochthonous breed originating from the Valtellina and Alto Lario regions, through the characterization of its productions. This breed represents the Italian smallest sheep breed in the Alpine area, being robust, agile, and frugal, particularly suited for life in a rustic habitat. It is predominantly used for meat production, but historical evidence suggests traditional use of Ciuta sheep milk and wool in the past for cheese production and garment manufacturing. Ciuta sheep are considered at a severe risk of extinction. In recent years, projects for the protection of the breed have been initiated, resulting in approximately 400 officially registered individuals in the breed registry. The breed recognition has provided a driving force for the territory of origin to promote its products, ensuring a comprehensive added value to supply chain project, also linked to the ecosystem services associated with this type of product. The starting hypothesis of the VAL3CIUTA project is that enhancing the breeding triple purpose, coupled with the promotion of local genetic resources and traditional derivative products, can add value to local animal husbandry, thus supporting the conservation of this local breed. This, in turn, contributes to the conservation of the landscape and biodiversity, aligning with the multifunctionality principle of agriculture. The project involves two Departments of University of Milan and three farms located in the Valtellina region, which have been involved for years in the protection of the Alpine territory and endangered fauna, particularly focusing on the recovery of local autochthonous breeds.

Dietary supplementation of orange peel ingredient in lactating ewes: effect on yoghurt physicochemical characteristics

E. Kasapidou¹, G. Papatzimos¹, P. Mitlianga², Z. Basdagianni³, S. Mai⁴, E. M. Barampouti⁴, M. A. Karatzia⁵

Animal feed production is increasingly favoring efficient use of alternative feed sources, with significant potential for incorporating food industry by-products. The study investigated the impact of supplementing ewes' diet with dried ingredients produced from orange peels, a primary by-product of orange juice production, on the physicochemical traits of yoghurt. Ewes were divided into groups receiving either processed (enzymatically hydrolyzed) or unprocessed orange peels (11% DM inclusion level) (groups POP and UOP, respectively), while the control group (CON) followed a standard diet. Three batches of yogurt were prepared and on storage day 14, characteristics like colour (chroma & whiteness), syneresis, viscosity and hardness were evaluated. ANOVA test was used to compare groups. Supplementation of ewes' diets with dried orange peel affected chroma ($P < 0.05$) and firmness ($P < 0.001$). Yoghurts from the UOP treatment, displayed lower colour saturation and firmer texture compared to POP and CON groups, with no effect observed on the other characteristics. Enzymatically hydrolyzed dried orange peel ingredients can be effectively used in the diet of lactating ewes. Funding: EU PRIMA Program for Research, Technological Development & Demonstration-grant agreement n°2013/ (NEWFEED, <https://newfeed-prima.eu/>).

Dietary supplementation of orange peel ingredient in lactating ewes: effect on yoghurt sensory characteristics

E. Kasapidou¹, P. Mitlianga², Z. Basdagianni³, G. Papatzimos¹, S. Mai⁴, E. M. Barampouti⁴, M. A. Karatzia⁵

¹ University of Western Macedonia, Department of Agriculture, GR, 53100 Florina, Greece, ² University of Western Macedonia, Department of Chemical Engineering, GR, 50100 Kozani, Greece, ³ Aristotle University of Thessaloniki, Department of Animal production, GR, 54124 Thessaloniki, Greece, ⁴ National Technical University of Athens, School of Chemical Engineering, Unit of Environmental Science & Technology, GR, 15780 Athens, Greece, ⁵ HAO-Demeter, Research Institute of Animal Science, GR, 58100 Paralimni, Greece

Nowadays, animal feed production is increasingly favoring efficient use of alternative feedstuffs with significant potential for utilizing food industry by-products. The present study assessed the effect of dietary supplementation with dried ingredients produced from orange peels, a by-product of orange juice production, on the sensory characteristics of sheep yoghurt. Milk was collected from ewes receiving either processed (enzymatically hydrolyzed) or unprocessed orange peels (inclusion level 11% DM) (groups POP and UOP respectively) while the control group (CON) was fed a conventional diet. Three batches of yoghurt were evaluated by taste panelists, who frequently consumed sheep yoghurt. Parameters like overall appearance, colour, aroma intensity, aroma, taste intensity, taste, acidity, texture (mouth & spoon), aftertaste, and overall acceptability were assessed using a 7-point hedonic scale. ANOVA test was used to compare groups. In all groups, the scores for all parameters surpassed the acceptability threshold (score = 4), with no differences ($P > 0.05$) among treatments. In conclusion, supplementation of ewes' diet with dried orange peel, either processed or unprocessed, had no negative impact on yogurt's sensory characteristics. Funding: EU PRIMA Program for Research, Technological Development & Demonstration-grant agreement n°2013/ (NEWFEED, <https://newfeed-prima.eu/>).

Discrimination of organic goat retail milk by fatty acid biomarkers

E. Kasapidou², P. Mitlianga³, G. Papatzimos², Z. Basdagianni⁴, M. A. Karatzia¹

¹ ELGO-DIMITRA, Research Institute of Animal Science, Paralimni, 58100 Giannitsa, Greece, ² UOWM, Department of Agriculture, Terma Kontopoulou, 53100 Florina, Greece, ³ UOWM, Department of Chemical Engineering, ZEP area, 50100 Kozani, Greece, ⁴ AUTH, Department of Animal Production, School of Agriculture, 54124 Thessaloniki, Greece

Consumer interest in organic goat milk is growing, yet authenticating organic products poses challenges. The study examined differences between retail organic and conventional milk by the application of fatty acid biomarkers for authenticating organic milk. Conventionally and organically produced milk samples from the same dairy company (n=3) were collected monthly from May 2019 to April 2020. The content of individual fatty acids/lipid classes, including pentadecanoic (C15:0), margaric (C17:0), vaccenic (C18:1 trans 11), conjugated linoleic acid (CLA) (C18:2 c9, t11), linoleic (C18:2 n-6), α -linolenic (C18:3 n-3), and n-3 fatty acids, was examined. The effect of production system, season and the interaction between production system and season within each company was evaluated with nested design ANOVA. There was no effect ($P>0.05$) of production system in all biomarkers whereas the effect of season ($P<0.05$) was observed in C15:0, C18:1 trans 11, C18:3 n-3 and n-3 fatty acids. Regarding the interaction between production system and season significant effects ($P<0.05$) were mainly observed for one of the three companies and particularly in winter. Fatty acids affected were C18:3 n-3, CLA and n-3 fatty acids. Although, there were no differences in production system, variations in particular acids between brands in certain seasons might be related to differences in the goat management practices employed in particular regions. Acknowledgement: "AGROTOUR" Project (MIS 5047196), NSRF 2014-2020.

Application of NIR spectroscopy coupled with DA-PCA for the authentication of lamb meat

S. Parrini¹, M. C. Fabbri¹, A. Crovetti¹, C. Aquilani¹, C. Pugliese¹, R. Bozzi¹

¹ University of Firenze, Department of Agriculture, Food, Environment and Forestry (DAGRI), Piazzale delle Cascine 18, 50144 Firenze, Italy

Rearing systems, linked to animal welfare and nutraceutical characteristics, are novel meat features that can drive consumer choice. The need to develop a traceability and authentication meat system emerges, especially for niche sectors such as local lamb meat. The present study aims to test the application of discriminant analysis based on principal components to near-infrared spectra derived from the meat of lambs reared with different feeding systems. Meat samples derived from Massese lamb, slaughtered at 69 days, reared in three conditions: extensive system linked to only pasture diet (n= 70), indoor system associated with concentrate and hay feed regime (n=74) and semi-extensive system linked to pasture, concentrate and hay diet (n=50). Samples of lamb meat referred to three muscles (Longissimus dorsi Triceps brachii and Semimembranosus) were acquired by Antaris II FT-NIRS (Thermo Fisher Scientific). Samples were scanned as intact and fresh meat considering the infrared region (3999 to 9999 cm⁻¹), and 32 scans were performed for each one. After, a multivariate exploration of original spectra was applied on 3112 wavenumbers by discriminant analysis of principal components (DAPC) using the factextra R package. A cross-validation was applied for class assignment where the full dataset was used for model training, and the discriminant functions were extracted based on all samples. The first two components explain 98% of the total variability of the dataset (75.3 PC1 and 22.6 PC2 as %of variance). The DAPC model resulted in an overall assignment success rate of 81,9% for rearing systems, using two discriminant functions.

Characterization and typology of egg consumers in the Central zone of Chile

P. Toro-Mujica¹, F. Gálvez¹, J. Aldana¹

¹ Universidad de O'Higgins, Instituto de Ciencias Agroalimentarias, Animales y Ambientales, Ruta I-90. Km 1, 3070000 San Fernando, Chile

An online survey was conducted to characterize egg consumers in the Central area of Chile with the aim of defining consumer groups. The study utilized frequency tables and a multivariate analysis comprising four stages: 1. variable selection, 2. Multiple Correspondence Analysis (MCA), 3. Cluster Analysis (CA), and 4. Discriminant Analysis (DA). A total of 415 surveys were collected, generating 134 variables from 38 questions. Variations in purchasing and consumption behavior were observed across demographics such as age, gender, occupation, rural residence, family size, and income level. After variable selection, 48 variables were included in the MCA, revealing three dimensions that explained 71% of the data variance with a Cronbach's Alpha coefficient of 0.9. The CA identified four distinct consumer groups representing 8.3%, 60.4%, 22.8%, and 8.5% of the respondents, respectively. The DA achieved a classification accuracy of 93.9%. Notable differences among groups included gender and income level, while factors influencing purchasing and consumption behavior encompassed reasons for egg consumption, frequency of consumption, and importance placed on various attributes such as refrigeration, price, shell color, cleaning, packaging, shell condition, size, brand, and certification. Additionally, concerns regarding nutritional intake, familiarity with concepts like free-range farming and carbon footprint, and quality indicators such as yolk and white appearance and egg size were identified. The findings underscore the multifaceted nature of consumer behavior, influenced by socio-economic factors as well as levels of awareness regarding sustainable production practices and animal welfare.

The effect of gender on meat quality of the longissimus lumborum muscle in growing-finishing pigs

K. Dobiesz¹, W. Kozera¹, U. Czarnik¹, A. Okorski¹, G. Żak², M. Dąbrowski¹, Ł. Zielonka¹, K. Karpiesiuk¹

¹ University of Warmia and Mazury in Olsztyn, Oczapowskiego 5, 10-719 Olsztyn, Poland, ² National Research Institute of Animal Production, Sarego 2, 31-047 Kraków, Poland

Pig producers consistently strive to improve production efficiency and profitability, as well as to adapt production systems to the binding rules and regulations, and increasing consumer expectations. Meat quality depends on a number of factors, which can be divided into genetic and environmental. Gender can significantly alter the meat quality of fattening pigs. The aim of this study was to evaluate the effect of sex on meat quality in growing-finishing pigs. Meat samples were collected from gilts, entre male pigs, surgically castrated males and immunocastrated males. Surgical castration was carried out at 5 days of age, whereas immunocastration was performed with two injections of Improvac administered 4 weeks apart, at 9 and 15 weeks of age. Gender was used as the source of selection. Nourished with complete feed mixtures. 4-phase feeding was used. Feed and water were available ad libitum. Pigs of each group were kept in separate pens, and they were slaughtered at BW of around 107kg surgically castrated males to 117kg entre male pigs. The pigs were slaughtered according to the usual procedure in meat plants. Samples of the longissimus lumborum muscle (musculus longissimus lumborum, LL), approximately 10 cm thick, were collected from the right half-carasses to determine the proximate chemical composition, physicochemical properties and sensory attributes of meat. The content of dry matter, total protein (Kjeldahl method), crude fat (Soxhlet extraction) and crude ash. Gender had no influence on the quality or processing suitability of pork, but it affected intramuscular fat content, which is an important consideration for consumers. Funded by the Minister of Science under "the Regional Initiative of Excellence Program".

Effect of sex on the quality and fatty acid profile of the longis muscle in danbred hybrid pigs

K. Dobiesz¹, W. Kozera¹, A. Okorski¹, G. Żak², J. Krzysztoń¹, K. Karpiesiuk¹

¹ University of Warmia and Mazury in Olsztyn, Oczapowskiego 5, 10-719 Olsztyn, Poland, ² National Research Institute of Animal Production, Sarego 2, 31-047 Kraków, Poland

The aim of the study was to check the effect of sex on individual quality and fatty acid (FA) profile in DanBred hybrid pigs. Longissimus dorsi (LD) muscle samples were collected from gilts and entire male pigs during the fattening period, they were kept separately in the pens of group animals. Gender was used as the source of selection. Nourished with complete feed mixtures. 4-phase feeding was used. Feed and water were available ad libitum. The slaughter was carried out in accordance with applicable laws. Longissimus dorsi muscle samples were taken with the half-carcass from the lumbar section between the 3rd and 4th vertebrae. The pH₂₄ meter was measured with a pH-meter and the meat color was measured in the CIE L*a*b system. Contains: dry matter, total protein – Kjeldahl method, raw material – Soxhlet method and ash of origin (AOAC, 2007) and FA profile of origin. The fatty acids were separated by gas chromatography. Fatty acid methyl esters (FAME) according to various Peisker methods. Fatty acids identified by improving their retention times with pure FAME standards (Sigma-Aldrich, St. Louis, Missouri, USA) and peaks in the analyzed samples. The degree of acidification does not differ by gender. Higher content of meat of origin for gilts. Longissimus dorsi muscle samples from gilts were characterized by a higher content of chemical components. The source of origin and high statistical significance between the sexes of the animals and the fatty acid profile were found. Funded by the Minister of Science under “the Regional Initiative of Excellence Program”.

Comparison of the slaughter weight, slaughter characteristics and carcass composition of South African Boer Goats and Dohne Merino sheep

T. Brand^{1,2}, J. Van Der Westhuizen², R. Swart¹, P. Strydom², B. Van Zyl²

¹ Department of Agriculture: Western Cape, Animal Science, Muldersvlei Street, 7607 Stellenbosch, South Africa, ² University of Stellenbosch, Animal Science, Merriman Avenue, 7600 Stellenbosch, South Africa

Sheep production holds significant importance in South Africa's small stock industry, whereas goat products are predominantly distributed in the informal sector. This study aimed to assess and compare the impact of species and gender on carcass composition, meat quality, and fat depth in Boer goats and Dohne Merino sheep of identical age and upbringing. Upon reaching 120 days of age, the kids and lambs were weaned and introduced to a feedlot environment up to 12 months of age when they were slaughtered. There was no significant difference observed between the slaughter and cold carcass weights of Boer goats (63.8kg; 32.4kg) and Dohne Merinos (61.6kg; 30.9 kg). However, the slaughter and cold carcass weights of the castrated males (65.3kg; 33.2kg) were notably higher than those of the females (60.1kg; 30.1kg) ($P=0.01$). The dressing percentages for Dohne Merinos (50.1%) and Boer goats (49.5%) fell within the expected range of 42.7% to 55.4% for sheep and goats. Boer goat castrates exhibited a dressing percentage (51.0%) similar to that of Dohne Merino wethers (50.0%), Boer goat females (47.9%), and Dohne Merino ewes (49.9%). Dohne Merinos (8.3mm) deposited significantly more fat on the longissimus lumborum compared to Boer goats (4.6mm) ($P<0.01$) at the same age, attributed to the earlier maturation of Dohne Merinos and distinct fat deposition patterns. Results from the study, based on three-rib cuts, indicated notable differences in lean muscle yield and fat and bone content between sheep and goats. Goat meat may be an alternative food option for consumers who prefer meat with a lower fat content.

Beef × dairy crossbreeding in mountain farms: major effects on carcass weight and retail cuts

N. Amalfitano¹, M. Berton¹, I. Bazzoli², G. Bittante¹, L. Gallo¹, E. Sturaro¹

¹ University of Padova, DAFNAE, Via dell'Università 16, 35020 Legnaro, Italy, ² Breeders Federation of Autonomous Province of Trento, Via delle Bettine 40, 38121 Trento, Italy

For this study, the data collected from 3443 crossbred heifers slaughtered weekly from September 2019 to December 2023 were provided by the Breeders Federation of the Autonomous Province of Trento (North of Italy). The heifers were sired by Belgian Blue (BB) bulls on dams of different dairy breeds: Brown Swiss (BS), Holstein Friesian (HF), Simmental (Si), Alpine Grey (AG), Rendena (Re), and Crossbreds (Cr). Heifers were born in 441 dairy farms, weaned in 7 specialized “weaner” farms and fattened in the same intensive fattening farm. Data for each heifer concerned weaning and fattening length, slaughter age, the weight of carcass (CW) and of 17 main retail cuts, and the average daily carcass gain (ADGc). Retail cuts weights were expressed quantitatively in absolute weight and qualitatively as incidence on CW. All the data were analyzed with a mixed model including the dam breed and slaughter season as fixed effects, while birth and weaning farm and slaughter date within season as random. The results highlighted, with small differences in weaning and fattening lengths, the better performances of the BB×Si compared to the other breed combinations for carcass and retail cuts weights and ADGc. Expressing the data qualitatively, the Alpine breeds (Re and AG) had higher incidence of the principal cuts over the entire carcass, indicating lower losses and/or trimming cuts used for hamburger production. These findings renew the interest, also in mountain areas, for the beef × dairy meat production to improve the economic sustainability of dairy farms. The study is part of the INTAQT project funded by the European Union’s Horizon 2020 research and innovation programme (grant agreement N°101000250).

Rheological and protein thermal denaturation properties of eggs from different farming systems

K. Kotsiou¹, C. Mouzakitis¹, A. Lazaridou¹, C. Biliaderis¹, I. Stavropoulos², N. Van Leuffen³, J. Smits³, Z. Basdagi-anni², I. Bossis²

¹ Aristotle University of Thessaloniki, Department of Food Science and Technology, School of Agriculture, GR, 54124 Thessaloniki, Greece, ² Aristotle University of Thessaloniki, Department of Animal Production, School of Agriculture, GR, 54124 Thessaloniki, Greece, ³ Aeres Applied University, Poultry Expertise Centre, NL, 8251 JZ Dronten, Netherlands

This study aimed to evaluate rheological characteristics and protein denaturation of eggs obtained from three different types of laying poultry farms, intensive, dual purpose and extensive. The flow curves of both egg whites and whole eggs, assessed by rotational rheometry, revealed a shear thinning behavior. Raw egg whites were more viscous than whole eggs due to the higher protein content of the former. Lower steady shear viscosity was recorded for the egg whites obtained from the intensive system, while the variability of values for the extensive system was higher. Differential scanning calorimetry showed no differences among the farming systems in lysozyme and ovalbumin denaturation temperatures of the egg white detected at ~ 65 and 80°C, respectively. The temperature and enthalpy values of an endothermic transition at ~ 82°C of the egg yolk samples, was ascribed to the composite mixture of lipids, lipoproteins and contaminant egg white proteins; these responses were similar among the farming systems, whereas the enthalpy values had higher variability for eggs of the extensive system. Overall, the farming system appeared to affect the variability rather than mean values of the rheological and thermal parameters, with samples from the extensive system exhibiting higher heterogeneity in their physical properties. However, due to the limited number of farms involved in the study and several substantial confounding factors involved (e.g. breed, feed ration), the results should be interpreted cautiously. Funded by EU (HORIZON H2020) under the acronym CodeReFarm Grant No: 101000216

Some genomic insights into the spatio-temporal dynamics of domestication and dispersal of sheep

I. Medugorac¹, J. Peters²

¹ *The Ludwig-Maximilians-University Munich, Population Genomics Group, Lena-Christ-Straße 48, 82152 Martinsried/Planegg, Germany,* ² *The Ludwig-Maximilians-University Munich, Institut für Paläoanatomie, Kaulbachstr. 37, 80539 München, Germany*

The transition from the Pleistocene to the Holocene is characterised by strong global warming, which forced plants, animals and humans to adapt quickly to the new environmental conditions. Human adaptation led to a new way of life and the domestication of plants and animals. A better understanding of neolithisation could be helpful in addressing the current phase of dramatic ecological restructuring and species extinction. To investigate the spatio-temporal dynamics of domestication and the evolution of small ruminant husbandry during and after the agricultural revolution, we combine zooarchaeological studies with palaeogenomics and population genomics of ancient and contemporary domestic and wild sheep and goats. During the screening phase of the ancient samples, we obtained 76 complete mtDNA genomes from the Neolithic sites Aşıklı Höyük (75) and Göbekli Tepe (1). In addition, there are 26 complete mtDNA genomes from the Chalcolithic site of Güvercinkayası. To test alternative demographic hypotheses, we combine the above genomes with hundreds of genomes from contemporary domestic and wild sheep across Eurasia, as well as ancient genomes contributed by other groups. We clearly show that domestication itself does not lead to a genetic bottleneck, but that this only occurs after domestication in the course of western expansion into Europe and Africa. We also clearly show that the entire genetic diversity of today's domestic sheep can be explained by a single domestication centre. The zoo-archaeological findings in combination with genomics clearly confirm the reproduction of small ruminants directly within Neolithic settlements such as Aşıklı Höyük and refute the recently proposed "catch-and-grow" strategy as well as some older theories.

What does the past tell us about the future – examinations of remains from domestic livestock

R. Schafberg¹

¹ *Martin Luther University Halle-Wittenberg, Natural Science Collection, Domplatz 4, 06108 Halle (Saale), Germany*

Identifying animal species in zooarchaeology, i.e. distinguishing between sheep and goat or domestic and wild animals, can be a challenge. Thus, an inventory of precisely addressed animal skeletal remains is essential as a basis for determining unknown animal bone material. Furthermore, this unique collection enables scientists to shape and evaluate their research tools in zooarchaeology. The comprehensive collection of domestic animal skeletons at the university Halle-Wittenberg, once generated from farm animals and their wild forms over a period of more than 100 years, ideally fits this purpose. The skeletal material with its accompanying data covering various time periods and breeds reflects a wide variation of domestic livestock in mainly six major species (pig, horse, cattle, sheep, goat, dog). Manfred Teichert, former curator of this collection, was one of the founders of zooarchaeological research in Germany. Jointly with Boessneck and Müller, a method for distinguishing sheep and goat bones was published (1964). Today, as geomorphometry (GMM) has replaced two-dimensional descriptions as a spatial method, the Halle collection of animal remains is used to evaluate and expand zooarchaeological as well as livestock research. As an example, third lower molars from modern specimens readily distinguish sheep from goats using GMM. Nowadays, the transferability of this method to archaeological samples has been demonstrated (Jeanjean et al., 2023). In addition, 3D-scans of skulls and postcranial bones made available online in a repository will open a new window for zooarchaeological research worldwide.

From Wild to Tamed and Back: demographic reconstruction of Sardinian sheep from whole-genome sequences

Currently, three sympatric sheep (*Ovis aries*) lineages are found on Sardinia: the Sardinian mouflon, thought to represent the feral remnants of the earliest domesticated sheep, the Pecora Nera di Arbus (hereafter Nera), a local breed showing ancestral features, and the Sarda sheep, strongly selected for milk production. Despite their cultural and agricultural significance, the evolutionary history of these three sheep lineages is still unclear. To unravel the evolutionary origins of the Sardinian sheep, we generated whole-genome sequences of 19 Sardinian mouflons, 6 Sarda and 9 Nera sheep, and co-analyzed them with a dataset of over 30 wild and domesticated sheep lineages. We explored the population structure, built a phylogenetic tree, and investigated the ancestry components. Results confirmed production-driven introgression in Sarda and suggested a first translocation of the Sardinian mouflon lineage followed by a later introduction of the domestic lineage originating Sarda and Nera sheep. Performing demographic reconstruction, we confirmed the time of emergence of the early domestic lineage at ~12,000 YA, from which the most modern domesticated sheep split around ~6,700 YA. Finally, we dated the split of Sarda sourcing from the Nera lineage around ~4,800 YA. Further analysis will reveal potential gene flow between the three lineages and allow the detection of genes involved in local adaptation and agronomic traits.

The regulation of fertility is an important aspect of reproductive control in farm animals, which have inherited vestiges of seasonal reproduction from their wild ancestors. Cattle and sheep seem to have followed different paths in this respect. Like the current representatives of their wild ancestor the oriental mouflon, modern sheep under temperate latitudes express a seasonal anoestrus. This has considerable consequences for flock management and product availability. However, out-of-season lambing is possible, particularly in breeds with less profound anoestrus – typically Mediterranean breeds. In contrast, while the last representatives of their wild ancestor, the aurochs, were described as seasonal breeders in the 16th century Poland; and while feral cattle populations in Europe reproduce seasonally, today's domestic cattle are non-seasonal breeders. The history of these two trajectories is still poorly understood, but recent methodological advances in zooarchaeology allow to go back to their origins. The seasonal cycles recorded in tooth enamel during growth can be reconstructed from oxygen isotope ratios, making it possible to determine the birth seasons of animals of the past. We will present an overview of the recent results which, on the one hand, demonstrate the existence of autumn lambing as early as the 6th millennium BCE in the western Mediterranean and, on the other hand, the persistence of highly seasonal reproduction in cattle until at least the 4th millennium in continental Europe. The reasons for these different trajectories will be tentatively explained and discussed.

African indigenous cattle genealogy revealed by whole-genome tree sequences

Africa has a uniquely rich cattle diversity with about 150 known cattle breeds or populations comprised of *Bos indicus*, *Bos taurus*, and their crosses. Various studies investigated their diversity and adaptation. However, methods that efficiently capture genetic differences and evolution between such populations are lacking. Here, we built whole-genome ancestral recombination graphs encoded via tree sequences to describe the genomic evolution of 193 African indigenous cattle from 15 breeds – Baoule, Gourounsi, Kuri, Logone, Boran, Ghanaian shorthorn, Guinean N'dama and Nigerian N'dama from *Bos taurus* origin; Zebu Gobra, Zebu Maure, Baggara, Butana and Kenana from *Bos indicus* origin; and one *Bos indicus* X *Bos taurus*, Djakore. Our results revealed the unique diversity, genomic evolution and subspecies differentiation of African indigenous cattle. The findings from this study will pave the way for future biological discovery and more informed breeding especially in admixed cattle populations.

¹ *Humboldt-Universität zu Berlin, Unter den Linden 6, 10099 Berlin, Germany,* ² *University of Khartoum, Shambat st., 32 Khartoum, Sudan,* ³ *Leibniz Institute for Zoo and Wildlife Research, Alfred-Kowalke-Straße 17, 10315 Berlin, Germany,* ⁴ *Northumbria University, Sandyford road, NE77XA Newcastle upon Tyne, United Kingdom,* ⁵ *University of Tlemcen, 22 rue Abi Ayad, 119 Tlemcen, Algeria,* ⁶ *Scotland's Rural College, Easter Bush, EH1259RG Edinburgh, United Kingdom,* ⁷ *Cairo University, El-Gamma St., 12613 Giza, Egypt*

In order to evaluate the genetic diversity and structure among Nubian goats and understand their relationships with Old English, Anglo-Nubian and worldwide goat breeds, 6,006 animals were studied. Among them, 558 goats were genotyped by using 60K chip, and additional 5,448 genotype goats using 52K chips goats were obtained from collaborators and publicly available data. In this study, genomic regions under positive selection were explored. Nucleotide diversity, heterozygosity, and excess of homozygosity were used to estimate the genetic diversity and genomic inbreeding. Breed relationships were assessed through the Fixation index (FST) and principal component analysis (PCA). The average nucleotide diversity for Nubian goats ranged from 0.00075% in the population from Egypt to 0.00083% in the population from Algeria. Nubian goats from Algeria showed the highest observed heterozygosity (38.0%), while Anglo-Nubian goats displayed the lowest (26.3%). The pattern was reversed for the excess of homozygosity. Pairwise FST-values between goat populations ranged from 0.02 (Nubian from Sudan vs. Nubian from Ethiopia) to 0.28 (Anglo-Nubian vs. Old English). The PCA revealed distinct clusters of goat breeds from Africa, Europe and Asia. Nubian goats clustered with African goats. Interestingly, Anglo-Nubian goats were located outside the African cluster, bridging clusters between Africa, Asia, and Europe. Results from runs of homozygosity (RoH) islands analysis support the presence of discernible traits such as adaptation, innate immune response, heat tolerance, reproduction, and pigmentation in Nubian goats. Further research will focus on identified regions and subsequent gene discovery.

Genetic diversity of eight local Belgian sheep breeds using pedigree and SNP data

N. Aerts¹, R. Meyermans¹, W. Gorssen¹, L. Chapard¹, K. Hooyberghs¹, N. Buys¹, S. Janssens¹

¹ KU Leuven, Department of Biosystems, Center for Animal Breeding and Genetics, Kasteelpark Arenberg 30, Box 2472, 3001 Leuven, Belgium

Conserving genetic diversity in local livestock breeds is vital to guarantee their future survival. Genetic diversity is a prerequisite for adaptability to environmental changes and resistance to emerging diseases, becoming more pronounced with climate change. We investigated the genetic diversity of eight indigenous sheep breeds in Belgium, based on pedigree and single nucleotide polymorphism (SNP) analysis. In total, more than 600 sheep were genotyped using the GGP Ovine 50K array. Effective population size (N_e) was estimated to be low for all screened sheep breeds, in both pedigree- ($N_e = 17$ to 90) and SNP-based ($N_e < 24$) computation methods. With a minimum sustainable population threshold of 100 animals according to FAO, all eight screened Belgian sheep breeds are considered endangered. Pedigree-based inbreeding estimates were between 3.1% and 11.3% whereas ROH-based inbreeding estimates ranged from 4.1% to 8.6%. In the next stage, 28 different ROH islands were identified for the studied breeds and compared with ROH islands found in international sheep breeds. Interestingly, common ROH islands were found between populations that are close either geographically or in terms of breeding goals. Some of these regions were mapped to known genes associated with specific traits, but further analysis is required to investigate the potential origins of ancestral haplotypes or the underlying genes in these (possible) selection signatures. In summary, this study provides the first genetic characterization of the local Belgian sheep populations, confirming their endangered status and contributing valuable information to the global dataset of genotyped sheep breeds.

Theatre 8

Integrating zooarchaeological, historical and genomic data to explore potentials for conserving the indigenous cattle breed of Cyprus

A. Spyrou¹, G. Hadjipavlou², A. C. Dimitriou², D. G. Bradley³

¹ The Cyprus Institute, STARC, 20 Konstantinou Kavafi Street, Aglantzia, 2121 Nicosia, Cyprus, ² Agricultural Research Institute, Cyprus, Nicosia 1516, 22016 Nicosia, Cyprus, ³ Trinity College Dublin, The Smurfit Institute of Genetics, Dublin 2, D02 VF25 Dublin, Ireland

ARETI is a multidisciplinary research project that weaves together evidence from different fields and disciplines, including zooarchaeology, ancient and contemporary cattle genomics, iconography, history and folklore studies, to explore human-cattle interactions on the island of Cyprus. Focusing primarily on cattle bone assemblages retrieved from several archaeological sites across the island, spanning the early Neolithic to Roman times, ARETI investigates the impact of historically significant events, including human migrations, agricultural intensification, population expansion, urbanisation and climate change, on cattle management practices and genetic structure. To explore further cattle genetic admixtures, population structure and the timing of *Bos indicus* introduction on the island, we analysed archaeological cattle bone samples at the Smurfit Institute of Genetics (TCD), while nasal swab samples from 90 unrelated cattle belonging to the island's modern indigenous breed have been collected and analysed at the Cyprus Agricultural Research Institute. Beyond presenting the project's main scientific results, our presentation will also demonstrate how public outreach activities, including the design of several educational activities for children, the production of a documentary and the collaboration with local craftspeople for the creation of products inspired by the thousands of years of history and tradition surrounding the local breed, can further highlight the local cow breed's cultural value and contribute to its conservation.

Evolution of genetic parameters for production traits and conception rate in the Dutch Holstein population
J. Vandenplas¹, Y. Wientjes¹, P. Bijma¹, M. Schrauf¹, M. Van Pelt²

¹ Wageningen University and Research, Animal Breeding and Genomics, P.O. Box 338, 6700AH Wageningen, Netherlands, ² CRV, P.O. Box 454, 6800AL Arnhem, Netherlands

Limited population size and selection can reduce the genetic variances of traits compared to base population genetic variances. These changes are a result of drift and the Bulmer effect, and can also impact the genetic correlations between traits. Here, we aim to evaluate the evolution of genetic parameters for production traits and conception rate (CR) in the Dutch Holstein population since 1990. The data included around 855,000 305 days-in-milk records for fat, protein and milk yields (MY), and around 676,000 records for CR at first artificial insemination for first-parity Holstein cows. Using a Gibbs sampling approach, changes in genetic (co)variances due to drift and selection were estimated by sex and per year of birth with bivariate models (one production trait and CR), in addition to base population (co)variances at five generations before 1990. For cows born in 1990, genetic variances were 22% lower for MY and 12% lower for CR than the base population genetic variances. From 1990, genetic variances for cows increased on average by 0.3% (of the base population genetic variance) per year for MY, and decreased by 0.2% per year for CR. Corresponding genetic covariances were rather stable over time. Finally, genetic correlations between MY and CR changed from -0.45 in 1990 to -0.41 in 2016. Similar trends were observed for sires, but with steeper increases for genetic variances of production traits and correlations, especially from 2010. This project has received funding from the European Union's Horizon 2020 Programme for Research & Innovation under grant agreement n°101000226.

Mpwapwa cattle is a synthetic dual-purpose breed developed at the Mpwapwa Cattle Research Station, Tanzania, in the 1920s. The development and maintenance of Mpwapwa cattle have faced many challenges, and this breed has never been characterized at the genomic level. Our objectives were to assess the current genetic diversity and population structure of Mpwapwa cattle owing to its highly admixed origin and decline in active genetic management in recent years. Hair samples were collected from 251 cattle from different agro-ecological zones in Tanzania and were genotyped with the Bovine 100K SNP chip (Neogen Geneseek®). After quality control (using PLINK 1.9), we assessed heterozygosity (PLINK 1.9), inbreeding (detectRUNS package in R), and admixture (LEA package in R). We found the observed heterozygosity (0.32) was higher than the expected based on observed allele frequencies (0.29). Furthermore, more than 75% of studied animals had a runs-of-homozygosity-based inbreeding higher than 20%. Admixture analyses have indicated separation of the sampled animals by agro-ecological zones. Our results provide information for developing conservation and improvement strategies for this endangered Tanzania cattle breed.

Genomic analysis of Greek mouflon

E. Tarsani¹, S. Katsipodas², I. Hadjigeorgiou³, A. Kominakis³

¹ The Roslin Institute and Royal (Dick) School of Veterinary Studies, Easter Bush, Midlothian, EH25 9RG Edinburgh, United Kingdom, ² Forestry Service, Hydras 5, 24131 Kalamata, Greece, ³ Department of Animal Science, Iera Odos 75, 11855 Athens, Greece

Six (6) blood samples were obtained from an equal number of mouflons that were hunted during the 2022 hunting season (November – December 2022) on the Sapienza Island (Methoni, Peloponnesse) of Greece. Genotyping of the samples using the 50K SNP array followed. Application of standard quality criteria resulted in a final number of 32,263 SNPs used for further genetic analyses. Levels of heterozygosity and homozygosity (via autozygous DNA segments i.e. ROHs) were estimated, while principal components, admixture and phylogenetic analysis were also performed using additional genotypes from other mouflon populations (Asiatic, n=13, Cyprus, n=3, Sardinian, n=23, and Corsica, n=11) and a typical domesticated breed of sheep (Chios, n=23) as an outgroup. In the Greek mouflon samples, the mean observed heterozygosity was low (mean=0.215, SD=0.006), while three of the six individuals were found to have a degree of consanguinity between 2nd (half siblings) and 3rd degree (first cousins). The inbreeding rate of Greek mouflon individuals ranged from 20.5% to 29.8% (average= 25.0%, SD=3.5%) with 70% to 100% of the observed inbreeding arising from relatives matings occurring in the distant and middle past (time horizon beyond 10 past generations). Based on the results of the analysis of principal components, admixture and phylogeny, the specific samples of the Greek mouflon were genetically classified between those of Corsica and Sardinian mouflons.

Poster 12

Morphostructural and phaneroptic variability of creole goats in the Southern Highlands of Peru

E. A. Sessarego¹, F. C. Trillo¹, D. J. Godoy¹, J. A. Cruz¹

¹ Instituto Nacional de Innovación Agraria, Dirección de Supervisión y Monitoreo en las Estaciones Experimentales Agrarias, Av. La Molina 1981, Lima 1524 Lima, Peru

This study aimed to characterize the morphostructural and phaneroptic variability of creole goats in the Southern Highlands of Peru. A total of 269 females older than two years, without signs of crossbreeding with specialized breeds, were used from Ica (three districts) and Ayacucho (four districts), Peru, located from 2500 to 3800 masl. Six phaneroptic (color, beard, horns, wattles, number of teats, teat direction) and four morphometric (weight, abdominal perimeter, body length, thoracic perimeter) characteristics were recorded. Factorial analysis of mixed data (FAMD) was applied, followed by a hierarchical classification analysis, using the package FactoMineR, R software (version 4.3.2). Six orthogonal principal components were found, and the first two explain 41% of the total variability observed in the study. The analysis revealed three types of creole goats that were mainly differentiated by the presence/absence of horns and beards, and the number of teats. Type 1 included mainly goats from Ayacucho, with composite coat colors, horns, and supernumerary teats. Type 2 was determined by goats with beards, without wattles, and with the correct number of teats. Type 3 was characterized by being from Ica, without beards or wattles, and with parallel teats. It is concluded that in the Southern Highlands of Peru, there were three types of creole goats with some characteristics in common, such as their large thoracic capacity and a tendency to develop dual-purpose (milk and meat) production. The variability observed represents an opportunity to establish policies that allow conservation and genetic improvement through a selection of this valuable zoogenetic resource.

Genetic analysis of Mediterranean wild rabbit populations (*Oryctolagus cuniculus*) using whole genome sequencing data

A. Kominakis¹, J. M. Alves², I. Hadjigeorgiou¹

¹ Agricultural University of Athens, Department of Animal Science, Iera Odos 75, 11855 Athens, Greece, ² Universidade do Porto, CIBIO, Centro de Investigacao em Biodiversidade e Recursos Geneticos, 4485-661 Vairao, Portugal

Abstract Genetic analysis using whole genome sequencing data of 8 wild rabbits sampled from 4 Mediterranean islands (Lemnos, Schinoussa, Thira and Malta) and 4 individuals of domesticated rabbit breeds (Rex and New Zealand) was carried out. The analysis involved numerous steps (applying base sequence quality criteria, mapping sequences to the species reference genome (latest version: GCA_009806435.2_NW_1.0), identifying single nucleotide polymorphisms (SNPs), etc.) and was performed using various Bioinformatics tools available on the Galaxy web platform (usegalaxy.org). Estimation of the percentage of heterozygous loci as well as principal components, admixture and phylogeny analysis, followed. The percentage of heterozygous loci ranged from 43.6% (Schinoussa1) to 58.7% (NZ1) with the domesticated breeds (Rex and NZ) showing higher heterozygosity rates when contrasted to the Mediterranean wild rabbit populations. Principal and admixture analysis showed genetic differentiation of the domesticated rabbit from the wild rabbits of Mediterranean origin. This differentiation was also confirmed by the phylogenetic analysis in which the samples from Lemnos were classified in a common subclade with sampled from the Malta island.

Session 41

Theatre 1

Estimated output from assisted reproductive techniques (OPU/IVF) in Holstein cattle associated with the genetic background

F. Guillaume¹, S. Brard-Fudulea², B. Desnouses², H. Grothmann³, S. Meier³

¹ SYNETICS France SAS, Research & Development, 4 rue Éric Tabarly, 35530 Noyal-sur-Vilaine, France, ² SYSAAF, UMR-BOA, Centre INRAE Val de Loire, 37380 Nouzilly, France, ³ SYNETICS Germany GmbH, Osterkrug 20, 27283 Verden (Aller), Germany

By improving all components of genetic progress, assisted reproductive techniques are central to modern cattle selection schemes. Of these techniques, ovum pick-up with adjoining in vitro fertilisation (OPU/IVF) has been predominant since 2016 (IETS). While selection of elite cattle is mainly decided by total merit indices composed of production, conformation, and functional traits suitability of donors to assisted reproduction techniques may counterbalance lower genetic merit, donor facilities and OPU/IVF labs costs. The aim of this study was to assess the opportunities offered by selection indices for donors' performance in an OPU/IVF program based on the total number of oocytes collected, viable embryos produced, and development rates up to the blastocyst stage per session. In total, 9,099 OPU sessions performed from 1,596 Holstein donors between April 2018 and August 2023 in a donor station in Northwest Germany were used to calculate genomic parameters using the blupf90 family program and investigate the genetic background of results from assisted reproductive techniques. Heritabilities were highest for oocytes collected ($h^2 = 0.24-0.26$), in the middle range for viable embryos ($h^2 = 0.13-0.14$), and lowest for the development rate ($h^2 = 0.09$). GWAS was performed using postGStf90 and a QTL on BTA11 (92,317,777-97,858,330 bp, ARS-UCD1.3) was identified to explain variance for oocytes collected. Positional candidate genes were aligned to reproductive physiology and verified from former described studies. In summary, selecting donors by their genetic ability to produce embryos using OPU/IVF could improve breeding schemes efficiency in the future.

Effects of moderate exercise regimen on reproductive development of replacement beef heifers reared in drylots at a high stocking density

R. Cooke¹, F. Cooke¹, S. Mackey¹, A. Pickett¹, K. Harvey²

¹ Texas A&M University, Animal Science, 2471 TAMU, 77843 College Station, United States, ² Mississippi State University, Animal and Dairy Sciences, 335 Wise Ctr Dr., 39762 Starkville, United States

This study evaluated growth and reproductive development of beef heifers reared at a high stocking density and provided with access to an exercise area. Angus × Brahman heifers (n = 180) were ranked by age (264 ± 1 day) and body weight (BW; 200 ± 2 kg) on day 0, and assigned to a) 1 of 12 drylot pens (10×14 m pens; 10 heifers/pen) resulting in a stocking density of 14 m²/heifer (DENS), or b) 1 of 6 paddocks (2-ha paddocks; 10 heifers/paddock) resulting in a stocking density of 2,000 m²/heifer (CON). On day 15, 6 DENS pens were randomly selected and given access to an exercise area (DENS-EX) for 1 h three times weekly. Negligible forage was available for CON heifers, whereas all heifers received the same limit-fed corn-based diet. Heifer shrunk BW was recorded after 16 h of feed and water withdrawal on days -3 and 225 for BW gain calculation. Heifers were also fitted on day 0 with a pedometer behind their shoulder and an ear tag to record behavioral responses. Pedometer results were recorded and blood samples were collected weekly. Hair samples were collected from the tail switch every 28 days. Steps per week were greater ($P < 0.05$) for CON vs. DENS and DENS-EX, and greater ($P < 0.05$) for DENS-EX vs. DENS heifers. Heifers from CON spent more ($P < 0.05$) time active, ruminating, and eating vs. DENS and DENS-EX. No treatment effects ($P \geq 0.91$) were detected for heifer BW gain. A treatment x day interaction was detected ($P < 0.01$) for hair cortisol, as CON had less ($P \leq 0.05$) hair cortisol vs. DENS and DENS-EX heifers beginning on day 56. Heifers from DENS experienced delayed puberty attainment (treatment x day; $P < 0.01$) vs. DENS-EX and CON. A greater ($P \leq 0.05$) proportion of CON heifers were pubertal by day 105 vs. DENS and DENS-EX, whereas a greater ($P < 0.05$) proportion of CON and DENS-EX heifers were pubertal by day 154 vs. DENS. Collectively, providing heifers with an exercise area alleviated the negative effects associated with high stocking density on their puberty attainment. Research supported by USDA NIFA AFRI (2021-67015-34083).

Theatre 3

Seminal cytokine profiles as markers of bovine sperm quality

J. Statham¹, N. Gahir², K. Burton¹, C. Freer², G. Mappa², C. Smalley², A. Lancaster¹, N. Orsi²

¹ RAFT Solutions, Sunley Raynes Farm, HG4 3AJ Ripon, United Kingdom, ² University of Leeds, Brenner Building, LS2 9JT Leeds, United Kingdom

Cytokines orchestrate pathophysiological inflammation and priming of the cervix/uterus for embryo implantation. This study aimed to determine if variations in standard spermatozoa (spz) parameters were reflected in seminal plasma cytokine concentrations. Individual bull semen ejaculates (n=83) were collected on-farm and split; (i) diluted 1:1 in PBS with 0.5% polyvinyl alcohol and protease inhibitor and snap frozen for cytokine analysis, and (ii) profiled for spz concentration, normal morphology, motility parameters, mitochondrial activity and acrosome integrity. Samples from (i) were analysed for interleukin (IL)-1a, IL-1b, IL-4, IL-6, IL-8, IL-10, IL-17a, IL-36a, inflammatory protein (IP)-10, interferon-inducible T cell chemoattractant (I-TAC), macrophage chemoattractant protein (MCP)-1, macrophage inflammatory protein (MIP)-1a, MIP-1b, thymus-expressed chemokine (TECK), tumour necrosis factor (TNF)-a and vascular endothelial growth factor (VEGF)-A by a combination of enzyme-linked immunosorbent assay (IP-10, ITAC, TECK) and fluid-phase multiplex immunoassay (other analytes). All analytes were detectable except IL-4 and I-TAC. Random forest-based analysis with 5-fold cross validation and feature ranking for each objective revealed normal morphology and motility parameters could be identified reliably using only 5 cytokines. Initial data showed positive correlations between a subset of cytokines and spz concentration, motility parameters and acrosome integrity. Statistically significant ($P < 0.05$) negative correlations were noted between acrosome integrity and certain cytokines. These findings suggest that seminal plasma cytokines show potential for use as surrogate indicators for conventional spz parameters and reflect the spz quality of bull ejaculates.

From womb to bloom: conception, early life and maternal effects on boar semen production

P. Sá¹, R. M. Godinho², M. Gòdia¹, C. A. Sevillano², B. Harlizius², O. Madsen¹, H. Bovenhuis¹

¹ Wageningen University and Research, Animal Breeding and Genomics, Droevendaalsesteeg 1, 6700 AH Wageningen, Netherlands, ² Topigs Norsvin Research Center, Meerendonkweg 25, 5216 TZ 's-Hertogenbosch, Netherlands

This study aims to quantify conception, early life and maternal effects on boar semen traits. Ejaculates were collected between 2009 and 2022 and evaluated using a Computer-Assisted Sperm Analysis (CASA) system. The phenotypic dataset included records from 449,966 ejaculates collected from 5,692 boars from a synthetic line. Pedigree information included 17,701 animals spanning 26 generations. Conception and early life effects included dam's parity, age of the dam and sire, and litter of origin effects such as gestation length, litter size, litter sex ratio, number of piglets born alive and number of litter mates at weaning. Additionally, length of rearing period and weight gain of the boar during rearing were included. A univariate analysis with a repeatability model accounting for fixed effects at collection, including age of the boar and interval between collections, was used to individually test conception and early life effects. A subset of 230,655 ejaculates from 2,837 boars were used to estimate a maternal environmental effect on semen traits. Conception and early life effects reported suggestive effects on a limited number of semen traits. Significant maternal environment effects were estimated on sperm motility traits, explaining between 2.3 and 5.7% of the phenotypic variance, resulting in lower estimates of heritability. Our findings reveal suggestive effects of early-life conditions and substantial maternal effects on semen quality traits. This insights emphasizes the importance of parental and early-life conditions on semen quality in boars.

Session 41

Theatre 5

Effect of grazing pastures with rich tannin legumes on ovarian activity in suckling anoestrous beef cows

G. Quintans¹, M. Lema¹, G. Fernandez-Turren¹, G. Banchemo²

¹ Instituto Nacional de Investigación Agropecuaria, Beef and wool, Ruta 8 km 281, 33000 Treinta y tres, Uruguay, ² Instituto Nacional de Investigación Agropecuaria, Beef and wool, Ruta 50 km 11, 70006 Colonia, Uruguay

The length of the postpartum (pp) anoestrous period determines the reproductive performance, and nutrition is one of the main factors affecting it. This study evaluated the ovarian activity in beef pp anoestrous cows grazing two different pastures. Fifty-six Aberdeen Angus×Hereford multiparous cows and their calves (LW 497±6.8 kg; BCS 4.05±0.04 units; Calf LW 60±1.6 kg) were assigned to each of two treatments on Day 22±0.82 pp: (i) native pasture (NP; n=28); (ii) native pastures improved with Lotus subbiflorus (improved pastures, IP, n=28; 3.6g/100 g DM of condensed tannins). BCS and LW was assessed at calving, onset of treatments and every 28 days. Ovarian activity diagnosis (OAD) was performed at Day 57 and 87 pp. OAD was obtained by ultrasonography classifying cows in: Cycling (presence of corpus luteum (CL)); Superficial Anoestrous (SA, maximum follicle diameter (MFD) ≥ 8mm); Deep Anoestrous (DA, MFD < 7mm). Natural service started at Day 72 pp and lasted 63 days. Treatments were compared using the PROC GLIMMIX of SAS using a binomial distribution. IP cows had greater LW (P<0.05) and BCS (P<0,001) respect to NP cows at Day 52 (545 vs 522 kg, SEM= 7.1 and 4,6 vs 4,2 u, SEM=0.04) and 78 pp (546 vs 523 kg, SEM=7.7 and 4.9 vs 4.5, SEM=0.05). At Day 57 pp more (P< 0.05) IP cows were in SA respect to NP cows (24/28 vs 16/28) but no differences were observed at Day 87 pp since most of cows in both treatments had presence of CL (25/28 and 26/28 for IP and NP, respectively). Although IP cows gained more LW and BCS than NP, cows in both nutritional treatments were above the BCS threshold to achieve adequate reproductive performance.

Relationship between sperm DNA fragmentation, semen quality and serum mineral concentration of bulls
*A. Benito-Díaz*¹, *A. Sarmiento-García*³, *M. Montañes-Foz*¹, *R. Bodas-Rodríguez*¹, *J. J. García-García*¹, *P. Vicente-Galindo*²

¹ *Instituto Tecnológico Agrario de Castilla y León, Línea de Investigación en Rumiantes, Autovia de Castilla 117, 47009 Valladolid, Spain*, ² *Facultad de Medicina, Universidad de Salamanca, Departamento de Estadística, Alfonso X el Sabio, 37007 Salamanca, Spain*, ³ *Facultad de Ciencias Agrarias y Ambientales, Universidad de Salamanca, Área de Producción Animal, Departamento de Construcción y Agronomía, Av. de Filiberto Villalobos, 119, 37007 Salamanca, Spain*

The present study analyzed the relationship between semen quality parameters (progressive sperm motility, sperm velocity leading), serum concentration of some minerals (selenium and copper), and sperm DNA fragmentation. Semen and serum samples were collected from bulls (n=18) of similar age and breed reared under identical conditions. The semen was collected from the electroejaculation procedure, while blood samples were drawn from the coccygeal vein. Blood samples were sent to the laboratory to determine selenium and copper concentrations, quantified by inductively coupled plasma mass spectrometry. Semen samples were analyzed using the CASA instrument, while sperm DNA fragmentation was evaluated using Sperm-Halamax® KIT. RStudio was used for data management and statistical analysis. Samples with progressive motility above the median (44,45%) were considered optimal. In those samples, a significant (P<0.05) positive correlation was described between semen quality parameters and DNA integrity. These results showed that the decline in semen quality parameters is linked with a lower DNA integrity, which could be translated into a cause of male infertility. Even optimal samples showed a numerically higher content of copper and selenium than the rest, no significant relationship (P>0.05) between the content of these minerals and sperm DNA fragmentation could be demonstrated. Hence, more research is needed.

Session 41

Theatre 7

Genomics of boar semen quality traits in U.S. Large White and Duroc breeds

*M. Terribile*¹, *G. Visentin*¹, *A. Costa*¹, *D. Buccì*¹, *Y. Huang*², *J. Jiang*³, *F. Tiezzi*⁴, *C. Maltecca*³

¹ *University of Bologna, DIMEVET, Via Tolara di Sopra 50, 40064 Ozzano dell'Emilia (BO), Italy*, ² *Smithfield Premium Genetics, 4134 US-117, 28458 Rose Hill, NC, United States*, ³ *North Carolina State University, Department of Animal Science, Polk Hall, 120 W Broughton Dr, 27607 Raleigh, NC, United States*, ⁴ *University of Florence, DAGRI, Piazzale delle Cascine, 18, 50144 Florence, Italy*

Semen quality dictates the efficiency and success of artificial insemination, thus impacting the profitability of swine farming. Despite that, semen quality traits are often overlooked in breeding programs. The present study aimed to estimate genomic parameters of semen quality traits in Duroc and Large White boars and to identify candidate genes associated with total number of sperm cells, sperm motility, progressive motility, and normal morphology through a genome-wide association study (GWAS). Data collected from 2013 to 2023 included 524 Duroc and 639 Large White boars genotyped using four SNP arrays with a density range from 48 to 68K. Only common SNP across all panels were retained (n = 27,350). Fixed effects included in the linear model were breed, year, and collection season; age was included as a linear covariate. Boar ID, fitted to a genomic relationship matrix (G), and the residual were the random terms. Heritability ranged from 0.04 (motility) to 0.19 (normal morphology), while repeatability varied from 0.39 (motility) to 0.57 (normal morphology). Strong and positive genomic correlations were estimated between Motility, Progressive Motility, and Normal Morphology (0.76 to 0.96). Total sperm was negatively genomically correlated to motility (-0.06) and progressive motility (-0.39). The GWAS revealed that candidate genes *STIM2*, *ATP10D*, *ABCA5*, and *ABCA9* were associated with total sperm, while *EBF1*, *CTNND2*, and *NAV2* were associated with motility and *PARVA* to progressive motility. SNP in *KCNC1* and *ZNF317* were the most significant for normal morphology. Results could be useful in developing breeding subindices for male fertility to maximize profitability and make informed choices in selection nuclei.

Effects of prolactin on serum hormones and related genes of ewes in the estrus cycle

S. Yue¹, R. Yang¹, Y. Liu¹, Y. Zhang¹

¹ College of Animal Science and Technology, Hebei Agricultural University, 071000 Baoding, China

Prolactin (PRL) has been reported to affect reproductive performance with rhythmic changes. However, the regulation of PRL on hormones and related genes during the estrus cycle remains unclear. This study randomly assigned 62 healthy post-weaning ewes to the control group (C) and the treatment group (T, bromocriptine, PRL inhibition) after estrus synchronization. The samples of blood and ovary were collected from each ewe during the next natural estrus cycle of the proestrus, estrus, metestrus, and diestrus for the detection of follicle count, corpus luteum (CL) count, hormone secretion, and the expression of related genes. The results showed that PRL inhibition had no significant effect on the days of the estrus cycle ($P > 0.05$). T group significantly promoted the number of large follicles and CL ($P < 0.05$), E2, FSH, ER, FSHR ($P < 0.05$), and the sensitivity of FSH during the proestrus period. T group significantly promoted the number of large follicles and CL than that of C group during estrus ($P < 0.05$) and promoted follicle development by significantly increasing StAR and CYP19A1 expression ($P < 0.05$). T group increased the number of CL than that of C group during metestrus ($P < 0.05$) and promoted follicle rupture and ovulation by significantly increasing LHR expression ($P < 0.05$). T group significantly increased the number of large and middle follicles in diestrus ($P < 0.05$). It improved steroid secretion during estrus by increasing P4 levels and PR, 3 β -HSD, and StAR expression ($P < 0.05$) than that of C group. Bcl-2 was reduced and Caspase-3 increased in T group during proestrus. Bcl-2 increased in estrus and Bax in metestrus. In diestrus, Caspase-3 and Bax increased while Bcl-2 decreased in T group. These results suggested that PRL plays an important role in the estrus cycle.

Effect of storage time in epididymis at 5°C on motility, viability and morphology of spermatozoa of European red deer (*Cervus elaphus elaphus*)

A. Dziekońska¹, N. M. Neuman¹, M. Kozirowska-Gilun¹, P. Gilun²

¹ University of Warmia and Mazury in Olsztyn, Department of Animal Biochemistry and Biotechnology, Oczapowskiego 2, 10-719 Olsztyn, Poland, ² Institute of Animal Reproduction and Food Research of the Polish Academy of Sciences, Department of Local Physiological Regulations, Tuwima 10, 10-748 Olsztyn, Poland

The use of stored semen in reproduction may contribute to significant progress in farm breeding of deer. The aim of the study was to assess the motility, viability and morphology of European red deer spermatozoa stored in the epididymis for up to six days at a temperature of 5°C. Spermatozoa were obtained from the cauda epididymis (n = 11) post mortem and diluted in Salomon's diluent. Analysis of spermatozoa included assessment of spermatozoa motility (CASA system), viability (SYBR-14/PI staining) and morphology (Giemsa staining). The tests were carried out on the first day (D0) and on the following days of storage (D2, D4, D6). The analysis of the results showed a significant ($p \leq 0.05$) impact of storage time on the analyzed variables. On D2, a significant decrease in motility and integrity of plasma and acrosomal membranes was demonstrated. However, on D4 the values for the percentage of spermatozoa showing movement (TMOT) and viability were still satisfactory and were 68.0 ± 3.7 and 76.1 ± 2.4 , respectively, and the percentage of spermatozoa showing progressive movement was 17.2 ± 1.8 . On D6, there was a decrease ($p \leq 0.05$) in the values of all analyzed variables, and the TMOT and viability values were 31.0 ± 2.4 and 44.7 ± 6.2 , respectively. The obtained results indicate that European red deer spermatozoa can be stored in the epididymis at 5°C for up to four days and used for reproductive purposes. Funded by the Minister of Science under the Regional Initiative of Excellence Program.

Effect of oxidative stress on reproduction of dairy cattle

J. Sekaninová¹, M. Janků¹, L. Luhová¹, M. Petřivalský¹, J. Bezdíček², J. Ducháček³, L. Stádník³

¹ Palacky University, Department of Biochemistry, Šlechtitelů 27, 78371 Olomouc, Czech Republic, ² Palacky University, Department of Zoology, 17. listopadu 50, 771 46 Olomouc, Czech Republic, ³ Czech University of Life Sciences, Department of Animal Science, Kamýcká 129, 165 00 Praha, Czech Republic

The efficiency of cattle reproduction is negatively affected by climate change, causing heat and, consequently, metabolic or oxidative stress. Another aspect that affects cattle fertility is the quality of ovulated oocytes in dairy cows, which is also affected by heat stress or discomfort and the capacity of their metabolism to overcome these conditions. Markers of oxidation and the antioxidant status of the animals can be analyzed from the blood collected from the monitored animals. In laboratory conditions, biochemical parameters of oxidation status (e.g., total oxidant content; lipid peroxidation products) and antioxidant status (total antioxidant content, involvement of antioxidant enzymes) can be determined. Moreover, we focused on production of heat shock proteins 70, a family of conserved ubiquitously expressed proteins that are essential in protecting cells from the adverse effects of physiological stresses, including heat stress. The variability of these indicators is closely correlated with the conception of dairy cows, which thus has a negative impact on the economy of reproduction and breeding of dairy cattle. Monitoring the metabolism level and optimizing the conditions during oocyte collection can be significantly improved, which leads to the efficiency of the whole process. In our study, we present the results of blood analyses for selected parameters from dairy cows at different phases of their reproductive cycle. These phases are reflected in the analyzed parameters and bring us information for streamlining the controlled reproduction of cattle. Supported by NAZV QK22010270

Poster 11

The effect of adding penicillin on the quality of pig semen

T. Sitorus¹, A. Tarigan¹

¹ Universitas HKBP Nommensen, Animal Science, Jl. Sutomo 4A, 20234 Medan, Indonesia

Pig farming is one of the livestock businesses carried out by many people in North Sumatra Province. Artificial Insemination (AI) is an artificial mating technique using semen from superior males and can prevent the spread of disease in livestock. In addition, antibiotics are natural substances that have the ability to inhibit or kill microorganisms in semen dilution. One type of antibiotic that can be used in the semen dilution process is penicillin. Some of the advantages of penicillin are that it can inhibit the growth of gram-positive bacteria. This study aimed to determine the effect of penicillin addition in the pig semen dilution process on the quality of pig semen after 24 hours of dilution. The pig used in this study was a male pig over 2 years old, where semen was collected four times as replications. The method used was a Completely Randomized Design (CRD), consisting of 4 treatments with 4 replications, namely P0 (without penicillin in the diluent), P1 (0.3 gr/l penicillin in the diluent), P2 (0.6 gr/l penicillin in the diluent) and P3 (0.9 gr/l penicillin in diluent). The extender used in this study was the non-antibiotic penicillin Beltsville Thawing Solution (BTS). The parameters observed were Motility, Viability, Sperm Abnormalities and pH. The data obtained in this research was then analysed using Analysis of Variance (ANOVA) and continued with HSD test when significant different was observed between the treatments. The results showed that the addition of penicillin was not significantly different ($P > 0.05$) on pH and abnormalities, but was significantly different ($P < 0.05$) on motility, and very significantly different ($P < 0.01$) on viability of sperm. The addition of 0.3 g/l penicillin was the best level in the pig semen dilution process.

Correlated response to divergent selection for litter size variability in rabbits' semen quality

*D. Serrano-Jara*¹, *M. J. Argente*¹, *M. D. L. L. García*¹

¹ *Institute CIAGRO, Miguel Hernández University of Elche, Tecnología agroalimentaria, Ctra de Beniel, Km 3,2., 03312 Orihuela, Spain*

In this research, sperm production and quality are evaluated in two rabbit lines selected divergently for resilience. Resilience has been measured as litter size variability. The homogeneous line is selected for decreasing litter size variability and the heterogenous lines is selected for increasing litter size variability. The results obtained show that the concentration (P = 83%) and total production (P = 84%) of spermatozoa is higher in the homogeneous line than heterogenous line. The homogeneous line also presents a higher dose potential for artificial insemination (P = 83%). The homogeneous line presents greater movement (P = 94%) and progressivity (P = 92%) . The kinetic parameters are also favourable to the homogeneous line (VCL, P = 90%; VAP, P = 86%; VSL, P = 83%), however, it shows higher values (42.08 vs 38.74%) in parameters associated with circular movements (WOB, P = 93%). It is likely that this difference between lines is not enough to affect the progressivity of the sperm, where the homogeneous line shows better results. In conclusion, the homogeneous line seems to present better sperm production and quality, although it would be necessary to evaluate a greater number of samples distributed over more weeks.

Reproductive tract morphology and symmetry of farmed common eland (*Tragelaphus oryx*) bulls, and their relationship with secondary sexual traits and social rank

J. Consolacion^{1,2}, *F. Ceacero*¹, *A. S. Musa*¹, *V. Ny*¹, *R. Kotrba*^{1,3}, *J. Illek*⁴, *M. Škorič*⁵, *T. Needham*¹

Common eland bulls are popular game ranching animals for tourism, breeding/live sales, trophy hunting, and meat production. Such lucrative profits from many game species like the common eland, have been recently classified as domesticated species in Southern Africa, supporting the intensification of their farming. However, few scientific information is available regarding the selection criteria for breeding bulls. Thus, this research aimed to provide basic information about the reproductive tract morphology, symmetry, and their associations with secondary sexual traits, social rank, and temperament in common eland. Six eland males (2–2.5 years old; 203 ± 20 kg) and their biometric data were utilised and determined before the animals were culled. Reproductive tracts were collected for morphometric and histological evaluations. Relatively low asymmetry in bilateral reproductive tract structures were found. Age, body weight, and social rank correlated the development of some testicular morphologies and possibly be used for the selection of breeding males, but not temperament and horn length, which should be carefully evaluated. Although, this study has provided baseline information from a limited sample size, further studies should incorporate the assessment of testicular hemodynamics, season, and androgen secretion patterns over a wider age range of populations to provide further information for the management practices of breeding common eland bulls.

Effect of food restriction on rabbit ovarian functions

I. Hadjadj¹, Z. Fabova², M. D. L. L. García¹, B. Loncova², M. Morovic², D. Serrano-Jara¹, P. Makovicky^{3,4}, M. J. Argente¹, A. V. Sirotkin²

The aim of this study is to examine the influence of caloric restriction (CR) on basic rabbit ovarian functions. A total of 16 does were used (8 fed ad libitum and 8 subjected to 50% CR). Morphometric analysis of folliculogenesis was carried out by using histomorphometry. Cell viability, proliferation (accumulation of PCNA and cyclin B1, and BrdU-positive cells), apoptosis (accumulation of bax, caspase 3, DNA fragmented cells), release of progesterone and estradiol were evaluated by Trypan blue extrusion test, quantitative immunocytochemistry, BrdU and Cell Death Detection assays, and ELISA. Proteomic analysis was performed by nano HPLC-Chip-MS/MS method. Diameter of follicle, thickness of theca and granulosa, and diameter of antral and preovulatory follicles were higher in CR group than control one. CR group showed lower percentage of viable cells and apoptotic cells, and the release of progesterone and estradiol. CR promoted proliferation, and altered the expression of 25 regulatory proteins. In conclusion, CR affects basic rabbit ovarian functions, and this effect can be mediated by changes in morphometric parameters of antral and preovulatory follicles, ovarian cell proliferation and apoptosis and release of reproductive hormones. Camelina sativa L cake as a source of n-3 fatty acids does not affect the reproductive traits of HF heifers

R. Poplawski¹, K. Sz kudelska², M. Psczcola¹, M. Murawski⁴, D. Fabian³, B. Nowak¹, P. Sidoruk¹, P. Kolodziej ski², D. Lechniak-Cieslak¹

¹ Poznan University of Life Sciences, Wolynska 33, 60-637 Poznan, Poland, ² Poznan University of Life Sciences, Wolynska 35, 60-637 Poznan, Poland, ³ Slovak Academy of Sciences, Dúbravská cesta 9, P.O.BOX 63 Kosice, Slovakia, ⁴ Agricultural University of Cracow, Rędzina 1b, 30-248 Krakow, Poland

The beneficial effects of n-3 FAs on metabolic and reproductive performance have been described in ruminants. Although the advantageous impact of n-3 FAs was shown in dairy cows, especially during transition periods, we used the model of nulliparous heifer to avoid possible interaction of the supplement with lactation and NEB effects. The study investigated the effect of Camelina sativa L cake (CSL), a rich source of n-3 FAs, on a panel of variables. This included profile and concentration of FAs, metabolic parameters (glucose, cholesterol, triglycerides, β -hydroxybutyrate), and metabolic hormones (insulin, glucagon, IGF-1). The number and size of ovarian follicles and selected sex hormones (LH, FSH, AMH, PGF2 α) were also analyzed. 16 HF heifers (11-12 months old) divided into control (8) and experimental groups (8) were included. The diet was supplemented with CSL for 48 days (1 kg per day). Diet supplementation with CSL increased the total n-3 FAs and ALA concentrations and reduced the n-6:n-3 ratio. The rise in glucose and cholesterol was observed, but the remaining parameters including sex hormones as well as follicle growth were not affected. To sum up, n-3 FAs may directly affect glucose and cholesterol synthesis. Regarding reproductive variables, our study confirms published results of experiments involving heifers fed fish oil and linseed. Besides, the profile and concentration of bioactive compounds of CSL may also interact with the FA effect. Supported by NCN Poland, grant OPUS21 UMO- 2021/41/B/NZ9/01256

Implementation of an Artificial Intelligence system for morphological evaluation of spermatozoa in routine bull semen analysis aUrli S., aCorte Pause F., bDreossi T., aStradaioli G. aDepartment of Agricultural, Food, Environmental and Animal Sciences, University of Udine, Via Delle Scienze 206, 33100, Udine, Italy, susy.urli@uniud.it, francesca.cortepause@uniud.it, giuseppe.stradaioli@uniud.it bDepartment of Mathematics, Computer Science and Physics, University of Udine, Via Delle Scienze 206, 33100, Udine, Italy, talissa.dreossi@uniud.it Morphological characteristics of bull spermatozoa are usually evaluated visually using bright field microscopy according to the guidelines proposed by The Society of Theriogenology for the Bull Breeding Soundness Evaluation. However, the evaluation is time consuming and requires experienced personnel to obtain reliable results. Nevertheless, the artificial insemination industry is increasing the usage of genomic selection scheme for young bulls. Hence, there is a growing need for a more standardized technique to analyze semen quality, particularly for the evaluation of spermatozoa abnormalities that affect semen freezing suitability and fertilizing capacity, both important due to the wide use of frozen-thawed semen. Therefore, we are currently working on an Artificial Intelligence (AI) system for automated classification of microscope-acquired images of spermatozoa. We will use neural networks, specifically convolutional neural networks (CNNs) and R-CNN or YOLO networks, which are able to learn and extract relevant features from complex visual data through segmentation of images. This will allow us to classify spermatozoa morphology (normal spermatozoa and both primary and secondary abnormalities). We will employ a dataset consisting of thousands of images, which will be labeled and annotated with bounding boxes to help the segmentation algorithm. If necessary, we will also exploiting augmentation techniques to enhance its size.

Session 41

Combined transcriptome analysis reveals the effect of prolactin inhibition on epididymal function in cashmere goats

X. Liu¹, Y. Liu¹, Y. Zhang¹

¹ Hebei Agricultural University, College of Animal science and Technology, Lekai South Street, 071000 Baoding, China

Male animals cannot lactate, but serum concentrations of Prolactin (PRL) are similar to those of females, suggesting that PRL may have an important role in males. However, the molecular mechanisms underlying the influences of PRL on epididymal function remain unclear. We studied the effects of prolactin on the epididymis of rams by feeding the prolactin inhibitor bromocriptine (BCT) to Yanshan cashmere goat rams. Serum hormone levels of the control group (n=10) and BCT group (n=10) were detected by ELISA, epididymal tissues were collected, hematoxylin-eosin (HE) staining to observe histomorphologic changes, and differentially expressed genes were analyzed by RNA-seq. The results showed that at the end of the experiment, the BCT group significantly reduced the hormonal levels of serum PRL, testosterone and estradiol compared to the control group (P<0.05). HE staining revealed no obvious pathological changes in the epididymis in both groups; afterward, we analyzed their measurements with an Independent Samples t-test and found that in the head of the epididymis the BCT group significantly elevated the epididymal epithelial height and the epididymal duct diameter (P<0.05). RNA-seq analysis revealed a total of 358 Differentially expressed genes in both groups. We screened the following pathways by GO and KEGG analysis including steroid binding, GnRH signaling pathway, Estrogen signaling pathway (ESR), cAMP signaling pathway, etc. Fifteen of these genes were selected for verification, and it was found that the qRT-PCR was consistent with the trend of the transcriptome results. In summary, we found that PRL is involved in the reproductive activity of the epididymis by affecting GnRH, ESR, cAMP and other pathways.

Morphometric study of the goat cervix during stages of natural estrus cycle

S. Kanthawat¹, F. Thatsanabunjong¹, P. Raksaseri¹, S. Panyaboriban², S. Srisuwatanasagul¹

¹ Chulalongkorn University, Faculty of Veterinary Sciences, 10330 Bangkok, Thailand, ² Prince of Songkla University, Faculty of Veterinary Science, 90110 Songkla, Thailand

The cervical canal plays a crucial role in ewe reproductive biology as it involves multiple reproductive phenomena such as the facilitation of sperm transports, as well as morphological changes during the stages of the estrus cycle. The study of the cervix is paramount, not only for understanding biological processes but also for herd health practice and management. The morphophysiological of the cervix influences numerous reproductive management such as natural mating, artificial insemination as well as pregnancy, and parturition. This study aimed to demonstrate the morphometric data of the domestic goats cervix in different estrus stages, by using CT scan, anatomical appearance measurement, and classification. In this study, the cervical canal was visualized and the 3D pictures were generated to show the appearance of the cervical canal of different cervical grades. Cervical canal grade 1 shows a straight canal with inter-cervical fold space, making a fishbone-like shape. For grade 2, there is a crooked canal around the second or third fold, with a normal straight canal after the crooked, corresponding to the incompleteness of cervical folds at the level of the crooked canal as shown in the longitudinal section. The canal is long, narrow, and crooked, inter-cervical fold cannot be distinguished in grade 3. The mean number of cervical rings was 5, ranging from 3 – 7 rings. The cervix size of the pregnant (11.08 ± 0.7) was significantly smaller than the follicular (14.42 ± 0.66) and the luteal stage (14.23 ± 0.89) ($P < 0.05$). The average canal size was significantly different among stages ($P < 0.05$). Further study on the collagen distribution was determined by Masson Trichrome. The distinct differences among stages were observed in the muscular layer. The percentage of the muscle in the follicular stage is lowest compared to other stages ($p < 0.05$). The percentage of collagen content in the muscular layer was highest in the pregnant cervix. When considering the histology distribution, it was shown that the collagen fibers were slightly detached from each other in the follicular stage compared to the luteal stage.

Session 41

Poster 19

Timing of Pregnancy Loss in Lactating Holstein Cows

P. Carvalho^{1,2}, V. Santos³, S. Priskas¹, V. Papanikolopoulou¹, C. Maia³, A. Souza⁴, G. Arsenos¹

¹ Aristotle University of Thessaloniki, School of Veterinary Medicine, University Campus of Thessaloniki, 54124 Thessaloniki, Greece, ² Sexing Technologies, Navasota, 77868 TX, United States, ³ Diessen Serviços Veterinários, Travessa dos Portugais, 67000-640 Evora, Portugal, ⁴ Cargill Animal Nutrition and Health, Minneapolis, 55441 MN, United States

The objective was two-fold: i) to quantify the extent and timing of pregnancy loss (PL) in lactating dairy cows, and ii) to determine the days of pregnancy in which PL should be considered stillbirth. A total of 16 commercial dairy farms were selected. Data from 516,473 artificial inseminations (AI) performed on 142,052 cows and heifers were used. Pregnancy was diagnosed with ultrasound at 30 days after AI. Pregnant cows were reevaluated at 70, 120, and 180 days after AI. Cows diagnosed pregnant and subsequently diagnosed open or AI, were considered to have suffered PL. Distribution of PL was determined by logistic regression using the PROC LOGISTIC of SAS. Determination of days of pregnancy in which calving occurred was classified as stillbirth vs PL based on the ROC plot that maximized the Youden's Index J. Overall, 43.1% of cows were diagnosed pregnant at 30 days after AI. The threshold of 260 was selected as days of pregnancy cutoff because it resulted in the highest Youden's Index. Pregnancy loss between 30 and 260 days after AI averaged 13%. The majority ($P < 0.01$) of PL occurred between 30 and 100 days after AI compared to 101 and 260 days after AI (71% vs 29%, respectively). The percentage of cows with twin parturitions was 4.2% and differed ($P < 0.01$) by lactation group (2.1% vs 4.6% vs 5.6% for cows in the first, second, and third or greater calving). In conclusion, delivery of a dead calf after 260 days of pregnancy should be considered a stillbirth. Pregnancy loss had higher incidence between 30-100 days after AI.

The impact of virtual fence on cattle's learning curve over several weeks with multiple borders

L. Wahlund¹, P. Nielsen¹, A. Jansson², L. Rönnegård²

¹ Research Institutes of Sweden, Ultunaallén 4, 75651 Uppsala, Sweden, ² Swedish University of Agricultural Sciences, Almas allé, 75651 Uppsala, Sweden

Research on virtual fences has primarily focused on the initial learning phase aiming to test the ability of cattle to respond to audio cues (AC) at a defined GPS border, allowing them to avoid an electrical stimulus (ES) from a collar, return to a virtual pasture. Knowledge of the ability to adapt over several weeks using multiple and changing virtual borders is limited. This study examined how the number of AC and ES varied over 42 days for a group of seven 12-month-old heifers, naïve to virtual and electrical wire fences, introduced to three successive treatments, with different numbers and positions of virtual borders. Treatment 1 (learning phase): 1 border for 1 week, Treatment 2: 2 borders for 2 weeks, and Treatment 3: 4 borders for 3 weeks. The number of AC and ES was collected by the collars. Two heifers were removed on day 2 for reaching the maximum of 15 ES per individual within the first five days. The highest average number per individual and day for AC (33.4 ± 1.9) and ES (9.9 ± 1.3) was recorded on day 1. For the remaining period (calculated for day 2-42) the daily average number per individual for AC and ES was 5.3 ± 0.3 and 0.4 ± 0.1 . Treatment 1 was recorded with a significantly higher number of ES compared to Treatments 2 and 3. There was a significant decrease in the number of AC per day within Treatment 1 ($P < 0.001$) and 2 ($P = 0.013$), but not for 3. Similarly, for the ES, there was a significant decrease in the number per day within Treatment 1 ($P < 0.0001$) but not for 2 and 3. The study concludes that cattle can learn to avoid ES through AC. Moreover, the level of ES per day remains stable over time after the initial learning phase and is not affected by the number or changing of virtual borders.

Session 42

Theatre 2

Virtual and electrical fences – perspectives from a survey for cattle farmers in Norway and Sweden

F. Petters¹, P. P. Nielsen¹, L. Wahlund¹

¹ RISE Research Institutes of Sweden, Agriculture and Food, Box 7033, 75007 Uppsala, Sweden

Virtual fencing (VF), utilizing GPS collars with sensors to create virtual boundaries for livestock, is currently prohibited in Sweden due to animal welfare concerns. However, it has been used in Norway since 2019. The aim was to investigate the perspectives of cattle farmers in Sweden and Norway regarding animal welfare and behaviour with virtual fencing (VF) and electrical fencing (EF). The research comprises two surveys: 1) gathering experiences from Norwegian VF farmers and 2) investigating Swedish farmers' interest in VF adoption and experiences with traditional EF. Preliminary results indicate that most of the Norwegian respondents report that cattle naïve to VF escape 2–5 times and receive 2–4 electrical pulses (EP) during the first week on pasture. During the same period, cattle experienced with VF seldom or never escape and receive 0 or 1 EP. Throughout the grazing season, animals accustomed to VF were estimated to receive a weekly average of 0, 1 or 2–5 EP by 39, 30 and 16 % respectively. No animal injuries were reported on VF pastures. However, 40 % observed abrasions from the collars. On a scale from 0 to 10, the risk of animal injuries while on pasture with VF was rated at 2.3. Perceived animal welfare with VF compared to EF was rated at 8.3. The learning period for cattle to adapt to VF was on average rated 3.7 days. Half of the Swedish respondents estimated that escapes occur “2–5 times” or “more than 5 times” on EF pasture throughout the grazing season regardless of previous pasture experience. 25% responded that they never witness animals receiving an EP from EF after the first week on pasture, whilst 73% occasionally see it. Most of the Swedish respondents had experience of animal injuries on pasture. On a scale from 0-10, the risk of fence-related injuries was rated 3.3. Based on the findings we conclude that, according to farmers, virtual fences efficiently minimize escapes and injuries compared to traditional electrical fences, indicating its potential for improved livestock management and welfare. However, there is a lack of research on cattle learning electrical fencing, though a majority report seeing occasional electrical pulses after the first week of training.

Drone RGB Image-Derived Vegetation Indices to Predict Yield in Humidicola (*Brachiaria humidicola*) Grass
A. Astillero¹, E. C. Lin²

¹ Bureau of Animal Industry, Livestock Research and Development Division, No. 5 Visayas Avenue, Barangay Vasra, Quezon City, 1128 Quezon City, Philippines, ² National Taiwan University, Department of Animal Science and Technology, No. 1, Section 4, Roosevelt Rd, Da'an District, Taipei City, 10617 Taipei, Taiwan

Forages are a significant component of ruminant nutrition, which relies on proper pasture management. However, improper management results in overgrazing and an overall decline in pasture productivity, causing poor animal performance and welfare. To prevent this, timely and relevant information on forage yield is necessary for the livestock farmer. Traditional ways of measuring forage yield are laborious, time-consuming, and less accurate for wider areas. In precision livestock farming, using drones for this application is gaining popularity because it offers more operational flexibility. Previous research still has limited application because, despite promising results, they used complicated workflows and very expensive equipment. Thus, there is a need for research to develop a workflow that is accurate yet simple, uses cheaper tools, and is computationally efficient. In this research, a DJI Mavic 3 Classic drone with an RGB camera was used to obtain images. Vegetation indices were extracted from these images as predictors to develop a polynomial multiple regression model for the prediction of forage yield. Results showed that fresh and dry matter can be highly predicted from 20-meter altitude with an adjusted R² of 0.71 and 0.66 (R² of 0.77 and 0.73), respectively, by combining linear, quadratic, and cubic vegetation indices. This demonstrates the potential of an alternative simple workflow, cost-effective tools, and statistical method for yield prediction in *Brachiaria humidicola* pastures.

Advancing Agricultural Efficiency: Unmanned Aircraft Vehicle in Soil and Pasture Management

G. Menezes¹, A. Franco³, J. Dorea^{1,2}

¹ University of Wisconsin-Madison, Department of Animal and Dairy Sciences, 1675 Observatory Dr, 53706 Madison, United States, ² University of Wisconsin-Madison, Department of Biological Systems Engineering, 460 Henry Mall, 53706 Madison, United States, ³ Indiana University Bloomington, Paul H. O'Neill School of Public and Environmental Affairs, 1315 E. Tenth Street, 47405-1701 Bloomington, United States

The utilization of Unmanned Aerial Vehicles (UAVs) has become a powerful method for supporting decision-making in pasture management. Multispectral imaging from UAVs could provide quantitative data, through vegetation indices, on the nutritional composition of pasture that may correlate with soil properties and soil health status. Our goal was to predict pasture and soil chemical composition using multispectral images taken from UAV. Data were collected from 11 farms located in Wisconsin, and the model was trained using indices derived from NIR, Red, Green, and Red-Edge bands. Partial Least Squares, Gradient Boosting Machine, and Support Vector Regression models were used and assessed through leave-one-out cross-validation. Additionally, the average of the predicted values was used as an ensemble model. The model predicted plant crude protein with an R² of 0.68 and a root mean square error of prediction (RMSEP) representing 10.9% of the average observed values. It also showed promising results for predicting total digestible nutrients and net energy for lactation in the pasture, with R² values of 0.78 and 0.79, and RMSEP representing 3.0% and 3.2% of the average observed values, respectively. The fiber content in the pasture was predicted with R² values of 0.80 and 0.69 and an RMSEP of 10.2% and 10.8% of the average observed values for Acid Detergent Fiber and Neutral Detergent Fiber, respectively. The model predicted soil pH with R² of 0.52 and an RMSEP representing 6.4% of the average observed values, and soil base saturation with R² of 0.62 and an RMSEP with represents 12.2% of the observed values. Equipped with multispectral cameras, UAVs facilitate the assessment of soil and pasture quality, enabling remote sensing on a large scale for optimal pasture management. Such development is crucial for generating the data required to enhance our understanding of soil-plant-animal interactions in grazing systems.

Can we use open data to track grazing intensity?

E. Padrón-Tejera¹, M. J. García-García¹, D. C. Pérez-Marín¹, F. Aranda-Viana¹, F. Maroto-Molina¹

¹ University of Cordoba, Department of Animal Production, ETSIAM, Campus Rabanales Ctra Madrid-Cádiz km 396, 14071 Cordoba, Spain

Grazing intensity represents the contribution of grazing to the level of pressure to which vegetation is subjected. Grazing intensity depends on the livestock load per unit of area and time, as well as on the characteristics of the vegetation. Monitoring grazing intensity can be a powerful tool to avoid the potential negative effects of grazing. GNSS tracking can be used to monitor the spatiotemporal distribution of animals on rangelands, but this technology has several drawbacks, e.g. price and connectivity, which can be limiting for some farms. The purpose of this study was to evaluate the feasibility of monitoring grazing intensity using open data sources. Two hundred GNSS collars were fitted to suckler cows grazing in two farms located in Avila, Spain, between 2017 and 2022. Over 7.9 million GNSS positions were recorded and used to compute kernel density estimates per month and pixel (10 x 10 m). The grazing intensity reference values were obtained by standardising kernel values on the basis of the percentage of animals wearing a collar in each farm and study period. Open data sources were used to characterise the spatial and temporal variability of pixels. Digital elevation models were used to compute slope and aspect. Orthophotos were utilised to calculate the distance to water sources and the percentage of grass coverage per pixel. Sentinel-2 imagery was used to analyse the temporal dynamics of grass by computing various vegetation, soil, and water indexes. Pearson correlations were calculated between standardised kernel values and pixel characteristics. Twelve features of pixels were found to have significant correlations with grazing intensity, as estimated from kernel values. However, all correlation coefficients were very low. The monthly average of the Normalized Difference Moisture Index (NDMI) and the Soil Adjusted Vegetation Index (SAVI) had the highest positive correlations with grazing intensity. Conversely, slope and distance to water showed the largest negative correlations. No single pixel feature had a large effect on grazing intensity on that pixel. However, a multivariate approach may help to explain a larger proportion of the variance of this complex phenomenon.

Session 42

Theatre 6

Digital ear tags in remote monitoring – exploring new (ab)use cases

K. Ueda¹, A. Ingham², G. Bishop-Hurley², S. Rieder¹

¹ Identitas AG, Stauffacherstrasse 130A, 3014 Bern, Switzerland, ² CSIRO, Agriculture and Food, Queensland Bioscience Precinct, 306 Carmody Road, QLD 4067 Brisbane, Australia

Sensor ear tags (SET) are promising tools for aiding with herd management. Apart from technical challenges, reporting of processed data rather than raw data streams, leads to a thinned or aggregated representation of sensor data. Consequently, available devices excel for specific areas of application. We outline a multi-year effort to successively evaluate SET devices, trial use cases, and test fringe applications. While the long-term goal remains the automation of the mandatory national animal tracing system, we report here on near-term, opportunistic gains based on existing technology for driving sector value. SET were first assessed under different holding conditions for their potential to support automated reporting on cattle. In a second phase, herds of cattle and small ruminants were equipped with commercial SETs on a collar during summering. Analyses were performed on the collected low-frequency data, comprising GPS positions and metrics of activity calculated from accelerometer raw data. The processed data was analysed for its potential to accurately describe herd behaviour and detect anomalies (i.e. predator presence) as this is representative of the data streams a producer purchasing the technology would receive. Herd activity analyses suggest that herd management practices influence daily behaviour pattern, especially level of nocturnal activity. Spatial metrics reflect constraints of available pasture. Interactions of animals with predators are not conclusively resolved in the data. During all test phases, technical and analytical discussions took place between Swiss and Australian stakeholders, representing an industrial user; and the producer – a spin-off – and their original research base institution. Incorporation of dedicated research devices in field trials, and raw data sharing back to the research institution, can contribute to a wider validation of algorithms under hitherto uncovered conditions. A comparative, increasing ease for industry of advancing software and embedded algorithms might allow to translate empirical findings of users into new, dedicated metrics for SETs, to summarise on-device raw data with more problem specificity.

Tracking bull reproductive dominance by measuring male-female interactions using Bluetooth Low Energy
M. J. García García¹, E. Padrón Tejera¹, D. C. Pérez Marín¹, F. Maroto Molina¹

¹ *University of Cordoba, School of Agricultural and Forestry Engineering, Animal Production, Madrid-Cádiz Rd., km 396, 14071 Cordoba, Spain*

In cow-calf grazing systems, natural mating is common. Cows are allocated with several bulls, allowing for competition among bulls to mate with cows in heat. Some bulls may exhibit dominance and mate with a large proportion of cows, which can result in a decrease in genetic diversity among calves. Tracking bull reproductive dominance can be time-consuming as it requires visual observations. Paternity tests based on SNPs sequencing can be used, but this may be limiting for some farms. The aim of this study was to assess the effectiveness of proximity sensors based on Bluetooth Low Energy (BLE) in identifying bulls with dominant reproductive behaviour. 53 cows were equipped with BLE beacons placed on a collar, while 3 bulls were equipped with BLE readers programmed to scan and register a maximum of 10 beacons every 30 min. Both cows and bulls were placed in the same paddock allowing natural mating. Cows were observed twice daily to detect signs of heat. Estrotec® patches were used as complementary tool to detect oestrus. Paternity tests were carried out on each bull using 19 SNPs to determine reproductive success. Number of readings (nr) per cow and day for each bull and average time interval between readings (avg gap) were used as indicators of male-female interactions. Significant differences were observed in nr and avg gap on days with cows in heat. Oestrus days exhibited an increase of 9 readings per cow and a decrease in the avg gap by 120 minutes. Regarding dominance behaviour, one of the bulls exhibited clear dominance over the others, siring 42/53 calves born. That bull had the highest nr and the lowest avg gap. This supports the hypothesis that BLE data could be used to monitor dominance in reproductive behaviour. Differences in behavioural indicators between the dominant bull and the others were higher on days with few cows in heat. When multiple cows were in heat simultaneously, there were increased opportunities for subordinate bulls to mate. BLE data may be used to monitor and optimise male-female interactions, reducing or limiting dominance. This could be achieved by separating dominant bulls or favouring oestrus simultaneity.

Session 42

Theatre 8

Improving animal health and welfare by using sensor data in herd management and dairy cattle breeding – a joint initiative of ICAR and IDF

C. Egger-Danner^{1,2}, I. Klaas^{1,2}, L. Brito^{1,2}, K. Schodl^{1,2}, J. Bewley^{1,2}, V. Cabrera^{1,2}, N. Charfeddine^{1,2}, N. Gengler^{1,2}, M. Haskell^{1,2}, B. Heringstad^{1,2}, M. Hostens^{1,2}, M. Iwersen^{1,2}, R. Linde^{1,2}, K. Stock^{1,2}, A. Stygar^{1,2}, E. Vasseur^{1,2}

¹ *ICAR IDF Initiative, ICAR, Arthur van Sendelstraat 650, 3511 MJ Utrecht, Netherlands, ² ICAR IDF Initiative, IDF, Blvd Auguste Reyers 70, 1030 Schaerbeek, Belgium*

Digitalisation is advancing with rapid developments in farm technologies, which has the potential to revolutionize and to improve the long-term sustainability of dairy production. This has motivated the International Committee of Animal Recording (ICAR) and the International Dairy Federation (IDF) to start a joint initiative aiming at providing guidelines and best practices for using data from sensors across systems and applications, with a focus on functional traits such as health and animal welfare. The key partners are the ICAR Functional Traits Working Group and the IDF Standing Committee of Animal Health and Welfare who have formed a network of representatives from various stakeholder and leading scientists. Research and approaches to improve the usability of data are discussed to promote knowledge transfer and practical implementation in the dairy industry. Experiences and best practices are exchanged, and recommendations for the use of sensor data are being elaborated. The results will be broadly disseminated through ICAR and IDF avenues. Furthermore, the collaborations among multidisciplinary experts are enabling a holistic approach to the current challenges faced by the worldwide dairy industry and will facilitate cutting-edge research and innovation. The initiative will be presented, with a progress report on reference standards, harmonised definitions and terminology, as well as recommendations and best practices regarding data cleaning and editing and definition of novel traits using data from sensor technologies in herd management and genetic evaluations.

TechCare: Technologies to manage the welfare of sheep and goats – from pilots to large-scale studies

An animal communicates its welfare state through changes in behaviour and physiology. TechCare explores potential technologies to manage the welfare of sheep and goats along the value chain. After stakeholders prioritised welfare issues in the nine project countries, technologies were identified, selected and tested in sheep and goat pilot farms in various environments. Thirteen technologies were evaluated in 5 countries (France, Israel, Italy, Norway, UK). Welfare assessments were also carried out. Five technologies were subsequently retained for further evaluation on commercial farms in 5 countries: indoor/outdoor weather stations and EID tags/readers (France, Greece, Ireland, Romania, Spain); automatic weight crates (Ireland, Spain); milk tank weighers and milk meters (France, Greece, Romania, Spain). Between 10 and 15 farms in each large scale country have been recruited, and welfare assessments are being undertaken, alongside data recorded by the technologies. This will guide the selection of optimal technologies for managing welfare on small ruminant farms.

Session 42

Theatre 10

Transferring a 3D imaging POC to beef cattle breeding stakeholders to do on-farm high-throughput phenotyping: the PHENO3D example

A. Lebreton¹, C. Gillé-Perrier², L. Delattre³, C. Allain¹, M. Bruyas⁴

¹ Institut de l'Elevage, 149 rue de bercy, F-75595 Paris, France, ² Races de France, 149 rue de bercy, F-75595 Paris, France, ³ 3D ouest, 5 rue Louis de Broglie, F-22300 Lannion, France, ⁴ Eliance, 149 rue bercy, F-75595 Paris, France

In the French suckler cattle industry, genetic enhancement relies heavily on phenotyping a large animal population. Calves, around weaning, are weighted and their morphology assessed by visual scoring done by advisors affiliated with the Eliance federation. The PHENO3D project endeavors to revolutionize this process through the development of a 3D scanner integrated with Artificial Intelligence for automated phenotyping. This abstract delineates the pivotal roles played by stakeholders in the PHENO3D project: the French Livestock Institute, 3D Ouest, an electronics design department, and two key breeding stakeholders—the national federation of breeding societies, Races de France, and the national federation of performance recording, Eliance. It elucidates on the synergies fostered amongst these entities, facilitating rapid co-development of a tailored 3D scanning solution for breeding stakeholders. Furthermore, it explores how collaborative efforts at both national and local levels have facilitated the collection of a diverse range of phenotypic data crucial for training the AI algorithms responsible for phenotype prediction. Lastly, it underscores the significance of collaborative solution development as pivotal to its future adoption. The PHENO3D project not only spearheads innovation within the French livestock industry but also paves the way for synergistic collaborations across research, technology firms, and breeding stakeholders. It aspires to serve as a model, inspiring similar collaborative endeavors between public and private entities worldwide.

Guideline to validate sensor output of animal-based measurements

J. Maselyne¹, A. Stygar², M. Pastel², Q. Allueva Molina³, A. Ramon Pérez³, P. Llonch³, H. L. Ko³

¹ ILVO, Burg Van Gansberghelaan 115b1, 9820 Merelbeke, Belgium, ² Luke, Latokartanonkaari 9, 00790 Helsinki, Finland, ³ Universitat Autònoma de Barcelona, Plaça Cívica, 08193 Barcelona, Spain

Sensor technology is used in precision livestock farming applications to monitor amongst others animal health and welfare. However, in order to effectively use sensor data for welfare monitoring, the sensors need to provide valid and reliable measurements and the measured data needs to be relevant for animal welfare. Thus, sensor validation is crucial for applications in commercial and research settings. For this validation process, there is a need for a standardized procedure, so that the performance of validation trials are comparable and can lead to a reliable outcome. In the context of the aWISH (HEurope, 101060818) and Clearfarm (H2020, 862919) projects, a guideline is set up to develop a standardized protocol for sensor validation, divided into steps organized into two main blocks. Block 1 is dedicated to output validation, meaning whether the sensor is measuring the output it is designed to measure accurately. Block 2 is dedicated to welfare relevance validation, meaning whether sensor output can provide information regarding animal welfare and can be used as an animal welfare indicator. This presentation will focus mainly on Block 1, which includes different steps: (1) description of the sensor output, (2) determination of the gold standard and reference output, (3) determination of sample size and statistical analysis, (4) limitations of the technology. The guidelines will be illustrated using a number of case studies in cattle, pigs and poultry covering cameras, microphones, wearables, load cells and a combination of sensors.

AgrifoodTEF's pioneering EU service provider from research to industry for the development of Artificial Intelligence and robotic solutions

Z. Guy¹, J. M. Gautier¹, J. Contreras²

¹ Institut de l'Elevage, 149 Rue de Bercy, 75595 Paris, France, ² Acta, 149 Rue de Bercy, 75595 Paris, France

The AgrifoodTEF project positions itself at the forefront of innovative synergies in the agricultural sector by promoting the development and validation of cutting-edge solutions based on artificial intelligence (AI) and robotics. By bridging the gap between researchers and private companies, this project marks a significant evolution in applied research, where research institutions offer customized services to industrials to support the development of advanced technologies. A tangible example of this collaboration is seen at Derval experimental farm, where video monitoring solutions for cattle are being assessed. Preliminary discussions between researchers and Ag-Tech companies help to precisely define technical and technological requirements such as the optimal placement of cameras, image quality requirements, and necessary data storage capacities. The design of services offered to companies is then modular, allowing customization according to the specific needs of each company. The services range from providing raw video recordings to external validation of the developed solution with the possibility for the company to add services such as provision of complementary data, video annotation, co-construction of test protocols and more. This modular approach ensures companies to build a service tailored to their objectives. This collaboration between research and industry results in a win-win relationship. For the research sector, it enhances the added-value of experimental facilities and asserts its expertise and experimental know-how. For companies, it offers the opportunity to advance in the development of their solutions and to test them under real conditions through the expertise of recognized researchers. AgrifoodTEF leverages the access to the European network of Testing and Experimental Facilities. AgrifoodTEF emerges as a European network offering a range of services to Ag-Tech companies, highlighting synergies and the diversity of production situations, thereby enriching the agricultural sector with innovative solutions that are tested to be market-ready.

Innovative Orchestration in Sheep Farming-IOSheep 4.0: Ensuring complete welfare, ecofriendly, quality and traceability of lambs

B. Odevci², E. Emsen¹

¹ ERGEN Biotechnologies, Health Sciences University Technology Development Zone Health Technopolis, 34903 Istanbul, Turkey, ² Imona Technologies, ITU ARI Teknokent, 34469 Istanbul, Turkey

IOSheep 4.0 marks a significant evolution in conventional sheep farming methods by incorporating cutting-edge technologies like the Internet of Things (IoT), artificial intelligence (AI), and blockchain. This study presents an innovative orchestration model that leverages these technologies to create a holistic and sustainable sheep farming ecosystem. By deploying IoT devices, we monitor the health and welfare of the sheep in real-time, ensuring prompt medical interventions and optimal living conditions. AI algorithms analyze data to predict health issues, optimize feeding strategies, and enhance breeding practices, contributing to improved lamb quality and welfare. Furthermore, blockchain technology offers a transparent and immutable record of the lamb's lifecycle, from birth to processing, ensuring traceability and consumer trust in the quality and safety of the lamb products. Our model also incorporates eco-friendly practices, including sustainable feed sourcing, waste management, and land use, to minimize the environmental impact of sheep farming. The implementation of our innovative orchestration in sheep farming demonstrates significant improvements in lamb welfare, quality, eco-friendliness, and traceability. This approach not only addresses the growing consumer demand for ethically produced and sustainable meat products but also sets a new standard for the sheep farming industry, paving the way for more responsible and sustainable agricultural practices.

The current use and demand for tracking systems on German grazing cattle farms

J. Maxa¹, S. Thurner¹

¹ Bavarian State Research Centre for Agriculture, Institute of Agricultural Engineering and Animal Husbandry, Vöttingerstr. 36, 85354 Freising, Germany

Various systems based on triangulation and ultra-high frequency have been in use for several decades for the monitoring of cattle in a barn. In contrast, monitoring of grazing cattle is currently mainly based on the use of GPS and GSM technology. Due to high power consumption for positioning and data transmission, these systems are more suitable for extensive grazing areas. To gain an insight into the current situation, use and requirements of tracking systems on German grazing cattle farms, a nationwide online survey was conducted in 2023. The survey was carried out using LimeSurvey and covered the topics of 'basic farm data', 'cattle and pasture management' and 'use of tracking systems'. Following a plausibility check, a total of 242 farms were included in the analysis, of which 46 % were full-time farms and 54 % were part-time farms, with an average herd size of 114 and 26 cattle, respectively. The most common form of grazing on participating farms was rotational grazing as all-day grazing with a grazing period of 7 months per year. Only on dairy farms half-day grazing was more common (38 %) than full-day grazing (32 %), with the rest performing other grazing times. The most common practice was to carry out a separate control (not combined with feeding and milking times) of the animals on pasture, generally once a day. Only 2.5 % of the farms surveyed used a tracking system for cattle on pasture, but approximately 20 % were interested in using such a system. Most of the cattle tracking systems already in use on the pasture were GPS-GSM tracking systems. High acquisition costs, installation effort and lack of a suitable tracking system for grazing cattle on the market have so far hindered its use in practice.

Veterinarians' perceptions on Precision Livestock Farming application in pig health management

L. Dieste-Pérez⁴, X. Zhou¹, B. Garcia-Morante², A. Burrell³, K. Eenink⁴, C. Correia-Gomes³, J. Segalés², M. Sibila², T. Tobias⁴, C. Vilalta², A. Bearth¹

Leitrim, Ireland, ⁴ Royal GD, Arnsbergstraat 7, 7418 EZ Deventer, Netherlands

Data-driven strategies meeting veterinarians' needs can facilitate decision-making in animal health management. This study evaluated veterinarians' goals and their current use and needs of data technology in pig health management. Focus groups were completed in Ireland (n = 8 participants), the Netherlands (n = 7) and Spain (n = 12). Written transcripts of these discussions were analysed with thematic analysis. Veterinarians' goals were to control/prevent disease, being the reduction of antibiotic use, an ongoing challenge. Veterinarians highlighted the potential of data-driven strategies in their daily work. Several structural barriers were however recognized for the current use of data tools, such as lack of convenient access to farm data requiring later transfer to digital softwares. Veterinarians' needs included user-friendly and intuitive data tools to share, manage and analyse data; integrated tools linking different data sources; early warning tools visualizing geographic disease prevalence to support detection and control of diseases; real-time data tools visualising data from farms, slaughterhouses and labs to track pig health status. This study uncovered barriers and opportunities to veterinarians' data use. To facilitate data utilization by transforming raw bytes into useful information, tools for intuitive analysis and visualization with standardized and timely updated and contextual information are in high demand by veterinarians.

Optimizing Low-Frequency Ultrasound for Enhanced Sow Pregnancy Diagnosis Using Vision Transformer-High (ViT-H) Approach

T. K. Kim², Y. H. Choi¹, J. S. Hong¹, H. J. Park¹, J. E. Kim¹, Y. D. Jeong¹, C. H. Kim¹, S. H. Back¹, S. J. Sa¹, J. H. Lee¹, J. S. Kim³, H. C. Cho⁴

¹ National Institute of Animal Science, Swine Science Division, Singbang 1-gil, 31000 Cheonan, South Korea, ² Kangwon National University, Interdisciplinary Graduate Program for BIT Medical Convergence, 1 Kangwondaehackgil, 24341 Chuncheon, South Korea, ³ Kangwon National University, College of Animal Life Sciences, 1 Kangwondaehackgil, 24341 Chuncheon, South Korea, ⁴ Kangwon National University, Department of Electronics Engineering and Interdisciplinary Graduate Program for BIT Medical Convergence, 1 Kangwondaehackgil, 24341 Chuncheon, South Korea

In the pursuit of advancing swine reproductive management, our study introduces an innovative application of the Vision Transformer-High (ViT-H) model to enhance sow pregnancy diagnosis using low-frequency ultrasound imaging. With the challenges of traditional diagnostic methods, our research leverages deep learning to address the resolution limitations inherent in low-frequency ultrasound devices prevalent in modern livestock farming. Utilizing a dataset of 5,792 non-pregnant and 18,086 pregnant sow ultrasound images across different gestational periods, we applied the ViT-H model under various conditions. The study's breakthrough was the ViT-H model's performance in identifying early to mid-gestation stages with notable accuracy. Particularly, for the crucial early gestational phase of 22-25 days, the ViT-H model exhibited an outstanding accuracy of 87.778%, specificity of 88.754%, and an F1-score of 88.172%, following data augmentation with AutoAugment. These metrics significantly exceed traditional methods, highlighting the potential of transformer-based architectures in veterinary diagnostics. Our findings underscore the transformative impact of integrating AI with veterinary science, presenting a cost-effective, accessible, and accurate solution for early pregnancy detection in sows. This advancement not only propels the efficiency of livestock management but also contributes to the sustainability of pork production.

Predicting the botanical composition of pastures using Near Infrared Spectroscopy

C. Reyes-Palomo¹, S. Gil-Domínguez¹, S. Sanz-Fernández¹, C. Díaz-Gaona¹, P. Rodríguez-Hernández¹, V. Rodríguez-Estévez¹, N. Núñez-Sánchez¹

¹ University of Cordoba, Department of Animal Production, Faculty of Veterinary Medicine, Campus Rabanales, 14071 Cordoba, Spain

Livestock diet is crucial for both animal production and health, significantly impacting the quantity and quality of animal-derived products. Grass serves as a primary food source in extensive ruminant farming systems; therefore, the composition of forage is essential for efficient production processes. Near-infrared spectroscopy (NIRS) technology offers a rapid, reliable, and cost-effective method for nutritional analysis without the need for toxic reagents and ensuring complete sample recovery. This study focused on developing a calibration model using NIRS to determine the botanical composition of pastures, specifically the percentage of grasses, legumes, and other weeds. A total of 102 controlled mixture samples from pastures harvested in eight different farms from the Southwest of Spain were created as follows: after fresh harvesting, the plants were manually separated into the three botanic groups (grasses, legumes, and other weeds), and then dried, ground, and sieved. Experimental mixtures were afterward created based on a predetermined percentage table ranging from 0% to 100%, thus resulting in a diverse sample set. NIR spectra and the botanical composition were used to develop Modified Partial Least Squares (MPLS) regression equations, using 90% of the samples to calibrate, and 10% to validate the models. High predictive accuracy models to estimate the percentage of grasses, legumes, and other weeds were obtained, with R² values of 0.99, 0.98, and 0.98, and validation errors of 2.9, 2.8, and 4.2, respectively. Therefore, this study validates the reliability, safety, and efficiency of NIRS technology for pasture analysis and to assess the botanical composition of pastures. This project has received funding from the European Union's LIFE program under Grant Agreement LIFE17 CCA/ES/000035.

Genomic selection in the era of digital phenotyping

D. Lourenco¹, M. Bermann¹, M. K. Hollifield¹, M. Billah¹, C. Y. Chen², E. Psota², J. Holl², S. Tsuruta¹, I. Misztal¹

¹ University of Georgia, ADS, 425 River Rd, 30602 Athens, United States, ² Pig Improvement Company, 100 Bluegrass C. Blvd, 37075 Hendersonville, United States

Promoting sustainable breeding programs requires several measures, including genomic selection and continuous data recording. Digital phenotyping can be used to track animal activity and behavior like feeding and walking time and distress continuously. Coupled with machine learning techniques, any feature of interest can be extracted and used as phenotypes in genomic prediction models. It can also help define novel phenotypes that are hard or expensive to measure by humans. For the already recorded traits, it may add extra precision or lower phenotyping costs. One example is lameness in pigs, where digital phenotyping allowed moving from a categorical scoring system to a continuous phenotypic scale, resulting in increased heritability and greater selection potential. Additionally, if an early digital phenotyping behavior is genetically correlated with a trait of interest measured later, selection decisions can be made earlier. One example is the strong, negative genetic correlation (-0.7) between distance traveled and average daily gain in pigs. Conversely, computer vision may add noise to the phenotype for some production or carcass traits, as correlations with the traditional records can be as low as 0.9. In this talk, we will review the benefits and opportunities of digital phenotyping, together with experiences in data analysis and quality control. Finally, we will discuss how to account for the inaccuracy of some phenotypes in genomic prediction models. Overall, digital phenotyping is a promising tool to increase the rates of genetic gain, promote sustainable genomic selection, and lower phenotyping costs.

Comparison of the potential of cow-side blood tests, MIR spectra and wearable sensor devices for breeding for metabolic health in dairy cows

K. Schodl¹, B. Fuerst-Waltl², D4Dairy Consortium¹, C. Egger-Danner¹

¹ ZuchtData EDV-Dienstleistungen GmbH, Dresdner Str. 89, 1200 Vienna, Austria, ² University of Natural Resources and Life Sciences (BOKU), Institute of Livestock Sciences, Gregor-Mendel Str. 33, 1180 Vienna, Austria

Metabolic health and in particular ketosis in the early lactation plays an important role in dairy cow management. Due to the low frequency and heritability of clinical cases, breeding for cows with better metabolic health is challenging. Thus, detection of subclinical cases as well as the use of readily available data from milk recordings and automation technologies such as sensor technologies or automatic milking systems may support the development of (auxiliary) traits for metabolic stability in dairy cows. Within the COMET-Project D4Dairy β -hydroxybutyrate (BHB) concentrations from cow-side blood tests measured with the hand-held WellionVet BELUA device at 7 and 14 days postpartum (8,329 test results), mid infrared (MIR) spectra from routine milk recordings up to 30 days postpartum (4,984 records) and data from two different sensor systems (Lely and smaXtec) were made available for 3,717 Fleckvieh dairy cows from 67 farms. Data were collected between October 2019 and January 2022. Sensor data comprised information on rumination and eating time, an activity index, reticular temperature, and number of drink cycles. The following traits were defined for the analysis of genetic parameters: BHB-values and log-transformed BHB, ketosis traits based on BHB-values (1: ≤ 1.2 , 2: 1.3-2.9, 3: ≥ 3 mmol/L and 0: ≤ 1.2 , 1: > 1.3 mmol/L, respectively), MIR-predicted ketosis risk from milk recordings (KetoMIR) and mean value and standard deviations of sensor variables on the day of the blood test and milk recording, respectively. Genetic parameters were estimated fitting bivariate models in VCE6. Heritabilities for BHB-value derived traits ranged from 0.1-0.2 and was 0.11 for KetoMIR. Genetic correlations between KetoMIR and BHB-value derived traits ranged from 0.36 to 0.63. Heritabilities for sensor traits ranged from 0.11 to 0.56 and high genetic correlations between activity derived traits and the binary ketosis trait (-0.49 to -0.70) were estimated. Standard errors were low for all estimations.

Can daily rumination time be used to breed for resilient Holstein cows?

W. Lou¹, B. Ducro², A. Van Der Linden³, Y. Wang¹

¹ China Agricultural University, Animal Genetics, Breeding and Reproduction, No.2, Yuanmingyuanxi Road, Haidian District, 100193 Beijing, China, ² Wageningen University & Research, Animal Breeding and Genomics, P.O. Box 338, 6700 AH Wageningen, Netherlands, ³ Wageningen University & Research, Animal Production Systems, P.O. Box 338, 6700 AH Wageningen, Netherlands

Breeding for resilient cows holds the potential to mitigate the impact of external stressors, thereby reducing additional expenditures on labor and antibiotics. Identification of resilience indicators currently becomes feasible through monitoring perturbations in cows' daily rumination time (DRT) and daily milk yield (DMY). The objective of this study, therefore, was to define resilience indicators from DRT in lactating cows, and to investigate the difference in genetics with resilience indicators from DMY. 4,479,754 DMY records of 9,640 cows were used, of which 6,557 cows had in total 1,929,920 DRT records. Resilience indicators were defined based on deviations from a quantile polynomial regression model on DRT and DMY. Indicators were the log-transformed variance (LnVar), the lag-1 autocorrelation (rauto) of daily deviations, the average size of deviations as a ratio to the expected curve value (rper) and the mean of deviations (devper) within the observed perturbations. Genetic parameters for the four indicators were estimated with repeatability animal models. Results showed that the four indicators had a low to moderate heritability (0.09-0.20) and repeatability (0.19-0.40) for DRT, which were comparable in magnitude to indicators derived from DMY (0.10-0.32; 0.22-0.50). The genetic correlations of the same resilience indicators between DRT and DMY ranged from 0.21 to 0.37, indicating they can be used complementary to indicators from DMY to breed for resilient dairy cows.

Use of machine learning methods to predict feed efficiency traits in dairy cows using phenotypic and genomic information

A. Seidel¹, L. Stahmer¹, G. Thaller¹

¹ Kiel University, Institute of Animal Breeding and Husbandry, Olshausenstr. 40, 24098 Kiel, Germany

Predicting direct production values of dairy cows at farm level is difficult. This study focused on the prediction of feed intake (FI), energy balance (EB) and feed efficiency (FE) of Holstein-Friesian cows based on individual phenotypic and genomic information. Different supervised learning algorithms such as Random Forest (RF), Support Vector Machine (SVM) and Extreme Gradient Boosting (GB) were tested. Milk yield, milk fat and protein content, lactation number and live weight between the 100th and 150th day of lactation of 1684 animals as well as a herd-year effect served as phenotypic input information. In addition, for all animals, genotypes of 45,613 SNPs were available. Aiming in reducing model complexity the genomic relationship matrix (G) and the principal component scores of the original marker matrix (UD) were used as genomic information. For each trait and algorithm, three different feature sets (FS) were analysed. FS 1 included only phenotypic data, FS 2 included only genomic data and FS 3 contained both phenotypic and genomic data. For the analyses the data was divided into a training set (80 %) and a testing set (20 %). The training set was used for hyperparameter optimization (5-fold Cross Validation, 10 repetitions) of the algorithms. On the other hand the testing set was used to evaluate prediction performance of the best fitted model from the training on new data. The highest prediction accuracy in the testing set was achieved by the SVM when only the phenotypic data was used. Daily FI, EB and FE were predicted with R² values of 0.60, 0.45 and 0.55, respectively. By adding G and UD, an improvement in the prediction quality could only be achieved with the GB. The consideration of further lactation phases is planned.

Comparison of methods to identify resilience indicator phenotypes using across lactation robot milk yield dynamics in the Nordic Red cows

A. Kavлак¹, E. Negussie², M. Lidauer², M. Pastell¹

¹ Natural Resources Institute Finland (Luke), Latokartanonkaari 9, 00790 Helsinki, Finland, ² Natural Resources Institute Finland (Luke), Tietotie 4, 31600 Jokioinen, Finland

Resilience is the ability of the animal to either remain unaffected by disruptions or to quickly return to its normal state before facing a disturbance. Therefore, high resilience to disturbances, fluctuating environmental conditions, and various stressors is becoming more important in dairy farming. However, since resilience cannot be directly measured, indicators can be used to assess resilience. Consequently, identifying phenotypes associated with resilience is a crucial phase in improving the resilience of cows through selective breeding. This study was aimed at testing different methods to identify resilience indicator phenotypes based on the milk yield dynamics over lactation using milking robot data. Data were from 15 dairy cows milked by a DeLaval milking robot at the Natural Resources Institute (Luke) Maaninka research dairy farm in Finland, spanning 2 to 425 days in milk. The perturbed lactation model (PLM) and differential smoothing (DS) methods were used to detect and characterize disturbances in the lactation curves using R software. The methods provided distinct phenotypes including the intensity of the speed of the decrease during the collapse phase and the speed of the increase during the recovery phase by the PLM as well as the magnitude of perturbation by the DS. The results from tested methods showed distinct phenotypes, with both the duration and the magnitude of perturbations differing over the lactation period compared to the idealized lactation curves. A comparison of the methods has been discussed, focusing on numerical stability, repeatability, and computational efficiency. This comparison will be extended to a larger dataset to verify the results. Additionally, the process will include identifying correlated (or redundant) variables to refine the phenotypes.

Genetic correlation between residual feed intake and easily measurable plasma parameters in early-fattening young bulls

S. Taussat^{1,2}, H. Aboshady³, P. Martin², G. Cantalapiedra-Hijar³

¹ Eliance, 149 rue de Bercy, 75012 Paris, France, ² Université Paris-Saclay, INRAE, AgroParisTech, GABI, Domaine de Vilvert, 78350 Jouy-en-Josas, France, ³ UCA, INRAE, VetAgroSup, UMR Herbivores, Theix, 63122 Saint Genès Champanelle, France

Knowing residual feed intake (RFI) early in life of growing cattle represents an interesting opportunity as it would allow both precision feeding and genetic selection. However, measuring RFI is too expensive. Blood plasma biomarkers represent a cost-effective way to predict RFI and identify feed efficient cattle. Previous works have identified candidate RFI plasma parameters that enable differentiation between extreme phenotypes in young bulls. However, their genetic relationships to RFI need to be clarified. The aim of this study is to estimate the genetic parameters of 13 easily measurable plasma parameters identified as biomarkers of RFI in early-fattening young bulls and assess their genetic correlations with RFI. A total of 639 young bulls were fattened in four experimental farms and were fed ad libitum either grass or corn silage-based diet. Metabolites and plasma enzymes were analyzed during the early fattening stage of animals (303 ± 25 days of age) by spectrophotometric methods performed in an autoanalyzer. Wombat software was used to estimate genetic parameters. The plasma parameters significantly correlated with RFI were alanine aminotransferase (0.89 ± 0.26), aspartate aminotransferase (0.50 ± 0.32), creatinine (-0.46 ± 0.28), triglycerides (-0.44 ± 0.32) and total plasma proteins (-0.41 ± 0.36). Among these five plasma parameters, the heritability ranged from 0.15 to 0.34, while the heritability of RFI was 0.21 (± 0.10). These results pave the way for using blood plasma parameters as proxy to implement genomic evaluation of RFI.

Theatre 7

Genetic parameters for novel climatic resilience indicators derived from automatically-recorded vaginal temperature in lactating sows under heat stress conditions

L. F. Brito¹, H. Wen¹

¹ Purdue University, Department of Animal Sciences, 270 S. Russell Street, 47907 West Lafayette, United States

We investigated the feasibility of using automatically-recorded vaginal temperature (TV) data for deriving novel indicators of climatic resilience (CR) for breeding more resilient pigs, especially during lactation when sows are at an increased risk of suffering from heat stress (HS). We derived 15 CR indicators and estimated genetic parameters for all traits, including their genetic relationship with sow reproductive traits. The heritability estimates of the CR traits ranged from 0.00 ± 0.00 (SlopeDe: slope for decreased rate of TV) to 0.29 ± 0.04 (HSUB: sum of TV values below the HS threshold). Moderate to high genetic correlations (0.51 ± 0.05 to 0.99 ± 0.13) and Spearman correlations (0.43 to 1.00) of ranks of genomic estimated breeding values (GEBV) were observed for HS duration (HSD), normalized median multiplied by normalized variance (Nor_medvar), the highest TV value of each measurement day for each individual (MaxTv), and the sum of TV values above (HSUA) and below (HSUB) the HS threshold. These five selected CR indicators were lowly to moderately genetically correlated with shoulder skin surface temperature (range: 0.14 ± 0.01 to 0.48 ± 0.04) and respiration rate (range: 0.08 ± 0.01 to 0.50 ± 0.09). The genetic correlations between these five selected CR indicators and sow reproductive performance indicators, i.e. total number of piglets born alive, total number of piglets born, and number of pigs weaned, ranged from -0.733 to -0.175 , -0.261 to 0.086 , and -0.434 to -0.169 , respectively. The individuals with the highest GEBV values (most climatic sensitive) had higher mean skin surface temperature, respiration rate (RR), panting score (PS), and hair density, but had lower mean body condition scores when compared to the bottom individuals. Most CR indicators evaluated are heritable with substantial additive genetic variance. Additionally, individuals with higher CR are more likely to exhibit better HS-related physiological responses, higher body condition scores, and improved reproductive performance under hot conditions. These findings highlight the potential benefits of genetically selecting more heat tolerant individuals based on the CR indicators.

The relationship between microbial composition and feed efficiency in Iberian pigs

P. Nuñez¹, C. Casto-Rebollo¹, S. Negro², J. Casellas³, L. Varona⁴, R. Pena⁵, N. Ibáñez-Escriche¹

¹ *Universitat Politècnica de Valencia, 46022, Valencia, Spain,* ² *IngaFood S.A., 06200, Almedralejo, Spain,*

³ *Universitat Autònoma de Barcelona, 8193, Bellaterra, Spain,* ⁴ *Universidad de Zaragoza, 50013, Zaragoza,*

Spain, ⁵ *Universitat de Lleida, 25198, Lleida, Spain*

Incorporating data on microbial composition into selection programmes could improve the prediction accuracy of the breeding values. This study aimed to estimate the percentage of the phenotypic variance explained by the microbial composition for feed efficiency and feeding behaviour traits in Iberian pigs. In addition, the heritability of each genus was estimated to determine which genus is more influenced by the host genetics. Pedigree information and 171 faecal microbial samples (16S rRNA) from Iberian pigs were used to compute different models: (a) the genetic model (GM), (b) the microbial model (MM) and (c) the holobiont model (HM). Heritability estimates (h^2) of feed efficiency and feeding behaviour traits of GM ranged from 0.34 to 0.48, while microbiability (m^2) ranged from 0.15 to 0.26 in the MM. When both effects were combined in the HM, h^2 ranged from 0.25 to 0.38, while the m^2 varied from 0.11 to 0.20. These results suggest that when h^2 and m^2 are estimated separately, their estimates may be inflated. On the other hand, the h^2 estimates of each genus ranged from 0.30 to 0.60 when only the genetic effect was considered. However, when the microbial interactions were included in the model, the h^2 decreased notably (0.13 to 0.27). This suggests that the h^2 estimates of genera may be overestimated by the relationship between microbial species. Therefore, not including the microbial interactions in the model could lead to erroneous conclusions. The results of this study highlight the importance of the gut microbiome on feed efficiency and feeding behaviour traits in Iberian pigs. However, further studies are needed to properly assess the effect of the microbiome on critical traits in Iberian pigs.

Machine learning approaches for classifying the Iberian pig strains based on microbiome

L. Azougagh¹, C. Casto-Rebollo¹, L. Varona², J. Casellas³, S. Negro⁴, M. Martínez-Álvaro¹, N. Ibáñez-Escriche¹

¹ *Universitat Politècnica de Valencia, 46022, Valencia, Spain,* ² *Universidad de Zaragoza, 50013, Zaragoza,*

Spain, ³ *Universitat Autònoma de Barcelona, 08193, Bellaterra, Spain,* ⁴ *IngaFood, 06200, Almedralejo, Spain*

There is an increasing interest unraveling the factors that shape microbiome composition due to its association with complex phenotypic traits in livestock. Increasing evidence points to the influence of host genetic variation. This interest has coincided with parallel advances in the field of machine learning (ML), providing valuable insights into microbial communities. Thus, the present work aimed to develop ML algorithms utilizing microbiome-based features to classify two genetically distinct Iberian pig strains (EE;Entrepelado and RR;Retinto) and their crosses (ER and RE). The study also compares the most important features used in ML model construction, with microbial taxa identified with classical differential abundance (DA) analysis. Fecal samples were collected from 239 castrated males and sequenced with 16S Illumina MiSeq platform. A total of 37 genera were selected to train nine supervised ML classifiers including ensemble, tree-based, linear, and probabilistic models. Classifiers' performances were assessed using area under the ROC curve (AUROC) on the testing set. Five scenarios were explored with varying classification aims. Models built with exclusively purebred animals achieved the best predictive capacity. The highest mean AUROC was achieved by the Gaussian Naive Bayes (>0.85), confirming microbiome distinctions between strains. Important features generated by permutation importance in ML models were partially aligned with the taxa that showed DA between strains. This study combines ML tools with microbiome-derived data to extract meaningful taxa signatures, potentially characterizing strain differences in Iberian pigs.

In-abattoir 3D measurements of beef carcasses for the prediction of saleable meat yield and novel carcass traits

H. Nisbet^{1,2}, N. Lambe¹, G. Miller¹, A. Doeschl-Wilson², D. Barclay³, A. Wheaton³, C. A. Duthie¹

¹ Scotland's Rural College, Peter Wilson Building, King's Buildings, EH9 3JG Edinburgh, United Kingdom,

² The University of Edinburgh, The Roslin Institute, Easter Bush Campus, EH25 9RG Midlothian, United Kingdom, ³ Innovent Technology Ltd., Northern Agri-Tech Innovation Hub Easter Bush, Roslin, EH25 9RG Midlothian, United Kingdom

Currently, most abattoirs across the United Kingdom (UK) and Europe rely on outdated methods for assessing the value of a carcass (subjective assessment of conformation and fat class). As technology advances, not only are machines capable of objectively predicting the same traits, but also alternative, novel traits. This provides an opportunity for new traits of value to be incorporated into systems that comply with current classification schemes. This study explores the use of 3-dimensional (3D) imaging technology and its ability to extract 3D measurements of beef carcasses to predict the saleable meat yield (SMY) of a carcass. Data were collected from 485 beef carcasses from two commercial abattoirs in the UK. A series of 3D measurements (widths, lengths, and volumes) were extracted from images of beef carcasses, captured using a time-of-flight camera. These measurements were used to predict the SMY (kg), which was calculated following butchery and the weighing of individual primal cuts, fat, and trim from each carcass. Initial stepwise linear regression models show that the 3D measurements are capable of estimating SMY with high accuracy when coupled with other information (cold carcass weight and kill date), ($R^2 = 0.94$). The same variables are also capable of predicting the SMY (kg) of the forequarter, flank, and hindquarter with high accuracy ($R^2 = 0.88, 0.86, \text{ and } 0.81$ respectively). Further analysis will explore the use of machine learning techniques for prediction of SMY and individual primals.

Pixels to feed: Digital phenotyping potential for genetic analysis of feed intake and efficiency in Atlantic salmon

A. Ahmad¹, A. Sonesson², B. Hatlen², G. Bæverfjord², P. Berg¹, A. Norris³, G. Difford¹

¹ Norwegian university of life sciences, Norway, Department of Animal and Aquacultural Sciences, Oluf Thesens vei 6., 1433 Ås, Norway, ² Nofima, Osloveien 1, 1433 Ås, Norway, ³ MOWI genetics, Sandviksboder 77AB, 5035 Bergen, Norway

Improved feed efficiency (FE) is a major goal in salmon production since feed constitutes the largest proportion of production and environmental costs. However, genetic studies on the efficiency of feed conversion to daily weight gain are limited, primarily due to difficulty in phenotyping individual feed intake in aquaculture. This study aims to overcome this limitation by (i) quickly and accurately phenotyping individual feed intake in salmon under commercial conditions; (ii) training deep learning model for efficient object (beads) detection and (iii) analyzing the genetic architecture of FE traits including individual feed intake (FI), average daily weight gain (ADG), Residual feed intake (RFI), and feed conversion ratio (FCR). The study was conducted on approximately 700 Atlantic salmon smolts belonging to 35 fish families of the 2017-year class at MOWI Genetics, Norway. The snapshots of individual FI were recorded using X-ray imaging. A deep learning model (YoloV5) for bead detection was trained to estimate the FI accurately and efficiently and then deployed on all X-ray images. The model performed exceptionally well with an R^2 of 0.99, low RMSE and a slope of ~ 1 across training, validation and test sets. Heritability estimates were intermediate to high for FI ($h^2 = 0.20 \pm 0.05 - 0.50 \pm 0.06$) and ADG ($h^2 = 0.47 \pm 0.07 - 0.54 \pm 0.06$), and low to moderate for FCR ($h^2 = 0.08 \pm 0.04 - 0.23 \pm 0.06$) and RFI ($h^2 = 0.10 \pm 0.05 - 0.17 \pm 0.11$), indicating their potential to be improved through selective breeding. We are currently diving into GWAS and genomic prediction to better understand FE genomics.

Genotype-by-environment interaction with high-dimensional environmental data: an example in pigs
F. Bussiman¹, D. Lourenco¹, C. Y. Chen², J. Holl², I. Misztal¹, Z. G. Vitezica³

¹ *University of Georgia, ADS, 425 River Rd, 30606 Athens, United States,* ² *PIC, 100 Bluegrass Commons Blvd, 37075 Hendersonville, United States,* ³ *INRAE, GenPhySE, 24 chemin de Borde-Rouge-Auzeville Tolosane, 31326 Castanet Tolosan, France*

This study investigated using environmental covariates to model correlated herd effects and genotype-by-environment interaction (GE), as well as their impact on the prediction accuracy of genomic evaluations in pigs. We used air, dew/frost, wet-bulb, and earth-skin temperatures, relative humidity, rainfall, wind speed and direction. Average daily gain (ADG) and backfat thickness (BFT) from a terminal pig line were analyzed by 6 different models: MG, which included herd as an uncorrelated random effect; ME30, which considered 30 days of daily weather information to correlate herd effects; and ME100, which used 100 days of daily climate covariates; MGE30, same as ME30 but also considering the GE as the Hadamard product of the genomic relationship matrix and the environmental covariates matrix; MGE100, same as ME100 but including the GE; and MTM, a traditional multiple-trait model with each herd as a different trait. All animals were genotyped and phenotyped; therefore, the statistical model of choice was GBLUP. Validation was based on LR method, and focal animals were those born in the last year. Accuracy, bias, and dispersion did not change among models, except for MTM. Comparing all models against MTM, the accuracy increased by 38% for BFT, whereas only slightly increased for ADG. Among all 11 herds, only 4 showed a genetic correlation stronger than 0.80 for BFT, while this number was much bigger for ADG. When the model has a variable accounting for environmental effects like herd in the case of MG, using weather information to correlate environments or adding the GE term has little benefit for genomic predictions.

Association analysis of daily rumination time with hindgut microbiota and metabolites in dairy cows

H. Lu¹, F. Li¹, Y. Wang¹

¹ *China Agricultural University, Yuanmingyuan West road 2#, 100193 Beijing, China*

The maintenance of rumination behavior is essential for dairy cattle's health and production performance. The gastrointestinal microbiota and their metabolic process may be the key factors shaping cow rumination behavior. However, the characteristics of hindgut microbiota and metabolites associated with rumination time are still largely unknown. Therefore, this study aimed to comprehensively identify the association between cow rumination behavior, hindgut microorganisms, and metabolite. The daily ruminating time measured by Hi-Tag necklet, hindgut microorganisms analyzed by 16S rRNA sequencing, and hindgut metabolites detected by LC-MS of 100 healthy first-parity Holstein cows with the same feeding condition and similar lactation days were available for this study. A total of 68 differential microorganism markers and 177 differential metabolites were identified using the LEfSe analysis (LDA>1, P<0.05) between high (547 min/d) and low (496 min/d) rumination time groups. The correlation analyses between differentiated microbiota and metabolite showed that *Romboutsia* was positively correlated with Morph, Isophorone, 3-Hydroxypicolinic acid, and Quinolinic Acid, and negatively correlated with Diethanolamine; *Howardella* was positively correlated with 5-Acetylamino-6-amino-3-methyluracil, and negatively correlated with Gemcitabine, Heliotron, and Artonin T; *Incertae Sedis* was positively correlated with Diethanolamine; and *Negativibacillus* was negatively correlated with Artonin T. These results increase the understanding of the microbial and metabolic mechanisms of rumination behavior and might help optimize feeding management and selection programs in dairy cattle.

Sensitive pathogens detection using nanozyme-based catalysis amplification on Ag-PSi SERS scaffold

G. Shtenberg¹, N. R Nirala¹

¹ ARO, Volcani Institute, Institute of Agricultural Engineering, HaMaccabim Rd. 68, 7505101 Rishon LeZion, Israel

Food safety and the prevention of foodborne illnesses depend significantly on the quick and accurate identification of pathogenic microorganisms. A bifunctional Pt@Au core-shell nanozyme was designed for the rapid identification of two major pathogens (*Escherichia coli* and *Staphylococcus aureus*) based on a label-free surface-enhanced Raman scattering (SERS) approach. Herein, we utilize their capacity to imitate natural enzymes to oxidize 3,3',5,5'-tetramethylbenzidine (TMB) into an oxidized product (oxTMB), a highly active Raman-reporter-molecule. The number of signal molecules may be considerably increased by catalyzing the conversion of Raman-inactive molecules into reporters using the ultrathin Pt shell. Additionally, the Au core and silver-decorated porous silicon (Ag-PSi) act as an active SERS substrate to boost reporter molecules' signals, prominently enhancing the detection sensitivity. The bifunctional Pt@Au nanozyme coupled to SERS immunoassay achieved low detection limits of 4 and 5 CFU mL⁻¹ for *Escherichia coli* and *Staphylococcus aureus* in an overall 60 min assay duration. Furthermore, the signal amplification, inherent physical features, platform's selectivity and overall shelf-life were thoroughly evaluated while depicting satisfactory performances. Finally, the practicality of the developed SERS bioassay was elucidated in various products with different pathogens concentrations that revealed recovery values of 90-115% with respect to conventional practices. The successful validation of actual samples' analysis emphasizes the platform's reliability, robustness and suitability for practical use, including on-site or pen-side operation.

Usability of raw phenotypic data in selective breeding of dairy cattle on health traits in Slovakia

M. Chalupková¹, N. Moravčíková¹, A. Halvoník¹, J. Candrák¹, L. Zavadilová², R. Kasarda¹

¹ Slovak University of Agriculture in Nitra, Institute of Nutrition and Genomics, Tr. A. Hlinku 2, 949 76 Nitra, Slovakia, ² Institute of Animal Science, Přátelství 815, 104 00 Prague, Czech Republic

The objective of the study was to estimate genetic parameters and breeding values for health traits and somatic cell score (SCS) on the 6 selected farms belonging to the Top 50 in Slovakia. Data for the analysis were collected between the years 2017 to 2022, with a dataset including 8776, 7923, and 7745 cows for the analysis of mastitis, claw diseases, and SCC. For estimation, single-trait animal models were used; considered fixed effects of parity, year, season, herd, breed (single or as interaction), the permanent environmental effect, and the additive effect of the animal. Estimated heritabilities for health traits were low: 0.0209 for mastitis (binary coded 0 healthy/1 ill), 0.0205 mastitis (number of cases 1/6), 0.1550 for SCS and 0.0161 for claw disease (non-infectious binary coded 0/1), 0.0592 (total binary coded 0/1) and 0.0908 (infectious binary coded 0/1). Reliabilities of breeding values were found 0.0665 for mastitis (binary coded and number of cases), 0.1342 for SCS, 0.0335 for non-infectious claw diseases, 0.0341 for infectious claw diseases and 0.0461 for claw diseases total. Significant correlation was observed between estimated breeding values (EBV) for mastitis (binary coded) and mastitis (number of cases) 0.909. Significant correlations of EBV for SCS and mastitis, ranging from 0.290 to 0.357, and among different groups of EBV for claw diseases from 0.0068 to 0.893 were found. Broader involvement of farmers and breeders in data collection and higher uniformity of health trait evidence could lead to decrease of variability, increase of reliability and breeding advancement. This research was funded by DS-FR-22-0016 and APVV-20-0161.

Machine learning and parametric methods for genomic prediction of feed efficiency-related traits

L. F. M. Mota¹, L. M. Arikawa¹, S. W. Boer¹, M. E. Z. Mercadante², J. N. S. G. Cyrillo², H. N. Oliveira¹, L. G. Albuquerque¹

¹ São Paulo State University, Animal Science, Via de Acesso Professor Paulo Donato Castellane Castellane, 14884-900 Jaboticabal, Brazil, ² Animal Science Institute, Rod. Carlos Tonani, 94 km, 14174-000 Sertãozinho, Brazil

Genomic selection (GS) offers a promising opportunity for selecting animals for feed efficiency (FE) traits in beef cattle, impacting profitability and environmental sustainability. Here, we compared the prediction accuracy of multi-layer neural network (MLNN) and support vector regression (SVR) against the parametric methods single-trait (STGBLUP) and multi-trait GBLUP (MTGBLUP) and Bayesian (BayesA, BayesB, BayesC, BRR, and BLasso) for FE-related traits. FE-related traits, average daily gain (ADG), dry matter intake (DMI), FE, and residual feed intake (RFI) were measured in 1,156 Nellore animals from an experimental breeding program and genotyped with ~300K markers after quality control. Prediction accuracy (Acc) was evaluated using a forward validation, splitting the dataset based on birth year and using the adjusted phenotypes for fixed effects as pseudo-phenotypes. The MLNN and SVR approaches were trained, splitting the training population in 5-fold. The results show that MLNN, SVR, and MTGBLUP outperformed STGBLUP and Bayesian regression, increasing the Acc by approximately 8.9% with MLNN, 14.6% with SVR, and 13.7% with MTGBLUP. The Acc for SVR and MTGBLUP were slightly different, ranging from 0.62 to 0.69 and 0.62 to 0.68, respectively, and empirically unbiased for both models (0.97 and 1.09). Our results indicated that SVR and MTGBLUP approaches were more accurate in predicting FE-related traits than Bayesian regression and STGBLUP and seemed competitive for GS of complex phenotypes with various degrees of inheritance. Poster 17

Prediction of blood β -hydroxybutyrate and hyperketonemia based on milk mid-infrared spectra in dairy cows

S. Gruber¹, A. Köck², C. Egger-Danner², M. Iwersen³, B. Fuerst-Waltl¹, J. Sölkner¹

¹ University of Natural Resources and Life Sciences, Vienna (BOKU), Institute of Livestock Sciences, Gregor-Mendel-Str. 33/II, 1180 Vienna, Austria, ² ZuchtData EDV-Dienstleistungen GmbH, Dresdner Str. 89, 1200 Vienna, Austria, ³ University of Veterinary Medicine, Vienna, Department for Farm Animals and Veterinary Public Health, Veterinärplatz 1, 1210 Vienna, Austria

Hyperketonemia in early-lactation dairy cows is mainly detected through analysis of associated blood metabolites, such as β -hydroxybutyrate (BHB). Mid-infrared (MIR) spectroscopy could however be a potential alternative to predict blood BHB content and to identify cows at risk for hyperketonemia. Thus, the objective of the present study was to predict blood BHB content in early-lactation dairy cows using milk MIR spectroscopy. The calibration dataset comprised 1005 observations of BHB concentration measured by a handheld device from capillary cow blood on first and second test-day between September 2020 and March 2021. Prediction models were developed based on 212 selected first derivative MIR spectra and test-day variables with BHB content or hyperketonemia class, based on BHB threshold, as dependent variables. Regression and discrimination analyses were conducted applying various machine learning algorithms. An additional dataset was used for external validation. Models developed for quantitative prediction of BHB achieved coefficients of determination ranging from 0.19 to 0.33 in external validation. Discriminant models for hyperketonemia obtained good classification accuracies (sensitivity 0.67-0.71, specificity 0.70-0.73). Results indicate a potential to monitor cows with hyperketonemia using MIR spectral data and to generate novel phenotypes for animal breeding on a large scale.

Dissecting production traits using metabolomics in pigs

S. Bovo¹, G. Schiavo¹, F. Bertolini¹, M. Bolner¹, M. Cappelloni², M. Gallo², P. Zambonelli¹, S. Dall'Olio¹, L. Fontanesi¹

¹ University of Bologna, Animal and Food Genomics Group, Division of Animal Sciences, Dept. of Agricultural and Food Sciences, Viale G. Fanin 46, 40127 Bologna, Italy, ² Associazione Nazionale Allevatori Suini, Via Nizza 53, 00198 Roma, Italy

Italian heavy pigs are mainly raised to produce Protected Designation of Origin (PDO) dry-cured hams. To breed pigs with the characteristics of the meat and legs needed for this purpose, specific selection programmes have been developed, using traits related to the overall fat/lean meat content of the animals, to growth and efficiency of the animals and to ham quality (e.g. intermuscular fat and weight loss at first salting). Metabolites represent simple molecular phenotypes that can be used to deconstruct complex phenotypes in their single biological components. We analysed targeted and untargeted metabolomic profiles (up to 1000 molecules) from plasma of Italian Large White and Italian Duroc pigs for which production traits and their estimated breeding values were available. We studied the relationship between all these simple and complex traits via correlation analyses and multivariate modelling. In general, metabolite abundances poorly correlated genetically with production traits (up to $|r_G| < 0.15$), except for a few metabolites (up to $|r_G| \sim 0.4-0.5$). Overall, we obtained a first picture of the correlation between molecular phenotypes and economically relevant traits that could be useful to further exploit their usefulness in designing selection programmes in Italian heavy pig breeds. Acknowledgements: This study has received funding from the European Union's Horizon Europe research and innovation programme under the grant agreement No. 01059609 (Re-Livestock project).

Longitudinal feed intake deviations at the pen level as a resilience indicator for pigs

W. Gorssen¹, C. Winters², R. Meyermans¹, L. Chapard¹, K. Hooyberghs¹, J. Depuydt³, S. Janssens¹, N. Buys¹

¹ KU Leuven, Department of Biosystems, Center for Animal Breeding and Genetics, Kasteelpark Arenberg 30, Box 2472, 3001 Leuven, Belgium, ² ETH Zürich, Animal Physiology, Institute of Agricultural Sciences, Universitätstrasse 2, 8092 Zurich, Switzerland, ³ Vlaamse Piétrain Fokkerij vzw, Aardenburgkalseide 254, 9990 Maldegem, Belgium

Recently, new resilience traits based on longitudinal deviations in pigs' weight, feed intake (FI) and feeding behaviour were developed. However, they require individual repeated observations which is often challenging or costly to record. Therefore, we evaluated longitudinal FI records at the pen level of related pigs as a potential resilience indicator trait. We studied 704 pens during the finishing phase composed of a mixture of 7 to 15 halfsib and fullsib pigs with known pedigree (352 Piétrain sires; 679 hybrid dams). Cumulative FI was recorded weekly at the pen level and studied for pigs of 90-160 days of age. All data were recorded at the same farm between 2020-2023. Longitudinal deviations of FI at the pen level were estimated as the natural logarithm of the mean squared error after linear regression of FI versus mean age of pigs (lnMSEFI). Genetic parameters were estimated using *remlf90* software. The heritability of lnMSEFI was estimated at 11.8%, while the common environment (herd year season) explained 44.5% of total variance. lnMSEFI was genetically correlated with FI ($r_G=0.59$) and daily gain ($r_G=0.46$), not with feed conversion ratio ($r_G=0.00$), and negatively correlated with meat percentage ($r_G=-0.42$). Breeding values for lnMSEFI were significantly correlated with breeding values for mortality ($r=0.23$). Our findings show that longitudinal deviations in FI are heritable, and associated with mortality, showing the potential of lnMSEFI recorded at the pen level as a resilience indicator.

Genetic analysis of milk FTIR spectra in Italian Simmental Cattle

R. Negrini², G. Gaspa³, L. Degano⁴, D. Vicario⁴, A. Cesariani¹, N. P. P. Macciotta¹

¹ Università di Sassari, Agraria, Viale Italia 39, 07100 Sassari, Italy, ² Università Cattolica del Sacro Cuore, Dipartimento di Scienze Animali, della Nutrizione e degli Alimenti, via Emilia Parmense 84,, 29122 Piacenza, Italy, ³ Università di Torino, Dipartimento di Scienze Agrarie, Forestali e Alimentari, Largo Braccini 2, 10095 Grugliasco (TO), Italy, ⁴ Associazione Nazionale Allevatori Pezzata Rossa Italiana, Via Ippolito Nievo 19, 33100 Udine, Italy

Fourier Transform Infrared spectra of cattle milk are currently used for investigating and predicting novel phenotypes (e.g., milk fatty acid profile, methane emissions). Due to the huge amount of information contained, the milk FTIR spectrum can be directly considered as a novel phenotype. The present work aims at assessing the genetic component of milk FTIR spectra in cattle. Data were TD records of milk FTIR spectra recorded on 39,271 Italian Simmental cattle. Variance component estimation was carried out with a BLUP animal model that included the fixed effects of herd-test date combinations and parity, and the random additive effect of the animal. A total of 103,878 animals were considered in the pedigree-based relationship matrix. The analysis was carried out on both 1,060 wavenumbers and principal component (PC) scores extracted from original data. In particular, the first four PC were able to explain 76% of the original variance. Heritability estimates for wavenumbers ranged from 0 to 0.19; whereas heritabilities were 0.07 ± 0.01 , 0.05 ± 0.01 , 0.24 ± 0.02 , 0.06 ± 0.01 for PC1, PC2, PC3, and PC4, respectively. These results underline a moderate to low genetic component for milk FTIR spectra variability and confirm that they can be modified by selection.

Prediction of nutritional content of black soldier fly (BSF) larvae using multispectral imaging

G. Gebreyesus¹, K. Jensen², A. Luca³

¹ Aarhus University, Center for Quantitative Genetics and Genomics, CF Møllers Alle 3, 8000 Aarhus, Denmark, ² Aarhus University, Institute of Animal and Veterinary Sciences, Blichers Alle 20, 8800 Tjele, Denmark, ³ Aarhus University, Department of Food Science, Agro Food Park 48, 8000 Aarhus, Denmark

The economic viability of BSF production for livestock and pet nutrition heavily relies on the nutritional composition of its larvae, notably protein and fat content, influenced by diet, harvest age, and genetics. Maintaining consistent product quality necessitates continuous monitoring across larvae developmental stages. Selective breeding also offers potential for enhancing BSF larvae's nutritional profile, requiring phenotypic data from potential live candidates. Conventional chemometric methods, while accurate, are costly, time-consuming, and destructive, hindering their suitability for live larvae phenotyping. Hence, there's a pressing need for rapid, non-destructive, and cost-effective techniques to evaluate the nutritional content at different stages of the BSF larvae. Recently, spectral imaging has emerged as a powerful tool for food quality assessment, capturing both spectral and spatial data simultaneously. This study explores the potential of multispectral imaging in predicting individual BSF larvae's nutritional content. With 71 larvae sampled and imaged, prediction models, employing 19 wave bands as features via PLS, exhibited promising predictive performance for lipid mass and lipid percent. With reasonable correlation between measured and predicted parameters for a test set of 21 larvae, the study demonstrates the promise of multispectral imaging in predicting individual larvae's nutritional content, offering avenues for future research in nutritional content prediction from live samples.

Comprehensive analysis of whole-transcriptome and metabolome provides insights into estrus expression in Holstein cattle

T. Yang¹, Y. Chang¹, Y. Wang¹

¹ China Agricultural University, No.2 Yuanmingyuan West Road, 100193 Beijing, China

The occurrence and the intensity of estrous expression improved the pregnancy of dairy cows, maximizing economic benefits in farms. Thus, the study aimed to investigate the underlying regulatory mechanism of estrus expression through metabolome and transcriptome integrated analysis. The intensity of estrus expression was assessed based on heat indicators from calving to first estrus (HIC) and interval from calving to first heat (ICH) by neck collar. Nine cows were categorized into three groups: LH_S (low HIC and short ICH), LH_L (low HIC and long ICH), and HH_L (high HIC and long ICH). A total of 8,727 mRNAs, 6,237 lncRNAs, 16,749 circRNAs, and 2,408 miRNAs were quantified and normalized. Results showed 1,266 DERNAs were regulated by a consistent trend, with 764 downregulated DERNAs and 411 upregulated DERNAs in both LH_S and HH_L compared to the LH_L. Furthermore, ceRNA networks were established, revealing bta-miR-671 with the highest number of target genes involved in pathways such as retinoic acid receptor signaling, GnRH signaling, and the estrous cycle. Five overlapped DMs associated with initial estrous events were observed in three groups. Moreover, weighted genes co-expression network analysis (WGCNA) identified three co-expression modules related to the overlapped DMs. The metabolite-RNA correlation network revealed 18 positive correlations (0.67 ~ 0.82, P<0.05) and 138 negative correlations (-0.67 ~ -0.90, P<0.05) between DMs and DERNAs belonging to the three key modules. Overall, this study found distinct regulatory mechanisms underlying the intensity of estrus expression by integrating omics data, offering valuable insights for enhanced fertility traits in Holstein cattle breeding programs.

Breeding cows able to effectively respond to stress could be a strategy to improve livestock resilience and welfare. In this work, the concentrations of 29 plasma biomarkers were used as endophenotypes for metabolic stress response in multiple GWAS approaches on 739 healthy lactating Holstein cows and 88,271 variants. Significant genetic associations were found for plasma γ -glutamyl transferase (GGT) concentration on BTA17, paraoxonase on BTA4, and alkaline phosphatase and zinc on BTA2. On these chromosomes, single-SNP and gene-based chromosome-wide association study confirmed GWAS findings. The signals identified for paraoxonase, GGT and alkaline phosphatase were in proximity of the genes coding for them. Plasma biomarkers concentration largely vary during the metabolic stress of transition period, with an inter-individual variability in the rate of change and recovery time. Genetics may account in part for these differences. To assess this, on a subset of 139 periparturient cows homozygous at three SNPs known to be respectively associated with plasma concentration of ceruloplasmin, paraoxonase and GGT, we compared the plasma immune-metabolic profile at -7, +5 and +30 days relative to calving between groups of opposite homozygotes. A significant genotype effect was found on paraoxonase and GGT concentration at all the three time points. No evidence for genotype effect was detected for ceruloplasmin. Understanding the genetic control underlying metabolic stress response may suggest new approaches to foster resilience in dairy cows.

Phenotyping tools and data collection for the agroecological transition

Livestock phenotyping has made significant progress in recent years through the increasing use of digital technology. When used appropriately, phenotyping tools can be an important lever in the agroecological transition of livestock production. The GIS Avenir Elevages undertook a multi-species review of recent advances in animal phenotyping and the contribution these new tools could make to the agroecological transition. In particular, we look at the measurement of new traits related to environmental impact (production of greenhouse gases), the efficient use of feed and water resources (intake of concentrates or forages, water, digestibility, etc.), animal behaviour related to welfare (movement sensors or image or sound analysis using artificial intelligence tools, etc.) and health (in particular through "omics" tools). The prospects of continuous measurement of more standard phenotypes (weight, milk or egg production) are also mentioned. The strengths and weaknesses of the different phenotyping technologies and tools will be discussed. The review will 1) provide a multi-species inventory of phenotyping tools for traits, and 2) identify gaps in certain areas and make proposals for research and development actions to fill them.

Blood metabolic biomarkers predicted from milk spectra are heritable in Holstein transition cows

S. Magro¹, A. Costa², R. Finocchiaro³, M. Marusi³, M. Cassandro^{1,3}, M. De Marchi¹

¹ University of Padova, Department of Agronomy, Food, Natural resources, Animals and Environment, Viale dell'Università, 16, 35020 Legnaro, Italy, ² Alma Mater Studiorum University of Bologna, Department of Veterinary Medical Sciences, Via Tolara di Sopra, 43, 40064 Ozzano dell' Emilia, Italy, ³ Associazione Nazionale Allevatori della Razza Frisona, Bruna e Jersey Italiana, Via Bergamo, 292, 26100 Cremona, Italy

Blood metabolic parameters provide useful information about cows' metabolic status, especially in early lactation. Determining these traits is however costly and requires invasive blood samplings. We used milk mid-infrared spectroscopy to predict blood concentration of β -hydroxybutyrate (BHB), non-esterified fatty acids (NEFA), urea, cholesterol (CHO) and glucose (GLU). Blood and milk samples were collected from 680 cows between 5 and 35 days in milk in 34 multi-breed Italian farms during the morning milking. Partial least square regression was performed for prediction models development and coefficients of determination in cross-validation were 0.64 for BHB, 0.64 for NEFA, 0.85 for urea, 0.53 for CHO, and 0.33 for GLU. Subsequently, we estimated heritability (h^2) with a linear animal model using blood traits obtained from a prediction set (8,277 early-lactation Italian Holstein cows, 374 herds). BHB exhibited the highest h^2 (0.13 ± 0.03), while NEFA the lowest (0.03 ± 0.01). The h^2 of the remaining traits was low too, ranging from 0.04 to 0.08. The minimum and the maximum coefficient of additive genetic variation were 3.1% (GLU) and 20.8% (BHB). Although the prediction accuracy and precision do not allow for punctual determination, predicted blood traits can be still used for selection purposes to guide genetic progress towards a reduced incidence of metabolic diseases.

Evaluating the Efficiency of Phenomic Selection in Dairy Cattle

E. O. Odah¹, M. P. Sanchez¹, B. Cuyabano¹, P. Croiseau¹¹ Université Paris-Saclay, INRAE, AgroParisTech, GABI, Domaine de Vilvert, 78362 Jouy en Josas, France

Phenomic selection is a relatively new, high-throughput method that uses spectra information from biological samples for phenotype prediction and selection. This study proposes a large-scale application of phenomic selection in dairy cattle using mid-infrared (MIR) spectra, routinely produced from milk samples, to predict milk composition. The objective is to compare the accuracy of the predictions obtained from phenomic evaluation (hyperspectral BLUP, or HBLUP) with those obtained with genomic evaluation (GBLUP). 36,986 milk MIR spectra records were available from three French dairy cattle breeds: Holstein (n = 2,330), Montbéliarde (n = 1,726), and Normande (n = 2,805), to predict eleven traits related to milk production (milk, protein, and fat yields, protein and fat contents), udder health (somatic cell count and clinical mastitis), fertility (heifer and cow conception rates, and calving to artificial insemination interval), and height at sacrum. All traits were evaluated using their yield deviations. The estimated heritabilities of absorbances along the wavelengths of the MIR spectra varied from 0 to 0.5, indicating the potential of using MIR spectra for genetic evaluation. Although the accuracy of the HBLUP predictions is not as good as that obtained with a GBLUP, on average, the HBLUP achieved up to 89% of the GBLUP prediction accuracy for functional traits, 73% for production traits and 42% for type traits. This result suggests that phenomic selection can be a low-cost alternative to the use of genomic information for breeding value estimation in dairy cattle. The next ongoing step of our study is to combine genomic and MIR spectra information to predict breeding values.

Genomic evaluation of SA Holsteins incorporating local and foreign genetic markers under two production systems

M. Van Niekerk^{1,2}, E. D. Cason¹, F. W. C. Naser¹, J. B. Van Wyk¹, V. Ducrocq^{1,2}¹ University of the Free State, Department of Animal, Wildlife and Grassland Sciences, 205 Nelson Mandela Drive, 9301 Bloemfontein, South Africa, ² Université Paris-Saclay, INRAE, AgroParisTech, UMR GABI, Rue de la Manufacture, 78350 Jouy-en-Josas, France

Evidence for genotype by environment (GxE) interaction between total mixed ration and pasture feeding systems (FS) for persistency of production has been shown in South African (SA) Holsteins. Analyzing test-day (TD) records from the two FS as separate traits, estimated breeding values (EBVs) from best linear unbiased predictions (BLUP) showed significant re-ranking of sires between FS. The addition of genomic information (single nucleotide polymorphism markers; SNPs) to existing pedigree information to get more accurate genetic relationships amongst animals over the FS may enhance prediction accuracy. The same 3-lactations, TD, random regression model utilized in the GxE study was used to analyze a comparable dataset. The model estimates the (additive) genetic effect of lactation as the function of an average-production (constant) and -persistency (slope) effect over days in milk. First, about 50K SNPs were used to form the genomic relationship (GR) matrix of the local SA Holsteins. Then SNPs from related foreign sires were added in an effort to form a more complete GR matrix. The single-step (SS) BLUP approach was used to form the H-inverse matrix, combining the pedigree and GR matrices, together with TD records from both FS and deregressed proofs of foreign sires to calculate SSBLUP EBVs. These SS-EBVs, their reliabilities, their rankings as well as the genetic parameters over the FS were compared to pedigree-based BLUP EBVs.

Evaluation of muscle transcriptome of beef cattle after intramuscular application of vitamin A

This study assessed the skeletal muscle transcriptome of calves post intramuscular vitamin A administration at birth. Forty male crossbred calves were studied from birth to feedlot finishing. At birth, 20 calves received a single intramuscular injection of 300,000 IU of vitamin A, while the remaining 20 calves were administered a placebo (control). After weaning at 210 days, all underwent 180 days of feedlot finishing. Longissimus muscle samples were collected for RNA-seq analysis (hot carcass) and meat quality evaluation (48h post-mortem). Total RNA was extracted from 100 mg LT muscle using TRIzol®, analyzed on Bioanalyzer 2100®, and sequenced using TruSeq RNA Sample Preparation Kit (Illumina, USA) on Illumina NextSeq550®. Transcriptome analysis identified 165 differentially expressed genes (DEGs), 59 upregulated in vitamin A group ($P < 0.01$; \log_2 FC [0.5], FDR 5%). Functional analyses revealed enrichment of defense mechanisms, intracellular signaling, fatty acid metabolism, and oxidative processes. Vitamin A led to >50% increase in intramuscular fat ($P < 0.05$) compared to control ($4.10 \pm 0.35\%$ vs. $2.57 \pm 0.27\%$). A trend ($P = 0.07$) towards meat tenderness was noted in vitamin A group (WBSF = 3.92 ± 0.16 kg vs. 4.23 ± 0.15) after 7 days of aging. Vitamin A upregulated key biological processes of transcriptome associated with energy metabolism, promoting IMF accumulation during finishing, which may help to improve meat tenderness and juiciness.

A. (Nutreco), Avenida de a Rúa 2, 06200 Almendralejo, Spain

The genetic architecture of intramuscular (IMF) and subcutaneous fat (SCF) composition in Iberian pigs was investigated to elucidate key factors influencing meat quality traits. Fatty acid profiles play a crucial role in meat quality, affecting fat firmness, intramuscular fat content, and oxidative stability during meat processing. In this study, 703 animals were analysed for fatty acid profiles in subcutaneous fat, 633 of them were also analysed for fatty acid profiles in intramuscular fat. After a CLR transformation for compositional data, we estimated the heritability and the genetic correlations between IMF and SCF for all analysed fatty acids and SFA, PUFA and MUFA. Moreover, we identified the genomic regions associated with largest additive genetic variance for each one of them. Heritability estimates were higher in SCF than in IMF, with varying levels across fatty acids. Genetic correlations between SCF and IMF fatty acids were predominantly positive, except for C20:3 (n-6), indicating a negligible relationship due to its residual percentage. Moreover, multi-trait GWAS identified significant regions associated with fatty acid composition, including genes like FAF2, LIPA, LIPM, and ANKRD1, known for their roles in lipid metabolism. This study enhances our understanding of Iberian pig genetics and provides insights for targeted breeding programs to improve meat quality.

Single marker and haplotype-based GWAS for meat quality and carcass traits in Italian heavy pigs

P. Zambonelli¹, S. Bovo¹, G. Schiavo¹, M. Ballan¹, J. Vegni¹, F. Bertolini¹, A. Ribani¹, V. Taurisano¹, M. Gallo², M. Zappaterra¹, S. Dall'Olio¹, L. Fontanesi¹

¹ University of Bologna, Dept. of Agricultural and Food Sciences, Viale G. Fanin, 46, 40127 Bologna, Italy, ² Associazione Nazionale Allevatori Suini, Via Nizza, 53, 00198 Roma, Italy

The selection and breeding programs of Italian heavy pig breeds have as their main objective the improvement of meat quality and carcass traits useful to meet the needs of the protected designation of origin dry-cured ham industry. The aim of this study was to investigate the association between genetic variants and several meat and carcass traits (e.g., pH, color, water holding capacity, intermuscular and intramuscular fat content, the weight of carcass cuts, back fat thickness, lean meat content, and carcass grading parameters) in a total of ~1300 pigs of the Italian Large White and Italian Duroc breeds genotyped with an SNP array. After assessing phenotypic correlations, single marker and haplotype-based genome-wide association studies (GWAS) were performed. Several genomic regions associated with the investigated parameters were identified, pointing out a few candidate genes. The results will be used to better understand the genetic components of relevant traits useful to address the selection programs of Italian heavy pigs. Acknowledgments: Funded by the Programma di Sviluppo Rurale Nazionale (PSRN) SUIS-2, co-funded by the European Agricultural Fund for Rural Development of the European Union and by the MASAF; and by the European Union – NextGenerationEU under the National Recovery and Resilience Plan (PNRR) – HamCapture, proposal code 202238NP9N – CUP J53D23009570001.

A promising genetic background of pork hemorrhages occurring at slaughter

J. Gelhausen¹, T. Friehs¹, J. Knöll², I. Wilk², D. Mörlein¹, J. Tetens¹

¹ Georg-August-University, Department of Animal Science, Burckhardtweg 2, 37077 Göttingen, Germany, ² Friedrich-Loeffler-Institut, Institute of Animal Welfare and Animal Husbandry, Dörnbergstr. 25/27, 29223 Celle, Germany

Reportedly, the use of inert gases like nitrogen or argon for stunning as well as electrical stunning induces more hemorrhages in the valuable carcass parts than CO₂. In the project for Testing Inert Gases in order to Establish Replacements for high concentration CO₂ stunning for pigs at the time of slaughter (TIGER) these findings could not be confirmed when the animals were stunned with argon. Out of 214 crossbreed pigs, 51 showed hemorrhages in the ham, where their incidence in the CO₂ and argon group was nearly equal, respectively. To investigate a genetic background that makes animals more susceptible to the bleedings, the pigs were genotyped using the GGP Porcine 50 K Array Chip. The data was filtered for 95 % genotyping rate per individual, minor allele frequency > 0.05 and 90 % SNP genotyping rate. The used model for heritability (h²) estimation and GWAS for the occurrence of blood spots was set up with the quantitative covariates gas exposition time, slaughter weight and lean meat content as well as the covariates gas mixture, sex and day of slaughter. With this model, the h² was estimated to be 0.28 (P < 0.01). The best, although not genome-wide significant association signal for blood spots was identified on chromosome 7 at 8.8 Mb. A first inspection of the genome region revealed EDN1, encoding endothelin 1 (ET-1) as the most adjacent gene. ET-1 is a very strong endothelium-derived vasoconstrictor peptide and might be a promising candidate gene. These findings will now be validated using an enlarged sample and applying a fine-mapping approach.

Characterization of the relationship between olfactory perception and quantified compounds as phenotypes for genetic selection against boar taint using a recursive model

A. Markey¹, C. Große-Brinkhaus², D. Mörlein³, E. Tholen², N. Gengler¹

¹ ULiège-GxABT, Animal Sciences, Passage des Déportés 2, 5030 Gembloux, Belgium, ² University of Bonn, Institute of Animal Science, Endenicher Allee 15, 53115 Bonn, Germany, ³ University of Göttingen, Department of Animal Sciences, Kellnerweg 6, 37077 Göttingen, Germany

Detecting and reducing boar taint is an important issue to maintain a high quality of fresh and processed pork. This deviant odor is mainly caused by skatole (SKA) and androstenone (AND) accumulated in fat and released when cooking pork meat. To avoid this, literature supports that breeding against boar taint is feasible considering the high heritability (h^2) of SKA and AND. However, carcass sorting at abattoir is performed by sensory evaluation yielding a human nose score (HNS). Sensory evaluation by trained assessors is considered a phenotype more closely related to consumer responses than chemical analyses. This study tried to characterize the origin of olfactory deviant attribution compared to SKA and AND concentrations by applying recursive mixed model (RM) using data of 1016 boar fat samples evaluated by 10 trained assessors. Some genetic correlations obtained by RM (-0.34 to 0.71 for SKA and -0.39 to 0.33 for AND) revealed that scores seemed to be assigned according to compounds related to SKA and AND in addition to these compounds themselves. Moreover, some heritabilities (h^2 0.04-0.20) from RM stayed moderate indicating that scores remained heritable without SKA and AND influence. Those results demonstrated the possibility to use HNS as boar taint trait but also the need to probably extend the “boar taint” phenotype to better relate it to the consumer’s perception for improving and applying HNS attribution at genetic level.

The effect of myostatin gene mutation on productive traits in Marchigiana young bulls in performance test

D. Colombi¹, F. Perini², V. Polifroni¹, F. Sbarra³, A. Quaglia³, E. Lasagna¹

¹ University of Perugia, Department of Agricultural, Food and Environmental Sciences, Borgo XX Giugno, 74, 06121 Perugia, Italy, ² University of Padova, Department of Agronomy, Food, Natural Resources, Animals and Environment, Viale dell’Università, 16, 35020 Legnaro (PD), Italy, ³ National Association of Italian Beef-Cattle Breeders (ANABIC), Strada del Vio Viscioloso, 21, 06132 San Martino in Colle (PG), Italy

Marchigiana cattle breed is an Italian local breed specialised for beef production. A double muscle phenotype occurs in this breed whose causative mutation (G>T) has been observed in MSTN gene, resulting in a GG normal genotype, a GT heterozygous one with an enhanced muscle development, and a TT hypertrophic genotype. Although the TT genotype is unwanted, the GT genotype is described in about 20% of population. It is questioned whether heterozygous animals show lower weight gains and performances, therefore the aim of this work was to confirm or confute this assumption by using performance records of 1074 young bulls tested at ANABIC genetic station (780 GG, 294 GT). The considered traits were morphological score, selection bull index, average daily gain index, muscularity index, average daily gain before and during performance test, weight at one year, muscularity. Data were analysed with ANOVA or Kruskal-Wallis tests. Results showed a significant increase in muscularity ($\mu\text{GG}=404.4\pm 62.3$, $\mu\text{GT}=444.6\pm 49.0$, $P<0.001$), muscularity index ($\mu\text{GG}=101.6\pm 9.7$, $\mu\text{GT}=105.1\pm 8.7$, $P<0.001$), and bull selection index ($\mu\text{GG}=102.2\pm 10.2$, $\mu\text{GT}=104.0\pm 8.9$, $P<0.01$) in heterozygous animals; no significant differences were observed for the other traits. Our results confirm the increase of muscularity related traits while other productive traits were not negatively affected. Funding: Italian Biodiversity Environment Efficiency Fitness— I-BEEF 2 — PSRN 2014-2020

Genetic parameters, genome-wide associations and single-gene effects for intramuscular fat content in a local dual-purpose cattle breed

I. Giambra¹, S. König¹, M. Bohlouli¹, K. Halli¹

¹ Justus-Liebig-University, Institute of Animal Breeding and Genetics, Ludwigstr. 21b, 35390 Giessen, Germany

The aims of this study were to estimate genetic parameters, allele substitution and dominance effects of specific meat quality genes (CAPN1, CAST, DGAT1, FABP4, RORC, TG) and to perform GWAS for intramuscular fat content (IMF) in the endangered cattle breed Rotes Höhenvieh (RHV). In total, 542 RHV cattle were phenotyped for IMF and genotyped with the 777K SNP BovineHD BeadChip. Meat quality gene SNP were typed by DNA tests. Direct and maternal genetic parameters for IMF and weight traits were estimated using a multi-trait genomic animal model. The direct and maternal heritabilities for IMF were 0.76 and 0.29, respectively, while the direct-maternal genetic correlation was unfavorable (-0.18). Pronounced genetic variation and heritabilities for IMF indicated major gene effects, but only one SNP surpassed the Bonferroni significance threshold. Gene annotations based on the chromosome-wide significance level inferred candidate genes for direct (e.g. VWC2L, effect on feed efficiency) and for maternal genetic effects (e.g. GRHL2, effect on growth), but not the six well-known meat quality genes. Consequently, allele substitution effects for the variants of the six major genes were non-significant, probably due to the predominance of alleles. Related dominance effects were quite small, but the IMF values were highest in heterozygous animals for CAST and TG. Results indicate RHV peculiarities differing from commercial cattle breeds for effects of known meat quality genes, probably due to the specific breeding history. The gene annotations based on IMF genomic analyses suggest possibilities for meat quality improvement in the context of environmental adaptation.

Genotype by management-system interaction on origin group of milk fatty acids in Holsteins

Y. Masuda¹, N. Yamamoto¹, D. A. L. Lourenco², S. Tsuruta², I. Misztal²

Cow health can be monitored using groups of milk fatty acids (FA) from de novo synthesis in the mammary gland. Environmental factors and management systems are known to contribute to the FA group. This study aimed to estimate genetic correlations among three management systems, i.e., tie-stall, free-stall, and pasture-based systems, for the FA group at early stages of lactation in Holsteins. A single-step genome-wide association study (ssGWAS) was also performed to detect regions unique to each management system. Data included over 1.45 million test-day records from 211,462 Holstein cows in their first or second lactation, calving in Hokkaido, Japan. Groups of “de novo” FA were predicted by Fourier-transform infrared spectroscopy of milk samples. The de novo FA percentage (DnF%) was calculated as the ratio of the predicted FA content to the total FA content for each origin group. The dataset was divided by lactation stage, defined as every 30 days in milk. A total of 119,822 animals were genotyped for 44,768 SNP. We used a tri-variate animal model with management systems as separate traits. Because of many genotyped animals, ssGWAS relied on the algorithm of proven and young (APY). The lowest genetic correlation was 0.96, between free stall and pasture, at stage 4 in the second lactation. At this lactation stage, we detected one significant region on chromosome 19 in all the management systems. The region was reported to be associated with milk FAs yield. Other lactation stages with genetic correlations greater than 0.99 among the systems were expected to have common significant SNP regions. More phenotypes and genotypes from multiple generations may be required to confirm the nonexistence of genotype by management-system interaction in the group of de novo FA at the early stage of lactation.

Investigating the effect of animal genotype on milk fat production in grazing dairy cows

C. Heffernan^{1,2}, R. Fitzgerald¹, J. A. O'Mahony², T. O'Callaghan², M. Dineen¹

¹ Teagasc, Animal and Grassland Research and Innovation Centre, Moorepark, P61P302 Cork, Ireland, ² University College Cork, School of Food and Nutritional Sciences, College Road, T12 Y337 Cork, Ireland

Milk fat composition and concentration are highly variable components of milk and while typically influenced by nutrition, an animal's genetic potential may also play an important role. The objective of this study was to investigate the effect of animal genotype on milk fat production in grazing dairy cows. Three groups of genetically divergent cows were evaluated within a large nutrition experiment where cows received a basal diet of grazed pasture and 3.6 kg of DM/cow/day of varying supplemental concentrates. The 3 genotypes evaluated were Purebred Jersey (JE; n = 60), Holstein-Friesian with high economic breeding index (EBI; Elite; n = 60) and Holstein-Friesian with the national average EBI (NA; n = 60). The study consisted of a 2-wk covariate and an 11-wk data collection period. Data were analysed using a repeated measures mixed model in SAS. The Elite and NA groups had significantly higher milk yield when compared to JE (26.5, 26.8, and 21.4 kg/cow/day, respectively; P<0.01). Milk fat concentration was highest for JE, intermediate for Elite and lowest for NA (5.74, 4.46 and 4.27 %, respectively; P<0.01). The Elite cows had higher protein concentration compared with NA (3.68 vs 3.53 %, respectively; P<0.01) but lower than JE (4.13%). Fat yield was lower for NA when compared to Elite and JE (1.14, 1.23 and 1.22 kg/cow/day, respectively; P<0.01). The Elites had significantly higher milk solid yields compared to NA and JE (2.19, 2.08 and 2.09 kg/cow/day, respectively; P<0.01). These results demonstrate the important role of animal genotype on milk fat production along with its ability to increase the economic and environmental sustainability of grazing systems.

Theatre 9

Colostrum yield is heritable and genetically correlated with immunoglobulins concentration in Holstein cows

A. Goi¹, M. De Marchi¹, M. Cassandro^{1,2}, R. Finocchiaro², M. Marusi², A. Costa³

¹ University of Padova, Department of Agronomy, Food, Natural resources, Animals and Environment, Viale dell'Università 16, 35020 Legnaro, Italy, ² Associazione Nazionale Allevatori della Razza Frisona, Bruna e Jersey Italiana, (ANAFIBJ), Via Bergamo 292, 26100 Cremona, Italy, ³ University of Bologna, Department of Veterinary Medical Sciences, Via Tolara di Sopra 50, 40064 Ozzano dell'Emilia, Italy

Bovine colostrum (BC) quality is given by immunoglobulins G (IgG) level, which should be at least 50 g/L for sufficient passive transfer of immunity in calves. 4 L of BC, ideally split into two meals, is the recommended volume in the first 12 h of life. However, calves often refuse to ingest 4 L of BC at birth. BC with high IgG concentration (> 50 g/L) enable delivering the same amount of antibodies (g) to calves with less volume, so that the high-quality BC in surplus can be stored for banking. Colostrum yield (CY, L) and IgG (g/L) are influenced by intrinsic and extrinsic factors in cows, but it is still unclear if these traits are genetically correlated and manipulable through genetics. Therefore, we estimated the heritability (h^2) of CY and IgG and their genetic covariance using REML approach. Data referred to Holstein cows' first milking, i.e. < 6 h from calving. For this purpose, more than 2,500 individual BC samples were stored to predict IgG via near-infrared spectroscopy with farmers recording for each sample the respective CY. IgG averaged 102 ± 33.62 g/L, while CY averaged 4.63 ± 2.28 L. The h^2 of IgG and CY was 0.22 and 0.07, respectively, and they were negatively correlated at both phenotypic (-0.26) and genetic level (-0.35). Results suggest that selection towards optimal quality and quantity of BC is feasible, but a proper index should consider their antagonistic association to ensure a genetic response in both traits in the right direction.

Heritability of traditional milk coagulation properties in Manchega dairy sheep

I. Heddi¹, A. Garzón², R. Arias¹, L. Jiménez¹, A. Cecchinato⁴, N. Amalfitano⁴, J. Caballero-Villalobos², M. Ramon³
¹ IRIAF, Cersyra, Av. vino 10, 13300 Valdepeñas, Spain, ² Universidad de Córdoba, Dpto. de Producción Animal, Ctra. Madrid-Cádiz km 3, 14071 Córdoba, Spain, ³ INIA-CSIC, Mejora Genética Animal, crta. Coruña Km 7.5, 28040 Madrid, Spain, ⁴, University of Padova, Dept. of Agronomy, Via 8 Febbraio, 2, 35122 Padova, Italy

This study aimed to estimate the heritability of traditional milk coagulation properties in the Manchega breed. Data from 791 Manchego ewes belonging to 5 flocks was used. The pedigree data was provided by AGRAMA. The rennet coagulation time (RCT), curd-firming time (k20), and curd firmness at 30 (A30) and 60 min (A60) were obtained using a lactodinamograph. Heritabilities were estimated using a univariate animal model that incorporated the parity type, age at calving-parity number and days of lactation as fixed effects and the flock-date as random effect. Marginal posterior distributions were estimated using Gibbs sampling with the GIBBSF90 program. Results were based on MCMC method consisting of 300,000 iterations with a burn-in period of 90,000, and only 1 of every 10 samples was saved for inferences. The heritability estimates (h^2) obtained were 0.16, 0.10, 0.14, and 0.10 for RCT, k20, A30, and A60 respectively. Overall, the h^2 of RCT and k20 were similar to those obtained in Sarda sheep, whereas the estimates of A30 and A60 were slightly higher. Our results suggest the possibility of using genetics for the improvement of the technological properties of milk within the breeding program. For that, it is necessary to study the genetic correlations of these traits with other traits already included in the breeding program in the Manchega breed. This research is part of Project PID2020-118031RR-C21/AEI/10.13039/501100011033.

Effect of protein polymorphisms on milk composition, coagulation properties, and protein profile in dairy sheep

A. C. Marshall^{1,2}, V. Vigolo³, M. De Marchi³, N. Lopez-Villalobos¹, S. M Loveday², M. Weeks⁴, W. McNabb²
¹ Massey University, School of Agriculture and Environment, Private Bag 11 222, 4442 Palmerston North, New Zealand, ² The Riddet Institute, Massey University, Private Bag 11 222, 4442 Palmerston North, New Zealand, ³ University of Padova, Department of Agronomy, Food, Natural resources, Animals and Environment, Viale dell'Università 16, 35020 Legnaro (PD), Italy, ⁴ AgResearch Ltd, Smart Foods & Bioproducts Group, Te Ohu Rangahau Kai, Massey University, 4442 Palmerston North, New Zealand

The objective of this study was to quantify the effect of protein polymorphisms on milk composition, coagulation properties, and protein profile in dairy sheep from a New Zealand flock. Repeated test-day records from 147 lactating dairy ewes were obtained. Milk samples were analyzed for percentages of fat, protein, lactose, and casein; contents of α 1-, α 2-, β - and κ -casein, α -lactalbumin and β -lactoglobulin; milk coagulation properties, cheese yield, pH and heat stability. In the statistical analyses, two polymorphisms observed for α 1-, α 2-, β -casein, and β -lactoglobulin from HPLC chromatograms were included, along with three polymorphisms observed for α -lactalbumin. κ -casein was found to be monomorphic. Data were analyzed using a mixed model, including the fixed effects of ewe age, coat colour, litter size, stage of lactation, deviation from median lambing date, and the effects of protein polymorphisms, one at a time. Protein polymorphisms significantly affected milk composition and protein profile. Polymorphism of β -lactoglobulin significantly affected milk heat stability (AB>AA). Further studies on larger populations of dairy sheep are necessary to confirm the findings before applying genomic selection on polymorphisms.

Heritability of milk Fourier transform infrared spectra in sheep

S. Casu¹, M. G. Usai¹, S. Salaris¹, M. Caredda¹, M. Addis¹, A. Carta¹¹ *Agris Sardegna, s.s. Sassari-Fertilia, KM 18.6, 07100 Sassari, Italy*

This work aimed at estimating the heritability of Fourier Transform Mid Infrared (FTIR) spectra of milk in sheep. Between 2020 and 2023, milk samples were collected fortnightly, at the a.m. and p.m. milking from December to July in an experimental flock of Sarda sheep. 1060 absorbance values from 925 to 5011 cm⁻¹ wavenumbers were captured with a MilkoScan FT+. After editing, 41075 spectra from 1256 ewes from 1st to 4th parity were retained. Variance components were estimated by a REML procedure (Asreml-R v4.2) applied to single trait repeatability animal models including the fixed effects of moment of milking, lactation stage within date and age-parity interaction; the random effects of the ewe within date, ewe within lactation and ewe across lactations. The individual genetic effect was included using the genomic relationship matrix (43390 SNPs). The genetic components of the covariance between repeated measures was nearly always higher than the other individual components. The average h² was 0.17 ± 0.10, ranging from 0 to 0.41 and being > 0.30 for 142 wavelengths. The highest values were in the intervals: 1141.968 -1273.14 cm⁻¹, related to amide III and phosphate bands and including the transitions in the vibrational energy of the triglyceride ester linkage C-O; 1442.892-1469.9 cm⁻¹, related to the vibrations of the CH₂ and -CH₃ groups; 2839.49 – 2978.38 cm⁻¹, associated with FA acyl C-H chain. Heritability estimates were low or close to 0 from 1624.22 to 1670.51 cm⁻¹ and from 3094.11 to 3653.52 cm⁻¹ where the absorbance due to the stretching of the O-H bonds (above~ 3000 cm⁻¹) or the H-O-H bending (~ 1600 to 1700 cm⁻¹), typical of water, occur. These results confirm that milk spectra can be used for the genetic improvement of innovative traits in dairy sheep.

Session 44

Theatre 13

The genetic background of goat milk oligosaccharides content

R. Gonzalez-Prendes^{1,3}, R. Crooijmans¹, B. Dibbits¹, K. Laport¹, S. Breunig^{2,3}, P. Keijzer³, L. Pellis³, H. Bovenhuis¹¹ *Wageningen University & Research, Animal Breeding and Genomics, P.O. Box 338, 6700 AH Wageningen, Netherlands, ² Wageningen University and Research, Food Quality and Design, P.O. Box 17, 6700 AA Wageningen, Netherlands, ³ Ausnutria BV, P.O. Box 50078, 8002 LB Zwolle, Netherlands*

One of the most remarkable milk components are the oligosaccharides (OS). Milk oligosaccharides are complex carbohydrates which show a large diversity and are mainly undigestible. They can act as prebiotics and can selectively reduce the binding of pathogenic bacteria and viruses to the gut epithelium. Goat milk has higher concentrations of OS as compared to cow or sheep and has been suggested as a potential natural source of OS to produce infant formula. This study investigated the genetic background of goat milk oligosaccharide (gMOS) content by estimating heritabilities and performing a genome-wide association study (GWAS) based on 996 Dutch dairy goats. Goats were located on 18 farms in the Netherlands and were genotyped using the Illumina 70K goat chip array. The heritabilities for gMOS were high and ranged from 0.31 (3'-GL) to 0.85 (3-FL). The GWAS identified highly significant associations between five gMOS and SNPs located in 6 genomic regions. For 3'-NGL, 3'-SL and 3-FL cumulative QTL effects explained approximately 25% of the genetic variation and for 2'-FL this was more than 80%. Analysis of positional candidate genes showed that genes related to the metabolism of OS were significantly enriched, including genes involved in the transfer of L-fucose and sialic acid. Our findings suggest that genetic differences play an important role in determining the content of OS in goat milk and genotypes for a limited number of SNP can be used to identify goats with superior OS content.

Uncovering environmental effects and genetic parameters on the mineral composition of sheep milk

The high levels of minerals in sheep milk affect its processing properties and impact product attributes and digestion kinetics. Their proportion in milk varies due to genetics, environmental conditions, and management. We assessed environmental factors influencing Ca, P, K, Mg, Na, Cl, S and estimated genetic parameters to identify their potential for selective breeding. Milk of 429 Comisana (CO) and 311 Massese (MA) reared at Asso.Na.Pa nucleus center was collected once during a total of 11 samples across a year. Milk was analysed for mineral, acidity and composition content and individual sheep information were also available. (Co)variance components were estimated using univariate animal linear mixed models. The additive genetic and residual terms were included as random effects while days in milk, parity and milk characteristics were considered as fixed effects. Heritability (h^2) estimates were moderate (0.24 to 0.33) for Ca, Cl, K, and Na in MA breed, and for K and Mg in CO breed. Higher h^2 was observed for Mg (0.59) and P (0.50) in MA and CO, respectively. Low h^2 was observed only for P in MA. The estimation of genetic parameters of milk minerals provides valuable information for breeding programs aimed at improving nutraceutical and technological properties at sheep population level.

Session 44

Poster 15

Molecular detection for *Coxiella burnetii* in bovine milk collected from bulk tank of small dairy farms in São Paulo, Brazil

Coxiella burnetii is a gram-negative bacterium that causes a cosmopolitan zoonosis called Q fever. It infects a range of animals, but ruminants are considered the largest reservoir. It is known for causing gestational disorders in animals such as miscarriage, stillbirths and premature births, infertility, generating a large negative economic impact. Infection in humans occurs through inhalation of aerosols containing the bacteria, coming from the excrement, milk or birth products of these animals. The aim of this study was to research *C. burnetii* in 102 samples of milk from lactating cows, from bulk tank milk of small family farming from eight cities of Sao Paulo State, Brazil. The molecular techniques of Polymerase Chain Reaction (PCR), Nested PCR and real-time PCR (qPCR-Sybr using primers Trans3 and Trans4 and qPCR Probe using primers IS-202 and IS-249) were performed and then genetic sequencing was carried out. *C. burnetii* was detected in sixteen samples (15.68%) by Nested-PCR, twenty-two (21.57%) by qPCR/Sybr and thirty-two (31.37%) by qPCR/Probe. There was detection in seven of the eight cities tested (87.50%). There is evidence of possible outbreaks and negative impacts on livestock that the presence of *C. burnetii* can cause silently, as notification and testing of the bacteria is not carried out.

Single-step genomic prediction for live animal ultrasound measures of carcass traits in Czech Aberdeen Angus
