Only (Re)connect: 20+ Years of the Social Identity Approach to Psychology in Organizations

ALEX HASLAM

Professor of Psychology and Australian Laureate Fellow at the University of Queensland

It is 20 years since the breadth of organization research informed the Social Identity Approach was first extensively reviewed in Psychology in Organizations. Since that time, interest in the approach has boomed — to the point where its scope and depth is now almost impossible to chart. Nevertheless, this talk attempts to do this. Alongside a survey of key developments, it does so by focusing on three key topics that are the focus for symposia and workshops elsewhere in the conference: leadership, organizational change, and followership. Research shows that social identity is central to all these phenomena and can thereby provide a platform for a range of positive organizational outcomes. However, at the same time, it also highlights the ways in which toxic identities (and the identity leadership and engaged followership that support them) can also have problematic consequences for organizations and their members. These considerations lead to a call for greater attention to the links between social identity and health, and to the forms of identity leadership that sustain healthy organizations. The practical implications of the analysis are also brought home by a discussion of 5R — an evidence-based leadership development programme that leverages social identity insights to help leaders build inclusive, effective and flourishing teams.

Keynote Speaker

The Future of Research in Work and Organizational Psychology – How New Technologies Allow New Insights

MARIANNE SCHMID MAST

HEC Lausanne Business School, University of Lausanne, Switzerland

This talk about what could be and not so much about what is. It is not so much a talk about results, it is rather a talk about possibilities. It is also not an advertisement for using new technologies for the sake of using them; it is an invitation to think about whether and how new technologies can help us address and answer questions that can otherwise not be investigated. Why should you use an immersive virtual reality setting in which participants stand on a plank facing a void while training to be a persuasive presenter? Can one make bosses who have to fire collaborators more empathic by training them beforehand to fire themselves (i.e., their virtual self)? Research shows that women emerge as leaders less often than men, but is it an effect of women behaving less leaderlike than men or is it an effect of the perceivers who are biased and associate men more easily with leadership than women? New technologies can help us tease apart those effects experimentally. Another example concerns the training of new communication skills. These are typically learned by presenting the trainee with videos of role models. What if the role model was you in a video already showing perfect mastery of the skill to learn? Would that accelerate your learning? Creating such a video is possible with a deep fake technology called pose transfer. Curious to boggle your mind? Happy to see you in my talk.

Keynote Speaker

Subtle Yet Powerful: Gender Stereotypes as Barriers to Women's Leadership

JANINE BOSAK

Professor of Organizational Psychology at the Dublin City University (DCU) Business School, Ireland

Women remain vastly underrepresented in leadership roles within business, academia, and in the political realm. One critical explanation for gender inequality and gender imbalance in leadership is the perceived lack of fit between beliefs about communal qualities (e.g., helpful, kind) in women and beliefs about agentic qualities (e.g., assertive, dominant) expected and desired in leaders. I will present my research illustrating the ways in which such a lack of fit can manifest itself in (i) bias against female leaders and women aspiring to become a leader and (ii) in self-directed bias among women leaders themselves. Moreover, I will discuss the question of the malleability of the perceived lack of fit, particularly important for stereotype and bias reduction, and I will close the talk with suggestions for how organizations and individuals can address biases and enhance efforts toward gender equality in leadership.

Keynote Speaker

"…a time for war and a time for peace…": What role can and should Work and Organizational Psychologists take in times of war?

MARTIN C. EUWEMA

Full professor for Organizational Psychology at the University of Leuven, Belgium

Confronted with a brutal war in Ukraine, and related crisis in Europe, within the EU the attitude towards war, the need to defend, and the use of military force, has changed dramatically. This also challenges us, as psychologists, and in particular Work and Organizational psychologists, to rethink how we can and should contribute in times of war, postwar, as well as in rebuilding peace. In this keynote Martin first shows the importance of our work as W&O psychologists throughout the complete deployment cycle (from recruitment and selection, to training, monitoring, and reintegrating). Secondly, challenges on our professional and personal ethics, how to engage, and relate to brutal violence, being close to, or far from home. Finally, Martin discusses the need for academic work on conflict and negotiation in the process of post-war, promoting the academic-practitioner.

Keynote Speaker

What makes a livelihood sustainable?

STUART CARR

The UNESCO Chair on Sustainable Livelihoods and Professor of Psychology, Industrial and Organizational Psychology Program, Massey University, New Zealand

The concept of a job has served WOP well, but has delivered far less for workers at large in this 21st-century. Most of the world's workforce does not even have one, and those that do are mostly trapped in working poverty and precarity. It is time to move on by setting more expansive, inclusive goals for 'who' we serve, 'how' we serve, and 'what' we aspire to deliver. Sustainable Livelihoods is that goal.

Goaling sustainable livelihoods includes prioritising decent work and wellbeing. It includes for example (1) fair incomes; (2) work security; and (3) social protection. Livelihoods help protect people from stress and shocks, plus enhance their capabilities and assets. Sustainable means contributing to the livelihoods of others, both now and for future generations.

These ideals are instantiated in three extant WOP projects: (1) GLOW (Global Living Organisational Wage) is a 30-country network that asks, Is there a global living wage that enables people, organisations and communities to prosper and thrive? (2) Project SAFE (Security Assessment For Everyone) is an interdisciplinary network that includes linking work security to nine other forms of Human Security, from personal to global. (3) Clean SLATE (Sustainable Livelihoods And The Ecosystem) reconceptualises the value of work occupations according to their ecological footprints for life, land, sea and air.

Together, these projects walk the talk on Sustainable Livelihoods and allow us to see tangible ways to renew our professional commitment to Humanitarian Work Psychology.

The Paradigm Shift in Talent Management: Engagement in the Post-Pandemic Era

RICHARD GRIFFITH

Executive Director of The Institute for Culture, Collaboration, & Management at the Florida Institute of Technology

In the modern workplace, perhaps no condition has been more sought after than employee engagement – an employee's positive state when at work characterized by enthusiasm and absorption in work tasks. Engagement has been linked to a number desirable outcomes such as individual performance, customer-satisfaction, loyalty, and profit (Harter, Schmidt & Hayes, 2002), and thus been viewed as a panacea in the modern workplace. However, left unchecked, recent research has suggested that employee engagement can also lead to undesirable outcomes such as burnout, workplace aggression, and work addiction. In addition, work engagement has been complicated by the pandemic and we see new relationships with work characterized by terms such as The Great Resignation and Quiet Quitting. This talk will explore the trials of the new era, and challenge organizational psychologists to elevate their research and practice to address this paradigm shift.

Workplace bullying and harassment: From an organizational taboo to the development of robust ethical infrastructures in organizations

STÅLE VALVATNE EINARSEN

Department of Psychosocial Science, University of Bergen

While bullying and harassment started out as a taboo in organizational life and in the field of work and organizational psychology, it is currently one of the more studied phenomena and concepts in the field, with empirical findings showing its great importance for the field. Workplace bullying and harassment can and should be studied in its own right as it is one the most severe stressors potentially facing workers and managers in contemporary organizations. So, what is the current state of knowledge regarding its causes and outcomes, its prevention and management. Based on the current knowledge, how can we build bully-proof organizations? But more than this; bullying and harassment constitutes a paradigm and a new set of lenses when studying work, psychology, organizations and leadership in general. Hence, which new general insights have and may come from this line of research? How have and can this this line of research inform the field of work and organizational psychology in general. Some of the findings may be surprising and rather novel and may even question some basic premises in psychology; “Vulnerable workers react more strongly than others when facing interpersonal problems and stressors at work!”. What is revealed instead is a reversed buffer-effect. And there is more…

The Future is Now Speaker

The Past and Future of Personality Assessment

RYNE A. SHERMAN

Chief Science Officer at Hogan Assessment Systems

Personality assessment began during WWI as a solution to the problem of how accurately and efficiently to screen large numbers of job candidates. Decades of research show that well-validated personality assessments provide the fairest, most accurate, and most efficient way to make personnel decisions. Despite the undeniable practical value of personality assessment, academics substantially disagree about its meaning and goals. For example, trait theory, the dominant academic perspective, contends that traits exist inside of people, that these traits cause behavior, and the goal of assessment is to measure these traits. For this perspective, the two major issues concern: (a) the structure of traits (e.g., Big 5, HEXACO); and (b) faking on assessments. However, other views (e.g., Socioanalytic Theory; Functional perspectives) contend that traits are simply observable patterns in others' behavior, that these behaviors reflect actors' agendas, and that the goal of assessment is to predict performance outcomes. For these perspectives, the major issue concerns predicting important outcomes, not understanding trait structure or faking. This talk illustrates the critical difference between these views by highlighting the concept of Ambition, a behavior pattern associated with career success that is curiously missing in Five-Factor Model frameworks. I suggest that trait perspectives ignore this important variable for ideological and not empirical reasons. Finally, I note that deciding whether assessment concerns measuring traits or predicting outcomes will crucially determine the future of assessment.

Headaches (and their remedies) in pursuit of best practice test development for a new multi-scale measure of leader wellbeing

AUDREY MCGIBBON

Executive Director & Founder, EEK & SENSE

Broad consensus in the scientific literature depicts wellbeing as an unstable and dynamic construct. Consensus also exists between academics and practitioners that wellbeing is a largely subjective and multi-dimensional construct. The conceptualisation of wellbeing as a complex psycho-social construct reflective of the interaction between a combination of individual factors, home-work-family conflict factors and organisational factors (job-demands-resources) is increasingly understood and adopted by organisations. Likewise, there is broad acceptance that wellbeing is both an enabler of individual and organsiational outcomes, and an outcome measure in its own right, but is only partially under an individual's direct control subject to the context, actions and inactions of others.

Is 'leader wellbeing' a new or even valid construct?

Why develop a new measure for 'leader wellbeing'? What if existing mental health and general wellbeing scales can provide valid measures of leader wellbeing? What if they can't?

Long before 'employee wellbeing' became the occupational phenomenon it is today, I was curious to answer these perplexing questions. More than curious. Deeply concerned. Our rooms were filling with overwhelmed managers, jaded executives in the throes of an existential crisis, lonely and emotionally fragile leaders, unfit and unhappy resentful professionals who routinely sacrificed their health and family life in pursuit of success. Once seen, it couldn't be unseen. As practitioners, it triggered a crisis of conscience. Compelled to find a new methodology which would address leaders' mental health and wellbeing needs as the starting point for leadership development rather than an incidental or belated component, we unwittingly embarked upon a journey which has continued unabated for almost ten years. A review of existing measures failed to establish a suitable measure – the scales were too clinical and oriented towards diagnosis of mental ill-health; too generic and broad in their scope as assessments of overall subjective wellbeing; or too narrow with single construct foci.

A new measure specifically of 'leader wellbeing' (GLWS®) was warranted to ensure successful application with senior professional, managerial and executive populations. In this session, it will be my privilege to share how we approached the development and evaluation process for a new measure of leader wellbeing by adopting conventional item and scale development methodology to a significant extent; making modifications to standard approaches where required for theoretical and/or practical reasons; pivoting to reflect rapidly changing global, political, economic, societal, health, organisational, environmental and legal norms; accommodating our philosophical stance of leader wellbeing as both an outcome measure and

a measure of outcomes. Over the decade of our independent research, we have sincerely attempted as practitioners to navigate and uphold orthodox best psychometric test design – but this has not been without its challenges.

By sharing how we built and evaluated our items, scales and reflective model of leader wellbeing with 6500+ individuals across Australia, UK, Hong Kong, China, New Zealand, Singapore, USA and Canada, the main tensions we encountered will be evident. Ultimately, we have established excellent scale reliabilities, robust convergent and divergent discrimination for all scales, and very good /excellent CFI, TLI, RMSEA and SRMR factor values which held strong across the whole sample, between samples and across gender. We have established beyond reasonable doubt that leader wellbeing exists as a latent construct, and that the approach we take to measuring wellbeing across both work and persona;/home life domains provides new information beyond current measures, and that our six scales within our model for leader wellbeing each add incremental value.

Please contact me if you would like to discuss, utilise my data or the tool in your research.

Safe haven? Refugees' challenges and threats in the receiving country's labour market, their coping, and avenues for adversarial growth and meaningfulness

UTE-CHRISTINE KLEHE & KATJA WEHRLE, Department of Work and Organizational Psychology at the Justus-Liebig-University Giessen (Germany)

Managing involuntary career transitions and/or traumas is challenging under the best of circumstances. For migrants, and particularly for refugees, this is especially the case. For these workers, typical career-related self-management behaviours related to exploration, deciding, and planning often require extra steps in overcoming numerous context-specific barriers. While commanding only meagre or exhausted resources, refugees must navigate an innately foreign context with its different requirements, power structures, and professional scripts. This mismatch of scripts, however, shapes refugees' self-regulation, inviting under-, mis- and overregulation, which can influence locals' interpretation of refugees' efforts and, with this, refugees' overall integration. In addition, employers' trust in hiring refugees can erode from trust violations between the different stakeholders involved in refugees' integration (i.e., refugees themselves, local employers and their existing workforce, various authorities, and/or official and unofficial supporters). Together with refugees' fundamental uncertainties (e.g., residence decisions), lacking personal resources (e.g., language skills, social networks), and loss of time in the process, these situations threaten some of the last resources refugees have left: Their fundamental understandings of themselves. Yet, refugees cope with these adversities in numerous adaptive and proactive manners. While social connections and rich local opportunities assist refugees' adaptation, refugees also exert career-adaptive responses characterized by high self-regulation (e.g., thought and emotion regulation, adaptive goal setting), paving the way to successful integration. Amid their struggles, refugees in our studies still managed to rebuild connections to themselves and others, weave together personally meaningful careers, and potentially experience psychological growth.

Evidence-based practice in organizational psychology: Where did we go wrong and how can we do it better?

ROB BRINER

Professor of Organizational Psychology at Queen Mary, University of London and was co-founder and Scientific Director of the Center for Evidence-Based Management

The idea of evidence-based practice has been around for some time, yet it is still unclear that organizational psychology as a profession is particularly evidence-based. What exactly is evidence-based practice? How evidence-based is organizational psychology and how can we know? How has evidence-based practice been promoted and developed within the profession? Where did we go wrong in promoting the idea? How can the profession get better at evidence-based practice?

The role of humans in the age of intelligent machines

JOANNA BRYSON

Professor of Ethics and Technology

Governments and transgovernmental agencies such as the EU are starting to encode into law the AI principles about which we have now achieved global consensus: 1) that the use of AI must be responsible, 2) that those building and deploying AI must be held accountable for any malfeasance or lack of due diligence, 3) that AI must be adequately transparent to achieve these goals, 4) that AI must be used justly, and 5) that above all, AI use must be human-centred. But what does human-centred mean, and can it be achieved? In this talk, Bryson gives a brief introduction to the current issues of digital governance of AI, including transparency of intelligent systems, labour impacts, geopolitics, and security.

Invited Symposium 1

Toxic behaviour and toxic leadership

Alex Haslam, University of Queensland

science

This symposium contains four papers that explore issues related to the psychology of toxic leadership. The papers are informed by a social identity perspective, and explore the ways in which leaders facilitate toxic behaviour in groups by cultivating a strong sense of identification in followers and enjoining them to see toxic activity as necessary for the protection and advancement of the group.

Keywords: Toxic leadership, social identity, group dynamics

Paper 1

Rethinking the roots of toxic behaviour

Alex Haslam, University of Queensland; Stephen Reicher, University of St Andrews

This talk revisits classic work in psychology into the dynamics of toxic behaviour. In particular it re-examines Zimbardo's Stanford Prison Experiment and Milgram's Yale Obedience studies and argues that these do not, as conventionally understood, show how people act toxically because they are unaware of the consequences of their actions but rather that they understand and indeed celebrate what they are doing. As an alternative to conformity accounts that dominate the literature, we argue that this involves a process of identity leadership and engaged followership and will illustrate the power of such an analysis in relation to real-world examples of toxic behaviour.

Keywords: identity leadership; group dynamics

Paper 2

Doing good as a warrant for doing bad: Why people 'obey' in a Milgram-type paradigm

Megan Birney, Staffordshire University; Niklas Steffens, University of Queensland

This talk draws on a series of experimental studies in which we investigate an 'engaged followership' reinterpretation of Milgram's classic 'obedience' studies. We argue that people 'obey' because the experimenter convinces them that they are participating in a valuable scientific enterprise that will contribute to human progress. Across four experiments we show that the more a study is presented as a piece of 'prototypical' science, the more worthwhile it is seen to be, and the further participants will go in implementing toxic instructions from the experimenter.

Keywords: identity leadership; obedience

Paper 3

Toxic behaviour in business

Fergus Neville, University of St Andrews

This talk applies the 'engaged follower' analysis to toxic behaviour by business organisations. It argues that the more that people identify with an organisation and endorse its values and goals, the more they will be willing to implement toxic instructions. To support this analysis, we first use this lens to examine real-world examples of corporate misbehaviour. We then go on to present the results of two studies which examine the relationship between identification with the organisation and misconduct. Third, we draw out the implications of the analysis for practical efforts to minimise misconduct in the future.

Keywords: identity leadership; toxic behaviour

Paper 4

High-Reliability Followership in elite military teams

Sally Knox, Alex Haslam & Kirsten Way | University of Queensland

The military is widely regarded as an extension and tool of government and the society it represents and serves. As a result, unreliable or problematic military behaviour during operations can have far-reaching strategic consequences. Historically, literature on military leadership focused on the psychology of individuals (their traits, styles, and attributes) and the role that leaders and their leadership play in staving off disaster. This paper develops a different framework for understanding these issues that draws on a new psychology of leadership which understands leadership as a dynamic group process involving all group members. This suggests that social identity strength and content — and the leadership that shapes this — could enable military groups to avoid potentially catastrophic consequences of military operational errors. It also points to the importance of social identity as a basis for high-reliability followership. Using social identity and High-Reliability Organisation theorising, this paper presents evidence from semi-structured interviews with members from elite military teams that supports this new framework. Results suggest that engaged followership is a critical determinant of effective military leadership — and that this is shown by group members who have internalised behaviours as a part of their social identity in ways that support high-reliability and thereby minimize the potential for toxic outcomes.

Keywords: High-reliability; followership; identity leadership

Invited Symposium 2

Welcome to the Dark Side: Identifying and Mitigating Individual and Contextual Predictors of Counterproductive and Unethical Work Behavior

Ute-Christine Klehe & Lenke Roth | Justus-Liebig-University Giessen

science

What will be covered and why. Bullying, theft, deception, fraud – unethical and counterproductive work behaviors cause major problems in organizations on so many levels, be it individual suffering, organizational underperformance, or a loss of reputation of complete industries. The current symposium brings together four papers that address these issues on multiple levels. On the problem side, Roth et al. address how the effect of psychopathy as an individual predictor on CWB is moderated by the contextual factor of organizational culture and how and when the CWB shown impairs the well-being of others. Leising et al. extend this perspective to a highly relevant practical context by focusing on unethical behavior in the academic system and identifying the characteristics that can shape the behavior of people within the system so that it becomes primarily self-interested and less aligned with academic ideals. Possible solutions to this problem represent systemic as well as individual factors. Here, Leising et al. proposes a set of systemic parameters, whereas Kleinmann et al. and Bechtoldt et al. address individual approaches to reducing counterproductive and unethical behaviors in the workplace. Kleinmann et al. focus on measuring counterproductive work behaviors in selection contexts. Using behavioral observations in a standardized setting, they aim to predict counterproductive work behavior without bias due to social desirability or distortion of other-ratings. Bechtoldt et al. experimentally demonstrate how to mitigate unethical behavior with a short-term mindfulness intervention.

Relevance to the Congress Theme. The papers of this symposium identify individual and contextual predictors of counterproductive and unethical behavior behaviors and address approaches on both the structural and individual level of how to mitigate these behaviors.

Research/Practical Implications. Research and practical implications will be highlighted on both the systemic and individual level. The latter pertaining to both personnel selection and interventions.

Overall conclusions. Counterproductive and unethical behaviors can wreak havoc in the workplace and our lives – yet understanding the individual and contextual predictors of these behaviors, we are able to design tools and structures that help us reduce their occurrence in the workplace.

Keywords: Counterproductive Work Behavior, Unethical Behavior

Paper 1

Systemic factors promoting unethical behaviors in the German academic system – analysis and possible remedies

Daniel Leising, TU Dresden

Theoretical background. In January 2022, the German Psychological Society (DGPs) tasked a newly founded committee with analyzing the systemic factors that enable or promote unethical behavior within the German academic system, and with proposing possible remedies. In this talk, I will give an overview of the current state of this process. The committee analyzed case examples, reviewed the relevant literature and consulted with numerous outside experts.

New Perspectives/Contributions. The committee identified many relevant system characteristics that may shape the behavior of people within the system such that it becomes primarily self-serving and less aligned with academic ideals such as transparency, replicability and accountability. To name but a few of these system characteristics: (a) Dysfunctional incentives (rewarding quantity more than quality), (b) flawed peer-review, (c) short term contracts, (d) unnecessarily steep power differentials, (e) lack of professionalism in personnel selection processes, (f) overburdening of professors with too many tasks, (g) low awareness of and low commitment to ethical standards, (h) weak control and sanctioning mechanisms.

Conclusions – research and or practical implications . The committee also developed many recommendations as to how these system parameters may be altered in a way that ultimately makes unethical behavior less likely. I will present a select number of these suggestions, as well. The process is ongoing, however. Necessary next steps will be to prioritize the suggestions that were already made, assess the proper level of the system that each intervention must target, attempt to implement the most promising ones, systematically evaluate the outcome, and then feed the conclusions back to the wider scientific community, and to the public. Relevance to the Congress Theme. This talk highlights several urgent needs for change in the German academic work environment. These are necessary to fortify the system better against occurrences of unethical behavior, which seems to be unacceptably widespread.

Relevant UN SDGs . Good health and wellbeing; Decent work and economic growth; Reduced inequalities; Peace, justice, and strong institutions; Quality education

Keywords: Academia, Ethics, System

Paper 2

What You See is What You Get: Measuring Counterproductive Work Behavior in Behavioral Observations

Valerie Sophie Schröder, University of Zurich

Research goals and why the work was worth doing. The goal of this research was to explore a new approach to measuring counterproductive work behavior (CWB) in selection contexts. CWB negatively impacts organizational success and the well-being of others. However, research and practice have difficulties identifying predictors of CWB, given that its measurement comes with certain challenges.

Theoretical background. Generally, CWB is harder to assess compared to other performance constructs, because of the difficulty to observe such behaviors from the outside. As a consequence, ratings of CWB are likely less informed by actual observations of deviant behavior and more by distortions such as overall impressions of an employee (Sackett et al., 2006; Spector & Fox, 2002). Thus, despite a common understanding in personnel selection research that other-ratings of job performance provide a more meaningful measure to examine and understand relationships with correlates, studies in the field of CWB research more often use self- compared to other-ratings (Gonzalez-Mulé et al., 2014). Previous findings give credence to this practice, as they indicate that other-ratings of CWB do not capture incremental validity over self-ratings (Berry et al., 2012). These practices however are based on studies solely comparing self- and other-ratings measured in questionnaires. A potential alternative way to retrieve a more comprehensive rating of performance is by using behavioral observations in a standardized setting.

Method. In a simulated Assessment Center (AC) setting, situations were manipulated in order to elicit the necessary cues for individuals to show CWB. Behavioral observations for interpersonal CWB (e.g., interrupting or making fun of others) were conducted during interactive assessment center exercises (namely role play, group discussion, business simulation). Behavioral observations for organizational CWB included five hidden observations in ostensibly non-evaluative situations (e.g., lying in tests, stealing exercises). Due to its situation-specificity, CWB can only be compared if ratees are put into the exact same situation. AC observations provide the necessary standardization and have several advantages, which qualify them to complement self- or supervisor ratings with additional perspectives (Heimann et al., 2021). Both CWB-I and -O were also measured with self- and supervisor ratings. In addition, we measured common predictors of CWB (i.e., personality and intelligence). A total of 205 participants took part in our study.

Results. We found that behavioral observations of CWB-I and CWB-O correlated with supervisor rated CWB (r = .26 and .23, respectively). Observed CWB was not related to self-rated CWB. Additionally, intelligence showed a significant negative relation to observations of all hidden observations (hidden observations overall) during the AC day. Personality showed almost no meaningful relations with behavioral observations. With regard to the other CWB measures, intelligence showed higher correlations with supervisor ratings of CWB compared to self-ratings. Conversely, personality showed higher correlations with CWB measured by self-ratings compared to supervisor ratings. Overall, the results indicate that CWB observations include meaningful variance that is not captured by self-ratings, and, more generally, that observing CWB in ACs is possible.

Limitation. To allow for full standardization, data were collected in a simulated setting. Generalization of hidden observations to and their application for real selection scenarios can be questioned, especially with regard to country-specific regulations of process .

Conclusion . Measuring CWB remains a challenge in and outside of personnel selection research. This study provides a starting point for research for using alternative measures when assessing CWB. Our findings indicate that there may be some observable variance in supervisor rated CWB that is not captured by self-ratings and that common predictor constructs likely predict either visible or private behaviors.

Relevance to the congress theme. By researching ways to measure (and eventually predict) CWB, our study aims to make work a better place and secure employees well-being. CWB-I in specific has detrimental impact on work climate and psychological safety at work, influencing a number of work-related outcomes such as job satisfaction and tenure.

Relevance UN SDGs . Our work contributes to two Sustainable Development Goals: (1) decent work and economic growth , given that CWB is expensive for organizations and hinders its success, impacting economic growth and (2) reduced inequalities , given that CWB gives advantage to dishonest employees and preventing it can help reduce inequality.

Paper 3

Mind the trap – Mindfulness renders immune to the temptation of fraud

Myriam Bechtoldt, EBS University of Business and Law

Research goals . Time and again, spectacular cases of fraud in organizations cause great damage to society. For example, in the more recent past, WireCard, a large German financial services provider, falsified balance sheets and booked 1.9 billion € that probably never existed. Significant people included the CEO, COO and several top executives. Monitoring programs do not prevent such fraud (Thiel, Bonner, Bush, Welsh & Garud, 2021). So what is to be done?

Theoretical background . Previous research established the notion that both trait and state variables are powerful predictors of individuals' unethical decision making. The present work investigates the role of state mindfulness and individual differences in dispositional sensitivity to injustice on cheating behavior in a group performance task.

Design/Methodology/Approach/Intervention . In a laboratory experiment with 395 participants, we assessed dispositional justice sensitivity and experimentally induced mindfulness via a 10-minute meditation. We then analyzed cheating behavior in a performance task. The incentive structure of the experiment was designed to allow participants to cheat on their true performance to positively influence their group payment.

Results . The higher participants scored on mindfulness, the less likely they were to cheat; this was also true for high scores on perpetrator sensitivity (fear of behaving unfairly). In turn, participants who scored high on victim sensitivity (fear of being unfairly disadvantaged) were more likely to cheat. There was no interaction of dispositional justice sensitivity and state mindfulness.

Limitations . The results derive from a laboratory experiment with high internal validity; future research should validate these findings in the field. In addition, we were unable to determine the extent to which the individuals who lied did so for prosocial reasons, i.e., to help their group, or for purely self-serving reasons, i.e., to increase their personal gain.

Conclusion . Our work highlights the importance of dispositional sensitivity to injustice and the role of state mindfulness in explaining cheating behavior. Resulting conclusions for organizations might be to screen job candidates for justice sensitivity and to install a mindfulness practice within the organization.

Relevant SDG-Goal . Peace, justice, and strong institutions.

Keywords: Cheating, Mindfulness, Justice sensitivity

Paper 4

Competition Sucks: How Psychopaths Burn their Coworkers Out by Engaging in Counterproductive Work Behaviors

Lenke Roth, Sebastian Schmitz & Ute-Christine Klehe | Justus-Liebig-University Giessen

Research goals and why the work was worth doing. This study served to examine a) the effect of employees' psychopathy on their coworkers' well-being via employees' exhibition and coworkers' perception of counterproductive work behavior (CWB) and b) how a competitive workplace climate moderates these effects.

Theoretical background. CWB bears severe consequences for others in the organization – including reduced well-being like burnout (e.g., Carlson et al., 2013; Islam et al., 2021). Yet, we need to differentiate: not all CWB actually happening is also perceived by others (cf. Berry et al., 2012), and we don't know which of these two, action or perception, causes CWB's aversive consequences on others? Psychopathy – particularly secondary psychopathy – fosters CWB (e.g., Blickle & Schütte, 2017; Ma et al., 2021; Szabó et al., 2021), whereas primary psychopathy's effects on CWB appear inconsistent and

contradictory (e.g., Schilbach et al., 2020 vs. Blickle & Schütte, 2017 vs. Sutton et al., 2020). Possibly, the relationship between psychopathy and CWB may vary by context – here organizational climate. In a competitive climate, where only the own performance counts and everyone looks after themselves first, psychopathic employees may exhibit more CWB, perceiving a competitive climate as more tolerant towards such behavior (cf., Kong & Yuan, 2018). Also, in an organization with a competitive climate, coworkers may be more discerning of their colleagues' CWB, given, for example, the prevailing rivalry and lower moral tolerance in such culture (cf., Deng et al., 2022). Therefore, this study examines the interactive effects of employees' psychopathy and competitive organizational climate on coworkers' burnout via employees' CWB and coworkers' perceptions thereof.

Method. We collected data from 121 coworker dyads in Germany. Dyads were peers of similar status, working together for at least 6 months on a regular work contract for at least 20 hours per week. All participants (140 women, 101 men, one diverse; average age = 38.11 years) reported their psychopathy (Levenson Self-Report Psychopathy Scale; Levenson et al., 1995), their own CWB and their perception of their coworkers' CWB (CWB-C; Spector et al., 2010), the competitive climate in their organization (Competitive Work Environment Scale; Flechter & Nusbaum, 2010), and their burnout (nine-item short-form of the Maslach Burnout Inventory – General Survey; cf. Sutton et al., 2020).

Results. Employees' overall psychopathy was positively linked to their own CWB, which was positively linked to their CWB as perceived by coworkers, which in turn related to coworkers' burnout. In sum, we found that the effect of employees' psychopathy on coworkers' burnout was fully mediated by the CWB used by employees and subsequently perceived by coworkers – effects that also held when differentiating between primary and secondary psychopathy. Competitive organizational climate positively moderated the positive link between employees' CWB and their coworkers' perceptions of such CWB – i.e., coworkers became more discerning of CWB in competitive organizations. Competitiveness also positively moderated the positive link between employees' secondary psychopathy and CWB – i.e., it took the breaks off secondary psychopathy to engage in CWB.

Limitations. Given that the first part of the model (employees' psychopathy and employees' CWB) and the second part of the model (coworkers' perception of employees' CWB and coworkers' burnout) were rated by the same sources, respectively, single-source bias might have colored results – which could not explain the moderating effect by competitive culture, however.

Practical Implications. That psychopathy can potentially cause harm in the workplace is a valid concern. This study shows not only that psychopathy seems to foster CWB, but also the process as to how and when employees' psychopathy links to coworkers' burnout. Both call for careful personnel selection. Organizations may consider assessing job applicants' levels of psychopathy. Considering the moderating effects of the competitive climate, managers should avoid creating a competitive work climate to inhibit employees' secondary psychopathic tendencies to translate into CWB in the workplace.

Relevance to the Congress Theme. Western – including European – societies build on individual self-interest and a certain level of competitiveness. Yet, both of these can foster counterproductive work behavior, which in turn can undermine both the well-being of others and thus sustainability of our societies.

Relevant UN SDGs. Our study contributes to the Sustainable Development Goal „decent work and economic growth". Impairing sustainable economic growth, CWB hinders the organizational success and influences coworkers' well-being.

Keywords: Psychopathy, Counterproductive Work Behavior, Burnout

Invited Symposium 7

Identity Leadership: A Global Perspective – Part 1

Rudolf Kerschreiter, Freie Universität Berlin, Germany; Rolf van Dick, Goethe University Frankfurt, Germany

science

Presentations : This is the first part of a two-part symposium. The goal of the two symposia is to present a current global perspective on identity leadership. This first symposium comprises five presentations. Identity leadership is a rather novel leadership concept routed in the social identity approach that has been developed by Haslam, Reicher, and Platow (2011, 2020). One of the central ideas of identity leadership is that group leaders are an essential part of the groups they lead because it is through a shared sense of 'we' and 'us' that leaders can gain influence on followers. In other words, by fostering a shared social identity via identity leadership leaders can exert power through their followers rather than power over them. To build such a shared sense of 'us' leaders can make use of the four dimensions of identity leadership, namely by being seen as "one of us" (identity prototypicality), by advancing the group's interests (identity advancement), by supporting the group in developing a group identity (identity entrepreneurship) and by creating structures that enable the group to successfully work together in line with the group's identity (identity impresarioship). Steffens et al. (2014) developed an operationalization for identity leadership, the so-called identity leadership inventory (ILI). In the first presentation, van Dick et al. provide an overview of the Global Leadership Identity (GILD) project, introduce its core ideas, and report some of the findings of the ILI validation. Specifically, they demonstrate that the ILI is metrically invariant across cultures and explains variance in criteria above and beyond more traditional leadership constructs. In the second presentation, Bibic et al. dive deeper into the GILD project data and investigate trust in the leader and team identification as mechanisms linking the dimensions of the ILI to certain work-related criteria. More specifically, they propose that identity prototypicality and identity advancement are connected to criteria via trust in their leader, whereas identity entrepreneurship and identity impresarioship are connected to criteria via team identification. The results of structural equation modeling mainly support the proposed relationships. In the third presentation, Lemoine et al. present the results of a latent profile analysis of the ILI. Specifically, they test whether there are profiles of identity leadership, check whether these profiles differ only on identity prototypicality and whether the profiles are associated with different work-related criteria. Results based on the first GILD phase suggest that there are two (high and low) profiles of identity leadership and that followers of a non-identity leader have lower levels of job satisfaction and OCB and higher levels of burnout than followers of an identity leader. Results from the second GILD phase confirm these findings. In the fourth presentation, Retowski and Godlewska-Werner provide nuanced insights into the findings of the GILD project in Poland. They confirm the four-dimensional structure and the reliability of the ILI in the Polish language and the general pattern of results. In addition, they offer a subscale analysis showing which ILI subscales are most strongly associated with certain criteria in Poland. In the fifth presentation of this first symposium, Hernandez Bark and van Dick investigate identity leadership in virtual settings with two longitudinal studies. Preliminary analyses support the conclusion that the positive effects of identity leadership are not restricted to face-to-face settings.

Relevance to the Congress Theme : In recent years, change processes in the world of work have been speeded up by external challenges. In this symposium, we focus on how leaders can support the groups they lead in dealing with these challenges by creating shared identities that provide followers with a secure base upon which followers can play an active role in shaping the future.

Research/Practical Implications : This symposium brings together five presentations that provide novel insights into how and under what circumstances identity leadership contributes to group and organizational functioning. Although the present studies base their conclusions on large international datasets, future research is needed that complements these studies with additional methodological perspectives such as experimental, longitudinal, and diary approaches to strengthen the conclusions and develop practical guidance for leaders.

Overall conclusions : The presentations in this symposium showcase that identity leadership can play an important role in making teams and organizations fit to deal with current challenges in the world of work. By fostering shared identities via identity leadership leaders can contribute to successful adaptation to change and ultimately to the accomplishment of group goals and employee health.

Keywords: leadership, identity, group

Paper 1

The Global Identity Leadership Development (GILD) Project: Introduction, aims and some results

Rolf van Dick, Goethe University Frankfurt, Germany; Rudolf Kerschreiter, Freie Universität Berlin, Germany; S. Alexander Haslam, University of Queensland, Australia; Niklas K. Steffens, University of Queensland, Australia; Jérémy Lemoine , University of East London and ESCP Business School, UK

Research goals and why the work was worth doing: Goals of this project were to build a community of researchers on all continents to work on identity leadership, promote the ideas and share knowledge of identity leadership and, specifically, to validate the Identity Leadership Inventory across cultures.

Theoretical background: Leadership is essentially a group process whereby a leader brings group members together to accomplish tasks that are relevant for group viability and progress. In the recent years, it has been found that leaders who help to create a sense of shared identity in teams and organizations are more successful in winning their followers' support. This process has been referred to as "identity leadership" (Haslam, Reicher & Platow, 2011, 2020) and it comprises four dimensions, namely (1) identity prototypicality (leaders' ability to represent what the group is about), (2) identity advancement (leaders' actions to defend and promote the group's interests), (3) identity entrepreneurship (leaders' creation and management of a sense of shared identity), and (4) identity impresarioship (leaders' creation of structures that help the group live out its identity). These dimensions were operationalized by Steffens et al. (2014) in the Identity Leadership Inventory (ILI).

Design/Methodology: In the GILD project, data have been collected in with cross-sectional self-report surveys in two phases in 2016/17 (7,682 participants from 26 countries) and in 2020/21(7,855 participants from 29 countries). Participants were asked to evaluate their direct supervisor's identity leadership (and other leadership constructs such as authentic leadership, transformational leadership, LMX) and then report on their own work-related attitudes and behaviors (e.g., team identification, trust, OCB, job satisfaction, innovative behavior, burnout). In a German subsample the survey was applied in a longitudinal, two-wave design.

Results: We confirmed the reliability and validity of the ILI and found metric invariance across cultures. Moreover, we found that identity leadership contributes to performance (engagement, innovation) and well-being (satisfaction, burnout) above and beyond other leadership constructs.

Limitations: The research is mostly cross-sectional and uses self-report. More longitudinal and experimental research is needed to uncover the dynamic development of shared identities and to establish causal relationships.

Conclusions: Identity leadership is a valuable concept that can help leaders make the workplace both more productive and healthier.

Relevance to the Congress Theme: In teams with strong group identities and with leaders who facilitate and actively contribute to such identity development, employees are both agents of change and better able to cope with change due to strengthened social support and the experience of collective self-efficacy.

Relevant UN SDGs: This research contributes to the SDGs of promoting health and well-being in the workplace and beyond.

Keywords: leadership, identity, group

Paper 2

Trust in the leader and team identification as underlying mechanisms linking identity leadership sub-dimensions to work-related outcomes

Kira Bibic, Goethe University Frankfurt, Germany; Rudolf Kerschreiter, Freie Universität Berlin, Germany; Rolf van Dick, Goethe University Frankfurt, Germany; S. Alexander Haslam, University of Queensland, Australia; Niklas K. Steffens, University of Queensland, Australia; Jérémy Lemoine, University of East London and ESCP Business School, UK; Svenja Frenzel, Goethe University Frankfurt, Germany

Research goals and why the work was worth doing: Identity leadership aims to integrate key group processes in leadership, whereby leaders and their employees are considered members of the same group and hence share a collective identity (Haslam et al., 2020). Identity leadership comprises four distinct dimensions: Prototypicality, advancement entrepreneurship, and impresarioship (Haslam et al., 2011; Steffens et al., 2014). So far, studies mainly focus on the overall construct of identity leadership – including all four dimensions – and consistently linked identity leadership to valuable workplace outcomes (i.e., job satisfaction, burnout, innovative work behavior, and occupational citizenship behavior (OCB) (van Dick et al., 2018). Yet, the distinct roles of the four sub-dimensions remains understudied. Extending earlier findings, we address this research gap by proposing that the sub-dimensions trigger the two distinct mechanisms of (1) trust in the leader and (2) team identification, which underlie the relationship between the IL-dimensions and work-related outcomes. Furthermore, we suggest that the respective dimensions vary in their importance for the underlying mechanisms.

Theoretical background: Our study draws on previous findings on identity leadership based on social identity theory (Tajfel & Turner, 1979). In line with theoretical understandings of Identity Leadership, we propose that the different dimensions operate through distinct mechanisms (Haslam et al., 2011; Steffen et al., 2014). Specifically, we suggest that prototypicality and advancement predominantly influence employees' trust in their leader, whereas entrepreneurship and impresarioship are considered more critical for strengthening employees' level of team identification. In turn, trust in the leader and team identification, respectively, are predicted to be directly associated with job satisfaction, burnout, innovative work behavior, and OCB (van Dick et al., 2018).

Design and methodology: Using structural equation modeling with latent factors, we tested our parallel mediation model in two different global samples as part of the GILD (Global Identity Leadership Development) project in two phases. The first data collection was conducted in 2016/17 (Phase 1: N =7,682), and Phase 2 in 2018 (N =7,294).

Results obtained: We found that the relation between prototypicality and trust was significantly stronger than the relationship between prototypicality and team identification in both samples. Also, in both samples we found our hypothesis confirmed that identity advancement and trust was more strongly related than advancement and team identification. As predicted, in Sample 2, the relationship between entrepreneurship and team identification was stronger than the relation between entrepreneurship and trust and impresarioship was more strongly related to team identification than to trust in Sample 2. In addition, trust in the leader and team identification were positively associated with job satisfaction, innovative work behavior, and OCB, and negatively associated with burnout in both samples. Most indirect effects were in line with our hypotheses.

Conclusions- research or practical implications: These findings provide new insights into the operating principles of identity leadership dimensions and, consequently, offer valuable practical implications for future work-related interventions (e.g., leadership trainings).

Limitations: Firstly, we analyzed data of cross-sectional nature. Thus, we cannot make causal inferences. Secondly, the obtained data is based on self-reports making the study prone to social desirability and common method bias.

Relevance to the Congress Theme: Identity leadership centers around shaping a collective identity among leaders and followers. When leaders foster this identity development, employees are not only agents of change but will also find it easier to deal with change as they receive more social support and make collective self-efficacy experiences.

Relevant UN SDGs: Our study demonstrates many connections with SDG 3 ('Good Health and well-being') and SDG 8 ('Decent work and economic growth') as it covers valuable work outcomes that contribute to a healthy work environment and accordingly promote people's well-being.

Keywords: leadership, identification, trust

Paper 3

Identity leadership is not only about being prototypical of the group: A latent profile analysis

Jérémy Lemoine, University of East London and ESCP Business School, UK; Rudolf Kerschreiter, Freie Universität Berlin, Germany; S. Alexander Haslam, University of Queensland, Australia; Niklas K. Steffens, University of Queensland, Australia; Martyna D. Swiatczak, University of Bergen, Norway; Rolf van Dick, Goethe University Frankfurt, Germany

Research goals

This project had three research goals. First, we aimed to test whether there are profiles of identity leadership. Second, we sought to check whether these profiles differed only on identity prototypicality or whether the other identity leadership dimensions would give a richer representation of identity leadership. Third, we aimed to see whether these identity leadership profiles would be associated with different work-related outcomes among the followers.

Theoretical background

Based on the social identity approach (i.e., the social identity theory, Tajfel & Turner, 1979; the self-categorization theory, Turner et al., 1987), Haslam et al. (2011) developed the concept of identity leadership. Identity leadership is composed on four dimensions: identity prototypicality, identity entrepreneurship, identity advancement and identity impresarioship. Some empirical studies support the importance of identity entrepreneurship (e.g., Gleibs et al., 2018), identity advancement (Steffens et al., 2016) and identity impresarioship (Reicher & Haslam, 2017). However, most studies focus on identity prototypicality (for a review, see Hogg et al., 2012; for a meta-analysis see Steffens et al., 2022). Results of studies investigating the four identity leadership dimensions (e.g., Steffens et al., 2014) suggest the four dimensions are highly correlated. Therefore, there is a need for empirical studies which investigate whether identity entrepreneurship, identity advancement and identity impresarioship add to the concept of identity leadership above and beyond identity prototypicality.

Methodology

This paper used data from Phases 1 and 2 of the Global Identity Leadership Development (GILD) project. In 2016-2017, 7,682 participants from 26 countries took part in the first phase of the GILD project and in 2020-2021, 7,855 participants from 29 countries took part in the second phase. Participants were asked to complete an online survey measuring several constructs including identity leadership of their direct manager and their own levels of job satisfaction, Organisational Citizenship Behaviour (OCB) and burnout.

Results

First, we conducted a latent profile analysis on the data from the first phase of the GILD project using the latent score of a bifactor (S-1) model with identity prototypicality as the general reference factor and three specific reference factors for identity entrepreneurship, identity advancement and identity impresarioship. The results showed that there are two distinct profiles of identity leaders. Second, we interpreted these profiles, with results suggesting that there is a profile of identity leaders (32%) who are perceived as having a high level of identity leadership (i.e., high level on the general reference factor). They also have higher levels of identity entrepreneurship and impresarioship that go above and beyond the differences of identity leadership explained by the general reference factor. The other profile (68%) refers to the non-identity leaders. They are perceived as having a low level of identity leadership (i.e., low level on the general reference factor) as well as lower levels of identity entrepreneurship and impresarioship. Third, we investigated whether these identity leadership profiles were associated with different work-related outcomes among the followers. We found that followers of an identity leader had higher levels of job satisfaction and OCB and lower levels of burnout than followers of a non-identity leader. All these results were reproduced on the data of the second phase of the GILD project with 35% of managers identified as identity leaders and 65% of them identified as non-identity leaders.

Limitations

The research is based on cross-sectional self-reported data. Longitudinal and experimental studies are necessary to confirm the findings of this study.

Conclusions

This paper gives empirical evidence that identity leadership is more than being prototypical of the group; it is also about being able to create a group identity (i.e., identity entrepreneurship) and promoting this identity (i.e., identity impresarioship). Doing so can lead to more positive outcomes among the followers. These important findings help develop our knowledge of identity leadership and

allow us to make practical recommendations to managers on how to promote identity leadership practices.

Relevance to the Congress Theme

Identity leadership is a recent conceptualisation of leadership and is changing our perception of leadership by offering a view of leadership which is based on the group rather than the leader. This conceptualisation is very applicable to the workplace and its evolution (e.g., flatter hierarchy, remote working).

Relevant UN SDGsBy promoting good leadership practices which influence employees' well-being at work, this paper contributes to the third (i.e., Good Health and Well-being) and eighth (i.e., Decent Work and Economic Growth) UN sustainable development goals.

Keywords: leadership, prototypicality, group

Paper 4

Polish adaptation of the Identity Leadership Inventory

Sylwiusz Retowski, SWPS University, Poland; Dorota Godlewska-Werner, University of Gdansk, Poland

Research goals and why the work was worth doing: The main goal of the present research is to test the validity and reliability of the Polish version of ILI. We formulate hypotheses about discriminant and criterion validity, i.e. we want to confirm the relevance of the Polish ILI version to some key positive dimensions connected with performed work.

Theoretical background: There are four key elements of identity leadership: identity prototypicality; identity advancement; identity entrepreneurship; identity impresarioship which are measured with the Identity Leadership Inventory (ILI, Steffens et al., 2014). Identity leadership increases team identification, job satisfaction, work engagement, and perceived team support; it also increases the level of trust in a leader and produces higher performance (Steffens et al., 2014a; Steffens et al., 2014b; van Dick et al., 2018). The higher the level of identity leadership, the better the well-being of team members.

Design/Methodology/Approach/Intervention: The sample consisted of 952 employees from different organizations located in Northern and Central Poland. In addition to the Identity Leadership Inventory, four other scales were used: Job Satisfaction Scale, Trust in the Leader Scale, Work Engagement Scale, and Intension to Quit Scale. Data were collected online with an anonymous survey. All participants took part voluntarily. We conducted CFA using Mplus version 8.5. In other analyses, SPSS ver. 25 were used.

Results: The results of the study confirm that the Polish 15-item version of the Identity Leadership Inventory (ILI) has a four-dimensional structure (prototypicality, advancement, entrepreneurship, and impresarioship) and is characterised by good reliability. The Identity Leadership Inventory-Short Form also shows a good fit with the data. As expected, the relationships between identity leadership and important work-related outcomes (general level of job satisfaction, work engagement, and trust in a leader) were also significant. Linear regression confirmed that work engagement and job satisfaction were predicted mainly by the advancement subscale, whereas trust was predicted simultaneously by three predictors: prototypicality, advancement, and entrepreneurship. The intention to quit was explained mainly by two subscales of the ILI: entrepreneurship and impresarioship.

Limitations: The cross-sectional design does not allow causal inference. The data collected were based solely on self-reports. In future research, it would be necessary to apply more complex designs, e.g. longitudinal or multilevel. We also believe that more research is needed into a more diverse set of organizations. It seems that Polish organizations dominated by traditional hierarchical organizational culture may be much more resistant to identity leadership.

Conclusions – research and or practical implications: In line with other research, the 15-item Polish version of the Identity Leadership Inventory (ILI) showed a four-dimension structure justifying the differentiation into the four facets: prototypicality, advancement, entrepreneurship, and impresarioship as suggested by authors Steffens et al. (2014b) but also allows the calculations of an overall ILI score. Both the overall score and the four subscales showed good reliabilities. The Identity Leadership Inventory-Short Form also showed a good fit to the data. Identity leadership appears to be a universal construct (van Dick et al., 2018). It is worth noting that Polish organisations are characterised by a relatively high degree of power distance. In high-distance cultures, employees are more often in formal relations with their superiors – it may result, for example, in their lesser identification with leaders. Based on these characteristics, we predicted that Polish employees might be less responsive to the influence of identity leadership. However, it turned out that despite these cultural differences, the results of our research are very similar to those in other countries. Intercorrelations among the ILI subscales, short version of ILI, and four outcomes (work engagement, job satisfaction, trust, and intention to quit) confirmed the hypotheses.

Relevance to the Congress Theme: Our research is part of the GILD project (Global Identity Leadership Development). The results of the research can inspire Polish leaders and organizations to influence employee attitudes and well-being.

Relevant UN SDGs: Our research is in line with the 8 th goal of the Sustainable Development Goals of the UN related to promoting productive employment and decent work for all.

Keywords: leadership, identity, group

Invited Symposium 8

Identity Leadership: A Global Perspective – Part 2

Rolf van Dick, Goethe University Frankfurt, Germany; Rudolf Kerschreiter, Freie Universität Berlin, Germany

science

This second part of the double symposium on a global perspective on identity leadership comprises four presentations and a discussant. Identity Leadership refers to a social identity-based concept of leadership in which the leader is conceptualized as an essential part of the group they lead who tries to accomplish group goals through their followers rather than by exerting power over followers. Leaders are more successful in doing so, the more they are seen as being "one of us", the more they advance the group's interests, help develop a group identity and create structures for the group to successfully work together in line with this identity. This concept has been developed by Haslam, Reicher, and Platow (2011, 2020) and Steffens et al. (2014) have provided an operationalization, the identity leadership inventory, comprising an overall score and scores for each of the four dimensions identity prototypicality, identity advancement, identity entrepreneurship, and identity impresarioship. In the first presentation, Kerschreiter et al. provide further evidence for the validity of the identity leadership concept from the Global Leadership Identity (GILD) project based on data from 2020/2021 with up to 27 countries. More specifically, they provide additional validity evidence for the Identity Leadership Inventory. Furthermore, and for the first time, they provide validity evidence for the Identity Leadership Inventory – Short Form and the Identity Leadership Scenarios, an additional form of measurement of Identity Leadership based on participants' answers to four different scenarios specially designed for this purpose. Swiatczak et al. also present results from a secondary analysis of both phases of the GILD data set (first wave 2016-17 with N =7,682, second wave 2020-2021 with N =7,855) employing a case-based configurational approach with coincidence analyses. Results show that while the absence of identity leadership can explain burnout at work, the presence of identity leadership cannot prevent burnout at work. This means that identity leadership on its own is not sufficient to prevent burnout. Further analyses and implications will be discussed. Monzani et al. provide an analysis based also on the GILD data set but they go beyond organizational leadership and will show that national country leaders' identity leadership relates to participants' civic citizenship behavior, that is their motivation to help their country and their fellow citizens. Furthermore, they show that this relation is mediated by perceived trust in one's fellow citizens. Also going beyond organizational leadership, Frenzel et al. present results from a different collaborative international project conducted during the COVID-pandemic. They show that national leaders' identity leadership relates to participants' perceptions of shared national identification among the country's citizens which in turn relates to more motivation to follow governmental regulations, i.e. stronger adherence to non-pharmaceutical measures such as handwashing or wearing a facemask. Finally, Haslam will provide an overall discussion involving also the audience.

discussant: Alex Haslam, University of Queensland, Aust

Lemoine, University of East London, UK; Dennis Kondzic, Freie Universität Berlin, Germany

1. Research goals

This research project had three main goals. First, we aimed to provide further validity evidence for the identity leadership inventory (ILI). Second, we sought to provide sound validity evidence for the short form of the identity leadership inventory (ILI-SF). Third, we examined if a newly developed measure of identity leadership, the identity leadership scenarios (ILS), would be associated with the ILI, the ILI-SF, and with a specific work-related outcome in predicted ways among followers.

2. Theoretical background

Haslam, Reicher, and Platow (2011) developed the concept of identity leadership with the goal of capturing a leader's contribution to their base of influence in a group beyond the well-established notion of leader group prototypicality (for a review, see Hogg et al., 2012; for a meta-analysis see Steffens et al., 2022). Building on the social identity approach (i.e., social identity theory, Tajfel & Turner, 1979, and self-categorization theory, Turner et al., 1987), they conceptualized Identity Leadership as a four-dimensional concept consisting of identity prototypicality, identity entrepreneurship, identity advancement and identity impresarioship. The results of empirical studies supported the notions of identity advancement (Steffens et al., 2016), identity entrepreneurship (e.g., Gleibs et al., 2018), and identity impresarioship (Reicher & Haslam, 2017) in addition to identity prototypicality (Steffens et al., 2022). However, validity evidence for the ILI-SF and the ILS was missing. The present research sought to provide additional validity evidence for the ILI and first validity evidence for the ILI-SF and the ILS.

3. Methodology

This research used data from Phase 2 of the Global Identity Leadership Development (GILD) project. In 2020-2021, 7294 participants from 28 countries took part in the second phase of the GILD. Participants completed an online survey measuring several constructs including identity leadership of their direct supervisor, Leader-Member Exchange, and trust in the leader as well as and their own levels of team identification, job satisfaction, Organisational Citizenship Behaviour (OCB), idea generation and burnout.

4. Results

To provide validity evidence based on internal structure we conducted confirmatory factor analyses on the data from the second phase of the GILD. The results showed that the theoretically postulated models for (a) the ILI, (b) the ILI-SF, and (c) the ILS, fit the data well. To provide validity evidence based on relations to other variables we first examined evidence for convergent validity, then evidence for discriminant validity, and lastly evidence for validity based on test-criterion relationships. Results supported convergent validity, discriminant validity, and validity based on test-criterion relationships for the ILI, the ILI-SF, and the ILS. Finally, due to the different cultures in the data set, it is important to ensure that the items are measurement invariant across these cultures. Results of the measurement invariance analyses provided support for at least weak measurement invariance for the ILI, ILI-SF, and the ILS.

5. Limitations

The data for this research is cross-sectional and self-reported. Therefore, it is necessary to confirm the findings of this study with longitudinal and experimental studies.

6. Conclusions

This research provides support for the notion that identity leadership can be validly assessed with the long (ILI) and the short (ILI-SF) version of the ILI. Based on the results, we recommend the use of ILI for manifest analyses. However, for latent modeling, we recommend the ILI-SF because it is a more parsimonious model, and it explains the same amount or even more variance in certain variables than the ILI. In addition, we provide first validity evidence for the newly developed ILS. Altogether, this research exemplifies how basic theory and basic research methods contribute to a better understanding of leadership in groups in the real world. This allows us to give practical recommendations to supervisors.

7. Relevance to the Congress Theme

The concept of Identity Leadership offers a modern view of leadership which bases leadership on the group rather than the individual leader. This represents a shift in leadership research that is not only changing our perception of leadership, but also is very applicable to current developments in modern workplaces like remote work and shared leadership responsibilities.

Keywords: leadership, identity leadership, validity

Paper 2

To Be or Not to Be a Good Leader? A Coincidence Analysis of Identity Leadership, Work-Related Attitudes, and Burnout

Martyna Swiatczak, University of Bergen, Norway; Alex Haslam, University of Queensland, Australia; Rolf van Dick, Goethe University Frankfurt, Germany; Niklas Steffens, University of Queensland, Australia; Rudolf Kerschreiter, Freie Universität Berlin, Germany; Jérémy Lemoine, University of East London, UK

1. Research goals

This study uses a novel research method from the family of configurational comparative methods, i.e. Coincidence Analysis (Baumgartner, 2009; Baumgartner & Ambühl, 2020), to unravel the complex interplay between identity leadership, work perceptions, and burnout. In doing so, it pursues several goals: First, it provides a more nuanced view on the formation and prevention of burnout at work. Second, it elaborates detailed paths via which organisations may prevent burnout at work. Third, it introduces a novel research method to the field of work and organisational psychology.

2. Theoretical background

Grounded in the social identity approach, Haslam et al. (2017) have conceptualised identity leadership as a group-based social influence process that revolves around leaders creating, embodying, promoting, and embedding a shared sense of “we” among those they lead. Meanwhile, identity leadership has been widely shown to promote beneficial work environments by positively influencing relationships at work, individual well-being, and organisational performance (e. g. van Dick et al., 2018). However, previous studies investigating the relationship between identity leadership and burnout do not provide completely straightforward evidence. For example, van Dick et al. (2018) do not find a direct relationship between identity leadership and burnout.

3. Design/Methodology/Approach/Intervention

To improve our understanding of the relationship between identity leadership and burnout at work we employ a case-based configurational approach and conduct Coincidence Analyses on two datasets collected in two waves (first wave 2016-17 with N =7,682, second wave 2020-2021 with N =7,855) of the Global Identity Leadership Development (GILD) project. This methodological approach allows us to investigate the complex interplay between identity leadership and other work perceptions, i.e. trust, identification, and satisfaction at work, in the formation and prevention of burnout.

4. Results obtained or expected (if not available, it must be made clear when they will be)

Preliminary results show that while the absence of identity leadership can explain burnout at work, the presence of identity leadership cannot prevent burnout at work. This means that identity leadership on its own is not sufficient to prevent burnout. To further investigate configurations that are sufficient to prevent burnout at work, we integrate several work-related attitudes that have been preciously shown to impact burnout, namely trust, identification, and job satisfaction. Taking into consideration the interplay between this broad set of potential causal factors, we show that either the absence of identification or the absence of satisfaction at work instantiate burnout while the lack of identification is instantiated by the combination of absent identity leadership and absent trust.

5. Limitations

Homogeneity is a central condition for causal inference via Coincidence Analysis. While the multi-level approach of the study helps to keep potential confounders constant, full homogeneity cannot be guaranteed. Therefore, further experimental studies are needed to confirm or reshape our results.

6. Conclusions – research and or practical implications

Our study sheds light on the complex causal mechanisms leading to burnout at work. They not only contribute to close current research gaps concerning the relationship between identity leadership and burnout, but also provide practical pathways for practitioners showing how to prevent burnout at work.

7. Relevance to the Congress Theme and UN SDGs

As such our study directly contributes to the congress theme by shaping positive change in the world of work. Moreover, it is of relevance to many of the UN SDGs. More precisely, preventing burnout at work contributes not only to economic growth and decent work conditions, but also shapes good health, and well-being.

Keywords: leadership, identity leadership, coincidence analysis

Paper 3

Identity leadership increases trust in one's fellow citizens and civic citizenship behaviors

Lucas Monzani, Ivey Business School at Western University, Canada; Rolf van Dick, Goethe University Frankfurt, Germany; Alex Haslam, University of Queensland, Australia; Niklas Steffens, University of Queensland, Australia; Jérémy Lemoine, University of East London, UK; Rudolf Kerschreiter, Freie Universität Berlin, Germany; Kira Bibic, Goethe University Frankfurt, Germany

1. Research goals and why the work was worth doing:

Creating a sense of group membership among followers is a central aspiration of Identity Leadership. As Frenzel et al (2022) recently showed, if a sense of a collective identity motivates group members to contribute to a common goal, at the national level it should elicit civic citizenship behavior. Specifically,

it was demonstrated that Identity Leadership predicted adherence to non-pharmaceutical interventions (e.g., mask wearing behaviors), mediated by perceived national Identity (PSNI). That is, the feeling that one's fellow citizens have a common understanding of what it means to be a citizen of the respective country and have a sense of cohesion. At the national level, we consider trust in one's fellow citizens an equally important construct than PSNI for encouraging civic citizenship behavior as the identification process also occurs between followers. Consequently, we predict that national leaders' identity leadership will influence such civic citizenship by the underlying mediation of trust in one's fellow citizens.

Given the importance of civic citizenship behavior for the collective mental and physiological wellbeing of a nation's population (e.g., Frenzel et al., 2022), understanding the attitudinal and behavioral drivers of civic citizenship behaviors is not only important but also urgent in the current zeitgeist.

2. Theoretical background Our study is grounded on a recent application of Social Identity Theory (Tajfel & Turner, 1979) to the study of leadership behaviors, mainly identity leadership (Haslam et al., 2011; Hogg, 2001). In short, Identity Leadership claims that merely representing a prototype of what makes a group (or nation) unique is not enough; leaders also must (re)shape, advance and protect their followers' shared interests. As a result, identity leaders create a "shared sense of us" that elicits positive follower attitudes and behaviors. The GILD project has documented the positive follower outcomes of identity leadership in more than 30 countries worldwide (van Dick et al., 2018). We elevate this logic to the national level, being civic citizenship behavior our main outcome of interest. Thus, we hypothesize that:

Hypothesis 1: Trust in one's fellow citizens will mediate the effect of politicians' identity leadership behaviors on civil citizenship behaviors.

3. Design/Methodology/Approach/Intervention

We conducted a secondary analysis of the GILD dataset (N = 7395). We employed Hayes' PROCESS macro to test an indirect effect model (Model 4), using trust in one's fellow citizens as mediating mechanism. We requested robust standard errors (HC3) and bootstrapped 95% Cis in 20,000 subsamples to increase the confidence in our results.

4. Results

Our results show that as participants' perceived frequency of identity leadership in their national leaders increased so did participants' trust in their fellow citizens (B = .28, SE = .01, p <.0001), and the frequency of their civic citizenship behaviors (B = .15, SE = .01, p < .0001). In turn, trust in fellow citizens also predicted civic citizenship behaviors (B = .35, SE = .01, p <.0001) and mediated an indirect effect of national leaders' identity leadership (B = .09, SE = .01, p <.0001). Thus, our results support our hypotheses.

5. Limitations

One clear limitation of our study is that we analyzed a cross-sectional design to test causal relations. However, this design choice was a necessary trade-off to collect a global dataset. Therefore, while we cannot make causal claims, the results align with prior studies showing similar results in the predicted direction.

6. Conclusions – research and or practical implications

Scholars and practitioners should take note of our findings. Whereas parsimonious in nature, our work showcases identity leadership as capable of shaping trust among fellow citizens and eliciting civic citizenship behaviors, result which seems to replicate across more than 30 nations worldwide.

7. Relevance to the Congress Theme

More and better civic citizenship behaviors are absolutely critical to address some of the big and urgent issues explored in this congress (pandemic, war, social change). Therefore, our study provides valuable insights that might be of interest of the congress audience.

Paper 4

Identity Leadership by national leaders during the pandemic and beyond

Svenja Frenzel, Goethe University Frankfurt, Germany; Rolf van Dick, Goethe University Frankfurt, Germany; Nina Junker, University of Oslo, Norway; Alex Haslam, University of Queensland, Australia

1. Research goals and why the work was worth doing:

In the early stages of the COVID-19 pandemic, adherence to non-pharmaceutical interventions (NPIs; e.g., washing hands, and wearing facemasks) was critical to reduce the spread of the virus as effective vaccines were yet to be developed (Chowdhury et al. 2020). Nevertheless, the effectiveness of NPIs depends on people adhering to them (Eikenberry et al. 2020). In the face of this health crisis, it is meaningful to examine how national leaders can motivate their citizens to adhere to NPIs. Here, scientific discussions and commentary suggest that identity leadership is a critical gatekeeper (van Bavel et al. 2020; Haslam et al. 2021), which connects national leaders to their citizens. This study aimed to test this claim empirically.

2. Theoretical background

Identity leadership is a leader's ability to create a shared identity among the people they lead – a sense of 'we'-ness (Haslam et al. 2020). Citizens who perceive a shared national identity (PSNI) within their country should be more willing to contribute to collective goals and keep fellow citizens safe. In other words, by engaging in identity leadership, national leaders secure support for their policies through engaged and intrinsically motivated followership (Steffens & Haslam 2013).

Accordingly, we predicted the following mediation model: National leader's identity leadership relates to more PSNI, which, in turn, relates to more adherence to NPIs.

3. Design and Methodology

We conducted a multi-national two-wave study to test our model. Therefore, we collected data in China (N = 548), Germany (N = 182), Israel (N = 198) and the USA (N = 108) from March-July 2020 and four weeks later.

We measured identity leadership at Time 1 with the Identity Leadership Inventory (Steffens et al., 2014) and asked participants to think about the highest political leader in their country while answering the questions. At Time 2, PSNI was measured with items adapted from Doosje et al. (1995), and we asked participants how much they would engage in different health-protective behaviors recommended by the government to assess adherence to NPIs.

4. Results obtained

Identity leadership and PSNI were positively associated in all four countries. In turn, PSNI positively predicted adherence to NPIs in China, Germany, and the USA but not in Israel. Accordingly, the indirect effect of identity leadership on adherence via PSNI was significant in China, Germany, and the USA and insignificant in Israel. In addition, we found a positive direct effect of identity leadership on adherence in Germany. Thus, the more individuals perceived Angela Merkel to engage in identity leadership, the more they adhered to NPIs. By contrast, we found a negative direct effect of identity leadership on adherence in the USA. This means the more people perceived Donald Trump as an identity leader, the less they adhered to health-protecting NPIs. We performed exploratory analyses to test mediation with only extreme cases (participants with low or high identity leadership values).

5. Limitations

We only used complete cases for data analyses as we experienced significant dropouts in Germany and the USA from Time 1 to Time 2. We assume that our final samples consist of relatively compliant individuals, which has to be considered when interpreting our results. Furthermore, the items to assess adherence to NPIs were created ad-hoc due to the lack of validated instruments at the beginning of the pandemic.

6. Conclusions – research and or practical implications

The results show that national leaders, who engage in identity leadership, have two ways through which they can reach their citizens. The indirect effect of identity leadership on adherence via PSNI is the first way ('relational path'). As predicted, leaders strengthen their citizens' adherence by creating a shared national identity within their country. The second way ('content path'), represented by the direct effect of identity leadership on adherence, shows that the leadership content reflects in their followers' behavior. As an identity leader, Angela Merkel emphasized the importance of adhering to NPIs continuously, while Donald Trump downplayed the threat of the virus.

7. Relevance to the Congress Theme

This study highlights identity leadership's positive and negative effects on collective mobilization and proposes ways for leaders and their followers to collectively shape a desirable future.

Panel discussions

Panel discussion PA1

Are we ahead of the trend or just following? The role of WOP in emerging technologies at work

Pascale Le Blanc, Eindhoven University of Technology; Markus Langer, University of Saarbrücken; Vicente González Romá , University of Valencia; Gudela Grote, ETH Zürich; Anna-Sophie Ulfert, Eindhoven University of Technology

science&practice

With its potential to solve critical societal issues, amongst other staff shortages, the implementation of emerging technologies, such as artificial intelligence (AI), is booming in all areas of our lives. As technologies become increasingly competent and autonomous, they are said to fundamentally transform how we will work in the future (Parker & Grote, 2020). Yet, despite the clear goal to support employees or extend human capabilities at work, Work and Organizational Psychology (WOP) perspectives are rarely considered in technology development and implementation. Beyond how operators react to certain system characteristics, we still know little about how emerging technologies are used at work and affect work design, and how they may change the future of work. At the same time, WOP rarely takes an active role in technology development, and WOP research has thus far focused on a descriptive or explanatory lens on technology use and implementation.

In the past years, emerging technologies at work has become a prominent topic at WOP conferences and is starting to appear more frequently in WOP literature – but are we already too late to the party?

Our panelists will discuss relevant questions regarding the status quo of WOP research in this interdisciplinary field. For instance, what is the role of WOP researchers in developing and implementing emerging technologies? And what should our role be? Should WOP take a more normative stance in technology development and implementation projects? And if yes, what would the benefits be? How can we ensure that central WOP topics, such as work design, personnel selection, or teamwork, are considered in technology development and implementation?

With their diverse research backgrounds, the panelists present unique viewpoints on the topic of emerging technologies at work. Gudela Grote has long been engaged in the development of socio-technical design methods (Grote et al., 2000; Boos et al., 2013), particularly addressing the increasing gap between control and accountability (Boos et al., 2012). More recently, she has highlighted the importance of prospective work design for emerging AI technologies (Parker & Grote, 2020). Markus Langer is an up-and-coming researcher in the field of AI systems and personnel selection. In his work, he particularly highlights the role of trust, transparency, and justice from different key organizational stakeholders' perspectives (e.g., Langer & Landers, 2021). Vicente González-Romá is a professor of work and organizational psychology. He is currently researching the influence of job digitalization and robotization on job characteristics and work outcomes (e.g., González-Romá et al., 2022). Anna-Sophie Ulfert-Blank is an emerging researcher in the field of human-AI teaming. In her work, she specifically addresses the role of autonomy, trust, and interpersonal relationships (e.g., Ulfert et al., 2022). As an expert in the field of human-centered implementation of emerging technologies in the workplace and sustainable employability, Pascale Le Blanc will moderate this discussion (Berkers et al., 2022).

In the panel discussion, we want to explore what role WOP researchers should take in this emerging and multidisciplinary field and how current approaches may differ from previous research on automation at work. This will raise questions such as: Should we become more actively involved in

technology development and implementation? What would be the benefits of WOP in technology development? And how can we overcome barriers faced when getting involved?

This discussion will cover an analysis of where we see barriers to our research that hinder us from "getting involved" in the actual development and implementation in practice. At the same time, we discuss the perils of being overlooked by other fields of research and practice with respect to the changing world of work.

Based on the relevance of this topic to WOP research and practice, the invited panelists' quality, and the discussion's interactive format, we expect a high level of participant interest with a medium to large audience size.

The planned discussion aligns with the SDG of "Decent work and economic growth" as the WOP research community aims at creating "decent" work environments. Yet, as we mentioned before, this perspective is currently lacking in practice when it comes to the implementation of emerging technologies. The panel will address these concerns, anticipating potential negative consequences and ways to overcome them. In addition, it also is closely related to the SDGs of good health and well-being and (reduced) inequalities. With its potential to solve critical societal issues, amongst other staff shortages, the implementation of emerging technologies, such as artificial intelligence (AI), is booming in all areas of our lives. As technologies become increasingly competent and autonomous, they are said to fundamentally transform how we will work in the future (Parker & Grote, 2020). Yet, despite the clear goal to support employees or extend human capabilities at work, Work and Organizational Psychology (WOP) perspectives are rarely considered in technology development and implementation. Beyond how operators react to certain system characteristics, we still know little about how emerging technologies are used at work and affect work design, and how they may change the future of work. At the same time, WOP rarely takes an active role in technology development, and WOP research has thus far focused on a descriptive or explanatory lens on technology use and implementation.

In the past years, emerging technologies at work has become a prominent topic at WOP conferences and is starting to appear more frequently in WOP literature – but are we already too late to the party?

Panel discussion PA3

Speaking about silence in healthcare: A necessary evil and a toxic norm that corrodes quality of care, employee well-being, and patient safety?

Michael Knoll, University of Leipzig; Madeline Carter, Northumbria University, Newcastle; Rosalind Searle, University of Glasgow; Anthony Montgomery, University of Macedonia, Greece

science&practice

Why this topic justifies inclusion in the programme

The caring sectors are major employers in every country in Europe and beyond, and are highly-relevant in terms of timely and ongoing societal challenges (e.g., Covid-19, aging workforce coupled with increased demand on healthcare, shortage in financial resources). Silence in healthcare is ubiquitous and negatively affects employees' well-being, organizational learning, and their potential to provide care to patients. However, certain types and levels of silence are a necessary component of functioning in healthcare. For example, withholding information can be a norm that contributes to team loyalty, concealing mistakes may preserve the reputation of healthcare professionals, and concealing bad diagnoses may keep patients hopeful. In this sense, patient safety initiatives to encourage healthcare professionals to 'speak-out' might take too narrow a perspective and run the risk of ignoring the prevailing professional norms and potential positive effects of silence.

The panel represents an opportunity to delineate and discuss the constructive, destructive, and ambivalent forms of silence in healthcare. We provide evidence for the detrimental role of silence but also challenge the widespread assumption that employee silence is always problematic. We do so by discussing positive and negative roots of silence in healthcare, and that the withholding of information may be a cultural norm that is transmitted when people are socialized in the medical professions or healthcare institutions. The panel aims to stimulate a debate on what needs to change for healthcare workers to feel comfortable about sharing information.

Why these panel members will add value

Anthony Montgomery held roles in health care education at the Royal College of Surgeons in Ireland-Medical University of Bahrain and was co-principal investigator of an European Commission Grant concerning Organizational culture, professional burnout and quality of health care in hospitals (ORCAB).

Michael Knoll contributed several innovations to silence research including evidence for the need to distinguish motives for silence, implicit motives for silence as basis of an organizational culture of silence, longitudinal studies on the negative and reciprocal relationships between silence and health.

Prof. Rosalind Searle is an advocate of research-practitioner dialogue and Director of the EAWOP Impact Incubator. She published "Making impact in healthcare contexts" in a recent issue of EJWOP showing her expertise in the field of this panel.

Fredrik Bååthe works closely with clinicians to engage their voices about balancing the dynamic tension among professional fulfillment, quality of patient care and organizational constraints. Previously Head of the A&E Department at Sahlgrenska University Hospital he also holds a clinical leader perspective.

Madeline Carter is an organizational psychologist whose research focuses on workplace bullying and negative behaviours in healthcare. In the UK NHS, she examined barriers to challenging and reporting bullying in healthcare.

Implications for research and practice

The panel discusses potential reasons for the disappointing outcomes reported by speaking up interventions in healthcare. Initiatives to address silence in healthcare need to enable employees to understand when withholding and sharing information is appropriate or represents a cultural norm. In terms of practice, one central challenge for clinical leaders in healthcare is to valorize behaviors that enhance psychological safety among teams, while modeling the sharing of information that leads to improvements in patient safety and quality of care. The proposed panel will clarify areas for future research, and outline how research can be translated into practice. It will become evident that initiatives to understand silence in the caring professions need to integrate knowledge from a broad range of work and organizational psychology areas including worker well-being, organizational culture, professional development and socialization, job performance and safety, and counterproductive work behaviors and include the voice of marginal agents in healthcare (e.g., janitors in hospitals, policy makers, relatives of patients, monitoring bodies).

Expected/intended audience and size

Besides targeting practitioners and academics involved in the caring professions, the panel takes a broader perspective and draws on knowledge from diverse domains across work and organizational psychology attracting researchers interested in cross-domain integration. The panel will also draw upon the results and attract participants of the 2021 EAWOP Small Group Meeting on “Voice and Wellbeing in the Caring Professions – Linking Research and Application”. To attract the input of frontline healthcare workers, support staff in healthcare, patients and relatives of patients, the event is live via Twitter. Opportunities to contribute their experiences are provided. Why this topic justifies inclusion in the programme

The caring sectors are major employers in every country in Europe and beyond, and are highly-relevant in terms of timely and ongoing societal challenges (e.g., Covid-19, aging workforce coupled with increased demand on healthcare, shortage in financial resources). Silence in healthcare is ubiquitous and negatively affects employees’ well-being, organizational learning, and their potential to provide care to patients. However, certain types and levels of silence are a necessary component of functioning in healthcare. For example, withholding information can be a norm that contributes to team loyalty, concealing mistakes may preserve the reputation of healthcare professionals, and concealing bad diagnoses may keep patients hopeful. In this sense, patient safety initiatives to encourage healthcare professionals to ‘speak-out’ might take too narrow a perspective and run the risk of ignoring the prevailing professional norms and potential positive effects of silence.

The panel represents an opportunity to delineate and discuss the constructive, destructive, and ambivalent forms of silence in healthcare. We provide evidence for the detrimental role of silence but also challenge the widespread assumption that employee silence is always problematic. We do so by discussing positive and negative roots of silence in healthcare, and that the withholding of information may be a cultural norm that is transmitted when people are socialized in the medical professions or healthcare institutions. The panel aims to stimulate a debate on what needs to change for healthcare workers to feel comfortable about sharing information.

Unions and Work & Organizational Psychology? Yes!

Denise Vesper, Universität des Saarlandes; Cornelius J. König, Universität des Saarlandes; Magnus Sverke, Stockholm University; David Martinez-Iñigo, King Juan Carlos University; Joanna Grzymala-Mszczynska, Jagiellonian University; Julian Barling, Queen's University

science&practice

Topic justification

In the last years, numerous employees at different companies fought for their right to unionize. One example being the wildcat strikes among delivery drivers (e.g., in Berlin, Krantz, 2021), which gained considerable media attention. Following the congress theme of "The future is now: The changing world of work", we plan to discuss how work and organizational psychology (WOP) can become more involved in these labor relations issues. We incorporate different perspectives in our panel discussion, also aligning with the EAWOP 2023 congress theme. These perspectives include cross-cultural perspectives with our panelists stemming from different countries with different cultural backgrounds and different legal systems (i.e., Canada, Poland, Spain, and Sweden). Furthermore, we also incorporate perspectives differing in experience with conducting research in this area with both senior researchers as well as more junior researchers to this area. We also want to discuss how WOP can profit from incorporating trade union perspectives in different research areas. Further questions that we will address are how collaborations between researchers and unions could be introduced and managed. Another looming question is what differences and similarities between trade union members and non-union members could be.

Value of panelists

Julian Barling has numerous publications on union membership (Barling et al., 1991; Barling, Fullagar, Kelloway, 1992; Barling, Fullagar, Kelloway, et al., 1992) and also on strikes (Barling, Fullagar, Kelloway, et al., 1992; Barling & Milligan, 1987; Bluen & Barling, 1988). In the late 1980s he already published a paper on industrial relations as a blind spot in teaching, research, and practice in WOP (Barling, 1988). Hence, he can add valuable insights and long-term experiences regarding unions and WOP.

Joanna Grzymala-Mszczynska's research focuses on motivations to engage in collective actions. In her preprint "When strike fails: The role of personal significance and positive expectations in maintaining a commitment to worker protests" she assesses willingness to engage in teachers' strike actions despite experiencing short-term failure (Grzymala-Moszczynska et al., 2021). She also has some practical experience, as she co-established the trade union Workers Initiative at Jagiellonian University

David Martinez-Iñigo conducted research on shop stewards and union members' loyalty in Spain (Martínez-Íñigo et al., 2020; Zacharewicz et al., 2016) and also on organizational culture and its relation to change in trade unions (Martínez-Iñigo et al., 2012).

Magnus Sverke also studied union support (De Witte et al., 2008; Goslinga & Sverke, 2003). Furthermore, he conducted research on consequences of job insecurity for unions (Sverke & Goslinga, 2003). His book "The future of trade unionism: International perspectives on emerging union structures" (Sverke, 2019) was first published in 1997. All these aspects make him a valuable panelist for the questions to discuss.

Implications for research and practice.

With this panel discussion, we aim to raise awareness among WOP researchers, but also practitioners on the role of trade unions. So far, WOP has widely neglected unions and labor relations (Cascio & Aguinis, 2008; Zickar, 2004). However, we are sure that in the future, labor relations will become an even more relevant aspect of employers and employees working lives and WOP researchers should also start to conduct more research on the issues that arise in labor relations.

Expected audience size.

We expect that 20-50 people will attend the panel discussion, because the topic of unions has increased in media attention and the on-going debate about the focus of WOP on employers rather than employees and their experiences throughout their working life (Bergman & Jean, 2016; Ruggs et al., 2013, but see, e.g., Anseel et al., 2018) has also received considerable attention from WOP researchers.

Relevant UN SDGs

This panel discussion addresses the following UN SDGs: decent work and economic growth; reduced inequalities; peace, justice; and strong institutions; and partnerships for the goals.

Keywords: unions, industrial relations, work and organizational psychology

Panel discussion PA5

AI-based Assessments: Should we embrace the technology?

Claudia Nuttgens, AMS; Alan Redman; Nathan Mondragon; Patrick Lockhart

practice

According to a recent analysis of the talent assessment marketplace by Rocket-hire, the estimated global market is approximately 4.5 billion and expected to grow to 6.6 billion by 2025. In this same survey of talent assessment providers, one-third and growing use advanced formats or novel based AI methods. Additionally, over half of the talent assessment vendors are 10 years or younger firms and most (62%) of these firms offer AI-based tools. Conversely, of the more established firms that are 10+ years old, only 16% offer an AI-based solution. Emerging legislation on the use of AI is also proving challenging to interpret locally and globally and is resulting in extreme caution in the application of technologies that automate selection decision-making.

Published research, as often the case, is lagging behind the creation and implementation of these novel or AI-based assessment solutions. In the field there is a conflict between the more predominant and established talent assessment providers and the younger, less established AI-based providers. In this session we aim to shed light on this issue by bringing together two assessment providers (one without and one with AI-based tools) and discuss the pros and cons of each approach from the viewpoint of a Recruitment Process Outsourcing provider/customer.

This Panel session will dive deep into the reasons behind choosing not to deploy AI-based methods and conversely reasons why to choose and deploy AI-based assessments. Experts from the talent assessment field with global perspectives will represent the various viewpoints. More specifically, Dr. Alan Redman who is the Head of Science and Technology at Psycruit will discuss and defend the reasons why AI-based tools have not been undertaken and Nathan Mondragon, Chief I/O Psychologist at HireVue will take the pro-side of the AI-based argument. More than vendor perspectives, the customer viewpoint is critical and will be taken by Patrick Lockhart, Senior Manager, at Alexander Mann Solutions. Leading or facilitating the discussion will be the Global Head of Assessments at AMS, Claudia Nuttgens (CPsychol).

Given the nascent nature of AI-based assessments, the scientific papers are minimal and far behind documenting the actual work taking place in the field (and lab) of the vendors creating these solutions. Solutions range from scraping social media for personality profiling, skills matching, and job matching solutions, to using machine learning to create complex scoring algorithms of game play behavior, to more traditional psychometric design principles combined with advanced data identification tools like natural language processing. No matter the sophistication of the psychometric design principles deployed (or not), the amount of peer reviewed research available to digest is sparse. In this session we hope to peel back some of the research available and identify many areas in dire need of academic rigor research. In the end, the audience will have a more informed basis on why they should look into AI-based assessments or not, and where the best AI-assessment Use Cases might exist for their specific organizational talent assessment needs.

Panel discussion PA6

Workplace assessment cannot be regulated so test publishers will continue to decide what makes a good test and who can use it

Nigel Evans, European Federation of Psychologists' Associations; Dragos Illescu, International Test Commission; Ian Florance, European Test Publishers Group; John Hackston, The Myers Briggs Company; Helen Farrell, SHL

practice

Why this topic justifies inclusion in the programme

Regulation in any area of life is a double edged sword. On the one hand it 'pulls up' less than thorough operators and protects consumers, on the other it can stifle creativity and put extra burdens on those who are already operating to high standards.

Workplace testing and assessment is currently self-regulated in Europe with clear standards to which to aspire from EFPA (European Federation of Psychology Associations). These test standards come is the form of the EFPA Test model which lays down very clear criteria for reviewing the quality of a psychological test, and EFPA Euro Test qualifications which give specific details to assess competence in test use.

However, the guardians of test supply are not individual country Psychology Associations, but the test publishers themselves. They have the ultimate power in determining who can access their tests, and to a large degree confirm that their test is fit for purpose.

Is this right? Should there be more regulation in Workplace Testing?

Why these panel members will add value

Panel members are drawn from global test publishers with varying degrees of regulation, together with representatives of international trade and professional bodies.

Chair: Nigel Evans, Chair of the Board of Assessment, European Federation of Psychologists' Associations

Panel:

- Helen Farrell, Europe Training Lead, SHL
- John Hackston, Head of Thought Leadership, The Myers-Briggs Company
- Ian Florance, General Secretary, The European Test Publishers Group
- Dragos Illescu, Past President, International Test Commission

Implications for research and practice

There are far reaching implications for rights of access to tests and assessments. Test publishers need to justify their logic for supply and quality control in order to ensure fairness to practitioners and their clients. For example: why should one practitioner have instant access, whilst another has to undergo significant extra training, even though they have the same qualifications want to purchase they same test, yet happen to be in different locations.

Expected audience size and why

50+ since many WO psychologists deploy tests and assessment in their work regardless of whether it is recruitment, selection, or developmental in application.

Keywords: Tests, Assessment, Regulation

Panel discussion PA7

The EuroPsy Specialist Certificate in Work and Organizational Psychology

Vicente Martínez-Tur, Fred R.H. Zijlstra, Per Straumsheim, Francisco J. Medina, Jose Ramos

science&practice

Facilitator: Vicente Martínez-Tur (IDOCAL-University of Valencia, Spain), member of the EuroPsy Specialist European Awarding Committee for Work and Organisational Psychology

Work and Organizational psychologists increasingly work in cross-national settings. In this context, it is a must for the future to have shared standards and tools to guarantee a proper professional service at the European level. The EuroPsy Specialist Certificate in Work and Organizational Psychology is a label of quality and an European standard of education and professional training in Work and Organizational Psychology, within the frame of the EuroPsy system. It was set by EAWOP, the European Association of Work and Organizational Psychology, in collaboration with EFPA, the European Federation of Psychologists' Associations. Progress has been significant in recent years, with several countries implementing the certificate, but there are still important challenges ahead.

The aim of this panel discussion is for participants to get the opportunity to discuss several relevant aspects of the Certificate such as the competences' model on which the certificate is based; training of Registered Specialists as supervisors for the Certificate; challenges; good practices on how to demonstrate competence; and map of Work and Organizational Psychology education in Europe.

The session will last 60 minutes, and it will be structured in 2 parts:

Overview. Each discussant will give a 10-minute overview of one of the aforementioned Certificate topics.

Debate. This will be an interactive discussion and brainstorming between the panelists and the audience about The EuroPsy Specialist Certificate in Work and Organizational Psychology and its challenges.

An audience of about 40 persons is expected, interested in the Certificate. The topic has a close connection to Quality education United Nation goal.

Panel Participants:

Fred R.H. Zijlstra, University of Maastricht (The Netherlands). He is Professor of Work and Organizational Psychology at Maastricht University and Scientific Director of the Center for Inclusive Organizations in this University, funded by the Dutch Social Security Fund.He is also President of ENOP 2017 – present. He has published on a wide array of topics such as interruptions during work; work and health, recovery after work, organizational climate and effects of technology on work. Also factors that hinder or facilitate return to work of people who have been long term absent from work for health reasons has the attention in order to develop policy relevant measures. In the last couple of years the topic of Inclusive Organizations was introduced focusing on including 'people with limited capacity' in organizations.

Per Straumsheim, Norwegian Psychological Association . He did his training in Work and Organizational psychology at the University of Oslo. He is now working in the education department at the Norwegian Psychological Association, especially with the training and development in work and organizational psychology. Per has been involved with research and several projects regarding supervision and development of supervised practice for psychologists. He is now the Chair of the

European Awarding Committee for the EuroPsy specialist certificate in Work and Organizational Psychology.

Francisco J. Medina, University of Seville (Spain) . He is Associate Professor of Work and Organizational Psychology in the University of Seville, Dean of the Faculty of Psychology, President of the Spanish Association of Deans of Psychology and past-chair of International Cooperation Office in the University of Seville. Francisco is Associate Editor of the Journal of Work and Organizational Psychology, and Chair of the Spanish S-NAC of the EuroPsy WOP Certificate. His research topics are focused on conflict resolution, power and influence, negotiation and mediation; research that has been published in some refereed journals. He is International Advisor from UNESCO Chair in Ecuador.

Jose Ramos, University of Valencia (Spain). He is Full Professor of Work and Organizational Psychology at the Department of Social Psychology and the Research Institute IDOCAL, University of Valencia (Spain). Former Dean of the Faculty of Psychology (2006-2012) and Head of Department of Social Psychology (2015-2021). Member of the Executive Committee of EAWOP (2015-2019) and SCEPS (Spanish Scientific Society of Social Psychology, 2020-). President of the Spanish National Award Committee of EuroPsy: European Certificate in Psychology (2010-). Coordinator, at the University of Valencia, of the International Joint Master on Research in Work and Organizational Psychology (Universities of Maastricht, Leuphana and Valencia). His research interests are managerial work, service quality, psychological contract, stress, youth careers and gender equity at work. Panel discussion PA8

The Future of Work and Organizational Psychology: leaving academia?

Yvonne G.T. van Rossenberg, Institute for Management Research, Radboud Universiteit, Nijmegen, The Netherlands; Severin Hornung, University of Innsbruck, Institute of Psychology; Luc Dorenbosch, Tilburg University / NSvP / De BaanIngenieurs; Amalia Raquel Pérez-Nebra, Universidad de Zaragoza, Psychology and Sociology Department, Zaragoza, Spain.; Mehmet A. Orhan, EM Normandie Business School, Métis Lab, Paris, France

science&practice

Topic Justification

Our field faces challenges, such as a limited relevance of our research for society (Bartunek, 2007), isomorphism of our research practices (Edwards, Berry, 2010), the burnout crisis in academia (Levecque et al., 2017), and the realisation that the best-evaluated graduate programs are the ones that make their teachers sickest (Cassandre, 2011). In addition, we find ourselves in a system in which publications are written primarily for individual scholarly recognition and career progression (Tourish, 2019), which diminishes relevance and meaning. The Covid-19 pandemic seems to have strengthened these effects, making precarious jobs more uncertain, increasing mental health issues and high lightening the issue of irrelevance.

The current academic environment is particularly unhealthy for Early Career Academics (ECAs), individuals in the first ten years after starting their PhD studies who aspire a career in academia (Bosanquet et al., 2017). We understand the position of Working on (prolonged) temporary contracts makes ECAs vulnerable to a discontinuation of their career outside of their control. There are several systemic factors in academia that reduce ECAs' control over adhering to those requirements, such as prolonged publication times (Van Dijk & Van Zelst, 2019), biased review and selection processes (Herschberg et al., 2018a, 2018b), and shifting requirements in number and outlets for publication. A recent study among ECAs (90% of which were PhD students) in 26 countries across 234 institutions found evidence that graduate students "are more than six times as likely to experience depression and anxiety as compared to the general population" (Evans et al., 2018, p. 282).

Besides the outflux of staff due to redundancies and failing to make tenure requirements, we identify also tenured professors on permanent contracts who show withdrawal (Harrison & Newman, 2013), or even deliberately are choosing to transition out of academic positions. With a global shortage of labour, and most western countries facing an aging (academic) population, this outflux of academic is worrisome.

Traditional models of work demands and resources seem to fail to explain such sudden outflux, given these academics have reached a very comfortable and stable position. With even the "winners" in the system looking for opportunities to leave, this raises the question whether the current evaluation systems and human resource management strategies are still appropriate to ensure the functioning of universities and the sustainable well-being of their employees (Biron et al., 2008).

Why these panel members will add value

The panelists are both theory experts in the people management fields related to leaving academia, as well as having personal experience, covering different approaches. Dr. Amalia Raquel Pérez-Nebra will provide an "outside" perspective from the Brazilian academic context, discussing how all aspects of dignity in the workplace (Bal, 2017; Thomas & Lucas, 2019) of are violated in Brazil's academia.

This includes universal themes such as “publish & perish”, internationalization requirements (Altbach & Knight, 2007; Knight & De Wit, 2018; Stromquist, 2007), income inequality, and the lack of recognition for research involving practice. Dr. Mehmet A. Orhan will discuss his experience of dominance of the academic elite, restrictions of academic freedom, and experience of critiquing theoretical models in our field (Bal et al., 2019). Dr. Severin Hornung will propose novel theoretical avenues for addressing the phenomena, connecting theory with his experience of his academic position. Dr Luc Dorenbosch will discuss his continuous search being an academic without wanting or seeking to work in academia fulltime. His discussion also includes the theoretical understanding of identifying most as a “prac-ademic”, an ‘ambivalent’ hybrids oscillating between his past practitioner and present academic selve (Lam, 2020).

Expected audience size and why

We have all thought about it at some point in our career: what about leaving? This panel symposium provides the space to share experience, pinpoint pressures and develop new theoretical directions to make sense of this issue. The idea for this paneld discussion was developed at the EAWOP Small Group Meeting on the Future of WoP in Brussels, September 2022, and attendants of this SGM have indicated their interest in this session. In addition, this is a topic of high relevance (not only for) early career academics, hence we expect an audience size of 20-40 attendants.

UN SDG

We seek to explore alternative explanatory directions including (though not limited to) the marketization and managerialism in academia, dignity at work, (alternatives to) the neoliberal ideology in WOP (Bal & Doci, 2018), and radical sustainable HRM practices (Bal & Brooks, 2022).This relates to the UN SDG of quality education, good health and wellbeing, decent work and reduced inequalities in academia.

Keywords: Future of Work and Organizational Psychology, healthy academia, dignity in academia

Demonstrations

Demonstration D1

Where's the limit? Talking about sexual harassment at work helps prevent it

Lise Keller, The Danish Sector Working Environment; Charlotte Bredal, FOA; Birthe Oest Larsen, The Danish Employees and Competence Agency

practice

Presenters:

- Keller, Lise, lke@bfa.dk, Certified MSc in Psychology

Psychologist Specialist in work and organizational psychology

The Danish Sector Working Environment Council, Welfare & Public Administration

- Oest Larsen, Birthe, biola@medst.dk Certified MSc in Psychology

Psychologist Specialist and Supervisor in work and organizational psychology

The Danish Employees and Competence Agency

- Bredal, Charlotte, chbr@foa.dk Chairman, Psychosocial following group,

The Danish Sector Working Environment Council, Welfare & Public Administration

In Denmark there is a long tradition for workers and employers organisations to work together on developing and disseminating guidelines and tools for workplaces, helping to prevent and manage occupational health and safety risks. The Danish Work Environment Council, consisting of unions and employers' organisations in the public and private sector, are working on disseminating knowledge targeted at the workplaces in their sector. It is a non-profit organisation.

The facilitators are experienced psychologist, who work together - from different positions.

The demonstration

Sexual harassment can be a work-related issue. Therefore, it must be managed and prevented at the workplace. In cooperation with the Danish Working Environment Authority (WEA) a campaign, to stimulate dialogue and promote prevention at workplaces, was I 2021-2022 realized with many different elements which will be presented at the workshop:

- Take the pulse – questionnaire
- Tool for dialogue at workplaces
- Special for the leaders
- Guides and posters
- Dialogue cards to start the dialog

The demonstration will concentrate at the dialogue cards

The dialogue cards help facilitate good discussions about sexual harassment and individual boundaries in the workplace.

Such discussions can make it clear that we all have different boundaries, something we need to be aware of when we work together.

Input and reflections from the discussions can provide an understanding of what constitutes sexual harassment and unwanted sexual attention.

The conversations can also provide the impetus for new policies on sexual harassment or identify areas of existing policies that need to be revisited.

Purpose for dialog cards

The dialog cards help you talk about unwanted sexual harassment in the workplace. The dialogue cards present fictitious scenarios about sexual harassment or unwanted sexual attention from others, including managers and colleagues.

Targeted attendees

All with interest in creating dialogue about sexual harassment.

Outcome

Since the facilitators will guide a session with the dialogue cards the attendees will get experience and opportunity to discuss different situations.

The dialogue cards are free for all to download and use afterwards.

Keywords: Sexual harassment, Dialog at the workplace, Cooperation between Authority, employer and employees

Demonstration D2

HUCAMA FACTORS: Integrated Personality, Ability & Competency Assessment

Rainer Kurz, Michele Guarini | HUCAMA Group

science&practice

Introduction

In the era of paper and pencil testing psychometric instruments were physically separate and reporting typically restricted to profile charts. With the advent of computer-based assessment expert systems were developed to facilitate interpretation. Thanks to the Internet instruments covering personality, ability and competency modalities may be used seamlessly. Accordingly integrated reporting across these three modalities would be helpful.

The HUCAMA Factors suite was developed to provide an integrated suite of tools that builds on leading academic and practitioner models.

Core, extended and full questionnaires were developed covering 16, 32 and 48 facets respectively for personality predictors and competency criterion assessments. Results are grouped under variations of the Great 8 factors (Kurz & Bartram, 2002) – a leading taxonomical model widely used in academia and applied practice.

Whereas the original Great 8 Competencies (Kurz & Bartram, 2002) were backwards mapped to existing instruments, the new suite of tools has been designed from scratch to provide a refined Great 8 Success Factors model with many practical and scientific advances.

With respect to the ability predictor modality a universally applicable non-verbal reasoning test was developed with Diagrammatic Matrices, Number Series and Spatial Reasoning components of 8 minutes each.

Across all three modalities Personal Report formats were developed with a common look and feel. Furthermore, Interactive Report formats were developed that provide value add features that facilitate interpretation and use of assessment results.

Description of the session specifying interactive element

The following elements will feature in the demonstration:

- Dynamic personality, ability and competency assessment formats.
- Personal Report formats for participants.
- Dynamic Report formats for users.
- In-Depth Report formats for expert practitioners.
- Competency Fit formats for business users.
- Capability Fit formats for business users.

Implications for research and practice

Newcomers as well as experienced assessment practitioners and academics find themselves confronted with a large array of assessment tools designed to measure personality, emotional intelligence, learning agility, competencies, capabilities and aptitudes. The HUCAMA Factors research program synergises these diverse strands of measurement (and marketing) to arrive at parsimonious solutions for general, professional and executive roles.

In the development study 466 professionals and managers completed 758 self-report items. From these items Competency Factors was developed with 48 competency items and Personality Factors with 240 items measuring 48 facets. Both tools share a higher-order structure based on the Great 8 Competencies (Kurz, Bartram, 2002). These in turn are paired up into GETTING THINGS RIGHT, GETTING ALONG, GETTING AHEAD and GETTING ALIGNED clusters inspired by the work of Hogan & Holland (2003), Silzer & Church (2009), Emotional Intelligence and Learning Agility research.

In a criterion-related validity study 113 professionals and managers who completed the HUCAMA FACTORS questionnaires were rated by external reviewers. A very high observed average point-to-point validity at factor level of .47 was found that compares very favourably to the corresponding value of .16 (N>4000) for OPQ found by Bartram (2005), .21 (N=855) for PAPI found by Kurz (2019), and .23 (N=369) / .21 (N=1835) for Wave Professional Styles found by Jeffery-Smith, MacIver (2021).The PF48 Total observed validity of .50 (N=113) compares favourably to corresponding values of .21 (N=855) for a PAPI composite found by Kurz (2019), .25 (N=308) for a Saville Consulting Wave Professional Styles composite reported by Hopton (2012), and values around .30 (N>4000) for an OPQ composite in Bartram (2005).

The integrative nature of the tool development harnesses the evidence built up over the last 35 years to provide insights that are backed by data. This in turn can improve performance and wellbeing at work.

Expected audience size and why

The demonstration session is aimed at practitioners and academics who are interested in a fresh take on long established psychological measurement modalities personality, ability, and competency. The demonstration can be adapted to the level of interest and size of facilities available. The presenters have considerable experience in utilising electronic presentation devices in conference settings.

Keywords: Personality, Ability, Competency

Demonstration D3

Learning Charisma 2.0: A Gamified Experience

Stefanie Franziska Krügl, Clara Antonia Seif el Dahan, Helena Marie Hüster | South Westphalia University of Applied Sciences

practice

Takeaway benefits

Didn't we all read articles that made us want to fall asleep, fight our eyelids to stay open, and just stop reading? Yet, other articles inspire us, are simple to understand, and sometimes even make us sad when we finish them. How do you write, talk, and present? Do you do it in an inspiring way? As researchers, we must ensure that our work has an impact and that people remember it. Who talks about a dull Netflix show? No one. In this workshop, we teach you the basic ingredients of charisma that will spice up your research papers.

Scholars demonstrated it: Charisma can be taught (Antonakis et al., 2011; Jacquart & Antonakis, 2015) and by employing charismatic leadership tactics (CLTs), we are able to persuade others to regard us as more trustworthy, influential, and leader-like.

Exercising the charisma muscle requires dedication and a well-planned training program that addresses all aspects of charisma (substance, frame, deliver). Based on the findings of Antonakis et al. (2011) we created a tailored charisma training program for the research project KernTrafo - a transformation concept for personnel of nuclear power plants in the process of decommissioning. Using the design thinking methodology at the beginning, we iterated former concepts of charisma training in different settings and training-groups (e.g. managers in nuclear power plants, but also students and managers in several large and medium-sized corporations).

As a result, a well-founded, but also entertaining and playful two-day training concept was developed, allowing highly qualified engineers, managers as well as master craftsmen to communicate charismatically during a vast transformation process. We were guided by the motto "doing, not talking" in order to make the concept accessible, especially for participants without an academic background. We reduced the theoretical information to a minimum and conveyed the content primarily through game concepts.

Description of the session

The training is divided into two parts. First, understanding charisma and second, applying charisma. Due to time constraints we only focus on some selected tactics here.

Understanding charisma (15 minutes)

The groups learn about the concept of CLTs. It begins with the participants being divided into five-person training groups. Following a brief introduction to the concept of charismatic leadership, we will begin learning charismatic leadership tactics (CLTs) using a matching game. Playing cards with short sentences that include one CLT each will be matched with cards that contain examples.

Applying charisma (30 minutes)

Now the groups practice incorporating CLTs into their own behavior. Each group receives a set of very short stories as well as a deck of playing cards bearing the names and explanations of the CLTs. They are putting the CLTs into practice by telling stories in their respective groups.

We will close with a short wrap-up and Q&A Session.

Implications for research and practice

This training is related to the topic „Charismatic Leadership" and the UN Sustainable Development Goal „Quality Education," and thus promotes the experience-based application of scientific findings. Working with non-academically trained managers who do hard physical work in addition to management tasks demonstrates time and again how little scientific research takes this group into account. As a result, it is time to present our research findings in a way that allows everyone to participate. The presented training concept is a step in that direction. The KernTrafo research project will publish the entire training concept, which participants can see parts of here, under the Creative Commons BY 3.0 license (https://creativecommons.org/licenses/by/3.0/), ensuring broad possibilities for use in research and practice.

Expected audience size and why

We anticipate at least eight participants. This is the smallest number of people for whom two small training groups work well. We can spontaneously scale up to 10 groups of 5 people each, for a total of 50 participants. In theory, the format can also be used with groups of up to 100 people, but if there are more than 50 participants, the information must be obtained in advance in order to properly prepare the materials.

Keywords: Charismatic Leadership, Leadership Training, Gamification

Demonstration D4

The Digital Applications of an Inclusive Big Five Psychometric in a Developmental Context – An Interactive and Fun Experience

Jonathan Cannon, Stewart Desson | Lumina Learning

science&practice

Takeaway Benefits

There are three key takeaways:

1) How to make the application of psychometrics more sustainable

2) How to make the application of psychometrics more scalable

3) How to make the application of psychometrics more effective in virtual settings

Participants will learn how two digital applications: Lumina Splash App and Spark Coach, integrate robust science with practical, digital applications for use in developmental contexts.

These tools will be demonstrated with supporting virtual and hybrid working models in mind while also demonstrating how to apply psychometrics in an inclusive way, valuing all ways of being, and avoiding biases inherent in traditional personality psychometrics.

Description of Session

The session aims to be an immersive experience, allowing participants to assess their own personalities using the Lumina Splash app, followed by group discussions around diversity in personality and its value.

One volunteer will receive a live experience of receiving feedback using the Spark Coach application, a digital visualisation of the Lumina Spark personality psychometric.

Finally, there will be discussion around the use of digital applications in developmental contexts.

Implications for Research and Practice

The demonstration will highlight the benefits of user validity (MacIver et al , 2014) in the use of digital psychometric tools in developmental contexts, especially when integrated with robust science.

The experience will also show the benefit of digital tools in the interactive exploration of psychometric data by users in ways that traditional paper or PDF solutions never can, producing new possibilities in creating meaning for users through interactivity. This further supports virtual and hybrid models of work, addressing an over-reliance on face-to-face workshops and coaching sessions.

The digital application of psychometrics addresses the issue of limited budget in some organisations restricting the availability of coaching for some levels, while also allowing for single practitioners to run large scale projects through the effective use of technology.

Research is ongoing into the user validity of such applications.

Expected Audience Size

This live experience is optimal for 10-20 participants, though any number can be accommodated through minor changes to the design of the session if notice is provided.

The workshop is designed to last 45 minutes.

Keywords: Lumina Splash, Remote Working, Digital Applications

Demonstration D5

Why are we vague? Towards conceptual precision in work and organizational psychology

Bram Fleuren & Wilken Wehrt | Maastricht University

science

This proposed demonstration aims to offer an interactive discussion on conceptual precision in Work and Organizational Psychology. Conceptual precision is crucial in science as it facilitates identifying valid operationalizations and promotes the testability of theories. With conceptual precision we mean providing consistent and specific descriptions that demarcate what the concept is – and what it is not – and that suggest how the concept can be used adequately in research. Accordingly, conceptual precision is a cornerstone of sound and meaningful research. However, maintaining conceptual precision can be challenging, as it requires careful thinking and a critical consideration of – sometimes 'established' – concepts.

We believe that the field of Work and Organizational Psychology exhibits conceptual imprecision to a relatively high degree. Thus, we aim to offer a discussion on conceptual imprecision, common field-specific examples and reasons potentially driving it. Moreover, the ultimate aim of this intended demonstration is to develop non-moralistic suggestions on how to handle and avoid conceptual imprecision at the individual, research group, and organizational level. This will be done in an interactive way, by continuously asking input from the audience to stimulate critical reflections and discussion.

The first part of our demonstration aims to discuss different manifestations and bases of conceptual imprecision. Specifically, we argue that conceptual imprecision manifests itself in several ways within our field. These include, for instance: i) aspecificity of theories and concepts; ii) sustaining vague but 'established' concepts; iii) presentation of categorizations based on frameworks or opinion as given facts; iv) imprecise naming of constructs; v) disconnects between concept and operationalization; vi) umbrella terming; vii) repackaging; and viii) using overly fancy language to explain simple ideas imprecisely. We go over each of the topics one-by-one and ask the audience about their perspective on and experiences with the topic, by engaging in extensive discussion with the attendance, we hope to collect ideas and test our own preconceptions. We highlight several potential reasons for these forms of imprecision, ranging from competition among researchers, suboptimal research practice socialization and peer-pressure in collaborations, to following buzzwords and practices to market a paper effectively.

In the second part of our intended demonstration, we plan to move from observations to solutions. Specifically, we argue that raising awareness for the importance of conceptual precision may help to foster a more conceptually critical culture of debate within Work and Organizational Psychology. Such a culture would be (more) immune against the influx of imprecisely defined concepts. Instead, it may inspire constructive exchanges that promote conceptual differentiation and clarification and, consequently, clearer theorizing and empirical testing. To create such a culture, we offer an interactive discussion about suggestions for improving conceptual precision individually, and in collaborations with team-members, supervisors, reviewers and editors. Together with the audience, we hope to generate suggestions for research groups, research organizations (e.g., universities), and journals to foster conceptual precision. Further, a movement towards conceptual precision may facilitate acceptance of alternative methodologies (e.g. qualitative) by shifting criteria for judging the adequacy of methods from 'what has been done and is established' towards 'what makes sense and

captures the phenomena of interest adequately'. By exchanging ideas with attendants, we aim to modestly contribute to ongoing (meta-)debates about the state and goals of our discipline.

Finally, our intended demonstration relates to the EAWOP 2023 conference theme as for a bright future of Work and Organizational Psychology, we need to do better as a field. Conceptual precision is key in fostering high quality research to study the complex and dynamic phenomena that characterize the current and future world of work. Moreover, if our talk is successful at stimulating conceptual precision or gets colleagues from the field to at least think about it more, the better research it might create contributes to the UN Sustainable Development Goals. That is, high quality Work and Organizational Psychology research can foster decent work and, consequently, good health and well-being for people.

We expect an audience of around 50 people who mainly work as researchers. We think that Work and Organizational Psychology researchers will appreciate the importance of the topic. Additionally, we have held a similar demonstration at an EAWOP small group meeting and had a rich and interesting discussion there. This might inspire people to attend. There is no commercial aspect or interest associated with this submission and we expect a discussion of 45 minutes.

Keywords: Conceptual precision, conceptual issues in work and organizational psychology, improving research quality

Demonstration D6

eRelate: supporting effective and sustainable leadership styles

Philipp Otto & Judith Volmer, University of Bamberg

science&practice

Why this topic justifies inclusion in the programme - what are the takeaway benefits?

Leadership styles are adapting to a rapidly changing world. The mobile app eRelate helps to manage and maintain the relationship between leader and followers. Furthermore, specifically targeted resources and skills are supported within daily leadership situations. Included modules cover the tracking of employee emotions, relationship asymmetries, behavioral nudges, and various forms of leadership trainings with a specific focus on digital leadership skills . eRelate is a newly developed specific purpose app, still being in the developmental phase, and is building on scientific insights of new leadership requirements. In this regard it is highly innovative and brings together novel forms of leadership with a systematic scientific evaluation. As a new combination of relationship management and leadership trainings, it supports the development of leadership capabilities that are increasingly required in rapidly changing working environments. Demonstration participants benefit from the design to foster the employer-employee-relationship and from evaluating the various leadership competence training mechanisms – from coaching companionship till customized skills trainings. It serves as an illustrative example of how apps can help to manage relationships within an organization and support those leadership skills increasingly required in new work situations. A summary of the app usage and its evaluation provides further insights concerning the scope of improvements becoming possible through daily practice supporting apps.

Description of the session specifying interactive element

The session is an illustration of the app and will be implemented as in a classroom setting experiment. Participants need to divide into employers and employees and the set up will be in analogy to a real work situation. A trial version of eRelate will be installed on the mobile devices of the participants. After a broad general introduction, various evaluation cycles are to be simulated for the relationship tracking. Features and functions of the app are directly explicated during its usage. Various trainings contents can be tested and two to three specific training modules will be described in more detail. The session closes with a description of usages and an impact evaluation.

Implications for research and practice

Apps supporting organizational processes are continuously increasing. eRelate adds to this development by directly addressing the quality of the dyadic relationship between leaders and their followers. Also new trainings specifically based on new work requirements are provided. This kind of adaptive training provision is to be increasingly informed by the results of relationship assessment and its changes. By systematically integrating research and practice in the project supported by European Social Fund, eRelate is developed to be scientifically sound and easily applicable at the same time. Its testbed of SMEs in Bavaria is to be expanded for practitioners in general. The evaluation of the app usage allows to refine content and the functioning of the different modules. The demo session will be evaluated and valuable feedback of the audience is to be expected, which will inform the ongoing project and further app development. Besides the obvious advantage coming from the usage of the app, the theoretical understanding of new forms of organizational design with a focus on relationship management is to be fostered.

Expected audience size and why

The audience is restricted to a total of 24 participants, who are divided into groups of four players (one leader with three followers). This is expected to be the maximum feasible number to go through the program, to answer questions, and to gather feedback within the time frame of 45 minutes. The research team presenting the app has ample experiences with leadership coaching and specific leadership trainings. This knowledge is optimally transported through the app in the demonstration, but also requires detailed instructions.

Keywords: e-leadership, digital training, relationship management

Demonstration D8

Motivational Interviewing for Organisations and Work Psychologists

Florian Klonek, Curtin University

science&practice

This workshop aims to give a gentle demonstration of Motivational Interviewing (MI) and explore its use for research and practice in Work and Organizational Psychology.

MI is a client-centered form of counseling to elicit and strengthen motivation for change. MI is used by many health practitioners who work with clients that want to address behavior changes in their lives (e.g., dealing with addiction, changing nutrition/exercising, and mental wellbeing). MI integrates methods from person-centered communication with a particular technical focus on change-related language, yet research on its application in Work Psychology is still in its infancy. One reason for this is that this intervention is mostly taught to practitioners with a background in Clinical Psychology. However, there is a growing interest from IO psychologists working with organisations in this type of intervention.

In the first part, after a short icebreaker, we will talk about some basic elements of the MI approach, its evidence base, and the effectiveness of MI trainings. In the second part of the workshop, which partly draws on research from the faciliator, we will take a conversational dynamics perspective and get some key insights into the process ingredients that shape effective communication in MI. We will include practical exercises and a demonstration to give participants the chance to get a feel for conversations that incorporate MI elements and try out their learnings.

Expertise of the presenter: Florian Klonek is passionate about teaching and researching Motivational Interviewing (MI). In 2015, he completed the 'MI Training New Trainers' (MI TNT) of the MI Network. In 2016, he completed his PhD, in which he investigated applications of MI for change managers. He has provided numerous multi-day MI trainings for different types of populations, and contributed towards language translations of MI research instruments as well as software applications of MI quality assurance instruments. His research on MI has been published in numerous peer-reviewed journals, including top-tier outlets (e.g., Journal of Vocational Behavior). He has developed MI training materials that are publicly available (i.e., open access) for the broader community, and he has been serving as a member of the scientific committee in the International Conference on Motivational Interviewing (ICMI 2022).

Why this topic justifies inclusion in the programme - what are the takeaway benefits?

MI is a highly relevant intervention from clinical psychology which has strong relevance for Occupational Health Psychology as well as Work and Organizational Psychology. Although there is an extensive line of research in clinical psychology, MI applications in Organisational and Work Psychology are heavily underused. Further, there is a lack of trainers and practitioners who are able to train others in MI and or show its potential value. In addition, new interest groups have been formed that aim to explore the application of MI in leadership and organisations (i.e., MILO – Motivational Interviewing in Leadership and Organizations, currently 230 members) or use it for career conversations. This also requires a close collaboration with researchers to better evaluate when and how MI interventions are useful for organisations.

Benefits: After the workshops, participants will i) be familiar with key concepts from Motivational Interviewing, ii) better understand the evidence-based behind MI and understand some of its main

mechanisms, iii) will know how to evaluate how MI changes conversational dynamics between MI practitioners and their clients, iv) will be able to evaluate whether an MI is a suitable intervention for their research and/or work with organisations.

Description of the session specifying interactive element

A brief introduction to MI

MI icebreaker: A room-scaling activity

A video (or live) demonstration

Summary and discussion of MI application for Organizational/Work Psychology

Implications for research and practice

MI is a highly suitable intervention when it comes to raising motivation, engagement and behaviour change. In contrast to other intervention methods from clinical psychology, trainings to learn MI (skillfully) are relatively short. Intervention studies focusing on changing health behaviours suggest that even brief interventions are impactful. While MI has been tested and evaluated in health /clinical psychology, there is much scope to apply it and contribute to a better understanding of MI interventions in the Work Psychology space. This could stimulate a rich line of research and there is a strong interest in upskilling trainers/practitioners in this intervention type and build a strong community of practice.

Expected audience size and why

Minimum of 10 to a max. of 45 participants for some of the interactive activities, which convey some of the techniques.

Keywords: Motivation, Training, Interventions

Demonstration D9

Robotic co-workers – how does collaborating with a robot really feel?

Markus Langer, Universität des Saarlandes; Barbara Kożusznik & Anita Pollak | University of Silesia in Katowice; Veronika Nathalie Lazar, Universität des Saarlandes

science&practice

Why this topic justifies inclusion in the programme - what are the takeaway benefits?

Collaborating with robots has become increasingly common in various domains such as production, logistics, as well as healthcare. Recent years have seen a surge of psychological research that examines the determinants of successful collaboration with robots. This session is a contribution by an international research project between Saarland University and the University of Silesia in Katowice. In this project, we will conduct a study investigating human-centered design of human-robot collaboration based on the principles of the work design framework (Morgeson et al., 2012; Parker & Grote, 2020, 2022).

Given that the IO-psychology perspective on human-robot collaboration has only been emerging over the last years, we believe it to be valuable for IO-psychologists to make this topic more tangible. We propose that this tangibility can come from actually experiencing how it feels to work with a robot. Therefore, in this session, we want to introduce participants to a real collaborative robot that we will be using within our project (the robot will be located in Katowice at the time of the conference because data collection will take place in Katowice). We will briefly introduce participants to our study idea, will demonstrate the collaboration with the robot, and will give participants the opportunity to accomplish a specific task with the robot themselves.

This session closely aligns with the overall theme of the EAWOP23 congress “The changing world of work”. Furthermore, the human-centered design of collaborations with robots supports the UN Sustainable Development Goal of “Decent work and economic growth”. Main takeaways of this session will include that participants will have a better idea of how it feels to closely work together with a robot and we hope that this session will inspire research ideas and connect IO researchers interested in human-robot collaboration.

Description of the session specifying interactive element

The session will start with a brief introduction to our international project collaboration. We will introduce participants to our research study that will be in the data collection phase in May 2023. We are optimistic that we will also be able to show first results. Afterwards, one of the presenters will demonstrate how working with the robot looks like in our study. In the end, participants will have the opportunity to interact with the robot themselves, thereby experiencing how it feels to work with a robot. Participants will be able to choose between different collaboration options (manual or autonomous mode) to demonstrate the versatility of the interaction with the robot.

Anita Pollak and Markus Langer have complementary expertise that come together in the international project collaboration and that will benefit this session. Specifically, Dr. Pollak is an expert in research on human-robot collaboration and has experience in conducting studies where participants interact with real robots. Dr. Langer is an expert in research on the collaboration between humans and artificial systems. In his research, he, for instance, examines human-centered work design in the interaction between humans and artificial systems.

Implications for research and practice

For research, this session will a) introduce participants to the topic of human-centered work design in the collaboration with robots, b) make the IO community aware the topic of human-robot collaboration as an important emerging topic within IO psychology, and c) will allow researchers a tangible experience when directly interacting with a robot. For practice, this session will a) highlight the importance of human-centered work design in human-robot interaction, and b) show possible levers to improve the design of jobs where the collaboration between humans and robots is central.

Expected audience size and why

It is challenging to anticipate exact numbers with respect to audience size. Audience size will be restricted by size of the available room and under consideration of the demonstration area (i.e., where the robot will be located). We expect significant interest by the EAWOP23 attendees since only a minority of them will already have experienced working with a robot. Furthermore, there is an emerging community within IO psychology that examines human-robot collaboration. Researchers and practitioners from this community will likely also attend this session.

Keywords: work design, robots, collaboration

Demonstration D10

The Team Based Learning Approach for Lectures/Training – Experiential Introduction

David O Hanlon, Munster Technological University; Caroline Conlon, Munster Technological University; Maeve O Riordan, University College Cork

practice

Team Based Learning (TBL) is a highly interactive pedagogical approach used, primarily, in higher education as well as within secondary education and professional training contexts. Recent meta analytic research has demonstrated how it can result in higher student attainment when compared to more traditional approaches in higher education. TBL is argued to be effective in the development of interpersonal skills with research indicating that engaging in TBL results in more positive attitudes towards teamworking.

TBL has been used successfully with cohorts of various sizes in face-to-face, blended and online contexts. TBL can transform live online sessions from more passive learning experiences to a far more engaging, interactive approach. Case studies of its successful adoption in Industrial Psychology, Positive Psychology, Statistics, Research Methods and psychology-related modules in business and health sciences programmes are present in the literature.

What distinguishes TBL?

The TBL approach contrasts with other small group teaching paradigms (such as Problem-Based Learning, Enquiry-Based Learning, Challenge-Based Learning), as well as ad-hoc group learning approaches in several ways:

Diverse, teacher-selected teams work together for an entire module/semester. They engage in two or more rounds of peer assessment and peer feedback during their time together.

The course content is usually divided into between 4-6 TBL “units”; each unit having the same basic structure:

o Step 1: A Readiness Assurance Phase consisting of pre-class assignments, individual tests and team tests coupled with clarification of any misunderstandings of key concepts.

o Step 2: “ Application Phase ” where a series of challenging “4S” exercises await. The 4 S model emphasises that teams should work on the same, significant exercises which require them to make specific decisions

o Step 3: A “ Whole Class Discussion” phase where inter-team discussion is facilitated, and lecturer feedback/consolidation of key learnings can be incorporated.

The approach also scales well to large classes of 150+, without the need for extra teaching support.

What can attendees expect?

Lecturers or practitioners who are searching for novel, evidence-based ways of supporting learning within universities or training programmes may be particularly interested in attending. The session help them to consider how this approach could be applied within a Work and Organisational Psychology teaching context. Attendees will experience TBL from the perspective of a student/trainee, providing a unique introduction to this innovative approach. Attendees will:

Work within diverse teams alongside fellow attendees to complete a “Team Readiness Assurance Test” as well as several “Team Application Exercises”.

Observe how a facilitator can identify areas to clarify based on the profile of iRAT and tRAT scores.

Experience how the “4S” application exercise structure can make for engaging, interactive whole class discussion.

Learn about the practicalities of facilitating a TBL approach within physical and online classrooms.

The session will be led by a Work and Organisational Psychologist and lecturer who has who has used TBL in the teaching of subjects such as Positive Psychology, User Experience Design and Management. The session leader has presented research and workshops on TBL at a number of national and international conferences. He has also co-facilitated TBL workshops within TBL training programmes for faculty in higher education, as well as teachers in secondary schools.

Research

Whilst empirical research on Team Based Learning in higher education is growing rapidly since the early 2000s, research on Team Based Learning as a workplace training approach is minimal. During the session, attendees will learn about how TBL was used in a recent teacher training programme and the associated preliminary findings.

Relevance to Conference Theme

Problem solving and interpersonal skills are frequently identified as key skills for the future, as teams of diverse professionals will tackle complex problems together. TBL is an approach that gives students/trainees the experiences which can help them to develop these skills with a diverse range of peers in a safe environment during their education/training.

SDG Goals

Adopting TBL can help to provide quality education in a variety of contexts, including the distance learning context. The potential for students or trainees to engage with an impactful and highly interactive pedagogy from their own homes can help to ensure that high quality small group learning can occur across borders and for people who may not have the opportunity to travel.

Expected Audience Size

20-30. As the focus is primarily on teaching in higher education, this may prove popular to the many attendees who teach. This session, however, may also be of interest to those with research interests in training and development, or who work in training and development roles.

Keywords: Teaching,Training,Learning

Demonstration D11

Forming the Future Working Environment - A dialogue tool concerning the hybrid balances for all ages in working life

Mads Kristoffer Lund, Lise Keller | The Danish Sector Working Environment Council for Welfare and Public Administration

science&practice

Presenters:

Mads Kristoffer Lund, mlu@bfa.dk, MA in Communication Studies and Educational StudiesProject manager in psychosocial working environmentThe Danish Sector Working Environment Council for Welfare and Public Administration

Keller, Lise, lke@bfa.dk, Certified MSc in PsychologyPsychologist Specialist in work and organizational psychologyThe Danish Sector Working Environment Council for Welfare and Public Administration

The Danish Sector Working Environment Council for Welfare and Public Administration consists of unions and employers' organisations in sector, working together on disseminating knowledge to boost positive factors in the psychosocial working environment and to prevent and manage occupational health and safety risks. It is a non-profit organisation.

The facilitators are an experienced project manager and an experienced psychologist in psychosocial working environment, both from the council secretariat.

The demonstration

The hybrid work place emerged as a way of working that many people were exposed to during the Covid-19 period in Europe. For employees, managers and workplaces, it reshaped the habits, rotuines and expectancies of working, combining working from home as well as showing up at the workplace. At the same time, public and private workplaces in Denmark face challenges recruiting the personnel they need with the skills they need for solving the tasks as hand. In this situation, it becomes relevant that the workplaces discuss how they can attract new employees and hold on to those are already there. As a means to the discussion, we have developed a dialogye tool that takes the workplace through the discussion of these subjects:

Life phases: Is it possible to work more or less hours than 'standard' in different life phases?

Young employees: How do we make the workplace a place young employees want to join and a place they want to stay? How do we do onboarding in the hybrid workplace?

Senior employees: How can the work tasks and the psychological contract between the employee and the workplace be adjusted?

Working in part-time positions: Which concerns are important in order for employees in part-time positions to become and stay part of the workplace working community?

The hybrid workplace: How do we make it work? How do we manage virtual and psysical employees in a fair and balanced manner? How do we promote equal participation and equal access to attractive tasks? How do we facilitate the sense of strong collaboration towards a common goal?

The demonstration will concentrate on the dialogue about the hybrid workplace.

The dialogue questions will facilitate discussions about the balances and concerns in the hybrid workplace. The workshop facilitators will present knowledge from research and investigations about the working environment on hybrid workplaces. And we will present the dialogue questions and facilitate the dialogue about the hybrid workplace.

Purpose for dialogue questions

The dialogue questions help the workplace talk about the different concerns and balances that the hybrid workplace need to address while aiming to create a strong working community and attractive workplace on one hand – that at the same time offers flexibility for the individual employee on the other hand. This dialogue theme is one of more offered to the workplace (the other themes are mentioned earlier) in order for the workplace to form a strategy for being an attractive hybrid and flexible workplace.

Targeted attendees

All with interest in creating dialogue about the hybrid workplace, the future workplace and life phases.

Outcome

The attendees will get experience with dialogue questions designed to address work environment in the hybrid workplace and the opportunity to discuss different objectives, concerns and balances regarding the hybrid workplace.

Keywords: Hybrid workplace; Future workplace; Making the workplace flexible and attractive for all age groups

Oral presentations

Oral presentation OP310

"Where's my desk?": A longitudinal approach to investigate personalisation and ownership at the workplace

Maria Gaudiino, Marijke Verbruggen & Anja Van den Broeck | KU Leuven

science&practice

Workplaces have undertaken a process of flexibilization, with companies aiming at making their offices more efficient. To achieve this goal, the choice is often a desk-sharing environment, with a range of diversified workspaces and no longer assigned desk that employees can personalise (i.e., nonterritorial offices). However, research indicates that many employees dislike the impersonal features of new offices. In fact, to some extent employees always tend to personalise their space according to what they like and what makes them comfortable. Personalisation in turn impacts their sense of ownership of the workplace, organizational commitment, teamwork and workplace satisfaction. On the one hand, limiting employees' personal expression can bring about a risk for their psychological ownership and can cause employees to prefer telework rather than go to the office, which is often at odds with the intention of many employers to convince their employees to come back to the office after the long period of telework of the latest years. On the other hand, in an increasingly sharable work environment, group-oriented forms of personalisation might still be possible (e.g., decoration of shared spaces with objects referring to the team).

Despite the important implications envisaged for the affective bond between employees and workplace, the consequences of personalisation and psychological ownership have barely been considered in research on new workplaces. We take a psychological perspective and set up this study to test whether psychological ownership at the workplace mediates the relationship between workspace personalisation and relevant individual and organizational outcomes (i.e., actual number of days at the office, preferable number of days at the office, affective commitment).

Personalisation is a form of territorial behaviour (i.e., identity-oriented marking) which implies decorating or changing some aspects of the space with the more or less intentional aim of making the space more familiar and expressing to others some personal characteristics. In light of the new features in flexible offices, we distinguish between self-oriented and group-oriented personalisation. Psychological ownership at the workplace concerns the thoughts and feelings of owning the workplace. We argue that in traditional offices employees can easily develop ownership feelings toward their personal workstation, while in nonterritorial offices people can still feel ownership towards the whole office. We therefore advance a distinction between desk-related and office-related psychological ownership and we also include collective psychological ownership. Additionally, whereas the previous conceptualizations on territorial behaviours and psychological ownership posited that the former follows the latter, we argue that ownership can also result from personalisation (territorial behaviour), as working in a space that displays objects symbolizing one's identity can contribute to employees' sense of ownership.

The study is based on a longitudinal design consisting of 3 waves, conducted between March (T1) and October (T3) 2022. The final sample with valid responses at T1 consisted in 341 participants, while valid responses at T2 were 95. Data from T3 are still to be analysed. The survey was available in

four languages and distributed in multiple countries among employees working in various office environments.

The cross-sectional data showed an initial support for the mediation of desk-related psychological ownership between self-oriented personalisation and the number of days at the office as well as the mediation of collective psychological ownership between group-oriented personalisation and affective commitment. The integration of T2 data only gave support to the mediation of desk-related ownership between self-oriented personalisation and the actual number of days at the office.

The study mainly relied on self-report measures. Also, due to a large dropout of respondents, the final number of participants with the correct survey completion at T1 and T2 consisted of a smaller sample than expected. This can impact the significance of our results and limit their generalisability.

Our research is the first to examine personalisation and psychological ownership in traditional and nonterritorial offices, providing original contributions at the theoretical and practical level. First, there is support for the impact of personalisation on psychological ownership at the workplace. Second, it can be relevant to distinguish self- and group-oriented personalisation, and desk- and office-related ownership, as differences were found in their relationships with the outcomes. Third, our findings suggest that personalisation is a relevant factor to foster employees' presence at the office and affective commitment.

By focusing on the currently changing physical work environment, our study contributes to the conference topic Work patterns and conditions .

Keywords: Personalisation of workspace, Psychological ownership, Nonterritorial offices

Oral presentation OP595

Happy and productive? Daily interruptions and daily strategy use while working from home during COVID-19.

Luisa Solms, University of Amsterdam

science

Research goals

In today's dynamic workplaces interruptions are inevitable. Importantly, interruptions, which are loosely categorized as external or internal, can have a negative impact on employee well-being and performance (Baethge et al., 2015). While prior research has predominantly focused on interruptions that originate from external stimuli (e.g., phone calls), we respond to the call by Puranik et al. (2020) to also examine outcomes of internal interruptions, that is interruptions originating from a person's own internal processes (e.g., thoughts). Also, in contrast to prior work that studied how outcomes of workplace interruptions differ between persons, we study how work interruptions fluctuate within persons from day to day, explaining fluctuations in a person's daily work experience. Therefore, in his study we used a within-person design to investigate how daily internal and external interruptions of ongoing work are related to daily employee well-being and productivity. Specifically, we examined how a) mind wandering, a process where attentions shifts away from a primary task toward internal information and b) interruptions triggered by external stimuli, such as emails or phone calls, are related to work pressure, positive and negative affect and perceived task accomplishment. Also, based on research showing the importance of planning strategies for employees facing interruptions (Parke et al., 2017), we studied the relation between time management and boundary management strategies and well-being and performance. Time management refers to short-term planning of daily work tasks, while boundary management refers to tactics that help individuals to manage work and family time such that both domains do not interfere with each other.

Theoretical background

The Job Demands-Resources theory (Bakker & Demerouti, 2001, 2017) provided the main theoretical basis for our study, describing how job demands (i.e., interruptions) and individual strategies (i.e., boundary management and time management) are related to well-being and performance. We hypothesized that daily internal and external interruptions would be associated with lower positive affect, higher negative affect, higher work pressure and lower task accomplishment at the day-level. We furthermore predicted that daily time management and boundary management would be associated with higher positive affect, lower negative affect, lower work pressure and higher task accomplishment at the day-level.

Design

A total of 162 doctoral students completed a general questionnaire and a daily survey over a period of five consecutive work days. Participants were 59% female, 50% Dutch, and had an average age of 29. Our final multilevel dataset consisted of 687 day-level cases nested in 162 persons. We used multilevel modeling to analyze the data using a maximum likelihood estimator in Mplus 7.31. We modeled the within-person slopes (effects) as fixed, and we group-mean centered all our predictor variables.

Results

Analyses revealed that internal interruptions were associated with lower positive affect, and higher negative affect, higher work pressure, and lower task accomplishment. External interruptions were associated with higher levels of work pressure and lower task accomplishment. With regard to the proactive strategies, we found that time management was associated with higher positive affect and higher task accomplishment. Boundary management was associated with higher positive affect, lower negative affect, lower work pressure and higher task accomplishment.

Limitations

The homogenous sample of our study limits the generalizability of our findings. Although we expect the underlying mechanisms to work similarly in other occupational groups, future research needs to test this. Another limitation relates to our analysis approach that does not allow for any causal conclusions.

Conclusions

While previous research has mainly focused on external interruptions, our study examined day-level relationships between both external and internal interruptions and employee well-being and performance. We found that both external and internal interruptions may jeopardize employee performance, however, with regard to well-being, internal interruptions seem to be more harmful. Importantly, employees can use protective strategies (i.e., time and boundary management strategies) to guard their well-being and performance. Given that boundary management was more beneficial compared to time management, employees may benefit from creating (temporal) boundaries between work and non-work to maintain their well-being and performance.

Relevance to the Congress Theme

To secure employee happiness and productivity in today's (remote) workplaces, it is important to understand the effects of different types of interruptions and to equip employees with strategies to prevent or minimize the negative impact thereof.

Keywords: work interruptions, time management, boundary management

Oral presentation OP144

THRIVE@WORK - Training programme for well-being at work for HR managers that want their organisations to thrive

Evie Michailidis, Charalambos Vrasidas, Panagiotis Kosmas, Vicky Charalambous | Institude of Development/ CARDET, University of Nicosia

science&practice

Research goals and why the work was worth doing:

The aim of this study was to assess HR professionals' perceptions and viewpoints on the importance of implementing well-being practices in the workplace, challenges they face during these efforts, the needs they might have in implementing wellbeing programmes and their intentions in developing well-being programmes. This study was conducted in the framework of the THRIVE@WORK project, an Erasmus+ funded project that aims to promote well-being at work by encouraging HR professionals to dedicate resources and invest in programmes for the psychosocial well-being of their staff.

Theoretical background

Despite existing good practices, management of workplace well-being is generally not embedded in HR policies in organisations, nor supported by national policies, especially in SMEs. The EU supports and promotes the well- being approach; however, it lies in the power of each organisation in the Member States to adopt this notion and to create such policies (European Agency for Safety and Health at Work, 2013). These skills and strategies related to workplace well- being are not usually adopted by companies, thus it is important to develop a compact source of information to impart the knowledge of the HR community of Europe. In the present study, the definition of well-being in the workplace was based upon principles of Positive Psychology, and more specifically, Seligman's (2011) PERMA model was used.

Design/Methodology/Approach/Intervention

In the framework of the THRIVE@WORK project, each partner country in the consortium (Cyprus, Belgium, Italy, Greece, and Bulgaria) conducted primary research at the national level utilising an online survey to assess the perceptions and training needs of HR managers in setting up wellbeing programmes for the organisations they work for. By utilising the findings from this primary research, the consortium is designing and developing the THRIVE@Work training and mentoring programme that aims to equip HR Managers with the right knowledge and skills to develop comprehensive well-being programmes and educate and mentor their organisational leaders and co-workers in key well-being principles and practices.

Results obtained

A total of 156 participants from all 5 partner countries participated in the online study. More specifically, HR professionals were asked to rate on a scale from 1 (strongly disagree) to 5 (strongly agree) the extent to which items (e.g. "My organisation takes employees' well-being seriously") reflect their organisations' overall approach to well-being. Findings indicated that overall organisations in partner countries hold a positive approach towards well-being in terms of taking a positive action on health and well-being, taking employees' well-being seriously, committing resources to promote employee's well-being, and understanding the importance of employee well-being. HR professionals were also asked to rate perceived factors that influence well-being at work

(e.g. “Leadership commits resources and effort to promote well-being in this organisation”). Correlation analysis indicated that the overall organisational wellbeing was positively related to each individual's perceived factor (relationships, health and safety, work-life balance, workload, leadership commitment).

Participants were also asked about factors that hinder their efforts in implementing wellbeing programmes. Findings suggested that lack of leadership commitment and lack of resources were the most frequently reported hindering factors.

Limitations

Cross-sectional nature of study, self-reported data and relative small sample size.

Conclusions – research and or practical implications/Originality/Value

This study has brought to the surface needs and gaps in terms of workplace wellbeing practices and relevant policies. In light of these findings relevant workplace wellbeing policy recommendations that will be relevant to policy-makers and decision-makers at the government level (e.g. national and EU MPs), but could also be used by HR professionals who wish to apply such policies in their organisations, will be presented and discussed in the presentation.

Relevance to the Congress Theme

The study is relevant to the Congress Theme “The Future is Now: the changing world of work”, as employee well-being, especially following the pandemic, has expanded beyond physical well-being to focus on building a culture of holistic well-being including psychosocial wellbeing.

Relevant UN SDGs

The topic is relevant to the Sustainable Development Goals (SDGs) and especially to the goal for good health and wellbeing.

Keywords: well-being, PERMA model, psychosocial wellbeing

Oral presentation OP227

"On building employee inclusion: A Preliminary Validation of a measure for assessing the Social Drivers of Inclusive Workplaces (SDIW)"

Ferdinando Paolo Santarpia, Laura Borgogni & Valentina Sommovigo | Sapienza, University of Rome

science&practice

Research goals. Firms are increasingly aware that people's diversity and inclusion are a source of competitive advantage. Although research on these issues is growing rapidly, a clear set of constructs is still lacking, which limits empirical testing (Jackson & Joshi, 2011). Based on Shore et al.'s (2018) model of inclusive workplaces and the Perceptions of Social Context framework (PoSC; Borgogni et al., 2010, 2022; Johns, 2006), this study aims to provide a preliminary validation of the SDIW scale, which simultaneously assesses the employee's perceptions of inclusive behaviours of the main social actors within organizations (i.e., management, leaders and co-workers).

Theoretical background. The benefits of a diverse workforce are unlikely without inclusion (Offerman & Basford, 2014). Workplace inclusion can be built by incorporating diversity into organizational priorities, making people feel safe to belong and contribute to their full potential (Jeronimo et al., 2021). Notably, a recent review suggested several social drivers of inclusion, including the workgroup and leadership (i.e., by shaping one's perceptions of the balance between belongingness and uniqueness) and top management (i.e., by implementing policies and practices; Shore et al., 2018). Based on the literature on the PoSC framework (Borgogni et al., 2010, 2022; Johns, 2006), we propose that the perceptions of workplace inclusiveness may be conceptualized through the inclusive behaviours of co-workers, leadership, and top management as perceived by the individual. Our proposal is in line with the contributions suggesting the need to investigate the comparative effects of different social influences on employee's health and job outcomes (Kim et al., 2017).

Design. A total of 1244 employees from a large Italian telecommunications company completed an anonymous online survey. The survey assessed: Inclusive Top Management (iTOM; 10 items), measuring the degree to which the top management implement policies and practices that provide representation, protect and value diversity and treat employees equally; Inclusive Leadership (iLEAD; 9 items) measuring the degree to which leaders commit themselves to problematize prejudices against diversity, nourish individual uniqueness and promote the integration of differences; Inclusive Co-workers (iCOW; 9 items), measuring the degree to which co-workers dialogue constructively, consider and integrate diversity as an added value to achieve common goals. The set of items was developed with a specific reference to diversity (i.e., cultural differences, ethnicity, gender, disability, sexual orientation, and age).

Additionally, we measured as correlates: negative regulatory emotional self-efficacy (RESE; Alessandri et al., 2018), affective commitment (AC; Allen & Meyer, 1999), interpersonal strain (ISW; Borgogni et al., 2012), the satisfaction of relatedness need (SRN; Van de Broeck et al., 2010), and mobbing (MOB; Nam et al., 2010). Participants were randomly divided into two groups to perform exploratory factor (EFA) and confirmatory factor (CFA) analyses. Reliabilities were estimated. Alternative models were tested through CFAs (1-factor, 2-factor, 3-factor, higher-order and bifactor models). Convergent and discriminant validity was explored. A series of ANOVAs were conducted on SDIW subscales.

Results . The EFA suggested a three-factor solution (χ 2 =765.83, df =297, CFI=.97, TLI=.96, RMSEA=.05, SRMR=.02). The three subscales had good reliability (iTOM α=.93; iLEAD α=.97; iCOW

α=.91). The three-factor structure was confirmed by the CFA (χ 2 = 673.54, df =347, CFI=.95, TLI=.95, RMSEA=.06, SRMR=.04). This model outperformed all alternative models, according to fit indices and Dχ 2 test. As expected, the dimensions were positively related to RESE, AC, and SRN, and negatively associated with MOB and ISW. Women had lower perceptions of iCOW than men, while senior employees had lower iLEAD perceptions.

Limitations. This cross-sectional study was limited to a single Italian company and relied only on self-report measures.

Conclusions. The preliminary validation of the SDIW scales provided a comprehensive, valid, and reliable measure to advance research on workplace inclusion as perceived by employees through the behaviors of social organizational constituents. Notably, the proposed model may help practitioners map the social drivers of inclusion within workplaces to design ad-hoc interventions.

Relevance to the Congress Theme. As organizations become increasingly aware of the importance of placing people at the center of their processes, our study is helping to advance research and applications on diversity and inclusion.

Relevant UN SDGs. Diversity and inclusion.

Audience. Both practitioners and academics

Keywords: diversity, inclusive workplaces, perceptions of social context

Oral presentation OP674

"Self-lead your work, but with others!" -- The paradox of self-leadership while homeworking in a moderated moderation model

Ferdinando Toscano, Salvatore Zappalà | University of Bologna

science

Research goals and why the work was worth doing

This study aims to highlight, through the testing of a moderated moderation model, the booster effects of concordance of tasks to be performed, with the manager and colleagues, in the relationship between self-leadership and performance within a homeworking setting. This research emphasizes how promoting self-leadership behaviours to effectively manage remote work may not be enough to achieve good and that self-leadership behaviours, without coordination with others, may bring no relevant results.

Theoretical background

Scientific and popular literature agree that self-leadership is a key for remote work. Adopting self-leadership behaviours involves setting goals and monitoring oneself efficiently and is associated with good outcomes, especially in a homeworking context (Galanti et al., 2021).

However, literature on personal and group self-management behaviours suggests that self-leadership does not always pay off (Langfred, 2000). This is particularly true in the cases in which self-leadership is not accompanied by good coordination with others, and especially with supervisors and colleagues. The risk is indeed, to end up in a condition of self-estrangement, which literature already showed to be detrimental to performance (Golden & Veiga, 2018).

We test precisely the relationship between employee self-leadership behaviour and homeworking performance by evaluating the role of the two moderator variables of task agreement with supervisor and task agreement with colleagues in this relationship.

Methodology

135 Italian civil servants (69,4% F; 49.6% in the age group 46-55, 59% with tenure < 15), all engaged in remote working for at least three months at the data collection time, participated in this cross-sectional research. They answered an online questionnaire on Qualtrics, which was administered to them for research and for organisational diagnosis purposes, in a survey assessing the efficacy of a remote working programme.

To carry out this research, the following variables were investigated. Self-leadership: 4 items of the goal setting and self-monitoring dimensions of the scale by Houghton & Neck (2002) (7-point Likert responses, Fully Disagree-Fully Agree); Homeworking performance : 7 items of the scale validated by Toscano and Zappalà (2022) (7-point Likert responses, Very Poor-Excellent); Task concordance with supervisors and Task concordance with colleagues : for each, a single item stating „How much of the tasks you performed at home were agreed upon with your supervisor/manager?" (5-point Likert response scale, Not at all-Very Much). The hypothesised relationships were computed by using the model 3 of the PROCESS macro for SPSS.

Results

The results confirmed, as expected, a direct positive relationship between self-leadership and homeworking performance. Nevertheless, they also revealed, through the different generated interactions, how homeworking performance does not increase as self-leadership behaviours increase in the cases they are not accompanied by adequate levels of task concordance with supervisors and colleagues. On the contrary, as one of this increases or, at best, both the task concordances are higher, as self-leadership behaviours increase, it is possible to observe a sharper increase in homeworking performance. This substantially confirms the reasoning according to which self-leadership alone is not enough to increase performance, and brings benefits for this purpose only when accompanied by a good concordance of the tasks with supervisors and colleagues.

Limitations

Among the limitations of the study, we point out the cross-sectional design of the study and the self-assessed nature of the variables. The homeworking period to which the data refer, relating to the first COVID-19 waves, could also represent a limitation and affect the data generalizability. In addition, we note the need in future studies to better investigate the task concordance measures, avoiding the use of single items.

Conclusions

This study reveals that the rhetoric of self-leadership as a key to homeworking may be misleading. Although the importance of these behaviours is recognized and confirmed, this research shows that the need to individualise the planning and accomplishment of work is accompanied by the need to agree punctually on the tasks to be carried out with supervisors and colleagues. Homeworking is a resource, but no homeworker is an island, thus a correct balance between self-leadership and coordination with others is essential to obtain the best results in terms of productivity.

Relevance to the Congress Theme

In accordance with the purposes of the congress, with a view to the progressive increase of homeworking, we provide information to optimize this way of working and provide employees with the possibilities to carry it out in a more productive way.

Keywords: self-leadership, tasks concordance, homeworking

Oral presentation OP744

"You're a nobody when you're unemployed": Unemployed's labeling, through a social cognition perspective

Charly Marie, Université de Lorraine (Metz, France); David Bourguignon, Université de Lorraine (Metz, France); Ginette Herman, Catholic University of Louvain (Belgium); Pierre Bouchat, Université de Lorraine (Metz, France)

science&practice

Research goals : Unemployed people are perceived in a very negative way (Norlander et al., 2020; Seghouat et al., 2021). This stereotype and the associated stigma have four main consequences for the unemployed, who:

Are discriminated against in access to employment (Kroft et al., 2013), depending on the length of time spent unemployed (Ghayad, 2013);

Exhibit poorer social inclusion, self-esteem and psychological well-being (Bourguignon et al., 2022; Brand, 2015; Wanberg, 2012);

Experience a deterioration of their physical and mental health, in part due to the effects of stigmatization (Andler et al., 2020; McKee-Ryan et al., 2005; Paul & Moser, 2009);

Do not take-up their unemployment insurance for 1 in every 3 eligible people in France (Hentzgen et al., 2022);

Why the work was worth doing: In view of these effects, it is crucial to better describe unemployed people's stereotype content, as well as its mediators and consequences, in order to relieve as many of its effects as possible.

Theoretical background: Social judgement is organised around the dimensions of warmth and competence, recently sharpened into the sub-dimensions of friendliness and morality, and ability and assertiveness (Abele et al., 2021; Fiske et al., 2002). These facets elicits various emotions (admiration, disgust, envy and compassion) that can be followed up through behaviour (Cuddy et al., 2007). Seghouat et al. (2021) show that French (study 1) and Belgian (study 2) workers judge the unemployed as less competent, perseverant and moral than employed people, with no difference on their friendliness.

Although this model is not strictly speaking a model of dehumanisation, some research has shown that groups perceived the lowest are often denied full humanity (eg. addicts and homeless people, Harris & Fiske, 2006; Haslam, 2006).

Methodology: As the group of 'workers' is diverse, we first investigate unemployed's stereotype content via two questionnaire studies considering a socialy highly valued group (firemen) and highly devalued one (railwaymen). Those two groups were selected on the basis on a pre-study. Since the literature predicts that specific groups are subject to extreme devaluation, we also test this hypothesis through (1) mechanistic and animalistic dehumanization in which targeted individuals are respectively compared with machines or objects, or with animals and (2) the "ascent of man" (Kteily at al., 2015) scale. Finally, a third questionnaire study with job placement professionals tests mediators of social judgement .

The first two studies, with mostly female students, examine unemployed's stereotype content in comparison to firemen and railwaymen (n1 = 259; n2 = 200). A third study, currently underway (n

temporary = 96 respondents), assesses the effects of positive and negative contacts on the general attitude towards the unemployed through Kenworthy et al.'s (2005) mediators: (1) perspective-taking and empathy, (2) intergroup anxiety and (3) increased outgroup variability, using path analysis.

Results: First two studies found that the unemployed are judged the most negatively when compared to firemen and railwaymen, on the dimensions of morality, ability and assertiveness but also friendliness. They evoke more disgust and less admiration.

In Study 2, compared to firefighters, the unemployed have higher scores on animal infra-humanisation but no difference in their mechanical infra-humanisation score. They also score the lowest on the 'ascent of man' scale (Kteily et al., 2015), which is itself predicted by social judgment and emotions.

The third study, currently underway and carried out with job placement professionals, suggests (n temporary = 96 respondents, ≈ 200 are expected) that contact, especially positive ones, has direct effects on attitudes towards the unemployed, and indirect effects mediated by Kenworthy et al.'s (2005) mediators.

Limitations: Although the literature has demonstrated causal effects of the stereotype content, as well as of contact and its various mediators, our design does not manipulate any information and our path analysis cannot overcome this limitation.

Conclusions and practical implications : Unemployed people bear a highly toxic social identity, with numerous consequences on their social and professional integration, psychological well-being, physical and mental health. A better understanding of the stereotype content and its consequences, in relation to the international literature, offers avenues for future studies, as well as for actions aimed at improving their inclusion with job placement professionals.

Relevance to the Congress Theme : The representation of the unemployed, and its toxic consequences, leads to a set of highly negative consequences for them and for society at large. We believe that this stigma must change in order to build a more inclusive future for the 13 million of unemployed people in the European Union (EuroStat, 2022).

Oral presentation OP508

'Don't Push it': The Role of Psychological Safety in Push and Pull Mechanisms towards Turnover of Elementary School Teachers

Ellen Peeters, TIAS School for Business & Society; Sietske van der Wegen, Xpect Primair

science&practic

Elementary school teachers play a crucial role in our society. In their signification position, they aid and facilitate children's early development and growth, fundamentally contributing to the future. Despite this rewarding job, the responsibility and role of elementary school teachers bring along many challenges. In class, these challenges range from addressing individual students' difficulties and potential, to managing different children at the same time. Outside of the classroom, teachers are likely to experience contradictory or conflicting requests or aims from children, their parents, colleagues, the principal, and the surrounding community. Facing these different stakeholders is likely to be translated into emotional labor and increased frustrations with the job or school. These frustrations may lie both in the domain of autonomy and in the domain of competence. Here lies a risk for hampering the job motivation of elementary school teachers and increasing turnover. Against the backdrop of the Self-Determination theory, both a push and pull mechanism toward turnover are identified.

Feelings of being pushed out of this job may stem from the following dynamic: Elementary school teachers may feel that their job is no longer appropriate for them – in light of frustrations about autonomy and feeling competent –, they may also believe that their organisation, or school, is no longer the environment they fit in because it is unable to address the issues they face. At the same time, teachers have several employment alternatives available since this profession faces shortages, especially in cities. Perceived better employment alternatives elsewhere can pull teachers out of their current job, putting potential turnover as a real threat to the continuity of the school and education. This study aims to test the combination of these push and pull mechanisms of the Unfolding Theory of Turnover among elementary school teachers.

We collected data from a Dutch Educational Foundation of elementary schools in one city in The Netherlands. In total, 119 elementary school teachers from 15 schools filled out the questionnaire consisting of validated and widely used scales. The survey also consisted of an open-ended question about reasons for leaving the school. The mediation model was tested through HLM.

Preliminary results indicate different levels of turnover intention between schools and different associated mechanisms on a job-, organisational-, and career level. Between schools, differences appeared concerning the impact of organisational career management and person-organisation fit (both with the Foundation as the referent), and schools' psychological safety, on turnover intention. Within-group differences found job-level push mechanisms and revealed associations of emotional labor, autonomy and competence thwarting, and person-job fit with turnover intentions. For the pull mechanism, perceived quantitative and qualitative employability was curvilinearly associated with turnover intention, partially mediated by individual career management. Different types of events were identified from the open-ended response field question, like personal development opportunities that ultimately pull and push them towards exit.

The limitations of this study lie in its cross-sectional test and the limited amount of respondents. However, the multi-level and multi-method approach adds value to this research and practical domain. The role of psychological safety, the differences between the groups of each principal, and the struggles with emotional labour and frustrations uncover more specific practical implications.

The combination of the push and pulls mechanisms depicts a teacher's turnover route. These insights allow us to establish alternative actions and avoid valuable teachers leaving a school or profession. This study suggests advising schools to invest in developing teachers' coping skills, addressing frustrations, and safeguarding psychological safety through interventions like sharing experiences. Because ultimately, elementary education teachers plant seeds for becoming adults and our future.

This study taps into different elements of the Congress Theme 'The future is now.?!'. Firstly, it addresses the optimal functioning of elementary school teaching professionals and sheds light on job-related, organisation-related, and career-related elements when considering leaving this job. The 'contribution' focus of the Congress Theme within this study lies in the crucial future-oriented and -relevant role of educators. The 'urgency' focus lies in the context of children in schools. Children are our future and the educator is preparing them for the future. And the 'delivery' focus especially lies in the psychological safety aspect and comparisons with the other elements and mechanisms, and the applied nature of this study, in short: which route to prioritize for this target group in the future.

Keywords: Turnover, Psychological Safety, Teachers

Oral presentation OP790

'Goal setting your way through a pandemic': Assessing the impact of a Reflective Goal Setting (RGS) approach on the development of personal resources

Cheryl Travers, Loughborough University; Karen Maher, Aston University

science&practice

Research goals and why this work was worth doing

"The RGS model has helped me become a better version of myself during this pandemic. When the whole world shut down and staying home meant that unproductivity was officially an approved solution, I was able to work on myself and well-being. This is a precious experience."

When Covid-19 hit, remote working became the norm – and study for higher education students. Research has explored the change in demands of enforced remote learning and subsequent effects on mental health and wellbeing, cognitive functioning, and coping. We go further and examine the impact of a 3-month goal setting intervention - when learning was predominantly remote during lockdown in the UK. Finalists embarked on a personal development goal setting programme in a UK Business School, providing a unique viewing window on their pandemic experiences. We show how goal setting during such an adverse and changing scenario built crucial skills and personal resources. Students self-set personal development goals utilising the five-stage RGS process and ongoing written reflective diaries provided unique insights on their 'lived' pandemic experiences and the impact of RGS.

Theoretical background

RGS is based on several key theoretical approaches and constructs: Goal Setting Theory, Pennebaker's Trauma Narration, Gibb's Reflective Model, and the JDR model.

Design/Method/Approach/

Findings are based on thematic analysis of written reflective documents of a randomly selected subset of 50/117 cases. We specifically explore how RGS impacted on managing pandemic challenges.

Results attained and expected

Covid-19 introduced a range of demands for our goal setters, impacting on goals such as mastery in sport and anything requiring face to face contact. But goal setters created ways to seek out practice grounds, becoming highly resourceful. Many acknowledged how the lack of usual distractions due to restrictions, made it easier to achieve their goals - especially those related to academic growth. They reported the impact of many negative stimuli (such as family/parents' isolation and fear of and catching covid), on developing resilience not usually offered in their usual student experience. "I still feel I have improved, and I feel very capable to deal with resilience building situations in the future."

Reflective goal setters reported that RGS and its features helped diminish the negative aspects of Covid-19. Some acknowledged the impact of several months of lockdown on their work ethic and motivation and reported that goals helped them focus and gave hope and purpose at a time when "It is easy to feel unproductive and like you're not contributing towards anything."

Reflective Goal Setting helped them establish routines in a highly unstructured time, full of many unknowns – especially well-being and fitness related goals made diffcult with the closure of gyms etc.

Goals became essential for ‘now’ as opposed to future orientated. Goal-specific tools and skills led to the development of personal resources to help cope with studying remotely and the wider Covid scenario. For example, goals around stress-management, self-regulation and work-life balance enabled much needed balance in the remote working experience.

Also, ongoing written reflection led to sensemaking related to their current situation and a new focus on values and priorities as resources. For example, many saw the value in better contact with my friends and family, e.g., “Time in lockdown has meant I have had more time to sit back and think about my situation more and realise what is important, being stripped of the luxuries, I now know that all I need is exercise and friends, and I should not stress myself out when things go back to normal and more stressful situations arise.”

Further, some saw the diary as a way of having crucial ‘conversations’, not possible with friends due to self-isolation. “As a people person who gets their energy and therapy from people-contact, the extreme isolation in COVID lockdown would have resulted in mental health deterioration if I didn’t have this reflective journal to unload on and talk to. And in this way, it has been a very valuable resilience and stress management tool as well as crucial to my reflective goal setting.”

Limitations

RGS is only with students here, but we will argue for the transferability of the framework to leaders and managers and a range of occupational settings and challening/adverse scenarios.

Research/Practical implications

Benefits of using ongoing written reflections and RGS as a framework for research. Shows that the framework can help people cope, adapt and transfer skills into adverse experiences.

Originality/value

Unique opportunity to study ‘lived’ experiences for a substantial period during the pandemic. Able to examine the impact of goal setting during adverse and changing times and profer ways to support the building of personal resources to meet demands by setting personal development goals.

Keywords: Reflective Goal Setting, Covid-19, Personal Resources

Oral presentation OP535

“Black Holes” in the Inter-Organizational Network in Mental Health Care of Forced Migrants: The Cultural Mediators' Point of View

Amalia De Leo &Caterina Gozzoli | Catholic University of the Sacred Heart, Milan, Italy

science&practice

Taking of caring of forced migrants with mental health issues is undoubtedly a very delicate and complex task. The diversity of needs of this population creates complex and persistent problems of service coordination, which is well established in many healthcare systems. One obvious solution is to create a network of regular links for coordinated care planning, referrals and exchange of information on migrants between the providers involved, with the aim of facilitating beneficiaries' transitions between one service and another that often fall into “black holes” of the network. This complexity creates the need to activate cultural mediation interventions, since dialogue between migrants and providers does not develop automatically but needs to be effectively supported and stimulated. Knowing the other person, his or her history, culture and religion is certainly one of the fundamental aspects in set up interventions aimed at the mental health care of forced migrants. Luatti defines mediation as 'mosaic professionalism' to indicate the variety of roles and activities associated with this profession. The main role of the cultural mediator is to act as a 'bridge' between cultural and linguistic differences in the relationship between foreign users and professionals. Cultural mediators are, in fact, in both 'camps' at the same time, they often belong to the same migrant population, as well as being members of the professional team. These alliances can influence the quality of the collaboration. As cultural mediators adapt intelligently to the context the quality of their interventions is often most visible especially in relation to networking between services. This professional has, in fact, a privileged view of the services, because he is in contact with several different operators at the same time, and a deeper and more continuous contact with the users. Most of the studies present in the literature on service networks highlight the need to activate inter-organizational networks for the important issues facing societies (poverty, crime, health promotion, economic development, natural disaster, education, health care reform) but rarely consider networks for the mental health care of forced migrants and still less consider the cultural mediators’ perspective. For this reason, our research aims to explore, the strengthens and weaknesses that cultural mediators identify in the inter-institutional and inter-organizational network responsible for the mental health care of forced migrants. The study is part of a broader research project that involved the institutional actors of the network of services for the care and reception of forced migrants in northern Italy, including the territorial psychiatry, the reception services, the prefecture and the municipality.

In the following qualitative study, we will only report the results of the 10 semi-structured interviews conducted with cultural mediators from different backgrounds and with different professional experiences. To grasp the deeper elements of their relationship with the users and with the other professionals; a symbolic graphic tool using 15 different pictorial images was proposed during the data collection. Data analysis was conducted within a constructivist paradigm; a paper-pencil content analysis was carried out following the lines of the IPA. From the interviews, emerged a very strong relationship between aspects of ineffectiveness of the network of reception services and the malaise and difficulties in the work of cultural mediators. Although mediators recognize that there are very effective parts of the network and that in recent years there has been a strong improvement in the work effectiveness and competence of individual professionals, the difficulty of communication and the gap of standardization in the passage of information from services of the

network make the work of the cultural mediator very complex. The malaise, shared with the beneficiaries who is often subjected to too much information and little concrete support from professionals in moving between services, is strongly linked to the fragmented nature of services. In a logic of future improvement, it would therefore be necessary to ensure that the network of services is structured more in a logic of centralized and institutional management. This improvement would make it possible not only to speed up and improve the care of users but also the wellbeing of cultural mediators. The main limitation of this study relates to the difficulty of having an exhaustive representation of the cultural mediators' nationalities who are very difficult to recruit. We believe that this contribution is relevant to the theme of the congress because we cannot solve the problem of migration without strengthening the network of mental health care services for migrants and without putting the professionals who care for them in the most favorable conditions to do their work.

Keywords: inter-organizational networks; mental health care; forced migrants; cultural mediators

Oral presentation OP660

“Craft your overload.” When autonomy becomes a demand.

France St-Hilaire, Université de Sherbrooke; Joanie Poirier, Université de Sherbrooke; Patrice Daneau, Université de Sherbrooke; Justine Dima, Haute École d'Ingénierie et de Gestion du Canton de Vaud; Julie Dextra-Gauthier, Université de Sherbrooke

science&practice

Research goals

Before the COVID-19 pandemic caused many disruptions, it was already clear that labour shortages, market competition, and technological transformations had redefined the work design and the conditions for workers (Hanelt et al., 2021) in knowledge-intensive work. With the acceleration of the work pace, it is more challenging to maintain the adequacy between the business goals, objectives, and work demands, in particular the technological demands (Day et al., 2021) to which workers must answer (e.g., effort level) and the resources available to them (e.g., time, control or support). Faced with more complex work demands and fewer resources, workers must, therefore, “always do more with less” with the risk of harming their psychological health at work. The main objective of this study is to outline the current understandings of the increasing overload in the context of unprecedented times to modify the work organization.

Theoretical background

Although the JD-R model (Bakker, 2011; Bakker and Demerouti, 2007) supports a link between workload (demands) and effects on stress and mental health, the specific dimensions of demands and resources are incomplete and imprecise as knowledge workers may experience the same work-related or organizational issue as both an opportunity and a source of stress (Ipsen and Jensen, 2012). In addition, it fails to capture recent and current work transformations (e.g., the increase in the information needed to be processed to complete the task and growing expectations of availability; Medzo-M'engone, 2021), as well as the new context for performing the task (e.g., digital connection that makes psychological detachment more difficult; Hu et al., 2021).

Method

We conduct a scoping review to give a recent portrait of the work (over)load in knowledge-intensive work post-pandemic. The review 1) considers the current and unprecedented context of changes in work and their effects on workload and well-being at work; 2) takes a mixed exploratory and multidisciplinary methodological approach to ensure a better understanding of the complexity of the work (over)load and the causes; and 3) a collaborative approach to consider workplace changes and support evidence-based action. The scoping study follows the six steps by Levac et.al, (2010). The key inclusion criteria are empirical studies published in English or French, carried out among knowledge workers, and published from 2017 (before and during the pandemic and the "new normal"). The review builds on journal articles indexed in 111 databases (e.g., APA PsycInfo, ABI/INFORM) or Publishers & Content Providers (e.g., ProQuest, EBSCO).

Results expected

The scoping study's results will offer an overview of the work (over)load regarding the literature and stakeholders’ perspective. The preliminary results show the importance of the interdependency between the workload and the autonomy (or control), especially for knowledge workers. If autonomy represents a resource for workers dealing with high demands, then autonomy (flexibility)

can also represent a risk when the worker has to perform in this « new context » (e.g., synchronous vs non-synchronous work). The multiple changes in job design before and as a consequence of the COVID-19 pandemic have made work organization obsolete and changed the responsibility for organizing and managing the tasks and working time. They do not just have to perform the task in the context of overload; they also have to do their job design to craft their job. If unsupported, people will look for individual strategies to manage the overload. In conclusion, these strategies will become insufficient and harmful to health and performance. Consequently, the organizational design needs to be aligned to avoid an unsolicited effect on performance and well-being (Ipsen and Jensen, 2012).

Limitations

This study has started in May 2022, and the complete results will be collected and analysed during the winter

Research and practical implications

From a theoretical perspective, this study will offer a systematic portrait of current scientific knowledge on unprecedented transformations in the world of work and their effects on workload, in addition to integrating immediate knowledge about "the new normality". It will contribute to a better understanding of the relationship between resources and the demands for knowledge workers in this new context. For practical implications, this project will provide organizations with a first frame of reference for managing (over)workload.

Keywords: workload, knowledge workers, work patterns and conditions

Oral presentation OP187

"Diversity is a mix and inclusion is making the mix work": the impact of diversity communication on diversity choices and inclusion

Oriana de Saint Priest, University of Lausanne; Claudia Toma, Université Libre de Bruxelles; Franciska Krings, University of Lausanne

science&practice

Research goals

Our research investigates whether short diversity communications (e.g., diversity statements on websites) foster choice of diverse teams across a variety of settings, as well as whether they promote the inclusion of diverse team members. Our results demonstrate the effectiveness as well as the limits of such diversity communications. We found that short diversity communications targeted at age were effective and significantly increased the selection of age diverse individuals into teams. However, similar diversity communications targeted at gender had no impact on the selection of women into teams nor on other inclusive behaviors. Thus, our research highlights that diversity communications and policies must be tailored to the targeted group, to change the representation and inclusion of disadvantaged employees in the organization.

Theoretical background

To foster work in diverse teams, linked to more creative decision making and increased innovation, firms often use diversity communications. According to social information processing theory, these diversity initiatives carry information about desirable behaviors that individuals then process through a central or peripheral route, further impacting their attitudes and behavior. However, it is unclear whether diversity initiatives such as diversity communications result in a positive impact on the selection and inclusion of diverse teammates.

Design

We conduct five online experiments (N_Study1=122; N_Study2=183; N_Study3= 107; N_Study4= 114; N_Study5= 121), where participants have to select other people to join their team, from a set of different candidates varying in age, gender and/or personality. Participants in each study are randomly allocated to one experimental condition, either including a diversity communication encouraging work with targeted individuals (older individuals or women, depending on the study) or not. We investigate how frequently people choose the diverse individual targeted by the communication as their teammate and how inclusive they successively are. We further test whether their behavior can be accounted for by the presence of the diversity communication.

Results obtained

In our studies investigating the impact of age diversity communications, we find that participants are 51% more likely to choose the older person into their team when there is a diversity policy. Moreover, the communication only increased the inclusion of older individuals specifically, as it had no effect on selection rates of women or individuals with certain personality traits. Yet in our studies on gender, we find no significant effect of the diversity communication on choosing a woman as teammate. In addition, diversity policy had no impact on inclusion, as people were not significantly more inclusive after they were exposed to a diversity policy.

Limitations

Participants were exposed to a diversity communication encouraging work in diverse teams right before selecting their teammates. It would now be interesting to test whether the effects we find replicate in a different setting, where participants are exposed to a diversity policy but make diversity-related decisions with a time delay. Moreover, future research could use additional measures of inclusion. We measured inclusion with a behavioral measure (choosing teammates) and behavioral intentions, using a modified version of the Organizational Citizenship Behavior scale. Further research could broaden the scope and include additional behavioral measures of inclusion (e.g., helping).

Conclusion

Our research highlights that organizations striving to encourage work in diverse teams should choose the diversity initiative they implement with caution. In fact, while we find consistent evidence for the positive impact of age diversity communications, we find no such impact for gender diversity communications. To our knowledge, our research is the first of its kind to integrate perspectives on the impact of diversity policies targeted at gender and age, while quantifying their effect on inclusive behaviors.

Relevance to Congress Theme

As remote work has become increasingly common in recent years following from the pandemic, it is of tantamount importance to investigate whether short online diversity communications can increase diversity in virtual teams.

Relevance to UN SDGs

The UN has made explicit that it wishes to put at the forefront the reduction of inequalities and gender equality. Hence this research is particularly relevant as it investigates which policies can be put in place to reduce age and gender inequality in the workplace.

Keywords: diversity, inclusion, gender

Oral presentation OP91

“I am a refugee, but…”: Career Experiences of Afghan Ex-Elites in the United States

Melika Shirmohammadi , mshirmohammadi@uh.edu; Ali Reza Sawar, Freedom House; Mina Beigi, University of Southampton; Wee Chan Au, Newcastle University

science

Research Purpose and Motivation

In August 2021, nearly 3.5 million Afghan people were forced to flee their country within a matter of few days upon The Taliban takeover of Afghanistan. The United States has accepted many Afghan evacuees, and the U.S. Department of Justice has issued them employment authorization. Many Afghans who arrived in the United States were considered elites in the context of their home country, specifically because the United States prioritized accepting those belonging to a select group deploying superior qualifications and work experience. In this study, we focus on career stories of Afghan ex-elites in the United States as an extreme case that enables us to examine the nuances of transitioning from an elite status and finding new pathways.

Previous studies suggest that refugees bring significant benefits to national economies and societies upon integration into the host country's workforce (Hirst et al., 2021). Those categorized as skilled with higher levels of education and work experience can fill industry demands for a skilled labor force, boost economic growth, and improve native-born populations' earnings (Ratha et al., 2011). Host countries can benefit from economic advantages if skilled refugees and immigrants fill jobs matching their qualification levels (Desiderio, 2016).

Most of the existing research has examined refugees as a general population, treating them as a homogeneous group rather than addressing the experiences of specific sub-groups, such as skilled or professional workers. Nor did they address the competencies that refugees deploy to transition from elite status to new employment statuses. We address the gaps in past studies by focusing on ex-elite refugees transitioning to new employment status in the host country.

Theoretical Background

Our review of the extant literature suggests that refugee status can be an important source of inequality in employment outcomes among refugees. For example, refugees tend to experience systematic employment discrimination (Lamba, 2003) as their qualifications and experiences, gained in their home country, may be disregarded by recruiters and employers (Bloch, 2002; Lamba, 2003). Such devaluation and denigration of prior education and professional experiences may restrict refugees' ability to join and continue their professional careers in the host country (Krahn et al., 2000).

We adopt the intelligent careers framework to examine our participants' career experiences. It proposes that in taking career ownership, individuals seek opportunities, activities, and experiences that help them develop competencies that facilitate the transition between employment statuses (DeFillippi & Arthur, 1994).

Methods

This study adopts a qualitative interpretive methodology informed by a constructivist epistemology (Crotty, 1998). Using both criterion-based and snowball sampling procedures (Patton, 2002), we recruit 20 Afghan evacuees who (1) have arrived in the United States after August 2021, (2) held elite

status defined as educated, white-collar, high status, or professional positions in Afghanistan, and (3) have obtained employment or are actively seeking jobs in the United States. The research team collects data by conducting semi-structured interviews upon receiving research ethics approval. With the participants' consent, interviews will be audio-recorded and transcribed. The constant comparative method will be used as the primary data analysis technique (Erlandson, 1993; Lincoln & Guba, 1985). In addition, we will use the member-checking technique to ensure the rigor of analysis and ask participants to provide feedback on the findings (Lincoln & Guba, 1985).

Expected Results

We expect the results before the conference in May 2023. We anticipate outlining competencies that describe why, how, and with whom Afghan refugees worked to integrate into the labor market in the host country.

Limitations

One of the limitations of our study is that we conducted one round of interviews, which limits capturing participants' career experiences over a more extended period.

Practical implications

Our findings inform organizations that depend on foreign-born talent and are interested in benefiting from refugees as a potential pool of qualified candidates. This study also provides a direction for policy development in facilitating refugees' employment transitions.

Relevance to the Congress Theme

We reach beyond the careers and labor market research to a wider community of organizational scholars interested in interdisciplinary views of work and employment in general. In that sense, our work contributes to understanding the changing population of workers becoming increasingly diverse. Also, scholars and practitioners in European countries receiving refugees find our findings relevant.

Oral presentation OP25

"If you want me to be great… get me a coach": The personal transformational value of the coaching process.

Linda Steyn, UNISA; Nuno Rebelo dos Santos, Research Centre in Education and Psychology (CIEP-UÉ), School of SocialSciences, Universidade de Évora, Évora, Portugal; Antoni Barnard, UNISA

science

Research goals

The value of coaching lies in achieving its aim, which is to facilitate intra- and interpersonal change. Objective measurement of personal transformation is inadequate to reveal the depth and personal meaning thereof and research lacks in-depth explorative and descriptive studies on how transformation manifests from the experience and perspective of the coachee. The study aimed to establish the personal transformational value of coaching by exploring and describing how personal transformation manifests during the coaching process for the coachee.

Theoretical background

Coaching has transformational purpose and is described as a human development process which involves a purposeful and structured interaction between the coach and coachee (client) to promote and sustain change. It ultimately entails a process-driven intervention that brings forth behavioural change in clients which extends to change on an individual, team and organisational level. Coaching as a process further emphasises coaching as a sense-making process where the client engages in understanding and integrating change and new experiences. It is intended to maximise potential and alter people's way of doing and being, which is ultimately a transformational process that brings about change.

Research design, methodology, approach and intervention

The study followed a qualitative methodology informed by a hermeneutic phenomenological approach to achieve the explorative and descriptive purpose of the study. Hermeneutic phenomenology accounts for the study of lived experience and renders a co-constructed understanding thereof based on the integrated application of interpretive lenses of participants and of the researcher. Data came from semi-structured interviews with 7 senior leaders after having engaged in an integral coaching programme of at least 6 sessions. Interpretative phenomenological analysis framed the data analysis strategy.

Results

Findings are described according to three themes: (1) Coaching initiates a process of critical self-reflection, (2) Coaching facilitates an evolving processing of the self; (3) Coaching establishes continued intrapersonal processing and the development of an internal processing competency. The findings indicate that coaching entails a process of critically engaging with the self that begins ' before ' coaching sessions start and continues into processing of the self ' during ' the coaching programme. Ultimately, the personal transformational value of coaching is relayed in the sense that coaching facilitates the development of self-reflective competence by establishing a sustained continuous processing of the self ' after' coaching has ended.

Limitations

The effect of receiving coaching was not explored over a longer period and the study was limited in that it could not provide longitudinal data. Interviews took place after having concluded the coaching programme for two of the participants, which may have influenced the richness of their memory. However, it did seem that these two participants had a clear sense of their lived experiences of being coached. Coachees were exposed to aspects of a particular coaching model (integral coaching) and findings may therefore not be applicable to other coaching models.

Research/Practical implications

The value of coaching can be described as an intervention that places 'working with the self' at centre stage and that its value is reflected in not only the evolving transformation of the self, but in developing a self-reflective competence that maintains personal transformation. Such transformation is not always conscious in the moment but experienced before, during and after coaching. Coaches can use the three staged transformation process of initiate (before), facilitate (during) and establish (after), to gauge the client's transformation readiness and progress. The findings enhance coaches' self-confidence to trust the process of coaching.

Relevance to the congress theme

Coaching facilitates personal transformation to enable adjustment and optimal functioning in the changing world of work. Coaching as a process facilitates personal and professional growth and development on a deeper level to reach self-actualisation and fulfilment in the midst of change.

Relevant UN SDGs

The research is meaningful in its value as it contributes to the 2030 agenda for sustainable development, with the sustainable development goal of good health and wellbeing regarding how coaching contributes to health and well-being and more specifically, psychological well-being.

Keywords: coaching; personal transformation; self-reflective competence; psychological well-being

"Should I Stay or Should I Go?" Unraveling top-tier university graduates' motivations to pursue or not pursue an international Career

Rita Rueff-Lopes, Esade, Universitat Ramon Llull; Ferran Velasco, EADA Business School; Josep Sayeras, Esade, Universitat Ramon Llull

science

Research goals

The goal of this study was to investigate in depth and from a phenomenological approach the main motivators of international graduates to pursue, or not, an international career after earning their degrees.

This goal is pertinent because this specific population is heavily under researched, although the number of international students increases year after year, having tripled between 1980 and 2009, from 1.1 million to 3.4 million (United Nations Educational, Scientific, and Cultural Organization Institute for Statistics, 2011) and is estimated to reach 8 millions by 2025 (OECD, 2013). This population is an important part of the global migrant community and is often a source of dispute between home and host countries as both compete for their definitive residence after graduation. Research has shown that about 15-30% of international students decide to stay in the host country (OECD, 2013), while others choose different destinations, and many others go back to their home countries. Still, the phenomenological motivations underlying these decisions are under researched.

Theoretical background

International Student Migration (ISM) theory is a line of research integrated in the Human Capital and the Global Migration theories. It lies in the middle of the continuum between education and general migration and interconnects with the needs and demands of the labor market. ISM takes into consideration the factors that enable or constrain students' mobility agency, also called push-pull factors (e.g., Mazzarol & Soutar, 2002).

In the current investigation we follow the Murphy-Lejeune's (2002) postulation that international students are a new migratory elite. She identified a set of distinctive characteristics, including the absence of economic difficulties as reasons to migrate, a young age and still being in the process of evolution to independence or adulthood (e.g., McManus et al., 2014).

Methodology

We conducted in-depth interviews to 63 international alumni who had completed a masters' degree in the academic year 2020-21, 73% of which were male. Ages ranged from 24 to 31 years old (M= 25.76, SD= 1.37). Of the 63 participants, 47% decided to pursue an international career, 16% chose to stay in the host country (Spain). The other 33 participants decided to not pursue an international career.

We applied the maximum variation selection criteria in order to diversify our sample in terms of nationality, migration behavior and educational background. We conducted semi-structured interviews that were recorded with the authorization of each participant, and then transcribed verbatim. Each interview had an average duration of 45 minutes.

Results

We identified 113 themes, 70 from the group who decided to migrate and 43 from the group who returned to their home country, thus resulting in a 2x2 model of motivating factors for migration decisions.

Main highlights:

16% of participants who decided to migrate stayed in the host country, which is concurrent with the statistics provided by OECD (e.g., 2013). Two of the common aspects of this sub-sample are 1) seeing career opportunities in the host country, and 2) having completed a Masters' degree in Innovation and Entrepreneurship. In this specific program students actively collaborated with local start-ups and family businesses since the beginning of the studies. This connection with the local business ecosystem may be instrumental in shaping participants perceptions of career opportunities in the host country.

From the entire sample that decided to migrate, only two saw salary as a motivator. This finding is in line with one of the characteristics of the new migration elite concept proposed by Murphy-Lejeune (2002): the absence of financial worries.

The motivators ideal company and ideal country were mostly mentioned by European participants who migrated to other Schengen countries, which reflects how not having travel restrictions promotes migration intentions.

The category global identity , which was reported by nearly half of all participants who decided to migrate, was never identified in previous ISM investigations. Having a global identity means that individuals perceive themselves as being part of the world as opposed to a single nation.

Limitations:

Gender proportion bias and the context are the main limitations of the research.

Conclusion:

Our results helps professionals like career advisors or human resource managers to better understand this population and to develop adequate support policies. It also adds to the literature by advancing knowledge on the motivations of this specific population, who continues to grow exponentially and plays a vital role both for univarsities and for the global economy.

"To Say or Not to Say": Privacy Behaviors in a Platform Prototype for Job-Seeking. How Designing for Transparency Affects Disclosure in E-Recruitment.

Arianna Boldi & Amon Rapp | University of Torino; Maurizio Caon & Alessandro Silacci | HES-SO, Universities of Applied Sciences and Arts of Western Switzerland

science&practice

Theoretical Background

The growing use of technology in the domain of work has transformed HR vital activities such as training, learning and especially recruitment (Baykal, 2020), so that, a variety of web-based technologies are now used by recruiters to attract and select candidates (McKinsey, 2012). Digital tools surely bring a number of advantages to both organizations and candidates (Faliagka et al., 2012; Sylva & Mol, 2009) but they may also entail some detrimental effects. One of the most relevant issues is that of privacy, which might compromise the experience of job-seekers. As literature showed, people who perceive that their personal information might be disclosed without their control are more likely to abandon the application and drop out of the selection process (Cober et al., 2003). This phenomenon may pose a reputational risk for the organization and may jeopardize the acquisition of new talents.

We thus need to understand how to contain such adverse effects for technology to be at the service of people and organizations. A first step towards this direction can be done by first considering the ergonomics factors involved in the web-based selection process. This implies an inquire into the interaction between users and platforms, as this has a tremendous impact on the quality of e-recruitment (Pfieffelmann et al., 2010). As a matter of fact, the perception of privacy was found to be capable of influencing self-disclosure and trust in an experimental study by Nickel & Schaumburg (2004). Moreover e-recruitment sites that guarantee transparency in the way data are collected and processed are perceived as more trustful and reduce users' privacy concerns (Bowyer et al., 2022). In a nutshell, a better interaction with web applications may support individuals who search for a job and employers who look for prospective candidates.

Research Goal

Grounding on this perspective, our research goal is to understand how people perceive job platforms when searching for a job, how they react to their specific design features and how then behave correspondingly. The objective of this study is twofold: first, to understand how single features aimed at improving the transparency of data usage in e-recruitment affect the user experience of prospect candidates and orient their decisions towards the privacy settings, i.e., to share or not certain pieces of information; then, to capture sense-making processes underlying privacy behaviors, i.e., what meanings people ascribe to personal data as well as their disclosure behaviors.

Tools

We employed a web job board, aimed at investigating which design features may support compliance with GDPR regulations and transparency in the context of job seeking: the board has been implemented as a prototype for research purposes only. The design of the platform integrates design recommendations drawn from Human-Computer Interaction literature, which have been proven to positively affect users' sensation of control on their data and trust towards the technology.

Method

A sample of 20 Italian individuals of age was recruited (female = 10). Participants were required to explore the prototype board and decide whether sharing or not personal information with a number of stakeholders that were i) the platform itself, ii) recruiters, and iii) partners of the platform. A member of the research group observed how users interacted with the platform, audio-recorded their comments, using a Thinking aloud protocol, and took notes about relevant interaction events. A semi-structured interview followed: grounding on the observational notes, the researcher delved into the experience of use of the platform, asked participants about their privacy behaviors, and explored the meaning that the shared information had for them.

Results

At present, we have collected all the qualitative data and we are about to start their analysis. We expect to present the results at the Conference.

Limitations

Possible limitations arise from the size of the sample, which hinders the generalizability of the results. However, we believe that the richness of qualitative data we have gathered would contribute to the understanding of the phenomenon under examination.

Contribution and Relevance

Hopefully, we might use this knowledge to inform the design of platforms and provide suggestions to organizations that use this kind of instrument to expand their workforce. Our study might be of interest for both academics in the Work and Organizational Psychology field and practitioners who take care of personal recruitment, assessment and selection in organizations. The study contributes to UN SDGs goals by supporting workers in enacting their right to privacy.

Keywords: e-recruitment; privacy; job-seeking

Oral presentation OP718

"Why should I even consider that?" Understanding challenges and opportunities for prospective work design from the viewpoint of technology developers

Aniko Kahlert & Gudela Grote | Work and Organizational Psychology, Department of Management, Technology and Economics, ETH Zürich

science&practice

Research goals: This study aims to expand existing knowledge of how prospective work design can be fostered among technology developers by applying a human-centred work design lens. Our research goal is to explore how exposure to interdisciplinary collaboration impacts technology developers' readiness to engage in prospective work design through broader design mindsets and professional identities.

Theoretical background: Emerging technologies will significantly impact the future of human work; if for good or bad is still under debate. The application of a holistic socio-technical innovation approach that leverages the intricate interaction between technological and human capabilities to promote effective performance and human well-being can help to ensure the realization of positive technological change. Special attention should be paid to proactively ensure high-quality jobs in new work systems, i.e., prospective work design. Most of the efforts that steer in this direction lack success in practice. Increasing our understanding of technology developers' perspectives on their own work by assessing their professional identities and design mindsets may open fresh opportunities for prospective work design. In our study, we, therefore, address the following research question: How does technology developers' experience of interdisciplinary collaboration influence their professional identity and readiness for the integration of prospective work design in the development process of emerging technologies?

Methods: We conducted a longitudinal semi-structured interview field study (N=32) with researchers of a large interdisciplinary centre for the development of new technologies in architecture, engineering and construction applying an inductive research strategy. In the second round of interviews, participants completed the multidisciplinary-identification task (developed based on Shamir & Kark, 2004), a graphic visualization task in which circles representing different disciplines (e.g., architecture, computer science) are placed to depict their professional identity, their project, and the research context. Following a thematic analysis approach (Braun & Clarke, 2006), we traced the development of researchers' design mindsets and examined potential drivers.

Results: Our analyses indicate that technology developers lack awareness of their work's impact on the jobs of practicing professionals, even in their own disciplines. This finding highlights the need to explicitly encourage developers to reflect on similarities between their own work and the new work systems they create for others. In this regard, we further identify enabling factors for prospective work design by demonstrating how actively reflecting on one's multidisciplinary professional identity and experience of interdisciplinarity supports the development of more holistic and impact-aware design mindsets. By illuminating the relevance of psychological and social processes in technology development, we corroborate and expand on earlier evidence regarding the necessary prerequisites for the successful use of prospective work design methods.

Limitations: Our findings stem from one research context in one country, which limits its generalizability. Future research could use quantitative data collection methods in larger samples to validate our main conclusions concerning the importance of shaping broader interdisciplinary

professional identities as prerequisites for establishing shared holistic and impact-aware design mindsets in research teams.

Conclusions and Originality/Value: Our results emphasize that the integration of work design considerations into early technology development remains challenging. We hope that our approach of studying people's conception of themselves in relation to the technological innovations they aim for may prove useful in devising better methods and contexts for prospective work design. The newly developed multidisciplinary-identification task serves as a visualization tool and conversation opener for interdisciplinary teams, on individual, team, and project levels in research and practice. Broader design mindsets and increased interdisciplinary professional identities can pave the way for prospective work design. Our study expands research on interdisciplinary collaboration towards promoting impact awareness and thus helps holistic socio-technical innovation gain ground.

Relevance to the Congress Theme: Our insight on the readiness for engagement of prospective work design can contribute to the current development of emerging technologies, actively shaping the future of work for the deliberate combination of high-quality work and technological advancements.

Relevant UN SDGs: Decent work and economic growth; Responsible consumption and production; Quality education

Keywords: prospective work design, emerging technologies, design-mindset

Oral presentation OP130

A cross-cultural comparison of the Psychological Capital impact on employee's engagement and performance : A Systematic Literature Review

Alessandro De Toma, University of Lincoln

science

This paper aims to contribute to the study of Psychological Capital, by looking at the impact of cultural differences on the relationship between PsyCap and employee performance and engagement. While there is a broad range of literature looking at those relationships, the results are frequently inconsistent. One of the reasons for this inconsistency may be due to cultural/regional differences. A systematic literature review was conducted to shed light on those cultural/regional differences. The concept of PsyCap refers to an individual's positive psychological state of development characterized by four main components: hope, self-efficacy, resilience, and optimism (Luthans et al., 2015).

Literature has shown that engagement and performance are important antecedents of different work-related outcomes such as productivity, well-being, innovation, and organisational change (Christian et al., 2011). Nevertheless, there is consistent instability of engagement levels among employees (Avolio & Luthans, 2006), which can compromise the performance and productivity of numerous organisations. To achieve effective organisational success modern companies should not only focus on negative-based strategies to minimize weaknesses and problems (Luthans et al., 2015) but also promote resources of investment in the face of adversities and organisational changes through the development of positive psychological states and capabilities (PsyCap). PsyCap became a central topic of discussion in positive psychology as the combination of its components supports the individual development and improvement of foundational resources for managing and adapting over adversities (Luthans et al., 2010), increasing various work-related outcomes including but not limited to performance, engagement (Simons & Buitendach, 2013). However, research about the impact of PsyCap on engagement and performance is globally sparse with contradictory findings depending on the geographical location of the studies.

This systematic literature review followed the Preferred Reporting Items for Systematic reviews and Meta-Analysis (PRISMA) Statement (Moher et al., 2015). Twenty-two study including primary (quantitative) and secondary (meta-analysis) was included. ProQuest, Academic Research Complete, PsycINFO, PsycARTICLES, Business Source Complete, and CINAHL were used as sources of information for the systematic literature review. The keywords selected in the search strategy were PsyCap, engagement, and performance. The screening process accounts for relevant studies including English language, full-text, reference list, peer-reviewed, and based on employees working across different geographical areas (West, Europe, East, Latino America, and Africa). Studies showing unclear findings, no demographic information, student-based research, remote workers, and variables unrelated to employees' engagement and performance were excluded from the screening process. In addition, the AXIS tool was administered to assess the quality of qualitative, cross-sectional, and longitudinal research design, while the Joanna Briggs Institute tool was adopted to provide a rigorous process for critical appraisal and synthesis.

The analysis shows a positive impact of PsyCap on engagement and performance in USA, China, Italy, and Zimbabwe. However, there are cultural differences between some African regions that affect the PsyCap impact on employee engagement overtime, compared to other geographical areas including West, East, and Europe, where high levels of PsyCap predicted was shown to be a good predictor

employee engagement. Besides, looking at the PsyCap dimensions, hope, self-efficacy, and optimism are the main drivers of engagement in the West and Africa, while in the East, particularly in India, hope and resilience seem to be more important.

One of the main findings of this systematic review is the lack of qualitative research which does not capture the full complexity of the topic in consideration. In addition, it was found limited research in some geographical regions such as Latin America, which does not allow us to treat these relationships as a global phenomenon.

Despite some regional differences, this systematic review provides some evidence of the significant positive relationship between PsyCap, engagement, and performance across different regions. The regional differences we found, stress the importance of tailoring PsyCap intervention to regional and cultural idiosyncrasies. Moving forward, more attention should be given to shed light on how exactly how we can adapt PsyCap interventions to cultural differences in order to maximise its impact on employee performance and engagement.

Keywords: Psychological Capital, engagement, performance, employee

Oral presentation OP115

A diary study of leader intellectual stimulation and employee growth mindset as predictors of daily strengths use and performance

Zselyke Pap, Andrei Rusu, Laurențiu Maricuțoiu, Delia Vîrgă & Luca Tisu | West University of Timișoara

science&practice

Research goal: The present research has adopted a multi-level perspective in predicting employee performance. In this perspective, we bring together workplace resources (leader intellectual stimulation), employee characteristics (growth mindset), and daily proactive behaviors (strengths use) as predictors of daily performance.

Theoretical background: Based on the combination of bottom-up and top-down dynamics discussed in the Job Demands-Resources Theory (JD-R), we hypothesized that employees who perceive a higher degree of intellectual stimulation from their leader would report higher growth orientation. Furthermore, we expected that employees with such growth-oriented mindsets would more frequently employ their strengths, which would raise their performance.

Methodology: The study adopted a daily diary design, which allowed testing of both top-down and bottom-up effects. Participants were recruited in collaboration with a company specializing in online data collection and market research in Romania. A total of two-hundred and nine (N L2 = 209) employees have participated in both the general survey (measuring mindset and perceived intellectual stimulation) and the daily survey across 12 consecutive working days (measuring strength use and performance). Overall, this design yielded a multi-level dataset with over two-thousand daily responses (N L1 = 2223).

Results: The model was tested through a 2-2-1-1 multi-level structural equation modeling procedure, which included testing the multi-level factor structure (MCFA) and comparing alternative structural models (MSEM). The results supported the proposed factor structure. Perceived intellectual stimulation and growth mindset defined employee-level (L2) factors, while daily measures of strength use and performance each loaded on a factor at the within-person level (L1) and one at the between-person level (L2).

The structural model showed that perceived intellectual stimulation from a leader had a positive and significant direct association with employees' growth mindset and strength use. Furthermore, we found a positive relationship between employees' growth mindset and their strength use. The data also revealed that the link between strength use and perceived intellectual stimulation was indirect, mediated by employees' growth mindset. Moreover, a growth mindset and strength use significantly and positively predicted self-reported performance. Here we found another indirect effect from mindset to performance, mediated by daily strength use.

Limitations: This study had the main limitation of using self-reports to assess leadership style and employee performance. These limitations are balanced by the strengths of the design and the sample size at both levels. Given that obtaining third-party reports for 12 days for over 200 employees would have been ideal but hardly realistic, we urge future researchers to further probe and develop our findings with different methods and multiple sources of information. Another limitation resides in the cross-sectional relationship between intellectual stimulation and employee mindset at the employee level and between strengths use and performance at the day level. Given that these were reported together, it is possible that employees with a growth mindset were more inclined to see

and appreciate leadership behaviors that lean towards intellectual stimulation because these are the aspects that the employee values. Given the positive associations we have found here, the next step for this literature is to probe the temporal order and causality of these relationships.

Conclusions and relevance to congress theme: Overall, this study contributes to our view of the modern world of work by exploring the relationships between factors that ultimately empower the employee and his/her characteristics and behaviors to develop high performance. In the new era of remote work and independent contracting, understanding what sustains performance beyond job characteristics is paramount. Our model recognizes that performance is a factor with daily variability, which also has a stable component and is determined by a combination of bottom-up and top-down effects between job characteristics, employee characteristics, and proactive employee behaviors.

Alignment with UN SDGs: One sustainable development goal defined by the UN resides in the promotion of inclusive and sustainable economic growth, with full and productive employment and decent work for all. Our approach could contribute to this goal by being centered around employees' mindsets. Rather than investigating what external factors can drive employee behaviors, we explore how leaders can encourage healthy and growth-oriented mindsets that can serve as an enduring characteristic of the employee that fuels employee-initiated work behaviors and higher performance.

Keywords: intellectual stimulation, growth mindset, strength use

Oral presentation OP322

A Digital Onboarding-Tool: Conceptual Paper of Content Development and Technical Implementation

Hannes Schilling & Simone Kauffeld | Department of Industrial, Organizational and Social Psychology, Institute of Psychology, Technische Universität Braunschweig, Germany

science&practice

Research Goal: To date, the scientific literature on digital onboarding-tools is very sparse, as they are not yet widely used especially not in the context of higher education (Schilling et al., 2022). Studies on onboarding-tools focus mainly on the design of the digital spaces (Lochrie et al., 2016). Accordingly, conceptual and content factors of a digital onboarding tool as well as the technical implementation have not yet been thoroughly researched. To fill this gap, our contribution is dedicated to these factors of a digital onboarding tool. Theoretical Background: The start of university holds challenges for incoming students like exemplary establishing a new learning identity (Briggs et al., 2012). To help new students overcome these challenges and to learn about the demands of a degree program universities rely on onboarding interventions (Jenkins et al., 2020). These onboarding interventions are usually delivered face-to-face on campus (Motycki & Murphy, 2021). The COVID-19 pandemic as well as the increasing numbers of online and blended learning courses led to a switch from the face-to-face onboarding processes to digital and virtual settings over the last few years (De Boer et al., 2022; Thompson, 2016). Digital solutions such as onboarding-tools present a sustainable way for this switch into the digital and virtual setting (Schilling et al., 2022). According to Pepping et al. (2017), onboarding processes can be divided into three phases. In a higher education context, it includes the pre-boarding phase (before beginning the university program), onboarding phase (first weeks of the university program), and post-boarding phase (first months of the university program). Based on this, content aspects of the onboarding interventions either need to be adapted to the three phases, or the individual contents could be offered in individual phases. Further theoretical derivations for content and conceptual aspects of a digital onboarding tool can be drawn from research on digital onboarding interventions in universities. In these, four content dimensions of onboarding interventions could be identified: information dimension, socialization dimension, self-study dimension, and counseling dimension (Schilling et al., 2022). Approach: Adapted to an economical, simple, digital implementation in a university context and the results of a previously prepared review (Schilling et al., 2022), an onboarding tool for students was created as follows: the tool was developed as a website application and is usable for mobile devices. This simple digital realization saves costs on expensive technological implementations. Furthermore, students can access onboarding interventions through their mobile device regardless of location. Universities can set the start time and end time of the onboarding process in the onboarding tool and tailor onboarding interventions to specific student groups. The content of the onboarding interventions is oriented on the four content dimensions identified. The information content group deals with onboarding interventions that ensure information transfer between universities and new students, e.g., announcements of first-semester events or campus overviews. The task content group are micro-interventions based on Walton's (2014) wise interventions. This content group provides new students with small 10-20 minutes tasks in which they deal with their strengths and weaknesses, their study goals, and study life in general. The video content group contains video messages from study-related people or onboarding experts who, for example, warmly welcome the new students. The diary content group contains a digital diary in which students can take notes on their insights and reflect on their onboarding process. Results: N=40 students evaluated the tool in an initial pilot phase. Currently, more than 330 students are

using the tool to start the winter semester 2022. A detailed analysis of the effects of the tool should be possible by the end of march. Limitations: Limitations of this study are the currently missing quantitative evaluation of the tool and the strong anchorage to a single review. Conclusions: The onboarding-tool can be applied broadly to guarantee personalized onboarding processes in a wide range of study programs. A detailed evaluation of the onboarding-tool also opens up the possibility for application in a company environment. The described onboarding-tool can function as an example for the development of other onboarding-tools in other contexts besides higher education. Relevance to the Congress Theme: The onboarding-tool offers the possibility for a standardized, digitalized and generalized, cross-university onboarding process facilitating and changing the work of many higher education professionals. Relevant UN SDGs: This onboarding-tool can foster quality education as determined by the Sustainable Development Goals (Rodríguez-Abitia et al., 2020).

Oral presentation OP505

A Dual-Pathway Model of Cyber Incivility and Sleep via Emotions: A weekly diary study.

Francisca Carvalho, The Iscte - University Institute of Lisbon; Michael Knoll, University of Leipzig; Silvia Silva, The Iscte - University Institute of Lisbon

science

Research Goals: Working life and personal life are commonly treated as two separated domains. However, the boundaries between one and the other are often blurred (Boswell & Olson-Buchanan, 2007; Carlson & Kacmar, 2000). This research seeks to (a)establish a pathway model between cyber incivility and sleeping problems, (b) test the mediating role of emotional reactivity and emotional regulation in this dual pathway.

Theoretical background: The interactive nature of working environments may induce rude and disrespectful attitudes. Or, in other words, promote uncivil behaviours (Andersson & Pearson, 1999). Cyber incivility is defined as a "communicative behavior exhibited in computer mediated interactions that violate workplace norms of mutual respect" (Lim & Teo, 2009, p. 419). This can mean, using online channels to say negative things about other people, or for instance using online channels for discussions that would require face-to-face dialogue (Lim & Teo, 2009).

Being a job stressor, workplace incivility can induce very negative emotional reactions (e.g. anger, sadness) that, if not regulated, can become too hard to cope. Throughout time, targets of this type of mistreatment may be faced with regular, extreme, and long-lasting responses (Nock et al., 2008) that stand long enough to affect one´s own private time. Thus, tempting to advance knowledge on these spill-over effects and their underlying processes, we examine whether incivility induce reactive emotional responses that stand long enough to affect someone´s night-time.

Sleeping problems, in turn, might affect employees' self-regulation abilities (Christian & Ellis, 2011). The failed attempts on emotional self-regulation can lead to further distress and a higher chance of having unpremeditated behaviours towards others (Wagner & Heatherton, 2014). For this reason, sleeping problems via the lack of emotional regulation might lead to the perpetuation of workplace incivility.

Design: A weekly diary study over the course of four weeks with individuals from different private companies is being employed. For cyber incivility, four items from Lim and Teo (2009) were selected. Emotional Reactivity is being measured through nine items from Preece et al. (2018), and emotional regulation through ten items from Gross and John (2003). To assess sleeping problems, we are employing five items from Soldatos et al. (2000).

Results Expected: Data collection with more than 70 employees has started in and is still in progress. Due to the study timeframe, and the fact that the collection of data is being carried through several companies at different points in time, we plan to have all data collected and analysed by the end of December/beginning of January.

Limitations: Self-report measures might be subject to same-source bias that may influence our results (Podsakoff et al., 2012).

Conclusions: The present paper can shed some light on how incivility affects and is affected within both personal and work life domains by providing a more consolidated framework of this type of mistreatment. Focusing on emotional reactivity and regulation – two understudied variables within incivility literature- we attempt to explain the mechanisms behind these associations. At a practical

level, the dual pathway model provides opportunities to tailor potential interventions. Either by tackling incivility - e.g. creating norms (Porath & Gerbasi, 2015); or, for instance, giving training on how to regulate emotions in a healthy way.

Relevance to the Congress Theme: "The future is now", but we are yet unknowledgeable of how to coexist in the virtual world. Our research topic revolves around cyber behaviours, which became more prominent to explore since the outburst of telecommuting ways of work, and that will require further investigation since the ICT´s are here to stay.

Relevant UN SDGs: Good health and wellbeing.

Keywords: cyber incivility, emotions, sleeping problems

Oral presentation OP32

A field study of internal job recovery amongst shift-duty officers: Does the JD-R model fit?

Shi Min Toh, Ministry of Home Affairs, Singapore

science&practice

In a rare study of the on-the-job recovery experiences of shift workers, the energy levels of 243 law enforcement officers were studied during their 12-hr night shifts. Leveraging on an expanded Job Demands-Resources model, the study attempted to uncover the relationships amongst the factors that influence on-the-job recovery, via a mix of survey and Experience Sampling Method. Latent Curve Growth Modelling and Repeated Measures ANOVA were utilised to analyse the data.

Preliminary results suggested that the impact of Work Demands and Work Resources on the change in energy levels across the shift differed depending on the specific types of demands and resources experienced. Certain demands and resources had unexpected impact on the energy levels due to the unique context of shift duty and policing. The impact of recovery experiences during official breaks influenced fatigue levels but not vigour levels. In particular, the recovery experience of control mediated the impact of certain work demands on the change in fatigue levels across the shift. Amongst the personal factors, Resilience was found to positively influence the changes in energy levels across the shift.

In summary, while the JD-R model appeared to be applicable to the internal recovery processes amongst shift-duty workers, the specific factors that influence officers' energy levels need further study due to the unique context of the nature of their jobs and their shift duty work conditions, such as the rather structured timeframes for recovery to take place during shift duties. Scientific implications on the study of internal recovery amongst shift workers, and practical implications on the energy management strategies contributing towards the health and well-being of shift duty law enforcement officers will be discussed.

Due to the field study nature of this research, there was limitation in terms of the need to balance data collection without interfering with actual policing operations. Further, the generalisabilty of this study may be limited to populations involved in frontline emergency shift duties.

The study contributed to the scientific understanding of internal recovery experiences for non-office hour workers through a field study with strong ecological validity, while comprehensively examining the impact of both individual and job related factors on energy management and internal recovery.

Keywords: Job demand resources model, Recovery experiences, Shift work

Oral presentation OP537

A gender research perspective on destructive leadership, employee well-being and performance

Mats Reinhold, Department of Psychology, Umeå University

science

Research goals and why the work was worth doing

The aim of the present study is to investigate followers' outcomes of destructive leadership from a gender research perspective. Consequences of a destructive leadership, for both organisations and employees, are well-documented (Mackey et al., 2021; Schyns & Schilling, 2013; Tepper, 2007;) with negative effects such as increased costs for reduced productivity, counterproductive work behaviour, lower personal well-being and job satisfaction, burnout, absenteeism, and the risk of leaving the organisation (Zhang & Bednall, 2015; Schyns & Schilling, 2013). In addition, studies in recent years have shown that destructive leadership is a more common phenomenon than previously known (Schyns & Schilling, 2013). Despite a growing number of studies investigating consequences of destructive leadership there are almost no research done with a feminist research perspective, combining theories from both gender studies and psychology. This is surprising, given that we know from research on constructive leadership and gender that gender plays an important role in how different leadership styles are perceived and how it effects employees.

Theoretical background

To implement a gender research perspective, this study uses Ackers theory of gendered organisations (2012, 1990). Gender inequalities are produced in organisations as work processes are carried out, both formally and informally. Ackers perspectives on gendered substructures such as power, hierarchies and assumptions about women and men as well as femininity and masculinity help us to point out and to understand often-invisible processes in organisations that create, reproduce, and perpetuate gender inequalities. In addition, we use Hobfolls (1989) Conservation of Resources (COR) Theory to explain destructive leadership's effect on employees' well-being and performance. Destructive leadership put strain on employees, leading to either threat of loss, actual loss, or failure to gain resources, leading to poorer well-being and performance.

Design and Methodology

For this study we used a two-wave survey design, collecting data on two occasions with 6 months apart. To get a sample that was stratified and randomly selected to represent the Swedish labour market demography, we took help from Statistic Sweden to send out surveys. Out of 3000, 1100 participants were included in the analysis. s. The analysis was done by moderated regression analysis using structural equation modelling.

Results obtained or expected

We found no significant support for gender as a moderator when investigating destructive leadership's effects on employees' well-being and performance. We found partial support that the gender composition of the leader-employee dyad affects employees' intention to leave the organisation. Employees showed a higher intention to leave the organisation if the leader was the same gender and used destructive leadership.

Limitations

It is hard to distinguish if the time span of six month for this two-wave study is suitable to capture the effect of destructive leadership on employees' well-being and performance. Destructive leadership could be conceptualised differently.

Conclusions - Research/Practical Implications/Originality/Value

With this study, we deepen the gender research perspective in destructive leadership studies by implementing theories from gender studies to understand the roll of gender and gender-match in an employee-leader dyad. We also help to further understand employees' well-being and performance due to destructive leadership.

Relevant to the Congress Theme and UN SDGs

The prevalence of destructive leadership is much higher than what is previously known and is still causing damage to both employees and organisations. To allow organisations to take action to prevent further damage, this is an important issue to understand further. This study is relevant in relation to SDGs due to wellbeing and good health in working life. It also contributes with a gender perspective on destructive leadership research to strengthen gender equality.

Keywords: Destructive leadership, gender, employee outcomes

Oral presentation OP394

A Hostile Work Climate and Workplace Bullying: Reciprocal Effects and Gender Differences

Denise Salin, Hanken School of Economics; Michael Rosander, Linköping University

science

Research goals: In this presentation we argue that organizational climate and workplace bullying are connected, intertwined and affect each other. More precisely, the aim of this study was to analyze how a hostile climate at work is related to workplace bullying. A hostile work climate is defined as an affective organizational climate permeated by distrust, suspicion, aggression and conflicts. Workplace bullying, in turn, is defined as a systematic prolonged mistreatment of an employee in situations that gradually become more difficult to defend against. In our study we tested four hypotheses about the reciprocal effects between a hostile work climate and bullying and possible gender differences. Our study is motived by previous findings demonstrating that workplace bullying can have very severe health effects for targets. Therefore, it is important to increase our understanding of risk factors and processes leading up to bullying.

Theoretical background: Studies on mistreatment point to the fact that bullying and related phenomena, such as incivility, are typically escalating processes, where conflicts and experiences of mistreatment may lead both to normalization of such behaviour and further perpetration. Our hypotheses thus draw from findings about ripple effects and incivility spirals.

Design/methodology: The data used in the study are from a longitudinal national probability sample drawn from the whole working population of Sweden (n=1095). Bullying was measured with the Short Negative Acts Questionnaire (SNAQ, Notelaers et al., 2019) and a hostile work climate was measured with five items from the Psychosocial Work Environment Questionnaire (PSYWEQ, Rosander & Blomberg, 2018). Controlling for age, we used structural equation modelling and cross-lagged structural regression models to assess the reciprocal effects of a hostile work climate on workplace bullying. Gender was added as a moderator to test two of the hypotheses.

Results: The results showed a strong reciprocal effect meaning there were significant associations between a hostile work climate and subsequent bullying, $\beta = 0.12$, $p = .007$, and between baseline bullying and a subsequent hostile work environment, $\beta = 0.15$, $p = .002$. The forward association between a hostile work climate and bullying depended on gender, $\beta = -0.23$, $p < .001$.

Limitations: The measures of a hostile work climate and exposure to bullying behaviours were self-report measures that are susceptible to social desirability and common method variance. However, in the present study we used an 18-month time-lag as separating measures in time has been argued to alleviate the risk of common method variance. Moreover, we used a new measure of a hostile work climate in the study, which means it had not previously been validated. However, for this reason we started by investigating and testing the validity of the measure and concluded that all results in these analyses indicated that this measure behaved as expected.

Conclusions: We investigated the reciprocal association between a hostile work climate and workplace bullying. The results support the notion that the organizational climate and bullying affect each other. The findings point to a possible vicious circle where a hostile work climate increases the risk of bullying, which in turn risks creating an even more hostile work climate. This was especially true for men, for whom the relationship between a hostile work climate and subsequent bullying was stronger. Breaking a vicious circle typically becomes harder and harder with time, so early measures against bullying and hostile work climates are of utmost importance—a stitch in time saves nine.

Relevance to congress themes: Ensuring a safe and sound psychosocial environment is of great importance in the changing world of work. Thus, this paper fits well with the overall congress theme and, in particular, with the topics of stress and dysfunction and well-being.

Relevant UN SDGs: This study is related to the UN sustainable development goal of decent work and economic growth, as reducing the risk of bullying is largely about promoting a safe and secure working environment for workers.

Keywords: bullying, organizational climate, gender

Oral presentation OP455

A longitudinal panel study on the reciprocal effects of self-perceived status and voice in self-organizing teams

Lotta Harju, EMLYON Business School; Paul Jansen, Vrije Universiteit Amsterdam; Mandy van der Velde, Utrecht University; Maria Tims, Vrije Universiteit Amsterdam

science

Goals of the study

Voice is crucial in teams where members need to share ideas and insights with each other because they are collectively responsible for organizing their activities and making decisions. Although lowering formal organizational hierarchies has been suggested to make it easier for team members to voice, studies have so far overlooked the role of informal hierarchies that may influence how team members participate in group decision making processes. This study examines reciprocal relations between team members' self-perceived status and promotive and prohibitive voice in newly founded self-managing teams. Thus, it will extend knowledge on how informal hierarchies in teams influence voice but also how status is gained and maintained in teams.

Theory

We build on expectation states theory (EST) and literature conformity to examine how self-perceived status and voice influence each other over the first six months of new self-organizing teams. Specifically, we will develop an argument that high status group members first display behaviors that are expected of them to legitimate their status, and later deviate from these expectations by displaying more dissenting behavior and consequently gain more status. We expect that during the first three months of self-organizing teams, self-perceived status will increase promotive voice, as this type of voice is expected from high-status members. At the later three-month period of the teams, in turn, we expect status to increase prohibitive voice, because this type of voice can be considered as more dissenting. Even though displaying expected behaviors, such as promotive voice, may enable group members to legitimize their status, gaining higher status may require them to display more dissent. Because prohibitive voice is more dissenting than promotive voice, this reasoning suggests that prohibitive voice should be more status enhancing. Based on the literature on conformity, we expect these effects to manifest during the later three-month period into new teams.

Method

Participants were 585 employees working in newly formed self-organizing teams in a large financial organization in the Netherlands. The survey was administered three times in 3-month intervals. Promotive and prohibitive voice and self-perceived status were measured at all three time points. Gender and organizational tenure were included as control variables. We used a three-wave panel design in SEM framework and employed the "complex" command in MPlus to account for the non-independence of observations.

Results

Our hypotheses were partly supported. Specifically, self-perceived status positively predicted promotive voice during the first three months of teams, between T1 and T2. As expected, prohibitive voice positively predicted self-perceived status at a later phase, between T2 and T3.

Limitations

We used self-report data to measure voice, which may bias the responses, although the repeated measurements of the longitudinal design ameliorate this effect. While three-month time lags between waves aligns with previous studies on voice and status emergence in field settings, it may be that a shorter interval could have uncovered relationships that were not observed in this study. More research is needed on the temporal framework of these dynamics in teams.

Conclusions

Our study indicates that voice can act as a mechanism that both marks and maintains the status hierarchy in self-organizing teams. Our findings also point towards a sequential pattern in how voice unfolds in the context of the first six months of self-organizing teams. Our results support the status legitimation process proposed by EST where the emergence of status perceptions occurs as the groups start forming, whereafter status hierarchies become legitimized and maintained via displaying expected behaviors, such as promotive voice. Prohibitive voice, in turn, emerged as a driver of status attainment. Our study implies that team members held back prohibitive voice in the beginning when teams were only starting to work in a self-organized way. At least in the context of our study, promotive voice may be a way to enact higher self-perceived status whereas prohibitive voice was found to increase it.

Relevance for the congress theme

This study focuses on self-organizing teams, which represents an increasingly popular way to organize work in the ever-turbulent world where organizations need to be able to quickly adapt to changes. This way of organizing is suggested to encourage team members to take initiative, including voice, that is crucial for organizations to successfully navigate various challenges that they face in this changing world of work. Our study scrutinizes this assumption by shedding light on the informal status hierarchies that emerge to guide voice and how different types of voice maintain these hierarchies, as perceived by team members themselves.

Keywords: Voice, self-perceived status, longitudinal

Oral presentation OP443

A meta-analysis of: Multi-level multi-dimensional workplace risks to Psycho-Social Health and Well-Being

Siobhan Kennedy, University of Limerick

science&practice

Research goals and why the research is worth doing:

The work environment can be a setting of both opportunity and risk for worker mental health. The goal of this research is to identify how the work environment contributes to psychological losses/gains in workers. This research is required due to the increasing evidence that worker stress and occupational burnout is on the rise, resulting in the World Health Organisation recommending that psychological risks are treated on a parity with physical risks in the occupational health and safety management system.

Theoretical background:

Psycho-social hazards describe any aspect of the work environment, working conditions or work design that could potentially harm the psychological health and well-being of workers (Leka et al., 2010). Factors such as automation of processes, the acceleration of hybrid working, increased integration of work-life boundaries and the changing demographics of the workforce are contributing to more demanding work environments, which means that organisations need to adopt a more systematic and risk-based approach to ensure the health and safety of workers. The management of workplace health and safety is changing. The World Health Organisation (WHO) have highlighted psycho-social well-being as a key risk area in their Global Monitoring Report 2000-2016 (World Health Organisation and International Labour Organisation, 2021) and burn-out has been reclassified from a phenomenon to an occupational phenomenon in the International Classification of Diseases (ICD-11) (WHO, 2019).

However, physical hazards are far more tangible than psycho-social hazards, making risk assessment and subsequent elimination/mitigation easier. Recognising this, the International Standards Organisations developed and released the ISO 45003 (ISO, 2021), which is the first internationally agreed standard on workplace psychological health and safety. This is a sub-standard of the ISO 45001 which is the standard for Occupational Health and Safety Management Systems. This signals that psycho-social well-being is a systematic endeavour involving Occupational Health and Safety, HR and Management that needs to be understood from an inter-disciplinary risk perspective where organisations proactively identify, assess, eliminate and mitigate psycho-social risks at source. The ISO 45003 identifies some key psycho-social hazards and outlines the steps involved for organisations to pro-actively manage psycho-social risk. However, it provides less detail in terms of the antecedents and interactions in a work environment that create a potential source of psycho-social risk. In order for employers to adopt the guidelines set out in the ISO 45003 standard and pro-actively conduct a robust risk assessment, an investigation to thouroughly understand the impact of the work environment on worker psychological health is required.

Design and methodology:

This research will conduct a systematic review and meta-analysis of research to date on the antecedents of various types of psycho-social risks. A multi-disciplinary approach will be utilised that

draws from Organisational Psychology, Management, HRM, Occupational H&S, Ergonomics and Safety Science literatures.

Expected Results: From preliminary searches of past research, I expect that antecedents of psycho-social risks will be multi-level (e.g. industry type, organisation, interpersonal/team and individual) and multi-dimensional in nature. The outcome of the meta-analysis will be the development of a framework to represent these multi-level, multi-dimensional psycho-social risks.

Limitations: Limitations include the secondary nature of the data that is typical of all meta-analyses. Future research using primary data will be required to validate the framework.

Conclusions: This research is the first step in providing organisations and consultants with an invaluable diagnostic tool which is aligned to the recommendations of the ISO 45003. This can be used to pro-actively assess the work environment for psycho-social risk and provide guidance on where to intervene to reduce such risks.

Relevance to the Congress Theme: This research seeks to make challenging psycho-social factors more tangible in terms of diagnosis and subsequent (re-)design of the work environment to eliminate, mitigate or buffer these risks at source. This aligns to the EAWOP theme of Stress and dysfunction (hazardous environments, job demands).

Relevance to UN SDGs: A goal of this research is to elevate psycho-social risks to the same level as physical risks in the organisational health and safety management system. With the development of this diagnostic tool, the work environment is systematically and pro-actively assessed for psycho-social risks and based on the outcome, an organisation level intervention is identified and implemented. This aligns with the SDG theme of Good Health and Wellbeing.

Keywords: meta-analysis, psycho-social, risk

Oral presentation OP163

A Model of Circular Work: Well-being, Performance, and Resource Regeneration

Christine Ipsen, Technical University of Denmark; Maria Karanika-Murray, University of Leicester

science&practice

Research goals and why the work was worth doing:

We are currently facing unprecedented and long-term unresolved challenges for both the well-being and productivity of the workforce (see United Nations SDGs), with a host of adverse outcomes at both individual (e.g., stress, burnout, reduced motivation, absenteeism) and organisational (e.g., reduced productivity, shortage of skills, staff turnover) levels. They also reflect a linear system where the individual resources applied to producing work outputs are depleted and exhausted through the process of work. We develop the notion of circular work as an alternative view that places emphasis on the regeneration of individual work resources and, in this way, aims to protect both the health and productivity of the workforce (Karanika-Murray & Ipsen, in preparation).

Theoretical background:

With this paper we propose a systems model of circular work to describe how individual work resources related to well-being and performance are used, depleted, and regenerated. We draw from the concept of circular economy (Pearce & Turner, 1990) and question the value of a linear understanding of work where workplaces treat individuals and resources as finite and present evidence that resource depletion and irreversible loss are costly in the short term and unsustainable in the long term, for both individuals and organisations.

Design/Methodology/Approach/Intervention:

This is a conceptual work model based on a critical evaluation of the evidence and insights from psychology, management, engineering, and systems theory. The approach is integrative rather than empirical. We start by describing the resources that individuals bring into the work process to produce agreed work outputs, as those that are related to well-being and mental health at work (psychosocial resources) and those that are related to work performance (capability resources), both of which are essential for productivity. We then examine how, through their use, these resources can be depleted (e.g. burnout, stress) or exhausted (e.g., sickness absence, staff turnover).

Results obtained or expected (if not available, it must be made clear when they will be):

We propose circular work as a regenerative systems-wide solution to preventing the irreparable loss of individual work resources. The starting point is a person-centred approach that acknowledges the interrelatedness of the two types of individual resources (well-being and performance-related) (Ipsen, Karanika-Murray, & Nardelli, 2020) and views these as renewable rather than finite. However, the organisational context is also integral in this process, for supporting the use/regeneration of resources and the work process. Through this analysis, we propose three principles of circular work: (1) individual work resources (well-being and performance-related) are renewable and mutuallyreinforcing, (2) the work process can lead to resource depletion, and (3) regeneration of resources is at the heart of circularity. We identify a range of mechanisms that can support resource regeneration, at both individual and organisational levels. By returning work resources back into the work process, work is circular and regenerative, and therefore sustainable for both the individual and the organisation. Limitations: This is a preliminary model that has yet to be tested empirically.

Research/Practical Implications:

The model has implications for reframing the role of management of well-being and performance at work and offering a solution towards developing management tools that integrate both the focus on well-being and the priority of performance in tandem. It also offers a novel perspective for integrating research into well-being/mental health and performance/productivity, supporting the growing area of sustainable work, and developing integrative theory. It can help to support the practice of well-being and performance by identifying methods to regenerate resources such as management practices, job redesign, and organisational level interventions. By better understanding how well-being and performance are dynamically interlinked in the work process, we can guide more sustainable work design and organisational practice.

Originality/Value:

The current disjointed approach to well-being and performance is a product of a prevailing either-or focus and a linear view of work. This has resulted in substantial losses in well-being, in various guises, and an unresolved productivity paradox, in the UK and elsewhere. Therefore, by providing a descriptive model of how individual resources can be regenerated to minimise waste and support sustainable work, the value of the circular work model lies in its potential for unifying diverse fields of theorising, research, and practice by closing the loop between the use and exhaustion of work resources. It also offers a feasible solution to the consensus that well-being and performance are interlinked but also a failure to address both in tandem.

Keywords: well-being, performance, sustainable work

Oral presentation OP527

A multimodal approach to detection of faking in a selection interview

Maja Parmač Kovačić, University of Zagreb, Croatia; Nataša Juničić, Center for Vehicles of Croatia

science

Research goals and why the work was worth doing

The selection interview is one of the most frequently used methods of personnel assessment for various jobs, despite its susceptibility to response distortion. Existing research indicates that experts in personnel selection are no better than chance in their detection of response distortion, irrespective of an interviewing experience. Some authors have proposed investigating the behavioural indicators of faking during the interview as one of the potential solutions for this challenge. However, the existing research on this topic is still scarce. Therefore, the aim of this study was to explore the possibility of detection of faking in a selection interview through a multimodal approach, based on paraverbal, verbal and nonverbal cues and facial expressions. Additionally, it was examined whether it is possible to detect response distortion with two different algorithms: one based on logistic regression and the other on artificial neural networks.

Theoretical background

According to various authors, differences in behavioural cues should mirror the differences in psychological processes between honesty and deception. More precisely, according to some theories (i.e., Buller & Burgoon, 1996; DePaulo et al, 2003; Walczyk et al, 2014; Ekman, 2002), deception should, at least under some circumstances, be more cognitively taxing, accompanied by more rigid behaviour and by less authentic facial expressions.

Design/Methodology/Approach/Intervention

In total, a convenience sample of 102 students/recent graduates (71% female, M age =24.2, SD age =3.08) participated in a videorecorded mock structured selection interview for the position of call centre manager. The interview consisted of two randomly ordered blocks: in one block participants had to answer honestly, while in another their task was to present themselves as an ideal candidate for the position. As an incentive to distort their answers effectively, participants were told that 10% of those with the most convincing self-presentations in faking condition would receive an award coupon of approximately 70 euros. At the end of the interview, some control variables and variables related to the experimental manipulation check were measured. Two independent coders analysed cues from every behavioural category. Additionally, facial expressions were analysed with the OpenFace application.

Results obtained

The manipulation check indicated that participants answered less honestly, used more faking strategies, experienced more cognitive load and fear of detection, and controlled their behaviour more when presenting themselves as ideal candidates. They achieved higher scores on extraversion and honesty/humility while faking as well. Interestingly, participants reported higher levels of motivation to present themselves convincingly in the honest condition.

Regarding the differences in behavioural cues between honest vs. ideal candidate conditions, significant multivariate effects were obtained for paraverbal, verbal and facial expressions (both for human coders and OpenFace) categories. Same levels of performance in classifying interview

conditions were achieved both with logistic regression and artificial neural networks, with 65% overall accuracy rates.

Limitations

Although statistically large effect sizes were obtained for various measures of the experimental manipulation, in an absolute and practical sense the psychological differences between conditions could have been more pronounced. Also, the convenience sample of highly educated participants was used.

Conclusions – research and or practical implications/Originality/Value

Although it was demonstrated in this study that response distortion in selection interview could be detected by its unique behavioural signature, not all modalities and their cues are equally useful. Additionally, when investigating different algorithms, future researchers should remember that more powerful models are not necessarily more successful in classifying candidate responses during the interview.

Relevance to the Congress Theme

This study demonstrates the possibilities of an interdisciplinary approach in solving the longstanding problem of faking in selection interviews by combining psychological insights and research design expertise with statistical algorithms and applications based on machine learning and AI.

Keywords: Selection interview, faking, behavioural cues

Oral presentation OP697

A network approach to the burnout-engagement relationship: A new perspective

Marius Hafstad & Knut Inge Fostervold | University of Oslo

science

Theoretical background and research goals

The dialectical theory of burnout and engagement (Leon et al., 2015; Schaufeli & De Witte, 2017) has been proposed as the solution to the longstanding jingle-jangle debate about the relationship between burnout and work engagement. The dialectical perspective propose that burnout and engagement are two distinct, i.e., real , and simultaneously overlapping, i.e., redundant, constructs (Leon et al., 2015; Schaufeli & De Witte, 2017).

However, we believe the conclusion and support for a dialectical perspective (Schaufeli & De Witte, 2017) on the burnout-engagement relationship is premature for several reasons. First, previous studies have examined and compared the psychometric properties of burnout and engagement by utilizing the two most common measurements, namely Maslach Burnout Inventory (Maslach & Jackson, 1981) and Utrecht Work Engagement Scale (Schaufeli et al., 2002). As such, preliminary evidence speaks more of a dialectical relationship between the two measurement scales. Arguably it is important to use other instruments because the field of psychology struggle to measure phenomena (Flake & Fried, 2020; Fried & Flake, 2018) and measurement can influence constructs (Edwards & Bagozzi, 2000). For example, in personality psychology, the relationship between extraversion and loneliness was moderated by the particular loneliness scale that was used (Buecker et al., 2020). In fact, correlation coefficients ranged from -.44 to -.19 depending on the scale.

Second, the empirical evidence that support a dialectical perspective has largely utilized a factor analytical approach to examine the relationship. Consequently, the similar analytical approach may account for a similar interpretation of results. In the latest examination, Trógolo et al. (2020) use the bifactor model to support the dialectical theory approach. They find that cynicism (burnout) and dedication (engagement) share a parent construct, while exhaustion (burnout) and vigor (engagement) do not. However, the bifactor model is known for numerous concerns including evidence of overfitting, unstable parameter estimates, and statistical bias in favor of bifactor models, even when other simpler models fit similarly well (Morgan et al., 2015; Murray & Johnson, 2013; Watts et al., 2019).

We believe that the empirical evidence so far suggests that burnout and engagement should be examined using network theory. Thus, the aim of this presentation is to introduce the network approach to burnout and engagement. While we agree that “considering burnout and engagement complete opposites (or a single construct) is inadequate” and an “incomplete view” (Leon et al., 2015, p. 92), we suggest to view them in light of network theory and as a network system that assumes dynamic and reciprocal relationships between variables. The approach allows for detailed examination of measurement and can reveal relationships between constructs (or communities) that answer authors calls for new theories and methodologies in the examination of burnout and engagement (Cole et al., 2012).

Design/Methodology

We examine the relationship between burnout and engagement in two different datasets. We answer the call for open science using one open online dataset by Gottenborg et al. (2022) with 2469

employees from two companie is in Norway. The second dataset is a cross-sectional study of more than 800 employees from UK and the US.

Results obtained

Preliminary results suggests that while engagement and burnout are separated, the items share different relationships (both positive and negative) with different items. At the center of the network is the exhaustion items, indicating that exhaustion is an important shared characteristic between engagement and burnout.

Limitations

We have two limitations. First, all data was collected by surveys, making it prone to common method variance. Second, we use cross-sectional design which makes it difficult to draw inferences about the direction of relationships in this study.

Conclusions

In this study, we show that engagement and burnout share a complex relationship where there are, albeit mostly negative correlations, positive and negative correlations between items. We uncover exhaustion as the center of the network, providing reason to believe that employees can become burned out if they are highly engaged over time. Consequently, a network approach to understanding engagement and burnout can increase our understanding of the relationship between engagement and burnout and provide avenues for future research on interventions.

Relevance to the congress theme and SDG

The changing world of work demand that we understand these two highly researched and well applied individual constructs. Furthermore, this topic cover decent work and economic growth and good health and well-being.

Keywords: Burnout, Engagement, Network analysis

Oral presentation OP635

A simulation tool for prospective work analysis and work design

Rüdiger von der Weth, Rinat Safoulline, Sabine Oeste & Tobias Jakubowitz | Hochschule für Technik und Wirtschaft Dresden

science&practice

Goal

The aim of our work is to develop a simulation tool for the analysis of demands for future work systems. It shall be used (A) as a tool for the planning and design of work places and production systems in industry to include aspects like mental health and qualification right from the start of the design of organisations and workplaces and (B) as core of simulation games for training and qualification.

Originality

Until now simulation tools for the assessment of human work exist mainly on the fields of anthropometry and production planning and control where the performance and qualification level of working persons are included in the planning process.

Theory

Starting point was an analysis of empirical research on the consequences of digital transformation on the demands of industrial work and classical results of the analysis of socio-technical systems and action regulation theory.

Method

Several models were derived which allow to perform simulation runs depending on the quality of available data in the design process. They were applied on the data of an empirical study for testing and calibrating the simulation model (n=41) and develop the simulation tool. This study was conducted in an Internet-of-Things-Testbed which allows to configure different kinds of work systems in a highly automated laboratory environment with state of the art production technology. The complexity of tasks and therefore the intellectual demands for the subjects was varied as well as the level of experience with this kind of work. Questionnaires, behaviour observation and process data were generated to create data for calibrating the model by comparing individual work processes with simulated processes generated by the application of the model on so called theoretical agents. These are configurations of demographic and questionnaire data in terms of the model. Their behaviour should fit to the data of real work persons of the same type. The results of the study serve as a validation and calibration of the model. After that it was tested in the practical context of a design process for a new work place in semi-conductor industry and assessed by the users.

Results

The simulation was transformed into a software tool, which allows to derive prototypical work processes for different simulated work persons described by variables like qualification level, work experience, self-efficacy, sense of coherence and attitude to the task for specific work places which are developed during a design process. The simulation tool is used for simulating psychological consequences of different possible solutions for the design of a work system which shall be implemented in a production system. During the planning process of new production facilities different solutions can be assessed on a conceptual level and conclusions about the consequences

for mental health and qualification demands can be drawn. This process is supervised by the research team to ensure an adequate use of the simulation tool and to develop a guideline for future use cases in this context. In a parallel use case the model is the base for a computer simulated game for the additional qualification of safety engineers and managers in a module developed for the german social accident insurance (DGUV). The participants have the chance to test the consequences of different designs of work places and work tasks on different types of work persons to optimise the use of new technology in a concrete game setting of a course for safety managers. This can be done in a simulated warehouse of a notional little company were different variants of new technology can be implemented and the consequences for the work persons can be studied.

Limitations and Implications

Besides the general approach of the simulation model, now the tool is developed and used only in the field of industrial work on the shopfloor level. More features have to be included for workplaces in other sectors and such with higher intellectual demands. Moreover guidelines and qualification courses for an effective and efficient use of the simulation tool in planning processes and training shall be developed.

The research has been funded by grants of the programme Ecsel-Horizon (project iDev4.0, EU, BMBF, Free State of Saxony) and the german social accident insurance (DGUV).

Oral presentation OP135

A study to determine the Antecedents of Interpersonal Trust in Hybrid Working Conditions

Marilyn Mathew, Kristina Potočnik & Lila Skountridaki | University of Edinburgh

science&practice

Theoretical background: The outbreak of COVID-19 saw a varying range of repercussions, with one of them being the extensive implementation of virtual mode of working. In particular, a large number of organisations, which predominantly relied on in-person work were forced to adopt virtual work. After state measures on virtual work eased, a large portion of the organisations transitioned to a hybrid work mode, whereby staff worked on site for part of their working hours. Currently, hybrid work remains common in a range of organisations. It is associated with benefits for both employees and employers such as, improved work-life balance, the provision to work with fewer distractions, saving time and cost for commuting, saving office spaces, reduced absenteeism, and increased job satisfaction (CIPD, 2022).

After exploring the existing research, trust when working in a hybrid mode stands out as an area of concern. This is because, trust is known to play a major role in employee-employer relations (Grzegorczyk et al., 2021) and little is known about how trust develops in hybrid work settings.

Upon looking into the different types of trust, there is one category of trust that emerges as being the driving force in ensuring the long-term stability of an organisation while also incorporating the well-being of its members. This category of trust is termed as Interpersonal Trust (Mayer, Davis, Schoorman, 1995) is expected to be impacted in post-pandemic workplaces as both managers and employees have developed concerns over each other's trustworthiness. Managers believe that hybrid working results in a loss of control and co-ordination (Grzegorczyk et al., 2021), whereas employees believe hybrid working style has increased the difficulty of sharing evidence of their trustworthiness in working conditions that have lowered their visibility (Mortensen & Haas, 2021). Despite its widespread adoption, hybrid work practices are typically new to most organisations, with interpersonal trust potentially playing a central role in the successful implementation of hybrid work arrangements. Therefore, this study focuses on determining which antecedents impact the development of interpersonal trust in hybrid working.

Methodology: To ensure that this study extensively explored all the possible antecedents of interpersonal trust in hybrid working conditions, while also considering that trust is dyadic in nature, a qualitative methodological approach was chosen.

Employees and managers were interviewed from an organisation belonging to the third sector, to understand both perspectives regarding how their interpersonal trust towards one another has developed in hybrid work setting. The interviews were semi-structured in nature to ensure that the participants had the opportunity to reflect on their hybrid working experience without being constrained by our pre-prepared questions. Reflexive thematic analysis (Braun & Clarke, 2022) was used to analyse the content of the interviews. Nvivo Version 20.7.1 was used for coding.

Results: This study highlights the key antecedents of interpersonal trust for individuals working in hybrid work setting, such as communication quality and vision and values. Communication quality includes aspects like clarity of communication, and having freedom to have difficult conversations as it helps build trust. Communication also emerged as a strong factor that led to the development of interpersonal relationships, thereby maintaining and building trust, once the individuals have gone

past the initial phases of trust building. Shared vision and values were also shown to have an impact in the development of interpersonal trust in hybrid work.

Limitations: The main limitation is that this study investigated the antecedents of interpersonal trust at the individual level between an employee and their manager and did not consider how the interpersonal trust was developed in teams. Also, as we considered participants who were presently working in the UK, the study failed to account for any cultural variations that might have an impact on how interpersonal trust is developed.

Conclusions: This study sheds light on different antecedents of interpersonal trust in hybrid work settings, such as communication quality, interpersonal relationship, and shared vision and values. As such, our findings extend the current theory on interpersonal trust by adding evidence on how this type of trust is developed in a unique context that has been under-theorised to date. These findings have the potential to drive quantitative studies that will establish the strength of the associations between different antecedents and interpersonal trust in hybrid work settings. In terms of practical implications, organizations can utilise our findings to shape the context in a way that fosters the development of Interpersonal Trust. For example, by using different digital or co-working tools (Cho & Lee, 2022) to enhance the Communication Quality.

Oral presentation OP456

A Support to Agency: the Associations between Support from Teaching Staff, Career Engagement, and Movement Capital among Italian University Students

Gerardo Petruzziello, Marco Giovanni Mariani, Rita Chiesa & Audrey Ansay Antonio | Department of Psychology, University of Bologna

science

Research goals

The entrance to the world of work is a challenging stage for young people, especially for their career development. Career behaviours are essential to counteract the complexity of the transition to the labour market. Accordingly, this study delved into career self-management behaviours encapsulated in the Career Engagement (CE) variable. In particular, we investigated the relationship between CE and Movement Capital. We also aimed to examine the predicting role of Support from teaching staff (STS) and online interaction during online learning. This study's value lies in enriching literature about the role of career behaviours among labour market entrants. Also, we shed light on the contextual meso-level factors which, in Higher Education, can facilitate career self-management behaviours and processes.

Theoretical background

According to the Conservation of Resources (COR) and Career self-management (CSM) theoretical frameworks, career behaviours tapped by CE represent an investment to enhance caravans of resources, represented here by Movement capital (i.e., Career Identity, Social Capital, and Self-efficacy). Moreover, STS – a form of social support reflecting work-based, career-oriented, and emotional-supportive teaching to prepare students for the world of work– is a social resource reflecting a resource caravan passageway, which may encourage students to be concerned with their career development. Arguably, STS may enhance students' CE and, in turn, Movement Capital development. Therefore, we hypothesised a mediation model where CE mediates the relationship between STS and Movement Capital (Hypothesis 1). Moreover, the pandemic directed scholarly attention to the role of interaction on online learning platforms in influencing learning experiences. Therefore, we explored whether and how online interaction between students and teachers moderates the relationship between STS and CE and, then, the mediation hypothesised (Research Question 1).

Methodology

Data collection started in March 2020. We invited last-year university students from several Italian universities to complete an online questionnaire. Participants have been assured confidentiality and acknowledged the right to participate upon informed consent. The final sample comprised 276 participants with a mean age of 25.63 years (SD = 5.84) and mostly Women (86.1%).

Results

We used the macro PROCESS of the SPSS package to test the hypothesis and answer the research question. Consistent with our expectations, we observed that CE mediates between STS and Movement Capital (Hypothesis 1 supported). In response to Research Question 1, we observed that the positive indirect effect between STS and Movement capital is significant and stronger at medium and high levels of Online Interaction.

Limitations

As most participants were women and with a Humanities background, a more representative sample may be required to test these relationships. Moreover, our empirical work may be replicated with a longitudinal design to produce more robust results and conclusions. Also, future studies may add or use items that measure the most recent experiences of teacher-student interaction in the online learning environment.

Conclusions

Our study provides evidence of CE's role in fostering Movement capital, which integrates existing research that sees career resources as inputs of career management behaviours instead. Future research should consider that entrants will need to rely on multiple behaviours to facilitate their transition. Also, we identified STS as one of the contextual Meso-level facilitators of career self-management, inviting future research to investigate these aspects further. We also highlight that in an online learning environment, the level of interaction is key to sustaining STS's role in fostering career development. Future studies may better articulate online learning factors and their impact. In a practical sense, our findings suggest devoting efforts to preparing teachers for their role of sustaining students' career progress and managing online activities. Also, targeted interventions should be aimed at motivating students' CE.

Relevance to the Congress Theme

Our study remarks on the need for Higher Education to embark on the social responsibility of supporting labour market entrants' career development. We call for integrating meso-level factors inside (e.g. teaching staff, career services), and outside (e.g. alumni, graduate recruiters) Universities to incorporate career education and career self-management themes into didactical activities.

Oral presentation OP334

A systematic review of the effectiveness of peer mentoring in the study entry phase.

Laura Gehreke, Simone Kauffeld & Hannes Schilling | Department of Industrial, Organizational and Social Psychology

science

According to Heublein and Schmelzer (2018) student dropout (25% of all Bachelor students), especially during the freshman year, is an issue facing universities today which can have longer-term consequences on an individual level (Klein et al., 2021), as well as for universities (Madner, 2015).

To address the problem, there are numerous interventions to support students in the early stages of their studies. One of the commonly used interventions is peer mentoring. It is defined as "an intervention strategy in which one or more students (i.e., mentees) are paired with a more experienced student (i.e., peer mentor) who provides both practical guidance and social support to the mentee(s)" (Yomtov et al., 2017, p.26). " It is designed to help promote academic and social integration of first-year students (Flores & Estudillo, 2018). According to Tinto (1993), academic and social integration are crucial factors that determine the decision to stay in university. In this context, academic integration is formally defined by students' academic performance and informally by interactions with faculty and perceptions of positive experiences. For social integration, extracurricular activities and peer support play a critical role. In general, students who feel more integrated into the university are more likely to graduate. Thus, peer mentoring plays a critical role, particularly in social integration. Furthermore Young and Perrewé (2000) present gender as an antecedent in their mentoring model. So Kalbfleisch and Keyton (2012) were able to show that women, in contrast to men, develop a friendly relationship more quickly in the mentoring relationship. Overall, women draw more social support from peer mentoring compared to men (O'Brien et al., 2010).

Comprehensive student support services are used by higher education institutions, but there is little substantiated evidence on the effectiveness of these interventions (Schubarth et al., 2018). The aim of this review is a systematic analysis of previous studies with regard to the effectiveness of peer mentoring as a support measure in the study entry phase. In doing so, effectiveness will be measured on the key variables of intention to drop out, sense of belonging to the university, and academic performance. In addition, since women experience e.g. more stress during the transition from school to university (Conley et al., 2014), it will be considered whether the effectiveness of peer mentoring differs between genders. In addition, particularly due to the COVID-19 pandemic, all services had to be digitally adapted (Breitenbach, 2021), so another research question looks at possible differences in the effectiveness of digital vs. non-digital peer mentoring.

The PRISMA guidelines were followed in conducting the systematic review (Page et al., 2021). To begin the search process, a search was conducted on Google-Scholar to identify existing reviews and key search terms and then a search string was developed at SCOPUS. The search string was then used to search three different databases: SCOPUS, Web of Science, and Ebscohost. The search results only included articles after 1990, as peer mentoring as we understand it today became established in the 1990s (Management Consulting, 2009). The search yielded a total of 17 801 articles. Their abstracts were rated by two independent individuals for inclusion criteria. A total of approximately 55 studies are included. Initial results show that peer mentoring is an effective support measure for first-year students. In particular, the social component of peer mentoring was found to be highly effective, predominantly among women. In general peer mentoring has an positive impact on emotional

needs, physical environment and social and academic integration. It was found that digital peer mentoring is indeed an effective alternative to non-digital peer mentoring. However, it was found that both psychological support and self-efficacy were rated lower in digital peer mentoring compared to non-digital peer mentoring. Further results are expected in March 2023. Peer mentoring is thus an effective support service that, due to its diversity and different components, can be adapted and used to meet different needs, e.g., increasingly for female students. Many implementation options are available for digital peer mentoring, which should be evaluated in the future in order to further establish the digital offering.

The issue is now of high relevance and urgency. Especially due to the Covid-19 pandemic and the resulting limited face-to-face teaching, it became apparent that it is much more difficult for students to arrive at the university and to establish contacts. Thus, it is important to highlight the importance of peer mentoring as a support measure in the study entry phase and also to shed light on the effectiveness and development of online formats for future crises.

Oral presentation OP150

A thematic analysis of how responsibility attribution and justice perceptions shape the impact of interpersonal emotion regulation on job well-being

David Martínez-Iñigo, Rey Juan Carlos University; Karen Niven, Sheffield University Management School; David Holman, Alliance Manchester Business School University of Manchester; Alejandro García-Romero, Rey Juan Carlos University

science

Research goals and relevance

Employees across many sectors, particularly those who are in customer or client facing roles, are expected to manage the feelings of those they serve, a process termed 'interpersonal emotion regulation' (IER). While research has conceptualized IER as a job demand that can affect employees' well-being, the goal of this research is to explore whether employees assign different meaning to this demand, depending, for example, on how fair they believe it is, and if the meaning they assign shapes the impact of IER on their well-being.

Theoretical background

Previous research has shown that employees´ IER at work is related to their own well-being. Most studies have focused on the psychological effort required and the resources available to meet IER demands as the main predictors of the kind (i.e., positive or negative) and intensity of effects of IER on employees´ well-being. However, employees´ interpretations of IER demands and their consequences for employees´ assessment of social exchange conditions during the interactions with others (clients, colleagues, subordinates, etc.) have received considerably less attention.

Recent studies have shown that the negative effects of intrapersonal and interpersonal emotion regulation at work partly depend on employees´ attributions for the associated emotional demands. In particular, attributions of responsibility for the organizational behaviors that lead to regulatory demands moderate the effects of emotion regulation on employees´ well-being. Results also shown that employees´ perceptions of distributive justice mediate the effects of responsibility attributions on well-being. In other words, when service workers attribute responsibility to the client, they perceive the situation to be less fair, and the intrapersonal emotion regulation they perform is associated with poorer well-being. However, it is not yet known whether employees make similar attributions and whether those attributions have similar consequences when it comes to IER.

Methodology

We conducted six group interviews (N=24) in our qualitative study. Participants were employees dealing with clients claims or complaints as their main activity during the working day. Participants were asked to describe different “typologies” of interaction with clients with regard to their impact on well-being. They also discussed the reasons to consider a particular kind on interaction relevant, its relationship with the quality of the service delivery, its impact on their exhaustion and its consequences for subsequent interactions. Transcriptions of the interview were thematically analyzed by three independent coders.

Results

Thematic analysis revealed a considerable consensus among participants identifying the classification of the client as responsible for the claim demanding employees´ regulation of the

client's emotions as a relevant category, together with the client´s attitude (aggressive vs. cooperative) and the client´s power (e. g., their influence on social network or the size of their turnover). Moreover, participants agreed upon the role of responsibility in the definition of the interaction as unfair ("demanding an undeserved effort"). Both attribution and fairness were associated with the effort that participants put into regulating the client's emotion. When the client was perceived as responsible for the emotional demands (e.g., to calm down a client who is angry because the product, that they have improperly operated, has not been replaced), employees reported putting less effort into service delivery. Paradoxically, they also considered this kind of interaction more exhausting, despite putting in less effort. This less-effort/more exhaustion paradox suggests that the meaning that employees ascribe to emotional demands shapes the impact of these demands on their well-being, over and above the amount of effort that they invest.

Limitations

Although the present results are promising, we acknowledge that this exploratory study has some limitations, including a relatively small sample size. Further studies using different methodological approaches will be needed to confirm the validity of the relationships established between the variables and to assess the extent to which the findings can be generalized.

Conclusion

Overall, the study confirms the relevance of employees' interpretations of emotional demands to explain the effect IER on well-being beyond the employees´ effort to meet them. Employees´ attributions on the interpersonal emotional demands from their job roles/organizations can help to clarify their perceptions of client interactions clients as (un)fair and consequent effects on employees´ perception of their working conditions as decent work.

Relevance to Congress theme

Understanding how the demands of emotional regulation affect well-being at work is an issue that needs to be urgently addressed in order to improve the working conditions of a wide range of workers.

Keywords: Interpersonal emotion regulation, responsability attribution, well-being

Oral presentation OP727

A workforce health and wellbeing performance measurement and management system – a novel approach to health data collection and reporting in GB rail

Magdalena Wronska & Noodhir Sobun | Rail Safety and Standards Board

practice

The British railway employs 115,000 people, supports a further 250,000 through its supply chain and contributes a £36bn annually to the economy. Its safety culture, through cross-industry data collection, monitoring, and public reporting, is well established, which has resulted in dramatic reductions in safety-related incident. The aim of this research is to support the industry in establishing an equally strong culture of data collection and sharing in the health and wellbeing (HWB) of the workforce. The rail workforce is regularly exposed to physical (e.g. vibration), ergonomic (e.g. flawed design of driver cabins) and psychological (e.g. witnessing suicide) hazards leading to poor health.

You cannot manage what you cannot measure. Data is becoming increasingly important in many fields including healthcare and HWB management in organisations, and there is growing interest from rail companies in HWB systems, and many are developing their own, presenting an opportunity for the industry, as a whole, to mature. With the support of cross-industry HWB groups, this work has built and is trialling a HWB performance measurement and management system (the dashboard) for GB rail.

The new dashboard provides rail organisations with a comprehensive measure of the health and wellbeing of employees. Currently at pilot stage, the dashboard is designed specifically for the rail sector. It measures 24 key performance indicators (KPIs), which were developed in collaboration with organisations across the industry. KPIS include long term sickness absence, lost time rate, reasons for sickness absence, health surveillance indicators as well as indicators on Covid-29, employee assistance programmes and drug and alcohol testing. Eight of the 24 health KPIs are converted to a single score – the Health and Wellbeing Index (HWI). The intention was to produce an equivalent of the Fatalities and Weighted Injuries Index (FWI) for health and wellbeing. The two indexes are compatible: the HWI value can be compared directly with the FWI, and both can be monetised to inform investment priorities.

Using data over a 3-year period from 16 rail organisations (including train operating and infrastructure and supply chain companies) as a start, this research through the implementation of its measurement and management system have shown that the rail industry's average cost of sickness absence is £3,341 annually per employee, which is £2.3k (or 8.5 days) more than the national average. Previous research showed that sickness absence and presenteeism costs in the rail sector are estimated to be £889m annually. These figures suggest that for every £15 lost to sickness absence, only £1 is spent on supporting employee health. In addition, data shows that the most common reasons for sickness absence are mental ill-health problems (16%), followed by musculoskeletal disorders (MSD) (14%). A high proportion of absence is recorded as other or unknown and data is self-reported, and therefore may be prone to inaccuracies related to diagnosis or categorisation. Furthermore, 60.56% of employees undertake safety critical work. Within that group, 98.87% passed drug testing as negative. It is the first time that GB rail, the Department for Transport and the regulator have a pool of HWB indicators for strategic decision-making. However, the data consistency and quality are poor, not allowing to report on all indicators.

For the first time, organisations can access shared, aggregated data to assess and monitor health risks, and benchmark against others. It drives behaviour change in HWB interventions, informs policies and helps build business cases. Benchmarking groups, taking place twice a year, have been established as a part of the project, where participants discuss their data in a confidential forum, debate common issues and share best practice. In addition, a major benefit of the whole system is that it encourages continuous improvement through quarterly recommendations tailored to participants and disseminated at an industry level. This two-pronged approach includes a data quality heat map to ensure that the data can be relied upon when maturity improves while also providing actionable insights on ways to support employees' HWB.

Keywords: health, data, management

Oral presentation OP734

Abstract not Concrete Rumination Explains Reduced Well-Being: Two Experience Sampling Studies

Jacek Buczny, Vrije Universiteit Amsterdam; Monika Kornacka, SWPS University of Social Sciences and Humanities at Katowice

science

Nowadays, employees are confronted with a growing number of stressors, such as long workdays and technological advances in communication. Despite a great body of research that help to understand the origins and mechanisms of stress and its consequences, burnout rates further increase, negatively impacting well-being of the workforce.

Experiencing daily stressor, especially related to social contacts, results in negative outcomes. The long-term accumulation of being exposed to daily stressors can lead to a decline of one's well-being and can increase the risk of chronic diseases. Coping is an important mechanism involved in dealing with daily stressors. Problem-focused strategies can be more effective and beneficial for the individual than avoidant strategies. Previous research has demonstrated that the coping strategies is, to a certain extent, dependent on personality. Interestingly, relatively little attention has been paid to content-specific traits like perfectionism. This is surprising, considering that perfectionism is more prevalent in the workplace than in other life domains.

Maladaptive forms of perfectionism have been linked to increased stress levels, depression and anxiety. In addition, maladaptive perfectionists are more likely to experience burnout, and have lowered evaluation of their professional competence. Studies on rumination delivered promising results to better understand the mechanism behind the negative outcomes of daily stressor and certain personality-related tendencies such as perfectionism. While rumination is generally considered a form of repetitive thinking and it is viewed as maladaptive, repetitive, prolonged, and recurrent negative thinking about oneself, feelings, personal concerns and upsetting experiences. Rumination is a way of responding to and coping with stressor and varies depending on the situation; state rumination refers therefore to the level of rumination experienced at a certain moment in time. Concrete rumination are thoughts about the concrete experience at hand, and the process of handling it appropriately. These thoughts can therefore be constructive or adaptive. Abstract rumination, on the other hand, is defined as a conceptual-evaluative self-focus, and it does not improve problem-solving abilities and has been found to be associated with intrusions about failure, as well as negative mood.

In the Study 1 (N = 109), we tested the prediction that abstract (not concrete) rumination mediates the positive relationship between daily (social) stressors and decreased well-being, whereas in Study 2 (N = 110), we tested the prediction that abstract (not concrete) rumination mediates the positive relationship between maladaptive perfectionistic tendencies and decreased well-being. We conducted the studies with samples of working individuals, using an experience sampling method (ESM). In 5-day long procedures, we collected data for 15 beeps. Each beep was sent randomly between 8 a.m. and 6 p.m., three beeps were sent every day. All the focal variables were tested at the beep-level, while controlling for mood and demographics. The main results supported the prediction for Study 1: the indirect effect for abstract rumination on decreased well-being was positive and statistically sigificant, B = 0.21, SE = .10, 95% CI [0.04; 0.44], but for concrete rumination was statistically non-significant: B = –0.05, SE = .05, 95% CI [–0.12; 0.02]. Similarly, in Study 2, the indirect effect for abstract rumination on decreased well-being was positive and

statistically sigificant: B = 0.13, SE = .04, 95% CI [0.06; 0.20], but for concrete rumination was statistically non-significant: B = 0.01, SE = .01, 95% CI [–0.02; 0.02].

The findings suggest that abstract rumination disrupts the recovery process related to mental health by reactivating and prolonging negative responses, and this identifies rumination as a core-mechanism between daily stressors, perfectionistic tendencies, and well-being. Previous research has shown that ruminations in general act as a maladaptive coping mechanism for uncontrollable work stressors. In these studies, we showed that this effect is specific for abstract not concrete rumination. Thus, the current research is aligned with processing mode theory that differentiates between maladaptive and adaptive types of rumination.

In previous research it was shown that mindfulness training can be an effective method reducing maladaptive rumination, and thus, can improve well-being of the workforce. We recommend organizations offering mindfulness trainings to their employees and encourage their team leaders to support such programs. Importantly, creating an office space specifically helping to reduce rumination can contribute to organizational culture that appreciates well-being of employees.

Abusive Supervision and the loss spiral: A study on the role of negative leadership in the JD-R model

Andrea Caputo, Psychology Department - University of Turin; Paola Gatti, Psychology Department - University of Milano-Bicocca; Valerio Dimonte, Department of Public Health and Pediatrics - University of Turin; Giacomo Garzaro, Department of Public Health and Pediatrics - University of Turin

science

Research goals and why the work was worth doing:

Drawing upon the Conservation of Resources (COR) theory (Hobfoll, 1989) and the Job Demands-Resources (JD-R) theory (Bakker & Demerouti, 2017), this study aims to investigate the role of a negative leadership style in impoverishing resources and increasing the negative consequences of demands for people at work. Furthermore, the role of leadership in the JD-R model is an aspect that needs to be developed and further explained; previous empirical studies (Schaufeli, 2015; Tummers & Bakker, 2021) attempted to clarify its position and role in the JD-R model. Considering the latest study about JD-R theory (Bakker et al., 2023) and the influence of leaders in shaping followers' wellbeing (Caputo et al., 2023), the role of leadership within the JD-R model needs further investigation to be clarified and test if leadership could be a resource (or a demand) itself.

Theoretical background

Abusive supervision is a negative leadership style according to which people perceive that their leader is engaging in "the sustained display of hostile verbal and nonverbal behaviors, excluding physical contact" (Tepper, 2000, p. 178). Considering that the central tenet of COR theory is that "individuals strive to retain, protect, and build resources" (Hobfoll, 1989, p. 516) and that abusive supervision consists of leaders ridiculing and undermining their followers, this leadership style could imply a decrease in resources among individuals, and trigger the subsequent resource loss spiral (Hobfoll, 1989). Abusive Supervision could, therefore, on the one hand, negatively affect followers' work engagement (Barnes et al., 2015; Li et a., 2021; Scheuer et al., 2019) by weakening personal resources such as self-efficacy (Xu et al., 2015), and on the other hand increase employees' emotional exhaustion (Xu et al., 2015) due to augmented perception of job demands, such as workload.

Design/Methodology/Approach/Intervention

A sample of 1505 nurses completed a self-report questionnaire. A full-model SEM approach was used for data analysis.

Results obtained or expected

The model shows a good fit: chi-square(797)= 2733.403; $p < .001$; CFI = .91; TLI = .90; RMSEA = .04 (.039, .042); SRMR = .06. Results confirm that, on the one hand, Abusive Supervision has a negative direct impact on Work Engagement (standardized beta = -.15) also through a weak mediation of Occupational Self-Efficacy (standardized beta = -.01); on the other hand, Abusive Supervision increases followers' Emotional Exhaustion (standardized beta = .20) also through the mediation of perception of Workload (standardized beta = .03). Direct and indirect effects are presented.

Limitations

Limitations include the cross-sectional nature of the study, which could only give starting insights about the loss spiral, and the lack of differentiation of effects based on the specific characteristics of the medical units.

Conclusions – research and or practical implications/Originality/Value

Theoretical implications of the present study are twofold: 1) deepening the role of leadership in the JD-R model, in this case as a contextual factor (a predictor of resources and demands); 2) giving suggestions about the functioning of the loss spiral. Longitudinal analysis is required to better explore the dynamics of the loss spiral. Practical suggestions concern tips for nurse managers about the crucial role of leadership in improving followers' resources (against the impact of negative leadership styles which determine a resource loss).

Relevance to the Congress Theme

In the work of the future, health care leaders need to be more aware of their role and their "power" to improve the resources of their subordinates. This resource enhancement is especially important in the health care sector, considering that nurses' workload will become increasingly heavier in the times to come.

Keywords: Abusive supervision, Job Demand-Resource, Conservation of Resources

Oral presentation OP609

Acceptance and Commitment Training (ACT) for work stress recovery

Elina Honkasalo & Markku Jokisaari | Turku School of Economics, University of Turku

science&practice

Research goals

A modern way of working challenges individual well-being in many ways, and work-related stress causes not only individual suffering but also, creates a considerable economic burden both for the organisations and society as a whole. Previous research has suggested that recovery can minimise the negative effects of work stress and therefore, called for more recovery intervention research. In response, this research aimed to 1) examine to what extent Acceptance and Commitment Therapy (ACT)-based recovery intervention affects work stress recovery and 2) investigate the mechanisms of this change. The proposed hypotheses were:

H1: ACT-based stress recovery training produces a positive change in recovery-related variables compared to the waitlist control group

H2: The intervention leads to post-intervention improvements also in occupational outcomes

H3: The expected post-intervention improvements in outcome variables will be mediated through improvements in psychological flexibility (i.e. change in participants' relation to their unwanted inner experiences such as undesirable thoughts, emotions and sensations)

H4: The intervention effect will be moderated by participants' level of stress, psycho-/physiological strain, work demands, social integration and support and/or job autonomy

Theoretical background

Strain, change, uncertainty, stress, growing demands and diminishing resources, long working hours and difficulties in organising work–leisure balance paint the picture of contemporary working life. While working can provide individuals with several positive resources, such as the potential for development and personal growth, and a sense of accomplishment and meaning (Christensen et al.2009), it is also a significant source of stress. Consequently, recovery – that is, the opposite of the strain and stress process – is perhaps more important than ever. Successful recovery can neutralise the negative effects of stress, and arguably, the key is not how much one experiences stress, but how well one recovers from stressful periods (Lindholm, 2013; Kinnunen & Rusko, 2009; Feldt et al., 2007). Previous research has provided indicative evidence that recovery can be improved through training interventions and identified a few different effective intervention approaches. However, Acceptance and Commitment Therapy (ACT) – a third-wave cognitive-behavioural approach – has not, to the best of author's knowledge, been studied in relation to work stress recovery. This is the research gap this research aims to address.

Methodology

The 58 participants of the study were assigned either to an ACT-based recovery training group or a waitlist control group. The participants received 12 hours of ACT-based recovery intervention that included psychological flexibility (i.e. mindfulness- and value-) exercises and an introduction to recovery from work stress. The data was collected at pre-, post- and 6-month follow-up, and analysed with appropriate statistical methods.

Results

Based on the initial analysis of the data, the ACT-based recovery intervention significantly increased work-related psychological flexibility, recovery experience, occupational self-efficacy and decreased need for recovery with small to medium effect sizes from pre- to post-intervention. However, the analyses of the control group, long-term and mediation-moderation effect are still in progress, but the results will be available by March 2023.

Limitations

The number of research participants is somewhat limited and this must be taken into account, both when analysing and interpreting the results. In addition, only half of the participants were randomised into intervention/waitlist groups. It, also, bears noting that, one intervention group was organised online (due to the pandemic), whereas the other three groups were arranged face-to-face.

Conclusions

By bringing together ACT and recovery research, this research contributes to and extends the previous research done in both disciplines. Firstly, this research answers the theory-development calls requesting more rigorous recovery intervention research (Sonnentag et al. 2017) and provides empirical support to the suggestion that recovery is, at least to some extent, malleable and trainable (Sonnentag et al. 2022). Secondly, this research provides evidence for ACT's feasibility for the working population and its ability to increase recovery experience and decrease the need for recovery, results exceeding those previously studied. Lastly, the research also contributes to our understanding of mechanisms of change by investigating the mediation-moderation effect of the intervention. From a more practical point of view, the final outcome of this study is to provide occupational health care and organisational wellbeing units with a scientifically-tested, ACT-based training that can help their employees to tackle work stress and recovery challenges.

Keywords: stress, recovery, ACT

Oral presentation OP93

Adapting or losing it? How time pressure and emotional exhaustion relate over time

Maren Mühlenmeier & Tim Vahle-Hinz | Psychologische Hochschule Berlin; Thomas Rigotti & Johannes Gutenberg | University Mainz and Leibniz Institute for Resilience Research

science&practice

Research goals and why the work was worth doing. Two prominent theories make predictions about how workplace stressors and well-being of employees might develop over time. First, the Adaptation theory suggests that people undergo a change in well-being after experiencing a critical life event or stressor, while also returning to their individual set point of well-being over time. Second, Conservation of Resources theory posits loss spirals, where the loss of a resource relates to a further subsequent loss of resources. Building on these two theoretical models the present study follows the numerous calls to closer investigate variation of both job stressors and well-being over time. Specifically, using data from an intensive longitudinal study, we examine the well-known relationship between time pressure and emotional exhaustion in its development over time. We aim at examining (1) if both time pressure and emotional exhaustion show adaptation over time, (2) if adaptation of one variable can be disrupted or enhanced by the (chronic) level of the other variable, and (3) how resource loss spirals occur in the interrelationship between time pressure and emotional exhaustion. The present study sheds new lights on existing theories on stressor-strain relationships by investigating the dynamic development of stressor-strain relationships over time.

Theoretical background. Although diary studies and thereby the study of within-person effects have become quite common in recent years, the focus has been on within-person effects, mainly neglecting temporal dynamics of workplace characteristics and well-being. The Adaptation theory and the Conservation of Resources theory make predictions about temporal developments of stressors and strains over time. Little is known about what enables and prevents the adaptational process. Relatedly, it remains unknown how loss spirals develop over time in the interrelationship between time pressure and emotional exhaustion. The present study aims at providing a deeper understanding of the development of stressor-strain relationships over time. Additionally, as empirical and theoretical evidence suggests that not only stressors relate to strain over time, but also strain relates to stressors (reverse causation effects), we systematically investigate both directions of effects.

Study design and methods. We conducted a weekly measurements study across eight consecutive weeks. Every Friday participants answered questions regarding time pressure and emotional exhaustion of the previous week. In total, $N = 259$ employees responded to our questionnaires. Sixty-two per cent of the participants were female, and the mean age was $M = 40$ years (ranging from 21 to 68 years). Participants came from a variety of occupations, with the majority working in the health care and social sector (17.4 %), followed by public administration (11.6 %) and industry (10 %). In order to investigate the development over time of time pressure and emotional exhaustion, as well as the relationship between these two variables, we use structural equation modelling and investigate cross-lagged relationships within our eight measurement points. Furthermore, we consider the relationship between a change in time pressure with a change in emotional exhaustion. In all analyses, we investigate the causal relationship from time pressure on emotional exhaustion as well as the reverse causation effect.

Results. Initial analyses support a reciprocal relationship between time pressure and emotional exhaustion. Results for analysing adaptation and resource loss spirals will be presented.

Limitations. The study design is limited to a weekly measurement of workplace characteristics and well-being to examine their adaptational effects when facing temporal dynamics across time. Thus, it is not possible to draw any conclusions on short- or long-term dynamics (e.g., on a daily, monthly, or yearly basis).

Research and practical implications. By focusing on adaptation processes in both workplace characteristics and well-being, we extend literature on adaptation and resource loss and gain spirals in the work context and offer practical implications with regard to resource spirals and working conditions.

Originality and value. In line with the UN SDGs targeting good health and well-being, it is important to understand the interplay between temporal dynamics of both workplace characteristics and well-being in the occupational health and stress context as well as their adaptational processes. This will help to refine current stress and resource theories. Also, deeper knowledge on the effects of dynamics of workplace characteristics and well-being over time will aid to provide evidence-based recommendations on job design in the changing world of work.

Keywords: stress, well-being, development over time

Oral presentation OP814

Deciphering Disengagement in Managers

Siobhan Victoria Renshaw, University of Exeter; Ilke Inceoglu, Alexandra Gerbasi, Allan Lee

Research goals and why the work was worth doing

Employee engagement has received much attention from academics, practitioners and organisations alike owing in no small measure to the plethora of benefits it boasts. Employee disengagement, however, remains relatively neglected and the concept is not well defined in management research. The experiences of disengagement of those who hold managerial positions may differ from those in non-managerial roles and may be highly consequential. This research explores the qualitative experience of employee disengagement, specifically in managers.

A reappraisal of disengagement is appropriate and timely. The disengagement literature is extremely limited. Existing literature tends to focus on engagement and to position it on a continuum with disengagement, or as a narrowly defined subconstruct of another construct, such as burnout. The world of work has undergone unprecedented change in the c.30 years since Kahn defined engagement and disengagement back in 1990; employees of 2022 operate in a very different world. Existing conceptualisations don't accommodate for potential variation in disengagement experiences between managers and non-managerial employees. Fundamental differences inherent in the dynamics of managerial roles such as different demands and resources make it possible that their experience of disengagement has distinct characteristics compared to those they manage. Consideration of disengagement in managers is important, not least given their influence on the engagement and disengagement outcomes of the entire workforce. This research aims to contribute towards a conceptualisation true to the experiences of today's employees and inclusive of managers.

Theoretical background

Kahn's theoretical framework for engagement and disengagement was built on motivation and job design. As a starting point, Kahn's consideration of personal disengagement is a functionable perspective pertinent to this paper. A key characteristic of disengagement in managers may be the leaving out from role performance elements of one's authentic self. The current research also draws on Crawford, LePine & Rich's (2010) work focusing on challenge and hindrance demands. Their theoretical framework functions as a useful lens through which to examine individual experiences of disengagement through exploration of appraisals of work conditions perceived as relevant. Social Exchange Theory views employees' decision to disengage in contractual terms as a result of perceived unfavourable return from their organisation on investment of their personal resources. This is based on the idea that individuals perform a cost-benefit analysis when making social decisions (Cropanzano & Mitchell, 2005). The dearth in the research on disengagement also necessitates some consultation of the engagement and burnout literature.

Design/method

Semi-structured interviews were conducted to gather insights into how disengagement is understood, its key characteristics, manifestations and outcomes.

Reflexive thematic analysis was performed to analyse this data. This latest articulation of thematic analysis operates with acute awareness of the researchers influence and gives primacy to the

importance of ensuring data interpretation remains as close to the intended original meaning as possible.

Results expected - December 2022.

Limitations

This study represents the first of a two-part programme of research. Results shall be transferable to similar contexts as opposed to being generalisable. Further research should focus on understanding disengagement in managers in different contexts. The root causes of disengagement in this group also warrants focus in future research.

Conclusions

This research informs research and practice. There are implications for how disengagement should be defined, measured, and ultimately addressed in interventions. This research is intended primarily for an academic audience but was designed with bridging the management research and practice gap in mind. It aims to produce insightful information that is relevant and accessible to academics which can be harnessed by practitioners to inform successful evidence-based interventions.

Very little academic attention has been dedicated to employee disengagement prior to this research. Disengagement specifically in managers is entirely overlooked. This research represents an empirically founded first step towards a revised conceptualisation of disengagement and the basis of an evidenced-based approach towards remedying it.

Relevance to Congress Theme

Recent global events have brought unprecedented change, not least to working lives. Disengagement persists, and its associated costs represent an increasingly unaffordable waste of potential. Deciphering disengagement is a matter of priority.

Addressing negative acts and bullying at work – and uphill battle? Results from an intervention study in two industrial workplaces.

Eva Gemzøe Mikkelsen, University of Southern Denmark; Jesper Kristiansen, National Research Centre for the Working Environment; Annette Meng, National Research Centre for the Working Environment; Amanda Risbæk Hovman, University Southern Denmark

science&practice

Research goals and why the work was worth doing:

The overall goals were to 1) design and implement multi-level interventions targeting negative acts and bullying at work, 2) explore their effects, and 3) explore context factors affecting the interventions. The study shows how context factors act as obstructing factors when conducting interventions targeting negative acts and bullying.

Theoretical background

Research has demonstrated severe individual and organisational consequences (Mikkelsen et al., 2020; Salin & Hoel, 2020) of negative acts and bullying at work. However, there is limited state-of-art research on how such phenomena may be addressed at group and organizational level (Gillen et al., 2017). Yet, research (Hoel et al., 2020; Ng et al., 2021) has pointed to factors in the work environment (conflicts, work pressure, role conflict, poor leadership), and group and organisational culture (poor psychological safety climate, passive bystander behaviour) that may contribute to the development and maintenance of these negative social phenomena, and which must be addressed for interventions to have an effect and seen as relevant by organisational stakeholders. Also, intervention research (Murray et al., 2019; Nielsen & Miraglia, 2017) highlights the importance of addressing stimulating and obstructing factors.

Methodology

Two medium-sized companies from the industrial production sector and passenger handling and service sector participated in the research project. We aimed to apply interventions that were comprehensive, context-appropriate, participatory, and adaptive in accordance with state-of-the-art guiding principles for workplace interventions: The intervention aimed to be comprehensive by targeting various organizational levels; context-appropriate by delivering intervention activities tailored to specific groups; participatory by involving management and employee representatives in planning the content of the activities; and adaptive as baseline results and process evaluation data were used when planning the content and process of activities. Data on negative acts, bullying and harassment, bystander behavior, psychological safety, use of ethical infrastructure elements, conflict management climate, work environment, and contextual factors were collected at baseline and follow-up via questionnaires and group and individual interviews with managers, employees, and employee representatives. Process evaluation data in the form of observations and participant evaluations were collected during and immediately after the interventions, which included workshops, training courses and lectures tailored to specific groups in the companies.

Results

The presentation focuses on discussing context factors that influenced the intervention process. The following obstructive factors were observed; insufficient planning and follow-up on interventions on the part of participating companies, low identification with stressor, lack of structural framework

within the occupational health and safety organisation impairing cooperation regarding work environment matters, a high focus on production goals and a culture of mistrust between management and certain work groups. On part of the researchers, we failed to adequately tailor interventions in company 1, and in company 2, we did not secure a timely involvement of line managers.

Limitations

The study only includes two organizations which limits generalizability. Strengths of the study include the a priori developed program theory, the implementation of organization-specific, theory-based interventions that generally fitted the identified challenges and the extensive collection of baseline, process evaluation and follow-up data.

Conclusions

The study confirms previous research documenting the challenges associated with organizational interventions targeting complex psychosocial work environment issues. Our results highlight the importance of; 1) researchers/practitioners and participating organizations sharing expectations regarding co-ownership of the interventions and their goals, 2) collecting and thoroughly analyzing qualitative baseline data to design intervention activities, and 3) using process evaluation data to continually monitor the implementation process, including addressing obstructing factors.

Relevance to the congress theme

The paper relates to the congress theme as the ultimate goal of the intervention study is to acquire knowledge that organizations may use to create inclusive and respectful work envionments.

Relevance to UN SDGs: The paper and project is highly related to the 'UN Strategic Development Goal 8: Decent Work and Economic Growth' in so far as the research addresses interventions aimed at reducing and preventing workplace bullying and sexual harassment which will help to create safe and secure working environments.

Intended audience: Both academic and practitioner

Keywords: Workplace bullying, negative acts, interventions,

Oral presentation OP71

Affective and behavioural consequences of boredom at work: the moderating role of autonomy

Madelon van Hooff, Open Universiteit; Edwin van Hooft, University of Amsterdam

science

1.Research goals and why the work was worth doing + 2. Theoretical background

It is relatively common for employees to experience boredom at work. Previous research has shown positive associations between this task-related negative emotion and both high arousal (e.g., frustration) and low arousal (e.g., depressed affect) negative affective consequences as well as adverse behavioural outcomes (e.g., counterproductive work behaviour). However, at least two issues regarding boredom's consequences have remained unsolved so far. First, there is limited knowledge about de conditions under which boredom differentially relates to high and low arousal affective outcomes. Scarce previous research (Van Hooft & Van Hooff, 2018) has proposed and found that among students autonomy explains when boredom relates to each of these affective states. Specifically, higher levels of autonomy strengthened the association between boredom and depressed mood, and weakened the relationship between boredom and frustration. Because these findings were based on cross-sectional and experimental studies in student populations, their generalizability to the work situation remains unclear. Second, there is limited knowledge about the mechanisms that explain why boredom results in adverse behavioural outcomes.

Therefore, in this study, we aim to build upon and extend previous research on the affective and behavioural consequences of boredom. That is, first, this study aims to test the ecological validity of the previously examined moderating role of autonomy in the relationship between work-related boredom and high vs. low arousal affective outcomes, by examining this effect in a work setting. Frustration and depressed affect are included as indicators of high and low arousal affective states respectively. Second, based on affective events theory (Weiss & Cropanzano, 1996) and the emotion-focused model of voluntary work behavior (Spector & Fox, 2002) this study strives to examine whether these low and high arousal affective outcomes act as mediators in the relationship between boredom and work-related behavioural outcomes, namely counterproductive work behaviour and procrastination. We hypothesize:

H1: The positive association between work-related boredom and depressed mood is moderated by autonomy in such a way that this association is stronger (weaker) in case of high (low) levels of job control

H2: The positive association between work-related boredom and frustration is moderated by autonomy in such a way that this association is stronger (weaker) in case of low (high) job control.

H3: There is a positive association between work-related boredom and subsequent counterproductive work behaviour that is mediated by frustration

H4: There is a positive association between work-related boredom and subsequent procrastination behaviour that is mediated by depressed affect.

3. Design/Methodology/Approach/Intervention

These hypotheses will be tested in a daily diary study conducted among a sample of 94 participants from various occupations (52.9% female). Participants completed a one-time 'general' questionnaire in which they reported their levels of autonomy, and subsequently participated in an experience

sampling study which involved completing two questionnaires daily (i.e., during the lunchbreak and at the end of the workday) for the period of one workweek. Work-related boredom, frustration, depressed affect, procrastination and counterproductive work behaviour were assessed in these daily questionnaires.

4. Results obtained or expected (if not available, it must be made clear when they will be)

Data will be analyzed by means of multilevel path-analysis in Mplus before the conference. Results will be further discussed in the presentation.

5. Limitations

Due to the non-experimental nature of the study, no conclusions can be drawn regarding the causality of the examined associations. Also, the study relies on self-reports. This may not be so problematic for the affective constructs that are included, as these can best be reported by those who experience them, but may limit the validity of the behavioural outcomes of our study.

6. Conclusions – research and or practical implications/Originality/Value

The study's findings will increase insight in conditions under which work-related boredom is associated with differential affective outcomes, and sheds light on the mechanisms underlying the relationship between boredom and behavioural outcomes. As such, it gives starting points for interventions to reduce the negative consequences associated with work-related boredom.

7. Relevance to the congress theme

This study fits with the theme of the changing world of work, because new technology, for example in the form of algorithmic management, may affect work characteristics in such a way that it increases the likelihood that employees experience boredom at work.

Keywords: boredom, well-being, behaviour

Oral presentation OP812

www.mymigration.academy research dashboard with instant feedback to respondents as a tool which unlocks human potential

Agata Jastrzębowska, CRASH Center for Research on Social Change and Human Mobility, Kozminski University, Warsaw, Poland

science&practice

As a result of the escalation of Russian aggression in Ukraine, many millions of people had to leave their homes and seek shelter in neighboring countries. According to UNCHR 7.5 million refugees crossed Ukrainian-Polish border by December 2022, nearly 5.5 million returned to Ukraine. It is estimated that 2/3 of refugees are or will be looking for a job. What Poland can do with these human resources? Firstly, we should get to know them, and secondly, we should find a place for them on our labor market.

The aim of this paper is twofold – methodological and empirical. Firstly, our aim is methodological. We would like to present **www.mymigration.academy** which is a research dashboard that measures four psychosocial capitals - human, psychological, social and economic. After completing professional research tools, the respondent receives an instant feedback. The dashboard is both for people who have experienced migration in their lives (going abroad for at least 3 months) and for people who do not have such experience (a reference population, a comparative analysis). The portal is available in three language versions - Polish, Ukrainian and English. On the one hand, the dashboard provides people with information about their resources, and on the other hand, it can be a source of knowledge for companies about the capitals embedded in organizations.

Secondly, our aim is empirical. We want to present what psychosocial resources refugees from Ukraine have and bring into the labor market. Referring to Stevan Hobfoll's conservation of resources theory (1989, 2006) people with bigger amount of resources cope better with stress and are more satisfied. My Migration enables people to discover themselves. If a person has large resources, the portal will provide information about what resources a person has. If a person has small resources, the portal will provide information on how and where the resources can be enriched

From a psychological perspective, the experience of migration is an event that enriches humans and increases people's capitals. The previous interdisciplinary research and analyzes (Grabowska and Jastrzębowska, 2019, 2022) show that the experience of migration enriches informal human capital, i.e. competences possessed by a person. As a result, people with migration experience show a higher level of competencies, earn on average more than people without such an experience, and more often set up their own businesses.

SDGs: Goal 10 – Reduced inequalities

Keywords: migration, human capitals, research tool

Oral presentation OP658

Afghan Refugees in the Netherlands: Perceptions of Economic Downgrading and Commitment System Dynamics

Yvonne G. T. van Rossenberg, Jeroen Lenssen & Sofija Pajic | Institute for Management Research, Radboud Universiteit, Nijmegen, the Netherlands

science

The amount of Afghan refugees in the Netherlands has increased drastically in the last few years. However, research has shown that Afghans struggle with their economic integration in the Netherlands (Bakker et.al., 2014). For this reason, the current study has researched the occupational downgrading of Afghan refugees that arrived in the Netherlands between 1980 and 2000 and the effect this had on the commitment system dynamic of an under researched group.

Meaningful and sustainable employment are increasingly recognized as significant outcomes for a positive refugee settlement (Loosemore et al., 2021). However, difficulties arise when refugees attempt to draw upon their home country's human capital to obtain employment. Typical employment barriers for refugees include the devaluation of their foreign credentials and work experience by institutional validation processes or employers (Verwiebe et al., 2018). To avoid consequential unemployment, refugees are often 'downgraded' in the host country, meaning that their position does not align with their qualifications (Dustmann et al., 2016), and is lower than the position of the host country's citizens who have similar education and work experience (Reitz, 2007). As a result, refugees often find themselves overqualified (Kalfa & Piracha, 2017).

Occupational downgrading and corresponding feelings of overqualification are evidenced to have a number of negative implications for employee "feelings toward, beliefs about, and attachment to" one's current position, occupation, or employer (Judge & Kammeyer-Mueller, 2012, p. 434) but research has yet to delve deeper into how the perceptions of economic downgrading and overqualification affect commitment of refugees (Bakker, 2015). Moreover, while employee commitment to the current organization has been studied most widely, employees can also be committed to other targets outside the organization such as their family (Cohen, 2004; Meyer & Allen, 1997). This study seeks to unpacks the effect of occupational downgrading among first-generation Afghan refugees in the Netherlands. Drawing on relative deprivation (Crosby, 1984) and commitment system theory (Klein et al., 2020b), we gain insight into how first-generation Afghan refugees perceive their occupational downgrading in the Netherlands and how this influences their commitment bonds towards their work and core family.

This study is based on an interpretive narrative study which researched how Afghan refugees ascribed meaning to the career-trajectories that they went through, and how those meanings have influenced their commitment systems. The study followed a non-linear abductive logic of enquiry (Schwartz-Shea & Yanow, 2012). Five students from the Radboud University executed twenty-nine semi-structured interviews. The story driven methodology allowed for in-depth conversations with the interviewees. The data was analyzed with a two-phase thematic content analysis in which salient themes were allowed to emerge from the data (Bengstsson, 2020).Three typical commitment systems were identified in reaction to economic downgrading, labeled (1) "Given Up Work", (2) "Hindered to Work", and (3) "Focused on Work".

The study has the following limitations. First of all, narrative interviews are influenced by memories of both the past and the present, influencing the relativity of the story (Squire et.al., 2014) and the perception of the change in commitments. Secondly, the stories are told at a specific moment in the

lives of the refugees, and careers may still be developed after the interviews. Thirdly, the interviewees were from the same context but were widely diverse in age, resulting in differences in career-stages, influencing the severance of occupational downgrading. Lastly, the current study focused specifically on work and family in the commitment systems, but commitment systems can consist of much more commitments that were now disregarded.

The specific contribution of this study is that it offers a first discussion on the influence of occupational downgrading on commitment systems, and specifically the dynamics of commitment to the family and commitment to work. The findings of this study support the value of interpretive abductive approaches in progressing commitment system theory, as recommended by Rossenberg et.al. (2022). In addition, the study shows the value of studying commitment system dynamics through lifestories, which provides unique insights into changes of commitment over time. Finally, the study integrates relative deprivation theory with commitment system theory, and thereby bridges the fields of Migration, Careers and Work and Organisational Psychology.

Keywords: Refugees, Commitment System Theory, Overqualification

Oral presentation OP172

Agency-Communion Tensions among Female Leaders: An Empirical Examination of Cognitive Implications

Stefanie Krauth & Dieter Frey | Ludwig-Maximilians-Universität München; Martin Fladerer, Technical University of Munich; Melissa Hehnen, Ludwig-Maximilians-Universität München

science

Research Aim

Women leaders are still underrepresented compared to men, despite diversity actions and intended equality norms. If they make it to the leadership level still, they are often confronted with gender stereotypes and conflicting expectations (Zheng et al., 2018). Despite progressive social rethinking, women are still expected to behave communal, while the typical image of leaders is still one of stereotypically male agentic behaviour (Koenig et al., 2011). Thus, many women experience incongruity between their gender and leadership role (Eagly & Karau, 2002).

The study's aim is to examine in what situations these agency-communion tensions appear and how women leaders cope with them on a cognitive level. In doing so, we will empirically test the core theses of the theoretical process model by Zheng et al. (2018) with the study at hand. Later, we will further expand the model.

Theoretical Background

The model by Zheng et al. (2018) is first to see agency-communion tensions from a paradox perspective and to distinguish between a dilemma and paradox mindset as results of these tensions. This important contribution answers Billing's call (2011) to investigate the issue more integrative, which a paradox lens can auspiciously provide. She argues that the mere focus on conflicts between agency and communion – and disregard of potential synergies – portrays women solely as victims and does not do justice to women's experiences.

As per the authors, women leaders have internalised a dilemma mindset, when they see agency and communion as incompatible requirements that are mutually exclusive (Zheng et al., 2018). In contrast, a paradox mindset allows for the existence of both, which may even be combined.

We argue that in situations in which women leaders are told that agency is expected, they will more likely experience role incongruity between their role as a woman and as a leader. In contrast, in situations in which women leaders are told that communion is okay, such role incongruity will be less present. This is important for the generation of the agency-communion tension inducing vignettes.

H1: In organisations, in which the desirability of agency (communion) is openly communicated, women leaders are more (less) likely to experience agency-communion tensions.

The model also postulates a moderating effect of organisational learning orientation on the relation between present agency-communion tensions and paradox/dilemma mindsets. Learning orientation is defined as "a set of organi[s]ational values that are related to the propensity of organi[s]ations to create and use knowledge" (Zheng et al., 2018, p.6). A high organisational learning orientation encourages its members to question and rethink existing, to generate new ideas, incorporate multiple perspectives, and think diverse (Sinkula et al., 1997).

H2: The higher (lower) the organisational learning orientation, the more likely women leaders are to adapt a paradox (dilemma) mindset when experiencing agency-communion tensions.

Design

In the pe-study of our work we will test our self-designed written vignettes that manipulate agency-communion tensions (high, low). In the main study, we manipulate both agency-community tensions (high, low) and organisational learning orientation (high, low) in a 2x1 between-subject design with a sample of female leaders.

Agency-communion tensions will be assessed via manipulation check, organisational learning orientation with a scale by Sinkula et al. (1997) and internalisation of the mindsets with a scale by Miron-Spektor et al. (2017). The study design will be pre-registered.

Results

Data collection will be completed early next year and results will be ready to be presented at the congress.

Limits

Our study is within a binary thinking scheme regarding gender. Also, it is not (enough) concerned with how to ensure that agency-communion tensions no longer arise at all, but examines how to deal with them. Still, we think that research takes place within a realistic frame and thus at least aids women on how to deal with these tensions.

Implications

We want to test and refine theory – a practice often overlooked (e.g., Kacmar & Whitfield, 2000). In an experimental setting, we seek to establish the causal relation between agency-communion tensions and female leaders' cognitive response. Practically, we aim to show that women leaders are still confronted with injustices/challenges based on their gender. The internalisation of a paradox compared to a dilemma mindset seems to be a good coping mechanism, since it is linked with advantages like better resilience or mental health (Zheng et al., 2018). Our study aims to show how organisations can support women to internalise this mindset and deal with the conflicting demands they cope with as leaders.

Relevance to the Congress

Our research is actively contributing with turning attention to the fact that sexism is present, and that we must use our voice to do better in the future –which is now .

Keywords: Agency-communion tensions, paradox mindset, dilemma mindset

Oral presentation OP811

Motivated Trust in AI: An Integrative Model Considering Multiple Stakeholder Views in HRM

Guido Hertel, University of Münster, Germany; Sandra L. Fisher Münster University of Applied Sciences, Germany; Jenna A. Van Fossen, Michigan State University, U.S.A.

Research goals and why the work was worth doing

Artificial intelligence (AI) applications have the potential to dramatically change the world of work. AI systems are particularly prevalent in Human Resource Management (HRM), such as leadership or personnel recruiting and selection. However, a core precondition for successful usage of AI-based technologies is that involved persons place sufficient trust in these technologies, for example, by following recommendations of an AI-system, by allowing AI-technologies to use their personal data, or by deciding to implement an AI system in HRM. Extant models on trust in technology and information systems fall short to consider the black box character and autonomous self-improving features of AI systems, and focus nearly exclusively on cognitive processes while neglecting motivational perspectives. The latter are particularly important for a conclusive understanding of trust in AI, and to explain differences in trust between different stakeholder groups (e.g., employer, manager, HR professional). The current paper introduces a new integrative model of trust in AI that considers both cognitive and motivational processes, and applies these to different stakeholder perspectives in HRM.

Theoretical background

Our integrative model of trust in AI builds on cognitive trust conceptualizations (e.g., Mayer et al., 1995) that have been specified for technology (e.g., McKnight et al., 2011) and AI systems (Solberg et al., 2022). However, we extend these conceptualizations with motivational and dynamic perspectives derived from research on interpersonal trust (van der Werff et al., 2019, Baer et al., 2022) based on control theory, self-determination theory, and motivated reasoning theory. More precisely, we specify three motivational drivers of trustors that lead to biased trustworthiness assessments of AI systems, and to changes in risk propensities of the trustor. This conceptualization of motivated trust in AI enables specific predictions for different stakeholder groups of AI systems across different levels of analysis (society, organization, team, individual, time).

New Perspectives/Contributions

Our new model of trust in AI provides a conclusive research framework, integrating various research lines that have been partly developed in isolation and/or not been applied for trust in technology. In addition to dispositional factors and cognitive assessments, we introduce motivational processes of trust in AI that enable a more complete understanding of trust from different stakeholder perspectives. Notably, we do not assume direct linkages between system features and trust motivation but argue that the impact of system features depends on the gains and losses that stakeholders expect as a consequence of AI usage. For example, managers and HR professionals receive and seek different information about the reliability of an AI-based recruiting system as compared to job applicants, affecting trustworthiness assessments of the AI system. Moreover, stakeholders hold different motives to use an AI system, leading to different propensities to place risk in the AI system. This consideration may also help to advance understanding of how trustors develop overreliance (trusting too much) and underreliance (trusting too little) with respect to AI systems. A focus on gains should lead to overreliance, while a focus on losses should result in underreliance. Our model suggests, for example, that stakeholders coming from the employer and decision maker perspectives may be more susceptible to overreliance, whereas stakeholders coming from the decision target perspective may be more susceptible to underreliance.

Conclusions – research and or practical implications

While empirical research on the derived predictions is pending, our model provides a promising framework and roadmap for future research. Moreover, the integrative model provides practical implications for building and maintaining trust in AI systems, separately for different stakeholder

groups. Finally, our model is not restricted to HRM but might also be relevant for other application fields of AI at work, such as customer relationship management or managerial decision making.

Relevance to the Congress Theme

This paper strongly relates to the congress theme “The Future is Now: the changing world of work”, addressing the implications of new technology (AI) in the world of work. Specifically, we address trust as precondition for the successful implementation of AI systems at work. Moreover, we derive implications for the design of AI interfaces based on different stakeholder perspectives and motives, supporting a human-centered engineering of new technologies. Finally, we also address excessive (blind) trust in AI systems that can lead to suboptimal and potentially harmful decisions.

Relevant UN SDGs

The submission relates to several UN SDgs. AI systems can support *economic growth and decent work*, for example, by relieving HR professionals from monotonous work routines. Moreover, AI systems can *reduce inequalities* and support *gender equality* due to highly standardized processes, e.g., in personnel selection. Trust in AI is a core precondition for the realization of these potentials.

Keywords: trust, artificial intelligence, stakeholder perspectives

Oral presentation OP564

The Development of Prosocial Work Characteristics: Examining Educational Experiences

Stephen A. Woods, Surrey Business School, University of Surrey

science

How do the trait antecedents of prosocial work behaviour develop through pre-employment experiences? Prosocial behaviour has been defined generally as voluntary and desirable actions that benefit others (Kanacri et al., 2021; Eisenberg et al., 2015). There are many ways in which behaviour at work can be considered prosocial, reflecting a general emphasis on behaving in ways that benefit others, who may be close coworkers, more distal members of the organization, leaders and managers, customers or service users, or members of society as a whole. The most widely researched behaviours encompassed by the concept of prosocial organizational behaviour (Brief & Motowidlo, 1986) are captured in dimensions of OCB, and more general descriptions of prosocial helping (Bolino & Grant, 2016). This paper advances a broader concept of prosocial organizational behaviour. This includes behaviour that may not directly be focused on benefiting organizational functioning, but rather may nevertheless benefit others, for example by supporting specific people and their well-being, inclusion or career progress, supporting others at work in general, for example by taking steps to improve things proactively or people in society through behaving in ways that are more pro-environmental, contributing to tackling the climate crisis.

Personality antecedents of prosocial organizational behaviour may be understood through trait activation theory (Tett & Burnett, 2003), which frames effects of personality traits on prosocial behaviour. Studies (including meta-analyses) of the effects of traits have confirmed associations of personality with OCB, proactivity, voice, and pro-environmental behaviour and with respect to inclusivity, pro-diversity attitudes. Models of personality trait development (e.g. Woods et al., 2013) propose that traits develop through activation and practice of behaviour through activity and experiences. Accordingly, the present study sought to establish developmental predictors of prosocial traits.

In the present study, twenty-two antecedent personality trait dimensions identified as relevant to forms of prosocial work behaviour were examined in relation to eleven categories of developmental experiences encountered by people in late-stage education. The purpose of the study was to observe the links between these developmental experiences and subsequent personality traits.

Method

918 early-career graduates (36% male, 63% female, 1% non-binary, mean age 24) completed a self-report survey comprising items on developmental experiences and prosocial personality traits. Data were collected through the prolific survey panel platform.

Prosocial personality traits were measured using 125 items organised into 22 scales (e.g. Kindness, Supporting, Initiative, Social Ease). Participants were asked to rate themselves as they perceived their characteristics at present.

Developmental experiences were measured using 51 items organised into 11 scales (e.g. Helping, Volunteering, Conserving). Participants were asked to rate the frequency with which they performed behaviours during their education from age 16 until the end of higher-education (i.e. University study).

Structural equation models were used to examine the associations of latent developmental experience factors and higher-order prosocial personality factors.

Results and Discussion

Structural equation models were conducted organised into six categories: prosocial, inclusive, sustainable, proactive, engaged and resilient. In each case, analyses revealed acceptable model fit, and significant associations between latent developmental factors and personality factors (ranging from 0.30 to 0.92). Retrospectively rated developmental experiences examined in the study did predict current prosocial personality characteristics.

These results highlight how late-stage educational experiences might form foundations of prosocial characteristics in work settings. Implications are discussed for understanding the development of prosocial organisational cultures, recruitment and selection of graduates, and employee learning and development.

Decent work and economic growth; good health and well-being

Keywords: Prosocial Work Behaviour; Personality at Work; Employee Development

Oral presentation OP564

An Ambient Information System for the Workplace

Toni Kovacevic & José Navarro | University of Applied Sciences and Arts Northwestern Switzerland, School of Applied Psychology, Olten, Switzerland

science&practice

The article is based on the experiment "Periphery" of a running interdisciplinary research project (anonymised reference). It focuses on peripheral user experience and data mapping design in an ambient information environment. Ambient Information Systems (AIS) and Ambient Display (AD) can be described as a physical, tangible representation of different information in the environment (Pousman & Stasko, 2006; Wisneski et al., 1998). AIS pass on these information to the users via technical systems such as sound (Mynatt, Back, Want, Ellis, 1998), light, or wind (Matthews, Rattenbury, Carter, Dey, 2003). The mediated information is not asking for full user attention but is perceived peripherally (Weiser, 1996; Pousman & Stasko, 2006).

The aim of the experimentally designed study was to find out how AIS can be used in everyday work and how the given information is perceived and processed by the test subjects. Furthermore, the research group investigated which interactive or reactive behaviour is triggered by the AIS. Studies already confirm that showing one persons for example their heart rate via eHealth devices are used as a successful intervention to reduce stress (Lukan, Bolliger, Pauwels, Lustrek, De Bacquer Clays, 2022). The visual relocation of such biofeedback from device to the architectural office environment through AIS represents a new type of work environment.

The research group designed a responsive space that maps human behaviour and arousal onto different physical parameters such as light, sound, vibration and airflow. Behaviour and arousal data were captured by means of visual position tracking, acceleration, heart rate and Galvanic Skin Response (GSR) sensors. To guarantee peripheral vigilance, the displayed information was weaved into the environment and the invited participants were asked to concentrate on their daily work for 90 minutes. Certain feedback is causal and real-time based on the measured physical motion and biodata, changes in atmosphere are temporal compositions. The represented data therefore is an indicator of somatic and psychophysiological states that have the potential to create different levels of awareness of personal reactions to outer influences. The temporal changes are designed to proactively influence user behaviour.

Two experimental groups of 10 members each were recruited. Before the experiment, group A received no indications of how the room would interact, whereas group B did receive this information. The data generated from the experiments were analysed using a mixed-method approach: The collected sensor data was visualised and synchronised with the recorded video track for the heuristic detection of correlations between action and arousal. Contextual feedback about their current well-being and their involvement for their work was collected by a short, self constructed questionnaire during the experience and will be evaluated by a frequency analysis, and semi-structured follow-up interviews were qualitatively coded and analysed by a structural content analysis by Mayring (2010). Although the gender sampling was sufficiently equal, diversity of age and background was limited, since we mainly tested with colleagues of our university. More diverse groups of subjects should be recruited to confirm the results in further research.

All participants of test group A became aware of interaction through change of position, some noticed the heartbeat in sound and light, but were not sure if it was theirs or a feature of the animated space. Participants of both groups did not consciously interact with the causal real-time

effects of hand and arm movements, designed as an indicator for restlessness – the triggered sounds were probably integrated too neatly into the background. Most participants noticed temporal changes, some became aware of the patronising attitudes of the environment and developed avoidance strategies. Some participants said they could imagine working with the AIS effects but would like to be able to adjust the parameters.

The focus of this paper is on the design and user experience of AIS for personal workplaces and possible implications and applications. Technical devices that provide personalised biodata in real time, such as eHealth devices like smartwatches, are already on the market and scientifically studied (Papaa, Mitalb, Pisanoa & Del Giudicec, 2020). In comparison to mobile devices the authors propose to weave the information into the environment with atmospheric qualities. Great potential lies the shifts of presence of information, moving from the periphery of perception to full attention (Weiser, 1996) in the situational context of the working process. How they are perceived, how they are given meaning, how they create behaviour patterns and are possibly used for the improvement of well-being and productivity.

Oral Session OP442

An analysis of the current situation of the Home Help Service in caring for the elderly. Professionalization and working conditions.

María Pilar Díaz Conde, Faculty of Labor Relations and Human Resources, Department of Social Psychology, University of Granada (Spain); Fátima Pineda Urbano, Faculty of Political Sciences and Sociology, Department of Sociology, University of Granada; Nancy Guzmán Raya, University of Alicante (Spain)

science&practice

Theoretical background and research objectives

The increase in the proportion of older people and the propensity to live alone is accompanied by a change in the trend in their care. Specifically, there is a transition from care carried out mainly by female relatives to care carried out by professionals. In response to these changes, the public system has implemented numerous services in accordance with the wishes and needs of the model of aging at home. Among these services, Home Assistance (hereinafter SAD) is essential because it is the one that most favors older people being able to continue living at home. But in addition to this essential objective, there is another reason that gives it great value: its potential for job creation.

However, from the perspective of the literature on care, the interest of the SAD falls on the characteristics of the demand, but not on the characteristics of this profession or on the working conditions of the employed persons who carry out the work. This communication aims to make the care profession visible by exploring some characteristics that currently define it, specifically, the degree of professionalism and the working conditions of those who perform this job.

Methodology

We show preliminary results of the research project 'Older people in solitude. Daily problems and improvement of their quality of life', funded by the Andalusian Studies Center Public Foundation. These results come from its qualitative part by conducting 19 in-depth interviews with professionals and volunteers in the field of care for the elderly, including SAD professionals in Andalusia (Spain). Their testimonies have enriched our knowledge with the purpose of addressing the object of study proposed in this work.

Results obtained or expected

Despite the usefulness of the SAD in making it easier to stay at home, complaints have been collected that come together in two key weak points: the lack of professionals in the SAD and their lack of professionalism. Added to this demand is the discontent of professionals due to the unfavorable working conditions in which they carry out their work and which directly affect their quality of life and the quality of the work they offer.

Limitations

The information analyzed regarding the object of study responds in part to the interviews carried out with SAD professionals and in part to the participant observations of other professionals. Within the general framework of our study, it remains to analyze the discourses of the elderly themselves in relation to the assessment they make of this service. Perhaps in this second analysis we will find more indications about the deficiencies of the SAD and possible proposals for improvement of this profession.

Conclusions

Working with older people is hard from a physical and psychological point of view, so it is a priority to require specific training for professionals in this field. But it is also essential to increase the workforce to better distribute the workload and to be able to cover more and better the needs of the elderly who decide to stay at home. Having more professionals, in addition to requiring more specific training and better working conditions, would add quality to this necessary but underused resource.

Relevance to the Congress Theme

The oral presentation is adjusted to thematic area 19. Work patterns and conditions; Specifically, Flexible hours, Physical work environment, Psychological contract, Temporary and fixed-term contracts.

Keywords: Home Help Service, Professionalization, Labor conditions.

Oral presentation OP191

An attributional perspective on leader's trusting behavior and followers' reactions.

Axel Rosenbruch, Guido Hertel & Janine Kloppe, Christoph Nohe | University of Münster

science

Research goals and why the work was worth doing

Trust is an important dimension in the relation of leaders and followers. Moreover, leader's trust in their followers gains importance, as digitalization and flexibilization of work reduce leaders' potential to directly monitor their followers. However, followers might perceive different causal reasons for leader's trusting behaviors, and might respond differently based on these attributions. The current study investigates whether followers attribute leader's trusting behavior differently and whether these attributions are related to different emotional reactions.

Theoretical background

Leader's trust – the willingness to be vulnerable based on positive expectations – manifests in trusting behavior of the leader. Attributions are formed when important, surprising, or unexpected events occur. A leader's trusting behavior, manifesting leader's vulnerability, might be surprising for the follower and / or signal importance, causing followers to form an attribution. More specifically, we assume that followers can attribute their leader's trusting behavior to either internal causes (i.e., their trustworthiness), external causes (i.e., the leader's trust motivation), or relational causes (i.e., the leader-follower-relationship). Moreover, we assume different emotional reactions of followers depending on the specific attribution. When followers consider themselves as the reason for leader's trusting behavior, followers should interpret the leader behavior as a positive confirmation of themselves and experience pride. When followers consider the leader as the causal reason, they should respond with emotions toward the leader, like gratitude and indebtedness. Lastly, when followers understand their relationship with the leader as causal reason, they should respond with feelings of relatedness.

Design/Methodology

We conducted an online study (N = 244 employed participants) based on the event-reconstruction-method (Grube et al., 2008). First, participants were instructed to re-experience a work event during which their leader had shown trusting behaviors. Participants then responded to an open question of why they thought their leader had shown the trusting behavior and lastly answered questionnaires about their emotional reaction during the event.

Results obtained

Qualitative analyses of participants' open-responses revealed different attributions. We found internal attributions, external attributions toward the leader, external attributions toward the situation, and relational attributions. In our quantitative analysis, we found internal attributions to be positively related with pride and relational attributions to be positively related with relatedness. We did not find the postulated relations of external attributions with gratitude and indebtedness.

Limitations

While the event-reconstruction method captures real-life events, results might be biased by memory effects and potential self-serving biases. Further, the cross-sectional design might be affected by

common-method-biases. Accordingly, cross-validation with different methodological approaches is desirable.

Conclusions

Our results suggest that followers indeed attribute their leader's trusting behavior to different causal reasons. In this sense, we contribute to an integration of trust and attribution literature, especially by demonstrating that relational attributions can be formed in response to trust. Moreover, we provide initial evidence for the differential effects of follower attributions on emotional reactions. Although future research should further investigate whether these effects can be replicated with experimental designs and consider behavioral outcomes. In addition, future research should investigate whether multiple attributions can be formed simultaneously, like our results suggest.

Practitioners can benefit from this work as it indicates that followers act as constructivists and create their own understanding of leader's behavior, which has implications for how followers react to leader's trust. Further, our qualitative results suggest that followers attribute egoistic motives to leader's trusting behavior, which provides further evidence for the potential "dark-side of trust".

Relevance to the Congress Theme

As digitalization and flexibilization of work increases, leader's trust becomes increasingly important. In digitalized working contexts leaders can no longer walk around to check what followers are doing and thus need to increasingly trust their followers. We contribute to the topic of changing working worlds by investigating the processes of how followers respond to leader's trust.

Relevant UN SDGs

Our work is relevant for the UN Sustainable Development Goals related to decent work and wellbeing. Our results indicate that leader's trusting behavior can contribute to followers' experiences of pride and relatedness, which might act as resources for followers' wellbeing and health.

Keywords: leader-follower-relationship, trust, attribution

Oral presentation OP354

An empirical investigation of the moderating factors in the relationship between presenteeism and well-being

Mariella Miraglia, University of Liverpool; Wee Chan Au, Newcastle University

science&practice

Research goals

Presenteeism, defined as the behaviour of working while ill (Aronsson et al., 2000), has predominantly been portrayed as harmful to individuals and organisations (e.g., Demerouti et al., 2019; Hemp, 2004). However, a review of the literature revealed inconsistencies in the association of presenteeism with health and well-being (Skagen & Collins, 2016), and a more recent stream of research sees presenteeism as an adaptive behaviour to manage health and performance at work, provided that specific resources are in place (Karanika-Murray & Biron, 2020). In light of these contradictions and the sparse research on the effects of presenteeism, we aim to investigate its influence on individual well-being and uncover the personal and contextual factors that can attenuate such effect.

Theoretical background

We draw on ego depletion theory (Muraven & Baumeister, 2000) to argue that presenteeism can lead to decreased subjective well-being and increased burnout. Working through sickness requires extra self-regulatory resources as employees have to compensate for the aversive consequences of the illness in question, and invest extra cognitive resources to regulate effort and attention to meet their work goals. Thus, presenteeism can deplete regulatory resources (Rivkin et al., 2022) and result in mental stress (Demerouti et al., 2009). In line with the call to investigate the nature of the illness in question to better understand the phenomenon (Ruhle et al., 2020), we also focus on the perceived significance of the health event triggering presenteeism, proposing that a significant event will exacerbate the detrimental effects of presenteeism for well-being. Moreover, we build on conservation of resources theory (Hobfoll, 2001) to explore whether workplace resources, operationalised as workplace support, can alleviate the negative effect of presenteeism on employee well-being. We argue that supervisory and collegial support could provide additional resources to mitigate the above-described loss of regulatory resources.

Methodology

A self-administered questionnaire was completed by 395 Malaysian teachers (response rate: 86%) at two points in time (attrition rate: 12%) – at the start (T1) and end (T2) of the academic year. Presenteeism, significance of illness, supervisory and collegial support from T1 and life satisfaction, exhaustion, and disengagement from T2 were entered in moderation models tested in Mplus 8.3. Age, gender, and perceived Coronavirus threat were used as controls.

Results

The significance of illness moderated the positive relationship between presenteeism and exhaustion ($B = .05$, $SE = .02$, $p < .05$), such that working while ill resulted in higher exhaustion only at high levels of significance. Supervisory and collegial support moderated the negative relationship between presenteeism and life satisfaction ($B = .35$, $SE = .17$, $p < .05$; $B = .49$, $SE = .20$, $p < .05$, respectively), such that the association was significant only at low levels of the moderators.

Limitations

The time frame of the research was dictated by the pandemic, preventing us from exploring the short- vs long-term effects of presenteeism and limiting the data collection to two waves.

Conclusions

The study's value lies in the exploration of the factors that shape the relationship between presenteeism and well-being, particularly in relation to the moderating role of the social context (i.e., workplace support) and the health issue causing working while ill. In so doing, we address previous calls in the literature (Miraglia & Johns, 2021; Ruhle et al., 2020); we empirically contribute to the health-performance theoretical framework of presenteeism (Karanika-Murray & Biron, 2020); and we extend initial empirical evidence on the pivotal role of workplace support in shaping presenteeism's consequences (Chen et al., 2021). Moreover, by showing that personal and workplace factors influence different well-being outcomes in relation to working when sick, we reveal the nuances of the association of presenteeism and well-being in line with a multi-dimensional view of well-being (Grant et al., 2017; Inceoglu et al., 2018).

The results have important practical implications for organisations, managers, and employees to help them gauge the relevance of presenteeism in the light of its consequences and understand the factors that can mitigate its negative outcomes. Workplaces should ensure that specific resources in terms of collegial and leadership behaviours are in place to manage presenteeism.

Relevance to the Congress Theme

Presenteeism permeates the current world of work emerging from the pandemic, as demonstrated by a greater salience associated with health behaviours in the workplace following Covid-19 and the rising phenomenon of virtual presenteeism (e.g., Brosi & Gerpott, 2022). It is essential to provide recommendations to individuals and organisations on how to tackle presenteeism in the changing world of work.

Keywords: Presenteeism; well-being; workplace support

Oral presentation OP105

An Event-Oriented Approach to Change: Role of Positive and Negative Everyday Events

Tina Kiefer, Warwick Business School; Neil Conway, Royal Holloway, University of London; Laurie Barclay, University of Guelph

science

Research goals and why the work was worth doing:

A substantial amount of research has focused on (mainly negative) employee responses to understand the challenges of organizational change. Despite the fact that change typically unfolds over time, much of the change literature is relatively static and investigates general responses to change, rather than everyday experiences. This can be problematic because it tends to overlook how the larger change trickles down to and affects everyday experiences, further impacting on employees' attitudes and commitment towards change. Furthermore, existing research has largely focused on negative responses to change, overlooking the role of positive change events. We here take an event-oriented approach, which suggests that employees' view and support of change may shift over time as they experience everyday events at work that are related to the ongoing change.

We aim to advance the literature in three ways. First, we argue that employees' commitment to change is not static but rather can shift as they experience everyday change-related events (e.g., as the change is implemented). Second, we argue that it is important to explore both negative and positive everyday events in change, as employees are likely to experience different aspects of change in different ways at different times. Third, we identify why and how everyday change-related events can shape employees' reactions to and support for the change project. We focus in particular on the role of organizational fairness.

Theoretical background:

We draw on event system theory (Morgeson et al., 2015) to argue that organizational change, as a major event, not only initiates but also shapes how employees experience everyday change-related events. We propose that employees' initial reactions to the major change event can shape their anticipatory perceptions related to the impact of the major change for themselves. These anticipatory perceptions can create a lens through which they experience subsequent change-related events. Employees' experiences of everyday positive and negative change-related events can signal information about the organization and affect perceptions of organizational fairness, which in turn impacts on employee support for the organization's major change initiative. Taken together, by applying event system theory, we reveal how employees' perceptions of major change events can guide their everyday experiences of organizational change, thereby showcasing the active role that employees can take in shaping their own experiences of organizational change. Further, we identify how employees' experiences of everyday change-related events can shed light on their dynamic reactions to and support for major change initiatives.

Design/Methodology:

Data was collected with a field study (N=276), in which employees were surveyed after a merger was announced (but before it occurred), then participated in a 2-week daily diary study as the merger was being implemented, and finally completed a second survey two weeks after the diary study.

Results:

Our hypotheses were generally supported. Findings suggest that employees' initial reactions to major change shape how they experience everyday positive and negative change-related events. Both positive and everyday change-related events impacted on employees' daily fairness perceptions and subsequent their commitment to the major change over time.

Limitations:

We used a diary methodology, sandwiched between two surveys. Asking respondents daily about their experiences, can bring attention to specific topics that might otherwise not have been noted. Furthermore, due to the complexity of the design, we had to rely on self-report.

Conclusions:

Our findings shed light on how organizational change trickles down to everyday experiences. In practice, organizational change should involve effectively managing of the major change event as well as the everyday change-related events. Whereas the former can guide how employees experience change on an everyday basis, the latter can offer the opportunity to enhance fairness and build commitment to major change.

The current world of work is in flux and norms about how best design work are dissolving. Our research has implications for the designed and implementation of change. It also speaks to the UNSDG's goal 3 on fostering wellbeing and goal 8, which promotes decent work.

Keywords: Organizational change, positive and negative events, fairness

Oral presentation OP15

An Examination of the Link Between Job Content Plateau and Knowledge Hiding From a Moral Perspective

Hongmin Yan, The University of Queensland; Gillian Yeo, The University of Western; Zhou Jiang, RMIT University; Xiaowen Hu, Queensland University of Technology

science

Knowledge hiding has been a growing concern for organizations, as their success is increasingly dependent on knowledge exchanges among employees. Drawing on an integrated ethical decision-making model, we examine knowledge hiding from a moral perspective and identify job content plateauing as an important predictor of knowledge hiding. We contend that when employees experience a high level of job content plateauing, they are inclined to hide knowledge from colleagues to serve their self-interest. We further propose that attribution of blame, a specific mechanism of moral disengagement, explains how employees' experiencing high content plateaus bypass their moral self-regulation to engage in knowledge-hiding behavior. Specifically, employees can cognitively reconstruct themselves as faultless victims who are driven to hide their knowledge because: (a) their colleagues cannot be trusted; and (b) the knowledge-exchange process in the organization is exploitative. We tested our dual-path mediation model using time-lagged data collected from 301 working adults across three time points. The results support the mediating roles of distrust in colleagues and fear of exploitation from the organization's knowledge-exchange process. Our study opens the door for future research to better understand knowledge hiding from an ethical lens.

Keywords: job content plateau, knowledge hiding, moral disengagement

Oral presentation OP623

An Exploration of Job Demands and Personal Resources of Teachers from Under-Resourced Contexts in Relation to their Burnout and Engagement Levels.

Anja Philipp, University of KwaZulu-Natal

science

Teachers are often described as burned out, but the levels of emotional exhaustion vary across countries. South African teachers report very high scores of burnout intensity, and many work under adversarial conditions. This study, thus, aims to shed more light on the working conditions and wellbeing of South African teachers. Research on teacher wellbeing has mainly focused on the effects of job demands and job resources. The personal resources of teachers have been less in the focus of research. Job resources, however, may activate employees' personal resources, and these, in turn, can make employees more capable of managing the work environment. They are, thus, less likely to be burned out and remain well (Xanthopoulou et al. , 2007). Thus, the role of personal resources for teacher burnout and engagement was investigated in this study.

A questionnaire study was conducted with 123 secondary school teachers from 18 schools in two school districts. Established scales were used to assess teacher burnout, work engagement, job demands (workload, emotional demands and disruptive pupils), and personal resources (meaning of work, opportunities for development, planning, humour, self-distraction and behavioural disengagement).

Descriptive results show that teachers in the sample were moderately burned out and reported high work engagement levels. Participants reported moderate to high levels of job demands. Interestingly, participants reported high levels of opportunities for development and meaningfulness of their work. They moderately use coping strategies like humour, self-distraction or behavioural disengagement. Their planning strategies were moderate to high.

Results of a series of hierarchical regressions with teacher burnout and work engagement as dependent variables show that workload, emotional demands, and student disruptions contribute to the emotional exhaustion levels of participants. Unlike workload and disruptive students, emotional demands did not significantly contribute to teacher depersonalisation and feelings of reduced personal accomplishment. Disturbances by disruptive students are consistently negatively associated with all three dimensions of work engagement.

Meaning of work contributed significantly to reduced emotional exhaustion levels of teachers and reduced feelings of impaired personal accomplishment. Meaningful work also made teachers feel significantly more vigorous, dedicated and absorbed in their work. Development opportunities are linked to lower levels of depersonalisation or feelings of reduced personal accomplishment. Teachers who perceive higher development opportunities will also feel more dedicated to their work. An interesting pattern occurred for the coping strategies of teachers. Despite the assumption that coping resources may be linked with teacher wellbeing, they did not significantly contribute to teacher burnout or work engagement. When entering personal resources into the regression models, the effects of job demands on burnout and engagement decreased substantially. Exploratory analyses were conducted to assess non-linear relationships. All personal resources had a curvilinear relationship with emotional exhaustion. Results indicate that coping strategies seem to increase levels of emotional exhaustion, but this effect then plateaus.

This study adds to previous studies by examining the effects of job demands on teacher burnout and engagement by looking at different personal resources. Results indicate a differentiated effect of personal resources on teacher wellbeing, which aligns with COR theory (Hobfoll & Shirom, 2001). Opportunities for professional development and meaning of work seem to set off a gain spiral. Coping strategies, on the contrary, seem to trigger a loss spiral. These results are especially relevant considering the location of the study in an under-resourced context. Under such circumstances, personal resources are even more crucial – not only for teacher wellbeing but also for providing quality teaching. Conclusions will be drawn on how burnout can be reduced, and engagement increased through fostering personal resources of South African teachers. The Congress Theme is 'The Future is Now: The Changing World of Work'. Teachers need to be supported to provide quality teaching and, thus, train and support the next generations.

Keywords: personal resources, wellbeing, teachers

Oral presentation OP499

An Exploration of The Emotions and Entrepreneurial Passions of Tech and Digital Entrepreneurs During Their Start-up Journey

James Brook, Birkbeck University

science

Research goals

Entrepreneurial ventures in the Tech and Digital sectors form an increasingly important part of the UK and European economies. One of the critical factors determining the success of entrepreneurs is how they deal with their emotions and remain passionate and motivated during the early start-up phase on their venture, when challenges, setbacks, failures, and frustrations are common. However, despite this growing interest, there is still a shortfall of qualitative research on the lived emotional experiences of entrepreneurs owing to a historical positivist bias in entrepreneurial research that endures to this day. This longitudinal, qualitative research aims to bridge this gap by examining how UK Tech-Digital entrepreneurs experience emotions and passions as their venture unfolds and how these shape the founder and the venture creation process.

Theoretical background

Entrepreneurship has long been regarded as an emotional endeavour. It has metaphorically been described as a rollercoaster ride involving stronger and faster changing negative and positive emotions than most other professions and occupations (De Cock, Denoo, & Clarysse, 2019). Although the role of emotions in entrepreneurship is receiving increased focus as a topic of research (Baron, 2008; Delgado et al., 2015; Fodor & Pintea, 2017), it remains under-researched. Most academic research into entrepreneurship has been positivist and temporal in nature, so very little is known about how entrepreneurs experience the process as it evolves (Schindehutte et al., 2006). Entrepreneurial passion (EP), or intense positive feelings toward entrepreneurial activities and roles that are meaningful to the entrepreneur (Cardon et al., 2009) has emerged as a particularly popular emotional and motivational construct among researchers seeking to better understand entrepreneurial behaviour and processes. This interest reflects a growing acceptance that entrepreneurship is typically a messy and intensely emotional experience requiring high levels of emotional energy, enthusiasm, and motivation to succeed. Yet despite EP having become deeply embedded in the folklore of entrepreneurship, it is still poorly understood. Most studies assume a positivist paradigm, are survey-based, and measure EP at a single point in time. There is also no agreed definition on what EP is and how it arises. Additionally, we know little about how EP is experienced by different people, how it emerges and how it shapes both the entrepreneur and the start-up of their venture.

Method

Employing purposive sampling and a longitudinal research method, data was collected from 12 Tech-Digital entrepreneurs over a 12–18-month period using 3 semi-structured interviews together with a short questionnaire before the second and third interviews. Each interview was transcribed and coded using NVivo. Within-case narrative analysis was used to capture unique variations in entrepreneurs' emotional experiences and EP. Cross-case exploration using template analysis was then applied to explore common themes within the sample.

Results

The results of the study will be available by April 2022, although publication of the final thesis is planned for September 2022.

Limitations

Given the qualitative nature of this research and intention to provide a rich, contextualized account of entrepreneurs' evolving emotions and passions, the results are not generalizable to UK Tech-Digital entrepreneurs or entrepreneurs in other sectors.

Conclusions

This research enriches the body of research and literature on the role of emotions and EP in venture creation by providing insights into how entrepreneurs experience the inevitable highs and lows of their start-up journey. Moreover, it highlights the unique emotional experiences and sense-making of each entrepreneur in response to unfolding events, including how this shapes their motivation, behaviour, and self-identity. This is particularly salient for the future design of training and development offered by entrepreneurial training organizations, start-up accelerators, universities, and incubators, as topics such as EP and emotional agility are rarely covered in such programs. Finally, it is hoped that the research will enable entrepreneurs themselves to gain a deeper understanding of how their emotions and passions shape their identity, motivation and how the venture unfolds.

Relevance to the congress theme

Entrepreneurship is becoming increasingly common in a fast-changing world of work, with more people of working age (particularly younger generations) turning to Tech-Digital entrepreneurship as an alternative to traditional corporate roles. In this fast-changing context, it is important we conduct more research to augment our understanding of entrepreneurial processes and behaviours, including how emotions and passions emerge, are experienced, and impact an entrepreneur's start-up journey.

Keywords: Entrepreneurship, Passion, Emotions

Oral presentation OP264

An Integrative Literature Review on Psychological Resilience in the Context of Leadership

Stefan Razinskas, Freie Universität Berlin; Silja Hartmann, Technische Universität Berlin

science

Research Goals/Purpose

In times of crisis and adversity, leaders are particularly challenged since they are expected to support the ones they lead while also having to cope themselves. This has made the concept of psychological resilience ever more important to leadership research. While psychologically resilient leaders are usually assumed to avail themselves of constructive types of leadership, they may also be at risk of creating challenging environments in expectation of their followers to keep up with their own resilience. Despite increasing interest in the psychological resilience of leaders and followers, theory is still about to switch from relatively well-established intrapersonal perspectives that consider either the leaders or their followers to the required interpersonal leader−follower perspective. We hence aim to take stock of what we know about psychological resilience in leader−follower contexts to help this field mature.

Theoretical Background

Defined as the positive adaption despite adversity, psychological resilience is one of the core constructs of positive organizational behavior. We draw on a multi-perspective leader−follower framework to help better understand the role that psychological resilience plays in the broader leadership literature, such as that on constructive (e.g., transformational, authentic, and servant leadership) and destructive types of leadership (e.g., abusive supervision and narcissistic leadership).

Design/Methodology

We offer an integrative review of leadership literature on psychological resilience. By following the most recent version of the PRISMA approach during our search for relevant research in Web of Science and EBSCO, we identified 109 journal articles and 24 dissertations that form part of our integrative literature review. When reviewing these 133 empirical research items, we develop a multi-perspective leader−follower framework that helps guide future research in this field.

Results

The majority of studies we identified investigated psychological resilience in the context of leadership from an intrapersonal perspective of either the leaders or their followers, with the latter perspective being more prominently applied. Although constructive types of leadership and their ability to activate psychological resilience in followers received more attention from both intrapersonal perspectives, some studies also considered more destructive types of leadership and how followers' resilience may buffer against their detrimental consequences. With regard to the upcoming literature attending to the intrapersonal leader−follower perspective, most studies are concerned with actual interactions between leaders and their followers by investigating how leader-member exchange or the support of leaders relate to the psychological resilience of leaders, followers, or both.

Limitations

While reviewing the leadership literature on psychological resilience, we identified three major shortcomings in this field that we consider worthwhile for future research to address. First, there is

scarce research concerning the interdependency between the psychological resilience of leaders and their type of leadership. Second, little is known about the contagion and convergence of psychological resilience among leaders and followers through their social interactions. Third, more research is encouraged to study the role that (in)congruence in resilience between leaders and followers plays for psychological resilience to become contagious.

Conclusions

Since leadership research on psychological resilience has grown rapidly in recent years but in unstructured ways, there is an urgent need for an integrative review of the interplay between leadership and resilience that guides research in terms of where to go in the future. The multi-perspective leader–follower framework advocated in our review advances leadership research on psychological resilience, contributing to the broader scholarly conversations on how leaders can enable adaptive organizational responses to change, setback, and adversity.

Relevance to the Congress Theme

The changing world of work is a critical challenge for leaders that are under enormous pressure because of being asked to ensure the continued success of their organizations and help their followers develop and demonstrate adaptiveness. Being expected to support their followers in the face of these challenges is even more problematic because they affect leaders themselves, which may have serious consequences for their functioning due to stress. Our integrative literature review offers a more elaborate understanding of the role that psychological resilience plays in the context of leadership, which is important to reliably inform organizational practices about the threat of considering resilience a silver bullet that allows every employee to cope even with the most critical situations.

Keywords: psychological resilience, leadership, interpersonal relations

Oral presentation OP102

Anger in Meetings: Do Resulting Emotional labor and Meeting Outcomes Depend on Meeting Members' Hierarchical Position?

Prisca Brosi, Kühne Logistics University; Jospeh Allen, University of Utah

Science

Research goals and why the work was worth doing

We aim to connect research on anger with the developing research on emotional labor in meetings, to understand 1) how meeting participants deal with their anger in meetings, 2) resulting consequences on meeting outcomes, and 3) whether hierarchical positions change how meeting members deal with their anger in meetings. Being the first to focus on anger in meetings, this research is particularly worthwhile as anger results from feeling that others block one's goals such as often occurring during changes in the world of work.

Theoretical background

The neglect of anger in meeting research is especially problematic as anger expressions can have both functional and dysfunctional consequences. On the one hand, anger expressions can provide useful social information as they indicate performance shortcomings and dissatisfaction with results. Yet, on the other hand, expressing anger can be confronting and harm relationships. Thus, despite anger expressions being potentially useful in meetings, the question arises how meeting participants deal with their anger during meetings.

Given the confrontational nature of anger, meeting members might refrain from openly expressing their genuine emotions after experiencing anger. Instead, employees may surface act, i.e., fake unfelt emotions and/or suppress felt emotions, or deep act, i.e., alter their emotion experience to genuinely display desired emotions, their emotions in meetings in response to anger experiences. Despite these general tendencies, however, not all meeting members may engage in emotional labor in the same way. Especially as anger is closely connected to power, one may expect hierarchical positions to change emotional labor in response to anger experiences.

Design/Methodology/Approach/Intervention

We tested the resulting research model in two studies. Study 1 applies a critical incident design (N = 458) to examine how incidental anger experiences in meetings influence meeting outcomes via emotional labor depending on meeting members' hierarchical position in the organization. In Study 2, we used an experimental design (N = 240) to compare emotional labor in response to anger experiences with experiences of sadness and, meetings in general, which additionally enabled a qualitative analysis of the causes of anger in meetings.

Results

Results across both studies confirmed that anger experiences are responded with emotional labor in meetings. Anger experiences are connected to less genuine emotion expressions and more surface as well as deep acting. The connection between anger experiences and genuine emotion expressions led, in turn, to lower meeting effectiveness, the connection with surface acting resulted in lower meeting satisfaction. In contrast, the connection with deep acting led to higher meeting effectiveness and satisfaction. Yet, the results for the moderating effect of hierarchical positions differed across both studies. Study 1 showed that those in lower hierarchical positions were especially likely to

refrain from genuine emotion expressions, while those in higher positions deep acted their emotions more in response to anger experiences. In contrast, Study 2 did not indicate differences across hierarchical positions.

Limitations

Despite replicating the results of the cross-sectional critical incident study with an experimental study, we cannot rule out that underlying differences in meetings alternatively explain the differences in emotional labor in response to anger experiences. Furthermore, all measures were taken from the same sources, i.e., meeting participants. While especially anger experiences and emotional labor are difficult to obtain externally, future research on anger in meetings may instead experimentally induce anger in meeting participants and objectively measure verbal and bodily anger expressions.

Conclusions

In sum, we make three theoretical contributions to research. First, we are the first to focus on anger in meetings. Second, extending the examination of anger experiences on meeting outcomes via emotional labor, we highlight a specific emotion, i.e., anger, and related circumstances that necessitate emotional labor. Third, we test hierarchical positions as a moderator for understanding how meeting members deal with their anger, which contributes to the long-standing discussion of power and emotional labor. Given the prevalence of anger in meetings, the results of the two studies give concrete indications on how meeting members — in low and high hierarchical positions — may best manage their anger in meetings.

Relevance to the Congress Theme

With anger resulting from feeling that others block one's goals such as often occurring when changing the world of work, our research can help paving the way for discussing changes in organizations. Furthermore, results give important implication for improving meetings, which for many employees constitute a substantial part of their world of work.

Keywords: Anger, emotional labor, meetings

Oral presentation OP235

Anticipated discrimination on the labor market: Implications for impression management tactics used on LinkedIn

Alissone Mendes De Oliveira & Franciska Krings | University of Lausanne

science&practice

Research goals: Hiring discrimination against minority applicants is widespread. The aim of the present research is to understand how anticipations of experiencing discrimination at hiring influence the way job seekers present themselves on social-media platforms like LinkedIn. We also explore the impact of these strategies on job-related outcomes.

Theoretical background : Discriminations against stigmatized individuals (e.g., women, older individuals) at hiring is prevalent and well-documented by experimental (Neumark, 2018) and survey research about job seekers' experiences of discrimination (Schmitt et al., 2014). We add a novel perspective to this literature by considering job seekers not only as passive spectators but as actors who react to the discriminations they are facing. It has been suggested that job seekers use certain impression management strategies to overcome stereotypes or stigmatizing associations and reduce the risk of negative outcomes (Shih et al. 2013). Indeed, some studies suggest that for minorities associated with low competence using impression management like self-promotion during the interview reduces social bias (Gioaba et al., 2017). In this study, we focus on impression management on LinkedIn, today's most important entry portal to the labor market. On social media platforms, job seekers craft their professional image to render themselves attractive to not only one specific employer but several potential employers and network contacts (Roulin & Levashina, 2016). We investigate the relationships between anticipated discrimination and the use of honest and dishonest impression management on LinkedIn, as well as the efficiency of these strategies, in a large survey with job seekers.

Methodology: We conducted a time-lagged survey with of 332 U.S.-job seekers (19 to 65 years; M age = 39.54; 41.9% women). Participants reported how they constructed their LinkedIn profile, to what extent they perceived and anticipated being discriminated against and several job search success indicators (e.g., invitations to company events or interviews). Moreover, we measured participants' use impression management tactics on LinkedIn with an adapted version of Bolino and Turnley's (1999) scale. Additionally, we measured the use of dishonest impression management strategies such as hiding information on LinkedIn. Finally, participants provided basic demographic questions and responded to a short version of the Big Five Personality Scale.

Results: The results of our regression analyses showed that perceived and anticipated discrimination were positively related to the use of impression management tactics: The more job seekers anticipated being discriminated against, the more they used honest and dishonest impression management tactics, when constructing their profile. Moreover, the extent to which they used impression management on their LinkedIn profiles was positively related to job related outcomes like invitations for job interviews obtained through LinkedIn. Importantly, all relationships remain stable when controlling for the Big Five personality traits, education, age, gender, and ethnicity.

Limitations: Our data are self-reports coming from the same source which may inflate relationships between variables. We tried to minimize this issue by collecting predictor and outcomes variables in different points in time. Nevertheless, to establish causality, our results should be replicated in an experimental study.

Conclusions: Our findings show the impact of anticipating the experience of discrimination on job seekers behavior on LinkedIn. By doing so, we hope to add to the innovating literature viewing minority candidates as active actors in this process. Our results also bring practical insights in showing the benefits for companies in engaging publicly in non-discriminatory practices. Indeed, when anticipating being discriminated, job seekers tend to use more dishonest impression management tactics. This could increase the difficulties for companies to hire candidates that fit with the organization and the requirements.

Relevance to the Congress Theme: This study is relevant for the congress theme "The future is now" because it explores the impact of anticipated discriminations and tries to provide jobseekers with tools to fight against them (honest impression management strategies). In addition, this research studies job seekers behaviors on LinkedIn, a technology that challenges the traditional paper resume. By studying these mechanisms on a popular platform, we hope to help building a better future for all.

Relevant UN SDGs: The present study is relevant for the UN SDGs by exploring how (honest and dishonest) impression management strategies can be related to discrimination and how these different strategies impact job-related outcomes. By doing so we hope to help reduce inequalities for all the minorities which is one of the priorities for the UN.

Keywords: diversity, impression management, LinkedIn

Oral presentation OP33

Applicants' reactions to traditional and digital interviewing and the impact of inappropriate questions

Evdokia Tsoni & Ioannis Nikolaou | Athens University of Economics and Business

science&practice

Research goals and why the work was worth doing

HR departments often face difficulties with applicants' reactions to employee recruitment and selection, e.g. fairness of the selection method, feedback to candidates, etc. This research investigates the comparison between face-to-face (FTF) and digital employment interviews, exploring how applicants' reactions are shaped. Digital interviewing is a process whereas applicants record themselves whilst answering interview questions received through text, audio, or video on an online platform, and interviewers can watch and rate these recordings at any time.

More specifically, we explore a) applicants' preferences in relation to the recently widely used selection method – the digital interview compared to the traditional FTF interview, including the determinants of the mechanisms associated with organizational justice perceptions, expectancy of a favorable outcome and propriety of questions.

Our research contributes further to applicants' reactions research. Recently, negative applicants' perceptions of technology-mediated interview methods are uncovered while organizations seem to assess the digital interview as an effective selection method (Blacksmith et al, 2016). Thus, our research attempts to examine this contradiction.

Theoretical background

The theoretical foundation of our study is based on the Organizational Justice framework. Initially, we compare FTF and digital interview regarding applicants' attitudes and fairness reactions suggesting that procedural justice influences applicants' perceptions towards these methods.

Moreover, the factor of propriety of questions that describes appropriate/inappropriate questioning and the likelihood of provoking positive/negative reactions based on the perceived fairness of selection procedures is under consideration. The more irrelevant/inappropriate the questions are to the job (i.e., sexual orientation), the more unfair the candidates will perceive the tool.

Our research contributes further to applicant reactions research based on Media Richness Theory, whereas an employment interview is perceived by candidates as more favorable depending on how rich the tool medium is (Chapman et al, 2003). Thus, the rich, personal communication of the FTF interview is taken as more favorable compared with the digital.

Design/Methodology

We employed a pre-post design with two groups (experimental and control) including FTF vs. digital interview and normal vs. manipulated interview questions (such as sexual orientantion, possible drug abuse, etc.)

Both the experimental and the control groups completed the same pre-test and post-test self-administered questionnaires, including measures as Process Favorability, Intention to online Review Writing, etc.

Our sample consisted of 80 participants (university students, employed or unemployed individuals) that have taken part initially by completing a pretest questionnaire and then by participating with active mock employment interviews. The sampling frame was selected along purposive lines.

Half of the participants attended a FTF interview first with a trained recruiter followed by a digital interview using a professional digital-interview platform. Upon completion, half of them were provided an official letter of job offer and the other half of rejection and subsequently completed the post-test questionnaires.

Results

The results of this research are mainly aligned with the existing theoretical literature. Hypotheses based on the positive perceptions of interviewees on the traditional interviews are confirmed while the effect of inappropriate questioning is inconsistent with the theoretical background. Also, it is demonstrated that perceived justice has a causal relationship with expectations of a positive outcome, implying that FTF creates a positive result based on its evaluation as more fair compared to digital interviewing.

Limitations

The study limitations include the relatively limited sample size, the lack of potential moderator's worthy of consideration that were excluded due to time limitations (e.g. interviewee status), the large percentage of students in our sample and the absence of prior experience of the digital interview.

Conclusions - Research/Practical Implications

The implications of this research are both theoretical and practical for testing interviewing process preference in relation to organizational justice perceptions. It could also be used by practitioners to determine the influence of the selection processes (FTF and digital alternatives) on the perceived fairness, high tech usage preferability, etc. to evaluate the different interviewing techniques.

Relevance to the Congress Theme

This research is associated with 'reducing inequalities' in the workplace since it covers the topic of appropriateness of questions during an interview, an element of candidates' selection that is relevant to inequities, discrimination, and subjectivity of the interviewer.

Keywords: Applicants' Reactions, FTF interview, digital interview

Oral presentation OP405

Applying for impact. Social Responsibility as a competitive advantage for start-up talent acquisition

Henrik Heinemann & Philipp Schäpers | University of Münster

science

1. The goal of this empirical research is to introduce social responsibility as an important recruiting factor for start-ups and to integrate it into existing employer branding theory. The results give important insights and practical knowledge for talent acquisition in start-up companies struggling considerably with the current “war for talent”.

2. Many entrepreneurs experience difficulties finding qualified employees, due to a lack of resources, reputation or other reasons (Greer et al., 2016). Yet, finding fitting employees is crucial for early-stage ventures (Nyström, 2021). The role of socially responsible actions for organizational attractiveness has been researched in the context of corporations, yet there is a lacking body of research in start-up firms (Aguinis & Glavas, 2012; Del Mar Ramos-González et al., 2022; Tiba et al., 2019). As job seekers value different employer attributes in start-ups and start-ups attract younger employees, we argue that social responsibility might be even more important in an entrepreneurial context (Ouimet & Zarutskie, 2014; Tumasjan et al., 2011). We propose that social responsibility is an important recruiting factor for start-ups that might even compensate for a lack of benefits such as an above average compensation, developmental opportunities and work-life-balance. Thus, we hypothesize:

H1: Social (SR) and environmental (ER) responsibility is positively related to organizational attractiveness and job-pursuit intention.

H2: SR and ER will influence organizational attractiveness and job-pursuit intention beyond the effect of the employer attributes (a) compensation, (b) development and (c) work-environment.

We propose that the influence of a company’s social responsibility depends on the applicant’s personality, in line with P-O Fit theory (Kristof, 1996). Accordingly, we expect the same values and traits that are shared by founders of social enterprises, to be important for the decision-making processes of applicants attracted to socially responsible employers. Hence, we hypothesize:

H3: The effect of SR and ER on organizational attractiveness and job-pursuit intention will be moderated by the prospective applicants’ (a) meaningful work value, (b) help value and (c) empathy.

3. Using a conjoint analysis approach, factorial combinations of five employer attributes are displayed, which participants rate on a scale of employer attractiveness. We vary the attributes within job ads, which have been a widely used and valuable source of information as the first touching point between employer and job seeker (Yu & Davis, 2019). Every job-ad includes high or low variations of the attributes. A fractional design will be used, displaying 16 decision profiles plus 16 replicated profiles to evaluate test-retest reliability. Following each profile, participants will rate the respective company’s organizational attractiveness (Highhouse et al., 2003). We target a sample of 306 of prospective job seekers, following an a-priori power analysis conducted for a small to medium sized effect ($1 - \beta = .80$; average marginal component effect (AMCE) = 0.04; Bansak et al., 2020).

4. The present research consists of two studies. A first study has already been conducted ($N = 90$), successfully checking the manipulations of employer attributes. Results of the first study indicate that ER was perceived as more attractive than SR (Cohen’s $d = -0.39$, $t(89) = -3.74$, $p < .001$). Data

revealed a two-factorial structure with SR and ER loading on one factor, and the other benefits loading on a second factor, indicating the applicability of the model by Lievens and Highhouse (2003). Data collection for the second experimental study is in preparation and will be finished by December 2022. In the second study we will also investigate possible moderating effects of the participants' individual values and personality factors typically associated with a social entrepreneurial orientation, assessing empathy as well as helping and meaningful work values (see H3).

5. To avoid fatigue effects, we use a fractional design (Graham & Cable, 2001; Karren & Barringer, 2002). This limits our ability to investigate three-way interactions between the employer attributes.

6. We integrate SR and ER into existing frameworks of organizational attractiveness, e.g., the instrumental-symbolic-framework (Lievens & Highhouse, 2003) and extend previous employer branding theory. We examine if responsibility can be conceptualized as a symbolic employer attribute, or whether it displays neither instrumental nor symbolic factors. Practical implications for entrepreneurs are given, offering insights about how social responsibility might be able to compensate a lack of other benefits.

7. We directly relate to the Congress Theme by addressing the rising importance of social and sustainable innovation and entrepreneurship in the changing world of work combined with the "war for talent".

Keywords: entrepreneurship, social responsibility, employer branding

Oral presentation OP308

Applying the Green Human Resource Management. An analysis and revision of the model guided by HR experts

Ilaria Buonomo & Paula Benevene | LUMSA University

science

Applying the Green Human Resource Management. An analysis and revision of the model guided by HR experts

Research goals. This contribution provides a new viewpoint for Green Human Resource Management (GHRM) analysis. More specifically, it aims to explore which GHRM practices are in use in Italy, HR managers' opinions about the helpfulness and suitability of current GHRM models, and suggestions to modify the current GHRM model.

Theoretical background. Although current literature provides no strict definition of GHRM (e.g., Shahriari et al., 2019), its domain has been broadly identified considering the perspectives of strategic HRM, corporate social responsibility, and Environmental Management (EM) (Randev & Jha, 2019). The lack of a structured definition allowed for several research papers analyzing GHRM without relying on a theoretical underpinning (e.g., Opatha & Arulrajah, 2014; Renwick et al., 2016). Some common GHRM dimensions emerge in the studies: selection and recruitment, employee training, performance appraisal and management, rewards, and employee involvement. According to literature reviews, the mentioned practices account almost for the totality of dimensions described as pertaining to GHRM in the current literature (Jackson et al., 2011; Opatha & Arulrajah, 2014; Renwick et al., 2016; Benevene & Buonomo, 2020). However, the knowledge about GHRM at theoretical and empirical levels is still far from being exhaustive due to its relatively recent development. Several points need to be further addressed and developed. Firstly, each dimension may have a differential impact according to organizational contexts. For example, while for some contexts, the use of green selection criteria is mandatory, for others, it is not, thus leading to a lower commitment to using this greening strategy. In these cases, the organizational story and culture should be addressed to verify how these dimensions impact employees' greening conduct and general corporate HR practices (De Vries, 2004). Secondly, several studies focus on the manufacturing sector. While activities in this sector are highly responsible for pollution and waste disposal (European Commission, 2010), each organization, according to its size, mission, stakeholders, and territory, will shape GHRM practices differently, thus leading to a more complex, extended model. Finally, current GHRM models have a normative approach to HR in greening processes. Given the implications of organizational features and cultures, a descriptive approach could be more helpful, as it may offer differentiated solutions to organizations willing to become greener by considering current best practices and customized solutions.

Methodology. Forty HR managers (85% males) of small, medium and large-sized Italian organizations took part in the study. 70% worked in profit organizations (e.g., transport, food, and ICT), while 30% in healthcare and non-profit organizations (e.g., private healthcare facilities). Semi-structured interviews were conducted on three main topics: 1) current GHRM practices; 2) research-based GHRM model; 3) proposals of revisions in the model to suit organizational greening needs better.

Results. Employee involvement (73%) and Training and development (54%) were the dimensions most frequently implemented. In the first case, implementations can involve "evangelists" (i.e., employees sustaining specific practices, behaviors or approaches to green issues at work) or follow external green initiatives (e.g., sustainability challenges or volunteerism). In the second case, the

training opportunities were often voluntary or integrated with awareness actions. Green recruitment and selection was considered the less feasible dimension (45%), mostly because of a general scarcity of qualified candidates and the potential reduction of the candidate pool due to the use of green sensitivity as an exclusion criterion (23%). Consistently, 9% suggested using it as a preference criterion. Proposed revisions of this dimension included assessing the candidates' cultural fit with the organization (14%) and curating employer branding activities to attract green-sensitive candidates (18%). Employee involvement (95%) and Training and development (82%) were claimed to be the most feasible dimensions, even because they were already being implemented.

Limitations. 1) The sample is not representative of the heterogeneity of Italian organizations; 2) A mixed-method approach could measure the impact of current practices and assess the expectations and attitudes of employees towards future initiatives.

Conclusions. Current GHRM models are mostly oriented to medium/large-sized manufacturing organizations outside Europe. This contribution provides information on the applicability of GHRM models in different contexts.

Relevance to the Congress theme . This contribution helps analyze how people within organizations can act as a lever for the greening process, which is crucial for the future of work.

Keywords: GHRM, greening processes, sustainable HRM

Oral presentation OP511

Are BDMs gender specific? An Exploration of Mentoring Experiences for Men in STEM

Carolina Saffie Robertson, St. John Fisher University

science

Research recently published suggests that women working in science, technology, engineering and mathematics (STEM), might experience mentoring relationships slightly different than their male counterparts. In particular, previous research suggests that women encounter four Barriers to the Development of Mentorship (BDM) when trying to develop a mentorship at work. These BDMs act as hurdles that prevent initial meetings between potential mentor and protégé from developing into long-term, healthy and successful mentoring relationships. The BDM identified for female employees include Need for Fit, Demonstrating Capability, Commitment of the Mentor, and Trust in the Mentor. Although very relevant and impactful for the mentoring literature and practice, these BDM were unearthed in samples comprised solely by females, which begs the following questions: Do men in STEM also encounter BDMs? If so, are these the same or are BDMs gender-specific?

The current study set out to answer these research questions by conducting in-depth interviews with 21 men holding managerial positions in STEM organizations in the United States and Canada. These interviews followed a semi-structured protocol that included questions such as “Think about your relationships with mentors. Do you have a mentor right now within your organization? Tell me about this relationship. How did it come about? What about past mentorships? What factors have helped you develop these mentorships?”. The collected data, as well as notes taken throughout the interview (including verbal and non-verbal cues) were analyzed using a grounded theory approach.

Common themes were found in the data regarding mentoring in general, and in particular, around the existence of BDMs. Data suggests that men also experience BDMs in the workplace when trying to establish these developmental relationships. However, the BDMs experienced by men are slightly different than the ones encountered by women. Men discussed two known BDMs, Commitment of the Mentor, and Trust in the Mentor, as two crucial elements that could impede initial meetings from growing into a mentorship. Furthermore, men interviewed described two BDMs that have not yet been discussed in the mentoring literature. These two new BDMs were labelled “Need to Share a Goal/Vision” and “Admiration towards the Mentor”. Therefore, the data from this study would suggest that both male and female employees experience BDMs, that there are at least six BDMs, and that these seem to be gender-specific.

Although these findings significantly expand our knowledge of mentoring relationships and BDMs, this study is not without limitations. Mainly, the sample used was North American, white collar and within a specific industry area, STEM. Even though the sample was adequate given the research questions, the generalizability of the findings needs to be explored. Future research needs to determine the existence and impact of BDMs across different industries, cultures and countries. Furthermore, even though personal characteristics of the interviewee (other than gender) was collected, these did not seem to be related to or impact BDM in any way. Future studies could explore the impact and pervasiveness of BDMs according to other personal characteristics of the protégé, such as race, age, cultural background and sexual orientation.

This study makes significant contributions to the mentoring literature in two related ways. First, the data from this study confirms the existence of BDMs as hurdles that impact the development of mentoring relationships. Second, this research discovered two BDMs previously unknown, therefore expanding our knowledge in this area.

In-depth understanding of BDMs could aid researchers and practitioners alike understand why women are under-mentored and consequently underrepresented in STEM workplaces. Furthermore, identifying which BDMs are most likely to impact a particular employee, could meaningfully improve the way we support the development of informal mentoring as well as how we design, implement and encourage formal mentoring programs.

Mentoring relationships have been signaled as very important for the development of employees. In fact, literature has identified mentorships as having the potential to help women and minorities break the glass ceiling. Therefore, the more we understand the factors that aid or impede these relationships from blossoming, the more we can help employees reach their full potential, furthering gender equality and reducing societal inequalities.

Oral presentation OP372

Are four working days enough? Working time preferences and working time reduction in Germany

Nils Backhaus, Laura Vieten & Johanna Nold | Federal Institute for Occupational Safety and Health (BAuA)

science

Research Goals

For a large part of the workforce in Germany, the five-day week is a reality. The discussion about reducing the working times was further reinforced by international pilot projects. This contribution is aimed at providing a representative overview of working time preferences in contrast to actual working time arrangements of German employees. Therefore, we describe preferences in terms of weekly working hours and the number of working days per week. Furthermore, we examine discrepancies between preferred and actual working times over time in relation to working conditions, health, and well-being.

Theoretical Background

According to the theoretical framework of Caruso (2006) long working hours reduce the time for sleep and recovery, and extend the exposure and increase vulnerability to job demands. Thus, long working hours increase stress, impair health and well-being (e.g., Pega et al., 2021), and increase the risk for occupational accidents (Matre et al., 2021). Furthermore, long working hours lead to impaired sleep (Bannai & Takahashi, 2014) and reduce family, social and leisure time (e.g., Arlinghaus et al., 2019). In contrast, researchers report that working time reduction is associated with reduced work stress, improved sleep quality and better work-life balance (Jansen-Preilowski et al., 2020; Voglino et al., 2022).

Methodology/Design

We use data from the BAuA Working Time Survey 2015, 2017, 2019 and 2021. The study is conducted via computer-assisted telephone interviews (CATI). The sample is representative of the German working population. Both the existing (actual weekly working hours and number of working days) and the preferred working times (preferred weekly working hours and number of working days) are analysed based on self-reports. We focus on describing the prevalence of working time arrangements as well as discrepancies between preferred and actual working times and working days per week in relation to subjective health status, work intensity, psychosomatic health complaints, and work-life balance. To identify relationships among these variables, cross-sectional and trend analyses are used based on linear and logistic regression models with predictive margins (Graubard & Korn, 1999).

Results

The descriptive results suggest that employees increasingly wish to reduce their working times over the last years. In 2021, half of all employees want to work 4 days per week or less, in most cases with a reduction in weekly working hours. This is also reflected in increasing working time discrepancies: A growing number of employees wish to shorten weekly working hours. Wishes to shorten the workweek are related with high work intensity, lower self-reported health, more psychosomatic health complaints and lower satisfaction with work-life balance.

Limitations

The analysis is partially based on cross-sectional data and does not allow for causal inference. In addition, common-method bias is also an important aspect since all variables stem from self-reports (Podsakoff et al., 2003). In contrast to „objective" data derived from electronic working time records, estimated dimensions of working times are subject to certain biases and lead to inconsistent results (Härmä et al., 2015).

Conclusion

The results make clear that more and more employees in Germany prefer to reduce their working times and shorten their working weeks. There are also growing discrepancies between actual and preferred working hours. A wish for a shorter working week is associated with high work intensity, a low health status and well-being, and a low level of satisfaction with work-life balance. However, implementing these preferences can be difficult, for example, due to the increasing shortage of skilled workers in many sectors or potentially lower income when working time is reduced, especially in the low-wage sector.

Relevance to the Congress Theme "The future is now: Changing world of work"

Working times are indicators of changes in the world of work. In particular, reducing working times is a current trend that has become prevalent in many international trials, e.g., in Great Britain, Iceland or Belgium. The article gives a representative overview about working time preferences in Germany.

Relevant UN SDGs

Recovery and free time are essential to maintain employment health and performance, especially in times of increasing work demands. Shorter working weeks can also lighten high workloads and promotes decent work (UN SDG 8). In addition, working time reduction improves health and well-being, especially when working long hours (UN SDG 3). Finally, by equalising the working times of men and women, a reduction in working times contributes to greater gender equality (UN SDG 5) and equality in general (UN SDG 10).

Keywords: Working time preferences, Working time reduction, Occupational health

Oral presentation OP628

Are Individual- or Team-Based Rewards Better in Minimizing Workplace Incivility? The Role of Competition, Frustration, and Task Interdependence

Catarina Marques dos Santos, Maastricht University; Suzanne van Gils, BI Norwegian Business School; Melissa Scheepens, EY

science

Building on research about the dark side of pay for performance, we investigated the influence of reward base (individual vs. team) on experienced and expressed workplace incivility through competition and frustration, as well as the moderating role of task interdependence on this relationship. We build on earlier research that shows that rewards increase competition leading to an aggressive organizational culture (Porter et al., 2018), and to interpersonal deviance (Gläser, et al., 2017). Previous research has not investigated the ways in which teams collaborate, however. We address this by investigating the effect of different levels of task interdependence (e.g., Wageman & Baker, 1997) as a moderator.

A first, cross-sectional, study surveyed eighty-seven professionals from different professional backgrounds about their experience in recent teamwork, asking about individual vs. team-based rewards, and measuring frustration, interdependence, and incivility. Contrary to our predictions, the regression results of this study did indicate that team-based rewards indirectly increase the level of experienced workplace incivility through competition. Furthermore, in line with previous research, team-based rewards were found to increase frustration, especially in low task interdependent situations. This study contributes to the rewards literature by analyzing and showing the differentiating effect of individual- and team-based rewards on workplace incivility through competition, and by analyzing task interdependence as an important boundary condition in reducing frustration.

In order to systematically explore the effects of rewards and interdependence without the confounding effects of other organizational aspects, we conducted an experimental study as Study 2. In this study, participants signed up through an online link and were entered to the 2 (team vs. individual reward) x 2 (high vs low interdependence) live online group task, followed by a survey measuring their experience during the task. The results complement findings about the dynamics between reward base, task interdependence, incivility, and the underlying mechanisms of competition and frustration of Study 1.

We aim to contribute to the literature on pay for performance (Barnes et al. 2011, Glaeser et al. 2017), as well as the literature on incivility (cf. Schilpzand et al. 2016). Based on our findings, we recommend organizations that implement a form of team-based rewards, to structure the tasks such that task interdependence is high, to avoid high levels of frustration among the team members.

This study is relevant to the Congress Theme “The future is now: The changing world of work” as it provides insights into teamwork and particularly focuses on teams that are self-managed and consist of different members. In addition, the study is relevant to the UN SDG “Decent work and economic growth” as it provides academics and practitioners with insights and competences to decrease competition and workplace incivility, and thereby contributes to improve individual and team collaboration, performance, and sustainability. Decreasing incivility will particularly benefit more vulnerable groups in organizations and minority members, as earlier research has shown those groups to be most likely to be subjected to incivility overall.
Keywords: Incivility, Rewards, Group dynamics

Oral presentation OP221

Are our Selection Instruments Actually Free of Stereotypes? Development of a Coding Scheme to Detect Gender Stereotypes in Situational Judgement Tests

Marie Luise Ohlms, Universität Ulm; Philipp Schäpers, Universität Münster; Stefan Krumm & Annina Braunreuther | Freie Universität Berlin

science&practice

In recent years, the focus on gender bias and discrimination against women in personnel selection is increasingly attracting attention. One trigger that can lead to gender bias in selection decisions are gender stereotypes among decision-makers in organizations (Heilman et al., 2012). However, gender stereotypes among HR managers can not only directly influence selection decisions but also indirectly by being reflected in personnel selection instruments, if recruiters have these stereotypes in mind when developing selection tools. This, in turn, would be problematic as it may perpetuate old role models (i.e., females are unsuitable for leadership positions) and may trigger a stereotype threat in the affected subgroups (Walton et al., 2015).

Thus, to promote a fair and diversity-enhancing personnel selection, our study aimed to develop a coding scheme to detect gender stereotypes in simulation-orientated selection instruments. Furthermore, we used the coding scheme to review ten Situational Judgment Tests (SJTS) and evaluate them in terms of the stereotypical use of gender, as the situation descriptions of SJTSs may reflect gender stereotypes of their developers.

Development of the Coding Scheme

In developing the literature review, we searched for articles concerning gender stereotypes and how women and men are stereotypically perceived. Based on the literature sighting and the Lack of Fit model (Heilman, 1983) as well as the Role Congruity Theory (Eagly & Karau, 2002), we identified agency and communion as the two dimensions into which most of the stereotypical perceptions regarding male and female workers fall into (Heilmann et al., 2012). Thereby, men are generally seen as more agentic, comprising attributes such as achievement orientation, assertiveness, and autonomy, whereas women are regarded as communal, attributing caregiving behaviors and emotional sensitivity (Bakan, 1966).

The coding scheme is implemented as follows: First, the protagonist is classified in a certain item (i.e., male, female, no gender, paired forms). Then the item context is determined as either agentic or communion, with a situation displaying agency when it is about career, work, achievement, and communion when the situation is about family, caring for others, social relationships, and activities outside work. After coding the items, items containing female and male stereotypes are summed up and put in proportion to the stereotype-free items. Here, an item would be classified as female stereotyped if it describes women in a communion situation or in an agentic situation where the woman is pictured solely as a clerk or similar. Items are counted as male stereotypical when male protagonists are described in an agentic context where they hold great authority or behave in an agentic manner.

Results

We applied the coding scheme to ten different SJTs by two independent raters. There was high interrater reliability for the 263 SJT items for ratings of protagonist and context (κ =.92) and for evaluations of the presence of a stereotype (none, female, or male; κ = .78).

The application of the coding scheme showed that among the 263 SJT items a total of 19 female and 36 male stereotypes were used, amounting to 20.9% of items with stereotypes. In addition, results of a Pearson Chi-square test showed that stereotype-consistent male protagonists (47) occur significantly more often in agentic contexts than do female protagonists (23), $\chi^2(1) = 8.23$, $p = .004$. Regarding the items with communion contexts, no difference was found in the frequency of female (15) and male (20) protagonists being present in these items, $\chi^2(1) = 0.71$, $p = .40$. Additionally, we tested whether a particular gender was overrepresented among the leaders mentioned in the individual items. Results showed that male leaders were mentioned in 19 items and were significantly more frequently represented than female leaders, who occurred in only seven items, $\chi^2(1) = 5.54$, $p = .02$.

Discussion

The application of our coding scheme indicated that stereotypical use of gender exists in various SJTs, with men more often present in agentic contexts and leadership roles. This is problematic not only for legal reasons but also becausesuch stereotypes impair a fair and unbiased personnel selection. Thus, HR specialists should be aware of common stereotypes regarding gender when designing, implementing, and evaluating selection methods. Aiming for a balanced proportion of males and females in both agency and communality contexts when creating items of selection instruments could be a first step to preventing the implementation of stereotypical use of gender.

Thus, the coding scheme may help identify and prevent gender stereotypes in developing new personnel selection instruments to promote a more diversity-friendly personnel selection process. Thereby, the coding scheme does not only apply to SJTs but can be used as a manual for the development of more gender-fair selection methods.

Keywords: gender stereotype, coding scheme, personnel selection

Oral presentation OP134

Are the Effects of Servant Leadership Only Spurious? The State of Research on the Causal Effects of Servant Leadership and an Illustrative Experiment

Annika F. Schowalter & Judith Volmer | University of Bamberg

science

Research goals

In the present study, we aimed to investigate the current state of research regarding causality in the field of servant (and authentic) leadership and provide recommendations on how causally identified studies can be conducted.

Theoretical background

As one of the most popular leadership theories in recent years, servant leadership has been associated with numerous positive work-related outcomes. However, the findings often cannot be interpreted causally, although this is a precondition for drawing reliable scientific or policy implications. Thus, we outline what we consider methodological problems that can threaten causality in the field of servant leadership (i.e., endogeneity bias and problems in randomized experiments). Based thereon, we provide recommendations on how researchers can investigate the causal effects of servant leadership more carefully. Our recommendations focus on the implementation of sound randomized experiments and the use of instrumental variable regression.

Methodology

First, to investigate the prevalence of the methodological problems that potentially prevent causal inferences (i.e., endogeneity bias and problems in experimental research), we conducted two systematic reviews of the effects of servant and (because of their overlaps) authentic leadership as explanatory variables. In both systematic literature reviews, we focused on the methodological aspects of the studies. For the review of servant leadership, we extended the time frame of a previous review (Eva et al., 2019) and searched for articles in Web of Science published in the top 30 journals (according to Web of Science) in each of the four categories business, ethics, management, and applied psychology since 2018 (resulting in 46 coded studies published in 38 articles). For authentic leadership, we used the same search string and coding scheme, except for the search date (starting from 2011, extending Gardner et al., 2011; resulting in 47 coded studies published in 42 articles).

Second, we illustrated our recommendations to establish causality by conducting an exemplary online experiment examining the effect of a combination of two servant leadership dimensions (i.e., stewardship and authenticity) on individual task performance ($n = 595$, without careless responders; both pre-study and experiment were pre-registered). Our manipulation consisted of two videos (combined stewardship and authenticity speech vs. neutral speech) in which participants were informed of the importance of the task that should subsequently be done (i.e., a consequential decryption task linked to donations). The manipulation was developed based on van Dierendonck and Nuijten's (2011) conceptualization and subjectively and objectively pretested, also showing discriminant validity regarding charismatic leadership. Moreover, to examine the effect of a potentially endogenous predictor (i.e., perceptions of combined stewardship and authenticity) on performance, we applied instrumental variable estimation using our manipulation as an instrumental variable.

Results obtained

Regarding our two systematic reviews of servant and authentic leadership, the interrater agreement between the coders was almost perfect, respectively. The results showed that the problems regarding causality are very prevalent, so we cannot be sure if servant or authentic leadership indeed affect the outcomes in the studies. Our illustrative experimental investigation and the instrumental variable regression showed no effect of combined stewardship and authenticity and their perception on performance.

Limitations

To measure combined stewardship and authenticity perceptions, we used the items for the two corresponding dimensions of the Servant Leadership Scale (van Dierendonck & Nuijten, 2011). The resulting construct might be ambiguous because the measure has not been validated for combining single dimensions. Secondly, the significant χ^2-values in our confirmatory factor analyses indicated that the models might not fit the data well. Finally, the quality fail rate in our experiment was high (but comparable to other online panel studies) and underscored the importance of detecting careless responders.

Conclusions

Rigorous and causally identified research is important to inform science and practice correctly. However, previous research on the effects of servant and authentic leadership could not provide such robust investigations. Therefore, we call for more profound experiments and the use of instrumental variable regression to account for the potential endogeneity of measured explanatory variables. As measured instruments are often difficult to find, experimentally randomized instrumental variables are an excellent way to tackle potential endogeneity. We hope that our work can help researchers address the challenge and further advance research intended to draw causal conclusions—not only on servant leadership but also on authentic leadership and other constructs in the field.

Oral presentation OP398

Are we on the same page? The moderating role of value congruence in charismatic signaling-charismatic effects relationship

Rafael Wilms, Vrije Universiteit Amsterdam; Clara Seif el Dahan, South Westphalia University of Applied Sciences

science

Research Goals

Charismatic leaders have strong moral convictions, stick to their values, and some love but others loath them for that. So, what determines whether a charismatic message falls on fertile or barren ground? Self-concept (Shamir et al., 1993) and signaling theories of charisma (Antonakis et al., 2016) posit that charismatic signals do not universally affect all followers, but only those who have (partially) congruent values with their leaders.

Therefore, we investigate the effect of leader charisma-charismatic effect relationship and whether leader-follower value congruence moderates it. Our study overcomes the conflation of leader behaviors with their evaluations (Banks et al., 2021), addresses the endogeneity problem of previous studies, and offers–to best of our knowledge–a first causal test for leader-follower value congruence as a central pillar of charisma theory. The validity of the value congruence assumption is crucial for charisma theory, as it fortifies the central role of values as an essential building block of charisma's definition and emphasizes the followers' role in the occurrence of the charismatic effect.

Theoretical Background

Charisma is defined as "values-based, symbolic, and emotion-laden leader signaling" (Antonakis et al., 2016, p. 304). Based on charisma signaling theory (Antonakis et al., 2016) and leader categorization theory (Lord et al., 1984, 2001, 2020), we predict that charismatic signaling (e.g., metaphors, moral conviction, or ambitious goals) increases follower perceived leader charisma, prototypicality and effectiveness. Based on self-concept theory (Shamir et al., 1993) and signaling theory of charisma, we predict that value congruence positively moderates the relationship between charismatic signaling and follower perceived leader charisma, prototypicality and effectiveness.

Study Design

In a pre-registered experiment (N=489), we manipulated leader charisma, using video recorded speeches (charismatic vs. neutral) about a foodbank. We operationalize value-congruence as two (potentially endogenous) questionnaire measures: helping others attitudes and altruism. We exploit that the interaction effect between an exogenous treatment and endogenous variables can be interpreted causally under some conditions (Nizalova & Murtazashvili, 2016). We reasoned that higher (lower) scores imply stronger (weaker) value congruence with the leader's mission (i.e., the food bank). We operationalize charismatic effect as three distinct dependent variables: perceived leader charisma, prototypicality, and effectiveness.

Results

Our study showed that charismatic signaling fosters perceived leader charisma, prototypicality, and effectiveness. Value congruence as helping others attitudes moderated the relationship for perceived leader charisma and effectiveness, but not for prototypicality. The effect of charismatic signaling on perceived leader charisma and effectiveness was stronger for participants that resonated with the

content of the speech. Value congruence as altruism did not moderate any of the relationship, but the altruism scale had a very low reliability.

Limitations

The marginal effect of value congruence is incorrect, as the main effect of it is very likely biased and inconsistent because of the omitted variable bias (Antonakis et al., 2010). Measuring value congruence introduces an endogeneity bias via measurement error (Antonakis et al., 2010; Wooldridge, 2008). Future studies could manipulate value congruence to obtain correct marginal effects and rule out measurement error.

Conclusions

We found that value congruence as helping others attitudes moderated the charismatic signaling-charismatic effects relationship. But we did not find that altruism moderates the relationship. Measurement error is a form of endogeneity (e.g., Antonakis et al., 2010; Wooldridge, 2008) and has the property to "pull" the regression coefficient to zero. Hence, larger measurement error in the altruism measure compared to helping others attitudes measure could have made it more difficult to find the effect (i.e., lower power). Our results contribute to the self-concept theory (Shamir et al., 1993) and signaling theory of charisma (Antonakis et al., 2016): Charismatic signaling does not affect all followers equally; instead, charismatic leaders create a connection between followers' initial values and their vision (Antonakis et al., 2016), leading value-congruent followers to perceive them as charismatic and effective. Overall, our results highlight that charisma is not a panacea. Instead, leaders must meet the values of their followers.

Congress Theme

This work puts followers in the center of charisma theory. The more people resonate with the leade's value, the stronger the charismatic effect.

UN SDG

Decent work and economic growth.

Keywords: Value congruence, charismatic signaling, charismatic effects

Oral presentation OP488

Are You Better than Me? Competitive Working Climate and the Impostor Phenomenon

Sanne Feenstra, VU Amsterdam; Felenka Philips, IFS

science

Research goals and why the work was worth doing. The impostor phenomenon (aka impostor syndrome) refers to an experience whereby individuals think that others overestimate their abilities (Clance & Imes, 1978). Despite their objective success, these individuals have trouble internalizing their achievements, and instead, attribute it to external causes. Therefore, they worry that they may be found out as "impostors". This phenomenon is common in all levels of organizations and has negative consequences (for a review see Bravata et al., 2019). Considering the widespread occurrence and detrimental consequences of the phenomenon it seems of upmost importance to examine what causes such feelings of impostorism. To date, however, we know little about the organizational roots of the impostor phenomenon, as previous research predominantly focused on identifying individual-level predictors (e.g., Bernard et al., 2002; Bravata et al., 2019). The present research aims to fill this gap, as we adhere to previous calls to examine the role of workplace context in shaping the impostor phenomenon (Feenstra et al., 2020; Kark et al., 2021).

Theoretical background. A particularly important workplace context is employees' perceptions of their work environment (aka work climate; Ames, 1992). Nerstad and colleagues (2013) make a distinction between a mastery and performance climate. The former refers to a working climate that focuses on, and rewards, effort and cooperation and emphasizes learning and development. The later focuses on intra-team competition and social comparison. Employees working in such competitive climates are encouraged to constantly compare themselves to their colleagues. We propose that such a work climate that focuses on competition and social comparison will elicit impostor feelings in employees (Cohen & McConnell, 2019).

Design/methodology. To test this prediction, we conducted two studies. We first conducted an experiment (Study 1; N = 199; M age = 37.07, SD = 11.43; 51.26% female) in which we randomly assigned participants to either a competitive or non-competitive working climate using animated videos (based on scenarios of Wisse et al., 2019). We further conducted a field-study (Study 2; N = 151; M age = 29.40, SD = 7.42; 49.67% female) in which we measured employees' perceptions of competitive work climate (Nerstad et al., 2013; 8 items; e.g., In my organization it is important to achieve better than others; α = .85), mastery climate (6 items; α = .83) and trait competitiveness (9 items; Houston et al., 2002; α = .90). Finally, in both studies we measured impostor feelings (Leary et al., 2000; 7 items; e.g., Sometimes I'm afraid others in my organization will discover how much knowledge or ability I really lack; α = .95).

Results. Across both studies we show that a competitive working climate is associated with increased impostor feelings. In Study 2 we further show that, as expected, a mastery climate is not related to impostor feelings and that the relationship between a competitive climate and impostor feelings remains unchanged when controlling for trait competitiveness and relevant demographics (i.e., age, gender, educational level, and organizational tenure).

Limitations. The present research is not without limitations. Our first experimental study might be suspect to demand effects and our second study relies on single-source survey data making it suspect to concerns of common method bias. Consistently showing the importance of competitive climate for impostor feelings in two studies using different methodological approach alleviates some of the

concerns observed in the separate studies. Nevertheless, we plan to conduct another two-waved study in which will measure perceptions of work climate at Point 1 and impostor feelings at Point 2.

Conclusion and relevance to conference theme and UN SDGs. Overall, the present research shows that a competitive working climate is associated with increased impostor feelings. By doing so, this work contributes to literature on the impostor phenomenon by empirically showing the importance of work context in shaping such insecurities (Feenstra et al., 2020; Kark et al., 2021). We further contribute to research on work climates by identifying impostor feelings as a potential mechanism that could explain the previously observed negative consequences of competitive work climates (Parker et al., 2013). Finally, the present research has important implications for practice. As women and members of ethnic minority groups are particularly likely to experience impostor feelings, and these insecurities hinder their career advancement, the impostor phenomenon is an important barrier to diversity (Chrousos et al., 2020). By identifying the organizational roots of the phenomenon, we can create organizational interventions that reduce impostor feelings of employees, thereby contributing to a future of work in which everybody feels like they rightly belong.

Keywords: impostor phenomenon competion

Oral presentation OP729

Artificial Intelligence (AI) in personnel selection: A qualitative study of HR professionals' beliefs about AI-based chatbots and decision support

Cordula Kupfer, Bettina Kubicek, Stefan Thalmann, Jürgen Fleiß & Christine Malin | University of Graz

science&practice

Research goals and why the work was worth doing: Technological advances have recently made it possible to use Artificial Intelligence (AI) in personnel selection. From a technical point of view, AI-based systems can perform a wide range of selection tasks, but show their greatest potential during the pre-selection phase e.g., by collecting candidate data through a chatbot and analyzing it as decision support for HR professionals. However, the use of such systems in practice is scarce. HR professionals, as first-party users, can provide an explanation for the gap between research and practice. Therefore, the aim of this explorative study was to examine HR professionals' beliefs about AI-based systems for personnel selection and how these may influence their intention to use them.

Background: Digitization in personnel selection has opened up new opportunities. Candidates can easily apply for multiple jobs online, and companies can track down potential candidates in databases. However, the screening of incoming applications or the active search in databases are among the most time-consuming and labour-intensive activities of HR professionals. Using AI-based systems for such tasks would save an enormous amount of time and HR professionals could focus on assessing the most promising candidates only (Black & van Esch, 2020; Leong, 2018). Companies using this new technology may thus have a competitive advantage in finding the best employees, which makes AI-based systems more and more attractive.

Methodology: Semi-structured online interviews with 25 HR professionals from 21 Austrian companies, covering a wide range of business sizes and sectors, were conducted between June 2020 and March 2021. They lasted about 60 minutes. Inclusion criterion for interviewees was the significant involvement in the selection of employees in the company. To create a basis for discussion, HR professionals were presented with two visualized, fictional examples of AI-based personnel selection tools: a chatbot to conduct pre-selection interviews and a dashboard with candidate ranking for decision support. Additionally, to establish common ground, we provided a definition of AI as intelligent technology which typically works with Machine Learning algorithms that iteratively learn from data to solve problems (Huang & Rust, 2018). However, we only did so after we asked HR professionals about their own conceptualization of AI. Interviews were transcribed verbatim and coded using thematic analysis (Braun & Clarke, 2006).

Results: HR professionals hold different beliefs about the scope of AI and its instruction needs. Beliefs about the scope of AI determine for which use cases the application of AI is conceivable. Beliefs about AI instruction needs affect how barriers to AI use are perceived. Taken together, they contribute to the finding that AI is still observed with some restraint in personnel selection, while HR professionals' attitudes toward AI as a supportive tool for repetitive, time-consuming, or organizational tasks are generally positive.

Limitations: Despite significant efforts, only a few companies could be identified that already have actual experience with AI-based systems in personnel selection. Its use in Austrian companies is currently still not widespread, which is reflected in the beliefs of HR professionals about AI capabilities. However, this allows us to identify pre-existing beliefs that should be addressed during introduction of such new systems in companies.

Conclusions – Originality/Value/Implications: Only few previous studies on AI in personnel selection have focused on the perspective of HR professionals. We contribute to research by exploratively investigating HR professionals' beliefs about AI-based systems in personnel selection. The results shed light on how HR professionals' beliefs shape perceived use cases and barriers of AI. They can explain the gap between perceived potential of AI and low application in practice. Often, the beliefs do not match the current state of AI applications, which is why our study emphasizes the practical importance of information and training that specifically address these beliefs and resulting perceived barriers.

Relevance to Congress Theme: AI-based systems for personnel selection are expected to show a significant increase in practical use in the coming years (Pan et al., 2021), and will thus change the personnel selection process. From the perspective of HR professionals as first-party users of such systems, this study addresses the question of what changes are actually desired as support, and what beliefs and perceived barriers researchers from different disciplines as well as companies need to address for AI-based systems to be successfully used in the future.

Keywords: Artificial Intelligence (AI), personnel selection

Oral presentation OP826

Assessing a Global Workforce: How to Account for Differences in Cultural Social Desirability

Paul Agnello & Sonya Stokes | Aon Assessment Solutions

Aon's ADEPT-15® is a personality assessment developed to be effective across the globe. It is currently available in 31 languages and 47 unique cultural configurations. In this symposium, we will discuss best practices and lessons learned from Aon's use of ADEPT-15® globally. Developing and maintaining an assessment for global use is complex. Each culture is unique, and the same statement, even with faithful translation, may be interpreted and valued differently across cultures, thus accounting for cultural differences is key to accurate cross-cultural measurement (Johnson & Van de Vivjer, 2003)

Adjusting Assessment for Cultural Contexts

ADEPT-15® is a multidimensional forced choice (MFC) personality assessment. Applicants are presented pairs of statements with each statement reflecting one of fifteen personality dimensions and asked to select which one better reflects them in a work setting. This format helps to reduce response distortion in the service of accurate and valid measurement (Christiansen et al., 2005; Converse et al., 2010; Jackson at al., 2000; McCloy et al., 2005; Stark et al., 2005).

However, a key consideration in the construction of MFC assessments is how statements are paired – there cannot be a statement that is obviously 'correct' or more desirable in a work setting. Statements must be matched on their social desirability (i.e., the attractiveness of the trait or behavior represented by the statement). Calibrating statement pairs in terms of social desirability prevents applicants from "faking good". However, what is considered "good" is variable across cultural contexts.

Accounting for Social Desirability in Personality Assessment

Statements reflecting high, medium, and low standing on each of the fifteen personality dimensions were developed. Once this pool of statements was finalized, the statements were analyzed via a generalized graded unfolding model (GGUM) to determine location and discrimination parameters for the statements. However, neither of those item parameters reflect social desirability in one culture, let alone several.

Whenever ADEPT-15® is developed for a new language, each statement is translated and then back translated. Once translations are completed, individuals who are fluent speakers in the language and native to the country of intended use are trained on rating the social desirability of each statement. Once these ratings are finalized, the result is an updated set of social desirability parameters so that no one language or culture encourage to "fake good" on ADEPT-15®.

Methods

Social desirability ratings for all 1470 ADEPT-15® statements across 41 different cultural configurations were examined. Additionally, country values from Hofstede's Cultural Dimensions (Hofstede, 1980; 2015) were examined alongside social desirability. Exploratory analyses were performed on this novel data set. Findings and best practices are discussed below.

Best Practices

Accurate translation is essential in developing assessments for international use and a critical step of this process is back translation. However, there is always the risk that two statements designed to

tap into ‘low’ and ‘medium’ or ‘medium’ and ‘high’ on a personality dimension end up converging into the same area of the latent construct after translation. While there is no magic number for the number of raters required, we generally recommend 8-10 raters to provide social desirability ratings. This ensures a more comprehensive view of social desirability for the respective culture and the larger sample size means sufficient ratings remain if a rater provides incomplete ratings.

Results

Cultural differences do exist together with cultural similarities. For example, while a statement like “The best way to get someone to do a favor for you is to praise and flatter them first” is a socially desirable statement in Japan, it is neutral in China and Australia and negatively received in the USA, Brazil, and Italy. When correlating social desirability values for each statement across cultures, the mean correlation was r=.79 with a low of r=.54 and a high of r=.84.

One also cannot assume that neighboring countries have same or similar views on social desirability – for instance, the United States and Canada have a social desirability correlation of r=.85 whereas China and South Korea have a correlation of r=.63. Indeed, when factor-analyzing social desirability ratings, whether overall or by ADEPT-15® dimension, any factor structure that emerges does not reflect cultural or geographic regions.

Country-level values of social desirability across ADEPT-15® dimensions showed small but significant relation with Hofstede’s Cultural Dimension scores. For instance, social desirability ratings for the Power dimension of ADEPT-15® are correlated r=-.05 with Hofstede’s values for Power Distance while Humility is correlated r=.39 with Power Distance. Indeed, non-leaders in cultures with high Power Distance are expected to show themselves as humble and obedient.

Assessment Centers in the Digital Age: Initial Evidence of Validity and Fairness about Gender-Based Adverse Impact.

Yumna Zafar Usmani, Department of Psychology, University of Bologna, Italy; Marco Giovanni Mariani, Department of Psychology, Renzo Canestrari, University of Bologna, Italy; Barbara Rizzo, Glasford International Italy

science&practice

Research Goals: Recruitment and selection of personnel is a relevant process for improving human capital but is complicated because it can produce errors. Assessment centers have played an important role in recruitment and selection. With a rapidly changing global environment in the form of the fourth industrial revolution, there is a need for organizations to adapt. In accordance, organizations have started utilizing assessment centers in a digital format. Consequently, this study is aimed at exploring and providing a general indication of the construct and criterion-related validity of digital assessment centers, along with, evaluating and establishing the adverse impact of the methodology mainly focusing on gender differences.

Background: Assessment Centers have been utilized for more than 7 decades for recruitment and selection. Since the methodology is adaptable to various needs, the assessment center may vary in its selection of exercises, number of participants, and other characteristics. Regardless, conventional assessment centers remain a vital methodology for organizations from diverse industries for their assessment needs. Since online assessment centers are assessments in a digital format, there is a lack of literature on its psychometric properties. In a study (Avni & Luria, 2022), a comparison of conventional and digital assessment centers revealed similar validity and reliability which is alignment with other studies providing support for digital assessments (Woods et al., 2019; Langer et al., 2017).

Therefore, this study aimed to answer three research questions, with respect to an application of the method in an Italian company. 1. Whether the assessment center in its digital format showed general indications of validity (construct and criterion-related validity) as a selection procedure, 2. Whether the selection procedure, digital assessment center, was an appropriate tool of selection for both the genders, male and female, candidates, and 3. Whether the gender of the lead assessors had an impact on the fairness of the selection?

Methodology: The paper is based on data derived from a pool of 120 managers of an Italian company that were subjected to an online assessment center. About 55.8% of the participants were male, whereas 43.3% were females. Of them, 91 (75.8%) were managers while 29 (24.2%) were senior managers. The age range of the participants was from 20 years to 51 years. Moreover, there was a total of 15 lead assessors. Of them, 11 (73.3 %) were females, and 4 (26.7%) were males.

The digital assessment center was developed with the objective of identifying the group talent from an Italian organization. The assessment center was an individually administered procedure conducted on digital platforms in English. It had a number of exercises, namely BEI Interview, In-Basket or Business Case Presentation, and Direct Report Meeting, and took 4.5 hours to complete on a standardized schedule. It was designed on 8 competencies that were based on the Company's Leadership Model. Predictive validity was gauged in accordance with the competencies and Status Validation of the employee as a group talent.

Results: To gauge validity, we used Pearson correlation indexes, Principal Component Analysis, McDonald's Omega, and Binary Logistic Regression. For Research Question 1, the results showed preliminary evidence of general indications of the validity of the digital assessment center: Pearson correlation indexes, normal distribution, and descriptive statistics showed support for content validity. As per Binary Logistics Regression, the competencies showed signs of predictive validity; but 2 competencies, Adaptability and Execution were found to be the better determinants of who will attain Status Validation. The findings also provide support for a unidimensional construct which is an indication of construct validity through Principal Component Analysis.

To gauge the fairness of the methodology, we used MANOVA, Chi-Square, and the 4/5 th rule. For Research Questions 2 and 3, this study found conclusive results suggesting fairness in terms of gender and there was no evidence of adverse impact.

Limitations: The paper is based on a single organizational case with a small sample, thereby, the first limitation is that the results lack generalizability. The second limitation is the absence of a job performance variable. If the performance data of the participants had been provided, the research would have claimed to provide validity of the digital assessment center.

Conclusion: Changing times necessitate changing measures, and assessments in a digital format are a fitting example. Our research presents preliminary evidence of validity and fairness for online assessment centers. However, it is important for future studies to, (a) explore multiple digital assessment centers, (b) compare digital and conventional assessment centers to gauge their effectiveness, and (c) find ways to assess fairness on more subgroups.

Keywords: Online Assessment Center, validity, fairness

Oral presentation OP599

Associations between digital work stressors, burnout symptoms, and biological stress: A prospective study in hospital employees

Helena Kaltenegger, Institute and Clinic for Occupational, Social and Environmental Medicine, University Hospital, LMU Munich, Munich, Germany; Matthias Weigl, Institute for Patient Safety, University Hospital Bonn, Bonn, Germany; Caroline Quartucci, Bavarian Health and Food Safety Authority, Institute for Occupational Health and Product Safety, Environmental Health, Munich, Germany; Dennis Nowak, Institute and Clinic for Occupational, Social and Environmental Medicine, University Hospital, LMU Munich, Munich, Germany; Nicolas Rohleder, Chair of Health Psychology, Institute of Psychology, Friedrich-Alexander University Erlangen-Nürnberg, Erlangen, Germany; Linda Becker, Chair of Health Psychology, Institute of Psychology, Friedrich-Alexander University Erlangen-Nürnberg, Erlangen, Germany

science

Research Goals and Relevance

With the profound change of the world of work in the age of digitalization, investigations into ramifications for employees' physical and psychological health are crucial. Despite the growing research interest in the concept of technostress (1) , biological effects of the work with digital technologies are under-researched (2,3). The goal of this study was to assess prospective associations of (digital) work stressors, mental health, and biological stress.

Theoretical Background

Chronic exposure to work stressors is associated with physical and mental morbidity as well as mortality (4–6). One potential pathway linking stress experience to disease development is chronic systemic low-grade inflammation. There is evidence that psychosocial working conditions are associated with inflammatory markers, yet prospective studies are scarce (3,7,8). Another potential mechanism how chronic stress facilitates disease pertains to the hypothalamic-pituitary-adrenocortical axis with changes of cortisol output (9). Analysis of hair cortisol concentrations (HCC) is increasingly used to capture cumulative cortisol secretion (10). However, there is a paucity of prospective studies on work stress and HCC. Technostress relates to the phenomenon of "stress experienced by end users of Information and Communication Technologies" (11), although several definitions exist. Only few studies with predominantly cross-sectional designs investigated mental health outcomes and showed positive associations of technostress and burnout (12).

To address these knowledge gaps and to draw conclusions on a higher level of evidence, we conducted a prospective study with repeated measurements of (digital) work stressors, burnout, and two biomarkers indicative of immunological and endocrine stress responses.

Methods

This study draws upon two measurement time points of a prospective cohort study, i.e., baseline (T1) and six months later (T2). The sample includes N =144 (107 women, M ± SD age =31.1±9.4) eligible participants of a cohort of new employees at a university hospital. Participants reported on general work stressors based on Karasek's model (work overload, job control), digital work stressors (work interruptions, multitasking), burnout symptoms (exhaustion, mental distance), relevant confounders (sociodemographic, health- and employment-related characteristics), and provided samples for biomarker analysis. We measured the inflammatory marker C-reactive protein (CRP) via

dried blood spots (13) and HCC from strands. Change scores and multivariate linear regressions were calculated.

Results

Burnout increased (M T1 =1.94, M T2 =2.11), CRP did not change (M T1 =1.15, M T2 =1.18; mg/l), and HCC decreased significantly (M T1 =8.71, M T2 =5.02; pg/mg) over time. Increased work overload was associated with increased burnout (β=0.35, p < .001), job control was not related to burnout. Moreover, increased work interruptions and multitasking were associated with increased burnout (β=0.35, β=0.32, p <.001), also after additionally adjusting for changes in work overload (β=0.26, p =.003; β=0.25, p =.004). Changes in work overload were not significantly related to changes in CRP, yet work overload at T1 was linked to CRP at T2 (β=0.14, p =.031). No associations of the other predictors with CRP were observed. Increased interruptions were associated with increased HCC (β=0.19, p =.047). Work overload, job control and multitasking were not associated with HCC.

Limitations

This study was based on a limited number of participants due to strict exclusion criteria regarding health status and employment-related characteristics. Given our a-priori power analysis yielding a target sample size of N =187, the results need to be interpreted with caution. Moreover, the findings concerning work interruptions should be cautiously considered, because this scale showed low internal consistency (Cronbach's α=.66-.67). Lastly, we only measured CRP as an inflammatory marker, while there are many other useful markers such as cytokines.

Conclusions

This study shows effects of different job factors on employees' health and well-being not only on a psychological (i.e. burnout), but also on a biological level (i.e. CRP, HCC). More specifically, we discerned adverse effects of digital work stressors with positive effects on burnout and HCC. To our knowledge, for the first time a link of a digital work stressor with HCC was revealed. Future research however, is needed to replicate observed effects in other occupational samples.

Relevance to Congress Theme

Especially in the healthcare sector, there has been a tremendous adoption of digital technologies in the recent time. However, there is a striking lack of research on possible health effects of this new reality of work conditions. From an occupational health and safety angle, we need to unveil whether digitalized working environments represent new forms of stress sources and if so how they affect workers' mental health and biological stress.

Associations Between Effort-Reward Imbalance and Burnout Among Swedish Physicians

Filip Christiansen, Institute of Environmental Medicine, Department of Occupational Medicine, Karolinska Institute, Stockholm, Sweden.

Gun Johansson, PhD.

Emma Brulin, Assistant Professor, Docent in Occupational and environmental health and Doctor of Health Sciences.

science

Research goals

The overall aim of the present study was to depict the levels of work-related stress and investigate the associations between psychosocial work-factors and burnout among Swedish physicians.

Background

Globally, the prevalence of burnout among physicians is high. Recently, Hagqvist et al identified a prevalence of symptoms of burnout in up to 28% of Swedish physicians, with significant variations across different specialties, worksites, and technical ranks. This is alarming due to the possible detrimental effects on both an individual level as well as on a societal level. However, knowledge of work-related stress across different groups of Swedish physicians, and the contributing factors, is lacking.

Organizational changes within Swedish healthcare during the past decades have resulted in an imbalance between occupational efforts and rewards among physicians. According to Siegrist et al, exposure to effort-reward imbalance (ERI) is related to increased risk for occupational burnout.

Methods

The present cross-sectional study was approved by the Swedish Ethical Review Authority (2020-06613). In February 2021, a representative sample of 7200 Swedish physicians were invited (inclusion criteria: age < 70 and employed the last 12 months). In total, 2761 submitted questionnaire data (response rate = 41.2%) which comprised i) assessments of job efforts (E) and rewards (R) using validated ERI items, ii) assessments of burnout using the The Burnout Assessment Tool (BAT), and iii) sociodemographic data.

Logistic regression models were used to investigate the associations between exposure to psychosocial work factors (i.e., high-risk ERI conditions: high E, low R, and E/R ratio > 1.00) and risk for burnout (i.e., mean BAT score >= 2.59). Models were adjusted for occupational and sociodemographic data. Data analyses were performed using STATA version 17.1 and SPSS version 28.

Results

The mean E/R ratio among all physicians was 1.20, and a majority (60.6%) had a high-risk E/R ratio > 1.00. Female physicians had higher mean E/R ratio (1.25) and more commonly a high-risk E/R ratio (65.1%) versus male physicians (1.15 and 56.1%, respectively). The highest mean E/R ratio and percent of high-risk E/R ratio were observed in emergency medicine (1.45 and 83.3%, respectively), followed by surgery (1.32, 66.9%), infectious disease medicine (1.26, 65.7%), and psychiatry (1.22, 60.4%).

In total, 12.1% of Swedish physicians were at risk for burnout (14.2% of female and 9.9% of male physicians). Across clinical specialties, the highest proportion of physicians at-risk for burnout were observed within psychiatry (23.7%), followed by infectious disease medicine (23%), emergency medicine (22%), and surgery (16.7%).

In crude models, all high-risk ERI conditions were significantly associated with increased risk for burnout among Swedish physicians (high E: OR 10.6, low R: OR 17.8, E/R ratio > 1.00: OR 16.3, $p < .001$). In adjusted models, associations were lessened but remained statistically significant (high E: OR 6.3, low R: OR 11.0, E/R ratio > 1.00: OR 12.5, $p< 0.001$).

Limitations

First, the cross-sectional study design precludes any causal conclusions. Second, self-report data implies a risk of several biases (i.e., recall bias). Third, data was gathered during the peak of the third wave of the COVID-19 pandemic and results should be interpreted accordingly. Last, factors that may influence individual experiences of work-stress (e.g., personality traits, resilience to stress, individual stress coping strategies) were not considered.

Conclusions & Implications

A majority (61%) of Swedish physicians were subject to high levels of work-related stress according to ERI, which was associated with a 12.5-fold increased risk for burnout. Additional studies are needed to further investigate the variations across different medical specialties.

The present study underlines the need to monitor occupational health among physicians over time. Therefore, we will adopt a longitudinal study approach, providing a robust foundation for continuous measurements of occupational health among Swedish physicians.

Relevance to the Congress Theme

In general, our research is highly relevant with respect to Work and Organizational Psychology. The present study is based on a well-established psychosocial model (i.e., ERI) and comprise results and conclusions that are relevant for several themes of the congress, e.g. 15. Stress and Dysfunction as well as 19. Work Patterns And Conditions.

Relevant UN SDGs

The present study stands in direct proximity to several UN SDGs, e.g. good health and wellbeing as well as decent work and gender equality.

Atmosphere, emotion and problem solving – hints for the design of virtual work environments

Ulrike Starker & Maria-Luise Giesecke | Hochschule Harz; Rüdiger Von der Weth, HTW Dresden

science&practice

Goal

The aim of our research is to understand how the atmosphere of a certain place influences the strategies and results of problem solving processes indirectly by triggering the emotional state of the problem solvers. Atmosphere is defined as the holistic influence of a location on all sensory channels of a human being. The result shall help to design virtual work environments which generate a productive atmosphere for problem solving which use visual information, audio information, haptics and, if possible, odour in an integrated way.

Theory / Originality

The approach of this research is new. The theoretical framework integrates research of environmental psychology, psychology of architecture and human factors about the influence of environments on emotion and stress and results of cognitive psychology on the influence of emotion on problem solving (Starker and Von der Weth, 2015). Especially the influence of work environments on strategies for solving complex problems shall be explained.

Method

In a first experiment students shall solve problems (an image interpretation, a creativity task and the crisis management of a nuclear accident) in three real life environments (place in front of a castle, in a tiny house and a church, n = 38). The ideas, problem solving steps and results were recorded. A questionnaire about the perceived atmosphere and the emotional state had to be filled in.

Results

Preliminary results show an influence of the environment and atmosphere on emotion and problem solving. For single sensory channels there are hints that view, temperature and feel good at the place are influencing the results of the problem solving process. The next step is to build up a model of a “problem solving atmosphere” which includes besides the location data about the mood and behaviour of the subjects to integrate all the aspects addressed in the experiment. For the design of virtual environments, the role of non-visual aspects of the atmosphere are most interesting at the moment.

Limitations

There exist much more complex problems for which the model about the influence of atmosphere on problem solving must be tested. It shall be adapted to additional demands of more complex problem scenarios. Until now the results have preliminary character.

Implications

This research generates important information for a planned application in an ongoing technology development project. In an interdisciplinary project an artificial environment for learning and serious games is planned which generates a highly naturalistic virtual atmosphere for these activities which integrates different places in the world to one common environment and atmosphere for working on

complex problems. This virtual work environment includes information for all sensory channels mentioned above.

Oral presentation OP429

Authentic Leadership, Authentic Followership, Need Satisfaction, and Self-Actualization at Work: A Multi-Level Study

Lucas Maunz, Jürgen Glaser & Laura Schoofs | University of Innsbruck

science

Relevance, goals, background. Authentic leaders are deeply aware of their values and beliefs and continuously strive to create meaningful organizational contexts. Recently, authentic leadership has gained immense attention because studies found it positively related to group and organizational performance, leader and follower job satisfaction, well-being, and work engagement (Gardner et al., 2011, 2021; Gill & Caza, 2018). To date, however, the authentic leadership literature has attributed little attention to outcomes related to self-actualization, which commonly refers to individuals' development of their potential. Moreover, most prior studies neglected the transmission process between leaders and followers and have thus failed to consider relational multilevel processes (van Knippenberg & Sitkin, 2013; Chun et al., 2016). Viewing authentic leadership as a relational leadership process (Uhl-Bien, 2006), we expected a transmission between leaders' authentic leadership and followers' authentic followership. Furthermore, drawing on the assumptions of the self-determination theory (Deci et al., 2001), we expected that authentic leadership is related to increased psychological need fulfillment and self-actualization of followers. This study is the first to study the associations between leaders' authentic leadership and followers' self-actualization with followers' authenticity and psychological need fulfillment as potentially explaining mediators.

Design, methodology . Data was collected from leaders and their followers via an online survey in an international organization within the food industry. We used established questionnaires: Authentic Leadership Inventory (Neider & Schriesheim, 2011), Work-related Basic Need Satisfaction Questionnaire (Deci et al., 2001), and Indicators of Self-Actualization (Glaser et al., 2018). We gathered self-ratings of the concepts under study from leaders and their followers from established teams. A team was composed of one team leader and three or more team members who reported directly to their leader. Structural validity was tested with confirmatory factor analysis (CFA). Complete datasets of 53 teams (i.e., 171 team members and 53 team leaders) were used to test three multi-level models using the MSEM approach with self-rated authentic leadership at the group level (Level 2) and followers' authentic followership, psychological need fulfillment, and self-actualization at the individual level (Level 1).

Results. The proposed factor structures of authentic leadership, authentic followership, psychological need fulfillment, and self-actualization were supported in their proposed configuration. The MSEM analyses confirmed the proposed (2-1-1) indirect effects of authentic leadership on followers' need satisfaction via authentic followership. They confirmed the proposed indirect effect of authentic leadership on followers' self-actualization via need satisfaction, and the proposed indirect effect of authentic leadership on followers' self-actualization via authentic followership.

Limitations. Characteristics of the sample do not reflect those of the entire labor force and hence might restrict generalizability to the whole population. Given the nature of cross-sectional designs, strong causal claims cannot be inferred. Additionally, self-reports might be inflated by common method bias. A larger sample is required to test our hypotheses in a full serial mediation model instead of splitting it into separate models. Finally, we approached followers indirectly through contact with their respective leaders, which may have biased the overall employee sampling.

Conclusions. We confirmed fundamental assumptions of the self-determination theory by showing that followers' self-actualization is not solely related to authentic leadership. The data suggest that self-actualization emerges from a synergistic effect of authentic leadership, authentic followership, and psychological need fulfillment.

Relevance to SDG. Leaders play a central role in organizations and their behavior has a significant impact on followers' work behavior, performance, and well-being (Inceoglu et al., 2018). Thus, studying how leaders can promote the well-being of their followers contributes to addressing challenges, such as achieving the Sustainable Development Goal of "good health and well-being".

Relevance to congress theme. Psychological need fulfillment and self-actualization are indicators of a „good life" and are important for the eudaimonic well-being of employees at contemporary workplaces.

Keywords: authenticity at work, self-determination, self-actualization

Oral presentation OP342

Automated Structured Interviewing: What question types work best for algorithms?

Justine Chalifour, HireVue; Franziska Leutner, HireVue & Goldsmiths University of London; Theodoros Bitsakis & Nathan Mondragon | HireVue

science&practice

The literature on structured interviewing suggests that past behavioural interview questions outperform situational interview questions in predicting job performance. Our goal is to establish whether the same is true for automated structured interviewing, that is, to establish whether machine learning models built to predict competency ratings are more accurate for behavioural versus situational interview questions.

Theoretical background

Structured interviews are a gold standard in personnel selection, with some of the highest prediction accuracy for job performance compared to other common selection methods (Schmidt & Hunter, 1998). They are characterised by a standardised set of interview questions, as well as standardised behavioural rating scales used to evaluate candidates on relevant competencies. Two different question types are commonly used: past behavioural and situational questions. Past behavioural questions might have an advantage, for example,as they demonstrate higher incremental validity compared to cognitive ability tests as well as situational questions, when measuring competencies (Campion & Campion, 1994; Pulakos & Schmitt, 1995).

In recent years, automated structured interviews have become popular in practice, where machine learning algorithms predict human interview ratings of competency proficiency levels, thereby automating the interview rating process. These machine learning models achieve similar levels of accuracy compared to human raters (Hickman et al., 2022; Rasipuram & Jayagopi's, 2016). However, it is unclear whether algorithms perform better when using data from past behavioural versus situational questions.

Methodology

We test the relative predictive accuracy of machine learning algorithms predicting competency scores based on recorded answers to past behavioural versus situational interview questions. We use data from 1,904 video interviews that were recorded as part of job applications, where applicants answered situational or behavioural interview questions to assess their level of Team Orientation. Situational questions ask about hypothetical scenarios ('what would you do if…') and behavioural questions ask about past experiences ('tell me about a time when…'). The mean age of interviewees is 29.49 (SD 9.95), 58% are female (31% male, 11% N/A), and 42% white (23% Black, 22% Hispanic, 5% Asian, 8% N/A). Interview responses were rated along the relevant competency by trained human raters (mean 2.8 ratings per response). We then specify Ridge Regression machine learning models predicting human ratings for each question type. Transcripts of the interview response (3,382 Bag of Words features, 4 Word Stats features, and 768 features generated with customised Bidirectional Encoder Representations from Transformers extraction) are used as predictors in the model, and competency ratings as the outcome. We compare inter-rater reliability of human ratings, as well as machine learning model performance by question type.

Results

Both human ratings of past behavioural and situational interview questions measuring Team Orientation show good and comparable inter-rater reliability.

Machine learning models perform well at predicting human ratings, with model performance comparable for both behavioural and situational interview questions.

Limitations

A smaller amount of past behavioural interview questions were available compared with situational interview questions, which might negatively impact the prediction model accuracy of models built based on behavioural questions. This could mask a potential advantage of behavioural questions for prediction models.

Conclusions

The preliminary results of this study indicate that both situational and behavioural interview question types perform well in automated ratings of structured video interviews. No differences in inter-rater reliability for human competency ratings, or prediction accuracy for machine learning models were found between the two question types.

Congress Theme Relevance

The use of Artificial intelligence (AI) is growing at a rapid pace, including with new assessment and selection methods. The benefits to organisations, candidates and society are equally as strong: supporting organisations in high volume hiring, identifying qualified talent quickly resolving labour shortages, getting people into roles that align to their skills, reducing biases in hiring, and improving the candidate experience. To ensure these benefits are realised, we must understand how AI is used in assessments. One of these avenues is to explore AI performance with different interview questions.

Oral presentation OP386

Barriers and facilitators of Human Resources Policies and Practices to Promote Hiring and Retention of Employees with Disabilities:A Systematic Review

Nelson Ivan Cardozo Perez, Erasmus Mundus Joint Master Degree (EMJMD) in Work, Organizational and Personnel Psychology-Universitat de Barcelona; Montserrat Yepes-Baldó & Marina Romeo | Universitat de Barcelona

science

Research goals: Our research aimed to develop a systematic review of foundations and contributions to the barriers and facilitators of Human Resources policies and practices for the labor inclusion and retention of people with disabilities, and synthesize the findings, best practices, and gaps identified.

Theoretical background: People with disabilities are often confronted with difficulties in their process of accessing and retaining employment. Moreover, both organizational policies and practices can play a major role in identifying barriers and facilitators, acknowledging that policies can become barriers when they are outdated, ambiguous, and do not offer strong protection to workers with disabilities. In this sense, the increase of factors perceived as enhancers and obstacles to organizational policies and actions to improve their inclusion in the labor market may lead to a revision exercise to identify the tendencies, gaps, and emergent elements that are foresting the recent developments in this matter.

Methodology: The systematic review collected and assessed the encountered findings on different topics to provide compelling evidence for the study of disability in the workplace between 2007 and 2021. The intention of selecting subsequent publications after 2007 lies in the occurrence of global phenomena that marked the development of employment globally, such as the Great Recession, the period of economic recovery, and the most recent crisis caused by COVID-19. The search string used a two-pronged approach including scholarly and grey literature search to balance possible gaps between the academic literature and cases of success in this topic from self-initiatives of organizations aside from the scientific approach. The coding and data extraction process was completed with the selection of 171 out of the initially 4,242 records that met the inclusion criteria in three databases (i.e., PsycINFO, MEDLINE, and Web of Sciences), and other sources (i.e., grey literature). The analysis was supported using an inductive approach as an alternative that allowed the characterization of emergent relevant topics avoiding the use of rigid data analysis procedures commonly used in structured methodologies. Two reviewers with Ph.D. in related fields, and specialists in disability and inclusion in the workplace participated in the critical appraisal of the selected studies and the systematization process.

Results: The findings of the scholarly literature search identified barriers categorized in negative attitudes of others, workplace accommodations, comorbidity, socio-environmental factors, governmental issues, employer negligence, personal barriers, and education, knowledge, and competencies. Facilitators were categorized in reasonable accommodations, education and training, governmental support, socio-environmental factors, personal strategies of development, inclusive employer interventions, different types of employment, technology-based solutions, networking, hiring programs, and empowerment strategies. In addition, the grey literature findings identified facilitators classified in networking, technology-based solutions, education and training, hiring programs, empowerment strategies, inclusive employer interventions, and reasonable accommodations in the workplace.

Limitations: The systematic review had certain limitations related to the extensiveness of the research in terms of geographic location, and type of disability. Besides, the systematization of the results could be affected due to the duality and co-dependence of the barriers and facilitators.

Conclusion: The research identified significant themes that can help to enhance the study of disability in organizations, such as the interactions between barriers and facilitators, the reasons that can motivate a barrier to become a facilitator, and vice versa. Important aspects on which the focus of the analysis was centered were the impact of the attitudes of others as a severe barrier to employment, the role of the employers to promote inclusion, the leverage of the rise of the technological advances, the influence of new ways to employment, and the inputs from the grey literature.

Relevant UN SDGs : The contribution of the research towards the study of disability in the workplace is tied to the strategy to reduce inequality in the population with disabilities reflected in the 2030 Agenda for Sustainable Development, and moreover in the Disability and Development Report realizing the sustainable development goals, in which SDGs 8 and 10 (i.e., 10.2) are focused in promoting decent and inclusive opportunities for all, including people with disabilities.

Keywords: Disability, inclusion, practices

Oral presentation OP591

Be a HERO, be Your Own Best Friend: The Effects of Developing PsyCap and Self-Compassion on PhD Students' Well-Being and Performance

Luisa Solms, Astrid Homan, Barbara Nevicka & Machteld van den Heuvel | University of Amsterdam

science&practice

Research goals and why the work was worth doing

PhD students are increasingly suffering from mental health problems. Compared to the normal population, PhD students are six times more likely to develop anxiety or depression (Evans et al., 2018). Although research has produced substantial knowledge about factors contributing to PhD students' ill-being (e.g., publication pressure, lack of supervisor support, self-doubt; Schmidt & Hansson, 2018), little is known about how to support PhD students effectively. Given that PhD students' ill-being is a critical threat for their functioning at work, there is an urgent need for intervention strategies to support PhD students. The aim of this study is to develop and evaluate two interventions aimed at developing PhD students' personal resources – namely, psychological capital and self-compassion, to increase PhD students' well-being and performance. Psychological capital (PsyCap; Luthans et al., 2007), a malleable four-faceted psychological resource consisting of hope, self-efficacy, resilience and optimism, enables individuals to pursue their work-related goals with confidence and perseverance. In addition, self-compassion, that is being understanding and kind to oneself when confronted with difficulties (Neff, 2003) allows PhD students to view own shortcomings and failures in a more positive light (Neff, 2003).

Theoretical background

We combined Conservation of Resources (COR) Theory (Hobfoll, 2001) with the literature on PsyCap and self-compassion to design two training interventions aimed at improving PhD students' well-being and performance. Specifically, we designed 1) a PsyCap training and 2) a self-compassion-based PsyCap training which extends the PsyCap training with self-compassion practice. Based on COR theory's resource investment principle, we argued that PhD students would be motivated to invest the resources gained from the interventions (i.e., PsyCap and self-compassion) in order to cope with the challenges of their PhD and to protect higher-order resources, such as their well-being and performance.

Design

We used a randomized controlled design with a waitlist-control group (N = 117) to investigate the effectiveness of the two training interventions. Because of scheduling conflicts, some participants switched groups, leading to a final sample of n = 40 in the PsyCap group, n = 33 in the Self-compassion-based PsyCap group and n = 44 in the wait-list control group. 74 participants were female, 40 were male and three participants did not disclose gender. We expected both intervention groups to increase in psychological capital, as well as well-being and performance outcomes after the intervention compared to a) their pre-intervention levels and b) the control group. In addition, we argued that self-compassion would facilitate the development of PsyCap, thereby expanding the positive effects of PsyCap. Consequently, we expected the self-compassion-based PsyCap intervention group to show higher psychological capital, well-being and performance compared to the PsyCap group.

Results

Pairwise comparisons indicated that the PsyCap group reported increases in psychological capital, decreases in work pressure and improvements in task accomplishment relative to baseline. The self-compassion-based PsyCap group showed increases in self-compassion relative to baseline and control group, increases in support seeking and positive affect relative to baseline, control group and the PsyCap group, and a reduction in work pressure relative to baseline and control group. There were no pre-post changes for the control group. Exploratory mediation analyses showed that the increases in well-being and performance that were observed in the self-compassion-based PsyCap intervention were driven by changes in self-compassion (rather than psychological capital).

Limitations

This study suffered from mortality issues, that is the three groups were smaller than expected and unequal in size. Also, given that PhD students were asked to sign-up for participation, there might be a self-selection bias in our sample.

Conclusions

Our findings suggest that developing PsyCap and self-compassion may be effective strategies to support PhD students' well-being and performance. Moreover, we found initial evidence that a self-compassion-based PsyCap training may be a more effective strategy to promote PhD students' well-being compared to a PsyCap only training.

Relevance to the Congress Theme

Academia is facing a mental health crisis and it is particularly young employees, such as PhD students that are affected. We argue that, in addition to structural changes, timely solutions are needed. One such solution is to develop PhD students' personal resources (e.g., self-compassion).

Keywords: personal resources, well-being, academia

Oral presentation OP90

Because I Care: Leader Work Centrality as an Important Antecedent of Visionary Leadership and Subsequent Follower Outcomes

Martin Buss, Riffat Noureen & Eric Kearney | University of Potsdam

science

Research Goals and Theoretical Background: It is often argued that visionary leadership – that is, "the communication of a future image of a collective with the goal of persuading others to contribute to its realization" (van Knippenberg & Stam, 2014: 241) – is one of the most important and effective leader behaviors (Lewis & Clark, 2020). While several studies have investigated which elements make visions more or less effective (e.g., Carton et al., 2014), we still know surprisingly little about which leader characteristics determine whether leaders employ this behavior and under which circumstances these characteristics might be especially important. In our research, we draw on theories of human and social capital (Becker, 1964; Kwon & Adler, 2014) and argue that work centrality – that is, the extent to which individuals believe that work plays a major role in their life (Hirschfeld & Feild, 2000) – is an important antecedent of visionary leadership. We propose that individuals with high work centrality care so deeply about their work that they are more willing than others to engage in visionary leadership – a leader behavior that is often seen as extraordinary and an act of unconventional risk taking (Halevy et al., 2011). Moreover, we argue that work centrality is more important for leaders with low rather than high organizational tenure (i.e., the length of an individual's employment in an organization; Ng & Feldman, 2010). We propose that while leaders with high organizational tenure have already acquired large amounts of organization-specific knowledge and many social contacts, which makes visionary leadership less difficult and risky for them, leaders at the beginning of their tenure need high levels of work centrality to compensate for their lack of these resources. Because work centrality enables leaders to engage in visionary leadership, we propose that such leaders are then also more likely to increase their followers' perceived work meaningfulness, which in turn reduces their turnover intentions.

Design and Results: To test these assumptions, we conducted a two-source, two-wave lagged-design field study with 101 organizational leader-follower dyads with established scales from Hirschfeld and Feild (2000), Kearney et al. (2019), Kirkman et al. (2004), and Chen et al. (2011). By using the regression-based approach from Hayes (2022), we found that leader work centrality predicts visionary leadership, and especially so for leaders with low organizational tenure. Moreover, we find that visionary leadership transmits this interactive effect via followers' perceived meaningfulness onto turnover intentions.

Limitations: We acknowledge two limitations of this research. First, the data from our field study do not allow for causal inferences and it would thus be desirable to complement them with experimental data. Second, the majority of our dyads came from Pakistan and India. Although it is generally argued that visionary leadership is a cross-culturally effective leadership style (Venus et al., 2018), future research should ascertain the generalizability of our findings to other cultural contexts.

Implications and Value: With our research, we provide two central contributions to the literature. First, our research complements and extends research on antecedents of visionary leadership (e.g., Venus et al., 2018) by highlighting the importance of work centrality for visionary leaders. In addition, we show that work centrality is especially important for leaders who are still new to their organization. While the leadership literature has mostly considered leader organizational tenure as a control variable (Bernerth et al., 2018), our research shows that it can also be an important boundary

condition for the effect of leader characteristics on leader behavior. Second, it has often been argued theoretically that visionary leadership provides followers with meaningfulness (e.g., Kearney et al., 2019; Stam et al., 2010a, 2010b). However, the only existing empirical evidence for this comes from research where vision communication is combined with other leader behaviors to form a broader measure of transformational leadership (e.g., Frieder et al., 2018). With our study, we address the criticism on such broader leadership constructs (van Knippenberg & Sitkin, 2013) and provide evidence for the specific and unique effect of visionary leadership on meaningfulness.

Relevance to the Congress Theme: Our work is especially relevant to this year's conference theme because the future of work will be determined by increasing levels of automation, a global dispersion of the workforce, and rising levels of complexity. Our work shows that organizations should focus on recruiting leaders with high levels of work centrality because it is those leaders in particular who will be able to help their followers navigate such an environment by providing them with vision and meaning.

Keywords: visionary leadership, work centrality, organizational tenure

Oral presentation OP393

Beggars can't be choosers – how managers grow marginalized employees

Marie Louise Kirkegaard, Kasper Edwards & Christine Ipsen | Technical University of Denmark

science

This study shows how the challenges of recruiting eligible employees can lead to the sustainable management of socially and psychologically marginalized employees while maintaining the corporation's competitiveness.

The record-high employment rate in Denmark results in labor and skill shortages, challenging companies to recruit and retain eligible employees. The food-processing industry in Denmark is particularly challenged in recruiting and retaining blue-collar employees. They commonly experience heavy lifting, straining work positions, high levels of accidents, and work-related pain. Despite the straining work conditions, the skilled or unskilled slaughterhouse employees are relatively highly paid compared to other European countries.

This study explores how a corporation with high-performance demands and physically demanding work processes can sustainably recruit and retain blue-collar employees. We apply the concept of sustainable management to describe the combined managerial focus on balancing organizational performance and employee health.

Design

We collected data from six Danish food-processing facilities belonging to the same corporation. We conducted semi-structured interviews with six top managers, four department managers, four line managers, ten administrative personnel, three shop stewards, and twenty blue-collar employees, both formally trained and untrained. We also examined stories in the twenty-eight magazines published by the corporation for its employees from the last three and a half years. We conducted a thematic analysis focusing on narrations from or about the employees' experiences of becoming blue-collar employees.

Results

Managers and administrators faced ongoing difficulties recruiting eligible employees to uphold the corporation's performance. A manager from the strategic level stated that their apprentices were critical to the development and competitiveness of the corporation. They recruited and retained marginalized employees, e.g., social or psychological issues, substance abuse, and migrants. Some employees recounted that they used to be in trouble with the law before working in the factory and needed the stability that the work provided. Another employee described, "I usually say that I was rejected everywhere else. I am neither tall, skinny, nor pretty enough; I also have dyslexia and dyscalculia ."

The work is male-dominated and values traits like strength and stamina. Around 15% of the blue-collar employees in the corporation were female. In the employee magazine, a manager on a strategic level described that potential female candidates perceived the corporation as having "a dusty image" with no clear career pathways. The corporation tried to change its image by creating role models and making the corporation a place where more people would like to work. The organization celebrated the craftsmanship of the trade by improving the education of the apprentices and by featuring employees that participated in or won trade competitions. A manager on a strategic level stated, " We have been on a journey that has lasted 5-6 years, aiming at

retrieving the pride in the trade and reinstalling the recognition of the trade as a proud craftsmanship".

An apprentice butcher described the prejudices towards settling for the trade as " it's something you do if you can't do anything else." Continuously, the organization tried to fight prejudice concerning the job by educating SO-ME ambassadors and presenting the job and education at fairs and in production schools. The organization attempted to manage the employees sustainably by addressing their issues and supporting them in growing to be the employees the corporation needed.

Conclusion and relevance to the congress theme

We studied how a corporation could recruit and retain blue-collar employees sustainably. The results show that the corporation has difficulties recruiting eligible employees, which forces the managers to hire socially marginalized candidates and support them in growing to be the hard-working and stable workers they need.

Corporate preconditions force managers to fight misconceptions and preconceived notions about the work and to reinstall pride in the work. They see the employees as an asset that needs to be managed rather than a cost they need to keep down. In this development, the employees and the corporation go from begging for employment and qualified employees to a position where they grow desirable blue-collar work. Beggars become choosers.

The future is now! Corporations today face recruitment and retention problems, and the solution to this challenge might also help solve pressing societal problems like creating decent work for marginalized groups.

Limitations

We conducted this study within one corporation in Denmark, so the transferability of the results to contexts with markedly different blue-collar working conditions is probably limited.

Keywords: Sustainable management, Blue-collar work

Oral presentation OP271

Behind Worker Perception Accuracy: The Role of Job Autonomy

Michela Carraro & Andrea Furlan | University of Padova

science&practice

Research Goals

The literature on team cognition emphasizes that shop floor employees need to develop accurate perceptions about their tasks in order to effectively accomplish the team's objectives. However, how can managers help employees to develop accurate perceptions? To address this question, we draw on work design theory and we examine whether and how the accuracy of shop floor employees' perceptions is related to characteristics of their work environment.

Theoretical Background

Effective teamwork relies on the emergent aggregation of individual perceptions, which can be defined as a set of mental activities resulting from their intimate interpretation of the external environment (Furlan et al., 2019). Given the emergent nature of team cognition, the literature has investigated how individual perceptions aggregate at the team level mainly focusing on intra-group similarity. Few scholars emphasize that "[similarity] does not equalquality [as] teammates may share a common vision of their situation yet be wrong about the circumstances that they are confronting" (Mathieu et al., 2000, p. 281). Inaccurate perceptions may mislead team members to focus on secondary rather than primary goals, impeding the team to work effectively. Therefore, some researchers have suggested to shift the focus from intra-group similarity to accuracy for enhancing the quality of both individual and team decision-making and performance.

In this study, we address the call for more research on perception accuracy rather than similarity. We draw on work design theory to examine the antecedents of perception accuracy. Specifically, we posit that job autonomy enables employees to develop accurate perceptions about their job by providing them with the freedom of organizing their work. Moreover, we argue that the effect of autonomy on workers' perception accuracy is moderated by the supportive climate in which workers operate. Having supportive colleagues or supervisors should help workers to make the most out of the autonomy in terms of quality of their perceptions.

Methodology

To test our hypotheses, we conduct a survey on different organizational levels from a range of 13 Italian manufacturing firms. Our sample is composed of 309 shop floor employees and 69 team leaders from 54 manufacturing units.

Findings

To test our hypotheses, we performed moderated linear regressions. We find that jobautonomy positively affects the accuracy of individuals' perceptions. However, this relationship is significant only when moderated by supervisor support, such that the higher supervisor support, the stronger the positive effect of job autonomy on perceptions' accuracy. Moreover, we find that coworker support moderates the effect of job autonomy on perception accuracy such that the lower coworker support, the stronger the relationship between jobautonomy and perception accuracy.

Limitations

First, our survey design did not allow to investigate the evolution of perceptions over time. Second, our measure of perception accuracy was based on the similarity between individuals and their reference group of experts, admittedly oversimplifying the task of assessing the quality of individuals' perceptions. Third, whilst most organizational theorists assume that perception accuracy should be maximized, inaccurate perceptions may also be beneficial or at least not damaging for organizations.

Conclusions

Drawing on the literature on team cognition and organizational behaviour, this study addresses the following research question: how can managers help employees to develop accurate perceptions about their job? To answer this, we collected data on shop floor employees and experts' assessments about the team priorities and we analysed whether and to which extent the similarity among their assessments (i.e., perception accuracy) was related to their job autonomy. We demonstrate that the accuracy of shop floor employees' perceptions about their job is related to both job autonomy and the moderating effect of supportive climate. This study provides insights to organizations seeking to enhance the quality of their employees' perceptions and explains how to create a working environment that supports the development of accurate understandings about the team's objectives.

Relevance to the Congress Theme

In a fast-changing world, our study seeks to help practitioners designing works that enable employees to better understand their tasks and to align with the team and organizational objectives.

Keywords: Work design, job autonomy, perception accuracy

Oral presentation OP453

BEING "GOOD" BENEFIT THE SELF BUT UNDER CERTAIN CONDITIONS: WHEN AND HOW HIGH-MORAL IDENTITY EMPLOYEES WANT TO KEEP THEIR JOBS

Valentina Sommovigo, Sapienza, University of Rome, Department of Psychology; Raffaele Staglianò, Università degli Studi di Messina, Department of Economics; Xiaodan Wu, University of Bologna-Rimini Campus, Department of Management; Francesco Montani, University of Bologna-Rimini Campus, Department of Management

science&practice

Research goals. Record numbers of employees have left their jobs since the beginning of the pandemic due to how they are treated by their managers and organizations, a phenomenon called the Great Resignation. This trend is troubling companies for the high costs related to employee turnover. Indeed, according to a new global PwC survey, a fifth of workers report they are very likely to quit their jobs in 2022. Shedding light on how and when "good" employees can decide to quit their jobs is nonetheless crucial to formulate preventive measures that help companies attract and retain valuable staff. This study aims to clarify to what extent, how, and when high-moral identity employees can develop turnover intention.

Theoretical background. Drawing on the conservation of resources (COR, Hobfoll et al., 2018) theory, moral identity – i.e., the centrality of moral traits in one's overall self-concept (Aquino & Reed, 2002) – is a personal resource as it enhances employees' self-regulation, motivating them to exhibit prosocial behaviors (Aquino et al., 2011; Jennings et al., 2015). This results in more morally desired actions and fewer unethical behaviors with potential gains in terms of positive social relations with others (Hertz & Krettenauer; 2016). Then, based on the COR theory (Hobfoll, 2001), we expect that high-moral identity employees will be better positioned for resource gains and less vulnerable to resource losses, thereby having less need to adopt defensive conservation strategies. In this regard, knowledge hiding (KH) represents a defensive coping behavior as it implies withholding relevant knowledge as a mechanism of self-protection intended to avoid experiencing personal resource losses (e.g., becoming less valuable; Shin & Kwag, 2017). KH is predictive of turnover (Anand et al., 2020), namely a withdrawal behavior that resource-depleted employees can adopt to scale back from resource investments and protect their left resources. Then, we expect that high-moral identity employees will be less likely to engage in KH and then develop turnover intention. However, this will be conditional on levels of the emotional culture of companionate love (ECCL). Thus, we hypothesize that the presence of a strong ECCL characterized by the expression of affection, caring, compassion, and tenderness among employees (Barsade & O'Neill, 2014) would be an enhancing environmental condition as it will provide employees with a satisfactory way of meeting their reciprocal responsibilities and socio-emotional needs of social connection with the care of each other (Parkinson et al., 2005).

Design. Data were collected on 235 employees from several UK and U.S. companies during the first wave of the COVID-19 pandemic. We used a three-wave, cross-lagged design with a one-month lag between measurements. Participants were recruited via Prolific Academic, an online crowd-sourcing research platform.

Results . Results from moderated mediation analyses revealed that when there were high (vs. low) levels of ECCL in the workplace high-moral identity employees were less likely to engage in KH and then less willing to leave their job.

Limitations. This study relied only on self-report measures and online data collection.

Conclusions. This longitudinal study moves a step forward in the moral identity and knowledge management literature, as it is the first to clarify when moral identity is a personal-level negative predictor of KH and then turnover intention, by identifying ECCL as a key enhancing environmental condition for this link. In doing so, our results shed new light on the reactions of high-moral identity employees to their own unethical behaviors and add to the limited number of studies that have examined the costs of KH for the hider. From a practical standpoint, when hiring new employees, HR representatives could consider a candidate's influence on the emotional culture and emphasize honest, prosocial, and helping characteristics as critical credentials that employees should have. Managers could cultivate practices and policies that make companionate love a desirable and normal practice by, for instance, conducting sharing and debriefing sessions where collaborators are encouraged to share their emotional experiences openly. To promote an ECCL, companies could consider arranging informal gatherings to help their employees build strong bonds with each other, while managers should adopt a compassionate approach, making them present and available for their employees.

Relevance to the Congress Theme. This study extends the topic of well-being by disclosing through which psychological mechanisms (i.e., KH) and under which organizational boundary conditions (i.e., low ECCL) high-moral identity employees may consider quitting their job.

Relevant UN SDGs . Good health and wellbeing.

Audience. Both practitioners and academics

Keywords: moral identity, knowledge hiding, employee turnover

Oral presentation OP184

Bending to fit: Improving equality of access to workplace policies and practices for LGBTQ+ people

Alice Rose, University of South Australia/The University of Adelaide; Melissa Oxlad, The University of Adelaide

science&practice

Aims: While reproductive technology advancements are aiding increased diverse family formation, limited literature exists on LGBTQ+ people's experiences of pregnancy loss and support at work. We aimed to contribute to a foundational understanding of how work-related factors affect the lived experiences of family formation for LGBTQ+ people. This presentation will illustrate: how the advancement of assisted reproductive technologies and associated legislation does not equate to access to equal workplace provisions for LGBTQ+ people; how access to heteronormative perinatal care and support can impact LGBTQ+ people in a range of domains, including the workplace; and discusses directions for practice in areas including antenatal healthcare, legislation and policy, counselling services, and informal supports.

Theoretical background: Interpretivist epistemology applying feminist theory was adopted to enable both individual experiences and structural factors to be captured in the study.

Design: Qualitative design using semi-structured in-depth interviews with LGBTQ+ people about workplace experiences after pregnancy loss. Data were analysed using reflexive thematic analysis.

Results: Heteronormative policies and entitlements can compound the distress LGBTQ+ people experience during their family formation efforts and pregnancy loss. Key findings demonstrate how workplaces featured prominently in the family formation efforts of LGBTQ+ people, particularly following pregnancy loss. Three aspects of the workplace featured prominently: How existing levels of inclusion influenced disclosure in the workplace; how heteronormative workplace policies, leave, and entitlements increase distress; and the need for leave flexibility as grief and coping at vary for different people. Organisations can take practical steps to improve equality of access to organisational policies, leave and entitlements.

Limitations: This sample comprised 12 English-speaking participants located in Australia and the United Kingdom. The conclusions, therefore, reflect a set of workplace policies and legislation within those two countries. While this presentation offers suggestions relevant for organisational settings in many countries, we recognise that not all suggestions will be applicable to all attendees due to varying legislation across countries.

Conclusions: A key feature of this presentation is the practical implications of the findings. We provide practical suggestions for academics, practitioners, and clients to better support LGBTQ+ people at work after a pregnancy loss. Examples include how employers and practitioners can assist by using inclusive language in leave policies and forms; providing access to parental and bereavement leave irrespective of family formation method and gestational age; and allowing flexibility in hours, workload, and tasks after a pregnancy loss.

Congress Theme Relevance: While technological advancements are enabling an increase in diverse family formation, limited knowledge exists about LGBTQ+ people's experiences of workplace policies and practices that relate to family formation. In line with the Congress theme 'The Future is Now', while the world of work is changing, LGBTQ+ people are experiencing a gap between their reality and policies, practices, and procedures at work. This presentation provides applied suggestions for

academics, practitioners, and clients to offer a more inclusive future for people with diverse sexualities and genders at work.

Relevance to UN Sustainable Development Goals (2015): The aims of this presentation and associated research align with three of the UN Sustainable Development Goals (2015): 1) the specific focus is on understanding how inequalities play out in the workplace and offers practical suggestions for academics, practitioners, and clients to reduce the impact of inequalities for people with diverse genders and sexualities; 2) this presentation supports the achievement of good health and wellbeing by sharing new insights about and providing examples of previously unreported workplace barriers to health and wellbeing; 3) caring responsibilities and the way in which these responsibilities impact paid employment are a known barrier to gender equality, and this presentation both highlights how the gendering of care perpetuates gender inequality at work and offers practical suggestions for improving gender equality in workplaces. Raising awareness and understanding the variability in inclusiveness and inequality of access to workplace policies and entitlements available to LGBTQ+ people is a vital first step in creating policies, practices and entitlements that provide truly equal care and support at work.

Keywords: LGBTQ+ inclusion; inclusive leave and entitlements; diverse bodies and genders

Oral presentation OP396

Between materialism and sufficiency: Influences of consumption orientations on well-being, support of political measures and sufficiency behaviors

Shirin Betzler, Karsten Müller, Sabine Lebedinski & Lena Schmeiduch | Osnabrueck University

science

Research goals: With historically high levels of individual consumption, we are exceeding the boundaries of the earth year by year. This makes it necessary to reduce absolute levels of individual consumption, and support respective societal change through political measures. This study aims at shedding light on how these outcomes relate to individual materialistic or sufficiency orientations.

Theoretical background: Our current global consumer culture is characterized by a materialistic orientation of individuals, where the consumption of rapidly circulating commercial products is aimed at achieving well-being, success and happiness. As a counterpoint, orientation towards sufficiency calls for a shift in the way we consume, focusing on finding a good life in deceleration and the simplicity of reduced consumption. With the global sustainability strategy vastly following a green growth paradigm, developments towards sufficiency are still a niche topic. However, on an individual level, initial studies suggest sufficiency orientation to have positive consequences for well-being (Tröger et al., 2021), environmental protection (Verfuerth et al., 2019), and social life (Loy et al., 2021).

Method: Against this backdrop, the present study examines the negative connection between materialistic and sufficiency orientation and their direct effects on cognitive and emotional facets of subjective well-being, individual sufficiency behaviors for different consumption domains (mobility, housing, nutrition, and leisure) and attitude towards sufficiency policies. Moreover, the mediating role of time affluence is examined. Data was obtained from an online survey with a final convenience sample of $N = 530$. Participants indicated their agreement to items adapted from existing research on a seven-point Likert scale. For the measurement of sufficiency policies, pro- and contra arguments of different policy measures were presented. Participants were asked to rate to what extent they were in favor of the measure. A model integrating the hypothesized connections was tested with structural equation modelling.

Results: Results revealed a negative correlation between materialistic and sufficiency orientation. Sufficiency orientation positively predicted individual sufficiency behaviors ($\beta = .83$, $p < .001$) as well as attitude towards sufficiency policies ($\beta = .65$, $p < .001$), but not subjective well-being ($\beta = -.07$, $p = .218$). Materialistic orientation was a significant negative predictor for subjective well-being ($\beta = -.31$, $p < .001$) and individual sufficiency behaviors ($\beta = -.12$, $p < .05$), but not for attitude towards sufficiency policies ($\beta = .06$, $p = .292$). As for testing the mediating role of time affluence, it was significantly and negatively predicted by materialistic orientation ($\beta = -.14$, $p < .05$), but not by sufficiency orientation ($\beta = -.03$, $p = .619$). Time affluence had a significant positive influence on subjective well-being ($\beta = .33$, $p < .001$), and a significant, however negative influence on individual sufficiency behaviors ($\beta = -.12$, $p < .05$). Overall, the model explained 22% of variance in subjective well-being, 41% in attitude towards sufficiency policies and 76% of individual sufficiency behaviors.

Limitations: Data collection via convenience sampling led to a predominantly female (60.9%), comparatively young (age mean = 31.8) and educated (38.9% with a University bachelor's degree or higher) sample. Reliabilities of the main constructs were generally at least acceptable (Cronbach's $\alpha \geq .70$). However, selected sub-scales of the factors of individual sufficiency behaviors and attitude towards sufficiency policies were as low as $\alpha = .52$.

Conclusions: The present study stresses the importance of sufficiency orientation for furthering individual sufficiency behaviors as well as the support of respective policy measures. Materialistic orientation seems to impede individual sufficiency behaviors and to have a detrimental effect on subjective well-being and the perception of time affluence. In turn, disposing of enough time has a positive impact on well-being. However, with time affluence having an unexpected negative connection with individual sufficiency behaviors, more research is needed in order to unravel the complex role that time affluence plays in this context. The results of this study offer valuable points of departure for education and training, such as questioning the predominant societal paradigm of materialism, or furthering critical thinking about individual use of time. Also, the results can be a promising avenue for social marketing campaigns for the public good.

Relevance to the Congress Theme: The study offers insights on what influences members of organizations or customers in their sufficiency behaviors and well-being and how they partake in the broader context of society. This contributes to shaping future-oriented and responsible producer - consumer relationships.

Keywords: consumption orientation, sufficiency behaviors, policy support, well-being

Oral presentation OP478

BEYOND CONSENSUS: A DYADIC PERSPECTIVE ON STATUS PERCEPTION IN GROUPS

Anneloes Raes; William Fawson, IESE Business School

science

Status, the relative amount individuals are voluntarily respected, admired and deferred to, is a central organising process in groups that facilitates performance (Anderson et al., 2015; Berger et al., 1972). Expectations States Theory, the dominant theoretical lens, predicts groups allocate higher status to members with higher willingness and ability to contribute towards performance, which requires groups to form consensus over expectations (Berger et al., 1972).

Whilst EST has dominated theorising on status, it overlooks a conceptual and empirical reality: not all interpersonal perception, particularly status, is consensual, as individuals develop unique status perceptions and often disagree over status rankings (Joshi & Knight, 2015; Kilduff et al., 2016). This calls into question the extent to which EST, reliant upon consensus, is able to explain the antecedents of status perception in groups, and thus highlights our incomplete understanding.

Here, we focus on dyads as a key locus of status perception to advance a relationship-based account of EST. We propose that individuals uniquely see others as higher or lower in status as a function of their dyadic relationships. Moreover, we hypothesise that members of dyads perceive higher status when they share similar personality traits, particularly extraversion, grounded in Similarity-Attraction Theory, which predicts that individuals prefer to interact with similar others (Byrne et al., 1986).

In our first study, we apply a Social Relations Model (Kenny, 1994) to allocate variance in status perceptions between consensus and relationships for 980 dyads nested in 39 teams. We find that 23% of the variance in status perception is relationship-based. We then analysed in Study 2 the status perceptions of 130 participants placed into 36 groups to complete a one-time problem-solving task. We used a Response Surface Analysis (Edwards & Cable, 2009) to show that congruence in extraversion uniquely predicts dyadic status perception. Though research has shown a positive link between extraversion and consensual status (Bendersky & Shah, 2013), our findings are notable since they demonstrate a dyadic link that goes beyond the consensus-based rational of EST. In terms of limitations, we note our data are correlational, which restricts our ability to make causal inferences.

Our findings are important because they provide both theoretical and empirical advances to the study of status-organising processes in groups. Theoretically, we advance knowledge of how individuals attain status by examining dyadic perceptions that dominate status. Empirically, we employ a technique that combines SRM and RSA in a novel way. Our research calls into question the hegemony of EST and brings to light new insights into how individuals attain status.

Keywords: Status, Dyads, Extraversion

Oral presentation OP482

Compressed Work Week – Intention Predictors and Outcomes: A Systematic Review Using Topic Modeling

Francisco Delgado, José Dias & Sílvia Silva | BRU-ISCTE

science

The title of our presentation is “Compressed Work Week – Intention Predictors and Outcomes: A Systematic Review Using Topic Modeling”.

In order to reconcile work and family lives, organizations offer their employees Flexible Work Arrangements (FWAs) (Allen et al., 2012). These arrangements allow individuals to choose when and where to work outside of their traditional work schedule (Spreitzer et al., 2017). One of the FWAs’ strategies is the Compressed Work Week (CWW), which can reduce the schedule to 3 or 4 working days (Baltes et al., 1999). This study aims to provide an overview on the state of the art regarding the intention predictors and outcomes of the CWW. Additionally, it also analyzes the latent themes arising from research articles on this theme.

For that purpose, we conducted a systematic review through the use of statistical text analysis methods (Sharma et al., 2021). Data was retrieved from Web of Science and we initially obtained a grand total of 1421 papers. We included all the English-written papers addressing the access and/or use of CWWs in our analysis, and excluded those who did not meet this criteria, thus resulting in a final corpus of 132 (N = 132). The topic modeling technique applied in this study allows us to identify the latent themes in the subject of CWWs, as well as their prevalence across a range of documents (Imel et al., 2015).

Our results provided a clearer overview on the state of the art regarding the intention predictors and outcomes of the CWW. Firstly, we could state the existence of multiple intention predictors regarding the use of CWWs (e.g., being women or perceiving a reduction in commuting time). Then, our analysis showed us that the outcomes from the use of CWWs are dependent upon the number of daily working hours. Thus, working under a “4/40” scheme (a 4-day work week, in which employees will work for 10-hours each day) may sort different outcomes comparing to a “3/36” (a 3-day work week where each workday has 12 hours). Further, we identified 15 topics and grouped them into 5 main clusters. Hence, these 5 main clusters were related to: 1) the work-family dynamic (work-life balance, role conflict management, supervisory support, parenthood and the gendered nature of flexible schedules), 2) health (health and stress, flexibility bias and the role of health and age on work engagement), 3) shift work (fatigue and sleepiness), 4) time and distance (number of daily working hours and commuting time and distance) and 5) talent retention.

A possible limitation of this study is that we used data retrieved from only one research database – Web of Science - and have not compared it with other sources (e.g., Google Scholar).

However, this study provided a clearer overview on the state of the art regarding the intention predictors and outcomes of the CWW. Additionally, we also identified the most common themes arising from the analyzed literature on this theme, and grouped them into 5 main clusters. A detailed explanation of each topic will be provided in the presentation, as well as the reason for framing each topic in its specific main cluster.

Considering the growing relevance of FWAs in shaping the world of work following some of the recent notable events (e.g., COVID-19 outbreak), as this study addresses one of it (CWWs), we believe it goes in line with the congress theme.

This study is relevant for the following UN SDGs: (1) good health and wellbeing and (2) decent work and economic growth.

Keywords: compressed work week, cww, intention predictors, outcomes

Oral presentation OP592

Binge-watching's effects on work engagement

Hermann Magnus Oddsønn Døsvik, Anett Rago & Dana Unger | UiT The Arctic University of Norway

science

Research goals and why the work was worth doing: During the past 25 years, there has been an increase in watching television for people of working age (Barwise et al., 2020). In the United States, the average amounts to around five hours a day. Employees may spend up to 30% of their waking hours in front of the TV and/or streaming devices (Barwise et al., 2020). Binge-watching (i.e., watching multiple TV show in one sitting; Starosta & Izydorczyk, 2020) may represent a unique domain in everyday life which should influence the work domain via spillover effects (Edwards & Rothbard, 2000). However, there is surprisingly little research on the work-related antecedents and consequences of daily binge-watching. Drawing on recovery research (Sonnentag & Fritz, 2007; 2015) and media psychology (Reinecke & Oliver, 2017), we have good reason to assume that binge-watching could be both positive and negative for work engagement. However, much-needed empirical evidence for this assumption is lacking. By examining the daily effects of job stressors (i.e., workload) on increased binge-watching with downstream consequences for recovery experiences (i.e., increased detachment and relaxation), recovery activities (i.e., deteriorated sleep), and occupational well-being (i.e., work engagement), we contribute to the literature by further integrating research on recovery and media consumption. Furthermore, with our moderated-mediation model, we introduce the role of TV enjoyment. Both binge-watching and TV enjoyment are under the employee's control and can be targeted to improve recovery experiences, recovery activities, and occupational well-being.

Theoretical background: The background for the research is recovery research (Sonnentag & Fritz, 2007; 2015) that hypothesizes job stressors such as workload to be associated with detachment—being mentally away from work—and relaxation with downstream consequences on well-being. However, with our media psychology perspective, we hypothesize distinct positive and negative effects of workload on work engagement via binge-watching. On days with high workload, employees might be more inclined to binge-watching because this activity does not require high energy levels to be invested. In turn, binge-watching may hinder and benefit work engagement (i.e., a positive, work-related state of mind that is characterized by high levels of energy, being dedicated and being concentrated and happily engrossed in work; Schaufeli & Bakker, 2004). Binge-watching should improve detachment and relaxation, whereas it should be negatively related to sleep in terms of sleep quality and quantity.

Furthermore, we hypothesize TV enjoyment boosts the positive relationship between binge-watching on the one hand and detachment and relaxation on the other hand. TV enjoyment should buffer the negative association between binge-watching and sleep quality/quantity. We assume that detachment, relaxation, and sleep will positively affect next-day work engagement. Taken together, we propose a moderated-mediation model with indirect effects of workload on work engagement via detachment, relaxation, as well as sleep quality/quantity, and TV enjoyment as a boundary condition.

Design/Methodology/Approach: We will conduct a daily diary study in November, in which we will sample 83 participants, which is an appropriate sample size for this method (Gabriel et al., 2019). Prolific Academic will provide access to the sample. Participants will fill out a baseline questionnaire to indicate demographic information and then fill out short questionnaires in the morning and afternoon for 10 working days. In the afternoon, participants will indicate their level of workload. The

next morning, we will measure binge-watching, TV enjoyment, recovery experiences (i.e., detachment and relaxation), and sleep quality/quantity. In the afternoon, we will assess next-day work engagement.

Results expected: We will have the results available in early 2023.

Limitations: The main restriction from a methodological point of view is using self-reports, which might contribute to common method variance.

Conclusions - research and or practical implications: We advance the literature on binge-watching and its effects on occupational well-being. The study can potentially improve organizations' knowledge of binge-watching and how it may improve or deteriorate the employee's work engagement. This could help organizations offer interventions targeted at their employees (e.g., providing certain highly enjoyable TV content during work breaks).

Relevance to the Congress Theme: With the ever-increasing popularity of watching TV, it is beneficial to understand how it may affect employees at work. We will contribute to this and help organizations coordinate action in this changing world.

Relevant UN SDGs: Our research advances knowledge on work engagement "Good health and well-being."

Keywords: binge-watching, recovery, work engagement

Oral presentation OP203

Bonus or Backlash?: Examining the Effects of Supervisor Gender Vanguards on Gender Differences in Subordinate Leadership Aspiration

Vedika Lal, Svetlana Khapova, Kathleen Stephenson & Janneke Oostrom | Vrije Universiteit Amsterdam

science&practice

Research Goals and Theoretical Background

According to the role congruity theory (Eagly & Karau, 2002), leader stereotypes place an emphasis on typically masculine, agentic features like dominance and assertiveness over typically feminine, communal features like being helpful and nurturing. This might not only reduce women's access to leadership roles but could also discourage them from aspiring to such roles to begin with (Hoobler et al., 2014). The purpose of the present research is to explore whether women's leadership aspiration can be strengthened by supervisors' demonstrations of communality or agency. Supervisors can serve as important role models and research has found that women with female supervisors have higher aspiration (Fritz & van Knippenberg, 2020). This supports research highlighting the importance of gender-congruent role models for women (Dasgupta & Asgari, 2004). However, the influence of role models can go beyond seemingly salient elements of perceived similarity, like gender (Cheryan et al., 2011), and the extent to which gender-congruent role models are considered critical at work is currently under debate (Yan et al., 2021).

We extend this debate by testing whether supervisors that disconfirm gender stereotypes (referred to as gender vanguards) can influence subordinate aspiration. According to expectancy violation theory, category-based violations can result in extreme evaluations, in line with the valence of the violation (Bettencourt et al., 1997). Behaving in gender atypical ways could create positive expectancy violations by means of a bonus effect (Hentschel, et al., 2017), in which demonstrations of atypical behaviour from an unexpected source could be perceived as especially favourable and generate positive outcomes. The same behaviour however, could create negative expectancy violations by means of a backlash effect (Bosak et al., 2018; Moss-Racusin et al., 2010) that could be perceived as especially unfavourable, and generate negative outcomes. This leads us to test the following competing hypotheses.

Hypothesis 1a: Communal behaviour would confer a communality bonus to male supervisors that could strengthen subordinate aspiration, especially women's.

Hypothesis 1b : Communal behaviour would confer a communality backlash to male supervisors that could negatively influence subordinate aspiration.

Hypotheses 2a: Agentic behaviour would confer an agency bonus to female supervisors that could strengthen subordinate aspiration, especially women's.

Hypothesis 2b : Agentic behaviour would confer an agency backlash to female supervisors that could negatively influence subordinate aspirations, especially women's.

Methodology and Expected results

We will test these hypotheses and finish data collection over the next two months. In a between-subject experimental study, participants' leadership aspiration will be measured in relation to a hypothetical supervisor where supervisor gender (male, female) and supervisor behaviour

(communal, agentic) will be manipulated. In a second, cross-sectional study, participants will rate their own leadership aspiration and evaluate the communality and agency of their current supervisors. We will analyse the effects of supervisor gender, supervisor behaviour and their 3-way interaction on subordinate leadership aspiration to determine which hypothesis is supported or rejected.

Limitations

The present studies only look at communality and agency in isolation as a way of assessing their unadulterated interaction with supervisor gender (Kulich et al., 2021). However, future research should assess the effect of supervisors who demonstrate both communality and agency. This aligns with recent research that increasingly highlights the positive evaluations of androgynous leaders (Kark et al., 2012; Powell & Butterfield, 2020).

Implications and Relevance

Prevailing stereotypes about gender and leadership place women in a double bind that can undermine their pursuits for leadership roles and their motivation to behave in stereotypically masculine ways (Amanatullah & Morris, 2010). As such, support for the agency bonus hypothesis could highlight the value of displaying agency for women, both in leadership roles and those aspiring for them, instead of navigating the backlash associated with it (Williams & Tijdens, 2016). Moreover, women are embedded in environments that are predominantly occupied by men in supervisory positions (Smith, 2002). Thus, if the communality bonus hypothesis is supported, it could encourage male supervisors to display their communal traits, by fostering more nurturing, sensitive working environments, that emphasize the role that men could play as allies at work (Yan et al., 2021). Overall then, identifying organisational factors that can strengthen women's leadership aspiration would positively contribute to changing existing dynamics of the workplace and development goals aimed at reducing gender inequality.

Keywords: Leadership aspiration, gender equality, supervisor behaviour

Oral presentation OP810

bulying; power;politics

Ana Verdasca, SOCIUS / ISEG

science&practice

This study advanced insight in the power dimension of workplace bullying by investigating its political dimension: we explore whether workplace bullying can be regarded as a deliberate, competitive strategy to favour the goals of the perpetrator. To this aim, and in line with the work environment hypothesis, we analysed the role played by the social climate at work, the presence of organizational politics, the extend of work overload and the degree of internal competition as catalysators of instrumental bullying behaviour. We also looked at the main sources of power underlying the bullying.

We combine quantitative data (N = 561) with qualitative data (N = 64) to (a) assess the association between exposure to bullying and the social work climate, organizational political behaviour, work overload, internal competition, and to (b) gain more in-depth insight in the interrelatedness of bullying incidents and instrumental behaviours by organizational members through organizational politics as well as the power dimensions at stake (i.e., reward, coercive, legitimate, expert and reference).

The social climate at work was regarded as “strained and competitive” by 45,3% of respondents. Exposure to workplace bullying was positively related to perceptions of political behaviour, work overload and internal competition at work. The qualitative data revealed that bullying incidents occurred when political behaviours happened in the line of organizational practices that tie closely in with negative social behaviour (i.e., “Being left idle”, “Denying of promotion”, and “Staff appraisal for performance”). The main sources of power identified in such incidents were coercive and negative reward power.

These results add to knowledge on the power dimension of workplace bullying and widens the traditional scope of research from work stressors to organizational features fostering instrumental and political bullying behaviours.

Keywords: workplace bullying; Power political behaviors

Oral presentation OP5

Calibrating Internal Communication Maturity within Organizations as an Auditing Index

Muath Jaafari, College of Medicine, King Saud bin Abdul Aziz University, Saudi Arabia; Rizwana Amin, Department of Professional Psychology, Bahria University, Islamabad, Pakistan; Amir Latif, Department of Psychology, National University of Modern Languages, Pakistan

science&practice

Research goals and why the work was worth doing: Organization's internal communication is an important aspect that increases organizational productivity. It represents the relationship between the employer and the employee (Verčič et. al., 2021). Literature regarding communication audit within organizations depicts its general understanding of various aspects of the communication process and evaluates it only from the channel of communication perspective (Zwijze-Koning et al., 2007). However, there is a need to develop a questionnaire that assesses internal communication with different aspects (feedback, interaction with supervisor and colleagues, formal and informal communication), which are considered essential within organizations. Moreover, there is a need to develop a questionnaire that measures the concept through an employee-centric approach rather than management centric. Therefore, the present study aimed to validate a newly developed scale that measures internal communication Maturity within organizations. It will be widely helpful in diagnosing specific communication Areas and formulating recommendations for improvement.

Theoretical background: Communication within the organization is a crucial activity that connects workers with management and enables organizations to function smoothly. It circumscribed both formal and informal communications within the organization (Verčič et. al., 2012). An effective communication system is considered essential for an organization's success (Hussain, 2013; Verčič, 2019). At present, organizations across the globe are investing financial and human resources to establishing internal communication systems (Downs, 1994) and monitoring with communication audits (Goldhaber, 1993; Hargie & Tourish, 2000; Verčič et al., 2009). Considering the importance of internal communication, the paradigm has shifted from management to the employee (Ruck & Welsch. 2012). From the employees' perspective, effective internal communication may enhance employees' understanding of change and consequently contribute to the organization's success (Hussain, 2013).

Methodology: Present study employs a cross-sectional survey research design. 2071 employees (94.4% Male; 5.6% female) working in the logistic industry across the Kingdom of Saudi Arabia were approached through a convenient sampling technique. Based on the literature review and results from FGDs, 16 items have been generated. Participants responded to these 16 items on a 5-point Likert Scale of 1 (strongly disagree) to 5 (Strongly agree). High scores indicate a high level of satisfaction among employees. Psychometric properties were analyzed via factor analysis (exploratory as well as confirmatory) and reliability analysis through SPSS 27.0. and AMOS V. 25.0.

Results: Analysis of the data indicated the measure is reliable and valid. Reliability analysis showed good alpha reliability coefficients (> .75) between Internal communication satisfaction total and its subscales (Awareness, Appreciation, Relationship, Engagement & Maturity). The correlation matrix from EFA revealed the presence of coefficients of .3 and above, indicating the data is fit for factor analysis. The Kaiser-Meyer-Olkin Measure of Sampling Adequacy was 0.951, indicating that the sample was adequate, and Bartlett's Test of Sphericity gave a p value of < .001. EFA was performed with Promax rotation with an enforced five-factor solution. Confirmatory factor analysis showed an acceptable model-data fit of the five-factor model. with the model being significant ($p < 0.01$). NFI,

CFI, and TLI are close to the 0.09 criterion, PCFI meeting the >0.5 criteria, and RMSEA meeting the < .10 criterion. The 5 confirmed factors are (1) Awareness of strategy, values, news, and rights; (2) appreciation involving praise from leader and organization to employees as well as from employees to the organization; (3) relationship between employees, their immediate boss, and employee family to organization; (4) engagement with other colleagues, job and corporate; (5) maturity involves active internal communication, satisfaction with it and its' reach.

Limitations: To improve psychometric properties, a second-order CFA can be done in future studies. Moreover, data is collected only from the logistic industry. However, data can be gathered from other industries as well. Furthermore, cross-sectional data is used in the current study. Therefore, it cannot be used to infer a causal relationship.

Conclusions: The instrument will be worthwhile in communication audits of the organization. It allows researchers and practitioners to utilize the newly developed scale in empirical studies to diagnose and improve organizational communication.

Oral presentation OP109

Can board games improve our change management competencies? Results from an organizational leadership training intervention

Johan Simonsen Abildgaard, Copenhagen Business School, Denmark; Karina Nielsen, Institute of Work Psychology, University of Sheffield, UK; Esben langager Olsen, The National Research Centre for the Working Environment, Denmark

science&practice

The current paper presents the results from an intervention (the Change Competency Intervention CCI) using board game-based simulations of change events to improve the change management competencies of managers and other change agents.

The specific context of the intervention is Novozymes A/S, a Danish biotech company whose production plants are conducting a long-term change process towards more systematic and widespread use of Lean management tools. Lean implementation is an interesting case as it is a type of change that is both potentially beneficial to and demanding on employees' wellbeing (von Thiele Schwarz et al., 2017).

Theoretical background

A primary element in CCI is training leaders to understand readiness (Holt et al., 2007) and resistance (Maurer, 2010) towards change and how these can be addressed. In relation to both change resistance as well as change success, a key element in CCI is that situations, contexts and people are different and hence change impacts differently (Oreg, 2006).

The CCI project aims to teach the managers these change concepts through a mix of dialogue tools and board game based leadership simulations. Using so-called 'serious games' (Abt, 1987), allows for the participants to play through, and learn from, a simulation in a training setting.

Previous change-management intervention studies (Abildgaard et al., 2018; Schweiger & Denisi, 1991), suggest that there are potential gains from intervening against the psychosocial effects of change, but substantial results of interventions targeting both employee wellbeing and organizational change goals are lacking. The current project aims to address this gap.

The programme theory for CCI is that implementation of Lean management can both improve production and be strenuous for employees in the sense production and organization of work will be changed. CCI is theorized to help managers implement Lean more efficiently hence improving the effects of Lean on productivity and reducing the strain on employee wellbeing.

Methods

The intervention consisted of four full days of workshops focusing on developing an understanding and a vocabulary for the human side of change management. Key topics were handling resistance, balancing stability and change, managing stakeholders. Personal and departmental action plans were developed at the workshops. All board games and dialogue tools were developed by the change consultancy agency Workz A/S, whose consultants facilitated all workshops in the project.

Ten departments in Novozymes were enrolled in the study. These consist of two production plants with each maintenance supply chain and production departments. Cluster randomization was conducted between matched pairs of departments. In total 700 employees participate in the study.

Measures and Evaluation strategy

For the project, tailored scales of employee-rated Lean maturity and a short scale of employee rated Lean leadership behaviours were developed and administered bi-monthly to measure impact of the intervention on the targeted change process.

For the evaluation of the project a mixed methods approach was used which included: audio/video data from workshops, workshop evaluation questionnaires, baseline and 12 month follow-up questionnaires and finally interviews with consultants, stakeholders, managers and employees.

The project is evaluated with a mixed methods (Creswell & Plano Clark, 2011) realist evaluation approach (Nielsen & Miraglia, 2017; Pawson, 2013) as well as with in-depth theoretically driven qualitative analyses.

Results

We present both quantitative and qualitative results from the intervention following a sequential mixed methods analysis. We demonstrate how training reactions are linked to both change specific and generic learning. The results show that the two departments in the second round of training had a significantly better learning from the course and that these high-learning departments had significantly improved change fit, and change management (assessed via repeated measures ANOVA on employee data compared to its matched comparison department). No significant effects were found in the low-learning departments.

Discussion

The study is a unique research opportunity to examine the effects of simulations and board games as novel intervention tools. It also contributed to knowledge on the impact of change management training on employee, change resistance and change success. The randomized design and the potential to collect comprehensive quantitative and qualitative data additionally strengthens the CCI project results.

Keywords: Intervention, Change management, mixed methods

Oral presentation OP517

Can Techno Pro-Bono aid towards achieving Sustainable Developmental Goals?

VIJYENDRA PANDEY & GREESHMA RAJGOPAL | CENTRAL UNIVERSITY OF KARNATAKA

science&practice

The COVID-19 pandemic issue had compelled all nations to re-evaluate the significance of the relationship between sustainability and technology. The COVID-19 pandemic's adverse environmental effects such as increased biomedical waste, healthcare waste, etc., have hindered world development in terms of achieving sustainable goals. Giving developing countries an unprecedented nudge to address the climate change crisis exhausts these nations due to its constraints. Studies emphasize the increment of digital pro-bono support post-COVID-19 pandemic that has aided numerous organizations, companies and communities towards acquiring sustainable goals. To understand the impact of technological pro-bono support for sustainable development goals (SDG) in India, the current qualitative study explored the perceptions, problems and solutions proposed by the technical experts who were recruited through purposive sampling. A total of N = 36 participants between the age group of 24 to 35 years (Mean 30, SD = ± 1.56) were interviewed. Thematic analysis generated six major themes. Post-COVID-19 impact addressed the participants' awareness regarding the environmental issues caused due to the pandemic. Environmental Injustice , emphasized the unequal pressure put on countries like India and various states within India to meet SDG. The third theme, Perceived severity of environmental problems, indicated the general population's seriousness and severity towards the ecological problems and how their severity could affect their decisions regarding SDG. Environmental commitment , the fourth theme focussed on the individuals' commitment towards environment protection and attaining overall SDG. Technological innovations for SDG highlighted the participants' awareness and suggestions towards the possible innovations that could be implemented to achieve SDG and mitigate the climate change crisis. Lastly, the sixth theme, Pro-bono & Charitable Support, gives significance to the voluntary service and charities done by professionals that are provided without payment. This support, mainly via technology addresses concerns related to environmental and sustainable issues and aids in offering services to communities that are mainly unprivileged and cut out from receiving help from the outer world. Overall, the findings demonstrate that to tackle the environmental problems of a community as a whole, individuals' severity, awareness, commitment and unequal expectations should be addressed and resolved mainly through digital pro-bono support. The study also investigates these themes with the country's socio-economic and cultural perspectives.

Keywords: Environmental injustice, technological support, climate change

Oral presentation OP23

Can We Measure the Unconscious Discrimination By Using Eye Movements?

Samet Çelik, Bartın University; Malik Volkan Türker, Marmara University

science

Aim: Discrimination among minorities is learned throughout the whole life. However, in adulthood, we do not directly measure discriminatory attitudes due to reasons such as the punishment of discrimination by the laws, social exclusion, and social desirability. However, our prejudices and behaviors towards minorities may continue implicitly. In this research, we are going to examine whether eye movements can be a predictor of implicit attitudes during the hiring process by performing eye tracking method. Although it has been shown that using eye-tracking is a valuable approach to assess attitudes in various fields, such as advertising, social and cognitive psychology, we aim to assess whether eye movements can predict implicit attitudes in the recruitment process.

Methods: The average age of the participants ranged from 24-47 (Mean:30.20, N=15). All participants work as recruitment specialists in one of the Top 500 companies in Turkey. We created 11 fictional resumes for evaluation by participants. All resumes belong to distinct minorities based on gender, sexual orientation, ethnicity, sect, mental illnesses and former convictions. In our pilot study, these fictional resumes are evaluated by experts who work in academia and the private sector. We found that all fictional resumes are equal in terms of work experience, education level, and skills. Only identities were found different. We allowed participants to see those identities in the membership section of the resume. All resumes were presented to the participants on a screen. Next, eye movements of the participants were recorded using a Tobii T120 recorder. A three-step procedure was applied so that all participants could evaluate each job application. In the first step, they evaluated all candidates with no time limit restriction. In the second evaluation, the participants were informed that they had to choose the three most suitable applications for the job among all candidates. All resumes were presented on the screen for 45 seconds at this step. In the final step, the participants were informed that all resumes would be presented again for 10 seconds to confirm the most suitable candidate for the job.

Results: Data analysis was conducted using Tobii 2.0.5 analysis software. This study analyzed whether the pupil movements of recruiters differed from each other in three steps. Review times (unlimited, 45 seconds, and 10 seconds) were defined as stress variables in the decision-making process. In three steps, the place where they looked at the CV were analyzed. We divided the fictional resumes into six parts to simplify the process. These sections were from top-to-bottom: Demographic Information, Educational Background, Work Experience, Computer skills, foreign languages and hobbies (CFH), Membership information, and Additional information. Fixation times and fixation frequency were analyzed in the 1st, 2nd, and 3rd steps of experiments for each fictional resume. Comparisons between résumés were not made because it was out of hypothesis. In the first step, the first fixation results were 44.81% (SD = 11.55), 17% (SD = 8.66), 16.23% (SD = 9. 63), 6.49% (SD = 5.93), 7.14% (SD = 6.38) and 7.79% (SD = 6.38), respectively. According to these findings, the participants examined the demographic information section more than the other sections in the resumes when they reviewed the resumes for the first time. In the third step, the difference between the departments regarding the first fixation widened to a greater extent. It decreased to 18.82% for demographic data. It increased up to 10.38% for educational background and work experience, CFH, membership, and additional information results were 24%, 7%, 30.95%, and 42%, respectively.

Conclusion: Theoretically, the eye-mind assumptions reveal the extent of discrimination. The eye-mind hypothesis indicates a strong causality between “the fixation of the eyes” and “the contents of the mind.” In this study, we investigated whether eye movements could be an objective measurement tool to evaluate implicit attitudes in recruitment processes. Similarly, it was seen that there was a contradiction between the choices made by the HR specialists among the resumes and the findings in the eye movements. Although HR specialists verbally state that they prefer according to candidates' experience and educational information, when their eye movements are examined, it is seen that they focus more on social identities. Additionally, we showed that there is a relationship between the selection preferences of recruiters and their eye movements. This study presented that eye movements focused on identities the most in CV reviews, despite the explicit declarations of recruiters at the end of the recruitment process that “everyone is treated equally; I have not discriminated against anyone because of their identity”. As far as is known, this study is the first to examine the relationship between eye movements and implicit attitudes.

Keywords: İmplicit attitudes, hiring process, discrimination in workforce

Oral presentation OP477

Career Adaptability and Career shocks: Antecedents and outcomes. Longitudinal Study during the crisis in the Lebanese banking sector

Dima Braiteh, Ans De Vos | University of Antwerp

science&practice

The survival of Lebanese organizations has been threatened by constant volatility and uncertainty due to various political and economic instability in the country since the Civil War in 1975. Nevertheless, the pressure of the continuous need for change has been aggravated mutually by the COVID pandemic and the Lebanese revolution that started in 2019. This latter has severely deteriorated the country's economic situation regarding liquidity, leading to an unprecedented currency devaluation in history. Among other sectors, Banks were the most impacted due to their influential impact throughout the years on the country's GDP and their exposure to the Government's financial difficulties (external and internal debts). Currently, this sector is still in the middle of a crisis with the need for serious restructuring measures (mergers and downsizing), which is confronting its employees with continuous disruptive shocks.

The experience of these ongoing adverse events can be conceived as a negative career shock, which is likely to affect employees' future career decisions. In this study, we address how two individual factors (individual adaptability and self-monitoring) affect how people deal with such a career shock and how this, in turn, explains career-related outcomes.

Furthermore, adapting has become vital for employees to manage their careers in volatile and challenging times. Accordingly, as a self-regulatory capacity, career adaptability plays a significant role in supporting employees to work better on their career-related challenges and traumas.

Therefore, this study addresses the impact of negative career shocks on the employee's well-being, organisational commitment and career engagement through career adaptability.

Our study contributes to the current career shock literature in several ways. First, by investigating how specific individual characteristics can explain people's sensitivity and reaction against negative career shocks.

Second, building on the growing interest in employee well-being in the current career literature, we investigate the impact of recurrent negative shocks on the well-being of Lebanese banking employees. Finally, a longitudinal design will help us better evaluate and understand changes in employees' career adaptability during negative career shocks, thereby studying the relationship with the frequency of shock occurrence and relating this to employees' organizational commitment and career engagement.

For our research model, we build on the Conservation of Resources Theory (COR), a promising theory to better understand the potential impact of career shocks on career outcomes (Akkermans et al., 2018). Furthermore, we used Career Construction Theory, CAAS (Savickas, 2013), to understand employees' adaptability while experiencing career shocks and the impact on employees' career outcomes.

The current empirical study uses a cross-sectional design to collect primary data. We distributed a survey using validated scales to Bank employees. We use multivariate statistics and structural equation modelling (SEM) to analyze the data and test the hypothesized relationships. We have received data from 500 participants.

We will use multivariate statistics and structural equation modelling (SEM) to analyze the data and test the hypothesized relationships.

Banks were the most impacted among other organizations following the recurrent shocks that hit the Lebanese population since the start of the Lebanese revolution in Oct 2019.

Therefore, for our study, we concentrated our targeted participants on this specific category of employees, " Bank Employees". Furthermore, we conditioned the participation only for the ones who have been working in the banking sector since the beginning of the crisis (tenure of three years), so they can better describe the impacts of the experienced recurrent shocks.

We have completed the first two waves, with responses from 500 participants at the time of writing. We expect to have the full results at the conference and will be able to discuss the respective findings accordingly.

One of our study's contributions is collecting data from one country in the Middle East, "Lebanon", a region that has been hardly explored, despite its being strongly affected by multiple waves of disruptive political, economic and social change. However, this also implies that conclusions cannot be generalized to other regions. Second, we aimed to collect data from banking employees since this sector has been affected the most during the crisis; however, different findings might result from other sectors. Third, it is difficult to isolate the impact of various social and economic changes in times of a global pandemic. This disruptive historical change has undoubtedly influenced perceptions of Shocks and corresponding outcomes.

Oral presentation OP709

Career Identity and wellbeing, the mediating role of job quality, job meaningfulness and job satisfaction

Juan P. Gamboa, Basque Institute of Competitiveness-University of Deusto; Marija Davcheva, Vicente González-Romá & Ana Hernández | University of Valencia; Carmen Picazo, University of Zara

science&practice

Research goals and why the work was worth doing

The general goal was to analyse the direct or indirect nature of the relationship between career identity and wellbeing (both at work and beyond) and the mechanisms operating between them. The study allowed to expand our knowledge about the impact of career identity on the work domain and beyond.

Theoretical background

According to Fugate et al. (2004), career identity is one of the four dimensions of employability that comprise one's self-definition in the career context, describing 'who a person is' or 'who wants to be' in the professional domain. Therefore, this dimension is a key driver of career and employment outcomes by helping individuals to direct, regulate and maintain their behaviour in order to achieve the desired career. Thus, career identity represents the motivational component of employability.

Previous research has found that career identity is a strong predictor both of the employment status (being employed) and job quality (measured in terms of indicators like horizontal and vertical fit, among others). However, it is expected that career identity has an impact that goes beyond job quality by having an impact both on wellbeing at work (job satisfaction) and general wellbeing (life satisfaction). In addition, career identity it is expected to be an even more important antecedent of job quality and wellbeing during critical situations like the coronavirus pandemic.

Therefore, the general hypothesis was that career identity has an indirect effect on life satisfaction via higher perceptions of job quality, job meaningfulness and job satisfaction.

Design/Methodology/Approach/Intervention

The hypotheses have been tested by means of a longitudinal design with several measurement points that started before the appearance of COVID-19 crisis and continuing through the pandemic. The study sample comprises 125 Spanish subjects with different educational backgrounds who were working at all measurement points (5). The mediation chain was tested using the Process macro for SPSS.

Results obtained or expected (if not available, it must be made clear when they will be)

The preliminary results show a significant indirect effect of career identity (t1) on life satisfaction (t5) via the general perception of job quality (t2), and the job meaningfulness (t3). The indirect effect through job satisfaction was not significant. More detailed results will be available for the oral presentation.

Limitations

The main limitation of the study was the sample size of subject working at all measurement points. In addition, all measures were self-reported.

Conclusions – research and or practical implications/Originality/Value

Career identity is an employability dimension that shows an important role in the prediction of job quality and wellbeing outside the work domain. This role remains important even during the pandemic when job quality and wellbeing were seriously damaged because of the lockdowns, health issues, job insecurity among others. Therefore, the results have important practical implications due to the need of developing workers' career identity for enabling them to find and perform high quality jobs and experiencing a higher wellbeing.

Relevance to the Congress Theme

The world of work is changing because of many factors like health and economic crisis, technological developments, environmental issues, among others. These factors could have negative consequences for the quality of the jobs many workers perform and for their wellbeing. Therefore, the present study is relevant to the Congress Theme due to its focus on career identity as a key driver of job quality and wellbeing.

Keywords: Career identity, job quality, wellbeing

Oral presentation OP126

Caring for Carers: A pilot study helping to cope with the emotional distress produced by daily work in a Spanish Public Hospital

Sabina Sales-Reid & Ruth Maria Marton Sobredo | Hospital Universitari Son Espases

science&practice

The activity in a large tertiary hospital is highly demanding, intensive, complex, and sometimes emotionally overwhelming. This situation could facilitate the development of Burnout (Maslach & Shaufeli, 2001). Burnout is associated with less work satisfaction and less empathy with peers and patients.

RESEARCH GOALS

To develop and consolidate a line of research that allows the generation of tools for teams that help them prevent and manage the work situations that cause distress and are emotionally overwhelming in their day-to-day.

To monitor the impact of tools used on the professional's well-being.

To analyze what are the organizational and psychological processes that impact burnout.

THEORETICAL BACKGROUND

According to the Job Demands-Resources Model (Demerouti, Bakker, Nachreiner & Shaufeli, 2001), work overload, emotional job demands, physical job demands, and work-home conflict are all risk factors for burnout (especially exhaustion and cynicism). However, the undesirable impact of job demands on burnout can be lightened by job resources such as job autonomy, social support, and quality of the relationship with the supervisor, and performance feedback.

This model was modified and expanded (Bakker & Demerouti, 2017), by including the role of the individual in modifying the impact of job demands and resources on motivation and energy, in the form of personal resources, job crafting, and self-undermining.

HYPOTHESIS

Increasing the job resources of health professionals could translate into a better employee experience by increasing empathy and social support intra-team, reducing burnout, and increasing team resilience. All this could impact the professional's well-being and patients.

We work on increasing job resources by exposing them to:

Dynamics that allows them the emotionally release patients' situations with high-stress level.

Workshops to develop intrapersonal and interpersonal skills.

Team coaching dynamics.

Psychological safety environments.

DESIGN / METHOD / INTERVENTION

The sample for this pilot study consists of 7 teams belonging to a large Tertiary Public Hospital with more than 5.500 health workers, 757 beds, more than 24.000 surgical interventions, and 157.000 medical year emergencies.

Participating work teams were identified among those experiencing a lot of stress daily. We engaged seven high-complexity teams in our interventions, some were interdisciplinary teams, and others were physician teams, nurse teams, or service teams.

The design was a mixed-method evaluation using:

Quantitative analysis with data collected twice, pre- and during-intervention.

Qualitative analysis is based on feedback provided by participants.

Instruments : Stress (VEDAS), burnout (reduced MBI), engagement (UWES), and resilience (Safety Organizing Scale) through online validated questionnaires.

Intervention:

We offered psychological safety spaces within working hours to do:

Dynamics that allow them the emotionally release patients' situations with high stress-level. We implemented a "Team Support Tool" to improve the team's emotional management. This intervention is a guided talk technique adapted from Mitchell (1983).

Workshops to develop intrapersonal and interpersonal skills.

Team coaching dynamics.

We want the intervention to be maintained over time, for those teams that need it.

RESULTS:

Qualitative: Having a program to cope with the emotional distress produced by daily work is highly valued by the participants. Part of the success is adapting the program to the needs that arise in the teams. Promoting tools to better fit the team's needs, like team coaching or soft skills development.

Quantitative : Preliminary pre-post data comparison shows that it is a useful tool to improve job resources, and we observe a tendency to increase the resilience of the team.

LIMITATIONS:

- We have difficulties reaching all the groups that need to use the program due to their complex work organization.

- We don't have a control group, because this project arises as a practice of Employee Experience.

VALUE:

The Value of this study is to develop a tool for hospital professional teams, which allows them to increase their job resources and better cope with burnout and distress at work. We hope that using that support teams also allows:

Increase team resilience

Help recover distress

Improve soft- skills

Increase team cohesion

Increase intra-group empathy

CONCLUSIONS:

Implementing and assessing methods to increase the job resources of healthcare workers have an impact on health professionals and their patients.

A well-being program can be an instrument that enables: improving employee experience, building sustainability, and impacting the community as a part of the Hospital's Social Responsibility.

RELEVANT UN SDGS:

The UN established 17 goals to transform our world and increase our sustainability. Working to prevent burnout in a Public Hospital and its consequences for professionals and patients should be mandatory for Institutions as it promotes good health and well-being.

Keywords: Employee Experience, Resilience, Psychological safety

Oral presentation OP6

Case studies on the impact of the corona crisis on firm specific transformation processes - healthcare industry and retail trade

Alexandra Shajek & Anne Busch-Heizmann | Institute for Innovation and Technology

science

Companies and institutions are facing profound changes and transformations, especially as a result of digital and technological change in the world of work. The corona pandemic, starting in spring 2020, will continue to change our working life. In this context, several open questions occur for research in organizational psychology: In particular, we are interested in the resources and obstacles within firms that help or hinder them getting through this crisis – and even probably make use of the crisis as a winner. We assume that some firms are more resilient than others and better able to make use of this crisis – also concerning the success of their transformation processes.

We draw on academic approaches on "firm resilience" (Bhamra 2016) and "innovative ability" (Trantow/Hees/Jeschke 2011). In those approaches it is assumed that firms differ in their characteristics and resources that can be activated for a transformation process or a crisis. Individual skills and social competences, organizational structures that promote flexible and autonomous work, and external networks that offer knowledge and social capital, are part of those resources. These types of capital are usually reflected in a corresponding organizational culture, which is characterized by positive dynamics, flat hierarchies, lateral leadership, openness and the promotion of individual skills and personal responsibility. Our theoretical goal is to find out the degree to which those factors affect (1) the success of transformation processes, (2), the firm's resilience within the crisis, and (3), the effect of the pandemic on firms' transformation processes.

To answer our research questions, we follow a qualitative case study approach focusing on 20 firms from different branches in Germany. For each case, qualitative guideline-based interviews were realized with one person from the employer side and one from the employee side, respectively. Using a longitudinal perspective, every interviewee was interviewed twice (December 2020 to February 2021 and April/May 2021). The focus on the interviews was on the topics firm specific characteristics and resources, e.g., competences, the degree of digitalization, participation structures, but also differences in home office practices, that are helpful within both the transformation and the crisis. Two economic sectors that are affected particularly by the crisis will be considered here: the healthcare industry and the retail trade.

The results show several digitalization transformation processes within the observed firms before the pandemic started. In all cases, resources were activated that are helpful for innovation processes: i.e., competences, (self-)organizational structures and external networks. The pandemic strengthened, but also weakened the transformation processes in several aspects. The interviewees evaluate the measures taken to adapt to the pandemic as useful; broad professional and social competences of the staff could be activated during the crisis. The study also shows the many ambivalences associated with working from home.

The research doesn't give representative results and it would be interesting to analyze to what extent these qualitative results are representative for the majority of companies in crisis. Given the lack of research on the impact of the crisis on our changing working life, however, the study helps to specify the conditions under which firms can successfully manage the crisis as well as less fundamental transformation processes. The study is also one of the few that traces the experience of the crisis in the companies in a longitudinal perspective.

Keywords: innovation, organizational structure, management of change

Oral presentation OP212

Changes in employees' perceived fairness at work: How transformational leadership affects the relation between fairness change, commitment and stress

Joshua Ewers & Sabrina Krys | Christian-Albrechts-University Kiel

science

Research goals

The aim of this longitudinal study was to examine whether changes in employees' perception of organizational fairness are related to affective organizational commitment and work-related stress. In addition, we aimed to examine whether transformational leadership moderates these relationships. Our study highlights the impact of changes in organizational fairness on employees' commitment and stress incremental to static levels of fairness.

Theoretical Background

Previous research indicates that organizational fairness affects employees' affective organizational commitment and work-related stress, which are both related to performance measures of organizations. Interestingly, recent research suggests that not only the absolute static level of organizational fairness but also the change in fairness between two points in time might affect employees' commitment and stress (Xu et al., 2021).

One explanation might be that a positive change in organizational fairness might lead to a convergence towards the target state of "maximum fairness". In this state, employees see themselves as a valued part of the organization. To maintain this state, they should show emotional attachment to the organization (cybernetic model of self-regulation (CMS); Carver & Scheier, 1998; Tyler & Blader, 2003).

Furthermore, Hobfoll (1998) assumes in his COR theory that resource losses are one of the main reasons for stress generation. Accordingly, a negative change in organizational fairness might represent a loss of resources. Consistent with the CMS, the unmet basic need for fairness should thus be related to an increased sense of stress.

Finally, to examine the moderating role of transformational leadership it might be helpful to identify a leadership behavior that is capable of enhancing the positive effects and mitigating the negative effects of changes in organizational fairness. On the one hand, we argue that because the supervisor acts as a role model in the context of transformational leadership (Kaya & Karatepe, 2020), the corresponding attitudes of the supervisor towards the organization are adapted. Accordingly, employees should show increased commitment if this is exemplified by their supervisor. On the other hand, we argue that employees' scope for action is expanded in the context of transformational leadership (Syed, 2018). This should lead to employees feeling empowered to make the organization comply with the rules of fairness. According to COR theory, this represents a resource against the development of stress. Through this additional resource, perceived stress should be reduced.

Method and Design

We collected data at two time points, two weeks apart. At the first time point, demographic data and organizational fairness were assessed. At the second time point, organizational fairness, affective

organizational commitment, work-related stress, and transformational leadership were assessed. Change in organizational fairness was determined using a latent change score model.

Results

89 complete and 98 incomplete data sets were obtained. Missing values were imputed using a random forest-based method. Two structural equation models were used to test our hypotheses. Controlling for organizational fairness at the first measurement point, positive change in organizational fairness was related to higher affective organizational commitment and lower work-related stress. The relationship between organizational fairness change and affective organizational commitment was moderated by transformational leadership. However, transformational leadership did not moderate the relationship between change in organizational fairness and work-related stress.

Limitations

The first limitation refers to the high number of incomplete data sets. In addition, data were collected at only two points in time. This has the disadvantage that the change in organizational fairness cannot be accurately assessed because changes in fairness that may have occurred between the two measurement points could not be detected.

Conclusion

Our results highlight the unique effect of fairness change incremental to static fairness levels on employees' commitment and stress. From a practical perspective, organizations should be aware that employees are sensitive to fairness changes and that these changes can have far-reaching consequences. One factor that plays an important role is transformational leadership, which can amplify the positive effects of change in organizational fairness. One conclusion could be that leadership trainings should focus particularly on teaching „idealized influence" and „inspirational motivation" as these overlap with characteristics of organizational fairness.

Relevance to the congress theme

The present work highlights the importance of capturing changes in employees' perceptions that go beyond static levels. These changes can affect cognitive, emotional, and behavioral outcomes, which might have far-reaching consequences for the organization.

Keywords: fairness change, transformational leadership, self-regulation

Oral presentation OP259

Chatbot-supported coaching in organizations: A field study

Gil Bozer, Sapir Academic College, Israel; Raija Salomaa, RaiConsulting Ltd., Finland; Silja Kotte, University of Applied Sciences Aschaffenburg, Germany

science&practice

Research goals and relevance of the study

The VUCA world has transformed the landscape of work and has emphasized continuous learning and development for individuals and organizations. In this context, workplace coaching as a reflective, goal-focused, customized learning and development intervention between an employee and a professional coach has become an increasingly important HRD practice. Coaching has taken on new forms during the pandemic, often digitally mediated. It has also begun to be supported by artificial intelligence (AI), particularly chatbot-supported coaching (CSC). Empirical research on CSC is only emerging, and little is known about its implementation within organizations: Why and how do organizations use CSC instead of or alongside human-led coaching? Our goal is to empirically investigate why and how CSC works. Specifically, we explore the aims, outcomes, challenges, and success factors of CSC in organizations from multiple key stakeholders' perspectives.

Theoretical background

By now, strong empirical evidence in meta-analyses and systematic literature reviews demonstrates the overall effectiveness of workplace coaching. Consequently, research attention has shifted towards investigating the coaching process , addressing the organizational context and moving beyond a generic conceptualization of workplace coaching towards investigating the particularities of specific coaching settings, target groups, and modalities. As part of the substantial changes that coaching practice has undergone, there has been an emerging interest to move beyond human-led coaching toward the application of AI in coaching, particularly in the form of chatbots. While it seems unlikely that AI will completely replace human coaches in the foreseeable future (‘general’ or ‘strong’ AI), ‘narrow’ or ‘weak’ AI, i.e., the fulfillment of specific tasks, plays already an important role in many contexts (e.g., customer service, healthcare, psychotherapy), and will inevitably play an increasingly prominent role in coaching in the future. AI coaching has the potential of lowering barriers to entry and expanding workplace coaching to a wider range of employees and organizations. Thereby, coaching is more easily scalable and its effect on the organization at large can be strengthened. To date, however, research on AI in coaching has been primarily conceptual and has failed to incorporate the organizational context. Therefore, an evidence-based understanding of chatbots' role in coaching, as well as relevant boundary conditions is essential. Of particular interest are CSC's peculiarities with respect to outcomes, processes, and contextual factors, as well as the overlooked organizational perspective on opportunities and challenges.

Design/ methodology/ approach/ intervention

In collaboration with a Finnish start-up providing hybrid human-led/CSC and fully CSC, we investigated CSC within its’ client organizations internationally. We used a qualitative design to explore the perspectives of key stakeholders on CSC implementation opportunities and challenges. We conducted semi-structured interviews with representatives from the commissioning organization (HR, pre-post coaching), project managers from the start-up (pre-post), coachees (post), and human coaches in hybrid coaching cases (post). We interviewed 34 stakeholders from five global client organizations in technology, construction, manufacturing, and engineering. Between 6 and 30

coachees per organization participated in up to 30 coaching sessions over a period of 4 to 52 weeks. Interviews are transcribed and will be analyzed using Qualitative Content Analysis.

Results expected and implications

Data collection will be completed in November 2022, followed by data analysis so that results will be available for the EAWOP congress. We expect to identify key challenges and opportunities of CSC across different organizations and from the perspective of different stakeholders. Thereby, the peculiarities of CSC in organizations will be identified and implications for CSC future research and practice will be deduced.

Limitations

While we shed light on the contextual embeddedness of CSC and its perceptions by different stakeholders, control-group intervention studies are required in the future to thoroughly assess CSC's effectiveness in an organizational context.

Relevance to the congress theme and the UN SDGs

Our study focuses explicitly on the congress theme's focus on the changing world of work. Specifically, it is relevant to how workplace coaching can help people navigate the changing workplace and how AI can shape coaching practice. Our research contributes to the UN 2030 sustainable development goals by advancing the science and practice of digital and AI coaching as a means of supporting lifelong learning and assisting employees in acquiring the knowledge and skills necessary to take advantage of growth opportunities, increase productivity, and ultimately promote economic growth.

Keywords: Chatbot coaching, Artificial intelligence (AI) coaching, human resource development

Oral presentation OP714

Clusters of work contexts and personal factors predicting employee health outcomes

Abigail Bailey, Nina Kupper, Renee de Reuver & Dorien Kooij | Tilburg University

science

Personal, job, and organizational factors in the workplace have been associated with stress and employee health outcomes, but it is still unclear how they cluster. By predicting groups of workers who may be vulnerable to chronic stress, and how we can tailor interventions to fit employee needs, we can protect individuals better during changing environments.

Previous research has found that risk factors for employee health cluster together. A cluster characterized by depressive symptoms, neuroticism, and stress, was related to heart disease, compared to the cluster characterized by social engagement, spirituality, and extraversion (Clark et al., 2012). One study found four clusters of job demands (high demands, low demands, psychosocial demands, physical demands), each related to different physical health clusters (Mayerl et al., 2017). Although no protective effect was found for singular work resources on heart disease development, clusters of resources did present a protective effect (Xu et al., 2022). Specifically, clusters of leader-, organizational-, and team-level resources were associated with a lower risk of heart disease. It appears that work factors cluster together, and this underlying latent variable is a better predictor of health outcomes than individual factors. However, a comprehensive integration of all risk factors has not yet been researched.

The conservation of resources theory states that individuals have an innate drive to obtain and protect resources needed for meeting demands. Chronic stressors deplete resources, thereby impairing one's ability to cope with demands, whereas workers with high resources are likely to obtain further resources and cope better with demands. Additionally, the biopsychosocial model states the interaction of biological, personal, and social factors as perpetuating the development of poor health. Therefore, the current paper aims to examine whether latent multidimensional risk profiles of personal and work-related factors could be identified. We will also examine whether these profiles are associated with stress and stress-related health outcomes.

Questionnaire and biological data in a 3-lagged research design (3-month intervals), were collected by a vitality consultancy company. The questionnaire (currently N = 2032 participants in 17 organizations) will be used to explore how work and personal factors (lag 1) cluster amongst employees, using three-step latent tree analyses. The questionnaire includes work factors, such as social support, perceived work practices, and contract type. Personal factors include optimism, resilience, and proactive behavior.

To be able to identify the risk profiles as predictors of stress-related health problems, biological data is collected within one company (N = 300). We will investigate whether the clusters from lag 1 affect behavioral (lifestyle) and biological (cortisol profile, heart rate variability) mechanistic processes (lag 2). We will then examine whether the clusters can explain employee psychological (emotional exhaustion) and physical (disease presence) health (lag 3).

Data collection is currently in progress, expected to end in December 2022. We will run explorative analyses to identify classes in January 2023, with the prediction of health outcomes available by February 2023.

A limitation is that a smaller sample is used to predict biological measures. Although this will provide insight into the predictive effects of the clusters, the generalisability of the findings will be limited compared to the larger population utilized for the latent class analysis.

Finding groups of employees who share comparable features and are exposed to comparable work contexts will allow the identification of groups who present a higher risk of chronic stress. This will contribute to the development of tailored preventative interventions in the workplace.

With huge shifts within and outside of the workplace, the world of work is rapidly changing. In line with the congress theme and the SDG target 3.4, it is crucial to understand how the workplace may contribute to the development of stress-related non-communicable diseases.

Keywords: Stress and burnout, coping and social support, optimism and self-confidence

Oral presentation OP540

Coaching for small business owners and their spouses: Exploring the diversity of actions to craft work-life balance as a success factor

Romana Dreyer, Jasper Ohlig & Christine Busch | University of Hamburg

science&practice

Research goals

Coaching is an intensive and systematic promotion of result-oriented self-reflection to improve the achievement of self-congruent goals. Identifying well-functioning strategies as well as developing behavioral intentions are essential for coaching success. In this present study, we examine already demonstrated and newly planned behaviors as drivers for coaching success. We take a closer look at the content and developed solutions in a highly effective work-life balance (WLB) coaching for small business owners and their spouses. They often co-work with their spouses and are an extremely vulnerable target group when it comes to WLB because their work-life boundaries are blurred, and they find it difficult to psychologically detach from work.

Theoretical background

Successful pursuit of a goal is a continuous process through the four successive action phases of the Rubicon model (Heckhausen & Gollwitzer, 1987). This study focuses on the second and fourth phases as those create a feedback loop between already demonstrated and newly planned behaviors (Gollwitzer, 1990). The second phase (pre-actional) entails planning concrete strategies for achieving a goal. The technique of implementation intentions has been found to facilitate goal attainment. In the fourth phase (post-actional), an evaluation of the achieved outcomes may inform new action planning.

To conceptualize the already demonstrated behaviors and newly set intentions, we apply the WLB crafting concept (Sturges, 2012). WLB crafting is defined as proactive, goal-oriented, and therefore intentional, behavior that aims to enhance WLB. WLB crafting behaviors may emerge in patterns and create synergies, for example, the cognitive adjustment of prioritizing the need for switching off from work may facilitate the formation of a corresponding physical action (e.g., turning off the phone after work). In the present study, we expect clients who report a more diverse set of (a) already demonstrated WLB crafting and (b) WLB crafting intentions to show higher general and specific coaching outcomes. Further, studies suggest that plan enactment is higher in dyadic than in individual planners (Keller et al., 2017), thus, we investigate the role of the partner's supportive crafting.

Methodology

In total, 15 couple coaching sessions were observed, therefore, 30 individuals are in our sample. The mean age was 52 years, the participants were married for 18 years on average and around 13 people were employed in their small businesses.

The course of action entails (1) qualitatively identifying reported WLB crafting and the intentions to craft during the coaching and (2) quantifying those strategies (amount and diversity). The fourth (out of five) coaching session of the couple coaching was transcribed and rated. In this session, the coach asks the clients to reflect on already shown behavior changes towards a more satisfying WLB (post-actional phase). Next, the coach guides the clients to develop implementation intentions that help them to further enhance their WLB (pre-actional phase).

Transcripts were deductively coded with an adapted rating system based on qualitative research on WLB crafting (Sturges, 2012). The categories include physical, cognitive, and relational crafting.

The general coaching outcomes were self-rated goal attainment and coaching satisfaction (Runde, 2003, 2016) four months after the coaching ceased. As a specific outcome measure, we used the change in clients' WLB scores (Syrek et al., 2011) from the pretest to the test four months after the coaching ceased. Regression analyses will be performed to test the impact on general and specific coaching outcomes.

Results

We are currently in the coding process. Therefore, unfortunately, no reliable results can be reported at this stage. The results will be available in January.

Limitations

Limitations include the sample's homogeneity, the small sample size, and the dependent data.

Conclusions

The study offers a unique insight into a coaching for small business owners and investigates coaching success factors. Researching coaching processes is in high demand to make coaching more efficient as coaching is time and money-consuming. Business owners are often difficult to reach for health-promoting interventions, therefore such an investigation is critical to advance effective evidence-based interventions built on clearly defined drivers for change. Further, we contribute to the growing body of literature that highlights the social embeddedness of the creation process of WLB. This encompasses the interdependence within a person's WLB crafting and the interdependence between the partner's actions. Ultimately, the results may help coaches to guide their clients toward more effective action planning.

Keywords: Coaching, Small business owners, Work-life balance crafting

Oral presentation OP803

Coactive Coping Inventory (EAC): Development and validation for the Chilean population

Javier Barria, University of Oviedo

science&practice

Objectives: In this framework, the main objective of this study is to develop a more accurate measurement instrument to diagnose coping strategies in the Chilean work context and to integrate it into the CALS battery for the evaluation of Subjective Work Climate. To this end, the psychometric properties of the new measurement instrument will be studied in relation to its internal structure, reliability, and evidence of validity in relation to other variables. Finally, the variables that make up coactive coping will be examined to help predict work-related burnout (emotional exhaustion, affective hardening, and personal fulfilment) and symptomatology (psychological and somatic).

Theoretical background: Co-active Coping (CA) is a fundamental construct in work and organizational settings, as it allows the exploration of individual and group behaviors within organizations. Thus, Co-active Coping accounts for the similar individual coping strategies that workers employ to cope with stressors, making it an organizational phenomenon. The aim of the present study was to develop a new scale called the Co-active Coping Subjective Work Environment Scale (EAC-ALS) in the Chilean context.

Design/Methodology/Approach/Intervention: The sample consisted of 1,442 workers with an average age of 30.48 years (SD = 11.13). 55% were public sector workers, 34.5% were workers in private commercial organizations and 10.5% were in private non- profit organizations.

Results obtained or expected: Based on the exploratory and confirmatory approach, the Coactive Coping Inventory showed a good fit to a structure of five correlated factors (Reflective Action, Rational Action, Seeking Spiritual Support, Seeking Affective Support and Avoidance), demonstrating measurement invariance in terms of gender and type of organization. The different domains of coactive coping explain between 20% (emotional exhaustion) and 41% (affective hardening) of occupational burnout and about 3- 5% of workers' symptomatology, with Reflective Action being the most important variable. These results indicate that the new scale has adequate psychometric properties; it can assess coping strategies in the Chilean organizational context in a reliable and valid way. These coping strategies have shown some importance in relation to organizational and clinical variables.

Limitations : Regarding the dimensionality of the instrument, the results account for a multidimensional structure leading to a set of scales or score profiles to the detriment of a unidimensional solution, which would allow proposing the construction of a global score.

Practical implications of the research: The results suggest that in the face of collective stressors (organizational culture and climate according to the ALS model), organizations should promote problem- focused collective coping strategies, such as people development through training, participative management, effective task coordination and seeking affective support among co-workers, to reduce stressful work climate and individual stress. In other words, coping resources at the organizational level should focus specifically on the organization, design, and management of work. Furthermore, the leader's position of power within this organizational management influences coping strategies for the performance and well-being of co-workers and is relevant for strengthening leadership styles and the quality of leader- member exchange. The new EAC tool is a good starting point for assessing people's coping styles in relation to the stressors in their organization and can

lead to identifying areas for improvement in order to develop training workshops in these competencies, which should also improve the organizational climate of the company.

Relevance to the conference theme: This study presents a new instrument (Coactive Coping Inventory; EAC) to assess coactive coping in the Chilean general population, providing satisfactory psychometric properties. The appropriate use of personal resources, such as coping strategies, can reduce work demands and the associated physiological and psychological costs, being decisive in meeting work objectives or in stimulating growth, learning and personal development. In this same sense and given the scarcity of studies in this area in Chile, studies are required that contribute to the knowledge of the quality of life and working conditions of workers, which would allow the impact of human resource management strategies in organizations to be evaluated. On the other hand, it would be interesting to carry out organizational diagnoses using the EAC, and in this way improve the effectiveness of current interventions for burnout at work, influencing preventive programs and adjusting them to the specific characteristics of coping strategies to manage stress at work.

Keywords: Coping; psychometric properties; assessment; occupational burnout; symptomatology

Oral presentation OP561

Cognitive job demands: the relation of their frequency and appraisals to self-reported stress in the field of education

Virpi Kalakoski, Teemu Paajanen, Teppo Valtonen, Suvi Ahtinen & Heidi Lahti | Finnish Institute of Occupational Health

science&practice

Research goals

Digitalization and intensification of work have led to pronounced cognitive demands in many fields of work. For example, requirements for attention, remembering, and flexible thinking can be intense. Nevertheless, few studies so far have focused on which specific cognitive demands are the most prominent, which ones are harmful, and which ones may conversely promote well-being at work. Our goal was to recognize those cognitive task and condition demands, in the field of education, that are prone to lead to chronic stress, and should thus be the focus of work environment risk factor assessments and stress management strategies in everyday work life.

Theoretical background

The Challenge–Hindrance Stress Model (CHM) and its latest refinements suggest that job demands can result in both negative and positive outcomes, depending on how they are experienced by the individual. Demands that are appraised as negative hindrances prevent employees from performing their job well, whereas demands that are positively appraised as challenges can produce positive feelings and outcomes. Previous research has not yet provided a comprehensive picture of the role of various cognitive job characteristics as hindrance or challenge demands. In our study, we studied occurrence of various cognitive demands. The main research question was whether the appraisal of 14 specific cognitive demands as a strenuous hindrance stressor or as an engaging challenge stressor mediates the relation between its frequency and the level of self-reported general stress.

Methodology

The cross-sectional survey data were gathered in 2020–2022 from 1507 participants working in various roles and organizations in many fields and settings of education. There were 39 cognitive demand (CD) items that were structured into 14 subdimensions of cognitive work, reflecting Basic cognitive demands (Language, Visuo-spatial, Visuo-Motor, Attention), Cognitive task demands (Remembering, Learning, Planning, Flexible Thinking, Teamwork, Participating), and Cognitive condition demands (Multiple Tasks, Time Pressure, Unclear Instructions, Distractors). Scores were calculated for the frequency of each of the 14 cognitive subdimensions and for the individual-level appraisal of the subdimensions as energizing/engaging (challenges) and straining (hindrances). A single-item measure of stress was included. The main research question was studied using 14 one-factor mediation models, each of which had CD Frequency as the independent variable, the associated CD Strain appraisal as the mediator, and Stress as the dependent variable.

Results

The results showed that basic cognitive demands and cognitive task demands at work were appraised as both hindrances and challenges. However, cognitive condition demands regarding multiple tasks, unclear instructions, distractors, and time pressure were mainly experienced as strenuous. The mediation models showed, first, that most relations between CD Frequency and the related CD Strain (Path a) were statistically significant: the higher the frequency of a specific cognitive

demand subdimension, the higher the level of appraised strain. Second, most CD Frequencies were related to Stress (Path c): the higher the frequency, the higher the level of stress. Third, most CD Strain were related to Stress (Path b): the higher the appraised strain, the higher the level of general stress. Moreover, the results indicated a partial mediation effect, especially for CD subdimensions of Attention, Flexible thinking, and Unclear instructions. That is, the frequencies of these cognitive demands were related to the level of general stress both directly and indirectly through the level of appraised strain. In contrast, the sizes of the estimated mediation effects regarding challenge appraisals were negligible.

Limitations

The main limitations of our study were related to the nature of the data. The study design was cross-sectional and the dataset was not representative in regard to work roles or educational setting in the field of education. Future studies with longitudinal or experimental data should validate the mediating role of appraisal in the relation between CD frequencies and stress.

Conclusions

Cognitive condition demands, such as multiple tasks, unclear instructions, and distractors are significant contributors to the self-reported general level of stress. Importantly, it is not only whether the demands are experienced negatively but also their frequency that underlies stress. Therefore, it is essential to develop work practices and conditions that control the occurrence of cognitively strenuous conditions at work.

Relevance to the Congress Theme

Cognitive factors at work are pronounced in the changing world of work. Our results indicate that the future of cognitively intense work is now, and cognitively strenuous conditions lead to harmful consequences.

Keywords: job demands, cognitive, stress

Oral presentation OP458

Cold but competent: The paradoxical effects of solitude expression on social reputation at work

Hodar Lam, University of Amsterdam; Maral Darouei, Vrije Universiteit Amsterdam; Dongning Ren, Emory University; Julian Jonathan Markus, WU Vienna

science

When someone says "I enjoy working alone", what would you think about this person? A recent study showed that university students judge a peer who expresses a preference for solitude – the experience of being alone without in-person or virtual interactions (Long et al., 2003), would be rated as more competent or agentic, but less warm or communal (Ren & Evans, 2021).

With increasing remote work arrangements, it is important to test if the above finding applies in employee contexts for three reasons. First, remote work may trigger a sense of disconnection and ironically lead to a stronger preference for solitude (Ren et al., 2021). Second, the effect of solitude expression on social reputation may be more salient in virtual interactions (Pillemer & Rothbard, 2018), due to limited social cues in online settings. Third, employee reputation is consequential. The social evaluation of employee agency and communality has implications for how employees are perceived, for instance in terms of their leadership capability and productivity (Koenig et al., 2011).

Drawing on signalling theory (Connelly et al. , 2011), we argue that the expression of a preference for solitude (high vs. low), would result in social evaluations of low communality, but high agency (Fiske et al., 2007). In remote work contexts, employees would use the expression of enjoying working alone as signals to infer behaviour and competence that are difficult to observe. We also explore if gender moderates the main effects, as previous results on social evaluations across gender are often inconsistent (Bowker et al., 2020; Coplan et al., 2019). Moreover, we test if solitude expression affects perceived productivity and leadership potential, as mediated by social evaluations.

Method

To test our hypotheses, we conducted three online experiments. We manipulated solitude expression by asking participants to read and form an impression of a fictional employee response to a survey about their solitude preference in remote work contexts (Ren & Evans, 2021). In Study 1 (pre-registered), we tested the main effects of (high vs. low) solitude expression on social evaluations. A total of 269 working employees were recruited via Bachelor students in a Dutch university. In Studies 2 and 3, we manipulated profile gender by specifying the name of the employees (Study 2: Greg/Emily; Study 3 [pre-registered]: George/Emily). Employees in the United Kingdom were recruited via Prolific for both studies, giving us final samples of 201 and 550 employees, respectively.

After reading the profiles, participants filled in questions about social evaluation (agency and communality) (Heilman & Okimoto, 2007), perceived productivity (Lerner et al., 2001) and leadership potential (Sczesny & Kühnen, 2004).

Results

Across three studies, we found support for the main effects of solitude expression: participants rated profiles expressing high solitude as more agentic (mean d = 0.50) and less communal (mean d = -0.85) than those expressing low solitude. We also found an interaction effect of gender on communality (mean η^2 = .19) and agency (mean η^2 =.06). Only in the condition of high solitude expression, female profiles are rated as more competent, and male profiles are rated as colder.

Moreover, high solitude expression led to higher productivity (d = 0.68), but lower leadership potential (d = -0.20), and these effects are mediated by agency and communality evaluations.

Limitations

First, there may be concerns about the realism and external validity of our profile manipulation of solitude expression. Future research may consider manipulating with simulated audio conversations. Second, we have yet to establish the causality between social evaluations and work reputations. Nevertheless, prior studies revealed that social evaluations would lead to individual reactions in societal contexts (Fiske et al., 2007).

Implications

Our study contributes to the literature in two ways. First, we contribute to signalling theory by showing that employees who prefer solitude are subject to evaluation biases in performance appraisals and (leadership) selection in organisations. Second, this study introduces solitude as a double-edged sword to the emerging literature of disconnectedness at work, including topics of loneliness, isolation, and ostracism. In particular, we shift the lens from an intrapsychic experience to the other reactions upon expressing disconnectedness.

Research Relevance

In our research, we found that the expression of solitude in remote work may be a double-edged sword at work. We believe our findings invite EAWOP participants to reflect on how remote work experience affects employees' social reputations, as more organisations are implementing remote work arrangements.

This research primarily addresses UN SDG 8: Decent work and economic growth and SDG3: Good health and well-being.

Keywords: Solitude, social evaluation, remote work

Oral presentation OP270

Comparative analysis of the mental states of different professional and social groups in Ukraine in the conditions of war

Kira Tereshchenko, Oleksandr Kovalchuk & Valentyna Lagodzinska | G.S. Kostiuk Institute of Psychology of the National Academy of Educational Sciences of Ukraine

science

Research goal and why the work was worth doing. The Russian-Ukrainian war has a significant impact on the mental health and well-being of the Ukrainian population. Acute and/or chronic stress caused by the war can be accompanied by negative mental states, such as depression, apathy, anxiety, aggressiveness, irritability, etc.

Research goal: to carry out a comparative analysis of negative mental states (anxiety, frustration, aggressiveness and rigidity) among various professional and social groups in Ukraine in the conditions of war.

Theoretical background . We used the approaches concerned the general characteristics and types of mental states (Bulgarelli, Henning, & Molina, 2017; Eysenck, 1967; Topolov, 2011). We also considered works related to the impact of traumatic events of war on mental health and well-being of the individual (Betancourt, 2020; Frey, 2012; Sagi-Schwartz, 2008).

Design . The study was conducted in May 2022. The sample was made up of 344 respondents from the Central region of Ukraine (the cities of Kyiv and Dnipro and Kyiv region), including 80.8% females and 19.2% males of average age M = 39.1, SD = 15.8, of which 58.1% were single and 41.9% were married. 29.9% of the respondents were in business, 24.7% in education and science, 13.4% in health care, 8.2% in civil service, and 23.8% were unemployed. 62.5% of the respondents during the war didn't move to a safer place, 20.9% moved to a safer place in Ukraine, and 16.6% moved to a safer place abroad.

To analyze the respondents' negative mental states, H.J. Eysenck Self-assessment of mental states was used. The data related to the respondents' professional, socio-demographic characteristics as well as the characteristics of their location during the war were collected using a questionnaire specially developed by the authors. The data were collected through Google form.

Results. The sample as a whole had the negative mental state indicators at the average level: anxiety (M = 47.48, SD = 11.16), frustration (M = 43.80, SD = 13.34), aggressiveness (M = 46.73, SD = 10.11), rigidity (M = 48.50, SD = 9.99) with rigidity having the highest and frustration the lowest values.

There were statistically significant differences in the levels of anxiety and aggressiveness between the respondents of different professions. The highest level of anxiety was found among the unemployed, civil servants and businessmen, while the lowest level among educators and scientists ($F = 3.06$, $p < 0.05$). The highest level of aggressiveness was found among health care workers and the unemployed, while the lowest among educators and scientists ($F = 2.40$, $p < 0.05$).

It was found that women had higher anxiety ($F = 20.33$, $p < 0.001$) and frustration ($F = 26.80$, $p < 0.001$) than men.

Besides, unmarried respondents (those who have never been married or have divorced) had anxiety ($F = 4.05$, $p < 0.05$) and rigidity ($F = 5.67$, $p < 0.05$) indicators higher than married respondents.

The respondents who moved to a safer place abroad had higher anxiety scores ($F = 3.37$, $p < 0.05$) than those who didn't move or moved to a safer place in Ukraine. At the same time, those who moved to a safer place in Ukraine had higher aggressiveness than those who didn't move or moved to a safer place abroad ($F = 2.85$, $p < 0.05$).

Those who stayed in the hostilities zone, had higher aggressiveness ($F = 5.11$, $p < 0.01$) and rigidity ($F = 3.19$, $p<0.05$) than those who were in a more peaceful or occupied territory.

Limitations. Since the sample consisted of the residents of the Central Ukraine, which is more socially stable compared to other regions, the sample cannot be considered a representative of the entire population of Ukraine.

Conclusions/Originality/Value. It was established that the population groups most susceptible to negative mental states were the unemployed, civil servants, entrepreneurs, women, single people, individuals from the hostilities zone, as well as refugees. The conducted research deepens the understanding of the mental states of various population groups during the war. The knowledge of the most vulnerable professional and social groups provides the basis for the creation of psychological support groups and interventions aimed at improving population's mental health during the war.

Relevance to the Congress Theme. The study is within the 'Mental health' sub-theme of the Congress 'Well-being' theme (item 18).

Relevant UN SDGs. The research findings can contribute to the promotion of mental health of various professional and social categories during the war, which meets the UN Sustainable Development Goal 'Good health and well-being'

Keywords: Mental states, professional group, social group

Oral presentation OP370

Compassion at Work: Process Evaluation of an Online Intervention in a Spanish SME

Mabel San Román-Niaves, Marisa Salanova Soria & Susana Llorens Gumbau | Department of Social Psychology, WANT Research Team, Universitat Jaume l, Spain

science&practice

Research goal and why the work was worth doing: The study investigates the interaction between the different phases of an individual-level Compassion intervention conducted in a Spanish SME. The study will present the preliminary results of a Context, Mechanism and Outcomes (CMO) configuration using quantitative process evaluation measures. We are particularly interested in examining the link between contextual factors (i.e., employee context participation, support climate and communication) and training design mechanisms as prompts of individuals' intention to transfer the training acquired in their daily activities.

Theoretical background: Interest in studying compassion as a personal resource has increased (Strauss et al., 2016). Despite this interest, there is a lack of studies of Compassion interventions at the workplace. Furthermore, research on interventions focuses on a methodological approach that strives to standardize outcomes and disregards the value of context, process and fit between the intervention and the organization (Gilbert et al., 2018). This study is part of the H-WORK European project (De Angelis et al., 2020), which aims to validate the evaluation and intervention toolkits to promote mental health in the workplace. The study design is based on the Realistic Evaluation theoretical approach (Nielsen & Abilgaard, 2013) which seeks to describe how interventions work from whom and in which circumstances.

Design/Methodology: One cohort of employees in one Spanish business performance consultancy (N=24), are participating in an ongoing online intervention called "Compassion at Work", that aims to strengthen intra- and interpersonal skills related to (self-)compassion and pro-social behaviours towards others to optimize psychosocial well-being and relationships between employees. The intervention consists of three online group sessions (2 hours each) over three months. Between sessions, a digital platform is available with activities and practices to apply to their daily work. To evaluate the process, quantitative measures at different time points (T1-T5; baseline 6 months before intervention, post-intervention, every 3 months after baseline) are still being collected and will be available between January and February 2023. Measures included Contextual factors, Mechanisms, and Outcomes. Data will be analysed using Structural Equation Modelling, with R software to test mediation and moderation effects.

Expected Results: We expect that contextual factors, such as context of participation, support climate, and communication climate will prompt participants to intent to transfer the training acquired to their daily work (mechanisms). As a result, employees will experience increases in their levels of self-compassion, compassion towards others and the quality of service, which in turn will positively impact their mental health and well-being. Work demands and readiness for change will act as moderators in the interaction between contextual factors and mechanisms.

Limitations: First, the sample size will be small regardless of the number of respondents of the questionnaires, which may create biases in the analysis and interpretation of the results. Second, even though the study design includes a follow-up evaluation time (6 months after finishing the intervention), we won't be able yet to show these results during the presentation, because we will have these data on June 2023.

Conclusions: This study provides knowledge about the importance of developing Compassion at the workplace. Moreover, conducting interventions in Compassion will strengthen and develop compassionate skills in employees, reduce levels of stress and perceived demands at work, and increase levels of wellbeing. The results may provide practitioners with recommendations on how to implement individual interventions based on Compassion, considering the conditions and mechanisms that lead to the intended outcomes, for whom and under what circumstances.

Relevance to the Congress Theme: The study proves to be innovative in two ways, as it is an online intervention with a digital platform, where it is easy for the participants to access, and secondly, the design of the study based on the Realistic Evaluation. In addition, with this type of intervention based on Compassion, people are given the necessary tools to cope with daily life situations in the best possible way, thus trying to reduce stress and discomfort levels.

Relevant UN SDGs: The research could be included in the framework of objective 3 (good health and well-being) and 8 (decent work and economic growth), as these types of interventions aim to promote mental health and wellbeing at work and developing compassion as a personal resource also has a positive impact on a personal and professional level. Furthermore, with the results obtained, organisations could develop and implement policies and practices to further promote the mental health and well-being of their employees.

Oral presentation OP519

Complex effects of ideology on labor union activism

Joanna Grzymala-Moszczynska, Agnieszka Kuhny, Anna Potoczek & Gabriela Czarnek | Institute of Psychology, Jagiellonian University

science

Research goals and why the work was worth doing

Despite the recent surge in the unionization of workers around the world, it is still unclear why most people do not unionize, despite experiencing poor working conditions and violations of fundamental worker rights. Our research aimed to address this issue from the perspective of psychological aspects of ideology. Here, we would like to present the results of two studies on the relationship between political ideology and willingness to support and engage in labor union actions.

Theoretical background

Past research suggests that labor union membership is motivated by attitudes and ideologies regarding unions and ideological perspectives on work (Deshpande & Fiorito 1989, Barling et al. 1991). Literature also suggests that general political ideology is related to engagement in labor unions, as more left-leaning people are also more frequently members of such organizations (Toubol & Jensen, 2014). However, the literature (especially more recent) on relations between ideology and union activism is relatively scarce and inconclusive, as it shows different relations between political attitudes and union membership in different countries (Jensen, 2017). We hypothesize that ideology will be related to attitudes toward unions and labor union membership.

Design/Methodology/Approach/Intervention

The first study was conducted among workers (N = 1653) from Poland, the United States, and India. It was a cross-sectional study conducted on a representative sample of workers in these countries through online panels. The results were analyzed with linear regression.

The second study is based on existing datasets from opinion polls conducted worldwide and locally, namely with European Social Survey, World Values Survey, and GSS. We analyze the relationships between questions about various aspects of ideology, support for labor unions, and union membership. The analysis was conducted with multilevel modeling, allowing to observe country-level relations between variables of interest.

Results obtained or expected (if not available, it must be made clear when they will be)

The first study's findings are only partially consistent with the predictions since ideological factors were not always related to union membership. Contrary to our predictions, union members were significantly more right-leaning compared to non-members in all countries.

The results of the second study confirm the overall relationship between ideology and attitudes towards labor unions, but not union membership. Interestingly, the observed effects vary between countries.

Limitations

The majority of the presented data is cross-sectional, what possibly undermines reasoning about causal relations between ideology and labor union engagement.

Conclusions – research and or practical implications/Originality/Value

First of all, we present important results suggesting a nuanced relationship between ideology and union membership, discussing the importance of conducting research on large datasets, including data from many countries and time points. In terms of practical implications, we believe that union organizers could find our results interesting as we contribute to the knowledge concerning motivational factors facilitating union engagement.

Relevance to the Congress Theme

In recent years, we have observed a revival of labor union participation around the world and we see that it has become a strong trend. We believe that labor unions are an important part of the future of work.

Keywords: labor unions, ideolo

Oral presentation OP657

Conflict at work: A survey

John Hackston, The Myers-Briggs Company

practice

Purpose and goals

Where there is a difference of opinion, conflict occurs. Often seen negatively, conflict can lead to new insights, especially when people are aware of how they typically deal with conflict, and have the ability to flex their style when needed. Getting the best from conflict also matters to organizations; a constructive approach to conflict can reduce costs and make positive outcomes likelier.

This study investigates how people see workplace conflict, and to produce recommendations as to how individuals can use a knowledge of their own conflict style. The paper will present an overview of the findings.

Theoretical background

The study uses the TKI framework developed by Thomas and Kilmann. This defines five conflict modes depending on the extent to which, when there is a difference of opinion, a person is co-operative (trying to satisfy the concerns of another person) and the extent to which they are assertive (trying to satisfy their own concerns). The five modes are Competing, Collaborating, Compromising, Avoiding, and Accommodating.

Methodology

271 people completed one of two online surveys. One was distributed to individuals who had previously completed the TKI assessment; the other contained the assessment items, allowing their conflict modes to be calculated.

Results

Most respondents felt they managed conflict well, had high job satisfaction, and felt included at work. Those with the most positive view of their skills had higher levels of job satisfaction, felt more able to be their authentic self at work, and felt more valued by and at home in their organization.

On average, respondents spent 4.34 hours per week dealing with work conflict, a significant organizational cost. The more time that an individual spent dealing with conflict, the lower their job satisfaction and the less included they felt.

Poor communication and lack of role clarity were seen as the most common causes of conflict at work, followed by heavy workloads and personality clashes.

When asked who was responsible for managing work conflict, the most common response was ‘my line manager’ closely followed by ‘everyone’. 98% of respondents said that conflict handling is was extremely or very important as a management skill.

There was a slight increase in perceived conflict due to COVID and its after-effects. Non-remote workers were the most likely to say that conflict had increased, remote workers the least.

52% of respondents felt that workplace conflict gave a mix of positive and negative results, 31% that it always or generally gave negative results and 17% that it always or generally gave positive results. The most frequently mentioned positive benefit was the opportunity to build relationships and

increase collaboration and co-operation. The most frequently mentioned negative outcome was poorer relationships, loss of trust, and decreased co-operation.

When asked ‘How does conflict at work make you feel?’, the most frequent answers were around the theme of feeling anxious, depressed, fearful, or stressed.

Respondents tended to think that their direct supervisor or manager managed conflict well. Female managers were more likely to be seen as managing conflict very well than were male managers, and less likely to be seen as managing conflict very poorly.

The results provide a rationale for helping managers to improve their conflict-handling skills. While 35% felt there was nothing more their supervisor or manager could do, 65% mentioned one or more actions.

Those who perceived their manager as having a Collaborating, and to some extent a Compromising style, had the most positive experience. Those who believed their manager had a Competing, and to some extent an Avoiding, style had the least positive experience.

An overview of the findings will be presented at the Congress, with a link to a full report.

Limitations

The study relies on self-report and uses a convenience sample.

Conclusions

Conflict takes time, is expensive and can have a negative effect on individuals. It may be useful for organizations, departments, or teams to review each of the causes, in particular poor communication, lack of role clarity, and heavy workloads and how the effects might be mitigated. To reduce personality clashes, increasing individual self-awareness via personality or conflict style assessments may be useful.

A positive view of one's ability to manage conflict has several positive outcomes. Training in handling conflict may be useful for all, but especially managers.

Those who saw their manager as having a Collaborating conflict style had the most positive experience. In practice, a Collaborating style may well be the most suited in some situations or interactions, but a different style in others. It is important that a manager is aware of their own typical approach ability to flex and take another approach when needed.

Relevance to the Congress theme

With change comes the possibility of conflict. Understanding workplace conflict is important for the future.

Keywords: conflict, TKI, conflict mode

Oral presentation OP223

Connecting the digital dots: Development of a measurement scale for employee digital disconnection

Alice Verlinden, Marijke Verbruggen & Elfi Baillien|KU Leuven

science

Introduction

An number of scholars suggest that digital disconnection – which refers to putting intentional constraints on the use of digital devices, features, and applications (Nguyen, Büchi & Geber, 2022) - could foster employees' focus during work and benefit their overall wellbeing. Despite the rapidly expanding research around employee digital disconnection, a valid and reliable measure to assess this construct is still lacking. With this paper, we address this void by developing and validating a scale that captures the variety of employee-owned disconnection behaviors. As such, we advance the field in several ways. First, this study is one of the few that puts employees on the map of digital disconnection research. Second, by encapsulating different employee digital disconnection behaviors into one comprehensive instrument, we contribute to a more unite and total view on the topic, while we recognize digital disconnection as a phenomenon that is more than the mere opposite of digital connection. Finally, we answer calls in the literature to make methodological progress in the field.

Methodology

We follow an established multistep procedure, consisting of an item generation phase, a scale development phase, and a scale evaluation phase (Boeateng et al., 2018). More specifically, study 1 entails interviews with employees (n = 39) to specify the domain of the construct, to define its main dimensions, and to inductively compile an initial item pool. We then adhere to interviews with experts (n = 10) and employees (n = 7) to review the candidate items' face validity, content validity, and clarity. Study 2 is a quantitative evaluation of the scale. Using a first sample (n = 486), we examine its dimensionality and using a second sample (n = in progress) we examine reliability, construct validity and nomological validity.

Results

The scale covers three relevant contexts of disconnection. First, digital disconnection from work-related ICTs outside work (DD WOW) implies that employees refrain from using ICTs for work purposes outside regular working hours, such as during evenings or weekends. Second, individuals can disconnect from private ICTs during work (DD PDW), through a reduction in the use of devices, applications, and features for private purposes during their worktime. Third and finally, employees can actively limit the use of selected work-related ICTs during work, by disconnecting from work-related ICTs during work (DD WDW).

For each of these three contexts, the qualitative data pointed at three different types of strategies. More specifically, we distinguish between technology-oriented strategies (i.e., limiting the use of devices, programs, or features), communication-oriented strategies (i.e., notifying others about unavailability) and time-oriented strategies (i.e., organizing time slots for being disconnected). Based on this, we constructed an item pool of 42 items (i.e., 14 items per disconnection context), which were reviewed and adapted with experts and employees. In the next phase, exploratory factor analyses confirmed the hypothesized dimensionality, except for two items that loaded poorly on the expected factor and were therefore re-worded.

The adapted version of the scale is currently being administered to a new sample, on which we will perform confirmatory factor analyses (CFA's) and validity tests. Regarding the latter, we expect digital disconnection to correlate with various individual characteristics (e.g., segmentation preference), job characteristics (e.g., workload, availability demands) as well as individual and work outcomes (e.g., concentration, exhaustion).

Limitations

Developing a valid scale requires testing many of its psychometric properties. Given there is considerable debate about the antecedents and outcomes of digital disconnection, predictive validity has not yet been tested in this study. Using our scale, future research could further unravel whether factors such as focus or workload are to be considered as disconnection antecedents, outcomes, or both.

Conclusion and contribution

In conclusion, our scale could serve a broad spectrum of empirical studies surrounding digital disconnection, thereby clarifying important questions with respect to the importance of 'switching off' for improving employees' (digital) wellbeing and performance at work. Overall, the evolving research line around this topic is extremely relevant in view of recent societal developments - such as the digitalization of workplaces - which was accelerated by the Covid-19 pandemic. If we want to minimize negative health consequences of hyperconnectivity (e.g., stress, fatigue), research on digital disconnection to avoid or to cope with possible technological drawbacks seems fundamental. Therefore, our contribution perfectly ties into EAWOP's conference theme 'The changing world of work' and the UN's third SDG 'Ensuring healthy lives and promoting well-being'.

Keywords: digital disconnection, scale development

Oral presentation OP522

Context matters: Varying preferences for decision-support levels by artificial intelligence in personnel planning

Thomas Schilling, Rebecca Müller & Thomas Ellwart | University of Trier

science&practice

Artificial intelligence (AI) now makes decisions and takes over tasks that used to be done by humans, thereby changing the way humans work and how entire industries operate. In AI research, scientists distinguish between different levels of AI support known as the level of autonomy (LoA) – the higher the LoA, the more autonomy has the AI and the less control remains with the human decision-maker (DM). AI can either pre-process data for further processing by a DM; it can process data and give the DM suggestions; or the AI can process data and make final decisions without involving the DM. LoA has been primarily examined in the context of robotics, aviation and autonomous driving. Comparatively little is known about users' preferences for a differential LoA in human resource management (HRM), although AI may also support DMs in HRM with personnel selection, planning, or evaluations. This study focusses on personnel planning (PP) decisions. Within this context, most research so far examined what factors affect the users' trust, acceptance, or fairness perceptions of AI systems, some of which are situation-specific or decision-specific factors User preferences for a system's LoA in the PP context might also strongly depend on such factors, e.g., the availability of decision-specific information, the perceived workload, or whether a team that is decided upon rejects decisions made by the AI. The goal of this study is to investigate whether DMs' LoA preferences vary with situational settings of personnel planning decisions.

Researchers and practitioners alike argue that the use of AI will improve business performance, work experiences, and thus may contribute to more decent work and economic growth. To support a human-centered design of AI in HRM, empirical research on user preferences and LoA may guide developers and practitioners to reflect contextual factors and allow to flexibly adapt the AI's LoA to these.

104 participants made fully manual PP decisions (no AI support) for a fire brigade in a computer simulation. Thereafter, the participants were asked to put themselves into the situation of the DM in several PP decisions (vignette study design). Participants rated on a 5-point Likert scale (e.g., 1=fully manual, 3=AI support with human decision, 5=fully autonomous AI) what LoA they preferred in each of two variants of six situations: (1) A situation where the DM's goal was either to follow a personal efficiency or a personal development goal; (2) a situation where relevant information was either lacking or fully available; (3) a situation with high versus low workload of the DM; (4) a situation where the described problem was either clear or unclear; (5) a situation where the PP decision either has or does not have negative consequences for the team; and (6) a situation where the team either accepts or does not accept decisions made by an AI.

We examined whether LoA preferences differed within subjects between the two variants of each situation using paired t-tests and OLS regressions.

The preferred LoA differed statistically significantly (all p-values <.000) between the two variants of each situation. Higher LoA was preferred when (1) the personal goal was efficiency (vs. development); (2) information about the situation was insufficient (vs. fully available); (3) the perceived workload was high (vs. low); (4) the problem of the situation was unclear (vs. clear); (5) the AI's decision did not result in conflicts (vs. conflicts were unavoidable) within the team; and when (5) the team was highly accepting (vs. not accepting) of AI decisions.

First, this study was done with students who were asked to imagine various situations they likely never experienced in real life. To counter this problem in part, we specifically hired only participants who at least had some experience with a similar decision in a computer simulation. Second, the vignette study design might artificially elicit differential LoA preferences due to the way the study was framed (framing effects, experimenter demand effects). Third, without actual consequences for the decisions made by the participants, the answers could be interpreted as only tentatively suggestive evidence. Therefore, future research is needed. Especially studies that observe decisions with real consequences of people with real-world experience in PP would be laudable.

This study suggests that designers of an AI must consider the situational context and allow the AI to be adaptable to this context for it to be used effectively by the intended DM. To ensure a human-centered work environment and economic growth, AI systems will be necessary, but it will also be necessary to design those by carefully considering the context in which the AI will operate.

Keywords: artificial intelligence, level of autonomy, human resource management

Oral presentation OP664

Contextualising lawyers' wellbeing: a synthesis review and integrative theoretical approach

Lucinda Soon, Kevin Teoh & Almuth McDowall | Birkbeck, University of London

science&practice

Review goals and rationale: Lawyers perform an integral role in society. Yet industry reports describe a profession ostensibly under strain. Contextualising lawyers' wellbeing is pertinent. The path to qualification is competitive and arduous. Commercial law firms compete for the best talent by offering elevated salaries for high workloads and long working hours. Financial incentives are constrained in legal aid practice, but heavy workloads, tight deadlines, and administrative backlogs arise from evolving socio-political agendas. Law firms face mounting pressure to protect and promote lawyers' wellbeing, yet knowledge remains fragmented across different disciplines hindering research development and progress in practice. Thus, our review aimed to determine, by way of a systematic map and synthesis of the published and grey literature, what we know and what we do not know about lawyers' wellbeing, specifically how lawyers' wellbeing is conceptualised and influenced by work context.

Theoretical background: Prominent work stress theories (e.g., job demands-resources theory) propose relationships between work demands, resources, and psychological stress. However, they may be insufficient for consideration of contextual nuances thus presenting a theoretical challenge.

Methodology: We adopt systematic review methodology and a pragmatic realist approach. We performed a global cross-disciplinary review of 143 publications from the scholarly and grey literature spanning the past 50 years. We also engaged a purposively established stakeholder advisory panel to review our a priori review protocol to ensure appropriate scope and relevance.

Review findings: Despite wellbeing's positive facets, we find lawyers' wellbeing is disproportionately conceptualised as a state of ill-being. Few studies have applied theory to situate and explain findings. There is also scant consideration of the contexts to which findings apply. We confront the theoretical challenge of considering wellbeing through the lens of work context by proposing the novel integration of Bourdieu's (1977) theory of practice and Hobfoll's (1989) conservation of resources (COR) theory. Our explanatory synthesis adopts an abductive approach.

Guided by Bourdieu's concepts of field and habitus, we infer two subfields of legal practice from the reviewed literature, each with different work structures, conditions and predispositions: commercial law practice with tightly managed performance and productivity measures, and legal aid practice with high emotional demands and emotional labour. Different types of symbolic capital (resources) are valued by different lawyers contingent on their subfield and habitus (i.e. their context). Drawing on COR theory, we suggest that threats to, or actual loss of, these valued resources is the mechanism by which context influences wellbeing.

While some resource losses may affect both subfields: low job autonomy, work-life conflict, and reduced social connectedness, we find unique resources are at risk of loss depending on context. For commercial lawyers, these include recognition and career growth, perceived professionalism and competence, and organisational support; for legal aid lawyers, they include social purpose, utility, work meaningfulness, and financial stability.

Stress, anxiety, depression, and burnout are common negative wellbeing outcomes. Unique outcomes for commercial lawyers include low motivation and job/life dissatisfaction, whereas legal

aid lawyers are distinctively susceptible to emotional dysregulation, trauma symptoms, and moral injury arising from the emotional valence of their work.

Limitations: More studies may exist than were retrieved owing to language and database limitations. Stakeholder engagement helped us to refine our population and concept search terms into as relevant a list as possible; however, lawyer titles and wellbeing synonyms vary considerably across countries meaning some studies may have been missed.

Conclusions: Our review is the first to systematically map and synthesise the scholarly and grey literature on lawyers' wellbeing that has developed across disciplines over the past 50 years. It is also, to our knowledge, the first to propose the theoretical integration of Bourdieu's theory of practice and COR theory to understand how work context impacts wellbeing. Identifying resources at risk of loss within specific contexts may help organisations develop more targeted and effective wellbeing interventions.

Relevance to the Congress Theme: The changing world of work has placed increased importance on understanding how context affects work-related wellbeing. We demonstrate, in relation to lawyers, the application of an integrative theoretical approach, which may be usefully applied to other professions and occupations.

Relevant UN SDGs: Good health and wellbeing.

Keywords: systematic review, conservation of resources theory, wellbeing in the legal profession

Oral presentation OP637

Coping with homeworking in the post-pandemic era: the role of home office quality and flextime in enhancing job performance

Salvatore Zappalà, Simone Donati, Ferdinando Toscano & Marta Giaccari | Department of Psychology - University of Bologna - (Italy)

science

Research goals and why the work was worth doing

This study examines if perceptions of home office quality affect homeworking performance. It is also hypothesized that employees' ability to cope with homeworking mediates this relationship and that flextime moderates the relationship between the ability to cope and homeworking performance.

Theoretical background

Many organizations are continuing to use remote work as a crucial resource after its massive adoption due to the COVID-19 emergency (Kosteas et al., 2021). However, the quality of employees' home workstations often varies by case. Despite the limited research on the ergonomic aspects of working at home, the relationship between comfort aspects and work outcomes is crucial (Carayon, Smith, 2000). A suitable workstation, in fact, improves to perform their tasks (McAllister et al., 2022) and may help employees to manage work problems, thus contributing to their ability to cope with their work, which in turn can improve homeworking outcomes (Toscano et al., 2021).

In addition, homeworkers can either work during canonical office hours or adopt independent time schedules (ILO, 2021). Thus, flexible work arrangements provide employees the needed flexibility in scheduling their work which seems to improve their job performance (Rosen et al., 2013; Toscano & Zappalà, 2020).

Moreover, the possibility to manage their job schedules can help employees to meet their daily needs in terms of both personal and work-related demands (Miglioretti et al., 2021). For this reason, we argue that flextime boosts the relationship between coping with homeworking and homeworkers' performance.

Methodology

A cross-sectional study took place in the middle of 2022. Data were collected to evaluate the organizational well-being of an Italian national research institute that introduced remote work two years before. The sample consists of 493 homeworkers. Most of them (39.8%) reported working at home about three days per week. All participants gave their consent to the data collection.

Results obtained

The PROCESS macro, used to test the hypothesized model, confirmed the relationship between quality of home office and coping ($B = .25$; $p < .01$) and between quality of home office and homeworking performance ($B = .33$; $p < .01$). Results also showed that coping was significantly related to performance ($B = .50$; $p < .01$). In addition, the relationship between coping and performance was moderated by flextime ($B = .16$; $p = .01$). These results, together with the index of moderated mediation (index=.04; 95% CI = [.01, .06]), confirm the positive mediating effect of coping in the relationship between the quality of home workstation and performance and show that the mediating effect is stronger in employees that can manage their worktime more flexibly.

Limitations

The present study has limitations. First, it is a cross-sectional study, thus the indirect effect would benefit from a longitudinal study. Second, because the measurements are self-reported, employees could have considered their ability to cope with homeworking as equivalent to their ability to perform homeworking, thus the two measures should be more extensively distinguished. Third, data were collected in a single Italian research organization. So, generalizing the study results might be risky. Finally, the measure of quality of home office can be enlarged by including a larger number of workstation ergonomic aspects.

Conclusions

This study encourages organizations to support workstation quality at home by considering specific resources for the worker, such as training on how to set up an efficient workstation, or economic incentives to cover home expenses. Furthermore, it is suggested to evaluate the introduction of flextime for homeworkers, as it acts as an enhancer of homeworking productivity.

Relevance to the Congress Theme

In the face of changes stimulated by the pandemic, we believe that homeworking is a resource chosen, not suffered, by organizations and workers. As the congress emphasizes, we are convinced that homeworking should be adapted over time to meet changing needs. Flexible scheduling and quality of home workstations can be a powerful resource for today's and tomorrow's work.

Relevant UN SDGs

Sustainable development goals here examined: decent work and economic growth, reduction of inequalities, responsible consumption, and production.

Keywords: home office quality; flextime; remoteworkers' job performance

Oral presentation OP124

Could a psychometric test be a self-confrontation tool?

Giuseppe Scavo, Conservatoire National des Arts et Métiers (Le Cnam); Jean-François Robin , Institut national du sport, de l'expertise et de la performance (INSEP); Jean-Luc Tomás & Marc-Éric Bobillier Chaumon | Conservatoire National des Arts et Métiers (Le Cnam)

science&practice

Research Goals and why the work was worth doing

We aim to show how a psychometric test could become a valid psychological instrument in a self-confrontation – based activity analysis. As this type of analysis normally requires video recordings, which could be hard to produce depending on work conditions, it is worth finding out alternative items for self-confrontation interviews.

Theoretical background

Our perspective is the French-specific clinical approach to activity (Clot, 2008), based on Lev Vygotsky's historical-cultural theory (1978). The clinical approach theorizes that there are hidden elements in a subject's activity, which are inaccessible while living a first-person work experience. By watching himself/herself in videos of his/her own activity, and being questioned at the same time by the psychologist, the subject "doubles" his/her work experience, having the chance to catch these "invisible" elements and thus to better understand and develop his/her work. We call this co-analysis methodology self-confrontation. Co-analysis with the subject is the work core in our clinical approach. No further analysis without him/her afterward is of interest, in our perspective, in order to help him/her improve his/her activity.

The psychometric test is HEXA 3D®, a vocational guidance questionnaire designed by Pierre Vrignaud and Bruno Cuvillier in 2006 on the basis of the RIASEC model (Holland, 1966). HEXA 3D® is composed of three parts, each one dedicated to a category of items: activities, personal qualities and professions. There is a total of 168 items. Three types of answers per item are possible: I'm interested/I own this quality (2), I'm indifferent/I don't know if I own this quality (1), I'm not interested /I don't own this quality (0). The score obtained reveals one main profile and up to two or three associated profiles, among the six RIASEC Types (Realist, Investigator, Artistic, Social, Enterprising, Conventional).

Design/Methodology/Approach/Intervention

Self-confrontation interviews are normally conducted with video recordings of a subject's activity. We applied this co-analysis methodology using the psychometric test HEXA 3D® instead of activity videos. The test was administrated to a French male swim coach aged 27 at time, after the 2021 Covid-19 lockdown and during an employment transition period.

One week after the test administration, we performed the self-confrontation interview: it was a semi-structured interview based on test results and how these were meaningful to the subject. Our questions were focused on the relationship between subject's profiles characteristics and his own actual work tasks. The interview was conducted in a distant mode configuration, via a videoconference platform. We recorded the entire session via the platform.

Results

Test performance - The subject completed the test in a short time (22 minutes). Personal qualities part was were it took longer to him to answer.

Confronting the results - The subject was surprised to discover that the Social Type is not his main profile. The Artistic Type is, in the end, the main profile, with Investigator and Social as associates. The coach finds the Conventional profile more reassuring and he estimates himself as Enterprising, wondering why these are not among his profiles.

Re-evaluating his activity – The subject realizes that Enterprising and Conventional Types characteristics are meaningful to him just because they're functional to the establishment of good work conditions. Even his choices on activities are all intended to improve his swim coach craft. Finally, the subject also understands that his attitude of letting swimmers free in their practice comes probably in reaction to his strict parental education.

Limitations

The number of items is limited, so are the choices for the subject. The standardization, somehow necessary to every psychometric test, is a limiting factor concerning the complexity of human work activity.

Conclusion, practical implications and value

Thanks to HEXA 3D® results discussion, the subject was confronted to his own work activity and was able to think it differently. We experimented this psychometric test for a clinical usage. We thus could think of vocational guidance as a new way to accede to subjective work reality in our clinical approach.

Relevance to the Congress Theme

We identify this topic as relevant to the congress theme "Research methods", and more specifically as a "Research design" topic. Our suggestion is to identify a new use for a well-known psychology tool such as a psychometric test.

Relevant UN SDGs

Analysing one's own vocational path could contribute to wellbeing and thus mental and physical health. Analysing it through work tasks means recognising work craft as a health factor.

Oral presentation OP112

Crafting Jobs and Careers: A Cross-lagged Analysis on the Moderating Role of Career Adaptability

Alessandro Lo Presti & Hira Khan | Università degli studi della Campania "Luigi Vanvitelli"; Yasir Mansoor Kundi, Institute of Business Administration (IBA) Karachi

science

Research goals and why the work was worth doing

Nowadays, frequent and unpredictable economic and organizational turbulences increasingly push employees to take a proactive stance with regards to both their jobs and careers in terms of heightened flexibility, adaptability, and customization. This study deepens the individuals' understanding of how to take charge of their own career and strive in turbulences. Thus, with the aim of examining the reciprocal associations between the individual orientations to customize one's own career vs. one's own job as well as the boundary conditions due to the levels of adaptability, and drawing on Career Construction Theory, we examined: (a) the potential bidirectional relationship between protean career orientation (PCO) and job crafting; and (b) the moderating role of career adaptability on their relationship over time.

Theoretical background

The protean individuals are more likely to engage in job crafting behaviors as they translate their propensity to personalize and self-direct their career to their job. Whereas in reciprocity, the reflection of job crafting behavior among employees lead them towards a higher protean career orientation. The CCT emphasizes how individuals discover their passions and construct a life-career that provides sense and meaning to their lives, also allowing them to re-creating themselves to cope with environmental turbulences (Arastaman, 2019). The career adaptability, as the main concept of CCT (Savickas, 2013), is positively associated with several positive outcomes both directly (Maggiori et al., 2013) and as a mediator (Jia et al., 2022).

Design/Methodology/Approach/Intervention

We collected cross-lagged data in three waves (one-month) from a sample of employees in Poland as part of a larger research project. The participants were Master's program students, at least 18 years old and currently employed for at least 20 hours per week. Besides, they were informed about voluntary participation, confidentiality and anonymity. Survey at Time 1 included demographics, items related to PCO, job crafting, and career adaptability. At Time-2 (one-month later) we used the same survey, excluding the demographics and finally at Time 3 (one-month after Time 2), career adaptability was also excluded from the survey. The questionnaire was administered in the English language. We used the measures of Protean career orientation, the 7-items scale proposed by Porter et al. (2016), Job crafting, the 9-items scale (by Slemp and Vella-Brodrick, 2013) and career adaptability, 12-item shortened version scale (by Maggiori et al., 2017). Cross-lagged path analyses were conducted using structural equation modelling (SEM) in AMOS, whereas the moderation analysis was conducted using Hayes PROCESS macro.

Results obtained

Out of 400 participants, we received 333 completed surveys at the Time 1 (response rate of 83.3%). At time-2, 211 participants completed the survey (attrition rate = 36.6%), and 168 participants at Time 3 (attrition rate = 20.3%). Our findings fully supported our hypotheses. The higher protean career was positively associated with higher job crafting behaviors at a subsequent time; at the same

time, higher job crafting behaviors positively contributed to ensuing protean career. Moreover, career adaptability proved to be a significant moderator in these relationships.

Limitations

There are some limitations to consider when interpreting our results. Since this study is based on the self-reported measures using questionnaires, there may exist some common method bias concerns. Addition to that, one of the limitations occurs when generalising this model, this study is not cross-cultural, the results may vary when the data is conducted from different cultures other than Polish. Moreover, the data was conducted during pandemic, there is a slight chance that individuals might experience increased or decreased association towards their career and job crafting in normal (less stressed) situations. Along with that, the longer duration between the data collection may help future researchers explore more in depth understanding of individuals' behaviours towards their vocation.

Conclusions – research and or practical implications/Originality/Value

We provide that there is a bidirectional relationship between PCO and job crafting. Also, our results confirmed the moderating role of career adaptability and showed that the relationship between PCO and job crafting was stronger for employees with higher career adaptability resources. We contributed to the literature by showing the reciprocal relationships over time between PCO and job crafting which reinforce each other and by highlighting the amplifying role of career adaptability.

Relevance to the Congress Theme

As jobs are continuously changing, individuals need to be proactive and able to customize both their job and careers. At the same time, adaptability is another valuable resource to make careers more sustainable.

Keywords: Protean career, job crafting, career adaptability

Oral presentation OP673

Crafting leaders for people and organizational adaptability: A preliminary validation of the Crafting Leadership Questionnaire (CLQ)

Ferdinando Paolo Santarpia & Laura Borgogni | Sapienza, University of Rome

science&practice

Research goals. What kind of leadership is needed for the transition to more agile organizations is still a matter of debate. The Complexity Leadership Theory (Uhl-Bien et al., 2007) addresses how leaders may enable potential to adaptively address shifting environments. However, a specific tool applicable to employee management is still lacking. Hence, this study aims to propose a conceptual and measurement model (CLQ) that specifically interprets the enabling function of leadership for coworkers management.

Theoretical background. Enabling leadership is the process that allows adaptability, creative problem-solving and learning to emerge within organizations (Uhl-Bien & Arena, 2018). Starting from Uhl-Bien et al. (2017) and from behavioral models (e.g., Yukl, 2012), we declined the concept into competencies. Crafting leaders adjust their style to the characteristics of coworkers (to activate their capability to shape the work environment and its outcomes) and manage the organization-coworkers interface (to provide consistency with the organization's strategic mission and to stimulate innovation throughout the organization). The concept naturally resonates with a situational approach to leadership (Hernandez et al., 2011). Indeed, by crafting we mean the leader's shaping of an adaptive context in which coworkers are able to explore and nurture their diverse skills/talents/needs and to contribute to organizational development (Tims et al., 2021; Tummers & Bakker, 2021). Although transformational leadership (TL) involves a top-down approach of managing employees (Northouse, 2016), we expect the two perceived styles to be positively correlated as they converge on employee's development. Moreover, we expect significant associations between CL and coworkers' job crafting (JC; proxy of adaptability; Bindle et al., 2019), as well as with engagement (WE) and exhaustion (EX) based on previous research (Tummers & Bakker, 2021).

Design. A total of 1507 employees from different organizations completed an online survey. Measures: CLQ (21 items), assessing CL as an higher-order construct derived from three behaviours (as perceived by coworkers), namely Person-Organization Alignement (POA; managing the organization-to-coworkers interface by strenghtening the comprehension of the organizational strategic and operational context), Tailoring (TAIL; valuing heterogeneity by seeding the conditions to engage co-workers in exploring, nurturing and integrating their characteristics) and Catalysing (CAT; managing the innovation-to-organization interface by facilitating the implementation and dissemination of innovative products). Transformational Leadership (TRL; 16 items, Avolio & Bass, 2004; α=.93); Promotion-oriented JC (PRO-JC; 9 items, Tims et al., 2012; α=.79). Prevention-oriented JC (PRE-JC; 6 items, Demerouti & Peeters, 2018 α= .72). The distinction between PRO-JC and PRE-JC is in line with Lichtenthaler and Fischbach (2019); WE (3 items, Schaufeli et al., 2019; α= .66); EX (3 items, Mazzetti et al., 2022; α= .81). We employed an investigator triangulation approach for the item development (Denzin, 1978). Confirmatory factor (CFA) analyses were performed to test CLQ factorial validity (1-factor, 3-factor, the hypothesised higher-order and bifactor models; Credè & Harms, 2016). Reliabilities were estimated. The discriminant validity of CL with regard to TL was tested, with the specification of a common method factor (Marsh, 1996). Then, we tested for predictive validity by estimating latent associations between CL, TL and outcomes (PRO-JC, PRE-JC, WE and EX). Multicollinearity indices (i.e., VIF and TI) were checked (Markoulides and Raykov, 2019).

Results . The higher-order model fitted the data better than alternative models according to fit indices and Dχ 2 test (χ 2 =1187.04, df =186, CFI=.96, TLI=.95, RMSEA=.06, SRMR=.03). The scales showed good reliability (POA α= .87; TAIL α= .91; COD α= .93; CLtotal α= .96). As expected, the correlation between CL and TL was strong and positive (r=.75). Both CL and TL correlated with PRO-JC (CL r=.46; TL r=.38), PRE-JC (CL r=.32; TL r=.25), WE (CL r= .60; TL r=.57) and EX (CL r= -.35; TL r= -.28). Moreover, CL outperformed TL in all regressions (with the latter resulted as nonsignificant). To be sure, VIF and TI values did not indicate the presence of multicollinearity between CL and TL.

Limits. This cross-sectional study employed self-report measures. Divergent and predictive validity of CL should be further investigated.

Conclusions. This study provided a valid and reliable model for reconsidering leadership in the contemporary scenario. Notably, CL uniquely associated with proactive behaviours, motivation and strain. The model may help practitioners to design developmental paths for leaders.

Relevance to the Congress Theme. As organizations face increasingly changing and complex scenarios, we proposed a leadership model for enabling people and organizational adaptability.

Keywords: enabling leadership; job crafting; work attitudes.

Oral presentation OP39

Creating High-Quality Coaching Conversations: What We Can Learn from Experienced Executive Coaches

Patrizia Ianiro-Dahm, Department of Management Sciences, University of Applied Sciences Bonn-Rhein-Sieg, Rheinbach, Germany; Erik De Haan, Hult Ashridge Centre for Coaching, Hult International Business School, Berkhamsted, UK and Department of Management and Organisation, School of Business and Economy, Vrije Universiteit Amsterdam, Amsterdam, The Netherlands

science&practice

Purpose. Researchers agree that it has been adequately demonstrated that executive coaching does indeed work, but that questions of "how" and "why" coaching is effective, have not been adequately answered (e.g., Athanasopoulou & Dopson, 2018). What is missing is a holistic view of coach behaviors and the systematic analysis of how these behaviors actually affect different aspects of conversation quality and outcomes (Pandolfi, 2020). One research approach to answering these questions is based on investigating the coaching process. Process-analytical studies providing insights into the active ingredients in coaching remain scarce – even more so when these studies are based on a representative sample of mature coaches.

Goals. The present study addresses this gap analyzing video recordings of 90 executive coaching conversations forming part of an accreditation process for professional, experienced coaches (average age 50, at least 90 hours of coaching experience). Based on behavioral observation, the study aims to explore which specific coach interventions and interpersonal behavior support different aspects of the working alliance (bonding, goal/task agreement) and the coach's overall performance as assessed by senior members of the profession.

Theory. Our hypotheses regarding high-quality coaching conversations are based on social psychological and humanistic theories (interpersonal, client-centered), and earlier findings on coach behavior demonstrably related to coaching effectiveness (e.g. Ianiro et al., 2014). Additionally, we focus on specific coaching interventions that have either been put forward in standard coaching works (e.g., De Haan, 2008), or in recent systematic reviews on executive coaching (Bozer & Jones, 2018), or that are demonstrably effective, at least in the context of process-analytic counseling research (e.g., Klonek et al., 2020). We propose that a coach's non-verbal dominance and friendliness, as well as "here-and-now"-interventions (addressing client's thoughts, feelings, the current relation, disclosing own emotions), and supporting and challenging interventions (contracting, reflections, humor, appreciation, supportive and challenging feedback) are crucial for high-quality coaching conversations in terms of initiating a positive working alliance and overall coaching performance.

Methodology. The recorded sessions N = 90 (N = 27 online, N = 63 face-to-face) each lasted 20 minutes and were part of a professional accreditation process for coaches at a British center for executive coaching. Four raters were trained in behavioural observation and the use of the Mangold INTERACT software until interrater reliability was reasonably high (κ = .74-.91; ICC = .98). One rater duo focused on interventions. One rater pair focused on the coach's interpersonal behavior, i.e., the duration of demonstrated dominance and affiliation. The other rater pair assessed the frequency of different coaching interventions (here-and-now, supporting and challenging). Additionally, the working alliance (WAI, Horvath & Greenberg's, 1989) and coaching performance were assessed independently as quality criteria. The coaching performance score was assigned by accreditors. It was based on seven evaluation criteria (e.g. contract and boundaries) and included a questioning of the

coach after the session, the feedback from peer candidates and the perceptions of the client. We then investigated the link between the behavioural categories and coaching quality criteria.

Results. Regarding interpersonal behavior, the present study replicated earlier findings on the importance of coaches' dominance and friendliness: effective coaches tended to behave in a neutral to dominant manner and were friendlier – particularly during online coaching. With regard to the coaches' interventions, simple and complex reflections were found to be positively and significantly related to coaching performance. However, this did not apply to online coaching – here, negative effects of complex reflections occurred. The coaches' sense of humor made a difference, significantly predicting working alliance bonding and coaching performance. Taken together, relevant coach behavior predicted 29% of coaching performance.

Limitations. Although the behavioral data only concern a relatively small part of any coaching process, clear differences between coaches emerged. In addition, the recording situation differs somewhat from practice, as it took place within the framework of an accreditation process. This may have led to the coaches being more excited than usual.

Conclusion. We contribute to the existing coaching literature by providing empirical evidence on how to distinguish between effective and less effective executive coaches. The results can be used for an evidence-based and specific design of coaching trainings. They also offer starting points for practical coaches, who can orient themselves here on successful, experienced peers.

Keywords: executive coaching, coach interventions and interpersonal behaviour, video-based process analysis

Oral presentation OP549

Creation and validation of shortened, revised versions of a Polish mobbing test (SDM Questionnaire)

Katarzyna Durniat & Maciej Karwowski | University of Wrocław

science&practice

Research goals: This project's aim was to revise a Polish 64-item mobbing test (called SDM Questionnaire) to create and validate new, shortened and more economical versions of the test and prepare them for international mobbing research.

Theoretical background : The vast majority of mobbing studies have been conducted with the implementation of behavioural tests, like the internationally most recognizable bullying/mobbing tests, at the top of which are: the Negative Acts Questionnaire (NAQ/NAQ-R; Einarsen, Hoel & Notelaers, 2009) and the Leymann's Inventory of Psychological Terrorization (LIPT; Leymann, 1990, 1996). However, this kind of tools have some limitations. The most crucial of them is that they do not reflect sufficiently comprehensive, interactional mobbing models and mobbing definitional criteria; the behavioural methods neglect important indicators of mobbing experience: negative emotions, appraisals, and psycho-somatic symptoms. Interestingly, the Polish SDM mobbing test, which was developed in phases (since 2006) in reference to international mobbing literature (mostly Leymann's approach) and clinical work with mobbing victims, consists both of behavioural as well as of emotional, cognitive and psycho-somatic mobbing indicators. The Polish method, grounded in theory and clinical practice, reflects a more comprehensive, interactional mobbing model that served as the theoretical framework for the development of the test.

Design/Methodology : The basic, 64-item version of the SDM Questionnaire (Durniat, 2008; 2020) was used in a study conducted in 2022 on a heterogenous sample of 2500 Polish employees. The EFA, CFA, IRT, correlation, and regression analyses were conducted to revise the test structure, shorten the instrument, and examine the psychometric properties of the abbreviated versions of the test. The incremental and convergent validity of the new versions of the questionnaire was explored in relation to the NAQ-R and three self-report measures of job stressors: The Interpersonal Conflict at Work Scale (ICAWS), the Quantitative Workload Inventory (QWI), and the Organizational Constraints Scale (OCS) (Spector & Jex, 1998).

Results : The results of EFA and CFA indicate that the SDM test consists of three theoretically consistent factors indicating: (a) exposition to personal mobbing behaviours (called PMS), (b) exposition to work-related mobbing behaviours (called WMS), (c) experience of negative emotions, appraisals and psycho-somatic symptoms (called NES). Aiming to create a more parsimonious version of this instrument, three shortened versions were developed: (a) 38- item version (14 PMS+9 WMS+15 NES/respectively, Cronbach's α: .945/.888/.956) (b) a 24-item version (8 PMS+8 WMS+8 NES, Cronbach's α: .920/.880/.929), and (c)18-item version (6 PMS+6 WMS+6 NES, Cronbach's α: .901/.855/.912). The factor structure of the new, revised versions of the SDM test was confirmed with an appropriate fit in confirmatory factor analysis: CFI = 0,911, TLI = 0,905, RMSEA = 0,06, SRMR = 0,037 for SDM 28-item version; CFI = 0,936, TLI = 0,924, RMSEA = 0,065, SRMR = 0,036 for SDM 24-item version and CFI = 0,935, TLI = 0,925, RMSEA = 0,074, SRMR = 0,039 for SDM 18-item version.

Limitations : The revised, shortened versions of the original Polish mobbing test were created and validated in specific Polish socio-organizational circumstances. To test the universality of the new, more advanced, and comprehensive approach to measuring and diagnosing mobbing further, international test adaptations, research, and validations are necessary.

Conclusions : The shortened versions of the SDM test are valid, reliable, and parsimonious yet comprehensive psychometric tools for measuring and diagnosing workplace mobbing.

Relevance: Given the presently dominating mobbing research methods, the original Polish mobbing tool offers an innovative and psychologically more comprehensive approach to measuring and diagnosing mobbing in the workplace. The SDM test reflects better than strictly behavioural questionnaires mobbing definition criteria and theoretical, interactional models of the mobbing phenomenon.

Keywords: mobbing/bullying research methods, SDM Questionnaire, validation

Oral presentation OP644

Critical incidents during the application process shaping the candidate experience

Laurens Biesmans, Yves Van Vaerenbergh, Diane Arijs & Rein De Cooman | KU Leuven

science

Theoretical background. Prior research extensively studied candidates' reactions toward application procedures. Research shows that recruiter behavior, feedback, and reasons given for rejection, among others, are important in understanding candidates' behavior and explains why these reactions might occur (e.g., Applicant Attribution Reaction Theory: Ployhart & Harold, 2004; Fairness Theory: Gilliland, 1993). Yet, candidate reactions to these 'touchpoints' have been studied independent of one another. In reality, touchpoints do not occur in isolation. Scholars emphasize the need for a holistic view of the entire candidate journey and lasting experiences (McCarthy et al., 2017; Miles & McCamey, 2018).

This study examines candidates' overall experience with the recruitment process, and relates this experience to their wellbeing and decision-making. While approaching the overall experience as an unfolding process, we aim to gain insights into the mechanisms and crucial (although interrelated) touchpoints at play in its development. For that purpose, we combine theoretical insights from behavioral economics, cognitive psychology, marketing and organizational behavior in an attempt to understand the antecedents of this overall unfolding experience. This paper reports the results of a first, exploratory study in which we collect critical incidents during the application process. This approach allows us to identify experience-building events that are most influential in determining the overall candidate experience and might yield novel guidelines to optimize application procedures.

Methodology. The critical incident technique has been widely applied in organization studies and service marketing, and is considered a suitable method when a phenomenon lacks documentation (Gremler, 2004). Critical incidents are events of extreme (in)effective behavior with respect to the general aims of the activity (Flanagan, 1954) but can relate to anything of critical importance to the participant's context (Butterfield et al., 2005).

We collected critical incidents at three organizations (a governmental institution, a consumer brand, and a recruitment agency) for which all candidates received our survey upon completion of their application. Candidates were asked to think back about the most memorable moment (positive or negative) during the application process and how it made them feel. Next, they could provide a second incident of the opposite valence. Afterward, candidates rated their overall experience, attitudes and behavioral intentions. At the time of writing, we already gathered 145 critical incidents from 104 respondents who were accepted (14%), rejected (76%) or decided to withdraw from the application/job offer (10%). Respondents are between 21 and 66 years old ($M = 37$, $SD = 12.29$), and 81% is male.

We developed an initial candidate experience measure for the purpose of this research. Preliminary analyses indicate the reliability of this scale ($\alpha = .89$) and the relevance of considering critical incidents as indicative of the overall experience. Data analysis followed a content analytic strategy during which the critical incidents were placed in categories that reflected practice (Flanagan, 1957). Subsequently, statistical analyses were performed on the outcomes of the incidents.

Results/Discussion/Implications. Results reveal the importance of timeliness and personalization of feedback and communication, followed by honesty, a supportive attitude, information sharing and

expertise of recruiters. These actions made candidates feel more ‘comfortable’ and ‘relaxed’ and were associated with powerful feelings of gratitude and appreciation (Kranzbühler et al., 2020).

The valence of the critical incident (0 = negative, 1 = positive) was significantly associated with the overall candidate experience ($\beta = .468$, $p < .001$). There was also a significant positive effect of incident valence on candidates’ wellbeing (i.e., perception of applying, $\beta = .543$, $p < .001$; self-confidence to reapply, $\beta = .506$, $p < .001$; general self-confidence, $\beta = .499$, $p < .001$) and on perceptions of the employer brand (i.e., image of the employer, $\beta = .555$, $p < .001$; image of the brand, $\beta = .582$, $p < .001$).

In addition, we find age and gender to moderate the effects of valence of the incident on self-confidence of applying ($\beta_{age} = -.540$, $p = .049$; $\beta_{gender} = -.454$, $p = .021$) and general self-confidence ($\beta_{age} = -.485$, $p = .079$; $\beta_{gender} = -.392$, $p = .047$). In other words, positive critical incidents resulted in higher self-confidence for younger job candidates but less so for older candidates, and the valence of the incident had a stronger impact on women’s self-confidence.

This study has uncovered critical touchpoints that affect candidates’ overall experiences, highlighting what employers should devote additional attention to. Future research in needed to further deepen our understanding of how these touchpoints interrelate toward a holistic candidate experience.

Oral presentation OP808

Cross Cultural Differences in Net Promoter Score Feedback on Online Assessment Candidate Experience

Fabian Jendroska, University of Kassell; Maximilian Jansen, Mert Kurtuttan, Nino Sziedell, Shloka Goyal & Yuyun Huang | Aon Assessment Solutions

Introduction

Applicant reactions have gained relevance in personnel selection research and practice, with research indicating their relations to behaviors such as acceptance of job offers, as well as test and job performance (McCarthy et al., 2017).

With the adoption of online assessments increasing as technologies further develop, personnel selection processes are becoming more globalized, making cultural differences an important factor to consider in research and practice as they shape people's values and influence their behavior (e.g., Straub et al., 2002).

An initial search for literature revealed surprisingly sparse research on cross-cultural differences in the context of the candidate experience of online assessments. Much of the present research is thus of exploratory nature. Our goal is to gain a better understanding of possible associations between characteristics of online assessment processes and candidate experience across different cultures.

Methods

This study uses a dataset including 1,030,928 applicant reactions collected in 32 countries around the world, across 2837 assessment projects, each of them using different combinations of online assessment instruments from Aon Assessment Solutions' portfolio. Each country included between 888 (Israel) and 256,399 (U.S.A.) candidates.

We have included cultural dimensions scores at country level using archival data from Geert Hofstede's personal website (Hofstede, 2015).

Applicant reaction was operationalized as Net Promoter Score (NPS) (Reichheld, 2003; Crispin, 2014; Verhoeven, 2016, 2020). NPS captures the willingness to recommend potential employers based on experiences in a selection process as score between 1 to 10.

For each assessment project we extracted the following information: median time of completing the assessment (MT), number of ability tests (Ability), number of personality tests (Personality), number of integrity tests (Integrity), proportion of gamified assessments (PGA), and proportion of customized assessments (PCA).

Analysis and Results

Due to the complexity of the research questions, we used several different methods. A Mixed Linear Model (MLM) using assessment characteristics as fixed effect, country as random effect, and applicant reactions as dependent variable, showed significant positive effects of PCA (.13), Personality (.04), and PGA (.01), and significant negative effect of MT (-.03) and Integrity (-.01). The model was run again for each individual country, saving each equation coefficient. We correlated the coefficients with the cultural dimensions of the countries.

Secondly, we ran an MLM with cultural dimensions as fixed factors, Country as random factor, and Projects as random factors nested in Countries. We found a significant positive effect of uncertainty

avoidance (.03), a nearly significant negative effect of individualism (.08, p = .087), and a negative, nonsignificant effect of long-term orientation (-.05, p = .21).

Thirdly, we ran a moderation MLM where the cultural dimensions, the assessment characteristics, and their interactions are the fixed effects, the country level is the random effect and the candidate reaction is the outcome variable. We found positive significant effect for PCA (.13), a negative significant effect for median time (-.06), and significant negative moderation effects for indulgence and personality (-.05) and uncertainty avoidance and integrity (-.03).

Limitations and Further Research

One downside of the NPS as candidate reaction measurement is its use of a single question, which limits reliability. Future research should use more psychometrically sound measurements of applicant reactions (e.g. Patterson et al., 2011). Also, we did not use for this study other potentially relevant variables such as candidates' personalities, values, and score to the cognitive assessments.

Due to the way Aon's assessments are usually embedded in clients' selection processes and branded using a company logo and colors, candidates may be under the impression of communicating directly with the company they are applying to through the NPS comment field. Reviews of Aon NPS qualitative data have shown a small number of candidates using this comment field for self-promoting messages, predominantly provided alongside an NPS score of 10. It seems reasonable to assume this might have a small positively distorting effect on quantitative analyses of NPS scores in this study.

Conclusions

Cultural differences are important to consider in globalized personnel selection, extend well beyond simple translations of items, and have far-reaching implications for fairness, equal opportunities, and ethical HR-practices. While limited by the structure of the data, our analyses reaffirmed that candidate reactions depend on a variety of factors including cultural differences. Culture also influences the effect test characteristics have on candidate experience, suggesting that the culture-specificity of design decisions in assessment should be considered in international personnel selection. We hope to prompt and enable further research on candidate experience and the NPS-method in cross-cultural settings by highlighting various avenues that might be worth exploring in subsequent, more targeted studies.

Oral presentation OP441

Cross-cultural validation and measurement invariance of the Short Grit scale (Grit-S): initial results

Fatima Abu Hamam, Riccardo Sartori & Andrea Ceschi |Università di Verona

science&practice

Research goals and why the work was worth doing

The present study aims to determine the validity, reliability, and measurement invariance across five European countries of the Short Grit Scale (Grit-S).

Theoretical background

Duckworth and Quinn (2009) elaborated the Short Grit Scale (Grit-S). According to the authors, grit comprises two separate, yet related dimensions: (a) perseverance of effort and (b) consistency of interest. The Grit-S measure is a short self-report scale that relies on a previous Grit scale, namely the Grit-Original scale (Duckworth et al., 2007, Grit-O) which has shown room for improvement. The Grit-S considers only 8 out of the Grit-O's 12 items that appeared to have the best overall predictive validity. The validation of the scale reported that the Short Grit Scale (Grit-S) improved psychometric properties if compared to the first original version (Grit-Original scale), with higher levels of internal consistency, test-retest stability, and predictive validity. Since that, Grit-S has been validated in different countries, yet the literature lacks cross-cultural validation.

Design/Methodology/Approach/Intervention

To determine the validity, reliability, and measurement variance of the Grit-S across countries, we gathered from previous international validations of the scale; Italy (n=235), Germany (n=350), Poland (n=570), Spain (n=1826), and the United Kingdom (n=264). A series of traditional confirmatory factor analyses (CFA) and less restrictive exploratory structural equation modelling (ESEM) models are used to determine the best factorial structure of the Grit-S Scale across countries.

Results obtained or expected (if not available, it must be made clear when they will be)

According to the literature, we expect results to show good reliability and validity indexes of the Short Grit Scale (Grit-S) across the nations we have considered. That is, a bifactor ESEM model, with one general factor of overall grit and two specific factors (i.e., consistency of interest and perseverance of effort).

Limitations

Limitations of the study can be reconducted to the fact that this study only includes European countries and therefore cultural differences among participants might be limited. Moreover, the scale was not compared to other scales measuring the same construct, which could have permitted the measurement of the discriminant component validity. In addition, individual differences such as age, gender, and social background had not been explored. It could be interesting, in the future, to investigate cultural differences in a wider range of countries including non-European, and to investigate whether demographic differences can have an impact on the validity of the scale. Moreover, it could be helpful to use another scale to compare the results, such as for example the previous version of the scale: the Grit-O Scale.

Conclusions – research and or practical implications/Originality/Value

The construct of grit has given proof to be a predictor of success in one's own personal and working life. Therefore, a valid instrument that measures grit in diverse cultural environments can be useful for academics and practitioners interested in such a positive construct. [FT1] What is more, the originality of this study lies in the fact that it is the first cross-cultural validation of the Short Grit Scale (Grit-S).

CROSSOVER OF ENGAGEMENT AMONG ACADEMIC STAFF AND STUDENTS DURING COVID-19

Chantal Olckers, Pieter Schaap & Reynell Van der Ross | University of Pretoria

science

Why the Work was Worth Doing: Globally, the pandemic had adverse consequences on the work engagement and overall well-being of university academic staff that in turn may have adversely influenced university students' emotional engagement. This study explores the crossover of engagement from academic staff to students during times of disruptive change.

Research Goals and Theoretical Background: This study drew on the premises of crossover theory and Kahn's theory on personal engagement to explore engagement linkages among academic staff and students. Given that lecturers can be important role models to their students or serve as a salient example, the present study operationalised the leader–member exchange (LMX) theory as a process that underlay and explained the crossover of engagement from lecturer to the student. This study utilised interpersonal processes of social interaction and exchange, such as reciprocity, to explain the mechanisms that underlay the crossover of engagement from lecturers to students to vice versa. Subsequently, the study explored the positive outcomes of engagement for both academic staff and students.

Design, Methodology, and Approach: A purposive, non-probability sample was employed and a cross-sectional survey research design was used. The sample consisted of a total of 1 594 students who were nested within 160 academic staff members. The average cluster size was 9.9 members. Multilevel structural equation modelling was conducted.

Results: The study's findings revealed non-significant relationships for both the crossover relationships proposed between academic staff and students. Although the results did not reveal crossover effects from academic staff to students and vice versa, the findings highlighted the positive influence of interpersonal factors such as high student leader–member exchange among students on student engagement. Findings further highlighted the negative impact of students' lack of reciprocity on the emotional engagement of academic staff. In exploring the outcomes of engagement in a crossover setting, findings revealed that student engagement was positively related to a deep-learning approach, and negatively related to a surface-learning approach. This suggested that when students were engaged, they tended to be intrinsically motivated to understand the meaning of the material they studied, and not to follow rote learning strategies. Furthermore, this study found a positive significant association between emotional engagement and the psychological well-being of academic staff.

Limitations: This study employed a cross-sectional design and measured all variables using self-report instruments. Subsequently, the study was limited in terms of testing the causality underlying the research hypotheses and was subjected to the possibility of common method bias. The university lecture sample size was another limitation.

Contribution, Implications, and Conclusion: Through the use of theories on personal engagement, crossover, and the LMX theory, as a theoretical lens through which to conceptualise the lecturer–student relationship, this study answered the call of scholars to address the scarcity of studies investigating mutual influences between students and academic staff within HE. This study further addressed the scarcity of studies on the crossover of positive constructs. This study further built on previous studies that highlighted the positive outcomes of engagement by exploring these outcomes

in a crossover setting during the COVID-19 pandemic. The study's findings highlighted the importance of the lecturer–student exchange relationship in addressing engagement and well-being-related aspects in respect of academic staff and students. The study further highlighted that engagement played a key role in supporting psychological well-being among academic staff, and in fostering a deep approach to learning among students. Against the backdrop of the COVID-19 pandemic and the priority of employers to reduce the negative psychological and behavioural challenges resulting from this pandemic, the present research intended to inform policy-makers in higher education institutions on how to approach aspects such as the engagement of both academic staff and students in a holistic manner and as a core institutional strategy.

Relevance to the Congress Theme : In the context of the challenges that organisations world over experienced as a result of the pandemic, it seems imperative to better understand and improve engagement as a positive psychological construct. The present study advocated the need for educational institutions to recognise the importance of engagement and mutual influences among academic staff and students.

Cultivating Personal Growth Outside of Work: A Daily Investigation of Affiliation Resources Provided by the Leader and Nonwork Mastery

Maie Stein & Vanessa Begemann | Department of Industrial and Organizational Psychology, Universität Hamburg, Germany; Sabine Gregersen, Institution for Statutory Accident Insurance and Prevention in the Health and Welfare Services, Germany; Sylvie Vincent-Hoeper, Department of Industrial and Organizational Psychology, Universität Hamburg, Germany

science&practice

Purpose: Mastery – the experience of personal growth during nonwork time – is a core recovery experience that emerges from off-job activities that include challenges and opportunities for learning (Sonnentag & Fritz, 2007). Despite the importance of mastery to day-to-day recovery, we know little regarding the day-level work-related antecedents of mastery experiences. Drawing on conservation of resources (COR) theory (Hobfoll, 1989) and resource exchange perspectives, this study aims to shed light on the role of affiliation resources provided by the leader (i.e., demonstrations of warmth, care, and positive regard) during the workday in promoting mastery during after-work time.

Theoretical Background: Based on COR theory, we propose that the affiliation resources provided by the leader during the workday will not in and of itself generate mastery experiences but rather serve to increase self-esteem and work engagement, which helps employees experience mastery during after-work time. Resource theory of social exchange (Foa & Foa, 1974), which suggest that people attribute more value to affiliation resources that they receive from someone with whom they have a high-quality relationship, allows us to identify leader-member exchange (LMX) quality as a boundary condition. Based on this idea of particularism, we argue that employees in high-quality LMX relationships benefit more from affiliation resources in terms of self-esteem and work engagement than do employees in low-quality LMX relationships.

Design/Methodology: We collected daily diary data from 198 employees (768 days), and we tested the proposed model using Bayesian multilevel path analysis.

Findings: The results showed that on days when employees perceived that their leader provided more affiliation resources, they reported higher levels of self-esteem and work engagement and, in turn, experienced higher levels of mastery during after-work time. Additionally, we found that LMX quality had a cross-level moderating effect on the relationship between day-specific affiliation resources and day-specific work engagement. Specifically, the indirect day-level relationship between affiliation resources and mastery via work engagement was stronger for employees with higher LMX quality.

Limitations: One limitation of this study is the correlational and self-reported nature of the data, which raises concerns regarding common method variance and reverse causality. Furthermore, we note that the high degree of work-related activation involved in work engagement might also interfere with nonwork experiences, and we recommend that future research examine other recovery experiences to explore potential adverse effects.

Conclusions: The findings of this study contribute to recovery research by identifying the day-level work-related factors and psychological processes that are associated with mastery during after-work time. By highlighting the interplay of day-specific resources and general perceptions of LMX quality, we advance the understanding of LMX as a dynamic phenomenon and provide a more nuanced understanding of the relative value of resources provided by the leader to employees.

Relevance to the Congress Theme and Contribution to the UN Sustainable Development Goals: In their 2030 Agenda for Sustainable Development, the United Nations Member States committed to work towards ensuring healthy lives and promoting well-being. With the adverse impact of the COVID-19 pandemic on the global workforce, the importance of this goal has even increased. Indeed, there is growing recognition that the future of work is through employee well-being. We believe that rethinking the role of organizations in improving employee well-being should move beyond employee optimal experience and functioning at work to place greater emphasis on the nonwork domain. Day-to-day recovery is a key factor in sustaining employee well-being. This work highlights that the provision of resources provides a promising avenue for organizations to improve employee recovery and well-being and sheds light on the important role of leaders in helping employees unwind from work.

Oral presentation OP314

Current and anticipated demands impact on work break behaviours: a field experiment

Maximiliano Escaffi-Schwarz, School of Psychology, Universidad Adolfo Ibáñez; David Hughes & David Holman | Alliance Manchester Business School, The University of Manchester

science

Goals

The aim of this study is to examine how pre-break and anticipated post-break task characteristics influence work break behaviours, e.g., recovery, rumination. Knowing under which conditions workers will engage in different break behaviours can lead to a better understanding of the break process.

Background

Work break activities can be broadly divided into being mentally detached (i.e., relaxation) from and being mentally engaged (i.e., thinking about work) in work during breaks (Cropley & Zijlstra, 2011; Fritz et al., 2011). Break activities are important because they impact well-being and performance (Lyubykh et al., 2022; Vahle-Hinz et al., 2017). However, little is known about how task characteristics influence engaging in different break activities. We consider this an important omission because fit and recovery theories suggest that employees need to tailor their resting time to their demands to maximise recovery (de Jonge et al., 2012; Venz et al., 2019). Thus, we consider examining the impact of task demands on break crucial to further our understanding of break processes and to better develop break interventions.

Based on recovery research, we propose that pre-break task demands influence the type of activities employees engage in during their breaks. Specifically, employees who experience emotionally demanding tasks (i.e., experiencing unpleasant emotions while performing a task; Van Veldhoven & Meijman, 1994) should be more likely disengage from work during their breaks in ways that foster positive affect, such as relaxation, to improve their mood. Alternatively, experiencing negative affect usually narrows the attentional focus to the source of the negative affect (Hamesch et al., 2014). Thus, experiencing emotional demands before the break could also lead to ruminating about negative work events during the break. However, past research has argued that workers not only anticipate future job demands, but also prepare for them (G. Feldman & Hayes, 2005). Thus, in the same way pre-break task demands affect break activities, we argue that post-break task demands should also influence break behaviours. Specifically, employees anticipating cognitively demanding tasks (i.e., high levels of concentration and attentional focus; Van Veldhoven & Meijman, 1994) should be more likely to mentally engage in work in the form of anticipatory problem-solving pondering to pre-emptively reduce stress (M. S. Feldman & Worline, 2011). Thus, we argue that both experiencing and anticipating emotional and cognitive demands at work should influence what workers do during their breaks in terms of relaxation, rumination, and problem-solving pondering.

Design

We recruited 306 participants working full-time to conduct a field experiment involving two surveys: one immediately before any break and one immediately after that break. In the first, participants were randomly assigned to one of three groups that nudged participants to describe their current task (group 1), anticipated task (group 2), or general work (control group) in terms of dislike, cognitive demands, and emotional demands. In the second survey, participants reported the extent

to which they engaged in relaxation, problem-solving pondering, and affective rumination during the break. In this way, we were able to compare how focusing on pre- and post-break task characteristics influence what workers do during breaks.

Results

As hypothesised, employees who completed emotionally demanding tasks were more likely to engage in affective rumination during the break. Further, employees who anticipated cognitively demanding tasks were more likely to engage in problem-solving pondering during the break. However, completing emotionally demanding tasks did not predict engaging in relaxation during the break, but performing a disliked task was.

Limitations

The treatment is closely related to priming behaviours which has been critiqued for its low replicability. Thus, future studies should aim to manipulate task characteristics to have more internally valid results. Another limitation is the self-report nature of the scales.

Conclusions

We conclude that pre-break and post-break task demands affect break activities. From a theoretical perspective, this study helps understand how workers can engage in different break activities depending on their job demands, and, to the best of our knowledge, this is the first study that addresses how anticipated demands can affect work breaks.

Relevance

Workers are facing new demands based on the new post-pandemic world, and our work can be crucial to help employees rest. Specifically, we show that instead of adopting a 'one break fits all needs' approach, common in many break interventions (e.g., Schulz et al., 2017), we suggest understanding what workers require to feel better based on their demands.

Relevant UN SDGs

The paper contributes to the UN SDGs by aiding our understanding of work breaks can contribute to 'Good Health and Well-Being'.

Keywords: Work Breaks, Task Characteristics, Field Experiment

Oral presentation OP35

Customized leadership practices: Do they work with Millennials?

Nikos Bozionelos, emlyon business school; Anna Centiu, Northumbria University, Newcastle, United Kingdom; Georgios Bozionelos, Sotiria General Hospital, Athens, Greece

science&practice

Research Goals

The study focused on customized leadership practices – a new construct that refers to those practices that are most effective in managing a population with particular characteristics or a cohort - with reference to "millennials" or Generation Y (Gen-Y) that is people who were born from 1980 until the mid-1990s. The study was conducted in a national setting that is different from the "western" settings where most conceptual work on leadership has been conducted, but also from which most references to the Gen-Y are drawn. It took place in Romania where early millennials were socialized in the Soviet era, characterised by an egalitarian environment, marked by the utopic idea of a planned economy, scarcity, and an omnipresent totalitarian government. The fall of the communist regime in 1989 and the tumultuous years that followed saw young millennials growing in a struggling economy that transitioned from a socialist to a capitalist structure. These events mark a distinct experience, very different from that of the "western" Gen-Y ((Raiu, 2021; Shaw, 2018).

Theoretical background

Being one of the most delved into subjects, many theories to address best styles and practices of leadership have emerged. However, leadership is not static, it needs to evolve and adapt in line with cultural and societal changes (Anderson et al., 2017; Northouse, 2021). Generations are linked with different values, expectations and life views; hence, to optimize the effectiveness of leadership practices it is necessary to understand the values, motives, and stances to life of each generation (Graybill, 2014; Omilion-Hodges & Sugg, 2019). Gen-Y already compose a large part of the work force, and they will become the dominant workplace generation in the years to come. Evidence suggests that no major leadership approach fits into the leadership preferences of Gen-Y (Graybill, 2014; Putriastuti & Stasi, 2019). Consequently, authors recommend combining elements of various leadership approaches along with translating generational characteristics into leadership traits and styles in order to find the optimal approach to leading Gen-Y (Farhan, 2021; Putriastuti & Stasi, 2019). In the present work, therefore, we considered customized leadership practices as those leadership approaches that are most effective in managing Gen-Y professionals. Farhan (2021) developed a comprehensive such framework by means of identifying extant approaches that matched best with the values, habits and expectations of Gen-Y: servant-tolerant, authentic-stringent, and ethical-tournament.

The aim of the study was to test the validity of the customized leadership practices (as above) using the Romanian Gen-Y as reference. It did so by testing their relationships with key work attitudes and outcomes. Additionally, the study aimed at identifying whether Gen-Y favours any leadership practice in particular.

Method

The setting was the Romanian software industry, and participants were 256 Gen-Y software developers (out of the 320 respondents who provided valid responses, the rest did not belong to Gen-Y) from 11 companies that are active the software business in the Cluj-Napoca area, the second

largest metropolitan area of Romania. Data were collected using validated scales that were made available in both Romanian and English (the original) language.

Results

Results showed a strong relationship between the total customized leadership practices with all outcomes (employee engagement, workplace well-being, job performance and turnover intentions) in Gen-Y participants (range of explained variance 26% - 37% beyond the controls). These relationships (amounts of variance) were stronger than the corresponding relationships for the non-Gen-Y participants. Each of the three leadership practices (servant-tolerant, authentic-stringent, and ethical-tournament) was significantly related with all outcomes. Of the three practices, it was the authentic-stringent that showed the strongest relationships with outcomes, alluding to the fact that this may be the preferable leadership approach for these Gen-Y representatives.

Limitations

The study was conducted within a particular culture, hence, generation to Gen-Y globally must be avoided at this stage. Furthermore, due to the design, definite conclusions about causality cannot be made.

Conclusions

The results attest to the validity of the customized leadership practices approach. This is one of the first studies to test this approach with respect to the Gen-Y generation. Furthermore, conducting the study in a country with a different historical course than “mainstream” countries addresses one of the limitations of generational theory (Parry, 2011; Rauvola et al., 2018).

Relevance to the Congress Theme

The submission is suggestive of the need to adapt our leadership style to the characteristics of each generation; hence, it is highly pertinent to the Congress theme: The future is now: The changing world of work.

Keywords: customized leadership; work well-being; generations

Oral presentation OP332

Daily recovery and performance outcomes in academia: The mediating role of work engagement and the moderating role of perceived supervisor support

Panagiotis Gkorezis, Anastasia Chatziioannou & Despoina Xanthopoulou | Aristotle University of Thessaloniki, Greece; Kyriakos Tsamantouridis & Victoria Bellou | University of Thessaly, Greece

science

Research goals and why the work was worth doing: In this diary study we focused on academics with the aim to investigate the role of state of recovery in the morning for daily task performance and organizational citizenship behavior (OCB) towards colleagues and students, through work engagement. We also aimed to examine whether these mediating effects depend on perceived supervisor support (PSS). In this way, this study contributes to the literature in the following ways. First, we add to the literature on the beneficial effects of recovery for work engagement and, in turn, performance-related outcomes for the specific occupational group of academics, who find it hard to recover due to the nature of their work. Next, we investigate whether PSS can act as an additional resource for academics that may determine when recovery is more likely to bring beneficial outcomes. Last, we extend existing literature on the context-specific performance-related outcomes of work engagement for academics, namely organizational citizenship behavior towards colleagues and students.

Theoretical background: In congruence with COR theory, we hypothesized that academics' state of recovery in the morning will relate positively to work engagement because state of recovery indicates availability of resources that may be invested at work. In turn, work engagement will have a positive association with task performance, OCB towards colleagues and OCB towards students as academics who demonstrate high levels of work engagement reinvest their resources to achieve higher performance-related outcomes. Furthermore, we hypothesized that PSS offers a surplus of resources which can boost the positive impact of state of recovery on work engagement and the latter's positive effect on performance-related outcomes, namely task performance, OCB towards colleagues, and OCB towards students.

Methodology: Our study focused on academics from a Greek university, who were invited to participate via the university's e-mailing list. Those who expressed interest in participating, first, completed a general questionnaire concerning their demographics and perceived supervisor support. Then, participants were asked to fill in an electronic diary for five consecutive workdays, twice a day: In total, 36 academics (46% men) participated in the diary study. Most participants (40%) were Full Professors.

Results: Multilevel analyses did not support the positive relationship between state of recovery in the morning and work engagement during work. However, PSS was found to moderate this relationship. Specifically, the relationship between state of recovery and work engagement was positive and significant only for higher levels of PSS and non-significant for lower levels of PSS. Furthermore, work engagement was found to related positively with task performance and OCB towards students but it was unrelated with OCB towards colleagues. PSS was not found to moderate these relationships. Finally, the Monte Carlo Method for assessing mediation showed that state of recovery related positively and indirectly with task performance and OCB towards students via work engagement but only for those academics perceiving higher levels of PSS.

Limitations: The small sample size and use of self-report data only are important study limitations.

Conclusions: The results of the current study are relevant for theory and organizational practice because they highlight the role of PSS as a boundary condition that determines when state of recovery may translate into higher work engagement and better performance at work. Our findings show that a supportive supervisor is necessary in order for successful recovery to facilitate optimal functioning at work on a daily basis.

Relevance to Congress Theme: Our study demonstrates relevance to the Congress Theme because examining academics' state of recovery affects performance-related outcomes.

Relevant UN SDGs: The area of this study is relevant to the Sustainable Development Goals of the United Nations because it demonstrates ways in which academics can promote their well-being.

Keywords: State of recovery, performance outcomes, moderated mediation

Oral presentation OP792

Daredevils in Suits? The Relationship of Managers‘ and Employees‘ Risk Preference Profiles with Gender and Social Class

Marie-Therese Wiese, University of Hamburg

science

Individual risk preferences play a crucial role in managerial decision-making. Thus, knowledge of valid measures and correlates of risk preferences is important.

While research, in general, has found that women are more risk averse than men (e.g. Croson & Gneezy, 2009), some research findings indicate different patterns of gender differences in risk preferences of managers and employees without managerial responsibility. Johnson and Powell (1994) found no differences in risk-taking behaviour of male and female manager, but found gender differences in a non-managerial population. Adams and Funk (2012) found that female managers showed more risk-loving behaviour than male managers. Research on social class in organizations, e.g. managers, and on social class and risk preferences is emerging but still at the beginning (Kish-Gephart et al., 2022). The first findings indicate that an executive’s social class origins affect their risk preferences (Kish-Gephart & Campbell, 2015).

This study investigates how gender and social class as demographic characteristics relate to the risk preference of managers in comparison to employees. More specifically, it incorporates a comprehensive view of risk preferences based on the psychological risk-return framework. This framework proposes domain-specificity of risk preferences (financial, social, recreational, health, ethical) (Blais & Weber, 2006; Weber et al., 2002). Based on the framework, Frey et al. (2020) developed a typology of four risk preference profiles: the “cautious”, the “recreational adventurers”, “the financial gamblers”, and the “daredevils”.

The current study investigates whether similar profiles are found in a population of German managers and employees. Data were collected in November and December 2020 using an online survey via a panel provider (N = 652). Individual risk preferences in the domains of finance, social, recreational, health, career, and driving and a general factor of risk preference (Frey et al., 2017; Highhouse et al., 2017) were measured using single items (Dohmen et al., 2005). Participants indicated their gender, age, managerial responsibility, and social class as education of the parents (UNESCO Institute for Statistics, 2012). Latent Profile Analysis and a 3-step ML auxiliary variable integration approach (Garber, 2021) were used to estimate the risk preference profiles and the relation to covariates separately for an employee (N = 437) and a managerial (N= 215) subpopulation.

The results of the data analysis are preliminary. Fit indices and theoretical reasoning suggest a model with four profiles. Results indicate two similar profiles for the managerial and employee subsample: one profile with overall low risk preferences termed the “cautious” (28.88% of the managers; 21.97% of the employees), and one profile with overall high risk preferences, termed the “daredevils” (18.55% of the managers; 4.37% of the employees). In the employee subsample, the third profile with overall slightly higher risk preferences than the “cautious” is called the “moderates” (41.58%). The fourth profile, “the recreational adventurers” (32.08%) has overall slightly higher risk preferences than the “moderates”, with the highest being recreational and general risk preferences. In the managerial subsample, the third profile shows low risk preferences for driving and health but high on everything else (“health cautious”, 27.76%). The fourth profile shows in general medium but slightly higher health and lower financial risk preferences (“moderates”, 29.81%).

Analyses of covariates indicate that in comparison to all other profiles, the “cautious” are significantly more likely to be female (except in comparison to “moderate” employees). “Daredevil” managers are significantly more likely to have a father with higher education. Employee “recreational adventurers” and “daredevils” are more likely to be male and younger than the “cautious” employees.

The main limitation is the small sample size (Nylund et al., 2007). In a follow-up study, conducted until the conference, data from the SOEP will be used to replicate the risk profiles within a larger, population-representative sample and test whether the profiles are stable over multiple time points, also to account for possible COVID-19-related effects.

Overall, the current study underscores the need of investigating managerial risk-taking in comparison to employees. Gender differences in risk profiles seem to be quite stable across subpopulations. Further, paternal education can affect managerial risk preferences.

The research relates to the congress theme as it investigates who and how is making relevant business decisions that will impact our work life in the future. It is relevant to the UN SDG of decent work and economic growth by contributing to the understanding of the individual characteristics which influence managerial decision-making.

Keywords: Risk preference, Managers, Gender

Oral presentation OP38

Dark side of top-management communication: ideologies, biases corruptions, distortions, mistrust

Anna Kiseleva & Petr Vlasov | Institute of Applied Psychology

science&practice

Problem setting: At the beginning, entrepreneur (initiator-owner) creates his own concept of organization – value-cognitive-actional pattern, which is socialized, coming into conflict with top-manager's and manager's (senior staff) individual interests (moral disengagement, A. Bandura). For this purpose, they use various distortion styles of organziational reality (K.Weick) in their interpretations of values, cognitions and actions, thereby distroying organizational productivity. Purpose: To explore wide-spread distortion styles in interpretations of organizational reality (with top-manager's and manager's (senior staff)). Method: we obtained 95 organisational self-descriptions from top-manager's and manager's (senior staff)(A.Kiezer)of companies (numbering 50-1500 workers) and classified them (key topis, actors, intention). Then we discovered interpretation styles in this organisational self-descriptions and have grouped them according to a specially developed hierarchical model of organisational self-descriptions on several levels (formal: procedures and rules of behavior; content (statics: objects, agents and their attributes; dynamics: processes, algorithms and technologies); sense-logical: purposes, causes, values and beliefs). Results : We indentified among top-manager's and manager's (senior staff) the following distortion styles of the entrepreneur's value- cognitive-actional pattern: Procedural (formal) - formal following of rules, norms, instructions, personnel follows formal rules. Authoritarian (static) – the power of guarantor, authority and enactor of rules; personnel is obedient and loyal. Participative (dynamic) – interaction, rules and hierarchies are the result of negotiations; the head of organisation is a moderator; personnel is a part in negotiations. Conclusions: Destructive distortion styles of top-manager's and manager's (senior staff) interpretations lead organziations to: Moral disengagement – avoidance of values in relationships, decisions and actions. Guilt instead of responsibility – feeling guilt or self-justification. Closed mindedness – insisting on one's own vision and ignoring environmental feedback.

Keywords: mistrust, values, organisational culture

Oral presentation OP249

Daydreaming at work: An experience sampling study of the frequency, content and characteristics of mind-wandering

Miguel Ibaceta, University of Manchester; Karen Niven, University of Sheffield; David Holman, University of Manchester

science

Research goals and why the work was worth doing:

Daydreaming or Mind-wandering describes thoughts that are unrelated to our immediate environment or task. Research on mind-wandering while working is emerging, but we currently know relatively little about what people mind-wander about (contents of mind-wandering) and the characteristics of mind-wandering, such as its intentionality and temporal orientation. The goal of the present study is to shed light on the contents and characteristics of mind-wandering at work, when compared to focused thoughts at work and to mind-wandering outside of work. Greater insight into the contents and characteristics of mind-wandering is important because scholars have just started to discuss the consequences of mind-wandering on our productivity and creativity, but not all types of mind-wandering may have the same implications.

Theoretical background:

While there is consensus on the detrimental effects of mind-wandering for attentional demanding tasks (e.g., supervising processes or driving) (Smallwood & Schooler, 2015), the idea that mind-wandering could benefit performance in, for example, creative tasks has begun to flourish (Dane, 2018). Arguably, the effects of mind-wandering depend not only on the task at hand but also on the characteristics and content of the ongoing thought. For example, it is known that unintentional mind-wandering is associated with diminished performance on memory tasks, while intentional mind-wandering is not (Seli et al., 2017). However, to the best of our knowledge, no study has previously described, in a naturalistic scenario, the nature and characteristics of our mind-wandering when working. Therefore, and taking into account the suggestions of Eronen and Bringmann (2021), to better understand the consequences of mind-wandering for work and develop theoretical models around it, we conducted this study to understand how mind-wandering takes place while people are working.

Design/Methodology/Approach/Intervention:

In this exploratory study, through experience sampling methodology (five consecutive days, three times a day), we asked 131 workers about the contents and characteristics (intentionality and temporal orientation) of their current thoughts while working and when doing other activities.

Results obtained:

We used inductive content analysis to derive categories or emergent themes from people's responses (Hsieh & Shannon, 2005). We found that most thoughts reported were about current concerns (e.g., work, food, health and well-being etc.). Using logistic regression, we found that people mind-wander less while working and more unintentionally than they do while not working, but they also mind-wander about work more than any other content. Also, mind-wandering thoughts are very similar in content to focused thoughts when people are not working. However, focused thoughts at work are notably different in content and characteristics from mind-wandering thoughts.

Limitations:

While this study has many strengths (e.g., using experience sampling and allowing people to describe their thoughts instead of imposing categories), it also has some weaknesses. For example, we got much fewer responses when people were working, perhaps because of the burden on participants' time due to having to write about the contents of their thoughts. Future studies could include other ways to acquire data, like using voice-recorded messages.

Conclusions – research and or practical implications/Originality/Value:

We conclude that the context (i.e., working vs not working) exerts noticeable influences on the nature of people's thoughts. It seems that people are able to regulate the frequency and characteristics of their thoughts depending on their surroundings. People report fewer instances of mind-wandering when working but also having more unintentional mind-wandering thoughts at work than outside of it. These findings are relevant because they tell us that mind-wandering varies significantly at the individual level and is mainly associated with current concerns. Future models about mind-wandering should consider concomitant variables like self-regulatory abilities and measures of current concerns.

Relevance to the Congress Theme:

Considering the propositions of Weiss and Rupp (2015), we believe that it is critical for the future of our discipline, taking into account the experience of workers. While part of our most intimate experience, the stream of consciousness has been mostly neglected in the organisational literature. This study highlights the importance of considering the subjective experience of working, which is pivotal in order to develop future sound theories that enable us to understand the relationship between people at work and their changing environment.

Oral presentation OP521

Demographic change in companies: Encouraging age diversity to benefit businesses - A Practice Report on an Austria-wide project

Alexandra Weilhartner, ÖSB Consulting GmbH, LMU - University of Munich; Dieter Frey & Irmgard Mausz | LMU, University of Munich

practice

Research goals and why the work was worth doing

As the population ages, and people are required to work for longer, a consulting project, funded by European Social Fund and the Austria Federal Ministery for Labour, is making it easier for Austrian companies to attract and retain staff, by helping them to create better working environments for everyone. Over the course of 5 years (2017-2022) 1800 companies in Austria took part in the consulting program. The aim is to maintain long term employment, high performance across all age groups and recognize demographic change and use its potential to an advantage over the long term.

Theoretical background

Throughout Austria and Europe, the retirement age is elevated, which means that working lifetime will be extended and companies as well as employees have to take actions to retain workability and performance. Demographic change and specifically the lack of utilisation of the labour potential of older people in Austria have a major impact on the constantly changing labour market. Accordingly, the last 10 years the employment rate of 15-24 year olds decreased by 2.3% (up to 10.7%), while the number of over 55 year olds increased from 10.1% to 16.1% (Statistik Austria, 2021). Possible illnesses and a lack of suitable jobs, as well as the strong trend towards digitalization, also make it difficult for older people to keep up with the increased flexibility requirements and the constant new training requirements (Eur-Lex, 2022; Leoni, & Thomas, 2018). In this context, preventive measures need to be taken such as age(ing)-appropriate work conditions to maintain employees' ability to work.

Design/Methodology/Approach/Intervention

To address the issue of demographic change the project was created to prepare companies to overcome the future challenges like shortage of skilled workers, a lack of knowledge transfer, a greater number of retirements in the future and lack of age-appropriated and lifecycle-oriented working conditions and in the need of prevention of illnesses caused by workloads.

Together with companies from various sectors and of different sizes, instruments were developed, tested and tailored in order to raise awareness of the challenges of demographic change and to identify possible solutions in the areas of: Work design, human resources management, knowledge management, leadership and health. These experiences were shared in inter-company practical forums and information events in order to sensitize other companies. Tools such as reverse mentoring, age-appropriate workplace maps and job crafting were tailored together with the companies to strengthen the path to a change-resilient organization.

Results obtained or expected

In a survey conducted after the end of the program (N= 622) the results show a very high level of satisfaction with the consulting services, a significantly increased awareness of demographic change

and significant improvements of the possibilities for adapting jobs and the conditions for ageing-appropriate working.

Limitations

Evaluation of the program didn't include pre-measures and therefore no casual conclusions on the effect of the program can be drawn. Data was obtained through self-reports which may have caused common method bias.

Implications for research and practice

The program developed tools for companies to face the challenges of demographic change and age-appropriate work. On the one hand, we would like to address practitioners who are looking for impulses on the topic of demographic change for their consulting practice and share our lessons learned. On the other hand, we would like to encourage researchers to integrate these experiences from practice into their research for systematical exploration further how age-appropriate work can be achieved.

Originality & value

Demographic change is one of the challenges of our time. The noticeable effects on society and labor market are undisputed. The project shows a variety of practical solutions based on application-oriented tools, an agile approach in the development of these tools and possibilities to sensitize companies. It follows two principles: Sustainability and applicability. Companies are empowered to meet challenges on their own challenges at an early stage and to act effectively in the long term in order to remain agile and competitive.

Relevance to the Congress Theme

The topic of demographic change needs to be considered when we talk about the changing world of word. Actions need to be taken sooner rather than later to deal with certain issues. Through our practical insights we give valuable information how to address challenges and handle the demographic change in companies.

Keywords: demographic change, age-appropriate work

Oral presentation OP373

Designing Decent Human-Machine-Systems: Experimenting with Human Characteristics and Facilitating Conditions in a High Job Decision Latitude Context

Milan Wolffgramm, Saxion University of Applied Sciences / University of Groningen

science

Research goals

For more than half a century, 'job decision latitude' – the number of decision-making opportunities workers have to design their work – was considered a job resource workers could not get enough of, according to work- and sociotechnical systems designers. Recently, an increasing amount of evidence indicates that workers can be burdened by too many job decision latitudes, leading to stress or even burnout due to suboptimal work design.

Scholars noted that each job decision latitude requires workers to master certain capabilities (i.e., knowledge, skills, and attitudes) before constructive work design decisions can be made. Furthermore, workers' stance towards their own capabilities (i.e., self-efficacy), uncertainty (i.e., entrepreneurial mindset), and technology (i.e., user intention) tend to be relevant characteristics too.

We built further on this reasoning and propose that the concept of 'facilitating conditions' – the organizational and technical infrastructures to support the use of a system – could enable workers to leverage their job decision latitudes more constructively when lacking the required characteristics. We consider the design of a highly interdependent human-machine-system to be a constructive use of job decision latitudes by workers. In such a system, workers use the machine to acquire necessary, reliability-enhancing, and/or efficiency-enhancing task support. We aimed to uncover which combinations of human characteristics and facilitating conditions relate to highly interdependent human-machine-systems.

Design

We used an experimental design since it provided a controlled method, allowing us to uncover how specific sets of conditions related to their outcome. In the experiment, subjects participated in a simulated bin-picking activity. Their goal was to accurately gather materials at a sustainable pace. All subjects worked in two simulations: a manual simulation and a collaborative simulation. In the manual simulation, subjects completed the orders by themselves. In the collaborative simulation, subjects could use a pre-programmed collaborative robot arm (cobot). All subjects were provided with high job decision latitude, allowing them to choose from nine cobot applications and fully control the cobot's speed. Subjects were encouraged to use the cobot if it would support their goal achievement.

We adopted a 2x2 design, comprising two levels of education and two types of facilitating conditions. Level of education consisted of secondary vocational education and professional education. Facilitating conditions were either present or absent and ascribed randomly. Only subjects with facilitating conditions were provided with scripted design advice and technical support. We included 50 students enrolled in a technical vocational education track and 50 students enrolled in a professional education track that either had a technical profile and/or educated students on how to design decent work systems. The sample was appropriate since it comprised individuals with exclusive educational backgrounds and, assumably, different characteristics, allowing us to test our configurational causality.

The simulations were videotaped and validated questionnaires were administered to estimate subjects': self-efficacy, entrepreneurial mindset, and user intention. Time logs are currently being created and will be inserted in an interdependence calculation tool. Between and within-group differences are to be calculated and by using fuzzy qualitative comparative analysis, necessary and sufficient conditions are to be uncovered.

Results, Limitations, Conclusions

Given that we are currently running our experiment, we are confident that we can present our results, limitations, and conclusions during the EAWOP congress in May. Irrespective of the experiment's outcomes, it provides an innovative perspective on worker involvement in the design of human-machine systems. Furthermore, this contribution could provide practitioners, such as Human Resource professionals and line managers, with specific recommendations on how to manage high job decision latitude at an operational level.

Relevance to the Congress Theme

Our contribution is highly relevant to the Congress Theme “The Future is Now: the changing world of work” since it studies the prerequisites for workers to flourish in a state-of-the-art human-machine-system. Our study relates to recent contributions about the negative side effects of high job decision latitude. Sound conceptualizations and validated instruments from a broad range of literature streams, including applied psychology, are used in our experiment design. We also respond to a growing call for research studying the design principles of socio-technical systems, such as high job decision latitude, in modern work contexts.

Relevant UN SDGs

The outcomes are relevant to help safeguard decent work and economic growth (UN SDG 8) and pertain to fostering responsible consumption and production (UN SDG 12).

Keywords: Human-Machine-Systems; Socio-technical Systems; Experimental Design

Oral presentation OP341

Detecting Faking On Personality Inventories Using Machine Learning Algorithms

David Buitenweg; Nadine Janssen, Department of Psychology, Education, and Child Studies, Erasmus University Rotterdam, The Netherlands. Ixly, Utrecht, The Netherlands;

Dirk H. M. Pelt, Department of Biological Psychology, Faculty of Behaviour

science

Theoretical background & research goals. Self-report personality inventories are a popular assessment tool for personnel selection. However, their vulnerability to faking threatens the validity of the selection decisions made based on these inventories (Donovan et al., 2014; Mueller-Hanson et al., 2003). Faking is defined as distorting one's answers to provide a more favourable image in order to obtain a desired outcome (Fell & Konig, 2016; Griffith & Robie, 2013; Ziegler et al., 2011). Various approaches have been proposed to identify faking, including the use of social desirability scales and within-person correlations. Most of these methods assume that faking is largely uniform across items (Burns & Christiansen, 2011). However, theoretical models and recent findings suggest that faking is an item-based decision process dependent on perceived item characteristics (Goffin & Boyd, 2009), resulting in heterogeneous responses across items (Krammer et al., 2019; Holden & Marjanovic, 2021). In this light, machine learning (ML) approaches may offer new possibilities. ML algorithms make no theoretical assumptions about faking behaviour, can model non-linear relationships (Marsland, 2014), and may therefore be better suited for the heterogeneous nature of faking.

In two instructed faking studies, ML approaches showed promise for faking detection (Calanna et al., 2019; Mazza et al., 2019). However, methodological limitations of these studies limits the generalizability of these findings. In addition, the ML algorithms were compared to one another, not to multiple traditional indices of faking. Clearly, more research is needed to evaluate the utility of ML algorithms. Therefore, in this study, we compare the accuracy of various ML algorithms to multiple traditional indices in the detection of faking on the HEXACO personality inventory (Lee & Ashton, 2018) and the Work-related Personality Inventory (WPI; Rusthoven et al., 2012).

Methodology. The accuracy of the ML algorithms and traditional techniques will be compared for both personality inventories across three data sources: 1) in independent test sets of Monte Carlo simulations; 2) in instructed faking data (intended N =500); 3) in job applicants and non-applicants data from Anglim et al. (2017; N =3226) and test publisher Ixly (N =8882). In the Monte Carlo simulations, responses on the HEXACO (N =3226) and WPI (N =8882) are simulated for 4x3x3=36 (1000 replications) faking conditions that differ in faking prevalence, magnitude and variability. A unique feature of these simulations is that the faking probability will depend on the item-level social desirability. ML algorithms including Extreme Gradient Boosting (XGBoost) will be trained and cross-validated on these simulated item responses. The accuracy of ML algorithms is compared to traditional faking detection methods, e.g., social desirability index (SDI; Konstabel et al., 2006), standard error of measurement band (SEM; Griffith et al., 2007) and blatant extreme responding (BER; Landers et al., 2011).

Preliminary results. Preliminary analyses were conducted for four HEXACO simulation conditions (100 replications each) for a subset of the detection techniques. When the faking prevalence was low, the XGBoost ML algorithm performance was equal to or slightly less than the performance of traditional methods SDI, SEM and BER. In contrast, the ML algorithm outperformed these traditional methods when faking prevalence and magnitude were both high.

Limitations . The ML algorithms were trained on HEXACO and WPI responses; therefore, these results may not generalize to other personality inventories. Furthermore, in the job applicant sample the prediction accuracy of ML algorithms vs traditional techniques cannot be evaluated since the true prevalence of faking is unknown.

Conclusions. These preliminary results suggest that ML algorithms can compete with traditional methods in the detection of faking on personality inventories. Therefore, ML algorithms could be valuable in improving the detection methods for faking in personnel selection practices. The current study contributes to the literature by evaluating the performance of multiple ML algorithms and traditional techniques in the detection of faking across diverse datasets. Hence, the present study provides unique insights into the generalizability of ML algorithms for faking detection.

Relevance. This paper is highly relevant to the conference theme, as it ties in with recent trends in selection and assessment of applying artificial intelligence, such as ML algorithms, in selection procedures. The current study could be relevant for the SDG 'Decent work and economic growth'. By exploring the utility of novel ML techniques for the detection of faking within personnel selection, this study could contribute to improving person-job fit by safeguarding the validity of self-report personality inventories and the selection decisions made based on these inventories.

Keywords: Faking, Personality, Machine Learning

Oral presentation OP208

Determinants of creative thinking of IT employees in the light of empirical research

Agnieszka Lipinska Grobelny, University of Lodz Institute of Psychology

science

We are functioning in the era of the fourth industrial revolution, and this means advanced technological transformations in almost all areas of life. Organisations that use Industry 4.0 solutions rely on innovation and entrepreneurship. In this way, they seek to build their competitive advantage. There would be no innovation by companies without the creative behaviour or creative thinking of employees, which is why they have become the subject of research. In the literature, many researchers have dealt with identifying and describing creative personality traits (e.g. Rogers, Maslow). This study not only looks for personality conditions, but also situational ones, as in interactional concepts of creativity, its context plays an important role.

Therefore, the aim of the analyses was to find out what determines creative thinking, and the group involved in the research process was IT employees, specifically programmers. Their work is strongly based on creative thinking when they write code, plan, anticipate the effects of their actions, and look for out-of-the-box solutions. Identifying personality factors in interaction with contextual ones can significantly enhance or inhibit creative thinking in organisations, not only high-tech, but in general all companies concerned with their competitiveness. As a result, the knowledge gained can be translated into training programmes addressed to individuals who wish to develop their creative potential; on the other hand, it can create an organisational culture conducive to innovation. The concept of creative thinking was defined with reference to Urban's concept of creativity. In turn, the personality conditions were described using Costa and McCrae's five-factor model of personality, and environmental conditions – Kolb's organisational climate approach.

The group of 224 programmers participated in the study and were asked to complete the following research tools with validated psychometric properties: Urban and Jellen’s Test for Creative Thinking – Drawing Performance, Costa and McCrae's NEO-FFI Personality Inventory, and Kolb's Organisational Climate Questionnaire. The survey was conducted using the snowball method and was based on direct contact with programmers. The choice of this group was dictated by the specific nature of their work and related competences. The subjects, after giving their consent, left completed questionnaires in sealed envelopes, which were systematically collected by the researcher. The procedure was carried out in accordance with the principles of the Declaration of Helsinki. Respondents were informed that their participation was voluntary. They were given full information about the purpose and conduct of the study. They were assured of anonymity and that the results would only be used for group analyses.

As it was expected, the results indicated associations of creative thinking with openness to experience, conscientiousness and agreeableness. Moreover, the autocratic climate undermined the creative thinking of the programmers, for whom it appeared important to work with the possibility of independent decision-making and good social relations. The most important achievement, however, was the determination that only the joint consideration of personality traits with situational dimensions yielded the best results in explaining the variability in programmers' creative thinking. In an attempt to look at the results obtained, it should be noted that openness to experience is mentioned as a major component of creativity. Regarding the negative association of conscientiousness with creative thinking, the answer should be sought in its characteristics. Personality determinants complement the two dimensions of organisational climate. Programmers

emphasise the importance of a climate that supports effective creative work in the form of encouraging participation in challenging tasks and projects, maintaining high standards of work. An important role is played by management. The inclusion of gender deepened the analyses. This is because the list of determinants of creative thinking of female and male programmers contains certain determinants in common; others are indicated only by one group studied. Accordingly, the 'gender-universal' creativity simulators were openness to experience and conscientiousness, indicating that these are subjective traits common to people of different cultures or professions. Differences emerge at the level of situational conditioning of creative thinking.

The knowledge gained can be translated into training programmes addressed to people who wish to develop their creative potential; on the other hand, it can create an innovation-friendly organisational culture. As for the limitations and future directions of the research, it should be noted that the whole procedure is correlational in nature, without a control group, and it is reasonable in this case to speak of relationships, explanation rather than determination.

Keywords: creative thinking, personality, organisational climate, programmers, gender

Oral presentation OP487

Determinants of networking behaviors: Subjective norms and self-efficacy are more important than attitudes toward networking.

Hans-Georg Wolff & Gina Kistner | University of Cologne

science

Research goals and why the work was worth doing

Research into the determinants of networking behaviors is important to identify levers to support people in developing and increasing their networking behaviors. In this research we seek to provide a broader coverage of malleable determinants of networking behaviors using a theory of planned behavior (TPB, e.g., Ajzen, 1991) lens. We expand prior research on attitudes towards networking (e.g., Kuwabara et al., 2020) and examine the full TPB model including subjective norms (SN) and perceived behavioral control (PBC) as additional determinants and intentions as a mediator.

Theoretical background

Networking is an important career self-management strategy that is associated with subjective as well as objective career success. While many studies have focused on personality traits as determinants of networking, scholars have recently turned to examine more malleable determinants. For example, Kuwabara et al. (2020) showed that attitudes toward networking play an important role in explaining people's beliefs about networking. However, studies across a wide range of behavioral domains have shown that next to attitudes, subjective norms and perceived behavioral control are important determinants of behavioral intentions and behaviors. We hypothesize that all three constructs positively determine networking and examine whether they differ in their relative importance.

Design/Methodology/Approach/Intervention

We recruited a sample of N = 340 working individuals for a two-wave longitudinal study. We assessed predictors (attitudes, SN, PBC) and intentions at the first wave. Three months later we assessed networking behaviors as our primary dependent variable at Wave 2. All constructs were measured using multi-item scales with adequate internal consistency (i.e., alpha > .90).

The study design and hypotheses were preregistered at https://osf.io/7tbpw/?view_only=e3f20e32680b429e88545c149c5ad865. We limit the focus of this conference presentation to a subset of these hypotheses.

Results obtained or expected (if not available, it must be made clear when they will be):

While all three TPB constructs exhibit significant bivariate correlations with networking intentions and behaviors, multiple regressions indicate significant effects of SN and PBC, but not attitudes. Relative weights (RW) analyses further corroborate this finding: Subjective norms (rescaled RW: 39%) and perceived behavioral control (rescaled RW: 55%) are the major determinants of networking behaviors. The rescaled RW for attitudes was not significant (5%).

Limitations:

Although our longitudinal study provides evidence for covariation and temporal precedence, it does not provide causal evidence. Moreover, the time lag we chose may affect the strength of the

reported relationships and attitudes might predict networking intentions and behaviors with closer temporal proximity.

Conclusions – research and or practical implications/Originality/Value:

This research shows that attitudes may not be important predictors of networking behaviors. In fact, organizational or professional norms and culture might play a role in the adoption of networking and therefore a lever to increase networking. Furthermore, networking trainings ought to focus on control perceptions. As PBC and self-efficacy are highly similar concepts (cf. Ajzen, 1991), training concepts that incorporate self-efficacy (e.g., behavior modeling, Taylor et al., 2005) may be better suited than those aiming to improve attitudes.

Relevance to the Congress Theme:

Scholars have suggested that networking has become more important in boundaryless career environments or protean careers. With the changing nature of work, for example, increases in project work and the "gig economy", networking may become indispensable to secure a satisfying and affluent career.

Relevant UN SDGs:

Target 8.5. of the goal "Decent work and economic growth" includes notions of employment and salary. Next to institutional regulations and legislation, individuals need to be prepared to navigate a complex economy, update their KSAOs, maintain their employability, and have a successful career. Networking is an important skill to obtain these goals.

Keywords: Networking, Theory of planned behavior, careers

Oral presentation OP538

Developing and accompanying Italian student athletes enrolled in university: the challenges of employability and skills development

Mattia Belluzzi, Greta Pepi, Elisa Guidotti & Chiara D'Angelo | Università Cattolica del Sacro Cuore di Milano

science&practice

The topic of careers and career transitions in sport takes on specific significance (Stambulova, 2000). In recent years, there has been increasing attention within the sporting context to the concept of Dual-Career (DC), understood as the possibility for athletes to successfully initiate, develop and finish a high-level sporting career in combination with the pursuit of education, employment and other important goals at different stages of life. DC is seen as a challenge for athletes and their environment (De Knop, et al. 1999), but it can be a protective factor for their identity definition during the delicate time of transitions, particularly at the end of their careers (D'Angelo et al., 2017). Dual Career pathways allow for the development of 'other' identities besides the sporting one, favoring the elaboration of future projects, as well as activating processes of awareness with respect to the skills that a dual career path enhances and trains.

In the face of such reflections, it seems interesting to look at the dual career paths of athletes through the lens of employability, defined as "the human capital, social capital and individual behaviours and attributes that underpin an individual's perceived employability in a labour market context and that, in combination, influence employment outcomes" (Clarke, 2018). Literature on employability specifically targets graduates students for their imminent transition into the labour market. Student-athletes in Universities' DC-Programmes are part of this target group, with some specificities. Within this contribution, we intend to apply this lens of "employability", considering it interesting to design and develop support services for student-athletes, especially within the university context.

This contribution starts from the experimentation of the first 4 years of a Dual Career service for student athletes at the university where the authors work. The service from 2018 to date has involved 119 student-athletes, belonging to more than 20 different sports federations and attending 9 different faculties.

The study aims to explore and learn about the experiences and perceptions developed by the student-athletes with respect to the DC pathway at the University, with a specific focus on the employability skills developed during this experience.

To this end, using an IPA approach (Smith et al, 2009), 27 student-athletes (who were in or had recently completed the DC Programme) and 3 sports career psychologists (who initiated and developed the DC Service) were involved in semi-structured interviews between June 2021 and June 2022. At the end of the interviews with the athletes, the Performance Profile (Butler & Hardy, 1992) and the Dual Career Competency Questionnaire for Athletes (DCCQ-A, De Brandt et al, 2018) were proposed and used qualitatively for a reflection with the student-athletes themselves on the topic of competencies.

Thematic analysis of the interviews have revealed how the experiences of the student-athletes strongly emphasize the value of personalized coaching, which makes it easier for them to plan their academic and sporting commitments and facilitates their time management. Among the most

developed skills, on the other hand, the ability to organize and plan and problem solving stand out, confirming their proximity to the demands of today's working world.

It is also interesting to reread this data of student-athletes through Clarke's (2018) integrated model of graduate employability, which highlights a conception of employability not only as competences or skills to be possessed, but according to a more holistic and expanded view.

This study doesn't intercept Clarke's (2018) 'graduate employability' level as it does not refer to the actual entry of graduates into the labour market and their career outcomes. Future research could be structured longitudinally, with the aim of capturing these outcomes as well. Furthermore, they could involve student-athletes from different universities' DC Programmes to explore possible variability related to the structuring of the Services themselves.

Re-reading the experiences, stories and representations of student-athletes through the lens of employability and the skills developed makes it possible to think of increasingly effective and valuable DC projects, responding to an ever-increasing demand in the target audience. In conclusion, the research is in line with the congress theme 'The future is now: the changing word of work'. By activating awareness of one's educational, sporting and life paths and of the demands of the environment, entry into the labour market becomes of value to the individual and to the receiving work environment.

Oral presentation OP216

Developing Skills for the Future: The Role of Internships in the Changing World of Work

Alex Lefter & Alexandra Panaccio |Concordia University; Guylaine Landry, Université du Québec à Montréal; Ingrid Chadwick, Concordia University

science

Research Goal : Societal and technological changes over the past decades have critically transformed the world of work, leading to new skill demands of the future workforce (Greiff et al., 2015). In particular, organizations are calling for 21st century skills that are competencies for lifelong learning, including soft skills such as critical thinking, adaptability, and collaboration (Kember et al., 2007). The development of 21st century skills has thus become a priority in higher education as universities aim to set students up for future career success. Beyond classroom experiences, many universities are using internships as an experiential learning strategy for the development of such skills. However, there are surprisingly limited investigations into the actual effectiveness of internships for this purpose (Gamboa et al., 2013). This omission is concerning given that about half of university students in Canada, the US, and the European Union complete an internship each year (Canadian University Survey Consortium, 2021; European Commission, 2013). The goal of this research is therefore to investigate the role of internships in students' development of 21st century skills. Theoretical Background : To better understand the impact of internships on students' learning, we draw from the literature on organizational learning, which emphasizes the importance of supportive learning contexts for individuals to be motivated and able to continually learn and adapt (Chadwick & Raver, 2015). Specifically, there are three building blocks required for creating learning organizations: a supportive learning environment, concrete learning processes, and leadership that reinforces learning (Garvin et al., 2008). Despite extensive theoretical and empirical support for this model, the internship literature has not benefited from its insights. Research on internship effectiveness has instead focused on individual characteristics of interns as drivers of their learning, ignoring the role of contextual factors. To extend this literature, we hypothesize that interns' development of 21st century skills is positively influenced by a learning environment that is safe for interpersonal risk-taking and by leadership that provides support for career development. Methodology : Participants were undergraduate students at a francophone Canadian university enrolled in management programs that included internships. Data were collected using online self-report questionnaires administered at 3 time points: before the beginning of the internship (T1), around the mid-point of the internship (T2), and at the end of the internship (T3). We assessed 21st century skills developed in university (T1) using the scale developed by Kember et al. (2007), psychological safety (T2) using the scale developed by Edmondson (1999), supervisor mentoring behaviors (T2) using the scale developed by Viator and Scandura (1991), and 21st century skills developed during internship (T3) using Kember et al.'s (2007) scale adapted to the internship context. We sent invitations to 296 students and received responses to all 3 questionnaires from 146 (49.32%) of them. Results : Results indicated that both psychological safety and supervisor mentoring behaviors were positively related to students' 21st century skills developed during internship. These positive relations remained significant and similar in magnitude even after controlling for baseline levels of these skills (i.e., 21st century skills developed in university). Collectively, these findings suggest that internships play a significant role in developing students' 21st century skills beyond the classroom. Limitations : In terms of external validity, our research was based on management students from a francophone Canadian university, and so it is possible that our findings may not generalize to other types of students or national contexts. In terms of internal validity, the correlational nature of our study prevents us from making causal claims. However, given

the operationalization and measurement of our variables, reverse causality seems unlikely. Moreover, controlling for students' baseline levels of 21st century skills accounts for key individual differences that might have affected the relations of interest. Conclusions : Our research highlights the critical role of internships in helping students further develop their 21st century skills. Theoretically, it suggests that the organizational learning literature is a helpful framework for helping us better understand students' internship experiences. Practically, it points to the importance of ensuring that interns are immersed in psychologically safe work groups and receive mentoring from their supervisors in order for them to further develop their 21st century skills. Relevance to Congress Theme : Internships are an experiential learning strategy intended to help prepare the future workforce for the "the changing world of work." References : Available upon request.

Keywords: skills development, internship, school-to-work transition

Oral presentation OP258

Development and Validation of a Scale for Measuring Psychological Well-Being in the Work Context (PsyGesA)

Vera Hebel, Elena Röder, Judith Volmer | Institute of Psychology, Work and Organizational Psychology, University of Bamberg, Germany

science&practice

Over the past decades, psychological well-being received more and more attention in the work context (Roczniewska et al., 2022). Organizations strive towards maintaining and improving employees' psychological well-being. Therefore, economic and also comprehensive instruments to assess psychological health of employees are needed. The present paper describes the development and validation of the PsyGesA Scale (Psychische Gesundheit im Arbeitskontext, engl: psychological well-being in the work context).

Building on the job demands and resources (JDR) theory (Demerouti et al., 2001), we first conducted an extensive literature research and qualitative interviews with 46 leaders and employees from diverse companies in order to identify demands and resources affecting psychological health at work. Initially, we created 194 items and 30 dimensions which were further tested. First, we assessed face validity using five independent raters. Following, item selection and construct validity were conducted, based on a German sample (N = 976) recruited via a panel provider. Exploratory and confirmatory factor analyses led to a final model with a very good fit (cfi = .96, tli = .95, RMSEA = .03, SRMR = .04), consisting of 28 dimensions, reflecting resources and demands, with 3 items each.

Further data sets collected via the panel provider (N ranging from 1000 to 1009) aim at testing different validity scores. Regarding convergent validity, we assume the PsyGesA demands and resources scales being positively related to the respective subscales of the FGBU (Dettmers & Krause, 2020), KFZA (Prümper et al., 1995) and COPSOQIII (Lincke et al., 2021). At the same time we expect that the PsyGesA demands subscale can be discriminated from depression (Beck et al., 2006; Bianchi & Schonfeld, 2020) and job anxiety (Linden et al., 2008), whereas the PsyGesA resources subscale should be discriminated from job satisfaction (Thompson & Phua, 2012) and resilience (Soucek et al., 2015).

We furthermore hypothesize that the PsyGesA scale explains variance in work-related outcomes (i.e., emotional exhaustion (Demerouti et al., 2003), depression (Bianchi & Schonfeld, 2020), rumination (Cropley et al., 2012), work engagement (Schaufeli et al., 2006), motivation at work (Gagné et al., 2010), and job satisfaction (Thompson & Phua, 2012)) beyond the KFZA and the FGBU. Additionally, we hypothesize that the PsyGesA demands subscale (T0) is positively related to emotional exhaustion (Demerouti et al., 2003), depression (Bianchi & Schonfeld, 2020), irritation (Mohr et al., 2005), negative affect (Watson et al., 1988), counterproductive work behavior (Spector et al., 2010) and rumination (Cropley et al., 2012) three months later (T1), whereas the PsyGesA resources subscale should be positively associated to sleep quality (Buysse et al., 1989), work engagement (Schaufeli et al., 2006), energy (Kessler & Staudinger, 2009), positive affect (Watson et al., 1988), motivation at work (Gagné et al., 2010), job satisfaction (Thompson & Phua, 2012), life satisfaction (Diener et al., 2018) and psychological detachment (Sonnentag & Fritz, 2007). Validity scores will be presented during the talk.

So far, our analyses are based on a German version and should be replicated with samples from different countries. The scale can be completed in a short amount of time (approx. 15 minutes) and is

comprehensive. Based on the PsyGesA scale scores, health promoting programs and incentives can be chosen and offered, to help people to cope with the changing world of work.

We believe that the development of our scale contributes to the goal “Good health and wellbeing” from the Sustainable Development Goals (SDGs) of the United Nations (UN) by offering an easily conductable diagnosis tool, upon which further health promoting programs can be executed.

Keywords: well-being

Oral presentation OP451

Development and validation of a scale measuring sexual identity disclosure and the reaction of the audience at work

Sara López Corlett, Alicia Arenas, Lourdes Munduate & Donatella Di Marco | Universidad de Sevilla

science

Research goals

This research aims to develop a valid instrument to examine the disclosure dynamics of lesbian, gay, and bisexual (LGB) individuals at work, taking into account the role that the audience plays in disclosure. It is relevant because it considers sexual identity disclosure not as a personal and voluntary decision, as traditionally conceived, but as a preference that necessarily involves the audience receiving the information.

Theoretical background

Sexual identity disclosure has been pointed out as a factor that promotes a sense of inclusion in the workplace for LGB individuals (Bell et al., 2011). Considering disclosure as an act of revealing personal information that is invisible to others, it has been assumed that LGB people have the control over disclosure (Lidderdale et al., 2007), conceiving it as an individual choice that is impacted by factors of the organizational context (e.g., diversity climate, industry context, legal protections), the interpersonal context (e.g., characteristics of other colleagues), and individual differences (Clair et al., 2005). As such, various authors have developed scales measuring disclosure as a set of voluntary behaviours or measuring the extent to which individuals consider themselves 'out' at work (Wax et al., 2018).

In contrast to the literatura, Di Marco (2022) proposed that LGB individuals have a preference to disclose or to conceal their sexual identity to others, yet they have to further deal with the targets' willingness to respect and/or support their preferences. Thus, the extent to which one is 'out' would not only depend on one's behaviors towards concealment/disclosure; disclosure is also shaped by supervisors, coworkers and clients who are part of the dynamic.

Drawing from Boundary Theory (Kreiner, 2006), Di Marco suggests that disclosing one's sexual identity or keeping this information back at work can be considered a way of merging or separating personal and work domains (Di Marco, 2014). According to LGB individuals' wish to integrate/segment domains and third parties' behaviors, LGB individuals encounter four different situations at work: segmentation, integration, distance violation, and intrusion violation (Di Marco, 2014; Kreiner, 2006). Segmentation and integration represent a successful and desired concealment or disclosure of LGB people' sexual identity, respectively. Distance violation occurs when there is a desire to disclose but third parties force concealment (e.g., not asking further about personal life). Finally, intrusion violation occurs when LGB people wish to conceal their sexual identity at work, but others force it into the spotlight (e.g., spreading rumors, asking non-wanted personal questions). The extent to which individuals' sexual identity is disclosed/concealed, therefore, would not only rely on LGB individuals' choice, but would also involve others that shape the process.

Design and methodology

We developed a scale of the described disclosure dynamics. The generation and reduction of items was both based on the literature and on the information from a previous study (Di Marco et al.,

2022). A set of 18 items were administered to n = 743 LGB workers collected through crowdsourcing together with other scales to test convergent, discriminant and concurrent validity. We performces exploratory and confirmatory factor analyses, correlational analyses between the developed scale and external measures and measurement invariance tests.

Results

The EFA showed that the scale is comprised of 18 items that load into a 4-factor solution, representing the four disclosure dynamics. The proposed model showed an acceptable model fit to the data in the CFA and acceptable reliability indexes for both EFA and CFA samples. Correlational analyses also showed evidence of convergent validity, discriminant and concurrent validity.

Limitations

Participants worked from different English-speaking countries. The mean age was around 30 years old, and age can impact experiences.

Conclusion

This study expands the boundaries of the concept of disclosure, extending it from the personal decision to disclose to the reaction of others who may support or hinder this decision. The use of this scale can show new indicators of the mechanisms involved in the disclosure of sexual identity. Our study shows it is important to consider both the boundaries that LGB people set around their sexual identity at work and how others respond to disclosure preferences.

Congress theme

The world of work is increasingly diverse. Organizations have made efforts to manage diversity in the past decade, although sometimes in a superficial way. This study provides an instrument to understand the complexities of the experience of sexual diversity at work for a better management in organizations.

UN SDGs

This study is related to goal 10 (reduced inequalities) as it promotes adequate management of sexual diversity, which empowers and promotes their social, economic and political inclusion.

Keywords: validation; disclosure; workplace

Oral presentation OP318

Development of the Model of Enabling Employment Guidance (MEEG) - conceptualization, practitioner toolkit, and employability metric

Nuala Whelan, Maynooth University, Ireland

science&practice

Research goals and why the work was worth doing: This research aimed to conceptualise the career and employment guidance components of welfare-to-work practice, with a particular focus on their well-being enhancing aspects and the extent to which they enable sustainable work-life outcomes for people experiencing unemployment. The research challenges the dominant activation discourse that 'any job is better than no job' and provides a praxis-informed framework for contemporary practice.

Theoretical background: The psychological impact of unemployment has been well documented (Paul & Moser, 2009; Wanberg, 2012) with studies showing negative impacts on wellbeing and re-employment. Yet government responses rarely focus on these challenges, concentrating instead on job search outcomes and monitoring behaviour. Over the past 30 years international trends in labour market policy have shifted towards reinforcing the regulatory and disciplinary aspects of policy, while de-emphasising their enabling aspects (Brodkin & Marston, 2013). Career and employment guidance aims to bridge this gap, but little is known about its implementation, effectiveness, or its enabling mechanisms within labour market activation contexts. Drawing on previous developments in employability approaches (e.g. Dean, 2003; Lindsay, McQuaid & Dutton, 2007), and building on capability informed career counselling conceptualisations (Robertson & Egdell, 2018), this research goes beyond traditional approaches to supporting the unemployed by proposing an expansion of theory informed employment guidance (e.g. Fugate et al. 2004; Robertson & Egdell, 2018; Duffy et al. 2016) in national Public Employment Services (PES) towards sustainable work-life employability, and its practical application.

Design/Methodology/Approach/Intervention: The study was conducted in two stages: First, a theory based realistic evaluation approach was used to observe, document and map practice in a sample of community based contracted public employment guidance services (n=8). A series of practitioner (n =20) and stakeholder (n =8) focus groups, and practitioner and client semi-structured interviews (n =16) were conducted to detail client needs, the guidance approach, and service goals. Second, informed by an extensive literature review, and feedback from employment guidance practitioners, a 50-item questionnaire was designed to identify distance travelled towards employability. Questionnaires were piloted with unemployed clients (n =98) at T1, with follow up questionnaires (n =33) completed at T2. Factor analysis and reliability studies were conducted to establish factor structure and reliability estimates.

Results: Analysis enabled the development of 1) a capability-led work-life inspired employment guidance conceptual framework; 2) a six-stage (Building Trust;Personalised Assessment;Career Exploration;Decision Making;Planning and Implementation;Follow-on support) Model of Enabling Employment Guidance (MEEG) toolkit for practitioners; 3) an outcome measurement tool for use in practice measuring five macro work-life factors: Career self-knowledge and decision making; Person focused employability strengths (self-esteem, hope, adaptability, self-value); Work related behaviour; Job search; and Job readiness.

Limitations: Refinement of the employability questionnaire is ongoing and while practitioner training in the model is currently being piloted, accreditation is not likely until Spring 2023.

Conclusions: research and or practical implications/Originality/Value: MEEG provides practitioners with a framework and associated tools for person-centred practice in a PES context. It moves beyond restrictive work-first models and human capital approaches, offering instead a holistic model where peoples life needs are considered as part of the re-employment process. It seeks to contribute towards the Psychology of Working research (Blustein, 2008; Duffy et al., 2016) by advocating for decent work, and for equality in opportunity in a dynamic, complex, and fast changing world of work, for people who experience intersectional challenges to sustainable employment. In this post-covid era where many will have experienced unemployment related distress, understanding how services can promote positive mental health, re-employment, and career sustainability for all job seekers is fundamental in PES design and labour market policy.

Relevance to the Congress Theme: To build strong resilient labour forces, PES must be ahead of changes occurring in the labour market. This means access to quality lifelong career guidance including information on new forms of working (e.g. hybrid working), skill shortages etc., while also recognising the often intersecting challenges faced by job seekers, the impact of unemployment and poor quality work on wellbeing and re-employment, and the approaches, skills and tools used by practitioners. MEEG offers a new way to think about person centred and future oriented PES.

Oral presentation OP801

Deviate from which norm: Antecedents of constructive deviance in organizations

Minnie She, Deanne den Hartog & Richard Ronay | University of Amsterdam

science

Research Goal

From one million to two million protestors, in 2019, a quarter of the inhabitants in Hong Kong took the street to protest against the amendment bill on extradition to the mainland of China. The peaceful demonstration escalated quickly to battle-like situations with Molotov cocktail and homemade shield in response to the violence crackdown from the police force. While some police officers comply to the orders from commander, some resigned from their positions during the protest. The Hong Kong Police Force also recorded a historical low of new recruits in 2020. In disciplinary forces, members have restricted options in response to commands, i.e., compliance or exit; however, in business organizations, employees are more flexible when confronted with supervisors' orders that conflict with one's own preferences. In this study, we explore how individuals with different personality combinations would react identity conflicts between self and organizational, and how it might develop into constructive deviance.

Theoretical framework

In general, people desire to hold positive beliefs about themselves, the groups they belong to, and the system they situated in. The main principle of System Justification Theory (SJT) was that individuals would justify the existing system as legitimate and fair even when they are disadvantaged in it (Jost, 2019). There are four common triggers of system justification, (1) perceived inescapability of the system, (2) strong personal dependence on the system, (3) low personal control in the system, and (4) perceived threat to the system (Jost, 2019). Individuals will then be motivated to rationalize or even reconstruct the preferences to make situation less unfavorable (Laurin et al., 2013). That is, even when the evaluations of self and group identities misaligned with the system identity, sometimes people will lean towards justifying the disadvantages they experienced under the system.

However, from the sociological lens, Bourdieu suggests that indeed people might be consumed by their immediate environment because of foreseeable rewards, such that they would be unable to reflect on their situation and became blind to alternatives (Mergen & Ozbilgin, 2021). Nevertheless, if they experience tensions between their predisposed ways of actions and the rules implemented in that particular social context (e.g., organization), the resulting dissonance from such tensions could accumulate overtimes to shaken one's perception (Mergen & Ozbilgin, 2021). Individuals would then begin to challenge existing norms and regulations. That is when the self and group identities surpass the system identity.

Methodology

Survey data will be collected from dyads of leader-follower in organizational context (estimated N = 400). Two surveys will be distributed to leaders and followers respectively. We will measure moral and organizational identities, personality, normative conflicts, and constructive from followers. In addition, we will measure perceived voice behaviors of followers from the leader's perspective to minimize common method bias.

Results

The results will be ready in January 2023.

Limitations

While survey data has strong external validity to understand how various identities influence the perception of constructive deviance, it lacks ability to make casual conclusion. However, we are planning for an experimental follow up on the results derived from this initial study to further explore situations that would induce strong self and group identities, and to what extent would that override the urge to justify the existing system, and thus, resulting in constructive deviant behaviors.

Relevance to the Congress Theme

Engagement and Motivation. Even though constructive deviance involve breaking rules of the organization, it is for the better of the organization or the broader stakeholders. Understanding the motivation of individuals to engage in such behaviors helps management to utilize them to identify problematic areas in the organizations.

Relevant UN SDGs

Going against the practiced norms in organizations is risky. Understanding what motivate individuals to engage in constructive deviance (a broad term that include actions like voice and whistleblowing) can help challenge existing hierarchy. At the very least, it increases information accessibility to the public, which could form the basis of collection actions.

Keywords: personality, identity, constructive deviance

Oral presentation OP730

Diagnostic Sensitivity and Specificity of a Burnout Hetero-Assessment Instrument Using Bayesian Latent Class Analysis

Yara Shoman, Irina Guseva Canu | Center of primary care and public health (Unisanté), University of Lausanne, Switzerland

science&practice

Research goals

Our primary aim was to illustrate the use of Bayesian latent class modelling to assess the diagnostic accuracy of measurement tools in the absence of a gold standard.

Theoretical background

Burnout is mostly assessed using Patient-reported Outcome Measures (PROMs). In 2020, the Belgian Public Service for Employment, Work and Social Dialogue (BPSEWS) developed the first hetero-assessment instrument intended to assess burnout by healthcare professionals (i.e., psychologists and physicians). Researchers attempted to evaluate the diagnostic accuracy of this Burnout Hetero-Assessment Instrument (BHAI) by estimating its sensitivity and specificity in comparison to a valid burnout PROM; Oldenburg Burnout Inventory (OLBI) in two recent papers (Leclercq et al., 2021; Nguyen Huynh et al., 2021). However, in the absence of a gold standard for burnout measurement, the assessment of diagnostic accuracy for newly developed tools remains challenging and can lead to either over or underestimating their accuracy, especially using frequentist statistics. Therefore, the latent class model approach was proposed to assess the performance of diagnostic tests in the absence of a gold standard using Bayesian statistics. We thus aimed to evaluate the sensitivity and specificity of the BHAI in comparison to OLBI using Bayesian latent class modelling.

Methods

We analysed the results of two groups of patients that were included in the studies of Nguyen Huynh et al., 2021, and Leclercq et al., 2021. The Swiss population included patients that had a "Work and Suffering" Consultation at the Centre of primary care and public health (Unisanté) between 2010 and 2013. The Belgian population included patients who had complaints regarding suffering at work and asked for a consultation with a general practitioner or occupational physician and their clinical judgement can be linked to the BHAI. Finally, in our analysis, we included the results of 65 Swiss and 123 Belgian patients who filled both BHAI and OLBI. The reported diagnostic sensitivity (se) and specificity (sp) of the BHAI was (se=0.88, sp=0.29) in the Swiss study and (se= 0.76, sp=0.60) in the Belgian one. However, these diagnostic sensitivities and specificities were estimated by comparing the BHAI to a comparator (i.e., OLBI) using frequentist statistics.

For OLBI, both studies used a cut-off of 44, which means that scores higher than 44 represent high-severity burnout. For the Bayesian latent class modelling, we applied the Hui-Walter framework to two tests and two populations and used minimally informative priors in models with or without conditional dependency. We further performed sensitivity analysis by replacing one of the minimally informative priors with the distribution (2,1) at each time for the six minimally informative priors. We also performed the analysis using informative priors for OLBI from the literature when compared to Maslach Burnout Inventory and Psychological Distress Questionnaire.

Results

Using the Bayesian latent class modelling without conditional dependency, the sensitivity and specificity of the BHAI were 0.91, and 0.82 respectively. The sensitivity analysis yielded no change in the BHAI's sensitivity and specificity. In all models, the sensitivity was never below 0.82 and the specificity was never below 0.78.

Limitations

The first limitation of this study is that we assumed that the sensitivity and specificity of the two tests are the same in Swiss and Belgian populations. The small sample size is the second limitation of this study. However, we aimed to present the concept of Bayesian latent class modelling using the available data to enable future studies to re-examine the diagnostic accuracy using representative samples. The third limitation is that the posteriors of this study cannot be later compared with the posteriors of future studies if these studies will be conducted using a gold standard. This study can be therefore considered a preliminary study.

Conclusions

The reported sensitivity and specificity of the BHAI in this study are higher compared to the previous studies conducted using frequentist statistics. These findings suggest that the use of Bayesian latent class modelling is preferred in the absence of a gold standard to avoid underestimating the diagnostic accuracy of the tested measure.

Originality/Value

To our knowledge, this is the first study conducted using Bayesian latent class modelling to assess the sensitivity and specificity of burnout assessment instruments. The findings of this study encourage the use of Bayesian latent class modelling in future studies with larger sample sizes and better informative priors.

Relevance to the Congress Theme Researchers may benefit from introducing this novel approach in testing the diagnostic accuracy in burnout research . Researchers and practitioners may benefit from the use of the new reliable BHAI to assess burnout.

Keywords: Burnout, Bayesian Latent Class Analysis , Diagnostic accuracy

Oral presentation OP574

Different jobs, different people: occupational personality profiles and the role of job situations and job characteristics

Artjom Rushanov, David J. Hughes & Paul Irwing | Alliance Manchester Business School, The University of Manchester

science

Many models of person-environment transactions suggest that people both select themselves into social roles that fit their personality and that their personality is moulded by those social roles (ASTMA model; Robert, 2006). One implication of these models is that we would expect clear personality profiles amongst different occupational groups. The notion of the existence of occupation-specific personality profiles is central to organizational HR practice in employee assessment and selection as well as employee training and development. However, empirical evidence on the existence or nature of such profiles is surprisingly weak.

This study aimed to provide a definite answer on whether different occupations consist of homogenous pools of individuals with similar personality characteristics, and if so, how these occupation-specific personality profiles look like for five selected occupational groups. Further, this study set out to examine the potential relationship between individual's personality characteristics and characteristics of their occupational environment (i.e. situational and job characteristics).

Theories focusing on individuals and their occupational environments share the assumption that different jobs consist of different situations and job characteristics, and therefore expose job holders to different, occupation-specific, characteristics of the respective job. These different and occupation-specific sets of occupational characteristics impose different demands upon job holders regarding adequate or ideal personality expression on the job. These demands are, like the situational and job characteristics, occupation- specific. The ASTMA model provides mechanisms (attraction, selection, transformation, manipulation, attrition) by which job holders' personality profiles would be a result of the transactions between the individual and the environmental characteristics of their occupation.

We examined to what extent occupational profiles exist, comparing 1,270 professionals from five different occupational groups, in personality (BFI-2), psychological situations (CAPTIONs), and job characteristics. First, we established measurement invariance using ESEM. Second, we used a series of ANOVAs to compare occupational groups regarding their mean levels of personality, traits, situations, and experienced job characteristics. In the last step, we employed multiple regression models to examine potential relationship between personality traits and situational and job characteristics, regressing each of the five personality traits on situational dimensions and job characteristics, respectively.

Results supported several theory-driven differences between occupational groups. We found distinct profiles for three of the five occupations: Artists, Health Professionals, and Law Enforcement Officers. We further examined whether situations or job characteristics explained the trait profiles observed. Although both situational and job characteristics did predict personality, the variance explained was typically moderate (R^2 =.075-.199).

In summary, 12 out of 18 hypotheses regarding occupational group differences in average levels of trait personality, perceived situations and job characteristics were supported, suggesting occupation-specific profiles for job holders' personalities as well as the experienced situational and job

characteristics. Further, analyses suggested that situational characteristics explained between 7.5%-14.1%, and job characteristics accounted for around 13.6%-19.9% of the variance in personality traits. With this in mind, and considering the profiles identified for personality traits, situational characteristics, and job characteristics as well as the correlations between these characteristics, the findings of this study suggest that either one or potentially multiple mechanisms of the ASTMA model are in place and operate as described by Roberts (2006).

As for limitations, samples of occupational groups ranged between 247 and 259 participants. Despite being an improvement over large parts of previous research and satisfying initial power analyses, we wish for large-scale studies in the future. Second, despite being a convenient method of data collection, using a third-party data collection tools reduces the amount of control the investigators have over the collected data.

In the future, we hope to see studies to examine possible causal relationships between situational characteristics, job characteristics, and individuals' personality traits. Testing potential causal relationships between personality and situational and job characteristics in an occupational context can shed light on the transformation mechanisms of the ASTMA model and provide insights in the areas of personality adaptation on the job. Answering these questions could help improve our understanding of person-occupation transactions which are relevant for HR practitioners in the areas of employee selection and training.

Oral presentation OP73

Digital remote working in the digitalization era: A cross-lagged study of attitude, behavior, and work engagement

Marjan Shamsi, Tatiana Iakovleva & Espen Olsen | University of Stavanger (UiS); Richard P. Bagozzi, University of Michigan

science&practice

Research goals

Over the past few years, unpredictable changes in the business environment due to the COVID-19 pandemic have led to rethinking employees' traditional ways of working. These fundamental changes have forced organizations to introduce new ways of working, such as digital remote work, which we define as using digital technologies in the remote work context. The present study investigates a longitudinal model of reciprocal relationships between digital remote workers' attitudes, behavior, and work engagement as a work well-being facet during and after the pandemic lockdown. Therefore, the study proposes and empirically tests a cross-lagged structural equation model to explore the relationship between digital remote work attitudes, behavior, and work engagement over time.

Theoretical background

We explore the relationship between employees' digital remote work attitude and behavior within the framework of the Technology Acceptance Model (TAM). The TAM posits that individuals' perceptions and attitudes toward technology use affect their acceptance of that technology, which results in explaining users' behavior (Davis, Bagozzi, & Warshaw, 1989). This study first proposes that employees' attitudes toward digital remote work during the pandemic will affect their post-pandemic decisions to continue working remotely using digital technology. In addition, building on the Job Demands-Resources (JD-R) theory, we address the relationship between digital remote work behavior and work engagement. JD-R theory posits that job resources help overcome job demands, accomplish job goals, and decrease the chance of health disorders (Bakker & Demerouti, 2007). This study proposes that digital remote work during the pandemic will positively impact post-pandemic work engagement by providing employees with greater locational and temporal autonomy. therefore, this study considers technology use in the remote work context as a job resource and, therefore, as a predictor of work engagement over time.

Design

We conducted a two-wave panel study with time lags of six months and collected the data from 670 employees (at both T1 and T2) using online self-report questionnaires. A cross-lagged longitudinal analysis was conducted using structural equation modeling (SEM) to test the study's research hypotheses. Multiple well-established measurement sources were used as measuring instruments, and their validity and reliability were assessed before performing SEM.

Results

Our findings show a positive lagged effect of attitude toward digital remote work during the pandemic on digital remote work behavior in the post-pandemic era. The results also revealed that digital remote work behavior during the pandemic influenced post-pandemic work engagement.

Limitations

Although the present study makes several contributions to the existing literature, its findings should be treated with caution. First, Since relying on self-reports may result in common method biases, studies should consider using multiple data sources. However, we tried to minimize this issue by collecting data at different times and controlling for autoregressive effects. Moreover, the first wave of this study was conducted during the COVID-19 pandemic, and new studies should explore the generalizability of findings in typical situations.

Conclusions

This study provides new insights for organizations regarding essential factors related to employees' digital remote work behavior over time. It shows that, in predicting digital remote working behavior, organizations should not only be aware of individuals' attitudes but also know about other work-related concepts, such as work engagement. In addition, results confirm that digital technology use in the remote work context could be perceived as a job resource by employees and improve their work engagement. This research is the first cross-lagged study on digital remote work behavior, reflecting its reciprocal relationships with digital remote work attitude and work engagement in the same framework. While the relationships between employees' digital remote work behavior and attitudes have been investigated in previous studies, there is no research with a cross-lagged panel design examining the reciprocal relationships between these two concepts. In addition, although few studies focused on the effect of digital remote working on work engagement, their reciprocal relationship has never been investigated.

Relevance to the Congress Theme

This research is related to the congress theme in two ways. First, it has focused on the changing work environment by considering digital remote working as a new way of working in the age of digitalization. Second, it addresses the long-term relationships between digital remote work behavior and work engagement, which can show us how we can make constructive changes in the future using current findings.

Relevant UN SDGs

This study will address the good health and well-being of employees as one of the SDGs.

Keywords: digital remote work; technology acceptance model; work engagement

Oral presentation OP466

Disparities in Job demands and Job resources in teams as potential meta-demands

David Stuer & Ans De Vos | Antwerp Management School

science

Purpose: The goal of the research is to conceptualize and empirically investigate the role of disparity in job demands and job resources within teams and how this affects both team and individual level outcomes.

Theoretical background: According to the job demands-resources model, the configuration of job demands, and resources are responsible for employee motivation, strain, and productivity (Demeroutti et al., 2001). However, these job resources and demands do not exist in a vacuum: employees tend to be embedded into social structures such as work groups. This embeddedness adds a social layer to how demands and resources are divided and experienced (Festinger, 1954; Foa & Foa, 2012). Consequently we need to take into account the emergent properties that arise out of this social embeddedness (Kozlowski & Klein, 2000). The distribution of job demands and resources among team members might differ between teams, resulting in some teams having higher and others having lower disparities when it comes to team members' job demands and resources and thus reflect an emergent property. This paper will theoretically reflect on the implications of these disparities at both the team and the individual level by investigating its impact upon motivation, strain and productivity . We build on the theoretical frameworks of justice theory (Colquitt, 2012), social resources theory (Foa & Foa, 2012), thereby looking at job demands and resources from a deep level diversity perspective (Harrison & Bell, 1998). We argue that - in line with the basic premise of JD-R theory - at the individual level, perceived resources positively affect outcomes, whilst demands will negatively affect outcomes, but that the individual level effects will be more pronounced in teams with high disparities in resources and demands. We expect this because there will be a status hierarchy (Knight & Mehta, 2014) with respect to demands and resources which becomes clearer the higher the disparity is. Subsequently employees will experience relative deprivation when they are at the 'bad end' of the job demands-resources distribution in the team (Beshai et al., 2017). Consequently, the relative place in the demands resources hierarchy will compound effects of job demands and resources and make relations between JD-R and outcomes more pronounced, thus acting as a cross level moderator. Furthermore, at the team level we expect that teams with higher disparities in perceived demands and resources will show more negative outcomes in terms of motivation, strain, and productivity because of increased intragroup distrust and the instantiation of subfactions with respect to demands and resources (the 'haves' vs the 'have-nots').

Design: We are employing a multi-level design where we are surveying employees from different teams in two organizations, using the team as a reference point for investigating the effect of emergent properties from the individual to the team level. The data are currently being collected, the targeted sample consisting of 50 teams, with at least 6 employees per team. We will analyze results using multi-level analysis to disentangle team from individual level effects.

Limitations: We will employ a cohort design so we will not be able to infer causality.

Relevance to UN SDG's and congress themes: the theme of our research fits in well with the goals of offering decent work and also reduction of inequalities since we are investigating the influence of disparities on 'soft' job characteristics on motivational, strain and productivity outcomes.

Keywords: Group processes, Organisational justice, Job demands

Oral presentation OP531

Diversity climate measurement across generations: A test of measurement invariance.

Sean McCallaghan, Optentia Research Focus Area North-West University, Vanderbijlpark Campus

science&practice

Research goals and research importance: Age-related diversity is considered an important feature for organisations, especially when employees are tasked to supply a wide range of services and products to a diverse age market. In this regard, organisations are very keen on ensuring their employees feel valued and are considered part of an inclusive environment, regardless of age. To develop diversity and inclusion-related interventions, it would be important for organisations to understand the current views of their diversity-related policies and practices, even across generational cohorts. The challenge, however, is that generational cohorts (Baby Boomers - born between 1945 and 1964; Generation X - born between 1965 and 1981; and Generation Y - born between 1982 and 2000 also known as millennials) display unique characteristics and behaviours due to certain values and priorities that might have persisted during their development. Managing age diversity may have several challenges among generational cohorts due to differences in values, attitudes, and behaviours. These challenges can include common misunderstandings and interpretations, a need for recognition versus status in the workplace, intergenerational conflict, and internal competition during times of change. Therefore, the primary objective of the present study was to conduct a measurement invariance test for a diversity climate measurement across three generations to examine the psychometric properties of a one-dimensional diversity climate instrument.

Theoretical background: We consider diversity climate as the shared perceptions on how well an organisation is managing diversity and creating a sense of inclusivity. The assessment of an organisation's diversity climate has shown to be a valuable indicator of diversity-related interventions. However, groups within the organisation may view diversity climates differently. This is mainly due to matters such as social identity and Faultline theory, whereby subgroups may form strong allegiances based on common characteristics and then influence each other, which in turn might have an impact on personal views of an organisation's efforts to manage diversity effectively.

Generation shares similarities formed by specific historical events. For example, Baby boomers are considered hard-working but less susceptive to technological change. Generation X are professional individuals but are less likely to express disagreement in team environments. Generation Y, also known as millennials, is very competent with technology developments but struggles to operate in a team environment. These distinct characteristics of each generational cohort due to different personal beliefs, values and behaviours pose diversity management challenges. Due to expected different views on diversity-related matters amongst generational cohorts, it remains important to apply an instrument considered universal across generational cohorts. The present study aims to examine this research opportunity.

Methodology: The quantitative cross-sectional study collected 324 responses from a South African convenience sample. Respondents completed a one-dimensional diversity climate measurement. We analysed data with the lavaan package, which was installed in RStudio. The first step was to assess the reliability and validity of each generational cohort. We set traditional CFA fit indices as minimum thresholds. The next step was to examine measurement invariance across generational cohorts. We compared a configured model against models with increasingly strict equality constraints across

generational cohorts. To conclude on measurement invariance, the ΔRMSEA should not exceed 0.015, while the ΔCFI should not exceed -0.01 across constrained models.

Results: The results showed that the diversity climate assessment for each separate generation can be considered reliable and valid. The change in RMSEA and the change in CFI did not exceed the minimum set thresholds when comparing the strict equality constraint models. This indicates that generational cohorts considered the one-dimensional diversity climate assessment in a similar manner.

Limitations: We only collected data from South African organisations.

Research/Practical Implications: Organisations who wish to enhance a diversity climate across generational cohorts, can apply the one-dimensional measurement with confidence to determine the shared perceptions of how well the organisation is managing and valuing diversity.

Value: A study of a similar nature does not yet exist. Therefore, the findings contribute to the body of knowledge for diversity climate studies.

Relevance to congress themes: A conducive diversity climate is manifested in how well an organisation can manage diversity. A validated assessment tool to measure diversity climates across generational cohorts (age diversity) can assist both practitioners and scholars in establishing a foundational view before designing interventions.

Keywords: Diversity climate, generations, measurement invariance.

Oral presentation OP765

Do followers mind the pay gap? The impact of vertical pay inequality on followers' organisational identification and contribution to group goals

Kim Peters & Oliver Hauser | University of Exeter; Niklas Steffens, University of Queensland; Miguel Fonseca, University of Exeter

science

Research Goals

This research aims to shed light on the impact of leaders' pay on other group members' identification with an organisation and motivation to contribute to organisational goals. While incomes of senior leaders have risen substantially in recent decades, we have little understanding of how such vertical pay disparities affect the functioning of organisational groups.

Theoretical background

Theorising in the social identity tradition suggests that high vertical pay disparities may undermine group members' identification with their organisations and reduce their contributions to organisational goals. Specifically, recent empirical work suggests that vertical pay inequality can introduce psychological divisions in the workplace, reducing the sense that all organisational members are 'in it together'. Importantly, according to social identity theory, if this pay inequality reduces organisational members' tendencies to identify with their organisation then we can also expect that it will reduce their willingness to work hard on its behalf. In line with this, there is evidence that people who identify more strongly with their organisation are more likely to prioritise its goals over their own more self-interested ones, increasing their tendencies to contribute to the common good. On the basis of this theorizing, we expect that when leader pay is relatively high (versus relatively equal), workers will (1) contribute less to the common good, (2) be less responsive to leader instructions and (3) identify less with (a) their organisation and (b) their leader.

Design and Methodology

We recruited 318 participants from Prolific.co to participate in a study on multi-tasking in organisations. The design was a 2-way between participants' design, such that participants were allocated to work in a high or low pay gap organisation. We randomly allocated participants to companies that had high or low vertical pay inequality and measuring their contributions to the common good, their followership and organisational identification. Specifically, groups of 3 participants were allocated to companies that consisted of one leader and two workers. Workers were responsible for producing Widgets and for repairing the machines that make Widgets while leaders were responsible for monitoring worker performance and providing feedback. The pay was set up such that while workers earned a sure wage from making Widgets, the organisation benefitted when they repaired machines. By examining how hard participants work to produce Widgets versus repair machines, we can see how willing they are to sacrifice their own personal interest for the collective good. Importantly, the pay of leaders was set up so that they are either received relatively equal or much higher pay than the workers. After participants had worked for the organisation for a number of periods, they completed a measure of their identification with the organisation and leader. We also included exploratory measures of workers' perceptions that their pay was fair as well as their affective wellbeing and stress.

Results

We tested our hypotheses with mixed effects models with random effects at the individual-round and group-round level and robust standard errors clustered at the group level to account for any intertemporal correlation of errors within groups. Contrary to expectations, we found that the level of vertical pay inequality had no effect on workers' contributions to the common good, $t(104)=0.001$, $p =0.999$, or to their responsiveness to leader requests that they make more widgets, $X 2 (1) = 2.85$, $p=.091$, or do more repairs, $X 2 (1) = 0.66$, $p=.416$. However, responses to the subjective measures indicate that participants were sensitive to pay disparities, and were less satisfied with their pay when vertical pay inequality was high. Importantly, in line with expectations, workers identified less with the organisation ($b=-.80$, $p < .05$) and their leader ($b=-1.04$, $p < .010$) when pay inequality was high. Exploratory analysis also suggested that workers' affective wellbeing was negatively affected by high vertical pay inequality. In sum, these suggest that working in an unequal pay environment may have negative consequences for worker wellbeing. This study did not provide evidence that vertical pay disparities will negatively affect worker behaviour.

Limitations

The major limitation of this study was its lack of ecological validity and the relatively short time span over which the company operated.

Conclusions

This work suggests that vertical pay disparity may harm group functioning by undermining group members' wellbeing.

Relevance to Congress Theme

The last 5 decades have seen a rise in unequal pay in many organisations, such that those in formal leadership positions have seen their pay rise much more than other organisational members. It is imperative that we understand the implications of this vertical pay gap in the changing world of work.

Keywords: Pay inequality, followership, organisational identification

Oral presentation OP369

Do Gender Equity policies of companies affect perceptions of barriers to women's promotion? A preliminary study.

Jose Ramos, IDOCAL, University of Valencia (Spain) and IVIE (Spain); Felisa Latorre; Amparo Ramos

science

Research goals and why the work was worth doing

Women continue to face barriers that hinder their access and promotion to managerial positions. Gender barriers affect not only women, but also society as a whole, and labor organizations. Barriers influence negatively the perception of organizational fairness and organizational outcomes. To cope with gender barriers and promote females to managerial positions, companies have developed different Equity Gender Policies. Regarding their efficacy, we don't know studies analyzing the relationship between women's perceptions towards these policies and their perceptions of gender barriers. This paper aims to analyze the relationships between both kinds of perceptions to improve Equity Policies and their efficacy.

Theoretical background

Women continue to find obstacles in accessing and remaining in managerial positions. Previous literature show agreement regarding the main barriers found by women regarding promotion: work-life balance barriers, inequal HR policies, inequal performance appraisal, barriers to access influential networks, organizational culture and gender stereotypes. Gender barriers affect negatively organizational attitudes and results (organizational justice, job satisfaction, organizational commitment, performance, OCB). Different gender equity policies had been developed to cope with such barriers. Gendermaisntraiming, as a strategy to integrate a gender perspective in all public policies, has given rise to actions such as policies for work-family balance (Stratigaki, 2005); recruiting, training and mentoring programs to promote women into the boardrooms, campaigns to sensitizing about gender balance (Szydlo, 2013); explicit commitments related to hiring women for key positions of power, ensuring salary equity, encouraging women to be involved in networking opportunities (Johnson et al., 2015); and the Plan of Equal Opportunities for Women (Bustelo, 2016). However, despite the widespread use of such policies, barriers to the advancement of women remain. There are different ways to check if such policies achieved their goals but it is no clear evidence of how these equity policies are effective in removing such barriers. This study is focused on analyzing the relationship between the gender equity policies and barriers to women's promotion. We expect that positive perception of equity actions will contribute to the perception of fewer gender barriers, so we can know which actions are more effective and on which barriers they have the most effect.

Design/Methodology/Approach/Intervention

To analyze the relationship between equity policies perception and gender barriers perception a structural equation analysis was carried out in a sample of 539 female employees in a Spanish financial group, using MPlus. Measures used include a scale of five points of frequency of Gender Equity Policies developed in the company (20 items) and three barriers to women's promotion dimensions from the TOP WOMAN scale on a seven-point Likert-scale (Ramos et al., 2022): Unfair human resources policies and practices (4 items; a=.83), Unequal performance appraisal (4 items; a=.96); and Barriers related to the work-life balance and family responsibilities (6 items; a=.81).

Results obtained

The exploratory (EFA) and confirmatory factor analysis (CFA) of Gender Equity Policies scale identified three factors: gender awareness (8 items; a=.90), gender equity in HRM (9 items; a=.91), and work-life balance (3 items; a=.79). As expected, the three factors of gender barriers perceptions appear negatively correlated with equity policies' perceptions, but these policies do not affect with the same effectiveness to each barrier. The more perception of the HRM gender equity policies, the less perception of the three barriers analyzed. However, the perception of work-life balance policies only reduces the perception of barriers related to unequal HR practices. Thus, women value the presence of gender equality policies, but women's perceptions of barriers seem to be mainly related with equity policies in HRM.

Limitations

This is a cross-sectional design, with a sample formed by female employees from only one organizational group.

Conclusions – research and or practical implications/Originality/Value

Our findings point out the relevance of equality policies in improving the gender balance in the labor market. To the extent that specific policies are carried out with a certain frequency, they significantly reduce the perception of gender barriers.

Relevance to the Congress Theme

This contribution is novel in analyzing the effects of Equity Policies in decreasing the barriers to women's perceptions.

Relevant UN SDGs

This paper contributes mainly to the SDG 5: Gender Equality, and secondly, to the SDG 3 Good Health and Well Being.

Keywords: Barriers to women's promotion, gender equity policies

Oral presentation OP806

Do HR Practices for Aging Workforce Improve Work Motivation among Older Workers Experiencing Career Plateaus?

Norihiko Takeuchi & Yuhee Jung | Waseda University

science

As populations age in many societies today, there is a trend for individuals to extend their professional lives. As a result, there is a growing interest among practitioners and researchers in motivating middle-aged and older workers to continue working. Existing research suggests that organisational HR practices specifically designed for ageing workforce may act as an important antecedent of older workers' motivation to continue working after retirement age. However, there are two major challenges in the literature. First, little evidence has been provided that takes into account factors related to the career context specific to older workers. In particular, there are greater differences in the extent to which older workers experience 'career plateaus' in their organisations. Accordingly, the effectiveness of the support from the organisation in motivating workers to continue working may well differ between older workers who experience career plateaus and those who do not. Second, the existing empirical reports are dominated by ones based on cross-sectional analyses, and thus fail to clarify the relationship between HR practices for ageing workforce and the motivation to continue working, operationalised as variables with time-series changes.

To address these issues, we develop an analytical model using job-demands resources model applied to ageing workforce career context, and examine (1) longitudinal effects of changes in HR practices for ageing workforce on changes in motivation to continue working and job apathy, and (2) moderating effects of changes in career plateaus on the relationship between changes in HR practices for ageing workforce and changes in motivation to continue working and job apathy.

Large-scale, time-series surveys were conducted over full-time employees in private companies with more than 100 employees in Japan. Japan is known as super-ageing society and has achieved the world highest ageing rate of 30%. Our analysis included data from 1,835 full-time workers aged 45 to 64 who participated in all four waves of the surveys, i.e., form Time 1 (T1) to Time 4 (T4), and who worked for the same company during the entire survey period (one year).

To test our hypotheses, we used a latent growth curve modelling, in which the intercepts and slopes of the repeatedly measured variables at four time points are estimated and a multiple regression model between the slopes of each variable can be estimated. Results revealed that changes in HR practices for ageing workforce (as operationalized by work assignment practices and performance review practices) were significantly and positively related to motivation to continue working after retirement age and negatively related to job apathy. In addition, we found that changes in career plateaus had significant moderating effects on the relationship between changes in the HR practices and changes in motivation to continue working as well as job apathy. Interestingly, the pattern of the moderating effects suggested that the HR practices designed for ageing workforce enhance motivation to continue working (and reduce job apathy) when the growth rate of workers' career plateaus are high while the same HR practices reduce motivation (and enhance job apathy) when the growth rate of career plateaus are low.

The contributions of this study are twofold. First, the study adds value to existing research on the HR practices-motivation relationship, which is mainly based on cross-sectional analysis, by identifying linkages between HR practices for ageing workforce and motivation to continue working (and job apathy) over time. Second, it was confirmed that changes in career plateaus moderated the

relationship between HR practices and increased motivation to continue working (and decreased job apathy), and that the relationship between HR practices (i.e., job resources) and outcomes (i.e., motivational outcomes) varies with the degree of career plateau experience (i.e., job demands). Specifically, for individuals with a decreasing trend in career plateau (i.e. declining job demands), HR practices can be effective in ameliorating motivation to continue working and job apathy, whereas for those with an increasing trend in career plateau (i.e. growing job demands), the HR practices may have worsening effects on motivation to continue working and job apathy.

In line with the EAWOP Congress theme 'The future is now: the changing world of work', this study focused on older workers' motivation issues from the sustainable career perspective. Furthermore, Goal 8 of the UN SDGs, 'Decent Work and Economic Growth', aims to achieve high levels of economic productivity through diversification. In particular, if the experienced and highly-skilled elderly population can continue to work after retirement through their intrinsic motivation, the possibility of achieving that sustainable goal will increase.

Keywords: HR practices for aging workforce, career plateau, sustainable careers

Oral presentation OP416

Do university students and employees face comparable demands and resources? Comparing data using the ReA employees and student edition

Britta Wittner, TU Braunschweig Industrial/ Organizational and Social Psychology; Eva-Maria Schulte & Simone Kauffeld | Industrial/ Organizational and Social Psychology

science

The number of students reporting to feel stressed is rising– even more since the beginning of the pandemic (Besa et al, 2021, Aristovnik et al, 2020). While studies underline this, society is often unimpressed: what kinds of struggles do students really have to face? Are demands and resources of students and employees truly comparable?

According to the Job-Demands-Resources Model (J-D-R; Bakker & Demerouti, 2017) stress is predicted by the demands individuals face at work and in their private life. In contrast, resources support work-engagement and can buffer the relationship between demands and stress. After applying the JDR to multiple contexts, it was adjusted to fit the needs of students at university (Study-Demands-Resources Framework, S-D-R, Lesener et al., 2020). Studies based on both models often use a limited amount of resources and demands as dedicated psychometrical scales were scarce. The ReA (Ressourcen und Anforderungen bei der Arbeit; Schulte et al., 2021) as well as the ReA_Stud (a version adapted to the higher education context; Wittner et al., in prep) fill this gap by offering questionnaires measuring 20 to 23 resources and 17 to 22 demands for employees respectively students. Since 27 scales overlap (13 demands and 14 resources), meaning that they are identical except the context (e.g., using the word “university” instead of “work”) they enable us to compare scores of students and employees.

Comparing the demands we assume that time pressure and private demands are more prevalent in employees. Deadlines are rapidly paced in organizations, while students often have all their exams and papers at the end of the semester. Since their parents are often younger, and they are less likely to already have children of their own they are less likely to have to offer care work. We expect pressure to perform, strain, and technical difficulties to not significantly differ, while students are more likely to feel overly challenged since they must learn something new every day. While some resources might be similar, we assume students to have more private support, recovery, and autonomy. Younger people often have more friends and closer ties to their parents, they can structure days as they feel fit and thus could have more time to rest and feel more autonomy. In addition to these expected differences, we examine all scales exploratively to identify potential other differences and, thus, to answer the question, how equally challenged students and employees are.

In this study, we compare data of N = 459 employees and N = 716 students. The employees were 38.5 years old (SD = 12.53) and on average entered the working world approximately 15 years ago (SD = 12.04). 40% respectively reported to be male or female, 20% made no allegations. Students were notably younger (Mean = 24.5 years, SD = 5.57) and in their 4 th semester (SD = 2.82). 65% were female, 27% were male and 11% diverse.

In contrast to our hypotheses initial results show that students perceived significantly higher time pressure and private demands, while employees reported significantly higher strain. Students were significantly more challenged and thus felt more overwhelmed. Contradicting to our hypotheses, students perceived significantly less private support and scored lower on recovery and autonomy. Our results show, that over all dimensions, students reported significantly less resources and more demands than employees.

Our study offered surprising insights, that lead to a better understanding and a call to take university students complaints seriously. Discussed in the light of previous results on stress and university students, it is important to support students early on. Stressed students are less successful in their studies and more likely to drop out of their major or university all together. Most alarming: first studies point towards an overspill effect – stressed students become stressed adults later on. Thus, universities, teaching staff and private support systems have to support students a) directly, b) by offering a learning environment they can strive in and c) guiding them to use and strengthen their resources.

With our study we support the UN sustainable development goals: supporting students early on does not only lead to quality education for all students, but it might also lead to employees in psychologically healthy careers. Since stress in the workplace influences all other aspects of an individual's life, it supports their long-term well-being and enables them to lead a healthy life.

Oral presentation OP465

Do you see me as I see myself? Implications of internal leader identity asymmetry

Samet Arslan, Cristian Vasquez, Anna Topakas & Kristin Hildenbrand | The University of Sheffield

science

Although researchers have contributed to the growing interpersonal congruence-related literature, the intrapersonal aspect of congruence has been neglected (Meister et al., 2014). Our study, first, answers the call for the need for studies to understand how leaders define themselves (Epitropaki et al., 2017) by examining the internal leader identity congruence of managers. Second, our research answers the call for exploring the causal relationship between the internal identity (in)congruence and outcomes (Meister et al., 2017) using a time-lagged survey design.

Due to the fundamental desire for self-verification of individuals (Swann, 1983), they seek to be affirmed and verified of their work-related (i.e., leader) identities (Meister et al., 2014). Developing a leader identity is complex because of the various processes such as being granted and validated by others through social interactions (DeRue & Ashford, 2010; Epitropaki et al., 2017). Individuals engage in both internal and external identity negotiation during the leadership development process (Collinson, 2003; Sinclair, 2011) and they might experience internal identity asymmetry (incongruence) when they feel misidentified (Meister et al., 2014) or symmetry (congruence) when they feel identified correctly. While internal identity incongruence might affect individuals negatively (Meister et al., 2017), increased congruence between self-views and the views of others might help individuals to predict and control their environment (Swann, 1983) and have a positive impact on their effectiveness and performance (Carter & Mossholder, 2015; Carter et al., 2018). We conceptualise internal leader identity incongruence as the incongruence in leader identity assessments between manager–subordinate reflected appraisal, that is, the distance in a manager's leader identity and their perception of their subordinate's assessment of their leader identity. Thus, in the current study, we propose that the incongruence between manager–subordinate reflected appraisal of managers' leader identity is associated with (1a) lower leader effectiveness and (1b) lower affective motivation to lead than is the congruence. Drawing on recent evidence that endorsing one's own leader identity as well as ensuring one's leader image is acceptable to others (Cunningham et al., 2022) we further propose that a high-high congruence is associated with (2a) higher leader effectiveness and (2b) higher affective motivation to lead than a low-low congruence.

In this study, participants having managerial responsibilities (N = 202) were recruited from Prolific. We used a two-wave time-lagged survey design, with a two-week interval. In Time1, managers were asked to rate the extent to which they see themselves as a leader and their subordinates see them as a leader (reflected appraisal) as well as the outcome variables. In Time 2, they were only asked to rate the outcome variables. We used polynomial regression with response surface methodology to test our hypotheses (Edwards & Parry, 1993).

Our findings did not support hypothesis 1a and 1b but supported 2a and 2b. The analyses demonstrated non-flat increasing (slope = .43, $p < .001$) and linear (curvature = .07, n.s.) leader effectiveness, as well as non-flat increasing (slope = .65, $p < .001$) and linear (curvature = .00, n.s.) affective motivation to lead along the leader-subordinate leader identity congruent axis.

Our study has several limitations. First, even though our study employed time-lagged data, we used a single source (i.e., managers) to capture both the predictors and outcomes. Future research might extend our study by collecting outcome data from the managers' followers, especially in the case of

leader effectiveness. Second, as we did not use an experimental design, our study has limitations in terms of inferring causality.

This study extends our understanding of intrapersonal dynamics of leader identity by evaluating the congruence between how managers see themselves and managers' reflected appraisal of their subordinates. Our findings might inform the organizations about the importance of using more comprehensive 360-degree feedback tools that include questions seeking the intrapersonal aspect of leadership ("how I believe others see me") as well as the external and actual aspects ("how others actually see me" and "how I see myself").

The future will be more inclusive and equal if we can act now to increase diversity in the leadership echelons. By exploring the implications of internal leader identity processes, we build knowledge and understanding of why some people may see themselves and be seen as having leadership potential, while others may struggle to endorse a leader self-view, which may prevent them from seeking leadership and evaluating their own leadership positively. We address "the future is now?" by pre-empting the future we want through understanding and removing the barriers to diversifying the leadership pool of the future.

Keywords: identity, Identity asymmetry, leadership

Oral presentation OP576

Does Career Change Make Life Better? Development in Health, Well-Being, and Job Satisfaction after an Occupational Change

Ivana Igic, University of Bern/ Military Academy at the Swiss Federal Institute of Technology Zurich; Gudela Grote, ETH Zurich, Department of Management, Technology, and Economics; Guri Medici, University of Applied Sciences Northwestern Switzerland

science

Research goals: Occupational changes are important and relatively common career transitions (Bachmann et al., 2020), that have important implications for employees because they influence individuals' work roles, behavior, and work-related outcomes (Dierdorff, 2019). Occupations also significantly shape the work environment, job conditions, and nature of job tasks (Dierdorff & Morgeson, 2013). Thus, changing an occupation may be difficult and can have significant consequences for employees and organizations (Dierdorff, 2019). According to the Institute of Labor Economics, 3% of European workers change their occupations yearly (Bachmann et al., 2020) and about 47% are unhappy wishing to change careers. The goal of the study was to address previous inconsistent results regarding the consequences of occupational change and expand the scope of investigated outcomes, by health and well-being. Furthermore, we also explore and explain why employees show different developments in tested outcomes after an occupational change .

Theoretical background: Switching occupations can lead to a devaluation of occupation-specific human and social capital, and a depletion of resources due to the necessary investment of resources for developing new skills and knowledge (Kambourov & Manovskii, 2009; Parrado et al., 2007). However, occupational change can also lead to gains and benefits for employees, such as an improved match between skills and job-specific requirements or improved working conditions (Edwards et al., 2006; Parker, 2015). Existing research on occupational change has led to ambiguous findings. Because of possible losses and gains, not all employees may show the same effects on outcomes or the same development of outcomes after the occupational change. Previous research commonly explored job and career-related effects as outcomes of occupational change (Carless & Arnup, 2011; Longhi & Brynin, 2010). However, because occupational change is a considerable transition with potentially broad professional and personal implications, it could also influence employees' health and well-being. Previous research has not yet clarified which factors contribute to favorable or unfavorable development over time.

Design/Methodology: We analyzed the career data of young employees in Switzerland, only including participants who changed their occupations within the first four years after entering the labor market (N = 352). To estimate intra-individual change across time in outcomes, we used latent growth models (LGMs).

Results: On average, our results suggest that those who change their occupations report positive developments in health, well-being, job satisfaction, and the quality of job conditions. Our expectations that job and personal resources in the new occupation should be positively related, and job demands negatively related to an improvement in health, well-being, and job satisfaction after an occupational change were supported. Our findings also imply that improvement in resources and demands in a new occupation is associated with more favorable developments in health, well-being, and satisfaction after an occupational change.

Limitations: Our sample only contains employees in their early career stage, not middle- or late-career employees. Different trajectories might be found for more diverse samples or samples with

employees in later career stages. Future studies should include more diverse samples regarding education, age, and career stage or might explore which factors or combinations of factors might moderate the different consequences of occupational change.

Conclusion: In the early career, occupational change has positive consequences for most individuals in our sample. We find an overall favorable development in health, well-being, and job satisfaction, as well as in job demands, job resources, and self-efficacy up to two years after an occupational change. An increase in job resources and self-efficacy and a decrease in job demands after an occupational change explain favorable development in tested outcomes. Furthermore, especially improvement (decline) in job resources seems relevant for improvement (decline) in “positive” outcomes (job satisfaction and positive affectivity). Improvement (decline) in job demands seems relevant for improvement (decline) in “negative” outcomes, such as physical ailments and negative affectivity.

Keywords: Occupational change, health, well-being

Oral presentation OP240

Does economic skills obsolescence increase older workers' absenteeism?

Angela Messioui, Maastricht University (ROA); Jos Sanders, HAN University

science&practice

Research goals

With accelerated technological developments, older workers can experience 'economic skills obsolescence ' in which their current skills no longer correspond to the newly required skills for their job and lose their value. Previous studies showed that skills obsolescence is related with job dissatisfaction and job-related stress (e.g., McGuinness et al., 2021; Tsai et al., 2007). Our study is the first to examine the relationship between economic skills obsolescence and absenteeism among older workers. Studying this relationship is important for finding ways to extend working lives and sustain older workers' employability. In today's tight labor market, where organizations face difficulties in recruiting adequately skilled workers, employing experienced workers with up-to-date skills is essential to ensure a successful organization.

Theoretical background

Using the JD-R framework (e.g., Bakker et al., 2003), we argue that economic skills obsolescence is a job demand, as it is a stressor related to the changes in the skills demanded in the job. Workers experience the fear of skills obsolescence and its consequences for their employability, as well as the constant pressure to keep their skills up-to-date. Building on the JD-R model, we hypothesize that economic skills obsolescence increases workers' absence rates (duration and frequency) by two processes: a health impairment process mediated by burnout and a motivational process mediated by work engagement.

Methodology

We used data from 'STREAM' - Study on Transitions in Employment, Ability, and Motivation for our study. STREAM is a longitudinal stratified cohort study among older employees, self-employed, and non-working persons in the Netherlands (aged 45-64 years). We analyzed the long-term effects of economic skills obsolescence on absenteeism in a job with data from employees who participated in the 2015 wave and the follow-up measurements of 2016 and 2017. We tested our hypotheses with SEM models, including cross-pathways, using R's statistical software.

Results

Our results show that economic skills obsolescence is a job demand that affects absenteeism both through a health impairment and a motivational process. More specifically, we find that burnout and work engagement mediate the relationships between economic skills obsolescence and absence duration and absence frequency.

Limitations

There are a few limitations to our study. First, variables were derived from self-report measures, raising concerns of common method bias. Our absence data also has a non-normal distribution, which is very common in studies using absence data. A final limitation is the low percentage of variance explained by the research models. However, the pseudo R^2 in our study corresponds with prior research, since absence behavior is influenced by a wide range of factors (e.g., Bakker et al., 2003).

Research implications

Our study is the first to examine the relationship between economic skills obsolescence and absenteeism, making several contributions to the literature. First, our study extends the JD-R literature by including economic skills obsolescence as a job demand that could lead to absenteeism. Second, it contributes to the current literature on absenteeism, which has so far not identified economic skills obsolescence as a possible cause. Finally, our study contributes to the empirical research on economic skills obsolescence as an early warning indicator of older workers' absenteeism.

Practical implications

Our study emphasizes the importance of monitoring economic skills obsolescence as an early warning indicator for absenteeism. Also, to promote lifelong learning and related pro-active HR practices, we suggest strengthening dialogue on the fit between workers' skill sets and current & future skills demand.

Relevance to the Congress Theme

Economic skills obsolescence is a stressor resulting from a process of continuous changing skill requirements in a job. Experiencing obsolescence usually stimulates workers to engage in developmental activities, such as training, but they could also increase workers' absence rates. We aim to analyze this latter relationship, discuss the results, and find ways to prevent or overcome economic skills obsolescence so that workers remain healthy and motivated at work.

Keywords: economic skills obsolescence, absenteeism, older workers

Oral presentation OP350

Does mindful organizing shape employees' attitudes and behavior? Testing a multilevel moderated model

Daniel Gajda & Przemysław Zbierowski | University of Economics in Katowice

science

Research goals

Ensuring the reliable functioning of an organization is one of the priorities for managerial staff, because in the age of modern technology, the consequences of failures and accidents at work may be global in scale. The particular importance of reliable functioning is assigned by so-called high reliability organizations (HROs), such as nuclear power plants, drilling platforms and airlines, that are positively deviant in their nearly error-free performance, despite operating in dynamic and time-pressured conditions. The scientific literature (e.g. Weick et al ., 1999) argues that the exceptional reliability of these organizations arises from mindful organizing (MO).

The current theory on MO is mostly informed by studies conducted in HROs, which has provided some details about the nature of mindfulness in organization and the conditions under which it thrives. Although the concept of MO is intriguing, there is a shortage of empirical evidence to support the usefulness of mindful thinking and action in ordinary business settings. Moreover, a growing body of evidence shows the positive impact MO has on reliability and safety related outcomes. However, very little is known about employees' subjective experience of working in contexts engaging in MO, especially about the attitudinal and behavioral responses of employees at work.

Therefore, the purpose of our study was to examine the employees' reactions to MO in ordinary business settings. Ultimately, we ask the question about how MO affects positive attitudes and behavior toward work and organization, such as work motivation, organizational commitment and organizational citizenship behavior (OCB), that is attitudes and behaviors associated with organizational performance in previous research.

Theoretical background

We apply social exchange theory (Blau, 1994) to explain how the employees' reactions to MO are formed. We also try to contextualize the employee-related effects of MO and study the moderating effect of the organization's environment on the examined relationships as several researchers (e.g. Vogus & Sutcliffe, 2012) argue that the effectiveness of MO may be higher under uncertain environments with constant changes.

Method

We surveyed 307 employees to test our model. Data collection was carried out with the use of convenience sampling to recruit employees who work for companies from many industries and occupy various positions. A series of hierarchical regression analyses and structural equation models were performed to test our hypotheses.

Results

The results reveal that MO has a positive and significant impact on employees' affective and normative commitment, motivation to work and OCB. Contrary to expectations, our study did not confirm that organizations' environment affect the attitudinal and behavioral results of MO.

Furthermore, we found that OC to some extent explains the relationship between MO and motivation as well as between MO and OCB.

Limitations

Like other studies, also ours has some limitations. First, all the data for this study were gathered from a single source at a single point in time, raising concerns about common method bias. Although we adopted the procedural remedies recommended by Podsakoff et al. (2003), we cannot exclude the possibility that CMV exists. However, the post-hoc test indicated that CMV is not a threat to our results. Second, because the data were self-reported, social desirability response bias cannot be fully ruled out.

Conclusions – research and practical implications/Originality/Value

To the best of our knowledge, our study is one of the first attempts to explore the effects of MO in the traditional business context. Our findings demonstrate that organizations situated in a less demanding environment than HRO's could also benefit from MO. Moreover, the study offers some insight into how MO affects employees' attitudes and behaviors. Results of our research show organizational leaders that it is in their best interest to foster MO, as it contributes to a more positive working experience and, consequently, strengthens employees' bond with the organization, boosts their work motivation and elicits discretionary behavior.

Relevance to the Congress Theme

The study is particularly relevant in the light of changing world of work because in contemporary economic realities, characterized by increased risk and uncertainty in managing the organization, raising awareness of and finding ways of responding to unanticipated occurrences daily in order to avoid more consequential crises is critically important.

Relevance to the UN SDGs

Our study shows that MO contributes to a more positive working experience and elicit discretionary behavior, which leads to strengthening interpersonal relations and building social capital. This may result in achieving the UN Sustainable Development Goals, such as creating wealth and well-being for customers, shareholders and the whole society.

Oral presentation OP210

Does performance management underpin employee's motivation and behavior

Channary Kong, Saxion University of Applied Sciences

practice

Subtitle: The Effect of Performance Management System on Change-Oriented Behaviors and the mediating role of intrinsic motivation in banking sector in Cambodia

Purpose: Performance Management System is one of the most important management tools that enhances performance and productivity of the organization by developing and improving performance of individuals and teams. It consists of a range of activities such as goal setting, on-going coaching and monitoring, providing feedback, and developing knowledge, skills and abilities of people to improve performance. Performance management system is considered as effective when it enables employees to positively change their behaviors and subsequently improve their performances. For this purpose, it has leaned toward motivational, developmental and nonjudgmental orientation that encourages discretionary behaviors among employees and increases their motivation for extraordinary efforts. Those discretionary behaviors include promotive and constructive behaviors which intend to stimulate and inspire something to happen. In organizational psychology, motivation refers to energy and willpower within individual to initiate work-related tasks and behaviors. It has been recognized that employees who are intrinsically motivated are more likely to be flexible, curious to learn and try new things, and open to new approaches to solve problems. According to cognitive evaluation theory, goal-oriented challenges, communication, evaluation, support, and freedom from being judged or criticized by others can reinforce individual's intrinsic motivation which drives desirable change-oriented behaviors such as taking charge, personal initiative, and speak up or challenge the status quos. These productive behaviors are critically important for successes of organizations. Nevertheless, there is little finding on how performance management system motivates employees to embrace change-oriented behaviors. Therefore, this research study aims to investigate the effect of performance management system on change-oriented behaviors and examine the mediating role of intrinsic motivation in banking sector in Cambodia.

Methodology: A sample of 469 employees in banking sector in Cambodia were surveyed. Four hypotheses were tested using multiple linear regressions and mediation analyses.

Findings: The result showed that 1) performance management system had strong effect on employee's intrinsic motivation and change-oriented behaviors. 2) among the four instruments, performance review had the strongest influence on intrinsic motivation and change-oriented behaviors followed by goal setting, performance coaching and performance feedback. 3) the predictor power of performance feedback on intrinsic motivation and change-oriented behaviors disappeared when adding performance review into the model although there was no sign of multicollinearity. 4) intrinsic motivation partially mediated the positive relationship between performance management system and change-oriented behaviors.

Research limitations & Implications: It is worth noting that four limitations were recognized in this study. 1) language barrier of the survey questionnaire which was written in the second language of the respondents, 2) the dominant responses from two organizations who participated would potentially influence the overall research finding. 3) demographic information of respondents such age, gender, education level, service tenure, and leadership responsibility of the respondents was not comprehensively analyzed and discussed for the maximum benefits of this study. 4) 15 outliers

were found but kept in dataset due to insufficient reasons to exclude them from the analysis, however, severe skewness and high kurtosis were in acceptable range.

Originality & Value: The relevant findings were that goal setting and performance review had the greatest impact on change-oriented behaviors so more attention and effort should be rigorously paid on these two main instruments. It was suggested to further investigate at workplaces why performance coaching had lesser impact on employee's intrinsic motivation and change-oriented behaviors than that of goal setting and performance review. Finally, intrinsic motivation partially mediated the positive relationship between performance management system and change-oriented behaviors. In this context, extra emphasis should be put on empowerment by management on changes or corrections of work process and procedure, and speak up culture that encourages new creative ideas. For future studies, it is suggested 1) to add extrinsic motivation as a mediator because external social-contextual events can reinforce intrinsic motivation. 2) to add demographic information of respondents as control variables given that the primary study showed some of these variables had influences on change-oriented behaviors. 3) to closely examine the relationship between performance review and performance feedback.

Keywords: Performance Management, Change-Oriented Behaviors, Intrinsic Motivation

Oral presentation OP805

Does procrastination can fluctuate day to day? A dynamic lens

TAIS DE MELO & HELENIDES MENDONÇA | PUC

science

Procrastination is a behavior that implies delays in starting or finishing tasks or making decisions, makes it difficult to achieve goals and is associated with feelings of guilt, shame and is experienced as stressful (Visser, Korthagen & Schoonenboom, 2018). Although great advances have been made to unravel the antecedents and consequences of procrastination, limitations can be identified, such as the lack of daily studies. New findings have already pointed to the daily fluctuation of procrastination that can decrease or increase as the days go by (Van Eerde & Venus, 2018). Studies have indicated task aversion as a reason to procrastinate, which may increase in the face of more difficult and boring tasks (Michałowski et al., 2020). To expand the nomological network of procrastination, the research aimed to analyze its daily fluctuation, considering the influence of the degree of importance and pleasure attributed to the task and the positive affects that occurred on the day. The study was relevant for confirming the fluctuation of procrastination over the days at work and in different groups.

Theoretical basis

The theoretical support of the research is Bandura's Social Cognitive Theory, for which, in addition to personal factors, it shows that behavior can be altered by contextual factors, confirming the situational perspective of procrastination and its dynamic structure.

Method

This daily study was carried out on six consecutive days with Brazilian workers. The first day of the survey was structured with sociodemographic questions and a questionnaire in which the participant programmed up to three work activities to be carried out the following day. The five subsequent days of the research consisted of questionnaires in which, in addition to containing the report of the activities planned to be carried out on the following day, the participant was asked to classify the percentage of completion of each task, the degrees of importance and pleasure that they experienced. felt when carrying out these activities, and the positive affects that occurred on the day. Such percentages of completion of these daily tasks were grouped in each of the five days, making a total of 420 responses, generated by the 84 participants. Most workers who participated in the survey were female (63.1%). The mean age was 35.65 (SD=8.983), with 44% having children and, of these, 37% having children living in the same household, 39% being married. The average working time in the profession is 12.3 years (SD=9.101). Almost half (n=51%) of the respondents were in face-to-face work format at the time of participating in the survey and 54% do not hold a management position. A multiple linear regression analysis was carried out, with the aim of investigating to what extent the variables importance and pleasure of the task and positive affects influenced task procrastination. The repeated measures ANOVA was used to evaluate the difference in procrastination fluctuation in groups such as men and women, workers in face-to-face and home office formats, leaders and non-leaders, groups according to marital status, groups that have children living at home and living abroad at the time of application of the survey.

Results

The research results support the fact that there was a variation in the impacts on procrastination over the six days verified, and the degrees of pleasure and importance attributed to the task were the variables that most impacted on procrastination, however positive affects did not had a significant impact in the research period. The fluctuation of procrastination occurred more intensely in the group of men and workers in the home office format than in the other groups. Workers who do not hold a leadership position procrastinated more and maintained this behavior over the days with low fluctuations. Married professionals groups procrastinated more than divorced and single professionals. Professionals who have their children living in the same house showed a greater fluctuation in procrastination throughout the research.

Limitations

Data were self-reported and new advances would be made in establishing external criteria to assess procrastination in workers. In addition, the assessment of procrastinating behavior lasted only six consecutive days, it is suggested that future studies verify this behavior over longer periods.

Research/practical implications

The study fills a gap in the literature on the fluctuation of procrastination and the factors that impact this behavior and justifies the development of training focused on productivity in the work environment.

Originality/Value

The research stands out for analyzing the fluctuation of procrastination through the daily study method, in addition to the influence of context variables on the procrastinating behavior of workers. The study makes theoretical and practical contributions by describing other mechanisms that affect procrastination at work.

Keywords: Procrastination, Degree of pleasure of the task, Degree of importance of the Task.

Oral presentation OP179

Does the leader's life story matter? Exploring generativity in leaders', employees', and teachers' life stories

Izabella Ilea & Orsolya Vincze | University of Pécs; István Csertő, Károli Gáspár University of the Reformed Church; Dániel Jenei, University of Pécs

science&practice

Generativity is a crucial leadership characteristic in today's VUCA environment. For highly generative individuals taking care of others is as important as the maintenance and the extension of the self. Their main aim is to create something that will outlive the self, that will be a gift for the future generation. This object, event, or behaviour will be their own legacy, the representation of their symbolic immortality. Generativity can contribute not only to the organization's profitability, but also to a better atmosphere, where everyone is committed to continuous development and organizational citizenship behaviour. That's how it can also contribute to the organization's sustainability. With a highly generative leader firms can become learning organizations and easily adopt to today's rapidly changing environment. The only way someone could authentically achieve generativity is the narrative revision of one's life story. The objective of the present study was to examine different forms of generativity in life stories of Hungarian leaders, employees, and teachers. It is widely proven that teachers represent the communal mode of generativity, but it has only been theorized that leaders represent the agentic mode. With the present study we would like to demonstrate that different types of generativity could be manifested differently in the life stories according to various work positions. In the present study, N = 85 participants (n CEO = 46 n employee = 20, n teacher = 21; n man = 68, n woman = 19) were interviewed using a shortened version of the life-story interview developed by McAdams (1985). Themes of agency and communion were used in coding. The result show that CEOs and teachers are the most generative group, but among different components. The characteristics of CEOs' generativity is agency, while teachers' life stories are marked by communality. Despite this difference both groups could integrate the two themes in their life stories equally, which is also a key feature of an authentic generative person. One of the biggest limitations of our study is the overrepresentation of males, which is a general pattern among Hungarian leaders. At the same time our study calls attention to the importance of leaders' life stories. With this powerful tool, we could develop and help leaders – with techniques such as narrative coaching - to find their true authentic self, become more effective leaders and be able to establish balance in their organizations in today's unpredictable environment. Leaders finding their inner generativity can result in a company culture that supports decent work and economic growth, innovation, and inequality within their organization, by which they can also have a positive effect on their employees' and local environment's well-being.

Keywords: leadership, generativity, life story

Oral presentation OP335

Don't leave accountable leaders alone: How and when felt accountability affects loneliness at work for leaders

Hodar Lam, University of Amsterdam; Zhuojun Wang, Institute of Psychology, Chinese Academy of Sciences; Shuai Yuan, University of Amsterdam

science

High quality connection is vital to employee motivation and satisfaction (Stephens et al., 2012). However, employees are finding it harder to feel connected at work, as indicated by a recent large-scale surveys in U.S.: half of the employees reported feeling lonely at work, an experience that impairs employee performance and well-being (Anand & Mishra, 2019; Ozcelik & Barsade, 2018).

Scholars and practitioners are now paying attention to loneliness among employees. However, leader loneliness has received substantially less attention. Emotion and well-being issues in leadership are often stigmatised, partly due to the romanticised view that leaders are mentally strong, powerful, and resourceful (Barling & Cloutier, 2017). Therefore, the literature contains little evidence for the leadership-specific trigger and protective factors of leader loneliness.

We argue that felt accountability, defined as the expectation that one's decisions or actions will be evaluated by a salient stakeholder (Wang et al., 2019), would be a key protective factor that prevents leaders experiencing an excessive degree of loneliness. Accountable individuals are more cautious in decision-making and hence, process information in more detail and produce better decisions (Aleksovska et al., 2019). In the decision-making process, leaders often need to discuss and disclose their information as well as stress and anxiety (Wright & Barling, 1998); this self-disclosure behaviours enjoy two important benefits: emotionally, it helps build mutual trust with peers, and cognitively, it facilitates information and feedback sharing.

Here we argue that leaders with high accountability, bearing the goals of support-seeking and information-sharing, are more likely to engage in self-disclosure with their peers (but not leaders or followers), and hence, feel less lonely at work. Moreover, we expect self-disclosure to peers is more likely when leaders feel more powerful, as power has a disinhibiting property that motivates individuals to satisfy their social goals more immediately (Guinote, 2017).

Method

We conducted a three-wave weekly survey study with 277 mid-level managers, recruited via Prolific Academic. The average self-rated hierarchy level, on a ten-point scale, is 6.55 (SD = 1.25), and the average number of followers is 8.04 (SD = 10.20). Each weekly survey measured participants' felt accountability (Giessner et al., 2013), self-disclosure to superiors, peers, and followers (Lam & Shemla, 2019), and workplace loneliness (Wright et al., 2006).

Results

We tested our hypotheses with the Structural Equation Modelling framework with the R package lavaan . In line with our hypothesis, felt accountability measured at Time 1 positively predicted self-disclosure behaviours towards the peers, measured at Time 2 ($b = .18$, $p < .01$), which in turn negatively related to leaders' self-reported loneliness at Time 3 ($b = -.32$, $p < .01$). Importantly, our suggested indirect effect is also significant ($b = -.06$, $p < .05$); in other words, felt accountability negatively affected the sense of loneliness through self-disclosure to peers. Last, subjective power

indeed positively moderated the relationship between felt accountability and self-disclosure to peers ($b = .17$, $p < .01$).

Discussion

Limitations

First, we proposed support-seeking and information-sharing as motives of accountable leaders to self-disclose to peers, but this explanation remains empirically untested. Second, our focal variables were measured by self-reports and are subject to response biases. Therefore, other-ratings of accountability and self-disclosure may provide stronger tests for our proposed hypotheses.

Implications

First, drawing on the accountability literature, we distinguish the concept of leader loneliness from employee loneliness by introducing felt accountability as a leadership-specific antecedent. Second, we identify a mechanism of self-disclosure that explains how accountable leaders cope with potential loneliness threats. Third, we show that subjective power is a key condition for leadership emotional experience, thus addressing the puzzle of when power could mitigate loneliness (Lee & Tiedens, 2001).

Research Relevance

Our study introduces loneliness as a likely emotional reality in the future of work. With increasing work digitalization and remote work arrangements, leadership will be even more challenging, as social cues are lost in online communications and workplace interactions become more instrumental (Chernyak-Hai & Rabenu, 2018). Therefore, we believe our study would inspire EAWOP participants on evidence-based interventions for leader well-being.

This study primarily addresses the UN SDG8: Decent work and economic growth and curb the spillover of leader loneliness to their teams (SDG3: Good health and well-being). Further, we raise public awareness on loneliness that is often-stigmatised at work (SDG10: Reduced inequalities).

Keywords: Loneliness, accountability, leader well-being

Oral presentation OP333

Don't you tell me what to do, you are just an artificial intelligence! – Perception, evaluation and motivational function of AI-assisted feedback

Klara C. Grünwald, Matthias F. C. Hudecek | Department of Experimental Psychology, University of Regensburg, Germany; Silke F. Heiss, FOM University of Applied Sciences

science&practice

Research goals and why the work was worth doing:

While Artificial Intelligence (AI) is becoming more prominent and is already used by 50% of workers in organizational context, most employees are optimistic and grateful to work with robot co-workers. 64% even have more trust in robots than their managers (Oracle, 2019). This gives the impression that the further implementation of AI is a relevant change for the future organizational context and future leadership.

Therefore, we intended to examine the underlying psychological aspects of AI in a leadership context. Our study aimed to investigate the acceptance, perceived quality and motivational function of AI in a managerial position in organizational context. We compared the perception of AI-assisted feedback to feedback from a human manager to investigate whether people really prefer an AI to a human manager when it comes to feedback.

Theoretical Background:

AI seems to generate an objectively higher quality of feedback than human managers under certain conditions (Tong et al., 2021), which correlates with better employee performance and learning. However, when employees know that the feedback was generated by an AI, they are less likely to accept the feedback and rate its quality lower than feedback from human managers, which negatively affects performance and learning.

Further, positive feedback from human managers correlates with higher evaluated accuracy and positive attitudes towards the organization, as well as higher work engagement, resulting in lower turnover compared to negative feedback (Anseel & Lievens, 2009; Lee et al., 2019).

Design/Methodology/Approach/Intervention

We set up a 2x2 online scenario-based study. Participants (n=357) were instructed to imagine a hypothetical scenario, in which they were working for several months in a lead position on an important project for their company. Before the last part of the project, the participants now receive feedback from their manager. This feedback was randomly varied in source of feedback (AI vs. human manager) and type of feedback (positive vs. negative).

We then assessed acceptance of feedback, evaluated quality of feedback, and individual work engagement as dependent variables, as well as the rated competence of feedback provider, i.e., the AI/human manager.

Results

Positive feedback was significantly more accepted (η^2=0.41), evaluated more positively regarding feedback quality (η^2=0.38) and feedback provider (η2=0.14) and led to a higher work motivation (η2=0.34) than negative feedback.

Further, we found that feedback from human managers was more accepted (η2=0.09), evaluated as more qualitative (η2=0.13) and led to a higher work engagement (η2=0.02) than the same feedback from an AI. Last, human managers as a feedback provider were significantly rated as being more competent than AI (η2=0.35).

Limitations

The present study was a scenario-based study and should be replicated in a real-life organizational context.

Conclusions – research and or practical implications/Originality/Value

This is the first study to compare AI in a managerial position to a human manager, and the first study using the exact same feedback to compare the perception of AI to human managers. Therefore, differences cannot be attributed to actual quality differences but to the source of feedback, i.e., AI vs. human manager.

Furthermore, previous tendencies regarding the acceptance and quality of AI-assisted feedback were confirmed and extended by the perceived competence of the feedback provider and individual work engagement as a relevant outcome for the organizational context.

Finally, the current study demonstrated for the first time that the findings on acceptance and quality of feedback and its effect on motivation from research on human managers can be applied to AI-based feedback.

Relevance to the Congress Theme

The present study is a critical response to the findings of the study conducted by Oracle (2019) and demonstrates that AI is not necessarily and unreservedly better accepted than human managers. Employees might seem optimistic and grateful towards AI co-workers and wish for a robot instead of their human manager, but when it comes to feedback, the results of the current study can not support these statements. Our study therefore contributes to a critical discussion on the use of AI as a manager in the organizational context.

Keywords: Leadership, feedback, artificial intelligence

Oral presentation OP359

Dutch workers' concerns towards having a coworker with mental illness: a latent class analysis

Iris van Beukering, Tilburg University

science

Research goals and why the work was worth doing

The aims of this study are to examine: (1) workers' concerns about towards having a coworker with mental illness, (2) to identify distinct subgroups of workers based on their concerns about towards having a coworker with mental illness, and (3) to characterize these subgroups in terms of knowledge, experience, attitudes, and background characteristics.

Theoretical background

Mental illness is highly common, and as people with common and severe mental disorders are three to seven times more likely to be unemployed than people with no disorder [1], this problem is costly for society [2]. Whereas unfavorable work environments can lead to mental illnesses such as burnout and stress, research has shown that overall, and especially under favorable conditions, employment is beneficial for wellbeing and mental health. For instance, employment can provide major benefits for health and wellbeing, (e.g. financial independence, social contacts) and it is increasingly shown to be beneficial for mental health [3-5]. Under the influence of the prevailing biomedical model, for decades it was assumed that the lower work participation rates were caused by the mental illness itself [6]. However, it is increasingly being acknowledged that these can also be attributed to other, psychosocial factors, such as stigma and discrimination [7]. Evaluating how processes of stigma are perpetuated in the workplace is essential for guiding the development of anti-stigma interventions [8]. A recent systematic review highlighted that publications on workplace stigma is rapidly increasing, although the roles of co-workers warrant more attention [9]. To design destigmatizing interventions to create more inclusive workplaces and to improve sustained employment of people with mental illness, more knowledge on worker's concerns towards having a coworker with mental illness is needed.

Design/Methodology/Approach/Intervention

In February 2018, a cross-sectional survey was conducted among a nationally representative internet panel of Dutch employees. The questionnaire was sent to 1,671 Dutch adults who participated in the panel, had paid jobs, and were not working in management positions. A new questionnaire was developed to address the aims of this study. To address the first research aim, descriptive statistics were used (means, standard deviations, and frequency table). For the second and third research aim a three-step approach Latent Class Analysis (LCA) was used.

Results obtained or expected (if not available, it must be made clear when they will be)

First, the most common concerns reported were the concern that a direct colleague with mental illness would not be able to handle the work (45.0%) and the concern that they were not sure how to help this colleague (38.0%). Second, five distinct subgroups of workers based on their concerns about having a coworker with mental illness were identified: two subgroups with less concerns (SG1 and SG2; 27.0% and 24.8% of the workers), one subgroup with average concerns (SG3; 22.7% of the workers), and two subgroups with more concerns (SG4 and SG5; 17.1% and 8.5% of the workers). Third, the majority of the biggest subgroup (SG1; the personal concerns subgroup) stated that they would want to learn more about how they can best deal with coworkers with mental illness. Also the

subgroups with more concerns (SG3, SG4 and SG5) want to learn more about mental illness in general. Differences between the subgroups were found on knowledge and attitudes, no significant differences were found between the subgroups on background characteristics.

Limitations

This study used self-reported data based on attitudes, this study did not focused on actual outcomes. That does not mean that attitudes do not say anything about actual behaviour. The results showed that having more concerns lead to not willing to work with or for a coworker of a higher ranking manager with mental illness. Also, this study did focus on concerns and did not include positive attitudes, this might resulted in a more negative picture.

Conclusions – research and or practical implications/Originality/Value

A broad approach of anti-stigma interventions is needed. The results indicate that these interventions should focus on teaching how to best deal with coworkers with mental illness and on mental illness in general.

Relevance to the Congress Theme

The inclusion of people with mental illness in the workforce is urgently needed, there is a shortage of workers. A lot of work potential is wasted when we exclude people with mental illness. With our research we can help to develop effective anti-stigma interventions which contribute to inclusion of people with mental illness at work.

Oral presentation OP621

Dynamic aspects of workplace resilience: Investigating the role of proactive coping in building resilience

Clodagh Butler, University College Cork; Deirdre O'Shea, University of Limerick

science

Introduction

Work-related stress is inevitable (Siegrist et al.,2016). To promote optimal stress levels, stress management approaches must incorporate a general approach where employees engage in proactive strategies; rather than utilising traditional reactive strategies only. Thus, we must expand our knowledge of proactive and adaptive processes that facilitate workplace stress and well-being.

The purpose of this research is to investigate the interplay between proactive coping and resilience, and subsequently, how this relationship influences stress and well-being. Resilience is a process by which individuals successfully use assets and resources to protect themselves against the negative consequences of stress; while promoting the ability to overcome, steer through and bounce back from adversity (Richardson,2002). Facilitative processes of resilience are both proactive and reactive, however, only reactive processes have been fully explored. Proactive coping too is a positive function in the promotion of well-being (Greenglass & Fiksenbaum,2009). Consequently, both constructs are salutogenic to occupational well-being; surprisingly, neither have been explored concurrently.

This research will refer to the Transactional Theory of Stress (Lazarus & Folkman,1984), Proactive Coping Theory (Schwarzer & Taubert,2002), the Integrative Model of Resilience for Employees (Britt et al.,2016).

Methods

Three distinct studies were assessed where different temporal and magnitude characteristics were predicted to be of interest.

Study 1 included employees experiencing job displacement within an Irish organisation. 146 completed T1 and 118 T2.

Study 2 included third-level students during a semester at an Irish University. 160 completed T1, 154 completed T2, 154 completed T3, and 150 Time 4.

Study 3 sample included a general Irish working sample. 345 completed T1, 222 completed T2 and 204 completed T3.

Proactive coping was assessed using a sub-scale from the Proactive Coping Inventory (Greenglass et al.,1999). Resilience was assessed using the Connor-Davidson Resilience Scale (Connor, Davidson,2003). Perceived stress was assessed using the Perceived Stress Scale (Cohen et al.,1983). Psychological well-being was assessed using the job-related Affective Well-being scale (Warr et al.,2014). Demographic questions.

Apparatus used included Qualtrics TM, IBM® Statistical Package for the Social Sciences v.24, Mplus v.8.2.

Longitudinal quantitative research design using self-report questionnaires. SEM Was used to analyse the longitudinal data. Cross-lagged modeling was adopted.

Results

Study 1 found proactive coping was a significant predictor of resilience over a four-month period (β =.30, SE =.137, p =.028). However, resilience was not a significant predictor of proactive coping (β =.067, SE =.052, p >.05).

Study 2 found Proactive coping T1 predicted resilience T2 (β =.42, SE =.12, p =.000), proactive coping T2 predicted resilience T3 (β =.29, SE =.10, p =.005), Proactive coping T3 predicted resilience T4 (β =.49, SE =.15, p =.001). Resilience T1 predicted proactive coping T2 (β =.19, SE =.05, p =.000), resilience T2 predicted proactive coping T3 (β =.09, SE =.04, p =.027) and resilience T3 predicted proactive coping T4 (β =.14, SE =.06, p =.019), over a four week period.

Study 3 results are predicted to replicate Study 1 and 2 findings, which demonstrate a reciprocal relationship between proactive coping and resilience. It also aims to show the role of perceived stress and well-being in this relationship.

Conclusions

Study 1 found no reciprocal relationship between proactive coping and resilience; however, it found that proactive coping was a significant predictor of resilience. Interestingly, resilience did not significantly reduce within the aversive context of pending job displacement. Suggesting that proactive coping may play an influential role in the maintenance of resilience.

Study 2 found a reciprocal relationship between proactive coping and resilience over a one-month period. Findings suggest that as resilience decreases, proactive coping maintains, as resilience increases, proactive coping decreases. Resulting in a complimentary relationship between the two.

The research so far has important theoretical and practical implications. It's the first set of studies to investigate the relationship between resilience and proactive coping. We advocate that resilience development should be seen as thinking, feeling and behaving in a way that not only facilitates recovery and growth after stressful events but is also a proactive self-regulated approach.

Limitations include inconsistent data waves, sample size, self-reported data, and limited direct measurement of stress.

This research has relevance to the congress theme ‘Well-being’ especially sub-topics coping and resilience and adaptability.

This research relates to the UN SDG's ‘Good health and Wellbeing’ in ensuring sustainable health in the working lives of employees and promoting well-being in the workplace.

Keywords: Resilience, Proactive coping, well-being

Oral presentation OP590

Early Career Gender Differences in Job Burnout Trajectories: Roles of Work, Family, and Financial Resources

Yirou Fang, Katariina Salmela-Aro & Xin Tang | University of Helsinki

science

Theoretical background: The gender-segregated job market reproduces gender stereotypes surrounding different workplaces (European Commission, 2015; Wood & Eagly, 2002). Those gender stereotypes then contribute to different social expectations in light of gender roles. It is well known that workplace can lead to job burnout (Maslach, 1982). According to the job demands-resources (JD-R) model (Demerouti et al., 2001), there are job resources and job demands that either prevent or worsen job burnout. Traditional gender ideology supports the specialization of tasks and roles by gender, suggesting different job demands and resources for women and men: women are expected to take up the caregiving responsibilities in the domestic sphere; men are expected to take the economic responsibilities in the public sphere (Davis & Greenstein, 2009; Bergh, 2006). Consequently, women and men share the same job duties at work but differ in their family duties and economic duties. To understand whether job burnout development is gendered and how job burnout may be prevented by resources for women and men, we examined the relationship between gender and job burnout trajectory, and the relationship between job burnout and job resources from three perspectives: (1) family resource (i.e., partner support, parenthood status), (2) work resource (i.e., belongingness to workplace), and (3) financial resource (i.e., monthly salary).

Methodology: We included data from the Finnish Educational Transitions project. Participants were followed between 2003 and 2020. Participants completed a survey that included questionnaires on gender, job burnout, partner support, belongingness to workplace, parenthood status, and income. The present study included young adults (N = 732) who were surveyed in 2013 (6 th wave: age 26-27), 2016, and 2020.

The research questions were analyzed using a latent growth model (LGM)with gender as time-invariant predictor and a multigroup LGM with gender as a group classifier. The analyses were performed by using the Mplus statistical package (Version 8.6, Muthén & Muthén, 1998-2017) with the missing data method.

Results: The results of the first LGM (X^2 (24) = 34.78, p = .07; CFI = .96, TLI = .93; RMSEA = .03; SRMR = .03) showed good fit of the model. In general, burnout decreased over years in early adulthood (Estimate slope = -.46). Moreover, gender had a main effect on the intercept of job burnout development (Estimate = -.22, SE = .06, $p < .001$), indicating that women scored higher in job burnout scores comparing to men. The results also showed that intercept was negatively related to the slope (Estimate = -.59, SE = .12, $p < .001$), indicating that participants with lower initial job burnout scores experienced less decrease in job burnout in the following years.

The results of the Multigroup LGM showed that the model has a good fit (X^2 (2) = .35, p = .84; CFI = 1.00, TLI = 1.00; RMSEA = .00; SRMR = .003). The results showed that for women: belongingness to workplace prevented job burnout in year 2016 and 2020; having children prevented job burnout in 2013 and 2016. For man: partner support prevented job burnout in 2013; belongingness to workplace prevented job burnout in 2016; higher income prevented job burnout in 2020.

Limitations: This is a longitudinal study started in 2003. We have only been able to collect binary gender.

Implications: Coherent with men's economic duties, financial resource prevented job burnout for men but not for women, and the relationship was only prominent during the pandemic. This finding suggests that stereotypical gender roles might have been enhanced during the pandemic—the social role of a paid worker was more salient for men when the boundary between work and home was blurred.

Having a child or children has been studied as a job demand even though many studies found negative relationship between burnout and having children (Maslach & Jackson, 1985). The current study included "having a child or children" and partner support to unfold job burnout at the intersection of work and home. Consistent with women's caregiving duties, having a child or children prevented job burnout for women but not for men. This effect disappeared during the pandemic. Stereotypical gender role was also more prominent during the pandemic for women, the demand of having a child or children might have exceeded the resource provided by social support of the child or children when the boundary between work and home was blurred.

Originality/Value: This study adds a developmental perspective to current job burnout research, where longitudinal study is scant. This study also adds a social role perspective into the J-DR model.

Relevance to the congress theme: Most workplace are still gender segregated. Experience of job burnout differs between women and men due to gendered nature of workplace. This study provides insights into the future of workplace burnout prevention intervention, as well as gender equality.

Keywords: gender, job burnout, job demands-resources

Oral presentation OP195

Early-stage power dynamic shifts in workplace bullying

Daniela Lazareanu, University of Reading

science&practice

Research goals and why the work was worth doing:

Workplace bullying research has become more contextually and methodologically diverse, providing new opportunities to uncover less understood but challenging to investigate psychological processes which underpin the phenomenon. As such, calls for critical approaches and interdisciplinary efforts have intensified (Fevre, 2018). To this end, an integrative theoretical framework focused on early-stage power dynamics is proposed as part of a three-piece project which will subsequently aim to verify the emerging relations empirically with a mixed methods design.

Theoretical background:

The framework is rooted in the critical realist philosophy and is distilled following the meta-triangulation guidelines set out by Lewis & Grimes (1999), building on theoretical assumptions of existing frameworks employed in bullying and related constructs research.

Design/Methodology/Approach/Intervention:

A systematic search of research articles which problematise notions of causality and power as central components of negative workplace behaviour that precedes and overlays bullying was conducted on several databases, resulting in a sample of 40 articles falling under four paradigms frequently employed in organisation studies: functionalism, interpretivism, radical structuralism, and radical humanism. Contrasting the respective insights from a meta-perspective allowed for the uncovering of boundary conditions and causal mechanisms at the onset of the bullying experience.

Results:

Boundary conditions were grouped under the theme of mismatched expectations, understood as conflict-generating interpretations of events and others' behaviour which contradict anticipated social interactions as informed by individual and/or group normative schemas and deeply rooted norms shaped over time through subjective experience, group(s) membership, institutional and more diffuse cultural characteristics. Mismatched expectations are necessary but not sufficient for bullying to occur; they are progressively amplified and driven by reinforcing mechanisms which run concurrently, allowing for the escalating and prolonged manifestations typically characterising bullying (e.g., isolation of targets, increase in power differentials, stress-related outcomes for targets and bystanders, deterioration of workplace climate, etc.). These, in turn, are described as inclusion/exclusion, reward/punishment, and resource boost/resource depletion mechanisms.

Power was found to be embedded in all normative frames theorised in the sample, which were best explained as frames of reference that help individuals navigate social contexts and exercise agency, however expectations being overwhelmingly future-oriented and therefore uncertain,, the conflict that mismatches generate is bound to become a power struggle. Equally, p ower is embedded in the mechanisms driving the bullying process, as the work environment represents a medium in which, when bullying occurs, the organisational structures, practices and discourses which otherwise support power inequalities generally recognised as legitimate,

effectively equip all stakeholders with additional means to exercise self-centred agency, delaying resolution.

Limitations:

An anticipated limitation of the propositions within this framework concerns their empirical validation. The difficulty of empirically tracing back perceptual processes and their effect on actual behaviour of stakeholders after the fact, or accurately capturing these in real time without influencing the outcomes of subjects' lived experience, might prove a frustrating task. However, in line with the promising prospects which a fresh and closer examination of paradigmatic assumptions often taken for granted might give as new insights, some solutions to overcome these challenges will be proposed in parts II and III of this study.

Conclusions – research and or practical implications/Originality/Value

Overall, the results contribute to theory by addressing methodological challenges inherent to the complexity of bullying dynamics, which stalls research into its causes and early-stage processes, but at the same time could impact the way prevention is conceived and implemented in practice.

Keywords: workplace bullying, bullying prevention, relational dynamics

Oral presentation OP337

Economy for the Common Good (ECG): How democratic practices in ECG-enterprises foster employees' moral behavior and their political & civic engagement

Christine Unterrainer, Bettina Lampert, Thomas Höge, Wolfgang Georg Weber & Severin Hornung | University of Innsbruck

science&practice

Economy for the Common Good (ECG) is a global social movement, promoting an alternative economic model intended to benefit people, planet and future generations (Felber et al. 2019). Enterprises adopting the ECG balancing and reporting system enshrine social and ecological value creation as their most important business purpose. This places ethical behaviour at the heart of corporate governance, prioritizing social and environmental concerns over profitability and economic value. Among others, transparency, participation in decision making, and an appreciative work climate are core values in ECG-enterprises. The current research aims at investigating if these values are also embodied by the employees in such enterprises. Further, we examine if ECG-enterprises have the potential to sustainably promote social well-being and to counteract anti-democratic tendencies by fostering employees' moral and political/civic behaviour through the implemented democratic practices.

The current research focuses on two types of democratic practices in ECG enterprises: 1) individually perceived employee participation, and 2) sociomoral organizational climate. Individually perceived participation reflects actual and direct participation in strategic or tactical decision making as reported by employees (Weber et al., 2020). Sociomoral climate represents a sub-domain of organizational climate, referring to employees' shared perceptions of organizational practices and procedures. Associated practices and procedures are characterized as supportive, appreciating, and participative, and are assumed (and have partly been shown) to shape moral and prosocial development of the members of an organisation (Weber et al, 2008; Pircher Verdorfer et al, 2013). This corresponds with the long-standing "Spillover Hypothesis" by Pateman (1970), which postulates the educative potential of organisations. Specifically, it states that democratic practices in organisations strengthen employees' political efficacy which, in turn, enhances (further) development of prosocial and civic attitudes or behaviours.

In a self-report questionnaire study N = 182 employees from six ECG-enterprises participated. Four enterprises were located in Austria and two in Germany. Questionnaire scales measured employees' individually perceived participation in organizational decision making, perceived sociomoral climate, political and moral self-efficacy, and employees' moral behaviour and political/civic engagement. Confirmatory factor analysis and structural equation modelling were employed for hypothesis testing. Bootstrapping techniques were used for assessing the significance of indirect effects. Models were corroborated by a battery of statistical fit indices.

In line with the Spillover-Hypothesis, the specified structural equation model confirmed that employees' individually perceived participation was positively related with their political self-efficacy which, in turn, correlated positively with their political and civic engagement. Hence, a significant indirect effect of individual participation via political self-efficacy to political and civic engagement was attested. Perceived sociomoral climate was not significantly related with political self-efficacy or political and civic engagement, but was positively related with employees' moral self-efficacy, which, in turn, correlated positively with self-reported moral behaviour. The indirect effect of sociomoral climate via moral self-efficacy on employees' moral behaviour was significant. A similar significant

indirect effect was also found for individually perceived participation, but was weaker than the indirect effect of sociomoral climate on moral behaviour.

The cross-sectional design limits inferences regarding the causality of the mediation model. Further, self-reported moral behaviour might have been biased by social desirability. Moreover, the number of analysed ECG-enterprises was insufficient to assess multilevel effects.

The present study has shown that ECG-enterprises can foster a healthy and democratic society by nurturing moral, prosocial and democratic competencies and behaviours of their employees. These competences may spill over from the work context into the civil domain. Adopting the ECG-model and conducting an ECG balance sheet may help practitioners to introduce democratic practices in their enterprise and thus contribute to a more socially sustainable society.

Power concentration in transnational corporations, problems resulting from financial speculation and corruption in the economy, and eroding systems of employee codetermination in Europe are among the societal problems that are already serious today, and will likely get worse in the future. The present study examines organisational and individual resources that may counteract societal disintegration and foster corporate social responsibility within democratic and social market economies.

Keywords: Economy for the Common Good, democratic organizational practices, political and civic engagement

Oral presentation OP816

Effectively managing sickness presenteeism - understanding the decision-making process

Zara Whysall & Huijun Chen | Nottingham Trent University; Maria Karanika-Murray, University of Leicester

science

Research goals and why the work was worth doing

Defined as working when unwell (Ruhle et al., 2020), presenteeism is commonly considered a negative workplace phenomenon. However, several researchers have highlighted the therapeutic effect of presenteeism with appropriate adjustments and managerial interventions (Karanika-Murray and Biron, 2020). Understanding how and when individuals decide to enact sickness presenteeism is an essential starting point in supporting employees.

Theoretical background

The current study is grounded in the presenteeism decision-making model developed by Whysall et al. (2023), which integrates insights from both decision-making theory and presenteeism research. It captures both absenteeism and presenteeism decisions, since they are potential outcomes of the same decision (Halbesleben et al., 2014; Patton & Johns, 2012), and outlines four stages in the decision-making process, that are (1) trigger, (2) options, (3) evaluation, and (4) feedback.

Design/Methodology/Approach/Intervention

An experience sampling method was adopted through a daily diary approach to examine how individuals decide to work or rest when they are unwell. To aid participants in elucidating their thought processes, both open and closed-ended questions (e.g., multiple choice, rating scales) were included. The open-ended questions were structured according to the decision-making model of presenteeism (Whysall et al., 2023), to explore participants' thought processes at each stage.

Results obtained or expected (if not available, it must be made clear when they will be)

Diary participants were recruited through an initial cross-sectional survey, which resulted in a total of 1387 daily observations nested in 155 participants. Through thematic analysis and quantitative analyses including multiple linear regression, the data largely support the process model and reveal important insights into presenteeism decision-making. Specifically, the thematic analysis showed that the decision-making process is triggered by a health event and begins with an assessment of symptom severity and how much this affects employees' work capability (Stage 1), identification of options (Stage 2), and evaluation of options (Stage 3). Stages 2 and 3 appear to take place in a non-linear, cyclical way until the decision-maker finds a preferred option, and Stage 3 will be driven mainly by work-related factors. Moreover, work-related factors appear to restrict employees' perceived available options (Stage 2). Finally, the results also demonstrated that employees' reflection on whether they made the right decision was driven largely by their work-related concerns than health-related concerns.

Limitations

A limitation of the experience sampling method is its dependence on self-report (Csikszentmihalyi and Larson, 2014). However, the daily diary study approach offers strong context validity with rich data on real-life attendance decision-making, and aims to reduce recall bias through the daily frequency. Another consideration is the number of health incidences. Overall, there were 474 health

incidences (34.2%) out of 1387 diary observations, and experience sampling techniques are reliant upon capturing a sufficiently large number of relevant incidences of the phenomenon under study. This sample size might not be sufficient for certain quantitative analysis.

Conclusions – research and or practical implications/Originality/Value

The current study extends presenteeism theory and builds on emerging work identifying presenteeism as an adaptive behaviour. Greater understanding of how individuals decide to enact presenteeism can help to create effective interventions to manage this behaviour, and even promote functional presenteeism as a purposeful and adaptive behaviour by which individuals aim to balance their health needs and work performance demands (Karanika-Murray & Biron, 2020; Whysall et al., 2018). Future research should focus on the prolonged effects on health, and on developing managerial interventions to mitigate detrimental outcomes.

Relevance to the Congress Theme

Due to the Covid-19 pandemic, most companies have shifted to remote or hybrid working. This has increased the prevalence of sickness presenteeism among employees, because of the blurred boundaries between home and work (Kinman and Grant, 2021). Employees can hide their ill-health symptoms behind the screen and without the need to be physically in the office, they feel more obligated to continue working even when they are unwell. To create a more positive work environment and enhance employees' health and well-being (UN SDGs Goals 3 and 8), it is essential to develop effective managerial interventions for sickness presenteeism, particularly when facing a potential global recession.

Keywords: Sickness presenteeism, attendance behaviour, organisation well-being, experience sampling

Oral presentation OP483

Effectiveness of a stigma awareness intervention about disclosure of mental health issues or illness in the workplace for unemployed people

Kim Janssens, Evelien Brouwers, Jaap van Weeghel | Tranzo, Tilburg School of Social and Behavioral Sciences, Tilburg University

science

Research goals/why the work was worth doing: People with mental health issues or illness are three to seven times more often unemployed than people without mental health issues or illness. One of the barriers to paid employment is the stigma attached to mental health issues or illness. The current study focuses on the health, well-being and job seeking activities of unemployed people with mental health issues or illness who receive social benefits from Dutch municipalities. In a clustered randomized controlled trial the effectiveness of a stigma awareness intervention, consisting of (1) the Dutch version of the decision aid 'Conceal or Reveal' (CORAL) about disclosure of mental health issues or illness and (2) a stigma awareness training for employment specialists, is evaluated on finding and retaining paid employment. The research goal of this study is to examine the effectiveness of a stigma awareness intervention for employment specialists and a decision aid and two infographics about disclosure of mental health issues or illness on finding and retaining employment for unemployed people with mental health issues or illness, compared to usual guidance.

Theoretical background: Both disclosure as non-disclosure of mental health issues or illness in the employment setting could have advantages and disadvantages. Therefore, the disclosure decision-making process can be seen as a risk-benefit analysis. Advantages could be support from colleagues or being able to get work adjustments. Disadvantages could be stigma and discrimination. For that reason, support in decision-making about (non-)disclosing mental health issues or illness may help in creating a positive outcome. The CORAL decision aid was developed by the Institute of Psychiatry at King's College London and is designed to support decision-making about disclosure in the work context. The principle of this decision aid is that people know their own situation best and therefore can make the best choices themselves, but still benefit from help with making a choice. In several follow-up studies, using the decision aid was found to be promising: people who used CORAL had less decision-making stress and were significantly more often working full time after 3 months than people who did not use the decision aid.

Methodology: Participants (N=153) were recruited by eight organizations, i.e. Dutch municipalities and organizations who work on behalf of the municipalities. Cluster randomization took place at organization level. Participants of four organizations received care as usual (control group) and participants of the other four organizations received care as usual combined with the CORAL decision aid, and besides that, their employment specialists received a stigma awareness training (experimental group). Inclusion criteria for participants were (1) suffering from mental health issues or illness and (2) being unemployed. Participants filled out a questionnaire in one-by-one appointments with the researcher about health, well-being, job seeking activities and disclosure of mental health issues or illness at baseline and 3, 6 and 12 months. Multilevel analyses, containing random intercepts of participants nested in organizations, were conducted to analyze the effects of the intervention on finding and retaining employment, as well as for the secondary outcomes.

Results: A total of 153 participants with mental health issues or illness were randomized to experimental (n = 76, age: M(SD) = 37.4 (11.86), women: N (%) = 44 (57.9%)) and control group (n =

77, age: M(SD) = 40.0 (12.5), women: N (%) = 37 (48.1%)). Intention-to-treat analyses showed that randomization to the experimental group was associated with finding (OR (95%CI) = 7.78 (1.33 - 45.53), p = 0.02) and retaining (OR (95%CI) = 12.15 (2.81 - 52.63), p<0.01) at twelve months. Analyses showed that participants of the experimental and control group did not differ in decisional stress.

Limitations: Limitations of the study are that participants were recruited via employment specialists, which may cause selection bias from the individual employment specialists. In addition, in this study only self-report data is used. Finally, participation in the study is entirely voluntary, therefore the study has a dropout of 20%.

Conclusions: Nowadays, there is more evidence that psychosocial factors such as stigma and discrimination are of major influence in relation to employment for people with mental health issues or illness. This cluster RCT showed that implementing a stigma awareness intervention was highly effective in improving employment outcomes for unemployed people with mental health issues or illness. Participants of the intervention group found and retained paid employment almost twice as often, compared to a control group. If replicated, this may substantially contribute to increased employment opportunities of people with mental health issues or illness.

Keywords: disclosure, stigma, discrimination

Oral presentation OP691

Effects of Daily Strain on Boundary Management Preference and Enactment: Findings from a Daily Diary Study

Nicolas Mueller & Regina Kempen | Aalen University of Applied Sciences; Svenja Schumacher & Kim Kristin Terkuhlen | University of Osnabrück

science

Research goals: The modern world of work faces employees with blurred boundaries between work and nonwork life. As a result, employees experience increasing spillover between work and nonwork life, underlining the significance of purposefully managing the boundaries around life domains. Boundary management refers to how individuals manage work and nonwork life by segmenting or integrating these life domains. The boundary management concept has become an established framework in the work–nonwork literature. Yet, most studies investigate boundary management on a trait level and explore the consequences of inter-individual differences in boundary management. In contrast, there is little research on intra-individual fluctuations in boundary management and their antecedents. To close these gaps in the current boundary management literature, the research goals of the present study are (1) to address intra-individual fluctuations in boundary management, and (2) to investigate daily strain as an antecedent of these fluctuations.

Theoretical background: We examine the influence of daily strain in work and nonwork life on four boundary management constructs: (1) work-to-nonwork boundary management preference, (2) nonwork-to-work boundary management preference, (3) work-to-nonwork boundary management enactment, (2) nonwork-to-work boundary management enactment. Drawing on cross-role spillover and conservation of resources theory, we hypothesize that daily shifts in boundary management preferences reflect a strategy to regulate strain-related negative spillover between work and nonwork life. In general, we assume that daily strain is associated with preferring more segmentation. However, daily strain may force individuals to enact more integration. For example, experiencing daily strain in work life shall increase individuals' work-to-nonwork segmentation preference to protect resources in nonwork life. However, individuals may not be able to enact their segmentation preference but need to integrate their work demands into nonwork life. Moreover, we consider work and nonwork role involvement as moderators of these relationships.

Methods: The present study deploys a diary research design with daily measurement waves over two workweeks. Full-time working participants from an online panel rated daily strain in work and nonwork life and the boundary management constructs every evening for ten workdays. In sum, we analyze data from 425 participants and 3,238 daily observations.

Results: Multilevel modelling results reveal considerable intra-individual variations in work-to-nonwork and nonwork-to-work boundary management preferences and enactments. These fluctuations are a function of daily strain in work and nonwork life. On days when employees experience more daily strain in work life, they prefer more work-to-nonwork segmentation but enact more work-to-nonwork integration. On days when employees experience more daily strain in nonwork life, they prefer more nonwork-to-work segmentation but enact more nonwork-to-work integration. Work and nonwork role involvement do not moderate these strain effects but directly influence work-to-nonwork and nonwork-to-work boundary management preferences and enactments.

Limitations: Limitations result from the use of self-report measures and the missing time lag between assessing predictor and outcome variables. Consequently, the study does not allow for

drawing causal conclusions. Furthermore, using an online panel to recruit participants could be considered a limitation.

Implications, originality, and value: The present study has several theoretical implications, opening new topics for future research. In general, it contributes to the boundary management literature by providing novel insights into intra-individual fluctuations in boundary management. Further, this is the first study addressing antecedents of these intra-individual fluctuations in terms of daily strain. Thus, it answers calls to identify factors that motivate individuals to prefer and enact segmentation or integration. Regarding practical implications, organizations should be aware of their influence on their employees' boundary management preferences and enactments via work demands that may affect daily strain in work life (e.g., workload). Considering the importance of fit between employees' preferences, their enactments, and external supplies, organizations should update their supplies to accommodate intra-individual fluctuations. Finally, coaching might empower employees in the daily management of their work–nonwork boundaries. Taken together, the present study adds a novel perspective on boundary management and provides several starting points for future research and practical action.

Relevance to the congress theme: Employees face several challenges managing the blurring work–nonwork boundaries in the "changing world of work" which highlights the importance of research on boundary management and its antecedents.

Keywords: boundary management, daily strain, diary study

Oral presentation OP119

Effects of Gender in Leadership in Higher Education Institutions.

Jon Pizarro & Leire Gartzia | Deusto Business School, University of Deusto

science&practice

Research goals . Despite notorious advancement in the actions for the advancement of women at work in European policies and legislation, putting these actions into practice often remains a challenge. The specific issue of advancing women in leadership and top managerial positions in Higher Education institutions is particularly relevant, given women´s limited progress in these contexts. In this study, we aim to identify elements that influence women's advancement to leadership positions in these fields, with a focus on employees´ perceptions and resistances about implementing gender action that supports women in leadership.

Theoretical background. In general, female leaders encounter many disadvantages that flow from distrust about their abilities as leaders. The incongruity between the characteristics usually ascribed to women and the characteristics typically ascribed to leaders is behind this situation and represents one of the strongest obstacles for women in leadership. The fact that domestic functions are commonly taken by women is also harmful for women's leadership career by limiting their access to decision-making positions or generating the expectation that they are less committed to such leadership roles (Mandel & Semyonov, 2005; Gupta et al., 2006). These findings are often referred to as a "motherhood penalty/fatherhood bonus" (Hodges & Budig, 2010). Despite this reality, it is not clear to what extent employees in real-life institutions and in particular research institutions are aware of women´s situation of discrimination, as well as male and female employees´ resistances to gender equality actions aimed at promoting women´s advancement.

Methodology. A questionnaire was designed and implemented to evaluation perceptions about women in management and gender action to promote women in management (quotas) from all the staff of the participating institutions. The data was anonymized, collated and analysed using SPSS Statistics. The first set of questions included general values and traits of male and female employees and leaders, in order to capture individual dispositions. attitudes and values are asked. The following section included questions intended to understand the perceptions of employees about their supervisors from a gender perspective, examining whether and how employees report different leadership behaviors from their leaders on several dimensions as well as resistances towards affirmative action (implementing gender quotas for women). The final set of questions asked about female and male employees´ and leaders´ perceptions of work-life balance (WLB), and the extent to which domestic issues influenced their leadership orientations and promotion.

Results. In terms of values and general dispositions, women and men identified with similar dispositions in terms of agentic traits (being competitive or courageous) and task-oriented leadership, but compared to men, women rated themselves higher in relation to communal traits and received higher people-oriented scores. In all the dimensions of work-life balance studied, women expressed higher concerns about the biases and obstacles that they encounter in the organisation regarding work-family issues. In contrast, perceptions of a work-family conflict in one's personal life were similar for all groups, except for people with managerial responsibilities: top managers experience the highest levels of work-family conflict (but also higher levels of satisfaction with work). Resistances against affirmative action of women in leadership were generally high but stronger for male than female respondents.

Limitations. Some factors may limit the generalization of these findings to other contexts. First, all the participating institutions (and, thus, individuals) are located in Europe, which is unique from a gender and affirmative action perspective. Furthermore, the study only gathered data once, which precludes the possibility of inferring causal relations.

Implications. Together, these results point to strong effects of gender in variables that are critical for leadership and decision-making in Higher Education Institutions, suggesting that gender equality actions should take into account how managerial activities are gendered and influence organisational dynamics at different levels. Implications are also discussed in relation to work-life balance and men´s perception of affirmative action.

Originality. Our analysis points to remaining challenges in higher education institutions regarding gender equality and the incorporation of stereotypically feminine values and needs in decision-making.

Relevance to the Congress Theme. Advancing towards gender equality is one of the objectives that work environments must integrate into their reality, as a demand of the society as a whole (as an element of social justice) and because of the implications it has both on their workers and on their organizational reality.

Oral presentation OP319

Effects of Quasi-Nonverbal Leader Communication on Impression Formation

Simon Liegl, University of Liechtenstein & University of Innsbruck, Austria; Marco Furtner, University of Liechtenstein; Sarah Auckenthaler, University of Innsbruck, Austria

science

Research goals. Digitalization poses increasingly wide-ranging affordances to individuals and organizations alike, particularly in regard to workplace communication. The most prevalent digital mediums (i.e., e-mail and messenger services), however, are less broad in information and omit nonverbal behaviours, such as gestures and facial expressions. This constitutes a substantial challenge for leaders, as the transferal of emotions, mostly being driven by a message's nonverbal delivery, constitutes one of the key pathways for leaders' effectiveness. Yet, digital written communication also entails an opportunity to re-enrich messages with quasi-nonverbal signals – Emoticons and Emoji. As these, however, may be perceived as inappropriate in the usually more formal and sober setting of workplace communication, this study aims to explore the immediate emotional and cognitive reactions to affective quasi-nonverbal leader signals.

Theoretical background. Building up on the foundations of the signalling theory and the Brunswik Lens Model, this study further distinguishes between the emotional contagion and the cognitive inference pathway of processing emotional displays, as proposed by the emotion as social information (EASI) model.

Methodology. For this study, an experimental design will be employed, with participants being randomly assigned to a specific text sample including verbal and quasi-nonverbal emotional expressions from an imaginary leader. These will depict the same text, either being enhanced by Emoji depicting emotions of positive or negative valence, or no Emoji. Participants will rate the message's emotional intensity and valence as a measure for their processing of its content and the emotional contagion pathway will be assessed using the affect grid before and after the stimulus presentation. Cognitive responses, i.e., appraisals of the sender resulting from these pathways, will be assessed by employing measures of ascribed charisma , perceived leader prototypicality, leader approval , and first impressions in regard to the leader's authenticity, competence, dominance, likeability, and warmth. Based on power analyses, we aim for a sample of 34 participants per experimental cell, resulting in a total sample of 102 participants.

Expected results. This study will be conducted throughout November and December of 2022. Results should therefore be available in January 2023. We expect ratings of emotional intensity to increase, and participants' affect and valence ratings to mirror the affect displayed in the respective enriched communication condition. Furthermore, we anticipate charisma, leader approval, authenticity, likeability, and warmth to be rated higher in the positive Emoji condition, and ratings of prototypicality, competence, and dominance to decrease as compared to the neutral condition. Negative Emoji, on the other hand, should lead to increases in dominance as well as decreases in prototypicality, leader approval, competence, likeability, and warmth ratings.

Limitations. This study focuses on providing internally valid causal insights into impressions based on quasi-nonverbal leader communication and thus must compromise on its external validity. The stimulus material will be specifically designed for this study to allow for a full standardization and therefore not depict fully authentic workplace communication.

Conclusions and or practical implications. This study will investigate reactions to quasi-nonverbal signalling in the digital workplace environment and thus provide valuable insights into whether leaders are well- or ill-advised to employ these emotional communication techniques. Its findings will allow for inferences on how followers will likely react to such displays and thereby aid leaders with recommendations on how to adapt their affective signalling to ensure it will elicit the intended outcomes.

Relevance to the Congress Theme. Digital communication is one of the cornerstones of the modern workplace. Yet, most of our communication in this context, especially via e-mail, follows potentially outdated norms. Quasi-nonverbal behaviors could be a means to lend leaders a voice in contexts where they cannot use their actual voice. Knowing how leaders could communicate through digital media in a way that increases their approval and ascriptions of charisma and desirable leader attributes is of great benefit for all leaders and indispensable for developing them to be fit for the future.

Oral presentation OP41

Effects of vigor at work between job stress and mental health: Is physical activity always beneficial?

Daniel Cortés-Denia, Manuel Pulido-Martos & Esther Lopez-Zafra | University of Jaén; Sandrine Isoard-Gautheur, Université Grenoble Alpes

science

Research goals: This study aims to enhance insight into the relationship between job stress and workers' mental health, testing the fit to the data of a moderated mediation model, where vigor at work mediates the relationship between job stress and workers' mental health, whereas weekly physical activity (PA) moderates the relationship between stress and vigor at work

Theoretical background: Job stress relates to a higher risk of poor mental health, as higher levels of anxiety and depression. However, potential mediators in this relationship may be explaining the effect of stress on health. In fact, personal resources are the psychological aspects, associated with resilient processes, and refer to the ability to control and act on the environment in an adaptive way. Therefore, personal resources may have an important role in the stress-tension framework, mediating the relationship between stress and health. Thus, we posit that an affective personal resource, such as vigor at work, could mediate the relationship between workers´ stress and mental health, analyzing whether PA may also moderate stress and vigor at work relation.

Design/Methodology: Five hundred and twenty-seven employees (53.3% were female), with a mean age of 38.2 years (SD = 11.5; range 19 to 63 years) and an average tenure in the organization of 9.9 years (SD = 10; range 0.5 to 41 years), composed the final sample.

Results: The results showed that vigor at work was related to better mental health, whereas stress was related to high psychological problems and low vigor at work. The interaction between stress and weekly PA on vigor was significant, indicating a counterproductive effect of weekly PA. Specifically, the negative relationship between stress and vigor at work was greater when doing weekly PA. In this vein, high levels of weekly PA would not have a favorable impact when workers experience high levels of stress, consuming part of vigor at work and reducing the positive effect of vigor at work on mental health by coping with stress.

Limitations: The use of a cross-sectional design and a convenience sample prevents the generalization of the results. Therefore, longitudinal studies are needed to further analyze the mechanisms between stress and its relationship with mental health. Additionally, work-related and leisure-time PA in this study were analysed jointly and in future studies should be considered separately, due to its possible paradoxical effect on health.

Conclusions – research and or practical implications/Originality/Value: Vigor at work and weekly PA constitute relevant personal resources in the interpretation of the connections between stress and mental health, where changes in stress levels, with the imbalance of psychological demands and control at work, over time, can predict subsequent changes in levels of vigor at work, with weekly PA having an important role. In consequence, vigor at work would decrease the probability of developing mental problems in workers, where weekly PA could have a counterproductive role in employees, consuming part of vigor at work affecting mental health. In addition, the design of preventive and intervention strategies should focus on increasing vigor and control at work, as autonomy and skill development, to reduce stress levels in workers and, this way, improve mental

health. Furthermore, it would be necessary to program the type, duration, and frequency of weekly PA to not exceed the threshold, where vigor levels are affected.

Relevance to the Congress Theme: The relevance of this study derives from the fact that the working environment is changing continuously due to psychosocial and technological changes at the workplace, which may be increasing the demands of workers and worsening their mental health. For that reason, this study focused on analysing variables that could reduce this relationship.

Relevant UN SDGs: This study contributes to the third goal (good health and well-being) of the Sustainable Development Goals.

Keywords: mental health, physical activity, vigor at work

Oral presentation OP55

Egoism at Work Attitude Questionnaire: Its development and psychometric properties

Marcin Wnuk, UAM

science&practice

Egoism is a significant motivational strength in the workplace. Employees can be encouraged or discouraged to egoistic behaviors at work and, depending on the leader ethics and organizational climate, awarded or punished for egoism attitude. Finally, besides these organizational and interpersonal factors, egoistic or altruistic activities will also be taken due to their individual level of egoism. The study aimed to operationalize egoism at work as a weakness of character and present measure to verify it. So far, in the literature egoism of employees, was not explored and only one measure had been used to verify this phenomenon as a personality trait, but it was not designed for the business and had some methodological limitation. Exploratory factor analysis (EFA) conducted on 460 employees from Poland revealed a one-factor structure of the Egoism at Work Attitude Questionnaire (EWAQ), which explained a 58.85% variance of the egoism attitude in the workplace. CFA in a sample of 754 employees confirmed the good construct validity of EWAQ and internal consistency, which measured by alpha Cronbach coefficient was 0.89. Values achieved to follow the Bagozzi & Heatherton (1994) criteria regarding the magnitude of factor loadings, average variance extracted, and the composite reliability showed good convergent validity of this tool. Criterion validity of EWAQ was confirmed through the correlations with religious practices and positive and negative indicators of occupational well-being as well as employee's attitude toward the organization. EWAQ is a well psychometrically sound measure to examine egoism attitude at work and is recommended to use in Polish employees. Further implications in reference to EWAQ were discussed.

Oral presentation OP194

Emerging vocational aspirations among young men and women – to limit or to expand the scope of options?

Ingrid Zakrisson, Mid Sweden University, Sweden; Maria Bogren, Nord University, Norway; Barbro Widerstedt, Mid Sweden University, Sweden

science

The aim of this research was to study differences and similarities between young men's and women's perceptions of their future, in terms of work and career. Working life is gender segregated in many respects, to the disadvantage for both individuals, organizations, and society (Statistics Sweden, 2018).

Girls and boys learn very early in life what is expected of them, in terms of roles, interests and values. Girls are expected to be warm and friendly, and to be interested in caring for others. Boys, on the other hand, are expected to be competitive and assertive, and to have technical or practical interests (Diekman, et al., 2010; Tellhed, et al., 2018). Such expectations stem from the norms they face in their daily life, which also tend to be internalized as beliefs about their own abilities (Jämställdhetsmyndigheten, 2022).

The present study is based on a questionnaire study among 350 high school and first year university students in Sweden and Norway, carried out in 2022. The questionnaire contained questions about goals in life (communion and agency), ability beliefs, interest in various lines of work, educational aspirations, autonomy, as well as demographic factors.

Based on the answers to the question "given your interests and what you think you are good at, which of the following occupational areas do you think you will fit?" (with 21 choices from Swedish Public Employment Service) three categories of occupations (each containing four occupations) were formed: those to a higher extent chosen by the young men, those to a higher extent chosen by the young women, and those occupations chosen by men and women to the same extent. The relations to goals, ability beliefs, and background factors were analyzed by multiple regression.

The results revealed that different factors were at work for men and women choosing male coded occupations, and also gender neutral occupations, while men and women displayed similar patterns when choosing female coded occupations. Furthermore, what they thought they were not good at had greater impact on choices than interests and what they actually believed to be their assets.

The sample used in this study was a convenience sample from a few regions in Sweden and Norway, and from a narrow array of study programs, mainly such that attract both men and women. This of course limits the generalizability of the results. The results still have some important implications:

In the pursuit of enhancing gender equality among young people, the focus very often is to expand their horizon of interests. Less work has been dedicated to boys' and girls' ability beliefs. This research shows that what young men and women think they are not good at tend to narrow their scope of options, which then counteract equality strivings. As ability beliefs are influenced not only by actual experiences, but to a large extent also by what is expected of a boy or girl, i.e., the norms they encounter, much more work need to be directed at trying to enhance young people's beliefs about themselves.

In Europe we face a backlash regarding gender equality, which not only limit the opportunities for women, but is also detrimental for the supply of people to the work force. Knowledge that deals with gender issues thus is in line with the congress theme.

Emotional agency at work in strategy implementation

Heini Ikävalko, Aalto University; Kari Nissinen, University of Jyväskylä; Susanna Paloniemi, University of Jyväskylä; Katja Vähäsantanen, Häme University of Applied Sciences; Päivi Hökkä, University of Jyväskylä;

science

Objective

The aim of the research is to understand how emotional agency at work relates to strategy implementation. Agency, that is, individuals' active participation and the power of making a difference in everyday activities and interactions, shapes social action in organizational life, whether looking at professional learning (Goller & Paloniemi, 2017) or at strategizing (Jarzabkowski, 2008). Previous literature has shown the relevance of both emotions and agency in strategy implementation but there is no research on the meaning of emotionally imbued agency in strategy implementation.

Background and research question

Emotional agency at work acknowledges the emotional component to grasp the agentic actions related to emotions (Hökkä, Vähäsantanen & Ikävalko, 2022). Emotional agency involves competence to perceive, understand and take into account both one's own and other people's emotions, and actions to influence emotions in organizational practices and interactions. Thus, it comprises two dimensions: i) emotional competence at work, and ii) influencing emotions at work (Hökkä, Räikkönen, Ikävalko, Paloniemi & Vähäsantanen, 2022).

Strategy implementation refers to the interactive processes of conceptualization, enactment, and coordination through which organizational stakeholders realize an organization's strategy (Weiser, Jarzabkowski & Laamanen, 2020). In this study, we investigate the enactment of strategy, the actions and interactions of organizational members "in making sense of and adjusting a given strategy to their own contexts" (Weiser et al., 2020, 974). We also consider the role of emotional climate at work, that is, organizational members' shared perceptions of the extent to which they perceive their organizational environment to be conducive to emotions and emotion-related activities, in this relationship.

Our research question asks how individuals' self-reports of emotional agency at work and emotion climate at work associate with their evaluations of strategy implementation. Based on the previous studies on the role of agency (Jarzabkowski, 2004; 2008) and emotions (Maitlis et al., 2013; Vuori & Huy, 2016) in strategy, we anticipate a positive relationship between emotional agency at work and strategy implementation. In the analysis we control for background variables such as gender, age, work experience, and position at work, as they may confound the relationships of our interest.

Methodology

A survey (N=837) was conducted in three organizations in Finland in a situation where each organization had an updated strategy to be implemented. In measuring emotional agency at work, we utilized a validated instrument consisting of ten items, which divide into dimensions of emotional competence and influencing emotions at work (Hökkä et al., 2022). Emotional climate at work was measured with five items based on organizational climate theorizing (Parke & Seo, 2017). Enactment of strategy was measured with eight items, related to clarity of actors' role in strategy (cf. Kauppila,

2014), integration of strategy into everyday actions (cf. Kohles et al. 2012) as well as to strategically aligned behavior (Riel et al., 2009).

The analysis of associations between emotional agency at work, emotion climate at work, and strategy implementation, as well as the confounding role of background variables, was conducted using a structural equation model.

Results

Of the two dimensions of emotional agency at work, influencing emotions at work was significantly and positively associated with enactment of strategy. Emotional competence did not show significant direct associations with enactment of strategy, but it was strongly correlated with influencing emotions at work. Emotional climate at work was positively correlated with emotional agency at work, but it also was significantly and positively associated with enactment of strategy.

Of the background variables considered, only female gender and managerial position at work associated significantly with emotional agency at work and enactment of strategy, these associations being positive. No confounding role was detected among these variables as the associations between emotional agency at work and enactment of strategy appeared similar regardless of whether they were controlled or not.

Limitations

This was a cross-sectional study and was conducted in three organizations.

Conclusions

The study highlights the role of emotional agency in the interaction processes of strategy implementation. The study has implications by offering new avenues to tackle the challenging task of strategy implementation and more broadly, understanding and utilizing the power of emotions in the everyday practice of organizations.

Relevance to the Congress Theme

Discussing emotions and the ways employees can develop emotional competence and exert influence on emotions at their work is highly relevant for the changing world of work.

Keywords: Emotions, agency, strategy

Oral presentation OP532

Emotional exhaustion in the face of personal and technological requirements among a sample of Spanish secondary teachers

Alejandra Trillo, University of Granada; Amelia Manuti, University of Bari; Rocco Giuliano, University of Bari; Francisco D. Bretones, University of Granada

science

The expansion of the use of technology has had a great impact on different aspects of life, including the professional. This expansion has led to the appearance of new forms of work where computer systems provide services. ICTs in the field of teaching have in fact become a basic pillar among all levels of educational instruction and learning.However, this technological expansion into the educational system has led to new demands on teachers, which are at times have been unable to cope either due to their misuse of technology or lack of training in it resulting in the advent of new psycho-social risks such as techno-stress or burnout (Alvarado, Aragón & Bretones, 2020; Lawrence & Tar, 2018).The current study analyses the presence of the psycho-social risks subsequent to the digitalisation process of teaching among a sample of Spanish secondary school teachers. It delves into the resources, both individual and organisational, that are available to deal with the aforementioned demands, which escalated and became more evident during the COVID-19 pandemic (Manuti, Giancaspro, Gemmano & Morrelli, 2022).The consequences on balancing work and family (Currie & Eveline, 2011; Harris, Harris, Carlson, & Carlson, 2015), the threat to job security and the fear of technological uncertainty (Tarafdar, Tu, Ragu-Nathan, Ragu-Nathan, 2007), the expansion of the work culture beyond the classroom (Ragu-Nathan, Tarafdar, Ragu-Nathan, Tu, 2008), and the stress generated by the use of technology (Al-fudail & Mellar, 2008; Joo, Lim, Kim, 2016) are some of the pernicious effects on teachers resulting from the introduction of ICTs into the classroom.These technological changes have heightened their professional and personal demands leading them to acquire attitudes of resistance and defense (Ertmer, Ottenbreit-Leftwich, Sadik, Sendurur, Sendurur, 2012; Kotrlik & Redmann, 2005; Yu, Lin, Liao, 2017). The current study therefore when taking into account the Job Demands-Resources Theory (Bakker & Demerouti, 2000), will attempt to model the influence of certain of these factors in predicting burnouts.The study, currently underway, focuses on a sample of Spanish secondary school teachers. They completed a questionnaire related to technostress (Ragu-Nathan, Tarafdar, Ragu-Nathan, Tu, 2008), adaptation to the Work-to-Family Conflict (Netemeyer et al., 1996), the Distributed Leadership Inventory (Hulpia, Devos, Rosseel, 2007), the Work and Meaning Inventory (Steger, Dik & Duffy, 2012) and the Maslach Burnout Inventory (Schaufeli, Leiter, Maslach, Jackson, 1996).Data collection is currently underway and completion is expected in December 2022.Relevance of the theme to the congress: This investigation explores the relationship between the use of new technologies and their influence on the changing world of work.

Keywords: Exhaustion, Job Demands-Resources, Teachers

Oral presentation OP58

Emotional Intelligence, Teleworking, Interpersonal Conflicts and Well-being at Work: A Path Analysis Model

Annick Parent-Lamarche, Université du Québec à Trois-Rivières; Sabine Saade, American University of Beyrouth

science

Research aims and objectives : This study aimed to identify the role specific emotional intelligence dimensions (i.e., self-emotion appraisal, others' emotion appraisal, use of emotion, regulation of emotion), and work characteristics (i.e., teleworking, workload, job insecurity, skill utilization, decision authority, social support) could play in interpersonal conflict at work and employees' well-being.

Theoretical background : According to the Job Demands-Resources model, work resources (e.g., low workload, social support) expand an individual's mental capacities. Inversely, a lack of resources could impair these capacities (e.g., capacity to avoid or to manage interpersonal conflicts at work). This lack of resources could in turn, impair one's mental health (e.g., lower levels of well-being). Beyond work-related resources, an individual's personal resources (e.g., emotional intelligence) could also play an important role in their mental capacities.

Design/Methodology/Approach/Intervention : Path analyses were conducted with MPlus software on a sample 264 Canadians workers from 19 small and medium organizations.

Results : Our results indicated that interpersonal conflicts played a mediating role between emotional intelligence, work characteristics and well-being. Regulation of emotion and teleworking were associated with a higher level of well-being via their effect on interpersonal conflicts (lower interpersonal conflicts). Use of emotions and workload were associated with higher level of interpersonal conflicts, while emotional regulation, teleworking, decision authority and social support were associated with a lower level of interpersonal conflicts.

Limitations : In terms of limitations, this study was cross-sectional and relied on self-reported questionnaires.

Practical Implications : Practitioners should pay particular attention to the differentiated effects of emotional intelligence dimensions in their training programs, as well as on the management of telework.

Originality/Value : Overall, the results of this study could provide valuable insight to employers. More specifically, this study could highlight different ways of improving interpersonal relationships at work to favor workers' well-being.

Keywords: Interpersonal Conflicts; Well-being; Emotional Intelligence.

Oral presentation OP12

Emotions as Social Information in Unambiguous Situations: Role of Emotions on Justice Perception

Othman Alkhadher, Kuwait University; Salman Alawadi, University of Miami; Hesham Gadelrab, Kuwait University

science&practice

Objectives, Importance

EASI theory proposed that in an ambiguous situation, individuals rely on others' emotions to make sense of the level of fairness. However, the theory provides no information when the situation is unambiguous. This study fills this gap and assesses if the information provided by emotions about the fairness of a situation can explain individual differences in perception of variance in unambiguous situations when people are treated fairly and unfairly. The study goes further to assess the possible moderation that emotions may play between the fairness of the procedure and the observer's justice perception of that procedure.

Theoretical background

According to the EASI, emotional expression provides information about the affective state of the transmitter, which may influence observers through inferential processes and/or affective reactions. To make judgements on procedural justice, individuals seek relevant information about a specific event. However, individuals often find themselves in ambiguous situations where no helpful information is available. The degree of uncertainty increases people's need for justice information, motivating them to attend to the emotions expressed by others. The observer may use the information inferred from others when forming their own judgments as well as others ' evaluations of an event.

The notion that in an ambiguous situation, people rely on others' emotions to make sense of the level of fairness encountered, as stated by the EASI theory, implies that in unambiguous situations, where sufficient information about the fairness of the procedures is available, people rely less on other emotions to understand the situation. This situation suggests that emotions may not have any incremental variance in the fairness of an event, in addition to what an unambiguous (un)fair situation can offer. To the best of our knowledge, this notion has not yet been tested. Accordingly, we test the following hypothesis:

H 1 : Emotions will not add significant incremental variance in addition to what an unambiguous (un)fair procedure could offer.

Therefore, we further assessed the possible moderation role that emotions may play between the fairness of the procedure and the observer's justice perception. Observer's procedure justice is formulated after he or she assesses others' procedural justice. In fair situation, happiness signals that the outcome is favorable and justified; whereas in unfair situation, anger indicates unfavorable outcome and that the goal is unfairly obstructed. When an individual treated fairly, an observer is more prone to believe the expressed happiness emotion; and when that individual treated unfairly, the observer is more prone to believe the expressed anger emotion, as there is no reason to fake.

Individuals may show emotions that they do not actually feel or may exaggerate to influence others. Therefore, observer estimates the appropriateness of emotional expressions to ensure that they are consistent with the norms of the surrounding situation. Inappropriate emotion decreases the inferential process and negatively activates the affective reaction, because they are seen as less

legitimate, or less deserved. There are situations where the observer has no access to the expresser's emotions. This may be because they have no direct interaction with the expressor who deliberately or inadvertently altering the emotions or masks them from reaching others. Accordingly, we proposed the following hypotheses:

There is a significant interaction between emotion and procedure for the other's procedural justice (H 2a), as well as the observer's own procedural justice (H 2b). Such that, in fair situation, happiness would significantly increase the justice perception of other's (H 2c) and the observer own procedural justice (H 2d) compared with anger. In unfair situation, anger would significantly decrease the perception of other's procedural justice, (H 2e), and observer own procedural justice (H 2f) compared with happiness.

Methodology

We collected data using Qualtrics online survey software from 1012 employees across different industry services in the United States. The participants were assigned randomly to one of the 12 experimental conditions (fair, unfair, and unknown x happiness, anger, guilt, and neutral). Measures were Colquitt's (2001) organizational justice and PANAS.

Results

for predicted other's procedural justice, inserting emotion added 5.2%, and for observer's procedural justice add 0.8% in addition to what procedure had contributed. Regardless of whether the procedure was fair or unfair, emotions were still able to contribute significant incremental variance in predicting procedural justice. Also, the results showed a significant interaction between procedure and emotion for other's procedural justice and observer's procedural justice. These results supported both H 2a and H 2b .

The study revealed significant interactions between the procedure and emotion. In fair situation, happiness significantly increases the perception of other's and observer own procedural justices compared with anger. Thus, H 2c and H 2d were supported. In unfair situation, though anger got lower mean compared with happiness, the difference wasn't large enough to be significant. Thus, H 2e and H 2f were not supported.

Limitations

At the time of data collection, COVID-19 continued to spread in the US. It is reasonable to think that such a health crisis may affect participants' perceptions when filling out the questionnaires. The study used self-report measures that could have caused many known biases.

Conclusions & implications

The findings highlight the importance of others' emotions as social information, the subjective nature of justice judgment, and that justice perceptions are not merely a result of deliberate cognitive processes. Emotions play a significant role in justice judgments, under (un)certain conditions, with (un)fair procedures, even when the observers were themselves not mistreated. The study also emphasized the role of emotion as a potential moderator between (un)fair procedures and the justice perception of that procedure. The results drew our attention to the importance of fair procedures and policies toward external parties, such as applicants and customs, as this may affect the perception of fairness of their internal parties. An employee who witnesses others being treated unfairly may experience injustice even when they are personally treated fairly. Accordingly, decision-makers should review their organizational policies toward external parties to eliminate any biases.

Oral presentation OP110

Employability as an antecedent of eudaimonic well-being at work: the mediating role of job meaningfulness

Marija Davcheva, University of Valencia; Pascale Le Blanc, Eindhoven University of Technology; Vicente González-Romá, Ana Hernández & Inés Tomá | University of Valencia

science&practice

Research goals: Despite the growing interest in eudaimonic well-being, there is still a lack of research focusing on the origins of eudaimonic well-being at work (Dagenais-Desmarais et al., 2017). Recently, the role of personal resources (i.e., employability) as antecedents of well-being at work has been highlighted (Akkermans et al., 2020). The current study explored the relationships of Fugate et al.'s (2004) employability dimensions (i.e., career identity, personal adaptability, and social and human capital) with eudaimonic well-being at work (i.e., personal growth at work and purpose in professional career) as well as the mediating role of job meaningfulness in these relationships.

Theoretical background: We hypothesized positive direct and indirect effects (via job meaningfulness) of Fugate et al.'s (2004) employability dimensions on the eudaimonic well-being at work dimensions (personal growth at work and purpose in professional career). With respect to the direct effects, we drew on Fugate et al.'s (2004) model of employability and argued that employability is a personal resource that fosters eudaimonic well-being at work. Strong career identity, adaptability, social and human capital can not only facilitate the identification of career opportunities, but also provide motivation and agency to realize growth opportunities at work and to pursue overarching purposeful career goals. With respect to the indirect effects, we took on the worker-centric approach of job meaningfulness which states that employees are active creators of meaning (Rosso et al., 2010) and meaningfulness depends on what they bring into work (Chalofsky, 2003). We pose that employability is an antecedent of job meaningfulness since research has suggested that work activities that are congruent with one's identity, in this case, one's career identity, are crucial for experiencing meaningful work (Lysova et al., 2018). In addition, a numerous social network, as well as competencies and adaptability contribute to employees' experience of their job as meaningful (Robertson et al., 2020). Job meaningfulness, in turn, has an eudaimonic direction (Steger et al.,2012) and as such may trigger eudaimonic well-being at work outcomes (Chalofsky & Cavallero, 2019). Thus, we hypothesize positive direct and indirect effects (via job meaningfulness) of the four employability dimensions on the two eudaimonic well-being at work dimensions.

Methodology: We implemented a time-lagged design with data collection at three-time points, each separated by 3 months starting in April 2020. The sample was composed of 263 Spanish employees (48 % women; mean age = 37 years, SD = 10). Career identity (T1) and Social Capital (T1) were measured with 4-item scales (González-Roma et al., 2018). Personal adaptability (T1) was measured with a 3-item scale (Ployhart & Bliese, 2006). Human Capital (T1) was measured by 6 items focused on several generic competences (Hernández-March et al., 2009). Job meaningfulness (T2) was measured by a 5-item scale (May et al., 2004). Finally, the two dimensions of eudaimonic well-being at work (T3) were measured by Van Dierendonck's scales (2004): 7 items for personal growth at work and 6 for purpose in professional career. All measures showed adequate psychometric properties. Structural Equation Modelling (SEM) was conducted in Mplus 8, and indirect effects were tested with bootstrap analyses.

Results: Our research model showed good fit to data (RMSEA = 0.02; CFI = 0.99; TLI = 0.99; SRMR = 0.04). The indirect effects of employability dimensions on the two dimensions of eudaimonic well-being were positive and statistically significant for career identity, human and social capital, since the 95% bootstrapped confidence interval did not include zero. However, contrary to our expectations, personal adaptability did not show significant indirect effects on any of the dimensions of eudaimonic well-being at work. Regarding the hypothesized direct effects after controlling for job meaningfulness, results showed significant direct effects of career identity on personal growth at work and on purpose of professional career, as well as of social capital on purpose of professional career.

Limitations: Our study limitations are the use of self-report measures and the limited generalizability due to the sample being composed of Spanish employees only.

Research/practical implications: Our study highlights the importance of fostering employability as a personal resource that facilitates employees' experience of job meaningfulness and ultimately their eudaimonic well-being at work.

Originality/Value: By integrating the literature on employability and the worker-centric approach to job meaningfulness, our study offers new insights into the underlying mechanism relating employability with eudaimonic well-being at work.

Keywords: employability, job meaningfulness, eudaimonic well-being

Oral presentation OP316

Employee non-work activities: a cross-disciplinary systematic review

Shumin Zheng, Yumeng Yue & Kristina Potočnik | University of Edinburgh

science

Research goal:

This study aims to integrate cross-disciplinary research on non-work activities and their impact on employee performance and well-being. After developing a novel typology of non-work activities from the perspective of content, we explicate how different non-work activities relate to employee outcomes. We further suggest that time, location, and whom the activities take place with act as important boundary conditions of these relationships.

Theoretical background:

While increasing research has explored the impact of various types of non-work activities on employee outcomes, our understanding has been thwarted by a lack of consensus regarding the scope of non-work activities and systematic integration of research across different disciplines. Our understanding of non-work activities has been primarily constrained to those that people engage in either out of working hours or workplace. However, working conditions have largely changed, with a general tendency to move away from fixed working hours and traditional offices and increasing implementation of flexible working arrangements. The traditional definition of non-work activities may prevent researchers from capturing these activities holistically and may also camouflage nuances of their impact. In this study, we expand existing research by differentiating non-work activities from the perspective of the content itself and focus on activities where content is not related to work. Furthermore, research located within different disciplines tends to take different conceptual and methodological perspectives on studying a specific non-work activity, and there is little consolidation across these disciplines. Existing research has also rarely considered the impact of non-work activities on performance-related outcomes and well-being at the same time. Our review aims to synthesize existing research on a broad range of non-work activities across different disciplines to provide a comprehensive overview of how different non-work activities contribute to diverse behaviors and well-being and propose a future research agenda.

Methodology:

We conducted a systematic search in the Web of Science Core Collection to identify potentially relevant outputs in March 2022. After reviewing 25,181 titles and abstracts, a total of 549 outputs from 34 disciplines met the inclusion criteria and form the basis of this review.

Results obtained:

Nine categories of non-work activities emerged considering the content, with sports and physical activities and the use of information and communication technology (ICT) receiving the most attention, followed by social, relaxation, and entertainment activities and traveling. Physical activities have been well-documented to be related to well-being indicators such as cognitive and affective state, life satisfaction, and sleep quality. Research on work-related benefits of physical activities has mainly addressed work ability, absenteeism, and presenteeism. Evidence that examined the impact of the use of ICT and social activities is mixed. While some studies found that participating in these activities contributed to increased positive emotions and recovery experience, leading to greater work engagement and work efficiency, in other studies, these activities were unrelated to changes in

well-being indicators or even activated fatigue, which could translate to deleterious work behaviors. Longer commuting time and distances as well as passive commuting mode exerts a negative impact on sleep time, subjective well-being, and psychological distress. Given the lack of studies and the broad range of activities included, it is difficult to draw general conclusions regarding the impact of volunteer activities, household and care activities, educational and learning activities, and religious and spiritual activities, respectively.

Limitations:

Although we conducted a systematic literature review across multiple disciplines that studied the effects of non-work activities on a number of employee outcomes, a meta-analysis could provide a cumulative effect size of such effects. Also, we limited our review to outputs published in English as this was the only common language spoken by all three authors.

Conclusions:

We observed that no theoretical framework has been consistently applied to explain the relationships between different non-work activities and outcomes. Also, not all non-work activities are uniformly related to all work-related behaviors and well-being dimensions. Given the mixed effects in existing research, future research could investigate the boundary conditions surrounding these relationships, especially in terms of time, location, and interpersonal relationships involved when engaging in different activities. Such effort could ultimately provide a framework that integrates the multifaceted effects of different types of non-work activities in relation to work-related behaviors and well-being indicators.

Keywords: non-work activities, systematic review, cross-disciplinary

Empowering self-direction in return to work of employees with lower and higher levels of education: two qualitative comparative studies

Inge Houkes & Bart Pennings | Maastricht University; Nicole Hoefsmit, Open University Heerlen

science

Research goals and why the work was worth doing

Return to work (RTW) after sickness absence is not self-evident, particularly among employees with lower levels of education. One third of the Dutch low-educated individuals (aged 25-65 years) is inactive in the labour market, partially because of failing RTW processes. Dutch legislation prescribes employees and employers to cooperate in the RTW process and encourages self-direction of employees. Yet, we lack insight into how employees exercise influence over (i.e. self-direct) their own RTW. In this presentation, we will present the results of two studies, focusing on employees with lower and higher levels of education. The first study aimed to enhance our understanding of (A) the role that employers play in the self-direction of employees with lower levels of education (EL) over their RTW, (B) how employers perceive these employees' efforts (or lack thereof) to self-direct their own RTW, and how employers understand and interpret the behaviours of these employees. The second study aimed to analyse (A) how representatives of a university (employing employees with high levels of education (EH)), manage RTW, (B) the similarities and differences between the RTW management of employers (or representatives thereof) of employees with low (EL) and high levels of education (EH), and (C) the degree to which the employers' roles resemble empowering leadership.

Theoretical framework

Social cognitive theory was used as a framework for the first study. The second study builds on the theory of empowering leadership, which may support employees' self-direction in RTW (e.g. by allowing and enabling their involvement in decision-making).

Design/Methodology/Approach

Study 1 [1]: A qualitative study was conducted with 13 employer representatives (EL) using semi-structured interviews. Data were analysed in NVivo12 using a template approach. Study 2 [2]: 10 additional semi-structured in-depth interviews with employers (EH) were held and these were compared with the interviews from study 1. For study 2, a thematic analysis of interview transcripts (research goal A) was followed by a comparison of themes (research goal B) and pattern matching (research goal C).

Results obtained

Study 1: Employers (EL) tend to play a guiding, directive role in employees' RTW, leaving employees with limited decision latitude. Employers can and do decide about the timing and mode of employees' RTW for instance. Employees generally comply with the employers' decisions and suggestions, whether or not after trying to realise their own preferences regarding timing and mode of RTW. Such employee behaviour can be understood by person-related factors (perceptions of sickness and RTW, work preferences, being unable to resume certain work), and environmental factors (financial pressures to resume work, fear of job loss, pressure of the private life domain to not return to work, feeling to be pushed away/pulled towards the workplace). Study 2: (A) EH tend to engage in dialogue and accommodate their employees as much as possible. (B) EL and EH showed

several similarities, such as aiming to meet legal requirements on RTW management. Compared to EL, EH tend to focus more on facilitating employees. (C) Empowering leadership seems to be more common among EH.

Limitations

Both studies focused on the employer perspectives. We recommend future studies to include the employee perspective as well.

Conclusions – research and or practical implications/Originality/Value

Compared to employees with low levels of education, those with high levels of education may be granted more opportunity to self-direct their RTW. The results demonstrate the vulnerable positions of employees with low levels of education during sickness absence and RTW. These employees hardly seem to (be able to) self-direct their own RTW. Employers should give voice to employees and enable them to have more control over their RTW. The study results provide starting points for employers for employees with both low and high levels of education who aim to enable employees' self-direction in RTW, and help them to develop empowering leadership styles.

Relevance to the Congress Theme

These findings stress the importance for professionals in the field to give voice to employees during RTW, particularly to employees with lower levels of education. This research is highly relevant to the congress theme as it addresses a group of workers that is particularly impacted by recent global developments in social security systems and at the labour market.

Oral presentation OP262

Empowerment and Organisational Support Predict Work Attitudes in Forced Remote Working

Duncan Jackson, King's College London; George Michaelides, Norwich Business School; Amanda Jones, King's College London

science

Goals and why the work was worth doing:

We sought to contribute to a theoretical understanding of the antecedent conditions predicting employee attitudes in the context of forced remote working. This study was important in developing models for progressing healthy and adaptive perceptions and attitudes during forced remote working conditions, such as those brought about by the pandemic.

Theoretical background:

The pandemic created an unprecedented set of forced remote working conditions about which little research currently exists. In the empowerment literature (e.g., Spreitzer, 1995), employees are thought to perceive varying degrees of meaning, competence, self-determination, and impact as a function of antecedent influences in their work environment. In forced remote working, employees do not have the usual stimuli in place that might otherwise influence empowerment perceptions. This includes antecedent predictors such as organisational, managerial, and collegial support (Anseel et al., 2015; Matusik et al., 2021). Other antecedent factors might play a role in predicting attitudes in forced remote work, including emotional stability, readiness for use of technology, and general readiness of one's home environment (Hutchinson & Williams, 2007; Parasuraman & Colby, 2015). There is evidence that empowerment relates to outcome attitudes such as intent to leave, well-being, satisfaction, and organisational commitment (Carless, 2004; Emery et al., 2019; Fisher, 2014; Van De Voorde et al., 2016). How these variables are expressed in the context of forced remote working is largely unknown. The pandemic has highlighted that furthering knowledge about attitudes in a forced remote working context is critical to (a) developing a theoretical understanding of processes relevant to forced remote work and (b) preparing organisations for how to foster psychologically healthy conditions for people who are forced to work remotely.

Design/Methodology/Approach/Intervention:

We fitted a Bayesian, Hamiltonian Monte Carlo multilevel model with a recalled pre- and during-pandemic within-participants factor and an occupational type between-participants factor to partial job complexity (N = 337). Predictors in the model included organizational, managerial, and collegial support, neuroticism, and technological and home readiness. Empowerment was specified as a mediator, with the outcomes intent to leave, well-being, job satisfaction, and organizational commitment.

Results:

All measures returned admissible reliability estimates (coefficients alpha > .70) with acceptable model fit and convergence (as indicated by Rhat [< 1.05] and posterior predictive p -value statistics [= .50], along with R 2 values per outcome ranging from .20 to .52). We found that the onset of the pandemic negatively impacted job satisfaction (β = -.32) and to some extent empowerment (β = -.16), well-being (β = -.13), and commitment (β = -.11). Our results consistently suggested that perceived organizational support (POS) was a critical factor in predicting all outcomes in our model, including intent to leave (β = -.34), organizational commitment (β = .36), and well-being (β = .21). We

found small, significant indirect effects for POS via empowerment relating to the same outcome attitudes. Moreover, empowerment predicted intent to leave (β = -.30) and job satisfaction (β = .47).

Limitations:

This study was conducted during forced lockdown conditions. However, we were reliant on recalled pre-lockdown perceptions for our within-participant contrast. Most participants in our sample were White and working in British organisations. It would be interesting to know about attitudes relevant to other ethnic backgrounds and in other countries.

Conclusions:

Our findings suggest that in forced remote working, POS and empowerment are critical to the prediction of outcomes that are relevant to the psychological health and well-being of employees. We contribute to theory relating to a novel, yet clearly impactful set of work circumstances. We moreover offer practical considerations for organisations about fostering POS and empowerment in the context of forced remote work.

Relevance to the Congress Theme:

A sustained normative shift towards increased levels of remote working is identifiable across countries (Šmite et al., 2023). Organisational policy directed at meeting the challenges of this shift, within a context of mounting economic challenges, could invite an increase in forced remote working in the future (Musleh, 2022). Within this uncertain context, we have much to learn from the circumstances brought about by the pandemic and the ability of organisations to remain sustainable and employees to remain psychologically healthy in conditions of forced remote working.

Relevant UN SDGs:

Good health and well-being; decent work and economic growth

Keywords: Remote working, Empowerment, Organisational Support

Oral presentation OP218

ENERGIZING LEADERS TO BE TRANSFORMATIONAL : WORK-BREAKS

Sooyeol Kim, National University of Singapore; YoungAh Park, University of Illinois at Urbana-Champaign

science&practice

Personal resources play a crucial role in important behaviors at work, but little research has explored the dynamic nature of leaders' personal resources and leadership behaviors. In this study, we examine one possible way to help leaders gain more resources and energize themselves so that they can be transformational on a daily basis, and further investigate the extent to which the importance of this resource-based mechanism is contingent on the level of leaders' daily work demands. Also, given that transformational leadership goes beyond leaders' self-interest and their own tasks to focus on followers (Dvir et al., 2002), we incorporate the relational nature of transformational leadership into our model. Thus, we examine how this resource-based process unfolds in the leader–member dyadic context. We use Conservation of Resources (COR) theory (Hobfoll et al., 2018) as an overarching framework and draw from the recovery literature (Trougakos & Hideg, 2009).

By testing our hypothesized model, we aim to make several key contributions. First, our study offers a new antecedent of daily transformational leadership, thereby contributing to the scholarly knowledge of how to facilitate leaders' daily transformational leadership behavior. Second, COR theory is a dynamic theory, acknowledging that human resources ebb and flow over time (see Halbesleben et al., 2014; Hobfoll et al., 2018, for reviews). In our model, we integrate this theory with the recovery and leadership literature to examine intermediary processes that support leaders as they exhibit transformational leadership on a daily basis. Identifying moderating conditions helps to refine theories, as moderators can specify conditions under which certain relationships/processes are either strengthened or weakened (Sutton & Staw, 1995; Weick, 1995). In our research, we test whether the proposed indirect effect of microbreaks on transformational leadership via affective resource states has moderating conditions that are embedded in leaders' work environment. Additionally, we test whether the extent to which leaders use their improved affective resources for transformational leadership depends on the quality of leader–member exchange (LMX) relationship with followers (Graen & Uhl-Bien, 1995).

COR theory (Hobfoll, 1989, 2001) has been perhaps one of the most cited theories in the organizational psychology and behavior literature (Halbesleben et al., 2014). Its central premise revolves around the assumption that human resources are finite, such that people seek to protect and obtain resources for meeting demands in their life. Although COR theory was heavily used in research to test its notion that resource loss leads to stress and ill-being, many gaps need to be filled to refine the theory (Halbesleben et al., 2014; Hobfoll et al., 2018). In the work context, the theory suggests that because work requires employees' continuous expenditure of resources (e.g., energy), it is critical for them to protect and gain important resources for their best work outcomes. However, COR theory did not specifically theorize how individuals might conserve and gain resources in various contexts at work. That said, the recovery literature has fleshed out the theory by identifying recovery processes—that is, means by which individuals replenish their resources to have better well-being and work outcomes (see Sonnentag et al., 2017, for a review). As a form of at-work recovery, within-day work breaks have been tested as an effective way to conserve and restore resources at work (see Trougakos & Hideg, 2009, for a review). Thus, we focus on microbreaks —short, informal respites that individuals voluntarily take between task episodes for momentary recovery (Kim et al., 2017; cf.

Fritz et al., 2011)—as a way to energize leaders so that they can improve their affective states that are critical for transformational leadership.

Data were collected through three daily surveys from 118 leader–member dyads for five workdays (n = 512 observations). Multilevel path analysis showed that on days when leaders reported taking more frequent microbreaks, they were more likely to show transformational leadership behaviors (as rated by followers) through increased positive affect and decreased negative affect. Interestingly, the mediated relationship between microbreaks and transformational leadership via the affective paths was stronger for days when leaders had higher work demands than for days with little demands. Further, the mediated relationship via positive affect was significant for leader–member dyads in a higher-quality leader–member exchange relationship, but not for those in a lower-quality relationship (as rated by followers). Overall, these findings extend the conservation of resources theory and the leadership literature by delineating resource processes of daily transformational leadership and identifying important moderating conditions for the resource pathways.

Keywords: microbreaks, resources, transformational leadership

Oral presentation OP142

Engage and Retain the Aging Workforce: Identifying the Workplace Antecedents and Mechanism Underlying Age-based Stereotype Threat

Sophie Coulon, The University of Queensland

science&practice

Theoretical background: Older employees are stereotyped as less capable, less flexible, and less willing to learn new skills (Posthuma & Campion, 2009). Encountering stereotypes can make older employees susceptible to age-based stereotype threat, or the concern about confirming or being reduced to a negative stereotype (Steele, 1997). Older employees' experiences of stereotype threat are associated with more negative workplace outcomes, such as poorer job attitudes and greater intentions to quit (Kulik et al., 2016; von Hippel et al., 2013).

Research goals: Although age-based stereotype threat is associated with disengagement, we know little about the factors that can trigger it. Drawing on stereotype threat, socioemotional selectivity, and social comparison theories, we tested a range of potential workplace antecedents of stereotype threat among older employees. It is also unclear why experiencing different antecedents might lead to stereotype threat. We proposed age salience (i.e., the extent to which age is at the forefront of someone's mind when interpreting an event; Taylor & Fiske, 1978) as a potential mediating mechanism. Given that organizations are multi-level systems (Costa et al., 2013), we approach the problem of stereotype threat via multi-source data by investigating how individual- and organizational-level factors impact employees' experiences. From a managerial perspective, identifying specific workplace antecedents can inform interventions designed to predict and prevent stereotype threat, thereby improving the engagement and retention of the aging workforce.

Method and Results: Three studies were conducted among members of an aging advocacy group and 26 municipal councils (N =1283 older employees). At the individual-level, the first two studies identified 10 key antecedents associated with higher stereotype threat (e.g., being overlooked for training opportunities, feeling excluded from the informal social aspects of the workplace). Mediation results revealed that experiencing any of the 10 antecedents related to increased age salience, which in turn, related to greater feelings of stereotype threat. Consistent with previous work, stereotype threat was associated with poorer workplace outcomes. At the organizational level, we collected responses from older employees' younger co-workers (40 years old and under; N =214) and HR representatives to understand if organizational culture impacts older workers' feelings of stereotype threat. Our findings indicate that stereotype threat may be less impacted by organizational factors, like younger co-workers' attitudes or the age-friendly HR programs available, than by factors that are local to each employee. Study 3 (N =197) used a 10-day diary study in which employees responded to a short survey at the end of each workday to determine how daily antecedents relate to daily feelings of stereotype threat, and consequently age salience, stress, strain, and belonging.

Limitations: Our research is correlational and cannot establish a causal link between the antecedents and stereotype threat. Additionally, given the size of councils, workgroup or departmental-level data would provide a better test of how younger co-workers' attitudes relate to older employees' stereotype threat.

Conclusions: Our studies identified 10 key antecedents to age-based stereotype threat for older employees and the frequency at which they occur daily in the workplace. We found support for age salience as a partial explanation underlying why experiencing an antecedent leads to stereotype

threat. Adopting a multi-level approach, we addressed concerns of common method variance and gained insight into how organisational-level factors relate to older employees' stereotype threat.

Relevance to Congress Theme: The global aging population has led to predictions of an upcoming labor shortage (UNDESA, 2019), indicating that it is increasingly important to better engage and retain older employees. Thus, gaining a better handle on the triggers of stereotype threat can help inform psychoeducation interventions designed to predict and prevent the antecedents from occurring, thereby minimizing feelings of stereotype threat, and consequently better engaging and retaining the aging workforce.

Relevant UN SDGs: Although younger employees also experience stereotype threat at work, they are not as susceptible to poorer workplace outcomes as older employees (von Hippel et al., 2013; 2019). Our research contributes to reducing inequalities in the workforce by focussing on the triggers to stereotype threat for older employees and minimising their stereotype threat experiences. Consequently, an engaged and retained aging workforce can ameliorate the upcoming labor shortage, promoting economic growth, and improve wellbeing and health outcomes for older adults worldwide.

Oral presentation OP575

Enhancing employees' competence development and career management – an RCT study

Otto Pankkonen, Jukka Vuori & Marjaana Pöyry | Finnish Institute of Occupational Health

science&practice

Research goals and why the work was worth doing:

Changing working life creates pressure to renew work-related competences and to navigate one's own career. Continuous learning and career management skills are increasingly important to all individuals to successfully grow and to update one's skills in today's labor market and to cope with changing working life (Hirschi & Koen, 2021; Nagy et al., 2018). Employees experiencing a career deadlock (i.e., employees who are dissatisfied with their current career situation but feel unable to make career-related changes) may be in a particularly high need of support in advancing their careers. Interventions targeted to reduce subjective career deadlock and to improve one's career situation are suggested (e.g. Stengård et al, 2016; Zacher et al., 2015), yet the research on this area is lacking. The aim of our study was to develop a resource-building intervention aiming to increase employees' self-directness in learning, preparedness for competence development and career management, and to assess whether employees in a career deadlock benefit the most from this intervention.

Theoretical background

The group-coaching intervention is based on theories on social learning (Bandura, 1986), planned behavior (Ajzen, 1991), and cognitive stress inoculation (Meichenbaum, 2007) that emphasize specific self-efficacies and preparation against setbacks as personal resources. We refer to these dimensions together as preparedness. The intervention program was also built utilizing prior preventive group methods that aim at increasing preparedness in educational and employment transitions (Vinokur et al., 1995; Vuori et al., 2002). The components of the group coaching included active learning techniques, supportive learning environment, and skilled trainers.

The topics and exercises of the intervention were designed to promote continuous learning and increase employees' career (self-)management skills (e.g. Bridgstock, 2019; Heslin et al, 2020; Hirschi & Koen, 2021). Examples of specific topics include self-appraisal, career planning, and goal selection, skill development, decision-making in career, and utilizing social networks to promote career advancement and to seek support.

Design/Methodology/Approach/Intervention

The study is conducted as a randomized controlled trial (RCT) in different work organizations from public and private sectors between 2022 and 2023. Participants are employees from different occupational fields who take part in the study voluntarily. As career refinement and questions about working identity are evident especially in mid- and late-career, the study is primarily targeted for employees over 35 years.

Two to four trainers from each organization are trained (4x3h) to conduct the group-coaching intervention in their workplaces. Participants are randomly assigned to the intervention (group-training, 4x3 h) and control groups (written material). All participants are asked to fill out online questionnaires before the treatment (T1) and immediately after (T2).

Results obtained or expected

We are currently collecting T1 data. Immediate follow-up data will be collected and analyzed in Spring of 2023. The results of these immediate effects will be presented in the conference. We expect the intervention to enhance individuals' preparedness for competence development and career management and self-directness in learning. We hypothesize that employees experiencing career deadlock at baseline will benefit most from the intervention.

Limitations

The trial results are currently limited only to immediate effects and thus, it would be beneficial to understand the long-term career and well-being effects of the intervention.

Conclusions – research and or practical implications/Originality/Value

Our study results will increase understanding of the effectiveness of group coaching in supporting employees' motivation and skills for continuous learning and career management. It will also help to understand whether employees in high need of support experiencing career deadlock can be supported in their careers through group-coaching methods. We provide evidence-based knowledge of best practices for supporting employees that can be easily adapted by organizations and practitioners.

Relevance to the Congress Theme

Individuals are expected to plan and proactively proceed in their working careers. Being able to learn continuously and develop occupational skills is not only useful for the future but essential in the current rapidly changing working life. Our work provides tools for employees to adapt and cope in the changing world of work.

Keywords: career management, competence development, subjective career deadlock

Oral presentation OP260

Entering and exiting self employment – how do they relate to health and well-being?

Louise E. Bergman & Claudia Bernhard-Oettel | Section for work and organizational psychology, Department of Psychology, Stockholm University; Susanna Toivanen, School of health, care and social welfare, Mälardalen University

science

Research goals and motivation: Self-employed workers contribute significantly to our society in terms of economic productivity, job opportunity and innovation. Thus, it is in the interest of our society to support and encourage self employment. It is well documented that self-employed workers – on average – experience higher levels of wellbeing, and less mental health problems than employed workers do. However, self-employed workers are a highly heterogeneous group when it comes to who they are, how they work, and their health status. Thus, averages are not sufficient to inform researchers, policymakers and companies on how to understand the mental health and wellbeing of this group of workers.

Workers enter and exit self employment all the time as business opportunities occur, need of an income arises, innovations are created, and businesses fail. However, little is known about the mechanisms behind these career transitions beyond economic factors. Is the decision to start a business related to wellbeing, and how? How many self-employed workers are thriving over time, both when it comes to wellbeing and their business? Who is struggling and experiencing mental health problems, and is this related to exiting self employment? Questions like these currently go unanswered.

Theoretical background: This study is mainly exploratory, but mental health problems, wellbeing and how it develops and how it relates to entering and exiting self employment can be related work environment. The effort-reward imbalance model (ERI) has proven to be a good framework to understand health developments, and is adapted and used in this study as theoretical framework.

Method: Latent transition analysis (LTA) is used to consider both the longitudinal aspect and the heterogeneity of the group of self-employed workers, in a unique and novel way. We investigate what profiles of mental health and wellbeing exist among self-employed workers, how common they are, and how the workers transition between these profiles over time. Further, we study how the profiles and transitions between them relate to entrepreneurial entrance and exit, work environment factors (ERI) and background variables (i.e., age and gender).

We use data from the Swedish Longitudinal Occupational Survey of Health (SLOSH) The current study is based on participants who responded to the 5 th -7 th wave of SLOSH conducted in 2014 (response rate 53%), 2016 (response rate 51%) and 2018 (response rate 48%). In this study, we use respondents who were self-employed at any of the three time points (N=2327).

Results: Results of all statistical analyses will be available when the conference takes place. Preliminary findings of factor analysis show that all scales have adequate fit and factor loadings. Based on previous research we expect to find at least one profile of relatively good mental health and wellbeing, as well as profiles with less advantageous mental health. We also expect that work environment factors are linked to health profiles such that better health is found in workers with less ERI. ERI, a well-documented theoretic model, is used to validate the health and wellbeing profiles. Probably, exist out of or entrance into self employment is related to changes in health and work

environment. Mechanisms, the number of transitions, and the temporal order will be explored in our study.

Limitations: The limitations of this study lie in the exploratory nature of the analysis, and more studies will be needed to further validate any found profiles.

Relevance to congress theme : This study is relevant to the first theme of the congress: Careers and the labour market. Specifically, career transitions and employee mobility. With regard to the UN SDG, our study addresses good health and wellbeing and decent work and economic growth.

Conclusions: Exact conclusions will depend on the findings, but the study is one of the first to focus on health profiles of self-employed workers, and ways in which these workers' mental health and wellbeing changes in relation to ERI and decisions to change employment. The results will yield a better understanding of how self-employed workers thrive or struggle, and how to identify the ones that struggle. This will also help to discuss potential possibilities to create better circumstances or preventive tools to shape decent work and sustainability of careers that involve self employment.

Keywords: self employment, wellbeing, mental health

Oral presentation OP516

Entrepreneurs' creativity in crises: Psychological wellbeing as a protective factor in difficult times

Przemysław Zbierowski, King's College London & University of Economics in Katowice; Ana Ana Pérez Luño, Pablo de Olavide University; Ute Stephan, King's College London

science

Research goal

The crisis such as the Covid-19 pandemic threatens the survival of entrepreneurs' businesses, but some of them also seem to 'thrive'. Why are some entrepreneurs better able to deal with the crisis? This paper explores entrepreneurs' psychological wellbeing (PWB) as an important psychological capability to preserve creativity during the crisis, allowing them to adapt and explore new opportunities.

Theoretical background

There is growing research interest in entrepreneurs' well-being, yet so far, the focus has been on hedonic wellbeing (Stephan, 2018; Wiklund et al., 2019). This is surprising as eudaimonic wellbeing, especially PWB, should be critically important for entrepreneurs by way of facilitating 'entrepreneurial behaviors' such as proactivity and creativity (Hahn et al., 2012; Ryff, 2019).

PWB emphasizes "multiple facets of well-being such as purposeful engagement, realization of personal potential, autonomy, mastery, quality ties to others, and self-acceptance" (Ryff, 2019:647). Evidence indicates that PWB is stable, has trait-like features (Anglim et al., 2020) and enables individuals to cope with adversity (Ryff et al., 2015). It may be a critical psychological capability for entrepreneurs to thrive in crisis by helping them to accept the crisis and potentially reframe it as an opportunity for personal growth and reaffirm the purpose of their work. High PWB is therefore likely to support entrepreneurs' creativity through the sense of agency that autonomy and master entail, while high quality ties with others allow them to mobilize social support to access new ideas and maintain energy and a positive outlook.

We further explore whether PWB may be a critically protective factor for those entrepreneurs who are most negatively affected by adversity. High PWB may enable them to reframe adversity as an opportunity for learning and growth (Franco et al., 2016) and to mobilize support from positive social connections (Ryff, 2017).

Method

We collected data before (January-March) and during the Covid-19 crisis (May-July) in two countries (Poland and Spain) that were differently affected by Covid. In both rounds, the same 158 entrepreneurs completed a questionnaire followed by a 10-day diary study using daily telephone interviews.

We measured PWB using Ryff and Keyes' scale (1995), creativity using an adaptation of Janssen's (2000) scale (as in Weinberger et al., 2018). To assess the severity of the negative impact on the entrepreneur's business we used the index of stringency of government response produced by Covid-19 Government Response Tracker. We employ stepwise regressions and standardized variables to test and plot interactions to test interactive effects of PWB with the negative economic impact of COVID-19 on the entrepreneurs' business. We control for the effect of our dependent variables at "time 0" (pre-Covid) and entrepreneur age, gender, education, firm size, industry sector, pre-

pandemic profit, years of business' ownership, and personal financial situation of the entrepreneur. We then replicate our findings using daily diary study data on a sample of 145 entrepreneurs in 1431 observations using multi-level modeling.

Results

Entrepreneurs creativity decreased during the Covid-19 pandemic compared to pre-Covid levels. Additionally, the more severely the entrepreneurs were affected, the bigger drop in creativity. Controlling for pre-Covid levels of our measures, we find that those entrepreneurs who showed higher levels of PWB before the crisis had higher creativity during the crisis. We also find significant interaction between PWB and severity of the impact: the more severely the entrepreneurs are affected, the bigger role is played by PWB in protecting their creativity.

Implications

Our study newly introduces PWB as an important psychological capability for entrepreneurs to deal with and thrive in crisis. This extends the scarce research on entrepreneurs' PWB and their eudaimonic well-being. We provide novel longitudinal evidence that PWB shapes creativity and helps entrepreneurs to deal with crisis. This consolidates theoretical expectations that PWB is particularly important for entrepreneurs (Ryff, 2019; Stephan, 2018, Wiklund et al., 2019) not just because it leads to higher hedonic wellbeing (Nikolaev et al, 2020; Shir et al., 2019) but also because it supports entrepreneurial creativity. We also complement crisis research in entrepreneurship which typically explores pre-crisis firm capabilities (Dorn et al., 2019) as opposed to personal resources and capabilities. Finally, our findings offer a more nuanced perspective on 'entrepreneurs as masters of adversity' who adapt with creativity to crises. We show both in a between-person and day-to-day diary study using objective measures of adversity that it diminishes entrepreneurs' creativity.

Relevance to the Congress

We explore of the changing world of work of entrepreneurs by highlighting how important their happiness is for their work.

Keywords: entrepreneurial creativity, psychological well-being

Oral presentation OP371

Entrepreneurship and innovation Competencies as predictors of high potential: an exploratory study with middle managers in Spain

Antonio García- Izquierdo, University of Oviedo

science&practice

In this work, a proposal of talent as a pool of predictors of high potential (HP), is revised. Talent management in organizations is a complex constellation of skills, motivational aspects, and interests, that interact to achieve excellence. It seems to involve the joint action of variables including intelligence, creativity, personality traits or dimensions of emotional intelligence, such as passion and perseverance. Drawing on Bartram (2008) and Dries & Pepermans (2012) talent model, we carried out this research.

In a sample of 806 middle managers of a multinational service company, it is verified if the competencies used as predictors: (i) can be grouped into the cognitive and socio-emotional categories, (ii) if the first category has a better predictive capacity for high potential of talent (HP), and (iii) if there are differences between men and women. Based on the data collected on the competencies and the final decision on the HP in the annual performance evaluation, factor analyzes were first carried out and then logistic hierarchical regression analyses.

The results showed that the competencies were grouped into the previously two categories proposed, in the way that: cognitive -initiative, appetite for learning and thinking beyond boundaries-; and sociemotional -commitment, cooperation, maturity and understanding of others- and that the first category was the most important to predict HP with an overall accuracy of classification of 75.3%. In addition, differences were found when segregating the results by sex for the self-cognitive skills: initiative, appetite for learning, and thinking beyond boundaries. Finally, the implications of these results are discussed when designing talent management actions and in organizations.

Keywords: Competencies, talent, managers

Oral presentation OP543

E-recruitment: the effects of the emotions on organizational attractiveness change and intention to apply

Marco Giovanni Mariani, Gerardo Petruzziello & Rita Chiesa | Department of Psychology "Renzo Canestrari", University of Bologna, Italy

science&practice

Research Goals:

Nowadays, corporate websites are one of the most used and sustainable sources of recruitment, and there is growing interest in the characteristics of the website that can change organizational attractiveness. Since the early 2000s, some evidence has encouraged the investigation of the relationship between website content and design and organizational attractiveness (Brady & Phillips, 2003).

The study intends to clarify the role of the emotions felt by applicants during a corporate website exploration with respect to organizational attractiveness and their intention to apply. Finally, we want to study whether the model is stable or not concerning different corporate reputation levels.

Background:

We study the emotions of job seekers after having visited a corporate website. We based our hypotheses on stimulus-organism-response Model (Mehrabian & Russell, 1974) that suggests that environmental stimuli lead to an emotional reaction that evokes behavioral responses; the model has been adopted in many fields and, in the last years, to explain the consumer decision-making process in online shopping (e.g. Kim & Lennon, 2013) but it is new in recruitment field.

The mediation variable, between emotions and intention to apply, is the organizational attractiveness that has been adopted in many models about online recruitment (i.e. Gregory, Meade and Thompson, 2013). Although this, few empirical studies have analyzed the malleability and the change of employer perceptions during recruiting processes (Kanar, Collins & Bell, 2010; Kanar, Collins & Bell, 2015). So we therefore want to contribute to the literature on recruitment by studying how company websites can change organizational attractiveness for a job seeker.

Finally given that a firm’s reputation has been demonstrated to affect job pursuit intention (i.e. Behrend, Baker & Thompson, 2009; Kanar et al., 2015), we will analyze all that at high and low levels of perceived reputation.

Methodology:

Participants (N = 422; F=59%; average age = 23.3) were postgraduate students who attended a university in Northern Italy. The procedure comprised three steps. First, the participants completed a questionnaire on a company's organizational reputation and organizational attractiveness. Second, they were invited to visit the website of the organization, thinking and behaving as if they were job seekers. Third, at the end of the exploration, they completed a second questionnaire on the positive emotions (joy, contentment, and happiness), organizational attractiveness, and Intention to apply on the sole basis of what they had seen on the company's website. The index of organizational attractiveness change was defined as the difference between the two measures of the same construct. The psychometric qualities of the measures were good. The recommended procedure for

moderated mediation model, as tested by IBM SPSS package PROCESS macro, was adopted for the data analysis.

Results:

The results indicated that emotions were positively related to the intention to apply via the change of organizational attractiveness, the change that occurred after the website exploration. The moderator effect of reputation was confirmed too: when the reputation was low, the indirect effect was higher, so, in these cases, the role of emotions was more relevant.

Limitations:

The main limitation concerns the generalizability of the results. Indeed, all the companies taken into consideration had at least fairly structured websites and the sample was of only young job seekers. Moreover, the emotions were measured not during the website exploration but immediately afterward and this could have impacted on the validity of the measure.

Conclusion:

The study presents significant implications for the strategy of recruitment communication in corporate websites, suggesting the importance of giving positive emotions, especially for a company with a low level of reputation. The contribution of this study is triple. First, the research offers new insights into the analysis of changing organizational attractiveness. Second, it suggests the role of emotions in the intention to apply and third underline the relevance of considering the different level employer reputation for understanding job seekers strategies.

Relevant UN SDGs:

Decent work and economic growth; Reduced inequalities

Keywords: E-recruitment, emotions, organizational reputation

Oral presentation OP782

Ethical challenges for employees in a time of pandemics and advances in artificial intelligence; or "is our psychology relevant any more"?

Richard Kwiatkowski, Andrew Angus & Emel Aktas | School of Management Cranfield University

science&practice

Research goals and why the work was worth doing

Our work is at an unusual intersection of professional psychology and professional business ethics. We partnered in an international survey examining ethical and unethical behaviour in industry. We make longitudinal comparisons of ethical behaviour with a focus on the ethical implications of Covid-19 and the growing role of Artificial Intelligence in the work environment and in social lives.

There has been much consideration of the impact of the pandemic by the social sciences, this has focused on changing patterns of work, health and particularly mental health. In particular we consider the 'moral hazard' raised in decision-making during the pandemic. Separately we examine 'rights' impacted by the increasing use of artificial intelligence. Industrial responses are examined, the experience of "workers" foregrounded, and the real-world challenges to academic and practitioner colleagues that arise as a consequence discussed.

This work uniquely represents the "user voice". It means that we, who seek to understand the world of work, can openly and honestly consider our response to these contentious ethical domains.

Theoretical background

Psychology as a profession has been argued to be fundamentally ethical and values-based (Kwiatkowski & Duncan, 2006; Lefkowitz, 2014). However, psychologists wear "multiple hats" (Sternberg, 2008) and so ethical questions inevitably arise. If we are not simply to be "Servants of Power" (Baritz, 1960), automatically dancing to our paymasters' tune we must fully understand the ethical landscape that impacts our science and practice.

There are many ethical pressures and dilemmas faced by working people who do not have the privilege associated with psychologist or academic status, and who have to daily engage with issues of ethics, misconduct, compromise, compliance, whistleblowing, dishonesty, and drags on development.

Two important and contentious sets of experiences, concerning the pandemic and the rise of artificial intelligence need to be kept in sight and examined. The ethical aspects of the changes brought about by these recent phenomena and the impact on work psychology, including changes to come, are particularly significant.

Design/Methodology/Approach/Intervention

The field work was carried out by professional market research organisation calling on a stratified sample of 9834 working adults (18+) from 13 countries. The survey has 125 questions including questions on age, gender, sector employed, company size, and managerial responsibilities. Main areas of investigation are 1) "the acceptability of" a range of unethical behaviours; 2) how prevalent "honesty" is in the organisation's daily operations; 3) a range of misconducts the participant is aware of; 4) reasons why employees will not speak up; and 5) managerial attitudes toward ethical behaviour in the workplace.

Results obtained or expected

We will present a variety of temporal (2015, 2018, and 2021) and geographical (13 countries in 2021) comparisons; for instance concerning the prevalence of ethical and unethical behaviours, focusing on change over time, and considering attitudes to the impact of the pandemic and the adoption of artificial intelligence in the workplace. However, our main focus (as well as utilising the data itself) will be to draw out the importance of these considerations for the field of psychology.

Limitations

The usual considerations of snapshot survey / testing design apply; however, the survey is well-designed and robust, and this dataset has a longitudinal component; further our purpose is actually to challenge psychological thinking using this analysis as a key stimulus.

Research/Practical Implications

Our paper will bring both academic and practitioner psychologists face-to-face with real ethical dilemmas experienced by working people. It will therefore challenge both theory and practice and will question some core principles of work and organisational psychology; if we are not involved in a fundamentally ethical endeavour then our work is a chimera.

Originality/Value

EAWOP was a signatory (2016) and key member of the “alliance for organisational psychology memorandum of understanding and fostering ethical relevant and rigorous research” which we support. We suggest that ethically relevant and rigorous practice are both critically important. Given the critique of “novelty” in that memorandum we hesitate to use that term; however, we are not aware that exactly this sort of material has previously been presented.

Intended audience

Both academics and practitioners. Specifically, the interactions between the adoption of artificial intelligence in the workplace as well as the status of being a “key worker” or not during the pandemic with the instances of unethical behaviour observed or showed in the workplace will doubtless attract commentary on the reasons behind our results.

Oral presentation OP616

Ethical dilemmas and well-being in teachers' work: A three-way, two-year longitudinal study

Taru Feldt, University of Jyväskylä; Saija Mauno , University of Jyväskylä & University of Tampere; Mari Herttalampi & Mikko Heikkilä | University of Jyväskylä

science

Research background: The aim of the present three-way two-year longitudinal study was two-fold: First, to explore what kinds of latent longitudinal ethical dilemma subgroups can be identified among Finnish teachers, and second, to examine how these subgroups differ from each other with respect to occupational well-being (burnout, work engagement) and recovery from job strain (psychological detachment).

Theoretical background: We investigated two kinds of ethical dilemmas: acute and rationalization dilemmas. Acute dilemmas refer to situation in which a person does not know which would be the right or wrong action to take. Hence, in facing acute dilemma, teachers perceive the situation to be without any obvious solution to the challenging dilemma. Rationalization dilemmas are situations in which an individual knows the right action to take but cannot or does not act upon this. Rationalization dilemmas are those in which teachers need to recognize that fundamental values are violated to make the dilemma visible to themselves. To investigate the associations between teachers' ethical dilemma subgroups and occupational well-being (burnout, work engagement) and recovery (psychological detachment) we used the stressor-detachment model, which comprises 1) job stressors, 2) strain reactions and well-being, and 3) psychological detachment from work (Sonnentag & Fritz, 2015). According to this model, we assumed that ethical dilemmas are job stressors that cause job stress. We assume that these reactions constitute a risk for teachers' burnout and work disengagement. A third component of the stressor-detachment model is psychological detachment, which is an important part of recovery from job strain. We assume that prolonged ethical dilemmas may impair teachers' psychological detachment from work-related issues in non-work time.

Design: Altogether 310 Finnish teachers participated to the three-way two-year longitudinal study. An electronic survey included scales of acute and rationalization dilemmas, burnout, work engagement, and psychological detachment at each measurement time.

Results: Using Latent Profile Analysis, three longitudinal ethical dilemma subgroups of teachers were identified: frequent dilemmas (22%), occasional dilemmas (51%), and rare dilemmas (27%). Teachers in the frequent dilemma subgroup experienced acute dilemmas almost daily and rationalization dilemmas weekly. This subgroup was overrepresented by special education teachers and teachers working in kindergartens and comprehensive schools. Teachers in the frequent dilemma subgroup had the highest levels of burnout, although it decreased slightly over time. Teachers in the occasional dilemma subgroup experienced acute and rationalization dilemmas on average monthly. Upper secondary school teachers were overrepresented in this group. Teachers facing dilemmas occasionally reported moderate levels of burnout and psychological detachment. In the rare dilemma subgroup teachers experienced acute and rationalization dilemmas approximately yearly. Senior teachers, subject teachers, and student counselors were overrepresented in this subgroup. Teachers' who reported dilemmas rarely, scored lowest in burnout, highest in work engagement, and moderately in psychological detachment.

Limitations: Our longitudinal study was conducted using self-report questionnaires, which may have affected the validity of the study because of common method variance. Furthermore, we cannot

verify causality between the ethical dilemmas and occupational well-being, which is a shortcoming in our study.

Conclusions: To summarize, ethical dilemmas showed significant associations with teachers' occupational well-being and recovery. Allowing time and possibilities for reflections and dialogue would help teachers to recognize and deal with ethical dilemmas better in their daily work. This would lessen teachers' long-term ethical dilemma frequency and overall strain reactions related to ethical dilemmas.

Relevance to the Congress Theme: Teachers face many kinds of ethical dilemmas in their daily work at school. Major changes in the environment, such as a pandemic and the increasing number of refugee children, cause ethically challenging situations that teachers must deal with. This study shows that ethical dilemmas are linked to teachers' well-being and that teachers need support in dealing with these dilemmas.

Relevant UN SDGs: The goal of the study is to promote teachers' good health and well-being.

Keywords: ethical dilemma, teacher well-being, recovery

Oral presentation OP496

Ethical infrastructure, leaders' attitudes, and discrimination of ageing workers – a time series study

Reidar J. Mykletun, University of Stavanger Business School

science&practice

Research goals and why the work was worth doing

This study presents relationships between an organisations' ethical infrastructure, leaders' attitudes, and indicators of ageism and discrimination against ageing workers. Age discrimination prevails (Wilsona, Errasti-Ibarrondod, Low, 2019; Voss, Bodner, Rothermund, 2018) in concert with leaders' mixed attitudes towards older workers (Andersen, 2021; Blomé, Borell, Håkansson, Nilsson, 2020; Leisink & Knies, 2011; Nilsson, 2016). Few studies have addressed these relationships, although „age-friendly" ethical infrastructures might be expected to hinder age discrimination in organisations.

Theoretical background

Ethical infrastructure in organisations are decisions and behaviour contributing to ethical effectiveness (Tenbrunsel, Smith-Crowe, & Umphress, 2003). Ethical effectiveness is principles and practices that do not hurt others, are legal, are seen as legitimate, and are supported as morally acceptable (Jones, 1991), here, absence of age discrimination. Ethical infrastructure may exist both as formal, written regulations and informal systems (e.g., climate, social norms), and the latter influences organisation members' behaviour in absence of the former (Tenbrunsel et al., 2003). Within this ethical infrastructures, a leader will still have some decision latitudes where the leader's attitudes may influence decisions and behaviour related to ageing workers (Furunes, Mykletun, & Solem, 2011; Wilckens, Wöhrmann, Deller, & Wang 2020).

Method

Data were collected by five time series questionnaire studies. IPSOS Norway sampled 750 leaders in public and private sector organisations in each of the years 2004, 2009, 2012, 2016, and 2019. Six questions probed for age discrimination. Two of these related to recruitment: leader willingness to employ older workers, and practice of inviting older workers to interview for vacant jobs. Two questions focused older workers' competence development: inclusion of older workers when new technologies and methods were introduced, and considering older workers for internal recruitments. Two questions focused on protecting older workers when down-sizing, and in particular protecting older workers who were not eligible for age pension. Formal ethical infrastructures were assessed by asking for documents urging older workers career extension by HR-strategies, economic incentives, adapting work to older workers' capacities if needed, and competence development programmes for older workers. Informal ethical infrastructures were assessed by asking for the perceived contribution of older workers to the organisation, and whether workforce aged 50 years and above had the same access to learning new skills and get access to new tasks. Attitudes towards ageing were assessed by asking for at which age they conceived a co-worker to be an older worker, whether workforce aged 50 years or above performed as well as their younger colleagues, whether workforce aged 60 years performed as well as those aged 55 - 60 years, and whether it was appropriate for the organisation to disregard a job applicant because of a mismatch between his/her age and the profile of the organisation. Data were analysed by frequencies, correlations, and multiple regression in SPSS 28.0.

Results

Indications of age discriminations were rather stable from 2004 to 2019. Age discrimination in recruitment was related foremost to informal ethical infrastructure and secondly, to the leader's own attitudes and private as opposed to public sector organisation. The formal ethical infrastructure was related to age discrimination in recruitment in the 2009 and 2012 data. Age discrimination in competence development was related foremost to informal ethical infrastructures and employment in private sector and secondly, to the leader's attitude and to formal ethical infrastructures. Age discrimination if downsizing was foremost related to informal ethical structures, secondly to the leader's attitudes, formal ethical infrastructures in 2009 and 2012, and private sector in 2004 and 2012.

Limitations

The results lean on self-reports and are thus subject to social desirability biases.

Conclusions

Established formal ethical infrastructures against age discrimination were negatively related to occurrence of age discrimination. The informal ethical infrastructures were more closely related to such discrimination. This indicates that interventions aimed at establishing „age-friendly" informal ethical infrastructures might be attempted to reduce or hinder age discrimination in organisations. Likewise, establishing "age-friendly" formal ethical infrastructure and modifying attitudes of the leaders' may contribute towards this goal.

Relevance to the Congress Theme

The paper reveals unfair and discriminating attitudes and behaviour in organisations (contribution) and indicates how they might be incompatible with „age-friendly" ethical infrastructures and leader attitudes (urgency and delivery).

Keywords: Age discrimination, Leadership, Ethical infrastructure.

Oral presentation OP323

Evaluating how employees and employers succeed in a facilitated job crafting intervention for Return To Work (RTW) after burn-out

Eva Geluk, Antwerp Management School

science&practice

Research goals and why the work was worth doing

Research on RTW after burn-out is highly relevant as burn-out and its adverse effects on the health and wellbeing of the workforce, are associated with high rates of sick leave and replacement costs (Pijpker, Vaandrager, Veen, Koelen, 2019). In contrast with the abundance of research on the causes and consequences of burn-out, there is a lack of research on RTW after burn-out and little is known on the barriers and facilitators of a successful RTW (Karkkainen, Saaranen, Hiltunen, Ryynanen, Rasanen, 2017). Furthermore, relapse after RTW affects circa 25% of cases (Geluk, Lenstra, Stuer, 2000; Koopmans et al., 2011; Norder et al., 2015). This raises questions on how RTW interventions are taking place and what determines their effectiveness (Rooman et al., 2021). Our research reports the findings of an intervention study designed to facilitate RTW after burn-out. The intervention consists of a neutral facilitator facilitating a dialogue between employee and supervisor during RTW. The facilitation is supported by a toolbox consisting of job crafting cards and a digital scan as well as a designed step-by-step process from the beginning of sick leave until 9 months after RTW. The research goal is to evaluate how both employees and employers succeed in a sustainable RTW, thereby contributing to the current gap in knowledge on the effectiveness of RTW interventions.

Theoretical background

A theory-of-change based upon several theoretical constructs is proposed. Increasing job resources as main enabler (van den Heuvel, Demerouti, Peeters, 2015) with Job Demands Resources (Demerouti, Bakker, Nachreiner, Schaufeli, 2001) and Job Crafting (Tims, Bakker, Derks, 2013) as underlying theoretical constructs. Second, feeling safe in the RTW as enabler for engaging in dialogue (Edmondson, 1999), whilst a good working relationship with the manager is conducive to job crafting and increases psychological safety (leader-member-exchange (LMX) theory). (Graen; Uhl-Bien, 1995)

Design/Methodology/Approach/Intervention

A within-case study method is chosen for the impact evaluation of the intervention, with the aim of gaining better understanding of the causal claims based on a mechanistic view of causality. (Wauters & Beach, 2018) We chose process tracing as it allows for evaluating how, in this case a theory-of-change based, intervention actually works. The theorized process is seen as an unbroken chain of action and reaction (activities) enacted by entities (actors). It combines a potential cause with its hypothesized outcome(Beach & Pedersen, 2019). The evaluation will test how certain theoretical assumptions are linked in RTW and will contribute to better understanding of what sustainable RTW could be taking a stakeholder perspective.

Results obtained or expected (if not available, it must be made clear when they will be)

Limitations

Given the complexity of RTW after burn-out, heterogeneity issues might complicate the interpretation of results. Whilst conducting a within-case study gives in depth knowledge on the

conditional context it will not allow for generalization other than conceptual and possible theoretical generalization which might provide greater insight in how concepts are linked.

Conclusions – research and or practical implications/Originality/Value

The research seeks to understand the role that job crafting plays in sustainable RTW after burn-out. It thereby contributes to JDR and job crafting literature by providing insights on a new application of job crafting namely supervisor and employee co-crafting the best job fit for a sustainable RTW. It further builds upon the RTW literature, contributing to defining dimensions and their operationalization of sustainable RTW examining how job crafting can lead to sustainable RTW without relapse. Thirdly it seeks to contribute on an interventionist level in RTW contributing to understanding how stakeholder oriented influence sustainable RTW. This is particularly relevant for practice as managing long term sick leave and relapse within teams has implications for team functioning and supervisor performance. Implications of the outcomes of this research are directed towards enabling organizations and supervisors to gain insights on interventions that can contribute to effective RTW after burn-out.

Relevance to the Congress Theme

This submissions fits in the subpart The future is now! Urgency . Stress related sick leave is on the rise in Europe with crises like Covid 19 leading to a further increase. Interventions including the context of work in RTW are rare but highly needed which is why the evaluation of an intervention that includes the work context is particularly valuable.

Keywords: Burnout, re-integration, jobcraftingintervention

Oral presentation OP587

Evaluation of the effects of an intervention directed to improve employee well-being in an organizational change context in Uruguay

Lorena Funcasta, Faculty of Psychology-Unversity of the Republic (Uruguay); Cristian Vásquez, Sheffield University Management School

science&practice

Research goals and why the work was worth doing

The intervention was implemented in a change process in a Uruguayan organization. In this context, the objective of this intervention was to improve the work climate and employee well-being by developing interpersonal relationships between employees and job characteristics.

Theoretical background

Literature in organizational change shows that such processes may generate different levels of uncertainty that negatively impact employee well-being (Bordia et al., 2004). Stress models suggest that employee well-being is determined by the balance between job demands and resources (Demerouti et al., 2001). Organizational change processes can be understood as a source of demands for employees. With the objective of decreasing workers' job demands and/or increasing their job resources, and to promote their sense of well-being, organizations can implement several interventions (Silvaggi & Miraglia, 2017). These interventions may take the form of group workshops, individual coaching sessions, or training activities. In this study we implemented a series of group activities directed to improve employee interpersonal relationships and job characteristics.

Design/Methodology/Approach/Intervention

The intervention was implemented in a small, 78 employees, organization in Uruguay. A quasi-experimental pre-posttest design was carried out. Employees voluntarily participate in the workshops (i.e., participants in intervention (n=36) and not participants (n= 42)). Data was collected during a year, including a baseline measure (T0), immediately after workshops (eight and ten months), and one follow-up (three after implementation). Measures included job demands (e.g., emotional demands, job insecurity), job resources (e.g., autonomy, peer support), and general health perception with scales of CoPsoQ Spanish version (Moncada et al., 2005), procedural organizational justice (Niehoff & Moorman, 1993), and counterproductive work behaviors (Fox et al., 2001). To explore pre-post differences, ANOVA tests were used, and to explore the role of contextual factors, moderation analyses were implemented.

Results obtained or expected (if not available, it must be made clear when they will be)

Results show that employees reported higher levels of global health, t (32) -2.143, p=0.40, and lower levels of job insecurity, t (22) 2.142, p=0.43, after the intervention. In terms of the intervention context, results show higher levels of job demands for employees who participated in the workshops versus those who did not participate, F (2,713) -2.577, p = 0.012. This finding shows that those employees who participated in the intervention were those who needed the most. Furthermore, the negative relationship between job demands (pre-intervention) and global employee health (post-intervention) was stronger for employees who perceive low levels of social support from managers and colleagues (B= 4.113; SE= 0.108; p < .001). Similarly, the negative relationship between counterproductive work behaviors and global employee health (post-intervention) was stronger for employees who reported higher procedural organizational justice (B= 3.982; SE= 0.129; p < .001).

Taken together, these findings suggest that social support and organizational justice can be important contextual factors to consider when evaluating the effects of a well-being intervention.

Limitations

This study is not exempt from limitations, such as being implemented in one Latin American SME, having a low sample size and using self-report measures of employee demands, resources and outcomes. In addition, there could have been changes in the organization and its context that could have affected the intervention process.

Conclusions – research and or practical implications/Originality/Value

Overall, the findings suggest that the intervention successfully improved global employee health and diminished job insecurity associated with the organizational change process. Moderation analysis results show that social support and organizational justice can be important context variables in terms of resources that also contribute to understanding global employee health improvements.

Relevance to the Congress Theme

Organizational changes are increasingly present in the current changing world of work. Therefore, it is essential to understand how well-being interventions can be helpful in protecting employee well-being during these processes.

Relevant UN SDGs

This work is relevant for at least two objectives: Good health and wellbeing and Decent work and economic growth.

Keywords: organizational interventions, wellbeing

Oral presentation OP678

Event-level Profiles of Morning Affect and Resources and Their Impact on Flow and Task Performance: The Roles of Task Relevance and Trait Autonomy

Stefan Diestel, Patrik Fröhlich & Elvira Radaca | Bergische Universität Wuppertal; Wladislaw Rivkin, Trinity College Dublin

science

Research goals and why the work was worth doing: We aim to explore latent profiles of self-control resources and positive and negative affect (PA, NA) at the morning to understand how these profiles shape flow experiences at work and predict task performance. We also examine moderating effects of task relevance and trait autonomy (the extent to which individuals strive for congruency of their personal values, interests, and goals) on the positive within-person relationship between flow and task performance. Our study seeks to provide in-depth insights into how and when patterns of morning levels of PA, NA, and self-control resources cause employees to engage in engrossing and enjoyable states of mind, thereby facilitating task performance. In doing so, we analyze boundary conditions that stabilize task performance, even when flow experiences are low after experiencing non-optimal morning events.

Theoretical background: We delineate a moderated mediation model that predicts indirect effects of morning patterns of PA, NA, and self-control resources on task performance via flow experiences. Our model is based on the proposition that resource levels and affect jointly influence work-related experiences and hence goal-focused behavioral regulation during task completion. This proposition derives from the broaden-and-build theory (Fredrickson, 1998) and resources-based theories (Kotabe & Hofmann, 2015). We also predict moderating effects of task relevance and trait autonomy on the within-person relationship between flow and task performance. In doing so, we extend both views and integrate insights from self-determination theory (Ryan & Deci, 2000) which proposes that autonomy and meaningfulness jointly provide a strong motivational base for goal-directed self-regulation.

Design: To test our predictions, we conducted a daily diary study and recruited participants from a wide range of occupational settings. In sum, 157 participants (Mean Age = 33.28; Percentage of Women: 61.8) provided data on 1027 days. PA, NA (Watson et al., 1988), and self-control resources (Johnson et al., 2014) were assessed at the morning, whereas daily flow experiences (Rivkin et al., 2018) and task performance (Yang et al., 2016) were measured at the afternoon and evening, respectively. Task relevance (Poethke et al, 2018) and trait autonomy (Weinstein et al., 2012) were included in the pre-survey.

Results: We conducted multilevel latent profile analyses (Mplus 8, Muthén & Muthén, 2017) and identified five profiles that predominantly differ in the negative affect levels and self-control resources. These profiles (dummy coding procedure) were specified to predict daily flow experiences in a multilevel moderated mediation model that was analyzed on the basis of Bayes estimation. The results show that profiles with lower PA, higher NA, and lower resources (as compared with an optimal morning profile) were negatively and indirectly related to daily task performance via flow experiences. We also found that task relevance and trait autonomy jointly attenuated the positive relationship between flow and task performance such that performance was constantly high when both were higher (irrespective of levels of flow experiences).

Limitations: Correlational designs do not allow causal conclusions in a strict sense.

Conclusions: We first investigate how configurations of resources and affect at the morning shape daily motivational and performance processes at work, and identified how personal and job-related contingencies mutually amplify each other in stabilizing employees' effectiveness even when a day does not start optimally. Thus, our research extends resource-based theories by showing how both affects and resource levels characterize morning event and jointly shape employees' daily functioning. Moreover, the three-way interaction between task relevance, trait autonomy and daily flow experiences emphasizes mechanisms of self-determination that stabilize and facilitate employees' effectiveness, when perceived meaningfulness of the job aligns with autonomous functioning.

Relevance to the Congress Theme: Our study aligns with the two congress themes: Contribution (in-depth understanding of how employees benefit from optimal affect-resource patterns and how job characteristics (task relevance) and trait autonomy jointly stabilize employees' functioning); Delivery (future avenues: strong scope on both employees' affect and resources and facilitating employees' autonomous functioning and experiences of meaningfulness at work).

Relevant UN SDGs: We address the following Goals: Good Health and Well-being (morning profiles and flow experiences as important psychological processes for health and well-being); Decent Work and Economic Growth (Task relevance as a job characteristic (decent work) and task performance as a growth-related outcome).

Keywords: Event-level profiles of affect and resources, Flow experiences, Task performance

Oral presentation OP755

Examining Informal Learning during crises: the case of UK healthcare practitioners

Margarita Nyfoudi, University of Birmingham

science

The project investigates how informal learning materialises through interpersonal interactions under extreme adversity and crisis. Our research objectives are to:

examine how healthcare professionals learn through interpersonal interactions during intra- and extra-organisational turbulence,

explore the interpersonal interactions through which healthcare professionals seem to learn the most (e.g., peer-to-peer, manager-to-employee, manager-to-team) during a crisis, and

identify the individual, contextual, and organisational factors that influence the degree to which healthcare professionals learn through interpersonal interactions in the midst of adversity.

The work has been worth doing because it advances our theoretical understanding of informal learning in a volatile, uncertain, complex, and ambiguous (VUCA) world and because it has clear practical implications for healthcare professionals and organisations.

Theoretical background

Informal learning is learning "predominantly unstructured experiential, and noninstitutional" and takes place while individuals are conducting their jobs (Marsick & Volpe, 1999 p. 4). It is achieved through a plethora of different behaviours, including self-reflection, experimentation with new work processes, interaction with others, and innovation (Noe, Tews, Marand, 2013; Bednall, Sanders, Runhaar, 2014), and is predominantly based on the individual learner's volition (Tews, Michel, Noe, 2016). In other words, the learner has "the intent to learn or improve" and thus, the learning experience, while informal and unstructured, is not incidental or unintentional (Tannenbaum et al., 2010, p.306). Reference to the concept of informal on-the-job learning can be found through the seminal works of Lindeman (1926), Dewey (1938), and Knowles (1970) on adult learning and andragogy. However, it was not until 1990 when Marsick and Watkins coined and popularized the term informal learning' that research on the phenomenon has begun to flourish.

Despite a plethora of studies on antecedents and consequences of informal learning (see Cerasoli et al., 2017; Colognesi et al., 2020), we still know little about how individuals learn informally in the midst of adversity and turbulence (Watkins & Marsick, 2021). Recent research heeds that interpersonal employee interactions amidst unprecedented volatility are pivotal in triggering informal learning which in turn may redress employee withdrawal reactions (Nyfoudi et al., 2020) and lead to breakthroughs (Biron et al., 2021).

Against this backdrop, the study draws from Noe, Tews, and McConnell Dachner's (2010) theory of learner engagement to explore how interpersonal exchanges influence learner motivation during turbulence and any subsequent pathways to informal learning.

Design/Methodology

The study has adopted an inductive research design with semi-structured interviews as the way of data collection.

Our sample consists of medical doctors, nurses, and professional staff members who are involved in clinical research programmes. The rationale is that this segment of healthcare staff not only has faced significant adversity over the past two years but also has to deal for the foreseeable future with an unprecedented backlog of multiple competing priorities in terms of restarting clinical trials outside the remit of Covid-19 (NIHR, 2020). In other words, the sample is instrumental in examining how healthcare professionals, who are facing adversity, learn through interpersonal interactions at work.

Results obtained or expected (if not available, it must be made clear when they will be)

We are currently analysing the data already collected (i.e. 20 interviews) using thematic analysis, as per Gioia et al.'s (2013) methodology. We envisage that by January 2023, we will have completed our data collection (40 interviews in total) and by April 2023 we will have finalised our data analysis and findings.

Limitations

Albeit we have been careful to recruit diverse members of clinical teams (e.g., consultants, registrars, nurses, co-ordinations), our data may be less informative for healthcare professionals not part of clinical teams.

Conclusions

Our research advances not only our theoretical understanding of informal learning but will have clear practical implications for healthcare organisations

Relevance to the Congress Theme

The study is in line with the three facets of the Congress Theme: a) Contribution: It helps uncover how healthcare practitioners learn informally, a key competence for the future of medical professionals; b) Urgency: it focuses on informal learning during crises, an unexplored but highly topical area, and c) Delivery: learning is change. By examining how healthcare professionals learn, the study offers more informed recommendations for the changing world of work.

Keywords: informal learning; crisis; healthcare

Oral presentation OP215

Examining the Effects of Islamic Work Ethic values Effect on Quality of Working Life Perception Among UK Employees

Zeynep Mercan, Yuksel Ekinci, Zarah Vernham & Darren Van Laar |University of Portsmouth

science&practice

Most of the literature on industrial/occupational psychology is conceptualised and published by Western researchers using Western participants. While it is commonplace that this body of research is adapted to non-Western contexts, it is rare for non-western research to be adapted and applied to Western settings. To address this gap in the literature, the present research project aimed to investigate the effects of the Islamic Work Ethic rules on the work-related wellbeing and measures of quality of working life (QoWL) of British employees.

Theoretical background

The most used work ethic surveys in the world are based on the Protestant Work Ethic values (PWE), which are said to be derived from ways in which workers can assuage their primordial or non-contingent guilt. However, relatively little is known about the equivalent Islamic Work Ethic, which is based on the concept that work provides a means for Islamic employees to achieve self-actualisation and equilibrium between the pressures of work and home life, especially outside the Muslim work environment.

Methodology

This study's data analysis was based on correlational statistical methods. The data were collected using the General wellbeing sub-scale from the Work-Related Quality of Life scale, an Islamic Work Ethic scale, and a four-question COVID-19 scale. The participants (N=481) were all UK based employees and were grouped into religious (participants with a religious belief; n=237) and non-religious (participants with no religious beliefs; n=244). Structural equation modelling techniques were conducted to model the effect of religiousness and Islamic Work Ethic on work-related wellbeing.

Results

The results showed an acceptable fit for this research project ($\chi 2$ (678) =1210.5***; TLI = 0.92; CFI = 0.93; RMSEA = .04; SRMR = 0.05). Islamic Work Ethic values were found to be valid predictors of UK employees' job characteristics regardless of their belief system. When divided into religious and non-religious groups, the results showed that the model accounted for more of the religious participants' general wellbeing (68%), than that of the non-religious participants (49% of the variance in well-being being for). The short COVID-19 scale did not significantly influence religious workers' perception of stress; however, COVID-19 increased the stress at work for the non-religious participants. Overall, religious participants reported having higher levels of work-related wellbeing compared to non-religious participants.

Limitations

As these results are based on self-reported surveys, it is acknowledged that this could cause problems such as common method bias. To overcome such potential problems, the researcher employed statistical suggestions by Podsakoff et al. (2003).

Implications

The most important implication of this study is the recognition of the influence of religiosity, and especially of Islamic Work Ethic values, on British workers' perception of their wellbeing and QoWL. It is hoped that this finding may help harness the impact of religious values to positively influence all workers' wellbeing. The practitioner literature is saturated with Western-based research, indicating that little is known about how to employ non-Western concepts such as Islamic Work Ethic, this research is the first step that address this gap. However, the results of the present study provide empirical evidence that such an understanding may improve the work-related wellbeing and QoWL of all employees. As globalisation continues to connect people and cultures around the world, this type of research could also help Western countries provide adequate support to their non-Western employees by recognising the cultural similarities (and differences) between ethnically and culturally diverse employee groups.

Originality

For the first time, the present research provides evidence that non-Western-based research constructs such as the Islamic Work Ethic can be applied to Western employment contexts. It also demonstrates that there is an association between Islamic Work Ethic values, wellbeing and the QoWL perceptions of workers.

Keywords: Well-being, stress and burnout, Work-life balance

Oral presentation OP169

Examining variables of the job context as predictors of nurses' demand appraisals

Martha Fernandez de Henestrosa, Georges Steffgen & Philipp Sischka | University of Luxembourg

science

Research goals: The present study examined whether (a) time-related factors of the job context, namely working time and job tenure, predict nurses' challenge/hindrance appraisals alongside job demands themselves, and whether (b) both factors might act as boundary conditions of nurses' workplace stressor appraisals.

Theoretical background: Based on the transactional theory of stress (Lazarus & Folkman, 1984), studies have so far examined employees' subjective evaluations of workplace stressors as challenging and/or hindering and their associations to different well-being outcomes (e.g., Webster et al., 2011). Although these studies have helped us to get a more nuanced insight into work-related demands and how they may affect employees, little is known on the question of whether the job context itself might shape how employees experience certain workplace stressors (LePine, 2022). Yet, knowing whether contextual factors of the job might impact employees' stress appraisal may help us to handle the negative effects of such job stressors (LePine, 2022). Thus, the current study aimed to investigate the role specific contextual variables of the job play as regards to nurses' subjective appraisals of job demands as challenges and/or hindrances.

Design/Methodology/Approach/Intervention: The current study was conducted as part of a broad scientific project on nurses' working conditions in Luxemburg. Cross-sectional data was collected via an online survey (French/German). The effective sample consisted of 460 nurses (76.9 % female, $n = 352$; $M_{age} = 39.40$, $SD_{age} = 9.95$). Statistical analyses were performed using IBM SPSS (version 25) and the PROCESS macro for SPSS (Hayes, 2018). To examine the associations between job demands, contextual variables and appraisals, a total of four simple moderation analyses (Model#2; Hayes, 2018) were conducted with challenge and hindrance appraisal as the criterion variables. Per criterion variable we performed two moderation analyses (i.e., one including time pressure as predictor, one including emotional demands as predictor). Working time and job tenure were specified as the moderator variables and were jointly introduced into the regression models. Predictor and moderator variables were mean centered prior analysis.

Results: Regression analyses showed that time pressure and emotional demands significantly related to their challenge (for time pressure: $b = -.19$, $p < .001$; for emotional demands: $b = -.11$, $p < .05$) and hindrance appraisals (for time pressure: $b = .33$, $p < .001$; for emotional demands: $b = .32$, $p < .001$). Moreover, job tenure significantly predicted nurses' appraisal of time pressure as challenging ($b = -.001$, $p < .05$). In other words, an increased job tenure went along with a decreased perception of time pressure as challenging. Yet, working time did not significantly predict nurses' appraisals of job demands (i.e., time pressure, emotional demands). Furthermore, we did not detect significant interaction effects.

Limitations: The current study focused on two time-related factors of the job context (job tenure and working time) as predictors of nurses' appraisals. Yet, other contextual factors of the job (e.g., shift work, breaks) might affect how employees appraise certain demands. Moreover, we implemented a cross-sectional design precluding a causal interpretation.

Conclusions: The current research identified time-related, contextual factors of the job, which contribute to how nurses appraise specific job demands. Results suggest that nurses with a higher

job tenure experience time pressure at work as less of a challenge. This might suggest that they may be better at coping/dealing with time pressure at work than their colleagues with fewer years working in nursing. Note, however, that nurses' self-reported working time was unrelated to their challenge and hindrance appraisals of job demands. These findings suggest that scholars might need to adopt a more differentiated perspective when conducting research on time-related, contextual factors of the job and their role within the stress appraisal process.

Keywords: job demands, job context, challenge/hindrance appraisal

Oral presentation OP711

Expanding behavioral and occupational health research in understudied populations: Military police

Israel Sanchez-Cardona, Kristin Horan, Tyler Collette, Bianca Channer, Brian Moore & Michael Schlenk | Kennesaw State University

science&practice

Research Goals: There is value in accounting for the context of an industry or occupation when assessing behavioral and occupational health (Horan et al., 2021), as the unique job demands, work environment, and norms within an occupation or industry can shape how employees experience occupational health risks and outcomes. The goal of this paper is to examine trends in incidence rates for behavioral and occupational conditions among military police officers.

Theoretical Background: This work builds on the work of Moore and colleagues (2022), who examined behavioral and occupational conditions among military firefighters. An analysis of data from the Defense Medical Epidemiology Database found that from 2001 to 2015, there were substantial increases in tinnitus, PTSD, insomnia, and obstructive sleep apnea for military firefighters, modest to large increases for depressive disorders, adjustment reaction, generalized anxiety disorder, and panic disorder, and decreases in rates of alcohol dependence, hypertension, and tobacco use disorder (Moore et al., 2022). According to the job overview 31A "Military Police Officer" on the website of the U.S. Army, military personnel officers are responsible for "ensuring the safety and protection of Army personnel, equipment and resources… control[ling] and secur[ing] terrain inside and outside military installations... and secured areas" (U.S. Army, 2022). The demands and context of this job likely expose individuals to several behavioral and occupational risks. The job represents and intersection of two inherently demanding occupations, law enforcement and active-duty military occupations. Employees in these contexts encounter risks above and beyond the general working population, including physical and psychosocial stressors (McCreary & Thompson, 2006; Pflanz & Sonnek, 2022) and risk of injury and fatality (National Occupational Research Agenda, 2019).

Method: A retrospective cohort design study was conducted to assess the incidence rate trends of adjustment disorder, alcohol dependence, generalized anxiety disorder, hypertension, insomnia, major depressive disorder, obstructive sleep apnea, panic disorder, PTSD, tinnitus, and tobacco use disorder among active-duty military police between 2005 and 2021. The Defense Epidemiology Database (DMED), a database within the Defense Medical Surveillance System provided the data using ICD-9 and ICD-10 diagnostic codes. Data for medical diagnoses were limited to the first occurrence and primary diagnosis to prevent oversampling. Incidence rates were calculated per 10,000 between 2005 and 2021. Standardized residuals were examined to analyze the size of differences between the observed and expected values. DMED data was accessed in September and October 2022.

Results: From 2005 to 2021, three conditions displayed steady or only slightly increasing rates: alcohol dependence, generalized anxiety disorder, and panic disorder. Two conditions displayed slightly to moderately increasing incident rates: adjustment reaction and hypertension. Four conditions displayed moderate to large increases: major depressive disorder, insomnia, obstructive sleep apnea (OSA), and tinnitus. Two conditions displayed decreasing rates: posttraumatic stress disorder (PTSD) and tobacco use disorder.

Limitations: The present study is limited in that only diagnostic and basic demographic information maintained in the database. It is therefore impossible to understand individual or organizational factors that promoted the development of a condition or aids in its treatment.

Conclusions: Military police officers encounter a heightened physical and psychosocial risks through their work. The present study analyzed trends in incidence rates of behavioral and occupational conditions among military police officers across time and among demographic categories. The results replicate several key findings from Moore and colleagues (2022), such as decreasing rates of tobacco use disorder and increasing rates of sleep disorders. This paper also illustrates the need for additional research and intervention for highly specialized subpopulations within high-risk contexts. Several interventions could be employed to prevent, treat, or manage the conditions studied within this paper, including psychoeducational programs on lifestyle medicine to cognitive behavioral therapies for mood and sleep disorders.

Relevance to Congress Theme: This presentation is relevant to the Contribution and Urgency facets of the Future of Work Theme of the congress. Increases in behavioral and occupational health conditions creates a substantial individual, organizational, and societal burden and multiple areas of expertise are needed in the ongoing monitoring, diagnosis, prevention, and treatment of these conditions, particularly in high-risk contexts.

Relevant Sustainable Development Goals: This presentation relates to the “Good Health and Well-being” Sustainable Development Goal.

Keywords: Military police, occupational health psychology, epidemiology

Oral presentation OP722

Experiences of Positive and Negative Feedback in Surgical Training

Madeline Carter, Northumbria University; Hannah Hesselgreaves, Northumbria University; Charlotte Rothwell, Newcastle University; Neill Thompson, Northumbria University

science&practice

Research goals

Effective feedback is regarded as a powerful tool which can improve surgical skill acquisition and performance, as well as confidence and motivation. However, poor feedback can be experienced as undermining behaviours which may have a negative impact on training, wellbeing and career intentions.

This study sought to understand positive and negative experiences of giving, receiving and observing feedback in surgery. In order to inform future interventions, this study also aimed to identify the enablers of, and barriers to, effective feedback in surgery.

Theoretical background

Feedback is regarded as one of the most influential and powerful elements of learning (Hattie & Timperley, 2007). However, evidence suggests that there is variability in feedback delivery in surgery (McKendy et al., 2017).

In medical education, there has been an increased focus on the relational aspects of feedback, and on the nature of the learning climate (Ramani et al., 2019). When trainees feel that corrective feedback is overly harsh and unjustified, they report it having minimal educational benefit, contributing towards perceptions of undermining and bullying and leading to negative feelings about their performance and career (Kamali & Illing, 2018).

Furthermore, reports of bullying and undermining are widespread in surgical training (Bradley et al., 2015; Clements et al., 2020; Ling et al., 2016). Evidence indicates that these negative behaviours have serious implications for patient safety (Paice & Smith, 2009; Kennedy, 2013), the quality of surgical education (Kamali & Illing, 2018), staff wellbeing (Bonde et al., 2016), and recruitment and retention (Carter et al., 2013; Jackson et al., 2012). In surgical training, negative behaviours are often experienced and witnessed as undermining feedback in theatre. While constructive feedback can augment training, overly critical feedback from seniors during training may have a negative impact on training and wellbeing (Kamali, 2016).

Method

Semi-structured telephone interviews (n=18) were conducted with surgical trainees, surgical consultants, and the wider surgical team in general surgery and trauma & orthopaedic surgery in the North of England. These qualitative interviews explored positive and negative experiences of giving, receiving and observing feedback in surgery. Data were analysed using framework analysis.

Results

Key features of positive feedback were identified, including specific evidence-based feedback with actionable advice, engaging in a two-way conversation when the recipient has the cognitive capacity to focus on it, taking a holistic perspective and considering an individual's broader skillset. Framing mistakes in the context of learning and career development was viewed as valuable, as was seniors

sharing ‘war stories’ from their own learning process. Conversely, poor feedback was generic with no actionable learning points, overly critical with no acknowledgement of positives, and incorporated negative behaviours such as public humiliation and shouting.

Feedback and learning occurred within a complex context which was shaped by workplace cultures and hierarchies; social relationships; individual differences in insight, skill and engagement; and the work environment with its stresses and pressures. These factors, along with aspects of the delivery of feedback, acted as enablers and barriers to effective feedback.

Feedback was associated with a range of emotional and psychological responses and had a significant impact on confidence. Feedback experiences were related to career progression and intentions to remain in surgery. Finally, individuals actively sought opportunities to work with effective trainers and feedback culture influenced organisational reputation, which may in turn influence recruitment.

Limitations

Participants were based in one region in Northern England. Although the sample size was fairly small, in-depth interviews were conducted, there was consistency across the data and key findings were supported by the wider literature on feedback in surgical training.

Conclusions and Implications

Findings can be used to inform training on effective feedback in surgery, drawing on the key features of positive and negative examples. The study findings also highlight the importance of a culture of positive, constructive feedback for wellbeing, recruitment and retention. These are of particular concern in specialist training where there can be critical shortages of staff and losses cannot be readily replaced (BMA, 2016; UKFPO, 2016).

Originality/Value

There is a lack of research exploring the wider impact of feedback on recipients and bystanders in surgical contexts, as well as on those providing feedback. In addition, there is a strong need for the development of effective interventions to address undermining behaviours and feedback in surgery, and this research should help to inform the development of interventions for this context.

Keywords: Feedback, Surgery, Bullying

Oral presentation OP275

Experimental Manipulation of Perseverative Cognition alters Psychological and Physiological Stress Responses. Preliminary Findings from an RCT.

Roman Pauli, Jessica Lang & Thomas Kraus | Institute for Occupational, Social and Environmental Medicine, RWTH Aachen University, Medical Faculty

science

Research goals and why the work was worth doing

This study aims at investigating differential effects of affective rumination and problem-solving pondering on psychological and physiological recovery from acute psychosocial stress. The results add to the understanding of how the valence of perseverative thoughts can alter individual recovery processes.

Theoretical background

Rumination about work can prolong work-related mental effort beyond working hours, thereby impair recovery from stress and thus lead to long-term health impairments. Studies on affective rumination and problem-solving pondering suggested that not perseverative cognition per se predicted poor wellbeing, but the valence of work-related thoughts is important. Growing evidence showed a link between negative thoughts about a stressor and the activation of psychological, cardiovascular and endocrine stress markers; i.e. rumination about a stressful event lead to decreased mood and heart rate variability as well as increased saliva cortisol secretion. The differential effects of different types of perseverative cognition on psychological and physiological recovery from stress are however still unclear.

Design/Methodology/Approach/Intervention

Participants (n = 52) in a randomized controlled and double-blinded study completed the Trier Social Stress Test (TSST) to trigger psycho-biological stress responses in a laboratory environment and were then instructed to engage in affective rumination (n = 19) or problem-solving pondering (n = 16) about the TSST. Participants in the control group (n = 17) engaged in cognition about neutral issues. Participants wore heart-rate sensors throughout the experiment and reported their mood at dedicated time points. Participants mean age was 23.7 years (SD = 4.6 years); 65% were female. We used simple slopes analysis to test for significant changes in stress parameters from before to after experimental manipulation across groups.

Results obtained or expected (if not available, it must be made clear when they will be)

After experimental manipulation, valence (-0.63, $p < .05$), calmness (-0.68, $p < .05$) and energetic arousal (-0.84, $p < .05$) significantly decreased in the affective rumination group but not in the problem-solving pondering and control group. Heart-rate variability significantly decreased in the affective rumination (SDNN: -11.75, $p < .05$) and problem-solving pondering (SDNN: -8.29, $p < .05$) groups and increased in the control group (HF Spectrum: 294.25, $p < .05$).

Limitations

Stress manipulation and subsequent recovery occurred under controlled laboratory conditions in a predominantly student population. Investigating the extent to which the effects of perseverative cognition on the recovery from psychosocial stress can be generalized to real-world job demands is a task for future research.

Conclusions – research and or practical implications/Originality/Value

Preliminary results of this ongoing study add to the understanding of the differential mechanisms by which different types of perseverative cognition affect individual recovery processes and highlight the complex interaction of psychological and physiological processes in coping with stress. Knowledge of these processes is an important prerequisite for understanding the mechanism by which work-related stress impairs individuals` recovery.

Relevance to the Congress Theme

In view of increasing (cognitive) job demands and new patterns of work, employees' ability to switch off from work will become increasingly important for sustaining a healthy workforce. The results of this study therefore provide important information for designing healthy working conditions that foster recovery from work-related mental efforts.

Relevant UN SDGs

In providing a basis for identifying good practices for recovery from work-related stress, this work contributes to finding pathways that lead to good health and wellbeing .

Keywords: Rumination, Trier Social Stress Test, Heart-Rate-Variability

Oral presentation OP397

Explaining teachers' life satisfaction through experienced compassion at work. The mediating role of collective school performance and burnout

Martina Pansini, Paula Benevene& Ilaria Buonomo | LUMSA University of Rome, Italy

science

1) Theoretical background

Compassion at work (CAW) includes noticing others' suffering, feeling empathy, and taking effective actions to reduce their pain (Kanov et al., 2004). Employees can receive CAW from three different sources: colleagues, supervisors, and the organization at large (Lilius et al., 2008). Literature shows that receiving compassionate acts from co-workers means strengthening emotional connections at work, boosting a sense of community, and increasing employee performance (Aboul-Ela, 2017; Ko et al., 2022). A supportive network within the workplace can be helpful to share a load of job demands and notice when one is suffering (Dutton et al., 2014). Overall, receiving CAW benefits personal and work well-being and reduces negative beliefs and conditions (e.g., burnout, low efficacy) in employees. In healthcare professionals, receiving CAW from colleagues reduces depersonalization and emotional exhaustion and increases professional accomplishment (Román-Calderón et al., 2022). Such effects are crucial for teachers, considering the heterogeneous web of relationships and interactions that characterizes their job role (Pereira et al., 2015). In this regard, the greater the workplace support from colleagues and supervisors, the lower the burnout experienced by teachers (Fiorilli et al., 2019). Despite this, limited research investigated the role of compassion in the educational field. Most of the studies focus on the teacher-student relationship, neglecting compassion's potential effects when oriented toward colleagues in distress at work. Secondly, the role of CAW has mainly been analysed in social and healthcare contexts. This research aims to fill this gap.

2) Research goals

Based on COR theory (Hobfoll et al., 2018), we conclude to the hypothesis that relational job resources, when strategically used, can be a positive impact on teachers' extra-work life. Building on this, the contribution aims to explore the role of received compassion at work on teachers' life satisfaction while considering perceived school collective performance and burnout conditions as mediators in this link.

3) Methodology and design

A sample of 136 Italian teachers (mean age=48.46, SD=9.46, females=85.4%) working in primary and secondary schools completed an online survey including: the Received Compassion scale (Lilius et al., 2008), Perceived organization-level performance (Salminen et al., 2017), Burnout (COPSOQ; Kristensen et al., 2005), and Satisfaction with life scale (SWLS; Diener et al., 1985). The hypothesized associations between the variables were analysed with a Structural Equation Model (SEM; Kline, 2011).

4) Results

The final model showed a good fit to the data $\chi 2$ (21) =30.716, p=.08, CFI=0.989, TLI=0.981, RMSEA=0.050 (90% CI=0.000–0.080, p=.465), SRMR=0.038. More specifically, findings showed that received CAW was significantly associated with life satisfaction (bDIRECT =.239, p=.007), and

perceived performance partially mediated this link (bINDIRECT =.230, p=.000), while burnout did not (bINDIRECT =ns). Overall, the model explained the 42% of life satisfaction.

5) Limitations

This study shows several limitations: 1) the cross-sectional data; 2) the involved convenience sampling does not represent the whole Italian teaching community; 3) this study involves only teachers, while school administrative staff members and other employees that support the teaching-learning processes can be involved in future research.

6) Research/Practical Implications

Based on our findings, future research may consider other subjective well-being outcomes besides life satisfaction. Furthermore, other related dimensions such as compassion dispositional components could be tested. Regarding practical implications, compassionate behaviours can be promoted through personal and organizational training (Trzeciak et al., 2019) and other organizational actions. Through building a compassionate culture, employees feel recognized as individuals with personal needs, desires, and scopes (Shuck et al., 2019).

7) Originality/Value

Literature shows that the role of received CAW has mainly been analysed in social and healthcare contexts. However, limited research investigated the role of compassion in the educational field despite it being a caring context. This research aims to fill this gap and expand current research on the implications of CAW.

8) Relevance to the Congress Theme

This contribution responds to Congress's attention to the themes of well-being promotion and stress/dysfunction prevention.

9) Relevant UN SDGs

This study contributes to the SDGs' goal of promoting "Good health and well-being" in the helping professions, specifically, in the teaching profession.

Keywords: Compassion at work, life satisfaction, work well-being

Oral presentation OP90

Exploring career experiences in the emerging world of work: The impact of career choices, career expectations, and career enablement

Dieter Veldsman & Marna van der Merwe | AIHR

science&practice

Research Goals

The purpose of this research was to study career experiences with a specific focus on the role that career choices, career expectations, and career enablement play, within the context of organizational talent practices. The research aimed to achieve the following goals:

Explore the influence of career choices, expectations, and enablement on individual career experiences;

Evaluate the interplay of organizational realities and talent practices on career experiences through a career experience management model;

Propose a methodology for career experience design and application in practice.

Theoretical Background

The effectiveness of people practices has come under scrutiny as rising levels of employee turnover impact organizational performance (Younas & Waseem Bari, 2020). Trends such as the "Great Resignation" are dominating the talent landscape, promtpting organizations to re-evaluate and redesign more human-centric workplaces (Fenton-Jarvis & Bull, 2022; Zaware, 2020). Positive employee experiences have the potential to create commitment and value for employees (Tucker, 2020). However, career experiences have remained largely unexplored, despite a lack of career opportunity being cited as one of the main drivers of attrition across organizations. The extent to which career experiences are designed, managed and supported within organizations directly impacts their access to talent and ability to respond to talent challenges.

A challenge within career management is balancing organizational benefit and individual gains (Barnett & Bradley, 2007). From an organizational perspective, career management practices are aimed at providing access to development opportunities to individuals, to pursue their own development and growth within the organization (Bagdadli & Gianecchini, 2019). However, individuals often experience career management practices as misaligned to their needs, overly focused on developing organizational skills, or vague with little transparency or support.

Research Design and Methodology

The study forms part of a broader research initiative aimed at conceptualizing an adaptive talent model. The study utilized an exploratory research approach, conducted in three phases. Phase one was a critical review of the current literature pertaining to careers. Phase two utilized semi-structured interviews (n=13) with talent management practitioners to inform the development of a conceptual framework. Themes were derived through a thematic analysis of the data. The findings were presented to an expert panel (n=8) and validated through the utilization of the Delphi method during the third phase of the study.

Results

The study found that career experiences are impacted by individual career choices, which leads to certain expectations from organizations. This includes the extent to which the organization plays an active role in managing careers and the type of support available to individuals. Organizational level career enablement practices and talent practices have a significant impact on the extent to which organizations deliver on expectations. The psychological contract was found to play an important role in managing mutual expectations.

Based on these findings, a model of career experience management is proposed to intentionally design practices that align career enablement to talent practices, and manages mutual expectations. A framework for designing career experiences was also defined as a practical methodology for practitioners, which takes into account both individual career journeys and organizational practices.

Limitations

Although various industries were included in the study, sample size impacts the generalizability of the study. As the participants of the study were talent management practitioners, the individual perspective of careers may not be fully represented. Given the timing of the study and current economic conditions, situational factors may impact on participant perspectives pertaining to.

Conclusions

The study highlighted the impact of career choices, expectations and career enablement on the career experience. Through the career experience management model, the interplay between these factors are outlined and made practical through a framework that could inform career experience design within organizations. The study confirmed the need for intentional career experience design that balances the expectations individuals with what is offered by the organization, through talent management practices.

Relevance to the conference theme

The study highlights the changing nature of careers and highlights the importance of creating meaningful career experiences as part of the employee value proposition. At a macro-level, the study also contributes to understanding the relationship between talent management and career experiences and the impact of situational factors.

Relevant to UN SDGs

This study contributes with a specific focus on Goal 8 with a focus on productive employment.

Keywords: Career, Experience, Talent Management

Oral presentation OP402

Exploring career uncertainty among young people: Meanings, sources, and coping resources

Audrey Ansay Antonio & Rita Chiesa | Department of Psychology, University of Bologna

science

The aim of this research is to explore the experiences of young people as they navigate through their careers in light of the uncertainties caused by changes in the environment (e.g., globalization, alternative work arrangements). Specifically, the meanings and sources that young people attribute to career uncertainty are explored with respect to the perceptions they hold of themselves and the labour market. The psychosocial resources that young people deem important to successfully navigate through the uncertainties in the world of work are also considered. This research is important in the context of modern careers as increasing uncertainties become the "new normal" in individuals' career development (Callanan et al., 2017). The research findings can inform both researchers and practitioners concerned with early careers into better equipping young people at the initial stages of their professional development.

Using the conservation of resources theory (Hobfoll, 1989) as a theoretical lens, career uncertainty is viewed as a career-related stressor in a shared social context. The theory posits that resources are fundamental for individuals to successfully cope with the stressor (i.e., accumulating sufficient resources allows individuals to increase their coping capabilities in handling future challenges). The insights of modern career theories are also considered in this research, especially in understanding young people's psychosocial resources to deal with uncertainty. Specifically, Savickas' (2005) career construction theory delves into individuals' successful adaptation to their environment by considering individual differences in preparedness to change (i.e., adaptivity) and resources to manage change (i.e., adaptability resources). The research sample consists of students enrolled in an Italian university. We used a mixed methods research design with a qualitative phase (i.e., online focus group discussions of experiences and resources to cope with career uncertainty) and a quantitative phase (i.e., survey research using measures from previous studies on career uncertainty).

Data collection and analyses finish by the end of 2022 in which the findings from both qualitative and quantitative phases are integrated in the interpretation of results. Specifically, the themes that emerge from the focus groups help inform the conceptualization of career uncertainty and its related coping resources. Whereas the survey results inform the relationships between factors and resources that contribute to the experience of career uncertainty. The results of this research include the identification of aspects that characterizes young people's career uncertainty (e.g., fit between one's degree/interests and the opportunities available in the labour market). Additionally, the distinction and/or interaction between personal factors (e.g., self-perceived skills and experiences) and environmental factors (e.g., perceptions of economic crises and labour market competition) are examined with regards to young people's sources of career uncertainty. Furthermore, the results highlight young people's psychosocial resources (e.g., protean career orientation, future orientation, career adaptability) and its relations with aspects and sources of career uncertainty. Some limitations that need to be considered from this research include the heterogeneity of the sample and the cross-sectional data collected.

This research has implications in the conceptualization and operationalization of career uncertainty as a psychological variable. It contributes to the expansion of knowledge regarding the dimensions and measures of career uncertainty, and it provides further insights on career uncertainty's

relationships with psychological variables that are relevant for coping with the changes in the labour market. The research also has practical implications to universities and employers, especially in addressing the career uncertainty of young people and enhancing their competencies to develop their careers. In line with the congress theme, this research delves into the experiences of young people as they become the new workforce that will confront the anticipated trends and changes in the world of work. By exploring the career uncertainty of young people, this research invites scholars and practitioners to essentially act in implementing solutions and interventions that benefit the long-term career development of the future workforce. This research contributes to Sustainable Development Goal 3, Good Health and Well-being, which highlight the psychosocial support or resources that young people need, especially after the impact of the COVID-19 pandemic in their experiences of uncertainty about the future. The research also contributes to Sustainable Development Goal 8, Decent Work and Economic Growth, considering the projected global unemployment rate that disproportionately impacts young people.

Oral presentation OP726

Exploring decisions to reduce workplace language barriers: A policy-capturing study

Sarah-Kay Walker, McMaster University; John Fiset, St. Mary's University

science&practice

In an increasingly globalized economy, many organizations must operate outside of their home country to prosper. Multinational corporations (MNCs), defined as any organization "that owns or controls the production of goods or services in one or more countries other than its home country" (Chipulu et al., 2018, p. 228), are characterized by linguistically diverse globalized work teams that span time zones, cultures, and languages. As a result, these organizations must work to sustain competitive advantage; while simultaneously ensuring reliable communication between headquarters and its subsidiaries (Harzing; Pudelko, 2014). On the communication front, these firms must reconcile linguistic and cultural differences within their workforce that if not properly managed, may lead to language barriers. In some cases, language becomes a barrier in MNCs inhibiting information flow and shared understanding. Several studies have discussed how language barriers reduce decision-making efficiency, foster feelings of exclusion, adversely influence organizational efficiency, and inhibit venture growth (; Fiset; Bhave, 2021). Research also indicates that exposure to others speaking a non-mutually understood language affects individuals' willingness to communicate and participate in workgroup activities (Lauring; Klitmøller, 2017). Scholars have proposed several responses to alleviate language barriers and improve overall communication in organizations (Janssens et al., 2004). These solutions include implementing a common corporate language (CCL) or lingua franca policy where all employees are mandated to speak a mutually understood language, offering translation and interpretation services to organizational members, and integrating language and/or cultural training into organizational development initiatives. Despite research examining how language use is experienced in MNCs, little is known about managerial preferences for initiatives that attempt to solve existing language barriers in organizations. Thus, the goal of this study is to assess individual judgements of several proposed organizational-level language barrier solutions by drawing on theoretical work developed by Janssens et al. (2004) to assess MNC manager preferences for various international organizational language barrier solutions.

To achieve this, we use policy-capturing methodology to assess how decision-makers use available information when making evaluative judgments, or, how they "weight, combine, or integrate information" (Zedeck, 1977, p. 51) by having respondents respond to a number of realistic, yet hypothetical vignettes (Connelly et al., 2016). Therefore, a policy-capturing approach provides an effective means to understand how MNC managers weigh the perceived effectiveness of a variety of language barrier solutions as it identifies both the within- and between-person variance of each strategy (Karren & Berringer, 2002). In addition, we also asked managers which solution they preferred and why. This was done to complement our quantitative analysis as well as to gain a more profound and more holistic understanding of how managers attempt to solve these issues. To test the perceived efficacy of these organizational language barrier solutions a 3-way repeated measures ANOVA within factor analysis was performed using SPSS (2 levels x 2 levels x 3 levels). The analysis revealed a statistically significant three-way interaction between language policy, translation and training ($F(2, 243) = 3.58$, $p = .03$, $\eta 2 = .01$), such that managers preferred a lingua franca language policy when professional translation and cultural/language training are recommended. Our findings suggest that managers are keenly aware of the challenges presented by language barriers. Moreover, it appears that supervisors are acutely aware that remedies to workplace language issues do not lend themselves to simplistic solutions. Rather, the current sample of MNC managers often

discussed the nuanced and often culturally and politically fraught challenges that they must navigate when operating in a multilingual work environment (Ahmad; Widén, 2015). Limitations of our study include only using managers and having a large portion of our sample from English-speaking countries. Future studies could focus on employee's perspectives as well as having a more well-rounded sample.

Given the rise of globalization and the increase of multilingualism in contemporary organizations, managers must find effective ways to solve language-related issues at work. In an effort to address this issue, the current study aims to understand managerial preferences for well-established organizational solutions to address workplace language barriers in MNCs. By achieving this, we hope not only to shed light on driving factors behind language policy decisions but also to give managers recommendations as to how to best navigate these issues at work. Thereby, this work is intended for both academics and practitioners.

Oral presentation OP164

Exploring hybrid work design profiles, their antecedents and wellbeing outcomes: A person-centered analysis

Caroline Knight, Curtin University

science&practice

Research goals and value

Hybrid work - working partly in the office and partly from home - has dramatically increased since Covid-19 and looks set to persist. It is therefore important that we understand how to design good quality work which spans these domains. Work design refers to the roles, responsibilities and tasks carried out in a job. Established research shows that jobs high in resources, with moderate demands, are beneficial for wellbeing and performance. However, it is not yet known how work experiences at home and in the office combine holistically for different subgroups of people and influence outcomes.

Focusing on hybrid workers, we aim to: 1) examine the nature and number of hybrid work design profiles that emerge, and the extent to which levels of work characteristics differ between home and the usual workplace within profiles; 2) explore the factors that shape hybrid work design profiles; and 3) explore how hybrid work design profiles impact thriving and mental health.

Theoretical background

Drawing on the job-demands resources model and previous person-centered research, we focus on work characteristics pertinent to hybrid work and expect at least three general profiles – high strain, low strain, and active. We propose differences between levels of work characteristics at home and in the workplace within some profiles, as some resources (e.g., autonomy, support), and demands, may vary between locations for some people. Additionally, some profiles may demonstrate similar levels of work characteristics, as the forces that shape work design, such as organizational policies, leadership, and individual differences, may be similar in both locations.

Methodology

Hybrid workers (n=386) completed an online survey (May 2021) focusing on: scheduling autonomy, colleague and manager support, workload, and close monitoring when in the workplace and, separately, when at home; and antecedents (gender, age, occupation, influence over work location, organizational support). Four months later, we assessed thriving and mental health. Latent profile analysis was conducted using home and workplace work characteristics as profile indicators.

Results

The four profile solution was considered optimal and comprised: 1) an “active, low monitoring, convergent” (20%) profile with relatively high resources and workload, and significantly higher autonomy at home than in the workplace; 2) a “demanding, high monitoring, divergent” profile (21%), where workload and monitoring were relatively high and differences were observed between levels of home and workplace characteristics; 3) an “average, low monitoring, divergent” profile (26% of sample), with average levels of most work characteristics, and significant differences between locations in autonomy and monitoring; and 4) a “passive, high monitoring, convergent” profile (33%), with relatively low resources and workload, and no significant differences between locations.

Males, older workers, those in skilled jobs higher up the hierarchy, or more influence over their work location, or more organisational support, were more likely to be in active, low monitoring jobs. Those in profiles with the highest autonomy and support experienced the highest thriving. Mental health was significantly lower in the two low monitoring profiles.

Limitations

Significant drop-out between Time 1 and 2 occurred, however, drop-out analysis revealed almost no significant differences between groups and we modelled missing data using the full information maximum likelihood approach. In addition, respondents completed both sets of questions about work characteristics at the same time rather than while actually in the relevant work location.

Conclusions

Our study shows that close monitoring drove lower mental health and resources drove thriving. There was no clear pattern of association between antecedents or outcomes and differences in levels of work characteristics between location within profiles. It is important to ensure high resources and low monitoring across locations when designing hybrid work.

Relevance to congress theme & UN SDGs

The nature of work is changing, with more people working flexibly, and many reassessing what they value most in life and their careers. Some are choosing to leave jobs amidst the "great resignation". Hybrid work is one way leaders can meet individuals' needs for flexibility and retain workers. Yet we understand little about how to design good quality work which transcends location, such that individuals can achieve optimum wellbeing and performance wherever they work. Our study paves the way for leaders to design motivating hybrid work and remain adaptable into the future.

Relevant UN SDGs are "Good health and wellbeing", and "Decent work and economic growth". We show which hybrid work design profiles promote optimal wellbeing, and identify factors which predict who is in these profiles, which can inform interventions to foster "decent work" for all.

Keywords: Hybrid work, work characteristics, latent profile analysis

Oral presentation OP716

Exploring the intention to work remotely: A moderated mediation model on the interplay between leadership, autonomy and trust-building self-efficacy

Nicoletta Massa, Ferdinando Paolo Santarpia & Chiara Consiglio | Sapienza, University of Rome

science&practice

Work patterns and conditions

Research goals. Since the COVID-19 outbreak, many organizations have reported a permanent shift to remote or hybrid work (Milasi et al., 2020). However, from employee's perspective remote working may be associated with both advantages and disadvantages. To date, the understanding of the individual and contextual factors that drive employees wanting to keep working remotely is still limited. In this study, we developed a moderated mediation model in which job autonomy plays a mediating role between remote leadership and the intention to work remotely and trust-building e-work self-efficacy acts as a moderator.

Theoretical background. Increased autonomy is a key predictor of remote workers' job attitudes and well-being (e.g., Allen et al., 2013), although its positive effects are determined by job-related and individual characteristics (Kubicek et al., 2017). Supervisors play a role in the autonomy-control dialectic in determining the effectiveness of new ways of working (e.g., Iannotta et al., 2020) and generally influence employee's outcomes by shaping job resources (Schaufeli et al., 2020). Hence, we hypothesized that the leader's remote support may relate to employees' intention to keep working remotely through the enhancement of job autonomy. Whether or not remote workers can handle greater discretion in performing their work is partly dependent on individual factors (Van Yperen et al., 2014). We hypothesized that trust-building e-work self-efficacy (i.e., one's confidence in meeting company policies and high performance standards under minimum supervision; introduced by Tramontano et al., 2021) may have a moderating role, so that employees with higher scores may capitalize more from the hypothesized process.

Design. The total sample consisted of 773 remote workers. The survey assessed: Remote Leadership (LEAD; 5 items), developed to measure leaders' behaviours that support the effectiveness of remote co-workers, like strengthening digital skills and virtual interactions; Job Autonomy (AUT; 3 items; Morgeson & Humphrey, 2008) measuring the degree of discretion in one's job; Trust-Building e-work Self-Efficacy (TBSE; 3 items; Tramontano et al., 2021) measuring beliefs about one's capability to build trustworthy relationships by achieving remote outcomes responsibly; Intention to Work Remotely (RINT; 1 item; adapt. from Davis et al. 1989), assessing the intention to keep working remotely for the next 6 months. Preliminarily, participants were randomly divided into two groups to perform validation analyses of the scales. Then, we tested on the overall sample: a) the measurement model through CFA; b) the structural moderated mediation model with path analysis according to suggested procedures (Hayes, 2015; Preacher et al., 2007). Alternative structural models were tested. Models were controlled for sex, age and type of contract.

Results. Preliminary analyses on the split halves of the sample confirmed the reliability and factorial validity of the scales. The measurement model on the overall sample fitted the data well ($\chi 2$= 4595.664; df= 55; RMSEA=0.06; SRMR=0.03; TLI=0.95; CFI=0.96). The test of hypotheses revealed that: a) LEAD was directly related to AUT (b=.26; p.<.001) and RINT (b=.18; p.<.001). In turn, AUT was directly related to RINT (b=.23; p.<.001). Hence, the LEAD-RINT relationship was partially mediated by AUT (ab=.08; p.<.001; LL= .04; UL= .12). b) TBSE significantly moderated the LEAD-AUT relationship (b=.08; p.<.05), so that LEAD was related to AUT only at higher values of the moderator (b=.12; p.<.05); c) Consistently, TBSE significantly moderated the mediating effect of AUT in the relationship between LEAD and RINT (IMM=.02; p. <.05; LL=.003; UL=.044). Alternative mediation models showed a worst fit to the data than the hypothesized one. TBSE did not moderate any of the other structural paths.

Limitations. The cross-sectional and self-reported nature of the data. The sampled employees do work remotely at least 2 days per week, thereby results were not controlled with differences in

intensity of remote working. Moreover, the results should be generalized to other national contexts, since our sample reflect the remote working as normatively defined by the Italian context.

Conclusions. Our results contributed to the understanding of the mechanisms involved in employees' intention to keep working remotely. This study suggests the importance of training the leaders of the future on the management of remote co-workers, with an emphasis on the enrichment of their job autonomy. For capitalization purposes, our results suggest that organizations should invest in empowering employees' capability to perform remotely in an autonomous and accountable manner.

Relevance to the Congress Theme. Our study is helping to develop research and applications with regard to the attitude of employees towards new ways of working.

Oral presentation OP507

Exploring the role of Existential Labour on Work related Well-Being: A weekly diary study.

Lakshmi Chandrasekaran, Aston University; Luke Fletcher, University of Bath

science&practice

Researchers have consistently found that the experience of meaningful work is associated with various positive benefits at various levels of work(May et al., 2004; Rosso et al., 2010; Steger et al., 2012) Certain theorists have gone so far as to posit that the experience of meaningfulness is a fundamental human need, which makes studying the concept more propelling than ever, especially within an organisational setting (Bailey & Madden, 2017; Frankl, 1962). That said, research on both the antecedents and consequences of meaningful work is maturing, but understanding how individuals experience meaningfulness in the context of organisational mandated protocol remains limited (Bailey & Madden, 2017; Lips-Wiersma et al., 2015; Rosso et al., 2010). More specifically, processes of deteriorating meaningful work need to be examined to understand how employees might cultivate counterproductive attitudes at work, i.e. cynicism and alienation due to organisational mandated meaningfulness(Cartwright & Holmes, 2006).

As a result of meaningfulness dissonance, i.e. tensions between experiencing meaningfulness at work, employees are often forced to adopt strategies to regulate their own versus organisational expectations to maintain meaningfulness (Lips-Wiersma & Wright, 2012; Tummers & Knies, 2014; Veltman, 2015). These strategies involve faking genuine experiences of meaningful work for the sake of adhering to organisational expectations and norms, also known as existential labour strategies (Bailey et al., 2017). This could benefit employees in the short-term to get through the day or week, but can have severe negative affective outcomes on employee wellbeing over time, including exhaustion and feelings of alienation (Bailey et al., 2016; Hirschfeld et al., 2018; Trougakos et al., 2015). Existential labour is thus experienced when the employee is 'pretending' that their role is meaningful, perhaps to cope with the monotony of the role when in reality they are only performing the role to further their self-interest in promotions, money or prestige (Bailey et al., 2017b).

In this weekly diary study, examining the within-person relationships between meaningfulness dissonance and work-related well-being through existential acting strategies was given importance. Adopting a within-person lens in examining the effects of existential acting on well-being outcomes allows researchers to account for fluctuations with regard to both constructs over time and is particularly useful when attempting to investigate the processes underlying these relationships. Week-level data was collected from 273 working professionals in UK using Prolific. Data was collected across 12 weeks. All employees were working professionals; 62.1% were female, 37.2% male and 0.8% non-binary; 81% had permanent contracts; 34% belonged to the public sector, 59% to the private sector and 6% to either non-profit organisations or other businesses; 38% had leadership responsibilities of which 15.8% were team leaders, 16% line managers, 5% senior managers and 3% CEOs or directors. The age of participants ranged from 20 to 61 (M= 33.3; SD= 9.27). Tenure ranged from 1 to 52 years (M= 6.9; SD= 6.5) and 98% had a bachelor's degree or better. Finally, 55.3% were working from home, 33.9% were commuting to work and the rest were furloughed.

ICC results show that within-person constructs exhibited considerable variance at the weekly level, ranging from 22% to 49%, thereby justifying the multilevel approach. Multilevel mediation analysis showed that weekly deep and surface existential acting significantly mediates weekly perceptions of MD and negative well-being outcomes(i.e. cynicism, depersonalisation and alienation). Cross-level interactions with organisational psychological safety as the moderator showed interaction effects

between weekly deep existential acting and depersonalisation. In other words, employees that perceived high organisational psychological safety had lower experiences of weekly deep existential acting and depersonalisation at work.

Relevance to EAWOP Theme

Given the nature of workforces and organisations today, one may argue that these findings are not surprising. The more the changes and insecurity around one's job occur, the more it becomes difficult for employees to experience meaningful work authentically. Thus, organisations need to be aware that employees are no longer experiencing meaningfulness as passive receivers (Bailey & Madden, 2017) but are actively 'faking' their sense of meaningfulness when required at work. HR professionals should consider the factors that are likely to give rise to forms of organizational acting, such as reward systems that emphasize "fitting in", and mechanistic structures and systems that allow little room for an individual's sense of meaningfulness, therefore exploring its implication on employee's well-being.

Oral presentation OP4

Exploring the Role of UK Middle Managers in Organisational Change

Natalie Fisher, QinetiQ; Georgie Akehurst, IES; Valentina Battista, Cranfield University; Emma Parry, Cranfield University; Dilys Robinson, IES; Melanie Wood, Dstl

science&practice

Research goals

This study was commissioned to explore the role of middle managers in organisational change, with a view to identifying how middle managers could be enabled so that change was more likely to be delivered effectively/at pace. Within the organisation in question, discussion at senior level had highlighted concerns about how messages were sometimes diluted as they transcended the organisation. Questions were raised regarding how the organisation equips its middle manager to facilitate change.

Theoretical background

Evidence from the change management literature suggests that managers are critical agents of change (Tabrizi, 2014). In organisations that consistently deliver change successfully, middle managers are actively involved in change. As part of this research, a literature review was conducted which explored both traditional approaches to organisational change, alongside newer approaches (high involvement change, behavioural nudging etc.).

Methodology

The research was conducted in three stages by a team of academics and social research practitioners.

Defining and understanding the issue:

Ten stakeholder interviews were conducted with individuals in change management roles to gain an understanding of the change context.

A literature review was undertaken to explore the enablers of change and factors that were critical in securing effective change implementation.

Nine interviews were conducted with representatives from organisations that were comparable to the study organisation to establish best practice in organisational change in other settings.

Engaging with middle managers ： 72 telephone interviews were conducted with middle managers to better understand how they perceive their role in change management.

Identification of interventions ： Using the outputs from stages one and two, 31 interventions were developed by the research team. An expert judgement panel of six experts assessed the list of interventions, and based on their feedback the long list of interventions was reduced to a prioritised list.

Findings

The findings indicated an expectation from the organisation that middle managers would take on a key role during change; they should be agents of change responsible for translating the vision into action. Despite agreement from middle managers that this should be their role, there was a disconnect between expectations and reality. Middle managers were not fully equipped and

supported by the organisation to manage change. It was evident that middle managers faced a number of barriers in conducting their role:

Middle managers were frequently not involved in shaping larger-scale change. Their role was often focused on implementation of the vision/strategy set out by senior leaders.

A lack of involvement often left them feeling like change was being 'done to' them.

The culture of the organisation was not always conducive to open communication, particularly in an upward direction. There was often a failure to explain the 'why' of change.

Often middle managers were required to implement a change initiative in addition to their 'day job' without any additional resources (financial, people, equipment, time).

Middle managers typically received very little change-related training and were just expected to 'get on' with implementation.

All the above meant an inconsistent approach to change was being taken across the organisation.

Conclusions

This study provided useful insight into a topic that had not been researched in this large, complex organisation.

Study findings made it clear that the solution to effectively managing change within this organisation does not lie solely with middle managers. In fact, to focus only on the role of middle managers would mean that many of the challenges that the organisation faces would be left unaddressed. With this in mind, four key interventions were suggested:

Adopt a change management framework to guide change management processes.

Provide managers with change management training.

Introduce a governance process to keep track of large-scale change initiatives.

Take a high involvement change approach which genuinely attempts to involve employees at every level in co-producing change.

In addition to the interventions a series of recommendations, alongside a short video outlining good practice, were also developed that could be implemented in quicker time.

Limitations

As only part of the organisation was sampled it is suggested that the project should be scaled up to include other areas which may have a different experience with regards to change.

Relevance to congress theme and UN SDG

The pace of organisational change continues to accelerate with the introduction of new technology and ways of working. Being good at managing change is no longer a choice but a necessity. Bringing people along on the journey, allowing them to shape the change, and involving them in the process is key to success.

Oral presentation OP413

Facing early career trauma without a safety net: the role of career resources for a sustainable start to careers

Belgin Okay-Somerville & Scott Hurrell |University of Glasgow; Pauline Anderson, Daria Luchinskaya & Dora Scholarios | University of Strathclyde

science

Research goals: For young people transitioning from education to work, the COVID-19 pandemic in 2020 was a traumatic career event which impacted the course of life plans as well as health and wellbeing (Blustein et al., 2020). Groups with fewer safety nets were shown to be especially vulnerable in the pandemic context (Pierce, et al., 2021; Understanding Society, 2021). Such patterns are likely to have exacerbated the shock and uncertainty associated with young people's transitions to employment. This research examines the nature of such early career trauma and the potential protective factors which may help build resilience and purposefulness (indicators that reflect a sustainable start to careers), and help towards sustainable career outcomes, for vulnerable young people transitioning to the labour market. The aim is to understand the role of career resources relevant for career self-regulation (i.e., proactivity, adaptability, and career competencies), for young people who may not have financial and social safety nets.

Theoretical background: We build on theorising related to person-career fit and career self-management (Hirschi and Koen, 2021) which suggests that career self-regulation is critical in crisis situations, such as the pandemic. This allows understanding of (i) which resources help a sustainable start to careers for young people; (ii) to what extent career resources differ based on social and financial insecurities; and (ii) how financial and social insecurity differentially impact the efficacy of career resources on sustainable career outcomes. We adopt the broad dimensions recommended by the sustainable careers framework (De Vos, Van Der Heijden, & Akkermans, 2020) to examine relevant education-to-work outcomes at the start of one's career including employment status, perceived financial stress, life satisfaction, mental health and social wellbeing one year on from graduation.

Design: Data is drawn from two waves of a longitudinal study of UK education leavers in the 2020 cohort (Time 1 (T1), N=502; Time 2 (T2), N=197). Study 1 used T1 data in a structural equation model to identify the most vulnerable groups in early pandemic labour markets. Financial insecurity (Netemeyer et al., 2018) was measured at T1 and T2. Other T1 measures were: indicators of social vulnerability (socio-economic status, level of education, and mentoring support (Scandura, 2004)); career resources relevant for career self-regulation, namely proactive personality (Seibert, Crant, & Kraimer, 1999), career adaptation (Savickas, Porfeli, Hilton, Savickas, 2018) and career competencies (Akkermans, Brenninkmeijer, Huibers, & Blonk, 2013); state resilience (Connor-Davidson Resilience Scale (CD-RISC); Connor & Davidson, 2003); and purposefulness (Organ & Greene, 1974). Study 2 examined the relationship between financial insecurity and career resources (T1) and career outcomes at T2 for the reduced longitudinal sample. T2 outcome variables were employment status, salary, perceived life satisfaction (Diener, et al., 1985), mental health measured using the GHQ12 (Goldberg, 1992) and social wellbeing (or loneliness) (Hays & DiMatteo, 1987).

Expected results: Results will be available during the EAWOP Congress in 2023.

Limitations: Although the longitudinal data one year following graduation provides some indication of early employment, health and wellbeing outcomes in relation to financial security and career

resources, conclusions on the longer term economic, social and individual scarring effects on young people is limited based on this data.

Conclusions: Theoretically, the study examines how self-regulation of careers operates differently with implications for a sustainable start to careers for those who experience social and financial insecurities. Moreover, the study broadens the scope of sustainable careers to those who are at the start of working lives. Young people are always among the most vulnerable in labour markets and experience the economic, social and individual scarring effects of eary unemployment. The study provides unique and in-depth data on first labour market experiences of a cohort of young people in the transition from education to work during a global pandemic. The availability of data on employment and life outcomes one year following graduation in the pandemic context provides insight into the sustainability of early career trajectories in times of crisis, taking into account health and wellbeing as well as employment outcomes.

Relevance to the Congress Theme: The study raises urgency with respect to required interventions to redress potential negative consequences of the pandemic as a career shock. We may see inequality emerging in terms of employment outcomes as well as health and wellbeing.

Relevant UN SDGs: The study directly addresses several UN SDG themes, most obviously 'Good health and wellbeing', 'Decent work and economic growth', 'Gender equality' and 'Reduced inequalities'.

Keywords: Education-to-work transitions, sustainable careers, financial vulnerability

Oral presentation OP256

Factors Affecting Normalisation of Deviance – Perspectives of Workers Within the Energy Industry

Nejc Sedlar, University of Aberdeen; Ruby Roberts, Robert Gordon University; Douglas Martin & Amy Irwin | University of Aberdeen

science

The present study aims to explore the influence of factors relevant to work safety and operating procedures on the normalisation of deviance (NoD). NoD describes the gradual degradation in workers' compliance with set norms as a result of a prolonged absence of perceived negative consequences. While the phenomenon has been identified across a wide array of industries and has been noted in numerous high-profile industrial incidents (Texas City Explosion, Chernobyl, etc.), there is a notable lack of research into the factors contributing to the acceptance of procedural deviations. Non-compliance with safety procedures is often a key weakness of many safety systems. The risk of non-compliance is what renders administrative, work practice, and personal protective equipment controls to be among the least effective safety measures according to the hierarchy of control. Historically, deviations from procedures were often viewed as the errors or malpractices of individuals (termed active failures), however focus has since shifted to understanding these from the perspective of latent failures within the system itself (operational pressures or conditions, outdated or difficult to follow procedures etc.), which may enable, or even promote, non-compliance with procedures.

In order to identify the factors associated with the NoD, we conducted a qualitative analysis of incident investigation reports. Through this, a number of factors reported as contributory to the initiation and subsequent normalisation of deviant actions were identified. These were categorised according to the socio-technical model of risk management. At the organisational level, factors relating to the imposition of production pressure, as well as the failure to effectively monitor conditions and learn from past incidents or near misses were noted. These were seen to contribute to the development of factors pertaining to worker (e.g., inadequate staffing or supervision) and operation (e.g., use of inadequate procedures or tools) management, which in turn influence the working conditions of operators. Factors relating to operators' lack of knowledge or reporting were also noted.

We now aim to build on these findings by further exploring these contributory factors from the perspective of operators and those involved in daily operations within high-risk industry. We hope to identify and investigate the factors that are perceived to impact their ability to conduct tasks in accordance with operating procedures, as well as identify the factors that they believe are contributory to NoD. To investigate this we are conducting 9 semi-structured interviews with workers from within the energy industry. These focus on investigating participants' perceptions and understanding of the factors affecting their and others' safety behaviours, with specific questions exploring previous experiences of intentional or unintentional non-compliance.

Following the completion of the interviews, a directed qualitative content analysis will be used to analyse the data. The coding framework developed during the analysis of incident investigation reports will guide the coding process. This will allow for the further development of the framework and the identification of gaps or discrepancies. The aim is to complete the interviews by the end of October 2022, and for the subsequent analysis to be completed before the end of the year.

A core characteristic of normalisation of deviance is its insidious nature, meaning that those deviating from procedures are often unaware of their deviance, or have rationalised the deviation as

acceptable. As such, it should be noted that interviews may not be the most effective means of capturing the actual normalised deviations that are taking place. Rather, participants may rely on retrospective analysis of their actions and surrounding factors or may focus on observations of other workers. While still beneficial, it is likely that accounts may suffer from retrospective bias and/or a reliance on second hand reports and observations.

Regardless, the aim of research within this area, including that of the present study, is to improve the overall safety and wellbeing of workers and operators within high-risk environments such as those present within the energy industry sector. This is achieved through the study and development of strategies which improve the interactions between workers and the systems within which they operate. Findings from our research will hopefully help specify the intra-organisational factors that influence operator compliance and deviance normalisation within the energy industry. With the help of the framework, NoD specific risk assessments may be developed which will aid in the early identification of the phenomenon and the implementation of appropriate interventions. The framework may also be used as an aid in explaining the downstream effects of organisational factors on frontline workers' behaviours and attitudes.

Keywords: normalisation of deviance, procedure compliance, high-risk industry

Oral presentation OP601

Factors influencing mental ill health disclosure in the workplace: a two-part study

Hoda Hussein, Jo Yarker & Rachel Lewis | Birkbeck, University of London

science&practice

Background and importance of research Mental illness is a growing public health concern globally, with significant costs to employers and employees. 1 in 6 employees report depression, anxiety, and stress at any one time; 72 million working days are lost due to mental illness; costs of mental illness in England are estimated at 105 billion (GBP) per year, employees with a long-term mental health condition lose their jobs at double the rate to employees without a mental health problem (MHFA England, 2020; Stevenson & Farmer, 2017). Unfortunately, many people with mental ill-health experience stigma and discrimination. This can take place at various stages in the employment cycle including at the application stage of employment, during work and/or returning to work after a period off work due to mental illness, (Dinos et al., 2004; Hielscher & Waghorn, 2017). Consequentially, many employees question the impacts disclosure decisions relating to concealing or revealing mental illness at work. Yet, research has found that disclosure is also vital for employees to access work adjustments and support that can be beneficial to sustaining work (Brohan et al., 2012).

This two-part study answers calls to better understand the complexities related to the subject (Hastuti & Timming, 2021; Brohan et al., 2012). First, a systematic literature review (SLR) examines what is known about the factors influencing a decision to disclose or not to disclose a mental health problem in the workplace. Second, a qualitative empirical study addresses an identified gap in the literature and explores the conditions for a positive experience of disclosure of mental illness in the workplace.

Theoretical framework Goffman's (1963) theoretical framework is most widely used for disclosure decisions and consists of categorising the social world in two groups the "stigmatised" and the "normals". The stigmatised group are often discredited by the normal group resulting in the stigmatised group "passing" as normal and not revealing their stigma (Link & Phelan, 2001). With that in mind, it explains job applicants and employee's decision to conceal mental illness in the workplace. Organisational and environment social support also inform individual's decisions to conceal or reveal a stigma such as mental illness at work, Chaudoir and Fisher (2010) and Jones and King (2014).

Method: SLR Relevant literature was identified following PRISMA guidelines, encompassing the period 1980-2021.A data extraction tool was developed, and quality was assessed (Snape et al., 2019). Snape et al.'s (2019) quality assessment integrated guidance for assessing research quality for quantitative (GRADE) and qualitative research (CERQual CASP). A narrative synthesis was used to synthesising the data and the IGLOO (individual, group, leader, organisational and overarching contextual factors) model (Nielsen et al., 2018) was used as an analytic framework to provide a thematic understanding of the disclosure decision factors at the individual, group, line manager, organisation and overarching level.

Method: Empirical Study A qualitative study including 15 one to one semi-structured interviews was used. Interviews were recorded and transcribed. Analysis is ongoing and deductive and inductive thematic analysis will be used to identify themes at the IGLOO levels.

Results: SLR Searches yielded 48 studies which was systematically reduced to seven studies that met the inclusion criteria. Four of the seven studies adopted quantitative methodology and three

utilised qualitative methodology. Findings revealed use of small sample sizes, self-reported mental illness, homogeneous samples, and the use of measures of likelihood of anticipated disclosure in a hypothetical situation rather than lived experience.

The systematic review findings showed disclosure decision making as complex, and that one employee's enabler is another employee's barrier to disclosing mental illness in the workplace.

Results: Empirical Study Ongoing with overarching themes at the individual, group, line manager, organisational and outside level, available May 2023.

Limitations: SLR The SLR was limited to the search strategy adopted, however the research team consulted experts prior to conducting the search and were reflexive during the process.

Limitations: Empirical study The empirical study was limited to a small sample size from a UK population, while not longitudinal, this study extends our understanding of the lived experience of positive mental ill health disclosure at work

Conclusions The findings from the two-part study identified several factors at the individual, group, line manager, organisational level and outside the workplace that influence decision making when disclosing mental illness at work. The findings aim to offer practical insights to facilitate positive decision making to disclosure, advance knowledge of various stakeholder groups and embracing a workplace culture of true inclusiveness.

Keywords: Mental illness, disclosure, employment

Oral presentation OP277

Fair Work Labelling as An Intervention to Reduce Inequality: How Would Consumers React to Fair Work Information Disclosure?

Shuting Liu, Juliette Summers & Boyka Bratanova | University of St Andrews

science

In the awake of the role played by organisations, a recent intervention for controlling inequalities has been to mandate disclosure of information on an organisation's pay practices to the general public. Although the potential of information disclosure to reduce inequality has been widely recognised, it has not been yet materialised. We propose that a direct link between the disclosed information and consumers' awareness of it at the point of choosing which organisation to support through their purchase can help realising that potential. Inspired by the successful fair-trade movement and research on other social labelling programmes, we propose a fair work label, which discloses a combination of information on an organisation's pay practices and employee's subjective experiences of work (i.e., CEO-to-worker pay ratio, gender pay gap, real living wage, and employee satisfaction), might provide the link between information that is already available in the public space and consumers. We conducted three experiments to examine how Scottish citizens would respond to fair work information disclosure in their role as consumers. Study 1(N=175) and Study 2 (N=140) adopted a between-group experimental design, while Study 3 (N=127) employed a pre-post design with real organisations to examine whether fair work information disclosure would induce changes in consumers' perceptions and attitudes.We found that Scottish residents perceived fair work labelled fictitious organisations as caring for consumers and employees, and were more likely to trust, buy from and even pay more for products of labelled organisations. Our preregistered pre-post experiment also indicated that fair work information disclosure indeed exerted an effect on consumers' perceptions and attitudes towards organisations that they already had previous experience. Furthermore, we also found that organisations with bad performance in fair work criterion were more likely to be boycotted.

There two main limitations. First is the question of how externally valid these findings are. It would be useful for future research to address the external validity of findings via field experiments. Second is that none of the four elements we included in the fair work label directly address procedural justice-the third dimension of fairness, nor employees' voices—a dimension of fair work initiative. This is due to the lack of clear, objective, and available measurement. Future research might focus on measurements development and the effects of fair work label when they are included in the framework.

The current research extends the literatures on public disclosure of pay, intraorganisational inequality, and more broadly interventions for controlling socioeconomic inequalities. Moreover, the current research also has some potential implications for organisations and policymakers. Scotland, where our studies were particularly targeted, has expressed its ambition of building an inclusive economy for all, outlined fair work initiative as one key action to achieve inclusive growth. However, the existing framework of fair work has not directly called to vertical pay inequalities within organisations nor provided clear definitions or objective measurements for existing dimensions. Although the Fair-Work initiative is a part of building inclusive economy, consumers have not yet been included into the conversation. The researcher-constructed Fair Work label might be a way to increase the involvement of consumers both in building inclusive economy and tackling social inequalities. Furthermore, this research answers the call from the "Build Back Better" movements.

Current research evidenced that consumers can be engaged as a player in the inclusive recovery of the economy after the pandemic and it is achievable through fair work labelling programme.

This research is highly relevant to the Congress theme in three ways. First, the broad issue we targeted – socioeconomic inequality – has illustrated its urgency through previous evidence on its relevance to various social and health problems. Such urgency motivates us to investigate what else can be done to change the status quo. Second, this research was built on the blueprint for an inclusive economy in Scotland. Being like political democracy in which citizens vote on the political leadership, citizens also "vote" on how organisations look like in the future in their role as consumers. A future of more inclusive and sustainable economy not only requires professionals' dedication but also contributions from every citizen. Third, considering that both tackling socioeconomic inequalities and building inclusive economy need contributions from the public, this research provides a possible way to achieve the democratic participation to broader economy.

This research relates to several UN SDGs, including gender inequality, decent work and economic growth, reduced inequalities, and responsible consumption and production.

Oral presentation OP494

Fairness in Diverse Teams and Team Cohesion

Munazzah Iqbal, Aston University; Yves Guillaume, University of Liverpool; Pawan Budhwar & Jonathan Crawshaw | Aston University

science&practice

Research Goals

Deep-level diversity refers to the differences between individuals in their psychological characteristics, including personality, attitudes, and values (Harrison et al., 2002). Our study explores the role of deep-level diversity in teams as a predictor of team justice climate and, in turn, team cohesion. We also examine the role of ethical leadership as a moderator of these effects.

Theoretical Background

Drawing on similarity-attraction theory, we propose that the emergence of shared justice perceptions in teams is contingent upon deep-level differences (or similarities) among team members. In short, in deep-level diverse teams individuals may limit the sensemaking interactions with their teammates that help to inform their justice judgments. In turn, this vacuum of information may lead to low perceived distributive, procedural and interactional justice. We propose the following hypothesis:

H1: Team sensemaking mediates the negative relationship between deep-level diversity and team distributive, procedural and interactional justice perceptions.

In turn, and drawing on uncertainty management theory, we argue that perceptions of team justice climate will be positively related to team cohesion (Nauman & Bennett, 2000). However, we propose that ethical leadership may moderate this relationship. In short, we argue that collective perceptions that a team leader is unethical creates uncertainty in the team, thus making more salient issues of organisational and team leader (in)justice. We propose the following hypothesis:

H2: Team distributive, procedural and interactional justice perceptions are positively related to team cohesion and mediate the positive relationship between team sensemaking and team cohesion, and this relationship is stronger when perceptions of ethical leadership are low.

Design and Method

A multi-source cross sectional survey study was conducted in the Middle East. The sample was composed of 249 individuals working across 58 teams in two hospitality organizations. Team members rated perceived deep-level diversity, team sensemaking, distributive, procedural and interactional justice climate, team cohesion, and ethical leadership. Team leaders rated perceived deep-level diversity, team sensemaking, and team cohesion. Data was aggregated at the team level and hypotheses were tested using SPSS and Hayes's PROCESS Macro (Models 4 and 14).

Results

Overall, we found partial support for our model. As hypothesised, team sensemaking was found to mediate the negative relationship between team deep-level diversity, procedural and interactional justice climate (but not team distributive justice climate). We also found that team interactional justice climate (but not distributive and procedural justice climate) was, in turn, positively related to

team cohesion and that this relationship was stronger when team perceptions of ethical leadership were low.

Limitations

A number of limitations are recognised. First, while a sample of 58 teams is reasonable this is still small and may impact on our confidence regarding the salience of our findings. Second, this is a cross sectional study, and while multiple sources of data were collected, we cannot with any confidence test the causal relationships in our model. Finally, our Middle Eastern and hospitality context is specific and may limit the generalisability of our findings to other contexts. Future research should seek to overcome these limitations.

Research/Practical Implications

Our study highlights the importance of deep-level diversity as a potential predictor of team justice climate and cohesion. Managers, therefore, should consider deep-level differences when composing teams and highlight – through training to both managers and employees – the significance of the deep-level aspect of diversity and inclusion. Moreover, the study highlights the potentially important role of ethical leaders in supporting and enabling deep-level diverse teams, and organisations should seek to develop and recruit/appoint ethical team leaders.

Originality

We provide the justice climate literature with a new deep-level diversity lens through which team justice and cohesion may be better understood. We also contribute new empirical research to the ethical leadership literatures, examining – for the first time – the role of ethical leadership as a boundary condition of the effects of deep-level diversity, sensemaking and justice climates. Finally, we provide much needed research on this issue in a Middle Eastern context.

Relevance to the Theme

In a team-led work environment, the manager's roles and behaviours are crucial for the effectiveness of teams. Our study highlights the need for greater sensemaking within diverse teams to encompass its impact on team members' perceptions of justice and the importance of employing ethical leaders to manage and lead teams effectively.

Keywords: Fairness, Deep-level Diversity, Ethical Leadership

Oral presentation OP161

Fake it 'til you make it – An investigation into current Impostorism research and development of the Occupational Impostorism Scale

Nora Berghoff, Kerrie Unsworth & Chiahuei Wu | Leeds University Business School

science

The impostor phenomenon (IP), also known in popular culture as imposter syndrome or impostorism, describes a subjective feeling whereby people perceive themselves as frauds, despite objective evidence of success and accomplishment. Initially observed in professional and successful women in their psychotherapy practice, Clance and Imes (1978) used the term, Imposter Phenomenon, to describe individuals who were not able to internalize their success, suffered from fear of failure and felt undeserving of their achievements. In the workplace, impostor feelings are frequent (Harvey & Katz, 1985) and detrimental to job attitudes (e.g., Vergauwe, et al., 2015), behaviours (e.g., Vergauwe et al., 2015), and career-related outcomes (e.g., Neureiter & Traut-Mattausch, 2016).

Even though the IP is a widely researched and popularised construct, researchers have not based their research on a common conceptualisation of the phenomenon, giving prominence to more distal attributes of the concept (e.g., self-esteem, personality traits, anxiety) instead of determining the core of the phenomenon. This becomes evident when reviewing the literature: several definitions and conceptualisations have arisen throughout the last few decades, each of them pointing out the problems and shortcomings of the previous one (e.g. Leary et al. 2000; Kolligian and Sternberg, 1991). Resulting from conceptual ambiguities is a lack of appropriate and psychometrically sound measurement of Impostorism (Mak et al., 2020).

This study fills the caveat resulting from previous Impostorism research. By having reviewed the emerging topic of Impostorism in several research areas, we clarify the nature of Impostorism in the workplace by providing a clear theoretical framework with which to examine the construct, accompanied by a newly developed scale to measure Occupational Impostorism (OI). Anchored in a self-regulation/cybernetic control theory framework, OI is defined as a person's subjective feeling of fraudulence when doing one's job. Underlying this experience is a discrepancy between one's self-appraisal (i.e., one's skills, abilities, and experiences) and the formal requirements of a job role. Since self-discrepancy processes have been picked up on (but not sufficiently elaborated on in its role for OI) (e.g., Tewfik, 2022; McElwee & Yurak, 2007), we build on this perspective to advance the development of a scale capturing the feelings of fraudulence stemming from this precise imbalance.

A classic scale development approach (DeVallis, 2012) was chosen for this study. The first stage focused on generating items to capture the Occupational Impostorism construct based on a literature review with reference to previously developed scales to measure impostor constructs. Content validity was assessed by having PhD students of the university's management department rate the suitability and readability of 12 items. In the second stage, online data of 266 UK residents at two timepoints were collected. Exploratory factor analysis (EFA) was used to reduce the number of items and assess the scale structure and properties. The nomological network was checked to establish that the scale assessed a distinct construct and explained additional variance in relevant organisational and general outcomes. Construct validity was assessed by correlating scores on the scale with those of constructs from the nomological net. Results show that the OI scale has high reliability, with a Cronbach's alpha of .94 and shows appropriate correlations with related and distinct constructs. Using a second sample, confirmatory factor analysis (CFA) will be used to test the

identified factor structure upon completion of the next data collection phase in December 2022. However, the study design and methodology bear some limitations. Since this scale development study is embedded in a larger PhD research project, the scope of data collection and sample sizes are limited. Furthermore, future research needs to validate the scale in multi-national samples to confirm cross-cultural generalisability.

By providing a solid theoretical foundation from which to examine this emerging construct with a psychometrically sound measurement, this study contributes to workplace behaviour and Impostorism research and practitioners' understanding of how to support employees' OI experiences. Thereby, this study contributes to the UN Sustainable Development Goal of fostering good health and wellbeing and integrates well with the congress theme – our study emphasises that the emerging construct of impostorism should receive more attention in management and organisational behaviour research and in the workplace, since it can have a strong impact on employee's work behaviour, their attitudes and performance outcomes; a better understanding of the phenomenon will contribute to better workplace wellbeing and health, thus contributing to a positive change in in the world of work.

Keywords: Impostor phenomenon, scale development, self-regulation

Oral presentation OP59

Feeling stuck: How does career plateauing affect emotions and counterproductive work behaviours?

Kara Ng, Alliance Manchester Business School; Wei-Ning Yang, King's Business School

science

Research goals

Although career plateauing has been studied for decades, we know very little about how it affects employees' emotions and behaviours. Early theorists suggest that plateauing is a universally unpleasant phenomenon and leads to similarly unpleasant emotions, like frustration or anger. Moreover, early researchers have proposed that plateauing is associated with unethical acts, like counterproductive work behaviour (CWB), though these claims have not been rigorously tested.

Theoretical background

Career plateauing describes a subjective state in which employees perceive that, in their current role, their chances of future promotion (hierarchical plateau) or new opportunities, responsibilities, challenges (job content plateauing) are very low. It has been associated with poor outcomes, such as worse well-being and job attitudes. Although early researchers have linked career plateauing with both negative emotions and unethical behaviours, these claims have been untested or poorly tested (e.g., with correlational and/or cross-sectional methods). Further, researchers have not offered theoretical explanations as to why plateauing is linked with feeling 'bad' and employee deviance.

To elucidate the theoretical mechanisms linking plateauing and CWB, we draw on the stressor-emotion model of CWB and situate plateauing as a stressor. The stressor-emotion model also emphasises how stressors are subjective, as individual differences influence the extent to which we perceive job or environmental factors as stressful. Specifically, employees who view plateauing as a threat are likely to experience negative emotions, which means they are more likely to engage in destructive behaviours as a way to relieve frustration and anger. We propose that emotion regulation ability moderates this relationship, such that employees with lower emotion regulation ability are less able to recognise and manage negative emotions caused by plateauing, leading to maladaptive responses, like an increased tendency to CWB. Alternatively, employees with higher emotion regulation ability are better able cope with unpleasant feelings, leading to them reporting experiencing fewer negative emotions and subsequent CWB.

Design

This study was part of a wider project on plateaued employees. Data were collected using a three-wave survey of 193 working adults.

Results

Using SPSS and PROCESS, we found that both plateauing types were related to negative emotions, but not to CWB. Rather, plateauing was indirectly related to CWB, only via negative emotions. Lower emotion regulation ability strengthened the relationship between only job content plateau and negative emotions, while higher emotion regulation ability had no moderating effect.

Limitations

We conceptualised negative emotions as a general construct. Future researchers may wish to examine this model using discrete emotions, such as anger or sadness. We conducted our surveys at the height of the COVID-19 pandemic; this extraordinary, exogenous event may have affected how participants perceived their work, how they experienced negative emotions, and the extent to which they could engage in CWB.

Research/Practical Implications

Regarding research implications, we examine early claims that plateauing leads to destructive behaviours; claims which weren't well supported empirically and lack theoretical explanation. By contextualising plateauing in an established CWB model, we elucidate plateauing's emotional and behavioural outcomes, and show how emotions play a role in whether plateaued employees engage in CWB. To explain why only low emotion regulation ability moderated only job content plateauing, we suggest that experiencing job content plateauing may encourage worse emotional states that are beyond one's emotion regulation ability. Past work suggests job content plateau is associated with boredom and depression, employees may feel less stimulated and there is a greater chance for them to engage in dysfunctional cognitive processes, like rumination, which can worsen one's emotional states.

Regarding practical implications, we show that plateauing itself is not harmful. Managers should therefore not see plateaued employees as inherently problematic. While we acknowledge that plateauing is inevitable in many workplaces, managers can try to reduce job content plateau, as it results in more negative emotional states and has harmful organisational implications, as employees are more likely to engage in CWB. Managers may seek to reduce job content plateau through participative interventions, such as job redesign.

Originality/Value

Our study is one of the first to examine career plateauing's emotional and behavioural consequences using stronger empirical methods. We highlight how plateauing is not only leads to individual-level harm, but also affects the workplace at the organisational level.

Relevance to the Congress Theme

Careers and the labour market

Relevant UN SDGs

Decent work and economic growth

Oral presentation OP60

Female entrepreneurs need to be self-efficient and not risk-taking: The validity of personality differences throughout the entrepreneurial journey

Alina Gerke, Hochschule Bonn-Rhein-Sieg; Benedikt Hell, Fachhochschule Nordwestschweiz; Nale Lehmann-Willenbrock, Universität Hamburg; Peter Muck & Patrizia Ianiro-Dahm | Hochschule Bonn-Rhein-Sieg

science

Research goals and why the work was worth doing: The aim of the present research was to examine interindividual differences in personality traits among female entrepreneurs throughout the entrepreneurial journey. In particular, we aimed to examine whether successful female entrepreneurs differ from less successful ones in their personality traits and which personality traits are relevant at different entrepreneurial phases. This is important as research so far has suffered from an overemphasis on male entrepreneurs as women are still underrepresented in the start-up scene. This work a) contributes to existing knowledge on female entrepreneurship and b) helps integrating the process perspective into empirical entrepreneurial research.

Theoretical background: In recent years, there has been growing interest in successful entrepreneurship, however, little is known on female entrepreneurship. Most studies to date either neglect a gendered perspective, the consideration of entrepreneurial success variables or the investigation of the entrepreneurial journey as a multi-phased construct. In summary, research to date has a) not been able to provide satisfactory data on successful female entrepreneurs and b) not empirically tested the importance of specific personality traits holistically across the entire entrepreneurial journey. This is important as the phases pose different demands on the individual, hence, it is likely that the relevance of personality traits changes during the entrepreneurial process.

Methodology: Data on personality and perceived, phase-specific success variables were drawn from a cross-sectional study with N = 305 female entrepreneurs in the DACH-region. Data were collected via a self-assessment tool for entrepreneurs. The research questions were elaborated using independent t -tests and multiple regression analysis.

Results: The results showed that successful and less successful female entrepreneurs significantly differed in eight out of twelve personality traits. The largest differences were found for proactivity, self-efficacy, need for achievement, and internal locus of control, which were more prominent in successful female entrepreneurs than in their less successful peers. Successful females also showed a higher need for autonomy, higher innovativeness, openness, and perseverance. Interestingly, risk-taking, an often-studied personality construct in entrepreneurial research, was not identified as a success driver for female entrepreneurs. Furthermore, phase-specific findings point to the importance of self-efficacy throughout the whole entrepreneurial journey. Need for autonomy was important for pre-launch and launch, while locus of control was important for pre- and post-launch, but not for the launch phase. Again, risk-taking was not a crucial trait for female entrepreneurs in any phase as it did not correlate with phase-specific success.

Limitations: The generalizability of the results might be influenced by the use of cross-sectional and self-reported data. Future research should enhance a longitudinal design with multiple data sources to avoid common method bias. Also, the data might be affected by an overrepresentation of successful entrepreneurs. Furthermore, the study had a focus on personality. Future studies should extend the analyses to other potential success factors, such as access to funding, team composition, personal socio-economic status or micro- and macroenvironmental country-specific factors.

Conclusions: A female-specific lens for both, practice and research, is needed. The study points to the importance of self-efficacy for female entrepreneurs for overall and phase-specific success. Hence, trainings or coachings should concentrate on increasing female's self-efficacy and belief in their entrepreneurial skill-set. Furthermore, coachings and trainings should be designed more specifically to what female entrepreneurs really need in a certain phase, not only in regard to self-efficacy, but also in regard to other traits, e.g innovativeness or proactivity. The investigated personality traits, which were crucial for perceived success, should not be understood as a certain typology of "the" female entrepreneur, but should rather be interpreted in terms of a strengths-and-weaknesses profile.

Relevance to the Congress Theme: The study contributes to the congress theme in the sense that we focus on current issues such as gender and equality in connection with start-ups and entrepreneurship as important future topics in today's working world. Therefore, the study sheds light on the subtheme of "creativity, innovation and risk-taking".

Relevant UN SDGs: The study contributes to the goal of gender equality as we derive implications for a gendered perspective in entrepreneurial education and reinforce support formats that specifically address the needs of women.

Keywords: Female entrepreneurship, self-efficacy, risk-taking

Oral presentation OP123

Finding a Silver-lining in Presenteeism: Examining the antecedents and consequences of autonomous versus controlled motivation for presenteeism

Qin Zhou, Leeds University Business School, UK; Tinkuma Edafioghor, University of the West of England; Chiahuei Wu, Leeds University Business School, UK

science

Research goals and why the work was worth doing

Working while sick, or presenteeism has attracted increasing research attention due to its significant impacts on employees, employers, and various stakeholders. While much research has been done to understand this important phenomenon (Lohaus & Habermann, 2019), there are two important limitations. First, although literature suggests that employees may have different motives for presenteeism, there is a lack of research to systematically differentiate them; even less has been done to understand the antecedents and consequences of these motivations. Second, while much research has identified a wide range of personal and contextual factors leading to presenteeism, and the outcomes of presenteeism, research has yet to examine the mechanisms that explain the relationships between antecedents and outcomes of presenteeism. Thus, in line with self-determination theory (SDT) (Deci & Ryan, 1985), this research aims to: 1) differentiate autonomous versus controlled motivation for presenteeism; 2) examine if autonomous versus controlled motivation for presenteeism mediate the impacts of ego resiliency and wellbeing supervisor support behavior (WSSB) on task performance and emotional exhaustion.

Theoretical background

According to SDT (Ryan & Deci, 1985), individuals who are internally driven or experience the support of basic psychological needs from the external environment are more likely to develop intrinsic and internalized motivation for their behavior, leading to better performance and well-being. Based on the theory, this research proposes 1) ego resiliency and WSSB are positively related to autonomous motivation but negatively related to controlled motivation; 2) while autonomous motivation positively relates to task performance and negatively relates to emotional exhaustion, controlled motivation negatively relates to task performance and positively relates to emotional exhaustion. 3) autonomous motivation mediates the relationships between ego resiliency/WSSB and task performance/emotional exhaustion; in parallel, controlled motivation mediates the relationships between ego resiliency/WSSB and task performance/emotional exhaustion.

Methodology

To test our proposed model, we conducted two empirical studies. In Study 1, we used data obtained from 240 full- and part-time employees recruited via Qualtrics. In Study 2, we replicated the study with a time-lagged design with data obtained from 190 full-time employees of the subsidiary of a multi-national company in China. All the participants in the two samples had varying levels of presenteeism behavior in the last three months prior to the data collection. Both studies were conducted between April and October 2021.

Results

The results showed that (1) both ego resilience and WSSB are positively related to autonomous motivation for presenteeism, but not controlled motivation for presenteeism; and (2) autonomous motivation is positively related to task performance, but negatively related to exhaustion; in

contrast, controlled motivation is positively related to exhaustion but negatively related to task performance. (3) autonomous motivation mediates the relationships between ego resilience/WSSB on task performance.

Limitations

This research has some limitations which suggest directions for future research. First, our studies were based on self-reports. This gives rise to the possibility of contamination of the reported relationships due to common-method bias (CMB). Future studies can improve the design by including data from other sources. Second, although our results were consistent with theory, the causal effects of the relationships discussed in our studies cannot be clearly determined, future research needs to use experiments to ascertain the causality and reciprocity of the study variables.

Conclusions

This research offers several important theoretical and practical implications: first, our research differentiates two different motives for presenteeism. By demonstrating their different impacts on task performance and emotional exhaustion, our research highlights the importance of examining the motives behind employees' presenteeism behavior. While autonomous motives can benefit performance and well-being, controlled motives can harm both. Second, our research provides evidence for the utility of SDT, unpacking why individual personal factor (ego resiliency) and contextual factor (WSSB) can influence the outcomes of presenteeism both in terms of performance and well-being.

Relevance to the Congress Theme

This research is relevant to the theme of employee wellbeing. Our research goes beyond the previous research which sees presenteeism as universally negative and provides a more nuanced understanding of this important phenomenon.

Relevant UN SDGs

This research is relevant to two UNSDGs: good health and well-being and decent work and economic growth.

Keywords: motives for presenteeism, ego resiliency, wellbeing supervisor support behavior

Oral presentation OP796

Finding and developing Game Changers to transform organisations

Nigel Evans, NEC, UK; John Mervyn-Smith, The GC Index, UK

science&practice

Background: Innovation and transformation are much mythologised in business storytelling. The economic need for growth requires doing transformation well, particularly identifying people who think differently and who can focus on making it happen. As the result of a corporate client asking 'what are the differentiating characteristics of people who can drive transformational change?' the researchers were able to more scientifically investigate what makes a game changer.

Goals: This paper presents the development of an Index, represented as an Organimetric, that measures and describes proclivities, rather than personality. Case studies will show that when it comes to making an impact, the language and concept of proclivities both resonates and is practical, as it can rapidly be applied at the individual, team and organisational level.

Methods: The development of the Index is described. Three years of research followed in 3 main phases: Phase 1 was an initial exploration of the characteristics of these individuals - called 'Game Changers' - using Repertory Grid interviews which yielded 180 observations from 20 interviews. Phase 2 built on phase 1 suggesting defining characteristics for Game Changers under 2 broad constructs: Imagination and Obsession. External experts were involved to test a set of items designed to measure individual differences in the perception of Imagination and Obsession. Phase 3 expanded initial interest in Game Changers on the basis of self-perception data. As a result of feedback with talent specialists, a factor analysis of 1000 completed questions was completed to explore the meaning of different responses to the questionnaire, e.g. how to make sense of people who score low on both Imagination and Obsession?

Results: Game changers do exist, so do four other distinct proclivities. The three phases of research yielded reliable and valid measures of five different proclivities when it came to making an impact at work. These differences are now represented as an Organimetric identifying both individual and collective impact of how people contribute to the achievement of strategic goals.

Limitations: Case work was originally based on UK samples. Whilst ongoing international sampling has found very few differences across group proclivity scores, more data needs to be gathered to fully confirm, and replicate the formative validation studies.

Conclusions: Through a series of practical application case studies, the Index is shown to provide a language and framework that can be used to inform key business decisions (from talent management to digital transformation) across a range of organisations and sectors for human benefit and economic growth.

Relevance to the conference theme: The future is being created now through the ideas of Game Changers, alongside their effective collaboration with colleagues of different proclivities, to make transformation happen. The Index provides an inclusive approach by acknowledging the diversity of thought and action that come from different proclivities.

Keywords: Change, Innovation, Development

Oral presentation OP289

Flattering to deceive: Understanding the disparity between obligations and actions to support employee wellbeing

David Watson, Norwich Business School, University of East Anglia; Matteo Ronchetti, Department of Occupational and Environmental Medicine, Epidemiology and Hygiene, INAIL—Italian Workers' Compensation Authority; Claudio Barbaranelli, Sappienza University of Rome

science&practice

Research Goals: It is not only what organizations do in relation to employee wellbeing that matters, but also how this is perceived by employees and the extent to which it meets expected obligations. If organizations are not regarded as authentic in pursuing wellbeing they are unlikely to effectively support employee wellbeing. The disparity between organizations' obligations and their actions on employee wellbeing as perceived by employees is likely to be critical to our understanding of employee experiences and wellbeing more specifically. Our aim was to investigate this. We developed and tested a new scale, 'Perceived Organizational commitment to Wellbeing' (POW) that measures employees' perceptions of their employers' obligations and their actions. In short, what employers do in relation to wellbeing, but also what they should do and importantly the disparity between the two. This is a key contribution to literature on organisational and employee wellbeing.

Theoretical Background: Existing concepts and measures such as psychosocial safety climate (PSC), aim to capture the extent to which organizational climate supports employee wellbeing but do not account for the perceived gap in obligations versus the support they provide for employee wellbeing. Psychological contract theory understands the relationship between employee and employer as a social exchange based on the norm of reciprocity, whereby the terms of the employment contract are constructed psychologically. Terms of exchange are typically considered as economic (transactional) and social (relational), but ideological is another dimension that highlights the importance of alignment between employer and employee perceptions and "contract breach" arising from disparity. Our research underlines the importance of how an organization pursues or realizes employee wellbeing in ideological, relational and transactional terms and whether this aligns with perceived obligations.

Research Design: We developed the POW scale by adopting a multi-method multi-study approach. Initial scale items were informed by the theoretical background and case study research of organizational wellbeing. After developing an initial list, we sought qualitative and quantitative feedback on these items from a group of experts on organizational wellbeing. Following this, the validation of the scale and the posited model were investigated through three quantitative studies. Study 1 included 307 UK employees (69% women). Study 2 and Study 3 were 3-wave studies. Study 2 included at T1 523 UK employees (44% women), and Study 3 included at T1 512 UK employees (34% women). Structural equation modelling was used for all the analysis.

Results: Results of the Confirmatory Factor Analysis (CFA) evidenced the good fit of the POW CFA model assessing both perceived obligations and actions for wellbeing. Results also showed that the two POW dimensions were different from existing related measures of organizational wellbeing climate. All the three studies attested the suitability of the POW scale to assess the disparity between perceived obligations and actions for wellbeing. Finally, we found support for our hypothesized model: A disparity in obligations and perceptions of employer actions towards employee wellbeing at T1 was associated to higher imbalance in Efforts and Rewards at T2 that in turn was associated to poorer employee wellbeing at T3 (Study 2: (SBχ2(213) = 354.010, p <.001; CFI = .98; SRMR = .063,

RMSEA=.036, 90%CI: .029 .042, p=1.00. Study 3: (SBχ2(213) = 294.174, p <.001; CFI = .99; SRMR = .058, RMSEA=.027, 90%CI: .019 .035, p=1.00).

Limitations: We present evidence for the validation and application of a new scale, which is yet to be extensively tested. However, our initial analysis uses a robust range of methods to establish validity and in its application supports hypothesized relationships with employee wellbeing.

Conclusion: The POW scale demonstrates the importance of understanding the disparity between employee perceptions of what actions employers should take versus what actions they are perceived to take in relation wo wellbeing. POW is likely to have further application in understanding the importance of employees' perception of organizational wellbeing and has potential for exploration with a range of other variables and multi-level analyses. Cross-cultural variation in POW is also another interesting avenue for further research.

Relevance to Congress Theme: The experience of the COVID-19 pandemic over the last two years has underlined the agenda for employee wellbeing that was already established as an important responsibility and goal for organizations. Our paper establishes a new scale that can help organizations and employees better understand how to address employee wellbeing genuinely and effectively.

Keywords: Organisation, Well-being, Scale validation,

Oral presentation OP541

Focus Time – Reducing stress and increasing productivity

Kasper Edwards, Technical University of Denmark

science&practice

Motivation and research goal

Knowledge workers are under increasing pressure to increase productivity. Tools and systems like SCRUM and Agile are used to streamline processes and ensure that agreed tasks are delivered. This works well when the knowledge workers can devote their full time to the projects.

When the knowledge workers also have a reactive role towards the organization e.g. support and development of new business ideas they get interrupted often. Knowledge work requires focus and preparation before actual work can be done. Preparation can be reading up on specs and understanding the problem. This mental preparation leads to solving the task and interruptions during this process mean the process has to be restarted and time is lost.

Hence interruption of knowledge workers has a detrimental effect on productivity and wellbeing as it leads to a sense of being unable to complete any tasks.

The purpose of this research was to examine if dedicated and uninterrupted time - Focus Time - to complete knowledge-intensive tasks would have a positive influence on productivity and wellbeing.

Study design

A programming department (33 employees) and a communication department (7 people) from a Danish insurance company participated.

During a 5 week experiment the participants agreed to:

Book up to 5 hours a week of Focus Time in their calendar

Every morning they should reflect on the most important tasks and plan their work.

All participants were offered a free Garmin fitness watch if they were willing to wear the watch and share pulse and stress data with the project.

We collected data on Focus Time from the participants calendars (outlook) and linked the data to the Garmin data.

We used Garmin's stress score, which is measured as heart rate variability (Garmin, 2020) as our measure of stress. Participants used the watches two weeks before the experiment for the watches to calibrate and create a baseline.

Following the experiment, we conducted focus group interviews with 16 participants.

Results

During the first week of the experiment, only few participants engaged in Focus Time. A pit-stop meeting in week two revealed that participants were not comfortable with signaling that they were not available to the rest of the organization. Availability was considered to be highly important to remain relevant for the organization. The managers had used Focus Time and praised it at the pit-

stop. This changed the perception and participants started using Focus Time. A key learning here is that managers must show the way by example for people to follow.

Not all employees used Focus Time which allowed us to ascertain the effect of Focus Time. Employees using Focus Time changed their physiological stress pattern and had a higher frequency of stress activation in the morning compared to the non-Focus Time group. The Focus Time group showed lower stress activation in the afternoon compared to the non-Focus Time group. The non-Focus Time group exhibited the highest stress activation in the afternoon toward the end of work.

This was cooperated by the interviews which showed that Focus Time and morning planning changed work patterns so that important tasks were prioritized and completed during Focus Time. Without Focus Time and morning planning employees started working on the task that was on top of their minds perhaps because they were randomly asked about a project. This meant that the first half of the day was spent on relevant but not important tasks. Approaching midday/afternoon they realized that some important tasks had to be completed and they scrambled to do so resulting in high stress activation. A further negative consequence was that the group without Focus Time and morning planning also experienced more overtime work.

Limitations

This study is limited to two departments in a single company. The experiment was done as an intervention with no comparison group. However, we established a baseline before the experiment. Further we were fortunate that a portion of the employees did not follow the guidelines allowing us to compare the two.

The study design does not allow us to separate the effect of Focus Time and Morning planning.

The researcher participated in planning and executing workshops as well as interviewing which may lead to biased inference and conclusion.

Conclusion

Focus Time and Morning planning can positively influence wellbeing i.e. reduce stress activation, reduce overtime and increase sense of accomplishment.

The experiment ran for just 5 weeks demonstrating that it is possible to make significant changes in work patterns leading to positive effects on employee wellbeing in a short period of time.

Relevance to Congress Theme

The study is relevant as it points to changes that can be made now to address the urgent problem of stress in knowledge work. The use of tracking stress activation with non-intrusive devices is an important next step in understanding the wellbeing effects of organizational interventions.

Keywords: Intervention, stress, productivity

Oral presentation OP209

Folie à deux : How Mavericks shape the relationship between the dark and light personalities and deviant behaviors

Daniel Silva, UBI/NECE; Ana Junça Silva; Paulo Pinheiro

science&practice

Theorectical background:

Deviant behaviours have mostly been investigated for their negative. Studies have linked deviant personality traits to equally deviant, however not all personalities are deviant and not all deviant behaviours have negative impact or intent.

In the field of extreme personality traits, two combinations stood out. The dark triad (DT), a trident of subclinical personality traits of narcissism, Machiavellianism and psychopathological traits mostly associated with detrimental effects within organisations. On the positive side of personality traits, the triad of light (LT) is defined as a constellation consisting of three personality dimensions - belief in the goodness of living beings (faith in Humanity), valuing dignity and every living being (Humanism) and treating people fairly and humanely (Kantianism). Not surprisingly, LT is linked to a set of positive impacts on the organisation in the form of individual outcomes such as leadership, resilience, creativity and performance.

Surprisingly maverickism, has not received much attention from the organisational sciences. Mavericks exhibit a personality characterised by being disruptive, translating into unconventional, creative, dynamic behaviours and an apparent disregard for organisational norms and policies. Characteristics such as dynamism, goal focus, creativity and disruption are critical to the innovation process and organisational survival in troubled times. Although there is a negative connection with maverickism, recent studies, associate it with positive organizational outcomes.

Deviant behaviours have mostly been investigated for their negative impacts. Studies have linked deviant personality traits to equally deviant behaviours, however deviant behaviours have mostly been assumed negative, with positive deviant behaviour being neglected.

Purpose:

Based on Trait Activition Theory (TAT) context can interfere with the relationship between personality traits). TAT presents a condition that is intrinsic to the individual in the form of personality traits and skills/abilities that being latent, are activated under certain contexts in order to obtain an intrinsic reward. Supported by the Trait Activation Theory our model analysed whether maverickism would moderate the relationship between the three dimensions of the Dark Triad, Light Triad and deviant behaviours (positive and negative).

Methodology: to achieve our proposed goal, we used a sample of 200 currently employed participants.

Findings: The results showed that individuals who scored higher on Dark Triad traits engaged in more negative deviant behaviours and individuals who scored higher on Light Triad traits engaged in more positive deviant behaviours. However, the mavericks intensified the engagement in each behaviour corresponding.

Limitations: The cross-sectional design should be regarded as a limitation, and we assessed all the variables through self-reported measures.

Originality/value: Such results allow a better understanding of employees' behaviour and extreme personality traits. It also allows understanding the relationship between maverikism traits and extreme personality traits, and what outcomes result from this coexistence. The present study is a warning sign for managers, mainly those in human resources, as well as an opportunity to develop mechanisms to identify the coexistence of such traits and/or create environmental and inter/intrapersonal conditions that suppress or exponentiate their impact.

Relevant UN SDGs: (3) Good Health and well-being; (8) Decent work and economic growth and (16) Peace, justice and strong institutions

Keywords: dark triad, light triad, deviant behaviors

Oral presentation OP600

Friendly Phantoms: How do individuals use their feared selves to construct a positive work identity?

Neveen Mohamed, Vlerick Business School - Ghent University; Katleen De Stobbeleir, Vlerick Business School - KU Leuven

science&practice

Research goals

How individuals think about their potential and themselves in the future has been the focus of research on "possible selves" in management and social psychology (Ibarra, 1999; Markus & Nurius, 1986). A person's possible selves include who they would like to become, i.e., desired or wanted selves and who they want to avoid becoming, i.e., feared or unwanted selves (Markus & Nurius, 1986). Research shows that people strive towards their desired selves and avoid their feared selves (Carver et al., 1999). We aim to extend prior research and explore the role of the feared selves in achieving positive identity outcomes. Specifically, we ask the following research question: How do individuals use their feared selves to construct a positive work identity? This is important because the contents of people's feared selves contain internalized unwanted emotions, hence, have stronger influence on motivation and goal-directed behavior (Carver et al., 1999). As such, these self-representations may constitute clearer self-guides for individuals to work on their identities.

Theoretical background

Research on possible selves has predominantly focused on how people continuously strive for their desired possible selves (e.g., Ashforth et al., 2014). For example, Ibarra (1999) described how newcomers experimented with their provisional selves by imitating their role models based on how they saw & desired to see themselves. It is surprising that the implicit assumption underlying most of the research is that individuals shape their work identities solely via their attraction to a desired self. Social psychology research, however, explored the self-regulatory role of both desired & feared selves. A very limited number of organizational studies examined the role of unwanted selves in the development of a work identity (i.e., Petriglieri & Stein, 2012; Vince & Mazen, 2014). These studies highlight the negative impact of leaders' unwanted selves. A question that still remains is whether people's feared selves may have benefits as well.

Methods

We draw on qualitative data from 68 independent workers in the UK to build a grounded model that addresses our research question. Independent work is a relevant context to study our research question because individuals need to exhibit agency & take the lead in crafting their possible selves in the absence of the holding environment of an organization.

Findings

Our findings show that workers' lack of having clear sense of self at work have stimulated the activation of workers' "feared selves" – what they dread and do not want to be. We theorize that workers deposit these images in what we call a repertoire of "Feared Selves". This repertoire is a mental container in which workers accumulate all the work identities (or aspects of them) they enacted that are incongruent with their work self-concept. Workers proactively use the images to revise their work identity. Specifically, they engage in three identity work tactics: they embrace and integrate some of their feared selves (i.e., holism); rebuff some of these feared selves by developing

boundaries and using these images in defining who and what they are not (i.e., identity deflection); or selectively separate their work self from the enactment of their unwanted selves (i.e., identity decoupling). By engaging in these identity work tactics workers develop a sense of identity growth that helps them to sooth their sense of identity precariousness.

Limitations

It is important to note that we purposefully selected our sample. Through creating theoretical criteria, we selected workers who asserted having a degree of freedom in doing their work. We acknowledge that this might not be the experience of all individuals working in the gig economy.

Conclusion

Our study makes two main contributions. First, by tracing the role that feared and unwanted selves play in achieving positive identity outcomes, this study advances our understanding of positive identity construction. Second, our study advances our understanding of the different ways independent workers shape their work identities. This enhances our understanding of independent work, suggesting that workers could benefit from defining what they fear and do not want to be to grow and feel free.

Relevance to the Congress

This study complements the theme The 21 st EAWOP Congress. For many, based on the events of the past 3 years (e.g., the pandemic, wars…), the future could be associated with a lot of fear. Our study aims at helping people understand how to use their feared future selves to cultivate positive and resilient work identity, which is a fundamental personal resource that people can rely on in facing change and turbulences.

Relevance to the UN SDGs

Harnessing the benefits of the feared selves and understanding how it could help people cultivate positive work identity contributes to empowering individuals develop decent work opportunities for themselves and to their overall wellbeing at work.

Keywords: Identity, possible selves, independent work

Oral presentation OP148

From personal resources to proactive work strategies and performance: Testing the antecedents and outcomes of strengths use in a three-wave study

Luca Tisu, Department of Psychology, Institute for Advanced Environmental Research (ICAM), West University of Timișoara; Consuela Tăbârță & Norberth Okros |Department of Psychology, West University of Timișoara

science&practice

Research goals: Despite growing evidence regarding the positive consequences of strengths use at work, few studies have attempted to identify malleable precursors of strengths use that can fuel employees' engagement in such proactive behaviors. Furthermore, due to a lack of synchronous investigations, there still seems to be a high amount of ambiguity regarding the placement and temporal precedence of strengths use in relation to cognitive-affective factors and performance.

The present study addresses these gaps. We test employees' psychological capital (PsyCap – a second-order factor comprising self-efficacy, hope, resilience, and optimism; Luthans et al., 2007) as a person-dependent cognitive-affective factor that promotes performance through strengths use. Additionally, the proposed mediation model is tested through a cross-lagged panel model, which allows us to test reversed and reciprocal relationships between PsyCap, strengths use, and performance. This approach can enlighten a temporal sequence in the emergence of this study's variables, providing clarity regarding strengths use's placement within the JD-R theory.

Theoretical background : The proposed mediation model is rooted in the Job Demands-Resources (JD-R; Bakker & Demerouti, 2017) theory. From a JD-R perspective, employees who believe they can alter their work environment (i.e., personal resources) draw upon their "can do" mindset to also engage in proactive behaviors that translate their beliefs into action (e.g., strengths use), reflecting on their performance (Bakker & Demerouti, 2017). Based on these theoretical considerations, we argue that employees with a success-oriented mindset (i.e., PsyCap – "what one is") will possess the motivational propensity to initiate proactive behaviors tailored to their strengths ("what one does"), leading to increased performance.

Design/Methodology : Data were gathered online across three months (one monthly questionnaire) from Romanian employees (T1 – N = 463; T2 – N = 347; T3 – N = 287). We used Structural Equation Modeling (SEM) in Mplus 8.5 (Muthén & Muthén, 2017) to compare a series of alternative measurement (Harman's single factor; longitudinal invariance) and structural models (auto-regressive, causal, reversed, reciprocal). We tested the hypothesized indirect effect (PsyCap > strengths use -> performance) from 5000 bootstrap samples.

Results obtained : The best-fitting model was the causal model, showing that PsyCap predicts strengths use over time, while strengths use predicts employee performance over time. Furthermore, while no direct effect was found between PsyCap and performance, there was a statistically significant indirect effect through strengths use. As such, PsyCap appears to be a distal predictor of performance, with strengths use acting as a full mediator of the relationship.

Limitations : The investigation's design permits only causal-like inferences (Little, 2013). Second, we relied on single-source self-reported data; employing more diverse and objective means for data collection would lend further credibility to our model. Third, our sample consists of white-collar and highly educated workers from Western culture. This may inhibit the generalization of our findings.

Conclusions – research and/or practical implications/Originality/Value: The main theoretical contribution of this paper is uncovering the role and place of strengths use within the JD-R theory. "What one is" (i.e., PysCap) must be translated into behaviors or "what one does" (i.e., strengths use) to elicit an increase in performance. Next to uncovering antecedents and outcomes of strengths use behaviors, our model clarifies the directionality of relationships between the employed variables. Strengths use, as opposed to other individual strategies (e.g., job crafting), does not appear to trigger a positive gain cycle (Hobfoll, 2011), probably due to the usage of internal resources (i.e., strengths), which are harder to notice and link to positive work-related outcomes.

From a practical perspective, we provide practitioners with a model containing only person-contingent factors that can sustain performance over time. Even if organizations cannot foster organizational resources that can enhance performance from a top-down approach, they can train their employees from a bottom-up approach to reach augmented performance levels.

Relevance to congress theme and alignment with UN SDGs : The parsimonious bottom-up approach unveiled in this study is vital for employees who work from home and have limited access to organizational resources (e.g., social support) that can stimulate employee performance. Furthermore, developing such personal factors could facilitate learning by building the resources and skills necessary to perform better in new positions, reflecting on enhanced career self-management (Baruch & Sullivan, 2022). Overall, the model promotes sustainable economic growth and an optimal way to achieve better work functioning.

Keywords: PsyCap, strengths use, employee performance

Oral presentation OP340

Future Work Selves, Proactive Career Behaviours and Future-Oriented Emotions in the University-to-Work Transition

Eleni Giannakoudi, Anita C. Keller & Antje Schmitt | University of Groningen

science

Research goals: Graduates' proactive career behaviours are a key determinant of a successful school-to-work transition. Research suggests that salient future work selves motivate and predict both proactive career behaviours and job search success. However, future-oriented emotions, such as negative anticipatory emotions, are commonly experienced during the school-to-work transition and can influence goal-directed behaviour. Hence, such anticipatory emotions have the potential to change engagement in proactive career behaviour and ultimately transition success. The present study addresses this research gap by examining the moderating role of negative anticipatory emotions, on the relationships between graduates' future work self, proactive career behaviours and job search progress. By focusing on negative anticipatory emotions as a moderator, we aim to shed light on how emotions impact graduates' career development and derive insights for theory and practice alike.

Theoretical background: Salient future work selves provide graduates with a clear image of who they want to be in the future within a work context. In line with control theories, future work selves highlight the discrepancy between graduates' current and desired work self and therefore prompt proactive career behaviours that minimize this discrepancy. Engaging in proactive career behaviours in turn predicts increased job search progress. Hence, we expect that increased levels of future work self will have a positive indirect effect on job search progress through proactive career behaviours. Similar to future work selves, experiencing negative anticipatory emotions during the school-to-work transition may indicate a discrepancy between graduates' desired and current state of their career transition, and prompt behaviours that minimize this discrepancy. We propose that higher levels of negative anticipatory emotions will strengthen the positive relationship between future work self and proactive career behaviours because graduates' future work self will provide guidance in utilizing these emotions as an additional motivation to reduce discrepancies.

Design: Graduate students (N = 375) who are about to graduate within the same year participated in a three-wave study on a biweekly basis. Future work self salience and negative anticipatory emotions (worry, anxiety) were assessed in the first wave, proactive career behaviours (networking, job information seeking) in the second wave, and job search progress in the third wave using validated self-report scales. Control variables (gender, previous jobs, job counseling) were assessed in the preselection and fourth wave.

Results: We found support for the direct effect of future work self on proactive career behaviours, while controlling for initial levels of proactive career behaviours. An indirect effect of future work self on job search progress was found for job information seeking as a mediator, but not for networking. Negative anticipatory emotions moderated the indirect effect of future work self on job search progress through increased job information seeking. However, contrary to our predictions, simple slope analyses revealed that lower levels of negative anticipatory emotions strengthen the indirect effect of future work self and job information seeking on job search progress.

Limitations: The study measured self-reported job search progress. Therefore, conclusions about longer-term transition success cannot be drawn.

Implications: This study adds to the proactivity and career transition literature by highlighting the role of future work selves in predicting career proactivity and job search progress in the school-to-work transition. Further, this study is the first to include negative anticipatory emotions as a boundary condition of career proactivity and transition success. The results suggest that, counter to predictions in line with control theories, negative anticipatory emotions experienced by graduates did not motivate proactive career behaviours. Rather, the results are in line with empirical research suggesting that negative affective states have an inhibiting effect on proactivity by distracting individuals from their goal and depleting cognitive resources. These insights could inform career counseling for students by highlighting the importance of salient future work selves and minimized negative anticipatory emotions for a successful school-to-work transition.

Relevance/UN SDGs: The study provides insights into how cognitive and emotional factors impact graduates' navigation of their career development in a rapidly changing market. Understanding the emotional experiences during career transitions contributes to the UN Sustainable Developmental Goal of employee well-being.

Gender Identity Transition in Quebec Workplaces: A mixed-methods study

Frédéric Mallette, François Courcy, Anabel Cossette-Civitella, Corinne Beauchemin, Arielle Doiron & Sarah Lortie | Université de Sherbrooke

science&practice

RESEARCH GOALS AND WHY THE WORK WAS WORTH DOING

Recent social movements have advocated acceptance of different sexual orientations and gender identities. In Quebec, research focusing on trans workers' experiences being recent (SAVIE-LGBTQ, 2018), there's still a need to explore their reality. This research examines challenges faced by trans people in the workplace, such as inadequate administrative systems and the absence of diversity initiatives. This study also discusses protective factors that help trans people negotiate these professional challenges.

THEORETICAL BACKGROUND

The beneficial impacts of living as per one's own gender identity are multiple, especially for one's wellbeing (Grant, 2011). However, while it is possible for these individuals to surround themselves with positive relationships, they must contend with society's and workplaces' gender norms. Studies have shown that trans individuals are at risk of experiencing violent behaviors at work (Balley, 2014). In Grant's study (2011), 90% of trans people reported experiencing harassment or abuse at work. To avoid discrimination and stigma, some trans people report having to take non-managerial jobs, positions in which they would not be overly exposed (Sangganjanavanich, 2009) and thus keep their trans identity private. Finally, to avoid negative career impacts, some trans people in positions of authority choose to conceal their gender identity from their workplace (Totaljobs, 2016). In addition to the emotional distress experienced, many report a lack of social support from their peers in the workplace (Mizock, 2018). Despite the well-established research on stigma and violence among the trans population, little data is available regarding their professional reality in Quebec.

METHODOLOGY

Six one-hour semi-structured interviews were conducted with trans workers in Quebec; Trans people in Quebec who are "out", or whose trans identities are known at their workplaces. Questions focused on how the GI disclosure was communicated, the violence experienced, the stereotypes/prejudice encountered, and the support obtained. Participants also completed an online quantitative questionnaire (LGBTCI-TF; Brewster, 2012) measuring the degree to which the workplace is open to trans people.

RESULTS OBTAINED

The survey of themes emerging from the interviews reflects a nuanced experience before, during, and after the GI disclosure. For example, knowledge of one's rights is a facilitating factor, while differences between cisnormativity and LGBTQ+ culture pose a challenge. The quantitative questionnaire also illustrates a nuanced work climate, revealing that all participants felt accepted in their workplace, but the majority didn't feel they could be themselves in their workplace and were convinced their employer wouldn't defend their rights.

LIMITATIONS

This study is limited by its small number of participants, which is not abnormal for a qualitative study, but still limits the generalization of results. These results also only describe the situation in Quebec, Canada. Finally, all participants were volunteers, which inherently limits the diversity of experiences.

CONCLUSIONS

Despite these limitations, this research still found insights for organizations and future studies. Particularly in Quebec, this study underlined the effect laws had on the experience of navigating administrative changes for those transitioning and on the protection against discrimination. Our research offers insights to other workplaces looking to improve the quality of life for their trans workers; the conclusions of this study may be used to smooth the relationship between organizations and non-gender conforming employees. For workplaces, this study highlights cumbersome administrative systems used in organizations, where name changes are sometimes impossible to do. It also accentuated the importance of offering support to the employees and not taking charge in their place. Detrimental effects could arise for trans people who realize they lost control of their coming-out process. This project also offers a case study of how an inclusive workplace enhances diversity and improves the quality of life for an organization's members.

RELEVANCE TO THE CONGRESS THEME AND UN SDG

This study falls within the scope of this congress, showing strong links with the changes in the world. Its' goals are to contribute to the DIVERSITY AND INCLUSION of SEXUAL AND GENDER IDENTITIES, by fighting UNFAIR DISCRIMINATION, three topics identified as relevant for the congress by EAWOP. This study's goal is also directly linked to the UN SDG of promoting Gender equality, particularly trans genders vs cis genders.

science&practice

Research shows that values inherent in some professions such as medicine, law and government are directly in conflict with those associated typically to women (Fox and Hesse-Biber, 1984); explained by traditional labour divisions defined by the two sexes where those roles more higher up in these organisations require more 'masculine' traits including less prioritisation for out of work family time (Sacharin et al, 2009). The salience of masculine-work-gender identity traits would increase gender work identity conflict for those in the minority identities in these cotexts (i.e. for women). It is well understood that a felt sense of discrimination can arise when there is an incompatibility or conflict in gender and work identity (Meeussen et al, 2016; Branscombe and Ellemers, 1998; Tajfel and Turner's, 1979; Turner et al, 1987). And can have an imapct on career success (Sacharin et al, 2009) wellbeing (Ashforth and Meael, 1989), improved job satisfaction (Veldman et al, 2017) and group belonging (Driscoll and Goldberg, 1993) at the job level.

Therefore we argue that the reduction in gender work identity conflict at the job level can decrease perceived discrimination generally; that this can be achieved at the job-level through organising aspects of work to be congruent with one's preferred gender. This can also improve wellbeing and perceived equality and a system of emic equality practices to help reduce hidden inequalities at the individual level (Syed 2007, Groutsis, Ng et al. 2014, Öztürk, Tatli et al. 2015, Knappert, van Dijk et al. 2019; Wimalasiri, 2021).

To investigate this, we undertook a study in IT sales work where traditional gendered roles are known to co-exist in jobs and are identifiable (i.e. Masculine: Feminine) (Leidner, 1991). We wanted to understand perceived equality and other consequences when people had agency over their gendered-work identities. And how this influences perceived inequality at work and career progress.

Method:

We interviewed 24 participants from a large IT sales company in the UK (N= 24; M: 13 F:11) Our questions focused on perceived gender-work identity (Veldman et al, 2017) (e.g. typical gendered ideals in society and career choices; perceived work identity in the current job. And perceptions of gender balance in IT sales; perceived equalities; societal influences on gender). Questioning laddered down to the job on a daily basis (i.e. how does perception of gender-work identity conlfict impact daily work?).

We used Organisational Discourse Analysis (ODA) (Fairhurst and Cooren, 2018) to understand how narratives of participants were shaping their gender identities, their relationships with others and how these in turn influenced the way they organised their daily work and how these created and diminished inequalities related to gender at the local level. ODA also allowed us to understand the wider societal influences on gender narratives in the organisation which was an advatnage of using this method.

Findings:

Our findings show that when there is a choice, people chose gendered roles congruent with their personal-gender identity. For example, those who identified as women tended to focus on job roles aligned more to characteristics considered feminine including higher levels of emotional intelligence and sensitivity to others (Comer, 1998). Whereas those who identified themselves as masculine tended towards work which needed more aggressive 'lad' approaches, such as skills needed for securing new sales contracts; regardless of the dominant gender -identity group. Those aspects of jobs that conflicted with personal gender identities, when most aspects were congruent, were adapted by each worker at the job-level to create a minority advantage. For example, women used flirtation to win large contracts and gain advantage over men in their section and create a niche for themselves. A third theme described a change in the attitudes to parenting that reflect changing societal norms where those identifying as men showed work-life-balance preferences which were closer to the those who identified as women, than trends in findings a decade ago in this area (i.e. Meussen et al, 2016; Allen et al, 2000).

Conclusion:

Findings provide empirical support to show that diversity can be influenced at the job level by workers; influencing the overall felt sense of equality in this group of workers and create emic equality practices in organisations (Öztürk, Tatli et al. 2015). Insight emerged on how gender equality in organisations are affected by wider societal frameworks and can be subject to change in tune with changing norms.

Getting ahead through political skill: Testing the toxic career model for Machiavellianism

Svenja Lehr, Gerhard Blickle & Bastian Kückelhaus | University of Bonn

science&practice

Research goals and why the work was worth doing

Previous studies have shown that dark personalities (low honesty-humility) can get ahead at work through a special set of social skills in the workplace (i.e., political skill). However, an open question is whether the toxic career model can also be applied to its core traits, namely the components of the dark triad (i.e., Narcissism, Psychopathy, and Machiavellianism; Paulhus & Wiliams, 2002). Therefore, our aim was to examine the role of Machiavellianism in the toxic career model and to shed light on why and how Machiavellians can be successful in their careers.

Theoretical background

According to the toxic career model, dark personalities may successfully climb the organizational ladder (Kholin et al., 2020; Templer, 2018). It suggests that dark personalities use political skill at work to create and maintain a positive reputation for political skill, which results in positive performance ratings by relevant others. Furthermore, previous research supports positive associations between Machiavellianism and work related outcomes (e.g., income; Kückelhaus & Blickle, 2021). Therefore, we used the toxic career model to explain the career success of individuals high in Machiavellianism, which is composed of agency, antagonism, and planfulness (Collison et al., 2018). We hypothesized an indirect link between Machiavellianism and workplace status via self- and other-rated political skill: Individuals high in Machiavellianism should strive for stronger political skill to create a positive façade, which should lead to higher other-rated political skill and in turn to higher workplace status.

Design/Methodology

In a first step, we conducted a power analysis using the Monte Carlo-based procedure with 1,000 Monte Carlo replications (Zhang, 2014). According to Kholin et al. (2020), we expected small to medium effect sizes for the path coefficients in our model and found a minimum sample size of N = 316 participants for a power of .80 with an alpha of .05 for the indirect effect. To test the indirect effect chain model of the toxic career model (Templer, 2018), we conducted a study with a multisource design with 421 triplets, consisting of employed targets and at least two co-workers, using online surveys. To avoid common-source bias, we used a criss-cross-design, splitting co-workers' ratings of political skill and co-workers' ratings of workplace status (Podsakoff et al., 2012). The indirect effect chain model was tested in MPLUS, using bootstrapping methods. Since workplace status usually increases with chronological age, we considered chronological age as a control variable.

Results obtained

As expected, we found a significant positive indirect effect of Machiavellianism on other-rated workplace status via self- and other-rated political skill. The significant positive indirect effect was also shown for the Machiavellianism aspects of agency and antagonism, but not for planfulness. In addition, we analysed the indirect effect with the reversed co-workers' ratings. There were no substantial differences between the two criss-cross versions, thus supporting the robustness of our results.

Limitations

The cross-sectional design and the use of subjective instead of objective criteria for career success.

Research/Practical implications

Our research contributes to the understanding of why and how Machiavellians can be successful in their careers. Due to their strive for good political skill, Machiavellians can create and maintain a positive reputation for their social skills among their co-workers, which in turn results in higher workplace status in the eye of their co-workers.

Originality/Value

Our research tests the toxic career model in relation to one of its core traits, namely Machiavellianism, explaining how individuals high in Machiavellianism may get ahead at work.

Relevance to the Congress Theme

As toxic personalities can harm both their organization and their co-workers, it is important to identify mechanisms how these dark personalities still can get ahead in the workplace in order to prevent those harmful consequences.

Relevant UN SDGs

Decent work and economic growth.

Keywords: Toxic Career Model, Machiavellianism, Political Skill

Oral presentation OP363

Getting Serious About Fun: The Role of Gamification in Organizational Socialization

Žigimantas Pečiūra & Irena Žukauskaitė | Insitute of Psychology, Vilnius University, Lithuania

science

Purpose: Organizations are increasingly integrating gamification elements into their procedures, but there is a lack of research on how this affects newcomers. On the one hand, gamification may be associated with increased employee motivation, work engagement or commitment to the organization (Eikelboom, 2016; Hussain et al., 2018). However, gamification is also associated with competition or artificial attempts to evoke positive emotions, which are not always received positively by employees (Algashami et al., 2019). The aim and objective of a present study is to evaluate the relationship between gamification and organizational socialization process.

Design/Method: The data from 149 surveyed participants (129 female and 20 male, average age – 35.67 years old) was collected. Participants were presented with 9 descriptions of the most popular gamification elements (e.g., points, leaderboards, challenges) in the work setting, which had to be rated in terms of how often and how actively employees were engaged in them. Proximal socialization outcomes (role clarity (Morrison, 1993), task mastery, social integration (Morrison, 2002)) and distal socialization outcomes (job satisfaction, organizational commitment (O'Reilly & Chatman, 1986), turnover intentions, perceived organizational insider status) were measured in this study. The relationships between variables were assessed with correlation and regression models.

Results: More than half of respondents (54.4%) have encountered at least 1 gamification element in their workplace. This number ranges from 1 to 7. Also, participants vary in terms of their average engagement and frequency of interactions with gamification elements. The results of this study suggest that gamification plays a minimal role in the socialisation process. However, there are some weak relationships between gamification elements and socialisation outcomes. Role clarity, social integration, task mastery and organizational commitment were found to be related to employee interactions with gamification elements. Of all these variables, gamification was most linked to role clarity. No relationships were found between interactions with gamification and job satisfaction, turnover intentions, or perceived organisational insider status. Of all the gamification elements studied, challenges were the most related to socialisation outcomes. There was also found a negative link between competitions and organizational commitment.

Limitations: In this study we used a cross-sectional design which included a limited sample size and a fixed number of gamification elements.

Implications: This study provides new insights into understanding the relationship between gamification and newcomer's socialisation and provides practical value for the managers in terms of gamification usage. According to the results of the study, the application of different gamification elements to new employees may have different consequences, which makes a rational and considered gamification design to be essential. Competitions may negatively affect new employees, while appropriate number of challenges may help them to grow professionally.

Keywords: Gamification, Organizational socialization, Newcomers

Oral presentation OP320

Getting social in leadership: A study of how social technologies affect leaders' influence process and subsequent outcomes

Wei-Ning Yang & Alexandra Budjanovcanin | King's College London

science&practice

Research goals

Organisations are increasingly adopting social technologies for internal communication (Holland et al., 2019). Subsequently, the proportion of leaders' interaction with their employees virtually has increased, leading to a scholarly focus on e-leadership, defined as "a social influence process mediated by advanced information communications technology (ICT) to produce a change in attitudes, thinking, feeling, behaviours and performance of individuals, groups, and organisations" (Avolio et al. 2000., p.617). Scholars have argued that we cannot assume leadership in the offline world will transfer unchanged to a virtual context (Lu et al., 2014). However, the e-leadership literature has focused on leadership mediated by web 1.0 technologies – e.g., email/video conferencing (Gilson et al., 2015) and there is less research on web 2.0 technology, exemplified by social technology (e.g., Facebook Workplace, Microsoft Teams). More research on web 2.0 technologies would be instructive since they have different affordances to technologies that preceded them and are increasingly used by leaders at work. This study hence examines the effects of social technologies on a central mechanism of leadership, namely influence.

Theoretical background

Drawing on well-established literature that different leadership styles emphasise different means of achieving goals through others (Anderson & Sun, 2017), the study focused on two specific influence tactics, i.e., collaboration and consultation. This is because social technology is "an open, interactive context in which rich two-way communication occurs between any of the members at any time" (Wang et al., 2021) and so lends itself to facilitating collaboration and consultation. These tactics have been associated with transactional and transformational leadership respectively (Curtis, 2017) and we thus examined the relationship between each leader style and outcomes - follower effort and leadership effectiveness - via these two tactics.

To conceptualise the effects of social technology, the study drew on the technology affordance literature. ICTs can be differentiated by their affordances - the properties of a communication medium that define its possible uses (e.g., Boyd, 2010). Although several affordances characterise social technologies, the interdependence affordance – the ability to work with and build on others' inputs - was the focus of the present study because when leveraged by leaders in their use of social technologies, it provides more opportunities to work on tasks simultaneously or sequentially in a way that creates a shared output regardless of physical presence (McFarland & Ployhart, 2015). Hence, we predicted that the interdependence affordance may strengthen the relationship between a leader's tactics and outcomes.

Specifically, we hypothesise that the relationships between leadership (i.e., transformational, and transactional leadership) and outcomes will be mediated by leaders' influence tactics (i.e., consultation and collaboration, respectively). Further, the strength of these relationships will be positively moderated by interdependence affordance.

Methodology

Three waves of data from 228 UK sector employees were collected via the online platform Prolific. Participants rated their leaders' leadership style at Time 1, their influence tactics, and adoption of the interdependence affordance at Time 2 and assessed leadership effectiveness and extra effort at work at Time 3.

Results

Regression analyses suggest that transformational leadership positively affects follower effort (but not leadership effectiveness) via consultation influence tactics, and the strength of the indirect effect increases as more interdependence affordance is adopted. Additionally, transactional leadership positively affects leadership effectiveness (but not follower effort) via collaboration influence tactic. Interdependence affordance also moderates this indirect effect, but as it increases, the effect weakens and eventually diminishes.

Limitations

The study focuses on the service sector, which limits its generalisability. It also predominantly focuses on Microsoft Teams, although the measuring of affordances mitigates this limitation.

Conclusions

We provide insights about how social technologies affect leadership and its outcomes, highlighting where they can be both beneficial and overused. We present novel findings by applying technological affordances to the leadership context.

Congress Theme/SDGs

The 'changing world of work' includes evolving ways of working, and technology is key to such changes. This study thus speaks directly to the congress theme and a work-based experience that is only going to become more prevalent. Understanding how social technologies shape our workplaces becomes imperative for guiding us to build relevant competencies amongst organisational leaders for competing and collaborating. This also speaks to SDG for fostering decent work and economic growth.

Oral presentation OP299

Giving voice to employees in low-skilled jobs works: evaluation of an organizational intervention promoting sustainable employability

Emmelie Hazelzet & Inge Houkes | Department of Social Medicine, CAPHRI Care and Public Health Research Institute, Faculty of Health, Medicine and Life Sciences, Maastricht University, The Netherlands

science&practice

Research goals and why the work was worth doing: Our aim was to study the effectiveness and implementation process of a participatory organizational intervention "Healthy HR" (HHR) which through targeting job control was designed to promote sustainable employability (SE) in employees in low-skilled jobs. Addressing this vulnerable and hard-to-reach group via the work setting can help reduce socio-economic health inequalities.

Theoretical background: Many work organizations are still unsuccessful in promoting employees' SE. More insight is needed into the extent to which such interventions are effective for employees in low-skilled jobs, who often are an underrepresented group in the field of occupational health. We assume that the focus on dialogue and active involvement will increase voice and hence the job control of this particular group, an important job resource for their health. This might lead to improved SE in the long run.

Design/Methodology/Approach/Intervention: An effect evaluation was conducted with a pretest-posttest design with a one-year follow-up among employees in two Dutch work organizations. Quantitative data were collected at baseline (N=120) and 12 months (N=71). Paired t-tests and dose-response analyses were performed (N=50). Parallel, a mixed-methods process evaluation was conducted to understand the implementation process (i.e. recruitment; reach; dose delivered; dose received, fidelity; satisfaction, and context) and perceived changes at the workplace using questionnaires, individual interviews with employees (N=15) and employer representatives (N=11), focus groups (N=4) and logbooks. Process data were obtained throughout the entire process, at 6 months and 12 months. Qualitative process data were analyzed thematically.

Results obtained or expected (if not available, it must be made clear when they will be): HHR had a positive effect on job control, but no significant effect was found on SE and only a small change in experienced productivity at 12-month follow-up. A higher dose of HHR resulted in better job control. HHR was partially implemented as planned. The overall reach was high, but despite HHR was delivered by the project leaders, the dose received of HHR among the employees varied. The process evaluation confirmed that a better implementation in terms of a higher dose received supported the positive effect of job control. Moreover, HHR had a positive impact on the awareness level among all stakeholders and helped to open the dialogue about health and create healthy workplaces. We also observed an increased feeling of a collective voice among employees.

Limitations: Limitations of the current study were the small sample size, the low response rate at follow-up, and the absence of a traditional control group. The latter was counterbalanced by the dose-response analyses and a comprehensive mixed-methods process evaluation.

Conclusions – research and or practical Implications/ Originality/Value: Despite the relatively small sample size and partial implementation, we found a positive effect on job control among employees in low-skilled jobs. This was supported by the qualitative process data. Effects on SE were, however, not confirmed. The overall dose received by the employees was limited for certain departments, but

the dose-response analyses showed that a better implementation resulted in better control. Hence, we expect that the effect would have been stronger after prolonged and more extensive implementation. This study demonstrated how job control of employees in low-skilled jobs can be improved through a participatory approach. The HHR philosophy of active involvement and genuine dialogue in terms of giving employees an active voice at work appears to be effective. This may eventually contribute to employees' SE and help to reduce health inequalities in the workplace.

Keywords: effect and process evaluation, employees in low-skilled jobs, organizational intervention

Oral presentation OP472

Going beyond commitment - Development and validation of identification, instrumental, and acquiescence bond type scales

Marina Schefer, Karsten Mueller & Tammo Straatmann | Osnabrueck University, Germany;
Howard J. Klein, Ohio State University, Columbus, USA

science&practice

Research goals

The goal of the present research project was to develop and validate short, unidimensional, target-free scales for three types of workplace bonds: identification, instrumental, and acquiescence, in a manner consistent with the established KUT scale for commitment (Klein et al., 2014).

Theoretical background

Workplace bonds have received a lot of interest from research and practice because of their relevance for outcomes such as absenteeism, turnover, motivation, prosocial behaviors, performance, and well-being (Cooper-Hakim & Viswesvaran, 2005; Klein & Park, 2020; Meyer, 2016; Simon, 1976). Indeed, a wide variety of constructs have been used to assess workplace bonds (e.g., commitment, identification, embeddedness, entrenchment, continuance, obligation, involvement). To overcome theoretical overlaps and ambiguities in conceptualization, Klein and colleagues (2012) developed a systematic framework of bond types including commitment accompanied by three other types of bonds: identification, instrumental and acquiescence. While with the KUT a validated short uni-dimensional target-free measure of the commitment bond is already available (Klein et al., 2014), the purpose of the current study was to develop measures for the other three bond types.

Methodology

Based on previous works (Klein et al., 2012; Klein et al., 2014), the project started by conceptually refining the three bond types beyond the commitment bond. Then, items were compiled from reviewing existing related measures and evaluated regarding their general fit to the construct definitions, their target neutrality and their clarity in formulation. Thus, scales were developed in alignment with the KUT scale. Content validity of initial items was established by obtaining 45 subject-matter expert ratings (Study 1). A cross-sectional panel aimed to provide first empirical results for the quality of the scales with a preliminary set of eight items per bond type and three targets (organization, supervisor, career) as well as a related nomological net (Study 2). Using an additional cross-sectional panel (Study 3), the item sets should be further reduced and tested with two additional targets (team, goal). The aim of Study 4 was to test the final four items per bond longitudinally.

Results

In Study 1, subject-matter expert ratings showed high fit to construct definitions and accurate assignment of the items. Some items were revised based on the received feedback. In Study 2, factor analyses supported the expected four-factor solution representing the four bond types for each of the three targets and psychometric properties lend further support to the initial scale development. By evaluating a series of alternative models, six items per bond type were identified best representing the constructs. In general, the used scales related to nomological network variables as expected, but to a weaker extent for the acquiescence bond. Data collected inStudy 3 were used to further reduce scale length and identify the best four items per bond type. CFA, ESEM, and LCA

analysis supported the scale structure for the four bonds across five targets demonstrating good fit. Study 4 results cross-validated the final scale structure showing good factor reliability and test-retest reliability. Additional analyses regarding longitudinal measurement invariance and convergent and divergent validity with nomological network constructs will be reported at the conference.

Limitations

Scale development largely relied on self-report data, pointing to the need of future research linking workplace bonds to the other data sources e.g., leader ratings or organizational indicators of performance, retention or employee well-being.

Implications

While representing work in progress, current results are promising and bring clarity into the conceptual domain of workplace bonds. Specifically, refinements of the conceptual definitions for three bond types as distinct constructs advance existing research. Moreover, new uni-dimensional, target-free scales are developed and validated to assess the three bond types beyond the commitment bond. Hence, together with the established commitment scale (Klein et al., 2014), now all workplace bonds proposed by Klein and colleagues (2012) can be assessed in reference to solid theoretical framework of workplace bonds.

Relevance to Congress Theme

For ensuring sustainable workforces and strong institutions in the future, the present research project offers important conceptual developments and provides new scales for understanding and assessing workplace bonds, overcoming theoretical overlap and ambiguities of previous conceptualizations.

Keywords: Bonds, Attachment, Commitment

Oral presentation OP569

Going deeper into bad behaviors at work: the incremental predictive validity of moral disengagement over the Dark Tetrad traits

Pedro José Ramos-Villagrasa, Elena Fernández-del-Río & Miguel Clemente | Department of Psychology and Sociology, University of Zaragoza, Spain

Theoretical background and research goals

Counterproductive work behaviors (CWBs) can be defined as deliberate actions displayed by employees that damage the well-being of the organization (CWBO) or its members (CWBI). So, more strong efforts are needed to determine their antecedents. Previous research has found a strong relationship between CWBs and the Big Five personality traits, with conscientiousness being its main predictor. Latest studies also highlighted that all Dark Tetrad traits (i.e., narcissism, Machiavellianism, psychopathy, and sadism) were positively related to CWBs. On the other hand, moral disengagement (MD) has also been identified as an antecedent of CWBs. Recent meta-analytic evidence showed that, at least, Dark Triad traits (i.e., narcissism, Machiavellianism, and psychopathy) share a common, latent dark core with MD. However, there is no previous evidence about the relationship between Dark Tetrad (Dark Triad plus everyday sadism) and MD, and if MD incrementally predicts organizational outcomes beyond Dark Tetrad.

To overcome this gap, the aim of this study was to explore the incremental validity of the MD over and above the "bright" and "dark" personality approaches in the prediction of CWBs. We intend to provide two specific contributions. First, to evaluate whether MD scores explain additional variance of CWBs beyond several basic sociodemographic and work experience characteristics, Big Five and Dark Tetrad scores. If so, we could consider that MD, despite the shared conceptual foundation with dark personality traits, uniquely predicts CWBs. Second, to evaluate whether MD plays a moderating role between Dark Tetrad traits and CWBs considering the target of workplace deviance.

Methodology

Our sample was composed of four hundred and fifty-five employees (58.7% women), aged between 18 and 70 years (M age = 39.29, SD = 13.81), from different organizations. Data were collected with non-probability sampling.

Measures included sociodemographic and work behavior characteristics, Big Five and Dark Tetrad traits of personality, and frequency of CWBs.

Regarding analytic strategy, we computed descriptive statistics, Pearson and point-biserial correlations, and reliabilities (Cronbach's α). Hierarchical regression analyses were performed with control variables (Step 1), Big Five (Step 2), Dark Tetrad (Step 3), and MD (Step 4). Moderation analyses were performed with the INDIRECT macro for SPSS (model 1).

Results

Hierarchical models showed that the incorporation of MD to the models incremented by 4.6% the explained variance of CWBO and by 4.9% the explained variance of CWBI. Regarding CWBO, conscientiousness (β = -.263), and narcissism (β = -.184) were related to lower frequencies of these behaviors, whereas psychopathy (β = .196), sadism (β = .221), and MD (β = .244), were related to higher frequencies of CWBO (all $p < .001$). Regarding CWBI, whereas extraversion (β = .128, $p < .05$),

sadism (β = .269, $p < .001$), and MD (β = .251, $p < .001$) had positive coefficients with workplace deviant behaviors aimed at individuals, agreeableness (β = −.244, $p < .001$), and narcissism (β = −.118, $p < .05$) had negative associations.

Moral disengagement significantly moderated the effects of Machiavellianism, psychopathy, and sadism on CWBO. Under medium or high levels of MD (not low), the effects of high scores on these dark traits on deliberate actions that harm the organization were stronger. Concerning CWBI, results showed that the positive associations between psychopathy or sadism and CWBI were stronger when MD was medium or high (not low).

Conclusions

Findings revealed that MD explains unique variance beyond Dark Tetrad, so it seems to be something conceptually unique about MD relative to other dark traits that drive outcomes of interest in the organizational behavior. In addition, this study complements precedent research that did not explore the predictive validity of MD considering the target of CWBs. Finally, we provide evidence about the moderating role of MD in the relationships between Dark Tetrad and workplace deviance. Overall, our findings suggest that some dark personality traits may be effective predictors of CWBs especially when employees present medium or high levels of MD.

The current study has a number of limitations that deserve mention here, such as the use of convenience sampling, the cross-sectional design, and the overreliance on self-report measures. However, as the study of Dark Tetrad in organizational settings is still in its youth and the debate regarding dark traits are theoretical correlates rather than antecedents of MD remains ongoing, our results may contribute to going conceptually deeper about MD relative to other dark constructs in the explanation of bad behaviors at work.

Keywords: counterproductive work behaviors; Dark Tetrad; moral disengagement

Oral presentation OP384

Going to the Office while Telecommuting is Ubiquitous: the Role of Need Satisfaction and Media Richness Theory

Astrid Lacroix, Sophie De Winne, Marijke Verbruggen, Elfi Baillien & Anja Van den Broeck | KU Leuven

science

Introduction

With the digitization of work, employees can work from any location. Telecommuting – a work arrangement that allows employees to execute working tasks from home during at least some portion of the working week by using ICTs – has gained popularity over the years. After a massive increase in telecommuting due to the pandemic, many organizations are asking employees to return to work at the office a few days a week. The idea is that office days can motivate employees because one can have face-to-face contact with colleagues. But is that always the case? Are all office days equally motivating? What needs to be done on office days to motivate employees and how does that work exactly? Indeed, to date, we lack knowledge on which aspects of working in the office are unique and therefore add value for telecommuters.

Following insights from research on self-determination theory, we therefore focus on how office days can contribute to basic need satisfaction; an aspect fostering a range of well-being and performance outcomes. Moreover, some studies have indicated that face-to-face interaction – typical of working in the office instead of home – is related to need satisfaction and longer lasting gains to psychological well-being as compared to digital social interactions. In addition, despite the opportunities to interact with others through computer-mediated communication, it cannot really provide the vibrancy and convenience (i.e. “the human touch”) that results from two people interacting in-person. Therefore, one might expect in-person contact to be an important, distinguished feature of office days for employees. However, what forms of in-person contact increase need satisfaction, and why, is still unknown.

In reply, the current research investigates how formal and informal face-to-face communication – two typical forms of in-person contact in the office – relate to need satisfaction. Reasoning from media richness theory, we argue that in-person contact affects need satisfaction through role ambiguity and social support. Indeed, face-to-face contact entails rich communication which is characterized by synchronous communication, immediate feedback, multiple cues, and personalized messages adding to role clarity and instrumental as well as emotional contact with others. We hypothesize that formal and informal face-to-face communication on office days will contribute to need satisfaction after work by decreasing role ambiguity and increasing social support during that day.

Methods

A daily diary study was conducted to investigate the role of role ambiguity and social support in the relationship between formal and informal communication, and need satisfaction. Only employees who regularly work from home as well as at the office were selected. During 10 consecutive workdays 111 employees filled in a daily questionnaire at the end of their office workdays. Multilevel modeling was used for the data analysis.

Results

The results show that employees experience more need satisfaction on office days when having more informal communication. This relationship is partially mediated by an increase in social support on that day. In addition, daily formal communication is related to daily need satisfaction, and this relationship is fully mediated by daily social support. The amount of role ambiguity experienced on an office day is related to daily need satisfaction, however not to formal nor informal communication. Therefore, the relationship of formal and informal communication with daily need satisfaction was not mediated by daily role ambiguity. As such, our research model is partially confirmed.

Contribution

Our research extends the literature on telecommuting by explicitly looking at the value of office days in a telecommuting context; introducing media richness theory in this line of research. In all, this study contributes to promoting wellbeing and performance by exploring through what and in what ways employee needs can be fulfilled by going to the office, given the ubiquity of telecommuting.

Relevance to the Congress Theme and Relevant UN SDGs

Since the pandemic, the line of research on telecommuting has become even more important. Yet not only research on the practice of telecommuting itself is relevant. Given the changing nature of work (e.g., digitization of work, hybrid work, reorganizations of office work), a thorough understanding of the processes involved in office days is at least as important to achieve desirable outcomes. In doing so, organizations can learn about how to organize work in a way that is beneficial for employee need satisfaction, and in turn, for organizations. Therefore, the current study is a first – in the light of recent developments – to investigate tangible aspects of office days that affect the wellbeing of telecommuters. As such, our research contributes to EAWOP's conference theme 'The changing world of work' and the UN's third SDG 'Ensuring healthy loves and promoting well-being'.

Gossip and coping in a challenging job: The case of migrant truck drivers in Western Europe

Elena Martinescu & Bianca Beersma | Vrije Universiteit Amsterdam

science

Research goals and why the work was worth doing

According to the Job Demands-Resources Model (Demerouti, Bakker, Nachreiner, Schaufeli, 2001), many jobs entail high demands and low resources, putting workers at risk of strain and burnout. One such particularly challenging job is that of long distance truck drivers, who stay on the road for weeks at a time, endure difficult work conditions (e.g. shift work, physical demands, risk of accidents), and prolonged social isolation. However, it is currently not well understood how these drivers cope with the challenges associated with their work. Being a truck driver presents two particular challenges: due to working in isolation drivers may experience a high need for information related to work, and a high need for social contact with others. One solution for coping with these challenges may be to seek social contact with colleagues by engaging in gossip. Therefore, we examine the role of gossip as a coping mechanism among long distance truck drivers.

Theoretical background

Coping represents the cognitive and behavioral efforts made in order to manage demands that exceed one's resources (Lazarus & Folkman, 1984). Problem-focused coping is aimed at changing one's relation to the environment (e.g. seeking information). Emotion-focused coping is aimed at regulating one's negative emotions caused by the harm or threat (e.g. seeking social support). Gossip, defined as communication about someone who is not present (Dores Cruz et al, 2021; Foster, 2004), has been shown to be pervasive across social contexts. Although gossip has not been studied as a coping mechanism, gossip could help drivers engage in problem-focused coping, and emotion-focused coping. By facilitating information access, Thus, given that gossip can help people exchange information, and seek emotional support (e.g. Beersma & Van Kleef, 2012; Foster, 2004; Martinescu et al, 2019), we explore whether gossip may play a role in coping with the challenges encountered by long distance truck drivers.

Design/Methodology/Approach/Intervention

We conducted a qualitative study by interviewing 32 migrant truck drivers in a Western European company.

Results

Results showed that gossip was essential in coping with high work demands (e.g. work pressure, living in difficult conditions, social isolation) and low work resources (e.g. low autonomy, low support, low fairness, lack of training). First, drivers gossiped with close friends at work to regulate emotions and maintain social bonds, which enhanced psychological well-being. Second, drivers gossiped with distant colleagues to establish rapport and to exchange useful information about people, procedures, or practical issues, which enhanced task performance and physical well-being. Third, drivers perceived few benefits of non-instrumental gossip with distant colleagues, and therefore avoided such communication.

Limitations

The work context of truck drivers is rather particular, therefore current findings should be interpreted within this context, and ideally extended and validated in other settings. Furthermore, among methodological limitations of our study are social desirability concerns, low sample size, and using an inductive, therefore subjective approach. Although these concerns are considered, we believe that the advantages of our methodological choices exceed their associated drawbacks. As a first study documenting the role of gossip as a coping mechanism, we deemed an inductive approach most appropriate for capturing the ethos of the phenomenon, and giving voice to our participants

Conclusions – research and or practical implications/Originality/Value

Overall, these findings show that drivers relied on different layers of their informal social network to cope with challenging work conditions. Adding to previous research which highlights gossip as a means to exert social control and enhance cooperation, this study shows that gossip represents an essential resource for emotion-focused and problem-focused coping in a challenging work context. As such, we extend theorizing about the use of gossip as a coping mechanism in the workplace.

Relevance to the Congress Theme

There is increasing societal attention to the responsibility companies bear in treating their employees well and enabling them to develop and flourish in their roles. However, as show in this study, employees in a job designed and managed by Taylorist principles often reached a high degree of exhaustion, and needed to harness all available support from their social network in order to cope with the difficulties encountered in their jobs. Hopefully this study will draw attention of researchers and practitioners to what challenging work might entail and how employees cope with it, and will build on our findings to design jobs better

Relevant UN SDGs

Oral presentation OP485

Happy Followers of Happy Leaders: Leader-Follower Well-being Cross-over and the Role of Leadership Style

Przemysław Zbierowski & Milena Gojny-Zbierowska | University of Economics in Katowice

science

Research goal

Well-being (WB) of employees is largely dependent on behaviors of leaders. But does it matter for the happiness of followers if the leader is happy as well? And do happy leaders behave differently towards their subordinates than unhappy ones? The purpose of the paper is to investigate the direct effect of leader's WB on follower's WB as well as indirect effect mediated by positive leadership behaviors, namely supportive leadership and empowering leadership. In this study we make an attempt to unpack the mechanism of cross-over of WB from the leader to the follower. We ask the question of how happiness changes the way in which the leader behaves, and how is that conveyed to happiness of followers.

Theoretical background

WB of employees as an outcome of behaviors of the leader has been a matter of intense scholarly investigation (Inceoglu et al., 2018). It has been found mainly related to specific leadership styles, such as transformational (Nielsen et al., 2008) and authentic leadership (Ilies et al., 2005). However, few studies considered the cross-over effect of WB from the leader to the follower and its underlying mechamism (Skakon et al., 2010). The existence of such cross-over effects has been proven in relation to some WB-related outcomes, such as emotional exhaustion and work engagement (Wirtz et al., 2017), job dissatisfaction (Sutherland & Davidson, 1989) or burnout (Ten Brummelhuis et al., 2013; Huang et al., 2014). Moreover, while there is evidence on the effect of specific leadership styles on both follower's (see e.g. Inceloglu et al., 2020) and leader's WB (Ilies et al., 2005), little is known about the dependence of certain leadership behaviors and style on the level of leader's WB.

Maurya and Agarwal (2015) found that followers are satisfied with their jobs if their leaders supportive behaviors are linked to leaders' WB, and Rafferty and Griffin (2006) state that support has positive effect on WB of the receipient of support. The positive effect of received support on follower's WB has been also supported by others (e.g. Schmidt et al., 2014; Ceasens et al., 2016; Kim & Beehr, 2018; Skakon et al., 2010). There is also some evidence that happy leaders are more empowering (Chi et al., 2011; Joseph et al., 2015) while the effect of leader's empowering behaviors on follower's WB is rather well-documented (Tuckey et al., 2012; Skakon et al., 2010). We therefore claim that both supportive and empowering leadership are mediating mechanisms in WB cross over from the leader to the follower.

Methodology

We use the data from 406 leader-follower dyads and structural equations modeling to test the hypotheses. We measure WB using SWLS (Pavot & Diener, 2008), support using Survey of Perceived Organizational Support (Eisenberger et al., 1986) and empowerment using Spreitzer's (1995) scale. We control for leader's and follower's age, gender and tenure.

Results

We confirm the expected cross-over effect of WB from the leader to the follower. This corroborates earlier findings in relation to WB-related constructs. We further unpack the mechamism of such cross-over effect and conclude that it is partly due to affective cross-over also referred to as emotional contagion. We also found that majority of the cross-over effect is indirect and mediated by supportive and empowering leader's behaviors. It seems that those two styles of leadership, and their consequences are reinforcing themselves, their combination is beneficial for WB and, as a consequence, performance of employees (Butts et al., 2009).

Implications

We contribute to the body of literature on leader's behaviors and WB. We contribute by reversing the question on the effect of leadership style on WB. Instead of asking what is the effect of certain leader's behaviors on leader's WB (Ilies et al., 2005, Bernerth & Hirschfeld, 2016; Kaluza et al., 2020) we ask and investigate how are leader's behaviors driven by the level of leader's WB. We also further unpack the mechamism by which the WB of the leader crosses over to the WB of the follower. We point to relational leadership styles: supportive and empowering as mediators and empirically prove that they play important role in the WB cross-over effect. This finding is important as earlier studies almost exclusively focused on WB of employees and very few that took into consideration WB of the leader used it as dependent variable. We uncover that leader's happiness might be an important resource in leading employees (Chi et al., 2011; Joseph et al., 2015).

Relevance to the Congress Theme

We provide understanding of the changing world of work by pointing to WB of leaders as a leadership resource.

UN SDGs

Our research especially strongly promotes UN SDGs 3 and 8 by highlighting the role of leaders' and followers' WB.

Keywords: well-being, supportive leadership, empowering leadership

Oral presentation OP306

Happy-Productive Worker thesis revisited: a mixed method approach of well-being and performance patterns

Amalia Raquel Pérez Nebra, University of Zaragoza; Esther Villajos, Universitat de València; Jonathan Peñalver, Universidad Internacional de Valencia, Universitat Jaume I

science

Research goals and why the work was worth doing:

The systematic review of the relationship between performance and well-being at work in Brazil revealed that contextual and task performance shows an unclear relationship with well-being, particularly when well-being is operationalised as hedonic (e.g., emotions) (Pérez-Nebra et al., 2021). Although previous studies have added knowledge to understand this relationship by proposing discriminative variables (Ayala et al., 2017), there is still much to be known from a mixed methodology integrating quantitative and qualitative data. Thus, this work aims to describe qualitatively how people dealt with and what contributed to having positive experiences working remotely, comparing well-being and performance patterns based on a person-centred approach.

Theoretical background: The happy-productive worker thesis (Staw, 1986) suggests that, ceteris paribus, happy people are more productive. However, this relationship, more than disappointing, is unclear, for many reasons (e.g., high levels of positive emotions may be unproductive or may be detrimental to performance, Grant, & Schwartz, 2011; or it could be due to different operationalisations of well-being and/or performance, Peiró et al., 2021). Based on the aforementioned reasons, Peiró et al. (2014) called this Sustainable Productivity and Well-being Synergy, describing the emergence of 4 profiles characterizing the relationship between well-being and performance: happy-productive, unhappy-unproductive, happy-unproductive and unhappy-productive. We expanded their proposition exploratorily by applying mixed methods.

Methodology: 236 valid questionnaires were analysed from Brazilian workers (56% of females, 54,6% undergrad degree, 43,7 years old (SD = 10,6). We conducted an embedded mixed method approach, asking people about their emotions at work (positive emotions, Ω= .94; negative emotions, Ω= .92) and general performance (composed of in-role and extra-role performance, Ω= .81). In a person-centred approach, we tested the best number of clusters. The different indicators suggest between 3 and 10, for parsimonious and theoretically reasons, we decided for 3 clusters with positive silhouettes. We controlled for personal and labour variables. The next step was to conduct the lexical analysis using Iramuteq (R interface), which organizes five different classes of words in the dendrogram. The last analysis, chi-square, tested whether different classes of words were more prevalent for different clusters.

Results: The cluster analysis suggested three clusters: Cluster 1: happy-productive, Cluster 2: unhappy-unproductive and Cluster 3: unhappy-productive. Any control variable increases the odds of being in any cluster. The five classes of words that emerged were: Class 1: mobbing; Class 2: domestic routine; Class 3: children routine; Class 4: time and home limits; Class 5: Commute and housekeeping. It is noticeable that Classes 2 to 4 aggregate different nuances of work-family conflict. The chi-square analysis suggests that Class 1, mobbing, aggregates more people from Cluster 3 (unhappy-productive); Classes 2 to 4, work-family issues, aggregate more people from Cluster 1 (happy-productive); and Class 5 aggregates people from Cluster 2 (unhappy-unproductive).

Limitations: Cross-sectional data were used; therefore no strict causal conclusion can be drawn. All variables were measured as self-reports, so common-method bias could limit the findings. Although it is a small sample, the study meets the minimum size required.

Conclusions – This works provides complementary theoretical lenses and antecedents of what helps to increase and decrease the odds of being in different clusters of happy and productive measures, particularly when we are measuring emotions at work. Also, it shows that work-family conflict could be an issue for a happy-productive relationship which is a less explored avenue of research. It is worth noting the role of cyber-mobbing after Covid-19, particularly in a country such as Brazil, where the evidence is scarce and suffers from many vulnerabilities. Finally, commuting and housekeeping themes include some sort of work withdrawal, where the function of withdrawal behaviour is to ameliorate a dissatisfying job situation.

Relevance to the Congress Theme : 18 Well-being

Harassment, bullying and psychological strain at work: Norwegian hospitality wokers' experiences during the COVID-19 pandemic

Tone Therese Linge, Olga Gjerald, Huseyin Arasli, Åse Helene Bakkevig Dagsland,Kai Victor Myrnes-Hansen & Trude Furunes | University of Stavanger, Norway

science

Research goals and why the work was worth doing

This study aims to examine employees' experiences within the hospitality industry in Norway in the context of the COVID-19 pandemic, and to analyze how employment relationship problems were managed during the pandemic. The survey is part of a broader study on the same topic in Norway, Scotland, Ireland, Greece, Australia and New Zealand.The COVID-19 pandemic led to extremely challenging conditions for hospitality workplaces worldwide and has had dramatic consequences for employees in the industry. Hence, this study aims to increase knowledge about how employees in the hospitality industry in Norway experienced and managed workplace challenges in light of the pandemic. The study further aims to gain insights into hospitality workers' experiences of bullying, harassment, and psychological strain.

Theoretical background

Previous studies have shown that employees in the tourism and hospitality industry are more exposed to continuous workplace-related mistreatment than workers in other sectors (Ram, 2018). However, few studies have investigated how these behaviors manifest in periods of crisis when interactions with customers, supervisors and colleagues occur under circumstances characterized by social stress (Booyens et al., 2022, p. 2) Changes in work conditions under COVID-19 may have added additional stressors, thus decreasing workers' resources and increasing psychological strain. This study is theoretically informed by the job-demands-resources (JD-R) model which points towards strain as a result of lack of balance between job demands and job resources (Aguiar-Quintana et al., 2021).

Design/Methodology

A cross-sectional survey was conducted using self-report surveys. The survey was distributed through relevant industry contacts and social media channels (Facebook, LinkedIn) from September 2021 to March 2022. The sample consists of employees who had worked in the hospitality industry over the past two years. 853 respondents answered the survey, of which 585 responses were complete. Most of the particpants had extensive work experience, and over 50% were between 26-45 years old, while only 12% were younger workers between 16-25 years. 66% identified as female, 32% identified as male, and 2% as other.

Most of the questions were developed by Curran (2021), while psychological strain was measured by the emotional exhaustion subscale of the Maslach Burnout Inventory (Maslach & Jackson, 1981). Both descriptive and inferential (correlation and regression) statistics were calculated using the statistical software SPSS, while the qualitative data from the open-ended questions was analysed through NVivo.

Results

The findings showed that both experienced and witnessed abuse (verbal/psychological and physical) were related to psychological strain. Verbal/psychological abuse showed highest correlation with psychological strain, followed by bullying and physical abuse. The most common unwanted workplace behaviors seen or observed by respondents were verbal and psychological abuse by customers, closely followed by supervisors or managers. However, although customer abuse was most prevalent, abuse by supervisors/managers or colleagues appeared to be more difficult to handle. In addition, the results showed that younger employees experienced increased stress related to psychological strain.

Limitations

Among limitations of the study are non-probability sampling, cross-sectional design, data based on self-reports, and common method bias.

Conclusions – research and practical implications

The study showed that there was a strong prevalence of abuse and harassment related to psychological strain during the COVID-19 pandemic. Furthermore, counterparty behavior appeared to deteriorate during the pandemic. Dismissive attitudes of managers emerged as an important predictor of such behaviors. The results also indicated that employees preferred to remain silent in the face of deteriorating conditions. The mentioned conditions can further be related to high job insecurity, depression, anxiety, turnover, poor work conditions and bad reputation in the hospitality industry.

Originality/Value

The hospitality and tourism industry has up until now largely neglected to focus on sustainable outcomes in relation to employment and workforce issues (Baum, 2018). Thus, there is a need for more research that addresses decent and dignified employment in the context of the hospitality and tourism sector.

Relevance to the Congress Theme

This study addresses how the COVID-19 pandemic changed work conditions for Norwegian hospitality workers, resulting in increased psychological strain and deteriorating work conditions. The results imply a need to address employees' experiences and well-being in light of changing work conditions.

Relevant UN SDGs

The aim of this study is grounded in the UN's Sustainable Development Goal 8, which promotes inclusive and sustainable economic growth, employment, and decent work for all.

Keywords: Hospitality workers' experiences, COVID-19, decent work

Oral presentation OP173

Health Culture in Occupational Integration Management

Anika Melzer, Inka Krüger, Manuela Metzner, Kathrin Moreno Superlano & Jochen Prümper | Hochschule für Technik und Wirtschaft Berlin

science&practice

Mental issues are no longer a marginal problem in society and working environment. In contrary, mental impairments and disorders often lead to long-term absences from work. Health culture is suspected of playing a key role in dealing with mental issues of employees. This research created a qualified measuring tool to examine how different participants in the return to work process perceive health culture. Furthermore, best practices and digital needs in health culture were examined to improve future working conditions.

In Germany Occupational Integration Management (ger.: "Betriebliches Eingliederungsmanagement") is regulated by law (§167 Abs. 2 SGB IX), thus employers need to support their employees to return to work after sick leave. The critical period is defined to be more than six weeks of absence within the past twelve months. After this period of time employees are entitled to receive occupational support for returning to work. Since long-term illnesses particularly frequently affect mental disorders, project BEMpsy prioritizes on this phenomenon in particular. To successfully counteract the mental stress of employees, this research wants to follow the indications that suggest an appreciative health culture as a solution. International research shows that health culture in companies is associated with the mental health of their employees. In addition, health culture should act as a key enabler for employees and organizations to improve their performance and productivity and reduce costs due to absenteeism, accidents and sickness.

The project explored key aspects of return to work in German organizations following a mixed-method design: first, a quantitative online survey with N = 178 participants was conducted, followed by qualitative, guided expert interviews (N = 42 participants of 21 organizations) according to the approach of Appreciative Inquiry. A new scale was developed in the survey to analyze health culture in Occupational Integration Management with three subscales "values and beliefs of the organization" (e.g. existence of specific corporate guidelines), "organizational activities for occupational health management" (e.g. occupational health care interventions) and "supportive social structures in the organization" (e.g. by management). The investigation included different target groups in the return to work process: affected employees and organizational stakeholders.

The results of the survey show that the health culture was perceived strongest at the level of "organizational activities for occupational health management" overall. The analysis separated according to target groups showed that the organizational stakeholders rated health culture significantly higher in all subscales compared to the affected employees. During the interviews, best practice examples were identified that provide valuable guidance for the design of the health culture, as well as a collection of supporting digital tool ideas.

The limitations of the present study lie mainly in the small size and variability of the sample. Even though the sample already includes nine relevant industries in Germany, further studies in more diverse industries in an international context are necessary. It should also be noted that the study was conducted in voluntary cooperation with companies that already have a well-implemented Occupational Integration Management. This is not the case universally in Germany and may have a biasing effect. The health culture questionnaire for Occupational Integration Management requires future validation.

In summary, the study provides a useful questionnaire tool for the health culture in Occupational Integration Management. Since experiencing an appreciative health culture is especially important for successful return to work, the question arises as to how this can be achieved. The digital tools identified in the interviews can provide an answer to sustainably improve the health culture and, thus, have an effect on the mental health of employees. This will hopefully reduce long-term absences caused by mental issues in the future.

This submission picks up on the theme of the upcoming EAWOP conference 2023 "The future is Now: the changing world of work", highlighting and developing people-centered and health-promoting working conditions with a digital approach.

_____

[1] This paper was created in the project "BEMpsy: Making digital simple – Promoting the participation of severely disabled people in working life through occupational integration management with special consideration of mental disorders". The project is funded by the Compensation Fund for Supra-Regional Projects for the Participation of Severely Disabled People in Working Life of the Federal Ministry of Labour and Social Affairs (BMAS, funding number: AGF.00.00009.19). Duration 01/10/2020 to 30/09/2023. Project management: Prof. Dr. Jochen Prümper, Hochschule für Technik und Wirtschaft (HTW) Berlin; Project partner: GAW.

Oral presentation OP21

Healthier at home? A 5-day diary study on the effect of character strength application on health in traditional vs. remote settings

Stephanie Neidlinger & Jörg Felfe | Helmut-Schmidt-University Hamburg

science

Research goals and why the work was worth doing

With current trends in work design, an increasing number of jobs has switched to hybrid or fully remote. It is important to identify possible resources to help employees adjust to remote work. Applying one's character strengths at work has shown positive health-related effects in the context of traditional work settings. We used a 5-day diary to test, if positive effects of the application of the character strength zest on health are contingent on work location (remote vs. office-based).

Theoretical background

A central concept within positive psychology are character strengths, 24 positive trait-like constructs, which have been positively linked to health and thriving in the context of work. Regardless of the trait-component, individuals can apply their strengths at work to varying degrees. Strength application has been linked to health, happiness and perceiving one's job as a calling. The focus of this study is the application of the character strength zest, which is defined as "approaching life with excitement and energy; not doing things halfway or half-heartedly; living life as an adventure; feeling alive and activated". Zest has been shown to relate positively to life and work satisfaction, and showing overall healthier behaviours, such as stress-coping. Within the Job-Demands-Resources (JDR) model, character strengths and their application are conceptualized as personal resources. However, the new demands arising from working from home, such as isolation, substituting face-to-face communication with videocalls, and technical difficulties might hinder employees to apply zest in the context of their work.

Design & Approach

We recruited a sample of 98 German employees with various remote, hybrid, and office-based work arrangements from various occupational backgrounds. The sample completed a 5-day daily diary study (Level1 n = 420 observations) every evening and reported their work location, application of the strength zest, and health. Using hierarchical linear modelling, we tested whether zest was an antecedent of employee health and whether this relationship was moderated by daily work location.

Results

Results of the hierarchical linear model showed that zest was an antecedent of daily health across five consecutive days. Work location also significantly predicted application of zest in such a way that those who worked at the office (as opposed to remotely) were able to apply zest more frequently. We only found a marginally significant ($p = .06$) moderating effect of work location on the relationship between application of zest and daily health, indicating that employees who work at the office might benefit more form the positive effects of zest on health. However, since the effect was not significant, further studies to clarify this relationship are required. A model with random intercepts and random slopes did not fit the data better than a model with random intercepts and fixed slopes.

Limitations

As many diary studies, this study was subject to dropout and missing data throughout the dataset. Based on theory, a model with random intercepts and random slopes would have been expected to show the best fit. However, model fit of a model with only random intercepts (and fixed slopes) showed very similar quality criteria. It is possible that due to low level 1 N , a model with fixed effects was favoured. Further investigations with additional character strengths as predictors for health, as well as samples with larger level 1 N are needed. Further studies could examine samples of only hybrid workers.

Conclusions

Investigating the relationship between zest and health in remote work settings contributes to our understanding of positive psychology and its implications in the contexts of new and digitalized ways of working. Results of this study show that applying the character strength zest is related to good health on a daily basis. Additionally, since we did not find a significant moderating effect of work location, the positive effects of zest on health seem to unfold regardless of work location.

Relevance to the Congress Theme & Relevant UN SDGs

Our study contributes to the congress theme and to the UN SDG by shedding light on antecedents of health under new working conditions. It will be essential for the future of work and the maintenance of good health to adapt work design and policies to cater to employees' needs.

Keywords: health, remote work, character strength application

Oral presentation OP31

High consequence listening in organisations: An integrated conceptual review

Alyssa M Pandolfo, Alex Gillespie & Tom W Reader | London School of Economics

science

Researchers, organisations, and policymakers have positioned voicing concerns as an effective way to prevent harms (e.g., death). Yet, organisational disaster investigations reveal that while many individuals raised concerns before scandals, listeners did not address these complaints.

'High consequence listening' is observable behaviour responding to raised concerns, where (in)action could result in significant proximal and distal consequences. For example, following a co-pilot's concern of an engine problem, the pilot can return to the originating airport (risking upset passengers) or continue the flight (risking crashing). While understanding high consequence listening is crucial for harm prevention, research is fragmented and inconsistently conceptualised and operationalised. Our conceptual review synthesises research on high consequence listening, proposing a unified conceptualisation and operationalisation of this phenomenon and suggesting factors underlying listening behaviours.

Methods

Our conceptual review included publications focused on listening to at least one high consequence concern in an organisational context. We performed a systematic review, examined publications citing and cited by included articles, searched relevant journals, and key authors' Google Scholar pages. We included 52 publications.

Results

Publications have variously termed high consequence listening (33 unique terms/definitions); however, they commonly position listening as based on listeners' motivations. Terms like 'wilful blindness' insinuate that (in)action is intentional, and conceptualisations frame listening as strategic (e.g., to minimise culpability). Narrowly focusing on motivations limits our understanding of the phenomenon and overlooks alternative explanations.

High consequence listening insights have primarily been obtained through methodologies employing imagined or recalled action following concerns (e.g., surveys, interviews, experiments). While using these methods is understandable given high consequence listening's elusiveness, they assume that findings in safe and controlled situations will extrapolate to dynamic environments with the threat of harm. In such decontextualised conditions, listening intentions or behaviours may be over-reported, misremembered, or misattributed.

The literature's conceptualisation of high consequence listening as motivational influences and is influenced by challenges obtaining behavioural listening data. Difficulties with reliably capturing listening behaviour likely led to using self-report methodologies; these methodologies' findings are prone to be interpreted in terms of listeners' motivations. Additionally, conceptualisations framing listening as motivational likely used self-report data with the assumption that listening is deliberate; these data then provided confirmatory evidence for explaining listening in terms of motivations.

We propose a conceptual model framing high consequence voice and listening in terms of shared cognitions. An individual first perceives a shared cognition discrepancy (e.g., an unnoticed hazard), are concerned, and engage in high consequence voice. The listener engages in high consequence

listening, demonstrated in their behaviours (failing) to address the voiced problem and to (re)establish similar and accurate shared cognition. Following high consequence voice and listening are the team's degree of shared cognition and the situation's outcomes (e.g., accident).

Limitations

We excluded unpublished work, and additional articles may have been published during analysis (June 2022 onwards).

Conclusions

Our review unifies the fragmented literature on high consequence listening in organisations, proposing a novel and standardised conceptualisation of this phenomenon. Broadening the literature's focus on listening as motivational, we suggest alternative factors underlying listening behaviours. For instance, listeners may have improvable listening skills or situation awareness leading them to miss, prematurely discount, or under-estimate concerns' importance; they may benefit from interventions encouraging listening behaviours. Alternatively, they might be situated in organisations with poor reporting systems.

Research should measure high consequence listening behaviour as it naturally occurs. Unconventional datasets (e.g., 911 calls) provide rich conversation data which can be analysed using natural language processing. Future research should create a reliable and valid method of coding naturalistic listening behaviours.

Congress theme relevance

To prevent possible future harms, individuals must hear voiced concerns and appropriately address them. High consequence listening in the present shapes proximal and distal consequences in the future. Consequently, understanding factors influencing and influenced by high consequence listening is crucial for intervention development and harm prevention.

Keywords: Listening, voice, high consequence

Oral presentation OP612

Hopping from GIG to GIG: Addressing GIG workers challenges through the prism of regulatory focus

Dina Van Dijk , Ben-Gurion University of the Negev; Ronit Kark, Bar-Ilan University; Ariel Daniels, Ben-Gurion University of the Negev

science

Introduction

The way work is accomplished has changed dramatically over the years. One trend dominating this change is the massive rise in employment through alternative work arrangements, such as GIG work, freelance work, and contract work (Barley et al., 2017). These modern work arrangements, and specifically their digital manifestation, the 'GIG economy', accounted for over 57 million adults, or 36% of the eligible workforce in the US in 2017 (Gleim et al., 2019; Hayzlett, 2018). While offering more autonomy and flexibility, modern-day work is often characterized by high levels of financial instability, job insecurity, and career path uncertainty, especially in the wake of the Covid 19 outbreak. These characteristics of modern work pose significant challenges for contingent and GIG workers, challenges that have thus far been under-theorized and under researched (Jabagi et al., 2019; Kuhn & Maleki, 2017; Petriglieri et al., 2019; Spreitzer et al., 2017).

Adopting regulatory focus perspective (Higgins, 1997; 1998), we suggest that workers who hold a prevention focus might be ill equipped to face uncertain times, and thus may be challenged by GIG work.

Drawing on the challenges identified by Ashford et al. (2018), we suggest four coping strategies ("anchors") that may support GIG workers with prevention focus: 1. Stability anchor: generating stability and maintaining status-quo, at least partially, through part-time work or through focusing on one or two substantial customers or projects. 2. Referential anchor: Ongoing work with a coach, buddy or business partner, in order to address prevention-oriented individuals' need to direct their sense of obligation and duty (Higgins, 1997; 1998) toward a reliable and stable figure. 3. Societal anchor: Association with a professional group or community, accommodating prevention-oriented individuals' interdependent self-perception which is supported by being part of a societal whole (Lee et al., 2000). 4. Facilitation anchor: using GIG marketplaces such as UPWORK or FIVERR that facilitate GIG workers' self-promotion and customer-acquisition needs, and so accommodate the avoidance tendencies of prevention-oriented individuals. The effectiveness of these strategic anchors was assessed in relation to three work related outcomes - work subjective success (Shockley, 2016), estimated potential income growth, and work engagement (Schaufeli, 2019). Thus, the following was hypothesized:

Hypothesis: The strategic anchors will moderate the negative effect of prevention focus on GIG workers' outcomes (e.g., subjective success), such that the negative effect will be attenuated when GIG workers are exposed to the strategic anchor.

Method

To test our hypothesis, we first ran a screening survey among 522 working adults (Prolific users; 52% men, M age=31), that were requested to fill in their work characteristics as well as their regulatory focus. Using a "GIG scale", constructed by the authors to reflect characteristics of GIG workers described in the literature, we identified 141 GIG workers that continued to the second stage. The

second stage included an experimental setting, in which the four anchors were manipulated. In each condition, one anchor was presented to the participants (the GIG workers). The work outcomes were measured before and after each anchor was displayed; before presenting the anchor, the workers reported their actual perceptions of their work outcomes (e.g., subjective success), whereas after the anchor presented, they were asked to estimate how much the anchor would affect their work outcomes. Results

Firstly, initial correlation tests revealed that whereas promotion focus was positively correlated with all three outcomes, prevention focus was not correlated with any of them. In addition, as predicted, under the condition of stability anchor (compared to the other three conditions) – prevention focus was positively associated with the engagement and subjective success work outcomes (Figure 1 presents the moderation effect of stability anchor on prevention focus – subjective success effect). The referential anchor found to moderated the effect of promotion focus on subjective success. Specifically, under the effect of the referential anchor, promotion focus was positively associated with subjective success (see Figure 2). These two interaction effects suggest that while stability (e.g., focusing on one or two projects) works for prevention focus, referential anchor (e.g., work with a partner) works best for promotion focus.

Discussion

Our results suggest that the effectiveness of different strategies in supporting GIG workers succeed and thrive in the GIG economy differs according to workers' regulatory focus. Specifically, in line with our hypothesis, stability strategies seem to fit individuals that are high on prevention (but not promotion) focus. However, contrary to our expectations, referential and societal strategies fit individuals that are high on promotion (but not prevention) focus.

The contribution of this research from a theoretical perspective, lies in the way it leverages the power of regulatory focus for explaining how individuals with different motivational orientations experience modern-day work challenges, and, moreover, how they can effectively address these challenges. From a practical perspective, this research may offer modern-day workers, as well as other stakeholders with a vested interest in their success, a better understanding of the challenges they face, and some practical strategies that may support them in coping and, moreover, thriving in these conditions. Future research could expand the investigation of strategic anchors that support individuals that are oriented to both prevention and promotion focus.

Keywords: regulatory-focus, GIG economy, motivation

Oral presentation OP606

How do effort, reward, and their combined effects predict burnout, self-rated health, and work-family conflict among permanent and fixed-term faculty?

Anna Tanimoto & Petra Lindfors | Department of Psychology, Stockholm University; Anne Richter, Department of Learning, Informatics, Management and Ethics, Karolinska Institutet

science

Research goals and why the work was worth doing: The goal of this study was to contribute to current knowledge of employment and working conditions in academia. As work in academia is increasingly described as stressful, academic faculty may be at risk for adverse health-related outcomes, which in turn may jeopardize the quality of education and research conducted at higher education institutions. Considering the crucial role that teachers and researchers in higher education play in society, it is important to strive to identify ways in which to improve their working conditions. In this study, we examine if and how faculty perceptions of the psychosocial work environment are associated with different health-related outcomes, and explore how these relationships play out for permanent and fixed-term faculty.

Theoretical background: Employment conditions and psychosocial factors have been associated with various health-related outcomes in different occupational groups, but few studies focus on the conditions in academia, particularly Swedish academia. Previous research suggests that the psychosocial work environment may contribute to impaired health and interference between work and family among faculty. Furthermore, temporary employment contracts are commonplace in academia, and may influence employee perceptions of the psychosocial work environment. Moreover, research from other sectors regarding the role of contract type may not generalize to academia. Thus, this study aimed to: 1) investigate the effects of effort, reward, and their interaction to explain burnout, self-rated health, and work-family conflict among faculty in Sweden, and 2) empirically contribute to the research on psychosocial working conditions, contract type, and associated health-related outcomes, including work-family conflict, in academia.

Design/Methodology/Approach/Intervention: Questionnaire data, collected online in 2016, came from 2335 faculty with a doctoral degree, working at higher education institutions in Sweden. The average respondent was 48 years of age, 57 percent were women and 78 percent held permanent contracts. Measures of the psychosocial work environment included effort and reward. Burnout, self-rated health, and work-family conflict constituted the health-related outcomes. Using structural equation modeling, multi-group analysis combined with latent moderation analyses was conducted.

Results obtained: Main effects of effort were found for all health-related outcomes revealing that effort was associated with higher burnout, poorer self-rated health, and greater work-family conflict. Main effects of reward were found for burnout and self-rated health in both contract groups revealing that reward reduced burnout and improved self-rated health. Reward was not significantly associated with work-family conflict. The interaction between effort and reward was significantly associated with all outcomes among permanent contract employees, but was non-significant among those with fixed-term contracts.

Limitations: Future research would benefit from longitudinal studies where both permanent and fixed-term faculty perceptions of the work environment in relation to outcomes of health and well-being could be compared over time.

Conclusions – research and or practical implications/Originality/Value: The results suggest that effort and reward may explain health-related outcomes among academic faculty, with the exception of work-family conflict. Reward does not seem to have beneficial effects for work-family conflict. Furthermore, the results indicate that reward may moderate the relationship between effort and outcomes among permanent faculty, while this may not be the case among fixed-term faculty. Perhaps this is because fixed-term faculty expect an imbalance between effort and reward for some duration of time, in anticipation of eventually securing a permanent contract. Overall, this study emphasizes the importance of psychosocial work environment factors to understand health-related consequences for permanent and fixed-term faculty in Swedish academia.

Relevance to the Congress Theme: The conditions in academia continue to change as the characteristics of the job and faculty responsibilities evolve. Moreover, the research and knowledge-production which characterizes academia is constantly reevaluated and updated, reflecting a context which is constantly changing. New research findings must be integrated with prior knowledge, and passed along to the next generation of students.

Keywords: academia, psychosocial work environment, temporary employment

Oral presentation OP468

How do Knowledge Workers Cultivate Opportunities for Creative Contributions in a Multiple Team Membership Context?

Mayssa Rishani, Erasmus University Rotterdam; Poornika Ananth, University of Bath; Dirk van Dierendonck & Inga Hoever | Erasmus University Rotterdam

science

Research goal – The proliferation of teamwork has lead employees to commonly be members of more than one team at a time. This practice of multiple team membership (MTM) is especially pervasive among knowledge workers who accomplish complex tasks. Despite recent scholarly interest in MTM (e.g., Margolis, 2020), our understanding of how members experience and leverage their multi-teaming for their challenging, nonroutine work remains lacking. In this study, we thus focus on creative contributions that are at the center of knowledge work and raise the question of how do knowledge workers cultivate opportunities from their MTM context for creative contributions.

Theoretical background – Prior research primarily studied the benefits and costs of employee multi-teaming. On the one hand, MTM is indicated to reduce idle time, promote efficiency, and disseminate knowledge within organizations. On the other hand, it is indicated to introduce additional workload, fragment attention, and compromise employee well-being (e.g., Margolis, 2020). The scholarly discussion thus focused on the impact of MTM (e.g., on employee performance, learning, strain), and overlooked how employees manage their MTM and make use of it for their work. Furthermore, research often studies MTM from a structural perspective that considers the impact of different MTM structures such as the concurrent number of teams (MTM number) and the differences across teams (MTM variety) on employees (e.g., Margolis, 2020). In that sense, our knowledge of MTM is largely bounded to the implications of these MTM structures on employees, and our understanding of employees' actual participation and experiences in multiple teams is lacking (e.g., Mortensen & Haas, 2018). Our research thus moves the scholarly discussion towards how employees actually work in multiple teams, and more specifically, towards how they cultivate opportunities from their MTM context for their creative work contributions. Our research focuses particularly on knowledge workers because a) they represent a dominant group of the workforce, b) they are typically multi-teamers (e.g., prevalence estimates placed as high as 95% for knowledge work), and c) creative contributions are imperative to accomplish knowledge work (e.g., problem solving).

Design – We adopted an inductive qualitative research approach that allows us to understand how knowledge workers interpret their MTM experiences in terms of opportunities for creative contributions. In particular, we employed grounded theory procedures (Gioia et al., 2013) and collected semi-structured interview data from 50 knowledge workers a) who are multi-teamers and b) whose work requires creative contributions (e.g., product development, marketing). Through theoretical sampling and constant comparisons, we organized and analyzed the emerging concepts.

Results – Preliminary results show that knowledge workers have different underlying MTM mindsets (i.e., mental representations of their MTM) that determine their experiences related to multi-teaming and how they thus establish connections for creative contributions. Building on workers' MTM mindsets, we then discuss whether and how multi-teamers attempt to find opportunities for their creative contributions. We also discuss the role of team centralization (i.e., the extent to which one team is considered central in comparison to the other concurrent teams) in

shaping how workers experience their MTM and the extent to which they engage in creative contributions across their teams.

Limitations – Though our focus on knowledge workers relates to the study's relevance, the transferability of our findings to other contexts where MTM may be common may be limited. Besides, although we think it is a strength to sample workers from different knowledge industries that necessitate creative contributions, we are aware that differences across industries are likely and future research should further examine these differences.

Conclusion – Despite the recent surge in MTM research, little is known about how knowledge workers make use of their multi-teaming for creative work contributions. Our research contributes to the literature by emphasizing the importance of a) studying the processes that accompany workers' MTM rather than mostly focus on MTM outcomes, and b) studying workers' experiences of MTM to move beyond the predominant study of MTM structures. We also derive insights for practitioners about how they can best manage their multi-teaming for creative work.

Keywords: Multiple team membership, creative work, modern teamwork

Oral presentation OP518

How do we Include? An investigation into Employee Inclusivity

Niamh Dawson, Nik Steffens, Stacey Parker & Tyler Okimoto | The University of Queensland

science

Aim: Despite the growing interest surrounding inclusion in the workplace (Roberson, 2019), research is yet to consider how individual employees contribute to the inclusive experience of those around them. This research seeks to examine the ways in which employees exhibit inclusion within their workgroup. That is, how do we include others?

Background: Increasing diversity in the workforce resulted in a focus shift from the challenges with diversity, to inclusion which promotes the integration and value of diversity (Roberson, 2019; Nishii, 2013). Creating inclusive environments has been described as the key to unlocking the many benefits of diversity (Shore, Cleveland, & Sanchez, 2018). These benefits include employee performance, creativity, helping behaviours, and commitment (e.g., Nishii & Rich, 2014; Cho & Mor Barak, 2008).

Yet, we have only recently agreed upon a definition for what it means to feel included at work (Chung; 2019; Tang et al., 2015). Drawing upon optimal distinctiveness theory (ODT; Brewer, 1991) Shore and colleagues (2011) established the first conceptual definition of inclusion; defined as the simultaneous fulfillment of one's need for belonging alongside their need for uniqueness.

To achieve real and felt inclusion, research agrees that inclusive treatment must come from all levels of the workplace, from organizational actions (e.g., Offerman & Basford, 2014; Roberson, 2006) to leader behaviours (e.g., Roberson, 2020; Nishii & Mayer, 2009). It has also been noted that one's local workgroup plays a significant role in determining experiences of inclusion (Nishii & Leroy, 2020). Despite this, very little conceptual or empirical work that considers how individual employees contribute to the inclusive experience of their fellow colleagues. Our research therefore aims to understand the ways in which employees contribute to the inclusive experience within their workgroups by examining how they exhibit and receive inclusive behaviours.

Design: An online, mixed methods study was conducted to explore the descriptive content of employee inclusivity as well as the related characteristics and associated motivations. Content analysis was used to analyse the data.

Method: An online survey was administered via Prolific Academic. The sample consisted of 251 (males=75; females=170; other=5) adult employees. Participants were asked to describe " four instances where they received an inclusive behaviour", and "f our instances where they exhibited an inclusive behaviour ". Participants were asked to rate the characteristics of each unique behaviour including its underlying motivation, genesis, target, goal, and resources. Commonalities were examined within qualitative responses using content analysis.

Results: Up to seven key themes of inclusive behaviours were revealed through content analysis. Across both received and exhibited behaviours, five core themes of inclusive behaviours emerged including 1) civility, 2) involvement, 3) value signalling, 4) compassion, and 5) identity acceptance. Within exhibited behaviours, two further themes emerged including 6) promoting egalitarianism, and 7) diversity and inclusion engagement.

Conclusions: Our findings offer several valuable contributions. First, they provide a tangible framework for understanding inclusion on the ground. Second, our results offer insight into the kinds of behaviours that (often resource-intensive) diversity and inclusion practices should be promoting.

Finally, they demonstrate the potential discrepancy between ‘behaviours we think are inclusive’ and ‘behaviours that make us feel included’.

Congress Theme Relevance: Our research appeals the congress theme by 1) contributing to our understanding of the practice of inclusion, 2) creating urgency around the ways in which we incentivise diversity and inclusion engagement, and 3) delivering key outcomes that will help change the future of work for the better.

Keywords: Diversity and Inclusion, Employee Inclusion

Oral presentation OP570

How Does Trust Sound? The Influence of Voice Pitch on Trust

Matthieu Jost, University of Lausanne - HEC Faculty

science

Research goals and why the work was worth doing

The influence of voice characteristics such as voice pitch (the perceived height of the voice, see Titze, 2000) on trustworthiness inferences sparked interest during the last decade, but the results are contradicting. In fact, low-pitch voices were associated both with increased trustworthiness (Tigue et al., 2012) and decreased trustworthiness (Schild et al., 2019). Yet, studies investigating the influence of voice pitch on trust differ to a large extent. Hence, it is not clear what the directional effect of voice pitch on trust is, or if such an effect exists at all. The goal of the current investigation was thus to test whether voice pitch influenced trust inferences about a social interaction partner. The work was worth doing because it introduced a novel economics perspective to the study of voice by using a robust experimental design with real monetary incentives.

Theoretical background

Voice pitch is considered as "the perceived 'height' of the voice" (Titze, 2000, p. 236) and is a perceptual correlate of the mean fundamental frequency (Titze, 1994). Voice pitch shapes inferences about speakers trustworthiness in situations where they are unknown to raters (Apple et al., 1979; Oleszkiewicz et al., 2017) and this may be due to the effect of testosterone on seemingly unrelated phenotypic traits (i.e., pleiotropic effect; Tognetti et al., 2020) that are vocal pitch and cooperation (O'Connor & Barclay, 2017). In fact, vocal pitch and cooperation are both influenced by testosterone levels in males (Bird et al., 2019; Fitch &Giedd, 1999). This led O'Connor and Barclay (2017) to suggest that voice pitch may thus be a cue to cooperation and may help individuals to determine whether to trust or not.

Design/Methodology/Approach/Intervention

The present research was composed of two studies that used the same experimental design with the same set of stimuli. Study 1 and Study 2 only differed in the participants that were recruited, the type of task that was used, and the addition of a perceptual measure of trustworthiness in Study 2. In study 1, 265 participants were recruited at a Swiss University. They were asked to play a Trust Game (TG, see Berg et al., 1995) with real incentives. Before playing, investors heard a brief message from their counterpart saying "Hi, I'm your partner and you can trust me." Investors then played the game, their gains were computed, and they were paid accordingly.

In Study 2, the same experimental design was used but participants played a hypothetical TG with no money involved. Perceived trust was also measured with a single Likert-scale item. To test this hypothesis, 318 Prolific participants were recruited and followed the same procedure as in Study 1.

Results obtained or expected (if not available, it must be made clear when they will be)

Overall, the results were consistent across both studies: voice pitch did not predict trust, neither measured as a behaviour or as a perception. The only consistent result was the effect of gender on trust, whereby male participants were more trusting than female participants, which is in line with previous meta-analytical results (van den Akker et al., 2020).

Limitations

Two potential limitations are noteworthy. First, the method used to modify voice pitch (shifting semitones) differed from earlier speech studies (e.g., Tigue et al., 2012) which used equivalent rectangular bandwidth shifting. This difference might have influenced how voice pitch was perceived by participants. Second, although the sample size was bigger than previously published studies in the field, it was still smaller than what was suggested by Monte Carlo simulations to ensure proper randomization of treatments to participants (Lonati et al., 2018).

Conclusions – research and or practical implications/Originality/Value

Across two studies with both perceptual and behavioral as well as incentivized measures of trust, the results consistently indicated that voice pitch did not affect trust. This calls into question the hypothesis that voice pitch could be a cue to cooperation. Further research is required to see if these findings are restricted to trust games or if they extend to other social dilemmas.

Relevance to the Congress Theme

One of the calls to action for the Congress is “How should we say it?” which is precisely the aim of the two studies. In fact, whenever someone speaks, listeners hear how high or how low they sound. By experimentally testing whether voice pitch influences cooperation, this research contributes to develop our knowledge on voice, and more broadly on interpersonal communication.

Relevant UN SDGs

By searching for insights into the mechanisms of cooperation between humans, the current research is highly relevant for economic growth (SDGs’ 8 th Goal) and ultimately peace (SDGs’ 16 th Goal).

Oral presentation OP177

How does workplace bullying influence personality change over time? Results from a Swiss panel study

Samuel Farley, University of Sheffield ; Tom Booth, University of Edinburgh; David J Hughes , University of Manchester; Karen Niven, University of Sheffield

science

Research goals

Workplace bullying has deleterious effects on victims. However, little is known regarding if or how workplace bullying can change one's core personality traits. Most existing studies examine cross-sectional correlations between bullying and personality and are not well-suited to addressing questions of personality change. Accordingly, we investigated the relationship between workplace bullying and personality over 4-years to determine if and how bullying exposure relates to victim personality change.

Theoretical background

Leymann's (1996) classic theoretical model describes workplace bullying as a 'vicious circle' in which the bullying treatment intensifies in frequency and severity, and in which the victim's behaviour and personality change in response to this, thereby perpetuating the process. Leymann's (1996) model, aligns with the TESSERA framework of personality change (Wrzus & Roberts, 2017), which explains that the mechanisms we use to regulate our momentary thoughts, feelings, and behaviours in response to situational triggers can become habitual and produce personality change when the triggering situations and subsequent sequences are repeated. The regular and repeated nature of bullying suggests that those who are exposed may then experience the personality changes that Leymann describes, which include becoming withdrawn (less extraverted), defensive (less agreeable), and more sensitive and anxious (neurotic).

Methodology

We used panel data collected by the Swiss National Centre of Competence in Research Lives project (NCCR LIVES: https://www.lives-nccr.ch/en). The data were collected from a representative sample of the Swiss working population across seven yearly intervals. We used waves 1-4: nWave 1 = 2469, nWave 2 = 1944, nWave 3 = 1629, nWave 4 = 1535. Bullying was measured in each wave using the item: ' In the last 12 months at work, In your last job, have you personally experienced mobbing / bullying?', the response scale was yes/no in wave 1 and 'never, rarely, occasionally, frequently' in waves 2-4. The personality variables were measured in waves 1 and 4 using the NEO Five-Factor Inventory Revised (NEO-FFI-R; McCrae & Costa 2004).

Results

Personality demonstrated moderate-strong levels of rank-order stability, in-line with the broader literature, with test re-test correlations (T1-T4) ranging from .66-.77. Bullying showed greater variation with test-re-test correlations (i.e., T1-T2, T2-T3, T3-T4) ranging from .38-.43.

We used latent change score (LCS) analysis to test the study hypotheses (McArdle, 2009). LCS analysis is a general framework for examining intraindividual change in which a key feature is the modelling of change between two time points (e.g., change in personality from T1 to T4). Bullying was positively correlated with changes in Neuroticism. The effects were present for bullying at any

time point (i.e., T1, T2, T3, T4 all correlated with change in neuroticism), with the most proximal effects being the strongest (i.e., T3 and T4) and this effect was robust to sample variations (i.e., whether those who were bullied at T1 were included or omitted) and scoring variations (i.e., whether bullying was scored dichotomously or as a severity). Bullying was unrelated to change in the other personality traits investigated.

Limitations

Personality was measured at wave 1 and wave 4, limiting the insights we could glean regarding the trajectories of change and potential existence of reciprocal effects.

Conclusions

By examining whether bullying victimisation across waves 2-4 predicted subsequent changes in personality, we found that becoming a bullying victim at any point in the study was consistently linked to greater changes in neuroticism. This effect was robust, regardless of whether the individual consistently experienced bullying across all study waves, or only experienced it only at wave 2 or 3. These findings suggest that bullying has negative effects on personality by increasing neuroticism, which may have longer-term distal implications as elevated neuroticism is related to a range of health outcomes (Lahey, 2009) and reduced workplace performance (Barrick et al., 2008)

Relevance to the Congress Theme

Our findings, alongside existing research (e.g. Matthiesen & Einarsen, 2004), suggest that the impact of bullying goes beyond work by affecting the psyche of individuals long after the initial experience. This means that the way people are treated in work today may have lingering implications for the decisions they make about work, how they interact with others, and whether they can contribute to society.

Relevant UN SDGs

Workplace bullying is relevant to the SDGs of ‘Good health and wellbeing’ and ‘Peace, justice, and strong institutions’.

Keywords: workplace bullying, personality

Oral presentation OP655

How does your workspace influence your personality?

Hannah Collis, Exeter Business School, University of Exeter; Matthew Davis & Chiahuei Wu | University of Leeds

science

Background:

In modern society we spend most of our lives working. However, the COVID-19 pandemic has dramatically changed this, specifically where we work. Many employees are now required to work from home or in a hybrid way, working from both the office and home throughout the week. Secondly, as the role and purpose of the office has been re-considered, several employers have introduced new areas and types of workspaces to their offices, moving away from the traditional banks of desks to offer spaces such as collaborative zones. The aim of these spaces is to promote specific behaviours and attitudes when working in them, such as communication, giving a 'focus' for working from the office.

Given the new range and variation between workspaces, it is proposed that personality expressions will show variability as a consequence of exposure to different environments. According to Trait Activation Theory (TAT), personality traits interact with the demands of the environment, for example rules about how to behave, to produce behaviours (Tett et al., 2021). However, we argue that since behaviour is only a facet of personality, a more direct method to examine personality expressions is through the study of personality states, defined as the momentary or short-term expressions of personality traits, inclusive of all attitudes, behaviours and cognitions which are aligned to the underlying trait (Zillig et al., 2002). A growing literature is supportive of personality state variability within the workplace, however most of the findings center around predicting performance (e.g., Minbashian et al., 2010). In contrast, the the present study operationalises personality states as the outcome to explore two questions:

Do home and office work environments promote different personality states?

Do personality expressions vary across different workspaces within the office?

Design:

An experience sampling study was conducted across employees of eight UK based organisations, consisting of two half-day responses (11am, 4pm) across a 10-day period. Over 5500 surveys were submitted, 1956 from an office workspace and 3627 from a home workspace. The total sample consisted of 471 employees, 60% female with a mean age of 39 years (SD = 11.1, range 20-80), 45% of whom were managers with an average tenure of 7.3 years.

Results:

Significant correlations were identified between work location (office or home) and personality states of extraversion ($r = .15$, $p < .001$), conscientiousness ($r = .06$, $p < .001$) and agreeableness ($r = .03$, $p = .03$). Using MLM to nest scores within individuals to examine within-person variation, we found a positive effect of work location on state extraversion (Est = .32, $t = 13.53$, $p < .001$) and conscientiousness (Est = .11, $t = 6.16$, $p < .001$), indicating that working in the office promoted higher levels of these states compared to when these individuals worked from home. No significant

relationship was found for state agreeableness. The reported results are controlling for both demographic variables and baseline measures of personality traits.

Within the diary entries logged from the office workspace, 1166 were reported from an open plan desk and 134 were reported from a closed office. No significant correlations were identified between office workspace and the personality states measured, suggesting that employees did not vary in how they worked across these spaces.

The analysis of this data is ongoing and further results will be presented at the conference.

Conclusions:

This study presents early insights into how the workplace may shape personality expressions. The significant differences between home and office-based working will have considerable contributions for practice, particularly relating to performance if state conscientiousness is lowered when working from home. Moreover, the lack of support for personality states variation across different workspaces may raise questions over the effectiveness of these workspace designs. Theoretically, by operationalising states as the outcome of an environment-trait interaction, in contrast to the previously identified behaviours, we provide a direct test of TAT. The results ultimately contribute to furthering our understanding of the new workplace, integrating the personality dynamics literature to present a novel assessment of employee behaviour within the workplace.

Relevance:

This study directly contributes to the Congress' Theme by exploring the experiences of employees' as they develop new ways of working, highlighting the impact on their personality expressions. Originating from a broader multi-disciplinary project, the study was designed in collaboration with industry partners and colleagues from Information Systems and Engineering. The work links into the UN SGD of 'industry, innovation, and infrastructure' and 'decent work and economic growth'.

Keywords: personality states, physical workplace, home working

Oral presentation OP756

How Leaderboards and Goals Improve Task Performance and Its Self-assessment

Tomas Kratochvil & Martin Vaculik | Masaryk University, Faculty of Social Studies, Department of Psychology

science&practice

Research goals

The aim of this study was to (1) to replicate a previous experiment on leaderboard and goal-setting effect on participants' task performance in an idea generation task (Landers et al., 2017), (2) to extend it by examining how participants assessed their performance, and (3) to evaluate such self-assessment by comparing task performance with a standard found in previous studies (Landers et al., 2017; White et al., 1995). Such a study allows us not only to evaluate whether gamification via leaderboards is a valid way of goal-setting to increase performance, but also to see whether goal setting in general and via leaderboards helps workers to assess their performance more accurately.

Theoretical background

Gamification is an intentional or emergent transformation of nongame environments (e.g., work, education, hobbies) to a more game-like state (Hamari & Koivisto, 2019) by implementing various game elements and designs (e.g., points, badges, and leaderboards). Its purpose is to increase motivation and task engagement (e.g., time-on-task), alter attitudes and behaviour, and to enhance goal achievement and performance (Deterding, 2011; Treiblmaier et al., 2018).

An example of this is a study by Landers et al. (2017) which demonstrates the gamification effect on performance in an idea generation task where a group with a leaderboard performed similarly to groups with a difficult or an impossible quantitative goal while also largely outperforming easy and "do-your-best" (DYB) goal groups. However, research also shows leaderboards may hinder performance when their users face large differences between themselves and higher-ranking competitors (Azmi et al., 2017). Meaning, if the environment becomes too aggressive and insecure due to strong competitiveness, users may perform less. Therefore, we should carefully design the leaderboard so that the competitive pressure is not too high. One suitable way is to develop the leaderboard in accordance with goal-setting theory.

Nonetheless, a question arises how the workers perceive themselves in such (possibly strenuous) situations. More specifically, whether the possibility to compare oneself with a standard (be it a goal or a leaderboard) helps the workers to assess their performance.

Hypothesis 1. Participants with leaderboards have similar task performance to the difficult and impossible goal group and better performance than easy or DYB group.

Hypothesis 2. Participants with leaderboards and difficult goals assess their performance more accurately based on the performance standard than easy or DYB goal group.

Methodology

We obtained a sample of 271 participants. The mean age was M = 25.16 (SD = 5.96) with 73 % women, 27 % men, and 0.4 % others; 1.5 % of primarily, 47.6 % high-school, and 51 % university educated.

Participants were given a 12-minute task to list uses of a knife in four goal conditions: DYB, easy (15; 1 SD below mean), difficult (39; 1 SD above), and impossible goal (53; 2 SD above). In the gamified condition, we presented a leaderboard consisting of fictional previous player scores based on the goals (15, 39, 53 points) and several scores in-between them. We measured task performance (number of uses) and self-reported performance (1-item on a 1–7 Likert scale). Finally, we divided the sample into low- and high-performing groups based on a performance standard (i.e., task-performance mean in previous studies).

Results

With an ANOVA, we found an effect on task performance, $F(4,266) = 11.05$, $p < .001$, partial $\eta^2 = .14$, where those with leaderboards outperformed those in DYB and easy condition while performing similarly to the other conditions, supporting H1.

Inconsistently, we have found higher self-reported performance for leaderboard vs. impossible and lower vs. easy and DYB conditions. Further, we found that low-performing participants in DYB and easy condition overestimated their performance in comparison to low-performing participants with a leaderboard or a difficult goal, $F(4,260) = 5.91$, $p < .001$, partial $\eta^2 = .08$, supporting H2.

Limitations

Our gamification design is quite simple and less externally valid due to fictious scores and a rather superficial task. It also considers only the quantity, not the quality of performance. We therefore suggest using a more complex design, a task closer to actual work, and assessing performance quality.

Conclusions

This study shows leaderboards utilize goal-setting theory to increase task performance to the level of difficult and impossible goals as well as mitigate any negative effects on self-reported performance. Moreover, both difficult goals and leaderboards improve self-assessment which in turn attributes to higher achievement and improved behaviour (Ross, 2006).

Relevance to the Congress Topics: 5. Performance Management, 8. Job crafting and work design, 16. Human-machine-systems

UN SDG: 8.2 Decent work and economic growth – Gamified design answers the call for technological innovation.

Keywords: gamification, goal-setting theory, performance

Oral presentation OP542

How organisational and leader support can have dual, opposing influences on absenteeism. A longitudinal, organisational-level field study

Mariella Miraglia & Pascale Daher | University of Liverpool; Thomas West, University of Bristol

science

Research goals

Despite its relevance to employee health and well-being (Kurtessis et al., 2017), workplace support has shown inconsistent results in relation to absenteeism. Weak meta-analytic correlations are reported for both collegial and organisational support with absence behaviour (Chiaburu & Harrison, 2008; Kurtessis et al., 2017), and there are contradictory findings regarding the relationships between collegial, supervisor, and senior leader support, and absenteeism (Dello Russo et al., 2013; Luetzen & Sonnentag, 2017). Responding to calls to uncover opposite effects (Johns, 2021), we focus on senior leader and supervisor support and investigate their role in both increasing and decreasing absenteeism. In so doing, we propose a double mechanism to explain such an opposite effect; namely, work pressure and feeling valued at work.

Theoretical background

We build on the job demands-resources model (Bakker & Demerouti, 2007; 2017) and conservation of resources theory (Hobfoll, 1989) and propose that senior leaders who engage in participative decision-making set supportive organisational-level norms (Sharma &Pearsall, 2016). Supervisors serve as the interpretive filters through which these norms are operationalised and engage in supportive leadership behaviours themselves, constituting a resource for employees to deal with increasing demands (Inceoglu et al., 2018). The high-pressure environment of healthcare coupled with the responsibility employees feel towards patients (and consequently, colleagues) (West, 2021) can lead to increased attendance pressure. Accordingly, improving workplace support should reduce work pressure and encourage employees to take sick leave when required. Simultaneously, supportive organisational norms foster a work environment where employees feel valued. This climate is likely to promote psychological well-being, thus reducing the likelihood of work and stress related absence.

Design/Methodology

Using longitudinal data from the annual English National Health Service National Staff Survey (NSS), we tested for indirect effects in Mplus Version 8.4 using path analysis and 10,000 bootstrapping samples with 95% confidence intervals (CI) across 380 organisations, aggregated to the organisational level (senior leadership (α=.90) from 2008, supervisor support (α=.92), work pressure (α=.78), feeling valued at work (α=.90) from 2009, and objective absenteeism data from 2009-2010). We controlled for organisational size, location, and teaching status.

Results

Results of the parallel mediation model show a positive effect between senior leader participative decision-making and supervisor support (B =.69, SE =.03, p <.01). Supervisor support has a negative effect on employee perception of work pressure (B = -.21, SE = .07, p <.01) and a positive effect on feeling valued at work (B =.71, SE =.04, p <.01). Employee perception of work pressure was negatively related to absenteeism (B =-.23, SE =.05, p <.01) as was feeling valued at work (B =-.18, SE =.07, p <.05). The mediation path from senior leadership to absenteeism via supervisor support

and work pressure was positive (indirect effect =.15, SE =.06, 95%CI [.06;.02]) and the path via supervisor support and feeling valued at work was negative (indirect effect =-.39, SE =.15, 95%CI [-.66;-.13]).

Limitations:

As the NSS constitutes secondary data, we recognise this as a limitation. However, the scales used were adapted for a healthcare context from validated constructs and have all appeared in peer-reviewed research (e.g. West, et al, 2022; Bilotta et. al, 2022). Our absenteeism data is reported at the organisational level, but multilevel analysis could provide more insight, particularly on the paths to individual absenteeism. We also highlight generalisability issues due to the nature of the healthcare context.

Conclusion

The value and originality of the study lie in uncovering opposite effects in the relationship between workplace support and absenteeism, contributing to solve possible contradictions in the relationship between the social context of work and absence behaviour. In fact, the study addresses calls to unravel and empirically investigate the multiple mechanisms that account for the influence of the social context on absenteeism (Miraglia & Johns, 2021).

Practical implications

The nature of healthcare work requires compassion whilst operating under increasingly high-pressure. By recognising the mechanisms by which leaders can influence these complex and paradoxical work mechanisms, we provide timely and relevant recommendations.

Relevance to the Congress Theme:

The global COVID-19 pandemic highlighted the centrality of healthcare to our world. The healthcare industry, and increasingly the modern world more generally faces work intensification. Our work addresses the importance of support and reducing work pressure in complex and paradoxical work environments, helping to shed light on some of these inconsistencies.

Keywords: leadership, absenteeism, organisational support

Oral presentation OP282

How responsible leadership fosters individual performance: affective commitment and individual creativity's sequential mediation.

Luís Miguel Simões & Ana Patrícia Duarte | Business Research Unit (BRU-IUL), ISCTE-Instituto Universitário de Lisboa

science

Research goals and why the work was worth doing : This study sought to answer the question "How employees' perception of responsible leadership fosters their individual performance?". It contributes to the literature on responsible leadership (RL), by identifying two mechanisms through which leaders' behavior fosters employees performance at work, namely affective commitment (AC) and individual creativity (IC).

Theoretical background : RL is described as a way of building and maintaining positive relationships with internal and external stakeholders, as well as coordinating actions responsibly to achieve a shared and meaningful business vision that contributes to sustainable value creation and positive change (Maak & Pless, 2006). Few studies explored RL consequences at the individual level of analysis (Haque et al., 2021). Based on this gap, this research adopted an employee-centered approach to analyze how RL is related to individual performance (IP) in the work context, within the scope of a model that proposes AC and IC as potential mediating mechanisms.

Regarding the relationship between RL and IP, Lin et al. (2020) found a positive relationship between the constructs and asked for more investment in the identification of mechanisms that help explain how leaders' responsible behavior positively impacts followers' IP.

The relationship between RL and AC has been established as positive and significant (Haque et al.2018, 2021; Mousa, 2017), as well as the relationship between RL and individual creativity (Castro-González et al., 2019; Zulfiqar et al., 2022). Responsible leaders are open to dialogue and present themselves as role models regarding the behaviors and attitudes expected by organizations. This allows employees and leaders to create a psychological bond that is transferred to the organization in terms of AC. This subsequently would lead employees to feel comfortable and safe to share their thoughts, feelings, and opinions, which is important to stimulate employees' creativity at work (Buil et al., 2019; Maak & Pless, 2011).

Design/Methodology/Approach/Intervention : A quantitative correlational, survey-based study was developed with 260 workers. The survey included instruments selected from the relevant literature to measure the variables of interest and socio-professional characteristics.

Results obtained or expected : The results indicated a significant relationship between RL and IP. Furthermore, the indirect effect of AC on the relationship between RL and IP is significant, indicating that RL indirectly influences IP through the promotion of AC. However, the indirect effect of IC on the relationship between RL and IP is not significant, indicating that in this sample RL does not indirectly influence IP by increasing IC at work. As for the third indirect effect, referring to the sequential effect of AC and IC in the relationship between RL and IP, it was significant. This indicates that RL contributes to strengthening the subordinates' AC to the organization, which increases their IC at work, which, in turn, reinforces their IP. The direct effect of RL on IP is no longer significant when the mediators are present, so there is a full mediation effect.

Limitations : The main limitations are: the risk of single source bias; the non-probabilistic sample that limits the results' generalizability; and, the correlational design that assesses correlations rather than causal relationships.

Conclusions : Literature had previously confirmed the relationship between the different constructs under analysis, but by combining them into a single sequential mediation model the current study offered a more comprehensive understanding of the relationships between them. It is important to note, that the sequential mediating effect emerges as the stronger indirect effect. This means AC and creativity combined are important variables that need to be considered by a responsible leader in order to influence positive outcomes on their employees such as IP.

Relevance to the Congress Theme : Corporate social responsibility has been gaining increasing prominence in the business world. Socially responsible organizations work towards their business goals in harmony with ethical values, respect for different stakeholders, protection of the environment, and the general well-being of society. This form of action is undoubtedly necessary to maximize the creation of value and achieve the SDGs. RL recognizes the importance of sustainability and CSR. This type of leadership calls attention to the need for leaders to be attentive to both organizations' inside and outside, and try to provide answers to the challenges that the world currently faces.

Oral presentation OP276

How supportive behaviour and psychological safety coevolve through time and their joint impact on innovative behaviour and thriving at work

Karolien Hendrikx, Joris Van Ruysseveldt & Ilke Grosemans | Open Universiteit

science

Research goals

In today's dynamic and complex work environments, employees who demonstrate learning and innovative behaviour benefit themselves as well as their employers. Psychological safety is considered an important condition for promoting learning, innovation and development in organizations (Edmondson, 2018). While lots of research on psychological safety focuses on the role of the leader, peer support also appears important in psychological safety (Frazier et al., 2017). Few studies examined how exactly psychological safety unfolds over time in relation to the supportive behaviour of key parties at work. Relying on a longitudinal research design, this study focuses on (1) how the instrumental and affective supportive behaviours of team members as well as the team leader evolve through time in relation to the experienced psychological safety and (2) how this impacts the innovative work behaviour and thriving of employees. We will specifically look at the differential role of four types of supportive behaviour, based on type of stakeholder (leader versus peer) on the one hand and type of support (instrumental versus affective) on the other hand.

Theoretical background

Psychological safety refers to the feeling that you are safe to take interpersonal risks within a team (Edmondson, 1999). For studying the development of psychological safety, we rely on the overall supportive organizational context as framework (Edmondson, 2004; Schepers et al., 2008), distinguishing peer support and leader support. In their meta-analysis, Chiaburu and Harrisson (2008) revealed how peer support impacts diverse outcomes beyond leader influences, and how the content of support (instrumental versus affective) makes a difference. We will take on a dynamic process approach, building on insights from Schulte and colleagues (2012) who found that network ties within teams and psychological safety coevolve, arguing how it is important to not merely rely on unidirectional models for studying these phenomena. We therefore investigate how (peer and leader) support coevolve with psychological safety.

For addressing the beneficial outcomes of psychological safety and a supportive work environment, we focus on innovative work behaviour (i.e. the development of new ideas in order to promote performance, the group, or the organization; Janssen, 2000) and on thriving at work (i.e. a psychological state characterized by the experience of vitality combined with growth/learning (Spreitzer et al., 2005; Kleine et al., 2019), as both appear to play a relevant role in helping employees adapt in dynamic environments.

Research design

A longitudinal three-wave quantitative design is set up to address our research questions. We chose a full-panel design, in which all variables are assessed at each wave. All hypotheses will be examined via a random-intercept cross-lagged panel model (RI-CLPM), which makes it possible to distinguish within-person from between-person effects. This technique allows to assess whether changes within-persons (e.g. an increase in psychological safety) relate to subsequent changes within-persons (e.g.

an increase in support). Furthermore, the model allows to detect feedback loops, which is at the core of our research interest.

Expected results

Data is collected in three waves with one-month intervals between January and April 2023 within a large corporation. Analyses will take place from March 2023 onward.

Limitations

Due to the homogeneity of the data collected within one corporation, a first limitation entails the generalizability of the findings. Second, we rely on self-report data, which may raise concerns for common method bias. Yet, personal perceptions of the key variables under study can give relevant insight into the processes that assist individual employees at work, especially as we study them longitudinally.

Originality and value

This study adds to the understanding of how supportive behaviour of team members and leaders can actually be helpful in stimulating innovation and thriving at work, enhancing our insight into workplace dynamics and the role of psychological safety herein. Future research can build on these insights for further investigating contextual and individual differences and underlying processes, or for developing interventions. Practitioners can build on these insights by actively pursuing and fostering relevant supportive behaviour at work.

Relevance conference theme ''The future is now''

The study is aligned with the conference theme as it investigates important processes that assist employees in their innovativeness and learning potential, two factors highly relevant to become future-proof in the current highly dynamic work environments.

Relevance UN SDGs: Decent work and economic growth

We investigate how a supportive work environment that fosters safety, vitality, learning and renewal at work develops. This adds to our understanding of building decent work as well as sustainable economic growth.

Keywords: psychological safety, supportive organizational context, learning and innovation

Oral presentation OP211

How Technology Invasion Is Affecting Our Wellbeing: A Moderated Mediation Model

Fatma Ece Demirer & Prof. Dr. Feride Pınar Acar | Business Administration/Middle East Technical University

science&practice

One UN sustainable development goal of particular relevance to the field of IO psychology is decent work. Decent work is not only an important contributor to wellbeing at work but also to the attainment of meaningful and fulfilling life for individuals. Unfortunately, high job demands and inadequate job resources prevailing in today's jobs lead to emotional exhaustion and diminished wellbeing. There is a significant body of research investigating a variety of job demands and resources. However, changes in the way of working coupled with the trend towards remote working triggered by Covid-19 pandemic increased technology use leading to the emergence of new job demands. Techno-invasion, referring to constant connectivity through ICTs for work and losing boundaries between private and work lives, is such a predominant demand and an important stress creator in contemporary jobs. Drawing upon Job Demands-Resources (JD-R) model the current study examines the impact of techno-invasion on psychological wellbeing through emotional exhaustion. JD-R model and Conservation of Resources (COR) theory suggest weakening negative effects of job demands, job resources may be used. Social support is one such job resource. This study investigates the indirect effect of social support in the form of supervisor and co-worker support on employee's psychological wellbeing as being relevant to the work context. Finally, the present study proposes that individual coping strategies such as yoga might help manage emotional exhaustion. Hence, this study tries to provide an integrated understanding of burnout by combining work and nonwork domains to enhance employee wellbeing.

Data were collected via an online survey. 353 employees from various sectors (including both yoga practitioners and non-practitioners) participated. The hypotheses were tested using path analysis. Results presented significant evidence substantiating the health impairment process of the JD-R model and extend the limited research on understanding of techno-invasion as a job demand with the presence of important job resources in the same model (i.e., supervisor and co-worker support). Results were in line with the JD-R model and COR theory: techno-invasion was significantly and positively related to emotional exhaustion and negatively related to psychological wellbeing. Supervisor support was significantly and negatively related to emotional exhaustion. Both supervisor and co-worker support were significantly and negatively related to psychological wellbeing. This study is also one of the earlier studies to assess the indirect effect of techno-invasion and social support on psychological wellbeing through emotional exhaustion. Results presented important contributions to the technostress and burnout literature indicating that emotional exhaustion was a significant mediator between techno-invasion, supervisor support and psychological wellbeing, whereas the indirect effect of co-worker support on psychological wellbeing was insignificant. Accordingly, this study also provides evidence for understanding the effectiveness of different types of support in relation to exhaustion. The overall moderated mediation model testing the conditional indirect effect of techno-invasion on wellbeing was significant, however in the opposite direction of the proposed hypothesis. Yoga was found to strengthen the positive effect of techno-invasion on emotional exhaustion. Still, up to a certain level of techno-invasion, yoga practitioners' exhaustion levels were lower than those of non-practitioners as expected. Assessing the effectiveness of yoga with a questionnaire and mediation effect through cross-sectional data might be limitations for the current study. Altogether, the findings have several implications for managers. First, managers can

take preventive actions to balance job demands and resources such as increasing their support to the employees by continuously communicating their goals, providing clear directions, and organizing mentoring programs to prevent burnout. Second, managers or organizations can take some measures to prevent technology invading employees' private lives by increasing awareness or setting some limits. Additionally, effective physical activity programs can be offered to enhance personal resources. Thus, this research aimed to contribute to extant literature by investigating a newly emerged and increasingly prevalent job demand (i.e., techno-invasion) and social support (i.e., supervisor and co-worker support) as a job resource on employee's psychological wellbeing through emotional exhaustion and assessing a personal resource (i.e., practicing yoga) as a moderator. Thereby, it was an attempt to add to the understanding of how to improve employee's wellbeing and how to build future workplaces respecting employee's physical and mental integrity.

Oral presentation OP96

How to Capture The Rage? Development and Validation of a State-Trait Anger Affect Scale

Robin Umbra & Ulrike Fasbender | University of Hohenheim

science&practice

Research goals and why the work was worth doing: While anger is the most commonly feltemotion at work, no scales are openly available to measure anger affect in the work context. For implementing measures against anger's destructive effects or to use it constructively, it has to be measured validly and reliably. But is it even possible to develop a scale that correctly measures the complexity of anger while also not overburdening time-pressured workers? To answer this question, we aim to develop and validate a new bilingual scale measuring state and trait anger. We set out to make the scale as parsimonious and adaptable as possible, while ensuring high reliability andvalidity. A psychometrically valid anger scale, which also alleviates the burdens of scale complexity and length, will allow researchers to conduct effective and efficient research on the subject of anger and practitioners to quickly spot and treat discontent in their companies.

Theoretical background: Based on a thorough literature review, we aligned the scale with appraisal theory, conceptualizing anger as an emotion perceived as strongly arousing and negative, resulting from an action enacted against oneself or confidants which is perceived as arbitrary, reckless, or malicious. We further refined the scale with prior knowledge from the anger literature.

Research Methodology: We pre-registered our hypotheses at the Open Science Framework (https://osf.io/bnwfd/?view_only=5c4c0aff60a74d1d80e284f8da2b43b2). We followed a systematic research methodology, first generating items, continuing with content validity assessments, and finishing with an initial item reduction and construct validity assessments. We generated items by consulting validated emotion theories to make sure that our items are framed in accordance with established scientific knowledge. We used back-to-back translation with the help of a native U.S.-English speaker for item translation. We subsequently conducted a content validity study with 109 German-speaking psychologists, instructing them to rate the items in terms of their theoretical fit and clarity. We further conducted a construct validity study with 302 German and 301 U.S.-American full-time workers, comparing our scale with other validated emotion scales.

Results obtained: Theoretical examinations as well as Q- and R-methodology principal component analyses support content validity. Robust confirmatory factor analyses support construct validity. We compared our scale with scales measuring anger and hostility. The first-order latent constructs sufficiently and significantly correlate with each other and tap a common second-order latent construct, supporting convergent validity. We also compared our scale with scales measuring surprise, joviality, serenity, shyness, and sadness. Most latent constructs do not sufficiently correlate with each other and present with significantly worse model fit when constrained, supporting discriminant validity. Our preliminary 4-item state-trait anger scale presents with excellent internal reliability and model fit (state: $\alpha = .90$, $X2(2) = .72$, CFI = 1.00, RMSEA < 0.001, SRMR < 0.01; trait: $\alpha = .89$, $X2(2) = .95$, CFI =1.00, RMSEA < 0.001, SRMR < 0.01).

Limitations: Current limitations include the cross-sectional design of the construct validity study. We aim to ameliorate this limitation by testing our scale in a diary-study. The use of self-report measures raises concerns of common-method-bias.

Conclusions: Researchers can readily use our anger scale for data collection in the work context. Because of its parsimony, the scale saves precious space and time in study designs, especially in diary

studies. This will reduce method-biases resulting from overburdening scales, such as participant resistance, boredom, and fatigue. Due to its simple design, researchers can translate the scale into other European languages without creating semantic issues. This increases the possibility of cooperation between culturally and lingually differing European researchers who aim to measure anger as part of their international studies. We deliver an easy-to-understand and readily applicable scale to practitioners, which allows them to anonymously inquire their workers' anger levels. By anonymously voicing their anger, workers will perceive that their troubles are beingtaken seriously. This will increase their work moral, loyalty, and productivity.

Relevance to congress theme: Workers' well-being has to be measured appropriately, urgent problems have to be identified and solved quickly, and solutions have to be properly implemented and reliably controlled for. Our measure can readily solve these issues by directly measuring workers' well-being, by identifying urgent problems brooding in the minds of workers, and by validly assessing and reliably controlling for the proper implementation of solutions.

Keywords: Anger, Scale, State-Trait

Oral presentation OP252

How to help migrants integrate into the workplace: Corporate responsibility and the adjustment process of migrant apprentices in German companies

Anna Apostolidou & Sebastian Koos | University of Konstanz

practice

Research goals

After the 2015 migrant crisis, the German government called on the private sector to help integrate migrants via the vocational education and training (VET) program. Indeed, many firms recruited migrant apprentices due to a sense of moral responsibility. However, the dropout rate of migrants is 10% higher than that of natives. One-third of all dropouts occur within the first 4 months of the apprenticeship (BIBB, 2019), indicating a newcomer adjustment problem. While most research blames individual challenges (e.g. language), we aim to shift the focus on the companies, evaluating organizational measures to support migrant apprentices. We ask two questions: 1) Do socially responsible companies offer more support? 2) Which specific support measures help migrants adjust better?

Theoretical background

We approach the firms' role from a Corporate Social Responsibility perspective. We draw from stakeholder theory (Freeman, 1984) and the categorization of CSR orientations into six domains (El Akremi et al., 2018), specifically the community and employee orientations. Moreover, we address the apprentices' adjustment in the workplace through the lens of organizational socialization (Van Maanen & Schein, 1977), i.e. the process by which newcomers become from organizational outsiders to insiders (Bauer et al., 2007). Newcomer adjustment is attained when the newcomers achieve role clarity, task mastery, and social integration, with other indicators being job satisfaction and intention to stay.

Design/Methodology

Individual-level data were collected from apprentices during the first week of their apprenticeship in the fall of 2021 (demographics, German language skills), as well as 3 months into the apprenticeship (dropout intention, job satisfaction, task mastery, social integration). Organizational-level data were acquired via surveys of representatives from the training companies (CSR attitudes, support toward migrant apprentices, such as mentoring and German language courses). We conducted binary logistic regression at the organizational level, and two-level hierarchical linear modeling to test the cross-level interactions between migrant status and various support measures. The final sample consisted of 265 apprentices (25% migrants) nested in 92 companies.

Results obtained/expected

Preliminary results show that firms with high community-oriented CSR offer more support measures such as tutoring, German courses, and introduction to professional clubs. The multilevel model demonstrates that there is a positive direct effect of mentoring on social integration, as well as a negative effect of help with authorities on dropout intention. Significant cross-level interactions point out that even secondary support measures, such as help with accommodation, may increase their social integration, while tutoring facilitates their task mastery. Surprisingly, the offer of German language courses seems to aggravate the migrant apprentices' dropout intentions.

Currently, we are collecting data from a new wave of companies and apprentices, who start their VET in the fall of 2022. We plan to run further explorative analyses in February 2023, when we will have surveyed them 3 months into the apprenticeship.

Limitations

Our sample consists of only 66 migrant apprentices, but it will be enhanced with the addition of the 2022 apprentices. Our sample is unfortunately not random, as the participating companies are already motivated in integrating their migrant employees. Additionally, the CSR scales elicit social desirability bias.

Conclusions

Our research suggests that socially responsible companies facilitate the adjustment of migrants in the workplace through specific support measures. The study examines a rather neglected object of CSR (migrants) and explores the practical side of corporate responsibility. The implications of the research are mostly practical, as the findings may influence how to allocate resources for the integration of apprentices. Information on the effectiveness of support measures is also valuable for decision-makers in governments with regard to funding private initiatives.

Relevance to Congress Theme

The study is relevant to the theme “The future is now: the changing world of work” in that it acknowledges the difficulties of migrant employees, who comprise one-fifth of the workforce in Europe (ILO, 2021), in adjusting to their workplaces and negotiates how to improve the world of work for them.

Relevant UN SDGs

Since it revolves around migrant employees, our study is associated with goal #10 (Reduced inequalities). Furthermore, it is relevant to goals #4 (Quality education) and #8 (Decent work), as it proposes measures for inclusive vocational education and productive employment for apprentices, particularly those with a migrant background.

Keywords: Migrants, Newcomer adjustment, Corporate social responsibility

Oral presentation OP645

How to Stay Focused in Stressful Times: The Effect of Strain Recovery on Concentration

Martina Hartner-Tiefenthaler & Julia Schöllbauer | TU Wien

science

Research goals and why the work was worth doing

Due to the COVID-19-pandemic and the intensified demands associated with working at home, knowledge workers were exposed to increased stress. In this study, we want to draw attention to individuals' cognitive functioning during stressful times.

Theoretical background

Drawing on the load theory of selective attention (Lavie et al., 2004), we argue that strain and its associated strain-induced cognitions produce perceptual load which, in turn, puts the feelings and thoughts associated with the stressor in the focus of workers' attention. And when workers are focused on stressors, they cannot concentrate on other important activities, such as their work tasks. Also, when strain decreases concentration, we assume that the recovery from strain may increase concentration.

Design/Methodology/Approach/Intervention

In order to investigate the effects between strain, recovery, and concentration, we designed a recovery intervention program in which workers were required to perform exercises over the course of four weeks. The self-training exercises aimed at knowledge workers who worked at least partially from home and were provided via a smartphone app that was specifically developed for the purpose of this study. The intervention was accompanied by a longitudinal questionnaire study. To show the reliability of recovery interventions and the robustness of its beneficial effects, intervention 1 targeted the experiences psychological detachment and control, while intervention 2 aimed at strengthening relaxation and competence.

Results obtained

After two and four weeks of exercising, the strain and concentration scores of intervention group 1 (36 workers) and intervention group 2 (34 workers) were significantly better than those of the waitlist-control group (32 workers). Moreover, a longitudinal analysis showed that the beneficial intervention effect on concentration was mediated via a reduction of strain supporting the theorized causal effect of strain on concentration.LimitationsDespite the usage of the objective manipulation, the results are still based on self-reports. Thus, an external validation of concentration or more details about the performed exercises would be beneficial.

Conclusions – research and or practical implications/Originality/Value

Our study contributes to the literature in three ways. First, we introduce the idea to conquer concentration issues by means of strain recovery and thus point out a potential novel purpose of such interventions. Recovery interventions are important because, particularly in stressful times, individuals need support to recover from strain as recovery experiences suffer when individuals face a high level of stressors (Sonnentag, 2018; Sonnentag et al., 2017). This may be the case because of strain-induced cognitions (Brosschot et al., 2005; Sonnentag & Fritz, 2015) and negative emotions that keep the organism aroused and impede the motivation to engage in relaxing activities (Sonnentag, 2018). Second, we theoretically and empirically underpin the mechanism by which a

recovery intervention affects concentration via lowering strain levels. By drawing on the load theory of attention (Lavie et al., 2004), we argue that strain induces thoughts about the stressor which occupy scarce attentional resources and, in turn, lower workers' concentration on other activities such as the performance of their work tasks during work hours. We aim to test the hypothesized link between strain and concentration by means of a longitudinal questionnaire study that accompanied the intervention. Although previous experiments indicate the effects of strain-related cognitions on mind wandering (Banks & Boals, 2017; Sliwinski et al., 2006; Sneddon et al., 2013), to our knowledge, empirical field evidence is still missing that links strain and recovery with concentration. Finally, by using a smartphone app to administer the intervention program, we tested a contemporary tool to administer intervention programs that holds many benefits as compared to traditional methods. In the past, recovery interventions were conducted in group settings with a trainer (e.g., Almén et al., 2019; Coffeng et al., 2014; Hahn et al., 2011; Poulsen et al., 2015; Siu et al., 2014). We believe that conducting an intervention via an app-based self-training is not only an appropriate reaction to the pandemic-induced change towards more e-learning, it also allows high levels of flexibility for participants and researchers and potentially strengthens participants' motivation to participate in an intervention program as well as the external validity of these programs.

Relevance to the Congress Theme

Our study investigates how workers can foster their wellbing in the changing world of work.

Keywords: recovery experiences, cognitive functioning, intervention

Oral presentation OP358

How to Stimulate Researchers' Motivation? Leaders' Perspective on the Pursuit of Scientific Excellence

Magdalena Szuflita-Żurawska, Krzysztof Leja & Beata A. Basińska | Gdańsk University of Technology

science

Research goals:

This study identifies the strategy of motivation management followed by academic leaders to build a solid university position at international level. Specifically, it examines how academic leaders compose the components of the motivational strategy and how they generate researchers' motivation in order to reach organizational goals by providing incentives and reducing obstacles to achieve scientific excellence.

Theoretical background:

Stimulating scientific excellence is a foundational element of strategic plans for all higher education institutions to consistently meet goals and achieve long-term success in a highly competitive landscape. Drawing on the New Public Management approach (focus on incentives, competition and leadership principles) and performance management (based on quantitative and qualitative key performance indicators), we take a closer look at the managerial function of motivation. In line with Vroom's expectancy theory, there are connections between motivation, performance and effort. We also introduce self-determination theory (SDT), in which a self-determined continuum ranging from intrinsic to external motivation, including amotivation, may drive researchers to their valuable work.

Methodology:

The study applied a qualitative approach method. We conducted 12 semi-structured interviews with top managers (rectors and vice-rectors) of Polish technical universities. We carried out data analysis using NVivo software. After collecting materials, interviews were transcribed and forwarded to the coding stages. Following the thematic analysis consistent with Braun and Clarke (2006), common patterns were identified to investigate how study participants understand and manage the motivation of researchers to achieve scientific excellence.

Results:

The findings revealed three main themes. The first theme concentrated on components of strategy, namely the brand building of higher education institutions, identification of intellectual capital and career path planning. The second theme focused on incentives implemented by rectors to reach organization-scientific performance goals (publishing papers in valuable outlets, accessing grants and economic partners). Moreover, we identified the inventory of incentives. For example, most facilitators focused on financial gratitude, less often on non-financial benefits (appreciation and recognition). The third and final theme described how leaders perceive different types of researchers' motivation. Rectors most often mentioned intrinsic motives (e.g., passion) and external motives (e.g., money and prestige). Furthermore, among all themes, we noticed dark sides reflecting shortcomings. They include, for instance, feeding on the passion of researchers instead of motivation management (first theme), omitting incentives that were essential to keeping up the efforts to obtain scientific performance (second theme) and ignoring the combination of various motives that may hold researchers back (third theme).

Limitations: Our study was conducted in one country (Poland) at universities of technology, omitting, e.g., medical or more humanities-oriented higher education institutions. Future research should include more types of higher education institutions and could be expanded to cover other countries.

Conclusions:

Our study highlights the importance of work motivation as one of the essential requirements to attain effective performance in higher education institutions. Establishing a well-defined, engaging and employee-oriented motivational strategy could affect the achievement of scientific excellence. In line with self-determination theory and Vroom's expectancy theory, researchers need adequate resources to obtain the expected results and need to be stimulated by incentives representing the whole spectrum of the auto-determination continuum.

Until now, the management of motivation using the lens of top managers has been rarely described in the literature; thus, our contribution will be of significance to a broad spectrum of stakeholders interested in higher education, management and psychological issues. In addition, the integration of managerial and psychological theories of motivation applied in this study is a novelty. Finally, our study shows that reaching organizational goals is impossible without appreciated and properly motivated employees. Consequently, leaders in higher education institutions must identify appropriate incentive instruments and adapt them to the strategy of achieving goals and researchers individually.

Oral presentation OP57

HR IN TURBULENT TIMES: How are HR priorities and mastery levels adjusting to new realities in Belgium?

Sarah Quataert & Dirk Buyens | Vlerick Business School

science&practice

In unpredictable times, many face the challenge of setting the right priorities. This is certainly true for Human Resource (HR) professionals sailing through turbulent waters, characterised by economic uncertainty and extremely tight labour markets.

But what is the impact of this turbulence on the functioning of HR? The HR Barometer study elaborates on the trends and challenges in Human Resource Management in the largest for-profit organisations in Belgium (Bel 20, + 200 largest for-profit organisations in terms of number of employees). As annual initiative launched each year in January, the HR Barometer survey comprises two parts. The first part focuses on the strategic importance of different HR practices and policies, so that changes in these priorities can be investigated from a longitudinal perspective. One metric used here is 'priority' of HR services, not only indicating the importance of a certain HR domain, but also its urgency. Another metric is 'mastery', explaining how well HR professionals have certain services under control. The second part of the study is a variable set of items, investigating a particular HR domain which gained importance over the past year.

The next wave of the HR Barometer study will be launched in January 2023, shedding light on priorities that prevailed in 2022 and examining how those changed in comparison to previous year(s), affected by the many challenges we encountered this year. For our data collection, which will run from January until March 2023, we will target HR Directors and Managers from a broad spectrum of industries in Belgium. Based on previous waves of our longitudinal survey, we expect to collect between 100 and 125 responses.

In the first part of our survey (focussing on the strategic importance of different HR practices and policies), respondents will indicate the priority of HR practices and the mastery of these practices on a scale from 0% (no priority/low mastery) to 100% (top priority/role model). We will combine the insights from the metrics 'priority' and 'mastery', and hence divide all responses into four quadrants: 1) high-priority domains that HR departments master well are what we call in this analysis 'strengths', 2) domains with high priority, but low mastery are 'improvements', 3) mastering a domain which is not considered a priority is 'under control', and 4) everything else is labelled 'low priority'. Findings that result from this will be compared to last year's results and strategic shifts will be revealed.

The second part of the survey will have a closer look on the topic of diversity, equity, and inclusion (DE&I) and will investigate how HR professionals are approaching the 'DE&I challenge'. Looking at our HR Barometer results from the last few years, diversity is traditionally one of the HR domains situated in the 'low priority' quadrant. Nevertheless, the topic was indicated in our most recent survey (launched in January 2022) as an important factor that will drive organisations' HR strategy in the coming years. To better understand this paradox, we will deep dive into prevailing ideas, attitudes and expectations related to the topic of DE&I. Also, we will investigate how HR is trying to diversify their talent pools and which concrete actions they are taking to build more inclusive workplaces. We will elaborate on the challenges HR professionals face, and the opportunities they see to overcome those.

Data analysis will take place from March until April 2023, and in our insights will be gathered in a research report. During the EAWOP conference, we will present our insights to inspire both academics and practitioners in the audience. On the one hand, we invite (human resource management) practitioners to inform them on recent trends and challenges in HRM in leading organisations operating in Belgium. On the other hand, we would like to invite academics to pursue similar research designs, which could be a first step towards international collaboration that allows for cross-country comparison of our Belgian data.

With our research, we hope to contribute to both the 'Decent work and economic growth' (first part of our HR Barometer study) and the 'Reduced inequalities' (second part of our HR Barometer study) Sustainable Development Goal, as described by the United Nations.

Oral presentation OP246

Humans as creativity gatekeepers: Why and when are human evaluators biased against AI creativity?

Federico Magni, ETH Zürich; Melody Manchi Chao, Hong Kong University of Science and Technology; Jiyoung Park, Duksung Women's University

science

Research goals: In the near future of organizational creativity, AI will generate ideas, products and solutions, and humans will largely act as creativity gatekeepers, evaluating the creativity of these artifacts, rather than idea generators. Thus, we need to assess how apt humans are at evaluating AI creativity. Specifically, as creativity evaluation is affected by a plethora of cognitive biases, many linked to identity of the creator, we aim to study whether the producer identity as AI (vs. human) is also a source of bias. We also look at what drives this effect, as well as at potential boundary conditions.

Theoretical background: The first auctioning of an AI-made artwork at Christie's in 2018 closed with the piece selling for a staggering US$ 432,500, insinuating that the creativity of AI-made artifacts is held in high esteem. Yet, the fear and anxiety of being replaced by AI because of its increasing ability to perform generative tasks and the limits of AI regarding autonomy, motivation, intention, consciousness, and emotions often engender a negative assessment of AI-made creative artifacts. So, it is unclear how human evaluators rate the creativity of artifacts created by AI differently than that of comparable human-made artifacts. This is problematic, because the appraisal of AI creativity has become a pressing issue, given that AI is now able to perform inherently creative tasks, leading human involvement in the creative process to switch away from idea generation and toward creativity evaluation.

Design/methodology: With seven experimental studies (cumulative N = 2,986 individuals, N = 13,773 observations) using a combination of within- and between-subjects designs, we examine whether the identity of the producer (as human vs. AI) impacts human evaluators' creativity evaluation, as well as nuances (i.e., mechanisms and a boundary condition) of this relationship. To enhance generalizability, we recruited both American (working adults) and Hong Kong Chinese (undergraduate students) as respondents and used different evaluation targets (visual, audio, written ideas) and experimental designs (within-person, between-person).

Results obtained: People generally—but not always—assign lower creativity to a given production when they are told that it was made by AI rather than a human. The existence of a producer identity bias was consistent in the evaluation of aesthetic content (e.g., Australian Aboriginal paintings), but did not appear as a direct effect in the evaluation of commercial content (e.g., advertisement posters, startup business ideas). It appears that the nature of the evaluation target matters in determining the strength of the producer identity bias.

Some specific mechanisms drive this effect, namely perceptions of effort and competence, and feelings of wonderment. The effect through effort was most consistent, and in four out of six studies it was also moderated by the evaluator's creativity mindset, such that the more the evaluator believes that creativity is fixed, the weaker the indirect effect of producer identity on creativity through effort.

Limitations: The evaluation targets we have chosen might not be representative of the wide variety of creative production that AI is and will be employed for in organizations. Specifically, several of our

targets are markedly aesthetic (e.g., paintings, music) and might not be part of the daily processes of many organizations. Also, our research was purely experimental, and thus is limited in terms of external validity.

Conclusions: Humans are not fully adequate gatekeepers of AI creativity, but this effect is situational. Specifically, humans are better gatekeepers of AI creativity regarding creative production that is framed more as commercial, whereas they are more heavily affected by biases when the production is framed more as artistic. The perception of the effort exerted in the production process us the most consistent mechanism driving the effect of producer identity as AI on creativity evaluation.

Relevance to the Congress Theme: In the near future, the role of humans in creativity processes in organizations will shift from idea generation—which will be increasingly outsourced to AI—to creativity evaluation. Thus, given the importance of creativity and innovation for organizational survival and thriving, how humans evaluate AI creativity is a critical theme to address when studying the future of work.

Oral presentation OP550

HUMANS OR MACHINES? A SYSTEMATIC REVIEW OF OBJECTIFICATION AT WORK

Bibi Zhang, Swansea University; Robert Lord, Durham University; Barbara Wisse, University of Groningen

science&practic

Objectification – treating human beings as instrumental tools that are deprived of agency and experience – is inherent in many organizational practices, as some employers attempt to maximize profits by objectifying employees. However, objectification undermines target employees' interests and well-being. This review seeks to address this dilemma by looking into relevant theories and empirical evidence with regard to workplace objectification. Specifically, this review summarizes and integrates what is known about antecedents and consequences of objectification from three different perspectives: Objectifying others, self-objectification, and experiencing objectification. We show that objectification originates in a market-pricing mode, such that people think of others and themselves in a calculative utilitarian way . This review sheds light on the dilemma of objectification by showing that people often objectify others in order to achieve their extrinsic goals, such as money and power, or to reduce subjectivity uncertainty, while thwarting the objectified targets' fundamental control, belonging, and self-esteem needs. We provide a comprehensive framework that integrates the extant literature on objectification and identifies both theoretical and methodological recommendations. We conclude by discussing the practical implications on how to promote both employee wellness and performance (hence profitability).

Keywords: extrinsic goals, objectification, psychological needs

Oral presentation OP46

Humour as a Resource in Healthcare – Comic Styles and work-related Well-Being of German Medical Assistants

Julia Raecke, Federal Institute for Vocational Education and Training; René T. Proyer, Martin-Luther-University Halle-Wittenberg

science

Research goals and why the work was worth doing

Medical Assistants (MAs) are the "link" between patient and physician and play a core role in the healthcare system in many countries. However – especially due to the COVID-19 pandemic – MAs' job strain is high while resources are typically low. Humour might be a helpful personal resource, however, studies on health care professionals' (HCPs) humour rarely consider different humour styles (e.g., fun vs. sarcasm), which is surprising, as some styles can be maladaptive (e.g., dehumanising healthcare). Therefore, this study investigates the relations between MAs' humour styles and their work-related well-being.

Theoretical background

The literature on humour in healthcare shows that HCPs' humour serves different functions (e.g., cope with stress, foster relationships). However, humour can show in different styles – mostly divided into light vs. dark styles. While light styles correlate positively with mental health, dark styles correlate negatively. However, regarding HCPs, literature on the adaptivity of humour styles is scarce and shows ambivalent results regarding the adaptivity of dark humour. Moreover, those studies do not consider different kinds of light and dark humour that vary in adaptivity. The Comic Style Markers (CSM; Ruch et al., 2018) include eight distinct humour styles that are used in this study.

Methodology

Applying a quantitative, cross-sectional design we assess the relevant variables by means of an online-survey that aims at German MAs (including apprentices). Humour styles are assessed using Ruch et al.'s (2018) CSM, whereas work-related well-being is operationalized with work-engagement, professional self-efficacy and job-satisfaction. Data will be analysed by means of bivariate and multivariate correlations/regressions, including control variables (e.g., age, job experience). Depending on sample size, either single CSM or combinations of CSM (i.e., humour clusters) will be analysed. Further, we also assessed some objective indicators of professional success (e.g., holding a leadership role) to control for common-method bias to some extent.

Results expected

Data collection runs from September until October 2022. We expect robust relationships between humour styles and work-related well-being, differing in a) direction (e.g., benevolent humour correlates positively with outcomes, while sarcasm correlates negatively) and b) magnitude (e.g., benevolent humour shows stronger relationships than does nonsense humour).

Limitations

Due to the cross-sectional-design, causality cannot be inferred (e.g., COVID-19-pandemic may have increased dark humour). However, as experimental and longitudinal research shows, humour and well-being probably influence each other reciprocally, ending up in a positive gain spiral. Further, as a person's humour styles might differ depending on context (i.e., private vs. work), results might be

biased. However, we included a variable asking for the congruence of one's humour to control for this bias. Moreover, although we integrated some objective indicators of professional success, there still might be a common-method bias, as all variables are assessed by means of self-ratings.

Conclusions

As most former studies on HCPs' humour are qualitative or even non-empirical, to our knowledge, this is the first study to investigate HCPs' fine-grained humour styles in a quantitative design. Regarding practice, this study sheds light on which certain humour styles should be developed in MAs and what styles should be cautioned against in order to maintain and improve MAs well-being and thus productivity. Regarding research, this study adds essential knowledge on the growing nomological network of the CSM (i.e., work-related variables).

Relevance to the Congress Theme

MAs' role in our healthcare system is essential – not only due to the current COVID-19 pandemic but also due to population ageing and growth (i.e., new diseases, wider spreading of diseases). In primary care the number of patients is increasing rapidly and thus physicians need MAs as an essential support in their practices. In the sense of "the future is now", we need to provide them with helpful resources NOW to foster their health and well-being which in turn maintains a functioning healthcare system and thus a healthy society.

Oral presentation OP53

I Choo-Choo-Choose You: A Hands-On Introduction to Automated Item-Selection in Scale Construction

Timo Lorenz, MSB Medical School Berlin; Martin Schultze, Goethe Universität Frankfurt

science

Research goals and why the work was worth doing

The use of automated item-selection procedures has become a regular part in contemporary scale construction and shortening. This is due to the rise in the complexity of research questions demanding shorter questionnaires which must simultaneously meet a wide variety of quality criteria beyond traditional reliability. However, while technical developments have been steady and applications of new approaches have become more frequent, an overview of current possibilities and general recommendations are lacking.

Theoretical background

Substantive research in organizations is often accompanied by time constraints or the need for diverse scales for more complex research questions. This goes along with a need for economic versions of the assessment with short scales and thus often with the question how to convert the long version of a scale into a short one. In the creation of short questionnaires, there are often problems, e.g. the change of the internal structure of the questionnaire or a low reliability. A key question in this conversion from long to short version is, which items should stay and which should go - the procedure of the actual item selection. Here too, depending on the method used, there are various subjective decisions made by the researcher.

Item selection is the heart of a scale, as the items serve as manifest anchors of the latent construct. Thus, item-selection is the foundation of every measurement and therefore it can be said that if the selection is problematic, the measurement instrument is problematic and consequently our results are problematic as well. So how can the item-selection be improved? A contemporary approach to constructing scales or short scales is to use meta-heuristics for item-selection.

Design/Methodology/Approach/Intervention

To demonstrate the possibilities of contemporary approaches to automated item-selection on the example of a German scale for the assessment of Meaning of Work. The original item pool consists of a total of 34 questions, unevenly distributed to assess the facets “self-realization” (17 items), “belonging” (9 items), and “justification” (8 items). The focus is the discussion of possibilities and requirements in automated item-selection in general, not the construction and evaluation of this specific scale.

Results obtained or expected (if not available, it must be made clear when they will be)

The goal is to explain the three core decisions that are critical when applying automated item-selection procedures and present recommendations on how to choose the right selection strategy, generate custom optimization functions, decide on possible schemes for quality control, and how to report the results.

Limitations

This section is not applicable.

Conclusions – research and or practical implications/Originality/Value

You should not see the use of machine-learning algorithms as a "magic pill" that solves all problems in measurement, but as a tool. It is a tool to produce an important measurement tool in organizational psychology, namely a new or a short scale. It is important to understand here that it is one tool among many in a toolbox. It can be helpful in certain situations, but may not be appropriate in others.

Relevance to the Congress Theme

A contemporary approach to constructing scales or short scales is to use meta-heuristics for item-selection. Although these approaches have been available for several years, their way into the field of substantive research has been slow and fraught with some questions and prejudices from colleagues, reviewers, and editors. The future is now – let us use contemporary tools for creating a better assessment.

Keywords: scale development, Confirmatory factor analysis (CFA), automated item-selection

Oral presentation OP198

I do not like it, but I do not say it: Social processes affecting work-related technology-use outside work hours in dual-earner couples

Silke Op de Beeck, Marjan De Coster & Marijke Verbruggen | KU Leuven

science&practice

Research goal. This study tries to better understand why dual-earner partners continue to engage in work-related ICT (information and communications technology)-use outside work hours (WICT) despite the tensions and irritations that this behavior triggers in the home context (Carlson et al., 2018). To this end, we examine how social interactions among partners contribute to or, conversely, interfere with partners' WICT behaviors.

Theoretical background. Work-related ICT-use outside work hours or WICT has become an increasingly prominent behavior in many households (Bourdeaud'hui & Delagrange, 2017). Yet, this behavior is not without risks. Earlier research has shown that employees who engage in WICT tend to experience more stress, more work-home conflict and lowered sleep quality (Ďuranová & Ohly, 2016). In addition, since WICT happens in employees' private time, also other family members, such as their partner, may be affected by their WICT (Carlson et al., 2018; Zhang et al., 2021). This is particularly likely in dual-earner couples, which are the dominant household type in many western countries (Roehling & Moen, 2003), since in these couples both partners may engage in this behavior. Prior research has indeed found that when one partner engages more in WICT, the other partner experiences, on average, more relationship tension, more family-to-work conflict, more emotional exhaustion and lower well-being (Carlson et al., 2018; Ma et al., 2016; Zhang et al., 2021).

Given these risks of WICT for both employees and their partners, it is intriguing that people continue to engage so intensely in this behavior. This is particularly striking since this behavior is a voluntary, non-obliged behavior that takes place in the home context outside regular working hours. Although it is known that employees' WICT is influenced by organizational availability norms and expectations (Ďuranová &Ohly, 2016; Gadeyne et al., 2018), we do not understand yet how social processes at home, i.e., between partners, interfere with or contribute to people's continued engagement in WICT. Therefore, we explore in this study how dual-earner couples interact and negotiate about their WICT and how they justify their own and their partner's WICT.

Method. We interviewed 44 dual-earners from 22 dual-earner couples. All interviewees had participated to a prior large-scale survey study, in which they had indicated to be willing to engage in a follow-up interview. We selected couples in which at least one partner engaged in WICT regularly. Interviews were done with each partner separately and lasted on average one hour. Next, the interviews were transcribed verbatim and currently, we are analyzing them through thematic analysis.

Results. Preliminary insights suggest that employees' WICT conduct is affected and regulated by the social processes at home, between them and their partner. Employees bring the values and expectations from their workplace to their homes, which stimulate them to engage in WICT (e.g., 'it is just part of my job, my function'). This behavior often clashes with their own and their partner's personal values and preferences, triggering irritations and tensions. Nevertheless, partners generally show understanding for each other's WICT ('if I need him, he is there for us') and because of this, they engage in practices like 'keeping silent' and 'chameleoning' (i.e., engaging in WICT when one's partner does it). Through these practices, partners implicitly signal acceptance and approval of each other's WICT, in that way reinforcing this behavior even more.

Limitations. Interviews were conducted online due to the covid-19 pandemic.

Implications. Our study sheds light on how dual-earner employees implicitly reinforce and reproduce WICT at home through the social processes of keeping silent and chameleoning. Talking about WICT and explicitly planning deconnection moments could potentially help dual-earner couples to avoid unwilling reinforcement of each other's WICT.

Originality. While earlier studies focused on the role of organizational norms to understand engagement in WICT, our study reveals that also social processes at home can contribute to the reinforcement and reproduction of WICT.

Relevance to the Congress Theme:

WICT and an 'always on culture' are increasingly normalized in today's world of work, despite the known drawbacks of this behavior for employees' health and well-being. Understanding processes that contribute to this normalization processes is a first step to alter this situation.

Relevant UN SDGs:

Ensure healthy lives and promote well-being for all at all ages

Promote sustained, inclusive and sustainable economic growth, full and productive employment and decent work for all

Keywords: Workrelated ICT-use outside work hours, dual-earners, social processes

Oral presentation OP296

I need a break! Gender differences on emotional exhaustion and recovery experiences in a weekly diary study

JOSE M. LEON-PEREZ, ANGELA FERNANDEZ-CANSECO & JOSE M. LEON-RUBIO | Universidad de Sevilla

science

Work stress literature and research are vast, but most theoretical models have ignored a key variable in the work-related stress process: the time of exposure to stressful conditions and the possibility of recovery (e.g., Roe, 2008; Scholz, 2019). However, despite the extensive longitudinal studies conducted over the past few years (Sonnentag et al., 2022), little is known about the optimal time lags to incorporate into such studies to better understand the stress-recovery process (e.g., Dormann & Griffin, 2015; Ford et al., 2014; Griep et al., 2021). Following the stressor–strain models proposed by Frese and Zapf (1988), being exposed to a stressor during a certain period can lead to psychological and psychosomatic dysfunctions. However, such dysfunctions can develop in different ways over time depending mainly on the time of exposition to the stressor and the ability to cope with it. In that sense, the situation (stressor) that produces the stress response is not the problem per se , but may become problematic if it produces prolonged activation over time and drains the workers' resources. Therefore, it is important to explore what the worker does (usually during non-working hours) to reduce activation and prevent potential adverse effects (i.e., recovery experiences: Sonnentag et al., 2022).

In addition, although some meta-analyses have shown that women seem to experience higher levels of emotional exhaustion than men (García-Arroyo et al., 2019; Purvanova & Muros, 2010), there is a lack of studies focusing on how sex/gender differences may affect the stress-recovery process. Consequently, this study aims at exploring how workers' biological sex influences their experiences of both emotional exhaustion and recovery (i.e., psychological detachment and relaxation) over time.

We conducted two intensive longitudinal survey studies. The first one is a five-wave weekly diary study with a one-week time lag between measures. Interestingly, during the third data collection time there were in-week days off, making it possible that participants disconnect from work for more days (four instead of two days). Participants were recruited by non-random sampling using a snowball technique through social networks and instant messaging services. Participants fulfilled a general online questionnaire measuring trait-like variables and working conditions (n = 170; 50.6% women; Mage = 39.46 years; SD = 11.52; min. = 20; max. = 67). Then, participation in the weekly questionnaires for five consecutive weeks was incentivized by a raffle of two €50 gift vouchers (n = 51). The weekly survey included the following variables: work-home conflict (3 items from Geurts et al., 2005), rumination (4 items from Sukhodolsky et al., 2001), emotional exhaustion (4 items from Shirom & Melamed, 2006), psychological detachment (3 items from Sonnentag & Fritz, 2007), and relaxation (3 items from Sonnentag & Fritz, 2005). Participants' age and the number of dependent children/elderly people under their responsibility were controlled. The second study follows a daily diary design with data collection during eight consecutive days (with the weekend in the middle) to explore even shorten effects of the recovery process.

We conducted a repeated measures General Linear Model with time as a within-subject factor, biological sex as a between-subject factor, and well-being measures as dependent variables. Overall, there were no significant differences between women and men in their weekly levels of emotional exhaustion than men. Regarding time, results showed that only at time three (t3), there was a

significant difference in emotional exhaustion depending on the participants' biological sex: women decreased their level of emotional exhaustion (all $p < .01$), whereas men maintained the same level of emotional exhaustion over time. Indeed, overall, men reported higher levels of weekly relaxation than women ($F(1,48) = 4.76$, $p < .05$); but in such a week, female participants self-reported higher levels of relaxation (but not psychological detachment), whereas men maintained their levels of relaxation over time. Furthermore, in such a week, women perceived a decrease in their work-home conflict levels (but not men). Therefore, it seems that there is a decrease in their demands that allows recovery experiences during the days off.

These results may be interpreted with caution because this study is not exempt from limitations. For example, the sample is quite small and is not representative of the general working population. Also, this study relies solely on self-reported data and future studies should include multisource measures (e.g., salivary cortisol to assess stress levels).

In conclusion, these results suggest that women benefit more from in-week days off (holidays) than men. Therefore, this research may have relevant implications for work-life balance policies and practices, including work design, flexible arrangements, and i-deals.

Keywords: stress, psychological detachment, relaxation

Oral presentation OP751

I want it all: Hoarding knowledge for creative idea

Sabina Bogilović & Tatjana Kozjek | University of Ljubljana, Faculty of Public Administration

science&practice

Research goals and why the work was worth doing

The aim of this paper is to extend the current discussion on the drivers of social exchange in idea generation by exploring whether and how knowledge hoarding and the use of tacit knowledge stimulate the generation of creative ideas. First, our research contributes to the creativity literature by examining how knowledge (hoarding and tacit) stimulates creativity, answering Anderson et al.'s (2014) call for more in-depth research on knowledge and creativity. Second, we provide evidence that the key knowledge utilization for idea generation is the use of tacit knowledge. Third, we contribute to the literature on knowledge hoarding by providing empirical evidence that knowledge hoarding can be valuable for idea generation.

Theoretical background

The social knowledge exchange between colleagues is a valuable source of creativity, while knowledge sharing enhances creative problem-solving capacity (Carmeli, Gelbard, Reiter-Palmon, 2013) and, in turn, supports an employee's own idea generation (Paulus, Larey, &Dzindolet, 2001). Hence, employees may be trapped in a "knowledge-is-power syndrome" (Du Plessis, 2005), which arises from the individual mentality that knowledge means power (Morgan, 1994) and owning knowledge is the only way outperform your colleagues (Webster et al., 2008). Knowledge hoarding refers to the accumulation of knowledge (Hislop, 2003) and has usually been viewed as a negative act in organizations (Bilginoğlu, 2019), while knowledge hoarding behavior results from a human predisposition to prioritize self-interest over organizational interest. However, we posit that knowledge hoarders actively make decisions about what knowledge to share, with whom, and when, based on their self-interest, and that thus they do not limit themselves to only sharing some knowledge, but actually seek to gain and use tacit knowledge from their peers. The use of tacit knowledge (e.g., insight, intuition, problems, concerns, issues, experiences, undocumented processes, "gut feelings," etc.) gained from colleagues can channel knowledge hoarders into the production of new ideas, whereas creative ideas do not spontaneously emerge from thin air but are born from a social process (Perry-Smith Shalley, 2003) in which individuals share knowledge with others (Perry-Smith, 2006; Unsworth). Therefore, we hypothesize that knowledge hoarding can actually stimulated individuals in gaining tacit know is positively related to idea generation and that this relationship is mediated by the use of tacit knowledge.

Design/Methodology

We conducted a field study on working professionals in public administration (n=383) and followed standard procedures to examine mediation model using a bootstrap approach (Preacher and Hayes, 2004). To test our hypotheses, we first examined the relationship between knowledge hiding and creativity (H1) mediated by the use of tacit knowledge (H2) by conducting mediation in PROCESS.Results The result reveled that knowledge hoarding was positively related to individual creativity. Moreover, mediation model 4 in PROCESS macro showed that the use of tacit knowledge indeed mediates the positive relationship between knowledge hoarding and creativity, thus supporting hypothesis 2.

Limitations

Our dataset is based on cross-sectional, self-reported data gathering, and although all variables can only be assessed through self-perceptions, causal relationships could be reversed. Future laboratory or field experiments or three-wave longitudinal studies could address these concerns and establish a more definite take on the proposed causal relationships. Another limitation of our research is that we examined the effects of knowledge on idea generation rather than on the different stages of innovation. Although sharing knowledge and information might be more important for idea generation than championing and implementing ideas (Bogilović, Bortoluzzi, Černe, Ghasemzadeh & Žnidaršič, 2020), it would be beneficial to provide empirical evidence on how knowledge hoarding and the use of tacit knowledge are related to the different stages of the innovation process.

Research/Practical Implications

From a managerial perspective, we provide evidence that knowledge is essential for generation creative ideas. Thus, managers should have in mind that not all knowledge hoarding leads to a negative employee behavior (e.g., knowledge hiding) and that more knowledge individual have the more his is creative and thus should focusing on increasing the social exchange quality at among all colleagues.

Originality/Value

This study is the first of its kind that is based on social exchange theory, empirically examining how knowledge hoarding stimulate idea generation. Furthermore, this paper provides insights that willingness to use of tacit knowledge stimulate is crucial for individual creativity.

Keywords: Creativity, Knowledge hoarding, Tacit knowledge

Oral presentation OP330

I'm frustrated, and you only make it worse: Employees frustration in the face of external disruptions and associated leadership actions

Amanda Roe, Trinity College Dublin; Anja Van den Broeck, Ku Leuven; Wladislaw Rivkin, Trinity College Dublin

science&practice

Research goals: C rises have increased threefold in the last 40 years (Wordsworth & Nilakant, 2021). We have witnessed several major crises, such as the 2008 Global Economic Crisis and recently, the COVID-19 pandemic, the war in Ukraine, and the cost-of-living crisis (Wu et al., 2021). These crises fundamentally impact people's well-being, not only in life in general but also in the work domain. For example, following the COVID-19 pandemic, many work procedures were subject to change because many people were obliged to work from home (van Zoonen & Ter Hoeven, 2022). Thus, the pandemic uniquely contributed to need frustration as it created challenges for employees to meet their autonomy (a sense of volition), competence (a sense of mastery), and relatedness (feeling connected to others) needs through work. Need frustration occurs when the social context actively thwarts needs (Vansteenkiste & Ryan, 2013) and can affect the psychological foundations that facilitate well-being and functioning (Moynat et al., 2022). We examined leader actions during crises because they play an important role in influencing employee well-being, yet often fail at attempts to improve it. In addition, crises create a unique set of workplace conditions, and research has not sufficiently examined how leaders effectively manage such situations. Accordingly, the question that guides this research is: How do well-intended leader actions contribute to employee need frustration?

Theoretical background: Self-Determination Theory (SDT; Ryan & Deci, 2017) outlines the fundamental factors that are important for employees' well-being and functioning. SDT highlights the satisfaction of three basic psychological needs (autonomy, competence, and relatedness) as basic nutrients essential for a person to grow, experience well-being, and thrive (Van den Broeck et al., 2016). Research so far has focused on what contributes to the satisfaction of these needs and how this facilitates optimal well-being and functioning. Yet less is known about the role, and consequences of need frustration and how need frustration can be overcome (Van den Broeck et al., 2016). One crucial way for organizations to manage crises is through leadership. Previous research suggests that one of the essential purposes of leadership is to support people in navigating through and managing situations characterised by high uncertainty (i.e., crises; Wu et al., 2021).

Methodology: We collected data from 50 employees during June and October 2020. All participants were in a period of lockdown during the interview. Thematic analysis was employed to analyse the data (Braun & Clarke, 2006). Following Braun and Clarke's six-stage process, data were first familiarised, and then we generated initial codes to categorise the data into meaningful groups. Once coded, codes were combined to create candidate themes (Braun; Clarke, 2006). Finally, the entire data set was re-read, and data within candidate themes were reviewed to ensure that all data had been coded appropriately.

Results: Besides the obvious relatedness need frustration, the other needs were frustrated during the crises. For example, restrictions on daily behaviour (autonomy frustration), increased loneliness (relatedness frustration), and difficulties completing work from home (competence frustration). However, we found that leaders focused on relatedness frustration at the expense of other needs. Through our analysis, we identified three factors of how leaders reacted to employee-relatedness

frustration, which resulted in surface-level actions. The three factors included: the adaption of practices to support employee relatedness, quick decision-making, and lack of guidance. In addition, we found that leaders used additive rather than subtractive transformations in the face of employee needs frustration. Finally, over time, not much changed regarding employees' situations, and they learned to adjust to this way of life. Yet, leaders did not update the activities to reflect the comfort employees began to feel at home.

Limitations: We only interviewed employees during the crisis. It would have been helpful to interview leaders to understand their actions during the crisis.

Conclusions. Little attention has been given to leader actions in alleviating employee needs frustration (Bundy et al., 2017). Up to now, leader actions are seen as a resource for employees. However, we discovered that leaders' actions were not always effective and frustrated employees' needs. Thus, this study contributes to leadership during crises and need frustration.

Relevance to the Congress: Disruptions continue to shape the future of work because they highlight the shifting role of employees and leaders. We highlight how they understand and react to the changing world of work. We guide managers and employees in the face of crises.

Relevant UN SDGs: This study is relevant to the UN SDGs as need frustration hampers individual growth, development, and well-being.

Keywords: leadership, self-determination theory, well-being

Oral presentation OP679

Imbalanced Sex Ratio and the Preference for a Strong Leader: An Evolutionary Threat Management Perspective

Xiaotian Sheng, Wendy Andrews & Mark van Vugt | VU Amsterdam

science

An evolutionary threat management perspective to leadership assumes that humans have adaptive followership psychology that responds to specific socio-ecological threats by selecting appropriate leaders to mitigate these risks. Previous research has found that people's support for strong, dominant leaders is upregulated during major crises such as wars, acts of terrorism, economic recessions, economic inequalities, and epidemics. The underlying assumption is that in such major disruptions people prefer a strong leader able to take swift action, resolve conflicts, and monitor, control, and punish individuals who deviate from group norms and act to undermine the nation's interests (De Waal-Andrews; Van Vugt, 2020).

Based on an evolutionary threat management approach to leadership, we hypothesize that an imbalanced sex ratio (either male-biased or female-biased) will be perceived as a threat to society and thus will upregulate the preference for a strong leader (Hypothesis 1). Our second hypothesis is that an imbalanced sex ratio will increase the intensity of competition (Hypothesis 2). In addition, we propose that a male-biased sex ratio primarily increases people's perceptions of threat to safety (Hypothesis 3a), whereas a female-biased sex ratio primarily increases people's perceptions of threat to traditional norms (Hypothesis 3b).

Methods

We created vignette descriptions to accurately and concretely manipulate the sex ratio at the society level, as this is not feasible with any other methodologies (Evans et al., 2015).The general design of the studies is as follows. Participants read information about a country that is described as having a male-biased sex ratio, a female-biased sex ratio, or neither (e.g., a balanced sex ratio or an unrelated threat; for a similar procedure, see Griskevicius et al., 2012). We then ask participants about their preferences for a national leader in a mock election. We operationalize strong leader preference in an explicit (Sprong et al., 2019) and implicit way (Laustsen & Petersen, 2020; Van Vugt; Grabo, 2015).

We investigate the effect of imbalanced sex ratios on the preference for a strong leader (Hypothesis 1) in four online scenario studies (Studies 1-4) and one archival study (Study 5). Study 2 examines whether people perceive an increased competition (Hypothesis 2) and threat to their safety when sex ratios are imbalanced (Hypothesis 3a). In Studies 3 and 4, we investigate respectively whether a male-biased sex ratio increases the preference for a strong leader by increasing a perceived threat to safety (Hypothesis 3a), whereas a female-biased sex ratio increases the preference for a strong leader via a perceived threat to traditional norms (Hypothesis 3b). Notably, we conduct a mini meta-analysis across the four studies to test the robustness of the effects in the individual studies. Finally, in Study 5, we investigate the effect of imbalanced sex ratios by combining cross-national data on sex ratios and leadership perceptions.

Results

We find that an imbalanced sex ratio – especially if it is male-biased – upregulates people's preference for a strong leader because they perceive it as a threatening situation. In accordance with

our theoretical model, derived from evolutionary psychology, we find that an imbalanced sex ratio increases the perceived competition in society, which is seen as both a threat to traditional norms and in the case of a male-biased sex ratio to one's safety. According to the mini meta-analysis, the effects of a male-biased sex ratio are robust across the explicit and implicit preferences for a strong leader, whereas the impact of a female-biased sex ratio is smaller and only significant for the explicit measure.

Limitation

A limitation is the reliance on scenarios in our studies. Like many other studies that rely on scenarios (Blaker et al., 2020; Griskevicius et al., 2012; Spisak et al., 2012), we carefully tailored their contents to provide controlled but realistic information about sex ratios while keeping other factors constant. In the real-world, operational sex ratios may not differ so dramatically between societies, and the effects these differences may be clouded by many other factors on which these societies vary (e.g., GDP, climate, cultural norms). Thus, our research makes use of the strength of scenario methodologies, which allowed us to isolate the effect of differing sex ratios at a society-level at which straightforward comparisons are not always feasible (Evans et al., 2015).

Conclusion

Our results suggest that an imbalance in sex ratios causes variation in leadership preferences. Notably, when societies are male-biased, people's support for a strong leader increases, because sexual competition intensifies and people perceive the situation as more threatening. It would be interesting to study the relationship between leadership preferences and other kinds of demographic transitions, such as in aging societies.

Keywords: sex ratios, leadership preference, perceived threats

Oral presentation OP257

Impact of differing working arrangements on employee inclusion and wellbeing

Alexandra Kirienko, London School of Economics and Political Science

science&practice

Research goals

The research aims to fill the empirical gap around the understanding of the impact of new home working policies on employees within organisations. Working arrangements that allow employees to work both from the office as well as from home or remotely are increasingly common. As organisations consider how to structure flexible working arrangements it is important to understand how this affects employees. This research is grounded on a secondary dataset with over 90,000 responses collected across 2020, 2021 and 2022 from several organisations in the financial sector. Focusing on variables relating to inclusion and wellbeing offers insights into the impact of different working arrangements on the employees.

Theoretical background

There is somewhat limited and at times conflicting evidence around the relationship between wellbeing and working arrangements. Work by Donati et al. (2021) finds that employees who already had the capacity to work remotely prior to Covid-19 restrictions were likely to experience higher job satisfaction during the pandemic (Donati et al., 2021). In terms of wellbeing employees who were still working outside the home during Covid-19 restrictions were more likely to experience negative feelings, such as being very nervous or depressed than those working from home (Central Statistics Office Ireland, 2020). The study by Rose; Brown (2021) finds a statistically significant effect of own job satisfaction on potential uptake of WFH policies beyond the pandemic. Zürcher et al. (2021) find that although the work-life balance of vocational counsellors did not improve during Covid-related WFH, they do report increased work satisfaction. Strong arguments in favour of improved work-life balance are made by Dousin et al. (2021) who find that flexible working has a positive relationship with job satisfaction, potentially reducing employees' emotional labour and burnout.

One of the prominent WFH concerns for employees is maintaining social ties (Central Statistics Office Ireland, 2020). Krug et al. (2021) find that social interaction at work translates to greater job satisfaction. Results of Juchnowicz and Kinowska (2021) similarly show that working exclusively remotely has a negative effect on employee well-being as work–life balance and workplace relationships suffer.

Research Approach

The research spans 3 datasets collected by a finance membership organisation in the years 2020, 2021 and 2022. Regression analysis is conducted to analyse relationships between different working arrangements and the relevant dependent variables. To address inclusion a bespoke index is created combining survey answers relating to questions on inclusion in each respective year. Supplementary differences-in-differences analysis is also used to eliminate time-related effects of changes in variables across the datasets.

Provisional Results

Provisional results point at the differing effect of working arrangements on inclusion and employee wellbeing. For inclusion, results with a range of controls show a negative effect as employees work

remotely as opposed to from the office. Sub-categories such as seniority provide an interesting insight, where senior male employees tend to feel the most included whilst senior female employees stand out as the least included category. Employee wellbeing however tends to increase, albeit to a different extent when looking at sub-categories of employees in particular by gender. The results to date are based on data from the 2020 and 2021 datasets. Further work will be done on these, and results from the 2022 will be incorporated. Full analysis is expected to be completed by February 2023.

Limitations

One limitation of the research is the finance-specific domain of the dataset. We suggest that the findings of the research will be externally valid in WEIRD countries in high-intensity industries such as finance, consulting or law. Another limitation stems from using secondary data for analysis which does not allow for bespoke creation of survey questions. However, the scale of the dataset supports the rigour of analysis and its outcomes.

Conclusions

Initial analysis conclusions point to the positive relationship between working remotely and employee wellbeing, suggesting that increased availability of flexible working options can improve overall employee outcomes. However, inclusion is negatively affected by working remotely from home. This calls for a balanced approach in introducing hybrid working arrangements. We believe that increased attention should be paid by organisations when introducing hybrid working policies to balance the wellbeing and inclusion outcomes.

Relevance to the Congress Theme

Hybrid and flexible working are now an integral part of the changing world of work. Understanding the effects of these new working arrangements are integral to building the future of work across different industries and geographies.

Keywords: working arrangements, inclusion, wellbeing

Oral presentation OP160

Implementing digital tools for shift scheduling and sleep coaching in shift work organizations

Heli Järnefelt, Finnish Institute of Occupational Health (FIOH), Helsinki, Finland; Mikael Sallinen, Finnish Institute of Occupational Health (FIOH), Helsinki, Finland / Department of Psychology, University of Jyväskylä, Finland; Christer Hublin, Finnish Institute of Occupational Health (FIOH), Helsinki, Finland

science&practice

Research goals: Our goal was to study implementation (acceptability, appropriateness, and feasibility) of two digital tools developed to support good sleep and alertness among shift workers. We were especially interested in identifying factors which enhance or hinder the implementation process in shift work organizations.

Background: Shift work is associated with sleep problems and impaired alertness which may decrease work ability and safety at work. Good sleep and alertness at work can be supported both by developing healthy shift scheduling and by offering sleep coaching to shift workers. Nowadays there are digital tools developed for these purposes. However, it is not known how well organizations can implement these tools and which factors affect the implementation.

Design and methods: The purpose of our implementation study was to: (1) examine implementation outcomes of acceptability, appropriateness, and feasibility of the new digital tools; (2) identify implementation barriers and facilitators.

Participating organizations were two bus companies which implemented two digital tools. One was VIRE (http://vire.arturcloud.com/) which predicts sleepiness in different shifts based on biomathematical fatigue modeling. VIRE was offered to the shift planners of the organizations to evaluate its suitability as a tool to enhance healthy and safe shift scheduling. The other tool was a digital sleep coaching tool which voluntary bus drivers from the studied organizations started to use to support their healthy sleeping habits. We collected data on implementation through questionnaires targeted at the shift planners and bus drivers and through Teams workshops with key personnel from the organizations.

Results: Six shift planners and 15 bus drivers answered the questionnaires. The shift planners evaluated the acceptability, appropriateness, and feasibility [1(completely disagree)–5(completely agree)] of the VIRE tool to be on average moderate (mean 2.7–3.4; SD 0.5–0.9). The shift planners appraised that VIRE was easy to use, and the results were easy to interpret but there were difficulties in converting their shift schedules to be analyzed in VIRE. They also assessed that the VIRE should take into account personal preferences and the suitability of shifts for a bus driver in interpreting the sleepiness level of a particular shift. The bus drivers rated the acceptability, appropriateness, and feasibility of the sleep coaching tool as good on average (mean 3.8–4.0; SD 0.7). The most common benefits reported by the bus drivers were ability to use it at their own discretion and comprehensive and practical content of the tool. However, some bus drivers experienced technical challenges in using the tool. The qualitative results from the workshops (n= 27–30) are not yet analyzed but the results will be presented in the congress.

Limitations: A relatively small number of participants responded to the questionnaires, which limits the generalizability and reliability of the results.

Conclusions: Based on the questionnaire results the acceptability, appropriateness, and feasibility of the digital tools varied from moderate to good in two bus companies. Easy and self-selected timetable for usage, easy interpretation of the results and comprehensive and practical content enhanced the implementation. Technical challenges and limits of the tool, which did not allow personal factors to be taken into account in the interpretations, hindered the implementation. The qualitative data from the workshops will likely give us more information to evaluate implementation more specifically and reliably.

The research was supported by grant from the Finnish Work Environment Fund (200403).

Keywords: implementation, sleep, working time

Impose or facilitate? A multi-study examination of an individual-environment model of positive thinking at work

Shafag Garayeva, Norwich Business School, University of East Anglia / Birkbeck, University of London; Almuth McDowall, Birkbeck, University of London; George Michaelides, Norwich Business School, University of East Anglia

science&practice

Research goals and why the work was worth doing

Positive Thinking (PT) is often promoted as vital for wellbeing and performance and can even be mandated in organisations. Our research sets to examine outcomes of imposing PT and its effectiveness in facilitating PT. Drawing on conservation of resources theory, we develop and test a model integrating imposing PT as an independent variable, psychological safety and self-efficacy as moderators and mediators, and surface acting and PT as outcomes. We suggest that, contrary to intentions, imposing PT can result in faking rather than enabling it.

Theoretical background

Since environmental conditions either hinder or foster resource creation and maintenance (Hobfoll, 1989), the organisational pressure to display PT can induce faking, whereas psychological safety should facilitate PT. As an attempt to dictate how to think/feel/act, imposing PT represents a threat to the sense of control, an important personal resource that one wants to protect. The endangered sense of personal control and the possibility of losing benefits associated with the "positive thinker" status reduce psychological safety contingent on access to resources (Newman et al., 2017). We suggest that coping with enforced PT and undermined psychological safety involves surface acting affective manifestations of PT, such as enthusiasm or cheeriness. As the risk of losing resources can encourage instrumental behaviours (Hobfoll et al., 2018) and displaying desired characteristics is rewarded in organisations (Hewlin, 2003), the individual succumbs to the pressure to display PT, especially, when their personal resources, such as self-efficacy, are low. Thus, to regain disrupted personal control employees do not internalise the imposed content. Yet, to avoid detrimental outcomes of not displaying the imposed quality, they create the appearance of adopting it. Further, as people must invest resources to gain new ones (Hobfoll et al., 2018), self-efficacy can activate PT through control over oneself and the environment. Finally, a psychologically safe environment enabling learning and growth facilitates PT both directly and through enhancing self-efficacy.

Design

We tested the model in two complimentary studies with individuals working in formal organisations worldwide: a between-subject random assignment online experiment with vignettes (241 participants) and a two-wave survey with a one-week time lag (199 participants) and a final response rate of 91%. For the first experimental study, we conducted a factorial analysis of variance to identify if imposing PT leads to surface acting. In the survey study, we used structural equation modelling to examine the relationship between imposing and surface acting and test the effect of imposing, psychological safety, and self-efficacy on PT.

Results

The experiment's results showed that imposing PT induces surface acting ($F(1,233)=6.6$, $p=0.011$). The survey study replicated this result ($\beta=.19$, $SE=.09$, $p=.003$) and identified that psychological

safety mediated the relationship between imposing PT and surface acting (indirect effect coefficient =.23, 95% CI [.13:35]; total effect coefficient =.50, 95% CI [.32:67]). In the survey study, imposing PT did not predict PT, whereas self-efficacy predicted it directly (β =.25; SE=.06, p<.001) and psychological safety indirectly through self-efficacy (total effect coefficient=.15, 95% CI [.04:.26]).

Limitations

Our research in a broad organisational context with occupationally and geographically diverse samples set up a knowledge base about PT in organisations. Apart from the imposing PT-surface acting relationship tested in the experiment study, we do not claim causal links among the constructs. Future longitudinal or experimental research in specific contexts could re-test the imposing-PT link and add controls to nuance the current knowledge.

Conclusions

Our paper extends positive organisational scholarship primarily focused on benefits of positivity with the new knowledge about negative outcomes of imposing PT and its ineffectiveness in developing PT. The paper stresses the role of individual and environmental resources as antecedents of positive phenomena. By identifying imposing PT as a factor contributing to the modification of self-expression, we add to the literature on antecedents of surface acting in workplace interactions. Interventions can focus on addressing the conditions captured by the paper's conceptual model: fostering individual (self-efficacy) and organisational (psychological safety) pre-requisites of PT and minimising the pressure to display it.

Relevance to the Congress Theme

The paper highlights the detrimental impact of imposing thinking/feeling/acting norms on employees and the effectiveness of facilitating positive phenomena at work. Our research challenges the assumption that employee psychological wellbeing is solely an individual responsibility and adds to the knowledge of contextual factors influencing it.

Keywords: imposing norms, positive thinking, individual/environmental resources, surface acting

Oral presentation OP157

Improving supervisors' age management skills through a peer learning training - Who benefits the most?

Mervi Ruokolainen & Marjaana Pöyry | Finnish Institute of Occupational Health

science&practice

Research goals:

The study tests the efficacy of a peer group-based training intervention focusing on improving supervisors' age management skills. In many industries supervisors are increasingly expected to support aging employees' work ability and working careers in order to prevent early retirement and to ensure an adequate amount of labor. However, there is a lack of evidence-based methods to improve leadership skills in age management.

Theoretical background:

The studied intervention aims to enhance supervisors' 1) self-efficacies regarding their skills and abilities to lead older workers and teams with varied age structure and 2) to improve supervisors' ability to deal with possible setbacks in age management. Theoretically the intervention applies Bandura's Social Learning Theory and Ajzen's Theory of Planned Behavior both emphasizing specific self-efficacies as important determinants of human behavior. The ability to deal with obstacles is based on Meichenbaum's view of cognitive stress inoculation training. Accordingly, the inoculation process, in which the participants recognize the possible setback, develop respective solutions, and rehearse these solutions, develops their learned resourcefulness. The training itself utilizes peer learning techniques: the participants and skilled trainers create together a supportive learning environment that enables the participants to learn from and support each other.

Design/Methodology/Intervention:

The data were collected in a randomly assigned field experimental study using a wait-list control group design (RCT) between 2021 and 2022 among 215 supervisors. The study was conducted in 10 Finnish work organizations. The supervisors responded to online questionnaires before (T1), immediately (T2) and six months (T3) after the intervention. The intervention group participated in a web-based training in their own work organization. The training lasted nine hours and included three group meetings. The control group received similar training after the last follow-up survey (T3). As the data collection is still going on, only the immediate and moderating effects of the intervention have been analysed.

Results:

GLM for repeated measures showed that the intervention improved supervisors' age management skills as expected. The participants in the intervention group assessed their abilities to lead older employees ($F=55.2$, $p < .001$) and to solve the possible setbacks ($F=19.3$, $p <.001$) significantly higher after the intervention (T2) than at baseline. No change was observed in the control group. Moreover, the supervisors' attitudes towards older employees improved in the intervention group and remained about the same level in the control group ($F=4.9$, $p <.05$).

The results of the hierarchical regression analysis found three significant moderating effects. Younger supervisors benefitted from the training the most it terms of improved self-efficacies ($\beta =.14$, $p <.01$) and less educated supervisors in terms improved of age attitudes ($\beta =-.12$, $p <.05$).

Furthermore, supervisors who worked in organizations, where organizational practices included less age and career specific practices, took greater advantage from the training in terms of tools to deal with setbacks ($\beta = .13$, $p < .05$).

Limitations:

The training was voluntary, and thus it is possible that only the most motivated supervisors signed up for it. Second, the participation alone may have affected supervisors' evaluations (i.e., uncontrolled novelty effect).

Conclusions:

Based on our results, we recommend peer group techniques for strengthening age management skills among supervisors. Our study brings a new theme to leadership interventions and provides an effective and evidence-based tool to promote age management at work organizations.

Relevance to the congress theme:

Working population is aging in Europe and labor shortage is a current problem in many industries. Thus, measures to promote labor market participation of all vulnerable groups, including older workers, should be studied and executed now in all levels of societies. Evidence-based interventions are needed, for example, to develop new competences among supervisors and to reduce age-based stereotyping and discrimination.

Relevant UN SDGs :

Although the labor status of older employees has improved in many European countries, the negative attitudes and discrimination associated with aging still exist at workplaces. We have developed the training intervention to enhance supervisors' skills to understand, support and interact employees with older age and decrease possible negative attitudes related to older employees. This is one step in a wider aim to reduce inequality in employment among older workers.

Keywords: age management, intervention, leadership

Oral presentation OP74

In AI we Trust: Determinants of Continuous Trust in the User/System Interaction

Ignace Decroix, Vlerick Business School & Ghent University

science

The main objective of this study is to examine which factors influence users' continuous trust in automated systems – and, more specifically, AI-based systems – and, subsequently, to develop an empirical model representing those factors.

Influenced by the fourth wave of industrialisation, society and business undergo significant changes (Hancock, 2017; Brynjolfsson & McAfee, 2017). This wave comes with a vast array of new digital technologies (Schwab, 2016a; Schwab, 2016b) – consider artificial intelligence (Hansen & Bogh, 2020) – that are positioned as assets to leverage digital transformation efforts (Besson & Rowe, 2012). People and digital technology (Kane, 2015) interact in this context (Christ-Brendemühl & Schaarschmidt, 2019; Glikson & Woolley, 2020), and automation frequently acts on behalf of humans (Russel & Norvig, 2009; Xu, Mak, and Brintrup, 2021). However, less-rational factors (such as fear) are more at play, even more so when higher levels of automation appear (Sarter, Woods, and Billings, 1997). Organisations risk employees developing technology perceptions that breed resistance (Venkatesh, 2006), reluctance (Kane et al., 2019), and disappointment. These, in turn, impact people's interactions with technology (Bardakei & Ünver, 2019) which leads to users neglecting beneficial decision aids (Davis & Kotteman, 1995) and discounting advice from algorithms (Prahl & Van Swol, 2017). Faulty interactions like these could cause a decrease in trust and subsequent disuse or sabotage of technology (Parasuraman & Riley, 1997). Various theories emerged in the technology and acceptance literature (e.g., Technology Acceptance Model (TAM3; Vankatesh & Bala, 2008)), where trust, considered the cornerstone of social interaction (Blau, 1964), was also found to mediate human-technology relationships (Taddeo, 2017) and is seen as the degree to which a user can rely on the technology to achieve their goals under conditions of uncertainty and vulnerability (Lee & See, 2004). Especially when the system becomes too complex to be understood completely, will trust navigate complexity and enable reliance (Gsenger & Strle, 2021).

Focusing on AI, we found that many concerns relating to AI usage link back to trust (e.g., the perception of AI as a black box; Logg et al., 2019; Lockey et al., 2021). The concept of trust, however, has received very little attention in AI literature thus far (Emaminejad et al., 2015). When trust is researched, the primary focus is on aspects of the technology itself rather than also including aspects of the individual and the environment (Toreini et al., 2019). We did not find any model in the literature that explains trust in systems deploying AI. Nor could we find any survey that allows for measuring trust (Böckle et al., 2021). As it stands, the majority of the current state of knowledge of human-machine interaction and the trust relationship draws on research in the context of automation. Further explorative research in the realm of AI is warranted.

Given that explorative research is required, we opt for qualitative research through Grounded Theory (Strauss & Corbin, 1994) and collect our data through semi-structured interviews with practitioners that use AI-based systems in their work context. We will use an interview guide with open-ended questions and transcribe the interviews verbatim. After every interview round, we incorporate our reflections into the interview guide before continuing a new round (Charmaz, 2006). This cycle (from recruiting data to coding and comparing excerpts in Nvivo12) will be repeated until theoretical saturation is reached. This will allow us to build the first empirical model of the antecedents of trust in AI-based systems.

Results have not yet been obtained, but we are confident to have a final empirical model before the EAWOP conference.

As this study is primarily explorative, the emerging antecedents and model will require testing to analyse their reliability and utility.

While conclusions cannot yet be drawn, we aim to increase the understanding of both academics and practitioners on users' continuous trust in AI-based systems. This research also lays the fundament for a follow-up study to build and validate a survey to measure trust in AI-based systems.

Studying continuous trust in AI systems connects to the changing world of work, especially given that the amount of human-technology interactions has increased over recent decades and is expected to continue increasing. This topic links to EAWOP's topic 16 (i.e., technology) and, specifically, subitems Artificial Intelligence and Human-Machine-Systems.

Decent work and economic growth.

Keywords: trust, artificial intelligence

Oral presentation OP387

In the Mood for Food: Monotony, Boredom and Snacking During Work

Dārta Vasiļjeva, Ute Hülsheger, Chantal Nederkoorn & Annika Nübold | Maastricht University

science&practice

Snacking is a common behavior that involves consumption of food or drinks besides main meals (Chaplin & Smith, 2011). Particularly unhealthy snacking may be regarded a serious problem as it may contribute to weight gain and obesity thus increasing the risk for cardiovascular diseases, diabetes and musculoskeletal disorders (World Health Organization, 2021). Considering the current obesity pandemic with nearly a third of the world's population being overweight or obese (World Health Organization, 2021), shedding light onto factors that may result in weight gain is crucial both from a theoretical and practical perspective.

Nevertheless, research on snacking has only recently emerged in organizational literature with recent reviews stressing the paucity of existing work (e.g., Clohessy et al., 2019). Although preliminary research has provided important first insights into predictors of work-related snacking behaviors, it has focused on a limited range of factors that represent conditions of high work stress (e.g., work hours and self-control demands; Jones et al., 2007; Sonnentag et al., 2017). Yet, prior work on arousal suggests that not only over-stimulating work demands (i.e., high arousal) but especially under-stimulating work demands (i.e., low arousal) may negatively affect employee behavior during work (i.e., the Yerkes-Dodson law; Yerkes& Dodson, 1908).

Drawing from optimal arousal theory, which states that there is an optimal level of arousal for desirable work outcomes (Hebb, 1955), we build on first laboratory studies with students that show increased snacking on certain foods when completing a repetitive task (Abramson&Stinson, 1977; Havermans et al., 2015). Applying this theory and initial empirical findings to employees' daily work life, we develop and test a conceptual model explaining how job monotony leads to unhealthy snacking during work through boredom. Furthermore, we propose two moderators for the relationship between job monotony and its outcomes. First, we propose that because task significance makes the task more interesting and relevant, it serves as an attentional pull factor that increases employees' arousal (Hackman; Oldham, 1980), thereby limiting the effect of daily job monotony on work-related boredom. Second, we consider trait mindfulness as a boundary condition between daily work-related boredom and unhealthy snacking as mindfulness increases one's emotion regulation ability and decreases impulsive reactions, which may arise from boredom as a state of dissatisfaction (Brown et al., 2007).

To test our hypotheses, we collected diary data from 105 employees across 10 working days. Results confirmed the positive effect of daily job monotony on unhealthy snacking through work-related boredom. Furthermore, although daily task significance did not moderate the hypothesized effect between daily job monotony and work-related boredom, additional analysis showed that it did act as a buffer in the relationship between daily job monotony and unhealthy snacking. Surprisingly, the protective nature of trait mindfulness was not confirmed by our results.

Despite the strengths of our study, we used self-report measures raising the issue of common method bias. Future studies could employ multi-source measurements by, for instance, asking supervisors or peers to evaluate the monotony of one's work. Furthermore, our sample was homogenous in terms of high education level and normal weight. While individuals with a university degree are generally much less likely to engage in unhealthy snacking (Liu et al., 2015), individuals with overweight and obesity consume snacks more frequently and are less able to resist eating

unhealthy snacks in response to negative mood (Bertéus Forslund et al., 2005; Udo et al., 2013). Future research should therefore test our results in various sampling populations.

Overall, our findings advance the work-related snacking literature by confirming the detrimental effect of daily monotony on work-related boredom and unhealthy snacking through boredom. Supplementary analyses revealed that these results persisted above and beyond over-stimulating work stressors (daily workload) and alternative mediators (daily negative affect). Surprisingly, neither the protective nature of daily task significance nor trait mindfulness was confirmed by our results. Overall, our findings evidence the dynamic nature of daily job monotony and work-related boredom, challenging the common conceptualization of jobs as either monotonous or non-monotonous.

Our submission contributes to the conference theme of well-being. Particularly, it concerns the topic of (un)healthy eating, which has implications for employee health (e.g., weight gain) but also functioning at work (e.g., decreased performance; Cho; Kim, 2022). Our study thus also directly aligns with the UN Sustainable Development Goal of good health and well-being.

Keywords: Job monotony, Boredom, Unhealthy snacking

Inclusive Leadership in for-profit organisations, a literature perspective.

Sile Walsh, Alex Hasset & Sarah Corrie | Canterbury Christ Church University, UK

science

How is inclusive leadership conceptualised and measured concerning for-profit organisations?

Understanding inclusive leadership from the literature perspective offers an essential scientific background to further developing inclusive leadership in practice and theory in for-profit organisations. The current upsurge of interest in inclusive leadership in practice and theory means that this research is more relevant now than ever.

The aims of this oral presentation

Briefly introduce why for-profit differs from other organisational motivations

Discuss how inclusive leadership is conceptualised in the literature related to for-profit organisations, including how it is defined, measured, and researched.

Discuss common research themes and the gaps in the literature related to inclusive leadership in commercial, for-profit organisations.

Discuss the theoretical and practice-based implications for future research and application of inclusive leadership for commercial for-profit organisations.

While Inclusive Leadership is gaining popularity, it still lacks a clear theoretical basis (Chung et al., 2020). Reviewing inclusive leadership in this conceptual review aims to support the exploration of the current conceptualisation and influences of inclusive leadership in the literature relevant to for-profit organisations. It also explores and considers areas for future opportunity, development and implications in terms of inclusive leadership practice and future research.

The aims of this literature review are to

Explore how inclusive leadership is conceptualised in the literature related to commercial, for-profit organisations, including how it is defined, measured and researched.

Explore common research themes and the gaps in the literature related to inclusive leadership in commercial, for-profit organisations.

Explore theoretical and practice-based implications for future research and application of inclusive leadership for commercial for-profit organisations.

Results

A general overview of papers resulted in a discussion about inclusive leadership measures, theories applied to inclusive leadership discussions, publications years, research locations and publication journals.

Common research themes and gaps in the literature related to inclusive leadership regarding commercial, for-profit organisations: Discussing mediating and moderating factors, papers with a focus on expanding theory included in this review, positive associations, a focus on innovation and creativity, a lack of a focus on leader's experience of inclusive leadership, inclusive leadership and employees and developing inclusive leadership.

Critiques in the literature include Inclusive leadership measures, limitations within the research, inconsistency in the literature, theories surrounding inclusive leadership, training as a solution to inclusive leadership and future research & implications for practice summary.

Conclusions – Research and/or Practical Implications/Originality/Value

The current measurements used for inclusive leadership are inconsistent across the research to ensure that the conversation and dialogue on inclusive leadership in commercial, for-profit organisations are reliable enough to create results that can be generalised across geographic, industry, and organisation contexts.

While a diverse remit of theories can add to the richness of conversations around inclusive leadership, it also poses a challenge in the application, understanding and appropriate use of the evidence provided. If the results cannot be generalised and the interpretations of inclusive leadership vary, it will be challenging to ensure robust application in commercial, for-profit organisational settings. This also challenges how the current and future research will be utilised.

The use of inclusive language may be part of the theory being applied; however, the perspective in which it is utilised in the research may vary as a function of the definition of inclusion, the expectations of inclusion, the cultural implications, including geographical, industrial and organisational in both and the perspective utilised to decide what and who is an inclusive leader.

While training is assumed to result in better outcomes for inclusive leadership, there is no evidence of that in inclusive leadership in commercial, for-profit organisations. Therefore, for developing inclusive leaders and robust research into inclusive leadership in this area, future investigations into the best way to develop inclusive leadership would benefit the field of inclusive leadership in commercial, for-profit organisations.

The researcher concludes that while much has been explored, robust evidence remains limited in inclusive leadership within for-profit organisations.

Keywords: Inclusive leadership, leadership, for-profit

Oral presentation OP762

Increasing Psychological Detachment from Work with Goal-setting and Gamification: A Research Proposal

Tomas Kratochvil, Ludmila Dudasova & Martin Vaculik | Masaryk University, Faculty of Social Studies, Department of Psychology

science

Research goals

The aim of this study will be to develop and test an intervention promoting psychological detachment from work by (1) decreasing how much time workers spend working on their devices (e.g., smartphones) after office hours (i.e., off-job ICT use), (2) increasing the workers belief that they are able to take respite after work (i.e., recovery-related self-efficacy, RRSE).

Theoretical background

In the last few years, we have seen how ICT have allowed us to work despite the pandemic. However, such flexibility also means that it may be more difficult to keep the boundaries between work and leisure time (Derks & Bakker, 2012). This can lead to higher physical or mental investment into work after office hours which may increase risks to mental health and well-being (Dettmers, 2016). For these reasons, we strive to improve psychological detachment from work.

Psychological detachment from work is a state in which people do not deal with their work physically or mentally. Achieving such a state during breaks and after office hours helps people to recover from work as it helps them renew their energy and to feel well (Sonnentag & Fritz, 2015). There are multiple detachment interventions, yet none focus on the fact that people detach less if they use of ICT for work purposes after office hours.

Consequently, if people learn to work less from their ICT devices and take some respite instead, their detachment should increase. Moreover, such intervention should also help their RRSE which in turn leads to better recovery.

As previous studies show that goal-setting and playing videogames leads to higher psychological detachment from work (Collins&Cox, 2014, Hahn et al., 2011), we propose using gamified goal-setting for the intervention. Gamification is the transformation of nongame environments to a game-like state by implementing game design (e.g., points, badges, leaderboards). In this case, we plan to create a playful environment where workers will set their goals. This should lead to higher psychological detachment thanks to decreasing off-job ICT use and increasing RRSE.

RQ1: Do classical and gamified goal-setting improve detachment via off-job ICT use? Does gamified goal-setting lead to better results than the classical one?

RQ2: Do classical and gamified goal-setting improve detachment via RRSE? Does gamified goal-setting lead to better results than the classical one?

Methodology

A field experimental study of classical and gamified goal-setting on detachment in comparison to control condition. In the goal setting condition, participants will set how much time a day they are maximally going to spend using ICT for work purposes after hours. In the gamified condition, participants will see a leaderboard consisting of five time-goals of increasing difficulty. Reaching

these goals will provide the participants with a helpful hint on how they can prevent themselves from refraining to the ICT. Setting goals through the leaderboard will be more fitting and specific than one time-bound goal. Receiving hints will give more meaning to the given goals. The intervention will be piloted with qualitative interviews and user-tested.

The sample will be Czech full-time white-collar workers who take and use their portable ICT off-site (with equal gender representation). A power analysis based on Hahn et al.'s intervention effect size (partial $\eta^2 = .211$), which is in line with the generally moderate to strong effect found in detachment interventions (Karabinski et al., 2021), showed we require at least 51 participants ($\beta = .10$, $\alpha = .05$). However, as gamification effect on psychological outcomes is smaller (partial $\eta^2 = .04$; Kratochvil et al., 2022), we will also aim for a best possible sample of 350 participants if feasible.

We will measure participants' psychological detachment from work (4 items, 1-5 scale), objective off-job ICT use (i.e., time spent on work device after hours), self-reported off-job ICT use (4 items, 1-5 scale), RRSE (6 items, 1-5 scale) and several intervening factors (e.g., job involvement, perceived availability expectations).

The study plan is to measure the variables across 3 weeks: (1) one week before the intervention, (2) one week while intervening, (3) one week after the intervention. While the intervening factors will be measured only once at the beginning of the study, the others will be measured repeatedly through the whole study.

Results

After cleansing the data based on the pre-set criteria and checking all assumptions, we will perform multilevel analyses to test both the within- and between-person variability caused by our intervention. Intervening factors will be addressed as covariates based on their correlation with the dependent variables.

Practical Implications

Our intervention may help people keep boundaries between personal life and work and to take respite, supporting both their well-being and performance.

Keywords: psychological detachment from work, off-job ICT use, gamified intervention

Oral presentation OP572

Individual and Collective Effects of Flexible Work Arrangements - A Multilevel Review and Synthesis

Alexander Goetmann, Lucerne School of Business

science&practice

Research goals. Flexible work arrangements (FWAs) are more and more emerging as a crucial tool for organizations to attract, motivate and retain their workforce. Researchers, practitioners, and policymakers are increasingly interested in workplace flexibility as an instrument to serve employees to balance their work and family roles, to increase health and well-being and work-related effectiveness. Previous research provided valuable insights on how flexible work arrangements (FWAs) influence important outcomes (e.g., job satisfaction, in-role performance). However, an up-to-date integration and synthesis of the vast and dispersed literature on FWAs is currently largely missing. Moreover, current research largely lacks an integrative understanding of crucial mechanisms and contextual factors of FWAs. The present research addresses this gap and provides an integrative synthesis of the current landscape on the impact of FWAs on individual and collective-level outcomes. Our review draws on self-determination theory and integrates findings on mechanisms and boundary conditions of FWAs by organizing the results in three major dimensions of flexible work arrangements: (a) flexibility in the employment relationship, (b) flexibility in the scheduling of work, and (c) flexibility related to where the work gets done. We contribute to the advancement of FWAs theory by offering an up-to-date systematic literature review on FWAs. Our results aim to fuel the practical debate on integrating FWA in organizational settings and help guide and inform decision-makers.

Theoretical background . We draw on self-determination theory as a macro-theory of human motivation to be better able to disentangle the potential effects of flexible work on important performance and health outcomes related to job design. The theory differentiates three major types of motivation workers might experience: intrinsic motivation , extrinsic motivation , and amotivation (i.e., lack of reasons to perform a certain activity). and highlights three universal psychological needs that are crucial in work-related contexts: relatedness, competence, and autonomy.

Design/Methodology/Approach/Intervention. A systematic literature review builds the foundation of our work. We followed best practice guidelines for creating impactful systematic and integrative literature reviews. We ran a computerized literature search on Scopus and PsycArticles to determine articles that examined FWAs or related terms (e.g., flexibility, alternative work arrangements) by investigating their titles and abstracts. Based on the previously identified articles, we also used forward and backward citation to find additional relevant literature. Our literature review focused on peer-reviewed articles that were published in English language since 2004. We did not consider grey literature or practitioner reports to ensure methodological rigor and quality and used the following exclusion criteria: (a) articles that were not empirical, b) articles that did not focus on the organizational context or workplace.

Results. Based on the identified previous research, our review provides several insights on boundary conditions (e.g., frequency of workplace-related rumination, openness to experience, perception of job similarity between temporary and permanent employees, family-friendly organization cultures) and mechanisms of FWAs (e.g., perception of the social context and job autonomy) and their relationship to important individual and collective level outcomes (e.g., health

and mental well-being, job satisfaction, organizational commitment, team performance). Hence, we advise organizations and policymakers to consider that the benefits of flexibility in the workplace are also subject to specific job characteristics and personality aspects that are described in more detail in our present work. To reap the benefits of FCAs organization need to also pay specific attention to employees` personal, educational, technological, and ergonomic resources.

Limitations . As in other studies, our research also has limitations. First, we only integrated English-speaking articles that are published in peer-reviewed journals. While this approach seems warranted, it may be the case that an elaboration on FWAs based on grey literature and practitioner reports would prove valuable in generating beneficial insights. Extracting additional data from other large-scale databases may generate additional valuable insights. Our review focused primarily on findings on FWAs that are empirical in nature. It would be beneficial for future studies to also take a closer look at theoretical and conceptual work on FWAs.

Conclusion. The present work generates up-to-date insights on FWAs and important individual and collective outcomes. We thereby contribute to the recent theoretical and practical debate on flexibility in the workplace. We hope to stimulate additional research and practical insights on this vital topic.

Keywords: flexible work arrangements, employment, literature review,

Oral presentation OP732

Integrating Shared and Vertical Leadership Perspectives as Drivers of Ambidexterity and Firm Performance

Lena Rudolf, Institute for Leadership and Human Resource Management, University of St. Gallen

science

Research goals

This study shows how the increasing complexity of leadership in the new world of work can be reduced by combining horizontal and vertical leadership. Today, leadership skills from all team members are needed to react dynamically and solve complex challenges. Research has shown that horizontally sharing leadership roles and tasks among team members leads to positive organizational effects, predominantly on innovation. However, ambidexterity research indicates that organizations must focus on both innovation and efficiency to succeed in the long run. Therefore, the research goal of this study is to explore under which conditions shared leadership can foster not only innovation but ambidexterity to increase sustained performance. By integrating insights from ambidexterity and shared leadership research, the study aims to shed light on the under-theorized shared leadership–performance link.

Theoretical background

Building on paradox theory, it is hypothesized that the imbalance towards innovation (exploration) promoted by a shared leadership (SL) climate can be counterweighted by combining it with leadership conducive to efficiency (exploitation): vertical closing leadership behavior (CLB). The reasoning for the hypotheses ensues from two paradoxes discussed in organizational research. First, the performing paradox states that embracing competing strategies and goals, namely innovation and efficiency, simultaneously requires exploration and exploitation. Supporting this notion, ambidextrous leadership research shows that the combination of opening leadership behavior (e.g., giving room for new ideas) and CLB (e.g., monitoring goal attainment) fosters ambidexterity. Second, the organizing paradox refers to competing designs and processes that lead to tension between empowerment and direction. This closely aligns with the paradox between empowering SL and directive vertical leadership. According to paradox theory, paradoxes should be viewed and embraced as complementary and enriching, not as contradictory. Based on prior research suggesting that SL promotes exploration, it is thus argued that CLB moderates the relationship between SL and ambidextrous behavior by fostering exploitation. According to recent scholars, the resulting ambidexterity positively influences firm performance.

Methodology

The hypotheses were tested in a sample of over 26,000 employees in 180 German companies from four industries, collected from 2019 to 2020. To address concerns of common source bias, data were collected from three different sources in each organization: two unique sub-groups of employees evaluated leadership and ambidexterity measures, whereas top management teams assessed firm performance. To test the hypotheses, multiple regression analyses were conducted using the PROCESS macro for SPSS.

Results

The findings support the proposed indirect positive effect of a horizontal (i.e., shared) leadership climate on firm performance, which is amplified when moderated by a guiding vertical leadership

style (i.e., CLB). SL is positively associated with ambidextrous behavior, an effect that increases when vertical CLB is included as a moderator. By introducing ambidextrous behavior as a mediator in the SL–performance link, this study uncovers and proposes a novel underlying mechanism.

Limitations

The sample consisting of German-speaking companies may limit the generalizability to other cultural contexts. Moreover, the cross-sectional nature of the data precludes causal inference.

Conclusions

The study unveils CLB as an important lever for the positive effect of a SL climate on firm performance through fostering ambidextrous behavior. Drawing on paradox theory, this study provides a new theoretical perspective to the SL–performance discussion, thereby connecting two research streams that were priorly independent. Based on the findings of this study, it can be concluded that, on the one hand, the autonomy inherent in SL enables teams to realize the full potential present in a team's variety of leadership skills, hence fostering innovation. However, on the other hand, it must be complemented by CLB to guide teams' efficiency. This breakdown of innovation promotion through SL and efficiency promotion through vertical CLB leadership reduces the complexity and ultimately leads to increased ambidexterity and, consequently, in higher firm performance. These findings hold important implications for companies suggesting that the paradox of SL and vertical CLB must be embraced to strive in demanding environments.

Relevance to the Congress Theme

The complexity prevalent in contemporary organizations has increased beyond the scope of single leaders, pointing to the limits of traditional leadership theories focused on vertical influence. By suggesting a fruitful combination of shared and vertical leadership as a driver of organizational ambidexterity, this study offers a new leadership approach to tackle challenges in the changing world of work.

Keywords: Shared Leadership, Vertical Leadership, Ambidexterity

Oral presentation OP16

Intentions to practice self-care, actual self-care practices, and relationships of self-care with wellbeing and health in self-employed workers

Antje Schmitt, University of Groningen; Bram Prasastyoga, Leiden University

science

Research goals

Self-care refers to individuals' self-directed engagement in behaviors that promote their functioning and health and includes physical, mental, social, and spiritual practices (Lee; Miller, 2013). The first aim of the study was to add to our understanding of the use of self-care practices among self-employed workers and examine how such practices predict their wellbeing and health. We also sought to explore what specific self-care practices self-employed workers report and how predictive these particular practices are for wellbeing outcomes. Second, we examined relationships between individuals' intentions to practice self-care and their actual self-care behaviors. While we argued for a strong general positive link, we considered that under certain circumstances, intentions do not translate into actual behaviors. Specifically, as self-employed workers face various stressful demands (Grant; Ferris, 2012), we argued that work stress may act as a barrier that prevents a strong intention to practice self-care from translating into actual behaviors and, as a consequence, reduces their vitality and positively predict health complaints.

Theoretical background

We draw on the conservation of resources (COR) theory (Hobfoll, 1989), which states that individuals aim to establish resources and prevent resource loss. Self-care may act as a personal resource that helps individuals to maintain their vitality and prevent the occurrence of mental and somatic health complaints (Kaluza; Junker, 2022). Moreover, we integrate Ajzen's (1991) theory of planned behavior (TBP), which has been used to predict and explain various health-related behaviors, such as smoking and exercising, by arguing that the stronger individuals' intentions to perform self-care behaviors are, the more likely it is that such behaviors are shown (Armitage; Conner, 2001). However, we consider the perspective of an intention–behavior gap (Sheeran; Webb, 2016) and explain this by studying perceived work stress as boundary condition that may explain when it can be difficult for self-employed workers to follow their intentions.

Study design

Self-employed workers from the United Kingdom (N = 290, 55% female, 47% solo entrepreneurs) participated in a two-wave study with a time lag of four weeks. We measured participants' intentions to practice self-care at time 1. Actual self-care practices, perceived work stress, vitality, and mental and somatic health complaints were assessed at time 2.

Results

The hypotheses were tested using structural equation modeling with maximum likelihood estimation in Mplus 8. Individuals reported, on average, having performed 2.4 self-care practices in the past four weeks. Practices such as relaxation and physical exercise were most frequently reported. The practice of physical exercise was most strongly related to wellbeing and health outcomes. As expected, individuals' intentions to practice self-care at time 1 positively predicted actual self-care practices at time 2, which, in turn, were positively related to vitality and negatively related to mental health complaints at time 2. The effect on somatic health complaints was non-

significant. We found no evidence for an intention–behavior gap. Perceived work stress did not moderate the relationship between behavioral intentions and actual self-care practices.

Limitations

The results may have been influenced by common-method bias because actual self-care practices (mediator) and individuals' wellbeing and health complaints as outcome variables were not temporally separated. As another limitation, we did not measure the outcome variables at time 1 and therefore cannot draw conclusions about changes in wellbeing and health complaints across the study period.

Conclusions

The study adds to our knowledge on the role of self-care practices for wellbeing and health in self-employed workers. Supporting the COR theory (Hobfoll, 1989) and the TBP (Aijzen, 1991), the study highlights that self-employed workers with strong intentions to practice self-care are likely to do so, independently of their level of work stress, and that practicing self-care positively predicts their wellbeing and relates to lower mental health constraints. The findings have practical implications to support self-employed workers in their healthy functioning.

Relevance to the Congress theme

Self-employment is an increasingly important form of labor. European governments have recognized the importance of self-employment for economic growth and societal development and have implemented policies to stimulate self-employment. Entrepreneurs' wellbeing and health are important and increasingly researched factors that determine their long-term development and success. Because human society is greatly dependent on flourishing businesses, our research, which helps explain how self-employed workers can maintain their wellbeing and health through self-care practices, is thus also of societal relevance.

Keywords: Self-care practices, wellbeing, self-employed workers

Oral presentation OP287

Interaction effects between work-stressors and job crafting on employee wellbeing?

Leif W. Rydstedt, Norwegian Inland Univerity of Applied Sciences; Mark Cropley, University of Surrey

science

It has previously been shown that hindrance and challenge work stressors have different consequences for the worker. The actual research goal was to explore if the employees job crafting efforts could modify the emotional reactivity to the different types stressors.

Theoretical background

Several previous studies on occupational stress have shown that a distinction can be made in what workers perceive as hindrance stressors (e.g. bullying, harmful leadership, bureaucracy), which are associated exclusively with increased workload and distress – and challenge stressors (e.g. meeting deadlines, complicated work tasks). While challenges also add to workload, successfully accomplishing them has been shown to increase e.g., self-efficacy and wellbeing.

Job crafting, the employee's self-initiated informal initiatives and strategies to adjust their working conditions to their personal preferences mainly aiming to increase challenges and to reduce hindrances in their work content, has been found to be related to increased motivation and wellbeing.

Besides the main effects from exposure to the different types of stressors it also seems reasonable to assume that the wellbeing of workers maybe interactively affected by perceived challenges and hindrances in the work content as well their job crafting efforts. The purpose of this exploratory study was to investigate these interactions – with the tentative expectations that high job crafting and a high degree of job challenges related to increased wellbeing, whereas the combination low crafting and a high degree of hindrances interactively related to reduced wellbeing.

Method

The sample consisted of 107 British fulltime (m=39,5 H) office-workers, whereof 61% women and 39% men, in the age range 19-62 (m=36) years, who volunteered to participate in a diary study on the relations between daily stress exposure and post-work reactivity.

As independent variables, job crafting, as well as challenge and hindrance stressors were dichotomized at median. For this study, aggregated daily Positive and Negative Affect (PANAS), measured in the evening, was used as a proxy for wellbeing. The data was analyzed by factorial ANOVA.

Results

Perceived challenge was strongly related to PA ($p<.001$), while the main effect from crafting failed to reach significance. On the other hand, challenges and crafting interacted significantly ($p=.022$) in the expected direction. In relation to NA none of the IVs nor the interaction was significant. For the factorial analyses between hindrances and job crafting, no interactions reached significance, while significant main effects from job crafting were shown in relation to PA ($p=.036$), and from hindrance stressors and NA ($p=.01$).

Discussion

The only significant interactive relation found was by challenges and job crafting in relation to PA, where participants with higher scores on both IVs, also reported high PA in the evenings. Thus, the initial expectations were only partially confirmed. On the other hand, several significant main effects in expected directions were found, suggesting that challenge stress and job crafting related to PA, whereas hindrance stressors related to NA.

Limitations

Since the sample consisted exclusively of British participants leaves the generalizability an open issue. Furthermore, the alpha coefficient of the job crafting measure was fairly weak (0.59).

Conclusion

In conclusion, organizational policies, should aim, where possible, to reduce hindrances and promote challenges, and encourage employee's to craft their work, thus promoting the UN 2030 Agenda goal sof: Good Health and wellbeing: Decent work and economic growth.

Keywords: workstress, crafting, interactions

Oral presentation OP467

Interpersonal justice as Heuristic of Service Performance in Centers for People with Intellectual Disability

Alice Maniezki, Jose Ramos Lopez, Carolina Moliner, Yolanda Estreder & Vicente Martínez -Tur | University of Valencia

science&practice

Research goals and why the work was worth doing

First, we try to identify professionals' interpersonal justice treatment as heuristic that helps families to judge the degree to which organizational performance is oriented to improve the quality of life (QoL) improvements of their relatives with intellectual disability.

Second, by considering QoL oriented to performance we are introducing a novel alternative to current indicators of organizational performance. QoL oriented to performance will serve as a contextualized definition that considers the specific social objectives of the sector.

Last, the majority of justice research focuses on individual differences in average levels of fair treatment. With our research we aim to investigate intra-individual fluctuations of the construct, which will allow us to make better causal conclusions and in-depth analysis of how justice treatment is evaluated over time and how changes in justice are associated with fluctuations in organizational performance oriented to improve aspects of QoL.

Theoretical background

In centers for people with intellectual disability, we usually see two relevant parties that co-create in order to reach the goal to improve the QoL of the person who is experiencing the disability: families and professionals. Due to limited chances for exchange and status differences between families and professionals, families often lack the important information to evaluate whether the center and its professionals will reach the goal to improve QoL of their relatives. We argue that families' interpersonal justice treatment – the degree that the person is treated with dignity and respect– can serve as such indicator as heuristic to reduce uncertainty and conclude whether the care-unit and their professionals will perform adequately to improve the QoL of their relative.

Design/Methodology/Approach/Intervention

We examine fluctuations in interpersonal justice treatment as dynamic heuristic that is reassessed and thus producing fluctuations in how families perceive organizational performance. Using hierarchic linear modeling, we analyzed the impact of change in the predictor variable to change in the respective outcome variables. Specifically, we examined whether changes in interpersonal justice over time were related to changes in organizational performance oriented to QoL.

Results obtained

The justice professionals' treatment of families serves as a heuristic suggesting whether the organizations' performance may be considered as adequate to enhance QoL. Members of the family review and re-evaluate the effectiveness of justice and organizations, describing changes over time. Significant variation was discovered, indicating that interpersonal justice is a powerful concept that can influence the family-professional connection through time.

Limitations

Heuristics are cognitive short-cuts. As the function of cognitive short-cuts is to purposefully have automated cognitive responses available that free cognitive space, this way of thinking may be faulty at times. Another aspect to mention is our research has done a first very important step to investigate justice variability, however, we did not manipulate the justice treatment, which could be another possible limitation in the generalization of findings.

Research/Practical Implications

Future studies could investigate the aspect of justice variability further by manipulating the justice treatment and hence controlling for continuous and discontinuous treatment. As many service environments underly external factors that can lead to a variation of justice treatment at times, this would be relevant to study.

Practitioners on the other hand can also benefit from the research. If families are treated well, they also evaluate the performance in terms of the QoL of their relative accordingly. Awareness and information are a step into the right direction and expanding the target of service towards families will help facilitate good relationships that are necessary for achieving a good organizational performance from the perspective of family members. It is further important to keep in mind that perceptions and evaluations of families can change over time. Achieving consistency over time is therefore very meaningful.

Originality/Value

We identify professionals' interpersonal justice treatment as heuristic and contextualized indicator that helps families to judge whether organizational performance is oriented to improve the QoL of their relatives. We are further studying within-person variability to widen the perspective by considering that families reevaluate the interpersonal justice treatment dynamically over time, impacting changes in the evaluation of organizational performance.

Intended audience

The intended audience can be found in academics who have a keen interest in within-person variability in organizational justice research, as well as in scientific practitioners of health organizations for people with intellectual disability.

Keywords: Interpersonal Justice, Heuristics, Service Performance

Oral presentation OP233

Interrelationships of Leader-Member Exchange and Work Engagement among Newcomers: An examination of intra- and interindividual effects

Patrik Fröhlich, Stefan Diestel & Fabian Otto | University of Wuppertal

science

Introduction & research goals: The future is now. In the changing world of work, people tend to change jobs more frequently and seek motivating and meaningful work. Although much is already known about how socilization resources may reduce uncertainty (e.g. Bauer & Erdogan, 2011), research has provided only scarce evidence on the antecedents, effects and outcomes of motivational constructs such as work engagement (WE) during the process of organizational socialization (Saks& Gruman, 2018). Also, several scholars found leader-member exchange (LMX) to predict WE, however only suggesting that WE may also in turn impact LMX (e.g. Agarwal et al., 2012; Breevaart et al., 2015). In line with this, potential problems regarding LMX as an endogenous vs. exogenous construct, questioning the position of LMX in causal relationships, have been pointed out (Antonakis, 2017; Gottfredson et al. 2020). In sum, the reciprocal effects of LMX and WE as well as the course of WE among newcomers during organizational socialization are yet to be determined. Therefore, our goal is to examine the longitudinal growth of WE and reciprocal effects of WE and LMX among newcomers from two complementary perspectives: intra- and inter-individually. We seek to test whether LMX influences WE among newcomers and vice versa and to shed more light on how newcomers differ in trajectories of WE over time.

Theoretical background : Based on social exchange theory (Cropanzano et al., 2005) and the Job-Demands Resources Model (Bakker & Demerouti, 2017) we predict reciprocal effects of LMX and WE on an intra-individual level. Inter-individually, we expect newcomers to systematically vary in their WE trajectories and person-average level of LMX to co-vary with WE trajectories.

Design & method : The sample of our study consists of 203 newcomers from different German companies. All participants were asked to fill out four consecutive surveys at an interval of four weeks each, starting 2-4 weeks after organizational entry. To test our hypotheses and uncover temporal trajectories we apply two analytical procedures. First, to investigate the intra-individual interaction between LMX and WE, we use the General Cross-Lagged Panel Model (GCLM, Zyphur et al., 2020). This allows us to consider short-term effects in terms of Granger-Sims causality (Granger, 1969) and longer-term impulse responses. Second, we perform exploratory group-based trajectory analysis (GBTA, Nagin et al., 2010) to explore inter-individually consistent clusters of development in newcomer WE and to analyze whether these trajectories co-vary with LMX.

Results : From the intra-individual perspective, the GCLM results indicate that WE influences LMX via short-term impulse effects, but not vice versa. In long term, there are substantial effects within constructs but not cross-lagged. On the inter-individual level, GBTA suggests a three-class solution to best fit the data, with person-average level LMX to predict trajectory-class membership.

Limitations : Despite our heterogeneous sample, a light over-representation of younger (M= 28.20 years, SD=6.6) people with rather less work experience (M= 4.70 years, SD=6.4) limits the generalizability. Furthermore, potential moderators and mediators were not included in our analysis that may grant further insight into the mechanisms of LMX-WE relationships among newcomers.

Conclusions : We conclude that although WE influences LMX on an intra-individual level, LMX does not influence WE. The absence of LMX affecting WE, contrary to past research, adds to the discussion

on LMX by implying the endogenous nature of LMX (Gottfredson et al., 2020). Impulses in WE seem to affect LMX, providing support for the supposition that higher engagement may lead to better LMX relationships (e.g. Breevaart et al., 2015) and suggests that the relationship should be investigated more fine grained. Furthermore, we were able to demonstrate systematical variation in WE trajectories by classes, hence confirming the presence of WE maintenance curves (Saks & Gruman, 2018). The relationship between WE trajectories and person-average level LMX implies a systematic link between overall LMX quality and the way of how WE decreases, persists or develops among newcomers. Therefore, practitioners should focus and foster newcomer WE, as it may positively impact newcomer-leader relationships by short-term impulses, and strongly consider the impact of inter-individual differences in LMX during organizational socialization.

To our knowledge, this is the first longitudinal study to investigate reciprocal effects of WE and LMX and trajectories of WE in association with LMX in the context of organizational socialization.

Relevance to the Congress Theme: As the future is now, practices in organizational socialization need to be reevaluated. Our research highlights the need of a joint focus on WE and LMX for a better socialization and a stronger focus on newcomer motivation and wellbeing.

Keywords: organizational socialization, work engagement, leader-member exchange

Intervening against sexual harassment in the police: Efforts and results

Brita Bjørkelo, Tatanya Valland & Celine Pedersen | Norwegian Police University College

science&practice

Background

"Speak Up!" A practice-oriented research project on the prevention of Sexual Harassment (SUSH, Nielsen et al., 2022) responds to the call for prevention efforts becoming more aware of "intersecting stigmatized identities" which increases some employees vulnerability to SH than others (Danna et al., 2020, p. 208). SUSH is positioned in the ethical infrastructure tradition (Tenbrunsel et al., 2003, p. 285), and targets by-standers, whose actions may affect SH situations positively or negatively.

Studies have documented that young women, women from ethnic minorities, migrant workers and HBTQ+ persons are more exposed to SH at work than other employees (Berdahl & Moore, 2006; Latcheva, 2017; Shaw et al., 2018). The interdependence between power relations, organizational culture and SH is well documented (Quick & McFadyen, 2017; Willness et al., 2007).

SUSH is conducted in partnership with working life actors across three Nordic settings (Denmark, Sweden and Norway), and the SUSH interventions are developed on the basis of an already compiled literature review on SH prevention (Hedin & Lane, forthcoming) as well as theory- and research-based intervention programs.

Research objectives

The main aim of SUSH is to develop and test the effect of two theory- and research-based bystander SH interventions (SUSH). Research questions are; 1 What are the vital components and risks associated with a bystander program for SH aimed at increasing bystanders' prosocial behaviours in SH situations at work? 2 What are the results and effects of SUSH interventions (knowledge, attitudes, and actions)?

The Norwegian pilot is conducted in close collaboration with key persons involved in the ongoing work (Bjørkelo, 2020; Ellingsen & Lilleaas, 2020) by the National Police Directorate, and the Norwegian Police University College (NPUC), of preventing and intervening to impact the occurrence of SH in the Norwegian Police Service (NPS). The pilot (1) compiles documentation on existing efforts on prevention and intervention of SH in the NPS and at the NPUC, and (2) starts to culturally adapt the Danish bystander intervention "Intervene-SH" with a focus on the characteristics of the involved persons (e.g., intersectionality) and the organisation (police).

Methods

In part 1 of the Norwegian pilot, existing NPS data giving evidence on existing SH prevention and intervention efforts and their effects are evaluated. Then, a process of adapting and elaborating existing SH interventions will start based on (a) input from the "Intervene-SH" program to ensure a focus on bystanders, and (b) input from with the Swedish pilot to ensure focus on intersectionality. The latter includes discussions about cultural adaptability. Key persons from the working life partner are involved.

Results

The presentation will contain preliminary results. The results from part 1 shows that there has been a number of initiatives taken from the Norwegian Police Service over time. The initiatives vary from verbal and written (action plans, posters etc.) information (raising awareness) to dilemma training (exercise). Is also seems as the attention drawn towards SH work over time is linked to research efforts and cases becoming known to the public. Based on the data we have been able to obtain, it is difficult to draw conclusions about potential effects. It does however seem as there overall is more focus devoted to awareness and training than effects.

In part 2, a professional translation of the Danish "Intervene-SH" into Norwegian is in progress. The work of culturally adapting the Danish bystander intervention «Intervene-SH» with a focus on the characteristics of the involved persons (e.g., intersectionality) and the organization (police) is also in progress. Input is gathered based on meetings with our working life partner, the diversity committee at the Norwegian Police University College, HR in the National Police Directorate, as well as others (e.g., previous students).

Implications

Direct results of the SUSH interventions are to increase awareness of the negative consequences of passive or colluding bystander behaviour and of risk situations for SH. The long-term aim of SUSH is provide free SH interventions to be used by workplaces in Nordic countries.

Keywords: Sexual harassment, police, whistleblowing, efforts, effects

Oral presentation OP603

Intervention against workplace bullying: the organization`s perspective

Justine Koloen, Aker Solution; Kari Einarsen, BI Norwegian Business School; Ståle Valvatne Einarsen, Department of Psychosocial Science, University of Bergen

science&practice

Research goals

Workplace bullying (WB) are documented to have devastating effects on the target's health and well-being (Nielsen and Einarsen, 2018). While individual targets may risk mental and somatic health problems (e.g. Nielsen et al., 2014; Verkuil et al., 2015), organizations risk productivity, reputation financial losses (Hassard et al., 2017; Hoel et al., 2020). Studies of organizations implementing intervention strategies are therefore important. This abstract represents the organization's perspective on implementing a bystander intervention to reduce WB. The main goal is to describe key factors of the implementation of the intervention that aims at decreasing WB prevalence in an industrial organization.

Theoretical background

The theoretical assumption behind the intervention is that the actions of bystanders in situations where coworkers are exposed to bullying acts can either escalate or reduce WB. A bystander is any person or group who witnesses the bullying event (Mason, 2014). How bystanders do react have an impact – also on the bystander (Nielsen, et al, 2020). Hence, stimulating early, active, and constructive intervention by bystanders should prevent further escalation and possibly create an anti-bullying climate.

Intervention

Meeting reports from the project group are used for documentation of the implementation process. Also, qualitative interviews with department managers, supervisors, local labor union representatives (LUR) and health and safety representatives (HSR) were conducted to evaluate the implementation of the intervention.

Background for the organization's participation in the intervention:

The intervention in focus was implemented in a Norwegian industrial organization (hereafter: organization) as they had disclosed relatively high WB prevalence rate (10%) over several years through work environment surveys. In 2016, the organization worked systematically to establish formal ethical systems for preventing and handling WB, such as formal policies, procedures and routines, surveillance systems and sanctioning systems. As formal policies and sanctions are associated with ethical decision making (Trevino et al., 1999), the organization developed formal routines for detecting and investigating WB, and formal sanctioning measures. Despite the effort, the work environment survey in 2018 showed no decrease in WB prevalence rate (10%). In 2019, the organization and the University of Bergen (UiB) started a collaboration on a bystander intervention aiming at training employees' ability to intervene if they observe bullying behavior.

Results

The meeting reports showed several key factors for developing and implementing the intervention:

First, a fundamental approach in developing the intervention has been participant involvement. Participant involvement aims at increasing ownership to the program, thereby ensuring key stakeholders contributing to successful implementation and follow-up of the intervention (Birzer 2002). Initially, a project group was established with representatives from UiB and the company. From the company's side, executive vice-president, department managers, supervisors, LURs and HSRs had active roles in the intervention implementation.

Second, meetings were held upfront with 300 line-managers and 70 LURs/HSRs, providing information about the organization's formal policies and procedures for handling WB as well as practical information about the intervention.

Finally, the implementation of the intervention program contained these elements: A planning meeting, and a three-hour group session. About 900 employees participated over a six-month period, in which supervisors, LURs and HSRs were given some central roles.

The qualitative interviews:

The preliminary result indicates that the intervention implementation was positively evaluated by the participants. Supervisors, LARs, and HSRs showed commitment and ownership to the intervention and were concerned with how the company would ensure further development of preventive measures related to the intervention.

Practical Implications

A systematic inclusion of key stakeholders in the organizations seems to be important for successful implementation of the intervention. The qualitative interviews showed that top management support, and active involvement and ownership among department managers, LARs and HSRs are crucial for the successful implementation of the intervention.

Limitations

The findings reported in this abstract are based on 18 interviews with key stakeholder employees, and thus, generalizing their perspective as representative for the whole organization should be done with precaution.

Value

Given the scarcity of evidence on effective interventions combating workplace bullying, this intervention is important and may help enhance our knowledge on how organizations may focus their efforts and resources in against workplace bullying. The abstract thereby inform practitioners about important key factors for implementing interventions.

Keywords: intervention, workplace bullying, bystander

Oral presentation OP403

Intraindividual variation in felt job insecurity: exploration of the reciprocal relationship between quantitative and qualitative job insecurity.

Sonia Nawrocka, KU Leuven, Belgium / Verona University, Italy; Margherita Brondino, Verona University, Italy; Margherita Pasini, Verona University, Italy; Hans De Witte, KU Leuven, Belgium / North-West University, South Africa

science

Theoretical background: Jahoda's deprivation theory holds that employment is the core resource, thus when threatened (quantitative job insecurity), other work features become less secure (qualitative job insecurity). On the other hand, it has been shown that changes to work features (qualitative job insecurity) occur more frequently and independently from threats to job loss. Conservation of resources theory (COR) demonstrates how these threats (lower salary, career opportunity, social status etc.) beget employees' vulnerability − deepening their threats concerning the stability of their employment (Hobfoll et al., 2018). COR theory also suggests reciprocal influences (i.e., loss spirals; Hobfoll, 2001) as due to experiencing initial threats to work resources (e.g., lower salary) employees develop higher threats to work-related resources, including job loss (quantitative job insecurity), which lead to further enhance threats to work resources. Although the defining feature of job insecurity is the subjectively perceived experience, individual differences have been largely neglected and a variable-centred approach is dominantly used. However, decomposing the variance and controlling for between-person differences when exploring processes at the person-level, improves theory, gives more precise predictions, and controls for biases in conclusions regarding the causal patterns (Hamaker et al., 2015; Hoffman & Stawski, 2009).

Method: We conducted a three-wave study and surveyed 3694 Belgian employees. Using a random-intercept cross-lagged panel model (RI-CLPM) we investigated the causal associations between quantitative and qualitative job insecurity at the within-person level.

Results: Our results confirmed large heterogeneity in the experience of job insecurity; above 60% of the variance in both quantitative and qualitative job insecurity is due to stable between-person differences. When controlled for these differences, we observed consistent within-person associations at each measurement wave. Stability effects were found for quantitative job insecurity; employees who experienced higher than their average threats to job loss at one point in time also experienced higher threats to job loss later in time. In contrast, we found no carry-over effects for qualitative job insecurity. However, the individual's deviation from the expected qualitative job insecurity score was predicted by deviations from their expected score in quantitative job insecurity. Therefore, in line with Jahoda's deprivation theory, we found that quantitative job insecurity leads over time to qualitative job insecurity, not reverse.

Limitations: Although our study controlled for the between-person differences in how persons usually perceive job insecurity (quantitative and qualitative), we assumed that the within-person processes are identical for all individuals (higher than a usual threat to job loss leads to higher than a usual threat to job insecurity, six months later, and vice versa). However, the relationship between quantitative and qualitative job insecurity may be different between groups of individuals who differ according to certain characteristics. This renders further studies to implement profile analysis in the analysis of the relationship between both job insecurity dimensions.

Conclusions: Overall, the results at the person level suggest that the experience of quantitative job insecurity is largely dependent on the individual's experience of these threats earlier on, whereas the

individual's experience of qualitative job insecurity is linked with other time-varying factors, such as individual's higher experience of overall threat of job loss.

Relevance to the conference theme: In post-pandemic life, continuous rearrangements in the work environment uncovered that not only quantitative but also qualitative job insecurity cause substantial strain to employees and organizations. Although both dimensions are independent work stressors, they are closely related. Our contribution highlights the importance of a holistic approach when exploring job insecurities, which empowers work towards more efficient solutions to promote employees' health and well-being.

Relevant UN SDGs: This research aligned with SGD#3: Good health and well-being and SGD#8: decent work and economic growth.

Keywords: quantitative job insecurity, qualitative job insecurity, random-intercept cross-lagged panel model

Oral presentation OP525

Intrinsic job quality over time: does it depend on personal employability?

Ana Hernandez, Marija Davcheva, Vicente González-Romá & Ines Tomas | University of Valencia

science&practice

Research goals and why the work was worth doing

The increasing flexibility and de-regularization of the job market, along with economic globalization and greater competitive pressure, have been threatening job quality in many countries (e.g., Lucifora & Salverda, 2005; ILO, 2005). Thus, promoting job quality is critical for policy makers, especially nowadays, after the COVID-19 pandemic strike. In this regard it is important to understand which factors foster job quality over time, especially in difficult job market situations. We focus on an indicator of intrinsic job quality: the motivating potential of a job (MPJ) (Hackam & Oldham, 1980). The goal of this paper is twofold: 1) to analyze the trajectories of intrinsic job quality (i.e., MPJ) over time to understand how they have been affected by COVID-19; and 2) to investigate whether the potential differences in trajectories depend on personal employability, particularly the dimensions of career identity, personal adaptability, and social and human capital (Fugate et al., 2004).

Theoretical background

People seek to obtain and keep jobs they enjoy performing, in other words that are intrinsically motivating. However, in some situations, especially in uncertain market conditions, people are forced to accept jobs that are not ideal in terms of their motivating potential. Thus, it is important to understand whether accepting these jobs may be steppingstones to obtain better jobs or if they are traps that condemn people to work in a job they do not enjoy (Scherer, 2004). The particular trend may depend on a personal resource: employability. Fugate et al. (2004) conceptualize employability as "a form of work specific active adaptability that enables workers to identify and realize career opportunities" (p. 16). Thus, individuals with this personal resource should have more chances to identity and obtain jobs with stronger motivating potential or improve faster if the initial jobs were not ideal.

Methodology

We collected data from a sample of heterogeneous employees. The data on MPJ was collected over 8 time points separated by three months (from January 2021 (N=484) to October 2021 (N=258)). Specifically, the five intrinsic job characteristics proposed by Hackman and Oldham (1980): autonomy, task identity, feedback, variety, and task significance, were combined in an additive compound as recommended by Fried and Ferris (1987). We also measured the different dimensions of employability at Time 1. Analyses were carried out by means of Mplus. Specifically, we fitted a discontinuous growth model (see Rioux et al., 2021), where Time 2 referred to the event (COVID stroke) that marked the discontinuity. We controlled for age, gender, and the number of job changes over time.

Results

The discontinuous growth model showed a good fit to data (RMSEA = .03; CFI = .99; SRMR = .05). Even if there was not a significant average decrease of MTJ at T2, there was a significant variability across individuals ($p<.01$) around the event mean. In addition, after COVID strike, MPJ significantly improved over time. Individual variances around the average slope and intercept were also statistically significant. After introducing employability and control variables as predictors of the

three latent variables (intercept, event, and slope), the model fit was excellent (RMSEA = .02; CFI =1.00; SRMR = .04). Two of the dimensions of employability significantly predicted the initial levels of MPJ: career identity (B=.31, p<.001) and social capital (B=.11, p<;.01). None of the dimensions of employability were related with the event or the slopes of MPJ over time. However, the number of job changes over time was positively and significantly related with the slope of MPJ (B=.03, p<.01), suggesting that employees that change jobs improve faster.

Limitations

The main limitation of our study is that all the data were collected through self-reported questionnaires and from the same source (employees).

Conclusions

Our results support the theory that there is an improvement of intrinsic job quality over time and that less motivating jobs can be steppingstones to get better ones. In addition, two dimensions of personal employability, career identity and social capital, contribute to getting more intrinsically motivating jobs.

Relevance to the Congress Theme

COVID and uncertain job markets have contributed to changing the world of work. Understanding which personal factors contribute to improving intrinsically motivating jobs in these uncertain situations are essential to design interventions that help individuals to obtain (and keep) jobs they will enjoy performing.

Investigatign the psychometric properties of the 6-item Stanford Presenteeism Scale

Vincent Cassar, Full Professor; Katarzyna Tracz-Krupa, Associate Professor; Agnieszka Zielinska, Associate Professor; Frank Bezzina, Full Professor

science&practice

The short version of the Stanford Presenteeism Scale (SPS-6) is a measure of presenteeism and has been translated into several languages including Italian, Brazilian Portuguese and Dutch. The current study examined the factor structure of the SPS-6 in Polish and sought to explore its psychometric properties. Using the responses of 204 employees working in an IT-based company, results confirmed the two-factor structure of the Polish version of the SPS-6 (PSPS-6). While a second order CFA on the PSPS-6 items with Presenteeism as a higher order factor produced loadings that were acceptable, these were not strong enough, suggesting that using the overall RSPS-6 scale is better than using a 2-dimension factor of presenteeism. To assess the concurrent validity of the scale, we adopted the JD-R model to define presenteeism as an outcome. Using work-family conflict as a job demand and peer/managerial support as a job resource, results indicated that both demands and resources have a direct effect on presenteeism while burnout (but not work engagement) mediated the relationship between job demand/resource and presenteeism. The findings highlighted above suggest that the PSPS-6 has good prospects as it is a reliable and valid measure of presenteeism. More specifically, the PSPS-6 is a useful tool in assessing presenteeism at the workplace and in workforce interventions related to health and employee well-being.

Oral presentation OP667

Investigating how shared SA is built based on communication in forestry crews

Ilinca-Ruxandra Tone, MA, MRes, NTSAg & APHF, School of Psychology, University of Aberdeen; Dr. Amy Irwin, University of Aberdeen

science

The current project aims to explore how forestry crews build shared situation awareness (SA) based on verbal exchanges within their team and how breakdowns occur in this communication. Forestry represents a high-risk industry in the United Kingdom (HSE, 2022). Most fatal and major injuries in tree work are associated with chainsaw operations, being struck by a tree/tree branch or a fall. Members of the public are also affected by these hazards, being involved in both fatal and non-fatal accidents. A previous study has shown that SA or knowing what is going on is a safety-critical skill for individuals in forestry crews, communication being an important influencing factor (Irwin et al., under review). Another New Zealand study found that 70% of reported incidents could be linked to human error, particularly cognitive failures (Hinze et al., 2021). A study with US forestry workers emphasized the importance of accurate SA, which was especially useful for chainsaw operators (Newman et al., 2018). The current project was conducted in collaboration with the national Government agency responsible for managing forests and land in order to further investigate the importance of SA in forestry at a crew level.

SA is formally defined as 'the perception of the elements in the environment within a volume of time and space, the comprehension of their meaning and the projection of their status in the near future' (Endsley, 1995a, p. 36). In high-risk industries, which feature complex and dynamic environments, SA represents a safety-critical skill and forms the basis of decision making and action taking. Whilst SA can be considered at an individual level, many operators in high-risk industries work in teams or crews which have common goals and interdependent roles. Shared SA thus represents the extent to which team members have the same SA on shared requirements. Information pertaining to overlapping SA elements needs to be shared between team members, usually in the form of verbal communication (Endsley & Jones, 2001). Poor shared SA can lead to unsafe work conditions and accidents.

Participants (projected n=12) are grouped into typical forestry teams, each consisting of a chainsaw operator, a supervisor and two banks people, corresponding to their work experience. Recruitment and online session scheduling were done directly through an organisational contact. Materials consist of an unfolding scenario related to forestry comprising seven progressive short vignettes, developed based on SMEs input. Each vignette describes a critical, dynamic situation (e.g., member of the public walking on site). Depending on their assigned role, participants are presented with slightly different versions of each vignette in text format through the means of a PowerPoint presentation, each containing safety-critical information which needs to be communicated to other team members to build shared SA. Each vignette is read for one minute, followed by self-paced team communication in real time via Teams, which is recorded, transcribed, and subsequently analysed based on meaningful paragraphs, using the Conversation Analysis approach. A Goal Directed Cognitive Analysis (GDTA) was done beforehand for the task to determine SA requirements. The analysis will focus on both the speech act and the specific content (the requirements shared). In order to assess information loss in situation-related communications, the closed-loop communication construct will be used. One study session (n=4) has already been run, with key points on SA being shared.

Data collection will be completed by October 2022, transcription by November and analysis by December, respectively.

Due to limited access to the population of interest because of their competing work commitments, the study is projected to have a small sample size. Nevertheless, the qualitative nature of the project will allow for an in-depth conversation analysis. Whilst the scenarios used in this study have been validated with technical SMEs, these are nonetheless low-level and may not completely reflect actual behaviours. Similarly, while online communication via Teams is reflective of in-helmet verbal exchanges which forestry crews typically have, visual cues such as signals fall outside the scope of this project.

The project has direct implications for the implementation of in-helmet communication devices and communication and/or SA training within forestry, e.g. guidance for more effective communication.

To the author's best knowledge, this is the first project to explore shared SA in forestry crews.

Since this is an applied psychology project with implications for safety in a high-risk industry, the intended audience consists of both academics and practitioners.

Team SA, communication, forestry

Keywords: Team SA, communication, forestry

Oral presentation OP154

Investigating Language and Demographic Differences in the Conditional Reasoning Test for Workplace Psychopathy (CRT-WP) with Military Applicants

Ryan Cook, Saint Mary's University; Wendy Darr, Department of National Defence - Canada; Nicolas Roulin, Saint Mary's University

science&practice

Research goals

The goals were to investigate two practical concerns about the Conditional Reasoning Test for Workplace Psychopathy (CRT-WP) critical to using the scale to screen for workplace-related psychopathy in diverse samples: 1) potential demographic differences contributing to adverse impact, and 2) language equivalence of the test (French vs English versions).

Theoretical background

Psychopathic leaders are linked to increased counterproductive work behaviors (CWBs) such as theft and abuse, white-collar crime, and unethical decision-making. Colleagues and subordinates of such leaders experience lower well-being and job satisfaction, and increased stress and turnover intent (see Lilienfeld et al., 2015). Unfortunately, organizations cannot screen for psychopathic personality in selection because all existing measures are either, 1) too clinical, 2) require third-party raters, or 3) are overt self-reports, which are easily fakeable. Conditional Reasoning Tests (CRTs) have been described as a promising direction for measuring personality in work contexts, due to their implicit nature (e.g., LeBreton et al., 2020). The CRT-WP was developed and validated in previous research (Cook & Roulin, under review), demonstrating reliability (internal consistency ranging .77 to 80, test-retest $r = .72$), validity (positively correlated with other psychopathy measures, negatively correlated with integrity, and predictive of selfish decision-making, CWBs, and cyberloafing), and faking-prevention (no significant difference between honest and selection conditions). However, potential adverse impact has not yet been explored with a large sample, and test equivalence in other languages (e.g., French) needs to be demonstrated.

Methodology

Participants were Canadian residents interested in applying to the Canadian Armed Forces (CAF). The CRT-WP was included alongside the Practice Canadian Forces Aptitude Test (PCFAT) and demographic questions on an online portal, where participants completed it as part of practicing for their application. The PCFAT is a general cognitive ability test which contains elements of verbal, spatial, and problem-solving abilities. Complete data was obtained from 3023 English- and 524 French-speaking individuals.

Both traditional analyses (classical test theory) an Item Response Theory (IRT) were used to investigate potential Differential Item Functioning (DIF) between demographic groups, and also between the English and French versions. The Item Response Theory-Likelihood Ratio Test (IRT-LR) was used to test for DIF from the IRT standpoint, while traditional mean comparisons were used from the classical test perspective.

Results

Results from traditional tests for DIF for the English sample (M age = 27.6, 66.8% male, 47.2% college/university education, 57.7% White), showed a statistically significant difference between

men (M = -12.31, SD = 5.75) and women (M = -12.80, SD = 5.25), F (1, 2510) = 4.22, p = .04, yet very small in effect size (η 2 = .002). Additionally, a small difference exists for ethnicity comparing White applicants (M = -13.03, SD = 5.51) to visible minorities combined (M = -11.75, SD = 5.51) and Indigenous peoples (M = -11.79, SD = 5.97), F (2, 2299) = 12.08, p < .01, η 2 =. 010. However, no difference exists for disability status, F (1, 3021) = 0.01, p =. 94.

IRT-LR analyses will be conducted in November 2022 for demographic comparisons with adequate sample sizes (>500), and comparing the English and French versions. It is expected these analyses will show that, even if there are small demographic differences (1% of variance or less), there will be no meaningful DIF between comparison groups. For the English to French comparison, it is possible that there is significant DIF as this is the first evaluation of an alternative version, and previous research with other CRTs have shown significant DIF across languages and cultures (Galić et al., 2014).

Limitations

We used Canadian participants to evaluate differences between English and French versions. They could be larger cultural or practical differences when used in European countries, for example.

Conclusions

Organizations can benefit from the results of this study by knowing whether the CRT-WP, which has already been psychometrically validated, may contribute to adverse impact and if its French version is also valid. While statistically significant, demographic differences in CRT-WP scores account for 1% of variance or less. If these findings are confirmed, the CRT-WP could be used in hiring processes to screen out leaders with psychopathic tendencies.

Relevance to Congress Theme

The future is now! With the current global climate (especially political) there is a great need for ethical leaders, and to prevent people with deviant and abusive personality from reaching leadership positions. This is critical for positions such as politics, policing, and CEOs.

Relevant UN SDGs

Gender Equality & Reduced Inequalities: Exploring potential adverse impact and demographic differences for our measure intended for use in hiring.

Decent work and economic growth: Validating a novel measure for selection to screen out "dark" leaders, and hire more ethical ones.

Oral presentation OP752

Is it still appropriate at this age? Perceived age norms and entrepreneurial intention in mature individuals

Ewelina Purc, John Paul II Catholic University of Lublin; Carlos-María Alcover, Rey Juan Carlos University; Gabriela Nazar, University of Concepción; Gabriela Topa, The National Distance Education University (UNED); Juan Antonio Moriano, The National Distance Education University (UNED)

science&practice

Research goals and why the work was worth doing

The aging of the population is currently one of the major challenges which many countries face. Governments have adopted different strategies to deal with these problems, such as, for example, raising the retirement age. People who are close to retirement may be interested in becoming entrepreneurs. In this line, senior entrepreneurship is attracting attention of policymakers and researchers. However, such activity is still not well studied in psychology. To fill this gap, a quantitative study was conducted among people who are around retirement age.

Theoretical background

If people perceive entrepreneurship as socially acceptable at any age, and in mature age in particular (so-called age norms in relation to entrepreneurship), such perceptions will exert a positive influence on their entrepreneurial intention. Within the theoretical framework of the theory of planned behavior, the most widespread theory in entrepreneurship research, these relationships will be mediated by the proximal antecedents of intention, i.e., attitude toward entrepreneurship, subjective norm, and entrepreneurial self-efficacy. Based on the theory of planned behavior, this study analyzes the effect of perceived age norms on the entrepreneurial intention among mature individuals.

Design/Methodology

For this purpose, a research questionnaire was administered to 793 late-career participants (54% female) aged 50 to 65 (M = 58.27, SD = 3.75) years residing in three countries: Poland, Spain and Chile. The questionnaire was composed of the perceived age norm scale in relation to entrepreneurship and the Entrepreneurial Intention Questionnaire (EIQ), which measures both entrepreneurial intention and its three antecedents (attitude toward entrepreneurship, subjective norm and entrepreneurial self-efficacy). Data were checked for common method variance, and the measurement invariance of the measures in the three countries was also analyzed. SmartPLS was used to examine the hypothesized relationships.

Results

The results show that perceived age norms predict entrepreneurial intention among mature individuals in three countries together and in each country separately. These relationships are mediated by attitudes toward entrepreneurship, subjective norm and entrepreneurial self-efficacy. Some cultural differences are identified between three country subsamples as well. Perceived age norms are presented as a variable on which to intervene to promote entrepreneurship in the last stage of the professional career.

Limitations

The use of self-report measures is a limitation of the study. Moreover, although intention is a good predictor of behavior, actual entrepreneurial behavior was not measured. Data were collected in three countries, which limits the generalizability of the results to other cultures. Future research would benefit from using data from more countries. The study was cross-sectional, so drawing causal conclusions is not possible.

Conclusions

The results show that the formation of positive social norms about starting a business at an mature age promotes entrepreneurial intention. The model of planned behavior was verified and confirmed in a new age-specific context on data from three countries. The findings contribute to work and organizational psychology, as well as to the entrepreneurship literature. It is also possible to formulate recommendations for practice. It is worth to promote business start-ups among people close to retirement age, for example by creating programs supporting older entrepreneurship and the formation of social attitudes conducive to starting a business at this age.

Relevance to the Congress Theme

When we want to better understand the changing world of work, we have to take into account the issue of aging populations, which has become a significant challenge. Senior entrepreneurship can be one of the important remedies to deal with these problems.

Relevant UN SDGs

The topic is related to UN sustainable development goals concerning poverty reduction, decent work and economic growth.

Keywords: Senior entrepreneurship, entrepreneurial intention, age norms

Oral presentation OP336

Is remote leadership a better fit for an introverted leader? An examination of leader and follower outcomes

Julia Schmidbauer & Cornelia Niessen | Friedrich-Alexander-Universität Erlangen-Nürnberg

science&practice

Research goals and why the work was worth doing

Leading remotely is becoming increasingly relevant, not just because of Covid-19. Remote leaderships has comparatively less in-person and informal communication than leading at work. Working from home might not fit with all leaders. Extraverts, for example, may suffer from the lack of in-person communication. For introverts, in turn, this lack of in-person communication when leading remotely could be beneficial, as they often perceive office-communication as distracting. Based on Person-Environment-Fit and Self-Determination Theory (SDT; Deci & Ryan, 2000), the present study aims to investigate whether leading remotely has a positive effect on introverts' leadership style and well-being, as well as on employees' intrinsic motivation and work performance.

Theoretical background

Extraverts are more likely to show effective leadership performance. This is often explained by extraverts being more outgoing, while introverts tend to be relatively calm and reserved. Nevertheless, there are contexts in which introverts lead to a better team performance (e.g., in a proactive team). Yet, there is little research on contexts in which introverted leaders can demonstrate their strength. Working remotely is accompanied by social requirements, which may be suitable for introverted leaders. While extraverts draw energy from interactions with others, introverts draw energy from time for themselves. Thus, having less in-person communication in remote leadership should better meet introverted leaders' needs and we propose that this fit between person and context provides advantages. Fit is generally associated with lower emotional exhaustion and can enrich people's lives through personal growths and leading remotely should thus be better for the well-being (i.e., less emotional exhaustion, more thriving) of introverted leaders. In addition, fit is associated with performance as it increases Leader-Member-Exchange (LMX), and leads to commitment and contextual performance. Thus, it should be easier for introverts to develop high LMX and empowering leadership (e.g., caring for needs and concerns of employees). Further, we assume that introverts are more successful in meeting employees' needs through remote leadership, which should lead to higher employee intrinsic motivation and higher work performance based on SDT (i.e., need satisfaction promotes intrinsic motivation and performance). In sum, we propose a more positive relationship between the leaders' number of home office days and their leadership-styles and well-being, as well as employees' intrinsic motivation and work performance for introverted leaders compared to extraverts.

Methodology

We collected data from supervisors and their subordinates in a large German company. Leaders rated their number of home office days , their trait extraversion , their leadership styles LMX and empowering leadership , and their thriving and emotional exhaustion . The employees rated their intrinsic motivation and work performance . Only teams of which we got data of at least two direct reports were included in the evaluation. The final sample consisted of 39 leaders with follower data from on average 4.02 direct reports (number of direct reports = 157).

Results obtained

The interrater reliability of employee study variables was sufficient (intrinsic motivation: rWG = 0.85; work performance: rWG = 0.82) so aggregation on team level was justified. Hierarchical linear regression analyses revealed that only for the most extraverted leaders a greater number of home office days was related to higher emotional exhaustion. For all other outcomes, we found no significant interaction between leaders' number of home office days and their trait extraversion.

Limitations

Limitations of the study are that all data were collected cross-sectionally and by self-report.

Conclusions – research and or practical implications/Originality/Value

Our study gives insight into the extent to which leaders' extraversion interacts with leading remotely. The data indicated that for leaders with very high extraversion, a high number of home office days is associated with higher emotional exhaustion. In contrast, less extraverted leaders do not seem to be impaired in their well-being when leading remotely. Considering the relevance of remote leadership for the future, this study directs attention to the importance of a fitting environment for one's well-being.

Relevance to the Congress Theme

The future is now. The world of work is not and will not be happening without remote leadership.

Relevant UN SDGs

Our study contributes to the SDG good health and wellbeing. One of the future's prominent working contexts (i.e., working remotely) may be disadvantageous for the well-being of the most prominent leader – the extraverted leader.

Keywords: introversion, remote leadership, well-being

Oral presentation OP121

Is team climate strength always a good thing? The benefits of variety in perceptions

Jeremy Dawson, University of Sheffield

science

Research goals

Team climate is a well-known predictor of group outcomes (Mathieu et al., 2008). Literature often suggests that to achieve best outcomes, team climate should not only be high in level, but also strong – with a high level of agreement within the team (Schneider et al., 2002). However, studies are divided on whether team climate strength has a generally positive effect on outcomes, with some research suggesting curvilinear effects, or a moderating effect on the climate-performance link. This paper examines this further by considering climate strength as a diversity attribute, and argues that the effect depends on the type of outcome, as well as the operationalisation of climate strength.

Theoretical background

Climate strength research often relies on the theory of situational strength (Mischel, 1973), which posits that a uniform climate creates a situation with clear expectations about how team members should behave, leading to greater cohesion and stronger outcomes. While this is a persuasive argument for some outcomes, for others it is less so.

Consider climate strength as a measure of diversity. Diversity of opinion can be of benefit to teams; the information/decision-making perspective (van Knippenberg & Schippers, 2007) suggests that team diversity can lead to more information being taken into account in decision-making, leading to better outcomes, particularly if the outcome requires elaboration of ideas (e.g. innovation). I therefore hypothesise that climate strength moderates the relationship between climate and innovation such that the relationship is stronger when there is greater variety of climate perceptions within the team.

Harrison and Klein (2007) defined three types of diversity: separation, variety, and disparity. Of these, variety is the most relevant to this perspective, as it considers the extent to which team members are spread across possible values of a variable. However most climate strength research relies on measures such as the standard deviation (SD), which does not reflect the total spread. Therefore I also ask: do relationships appear stronger when climate strength is measured by range, rather than by SD?

Methodology

Data was collected from 113 Community Mental Health Teams (CMHTs) from the NHS in England as part of a larger study. 1443 completed questionnaires were received (a response rate of 75%). Measures included four dimensions of the Team Climate Inventory (Anderson & West, 1998), and climate for Reflexivity (Carter & West, 1998). These were aggregated to the team level in three ways: climate level (measured by the group mean), and climate strength measured by both the SD and the range.

Team innovation was rated by three experts from collated lists of changes mentioned by team members that had occurred in their teams in the previous 12 months (ICC2 = 0.84).

Analysis was conducted using moderated multiple regression, examining each of the five climate dimensions predicting team innovation, moderated alternately by climate range, and climate SD.

Results

As expected, all five climate dimensions were significant predictors of team innovation. When moderated by climate strength as measured by range, two of the five interactions were significant (Support for Innovation: B = 0.390; p = .045; and Reflexivity: B = 0.205; p = .041). The effect is such that, whether climate strength is low or high, there is a positive relationship between climate and innovation; however, the effect is substantially stronger where the range of climate perceptions within the team is greater, i.e. when climate is weaker. This effect was found for two of the five climate dimensions tested, therefore partially supporting the hypothesis.

Interestingly, when tests were performed using SD rather than range as the measure of climate strength, none of the interactions was significant. This suggests range may be a more appropriate conceptualization of climate strength.

Limitations

The findings are based on a single sample of work teams in the health care sector and may not be representative of all types of work team.

Conclusions

The results suggest that having a greater variety of perceptions of climate can help the link between climate and innovation: that is, a weaker climate can be beneficial for enabling more innovative teams. However, the average climate is always a positive for the team; teams with more positive average perceptions are generally more innovative.

The fact that this was found when climate strength is measured by range rather than SD suggests that it may be beneficial to consider climate strength as a measure of variety, rather than separation.

Relevance to the Congress Theme

Given that increased variety of work methods, geographical dispersion, and greater cultural diversity are part of the changing world of work, these results offer hope that such variety can be harnessed to be beneficial to outcomes.

Keywords: Team climate, climate strength, measurement

Oral presentation OP763

Job characteristic and students' output in basic education: Multilevel mediational analysis by well-being and presenteeism

Amalia Raquel Pérez-Nebra, University of Zaragoza; Fabiana Queiroga, University of Lorraine; Felipe Valentini, São Francisco University; Aristides I. Ferreira, ISCTE-Lisboa

science

Research goals and why the work was worth doing: This study aims to test the job characteristic model in a multilevel mediation proposition. We hypothesise that the job characteristics dimensions predict students' output – measured in the second level – are mediated by well-being and productivity loss (i.e., presenteeism) – both measured at the individual level.

Theoretical background: The Job Characteristics Model (JCM) suggested that job characteristics will predict outputs mediated by psychological states (Hackman &Oldham, 1975, 1976). This model has been reviewed (Fried & Ferris, 1987; Grant & Parker, 2009) and the core elements of job characteristics were expanded (Morgeson & Humphrey, 2006). In addition, the critical psychological states were questioned and reconsidered (Renn & Vandenberg, 1995); and the whole model received (partial) support in the educational field (Guise, 1988; Pérez-Nebra et al., 2020). However, to date, no empirical evidence of the JCM multilevel approach has been provided, although, already suggested (Croon & van Veldhoven, 2007; van Veldhoven, 2012).

Methodology: A cross-sectional study was conducted among 171 schools and 1,281 public servants (80,4% of women, mean age 44.00, SD = 8.36; 93.4% in urban areas). We used an online and paper-and-pencil survey to measure job characteristics, well-being at work (w= .90), avoiding distraction (w =.76) and completing work (w =.78). Students' output was measured using a Brazilian standard national IDEB score (Basic Education Development Index) for each school.

Results: The proposed model was examined by using Multilevel Structural Equation Modeling (MSEM), which assumes sampling at both individual and group levels. At the between level, IDEB was predicted by Completing Work (ß= -.40; p = .04) and Avoiding Distraction (ß= .42 ; p =.04), but not by well-being at work (p = 0.70). At the within level, well-being at work was predicted by social job characteristics (ß=.28; p =.01) and task characteristics (ß= .35; p =.01, ICC (1)=.052). Completing Work and Avoiding Distraction (ICC(1) .032 and .030 respectively) were predicted by well-being at work (ß respectively -.30 and -.37), and well-being at work mediated the relation between job characteristics and productivity loss (measured by presenteeism – Completing work and Avoiding distraction), however, cannot predict IDEB.

Limitations: The study was cross-sectional, and data were collected in school via self-report questionnaire.

Conclusions – research and or practical implications/Originality/Value: To our knowledge, this study is the first to examine JCM in schools from a multilevel perspective. It provides clear evidence that improving job characteristics, protecting and increasing well-being and reducing presenteeism of school professionals will positively affect the quality of basic public education.

Relevance to the Congress Theme : The results support critical workplace changes that can contribute to more sustainable work activities, well-being and promote decent work. Sustainable and decent work are two crucial pillars for promoting the transformative education the world requires.

Relevant UN SDGs : Good health and well-being, Quality Education, Decent Work and Economic Growth.

Keywords: Presenteeism, job characteristic model, work design

Oral presentation OP470

Job characteristics, engagement and affective commitment in a Spanish Non-Governmental Organization: A moderated mediation analysis

Alejandro Orgambídez, University of Málaga (Spain); Jose María León-Pérez, University of Sevilla (Spain)

science&practice

Research goals

One of the main concerns of non-governmental organizations (NGOs) is how to retain their volunteers over time. In that sense, workers' affective commitment to the organization is considered a key antecedent of both volunteers' future performance and the quality of service they provide. Therefore, this study aims at exploring workers' psychological resources and work conditions that are related to their affective commitment to the NGO.

Theoretical background

In doing so, we follow the Job Demands-Resources theory (Bakker & Demerouti, 2017) to specific NGO (i.e. Red Cross Spain) and explore the motivational paths of this theory: job characteristics (i.e. opportunities to learn new professional skills) are related to engagement and commitment and if, in addition, volunteers have high psychological capital, they will have a high affective commitment to the organization. In this sense, a recent meta-analysis suggests that psychological capital is associated with positive outcomes for both workers and organizations (Loghman et al., 2022). Therefore, using a moderated mediation model we examine how job characteristics may be related to engagement (H1) and affective commitment (H2), as well as whether psychological capital is a moderator in the engagement-commitment relationship (H3).

Design

A correlational and cross-sectional study was carried out, using online questionnaires for data collection. The final sample consisted of 375 volunteers from an NGO 'Red Cross Spain' (Mage = 36.72, SD = 12.34, 64.8% women). Participation was voluntary and non-rewarded. Data collection was approved by an ethical committee and all datasets were anonymized. The following instruments were used in their Spanish versions: the Short version of the Psychological Capital Scale (Authors, 2017), the 3-item version scale of the Utrech Work Engagement Scale (Schaufeli et al., 2019), and the Volunteer Satisfaction Scale (Vecina et al., 2009). Hypotheses were tested using multiple linear regressions calculated by maximum likelihood and bootstrapping methods (5,000 resamples, Percentile Confidence Intervals).

Results

Results showed that job characteristics were related to engagement (H1) and directly and indirectly, through engagement, related to affective commitment (H2). Psychological capital moderated the relationship between engagement and commitment (H3). That is, when psychological capital is high, the effect of job characteristics on organizational affective commitment through engagement is significant ($p < .01$).

Limitations

As every study, our design has some limitations. This study is not exempt from potential common method biases because all measures were self-reported and collected at one point time. Future

studies should incorporate longitudinal designs with more representative samples that may help to infer causality in the relationships between variables.

Conclusions

In conclusion, good working conditions and the motivational component of engagement, together with the positive psychological states of psychological capital, especially strengthen the bond of volunteers with their organizations, favoring their involvement in the activities and ensuring their permanence in the volunteer programs.

Besides these limitations, these results are interesting from a practical point of view because offer some insights into how to improve volunteer retention in NGOs. For example, it seems that NGOs should offer good working conditions and facilitate engagement at work. Also, training programs to improve volunteers' psychological capital may be a potential intervention (see Luthans et al., 2006). Indeed, these results are interesting for the United Nations' Sustainable Development Goals as NGOs participate actively in the consecution of all goals, particularly goals #1 (no poverty) and #10 (reduced inequalities).

Relevance to the Congress Theme

The future of NGOs and their ability to respond to some of today's social challenges (i.e. immigration) necessarily involves determining why some individuals choose to volunteer, as well as the reasons why some continue to volunteer over time. Organizational commitment is a strong predictor of the intention to continue, so understanding the link between work conditions, motivational processes and psychological resources would be helpful for NGOs to manage volunteers' goodwill and initiative.

Relevant UN SDGs

Our findings are relevant to the United Nations' Sustainable Development Goals as NGOs participate actively in the consecution of all goals, particularly goals #1 (no poverty) and #10 (reduced inequalities).

Keywords: commitment, volunteers, NGOs

Oral presentation OP469

Job Crafting As a Predictor of Work Engagement Among Polish Nurses. The Mediating Role of Job Resources: A Two-Wave Study

Grzegorz Wójcik & Antoni Wontorczyk | Institute of Applied Psychology at Jagiellonian University

science

Study goals

The relationship between job crafting and work engagement seems to be well documented, however, not in the occupational group of nurses, especially from Poland. Moreover, the mediating effect of job resources on job crafting-work engagement link among nurses was mainly tested in countries of Western Europe, but, to the best of the authors'

knowledge, not in Central and Eastern Europe. Based upon the Job Demands-Resources model, Conservation of Resources (COR) theory and Self-Determination theory, this longitudinal study examined whether job crafting behaviours predict directly work engagement among Polish nurses. The second aim of the study was to investigate whether job resources, i.e., perceived organizational support and support at work, mediated the relationship between job crafting and work engagement.

Theoretical background

According to Wrzesniewski and Dutton (2001), job crafting could be described as self-initiated forms of behaviour in which employees proactively shape the characteristics of their jobs in order to adjust them to their own needs and preferences. To date, studies demonstrated that job crafting leads to higher work engagement among employees (Harju et al., 2016; Vogt et al., 2015). Work engagement was defined as a positive, work-related state of mind characterized by vigour, dedication and absorption (Schaufeli et al., 2002). The analyzed job resources consisted of two dimensions – perceived organizational support and support at work. The former referred to support from supervisors, while the latter concerned support derived from coworkers.

Methodology

This longitudinal study employed two waves of measurement and three and a half-month time intervals between them. During the first measurement (T1), a sample of 270 nurses from the biggest hospital in Southern Poland filled out an online questionnaire from 3 January until 6 February 2022. 121 out of 270 nurses who took part in T1, filled out the same questionnaire during the second measurement (T2) which was conducted from 23 May until 8 June 2022. Job crafting was assessed by Job Crafting Questionnaire (JCQ; Slemp, Vella-Brodrick, 2013, Pol. adapt. Kasprzak et al., 2017) and work engagement was assessed by Utrecht Work Engagement Scale (UWES; Schaufeli, Bakker, 2003, Pol. adapt. Szabowska-Walaszczyk et al., 2011). Perceived organizational support and support at work were estimated using the Polish adaptation of three subscales from Areas of Worklife Survey (AWS) developed by Leiter and Maslach (2006; Pol. adapt. Terelak, Izwantowska, 2009).

Results

The obtained results indicated that job crafting predicted directly work engagement among Polish nurses in both measurements. Moreover, both perceived organizational support and support at work partially mediated the relationship between job crafting and work engagement in T1 and T2.

Limitations

There have been distinguished three main limitations. Firstly, the sample consisted of nurses from only one hospital and only females, therefore future studies may take into account a more representative sample of nurses to draw better conclusions. Secondly, only self-reported measures were used, therefore future studies could also employ the assessment of the supervisors in order to get a more objective perspective of the analyzed phenomenon. Thirdly, no personal traits were included in the research model, therefore in the future it may be worth exploring personal traits and their role with relation to work engagement in order to get a more comprehensive overview of the well-being of Polish nurses.

Conclusions

To the best of authors' knowledge, this is the first study which explored the direct and indirect (through job resources) impact of job crafting on work engagement among Polish nurses. This study indicates that when nurses proactively build a resourceful and challenging work environment for themselves, it can lead to diverse positive outcomes such as an increase in their job resources and increase in work engagement that are crucial for their well-being. Thus, nurses should be encouraged by hospital managers and supervisors to craft their job.

Relevance to the Congress Theme

The study is strongly related to the current phenomena observed in work environment, such as job crafting and its positive outcomes for employee's wellbeing. Thus, the study seems to fit very well to the main theme of the Congress.

Relevant UN SDGs

The study is closely relevant to 'Good health and wellbeing' topic promoted by UN SDGs. It could be stated that the general aim of the study was to show the predictors of work engagement considered as an indicator of occupational well-being among Polish nurses.

Keywords: job crafting, work engagement, nurses

Oral presentation OP520

Justice in Nascent Entrepreneurial Teams

Agustin Molina, Pontificia Universidad Católica de Chile

science&practice

Research goals and why the work was worth doing

Nascent entrepreneurial teams confront high levels of group uncertainty that arise from external factors (customers, products, markets) but also from within the team itself, as the interactions between team members are bound to several social complexities (e.g., engaging in negotiations due to individual preferences). Since justice provides a sense of control and belongingness that helps individuals navigate complex social-exchange relationships, this study focuses on team justice climate—also labeled peer justice or intraunit justice—as a trigger of successful nascent entrepreneurial team dynamics. To that end, we examine the influence of team justice climate on team reflexivity, a group process that improves the understanding of how the team functions, while providing adaptative responses to emerging challenges.

Theoretical background

Evidence suggests that team justice climate (group-level perceptions of fairness that teammates display toward one another) promotes team reflexivity. This research, however, has typically focused on one or two justice dimensions at a time. Since justice dimensions tend to be correlated, previous findings may have misattributed the effects of justice dimensions. Moreover, research has focused on one or two climate properties, including climate level (amount of justice within the team) and climate strength (degree of agreement on the amount of justice that exists within the team). Despite its potential detrimental effects, research has disregarded the pattern of the within-team distribution of justice scores, referred to as climate uniformity. Since climate properties also tend to be correlated, previous findings may have also misattributed the effects climate level, strength, and uniformity. To contribute to the team justice-reflexivity link, this study addresses all three dimensions of team justice (distributive, procedural, and interactional) and their corresponding climate properties (level, strength, and uniformity). We examine the indirect effect of each of these variables on team entrepreneurial performance, through the mediating role of team reflexivity.

Methodology

The study was conducted in the context of a competition organized by a higher-education institution specialized on promoting nationwide innovation and entrepreneurship. The competition helped nascent entrepreneurial teams develop their business idea, while providing a structured but real scenario which includes strong incentives for the competing teams (training, feedback, funding, and other legal, administrative, and marketing resources). The final sample consisted of 219 individuals nested in 59 entrepreneurial teams, ranging from six to three members. The average age of participants was 24.26 years (SD = 3.93) and 39.3% were women. Eighty three percent of teams had a longevity of 12 months or less and none of them had initiated commercialization. Team distributive, procedural, and interactional justice and team reflexivity were collected at Time 1 using self-reported scales. Team performance was assessed at Time 2 by a panel of specialized jurors who used previously defined guidelines designed to conduct multiple-rater assessments.

Results

A SEM model showed that all team justice climate (JC) dimensions were related to team reflexivity. The effects, however, depended on the climate property. Distributive and procedural JC level were positively related to team reflexivity; this was not the case for interpersonal JC level. Interpersonal JC strength was also positively related to team reflexivity; this was not the case for distributive nor procedural JC strength. Nonuniform distributive JC was negatively related to team reflexivity; this was not the case for procedural nor interpersonal nonuniform JC. All the significant effects on team reflexivity had an indirect effect on team entrepreneurial performance.

Limitations

Self-reported scales might have inflated the correlations among peer justice and team reflexivity.

Conclusions

Previous studies have highlighted the role of procedural justice in promoting team reflexivity. Our results support this evidence but also show that other team justice dimensions are key as well. Moreover, we show that promoting team reflexivity is not just a matter of increasing the level or amount of justice. Nor is it enough to focus on the degree of agreement on the amount of justice that exists within the team. Researchers and practitioners should also consider the pattern or shape of the within-team distribution of justice scores (climate uniformity), as this climate property had a direct independent effect on team reflexivity, that indirectly reduced team entrepreneurial performance.

Relevance to the Congress Theme

Intrapreneurial and entrepreneurial teams are key to providing innovative responses to the challenges ahead. This study will help design better training strategies to promote team reflexivity within this context.

Keywords: justice climate, team reflexivity, entrepreneurial teams

Oral presentation OP672

Keep your chin up: Investigating the benefits of Augmented Reality to support measurement-related tasks

Valeria Orso, Luciano Gamberini, Patrik Pluchino & Leonardo Miglioranzi | University of Padova

science&practice

Augmented Reality (AR) allows the user to access and interact in real time with digitally-generated contents displayed onto the physical environment. These features make AR technology a valuable tool for supporting complex tasks that depend on contextual information. Indeed AR has been exploited successfully in various contexts such as tourism (e.g., Han, Jung, & Gibson, 2013) and education (e.g., Hsieh, & Lee, 2018), and increasingly it is experimented also in smart factories. There it has the potential to support the training of inexperienced workers, by showing the sequence of actions (e.g., Gattullo et al., 2019), and more generally to assist the task execution, for instance in the case of complex assembly tasks, where AR can provide readily available information and facilitate the implementation (Wang et al. 2013).

In the present work, we aimed to investigate whether using AR technology could benefit the user in the execution of a measurement task. To this end, we ran a comparative within-participant experiment, in which users were asked to employ a digital oscilloscope to measure different wave shapes, by reading information displayed either on a monitor or on an AR Head-Mounted Display (HMD). More specifically, participants had to carry out the requested task in two different conditions. In one condition, the electric circuit to be measured was placed on a desk. While in the other condition, the electric circuit was attached on the back of a large object. Aspects related to the participants' experience of use (e.g., ease of use, information readability, perceived efficiency, hedonic aspects, visual discomfort) were collected using post-task questionnaires. Moreover, the entire experimental session was video-recorded using multiple video-cameras to allow off-line computer-supported analysis of participants' performance. A total of 32 participants took part in the experiment (5 females; average age 24.5 years old SD=2.4). They all reported to have previous experience with the oscilloscope, but none of them had tried AR before. At the beginning of the experimental session, participants were shown how the system worked and were allowed some time to familiarize with it. After that, the participant was invited to carry the measurement task by referring to the monitor or to the HMD with the electric circuit placed either on the desk or behind a large object (the presentation order of both the display and the circuit location were counterbalanced). After the conclusion of each experimental phase, participants were invited to fill in the questionnaires.

Data from the video-analysis revealed that, overall, when using the HMD participants were more accurate in the execution of the task, even if they were not faster. Concerning the self-reported data and with reference to the condition in which the circuit was placed on the back of the large object, participants reported higher levels of perceived efficiency when using the HMD as compared to the monitor.

Overall, our data support the idea that AR is a valuable tool to supplement information in situ, thereby facilitating the execution of tasks. We have to acknowledge that our experiment entailed the simulation of a measurement task and that it was conducted in the laboratory, thereby limiting the generalizability of the results. Future investigation should be set up in more ecological environments and with more realistic tasks, to assess the actual benefits that this technology can bring to the users.

Oral presentation OP530

KNOWLEDGE MANAGEMENT TO CREATE, TO INNOVATE, AND TO MANAGE PEOPLE IN THE ORGANIZATION: a study of moderate mediation of Information technology

Antonella Alba Scalera, Amelia Manuti & Maria Luisa Giancaspro | Università degli studi di Bari Aldo Moro

science

Research goals and why the work was worth doing

The main aim of this research is to stimulate, according to the people-based approach, a vision of work that considers human capital and develops effective performance management models to address the new technological challenges of Industry 4.0, and to transform the limits of the pandemic into advantages with long term positive impacts. The study of positive working behavior considers the perception of workers in respect to the knowledge management practices put in place by organizations, and how this can influence innovative performance behaviors. In this regard, the specific objective of the study is to explore the empirical relationship between the perception of knowledge management and innovative work behaviors, considering this relationship mediated by the technology, as perceived by the employees: in this study we assume that this mediated relationship is moderated by low/high Thriving at work values.

Theoretical background

In the age of technological innovation, Knowledge management Practices promote innovative working behaviours that are useful in responding to the demands of Industry 4.0 (Andreeva & Kianto, 2012). In accordance with the people-based approach (Pfeffer, 2010), workers who perceive - by the organization - the enhancement of knowledge and professional growth, develop innovative work behaviors, in line with business objectives (Rudolph et al., 2021). Studies on Positive Organizational Behavior show that in the I-O relationship a work characterized by learning possibilities and vitality (Thriving at work) develops commitment and engagement, and encouraging organisations to respond to Industry 4.0 and pandemic demands (Carmeli & Spreitzer, 2009; Wallace et al., 2013). Moreover, the presence of technological infrastructure aimed at the implementation of work processes stimulates the worker to implement innovative performance behaviours and the feeling of valorisation for their human capital (Lee, Leong, Hew, & Ooi, 2013).

Design/Methodology/Approach/Intervention

The study was attended by 461 employees with different types of contracts and belonging to different organizations in the process of innovation and technological change. Data collection included the administration of a self-report questionnaire containing the following scales: Knowledge Management Orientation Scale by Wang and Ahmed (2004); Innovative work Behavior Scale (Scott & Bruce, 1994); Information Technology Scale (Hussinki, Kianto, Vanhala & Ritala, 2017); Thriving at work Scale (Porath et al., 2002). The hypotheses have been tested through a model of moderate mediation with the macro PROCESS (SPSS 26.0; Model 14) and with the use of the bootstrap for the significance of the effects (Hayes & Preacher, 2013).

Results obtained or expected

The results of the moderate mediation model show that the direct relationship between Knowledge Management Orientation and Innovative work Behaviors is not significant in the presence of Information Technology. The results demonstrate a total mediation of IT. The total mediation

relationship in this study is moderate according to the levels of Thriving at work: workers implement innovative work behaviours if they perceive the presence of technology dedicated to knowledge management, this perception increases or decreases depending on the levels of learning and vitality.

Limitations

The limits are in the use of self-report responses and the cross-sectional nature of the study on an undifferentiated sample. In addition, the study captures a moment of organizational change that occurred between 2019 and 2020, and which consequently does not recall aspects of the current post-pandemic workers' perception. The type of sampling involves limits to the generalization of results.

Conclusions – research and or practical implications/Originality/Value

Results confirmed the role played by a people-based approach to HRM underlining its implications for organizational behaviour and individual adjustment. In the process of digitalization of production systems, this study is useful in understanding the mechanisms underlying innovative performance. A strength of the study was its contribution to the investigation of the effect of Information Technology and Thriving at work on the relationship between Knowledge management orientation and Innovative work Behaviors in the italian public and private organizational context.

Relevance to the Congress Theme

In line with the theme of the Congress, the study emphasizes the importance for organizations and people to take action towards change, placing at the center of the theme people as the main actors and stakeholders of change itself.

Relevant UN SDGs

The overall objective of this study is to develop performance management models that primarily promote quality of working life and well-being. This aim is in line with some of the UN’s Sustainable Development Goals (SDGs), such as Good Health and Wellbeing.

Keywords: Knowledge Management, Innovation work Behavior, Information technology

Oral presentation OP241

Leader character moderates the effect of leadership context hostility on eudaemonic wellbeing as mediated by hedonic wellbeing

Lucas Monzani, Ivey Business School & Andriy Rozhdestvensky | Ukranian Katholic University

science

What is subjective wellbeing and why should organizational stakeholders care for the wellbeing of its leaders? Subjective wellbeing, as composed of hedonic and eudaemonic facets, is not only inherently important, but also has been linked to positive outcomes for leaders, followers, and their organizations. Following Job Demands-Resources theory, we predicted that the hostility of the context in which leadership occurs (taken as job demand) would reduce leaders' subjective wellbeing (H1a) and eventually erode their character (H1b). Conversely, we predicted that leader's strength of character (taken as a personal resource) would protect leaders eudaemonic wellbeing (H2). We argue that this effect would be partially mediated by hedonic wellbeing (taken as reverse proxy of job strain; H3). Finally, we contribute to this theory showing that leaders' character moderates the negative effect of leadership context hostility on leaders' eudaemonic wellbeing (H4).

We tested our hypotheses in two independent samples. In our first study, we sampled 60 leaders (21.7% female) operating in either hostile or extreme leadership contexts (active military theatre of operations). Our second sample consisted of 81 military leaders and 108 business leaders 17.9% female), again operating in either hostile or extreme leadership contexts. Three MANOVA and two Structural Equation Models confirmed our Hypotheses. Our results show that as the hostility of a leadership context increases, leaders' social wellbeing decreases. Further leader character increases leaders' hedonic and eudaemonic wellbeing but also protects leaders against the negative effect of a hostile leadership context on social facet of subjective wellbeing.

Study 1- Hypothesis

Hypothesis 1: As the hostility of a leadership context increases, leaders' subjective wellbeing will decrease.

Hypothesis 2: As leaders' strength of character increases, so will increase leaders' subjective wellbeing.

Hypothesis 3: Leader character will moderate the effect of leadership context hostility on leaders' subjective wellbeing. More precisely, as leaders' strength of character increases, an extreme leadership context's negative effect on leaders' subjective wellbeing will decrease.

Study 1- Methods

Our first study consisted of two samples comprised of 30 military leaders at different rank levels within the Ukrainian Military Forces and 30 business leaders of small to medium Ukrainian business firms (Sample A), and 37 military leaders and 32 business leaders (Sample B). 25.8% of our participants were female. The mean age was 38.24 (SD = 8.71), being 39.8% between 18 and 30 years old, 49.9% between 31 and 45 years old and 10.6% between 46 and 60 years old. and. Participants supervised 130.23 employees in average (SD = 257.29), with a mean tenure of 3.58 years (SD = 3.20) in their leadership positions. Nineteen participants declined to indicate their age, 454 their span of control, and 74 their tenure for confidentiality reasons.

After obtaining ethics approval, a co-author and his research assistants contacted Ukrainian leaders operating in major Ukrainian cities (Kyev, Lviv) or in the Crimean theatre of Operations (Donetsk Region) and invited them to participate in this pilot study. After providing their informed consent, each participant completed an online self-report questionnaire measuring the importance that attributed to leader character towards leader effectiveness, and one month later, participants self-reported their levels of hedonic and eudaemonic wellbeing (Sample A). 6 months later, we collected second, independent sample using the same procedure, with the difference that we also included a self-report measure of their leader character behaviors (Sample B). None of the participants of Sample A took part I the data collection of sample B. Participation in this study was anonymous and voluntary, meaning that confidentiality of responses was ensured, and no monetary compensation was provided for completing the survey.

Study 2- Hypothesis

Hypothesis 4: Leader character moderates the negative effect of leadership context hostility on leaders' eudaemonic wellbeing

Study 2 - Methods

For Study 2, we collected an additional sample of 132 leaders (Sample C) to increase the statistical power of our analyses involving leader character behaviors. Sample C consisted of 71 military leaders (0% female) operating within the Ukrainian Military and 61 Ukrainian private firms' leaders (13.7% female). At the time this paper was written, the average age of participants included in Sample C was M = 37.76 (SD = 10.21). Those participants who reported their tenure as leaders supervised 579.45 employees on average (SD = 5173.18) and had a mean tenure of 4.79 years (SD = 4.28) in their respective leadership positions. To test our hypotheses regarding leader character behaviors, we combined Samples B and C, being the final sample of this study N = 204.

Results

All our hypotheses were confirmed by our results.

Leader commitment to digitalization change: The role of employees as change agents

Charlotte Jonasson, Malene Flensborg Damholdt & Sidsel Maria Monrad Villumsen | Aarhus University; Rikke Amalie Agergaard Jensen, Southern Denmark University

science

1) Research goals This study investigates opportunities and barriers for leader commitment to changes related to digitalization in healthcare. This is important as research suggests that leaders are key actors in advancing digital transformations [1]. Yet, they face challenges of paying divided attention to both development of employees and technical aspects of change [2]. How leaders balance their commitment to different areas of digitalization change is thus essential.

2) Theoretical background Commitment to change (henceforth C2C), as a mind-set binding an individual to a necessary course of action, has been found key to successful change [3]. Despite leaders' impact on change, their own C2C has been little investigated. Yet, research suggests that leader C2C moderates employee C2C [4]. Thus, it is relevant to investigate how such leader C2C is developed or hindered in a context of digitalization.

3) Methodology A two-year qualitative study of healthcare digitalization, including participant observations, interviews (n=23), and documents, was ideal to investigate how leaders balance commitment to different areas of digital transformations. The studied digital solutions (anonymized) concerned healthcare information and logistics. Data was analyzed through first and second order coding and generation of themes [cf. 5].

4) Results The leaders developed commitment to digital solutions, which were considered appropriate means of improving healthcare. However, leaders were challenged by having to prioritize their commitment to either daily healthcare 'core tasks' or the digital solutions. As mentioned by a leader:

I think the [digital solution] makes it easier to be a patient and gives a feeling of safety and quality. But it cannot take up too much of our time. I have to make sure that my employees do not feel too disturbed by having to implement this […]. With projects like this you have to find the hours somewhere in the everyday running of the department.

Moreover, certain employees influenced the leaders' commitment. These employees actively ensured that the digital solutions would cause minimal disturbance to the daily core tasks, i.e., by collaborating with the providers to remove technical obstacles for their colleagues. They furthermore created a clear role description for needed digitalization leadership. As mentioned in a conversation:

Leader: I like it when you just say, well now I need you to attend to this obstacle and then we are good to go.

Employee: Yes, I really try to explain what is needed right now and sort out all that is less relevant. And, at the moment, it is simply that I need you to pitch the [digital solution] at the meeting so our colleagues and also [top management] understand that we think this is important for us to have.

Due to such employee change agency, the leaders could direct their commitment to aspects that were critical to facilitating digitalization.

5) Limitations First, being a qualitative study, the empirical findings cannot be generalized to similar contexts. Second, the study only concerns digital solutions that are strategically committed to by the hospital management.

6) Conclusion Employee support of balanced leader commitment to both healthcare core tasks and the digital solutions is essential for driving change. In accordance with prior research of employee C2C [6], the study concludes that role clarity and appropriateness of change are also important antecedents for leaders' C2C. The study provides new knowledge of employees' key role as change agents ensuring leader commitment. Finally, in terms of commitment foci, detrimental conflicts between areas of change and more stable core tasks need to be overcome.

7) Relevance to Congress theme The study is highly relevant for the Congress theme as the findings show how leaders' and employees' work tasks may evolve in interaction with digitalization changes.

Keywords: Leader commitment to change, digitalization, change agent

Oral presentation OP94

Leaders' daily feedback-seeking: feedback occasions and error management climate as predictors of day-level feedback-seeking behaviour

Anastasiia Lynnyk & Andrea Fischbach | German Police University

science&practice

1. Research goals and why the work was worth doing

Although leaders frequently lack essential information about their performance, they avoid active feedback-seeking to fill this gap. However, little is known about why leaders' feedback-seeking behaviour is seemingly rare. Moreover, while former research focused on feedback-seeking as a stable work behaviour, the dynamic nature of feedback-seeking has largely been neglected in earlier research. With this study, we seek to contribute to a better understanding of leaders' feedback-seeking and examine predictors of leaders' daily feedback-seeking behaviour.

2. Theoretical background

Theory on leaders' feedback-seeking behaviour has suggested leaders avoid feedback because they fear being seen as weak or incompetent or fear image losses. However, situational feedback-seeking should be less of a risk to the leader's general self-esteem because negative feedback could be attributed more easily to situational constraints than personal insufficiencies. Based on this reasoning, we identified and examined three predictors for daily feedback-seeking a) day-level occasions for feedback-seeking (H1); b) day-level time pressure as a moderator for this relationship (H2); and c) the general error management climate (H3).

3. Design/Methodology/Approach/Intervention

We collected data in a German police department. We invited 70 police leaders to complete a general online questionnaire (measuring the error management climate) and short online questionnaires on ten consecutive days after work (measuring feedback-seeking, feedback occasions, and time pressure). Leaders' daily feedback-seeking was measured with five items related to whether they asked their followers for feedback that day. Leaders who filled out the day-level questionnaire for less than three days were excluded from our study. The final sample comprised 226 daily entries from 36 leaders (M = 6.28 daily entries per leader). Because nine leaders did not complete the general questionnaire, effects of error management climate on feedback-seeking were tested on a sample of 188 daily entries from 27 leaders (M = 6.96 daily entries per leader).

4. Results obtained

As expected, leaders report feedback-seeking rather seldom (in 43% of daily entries). Multilevel structural equation modelling showed a positive association between day-level feedback occasions and leaders' feedback-seeking. As hypothesised, this relationship was moderated by day-level time pressure, with higher time pressure leading to a weaker relationship. In addition, the general error management climate positively affected leaders' daily feedback-seeking behaviour.

5. Limitations

The results are based on a small sample of police leaders. Thus, it is necessary to confirm these findings in a more diverse sample. Moreover, self-reports were used. Future studies should consider followers' perception of leaders' feedback-seeking as well as followers' reactions to it. Finally, we

used questionnaire data that may be subject to memory bias. Event sampling methods could be used in future research to reduce such biases.

6. Conclusions – research and or practical implications/Originality/Value

Our study demonstrates that leaders' feedback-seeking can be enhanced when feedback occasions together with enough time for feedback-seeking exist. Moreover, a positive error management climate further enhances leaders' daily feedback-seeking. Thus, organisations can create a positive context where leaders and their followers meet on a daily basis with enough time to talk and reflect. Such a context should also promote a positive error management climate and further encourage leaders' feedback-seeking.

7. Relevance to the Congress Theme

The "changing world of work" requires proactive workers. Since work processes – and sometimes even work goals – change rapidly, employees and leaders need to be agile and self-initiate actions to accomplish their work. Feedback-seeking behaviour is a proactive way to identify weaknesses and change the behaviour in a timely and easily accessible manner without relying on formal and outdated feedback processes. "The Future is Now", and leaders must lead the way to a work environment where proactivity is embraced, and employees are encouraged to identify and learn from past mistakes.

8. Relevant UN SDGs

Promoting "decent work" includes a work environment with information about one's performance, thus with performance feedback. Fostering leaders' proactive feedback-seeking behaviour is one way to enhance the importance of feedback as a part of "good work".

Keywords: feedback-seeking behaviour, leadership development

Leaders' performance goals and employees' counterproductive work behavior

Isabeau Van Strydonck, Ghent University; Aoife Lyons, Public Appointments Service; Aine Gray, An Garda Síochána; Mieke Audenaert, Ghent University; Frederik Anseel, UNSW Sydney; Adelien Decramer, Ghent University

science&practice

Research goals and why the work was worth doing: While an appreciable body of research focused on the intra-personal effect of people's goal strivings (Vandewalle et al., 2019), there has been a lack of research considering its inter-personal effect across leader-employee dyads (Dragoni, 2005; Tuncdogan et al., 2019). In this study, we contribute to the literature by investigating how leaders' goal striving to perform better than other leaders – also referred to as leaders' performance goals – can undermine their team members' contributions to the organization, more specifically by instigating employee counterproductive work behavior.

Theoretical background: Leaders with high performance goals hold an interpersonal standard of performance, which means they define competence relative to how well they perform in comparison with others. Building on Dragoni's (2005) argument that leaders transmit their goal strivings by engaging in behaviors and practices that support, reinforce, and imply this goal striving, we posit that leaders with high performance goals are more likely to engage in practices in which normative comparison among employees prevail. More specifically, we suggest that leaders with high performance goals are more likely to provide their employees with comparative feedback, in which employees' performance is compared relative to the performance of other employees. Subsequently, building on the Job-Demands-Resources theory (Demerouti et al., 2001), we posit that receiving comparative feedback from a leader constitutes a stressful job demand for employees, which increases their feelings of being emotionally exhausted, and which, in turn, causes them to engage in counterproductive work behavior.

Methodology : Our hypotheses were tested among 634 recruitment consultants (i.e., employees) and their 220 corresponding managers (i.e., leaders), using a three-wave survey design.

Results: Multilevel structural equation modeling indicated that leaders' performance goals were positively related to their provision of comparative feedback at Time 1 (October 2020), which was positively related to employees' emotional exhaustion at Time 2 (December 2020), which in its turn was positively related to their counterproductive work behavior measured at Time 3 (November 2021).

Limitations : This study is based on a relatively homogenous sample of recruitment consultants. While this has the benefit of controlling for potential effects of work design on employees' wellbeing and performance, it remains unclear to what extent our results can be generalized to other samples, including other industries and countries.

Conclusions - research/practical implications: This study contributes to prior research that displayed a positive relationship between leaders' performance goals and employees' emotional exhaustion (Sijbom et al., 2019), by identifying comparative feedback as an underlying mechanism that explains this effect. In addition, this study showed that employees' emotional exhaustion, induced by the comparative feedback given by leaders with high performance goals, was also associated with more counterproductive work behavior. Interestingly, this finding suggests that although leaders with high performance goals strive to outperform other leaders, they, ironically,

may find their own team of employees to work more counter-productively. Regarding the practical implications, organizations may want to identify and consider their leaders' goal strivings, and more specifically the performance goals they endorse, to understand and prevent their stressful and negative effect on employees' wellbeing, and eventually their performance.

Relevance to the Congress Theme: In this unpredictable and constantly changing world of work, preserving employees' wellbeing and performance is fundamental. Enhancing our understanding of the potential impact of the leader in this regard, is critical (De Vos et al., 2020). In this research, we thus contribute to the congress theme by exploring the role of leaders' goal strivings on employees' wellbeing and performance. The current study particularly contributes to the conference topic of 'Engagement and Motivation', as it investigates how leaders' performance goal strivings might undermine employees' own performance, as evidenced by the counterproductive work behaviors shown by employees. In exploring this relationship, we focus on performance management, and more specifically the practice of feedback giving, as an underlying mechanism that explains this relationship.

Relevant UNSD goals : we particularly contribute to the UNSD goals of 'Good health and well-being' and 'Decent work and economic growth', as we enhance our understanding of how leaders' goal strivings - and the feedback they give - impacts employees' health (i.e., emotional exhaustion) and, in its turn, employees' performance (i.e., counterproductive work behavior).

Keywords: goal strivings, feedback, counterproductive work behavior

Oral presentation OP79

Leadership and Well-being in Firefighter's Permanent Intervention Teams: Validating a Leadership Skills Development Program

Laura Carmona, Faculty of Psychology, University of Lisbon; Raquel Pinheiro, National Fire Service School; Luís Curral & Maria José Chambel | Faculty of Psychology, University of Lisbon

science&practice

Firefighters are considered to have a high-stress profession due to a daily exposure to disturbing and traumatic situations. However, despite the adversities inherent to this profession, a significant part of firefighters demonstrates high well-being, revealing a greater ability to adapt to the circumstances of their function. Previous studies had proven the importance of the leadership style, particularly the transformational style, to ensure the well-being of subordinates. Therefore, this study aims to: (i) evaluate the effectiveness of a transformational leadership development program for firefighter leaders; (ii) understand the evolution of the transformational leadership style of participants in training program; (iii) examine the consequences of this evolution in transformational leadership on the resilience of the respective team and on the well-being of its members. The study will have a quasi-experimental design with 2 groups: experimental (team leaders that participate in the program) and control (team leaders that don't participate in the program). Team leaders and respective subordinates answering an online questionnaire at 3 different times (before the program, immediately after the program and approximately 3 months after the program). The data will be collected until March of 2023. Despite the homogeneous sample as a possible limitation, this study contributes theoretically and empirically for the theory of transformational leadership. Firstly, it is important to point out the methodological and innovative contribution of a transformational leadership development program for firefighters' team leaders and its relationship with subordinates' well-being. Moreover, it extends existing literature on the above-mentioned relationship, considering its effect and possible variations on leadership and well-being after 3 months. Hence, taking these variables together, this study can bring important implications for future research and practice, especially in what concerns to the implementation and use of skills development programs in a time where emergency organizations and emergency professionals are bringing the well-being concept to the table. Accordingly, this study gives an important contribution for the thematic of the changing world of work , specifically regarding emergency context and well-being. Likewise, it contributes for the UN Sustainable Development Goals, namely decent work. and economic growth plus good health and wellbeing.

Oral presentation OP92

Leadership behaviour and employee recovery: A review and meta-analysis

Lydia Bendixen & Tabea Scheel | Europa-Universität Flensburg

science

Leader behaviour is known to affect employees' recovery process; regular recovery, in turn, is important to sustain well-being and reduce strain. However, a systematic review and meta-analysis that examines the effect sizes are missing. Further, most research on this topic has not considered the type of leadership behaviour (constructive vs. destructive). For example, if there are enough resources in form of supervisor support available, in the end, it also helps to recover. On the contrary, when the supervisor's behaviour is inconsiderate, this can be perceived as threatening and hinders the person's recovery. Both, constructive and destructive leader behaviours, affect two different aspects of the appraisal within the transactional stress theory by Lazarus and Folkman (1984). Thus, we postulate that constructive leadership relates positively, and destructive leadership behaviour relates negatively, to employees' recovery. We conducted a search of leadership and recovery studies according to the PRISMA guidelines, which yielded 42 papers that were systematically reviewed. 23 papers with 12,860 observations were included in the meta-analysis. The meta-analysis supported the expected positive relationship between constructive leader behaviour and employees' recovery experience (r = .18, p <.001, 95 % CI [.13;.22]). Destructive leader behaviour relates negatively to recovery experiences (r = -.16, p <.001, 95 % CI [-.29;-.02]). The subgroup analysis revealed, that supervisor justice (constructive type) has the strongest relation with employees' psychological detachment (r = .23, p <.001, 95 % CI [.18;.29]), with no indication of publication bias. Moderator analysis of employees' age and countries with high recovery-friendly regulations ergo more vacation days, were overall not significant. However, the employees' age is an attenuating moderator of the relationship between supervisor support and psychological detachment. Limitations of the paper are that the research so far relies on self-report data and is mostly cross-sectional, so no causal conclusions can be shown by the summarized data. In the future, research dyads of employees and supervisors should be assessed in a diary study design for a better understanding of the causal relations and processes between leadership behaviour and employee recovery processes. The number of studies for the moderating analyses was limited and therefore also the strengths of the results.

This review and meta-analysis is the first holistic approach to examine the associations between leadership behaviour and employee recovery. As hypothesized, the research indicated a positive correlation between constructive leadership behaviour and recovery experiences as well as a negative correlation between destructive leadership behaviour and recovery experiences. The meta-analysis further revealed subgroups of constructive leadership such as supervisor justice and support associated with psychological detachment as well as relaxation. Overall, these results suggest that leadership behaviour may enhance (constructive behaviour) or threaten (destructive behaviour) employee recovery and plays an important role in employees' recovery process as a proxy indicator for well-being and performance. The topic of leadership behaviour and employee recovery should be further examined and be part of management training courses. Also, leaders should be aware of their role model function for employee recovery.

The changing world of work with technological acceleration and processes of digitalization, flexibilization, blurring boundaries, and the recent COVID-19 pandemic may lead to changing work characteristics such as increasing work intensification. When such work-related demands are high and resources in the form, for instance, of supervisor support, are low, employee recovery may be

threatened and in the long run, lead to decreased well-being. Therefore, in addition to optimizing work and job design, leadership behaviour plays an ever more important role in employees' recovery in a changing world of work.

The focus and results of the meta-analysis are in line with the goal of the UN SDGs to sustain good health and well-being. Companies can act socially sustainable by promoting, among others, a recovery-friendly leader behaviour in form of supportive and fair behaviour towards their employees. Moreover, they can prevent counter-recovery behaviour such as abusive supervision or passive leadership. Thus, with the help of constructive leadership behaviour, employees can recover and sustain well-being and health in the long run.

Oral presentation OP748

Leadership emergence in politics: The role of personality and intelligence.

Jo Silvester, Loughborough University; Christina Dykes, Buckingham University; Madeleine Wyatt, Kings College London

science&practice

RESEARCH GOALS

Two of the most important functions of a political party are to identify and select candidates capable of running excellent campaigns, winning votes, and ultimately delivering strong democratic government (Coller et al 2018). Yet little is known about psychological attributes that contribute to leadership emergence in politics – nor the role played by political parties in identifying future political talent. The aims of this research are to draw on theory and practice from work psychology to investigate (i) whether applicant personality and cognitive ability impact likelihood of being approved as eligible to become a candidate by a political party, and (ii) subsequent performance in a national election. Our research addresses an important gap in extant research, namely leadership emergence via elections (e.g., political roles, partnerships) as opposed to appointment by elites.

THEORETICAL BACKGROUND

The process of applicant approval allows a political party to control the 'pipeline' of potential candidates for elected office (Steele, Lee & Baron, 2021) and thus the quality and diversity of those who make onto the list of candidates (Rahat & Hazan 2001). This is important because while political parties may respect the democratic right of local party members to choose their own candidate, elections mean members of the public have the freedom to vote for whomever they prefer, based on whatever criteria they choose – relevant or not for performance as a candidate or in office. By introducing a standardized and evidence-based process of evaluation and approval a political party can identify a central pool of eligible, motivated and potentially trained applicants from which local party members can choose their candidate. However, key to success is understanding which psychological attributes contribute to performance both in elections and office.

Our research draws on evidence from studies of leadership emergence in business (Judge, Colbert & Iles, 2004; Schmidt & Hunter, 2000), to investigate hypothesized relationships between personality traits (FFM: Costa & McCrae 2006), cognitive ability, and leadership emergence in politics. We examine whether personality and cognitive ability contribute to applicant approval decisions and, controlling for seat effects, subsequent performance of political candidates in a general election. We predicted that extroversion, conscientiousness, and cognitive ability would be positively, and neuroticism negatively, associated with approval decisions and, controlling for seat effects, candidate electoral performance. We also use Latent Profile Analysis (LPA) to examine whether applicants with different trait profiles were selected to fight as candidates in target and non-target seats.

We examine the implications of these findings for understanding the contribution of candidate characteristics to strong democratic government, and to a broader understanding of leadership emergence in work contexts where leaders are elected rather than appointed.

RESEARCH DESIGN AND METHODOLOGY

Our research utilised self-report personality data from 416 applicants participating in a multi-method multi-trait (MMMT) assessment centre, designed to evaluate applicant eligibility for approval, and 123 of these applicants who were later selected as parliamentary candidates and

fought in the subsequent general election. We control for seat effects using economic data. Assessors and members of local associations were not provided with personality information about candidates.

RESULTS

Our research found that the traits conscientiousness and cognitive ability were positively and significantly associated with applicant approval, controlling for seat effects conscientiousness also approached significance in predicting electoral performance. Using LPA, we identified three candidate types differentiating between candidates selected for lower and higher target seats. No significant gender differences were found for candidate approval or election performance.

CONCLUSIONS

To our knowledge ours is the first longitudinal study of psychological attributes associated with leadership emergence and performance in elections. Our findings are similar to that of extant trait research which finds conscientiousness and cognitive ability important for leadership emergence in business settings.

INTENDED AUDIENCE

Scientists and practitioners.

RELEVANCE TO CONGRESS THEME

How politicians achieve office affects all citizens. While voters participate in the more public process of listening to candidate manifestos, and casting their votes, much less is known about the processes that lead up to becoming a political candidate which can play an important part in deciding what choices the electorate have.

RELEVANCE TO UN SDGs

Peace, justice, and strong institutions : understanding and enabling psychological characteristics that contribute to good political leadership can help to ensure strong and ethical government institutions.

Keywords: Leadership, personality, election

Oral presentation OP666

Leadership profiles relationships with error culture and errors at work: A Latent Profile analysis approach and a mediation analysis

Ilaria Olivo, Maria Luisa Farnese & Ivan Marzocchi | Sapienza University of Rome

science

Research goals and why the work was worth doing

Errors are ubiquitous within organizations. Since they have been mainly investigated at the individual-level of analysis, a recent line of research has recommended a more comprehensive approach which also consider organization-level processes, such as organizational culture (i.e., error culture), as determinants of errors. Leaders are acknowledged as the most influential actors for organizational culture and are fundamental in organizational life, determining collective efficacy and also in preventing and managing the errors. However, few studies have empirically investigated the association between leadership, error culture and work errors, and no one has used a person-centered approach. Thus, our study aims are: to identify different profiles of leadership styles through a latent profile analysis (LPA); b) to assess the association between leadership profiles and error management culture (EMC), error aversion culture (EAC) and its two facets (strain due to errors – STR; covering up errors – COV), and errors at work; and c) to investigate the influence of leadership profiles on errors at work through error culture. Our study answers recent research calls for a more nuanced examination of within-individual leadership styles. Indeed, we apply LPA to categorize employees who hold a similar set of leadership perceptions into qualitatively distinct profiles. Second, we contribute to the leadership literature by further exploring its potential correlates (i.e., error culture and errors at work). Third, we extend the existing literature on organizational culture by focusing on both positive (EMC) and negative (EAC) facets of error culture.

Theoretical background

We use the Social Information Processing theory (Salancik & Pfeffer, 1978) and the full-range leadership theory (Avolio, 1999) as our theoretical frameworks. Social information processing theory suggests that leader behaviors are crucial social information cue which can shape employees' perceptions about the work environment, and in turn, affects individuals' attitudes and behaviors. Thus, leaders act as role models who can encourage team members' engagement by framing mistakes as learning opportunities rather than something to be hidden or punished. The full-range leadership theory describes five leadership categories: transformational leadership, contingent reward, management by exception active, management by exception passive, and laissez-faire/avoidant. To better capture different nuances of leadership styles, in our investigation we also include the abusive leadership behaviors described by Tepper (2000).

Design

We reached 388 Italian workers (48.7% females). The Multifactor Leadership Questionnaire (MLQ) Short Form – 5X and the Tepper's abusive leadership scale were administered to investigate employees' perceptions of different supervisors' behaviors. Error culture was investigated using the scale developed by Van Dyck et al. (2005). LPA was used to identify leadership profiles. Through an ANOVA, we assessed the distinctiveness of the leadership profiles in their levels of error aversion, error management and work errors. Finally, through a mediation model we investigated the role of error culture as mediator of the influence of leadership profiles on work errors.

Results

We identified four leadership profiles: positive (POS), corrective-abusive (CAB), passive (PAS) and passive-abusive (PAB) leadership. ANOVA showed significant differences between the leadership profiles in error management, error aversion (STR and COV) and work errors. Using the POS profile as our reference group, we found that CAB, PAS and PAB were negatively associated with ECM and positively associated with STR and COV. In turn, COV was positively associated with work errors. Moreover, CAB, PAS and PAB influenced work errors through COV.

Limitations

The sample was composed of Italian workers and the results should be generalized with caution. Moreover, the constructs were measured with self-report scales. Finally, the study is cross-sectional.

Conclusions and relevance to the congress theme

Errors are inevitable in work contexts. Our study demonstrates that organizations need to enhance their error-handling process by promoting error management culture (i.e., through promptly identifying errors and learning from them) and avoiding error aversion culture. As leaders are fundamental in influencing error culture, proper training courses should be provided to enhance leadership and, for example, to avoid abusive or passive behaviors against their subordinates. Since different leadership styles can co-occur, rather than designing leadership training around individual styles, a more integrated approach would be beneficial.

Relevant UN SDGs

Decent work and economic growth

Keywords: leadership, error management culture, error aversion culture

Oral presentation OP351

Leadership Style and Safety Culture in Commuter Railroad Companies

Patrick Sherry, University of Denver; Karen Philbrick, San Jose State University

science&practice

Introduction

The relationship between organizational culture and organizational performance has been thought to explain why one company succeeds where another fails within an industry. Furthermore, Frazier (2018) suggested that organizational leaders might improve safety performance by utilizing transformational leadership practices. Additionally, Casey (2017) reported on several studies that linked safety climate to occupational safety performance and concluded that, “safety climate is firmly established as an organizational antecedent of safety performance.” (Casey, 2017)

The US Department of Transportation Federal Railroad Administration (FRA) also determined that safety culture plays a key role in accident prevention. (FRA, August 2011). In addition, Canada's Transportation Safety Board (TSB) identified a number of factors that likely contributed to the catastrophic Lac-Mégantic derailment that resulted in a significant loss of life noting that, the company that owned the railroad, „was a company with a weak safety culture that did not have a functioning safety management system to manage risks."

Schein (1992) postulated that an organizations culture is its pattern of shared assumptions, values, norms and rules of behavior. He also wrote that leadership is the source of those beliefs and values. A leader’s and values gradually come to be the shared assumptions, beliefs and values of an organization. Consequently, leaders and their leadership styles are essential to the formation, maintenance, and ultimately changing an organizational culture.

Reason (1998) argued that the safety culture develops in response to local circumstances, events, conditions, the character of the leadership and the mood of the workforce. According to Reason, the safety culture affects all aspects of an organization and influences the occurrence of accidents and injuries. In fact, only a positive safety culture is able to prevent the conditions and circumstances that lead to lapse, near misses and accidents.

Sherry & Colarossi (2016) developed the Safety Culture Scale to measure safety culture normed on a sample of employees from a large public transportation agency (N=1909). Validity of the measure was shown in that the scale significantly differentiated ($p<.05$) between persons who had been involved in accidents and safety violations. A follow-up study with a large regional transportation company demonstrated significant differences in safety culture and attitudes between key departments in the organization.

This report summarizes demonstrated the empirical linkages between leadership practices, safety culture factors in an organization with an effective safety culture.

Methodology

Two mid-sized rail transportation companies in the United States agreed to complete the Safety Culture Survey (SCS) and items adapted from the Management Style Inventory (Hay Group, 1980) measuring Autocratic, Authoritative, Affiliative, Democratic, Pacesetting or Coaching leadership style using a five-point Likert style format. Useable data from a total of 103 participants was obtained.

Results

Ten factors of the SCS were significantly correlated with perceptions of the effectiveness and overall quality of the organizational safety culture. In addition, significant correlations between leadership styles and indicators of safety performance were also obtained. For example, a measure of Authoritative style, "regularly monitors compliance with safety rules/procedures", was found to be significantly correlated with an effective safety culture ($r=.70$, $p<.001$). Similar results, of lesser magnitude, were found between Participative and Coaching styles. In addition, odds ratios were calculated that demonstrated that the utilization of an authoritative leadership style was more than nine time more likely to result in a perceived positive safety culture ($p<.001$). However, the absence of these styles and inconsistent monitoring was negatively correlated with effective safety performance.

Discussion

Results provide support for the hypothesis that leadership behaviors demonstrated by supervisory personnel are significantly related to perceptions of safety culture and safety performance. The understanding of the relationships between supervisory behaviors and practices and the development of safety culture that leads to effective performance was enhanced by this study. An authoritative style that emphasizes desired practices and behaviors is most clearly related to a positive safety culture and fewer reported accidents and injuries. However, inconsistent monitoring and lack of training was found to be negatively related to effective safety culture. The implications of these results and recommendations for the development of effective and positive safety culture are presented.

Leadership training and development: the role of organizational structure and accountability systems

Anne Bellingtoft & Margit Malmmose | Aarhus University

science&practice

Research goals, why the work is worth doing and theoretical background

In the light of the changing world of work, leadership training and development remains an essential strategic priority for organizations. Although it is estimated that organizations spend an increasing and sizeable amount of money on different leadership programs, these investments are highly debated.

Beer et al (2016), for example, suggest that organizations are "victims of the great training robbery" (p. 51), as people often revert to or continue their usual ways of doing things. However, there are also studies providing substantial evidence that leadership training and development programs are effective. For example, based on a meta-analysis of 335 leadership training studies, Lacerenza et al. (2017) find, that leadership training programs can lead to increase in learning, the learning can be transferred and result in positive outcomes.

However, while the growing literature within leadership training and development has engaged immensely in how to design, deliver, and implement a leadership training program to ensure and maximize effectiveness, there is still a gap in knowledge on enabling versus hindering elements involved in ensuring actual transfer of learning and positive outcomes of leadership training and development programs.

By integrating a management control system perspective, we get hints towards the forces of organizational structure as well as accountability systems and contracts in place (Malmi & Brown, 2008; Merchant & Van der Stede, 2016; Otley, 1994). For example, Otley (1994) highlights that "The context and operation of contemporary organizations requires flexibility, adaptation and continuous learning to occur, but such characteristics are not encouraged by traditional control systems" (p. 298).

Therefore, in this study we take departure in a management control system perspective which encompass such vital elements, representing important context conditions that potentially can hinder or support actual transfer of learning and the continued use of learning in an organization. From this backdrop we investigate leadership training programs and their outcomes to identify potential supportive and/or limiting factors, which could assist organizations and leadership program educators towards more successful programs by overcoming or being aware of such factors.

Design/Methodology/Approach/Intervention

During the spring 2023, we will be conducting 36 interviews with leaders and employees participating in a field experiment based on a so-called VDOC project which stands for Value-adding Development of Organizational Collaboration. During the project period, 2019 – 2023, units from three different public organizations (Police, job centers and assisted living facilities) are randomly selected to receive a development course in one of three different treatments, relying respectively on visionary leadership, distributed leadership or employee motivation.

The 36 interviews will thus be conducted after the leaders and employees' participation in the treatments, more specifically in the period where the participants transfer and implement their knowledge from the course in their own unit. Our focus in the interviews is on understanding the role of the management control system in place, and how this might hinder or support the process. In our understanding of the role of the management control system in place, we will lean on the conceptual framework of Malmi and Brown (2008), which gives varied insights into the implications of cultural, planning, cybernetic and administrative controls that makes up the organization.

Keywords: Leadership training and development, transfer, organizational structure and accountability systems

Leading the sustainable careers of blue-collar workers: a comparative case study in the Dutch road-transport sector

Wouter van Zwol, Radboud University; Beatrice van der Heijden, Radboud University; Ellen Rusman, Open University of The Netherlands; Jeroen de Jong, Radboud University

science&practice

Purpose

Today, manual labor is subject to change as a result of technological revolutions. This makes the employability of blue-collar workers critically important. Employability concerns the ability of the individual to adequately carry out work in current and future jobs, within and outside of the current organization. Automation, robotization, and artificial intelligence foster economic growth and welfare, but have far-reaching consequences for manual workers' future and way of working. Moreover, blue-collar workers may face disproportionally more issues concerning safety, and well-being in the workplace compared to other occupations such as white-collar jobs. In sum, the inherent manual and physically-intensive aspects of blue-collar work pose a threat to workers' sustainable careers (SC).

Theoretical background

Leadership is considered one of the most important factors in driving SCs. For instance, previous research has shown that certain leadership styles can result in increased employee learning, employee well-being, and sustainable employability. Therefore, leadership may be particularly important for blue-collar workers to foster their SC. However, we know little about how leadership can impact SCs among blue-collar workers. Given the underrepresentation of blue-collar contexts in leadership research on the one hand and the importance of leadership in fostering SCs among blue-collar workers, on the other hand, this study will contribute to the knowledge of SCs by focusing on the role of leadership as a crucial factor. It will do so by making use of the conceptual model of SCs, the competence-based employability framework, and the integrative model of leadership behavior (IMoLB).

Methods

To explore the processes and conditions by which SCs can be fostered by leadership behavior, and how context affects the way blue-collar workers are being led, this research has adopted a multiple comparative case study design. Semi-structured interviews with truck drivers, their operational supervisors, directors, senior management, and mentor drivers have been conducted in 6 road-transport organizations in The Netherlands. The organizations vary in size and geographical location. In total, 35 truck drivers and 6 operational supervisors have been interviewed. The interview protocol that has been used, was developed by using the three dimensions of the SC model: happy, healthy, and productive. Furthermore, a set of questions have been developed by using the competence-based employability model.

Preliminary results

First and foremost, respondents are unable to detect the discriminant validity of the SC indicators. According to them, the indicators share great overlap and contribute to each other as well: a happy and healthy driver is also productive. Moreover, they take ownership of their happiness, health, and productivity. Only with regard to material support (i.e. the right tools to carry out the job), they

generally put the responsibility on their supervisor. The professional development of truck drivers is highly limited. Their professional development is mainly geared toward achieving mandatory certificates. Little emphasis is put on upward mobility or adaptability. Secondly, leadership behaviors are often found to be distributed among several individuals within road-transport organizations. Operational planners, managing operational planners, and directors often display task-oriented leadership behaviors. It appears that in most cases, the mentor truck drivers display the most relation-oriented leadership behaviors. Mentor truck drivers are tenured drivers that are able to show the less tenured drivers the way of working. These findings seem to be in line with the phenomenon of dispersed leadership. Organizations that have employed mentor drivers appear to show more consideration for the individual worker compared to organizations that do not. These relation-oriented leadership practices appear to have a positive effect on drivers' happiness, healthiness, and productivity.

Preliminary conclusions

Multiple individuals within road-transport organizations display leadership behavior that affects truck drivers' SC. However, there is not much attention to one's career in the long run, and what current and potential future developments would mean for truck drivers' careers. Moreover, drivers find it generally difficult to reflect on their careers. Potentially due to the fact that they rarely reflect with their supervisor on their career or work.

Preliminary limitations

Selection bias may limit the validity and reliability of the results. Participating organizations were found through a sector institute of road transport that is responsible for workers' sustainable employability. Organizations that participated were often already taking action to improve workers' health, happiness, and productivity. Hence, road-transport leaders' harmful leadership behavior is unlikely to be covered in this research.

Oral presentation OP219

Learning and developing capability of change – enhancing (work-related) well-being

Kati Tikkamäki, Pauliina Tiuraniemi & Anne Mäkikangas | Tampere University

science&practice

Aims and research goals

The impact of the coronavirus crisis has been particularly strong on the operating conditions and future prospects of the hospitability sector. The goal of the ESF-project "Capable – becoming resilient in the hotel and restaurant business" is to strengthen the capability of change of professionals in small and micro businesses in the hospitality sector by improving capability of change, general and work-related well-being, resilience as well as continuous learning skills.

The research goals were a) to examine the participants perceptions of the concept of capability of change and b) the association between resilience and learning.

Theoretical background

The ability to learn and renew are seen at the core of change capability. The concept is often examined as a change management (Burke, 2018) or change leadership (Stouten et al. 2018) where the focus is on organizational- and leadership-led change processes. However, here the capability of change is examined from the point of view of individuals, teams and companies (work-related) well-being. Learning with others and taking the advantage of social support are seen as an important part of capability of change and resilience.

The concept of resilience is closely related to the capability of change. Resilience is seen as a capability of a system, organization or person to maintain its core purpose and integrity in face of dramatically changed circumstances (Zolli, 2012). Recovering from stress (Smith, Dalen, Wiggins, Tooley, Christopher, & Bernard, 2008), handling and bouncing back from challenges (Alliger, Cerasoli, Tannenbaum, & Vessey, 2015) and rebounding from unexpected, stressful and adverse situations (e.g., Kobasa et al.,1982; Sutcliffe & Vogus, 2003) are seen core resilience indicators on individual, team and organizational levels.

Methodology

The development project is based on the participatory action research where the participants play an active role in development. Research methods are utilized also as development tools.

The mixed method data used in this project, contains both quantitative and qualitative methods, such as questionnaire-based data (N=78) and thematic individual, pair and group interviews (N=15) . The baseline questionnaire used in here was collected before the interventions.

Results

Interviews showed that the perceptions of capability of change were subjective. Features related to change capability were: 1) consciousness of the reality, 2) proactivity, 3) flexible thinking patterns, 4) willingness to learn and develop, 5) social interaction, 6) creativity, 7) criticality and evaluation, 8) positivity and 9) hopefulness.

Based on the survey data, the participants estimated their resilience as a good level (M = 3.70, scale 1-5), likewise their learning at work (M = 3.52, scale 1-5). They experienced to cope with challenging situations quickly (M = 3.91), recover from stressful situations fast (M = 3.40) and get to pounce back

fast when encountering problems (M = 3.79). They wanted to continuously learn new things at their work (M = 3.93) and from the other professionals (M = 3.94). They also developed their ways of working regularly (M = 3.36). Participants' resilience and willingness to learn were already at the good level at the beginning of the project. Based on the correlation analysis, learning correlated significantly with resilience (r =.32, p < .01).

Limitations

The relatively small number of the respondents and the focus on one profession only are seen as the main limitations of the research.

Conclusions and implications

The "Capable" -project improves the capability of change of hospitality sector businesses and their personnel now and in the future by enhancing capability of change, resilience, continuous learning and work-related well-being. The quantitative analysis resulted significant correlation between resilience and learning. The capability of change was seen as a skill and an ability that can be learned and developed. Based on the data presented here, the emphasis in capability of change is on individual level. However, what is the role of social dimension in capability of change? Capability of change is an interesting and useful concept at nowadays working life. More research and deeper definition of the concept is needed.

Relevance to the Congress Theme

The challenges at the hospitability sector are huge due to covid pandemic and the consequences of war in Ukraine. The aim is, that as a result of the project, businesses, their employees, and supervisors have an improved ability and skills to stay functional in an ever-changing environment. This is enhanced by improving capability of change, resilience, skills of continuous learning and utilizing social support.

Relevant UN SDGs

We suggest that capability of change and learning and resilience should be considered as fundamental factors in developing work-related wellbeing and a socially sustainable working life.

Oral presentation OP228

Learning to share while sharing learning: How perceived shared mental models and team learning interrelate

Catarina Santos, Jandre van Rensburg & Simon de Jong | Maastricht University School of Business and Economics

science

Research goal: Drawing on Social Cognitive Theory, this study aims to analyse the reciprocal relationships of perceived shared mental models (SMMs) and team learning. This work advances existing knowledge as we investigate how these variables influence one another, drawing on a temporal, integrative approach.

Theoretical background: In today's dynamic world, SMMs and team learning are paramount, yet we need to understand how these factors specifically influence one another in order to best exploit their relevance in improving team functioning. Perceived SMMs refer to a team members' awareness of shared understanding about key elements of their work environment. Team learning refers to the social-cognitive process underlying the development of shared conceptions and knowledge in teams. Prior studies only investigated the relationships between these constructs unidirectionally. We expect that team learning behaviours influence perceived SMMs through team members' interaction, behaviour, and observation of one another, and are influenced by SMMs through the perception and communication of a common, shared understanding about the team's function and processes. Failure to understand or capture how such reciprocal, temporal relationships between perceived SMMs and team learning manifest could mean that teams miss out on opportunities to better develop and improve their functioning over time.

Research design and methodology: We conducted a three-wave longitudinal study in a Master level course at a Dutch university with 96 project teams (340 students) over seven weeks. Teams worked on an assignment for this period. Participation was voluntary and we obtained data for 66 teams to date (n T1 =290, n T2 =254, n T3 =228 individuals). Respondents predominantly hailed from Germany (31.4%), the Netherlands (30.9%), and Belgium (11.5%); 68.4% were female; the average age was 23.7 years (SD= 1.98); and teams comprised 3.54 members on average (SD= .55).

We used validated scales to measure team learning and perceived SMMs at all three points. We conducted preliminary analyses using Process macro model 4 for SPSS to test four mediation models[1].

Preliminary results: The results indicated that (Model A) the indirect effect of perceived SMMs at T1 on T3 through T2 was significant (b= .33; 95%CI [.04, .69]), (Model B) the indirect effect of team learning at T1 on T3 through T2 was significant (b= .26 ;95%CI [.02, .60]), (Model C) the indirect effect of perceived SMMs at T1 on perceived SMMs at T3 through team learning at T2 was insignificant (b= .18; 95%CI [-.05, .46]), and (Model D) the indirect of team learning at T1 on team learning at T3 through perceived SMMs at T2 was significant (b= .24; 95%CI [.02, .54]).

Limitations: The main limitation to the study is that student teams are short-lived and work on a task for a limited amount of time. This may have implications for generalising the findings to other settings, yet student teams are often used and offer a more stable and controlled setting.

Conclusion: Preliminary results shed light on the reciprocal relationship between perceived SMMs and team learning. We find support for our argument that team learning and perceptions of SMMs

have a reciprocal effect over time. Our findings bridge unidirectional previous findings and provide insights into the timing at which either learning or perceived SMMs may offer teams benefits in their growth and development. We demonstrate that these relationships are more complex than previously thought and that they offer different avenues for coming to a shared understanding in our teams.

Relevance to the theme and UN SDGs: Teams are used in many organizations and their functioning is vital to organisational success. Due to changing and dynamic environments, teams increasingly need to be able to learn and adjust in order to perform. Perceived SMMs and learning provide mechanisms to support this, hence their relevance to the congress theme “The future is now: the changing world of work”. With regards to the UN SDG’s this study is, for instance, relevant to goal 8 (Decent work and economic growth), as it aims to improve mutual understanding and learning, which are helpful for reducing knowledge gaps and for improving knowledge transfer within teams.

[1] We will conduct longitudinal analysis on the final dataset and share the updated results during the EAWOP 2023 Congress.

Oral presentation OP395

Leave Me Alone, I Was About To Get Into My Zone! The Impact Of Others' Presence And Social Interruptions On Work-Related Flow

Jonas De Kerf, KU Leuven; Sara De Gieter, Vrije Universiteit Brussel; Rein De Cooman, KU Leuven

science&practice

Research goals and theoretical background: Organizations have been striving to maximize workers' potential, in terms of overall functioning and performance, as this is crucial for their survival and success in the long-term (Csikszentmihalyi, 2004). To enhance their effectiveness and wellbeing, workers are often provided with more autonomy and flexibility to choose where and how to work (Demerouti et al., 2014). One of the largest contributions towards such positive psychology was made with the introduction of the concept of 'flow', which refers to an enjoyable state of mind that occurs when people feel fully engaged and absorbed in their activities (Csikszentmihalyi, 1975). Because flow is considered as a short-term, complex and dynamic experience, it remains unclear what workers can do, or where they can work, to create a situation that allows such deep involvement (Peifer & Wolters, 2021).

Because attention is at the core of flow (Harris et al., 2017), this study aims to comprehend how situational characteristics that affect workers' cognitive functioning impact work-related flow at the momentary level. We argue that both the nature of people's work and their work environments strongly impact flow experiences. Flow occurs when people work on challenging tasks that stretch their current abilities, because deep absorption is then required to perform well (Csikszentmihalyi, 1990). This study, therefore, investigates how the type of task someone is working on at a given moment – based on knowledge work characteristics – is related to flow at that moment, and what potentially influences this relationship. Distraction Conflict Theory (Baron, 1986) states that social disruptions are detrimental for workers' functioning when they perform tasks that require deep concentration. Because social stimuli are often indicated as the most common form of workplace distractions (e.g., Kim & De Dear, 2013), this article investigates how both the presence of others and social interruptions impact workers' flow on knowledge tasks.

Design/methodology: We conducted an experience-sampling study that uses a semi-random signal schedule to understand how task and environmental predictors jointly impact workers' state of flow. More precisely, 82 knowledge workers completed up to four surveys a day for two consecutive work weeks to report their flow experiences, knowledge characteristics of the task at hand and whether they work alone and without interruptions or not. In total, about 1600 surveys were filled in.

Results: Our analyses indicate that the state of flow is strongly related to the knowledge demands of workers' tasks. However, the presence of others has a different impact than hypothesized. Surprisingly, conducting knowledge work leads to higher levels of flow while working in the presence of others, whilst controlling for social interruptions. Also contrary to our expectations, the extent of interruptions negatively influences workers' flow levels, regardless of the knowledge demands of their tasks.

Limitations: We relied on self-reported measures to capture flow, interruptions and task characteristics. The ESM methodology allows to limit recall bias as much as possible, although we cannot rule out the possibility of common method bias. Moreover, the nature of tasks in our sample was rather social, with people working as instructors, supervisors, consultants, etc., which could limit the generalizability of our results towards knowledge workers.

Conclusions and practical implications: This study expands the current knowledge on work-related flow by looking at task and environmental characteristics that enable workers to obtain such a peak state. While doing so, our findings suggest that not only the nature of the work that is carried out is important, but also in what kind of environment workers perform their tasks. Our results suggest that workers could benefit from performing challenging tasks that enable the full use of their skills and abilities. Because working in an environment without interruptions facilitates flow, practitioners should stimulate a work culture in which people work in the presence of one another, while limiting the amount of interruptions.

Relevance to the Congress Theme: The current shift in working locations and expansion in remote and digital work raises uncertainty about where to perform which kind of tasks. Moreover, the rise of technology-related communication, the use of open-plan offices and increased overall workload has limited workers' opportunities to feel productive in their work without disruptions. This often results in stress, frustration and negative emotions while working (Demerouti et al., 2014). Our results suggest that workers should seize the opportunity to choose their work environments so that deep concentration is possible, to thrive and deal with the challenging demands of their work.

Keywords: Knowledge work, Work-related flow, Social stimuli

Oral presentation OP127

Less or More? The Curvilinear Linkage between Workplace Interruptions and Task Performance – The Moderating Role of Mindfulness

Ghulam Murtaza, Kedge Business Schoolsender; Rahman Khan, NEOMA Business School; Qurat-ul-ain Talpur, ESSCA Business School

science&practice

The prime objective of this study was to explore how different work interruptions can influence employee's performance. Specifically, the current study explores the non-linear role of interruptions by looking both bright and dark sides. In the current work environments when people working in hybrid mode it becomes more necessary to see how interruptions originating from multiple sources can hurt work related task performance.

Researchers have argued that workplace interruptions are common in the current organizational settings as work is becoming more dynamic and complex (Grant & Parker, 2009; O'Leary, Mortensen, Woolley, 2011; Parke et al., 2018). Therefore, the prevalence of such phenomena can be costly to individuals and organizations (Cai, Gong, Lu, Zhong, 2018). Consider, for example, Spira and Feintuch (2005) stated that the direct costs of unnecessary interruptions had been estimated at an average of 28% of the daily time for workers in the United States. On contrary to this, emerging empirical evidence suggests that interruptions such as information gain may positively affect employees' performance (Baethge et al., 2015). For instance, a co-worker can indicate an error or facilitate work progress by giving valuable suggestions. Consequently, an employee may be able to deal with issues more effectively, and thus performance may increase, even if the interruption has disturbed the workflow (Baethge et al., 2015). Specifically, this study tests the interactive model of workplace interruptions such as intrusions, distractions, discrepancy detections, and breaks with task performance. Based on the too-much-of-good-thing (TMGT: Pierce & Aguinis, 2013) perspective, we suggest the curvilinear role of workplace interruptions in predicting task performance. In addition, based on the conversation of resources theory (Hobfoll, 1989), we explore how mindfulness as a valuable resource can moderate these nonlinear relationships.

A multi-source time-lagged study was conducted at two time points (T1 and T2) with an interval of two months. Online available questionnaires were completed by employees and their concerned supervisors working in different industries across Pakistan. At the second time point (T2), questionnaires were distributed and collected back from only those employees who had already participated at time 1. In addition to that, at time 2 respective supervisors also completed the questionnaires. Specifically, at time 1, the questionnaire included workplace interruptions, age, gender, and industry items. While at time 2, the employee questionnaire included scale items related to mindfulness, and the supervisor questionnaire comprised items related to employee's task performance. The final sample included N=323 with completed surveys from employees and supervisors.

Multi-sourced survey data from 323 supervisor-subordinates working in manufacturing, retail, and service industries showed significant inverted U-shaped relationships of intrusions and breaks with employee task performance. But we found linear negative impact of distractions, discrepancy detections on task performance. Furthermore, findings confirmed that curvilinear relationships of intrusions and breaks are significantly moderated by employee's mindfulness. We confirmed that workplace interruptions might not be necessarily bad, but the level of occurrence coupled with an individual's psychological resource, i.e., mindfulness, predicts employees' task performance.

First, due to the short time lag (two months) between time 1 and time 2 data collection, this does not allow us to rule out reverse causality completely; future researchers might be reexamining this model using a longitudinal design. Second, our findings may be generalizable only within the context of Pakistan. Due to differences in the work environment, nature, and complexity of interruptions, the optimal inflection level might differ in some other cultural contexts.

Our findings also provide organizations with practical insights regarding employees' task performance. Based on our study results, we suggest that workplace interruptions may be harmful and helpful; however, it depends on the frequency, duration, and complexity of interruptions during work. To establish effective strategies to reduce workplace interruptions, managers need to understand the effect of interruptions on outcomes. It would be helpful to know who or what the sources of interruptions were, such as frequency, duration (Meijman & Mulder 1998), and when interruptions occurred (Raban, & Westbrook, 2018). Once managers clearly understand what causes the interruptions, they can develop policies to control them.

The current research relates with congress theme by exploring differential role of workplace interruptions. We can expect different forms of interruptions in current work environment so study results remain beneficial for managers.

Keywords: Workplace Interruptions, Task Performance, Mindfulness

Oral presentation OP698

Let it go – the relevance of psychological detachment in entrepreneurs' recovery

Luise Penseler, Technische Universität Dresden; Ute Stephan, King's College London; Dominika Wach, Technische Universität Dresden

science

Research goals and relevance The extreme nature of entrepreneurial work can lead to high levels of stress. Particularly in times of crises and economic uncertainty, entrepreneurial well-being is at stake. Therefore, insights into how entrepreneurs can safeguard their well-being are particularly important in the current times. One avenue to cope with stress is recovery. Recovery-enhancing processes such as psychological detachment from work during none-work time, physical exercise, and sleep have the potential to protect well-being (Sonnentag 2018). Our mixed-methods study contributes to the growing field of research on entrepreneurial recovery and well-being (Stephan, 2018, Stephan et al., 2022). It addresses the recent call for more attention to recovery as a potentially promising solution to entrepreneurial ill-being (Williamson et al., 2021). First, this study offers new insights into the types of recovery experiences and activities that entrepreneurs themselves deem useful. Second, it examines psychological detachment as a particularly important recovery experience (Bennett et al., 2018; Sonnentag, Fritz, 2007, 2015) and its impact on perceived stress and well-being. Theoretical background Our study draws upon the Effort-Recovery Model (Meijmann, Mulder, 1998) and Stressor- Detachment Model (Sonnentag & Fritz, 2015). Following Williamson et al. (2021) we consider recovery experiences as crucial to maintain entrepreneurial wellbeing. Based on prior research in the field of entrepreneurship (e.g. Wach et al., 2021) we focus on psychological detachment from work as particularly relevant experience to enhance entrepreneurs' well-being.

Design/Method We collected data via online survey from April to June 2022. Our participants (N =103) were German entrepreneurs, 31,2% male, 67% female and 1,8% diverse at an average age of 46 years. Two open-ended questions asked entrepreneurs about their preferred recovery experiences and activities. The answers were analyzed qualitatively using thematic content analysis (Mayring, 2015) and the MAXQDA software. Besides socio-demographic and firm data, we collected data on psychological detach from work, entrepreneurs' perceived stress and life satisfaction using established scales.

Results The results of the qualitative data analysis (Mayring, 2015) show that entrepreneurs desirable (most frequently mentioned) recovery activities were physical activity, social contacts, breaks during work, as well as mindfulness and relaxation. Further, we found psychological detachment was poisitvely associated with wellbeing and negatively with perceived stress. Regarding psychological detachment, no mediation could be identified, i.e., the negative relationship between perceived stress and well-being was not weakened by recovery. In contrast, a moderator analysis showed that psychological detachment attenuated the relationship between perceived stress and well-being, i.e., entrepreneurs who experienced high levels of stress and high psychological detachment reported higher levels of happiness.

Limitations Our sample was relatively small and homogeneous, which limits the generalizability of our findings. Psychological detachment was assessed as a neutral emotional construct by using the REQ scale (Sonnentag & Fritz, 2007). Future research should consider more specific measurement of the valence of work-related thoughts such affective rumination and include other recovery experiences such as relaxation, mastery, and control. Particularly the latter was identified as

important by entrepreneurs in the current study. In a similar vein, including more specific work-related stressors (Stephan, 2018) might provide valuable insight.

Research/Practical Implications This study identified the preferred recovery strategies of entrepreneurs. Moreover, it identified psychological detachment from work as a particularly important to maintain a high degree of well-being, especially when perceived stress is high. Detachment during and after work can have a positive impact on well-being (Headrick et al., 2022; Wendsche & Lohmann-Haislah, 2017) but so far the majority of studies has studied detachment in employee samples (Karabinski et al., 2021). Our qualitative results on desired recovery activities offers important pointers for the design of future interventions. Relevance to the Congress Theme The theme of the congress indicates that the world of work is facing particular challenges. This is especially true for entrepreneurship, as entrepreneurs were strongly affected by the COVID-19 pandemic (Stephan et al. 2022) and they are now also confronted with the economic problems and the related international crises. Insights into promoting and sustaining entrepreneurial well-being are therefore particularly essential for building a resilient economy.

Relevant UN SDGs Good health and wellbeing (SDG3)Decent work (SDG8)

Keywords: entrepreneurship, recovery, well-being

Oral presentation OP229

Let' s stay in touch: Frequency (but not mode) of interaction between leaders and followers predicts better leadership-outcomes

Daniel Wroblewski, Kai Sassenberg, Lotte Pummerer, Lara Ditrich & Annika Scholl | Leibniz-Institut für Wissensmedien

science

Successful leadership requires leaders to make their followers aware of expectations regarding the goals to achieve, norms to follow, and task responsibilities to take over. This awareness is often achieved through leader-follower communication. In times of economic globalization and digitalization, however, leader-follower communication has become both more digitalized (virtual, rather than face-to-face) and less frequent, making successful leader-follower-communication more challenging. This may pose a challenge for leaders to practice effective leadership, in terms of making followers aware of the goals and norms to follow, and the responsibilities to assume. For this reason, we investigated how the above mentioned aspects (frequency and digitalization of interaction) relate to task-related leadership outcomes (i.e., followers' goal clarity, norm clarity, and task responsibility). Specifically, we expected frequency of interaction to predict more goal clarity, norm clarity, and task responsibility. For digitalization of interaction, however, we expected negative relations to all three outcomes.

The current research tested these assumptions in four studies (three preregistered). First, we conducted a cross-sectional study via direct approach (Study 1, N =200). Here, we regressed the task-related leadership outcomes goal clarity, norm clarity, and task responsibility on frequency and digitalization of interaction and found that frequency of interaction predicted more goal clarity and norm clarity, but not task responsibility. Digitalization of interaction, however, predicted neither of the three outcomes. Subsequently, we aimed to replicate these results in one longitudinal study (Study 2, N =305, time-lag of 6 months, Prolific). Results showed that, again, frequency of interaction predicted more goal clarity and norm clarity, but here also more task responsibility. In contrast, as in Study 1, digitalization of interaction predicted neither of the outcomes. To gain a clearer picture on the causal direction of the relations found, we afterwards conducted a quasi-experimental study (Study 3, N =178, Prolific), inducing different levels of recalled frequency of interaction (high vs. low) between leader and follower. In line with our hypotheses, the high frequency group reported more goal clarity, norm clarity, and task responsibility than the low frequency group. Furthermore, results of mediation analyses suggested that the relations between frequency and the outcomes are mediated by more work-related information sharing between leader and follower. Finally, another quasi-experimental study (Study 4, N =261, Clickworker) further targeted this mechanism by inducing different levels of recalled work-related information sharing (high vs. low); results showed that higher levels of work-related information sharing between leaders and followers were related to more goal clarity, norm clarity, and task responsibility.

Our studies have some limitations. Despite the fact that we approached our research question via several methodological approaches, thereby gaining solid evidence for our assumptions, we can not make definitive statements regarding causality. Even though we tried to attack this issue with our quasi-experimental studies, these studies are not entirely experimental and therefore cannot reveal causal relations. Moreover, all studies relied on self-report and on one data source (i.e., followers). Extending these via leaders' perspective or objective measures would be desirable in the future. Furthermore. contrary to Hypothesis 5, we found no relations between digitalization and the leadership outcomes that go beyond those of frequency (except for goal clarity in Study 3)—which,

overall, supports the idea that the effects of leader-follower interaction on task-related leadership outcomes depend on the frequency rather than the mode of interaction.

In summary, these results improve our understanding of contextual factors contributing to leadership success in collaborations across hierarchies. They highlight that it is not the digitalization but rather the frequency of interacting with their leader that predicts whether followers gain clarity about the relevant goals and norms to follow and the task responsibilities to assume. On a theoretical level, these findings enhance our our knowledge about how exactly the frequency of interaction may shape subsequent outcomes - a question that was not directly addressed in prior work. On a practical level, our findings suggest that leaders may still practice effective leadership despite a potentially greater distance between them and their followers if they manage to stay in touch with each other.

The findings are also directly related to the congress theme "The Future is Now: the changing world of work", since it tackles the gradual shift from more "traditional" work settings to newer work models (e.g., home-office, virtual teams, flexible work models).

Keywords: Frequency of interaction, digitalization, e-leadership

Oral presentation OP243

Let's talk our walk: How psychological safety and conversational patterns predict team performance

Christine Gockel, SRH Berlin University of Applied Sciences; Thomas Bachmann & Katherina Quispe Bravo | artop - Associated Institute of the Humboldt University Berlin

science&practice

Research goals and why the work was worth doing

Leadership is important for the creation of psychological safety in teams. However, new forms of teamwork evolve and raise the question of how psychological safety emerges when leadership is decentralized, and group dynamic processes come to the fore. To shed light on relevant within-group processes, this study examines the relationship between team psychological safety, group conversational patterns, and team performance in self-organized teams.

Theoretical background

In today's global work environment, collaboration in self-organized teams is becoming increasingly essential, and psychological safety is gaining attention as a key factor for team performance. Psychological safety is a shared belief amongst individuals as to whether it is safe to engage in interpersonal risk-taking in the workplace (Edmondson & Lei, 2014). Behaviorally, employees who feel psychologically safe engage more in interpersonally risky behaviors, such as communicating openly, coming up with questions and recommendations, voicing concerns and objections, seeking critical feedback, and engaging more in experimentation (Pearsall & Ellis, 2011; Nembhardt & Edmondson, 2012). This effect of psychological safety perceptions on individual communicative behavior implies that a team climate of psychological safety similarly effects communicative behavior and patterns within a team. Therefore, this study links team psychological safety to conversational distribution as well as conversational exchange. Equal conversational distribution refers to the degree to which conversational turn-takings are equally distributed among team members. For collaborative problem-solving, team members need to share their unique knowledge and skills and jointly organize these inputs (Larson, 2013; Macmillan et al. 2004). Extant research has demonstrated the importance of a high level and relative equality of conversational contribution for collective intelligence (Engel et al., 2014; Woolley et al., 2010). Hence, we argue that teams with high levels of psychological safety perform better because all team members participate in task-related discussions and therefore, conversational turn-takings are relatively evenly distributed. Thus, psychological safety should lead to higher performance through a higher and more even conversational.

Design/Methodology/Approach/Intervention

In our study, we assessed a total of 51 existing work teams (with 3 to 9 members) in online or face-to-face settings. Teams completed the desert survival task (Lafferty & Pond, 1974). Before the team task, we measured baseline psychological safety (with the Team Psychological Safety scale by Edmondson, 1999) and predicted team performance, which refers to how team members subjectively predict their general team performance. During the team task, we coded the number of conversational turns of each team member and computed conversational distribution, which refers to the standard deviation of individual contributions within a team. After the team task, objective team performance was assessed by comparing the team solution to an expert solution. All data were analyzed on the group level.

Results obtained

We are currently in the process of analyzing the data. First descriptive results show that psychological safety does indeed highly correlate with predicted team performance, but not with objectively measured team performance. Contrary to expectations, there is a negative relationship between a team's total amount of conversational contributions and objective team performance, indicating that teams with fewer contributions performed better in the desert survival task compared to teams with more contributions.

Limitations

The relatively small sample size of this study (51 teams) is its first limitation. We collected data from a convenience sample only including self-organized teams. Therefore, future studies with a larger sample size should be undertaken. The second limitation is the research's generalizability. Because of the characteristics of self-organized teams, not having a formal leader, it can be assumed that communication patterns differ from other teams. Therefore, the study's results may not be generalizable to other forms of teamwork.

Conclusions

The results of this study will be important for high-performance and innovation-driven organizations, which have implemented agile collaboration structures, self-organized teams, and other project teams with little to no formal hierarchies. Our results will give them an applicable framework for conversational behavior within the team for decision-making and problem-solving processes.

Relevance to the Congress Theme

This study investigates the relationship between conversational patterns and the performance of teams. Our research contributes to the overall Congress Theme because it points to future research in team communication and performance.

Keywords: team psychological safety, team performance, team communication

Oral presentation OP180

Linking Selective Incivility Theory to Turnover

Maria Kraimer, Scott Seibert, Jerry Liu & Lawrence Houston III | Rutgers University

science

Theoretical background : Cortina's (2008) selective incivility theory argues that employees with marginalized identities are more likely to be targets of incivility at work, a subtle and covert form of workplace discrimination. This is because some people may consciously endorse values of egalitarianism and identify as nonprejudiced, but nevertheless harbor stereotypes toward marginalized groups. Such individuals feel free to express their negative emotions in the form of uncivil interpersonal behavior because the motives for such behavior are ambiguous and cannot be clearly attributed to the actor's prejudice. Yet, uncivil behavior has serious consequences for the targets, such as their ability to access information, instrumental resources, and career opportunities, and, thus my serve as a form of "modern discrimination." At the same time, Cortina recognized there may be situational factors that mitigate the experience of incivility for marginalized group members. Although the empirical evidence tends to be consistent in support of selective incivility theory with respect to gender, such that women report experiencing more incivility than men (e.g., McCord et al.., 2018), the findings with respect to race are mixed (e.g., Cortina et al., 2013), and we are not aware of any research examining lesbian, gay, or bisexual (LGB) or disability identities. In addition, research has not yet examined situational factors that may mitigate incivility experiences, nor has incivility been linked to voluntary turnover.

Research goals and why the work was worth doing: The research goals of this study are to test and extend selective incivility theory by examining whether: (a) employees from marginalized social identities (e.g., women, racial minorities, disabled, and LGB) experience more incivility at work than do their majority counterparts; (b) social integration in one's work unit can mitigate the experience of incivility for marginalized identity groups; and (c) experienced incivility predicts turnover.

With respect to goal (b), we hypothesize that social integration moderates the relationship between the demographic identities and experienced incivility, such that marginalized identities will experience more incivility when they have low levels of social integration in the work group . Social integration is the degree to which one feels approval from and included in their workgroup (Kammeyer-Mueller &Wanberg, 2003). Social integration is important because it satisfies a fundamental need to belong, is a source of social support, and provides access to important instrumental resources. Consistent with Cortina's (2008) theorizing, we expect social integration to circumvent the pernicious effects of social categorization for employees from marginalized groups.

With respect to goal (c), we propose that experienced incivility will positively relate to turnover through turnover intentions. Experiencing incivility over time may lead to accumulated job dissatisfaction (e.g., Yao et al., 2021), which prompts thoughts of quitting and eventual turnover (Lee & Mitchell, 1994). Incivility acts are unlikely to be a "shock" that prompts immediate turnover, but rather, repeated exposure to incivility may slowly lead one to begin the job search process eventually resulting in turnover once an alternative job is secured.

Methodology: We collected two waves of survey data from 149 administrative staff at a North American university, with turnover data collected from organizational records 14 months after the conclusion of wave 2.

Results: Mean score differences indicated that women and disabled experienced more incivility than men and non-disabled, respectively, but there were not mean differences in incivility between minority (Blacks, Asians, & Hispanics) and majority (White) racial groups or between heterosexual and LGB employees. Further, path analysis indicated social integration moderated the relationship between the demographic identity and experienced incivility for gender, disability status, and race. Finally, there was a significant indirect effect of incivility on turnover through turnover intentions.

Conclusions and Limitations: Our findings extend selective incivility theory by identifying social integration as way to buffer marginalized groups from incivility and linking incivility to turnover. Limitations of the study include the small sample size that may not generalize to other settings.

Relevance to Congress Theme and UN SDGs : The findings of this study contribute to helping organizations retain employees from marginalized demographic groups and leverage the benefits of a diverse workforce. It is related to the conference theme of the “future is now: the changing world of work” in that the workforce is now demographically diverse in most countries. Further, our study helps to identify ways to “reduce inequalities” across various demographic groups through the reduction of incivility experienced at work.

Keywords: incivility, turnover, diversity

Oral presentation OP649

Lone working in rail: from theory to practice

Joana Faustino, Rail Safety and Standards Board (RSSB); Rachel Lewis, Affinity Health at Work and Birkbeck; Faye Bacon, Rail Safety and Standards Board (RSSB)

science&practice

Research goals

The first phase of this research aimed to create a definition of lone working in the rail industry, understand safety, health and wellbeing risks associated with lone working in rail and develop evidence-based guidance for addressing risks. The second phase aims to understand barriers and facilitators to the implementation of evidence-based guidance.

Background

Prior to this research, little was known about safety, health and wellbeing risks associated with lone working in rail. A rapid evidence review of literature identified only 16 academic papers and 6 practitioner papers covering lone working risks, with only one focusing on lone working in the rail industry.

Methodology

The first phase of this research used an evidence-based practice model approach, which included:

An industry mapping workshop to gather insights into lone working. A rapid evidence review, to explore lone working literature, gaps in knowledge and research opportunities. Interviews with 22 lone workers and 16 managers in the rail industry, to understand views and experiences of lone working.

The second phase, started 10 months later, focuses on implementation and uses participatory action research methods, which include:

An industry survey to measure usage of lone working guidance. Interviews with industry stakeholders to understand experiences in using guidance. Review of lone working policies and practices in the rail industry.

Results

This research established a rail industry definition of a lone worker as ‘someone who works physically alone for a number of hours, with low levels of contact with other colleagues'. Using this definition, it is estimated that 47% to 79% of rail workers may be classified as lone workers, making it vital for the industry to adequately understand and manage risks associated with lone working.

Many lone workers appear to have chosen their roles due to a perceived sense of autonomy and a preference for working alone. At the same time, lone workers may experience negative outcomes such as isolation, fatigue, stress and exposure to safety risks (such as work-related violence). These appear to be associated with pressures of lone decision making and lack of social interaction and support.

Organisational empathy, proactive support and a review of management requirements appear to be key strategies for adequate lone working risk management.

An industry survey (n=36) suggests that a large proportion of rail organisations may not be familiar with the guidance developed in the first phase of the research, with only a small fraction (17%) having read it. Lessons learnt both from work developed with stakeholders in the first phase and practical implementation challenges and opportunities are currently being gathered. Outcomes for both ongoing activities are expected to be available in early spring 2023.

Limitations

This research focuses specifically on lone working in the rail industry and does not include considerations on home working, making it not generalisable to other contexts. Findings may however be relevant for other industries due to the nature and variety of roles in rail.

The number of respondents to the survey conducted in the second phase of the research was low. Ongoing implementation work is also currently limited to a small number of companies.

Conclusions

This is the first research to focus on the health, safety and wellbeing impact of lone working in rail and to develop an agreed definition for lone working in rail, together with guidance that translates evidence into practical recommendations. Three good practice guidance documents were developed to tailor recommendations to employers, managers and lone workers themselves. These include a decision tree to identify lone workers, tips on how to improve the provision of support and tools to help develop plans for their organisation.

Work currently being developed is expected to provide valuable insights regarding the practical application of evidence-based guidance.

Relevance to Congress Theme

The last couple of years have had a tremendous impact in the way people work. During the COVID-19 pandemic, many roles may have become lone working roles. With the current financial climate, it is likely that more roles will be carried out by lone workers. This research can support better integration between research and practice by exploring how research on organisational psychology can be communicated, understood and valued in contexts where other disciplines are historically prioritised (engineering in rail, for example).

Relevant UN SDGs

Good health and wellbeing is supported by understanding the risks faced by lone workers and the development of evidence-based guidance to adequately control those.

This research is also relevant to the provision of decent work and economic growth . Worker health and performance walk hand in hand. Adequately supported workers are more likely to be able to contribute effectively to their organisations' and wider economy.

Keywords: lone working, health and wellbeing, safety

Oral presentation OP720

Loneliness and the Covid 19 lockdown: Do working from home matter?

Knut Inge Fostervold & Anne Marie Halberg | Department of Psychology, University of Oslo; Odd Viggo Nilsen, Viken County Council

science

Introduction

The outbreak of the Covid 19 pandemic generated large changes in the working conditions. Isolation was used to combat the spread of the virus and employees were ordered to work from home if possible. Many workers have learned to appreciate the increased autonomy entailed by working from home (Wang et al., 2021) and are reluctant towards returning to the organizational office (Liu et al., 2020). However, working from home does not only have positive consequences. Increased feeling of loneliness is among the unfavourable effects most often mentioned (Wax et al., 2022). Feeling of loneliness is considered detrimental and has been connected to reduced health and well-being as well as reduced productivity (Lim et al., 2020).

Research on hybrid work (i.e., the blend of working from home and from the company office) is still in its infancy, and the relation between the number of days individuals work from home and feeling of loneliness is poorly understood. To enhance our understanding, the aim of the present study was to investigate how the number of days working from home influence loneliness. Furthermore, the aim was to investigate if this relationship was mediated by work demands and/or moderated by perceived social support.

Methods

The study was conducted as a part of a large electronic work environment survey directed towards the administration of a large county in Norway. The sample consisted of 6500 participants (60.1 % females). Informed written consent was obtained from all participants and the participants were informed of the purpose of the study and their right to terminate participation without reason. Loneliness was assessed by three items from Hughes et al. (2004). Work demands (quantitative job demands and learning demands) were assessed by two sub-scales (three items each) from the QPS-Nordic (Pahkin et al., 2007). Social support was assessed by four items adapted from the Leiden Quality of Work Questionnaire (van der Doef & Maes, 1999). Statistical analyses were conducted in IBM SPSS Statistics v. 27. Mediation and moderation analyses were conducted using the PROCESS macro v.3.5 (Hayes, 2018).

Results and discussion

A parallel mediation model was drawn with days working from home as predictor variable, learning demands and quantitative job demands as mediators and feelings of loneliness and isolation as outcome. The total model explained 29% of the variance in loneliness. The number of days working from home ($\beta = .18$) was associated with increased feeling of loneliness. Learning demands ($\beta = .17$) and quantitative job demands ($\beta = -.07$) were both associated with reduced feeling of loneliness. Thus, apart from corroborating the notion of a relationship between the number of days working from home and feeling of loneliness, the results indicate that having adequate and challenging work tasks reduce the feeling of loneliness.

In the second analyses, social support was introduced as a potential moderator. The analysis showed a significant main effect of social support on feelings of loneliness ($b = -.055$, SE $b = .075$, $p < .001$) as

well as a significant interaction effect (b=.016, SE b =.006, p =.005). The result indicates that although individuals experiencing low social support generally suffer from more feeling of loneliness when working from home, individuals experiencing high social support seem to have a somewhat steeper increase in the feeling of loneliness with increasing number of days working from home.

Oral presentation OP646

Machiavellian Leaders and Subordinate Affective Organizational Commitment: The Role of Political Skill

Christina Nill & Gerhard Blickle | University of Bonn

science&practice

Research goals and why the work was worth doing: While leader Machiavellianism has been linked to reduced subordinate job satisfaction and emotional exhaustion, it has – to our knowledge – not yet been investigated as a predictor of affective organizational commitment. Building on previous research, which has identified political skill as a potential moderator of successful Machiavellianism, we focused on the moderating role of leader political skill. It has been pointed out, however, that the Machiavellian scales used in previous studies fail to adequately assess the construct. To address this issue, we examined Machiavellianism with the recently devised Five Factor Machiavellianism Inventory (FFMI), which has been shown to more closely grasp the construct than other measures.

Theoretical background: Affective organizational commitment refers to employee's emotional attachment and engagement regarding their organization (Allen & Meyer, 1996). It is closely related to job involvement and turnover, physical and mental health (Eisenberger et al., 2010), as well as employee performance in general (Gao-Urhahn, 2016). We propose that leader Machiavellianism, a personality trait characterized by emotional detachment and linked to abusive supervision (Wisse & Sleebos, 2016), will be negatively related to subordinate affective organizational commitment. As prior research has shown that social skills, specifically political skills, can not only mask trait Machiavellianism (Blickle et al., 2020) but can also allow Machiavellians to be effective leaders (Genau et al, 2022), we expect that political skills will moderate the relationship between leader Machiavellianism and subordinate affective organizational commitment. When leader political skills are low (high), leader Machiavellianism will be negatively (positively) related to affective organizational commitment. Previous research has argued, that traditional Machiavellianism scales fail to sufficiently capture the construct and can instead be considered alternative measurements of psychopathy (Miller et al., 2017). We respond to this criticism by assessing Machiavellianism with the Five Factor Machiavellianism Inventory (FFMI; Collison et al., 2018), which has been specifically devised to combat those issues.

Design/Methodology: In our multi-source study, i.e. N = 276 leader-subordinate dyads, leaders completed the German translation of the Five Factor Machiavellianism Inventory (FFMI; Kückelhaus et al., 2020) and rated their political skills with the Political Skill Inventory (PSI; Ferris et al., 2005), while their subordinates provided self-assessments regarding their affective organizational commitment. A moderated regression analysis was used for hypothesis testing.

Results obtained: Leader political skill moderated the relationship between leader Machiavellianism and employee affective organizational commitment: when political skill was low, leader Machiavellianism was negatively related to affective organizational commitment. Contrary to our expectations, when political skill was high, leader Machiavellianism did not positively predict affective organizational commitment. Instead, in the case of high political skill, we found no significant relationship.

Limitations: Due to the cross-sectional design, causal or longitudinal inferences cannot be made.

Conclusions – research and or practical implications/Originality/Value: While leader Machiavellianism is negatively related to subordinate affective organizational commitment, this

relationship can be counterbalanced by leader political skill. We contribute to existing literature by identifying circumstances under which Machiavellian leaders may not be detrimental to organizations. We respond to criticism of traditional Machiavellianism measurements by examining Machiavellianism with the recently devised Five Factor Machiavellianism Inventory.

Relevance to the Congress Theme: Due to its relation to employee wellbeing and job performance, affective organizational commitment has great significance to both employees and organizations. In order to create healthy and conductive workplaces, it is important to understand predictors of affective organizational commitment, particularly how potentially harmful variables can be mitigated.

Relevant UN SDGs: Decent work and economic growth

Keywords: Machiavellian Leadership, Affective Organizational Commitment, Political Skill

Oral presentation OP269

Managers and staff' coping styles in the context of the 2022-war in Ukraine

Liudmyla Karamushka, Kira Tereshchenko & Oksana Kredentser | G.S. Kostiuk Institute of Psychology of the National Academy of Educational Sciences of Ukraine

science

Research goal and why the work was worth doing

The 2022 Russia-Ukraine war has increased work-related uncertainty and risks, thus aggravating job stress experienced by managers and staff. To date, there has been limited research into how managers and staff cope with job stress in the conditions of war.

The aim of the present study was to investigate the features of coping styles used by managers and staff during the 2022-war in Ukraine.

Theoretical background. The research drew on the nature, content and classifications of coping styles (Endler and Parker, 1990, 1994; Frydenberg and Lewis, 2000; Lazarus and Folkman, 1984; Rodina, 2011; Willi and Heim, 1986) and on the role of coping styles in managing organizational stress (Hayness and Love, 2004; Modranský et al., 2020; Salinas and Webb, 2018), as well as on manifestations of and coping with war-related stress (Vivian, 2015; Miller and Rasmussen, 2010).

Design. The study was conducted in May 2022. The sample was made up of 344 respondents from the Central Ukraine, including 80.8% females and 19.2% males aged M = 39.1, SD = 15.8. 7.0% of the respondents had high-school or vocational education, 84.3% had university degrees, 8.7% had scientific degrees. 25.0% of the respondents were managers and 75.0% were employees.

The Coping Inventory for Stressful Situations (Endler and Parker, 1990, 1994) was used to identify coping styles, such as Task coping (active and productive), Emotion coping (passive and unproductive), Avoidance coping (passive and unproductive), Distraction coping (passive and semi-productive), and Social Diversion coping (active and semi-productive). The data related to the respondents' organizational and professional characteristics were collected using a questionnaire specially developed by the authors. The data were collected through Google form. The data were processed using descriptive statistics and 1-Way ANOVA.

Results. On the whole, managers' and staff's coping styles were at mid-level: Task coping (M = 3.74, SD = 0.54), Emotion coping (M = 2.93, SD = 0.71), Avoidance coping (M = 3.24, SD = 0.54), Distraction coping (M = 2.98, SD = 0.61), Social Diversion coping (M = 3.44, SD = 0.79), with Task coping and Social Diversion coping having the highest scores, and Emotion coping having the lowest scores.

Organization's staff had statistically significant education-relevant differences in Task coping ($F = 4.016$, $df = 3$, $p = 0.008$), Emotion coping ($F = 8.042$, $df = 3$, $p = 0.000$), Avoidance coping ($F = 5.528$, $df = 3$, $p = 0.001$), and Distraction coping ($F = 9.219$, $df = 3$, $p = 0.000$). As the level of education increased, Task coping increased, too, while Emotion-coping, Avoidance coping, and Distraction coping decreased.

Staff also had statistically significant position-relevant (managers, rank-and-file employees) differences in Task coping ($F = 15.315$, $df = 1$, $p = 0.000$) and Emotion coping ($F = 2.740$, $df = 1$, $p = 0.05$): managers used mainly Task coping, while employees used Emotion coping.

Limitations. Since the sample consisted of the residents of the Central Ukraine, which is more socially stable compared to other regions, the sample cannot be considered a representative of the entire population of Ukraine.

Conclusions/Originality/Value. 1) The employed who were in managerial positions had higher scores on Task coping, while the rank-and-file employees had higher scores on Emotion coping; 2) as the level of education increased, the use of Distraction coping decreased, although, it was sometimes used by highly-educated staff to relieve psychological tension; 3) respondent groups had no statistically significant differences in Social Diversion coping.

The underuse of active and productive coping styles by some staff groups suggests a need for psycho-educational webinars as well as on-line and off-line psychological support groups and individual psychological counselling. This can be done by psychological services in organizations and territorial communities.

The conducted study is the first one on coping styles used by managers and staff during the 2022-war in Ukraine.

Relevance to the Congress Theme. The study falls under the 'Coping and social support' subtopic of the Congress 'Well-being' topic (item 18).

Relevant UN SDGs. The obtained findings can be helpful in promoting staff's mental health and psychological well-being in organizations, which meets the UN Sustainable Development Goal 'Good health and wellbeing'.

Keywords: coping strategies, staff, war conditions

Oral presentation OP724

Managers' and HR's views on mobile phone behaviors in social situations at work – an ongoing qualitative study

Sara Thomée, PhD, Department of Psychology, University of Gothenburg, Sweden; Karin Allard, PhD, Department of Sociology and Work Science, University of Gothenburg, Sweden; Therése Javér, MSc, Department of Psychology, University of Gothenburg, Sweden

science

Aim

As part of the research project " Phubbing at work – mobile phone behavior in social contexts at the workplace and associations with the psychosocial work environment" , the present study focuses on habits of mobile phone use in social situations at work from managers' and HR's perspectives.

The aim is to explore 1) if mobile phone use behaviors in social situations at work are regulated with mobile phone policies in work organizations, 2) managers' and HRs' view on whether mobile phone use behaviors in social situations like coffee breaks and meetings in the organization are understood as a problem.

Why the work is worth doing

The situation when a person chooses to look on the phone instead of paying attention to the others who are physically there, is called "phubbing", from "phone" and "snubbing" (Haigh, 2015). As the mobile phone use has increased, work organizations may have implemented a mobile phone policy which include restrictions for employees regarding posting photos, not visiting inappropriate web pages, not to use the phone in front of customers etc. If phubbing occurs at work, it may have implications for the organizational climate and the psychosocial work environment. However, there is a lack of research on managerial and HR perspectives on employee phubbing behavior.

Theoretical background

In the Swedish working life context, the manager is responsible for employees' work environment. HR, is often understood a support function which supports managers in their work with the organization's psychosocial work environment. This research is inspired by safety climate perspectives where our point of departure is that interventions regarding norms in an organization needs to be handled on a group- and organizational level. Accordingly, we view phubbing behaviors at work as social behaviors that are governed by norms.

Methodology

This interview study is currently ongoing. Participants are recruited through snowball sampling with approximately 25 managers and HR in health care and technical trade in Sweden. Interviews are analyzed with thematic analysis (Braun & Clarke, 2006) in ATLAS.ti.

Preliminary results

This is an ongoing study and final results can be presented at the conference. This far, five tentative themes have been identified: 1) mobile phone policy; 2) normalization of mobile phone use at work; 3) mobile phone use among different groups of employees; 4) phubbing as a matter of misconduct; 5) phubbing as a psychosocial risk factor.

The preliminary results suggest that mobile phone policies do not include social situations at work, with the exception for meetings. Managers and HR indicate that the use of mobile phones at work is normalized, especially among younger employees.

Even though some HR-personnel have received signals that phubbing has negatively affected the psychosocial climate, neither managers nor HR express that employees' phubbing behavior is a large problem. When complaints regarding mobil phone behavior reach HR, it seems to be mainly seen as an individual's behavior of misconduct, rather than a work environmental issue. However, some HR personnel have encouraged managers to set rules in their own group of subordinates, to manage the norms of mobile phone use in social situations, and some of the managers have questioned employees' phubbing behavior or put up limits for the mobile use in meetings and at breaks.

Limitations

This explorative study has been performed in a restricted number of workplace settings. We do not take for granted to encompass all organizational settings. The choice of informants, recruited through snowball sampling, may reduce the transferability of our results.

Conclusions

Preliminary results indicate that mobile phone use in social situations is not yet an identified organizational problem. Coworker phubbing does not seem to be discussed among managers or HR. When mobile phone use is understood as a problem at the workplace, the managers/HR seem to address it as a matter of misconduct – that is on the individual level. Since mobile phone use in social situations is becoming more normalized, phubbing behaviors may be a new psychosocial risk factor at work. If this is the case, it implicates that HR and managers need to be sensitive to signals that indicate mobile phone behavior as a work environment risk factor.

Relevance to the congress theme

The normalization of mobile phone use at work is ongoing. If phubbing behaviors has consequences on the individual-, work group and organizational level in practice, we need to implement measures on the right level.

Keywords: smart phones, organizational climate, managers

Oral presentation OP353

Managing the Future Workplace: An Analysis of the Experiences and Intentions of London-Based, Public and Private Senior Managers Following the Covid-19

Amanda Jones, King's College London

science&practice

Goals: This paper has two aims. The first is to develop an understanding of how employers in London experienced the Covid-19 pandemic and how this has affected their intentions towards managing employees' locations and methods of work in future. The second is to use this understanding to deliver insight into, and innovative recommendations towards, managing the future workplace.

Background: The Covid-19 pandemic precipitated an identifiable shift in the amount of remote working and the characteristics of remote workers (CIPD, 2020). While the pandemic served as a disruptive event triggering sudden change, diverse organisational practices continue to unfold (Kossek & Keliher, 2022). The manifestation of these practises can be seen as materialising through a process of collective sensemaking and ongoing negotiation (Langley & Tsoukas, 2010,p.4). As such, this study draws on the processual model of organisational change, which presents change as a 'messy' and continuous process, fashioned by aspects of an organisation's context, including its history, culture, and internal politics (Pettigrew, 1985). The intention is to use this perspective to understand and explain how the pandemic has been experienced in diverse organisational contexts. Moreover, it aims to uncover why and how certain conditions and experiences have shaped managers' intentions towards future workplace strategies, providing insights into potential ways of planning, organising, and overseeing employees going forward.

Methodology. Following the findings of a related survey of 2000 London workers, this research utilised thematic analysis to analyse data from 12, in-depth, semi-structured interviews with senior managers from 12 large London-based organisations. Respondents included representatives from organisations in the legal, infrastructure, retail, banking, tech, media and telecommunications industries, and from five London-based local authorities.

Results. Organisations across sectors and from within diverse industries accept, and generally embrace, a shift towards hybrid working. Most favour a 'light touch' approach, with responsibility for employees' working patterns delegated to line management, to enhance flexibility and inclusivity for employees. Distinct benefits to organisations, such as recruitment and retention enhancements, of catering to specific employee groups were also recognised. However, alongside acceptance of hybrid working, challenges of inequality and uncertainly were reported, and most organisations still value employee' presence. Initiatives including inducements, 'office days', and working space alterations were directed towards fostering collaboration and increasing employees' attendance. However, such interventions, in the face of wider normative shifts towards hybrid working, and challenging economic conditions, may ultimately deter employees' office attendance if careful policy-directed consideration is not employed.

Limitations. The research drew on a small sample of 12 respondents. However, purposive sampling was employed to carefully capture perspectives from a diverse range of industries and management responsibility which, alongside analysis of our preceding large-scale survey of London workers, enhanced triangulation of the findings. It should also be noted that the findings from this phase of the project were specific to London.

Implications. The findings provide unique insights into the workplace-related experiences and intentions of large employers following the pandemic. They can inform future workplace strategies which create mutual gains for both employees, such as improved wellbeing, and for organisations, such as increased flexibilty and reduced staff turnover. For example, the study indicates that targeting specific groups, such as those in technical roles or within certain demographics and developing tailored organisational polices to assist these groups in achieving their aims, could result in essential improvements in employee recruitment and retention. Given the altered characteristics of hybrid workers (CIPD, 2020), a theoretical contribution follows from the identification of specific mechanisms by which these employees' work outcomes, such as wellbeing or commitment, may be enhanced in this new context.

Relevance to the congress theme: Informing organisations and their employees on ways to effectively respond to the changing world of work is the central consideration of this project. The findings support existing evidence that ongoing alterations to how organisations operate following the Covid-19 pandemic is accompanied by parallel shifts in the requirements and expectations of organisational members going forward (Kossek & Keliher, 2022). Importantly, this study provides direct insights into managers' intentions towards future working practises and provides targeted suggestions aimed at leveraging related opportunities and overcoming identified workplace challenges.

Oral presentation OP345

Managing the hybrid working team: A new leadership reality?

Mejse Hasle, Christine Ipsen & Kasper Edwards | Technical University of Denmark;

science

Motivation and research goal

The COVID-19 pandemic has increased employees' demand for flexible working practices and has accelerated the discussion: What is the future of work? Hybrid work, the combination of working in-office and remotely, has been pointed out as a possible future working model, and many organizations are currently testing different approaches to "working-from-home". Most existing studies focus on employee experiences of hybrid work (Lund et al., 2022). However, research on how managers experience their new roles as "hybrid work managers" is limited. This is a scarcity as Ipsen et al. (2021) find that managers generally experience distance work as more challenging than employees. Moreover, current research shows that managerial stress and discomfort negatively influence employee well-being (Skakon et al., 2010), stressing the importance of exploring managers' experiences of new hybrid ways of working.

This study aims to investigate how managers in Danish Municipal departments experience managing hybrid working teams, and how the managers can best be supported in their new leadership roles.

Theoretical Background

Theoretically, this study approaches team managers' leadership as a relational and reciprocal process (Day, 2012). We draw on the concepts of reciprocity and followership, focusing on how leadership and the adoption of new leadership behaviors are greatly influenced by relationships with subordinates and contextual factors in the working environment (Graen & Uhl-Bien, 1995).

Study design

In this ongoing exploratory case study, we apply a longitudinal observational research design in which qualitative interview data is collected from team managers (N=11) over a 1-year period (Bryman, 2006). The research team conduct six rounds of semi-structured interviews with six weeks intervals in the period March 2022- Jan 2023. The team managers represent different municipal departments implementing hybrid working models.

Results

The study's preliminary results show that team managers experience hybrid working models as bringing both opportunities and challenges to their leadership practice. While opportunities include experiences of increased flexibility, efficient meetings, and high productivity, five key leadership challenges consist of how to: 1) Create team cohesion, 2) Ensure employee well-being from a distance, 3) Navigate between employee needs and organizational needs, 4) Show trustfulness while also controlling work processes and 5) Be available and present without over working. Results show that hybrid work can create interpersonal challenges when managers meet conflicting employee needs and expectations and when the virtual work setting make them act in ways that clashes with their leadership values, e.g., when "checking-in" on off-site employees while also wanting to show trustfulness. Finally, the findings indicate that team managers miss organizational support and request more organizational guidelines and rules which they can rely on in their leadership practice. The data collection is expected to be completed in January 2023.

Limitations

The municipal departments of the study covers a broad variety of job functions. Thus, even though the team managers are on same managerial levels they manage teams with different job tasks and professional backgrounds. The character of job task may impact manager-employee relationships, as different tasks demand different forms of collaboration and coordination. This is a potential limitation when wishing to point out general experiences of being “hybrid work managers”.

Conclusion

The study adds to the body of research investigating hybrid remote work, but helps fill a research gap with its distinctive focus on how hybrid work impacts daily leadership practice. The preliminary findings show that hybrid work imposes both opportunities and challenges on managers impacting their well-being and everyday interactions with employees. Thus, highlighting new leadership challenges and stressing managers need for organizational support, these findings are crucial for organizations who consider establishing hybrid workplaces. Moreover, the studies investigation of different types of municipal departments contributes with valuable insights into what contextual factors, e.g., team structure, team size, work setting and job tasks, that may affect leadership of the future’s hybrid working teams.

Relevance to Congress Theme

This study makes essential contributions to the conference theme , pointing towards transitions regarding both working life and leadership practice that we do not yet know the everyday consequences of. A longitudinal study exploring the leadership of hybrid working teams over time can help us address questions such as: How do managers navigate in both opportunities and challenges of leading hybrid working teams? (contribution), and what should organizations pay attention to in supporting the hybrid leadership practices of the future? (delivery).

Keywords: Hybrid Work, Leadership, Perceived Organizational Support

Oral presentation OP409

Managing the Negative Effects of Mobile Technology Out-Of-Hours Work Demands. A Systematic Literature Review and Co-Design of a Prototype Toolkit.

Charlie Eyre, Workspheres Ltd. & Birkbeck, University of London; Rachel Lewis & Jo Yarker | Birkbeck, University of London & Affinity Health at Work

science&practice

Research goals and why the work was worth doing

The research goals were twofold. Firstly, to understand what interventions and strategies have been used for managing the negative impact of out-of-hours work-related mobile ICT demands. Secondly, to assess the feasibility of an evidence-based, co-designed toolkit for managing these negative side-effects.

Theoretical Background

The growing use of advanced mobile ICT devices for work has led to significant changes in the boundaries between work and home. Work-related email, phone calls and instant messaging have become increasingly accessible. Over the past decade, much research has focussed upon the impact of out-of-hours work-related ICT usage (and the 'always on' culture) on individual employees' well-being (e.g. Schlachter et al, 2018). A significant evidence base has been developed around the potential negative impacts of these out-of-hours demands. These include work-home conflict (Gadeyne et al, 2018), negative impact on general well-being (Adisa et al, 2017), reduced psychological detachment (Derks et al, 2014), exhaustion (Barber and Santuzzi, 2015), insomnia (Park et al, 2020). However, there has been far less research focus on practical strategies to minimise these negative impacts.

Design / Methodology / Approach / Intervention

Study 1 (the systematic literature review) was completed in 2021, following PRISMA guidelines (Page et al, 2020). The search criteria focussed on interventions or strategies designed to minimise the negative impact of out-of-hours mobile technology demands. Study 2 was completed in 2022, and involved the co-design of a evidence-based, prototype toolkit. The co-design methodology has been used successful in a range of healthcare settings (e.g. Leask et al, 2019). Its aim is to maximise the success of an intervention through involving end users throughout the design process (Davies et al, 2016). A longitudinal focus group design was used, with thematic analysis used to inform the content and format of the prototype toolkit.

Results Obtained / Expected

From Study 1, a total of thirteen papers were identified. The findings provided some insight into the strategies and interventions that could be used at individual, leadership and organisational levels. These were synthesised to highlight areas relevant for the Study 2 intervention. However, the review showed that there was limited systematic evaluation of the effectiveness of these strategies, and few longitudinal intervention studies had been conducted. The detail and implications of these findings will be discussed.

For Study 2, a total of 25 participants took part in the co-design process, representing HR professionals, leaders and employees across public and private sector organisations. The prototype toolkit was developed based on both the literature review findings, and the outcomes of the Round 1

focus groups. The toolkit included a range of information resources, exercises, coaching tools, and goal setting activities. Refinements were made following Round 2. Overall, the participants felt that the toolkit concept would be a valuable resource for individuals and organisations. However, successful adoption would be contingent on clear leadership support and role modelling. In particular, the toolkit should have sufficient flexibility to adapt to individuals' personal and work circumstances. Key factors include personal boundary management preferences (e.g. Crowe & Middleton, 2012), perceived locus of control (Ohly & Latour, 2014), ability to psychologically detach (Sonnentag & Fritz, 2007), and organisational culture (e.g Grawitch et al, 2018).

Limitations

The output of the research is still at prototype stage. Further work is still required to finalise this as an operational tool. Further work is still needed to systematically assess the long-term benefits that the toolkit might deliver in an operational setting.

Conclusions – research and or practical implications/Originality/Value

The evidence review shone a light on the need for more accessible interventions, and a co-designed toolkit was developed based on these findings. The toolkit concept was found to have value. Its success would be contingent on factors such as leadership support and organisational culture, and it may be best suited as part of a broader organisational well-being intervention.

Relevance to the Congress Theme

The research is of direct relevance to the conference theme of 'the changing nature of work', as it focuses on the psychological impact of how technological developments have blurred the boundaries between home and work.

Oral presentation OP266

Managing Well-Being and Performance at Distance: Development of a Telework Leadership Scale (TWLS)

Felipe Bravo, Alexandra Puentes, Isabel Rodríguez & Nuria Tordera | Universitat de València

science&practice

Research goals:

Hybrid or full teleworking arrangements implies several changes in the way of working. Different institutions have raised the importance of developing new digital competencies and the digitalization of soft competencies. Thus, it is important to reflect on how the function of leadership must be adapted to this new context and identify the most relevant competences to accomplish this function, favoring both well-being and performance of their teams.

To facilitate the development of these competencies it is important to have appropriate measurement tools. Thus, our main research goal is to develop a scale for measuring leadership competencies that impact positively on teleworkers well-being and performance.

First, we developed a competencies model for the development of leadership for telework based on a systematic review and qualitative analysis. Second, we constructed a first version of the scale that was further reviewed by two waves of experts and practitioners in the field. Finally, we will conduct the analysis for the validation of the scale.

Theoretical background:

Leaders and leadership have been found to play a key role in the performance and wellbeing of workers (Avolio et al.,2009; Inceoglu et al., 2018) even more in telework arrangements (Cortellazzo et al., 2019; Kozlowski et al, 2021). The task of leaders in this new context is to reduce virtual distance, in an operational and relational way (Sobel & Reily, 2020).

Well-being and performance are the main expected outcomes of leadership. The happy-productive worker theory considers that there is an alignment between them. However, most part of the research in leadership has been focused on performance (Inceoglu et al., 2018), and it has shown that misalignments can also be found (Peiró et al., 2014). Thus, it is important to measure effective leadership in a way that can improve both.

Methodology:

First, a systematic review of 74 qualitative and quantitative studies of telework leadership from the last 22 years has been developed. We included only empirical articles (qualitative and quantitative) that had investigated a real population of teleworkers.

Second, we analyzed current leadership practices and challenges through focus groups and interviews to a sample of Spanish managers and teleworkers.

Third, we proposed a competencies model for the development of leadership for telework (described in the next section).

Fourth, based on this model we constructed an 88 items scale for measuring telework leadership.

Fifth, we analysed the content validity of the scale with a sample of experts and practitioners in the field.

Finally, in November and December 2022 we will conduct the validation study in a sample of teleworkers in Spain. Confirmatory factor analysis and internal consistency analyses will be done.

Results:

Using the findings of the systematic review and the qualitative study, a pool of behaviours grouped in six competences were proposed for the scale.

Digital Communication: Establishing rules about media usage, planning meetings, managing videoconferences, and providing feedback in virtual media.

Digital Trust: Promoting trustworthiness in digital media, facilitating self-openness virtually, and demonstrating professional and digital competence.

Remote Goal Management: Involves planning virtual work, promoting self-management, and facilitating remote tasks.

Relationships Development in Virtual Environments: Involves strengthening collaboration, social cohesion and team identity using available technologies.

Work/Life Balance in Telework: Actions aimed at promoting and modelling work-life balance and disconnection behaviours.

Results of the validation of the scale will be shown in the congress.

Limitations:

The scale is being developed in the Spanish context. As further steps, we consider making a cross-cultural adaptation of this tool.

Conclusions:

The development of a model of leadership competences for telework and the scale for measuring them provides a valuable tool to guide the training and development of leaders in the context of work digitalization program for leaders, which is the future line resulting from this research.

Relevance to the Congress Theme:

The model and the scale presented contribute to the development of leadership competencies in this changing world of work. It aims to respond to the challenges of the new work arrangements related to digitalization and telework.

Relevance to UN SDGs:

This research contributes to the " Decent work and economic growth" development goal, in the way that provides a tool for measuring effective leadership in telework context, which can help to implement interventions for improving working conditions of employees in a sustainable manner.

Also, it impacts in the " Good health and wellbeing " development goal, because it measures leadership competencies that improve wellbeing of teleworkers. With this tool, interventions for improving wellbeing at distance can also be assessed.

Oral presentation OP613

Mediating processes for the effects of subjective socioeconomic status on well-being and performance in the work context

Filiz Meidrodt, Bergische Universität Wuppertal; Daan van Knippenberg, Rice University ; Wladislaw Rivkin, Trinity College Dublin; Stefan Diestel & Charlotte Hohnemann | Bergische Universität Wuppertal

science

Research goals and why the work was worth doing:

The current global and national inequality in the distribution of wealth can be seen as a societal risk factor, as socioeconomic status (SES) shows an inverse relationship with various health outcomes and well-being. Current political and economic crises lead to an increased risk of social division based on rising differences in access to socioeconomic resources. Although employees with various SES interact within the workplace and one's job role can significantly influence the own SES, there is a lack of deeper understanding of how SES affects experiences and behaviour in the workplace. Therefore, the present study aims to investigate explanatory mechanisms in the effect of SES differences on psychological well-being and withdrawal behaviour in the organizational context.

Theoretical Background:

Research already showed that employees' SES has critical implications in organizations (Côté, 2011). Preliminary results show that people from a lower social class perceive emotions of colleagues more accurately than their higher class counterparts (Kraus et al., 2010). Furthermore, a lower social class can be identified as a stigmatized identity at work which influences how it is concealed or disclosed (Kallschmidt & Eaton, 2019). However, the relationship between SES and work-related behaviour and well-being remains largely unexplored. On the basis of COR-Theory, which states that those who lack resources are more vulnerable to resource loss and less capable of resource gain (e.g. loss spiral; Hobfoll et al., 2018), we propose that a low subjective SES increases perceived weekly stressors (e.g. interpersonal conflicts) and decreases perceived uplifting events (e.g. goal achievement). This shift in perception should reduce well-being and increase withdrawal behaviour. Additionally, we predict that implicit assumptions towards social classes (i.e., appreciation of higher & devaluation of lower classes) further amplify the effect of SES on employees' functioning. This prediction derives from the notion that implicit attitude measurement is particularly relevant in areas where self-presentation concerns are high, such as prejudice and stereotyping (Greenwald et al., 2009). Accordingly, negative self-evaluations concerning social categories can cause psychological distress that reflects loss spirals and should hence intensify the deleterious impact of SES (John-Henderson et al., 2013).

Design:

Our predictions will be tested via a twelve-week diary study with about 150 participants. After a pre-survey (e.g. SES, implicit bias), the participants receive a survey each Friday. The acquisition is currently carried out via Prolific Academic. The use of Prolific is mainly due to the possibility of generating a specific sample (people under greater strain e.g. due to precarious working conditions) that is relevant to the purpose of the study and the high data quality, which can, for instance, be observed in the comparatively high diversity of the sample and high criterion validity, that can be achieved (Palan & Schitter, 2018; Walter et al., 2019).

Results:

Our hypotheses focus on temporal changes depending on SES differences. Following recommendations from previous studies (Chen et al., 2011; Dust et al., 2021), we will therefore calculate mixed models with a random intercept and fixed slope to examine the change trajectories of perceived uplifts, perceived stressors as well as well-being and withdrawal behaviour on the within-person-level. We hypothesize that the trajectories of perceived stressors and uplifts, which are dependent on SES, predict the trajectories of well-being and withdrawal behaviour. Additionally, we will test the moderated mediation (between-person level) by following the procedure from Chen et al. (2011), which can be used to integrate change trajectories in mediation models (e.g. Dust et al., 2021). Data collection will be completed in the first of quarter of 2023, making the results available by May.

Limitations:

All measures were assessed based on self-reports which increases the risk of common method bias. Future studies should also use objective indicators like physiological parameters for stress (e.g. skin temperature, Arza et al., 2018).

Conclusion:

The study provides initial insights into the explanatory mechanisms between SES and employees' behaviour at work. These findings should then be expanded to include further attitudinal dimensions as well as organizational boundary conditions. Overall, the results should help to understand the dynamics of SES that influence employees and help to find ways to provide equal opportunities.

Relevance for the Congress Theme:

The unequal distribution of resources is not only a socially relevant issue but has important implications for the work context and is in turn strongly influenced by it. Therefore, it is important to understand the dynamics at stake in order to design measures to address this inequality in the future.

Keywords: social class, well-being, inequality

Oral presentation OP52

Medical students' career decision-making stress during clinical clerkships

Daan Fris, Universiteit van Amsterdam / ErasmusMC

science

Objectives:

Many medical students experience career decision-making stress in the final phase of training. Yet, the factors that induce or reduce career decision-making stress and how progression in their clerkships relates to these factors, are unknown. This knowledge gap limits the possibilities for medical schools to develop and implement interventions targeting students' career decision-making stress.

Theoretical background:

Theoretically, we draw upon the CPC-framework by Lent and Brown (2020) which takes a comprehensive view on career decision-making including content (i.e., elements of people's self-concept regarding their work), process (i.e., factors influencing the process of career decision making), and context factors (i.e., environmental features that can aid or impede choice-making) involved in the process. This study explores the content, process, and context factors that may affect career decision-making stress among medical students.

Methods:

Using cross-sectional survey data from medical master students from two medical schools (N =507), we assessed content (future work self), process (choice irreversibility, time pressure, career decision-making self-efficacy), and context (supervisory support, medical school support, study load, competition) factors and their relationships with career decision-making stress. The hypothesized relationships were tested with structural equation modelling.

Results:

A clearer future work self and higher career decision self-efficacy were associated with lower career decision-making stress, while experienced time pressure, competition, and study load were associated with higher career decision-making stress. Choice-irreversibility beliefs, supervisory support, and medical school support were unrelated to career decision-making stress. As students' clerkships progressed, they gained a clearer future work self, but also experienced more time pressure.

Limitations:

The cross-sectional nature of this study does not allow conclusions to be drawn about the direction of relationships. In addition, common method bias might have attenuated relationships between the variables in this study. Finally, the data of this study were collected during the COVID-19 pandemic. It is possible that students experienced relatively more insecurity about setting and attaining their career goals and their study progress might have been delayed.

Conclusions:

Results suggest that clinical clerkships help students to form a clearer future work self, which can diminish career decision-making stress. Yet, students also experience more time pressure as the period of clerkships lengthens, which can increase career decision-making stress. A school climate of

high competition and study load seems to foster career decision-making stress, while school support hardly seems effective in diminishing this stress.

Results bear practical implications for medical schools. First, medical schools could provide tools to stimulate the timely development of students' future work self. Second, medical schools could focus on helping students deal with time pressure and competition, both of which promote career decision-making stress. Third, medical schools could invest in career supportive practices.

Relevance to congress theme:

The COVID-19 pandemic has had a severe impact on medical students as well as healthcare workers in general, with some even reevaluating their career choice. To ensure a healthy workforce in the future, it is of critical importance that medical students make a career choice fitting with their personal interests, values, and competencies.

Relevance UN SDG's:

This study contributes to the third (good health and well-being) and fourth (quality education) sustainable development goals from the UN. Optimizing students' career choices not only keeps them healthy, but contributes to the quality of healthcare as well. Besides, part of high quality education is providing adequate career guidance. This study does several suggestions for medical schools to optimize career guidance for medical students.

Keywords: Career decision-making, decisional stress, clinical clerkships

Oral presentation OP97

Mental illness and substance abuse (non-)disclosure to a supervisor: A cross-sectional study on beliefs, attitudes and needs of military personnel.

Rebecca Bogaers, Tilburg University & the Dutch Ministry of Defense; Andrea Rozema, Tilburg University; Neil Greenberg, King's College London; Dike van de Mheen, Tilburg University; Fenna Leijten & Elbert Geuze | The Dutch Ministry of Defense

science

Purpose & theoretical background

The decision for workers whether to disclose their mental illness, including substance abuse, to their supervisors can potentially have far-reaching consequences for their sustainable employability. Disclosure can lead to workplace support and accommodations, which can prevent worsened symptoms and sick-leave, and non-disclosure can lead to missed opportunities for this support. However, disclosure can also lead to being stigmatized and discriminated against.

The disclosure dilemma is expected to be even more prominent for trauma-prone occupations, such as the military, where workers are expected to be 'strong' and disclosure may yield less positive outcomes. Additionally, workers in these high-risk occupations are exposed to stressors at work, increasing their risk of developing mental illness.

Research suggests that military personnel frequently delay disclosing mental illness, including substance abuse, to supervisors. This delay causes missed opportunities for sustainable employability. The current study aims to examine disclosure related beliefs, attitudes, and needs, to create better understanding of military personnel's disclosure decision-making.

Methods

The current study consisted of a cross-sectional questionnaire study among military personnel with (N=324) and without mental illness (N=554). Military personnel with and without mental illness were approached based on earlier questionnaires which personnel receive after deployment. For the current study, beliefs, attitudes, and needs regarding the (non-)disclosure decision to a supervisor were examined, including factors associated with (non-)disclosure intensions and decisions. Military personnel with mental illness, were asked about their past disclosure decisions, and military personnel without mental illness were asked about their intentions regarding possible future disclosure if they would develop a mental illness. Descriptive and regression (logistic and ordinal) analyses were performed.

Results

Common beliefs and attitudes pro non-disclosure were the preference to solve one's own problems (68.3%), the preference for privacy (58.9%), and a variety of stigma related concerns. For example, 32.4% believed that disclosure would lead to negative career consequences and 25.2% believed that disclosure would lead to social rejection.

Common beliefs and attitudes pro disclosure were that personnel wanted to perform well at work (93.3%) and the desire to act responsibly towards work colleagues (84.5%). The most reported need for future disclosure (96.8%) was having a supervisor who shows understanding for mental illness.

The following factors were associated both with non-disclosure intentions and decisions: higher preference for privacy (OR (95% CI) = 1.99 (1.50 – 2.65) intention , 2.05 (1.12 - 3.76) decision) and

self-management (OR (95% CI) = 1.64 (1.20 – 2.23) intention , 1.79 (1.00 - 3.20) decision), higher stigma related concerns (OR (95% CI) = 1.76 (1.12 – 2.77) intention , 2.21 (1.02 - 4.79) decision), and lower quality of supervisor-employee relationship (OR (95% CI) = .25 (.15 – .42) intention , .47 (.25 - .87) decision).

Limitations

First, due to the cross-sectional design of the study, no conclusions about causality can be drawn regarding the factors associated with disclosure (intentions). Second, the sample is not representative for the entire military, due to the sampling method used.

Conclusion

To facilitate (early-)disclosure to a supervisor, creating opportunity for workplace support, interventions should focus on decreasing stigma and discrimination and align with personnel's' preference for self-management. Furthermore, training is needed for supervisors on how to recognize, and effectively communicate with, personnel with mental illness. Focus should also be on improving supervisor-employee relationships.

Relevance for congress

This research is relevant to the congress theme as it focusses on the UN Sustainable Development Goal 'Good health and Wellbeing'. The findings of the current study can help to inform future research and interventions which can create a more inclusive work environment. In a more inclusive work environment, disclosure of mental illness is possible, creating opportunities for supervisor support and work accommodations, which contribute to good health and wellbeing.

Keywords: Mental illness, disclosure, stigma

Oral presentation OP14

Mental workload mediates the effect of communication on team performance and work satisfaction in interdependent teams during a simulated Mars Mission

Vera Hagemann, University of Bremen, Business Psychology; Christiane Heinicke, University of Bremen, ZARM; Lara Watermann, University of Bremen, Business Psychology

science&practice

Research goals and why the work was worth doing

High Responsibility Teams, like astronaut crews and their support teams, that are interdependent, geographically separated and time-delayed need to communicate effectively to work error-free, reliable and achieve high team performance in complex work environments. Thus, the research goal of this study was to identify the aspects of communication in teamwork that are important for team performance and work satisfaction and how this relationship is mediated by mental workload.

Theoretical background

Isolated, confined, and extreme (ICE) environment-specific team research is still in its early stage. As for all other high responsibility teams, teamwork skills are an important, yet less emphasized, aspect of flight controllers' and astronauts' job. Team communication, resp. information exchange with its facets clarity of objectives and information flow, is a key coordination process in order to develop a shared understanding and to not experience so-called "process losses" and to achieve high team performance and work satisfaction. As miscommunication has shown to lead to increasing workload in terms of effort and frustration in teams working under time-delayed communication, the following hypotheses are set up: 1) Clarity of objectives positively influences a) team performance and b) work satisfaction. This relationship is mediated by the mental workload facet "effort". 2) Information flow positively influences a) team performance and b) work satisfaction. This relationship is mediated by the mental workload facet "frustration".

Design/Methodology/Approach/Intervention

The experiment INTERTEAM was executed during the AMADEE-20 analogue Mars mission hosted by the Austrian Space Forum. Six analogue astronauts (AAs) lived in isolation for four weeks in the Negev desert in Israel. They were supported by Mission-Support-Centre (Innsbruck) and On-Site-Support team (Israel). As these three teams work closely together in conjoint teams throughout the mission to execute tasks correctly, it is essential that they communicate effectively with each other. Clarity of objectives and information flow are important factors of communication between these teams. Communication between teams is complicated as Mission-Support-Centre is the only contact line for the AAs, including a communication time delay of 10 minutes one-way. This time delay reflects the signal propagation time between Earth and Mars. Three experiment runs, each of one and a half hours duration, with changing conjoint team members were conducted during the four-week mission. For that, two participants each from the AAs, Mission-Support-Centre and On-Site-Support worked as a team and had to exchange information to solve an interdependent task in a specified time. Communication, work satisfaction and mental workload (subjectively measured) as well as team performance (objective measure) were assessed in each run. Hypotheses were tested by mediation analysis based on bootstrapping.

Results

Results show that the communication aspects clarity of objectives ($B = .62$, $p < .01$) and information flow ($B = .68$, $p < .01$) significantly influence team performance positively. The positive relationship between clarity of objectives and team performance is mediated by the level of effort ($B = -.46$, $p < .05$). Only information flow has been shown to significantly influence work satisfaction positively ($B = .48$, $p < .05$), which is mediated by the level of frustration ($B = -.69$, $p < .05$).

Limitations

Generalizability of the results is limited due to the small sample size of three teams including six participants each. Furthermore, no standardized conditions could be applied for the experimental implementation.

Conclusions

Findings show that communication in regard to clarity of objectives and information flow is very important for interdependently working and geographically separated and time-delayed teams. Thus, specific communication trainings and support by humans and technique are really necessary for all team members of future Mars missions to achieve safe and reliable work throughout the mission.

Keywords: communication, teamwork, analog mars mission

Oral presentation OP770

Meta-analyses investigating if work engagement is related to contextual, adaptive, and creative performance

Leander van der Meij & Dennis van Hoesel | Eindhoven University of Technology

science

Introduction

Meta-analyses have shown that work engagement and task performance are positively related (e.g., Hakanen et al., 2006; Christian et al., 2011). However, it is less clear if work engagement is also related to other important types of work performance, such as contextual performance (i.e., organizational citizenship behavior), creative performance (i.e., generation of ideas, procedures, and products), and adaptive performance (i.e., capability to modify behavior according to the requirements). To the best of our knowledge, only one recent meta-analysis (Christian et al., 2011) showed that work engagement and contextual performance were indeed related. However, at the time of that meta-analysis, only 11 studies were available. Therefore, a meta-analysis with a larger sample of studies is needed to assess the true effect size more reliably. Furthermore, to our knowledge, there are no meta-analyses investigating if more work engagement is related to creative and adaptive performance.

Methods and results

To address this, we used meta-analyses to investigate if work engagement was related to contextual performance (111 studies, N = 44,116), creative performance (42 studies, N = 14,120), and adaptive performance (14 studies, N = 5,909). In doing so, we followed the PRISMA method for meta-analyses. The results indicated relatively large effect sizes, showing that work engagement is positively related to contextual performance (r = .49), to creative performance (r = .50), and to adaptive performance (r = .44). Moderator analyses showed that for contextual performance the relationship with engagement was stronger for self-assessed performance than for performance assessed by the supervisor. However, effect sizes for contextual performance were similar for western vs. non-western populations, contextual performance vs. organizational citizenship behavior, cross-sectional vs. longitudinal designs, or used questionnaire. For creative performance, we found that the relationship with engagement was stronger for studies using the questionnaire by Zhou and George (2001) than for studies using the questionnaire by Wang and Netemeyer (2004). Furthermore, for creative performance, effect sizes were similar for self-reported performance vs. performance reported by the supervisor, western vs. non-western populations, and cross-sectional vs. longitudinal designs. Our sample size was too small to do any meaningful moderation analyses for adaptive performance. We did not find evidence of publication bias in any of the meta-analyses. Importantly, for all performance types, we found high levels of heterogeneity in the effect sizes (91-93%) which were unrelated to sample size, as shown by the asymmetric funnel plots.

Discussion

Our meta-analyses show that more work engagement was related to better contextual, adaptive, and creative performance. This indicates that employee motivation is important to consider if companies want to improve not only task performance but also other forms of job performance. However, the large differences in effect sizes between studies for all the studied performance types make interpreting the results difficult. This large variance in effect sizes (unrelated to sample size) may indicate that the study characteristics greatly impacted the studied relationships. Likely

candidates of influence are the studied population and characteristics of the job. In support of this, our moderator analyses showed that some study characteristics (performance rater and used questionnaire) did reduce the heterogeneity of the effect sizes for some performance types. However, variability in effect sizes remained high, even after controlling for these factors. This suggests that we were unable to include the most important moderators and that future study designs need to address this. Alternatively, perhaps we need to improve how we conceptualize, operationalize and measure these types of performances. Indeed, contextual, creative, and adaptive performance are more prone to subjectivity and interpretation compared to task performance.

Congress and UN SDGs relevance

This research is relevant to the congress theme of “changing the world of work” because this study highlights that work engagement does not only relate to task performance. Well-designed work also needs to value other forms of job performance, such as contextual, creative, and adaptive performance, which are studied in this research. Our study is also relevant to the UN Sustainable Development Goals of “Good health and well-being” as it is important to know how work performance and engagement relate to each other to stimulate employee well-being.

Methodological Issues Related to the Theory of Self-Presentation

Henning Hummert, University of Rostock

science

Recently, several articles have been published that have dealt with the verification of Marcus' (2009) theory of self-presentation (SPT). Several core propositions have been successfully confirmed. However, various methodological issues have also been raised, which I examine using four empirical studies, including non-student samples. I present the results in this talk.

Analytical self-presentation skills and motivation, core constructs of SPT, have been operationalised through profile comparisons. Based on the available data and considering practical trade-offs (like usability in practice), I recommend the use of the Pearson correlation as a profile similarity index for calculating analytical self-presentation skills and motivation, rather than using more elaborated indices. The issue of normativeness is discussed, but raises several problematic managerial implications and needs to be further examined in additional studies. I also show, why more sophisticated methods like Dyadic Response Surface Analysis or the Social Accuracy Model are not applicable in this context.

Furthermore, I show results that support existing evidence on the criterion-oriented validity of the theory. Thus, the assumption is supported that SPT could be suitable to explain some of the inconclusive results regarding the impact of faking on validity.

Finally, I make clear that a central element of the theory, analytical skills, can be distinguished from the ATIC concept, contrary to recently voiced concerns in literature.

Oral presentation OP422

Min and/or max goals: A dynamic account on ongoing goal failure and the development of efficacy beliefs and self-set goal standards within individuals

Jorrit Alkema, Dirk Van Dierendonck & Steffen R. Giessner | Rotterdam School of Management, Erasmus University

science

Research goals: We study the effects of ongoing goal performance failure within individuals. Specifically, we centre on the development of self-efficacy feelings and self-set goals. By considering minimal and maximal goal standards, we show how framing goals as maximal (versus minimal) goals can buffer against expected negative consequences of not achieving a goal. This allows us to provide managerial recommendations of how to effectively use (maximal) goal standards in organisational settings.

Theoretical background: Looking to provide insights in how managers should approach the balancing act of setting difficult goals to motivate employees to perform at top level (Locke & Latham, 2002; 2019) while at the same time increasing the risk of continuous failure (Ordóñez et al., 2009), we addressed this problem by integrating the theoretical framework of minimal and maximal goal standards (Brendl & Higgins, 1996; Giessner et al., 2020) with goal-setting theory and explored effects on task self-efficacy beliefs (Bandura, 1986; Locke & Latham, 1991) and self-set goal levels (Bandura & Locke, 2003).

Methods : We conducted three experimental studies (N=124/N=223/N=253) to test for our beliefs. Participants engage in a performance challenge over several rounds.

Results : Externally assigned maximal (versus minimal) goal standards resulted in overall lower self-set goal-setting (i.e., minimal, and maximal self-set goals). Furthermore, repeated negative performance feedback reduced task self-efficacy over time. However, this effect seems to be reduced if individuals received a maximal (versus minimal) externally-set goal standard. We found similar effects on subsequent self-goal-setting. More precisely, while repeated failure decreased the self-set goal levels over time, maximal (versus minimal) goal standards buffered against this negative effect of goal failure. Furthermore, self-efficacy beliefs mediate the effects between externally set minimal versus maximal goal-setting on self-set goals.

Limitations : Our research focused on the effects of goal standards on self-efficacy and self-set goal over time under repeated failure. As a consequence, we limited the time for the tasks in our design and, thus, did not allow to test for the performance persistence which self-efficacy and goal setting would predict (Wood & Bandura, 1989). As a result, our research design does not allow to reliably test for performance outcome effects. Second, even though the experimental approach makes it possible to draw causal inferences between the key variables, it does restrict extrapolating the findings to more realistic settings beyond the laboratory and student participants/online panel sample.

Conclusions : We show that repeated failure experiences indeed decrease task self-efficacy beliefs (cf. Ordonez et al., 2009), our extension with the minimal and maximal goal standard framework (Giessner et al., 2020) reveals that this negative side-effect of goal setting is reduced when maximal (versus minimal) goal standards are used. In line with earlier research (Donovan & Williams, 2003; Ilies & Judge, 2005), our studies demonstrated a downward development in the average level of self-set goal standards when individuals were confronted with continuous failure feedback.

Differentiating for the two specific self-set goal standards – self-set minimal or maximal goal standards – the change over time is most extreme for the maximal (versus minimal) self-set goal standard. Our theoretical and empirical extension of prior research yields a clearer picture of how leaders should deal with their own goal-setting balancing acts. Hoping to 'get the most out of individuals' in one-off situations, our advice would be to assign goals in a minimal way, to stimulate relatively higher levels of self-set goal standards as a result of the goal internalisation process. In repeated situations, we would recommend managers to generally set performance goals that they are assigning to their subordinates as maximal standards – particularly if it is likely to expect adversity over time (i.e., negative performance feedback): not only does it weaken the (inevitable) negative development of the experienced levels of self-efficacy, but eventually it also results in relatively smaller decreases in self-set goal standard levels.

Relevance to the Congress Theme : Goal-setting plays a central role in HR's performance management practices, as they allow organisations to motivate current and future workforces. To compete in and deal with this changing world of work, understanding how goal-setting exactly impacts employee beliefs will futureproof organisations in delivering desired changes.

Relevant SDG#8 : Decent work implies not only workplace security and better prospects for personal development, but also work that motivates. Understanding how to motivate individuals – even when faced with continued adversity – will create more 'decent' workplaces and enhance employee's well-being.

Oral presentation OP293

Mindfulness and Negative Performance Feedback – the Mediating Role of Cognitive and Emotional Self-Regulation

Loreen Hennemann & Heidi Möller | University of Kassel; Silja Kotte, Technical University of Aschaffenburg

science&practice

Due to a continuously changing world facing various challenges and an ever-faster evolving economy, the demands for innovation and learning processes on a societal and economic level are rising. Intensified by the simultaneous shortage of skilled workers, human capital becomes essential for economic success (Carmeli & Schaubroeck, 2005). Thus, organizations are not only striving to recruit and retain valuable employees, but also to develop them to enhance their learning and performance (Aguinis & Pierce, 2008). In this context, practitioners consider performance feedback effective. However, research findings question its effectiveness and point out a paradox: Negative feedback creates a tension between (1) the intended goal of performance improvement on one side and (2) its risk to cause dysfunctional responses (Alam & Singh, 2019; Kluger & DeNisi, 1996; O'Malley & Gregory, 2011) and to diminish feedback's effectiveness (Eskreis-Winkler & Fishbach, 2019) on the other. The essential question therefore is: How do individuals respond more constructively to negative feedback? One potential way is to perceive feedback in a more neutral and differentiated way which may initiate a learning process with higher levels of adaptive self-reflection and insights about how to improve behavior rather than perceiving it as a threat to their self-esteem.

To better learn from negative feedback, Kuhl's Personality System Interaction theory (PSI; 2000) states that self-growth grounds on a dialectical process of (1) a strengthened problem focus and (2) the downregulation of negative affect for a successful integration into the self. This process may be supported by mindfulness. Research findings indicate that mindfulness leads to higher awareness and less avoidance behavior as well as reduced affective reactivity (Lindsay & Creswell, 2017; Uusberg et al., 2016), reduced self-esteem threat (Heppner et al., 2007), and improved self-regulation (Hölzel et al., 2011).

Thus, this study investigates the extent to which mindfulness, through modified cognitive and emotional self-regulation, enables people to learn more constructively from negative feedback. For this purpose, an online experiment with a 2x2 design (N = 422) was conducted. Subjects were randomly assigned to a mindfulness induction vs. no-treatment condition as well as a negative vs. positive-negative mixed 360-degree feedback vignette. The mindfulness induction covered one educational video and one audio exercise based on evidence-based inductions (e.g., Garland et al., 2015; Reynolds et al., 2015; Watford and Stafford, 2015). To enhance participants' identification and involvement, we enriched the vignette with personalized information for each participant (i.e., job position, project objective) so that hypothetical feedback towards real work experience was created. Both experimental manipulations were controlled via manipulation checks and were rated as sufficient.

We used structural equation modeling to examine the effect of mindfulness state on cognitive feedback response (i.e., rumination, insight), mediated by cognitive and emotional self-regulation (i.e., avoidance, reappraisal, and acceptance). Results indicate mindfulness fosters more constructive responses to negative feedback: Mindfulness significantly reduces rumination via an indirect partial mediation of higher cognitive acceptance and emotional adjustment. Further, mindfulness increases

participants' insight into their strengths and weaknesses directly as well as via an indirect partial mediation of higher emotional tolerance.

Limitations include problems regarding the construct validity of mindfulness questionnaires as well as self-report data's limited validity and potential biases. Nevertheless, the study offers a significant contribution to answer the research question of how individuals learn better from negative feedback. Results indicate that mindfulness could operate as preventative treatment before receiving feedback to generate (more) constructive responses to negative feedback. Future research should conduct further analyses of the differential indication of mindfulness treatments with respect to target groups, specific mindfulness methods, and contexts of application. Field studies and investigations of potentially negative effects of mindfulness could be beneficial. Additionally, mindfulness should be measured multidimensionally and outcomes via alternative approaches to self-reports (e.g., learning outcomes, behavior).

In light of the urgency of solving various social and economic problems, learning after criticism is crucial to foster problem awareness and, in turn, behavior change. Our study sheds light on how mindfulness can help employees learn more constructively after negative performance feedback, develop new competences, and improve performance. Thus, this promotes reflection and learning processes within organizations to support necessary future developments and economic growth.

Keywords: mindfulness, negative feedback, learning

Oral presentation OP344

Mitigating the Negative Impact of Remote Work: The Role of Identity Leadership

Jian Shi, Mark van Vugt & Sanne Feenstra | Vrije Univeristeit Amsterdam

science&practice

As a result of the COVID-19 pandemic, a massive shift towards remote working is taking place in organizations worldwide (Forbes, 2022). This shift towards remote work comes with many benefits for organizations and employees (e.g., more flexible work arrangements, reductions in commuting hours and office space; Allen et al., 2015). This shift, however, also comes with costs as research suggests that employees who work remotely loose their sense of identification with, and connectedness to, their coworkers and team, in turn, reducing their job performance and satisfaction (e.g., Wood et al., 2022; van Zoonen et al., 2022). The shift towards remote work thus creates an important challenge for managers how to ensure that remote employees feel connected to, and identified with, their coworkers and workplace.

At this moment, we know little about what type of leadership behaviors remote employees endorse and which leadership behaviors are most effective in increasing employees' affiliation needs when working remotely. Drawing on a social identity perspective of leadership (Hogg, 2001; Turner & Haslam, 2001; van Knippenberg & Hogg, 2003), we propose that identity leadership - a leadership style characterized by enhancing a sense of togetherness among team members - is a crucial factor in increasing team identification and reducing feelings of isolation in a remote work context. In particular we propose that employees who work remotely favor an identity leadership style, because these identity-enhancing activities are crucial in fostering a sense of belonging. We further hypothesize that identity-promoting leadership behaviors buffer against the negative effects of remote work regarding employees' reduced team identification ("lost identities") and increased feelings of isolation ("lost connections"), and as a result, reduced work engagement and job satisfaction.

We conducted two studies to test these predictions. We first conducted a field survey among 181 employees (Mage = 37.38, 50.3% female; UK), who all had remote working experience, to examine what type of leadership behaviors they preferred when working remotely. Results confirmed that employees endorsed identity leadership behaviors more in a remote compared to on-site work context. We then carried out another field study among 203 employees (Mage = 38.45, 47.5% were female; UK), to examine the moderating role of identity leadership for the relationship between remote work and employees' team identification and feelings of isolation, as well as, work engagement and satisfaction. Results revealed that working remotely (measured objectively in terms of the proportion of time employees spent working remotely) was negatively associated with team identification and positively associated with feelings of isolation. Moreover, as expected, identity leadership moderated these effects, such that remote work was only negatively (positively) associated with team identification (isolation) when identity leadership was low. Furthermore, the negative indirect relationships between remote work and employees' work engagement and job satisfaction through team identification were less severe when identity leadership was higher.

Our research makes several important contributions to the literature. First, our findings provide first empirical evidence that employees endorse specific types of leadership behavior in a remote working context. Second, our findings reveal the importance of identity leadership in a remote working context. In doing so, our findings suggest that leaders should increasingly show, promote, craft, and embed a shared identity among their employees when working remotely. By doing so, leaders can

prevent that their employees will experience a loss of team identification and connectedness. The findings of this research should be interpreted with some limitations in mind. Most importantly, our studies utilized cross-sectional and correlational data. Therefore, we are unable to eliminate common method bias and cannot make strong causal claims. In future research we therefore plan to conduct additional studies to replicate findings in a multi-wave study and/or using an intervention of identity leadership. Moreover, participants for the two studies were recruited only via online samples obtained in the United Kingdom. It would be a significant extension to replicate these findings in other countries experiencing the transition to remote work.

Overall, the present research demonstrates the importance of supervisors engaging in identity leadership in remote work contexts. Remote employees value such identity-building activities more and it enhances their sense of team identity and connectedness-two crucial aspects of a high work engagement and satisfaction. Accordingly, our research is relevant to the future of work especially in identifying the critical role of leadership in remote workplaces.

Keywords: remote work, identity leadership, team identification

Oral presentation OP175

More than a respect issue: Basic psychological need frustration and satisfaction through illegitimate tasks and appreciation

Marvin Schröder & Dieter Zapf | Goethe-University Frankfurt am Main; Marcel Kern, Ruhr-University Bochum

science

Research goals

Work characteristics affect employees through a variety of pathways. The Stress-as-Offence-to-Self (SOS) framework mainly focuses on negative emotions, offenses to the self, and stress outcomes. In the present study, we attempt to integrate basic psychological needs (BPN) into this framework to shed light on motivational processes elicited by threats (illegitimate tasks) and boosts (appreciation) to self-esteem.

Theoretical background

The SOS concept highlights that tasks, violating the norms of what can be reasonably expected from a person in a certain position are stressors and lead to anger, felt disrespect and lower self-esteem. Appreciation through supervisors, colleagues or clients, in contrast, is seen as a self-esteem relevant resource. As Semmer et al. (2019) suggested, there might be other ways (beyond the self-esteem relevant messages of disrespect and appreciation) in which illegitimate tasks and appreciation influence employee well-being. Research on motivational aspects and consequences of these two constructs is still young and thus far not well integrated in any theoretical framework. We address this issue in our research by employing the BPN theory. Within BPN theory a not satisfied need is not automatically frustrated, therefore the differentiation between need frustration - which leads to ill-being – and need satisfaction – which leads to well-being – is made. Based on this differentiation we argue that illegitimate tasks mainly frustrate needs for autonomy, relatedness and competence and thus lead to emotional exhaustion. Appreciation, on the other hand, should mainly satisfy those needs and therefore lead to engagement. Furthermore, both theories portray self-esteem as a relevant outcome of their respective constructs. Hence, we want to examine the direct effect of illegitimate tasks and appreciation on self-esteem while controlling for the motivational indirect effect through need frustration respectively satisfaction, as a new pathway to organisational based self-esteem.

Design

We designed a three-wave longitudinal study with a time lag of three month to test our hypotheses. Data collection for the first measurement occasion is currently ongoing in the German energy sector. Except for BPN satisfaction and frustration (BPNSF) we employ established measurement instruments. To measure BPNSF in the work context we used a newly developed and validated scale by Olafsen et al. (2021). Hypotheses will be analysed by ways of latent growth curve modelling. Due to complications in data collection, only the results of the first two measurement points will be presented.

Results

Preliminary results of the first 40 participants at T1 indicate significant indirect effect of illegitimate tasks on self-esteem and emotional exhaustion through all frustrated needs. Direct effects of illegitimate tasks stay consistently significant for emotional exhaustion, but only in the case of

competency frustration for self-esteem as well. Appreciation effects self-esteem and engagement mainly directly and only indirectly through relatedness satisfaction.

Limitations

This study employs only self-report data. Additionally, we decided to use a three-month time interval but are aware that some effects may also develop in a shorter period of time, such as frustrated needs through illegitimate tasks.

Implications

While managers might be able to compensate the disrespectful nature of illegitimate tasks by being appreciative, it might as well be necessary to address the motivational effects of illegitimate tasks to negate their unfavourable outcomes. Furthermore, a theoretical contribution of this work is the new mechanism via psychological need frustration through which illegitimate tasks influences self-esteem perception.

Relevance to the Congress Theme

This research contributes to the congress research themes of well-being as well as engagement and motivation by disclosing the motivational effects of illegitimate tasks and appreciation, their consequences for personal self-perception as well as exhaustion and engagement at work. In the next step this insight provides ideas on which resources might be necessary to address consequences of illegitimate tasks to keep employees motivated and well at work.

Relevant UN SDGs

We believe for economic growth to be sustainable the implementation of decent work a necessity. Our research helps to give an understanding of what work tasks reduce BPN of each and every employee, subsequently leading to less well-being and productivity at work. Company's, leaders and team members can create respectful and motivational work environment by recognising and addressing illegitimate tasks on a self-esteem level via appreciation and on a motivation level via a compensation of frustrated needs though a satisfaction of them in another work areas.

Keywords: stress-as-offence-to-self, basic psychological needs

Oral presentation OP114

Motivation Profiles at Work and Their Relationship with Core-Self Evaluations and Perceived Organisational Support

Hannah Möltner & Philipp Diekena | FOM University of Applied Sciences

science

Research goals and why the work was worth doing

Recent studies in the context of self-determination theory are concerned with the identification of motivational profiles. Motivational profiles consist of combinations of multiple motivations regulations that characterise subgroups of a given population. This study is the first to analyse motivational profiles of German professionals and their antecedents. Thereby, it answers the call for replication studies and extends existing studies on how to positively influence motivation at work.

Theoretical background

Person-centred approaches allow to model multidimensional motivational profiles and to analyse their antecedents and consequences. These profiles consist of autonomous regulation (intrinsic and identified) and controlled regulation (introjected and external) constellations. Importantly, these profiles relate differentially to adaptive and maladaptive work outcomes. Previous studies have identified four to six motivational profiles and have called for more research on their antecedents.

Design

Data of 573 professionals was collected in Germany. Confirmatory factor analyses were used to examine concept discrimination of the motivational regulations. Next latent profile analyses were applied to determine the motivational profiles. Finally, multinomial logistic regressions were used to analyse their relationship with antecedent core-self evaluations (CSE) and perceived organisational support (POS).

Results

Results reveal four profiles, that are characterised by (1) low autonomous and moderately controlled regulation, (2) high autonomous and low controlled regulation, (3) very low autonomous and moderate to low controlled regulation, and (4) high autonomous and moderate to high controlled regulation. CSE and POS relate positively to the more autonomous profiles (2) and (4). Further, these constructs relate to the profiles differentially. While CSE relates stronger to profile (2), POS relates stronger to profile (4).

Limitations and future research

As the study is based on cross-sectional, self-report data, future research with longitudinal and multi-source designs is recommended. Furthermore, additional antecedents can be explored in their relationship to motivational profiles. These might include variables such as perceived supervisor support, organizational or job fit, and basic psychological need satisfaction and frustration.

Practical implications

The identification of motivation profiles allows to tailor human resource and work design activities to different needs in the workforce. Especially those displaying low to moderate motivation profiles could benefit from increased organizational support and activities that foster CSE, i.e. coaching, mentoring and trainings.

Relevance to the congress theme

Research on self-determination theory in the workplace aims to generate knowledge on how to positively influence motivation in this context. Thereby, it adds knowledge on the congress theme how to change the world of work for the better.

Keywords: Self-determination theory, motivation profiles, antecedents

Oral presentation OP804

Multidimensional Model of Subjective Work Environment: A conceptual and empirical development

Javier Barria, University of Oviedo

science&practice

Objectives:

In this framework, the main objective of this study is to validate a theoretical construct called Multidimensional Model of Subjective Work Environment (MM-ALS), which aims to guide the assessment and intervention in complex organisations. In addition, it aims to validate the psychometric properties of the Subjective Work Environment Battery (B-ALS), which is based on the theoretical foundations of the MM-ALS, an instrument that assesses the well-being and occupational health of people in organisations and how this affects work performance.

Theoretical background:

The MM-ALS model brings together the influence of two theoretical approaches; the Multilevel Model of Organisational Culture and Climate by Ostroff, Kinicki, and Muhammad (2012) and the Demands and Resources at Work (DRL) theory by Bakker and Demerouti (2018) and its definition states that the „balance between personal resources - coping strategies - and job demands - job burnout - to which employees are exposed, are explained by organisational culture and climate and mediated by leader support, which in turn moderates intersubjective processes and organisational practices and impacts on well-being and job performance". From the model of Ostroff et al. (2012), the MM-ALS construct considers the dimensions of organisational culture and climate focused primarily on the shared meanings of the work context, and mediated by organisational structures and practices, and in its specific dimensions of professional burnout (demands) and co-active coping styles (personal and work resources), it frames us directly with the theory of Demand and Resources at Work (DRL; Bakker and Demerouti, 2018). From the proposed construct, a Subjective Work Environment assessment instrument is developed that considers its different dimensions, called the Subjective Work Environment Battery (B-ALS , Barría-González et al., 2021; Pérez-Luco, 2008).

Design/Methodology/Approach/Intervention:

The sample is composed of 1,439 workers from service and production organisations, seven public and two private, in different cities distributed throughout Chile. In total, 55% of the sample belonged to public organisations, 34.5% to private for-profit organisations and 10.5% to private non-profit (social development) organisations. The age range was between 18 and 65 years, with a mean of 39.48 years and a standard deviation of 11.13. Forty-five percent of the sample were women. The organisations were purposively selected to represent different productive sectors and to be nationally representative.

Results obtained or expected:

So far , the MM-ALS is in the process of conceptual development in the doctoral thesis of the undersigned and the empirical formulation of the construct through the validation of the psychometric properties of each of the scales that arise from the construct and that make up the B-ALS instrument. Articles derived from the validation of the psychometric properties of the B-ALS scales are in the process of being published. Also, the application of the instrument to the employees

of a Chilean University is being piloted. In the medium term, the results of the evaluation and creation of interventions oriented to the work teams will be obtained from the model.

Limitations:

The model is multidimensional and integrates different dimensions, which makes its simplicity and analysis difficult. One of the important dimensions of the model is Organisational Culture and Climate, which in the literature there are few empirical studies of this relationship between the constructs as pointed out by González-Romá (2019). On the other hand, the B-ALS is a battery that has an important extension of scales and items that could affect the efficient response of employees.

Practical implications of the research:

The practical purpose of the MM-ALS and its B-ALS is to continuously provide the organisation with strategic information on the working conditions from the subjective experience of its workers, allowing it to manage through differentiated intervention the satisfaction and well-being of employees and the health of the organisation, with the consequent impact that this has on productivity indicators and operating costs.

Relevance to the conference theme:

This study presents a new model and instrument for the improvement of organisational well-being andhealth, considering dimensions that are little considered in themodels of organisational diagnosis and intervention.

Keywords: Model, Multidimensional, psychometric properties; assessment

Oral presentation OP49

Multidimensional narcissism and emotional exhaustion at work

Franziska Böhm & Gerhard Blickle | University of Bonn

science

Research goals and why the work was worth doing

Research on narcissism and emotional exhaustion at work has yielded heterogeneous results, often used homogeneous samples (e.g., in-patients or employees from one industry or company), and focused on unidimensional grandiose narcissism. Therefore, we examine the relationship between narcissism and emotional exhaustion at work (i.e., burnout and workaholism) with an industry diverse sample, focusing on the relative importance of the three narcissism dimensions narcissistic agentic extraversion, narcissistic neuroticism, and narcissistic self-centered antagonism.

Theoretical background

Workaholism and burnout are both indicators of emotional exhaustion at work. While workaholism describes a need to work excessively and hard, burnout encompasses a decrease in mental resources and a sense of indifference to the work environment (Schaufeli et al., 2008). Research on narcissism and burnout or workaholism has mainly focused on unidimensional grandiose narcissism and yielded heterogenous results with some studies finding positive (Andreassen et al., 2012; Clark et al., 2010; Von Känel et al., 2017) and some studies finding non-significant relationships (Falco et al., 2020; Prusik & Szulawski, 2019). However, narcissism is a multidimensional construct (Crowe et al., 2019) and it is important to identify the differentiating associations of its dimensions (Lilienfeld et al., 2015). Research suggest that grandiose and vulnerable narcissism comprise three subdimensions, which are the focus of our study: Narcissistic agentic extraversion involves striving for acclaim and authority, and grandiose fantasies. Narcissistic neuroticism involves a need for admiration and validation, and feelings of shame. Narcissistic self-centered antagonism includes manipulative and exploitative behavior, and reactive anger (Miller et al., 2016). Von Känel et al. (2017) found, that the maladaptive dimension of grandiose narcissism (i.e., narcissistic self-centered antagonism) is positively associated with burnout. Furthermore, the Big Five correlates of narcissistic neuroticism (reversed emotional stability) and narcissistic self-centered antagonism (reversed agreeableness) suggest positive associations with burnout (Alarcon et al., 2009; Crowe et al., 2019). Therefore, we hypothesize that narcissistic neuroticism and self-centered antagonism are positively associated with burnout (H1). We hypothesize that due to the fear of shame and need for admiration and validation and due to the strive for acclaim (Miller et al., 2016), narcissistic neuroticism and agentic extraversion are positively associated with higher workaholism (H2). As narcissistic agentic extraversion should be positively related to workaholism, and workaholism is an antecedent of burnout (Moyer et al., 2017), we hypothesize that workaholism mediates the relationship between narcissistic agentic extraversion and burnout (H3).

Design/Methodology

Our sample consisted of 279 employees from different industries. All reliabilities were $\alpha > .70$. Supporting the measurement model, a five-factor model showed superior fit compared to a one-factor model ($\Delta X^2 (10 \text{ df}) = 593.16$, $p < .001$). We simultaneously regressed all three narcissism dimensions onto burnout (H1) and workaholism (H2). H3 was tested with the PROCESS Macro for SPSS (model 4 with 10000 bootstraps; Hayes, 2018), while controlling for the other two narcissism

dimensions. All analyses were carried out with and without occupational status (1 = unskilled worker to 15 = proprietor of a large business) as control variable (Dietl et al., 2016).

Results obtained

Supporting H1, only narcissistic neuroticism and self-centered antagonism were significantly positively associated with burnout. Supporting H2, only narcissistic agentic extraversion and narcissistic neuroticism were significantly positively associated with workaholism. Supporting H3, there was a significant positive indirect association between narcissistic agentic extraversion and burnout via workaholism. Results remained stable when occupational status was controlled.

Limitations

Future designs should realize at least two measurement points to disentangle the association of workaholism and burnout.

Conclusions

It is important to study narcissism multidimensionally as its dimensions have differentiating associations with burnout and workaholism. Particularly narcissistic neuroticism seems to be a risk factor as it relates to both workaholism and burnout. Narcissistic self-centered antagonism is also associated with burnout, especially with its subdimension depersonalization. The adaptive dimension narcissistic agentic extraversion is also linked indirectly with burnout through workaholism.

Relevance to the Congress Theme

To prevent emotional exhaustion at work in the future, it is important to identify associated personality traits.

Relevant UN SDGs

Good health and wellbeing

Keywords: Narcissism, Burnout, Workaholism

Oral presentation OP417

Multilevel Job Demand-Control-Support: A between- and within-person examination of work characteristics and employee well-being

Ivan Marzocchi, Department of Psychology, Sapienza University of Rome; Roberta Fida, Norwich Business School, University of East Anglia; Claudio Barbaranelli & Matteo Ronchetti | Department of Psychology, Sapienza University of Rome

science&practice

Research goals and why the work was worth doing

Research on the characteristics of the work environment has mainly focused on between-persons differences, investigating whether employees dealing with high job demands and low job resources generally experience impaired well-being (Morrison et al., 2003). A major shortcoming is that this approach assumes that variables are completely stable over time. Conversely, recent studies highlighted that the perceptions of work characteristics and well-being are likely to vary over the course of employees' work experiences (e.g., Totterdell et al., 2006). Moreover, recent evidence showed that within-person fluctuations in work characteristics' levels could have contingent effects on well-being (e.g., Pindek et al., 2019). Thus, the present study is aimed at: (a) investigating the degree of stability and fluctuations of the three main components of the Demand-Control (-Support) model (DCS; Karasek & Theorell, 1990) and well-being across a three-months period; and (b) examining the association among work characteristics and well-being at the between-persons and the within-person levels. In doing so, we provide an updated representation of the DCS by testing whether the model is also suitable for understanding how well-being may result from interactions between employee and more situational, dynamic characteristics. Moreover, we integrate the between-persons and the within-person perspectives to investigate whether and how work characteristics are associated with well-being at both levels of the employee functioning.

Theoretical background

We rely on the DCS as our theoretical framework. The underlying rationale of the DCS is that impaired well-being occurs when specific combinations of workload, control and support make it difficult for employees to provide effective strategies to deal with the challenges of their job (Karasek & Theorell, 1990). This assumption has been tested at between-persons (or trait-like) level and, albeit only rarely, at within-person (or state-like) level. While the between-persons level reflects inter-individual variability and capture differences between employees, the within-person level reflects intra-individual variability and capture processes that happen within the individuals. So far, little is known on to what extent work characteristics and well-being (and their associations) differ with respect to their trait-like and state-like features, although most personality and organizational researchers contend that these variables are determined by both stable and dynamic factors.

Design

We recruited a sample of Italian employees to set up a shortitudinal research design (Dormann & Griffin, 2015). At time 1 (T1) we had a total of 1308 participants. One month later (T2) we had 638 participants. After one month, the final sample at T3 included 317 workers. Workload, control and support were investigated through the Management Standards Indicator Tool (Rondinone et al., 2012), while well-being was assessed with the General Health Questionnaire (Goldberg & Williams, 1988). We used a Doubly Latent Multilevel Structural Equation Modelling approach (Marsh et al., 2009) to investigate our research questions.

Results

About two-thirds of the true variance in workload, control, support, and well-being was accounted for by the trait-like component, revealing that, although relatively stable, considerable within-person variations occur in the four variables. At between-persons level, trait-like workload, control and support were all significant predictors of trait-like well-being, explaining a total variance of 26.7%. Moreover, at within-person level, a non-negligible proportion of variance in well-being (6.4%) was accounted for by work characteristics, with higher-than-usual workload and higher-than-usual support significantly associated with state-like well-being.

Limitations

The constructs were measured with self-report scales. Moreover, we limited our investigation to the three main components of the DCS and we did not include individual characteristics in our investigation.

Conclusions and relevance to the congress theme

Our study demonstrates that the perception of work characteristics can fluctuate over time, and that such fluctuations can trigger certain levels of well-being on a more contingent basis. As the costs of poor mental health in the workforce are significant, proper occupational health interventions are needed to promote and protect employee well-being. These should enable employees to properly perform their tasks on a day-to-day basis, and to protect them against particularly intense periods of work which may lead to well-being issues.

Oral presentation OP244

MY LIPS ARE SEALED! HOW EMPOWERING LEADERSHIP AFFECTS EMPLOYESS' ERROR REPORTING

Miguel Fernandes, Nova School of Business and Economics; Aníbal López, Instituto Português de Administração de Marketing

science&practice

Research Goals: This research aims to investigate the antecedents of employees' error reporting by exploring the role of empowering leadership. We argue that empowering leadership should positively influence employees' paradox mindset and, consequently increase employees' likelihood of reporting their errors. Additionally, we explored whether the positive effect of empowering leadership on employees' paradox mindset is affected by their gender. Our work advances knowledge on factors and conditions that affect employees' error reporting and contributes to the leadership literature by exploring the boundary conditions and mechanisms of empowering leadership.

Theoretical Background: Employees more often cover up their errors rather than report them (Carrol et al., 2021). As a result, leaders may not possess important information that otherwise could reduce the negative consequences of errors and lead to increased performance and innovation (Frese and Keith, 2015). Past research on error reporting suggests that the organizational context influences how employees perceive their errors and their willingness to report them (van Dyck et al., 2005). Although leaders are a critical element of this context (Christian et al., 2011) and the direct recipients of employees' error reporting (Zhao and Oliveira, 2006), little is known about how different leadership styles affect employees' error reporting. We propose that one leadership style likely to affect error reporting is empowering leadership as past research shows that it is particularly valuable for discretionary and potentially risky behaviors (Lee et al., 2016). Under empowering leadership, employees' should perceive less costs associated with reporting their errors, increasing their willingness to report them. We draw on social information processing theory (Salancik and Pfeffer, 1978) to argue that one's paradox mindset (i.e., the extent to which one is motivated and energized by tensions; Miron-Spektor et al., 2018) mediates the effect of empowering leadership on error reporting. Employees' paradox mindset enables them to constructively approach the tension imposed by the perceived costs and benefits of error reporting and reduce defensive strategies (e.g., ignoring the error or blaming a colleague). However, prior research shows that not all employees respond equally to empowering leadership, and that its effects depend on individuals' perceptions of these behaviors (Lee et al., 2016). We draw on social role theories (Eagly, 1987) to argue that due to persisting gender stereotypes, men and women are likely to react differently to empowering leaders.

Design/Methodology: We conducted a time-lagged field study in a variety of industries (N = 254), with three data collection moments.

Results: We found that empowering leadership is directly associated with error reporting and that gender tempers the indirect effect of empowering leadership on error reporting via paradox mindset.

Limitations: We collected our data from the same source (i.e., employees), which may raise concerns regarding common method variance (Podsakoff et al., 2003). Nevertheless, we employed procedures to account for this possibility (Podsakoff et al., 2003).

Research/Practical Implications: Our research expands current understandings of the antecedents of employees' error reporting (Zhao and Oliveira, 2006; Russo et al., 2015), and specifically on the role of leaderships styles. Furthermore, by considering the mediating role of one's paradox mindset (i.e.,

a cognitive mechanism), we contribute to the empowering leadership literature which tended to focus on motivational mechanisms. Fostering employees' ability to embrace tensions in the workplace and react constructively to them (i.e., promoting their paradox mindset) should have an impact on how they approach the tension imposed by reporting their errors and increase their willingness to report their own errors. Finally, we contribute to the discussion on the effectiveness of empowering leadership by introducing gender as a boundary condition.

Originality/Value to the Conference: We demonstrate how leadership affects employees' error reporting. Also, we highlight gender differences in reactions to empowering leadership.

Value to the UN SDGs: Our study speaks to the goal of promoting gender equality, by showing that the same leadership style may produce different results for men and women.

Intended Audience: Academic and practitioner.

Keywords: empowering leadership, error reporting, paradox mindset

Oral presentation OP448

Narcissism and identity motives underlying self-employer brand relationship

Małgorzata Styśko-Kunkowska, Marlena Urban & Miłosz Niemiro | University of Warsaw

science

Studies on the role of narcissism, particularly grandiose narcissism, in organizational context are arising, however it was not studied as a factor related with employer brand nor with identity motives. Two studies regarding connections of narcissism and identity motives underlying self-employer brand relationship will be reviewed. Narcissism as a personality characteristic in subclinical sense is related with higher sense of superiority and sense of being better over others, desire for recognition and admiration, focus on own needs, with some differences between narcissism grandiose (e.g. dominance) and vulnerable (e.g. social withdrawal). The model of identity motives underlying self-employer brand relationship refers to a model of Vignoles of six identity motives (belonging, continuity, distinctiveness, efficacy, meaning and self-esteem) which was expanded by qualitative and quantitative studies of the first author in the area of work by submotives, e.g. distinctiveness includes individualism and superiority). The term of inclination to build self-employer brand relationship based on identity motives refers to beliefs, emotions and intention of behaviors toward ideal employer brand. In turn, the term sense of satisfaction of identity needs by employer brand refers to the present employer.

The first study focused on relationship between grandiose and vulnerable narcissism with inclination to build self-employer brand relationship based on identity motives. In the sample of 111 participants, who had considered changing jobs in the last 12 months, positive correlations between grandiose and vulnerable narcissism and all identity motives and sub-motives were found. Grandiose narcissism was a significant predictor explaining the level of all six motives. The specific target group and analyzing only inclination to build self-employer brand relationship as well as very limited literature on vulnerable narcissism constitute some of main limitations of the study.

The second study was aimed to understand moderating effects of employer brand strength and identity needs satisfaction on the relationship between grandiose narcissism and counterproductive as well as citizenship voluntary work behaviors. In the sample of 125 working persons, one of hypotheses was confirmed that grandiose narcissism, particularly leadership, was a significant predictor of counterproductive work behaviors. Explorative analysis revealed the positive relationship of narcisstic self-sufficiency and citizenship work behaviors. The hypotheses on moderating role of brand strength and sense of satisfaction identity needs by employer brand neither interaction of self-sufficency and sense of satisfaction of identity needs on citizenship behaviors were not supported by data. One of key limitations of the study include predominance of the short work experience and of people during studies, what could result in not expressing full range of organizational behaviors, as well as wide range of occupations, what can dilute the effects.

We find the role of personality and identity as of key importance for understanding complexity of human functioning in modern organizations, and as such the studies contribute to research on the role of narcissism in functioning of an individual on the labour market, as well as for research on narcissism.The results of the studies may be particularly relevant with regard to growing scholarly interest about the meaning of the personality traits traditionally regarded as malevolent in organizational setting. The findings point out that highly narcissistic people are especially prone to look for the employment opportunities where they can satisfy their identity needs. However, the level of need satisfaction may not be indicative of their future involvement in organizational -

counterproductive or citizenship - behaviors. Furthermore, the findings underscore the need for more nuanced reconceptualization of grandiose narcissism.

The studies indirectly addresses the conference theme The Future is now? Delivery as it regards the role of one of arising individual characteristics for organizations.

The topic is relevant UN SDGs in the area of strong institutions.

Keywords: narcissism, employer brand, work behaviors

Oral presentation OP331

Navigating resocialisation into the workplace as a mother-worker following an extended career break

Yseult Freeney, Dublin City University; Alison Coleman, Dublin City University; Vera Costello, Central Statistics Office; Teresa Hayden, Accenture; Lisa van der Werff, Dublin City University

science

Research goals and why the work was worth doing: The term women returners refers to women coming back into paid work after spending a significant number of years raising a family, having devoting themselves to motherhood (Tomlinson et al., 2009; Herman and Webster, 2010). The skills of women returners are of crucial importance to the labour market, yet there is little empirical evidence on women's experiences of this transition. Research suggests that returners face considerable structural obstacles to reentry (Cabrera, 2007), and experiences during return-to-work transitions have critical consequences for career success and professional relationships (Freeney et al., 2021). Moreover, the transition back to work amplifies tensions between identity as a mother and identity as a worker-mother (Ladge & Greenberg, 2015). We know little about how mothers navigate this transition back to work, particularly when confronting maternal penalties and inequalities (O'Brien & Liddy, 2021). Thus, this study seeks to gain insights into the lived resocialisation experiences of mothers who have spent three or more years at home caring for children.

Theoretical lens: We conceptualise return-to-work experiences through the lens of organisational socialisation theory (OST; Van Maanen & Schein, 1979), employing Chen & Klimoski's (2003) stages model of OS. This suggests that a newcomer progresses through three socialisation stages: anticipation, encounter, and adjustment.

Method, Analysis and Findings: We adopt a qualitative approach conducting semi-structured interviews with 34 mothers in a range of occupations. Inductive analysis revealed that, during the anticipation phase, mothers are attuned to market realities and take steps to up-skill and draw on their networks to orchestrate their return. The participants made decisions to return in the context of their relationships and personal values, some choosing to work part-time to balance motherhood responsibilities, others changing careers to occupations more consistent with their values. Women experience challenges predominantly in the anticipation phase: recruiter bias toward their CV gap, an undervaluing of motherhood, and poor fit with state support. In the encounter phase, mothers face challenges with finding their professional voice and adapting their work-life interface. The shift to the adjustment phase of socialisation is supported by positive professional relationships and often involves an evolution of mother-worker identities enabled by valuing their own contributions at work and at home.

Limitations: Our results are limited by the retrospective nature of the interviews. Ideally, longitudinal qualitative research would capture womens' experiences during the early stages of the anticipatory phase so that we can fully identify triggers, in terms of content and timing, for occupational downgrading.

Originality / Value: Our analysis supports a stages model of resocialisation but identifies some inherent challenges in employing OST to inform our understanding of mother's reintegration. Traditional OST defines the 'anticipatory' phase, as the period just before "getting in" when individuals gather information about what/how the organisation is and their possible role within it. Our analysis suggests that, for mother-returners, the anticipatory phase begins long before the actual

return and, as they internalise stigmatised attitudes that exist towards mothers, they engage in 'occupational downgrading', opting for jobs for which they are overqualified.

We contribute to the literature on motherhood and work in surfacing subjective experiences of mothers' return-to-work experiences after a hiatus by applying Chen and Klimoski's (2003) phases model. We identify that, in the context of career breaks, the definition of the "anticipatory" phase should be extended to include, not only the period before "getting in", which is concerned with organisational/role expectations, but also the decisive "looking forward" period, in which women start preparing to transition back to employment. Emerging findings point to worker-mothers engaging in deep reflection on their sense of sense, with an emerging 'temporal identity' where they subjectively assess their current self in comparison to their past self and future ideal self. The distance between these temporal-based selves is associated with well-being and contentment.

Conclusion: Our study raises awareness of the unique issues confronting mothers as they interact with their worker-mother identities during the resocialisation process following a career break. Our findings highlight a lengthy 'anticipatory phase' where women internalise stigmas as a result of the barriers they face to successful reengagement with work.

Network analysis: an intuitive perspective on complex phenomena

Carla Quesada-Pallares, Universitat Autònoma Barcelona; Paulina Robalino, Head of People Science & Research at Slik

science&practice

With the advances of open science, researchers and practitioners face new challenges: deciphering large volumes of information data and maintaining inherent structures. Other areas of science have tackled this challenge by using network science and graph theory methods. In psychology, Network Analysis (NA) can be used as a novel psychometric approach for surveys. Literature suggests that NA provides a better way to understand both the architecture and the associations between the components of a model. This analysis offers an intuitive perspective on complex phenomena via models depicted by nodes (variables) and edges (correlations). One of its main advantages is the identification of components that are central, stronger, and actively involved, leading to a better understanding of the model with a potential impact on improving the application in work-related variables. Our main goal was to test the reliability and the structure of a questionnaire using NA, while comparing it with a traditional Exploratory Factorial Analysis (EFA). A total sample of 263 employees (89% Male) with ages between 19-61 (M=33.35; SD=8.90) and an average tenure of 7.84 (SD=5.78). Participants responded to an online questionnaire of 28 items to evaluate 5 dimensions of the job-related questionnaire (leadership, task, engagement, individual expectations, organizational satisfaction); their voluntary consent was recorded by accepting the form. Data were analysed using JASP-stats. We applied Regularized Partial Correlation Networks (RPCNs) to explore relations among items without assuming any structure or model. We chose the Expected Bayesian Inference Criteria (EBIC) estimation with the graphical Least Absolute Shrinkage Optimization (gLASSO) regularization as the network estimation method since it provided the most adaptable estimations for ordinal, approximately normal data. Descriptive statistics were obtained for all variables and plots were examined. Reliability analysis presented alpha coefficients between .70 to .90. Results showed a positively correlated network and a stable 5-dimension structure. Based on visual inspection, theoretical dimensions showed good preliminary correspondence within the network. The Kaiser Meyer-Olkin was .95 and Bartlett's Test of Sphericity was significant ($X^2=4731.15$; $p<.001$). EFA found a five-structure explaining 58% of the variance. As a limitation, our measure was a self-report, which impedes control for single-method bias. Future research could also explore the use of NA in other variables or models. Our study confirms that the NA method can be used as an alternative to identifying the structure of the psychological scale. Furthermore, the results of the analysis are presented in a visual form facilitating the researchers to quickly identify the scale structure based on the relations displayed in the form of lines (thick-thin) and colours (blue-red). This NA will significantly help researchers, especially if some items or dimensions are very highly correlated so it is difficult to determine whether they are from the same structure. This is because NA presents network plots, weights matrix, centrality plots, and centrality tables that help researchers to make decisions. All this data visualization is useful for both researchers and practitioners not used to statistics, so this technique can help non-statisticians to get familiar with reliable statistics for validation purposes.

Oral presentation OP390

Network Approach to Work Addiction: A Cross-Sectional Study

Piotr Bereznowski, University of Gdańsk, Institute of Psychology

science

Research goal and why the work was worth doing: In this study, I aimed to use a network approach to conceptualize work addiction as a dynamic system of symptoms that are in direct relationships with each other. Such conceptualization might provide novel insights regarding potential targets of therapeutic interventions and prevention programs focused on work addiction.

Theoretical background: According to the World Health Organization and the International Labour Organization, every year over 745 thousand people die worldwide due to overworking. One of the mental health problems contributing to these deaths is work addiction, which has a prevalence rate of up to 10% among working individuals. Besides death, work addiction leads to other negative work-related phenomena such as occupational stress, job burnout, work-life conflict, and a global burden of disease. Typically, work addiction is investigated within the latent trait framework. However, previous studies showed some non-trivial direct relationships between the symptoms of work addiction. The presence of these relationships might indicate that there exists an additional process in which symptoms of work addiction influence each other. Such a process would be congruent with both clinical practice, in which intervention strategies focused on symptoms and relations between them are usually successful (e.g., cognitive-behavioural therapy), and the network theory of mental disorders (i.e., a theory behind network approach). Consequently, the network approach to work addiction might constitute a bridge between the results of quantitative studies on work addiction and intervention strategies applied in clinical practice.

Methodology: I used four datasets in which work addiction was measured with the Bergen Work Addiction Scale. Two datasets comprised responses from working Norwegians ($n_1 = 16{,}426$, $M_{age1} = 37.31$, $SD_{age1} = 11.36$; $n_2 = 776$, $M_{age2} = 29.76$, $SD_{age2} = 7.12$) and two datasets comprised responses from working Poles ($n_3 = 719$, $M_{age3} = 36.39$, $SD_{age3} = 11.36$; $n_4 = 715$, $M_{age4} = 25.58$, $SD_{age4} = 3.41$). I jointly estimated the four networks of work addiction and estimated the stability of the four networks. Then, I searched for potential clusters of symptoms, estimated symptoms' centrality (based on node strength), and estimated symptoms' predictability in each network. Finally, I quantitatively compared the edge weights in the four networks.

Results: Stability analyses indicated that all four networks were accurately estimated, with small to moderate confidence intervals around the edge weights. The four jointly estimated networks featured many consistent edges (e.g., an edge between conflict and problems) and two clusters of symptoms. The first cluster included salience, mood modification, and withdrawal. The second cluster included tolerance, relapse, conflict, and problems. Relapse was the most central symptom and mood modification was the least central symptom in each network. Mean symptom predictability varied between 23.1% and 28.6% across networks. In the omnibus tests of the six possible pairwise comparisons, only Network 1 differed from Network 4 ($p < .001$), and Network 2 differed from Network 3 ($p = .030$). Out of all 21 edges, four edges differed significantly between Network 1 and Network 4 and three edges differed significantly between Network 2 and Network 3.

Limitations: The symptoms of work addiction were measured with single items, which might have biased estimates of networks' parameters and reduce the validity of the results. The data were cross-sectional, which puts limitations on causal inference. Last but not least, the four samples were predominantly female and represented general populations from just two European countries, which

puts restrictions on the generalizability of the results to clinical populations and populations from other countries and cultures.

Conclusions: This study showed that the network approach constitutes a promising framework for studying work addiction. However, it also highlighted the need for conceptual clarification of the meaning of centrality in cross-sectional networks. The obtained results seem to indicate that centrality represent diagnostic importance of a symptom rather than its potential to influence other symptoms in a network.

Relevance to the Congress Theme: In recent years, there has been an exponential growth in the amount of research papers applying network analysis to psychological phenomena. It is probable that in the future, network analysis will become an important statistical tool for analysing work-related behaviours. Consequently, this presentation might allow the congress attendees to familiarize themselves with network analysis and make them aware of strengths and limitations of this statistical tool.

Keywords: network analysis, work addiction, workaholism

Oral presentation OP129

Never Too Much? The Curvilinear Relationship Between Employees' Humor and Customers' Enjoyable Interaction: Moderating Role of Service Climate

Qurat-ul-ain Talpur, ESSCA Business School; Ghulam Murtaza, Kedge Business School; Rahman Khan, NEOMA Business School

science&practice

The current study intended to explore the usefulness of employee humor as a tool to make enjoyable customer interaction. Specifically, the current study explores the curvilinear role of employee humor by testing how much humor could remain beneficial and when it can start hurting the customer's experience. In the current environments, organizations are struggling to make their customers happy and for that purpose they are utilizing various tools to succeed in this purpose.

An enjoyable customer experience has been one of the prime goals of retail firms (Mottl, 2015) because a positive customer experience is crucial to the success of service organisations. Notably, a customer experience is expected to be improved if frontline employees (FLEs) use affective components when communicating with customer. One such component might be is "humor" which is an effective way of communication that allows FLEs to keep intact with customers and can promote customers' positive behaviours (Kobel and Groeppel-Klein, 2021) during their service interactions. Though, interpersonal interactions have an emergent, dynamic quality whereby key variables can change from moment to moment (Diefendorff and Gosserand, 2003). Consequently, we posit that the aspect of "when" is important to consider the difference between various time slots in a single service interaction because time sequence may positively or negatively impact customer outcomes. We, therefore, anticipate that the timing (the beginning, the middle or the ending) selected (when) by the FLE to use the humorous comments during service interaction may have differential effects on enjoyable interaction.

Although former studies attest the positive effects of humour on firms' outcomes (Blanchard et al., 2014), questions remain about how effective use of humor is unanswered. In other words, previous research shortfalls in explaining, Is more humor necessarily better? Therefore, by questioning the assumptions regarding the beneficial role of humor, previous research has drawn our attention to the fact that humor can be a potential tool in employee-customer interaction. When use it inappropriately, it can have serious consequences for organisations. Using the framework of too-much-of-a-good-thing (Pierce and Aguinis, 2013), we argue that while FLE's humorous remarks can bring joy, create a sense of intimacy and create a successful relationship between FLEs and customers up to a certain level, too much humor might not be fruitful for customer interaction (Eatough, 2021).

Service interactions are potentially uncontrollable and unexpected, it may appear that service organizations may face challenges in managing their positive and negative consequences through organizational policy and practice. However, organisational factors might serve as moderators, buffers, or help meet these demands (Kahn and Byosiere, 1992; Morris and Feldman, 1996). Specifically, we draw from social exchange theory (Blau, 1964; Cropanzano and Mitchell, 2005) that we presume that organisational service climate could potentially moderate a novel, curvilinear relationship between FLEs' humor and enjoyable interaction.

In study 1 (n = 318), using 2 × 3 factorial design, the ANCOVA results supported that humor used by the frontline employee in the time slot in the middle of interaction remains more enjoyable for the customers. In study 2, dyadic data from 387 service interactions between the frontline employee and

customers show a curvilinear relationship of frontline employees' humor with customers' enjoyable interaction. Our study results demonstrate that service climate moderated the curvilinear relationship of frontline employees' humor with customers' enjoyable interaction.

First, the current study used a cross-sectional design, and therefore we cannot claim a causal relationship between study constructs. Second, we have demonstrated that a moderate level of workplace humor is optimal for enjoyable interaction. Neither we nor our predecessors in humor research have been able to clearly define a moderate level of the workplace.

The results of two separate studies showed that unwise use of workplace humor has a dark side. The extent to which this dark side appears depends on two factors, such as suitable time and an appropriate quantity of humor to be used that can positively impact affect enjoyable service interaction. We also gleaned some information about the condition under which workplace humor strengthens or weakens the curvilinear relationship between workplace humor and enjoyable interaction.

The current research relates with congress theme by exploring positive and negative sides of employee humor at work. It remains relevant in current work situations where organizations are exploring more ways to provide quality service experience to their customers and compete with other organizations.

Keywords: Employee Humor, Customer Enjoyable Interaction, Service Climate

Oral presentation OP656

New Ways of Work and Mental Health: Work Intensity as a Mediating Factor and Target Variable of Job Resources

Roman Soucek, MSH Medical School Hamburg; Amanda S. Voss, Friedrich-Alexander-Universität Erlangen-Nürnberg

science

Research goals and why the work was worth doing

The world of work has profoundly changed. Information and communication technology has expanded the availability of information and shaped our way to communicate and collaborate during the last decades. The variety of communication tools has increased, such as video conferencing, and work settings have changed due to increased flexibility both concerning work locations (e.g., working from home) and working hours (e.g., working in the evening). Also, the Corona crisis has accelerated these developments such as working from home. These recent changes in the world of work have not been given a uniform name in research but can be summarized under the general term “new ways of work”. The consequences of these new ways of work are the subject of controversial discussions on whether they are good or bad for employees’ health. To understand the impact of new ways of work on mental health, we have to address two fundamental questions. First, how are new ways of work related to consequences for mental health? Second, under which conditions do these consequences occur?

Theoretical background

Central dimensions of the “new way of work” are digitalization of work processes, flexibility concerning working times and locations as well as the dissolution of boundaries between the spheres of work and non-work. Digitalization and flexibility of workplaces are associated both positively and negatively with employees’ well-being. However, the mechanisms behind this relationship are not clear yet. Thus, we present work intensity as a link between new ways of work and mental health. Furthermore, we address two job resources to reduce this association: autonomy and boundary control.

Autonomy in the workplace means that employees have control over decisions within their job. We assumed that autonomy in the workplace negatively relates to work intensity and that the higher autonomy in the workplace, the weaker is the association between flexibility and work intensity.

The rise of technological devices such as laptops and smartphones allows the performing of work tasks at home outside of the workplace and regular working hours, thereby weakening the boundaries between the spheres of work and private life. As a countermeasure, a stronger perceived segmentation norm may protect from work-related technology use at home during non-work hours. Thus, we assumed that the perception of control over the self-determined drawing of boundaries between work and private life contributes to lower work intensity. Furthermore, we assume that boundary control buffers the relationship between the dissolution of boundaries and work intensity.

Design/Methodology/Approach/Intervention

Overall, 1097 employees of a public administration organization participated in the survey and answered a web-based questionnaire. All variables were assessed with existing measures. We tested all models with the statistical software R and conducted hierarchical regression analyses.

Results obtained or expected (if not available, it must be made clear when they will be)

The results provided evidence that flexibility and dissolution of boundaries were related to irritation and work engagement through work intensity. Moderated mediation analyses revealed that autonomy and boundary control moderated the relationship of flexibility respectively dissolution of boundaries with work intensity, protecting mental health.

Limitations

The present study has some limitations. First, we relied on cross-sectional data, which does not permit any strong conclusions about causal relationships. Therefore, future studies should focus on longitudinal processes to unravel the interrelations among new ways of work, work intensity, and mental health. Second, another limitation of the present research is the use of self-reported data, which may inflate the correlations between the variables. However, the use of self-reports for the assessment of work intensity and strain is appropriate because these aspects are experienced by the persons.

Conclusions – Research and/or Practical implications/Originality/Value

The results indicated that work intensity could be perceived as a conceptual bridge between new ways of work and mental health providing a promising starting point for the deployment of job resources such as autonomy and boundary control. However, these resources have to match the specific demands imposed by new ways of work. The matching of appropriate resources and implementing them in organizations remains an ongoing task in the face of changing work arrangements.

Relevance to the Congress Theme

This research explicitly addresses with new ways of work the congress theme “The future is now: the changing world of work”.

Relevant UN SDGs

Good health and wellbeing, Decent work and economic growth

Keywords: new ways of work, work intensity, mental health

Oral presentation OP381

New Ways of Working in Relation to Job Characteristics and Well-being: A Cross-Lagged Panel Study

Ivana Vranjes, Tilburg University; Lode Godderis, Sofie Vandenbroeck & Tinne Vander Elst | Tilburg University & IDEWE Group

science&practice

New Ways of Working (NWW) refer to a work design in which employees can determine the timing and location of their work, while being supported by electronic communication. Although this work practice is gaining popularity in the work field, it is surprising that research on this topic seems to be lagging behind. While past research on this topic suggests that NWW are related to both beneficial (e.g., increased engagement and performance) and detrimental (e.g., blurred work-home boundaries and fatigue) employee outcomes, most of these findings stem from correlational studies conducted in specific work sectors (Kotera & Vione, 2020).

Building on the Job Demands-Resources Model (JDR; Bakker & Demerouti, 2007), job demands and resources have traditionally been studied at the task level. However, they can also be conceptualized at a higher level. In this regard, organizational demands and resources refer to employee experiences of the distal, contextual, or system-level aspects of the organizational environment (Albrecht, 2012), which provide context for how employees experience their work (Albrecht et al., 2015; Leiter & Bakker, 2010). Consequently, they may impact individual demands and resources and influence their effect on employee outcomes (Bakker & Demerouti, 2007; Demerouti & Bakker, 2011). In this study, building on the JDR and Renard et al.'s (2021) positive conceptualization of NWW as organizational practices that lead to positive employee outcomes, we wanted to examine whether NWW can be conceptualized as an organizational resource that impacts employees' well-being over time through changes in their perceived task characteristics. In specific, we focus on two well-being indicators (i.e., pleasure at work and risk of burnout), and seven task characteristics (i.e., work intensification, task changes, norms of colleagues to stay connected, workplace telepressure, and manager's support of employees' commitment).

Data were collected from a heterogenous sample of 881 Belgian workers who participated in at least one of two online surveys during the period June-September 2021 (time lag of three months). At Time 1, a large proportion of the labor force was required to work from home to contain the spread of the COVID-19 virus. At Time 2, this obligation was lifted which could have caused changes in NWW over time. We performed cross-lagged Structural Equation Modeling (ML estimator) in MPlus 8.7 to test the hypotheses. Bootstrapping was used to calculate 95% confidence intervals of the indirect effects.

The results show that NWW at Time 1 was negatively related to both work intensification and task changes at Time 2, and positively to norms of colleagues to stay connected to work during after-work hours at Time 2 (after controlling for baseline values at Time 1). However, we did not find a significant effect of NWW at Time 1 on workplace telepressure and manager's support of employees' commitment at Time 2. NWW at Time 1 negatively predicted WHI, but was not significantly related to HWI at Time 2. Next, none of the task characteristics at Time 1 predicted work pleasure and risk of burnout at Time 2. Accordingly, no indirect effects proved to be significant.

Study limitations are the use of self-reports to measure the study variables, and the two-wave cross-lagged design only allowing us to investigate rank-order (between-person) relationships across time instead of intra-individual processes.

This study contributes to previous studies on NWW by offering a comprehensive test of multiple task characteristics that may explain the relationship between NWW and employee well-being. As such, it answers the call for more research into the impact of NWW on employees that considers a wide range of outcomes and to test its effect in diverse workforces using a longitudinal design (Kotera & Vione, 2020; Renard et al. 2021). Our results suggest that NWW might be particularly beneficial to employees by making the work situation less demanding in terms of work intensification, task changes and WHI. However, we did also observe a negative effect of NWW as manifested though greater pressure from colleagues to be available after working hours. Notably, none of the task characteristics affected employee well-being over time. As multiple factors can account for this, like the context of the study (COVID-19 pandemic) and the length of the time-lag (short time-lag of three months), we urge researchers to further explore these relationships and probe into possible moderators on individual, team and organizational level that may amplify or buffer outcomes related to NWW.

This study best fits within the '8. Organisational design and development' EAWOP topic area. It also contributes to the UN Sustainable Development Goals of 'Good health and wellbeing' and 'Decent work and economic growth', as it investigates the relationship between NWW and employee well-being and addresses ways to protect the welfare of home workers.

No One-Size-Fits-All: Paradoxical Leader Behavior Influences Followers' Creativity Depending on Followers' Integrative Complexity

Katja Kristin Mayr, Felix Claus Brodbeck & Katharina Gabriele Kugler | Ludwig-Maximilians-Universität München, Munich, Germany

science

1. Research goals

As paradoxical cues can elicit out-of-the-box thinking, they improve the creativity of those confronted with them. First studies show that the same is true for paradoxical leader behavior ("seemingly competing, yet interrelated, behaviors to meet structural and follower demands simultaneously and over time"; Zhang, 2015, p. 538), as paradoxical leader behavior is associated with higher creativity of followers. Yet, evidence on this effect is scarce and consistently non-experimental. We therefore provide experimental evidence on how paradoxical leader behavior influences followers' creativity, depending on the followers' characteristic of integrative complexity.

2. Theoretical background

Leaders have to meet seemingly contradictory demands like treating followers uniformly while allowing individualization, or maintaining decision control while allowing their followers autonomy. Therefore, some leaders show paradoxical leader behavior (PLB) to meet those demands. Studies show positive relationships between PLB and various measures of followers' performance including creativity. Nevertheless, PLB also has the potential to confuse followers with its contradictory nature, especially if followers cannot differentiate and integrate different facets of a complex issue (i.e., integrative complexity), potentially hampering those beneficial effects. We therefore expect followers' integrative complexity to moderate how their creativity is impacted by PLB, such that followers with high levels of integrative complexity profit more in creativity from PLB than followers with low levels of integrative complexity.

3. Design

We conducted an online vignette-experiment with two times of measurements (N = 164): At t = 1, participants wrote paragraphs for coding integrative complexity. At t = 2, participants were randomly assigned to a vignette for PLB (PLB condition) or one of two vignettes for non-PLB (later combined to the non-PLB condition). Afterwards, creativity was measured using the Compound Remote Associates Test. Participants who did not complete the survey and participants who gave no or only nonsensical answers in the tasks for integrative complexity or creativity were excluded (N = 17).

4. Results

As expected, there was a significant interaction of the conditions and integrative complexity: Higher levels of followers' integrative complexity were associated with higher creativity in the PLB condition (but not in the non-PLB condition). We found no main effect of PLB on creativity.

5. Limitations

While being a strength of our study, the experimental design using vignettes also compromises ecological validity of our findings.

Despite measuring integrative complexity a-priori and assigning conditions randomly, high values of integrative complexity were scarce in the PLB condition, making evidence on followers with high IC in the PLB condition less reliable.

6. Research/Practical Implications

Although current literature emphasizes the positive effects of PLB on followers, we found a negative impact of PLB on followers with low integrative complexity. Leaders aiming to enhance creativity with PLB should make sure to not confuse their followers, especially those low in integrative complexity.

7. Originality/Value

To our knowledge, this study constitutes first experimental evidence for the influence of PLB on follower creativity.

8. Relevance to the Congress Theme

Our study contributes to the facet „The future is now. Contribution." of the Congress Theme: The future as being created by professionals from many fields will be rich with paradoxes, meaning seemingly contradictory demands. To handle the paradoxical demands, we need to develop new competences to compete and collaborate. Leaders need new competences to handle paradoxical demands connected to the leader role and followers need new competences (e.g., integrative complexity) to benefit from their leaders' paradoxical behavior in order to produce, for example, highly creative work.

Keywords: Paradoxical leader behavior, integrative complexity, creativity

Oral presentation OP457

No Profile, No Job? Investigating the Role of Missing Information and Recruiter Perceptions in Cybervetting

Franz W. Mönke & Philipp Schäpers | University of Münster, Germany; Amelie S. Bürger, Free University, Berlin, Germany

science

Research goals

Cybervetting, i.e., recruiters assessing applicants' social media profiles, is a new standard procedure in personnel selection: Various studies found that two of three recruiters engage in such scouring of online information. The goals of this study are three-fold, (1) to evaluate the influence of online information absence on recruiter judgments, (2) to investigate recruiters' decision processes in cybervetting, and (3) to evaluate the factors that influence these processes.

Background

There is a controversial debate about whether HR professionals should use social media for selection. So far, decision processes in cybervetting have remained a black box: That is, it is still unclear which cybervetting perceptions drive a recruiter's judgment. In our study, we investigate three variables that are promising mediators in cybervetting evaluations: Warmth and competence (two major dimensions of interpersonal perceptions, see social cognition theory) and the professionalism construct (often mentioned in practitioner surveys). One further concern in this debate is that social media profiles might be highly unstandardized: They differ in the quantity of available information, e.g., due to privacy concerns, personal preferences or general skepticism. Yet, it is unclear how recruiters react to such differing levels of information: Surveys with HR professionals suggested that missing or outdated profile information elicits negative reactions. At the same time, they reacted positively to the applicant's use of privacy settings, i.e., restricting available information. These contradictory information leave job seekers and practitioners with uncertainty.

Methods

Based on a power analysis, we recruited 363 German working professionals. In an online experiment, we asked them to act as a recruiter for a position as a junior project manager. Then, participants were randomly assigned to an experimental group, in a 2 x 3 x 2 between group design: Depending on their group, as manipulated, they saw the CV of a high or low qualified candidate (2 levels), who had a LinkedIn profile (3 levels of content detail: (1) maximum privacy settings: name and current occupation; (2) basic information about education, prior employers; (3) full profile: postings, details about prior jobs, study majors, grades, specific interests, and skills) that included either a profile picture or not (2 levels). Additionally, as a baseline, a subsample of participants rated the hireability of an applicant who had no LinkedIn profile. We will conduct variance analyses (MANOVA) and structural equation modeling (SEM) to test our hypotheses. The local ethics committee approved our procedure; we pre-registered our procedure.

Expected results

Data was collected in late 2022, data analysis is ongoing. We expect that the availability of information and a profile picture will impact hireability judgments, namely expectations of task performance, organizational citizenship behavior, counterproductive work behavior, and overall hireability judgments: The higher the amount of information, the more positive the judgments. As

mediators, i.e., recruiters' perceptions that drive their judgments, we suggest that perceptions of honesty, agency, communion, and professionalism are central mediators in cybervetting judgments. As a moderator, we expect that a higher perception of the applicant's privacy intention reduces the effect of missing information.

Limitations

We point out that our study is a vignette study: Thus, we call for future research to investigate how our findings transfer to other contexts. Also, joint effects of various platforms should be investigated. Research should also address the influence of applicants' attitudes on their profile design as well as cybervetting effects in comparison to "classical" CVs.

Implications

This study contributes insights to the debate about cybervetting, a growing yet controversial HR practice. Specifically, we provide substantial evidence how recruiters react to missing information in cybervetting, e.g., due to the use of privacy settings. Further, beyond self-reports, we illuminate recruiters' decision processes in cybervetting. These results send an important signal to HR professionals and provide input to the controversy about cybervetting validity.

Relevance to the Congress Theme

From hand-written cover letters to one-click applications: The future of HR is now. Online footprints from job seekers might be substantial first impressions–but studies need to investigate whether cybervetting can truly fulfil this promise. However, such research is still scarce. This is mirrored in that most organizations use cybervetting, but provide no guidelines for their HR professionals how to do so. With this study, we echo calls for insights into how the world of work is changing.

Keywords: cybervetting, social media assessments, personnel selection

Oral presentation OP146

No work at work: Is it better to recover than to be idle?

Martin Zeschke, Hannes Zacher & Sophia Kramer | Leipzig University

science

Research goals

We investigate how idle time at work, a period during which in-role tasks cannot be done for reasons beyond one's control, affects employees. The job demands-resources model assumes that recovery is a resource and an advantage for employees, whereas action regulation theory states that individuals want to achieve the goals they set for themselves and that adjustments in the goal achievement strategy negatively affect individuals. We want to find out which theoretical framework is the appropriate one for idle time and recovery: Recovery during idle time as a positive resource from a JDR perspective or a costly adaptation to the action regulation process from an action regulation perspective.

This research is worth doing because little is known about the effects of idle time at work on employees. Until now, only either objective or subjective measures have been investigated, but not both. We thereby do not know how objective idle time influences employees subjectively. With this study, we are able to identify the effects of idle time on employees, additionally mediated through boredom. We expect objective idle time to have negative effects on (a) task satisfaction, (b) motivation, and (c) well-being, and (d) a positive effect on exhaustion and that recovery experiences during idle time moderate these effects.

Theoretical background

The job demands-resources model argues that job demands positively influence exhaustion, while job resources positively influence motivation. We argue that idle time is a job demand that employees need to overcome during their work but often cannot and that recovery experiences are resources that may buffer the negative effects of idle time. Action regulation theory argues that sequentially complete actions are beneficial for employees, making both idle time and recovery experiences interruptions to the action regulation process.

Design

We used an experiment to investigate the effects of idle time on participants. After the baseline questionnaire (containing age, gender, and education), we presented 20 of the 60 items HEXACO, then asking participants about their task satisfaction, motivation, well-being, and exhaustion as baseline measures. After presenting the next 20 items of the HEXACO, we manipulated idle time in 6 experimental groups: (1) no idle time (control group), (2) mouse click condition (to indicate that participants are still at their computers), and the four subscales of recovery experiences: (3) relaxation instruction, (4) detachment instruction, (5) mastery instruction, (6) control instruction. Idle time duration was 5 minutes for all experimental groups. Participants were instructed to continue with the study as soon as the continue button appeared (cover story: an AI generates new items). We then presented the last 20 HEXACO items before the final questionnaire, again containing task satisfaction, motivation, well-being, and exhaustion. We additionally asked for the four recovery experiences subscales, whether they engaged in the suggested activities during idle time, and how much they enjoyed them. Finally, we asked whether they subjectively experienced idle time and how bored they were.

Results

We expect idle time to have negative consequences for participants. Recovery strategies may buffer the negative effects on the outcomes. After preregistering our hypotheses, we will conduct the experiment and we expect to obtain the results in December 2022.

Limitations

We could not control whether participants actually engaged in the activities we assigned them to but measured whether they did.

Conclusions

By using the job demands-resources model as a framework we may identify whether recovery strategies at work are always a resource for employees and which might work better than others. Action regulation theory argues that individuals want to achieve their goals and that interruptions or necessary adjustments to goal pursuit cost energy, which could include (recovery during) idle time. Our results contribute to a better understanding of both theoretical frameworks and the relatively new construct of idle time.

Relevance to the Congress Theme

How do we want to work in the future? The workday is becoming increasingly flexible and employees and companies need to develop strategies on how employees can effectively deal with certain adversities in the workday. We need to educate stakeholders on how to deal with certain situations, such as idle time.

Relevant UN SDGs

We argue that employees need to have “decent work and economic growth” as well as “good health and well-being” not only in their work. We want to identify whether idle time at work may be detrimental or beneficial for employees and translate these findings into practice. By identifying strategies that employees can use to counter idle time, we contribute to active work design.

Keywords: idle time, recovery, boredom

Oral presentation OP43

Noise as stress factor for school staff: Results of a qualitative interview study

Victoria Heumann, Occupational Health Institute for Schools in Bavaria; Marco Prof. Dr. Steinhauser, Catholic University of Eichstätt-Ingolstadt; Meike Dr. Sons, Occupational Health Institute for Schools in Bavaria; Manuela Dr. Sirrenberg, Institute for Occupational Health and Product Safety Environmental Health

science&practice

Noise exposure and poor room acoustic (reverberation) are among the greatest stress factors in the teaching profession. Surveys conducted with school staff show that specially noise coming from students is perceived as highly stressful. Depending on the situation, average sound pressure levels between 60 and 80 dB(A) can be measured at schools and during classes, which causes numerous physical and psychological reactions (e. g. impaired concentration, influenced affectual state).

The present interview study is part of a multi-component research project of the Occupational Health Institute for Schools in Bavaria (abbreviation: AMIS-Bavaria), which aims to identify school-specific noise sources and explore how noise affects the daily work and the stress experience of school staff.

In semi-standardised interviews, teachers and school administrators were asked to assess recurring noise situations at their schools. In doing so, participants should consider their cognitions, emtotions, and actions when assessing noise-related effects and strategies used in order to cope with noise exposure. In addition, typical noise sources and situations in schools were to be evaluated with regards to the perceived loudness and level of annoyance. As part of the multi-component research project the interview data is supplemented by acoustic measurements at schools. The results enable the derivation and implementation of suitable noise prevention measures in schools.

The transcribed interviews were evaluated using qualitative content analysis by helps of the statistical software MAXQDA. Overall, 25 interviews have been conducted between March and September 2021. A heterogeneous sample was selected with regards to professional experience, type of school, etc.

The results indicate that school noise is perceived as particularly stressful if the noise source cannot be influenced. This especially applied for noise coming from the school environment (e. g. noise from the schoolyard, road traffic) and for noise generated by technical equipment (e. g. beamers, heating, ventilation). When assessing noise generated by students' verbal and non-verbal activities, teachers' perceived stress depends on the respective context. If students’ noise is assessed as reasonable or useful, e. g. because a question is being discussed, the perceived stress level is low, even if the volume increases. Initial results of acoustic measurements indicate that situations reported as particularly annoying in the interviews, actually reach high volume levels. This is especially true for sports lessons in gymnasiums and the working environment in the teachers’ lounge.

The data shows that there is a need for appropriate actions to reduce noise exposure and create space for recovery. Furthermore, the reported coping mechanisms provide valuable approaches in dealing with school noise.

Oral presentation OP736

Not all jobs can be done from home – Developing the Mobile Work Potential Score to identify characteristics of jobs that can be done from home

Adrian Bidlingmaier & Florian Kunze | University of Konstanz

science&practice

Research goals and why the work was worth doing

When the pandemic hit large numbers of employees were working from home (WFH) or had other flexible work arrangements. Even with a relaxed obligation to work mobile flexible work arrangements remain in many organizations. However, it stays unclear which jobs require physical presence in the organization and which jobs can be performed remotely without major limitations.

We do not know which employees should be allowed to work mobile. Given the high saliency of the topic, we developed the Mobile Work Potential Score (MWPS), a scale that is independent of general factors such as industry, occupation, personal traits instead limited to an individual's job.

Theoretical background

The job-characteristics model (JCM) (Hackman & Oldham, 1976) identified five core job characteristics affecting relevant work related outcomes. Since the working environment changed rapidly with the increased amount of mobile work, work design scholars argue for the need of theory keeping up with the changing working environment (Gibson et al., 2011; Humphrey et al., 2007).

Following this argumentation, we identify relevant job characteristics that allow for a job to be performed from home. We argue that there are four distinct dimensions that determine whether a job can be performed mobile:

Digitizability refers to the potential of a task being digitally feasible. It focusses on the technical possibility to work mobile.

The dimension Autonomy is built on the argument that increased autonomy leads to higher employee motivation (Gajendran & Harrison, 2007), one of the most relevant characteristics when researching the potential to work mobile.

The dimension Internal Cooperation focuses on exchange between employees. We explicitly consider informal exchange as it shapes social networks and the culture in organizations. Incorporated here is feedback from colleagues and supervisors.

External Cooperation focuses on the exchange between employees to other persons outside their organization, drawing from media richness theory (Daft & Lengel, 1986) . We argue it is easier to build trust to external partners and customers in person (Rockmann & Northcraft, 2008).

Design/Methodology/Approach/Intervention

Following interviews, literature search and a pre-survey, we developed a set of items included in two surveys for two independent samples. These items were grouped into the four dimensions theoretically developed, consisting of four or five Likert-type scale items.

We ran exploratory factor analysis (EFA) followed by confirmatory factor analysis (CFA) on the first sample with 619 employees from one company. This first survey was conducted in April 2021 in a company mostly not allowing its employees to work mobile before the pandemic. We used a second

general labor force sample with 346 employees of another CFA for validation of our results and performed structural equation modeling on several dependent variables we hypothesize to be influenced by the MWPS, such as performance, engagement, exhaustion. A third such survey with another company is its finishing stage.

Results obtained or expected

The EFA supports our assumption there are four distinct factors and all items load on their intended factor with Cronbach's Alpha ranging from .79 to .93. The CFA results in a model with a very good fit (CFI is .963, TLI is .951, RMSEA is .081 with a CI (90 per cent) from .068 to .093, SRMR is .093).

In our SEM we find a strong positive relationship of the employee's performance and assume positive relationships to the other work-related outcomes. Further results of the two samples will be available in December, the analysis of the third sample has not yet started.

Limitations

In future surveys we might incorporate and test an adapted version of items we had to remove since it was formulated negatively resulting in a bad fit.

Conclusions

Adding to the growing literature of WFH, the MWPS can be used by researchers and practitioners to assess the mobile work potential for research as well as for decision making.

Relevance to the Congress Theme

The changing world of work comes with a lot of unanswered questions – both challenging for science and practice. We know there are many employees wishing to continue to work mobile at least some days of the week. The current developments call for investigation and with the MWPS we close one relevant gap by extending the established job characteristics knowledge to the digital work world.

Relevant UN SDGs

This work is relevant to the UN SDGs of reduced inequalities (10) as well as for decent work and economic growth (8) as it advocates for fair and equal work design decisions based on evidence about a jobs characteristic. Some jobs are labelled "unsafe jobs", as they put the workers at risk of being infected by viruses when WFH is not possible. Such jobs are very unequally distributed across types of workers (Basso et al., 2022). Our scale development helps to promote better work conditions.

Keywords: Working from home, mobile work, job characteristics

Oral presentation OP250

Not in need for help? How type of work-family conflict shapes the amount of social support received

Nada Jmili & Franciska Krings | University of Lausanne

science&practice

Research goals and why the work was worth doing: Many parents experience work-family conflict when trying to fulfill both work and family roles. Experiencing this conflict leads to negative consequences on well-being, attitudes, and behavior at and outside work (Amstad et al., 2011). Recent evidence shows that parents experiencing family negatively impacting work (FIW; e.g., leaving work earlier to pick up children form school) are perceived more negatively than parents experiencing work negatively impacting family (WIF; e.g., missing family events due to work) (Butler & Skattebo, 2004; Steiner et al., 2021). This research examines to what extent the social support these parents receive also depends on whether they experience more FIW or more WIF, and how gender could moderate this effect.

Theoretical background: A vast body of literature shows that experiencing work-family conflict is associated with negative effects in the work, family and health domains (Amstad et al., 2011). Social support is an important buffer of these negative effects, attenuating the negative health consequences of both WIF and FIW as well as the level of conflict (French et al., 2018). However, social support may depend on the type of conflict: Parents experiencing FIW are perceived more negatively by others (e.g., colleagues, supervisors) at work compared to parents experiencing WIF (Steiner et al., 2021). These perceptions may determine the willingness to provide support. We therefore conducted two studies examining to what extent the type of work-family conflict determines the amount of social support provided.

Design/Methodology/Approach/Intervention: Study 1 was a vignette study with a 3 (type of conflict: WIF vs. FIW vs. no conflict) x 2 (Gender in profile: man vs. woman) between design. 251 participants were recruited (mean age 42.43 years, 45.8% of women, 47% of parents). We measured emotional and instrumental support by adapting Vaux and colleagues (1987) scale, so that participants reported social support they provide to the coworker described in the vignette. Advice support was measured by asking the participants whether they would like to give advice to the target in an open text format. For Study 2, we recruited 257 participants (mean age 39.97 years, 44% of women and 56% of parents). As gender did not show an effect in Study 1, only the type of conflict was manipulated in Study 2. Same variables measured in Study 1 were measured in Study 2, but we added a measure of instrumental support, i.e., charity donation (amount of money donated to a charity supporting working parents).

Results obtained or expected (if not available, it must be made clear when they will be): We found that participants tend to give less social support to coworkers facing a WIF than to coworkers facing no-conflict or FIW in both studies. They also tended to donate less money to charities supporting working parents after being confronted with an individual experiencing WIF. In line with these tendencies, the analysis of the advice content showed that participants suggested less frequently to ask for help and more frequently to simply handle both work and family care to coworkers facing WIF compared to coworkers facing FIW. This pattern of advice was consistent across Study 1 and 2.

Limitations : Both Study 1 and 2 were vignette studies. Future research should investigate these questions in organizational settings.

Conclusion/Practical Implications: This research showed that the type of work-family conflict tends to play a role in determining how much social support individuals receive. Individuals facing WIF tend to receive less social support from their coworkers, suggesting that they are perceived as less in need for it than coworkers experiencing FIW. Because social support is important for both workers experiencing FIW and WIF, organizations could implement measures (e.g., empathy trainings (Johnson et al., 2013) to increase the willingness to help parents facing work-family conflict.

Relevance to the Congress Theme: This research highlights the inequalities in receiving social support when facing work-family conflict and raise the question of the possibility to provide some type of social support (e.g., emotional support) in new work-settings, like remote work.

Relevant UN SDGs: Work-family conflict leads to negative mental and physical consequences, which could in turn impact work performance. To overcome these difficulties, individuals need social support from work. This research is thus important as it showed inequalities in receiving social support between types of work-family conflict, and thus, that individuals facing work-family conflict could not only rely on coworkers for help. Indeed, organizations should implement strong policies to guarantee equal work opportunities for all parents facing work-family conflict.

Intended audience (Academic, Practitioner, Both): Both.

Keywords: Work Family Conflict , Social support, Gender

Oral presentation OP181

Not us, not now: Why the climate crisis is not perceived as a corporate crisis

Carina Keller, Karin Kreutzer & Myriam Bechtoldt | EBS Universität für Wirtschaft und Recht

science&practice

Climate change not only poses a threat for human survival in the long run (McMichael, 1993), but is already now a tangible risk for organizations: Physical and transitional risks resulting from climate change have significant impact on organizations (Sanderson et al., 2019) and their members' well-being (Lamb & Steinberger, 2017). However, despite the scientific evidence for such risks, the so called "risk perception paradox" prevents people to act (Wachinger et al., 2013). Even when people are confronted with natural hazards and should therefore develop a high-risk perception, they are not necessarily prepared to act or willing to mitigate future risks.

Compared to other risks, climate change is characterized by unique features – magnitude, complexity, and distance in time and space (Spence et al., 2012) – that influence how it is perceived (Breakwell, 2010). Therefore, advancing a more detailed understanding of the psychological factors that drive individual risk perceptions of climate change is a pivotal task, given that a large amount of studies are indicating that risk perception is an important predictor of the public willingness to engage with climate change (Leiserowitz, 2006). However, to our knowledge there is no empirical evidence on the psychological factors shaping climate risk perception and action in the corporate context. Therefore, we address the following questions in our study: Why is the climate crisis not perceived as a corporate crisis, and what can we learn from the engagement with other social-environmental crises?

These questions were the focus of a sixteen-month ethnographic case study of a German Energy Company (EnCo). EnCo offered a particularly instructive case, because we could investigate the corporate engagement with several socio-environmental crises in real-time across hierarchical levels: During our research period, the company was exposed to a natural disaster, the war in Ukraine, and the overarching climate crisis. Through analysis of observational (>60 days), interview (70+ interviews), and documentary data (500+ pages) we explored how differently the actors in the organization dealt with the three crises. To guide our analysis, we followed the principles of grounded theory in our inductive study (Glaser & Strauss, 1967), and draw on the method of Gioia et al. (2013).

We introduce the PANNIC model of corporate climate risk perception, thereby extending the PAIN theory (Gilbert, 2014). Our analysis shows that six factors mainly influenced the low climate risk perception and consequent low engagement of corporate actors. Compared to the other two socio-ecological crises, the climate crisis is not perceived as

Personal [substantial effect on work role and work environment, direct link between private and business role],

Abrupt [immediate influence on everyday business, establishment of new normal],

Now [visibility of consequences, real-time permanent engagement],

Negative [strictly negative emotional engagement, physical stress reaction, no positive re-framing],

Immoral [strong link to human crisis, perception of malpractice],

Collective [collective action and sensemaking enforced].

Thus, this study advances our understanding of the relative contributions of various risk features to corporate climate action. Moreover, we show how perceived tensions between the three dimensions of sustainability (economic, ecological and social) dissolve over time to the extent that the climate crisis is no longer perceived as a purely environmental-technical crisis, but as a social-economic crisis.

Because we studied a single case, our proposed model comes with limitations. We studied the risk perception in the energy industry, which is highly exposed to several sustainability risks and thus might differ from other industries and locations. Moreover, our model was developed based on qualitative data and needs to be verified quantitatively with a larger sample.

Yet, we respond to the call by van der Linden (2015) to further explore the connection of cognitive, experiential and socio-cultural factors in shaping risk perceptions of climate change in contrast to other types of environmental risks and crises. Hence, this paper contributes to the literature on climate change cognition (Boon-Falleur et al., 2022) and risk perception (Slovic, 1993), as well as to organizational risk management by showing how social-psychological factors steer corporate climate action. We discuss how the public debate can take the six factors of the PANNIC model into account in order to increase visibility of climate change, risk perception but also response to the climate crisis.

This research project mainly addresses SDG 8 and 12, as we investigated corporate engagement with several socio-ecological crises that now ask for immediate action to prevent further devastating changes of our world (of work). Hence, it clearly fits the theme of EAWOP 2023.

Keywords: climate crisis, risk perception, corporate climate action

Oral presentation OP327

Novel aspects in strengthening identification in a self-managing organisation

Merja Luostarinen, Work Research Centre, Tampere University, Finland; Jari Hakanen, Finnish Institute of Occupational Healthcare; Anne Mäkikangas, Work Research Centre, Tampere University, Finland

science&practice

Research goals

Given the limited amount of research on identification in self-managing organisations, where the number of formal leaders has been minimised, this study aimed to understand the measures a case organisation takes to strengthen identification. Specifically, the research aimed to find novel means organisations could employ to promote identification in their employees. Promoting identification seems to benefit both parties of the employment; from the employer's perspective, it's predicted to lead into e.g., more in-role and extra-role behaviour, as well as carefully co-ordinated teamwork. On the other hand, employees who identify strongly are likely more satisfied and motivated by their work, as well as experience psychological wellbeing and engagement.

Theoretical background

Previous research has shown that strong social identity leadership that is, leaders seen as 'one of us', actively crafting what it means to be 'us', advancing 'our' shared goals, and structuring 'our' meaningful actions towards the shared goals, lead into strengthened identification in the employees. Similarly, stronger organisational justice perceptions, particularly processes considered fair, have been shown to promote identification. Furthermore, experimental evidence suggests the initial identification may be aided by including prototypical members in the recruitment and induction, as well as by discussing the organisational values during these practices. However, only limited amount of qualitative research exists on the topic, and barely any studies have addressed the topic in self-managing organisational context.

Methods

Qualitative case study and triangulation were chosen as methods to secure rich data and uncover new approaches to the topic. The primary data consisted of five semi-structured interviews with the CEO, COO and two informants in HR team, as well as three focus groups with the employees of the IT consultancy. Four recorded townhall meetings were also included. The additional data sources strengthened the understanding of the lived organizational experience. The data was analysed following theory-guided content analysis.

Preliminary results

The results extend prior research on Social Identity Leadership (SIL) in four ways. First, the data evidenced strong shared SIL from the leaders and the employees alike. Secondly, the leaders were not only seen as 'one of us', but truly perceived to be equal to the employees. Thirdly, an important part of SIL and guiding the team's actions towards the shared goals was designing and implementing core practices like line management duties and professional development together. Similarly, significantly contributing to SIL were the structures the leaders created to enable the team to make decisions and champion the shared goals autonomously. Fourth, the leadership style of giving the employees the space to contribute to the steering the workplace direction and inviting them to co-

create new organisational initiatives was noteworthy. Altogether, these measures in turn resulted into strong organisational justice perceptions.

Furthermore, the results extend the prior experimental research into organisational context by showing how the socialisation practices led by prototypical members and including a shared meaning-making of the organisational values resulted in a community full of similar but appropriately different members. The shared value-base provided a sense of familiarity and strengthened cohesion, which in turn promoted identification. Furthermore, the socialisation practices secured a personally meaningful endorsement of the organisational values, resulting in a sense of authenticity, as the members perceived to be accepted as their genuine selves at the workplace. This in turn, made the identity more personally important, and further strengthened identification.

Full results will be available in the congress.

Limitations

By design, the case study does not offer generalizable results across self-managing organisations, nor does it directly offer evidence that hierarchically organised workplaces would not offer similar advantages than the ones captured.

Conclusions: implications and originality

The results show indications that particularly through strong Shared Social Identity Leadership exercised by both leaders and followers, as well as modern socialisation practices, the self-managing organisations seem to make the organisational membership highly meaningful for their employees. The results suggest practitioners would be wise to apply these learnings and give the employees more room to be included in the organisational decision making to build more effective and engaged teams.

Relevance to Congress theme and UNSG

Understanding how the novel self-managing organisations operate from a psychological perspective helps to develop more inclusive and decent working conditions in practice. Thus, the topic is directly related to the congress theme as well as the UNSG.

Keywords: Leadership styles, Organisational justice, Organisational commitment

Novel technologies to enhance resiliency: the Hybrid and Sustainable Worlds Project

Luciano Gamberini, Valeria Orso, Alice Bettelli, Giovanni Portello, Maria Luisa Campanini & Luigi Porto | University of Padova

science&practice

The strict restrictions imposed by the COVID-19 pandemic have severely impacted economies all over the world, with small and medium enterprises (SMEs) being especially hampered in various sectors (e.g., retail, tourism): while the large enterprises with a strong presence online increased their profits, the small and medium businesses with little or no presence online recorded significant losses [1-4]. Indeed, the prolonged lockdowns have revealed the weaknesses of those businesses that strongly rely on the physical co-presence to deliver their services and sell their products (e.g., brick-and-mortar stores), along with their difficulty in promptly responding to the changing market needs.

The research project Hybrid Sustainable Worlds (HSW) merges the knowledge and expertise of the academic world with the know-how of enterprises to design and implement innovative and concrete tools that will enable small and medium companies to respond to the increasingly ephemeral market conditions. The project addresses several strategic business sectors, including tourism, cultural heritage, and retail. With respect to retail, the project Hybrid and Sustainable Worlds aims to develop an innovative e-commerce platform that exploits Augmented Reality (AR) and 3DWeb technologies, to support the online retail of small and medium businesses.

The platform has been designed in a user-centric perspective [4] and it features two main components: the back-e-shop, addressed to sellers, and the e-showroom, addressed to customers. The platform can be managed directly by the small shop owners. Differently from all the other platforms for online shopping, in the HSW platform the seller can share the 3D models of their products, so as to enhance the customer's shopping experience and compensate for the lack of sensorial stimulation, which is typical of the shopping online [5]. Since one of the main issues encountered by small shop owners in running an e-commerce website is the time and effort required to learn and use a new system [5], the back-e-shop interface has been designed to be intuitive and easy to use.

Moreover, the back-e-shop includes an extension that allows the shop owner to set up an AR shopping window to be seen by the consumer using a head-mounted display. In so doing, it will be possible not only to showcase the products that are currently out of stock, but also enable the customer to interact with the 3D model in a novel way, e.g., by resizing the object.

The e-showroom will also include special features that are aimed to enhance the shopping experience. The products will be displayed as 3D models within the 3D shopping environment, and the customer will be abled to manipulate the model and explore additional interactive information.

Keywords: retail; small-medium enterprises; innovation

Oral presentation OP245

Observer Ratings of Honesty-Humility and their Relationship with Extra-Role Behaviours

Erik Dietl & Olga Kombeiz | Loughborough University

science

Research goals and why the work was worth doing: Previous research established that the personality traits of honesty-humility, agreeableness, and conscientiousness are predictors of counterproductive work behaviour (CWB) and organizational citizenship behaviour (OCB) (Berry et al., 2007; Chiaburu et al., 2011; Lee et al., 2019). However, these meta-analytic findings relied on self-reported personality. Other emerging research highlighted the value of acquaintance-rated personality for predicting work outcomes (Connelly & Hülsheger, 2012; Kluemper et al., 2015; Oh et al., 2011). Here we build on and extend this stream of research by focussing on honesty-humility, agreeableness, and conscientiousness, and investigating how those self- and acquaintance-rated personality traits predict CWB and OCB in a multi-source study with matched triads.

Theoretical background: Research found that observer-ratings of personality predict job performance better than self-ratings (Oh et al., 2011). There are two perspectives which can explain the predictive advantages of observer-ratings: the clearer lens perspective and the narrower scope perspective (Connelly & Hülsheger, 2012). The clearer lens perspective assumes that predictive advantages stem from the greater accuracy of observers because they see targets clearer than the targets themselves. The narrower scope perspective suggests that work-specific expressions of personality may differ across distinct contexts (e.g., work and private life) but stay consistent within a context (Mischel & Shoda, 1995). Typically, observers have only access to context-specific expressions of personality (e.g., only within the work context). Therefore, the frame of reference for observers at work is more closely aligned with important work outcomes. Self-reports of personality, however, draw trait information from a variety of contexts. The clearer lens perspective received support from findings showing that acquaintance-rated conscientiousness was a better predictor of colleague-rated job performance (Connelly & Hülsheger 2012) and CWB (Kluemper et al., 2015) than self-reported conscientiousness, providing incremental validity beyond self-reports. We therefore hypothesized and tested whether acquaintance ratings of honesty-humility would predict CWB and OCB beyond self-ratings of honesty-humility. We also compared the predictive validities of honesty-humility, conscientiousness, and agreeableness.

Design/Methodology: We employed a cross-sectional multi-source design and collected data from three sources: 194 target employees provided self-ratings and were rated by 194 co-workers and 194 personal acquaintances (totalling 582 raters). We collected self-ratings, personal acquaintance ratings, and work colleague ratings of honesty-humility, conscientiousness, and agreeableness using the HEXACO-60 (Ashton & Lee, 2009). Work colleagues also assessed employee's CWB (Bennett & Robinson, 2000) and OCB (Staufenbiel & Hartz, 2000). Cronbach's alphas ranged between .64 and .89.

Results: Self-rated and acquaintance-rated honesty-humility, agreeableness, and conscientiousness had positive relations with OCB. Moreover, acquaintance-rated honesty-humility and conscientiousness had incremental validity for predicting OCB beyond self-ratings. In addition, multiple regression analyses showed that acquaintance-rated honesty-humility was the strongest predictor of OCB. However, self- and acquaintance-rated honesty-humility, agreeableness, and conscientiousness did not significantly predict CWB in both correlation and regression analyses.

Limitations: We did not collect self-ratings of CWB. CWB self-ratings may also assess covert behaviours, that are unlikely to be observed by coworkers. In addition, the field study design does not allow conclusions about causality.

Research/Practical implications: The findings for predicting OCB support the theoretical perspective of the clearer lens, suggesting that self-ratings suffer from self-misperceptions and observers have higher accuracy. The results for CWB may indicate that it is difficult to predict work-colleague rated CWB by self- and acquaintance ratings, and that work-colleagues may not be able to observe covert CWBs. Organisations might consider employing observer ratings of e.g., personal acquaintances in their assessment procedures to complement target employees' self-ratings.

Originality/Value: This research extends the few studies that have examined the validity of acquaintance-rated personality for work outcomes by investigating the validity of acquaintance rated honesty-humility in the prediction of CWB and OCB. This helps to better understand the predictive advantages of observer ratings of personality.

Oral presentation OP533

Occupational Stress in Spain: Validation of the Perceived Occupational Stress Scale

David Saeteros, Univeristy of Barcelona; David Gallardo-Pujol, Univeristy of Barcelona; Guillermo Soriano-Tarín, Spanish Association of Specialists in Occupational Health Medicine; María Villaplana García, Univeristy of Murcia

science&practice

Work-related stress produces disadvantages at the individual, organizational, and societal levels (Hassard et al. 2014). Thus, developing tools to assess it is crucial for buffering the negative outcomes it entails. In this study, we validated The Perceived Occupational Stress (POS) scale for the Spanish population. The POS is a self-report measure of four items designed for assessing work-related stress as perceived by an individual (Marcatto et al. 2022). It aims to bridge the gap in the evaluation of occupational stress, between the objective and subjective appraisal of it. Until recently, the objective appraisal has been the preferred approach but since stress depends more on the perception of a stressor than on the stressor itself (Min, Kim, and Lee 2015), the best alternative is to combine both approaches. Therefore, we translated and back-translated the English version to Spanish and administered it to 1107 Spanish individuals (only 675 were complete). We tested its internal reliability, nomological network, factorial structure, and distributional overlap among subsets of the total population, emphasizing health workers. The Spanish POS has an internal consistency of $\alpha = 0.903$, and its confirmatory factor analysis of one dimension shows good adjustment indices (CFI = 0.946, RMSEA = 0.206, SRMR = 0.031). The distribution overlap between health workers and the rest of the sample is 0.83, showing that health workers (M = 3.24, SD = 1.03), as compared with another type of workers (M = 3, SD = 1.11), obtained higher scores, $t(320) = 2.11$, $p = .035$. As per the concurrent validity, we gathered data from the same sample on other related psychological variables: work engagement (Utrecht Work Engagement scale) (Schaufeli, Bakker, and Salanova 2003), psychological distress (Brief Symptoms Inventory 18) (Derogatis 2001), positive psychological capital (Psychological Capital Questionnaire-12) (Martínez et al. 2021), and risk assessment (PRIMA-EF) (Organization et al. 2008).

No significant correlation was found between the POS and the BSI-18, which showed the best factorial solution at 2 factors instead of 3 as is commonly used. The UWES scales, on the other hand, showed a significant negative correlation (vigor: -0.27, dedication: -0.28, abstraction: -0.21). The PRIMA-EF was factor-analyzed prior to correlations and it was found to have two clearly defined factors which we called positive and negative elements of risk assessment. The correlations between these two factors and the POS were found to be positive with the negative factor (0.49) and negative with the positive factor (-0.32) as predicted by the theory. The positive psychological capital showed a better factorial solution with 3 factors instead of 4 as is commonly used. The PCQ-12, however, did not show any significant or strong correlations. The findings indicate the Spanish POS scale is a valid and reliable measure of perceived work stress with psychometric properties similar to the original version.

The study has two limitations: the sample size is not as big as needed and it lacks independent replication which should be pursued in future studies.

This scale, which complies with EU regulatory instructions, can be used in Spain as an effective short tool for assessing perceived occupational stress as a necessary complement for risk assessment evaluations. Furthermore, we validated all the rest of the used scales because, though used a lot in current research no one has worked on their validity.

Keywords: Perceived Occupational Stress, Health Workers, Psychometric validation

Oral presentation OP577

On the Current Implementation of Open Science Practices in Industrial and Organizational Psychology and Management

Ann-Kathrin Torka, TU Dortmund University; Joachim Hüffmeier, TU Dortmund University; Ernest O'Boyle, Indiana University; Sven Kepes, Virginia Commonwealth University; Martin Götz, University of Zurich; Jose Cortina, Virginia Commo

science

Research goals

The goal of this research was to describe and explain the implementation gap regarding open science practices (OSPs) in industrial and organizational psychology (IOP) and management research (i.e., low adoption rates despite high information levels). Therefore, we first examined the extent to which IOP/Management journals encourage, support, and implement OSPs on their websites (Study 1). Second, we asked all journals' editors about their main reasons not to add a statement about OSPs on their websites (Study 2). Together, our work provides a description of the extent to which these journals currently refer to OSPs on their websites and deeper insights into their reasons (not) to do so.

Theoretical background

In recent years, various empirical findings in IOP/Management could not be replicated and questionable research practices (QRPs) were found to be common. To address such problems, OSPs have been developed. Yet, OSPs are only helpful if actually used, and currently there appears to be an implementation gap: Although the knowledge about OSPs increases, researchers often do not adopt such practices. Current journal practices may help to explain why researchers are reluctant to adopt OSPs and why, as a consequence, many types of QRPs may still be used. Aguinis et al. (2020a) for instance assume that researchers may perceive that the costs of implementing OSPs may outweigh the perceived benefits. This unfavorable relation of costs and benefits is most likely related to the communicated practices of scientific journals because journals "have the power to create and enforce policies regarding standards for published (…) research" (Aguinis et al., 2020a, p. 28). In other words, journals act as gatekeepers for scientific discoveries. If they do not support the use of OSPs, researchers have little incentives to use them.

Methodology

We pre-registered this project on the Open Science Framework. We based our content analysis on the websites of all journals that are listed in the 2019 Journal Citation Reports for the journal category "Management". Our key coded variables mirror the standards in the Transparency and Openness Promotion (TOP) guidelines. Specifically, we coded the following characteristics: data transparency, method and code transparency, material transparency, preregistrations, registered reports, open science badges, open access publishing, and whether and how replications are mentioned. In Study 2, we sent out standardized letters to the editors in chief of all IOP/Management journals from Study 1 via email and asked them about the journals' reasons not to add a statement about OSPs on their websites.

Results

The final sample includes N = 202 journals and N = 279 editors. In summary, most IOP/Management journals did not mention OSPs at all. For example, only two, five, and 14

IOP/Management journals mentioned pre-registration, registered reports, and explicitly invited replications, respectively. Study 2 revealed that most editors are sympathetic to OSPs in general. Among the responding editors, 35%, 25%, and 12.5% attributed the lack of incentives for OSPs to a lesser suitability of OSPs for qualitative research, missing authority, and missing familiarity with OSPs, respectively.

Limitations

As a possible limitation, contrary to our dichotomous coding of all practices (except for replications), the Top Guidelines specify three levels of implementation for each practice. However, as most journals simply do not mention OSPs at all, it appears more adequate to maintain the dichotomous coding of our variables (i.e., mentioned vs. not mentioned).

Conclusions

In a field like IOP/Management research, where publications in A journals are seen as the "new bottom line" (Aguinis et al., 2020b, p. 136), the extremely low implementation rate of OSPs is likely to result in problems because the current practice may well be associated with the prevalence of QRPs. As journals have the power to initiate or at least contribute to a change towards a greater usage of OSPs and, thereby, more reliable discoveries, there is a need for a top-down movement where journals encourage OSPs and replication efforts to support the development of an open and transparent research culture in IOP/Management. This research provides novel insights into the currently rather low adoption rates of OSPs in the IOP/Management domain and is, at least to our knowledge, the first to directly ask journals about their attitude towards OSPs.

Relevance to the Congress Theme

Our research contributes to the congress theme "The Future is Now: the changing world of work", because our insights can support the mitigation of the current implementation gap regarding open science practices. It is a call to action for publishers and journals to change the communication on their websites.

Keywords: open science practices, academic reward system

Oral presentation OP355

One or many roads to innovation? - A sequence analysis of career trajectories in agriculture and their relation to individual innovativeness

Larissa Angelina Reis & Simone Kauffeld | Technische Universität Braunschweig, Germany

science

The research goal is to take a biographical view on farmers as central actors in sustainable agricultural transition and investigate: what characterizes career paths in agriculture and how do they differ from each other (RQ1)? Which career paths show the strongest correlation with individual innovativeness (RQ2)? In a final step, we test whether similarity of career trajectories affects innovativeness that goes beyond the effect of personality characteristics (e.g., regulatory focus, openness to experience; RQ3). The work is worth doing because the agricultural sector needs innovation facing complex challenges due to climatical, political and societal changes. We contribute by studying the individual perspective and connecting careers and innovativeness.

In theory, innovation starts at the individual level. Innovation potentials can only unfold if the farmer, as innovator and early adopter, has the required abilities for and attitudes towards innovation (Rogers, 1962). These abilities and attitudes are accumulated on the career trajectory (Bird 1994). The Career Construction Theory (Savickas, 2002) says that career is a core for constructing the own self. The self gains meaning from career and therefore spends importance to it. We assume that individual innovativeness is part of the vocational self-concept, which people assimilate to their work roles across their careers (Savickas, 2002). Consequently, individuals with similar personality dispositions, education, abilities, or interests have similar career patterns (Huang & Sverke, 2007). Biemann et al. (2020) followed that similarity in career sequences can predict vocational outcomes.

Methodological, to answer RQ1 we conducted study 1 with N=18 farmers and collected their career trajectories by interviewing them. We extracted the distinctiveness of career paths in agriculture (content analysis; Mayring, 2010). Second, we asked N=16 experts from the agricultural sector which characteristics in careers are crucial for innovativeness in later situations. Building on this in- and outside view on agricultural careers we assembled a quantitative online survey (study 2) and asked farmers retrospectively about their educational and vocational career stages and their self-rated personal innovativeness. So far N=105 farmers answered the whole questionnaire. The data collection is still ongoing and will be finalized in early spring 2023. We then conduct sequence analysis to identify patterns and (dis)similarities among farmers career sequences throughout a period of 12.5 years starting after school graduation and group them by cluster analysis (see Studer & Ritschard, 2016). The clusters will be used in logistic regression analysis to predict innovation outcomes (RQ2). The methodological extension from Biemann et al. (2020) allows us to use the similarity of sequences as a predictor, too (RQ3).

Preliminary results from study 1 revealed that the career trajectories of farmers differ in the following characteristics: educational stages (e.g. diploma, job training), vocational stages (inside and outside of agriculture/ the “home farm”), and the amount of job changes and side-jobs. The experts named experience abroad, experience with sustainability, many transitions in work sector, location or occupation during career, a well-grounded education and the agricultural family background as factors that positively influence innovativeness. Results from study 2 will be presented on congress.

To limit the findings, we will discuss the representativeness of the sample (e.g. age, location of farms and farm size) as well as the fact that basic technology affinity was precondition to participate in the

online study. Furthermore, methodological limits will be discussed concerning the missing structure of sequence data and the cross-sectional design.

As conclusion, this research is one of the first to use the similarity predictor and test the effect of similarity in careers on vocational outcomes (innovation). Sequence data build on curriculae vitae are a easy-to-derive data source. The data is comparable free from biases e.g., social desirability and therefore could complement vocational research. On the practical side, the information about innovator careers can be used for qualification in agriculture.

This work contributes to the congress themes Careers and the Labour Market , as it investigates career trajectories of farmers. Moreover, we add knowledge to how innovativeness develops on the career pathway, which fits to the congress theme Creativity, Innovation and Risk-taking . The work is related to the SDG 8: Decent work and economic growth , as we study the input of individual career experiences to a transformation in agricultural sector and translate the findings into learnings for the qualification system. Furthermore, facing climate change it is worthy to study how innovativeness can be fostered in agriculture (SDG 9).

Keywords: Sequence analysis, career, innovativeness

Oral presentation OP654

One ring to rule them all! Need for power and adult attachment as antecedents of knowledge hiding in organizations

Oana Fodor, Babeș-Bolyai University

science&practice

Research goals and why the work was worth doing

An increasing number of organizations strive to sustain knowledge transfer among employees via knowledge management interventions. That is because knowledge is considered a strategic resource for both individuals and organizations. Knowledge sharing is associated with individual performance, innovation and organizational growth (Pereira and Mohiya, 2021, Connely et al., 2019, Garg and Anand, 2020 etc.), whereas knowledge hiding is associated with reduced productivity and companies' loss of revenue among other detrimental effect (Xiong et al., 2019, Arrain et al., 2019).

However, despite organizational efforts strive to promote knowledge sharing, the employees' intentional concealment of knowledge when requested by others (i.e. knowledge hiding behaviors/ KH) remains a frequent behavior. Thus, understanding its antecedents becomes key for designing effective interventions and successfully managing this issue within organizations.

In particular, the study focuses on individual factors and explores the role of need for power (i.e., an individual's desire to influence others, change people or events, and make a difference, McClelland, 1975) as antecedent of KH, and the role of avoidant (i.e., individuals who declare they dislike when others open up to them emotionally, Harms, 2011) and anxiety attachment styles (i.e., individuals who have an unfavorable view of the self and experience anxiety in their relationships, Richards & Schat, 2011) as boundary conditions of this relation.

Theoretical background

The paper is grounded in the Resource Control Theory (Hawley, 1999) and argues that need for power is a hallmark of social dominance (i.e. one's competitive ability relative to others in the social group). Based on this theory, we hypothesize that individuals with high levels of power, who enjoy influencing others and defeating their competitors, will engage more frequently in KH behaviors, as a coercive strategy of resource control and a way of attaining a position of greater authority (i.e., "getting ahead"). In addition, the paper builds on Attachment theory (Bowlby, 1973, 1988) and argues that the different attachment styles as internal working models (i.e., internalized cognitive, emotional, and behavioral schemas) of interpersonal relationship will also influence organizational behavior such as KH. In particular, we argue that anxious attachment will reduce the positive association between need for power and KH, whereas avoidant attachment will have the opposite effect.

Design/Methodology/Approach/Intervention

In order to test the hypotheses, I used a time lagged correlational design (preliminary N = 178 employees, data collection is expected to end in February 2023) with need for power, avoidant and anxiety attachment styles measured at time 1 and KH measured at time 2. Additionally, I used a vignette study where the level of need for power and type of attachment styles were manipulated (data collection is expected to end in February 2022) and KH behaviors were measured.

Results obtained or expected (if not available, it must be made clear when they will be)

Preliminary results from the field study (Study 1) show that need for power (measured in Time 1) increases employees KH (measured in Time 2) and anxious attachment moderates the relation. The data collection for both Study 1 and 2 are expected to end in February 2023

Limitations

Data in the time-lagged design are self-reported.

Conclusions – research and or practical implications/Originality/Value

Our findings will clarify (some of) the individual antecedents of KH behaviors in organizations and will extend the application of attachment theory to organizational setting, thus answering the calls for more research on the matter (e.g., Yip et al., 2017). These findings will also inform managerial and HR practices into designing interventions directed at managing the impact of such individual factors on KH behaviors, thus reducing its occurrence.

Keywords: knowledge hiding behaviors, need for power, attachment style

Oral presentation OP604

Ongoing research: Phone snubbing and its links to psychosocial factors at work among Swedish electricians – development of a co-worker phubbing scale

Sara Thomée, PhD & Per Martinsson, MSc | Department of Psychology, University of Gothenburg, Sweden; Maria Spante, PhD, School of Business, Economics and IT, Division of Informatics, University West, Trollhättan, Sweden

science

Aim

The present study addresses the question of whether smartphone habits during traditionally social situations at work, such as breaks and collaborative work, are connected to psychosocial work environment factors. Phubbing, from the words “phone” and “snubbing”, indicates prioritizing one’s phone over present individuals. This study aims to develop a new co-worker phubbing scale, adapted from previous scales by Roberts and David (2016, 2017) and Chotpitayasunondh and Douglas (2018). As such, it is a development and adaptation to a new context rather than a replication study. Further, the study seeks to propose a tentative model for associations between co-worker phubbing behaviors and psychosocial factors at work.

This study is part of the research project Phubbing at work – mobile phone behavior in social contexts at the workplace and associations with the psychosocial work environment.

Background

Smartphones are a tool for communication, but may also impede relationships with those around us, including our co-workers. Research on phubbing has shown that feeling neglected due to others’ smartphone use is linked to a range of negative outcomes, including lower quality of communication, social exclusion, and decreased relationship satisfaction. Though many spend as much or more time with their co-workers as with family and friends, little is yet known about how phubbing affects collegial relationships. Positive relationships at work are instrumental for establishment of support networks, well-being, and job satisfaction. If smartphone use in social situations at work gets in the way of socialization and relationship formation, it is thus possible that important psychosocial work environment factors could be negatively impacted.

Method

Members of the Swedish Electrical work union responded to a survey, N = 808. Data is analyzed using confirmatory factor analysis (CFA) for scale validation of co-worker phubbing constructs, and structural equation modelling (SEM) for testing a theoretical model of relationships between co-worker phubbing, psychosocial work environment factors, and demographic variables. Included psychosocial work environment factors are social support from colleagues, sense of community, commitment to the workplace, and horizontal trust.

As the research topic is novel and lacks established theoretical frameworks, a combination of exploratory and confirmatory approaches are utilized in model specification and assessment.

Preliminary results

Analyses are ongoing. Preliminary assessments indicate satisfactory psychometric properties of the co-worker phubbing scale. Phubbing as measured by the scale has two latent factors, indicating a possible difference between exposure to “low-grade” and “high-grade” phubbing. Finally, phubbing

appears to be significantly and negatively linked to psychosocial factors at work. Associations are weak to moderate in strength.

Further and more detailed results are pending and expected to be finalized during the first half of 2023, in time for the conference.

Limitations

The current study includes responses from Swedish electricians, and while the specific working arrangements of this sample make it suitable for exploring co-worker phubbing (e.g. typically working and taking communal breaks alongside others), it is a largely homogenous group, limiting generalizability. Further, the present study is cross-sectional, disallowing causal inferences. Future planned studies will address these issues by including a more representative sample of the working population and a cross-lagged panel design with two time points.

Conclusions

Preliminary analyses indicate that the co-worker phubbing scale is psychometrically sound and able to measure perceived phubbing behaviors at work. Further, co-worker phubbing appears to be negatively linked to psychosocial factors at work, indicating that those who experience more phubbing also report slightly less satisfying psychosocial conditions. These preliminary results indicate that the role of co-worker phubbing for psychosocial work environment factors warrants further consideration and examination.

Relevance to the congress theme

The smartphone arguably constitutes a fundamental shift in how we relate to the world and other people. While its advantages are obvious and manifold, understanding how it affects interpersonal dynamics at work is of importance for shaping work arrangements so that we can utilize the power of the technology while promoting the positive relationships and interactions that are central to both well-being and performance of individuals, groups, and organizations.

Keywords: phubbing, smartphone, psychosocial factors

Oral presentation OP630

Online, Offline, or Both? Does Coaching Format Matter for Side Effects in Business Coaching?

Natalie Michalik, SRH Berlin University of Applied Sciences; Carsten Schermuly

science&practice

Accelerated by the COVID-19 pandemic, face-to-face coaching has largely shifted to online coaching in recent years, a practice that has grown tremendously. We examined the side effects of and success in face-to-face coaching, blended coaching, and online coaching from both coaches' and clients' perspectives. Thus, to further enhance our understanding of side effects in coaching and to integrate current trends, we compare different coaching formats and explore the following research questions:

1. Do side effects differ among the different coaching formats (i.e., face-to-face, blended, or online coaching)?

2. Is there a difference in perceived coaching success among different coaching formats?

Side effects are defined as harmful and undesirable effects directly caused by coaching and occur quiet frequently with a low intensity regardless of coaching outcome. To date, quantitative coaching research examining side effects has focused on coaching that occurred in traditional face-to-face settings. However, in recent years, accelerated by the COVID-19 pandemic, coaching practice has undergone tremendous changes, with a substantial global increase in online coaching. The trend towards online coaching can bring several benefits, such as greater convenience, location independence, and thus time and cost savings for both coach and client. Nevertheless, online coaching can also bring new challenges, such as limited eye contact due to uneven positioning of the camera, delays in recording, or lack of body language due to a limited camera frame. In addition, coaches have reported that their online work is less intimate and requires greater effort to build rapport and is less fun overall. Given the increasing prevalence and interest in online coaching and potential concerns about the side effects of the online coaching format, exploring the side effects of different coaching formats (i.e., face-to-face, online, or blended) may be a promising starting point to identify theoretical and practical implications for researchers and practitioners.

We conducted two independent studies to examine differences in the side effects of face-to-face, blended, and online coaching. In Study 1 (N = 119), we compared the side effects of these formats using a quasi-experimental design and tested differences in perceived coaching success from the coaches' perspective. In Study 2 (N = 104), we incorporated clients' perspectives on the side effects of the different coaching formats into the design.

Coaches in the face-to-face format experienced a significantly lower percentage of side effects with their clients than coaches in the blended and online coaching formats. From the clients' perspective, the number of side effects was highest in the blended coaching format. Both studies showed no differences in perceived coaching success between coaching formats.

All measurements were based on self-report, so common method variance may be a potential problem. To minimize this effect, we also included clients' perspectives in Study 2. However, future research should address this issue by using data from multiple sources (e.g., matching coach and client). In addition, in Study 1, we used a quasi-experimental design that simply mimicked experimental conditions, making the study particularly vulnerable to compromising internal validity.

This work is the first to extend knowledge about coaching side effects across different coaching formats from the perspective of coaches and clients. Our findings provide guidance to help practitioners choose the most appropriate coaching format for them. Knowledge of coaching side effects can help both coaches and clients take appropriate action to mitigate their effects.

We contribute to the congress theme by considering latest developments of the coaching practice and investigating on it.

Keywords: coaching, digital coaching, side effects

Oral presentation OP407

Online training on psychosocial risk assessment as primary prevention approach

Lisa Auweiler & Jessica Lang |Institute for Occupational, Social and Environmental Medicine, RWTH Aachen University, Medical Faculty; Ute Hülsheger, Maastricht University

science&practice

1.Research goals and why the work was worth doing

Although required by EU law, less than 30% of European organisations have implemented psychosocial risk assessment (PRA) procedures in their occupational safety and health (OSH) management (Eurofound and EU-OSHA, 2014). The main reason for this gap between practice and policy and research is a lack of expertise (Beck, 2019). Therefore, the aim of the project "PsyHealth worXs!" was to develop and evaluate a user-friendly, practical and easily accessible training tool that teaches managers and OSH practitioners the PRA process as preventive approach. The project was funded by EIT Health and strives to create and promote healthy work places.

2.Theoretical background

Training evaluation of the Massive Open Online Course (MOOC) is based on the evaluation models of Kirkpatrick (1996), and Moore (2009). Success criteria for the evaluation models is participants' reaction and knowledge gain. Data on intentions for action, attitudes, motivation and expectations were collected according to Francis (2004) who constructed scales for health research according to the Theory of Planned behaviour (Ajzen, 1988).

3.Design/Methodology/Approach/Intervention

The participants of the MOOC runs in 2020 and 2021 (N=985) were invited to participate in an evaluation survey at the beginning and after voluntary completion of the MOOC on edX. In total, N=225 participants responded to the first questionnaire and N=87 responded to the second questionnaire. Descriptive statistics are provided for rating the training and assessing the level of knowledge. For comparison of the two measurement times, t-tests were used. Participants were all kinds of stakeholders of OSH management, mostly in consultative roles.

4.Results obtained or expected

Overall, the participants' reaction to the training was highly satisfactory. 82% of respondents felt more competent in conducting PRA after participating in the training. After the training, participants' knowledge of the process was significantly greater ($t(258.965) = -11.701$, $p = .000$, $d = 1.112$), and the proportion of those who felt competent to derive occupational health and safety measures increased from 33% to 88% ($t(240.298) = -10.891$, $p = .000$, $d = 1.043$). Additionally to the increased knowledge, the participants' expectations regarding behavioural control to conduct PRA are perceived significantly easier after completion of the training ($t(290) = 6.365$, $p = .000$, $d = .843$). For the intention to conduct PRA in the future, no significant training effect was detected which was probably due to high initial levels of intention. Greater awareness of the topics on psychosocial risks and mental health was achieved with the training.

5.Limitations

Intentions and motivation are self-reported here; a follow-up survey of actual behaviour change has yet to be collected. High drop-out rates in the evaluation process could be due to the generally low

completion rates of MOOCs and limit the generalisability of results. However, retention rate for this MOOC was high with regard to edX criteria.

6.Conclusions – research and or practical implications/Originality/Value

PsyHealth worXs! is successful in teaching PRA and in this way is tackling the biggest obstacles that hinder the implementation of PRA strategies. The remaining questions are how to convince decision-makers to address PRA in their organisations and if a different type of training needs to be offered here. In the long term, the MOOC can help OSH stakeholders to close the gap between legal requirements and practical application. To further contribute to this goal, PsyHealth worXs! is currently expanding and developing further materials and subtitles in eleven languages and a new serious game that converts the gained knowledge into skills.

7.Relevance to the Congress Theme

The submission contributes to the themes safety and work (13) and training and development (17) by presenting a user-friendly, practical and easily accessible training to teach professionals in a primary preventive approach to tackle work stressors before they become a risk for employee health.

8.Relevant UN SDGs

In providing a successful training for identifying job stressors, this evaluation contributes important insights to provide good (employee) health and wellbeing as well as implications for quality education.

Keywords: Psychosocial risk assessment, training evaluation, online training

Oral presentation OP70

Only together we are strong? Revisiting the linkages between Human Resource Management and Leadership for employee well-being

Ann-Kristina Løkke & Marie Freia Wunderlich | Aarhus University, Department of Management science

Research goals

Employee well-being (WB) refers to the overall quality of an employee's experience and functioning at work (Warr, 1987). There is a strong ethical case for focusing on employee well-being, particularly in times of increasing pressure at work. Leaders devote considerable organizational resources to enhancing employee well-being (Grant et al., 2007). Similarly, there is strong evidence that Human Resource Management (HRM) practices affect employee well-being (Van De Voorde et al., 2012, Peccei and Van De Voorde, 2019). The streams of literature focusing on the leadership-WB and HRM-WB relationship developed largely independently from each other. Concurrently, we know that HRM and leadership interact in various ways, ranging from independence to a synergistic fit (Leroy et al., 2018). Therefore, this paper aims to provide a systematic literature overview of what we know about the combined effects of HRM and leadership on employee well-being.

Theoretical background

Existing research provides evidence that leadership influences employee well-being (e.g. Inceoglu et al., 2018), and similarly that HRM impacts employee well-being (e.g. Peccei and Van De Voorde, 2019). However, in reality, employees do not experience leadership and HR practices separate from each other and their well-being at work is impacted by both factors at the same time.

Research design

We searched for papers that included in their abstract terms linked to leadership and HRM and well-being in relevant online databases (e.g. Business Source Complete, Web of Science). We limited the search results to papers that were published in English in peer-reviewed journals from 2000 onwards.

Our search provided 28.667 potentially relevant articles. After removing duplicates, the final dataset comprised 4.924 papers. For the screening of abstracts, we defined the following inclusion criteria: (1) the paper is an empirical study. (2.1) It includes a dimension of leadership (e.g. a certain type of leadership style, behavior, trait/personality), and a dimension of HRM (e.g. bundle of practices), and a dimension of employees' psychological or physical well-being. (2.2) alternatively, the paper refers to people management, in the sense of LS and HRM, and well-being. (3) Studies must be conducted among a working population.

Results

We identified a total of 65 relevant papers for which the coding process is in progress. Various approaches to HRM and leadership are taken across the studies. The most dominating HRM approach is the High-Performance Work System approach (20 studies) and in terms of leadership, transformational leadership (14 studies). Following the coding, we investigate how existing studies model the HRM and Leadership interact in co-determining well-being. Findings will be presented at the conference.

Limitations

Literature reviews always bear the risk of not identifying all existing and relevant studies. Furthermore, our review is not free from reproducing a positive publication bias where “positive studies”, i.e. significant ones, are predominantly published.

Conclusions

This review provides insight into the different ways how leadership and HRM jointly influence employee well-being. Thereby we contribute to a better understanding of how HRM and Leadership work together in influencing well-being. Our research presents avenues for future research by spotting important gaps.

Relevance to the Congress Theme

Securing well-being is a competitive parameter for organizations in the future. Therefore, it is relevant to broaden our view of employee well-being by considering the complex relationships between HRM and leadership for employee well-being.

Relevant UN SDGs

This study promotes the SDG of ‘Good health and wellbeing’.

Keywords: Leadership, HRM, Well-being

Oral presentation OP809

On-The-Spot Mindfulness as a Well-Being Intervention Improves Performance and Civility: A Meditation Field Experiment at a Construction Company

Andrew C. Hafenbrack, University of Washington; Eric Shaoxue Wu & Wen Wu | Beijing Jiaotong University

science&practice

Over the past 15 years, mindfulness meditation has become a popular practice in organizations throughout the world (Gelles, 2015), with most large organizations in the US having provided a mindfulness program for their employees (Tan, 2012). Management scholars have predicted for over a decade that mindfulness could enhance work performance, yet supporting evidence has been elusive (we only know of three articles and they all were cross-sectional in nature: Dane and Brummel, 2014; Lyddy et al., 2021; Reb, Narayanan, & Chaturvedi, 2014). While mindfulness is generally practiced in people's personal time before or after work in a time and place removed from workplace stressors, mindfulness was initially theorized as a functional response to stress (Kabat-Zinn, 1990). Revisiting and extending that logic further may be informative as to when and why mindfulness could improve performance. We are the first to test the idea of on-the-spot mindfulness (Hafenbrack, 2017) – meditating in the specific situations in the workplace in which people are highly stressed for 8-15 minutes to change their psychological state, approximately twice per week. We build a theory of on-the-spot mindfulness and how it can improve how employees perform (work performance and customer service quality) and treat others (helping behaviors and less counterproductive work behaviors). We expected it to do so by reducing stress, and thus cuing an internal locus of control. We tested our hypotheses in an 8-week field experiment among 466 employee-supervisor dyads using multiple meditation conditions (focused breathing and loving kindness), control conditions (no treatment and therapeutic writing), well-being manipulation checks (anxiety, stress, and depression), and supervisor-rated measures of the dependent variables. Our setting was a large construction company in China, due to the moderate level of stress that ebbs and flows in that company and industry. Our hypotheses were supported in 75%-93% of the contrasts of interest between treatment and control conditions. Theoretically, we show that mindfulness can be used to causally enhance work performance if mindfulness is used in this novel way – as a targeted micro break (Trougakos & Hideg, 2009) state induction applied on-the-spot during people's most stressful moments, improving their overall well-being and making their locus of control more internal. We draw on and extend Expectancy Theory (Porter & Lawler, 1968; Vroom 1964) by showing that on-the-spot mindfulness is a novel means of raising employees' positive expectancies that their efforts will lead to high performance and rewards, as those expectancies are well known to become self-fulfilling. Our study revives the importance of thinking about mindfulness as a state rather than as primarily a trait or long term daily practice. We provide further support for the emerging consensus is that mindfulness can increase prosocial behavior (Donald et al., 2019; cf. Poulin et al., 2021), including in the workplace (Hafenbrack et al., 2020; Sawyer et al., 2022), as well as reduce counterproductive, aggressive, or retaliatory workplace behaviors (Hülsheger et al., 2021; Krishnakumar & Robinson, 2015; Long & Christian, 2015; Yu & Zellmer-Bruhn, 2018). We show a way that one's locus of control can change to become more internal. This is notable because locus of control is generally thought to be a fairly stable personality variable (Spector, 1982) and if anything it can be easier for people to shift in the direction opposite to what we found (from internal to external). We also contribute to the literature on expressive writing by drawing into question how effective it is, given that both meditation conditions led to better outcomes than it. Practically, we show mindfulness can be cultivated on-the-spot in specific situations in the workplace to improve

employee well-being, performance, and civility. Metaphorically, on-the-spot mindfulness is similar to a person taking an aspirin when they have a headache. This has the potential to change the way mindfulness is presented, taught, and used. We found that the content of the meditation did not matter as much as whether people meditated. The focused breathing and loving kindness conditions led to very similar results (akin to Hafenbrack et al., 2020) that were more similar to each other than they were to either of the control conditions. If one were trying to optimize the workplace benefits of mindfulness less the time spent engaging in meditation, on-the-spot mindfulness is a valuable option. People who don't meditate at all might be able to feel and perform substantially better by engaging in the occasional on-the-spot meditation when they are feeling their worst. Likewise, people who are engaging in secular meditation for an hour each day or more, primarily to feel good and perform well, may reduce the time they spend meditating if they meditate on-the-spot when they are feeling their worst.

Oral presentation OP226

Optimistic is more responsible and pessimistic is more neurotic! Attribution styles at work and their relationships with affectivity and personality

Ruba Ezzeddine, University of Barcelona; Rita Rueff-Lopes, ESADE-University Ramon Llull; David Leiva & Jose Navarro | University of Barcelona

science

Research goals

The process of making sense at work varies among workers. Going beyond some existing measures based on hypothetical situations or developed in non-work contexts, we propose a scale to measure the main attribution dimensions (i.e., controllability and stability) and styles (i.e., optimistic and pessimistic). We were also interested in studying the relationships of these cognitions with affectivity dimensions and personality traits to better understand these individual differences as relevant in posterior selection or assessment processes.

Theoretical background

Workers do not interpret experiences of success and failure at work similarly. Attribution theory (e.g., Weiner, 1986) proposed that workers differ in attributional styles (i.e., optimistic or pessimistic). Attributions are causal explanations for events or behaviours (Harvey & Martinko, 2021). The literature considers different dimensions to characterize these explanations such as controllability (i.e., internal or external cause) and stability (i.e., the temporal recurrence of the cause).

Different scales of attribution dimensions and styles have been proposed. However, the majority were originated in clinical contexts (e.g., to understand learned helplessness; e.g., the ASQ by Peterson et al., 1982), or proposed hypothetical situations (without considering their relevance) in which workers have to imagine themselves (e.g., the OASQ by Furnham et al, 1992). Hence, the development of a tool to measure attributions especially adapted to real situations at work becomes necessary. It is then important to consider some recent advances about frequent work events or situations most relevant in triggering cognitive and affective reactions (e.g., Ohly & Schmitt, 2015).

Methodology

To that end, we conducted a systematic literature search to find studies that identify categories of relevant affective work events to explore as sources of posterior attributions. 21 studies were chosen after a search in the PsycINFO, PsycARTICLES, and PsyCRITIQUES databases. Full agreement among the researchers was reached after several rounds to propose 16 frequent and relevant work situations to be considered in assessing attributional styles (e.g., “You receive inappropriate comments (from a colleague, from your boss, etc.) about the quality of your work”, “You successfully complete a task”, “You are assigned to tasks and projects that you do not want”).

The 16 situations were used as items for the new scale. Participants rated the 1) relevance of the situation (Not at all–Very relevant), 2) controllability (Totally due to me–Totally due to others or circumstances) and 3) stability (Unlikely–Very likely to be repeated).

262 workers (77% women, average age 29 years old, and 36,5 hours worked weekly) answered the questionnaire jointly with PANAS and NEO-FFI.

Results

All 16 situations were considered highly relevant (average range 3,5-4,4, in a scale 1-5). Controllability and stability dimensions showed appropriate reliability values (omegas values of 0,78 and 0,75). Factorial analysis grouped the items in positive and negative situations with a general factor as the best solution. Following previous works (e.g., Miralles et al., 2015), we calculated a score of optimism: workers with high controllability-stability in positive situations and low controllability-stability in negative situations, and vice versa for pessimism.

Regarding the correlations with affectivity and personality, the results followed our expectations: Optimistic showed higher positive affect (r=0,27**), extroversion (r=0,23*) and conscientiousness (r=0,23*), while pessimistic showed higher negative affect (r=0,21**) and neuroticism (r=0,29**).

Limitations

Sample size and gender proportion bias are the main limitations of the research, making it necessary to recruit new participants.

Conclusions

The tool created has the strength of being focused on work by presenting common situations in that context. Attributional styles have shown to be useful in understanding individual differences to explain other phenomena of interest in work behaviour such as the affectivity (positive or negative) of employees. These individual differences can be incorporated into selection and assessment procedures, as they likely correlate with motivation or performance.

Relevance to the Congress Theme

Incorporate the assessment of attributional styles in selection and assessment procedure could contribute to the attraction and attrition of talented workers in our current contexts with high instabilities and uncertainties.

Keywords: attributional styles, affectivity, personality

Oral presentation OP789

Organisational correlatation of workplace bullying in Hungary

Gyöngyvér Csapó, University of Pécs, Faculty of Humanities, Institute of Psychology, Doctoral School of Psychology, Doctoral Program of Applied Psychology; Andrea Czibor, University of Pécs, Faculty of Humanities, Institute of Psychology, Department of Social and Organizational Psychology

science

Workplace bullying is a situation in which an individual is exposed to insults and harassment at their workplace constantly and over a long period of time (Leymann, 1996; Matthiesen and Einarsen, 2007). Bullying usually starts with a conflict escalating later into psycho-terror, with victims being exposed to attacks such as being talked about behind their backs, criticism, or the creation of a threatening atmosphere. At the system level, mobbing negatively influences work effectiveness and efficiency, reduces job satisfaction and motivation, as well as contributes to higher levels of intention to leave work (Martino, Hoel, and Cooper, 2003).

Although workplace bullying is being intensively researched internationally, very few studies on mobbing have been conducted in Hungary. Over the past 25 years, hardly any studies have been published on the subject, despite the fact that, in addition to its numerous negative correlates (e.g. stress, anxiety, health consequences, and even PTSD) appearing at several levels, mobbing has been shown to have a correlation with job satisfaction, effectiveness, and the intention to leave. Furthermore, there is presently no methodically reliable questionnaire that measures mobbing in Hungarian. Therefore, during our research, we are adapting the Negative Actions Questionnaire (NAQ-R), which has been developed by Einarsen and his colleagues (NAQ-R, Enairsen, Hoel, and Notelaers, 2009), and is the most commonly used measuring tool internationally.

The employees taking part in the adaptation of the questionnaire are over 18 years old and have been working for a minimum of 4 hours a day for at least half a year. In the first part of the adaptation, more than 200 people filled in the questionnaire, which rose to over 300 during validation. The validity of the questionnaire has been examined with the help of several questionnaires concerning system wellbeing and system output, such as the relevant scales of the Copenhagen Questionnaire (COPSOQ II; Pejtersen, Kristensen, Borg, and Bjorner, 2010), the Intention to Leave Questionnaire (Mobley, Horner, and Hollingsworth, 1978), the Workplace Stress Questionnaire (Coping and Stress Profile, Kissné Viszket and Hunyady, 2001), as well as the WHO Wellbeing Questionnaire (WHO Well-Being Questionnaire — WBI5; Bech, Gudey, and Johansen, 1996).

According to our initial analyses, the Hungarian version of the NAQ-R questionnaire has the required reliability. We have also received conceptually expected correlations with the scales used for testing validity. However, the long-term goal of our study is not only to adapt the NAQ-R questionnaire to Hungarian but also to explore how the system, as a community, influences workplace bullying in Hungary. Furthermore, we aspire to understand the average employee's attitude towards mobbing and to what extent they consider it acceptable.

Oral presentation OP178

Organizational culture impacts the effects of Design Thinking practices on novice users

Justine Massueil, Institut de Recherche en Gestion, Université Paris Est Créteil

science

Organizational culture is defined as the underlying norms, values, and assumptions that define the "right way" to behave in an organization (Schein, 2010). Therefore, this culture, as perceived by collaborators influences the perception and adoption of tools from Design Thinking (Canato et al., 2013; Elsbach & Stigliani, 2018). A culture advocating collaboration, and proximity to consumers or users favors the integration of Design Thinking tools (e.g., Chen & Venkatesh, 2013; Kolko, 2015; Stigliani & Ravasi, 2012; Wilkie et al., 2010) while a culture focused on performance or productivity may inhibit the use of these tools (e.g., Berk, 2009; Chang et al., 2013; Goffin & Micheli, 2010)(e.g. Berk, 2009; Chang, Kim, & Joo, 2013; Goffin & Micheli, 2010). This obstacle does not only come from a reluctance on the part of managers, as one might think, but may result from a failure to implement these tools and to reap the theoretical benefits because the gap between usual practices and Design Thinking practices would be too large (Chang et al., 2013).

In order to define such potential gap between culture types and design thinking tools and practices, the study focuses on how novice participants in a Design Thinking process form attitudes and perceive the novelty and utility of Design Thinking tools over time. Moreover, we hypothesize that culture influence participants' general attitudes towards Design Thinking practices, the evolution of such attitudes and the specific practices they perceived as novel and useful.

Data were collected from 46 participants grouped in 15 cases of novice multidisciplinary product development teams using design methods across phases of product development and implementation. A hybrid qualitative and quantitative analysis indicate the impacts of culture on perception of Design Thinking practices: First, culture influenced the evolution of participants' attitudes and engagement in the process. Culture oriented toward competitiveness and security show opposite effects compared to culture oriented toward relationship and improvements. Second, participants reported different practices or tools that they retained as new and useful and wish to implement. Such differences were partially influenced by participants' perception of the culture of their organizations. Thus, what is retained and highlighted from a discovery of a Design Thinking process depend on how participants perceive their actual environment and the practices already in place. And third, a sample of participants showed an important evolution from passively resistant to the Design Thinking Process to actively promoting its use and development in the organization. Interviews analyses showed the evolution of attitudes during the different steps of the process.

The present study aims to be applied in more organizations in order to identify significant and replicable effects. Moreover, as limitations, the longitudinal and cross-organizational design led to numerous potential biases such as variances in communication about the Design Thinking program, the length of the program and time between the different steps, the importance of the product for the organization strategy. Such aspects might have influenced attitudes toward Design Thinking.

Implications from this study include that organizations benefit differently from the implementation of Design Thinking program and participants find interest and seek to replicate differents tools and practices depending on their organizational context. Finally, participants refractory to Design Thinking were found to benefit more from it, as they changed their views along the process in a greater way than neutral participants.

Organizational factors and work engagement: study among contractual teachers of regional academies

Soufian Azouaghe, Mohammed V University in Rabat / Univ. Grenoble Alpes / Univ. Savoie Mont Blanc, LIP/PC2S; Ahmed KHAOUDI, Université Moulay Ismail- Meknes; Lamia MOUHSSINE, Université Moulay Ismail- Meknes; Houdaifa NADIF, Mohammed V University in Rabat

science&practice

1. Research goals

Teaching has been considered a very demanding job and high-stress occupation (Bakker et al., 2005; Newberry & Allsop, 2017; Travers & Cooper, 1996). In the same way, Moroccan teachers face a lot of constraints and demands (e.g., overcrowded classrooms, work overload, lack of pedagogical resources, student misbehaviours) that impact their motivation, well-being and engagement (Azouaghe, 2018, 2019; CSEFRS, 2014). Given these conditions, the Moroccan government, launched in 2016, a new status namely "contractual teachers of the Regional Academies of Education and Training" to fill the teacher gap (decision, N° 7259, 2016). This decision has led to strikes and protest stops by teachers of regional academics during each school year. The situation has changed from "public job stability" to employment on a group contract basis which means "unstable job" what created the difference between "us and them"; "us" refers to the contractual teachers and "them" refers to the public sector teachers. Despite the fact that they have the same role/work, it should be noted that they have not the same status and rights. However, authors emphasized that not all teachers are anxious and stressed (Hakanen et al., 2006). This study focuses on the impact of organizational factors (i.e., job insecurity, social support and procedural justice) on work engagement among the contractual teachers of regional academies in Morocco.

2. Theoretical background

Work engagement is "a positive, fulfilling, work-related state of mind that is characterized by vigor, dedication, and absorption" (Schaufeli et al., 2002, p. 74). Based on the job demands-resources (JD-R) theory (Bakker and Demerouti, 2014, 2017), the combination of job characteristics and personal resources makes it possible to predict job performance through employee engagement. Consequently, engagement at work appears more likely when workers face high challenges and have sufficient professional and personal resources to meet those challenges (e.g., Bakker and Sanz-Vergel, 2013; Tadic et al., 2015). Schaufeli et al. (2009) show that social support is among the predictors of work engagement.

3. Methodology

Participants. The sample consisted of 99 teachers: 38 teachers in primary school and 61 teachers in secondary school. It included 41 male and 55 female. For 3 teachers, information about gender was missing. The age range of the participants was between 22 to 50 years. Furthermore, the number of years of working experience was between 1 year to 6 years.

Measures. Data was collected using a questionnaire. Job insecurity was measured by job Insecurity Scale (De Witte, 2000). It contains 4 items are scored on a 5-point scale, ranging from 1= totally disagree to 5 = totally agree . Social support was based on a scale using the results of the exploratory study and the job content questionnaire (Karasek & Theorell, 1990). It includes six items measured on a 5-point scale (1= strongly disagree , 5= strongly agree). Procedural justice was

assessed using an adaptation of Brashear et al.'s (2004) organizational justice scale. The scale includes nine items, ranging from 1 = strongly disagree to 6 = strongly agree . Work engagement was measured with a short version of Utrecht Work Engagement Scale (Schaufeli & Bakker, 2006). It includes nine items are scored on a 6-point scale (0= never , 6= always).

4. Results

Results show consistency of all measurement scales is satisfactory. Cronbach's alpha coefficient higher than .70. They indicate a positive and significant relationships between social support and work engagement (b = .41, p <.01). However, there is no significant effect of job insecurity (b = .11, p = .26) and procedural justice (b = .06, p = .50) on work engagement.

5. Limitations

The sample size is small. The results are preliminary. A large sample study is in progress which results will be presented at the 21 st EAWOP Congress.

6. Research/Practical Implications & Originality/Value

Our study reveals the importance of taking into account the social support as a key variable in promotion of well-being and engagement among Moroccan contractual teachers. To the best of our knowledge, no such study has yet been conducted in the field of work psychology in the Moroccan context. In order to address this gap, the overall goal of this study is to explore the impact of organizational factors on work engagement among Moroccan contractual teachers.

7. Relevance

The study is fully in line with the theme of the congress and UN SDGs in that it focuses on organizational factors (job stability, feeling of precariousness, role of the entourage) which have a positive or negative impact on well-being, engagement and motivation at work, especially in the education system.

Keywords: Contractual teachers, Work engagement, Organizational factors

Paths to team performance: a configurational analysis using fuzzy-set qualitative comparative analysis

Teresa Rebelo, Univ Coimbra, CeBER, Faculty of Psychology and Education Sciences, Portugal; Pedro Torres, Univ Coimbra, CeBER, Faculty of Economics, Portugal; Paulo Lourenço , Univ Coimbra, CeBER, Faculty of Psychology and Education Sciences, Portugal

science&practice

Research goals/Theoretical background

Work environments are increasingly volatile, uncertain, complex and ambiguous (VUCA). In these turbulent contexts, the use of teams as a way of organizing and managing work gives organizations flexibility, maximizing the value of their human capital. As the main purpose of creating teams is always generating value for the organization, acknowledging what drives team performance has been one of the main concerns of both research and practice.

Much of the recent research developed in team performance was guided by the input-mediator-output-input model, in which outcomes of team activity are conceptualized as the result of antecedent factors (inputs) that influence member's interactions (processes) and emergent states (e.g., affect and cognitions). In the present research, adopting a configurational approach, we intend to explore how two processes – team learning and team conflict – and two emergent states – team trust and team psychological safety – combine to generate (or undermine) team performance.

Although the literature considers that a group is a complex adaptive system where causal relationships are not necessarily linear, most of the research in this area has adopted symmetrical approaches. In this paper, we intend to advance on previous studies, by using fuzzy set Qualitative Comparative Analysis (fsQCA), an approach that takes into account the possible asymmetric effects of the variables on the outcomes. Specifically, this approach allows the conditions that lead to a given result to be identified, considering that in some configurations the presence of a given condition may contribute to reaching the outcome whereas, in others, it may be its absence that leads to the result.

Methodology

A field survey study was conducted with 82 teams (353 team members and 82 team leaders) from 57 Portuguese organizations. Most companies are from the services sector (73%) and the majority are small and medium-sized companies (80%).

A multisource approach was implemented in this study: team members were surveyed about team trust, intragroup conflict, and team psychological safety, whereas leaders were surveyed about team learning and team performance. The convergent and discriminant validities of measurement scales were analyzed through two confirmatory factor analyses (CFA) using the maximum likelihood method of estimation, conducted with AMOS Software (Version 25). FsQCA was used to test the configurations (i.e., a combination of antecedent conditions) that reflect the necessary and sufficient conditions for high and low team performance. FsQCA 3.0 was used to perform this analysis.

Results

The results obtained suggest that three alternative paths can lead to high levels of team performance, which explain together about 53% of this outcome. Team learning and cognitive trust

are the core conditions in these models, but contributing conditions vary. The most frequent configuration (with a raw coverage of .443 and a unique coverage of .441) includes the presence of team learning, cognitive trust, affective trust, and the absence of both socio-affective conflict and task conflict. Regarding the paths that lead to low levels of team performance, five configurations were obtained, which account for 57.8%. The absence of psychological safety is always a core condition, and the absence of team learning, or the presence of socio-affective conflict, are also core conditions, alternatively. The absence of team learning is a core condition in three of the obtained configurations, while the presence of socio-affective conflict is only present in two configurations.

Limitations

The cross-sectional nature of data may lead to the role of team learning, team conflict, team trust, and team psychological safety as antecedent conditions of team performance being questioned.

Conclusions

A higher number of configurations was obtained for low levels of team performance than for high levels, which suggests that there are more paths to failure than to success. The centrality of team learning as a fundamental process to achieve success and avoid failure is clearly highlighted, emphasizing the importance of developing this process among teams.

To the best of our knowledge, this is one of the first studies to explore the asymmetrical effects of team processes and emergent states on team performance. Due to the complex nature of teams, adopting this kind of approach may lead to an enhanced understanding of the conditions that lead teams to succeed.

Funding Statement: This work was funded by national funds through FCT – Fundação para a Ciência e a Tecnologia, I.P., Project UIDB/05037/2020.

PATIENT EXPERIENCES AND HOSPITAL-ASSOCIATED INFECTIONS: A GROWTH MODEL

SETH ADDO, UNIVERSITY OF STAVANGER BUSINESS SCHOOL

science&practice

Research goals: For decades, calls have been made for studies linking different types of patient outcomes. Patient outcomes have taken two main forms: subjective (based on the perceptions of patients) such as patient experience, and objective (independent of the perceptions of patients) such as injuries and hospital acquired conditions. The health sector is a highly volatile one with several dynamic factors. Considering that patient experiences have gained traction in health research over the years, a relevant question to ask is if patient-reported experiences are reliable sources for improving healthcare quality in such a volatile sector. This paper argues that if patient-reported experiences are significantly linked to objective patient outcomes over time, then subjective outcomes are a solid basis for assessing healthcare quality and improvement. The aim of this paper is to develop a growth model of hospitals on patient-reported experiences to assess trends together with trends in hospital-associated infections.

Theoretical background: This paper draws on the existing theories on quality healthcare such as the Donabedian framework.

Methodology/Approach: The study will obtain data for both patient experiences and hospital-associated infections from the website of the Norwegian Health Directorate on quality indicators between 2012-2021. The unit of analysis will be the hospitals. A latent growth model will be developed with the aid of Mplus to assess the concurrent changes and relations between the two variables over time.

Expected results: It is expected that the intercept and slope of hospital-associated infections will relate negatively with the intercept and slope of patient-reported experiences. Thus, hospitals that start high and continue scoring high on hospital-associated infections will start low and continue scoring low on patient-reported experience. The final results of this will be ready by January, 2023.

Limitations: This study will be limited by the measurement of the two variables as there may be variations of this at the hospital level due to factors such as length of stay, hospital size, preferred treatment by patient, and type of illness. Nonetheless, the study will control for some of these factors to generate reliable results.

Conclusions/Implications: The study will buttress the relevance of patient-reported experiences as reliable basis for quality improvement as well as a reflection of existing conditions in hospitals. Hospitals will take patient experience scores into consideration when making decisions to improve healthcare quality. The study will also contribute to filling the dearth in literature regarding relationships between different forms of patient outcomes.

Originality: This study will be one of few that links subjective patient outcomes to objective patient outcomes over time, especially in Norway.

Perceived age discrimination misfit in employee-supervisor dyads and objective employability ratings: The buffering effect of motivation to continue work

Ellen R. Peeters, Open Universiteit; Selin Kudret, Henley Business School; Benjamin Laker , Henley Business School; Judith H. Semeijn, Open Universiteit; Beatrice I. J. M. Van Der Heijden, Radboud University Nijmegen

science&practice

Employability is one of the key indicators of sustainable careers (Van der Heijden, 2015). In a novel approach, we move beyond the traditional agentic view of employability and account for an unexplored contextual and relational factor that impacts on employability, thereby bringing a fresh multi-source and multi-level approach to employability studies (Forrier et al., 2017).

Drawing on Conservation of Resources theory (Hobfoll, 1989), we test whether the negative impact of the perceived age discrimination misfit in employee-supervisor dyads (an adverse contextual and relational factor) on objective employability ratings (resource loss) will be buffered by employees' motivation to continue working (optimal functioning). We tested our multi-level moderated polynomial model of dyadic age discrimination misfit in a sample of 190 employee-supervisor dyads drawn from corporate organisations operating in Europe. Using Response Surface Methodology, we found that objective employability ratings suffer most when the misfit between the employee and supervisor perceptions of age discrimination is greatest in both directions under lower levels of employee motivation to continue working. However, we do not observe a similar decline in objective employability ratings under higher levels of employee motivation to continue working – suggesting a buffering effect to achieve optimal functioning in the face of an adverse contextual and relational factor.

This is the first empirical study introducing dyadic age discrimination perceptions as an adverse contextual and relational antecedent of objective employability and testing this hypothesis by using polynomial regression and response surface methodology, thereby offering new conceptual and methodological insights into employability and sustainable careers literature.

Perceived similarity and change reactions' endurance and valence: The mediating role of trust in dyads

Maria Vakola, Athens University of Economics and Business; Janne Kaltiainen, Finnish Institute of Occupational Health

science

Research Goals and why the work was worth doing

Much of the interaction among group members and leaders happens within dyads. Amongst the other individuals, the employees' supervisor is potentially the most important (Vecchio & Bullis, 2001). As a result, employee-supervisor interactions can influence how the change is perceived and assessed (Lines, 2005). These dyadic interactions between employees and their supervisors are described as more positive when people engaged in these interactions perceived the others as similar which increases trust (Liden et al., 2016). Trust can influence both the valence (positive or negative) and the strength/endurance of reactions to change.

Previous research has scarcely examined the strength/endurance of reactions to change which are more durable and impact the associated work and change outcomes. This research contributes to collective change research and practice by examining both the valence and the endurance of a reaction to change through a relational perspective, which is an important missing element in our understanding of employees' reactions to change. Examining whether perceived similarities of reactions between employees and their immediate supervisors increase interpersonal trust and whether trust can increase the valence and the endurability of an employee's reaction to change, may reveal important contingencies that can add to our understanding of collective reactions.

Theoretical background

Collective reactions to organizational change are driven by interactions between change recipients. Employee-supervisor interactions can influence employees' reactions to change which are important for change success. These dyadic interactions are described as more positive when employees engaged in these interactions perceived their supervisor as similar. When similarities in attitudes exist in a dyad, employees report greater trust. The similarity in reactions to change can assure the employees about the 'correctness' of their reaction to change but we hypothesise that trust can make them feel safe to develop endured and shared reactions to change. Trust can make employees feel safe to keep the same reaction because their immediate supervisors have all the necessary abilities to guide them through change, they demonstrate consistency between words and actions, and they show concern for their welfare. As a result, employees not only realize their common aspects of cognitive processing and therefore a common way of interpreting events but they feel safe that the trusting relationship with their immediate supervisors will reduce any risk associated with keeping or shifting reactions to change.

Design/Methodology/Approach/Intervention

We conducted a study of 168 dyads and a total of 336 participants. Hypotheses were tested as a structural equation model in Mplus version 8 (Muthén & Muthén, 2017).

Results obtained or expected (if not available, it must be made clear when they will be)

We found support for the mediating role of trust in the relationship between perceived similarity and the endurance and shared valence of reactions to organizational change. In an atmosphere of trustful dyadic exchanges and interactions in a changing context characterized by uncertainty, speculation, and fears, perceived similarities in reactions validate an employee's reaction more, making it more enduring. Perceived similarities in reactions to change is a valuable source of information that signal the right valence and the 'correctness' of these reactions. But, to adopt a favorable reaction to change and keep the same reaction to change, facing the possible risk associated with this decision requires more than a common way of interpreting the change. It requires trust.

Limitations

Although supervisory reactions were assessed by their employees, and employees' reactions were assessed by their supervisors in our research, data was collected in Greece, a country categorized as high on power distance (Hofstede, 2001). As a result, employees may be particularly perceptive to their immediate supervisors' reactions to change.

Conclusions

Organizations can no longer rely on dyadic attitudinal similarity to generate positive and effective reactions to change. Building trust in an organizational change context is essential because it creates conditions for favorable and endured reactions to change. The nature of the interpersonal relationships between employees and their supervisors can have a great effect on the valence and on endurance of employees' reactions.

Relevance to the Congress Theme

Understanding reactions to change on a dyadic level contribute to our understanding of the changing nature of work and its dynamics. Failing to examine the valence and the endurance of reactions to change reduces the accuracy and validity of the results and can mislead decision-makers.

Performance management effectiveness in SME's – evidence from Belgium

Jana Machtelinckx & Koen Dewettinck | Vlerick Business School

science&practice

Both academic research and practice have been highlighting the challenge to design and implement effective Performance Management (PM) in organisations, making it potentially one of the bigger challenges in Human Resources. In the present study the goal is to get a view on those factors that impact the effectiveness of performance management systems. We aimed at getting a better view on how organisations, more specifically Belgian SME's (Small and medium-sized enterprises), currently shape performance management and we investigated how these characteristics explain the effectiveness of performance management.

Existing research is not clear about the effect of frequency of an appraisal talk. Recurring feedback can be helpful, but this doesn't always need to take the form of a formal talk (Casas-Arce, Lourenco & Martinez-Jerez, 2017; Wood, Pichler & Beenen, 2017). In our study, we investigate if the frequency of an appraisal talk is linked to PM effectiveness. Furthermore, research suggests that the content of an appraisal is a determining factor for performance management. Researchers indicate that it should focus on skills and competencies, training needs and personal development in the company (Armstrong, 2006; Lawler & McDermott, 2003). Our research takes a closer look at topics that are discussed during an appraisal talk and their effect on performance management. These topics include skills, attitudes, company values, individual and team goals, salary, …

Additionally, scholars argue that the supervisor plays a vital role in performance management and therefore they should get training and support in the performance management of their team members (Armstrong, 2006; Botha, Blom & Modipane, 2019; CIPD, 2022; Kondrasuk, 2011). We investigate if training and supporting supervisors in performance management is correlated with PM effectiveness. Other variables were included in our study as well: automatization, appraisal scoring, … (Armstrong, 2006).

Data collection was done in the beginning of 2021 through an online survey directed towards Belgian SMEs. 156 organisations from different industries filled out the survey. Our regression analysis shows that supervisor training and content of performance conversation are important drivers of PM effectiveness than conversation frequency. More specifically, organisations that report to train their supervisors more heavily and that focus on skills development and training and development needs during the conversations report higher PM effectiveness. Together these variables explain 39% of performance effectiveness, as measured in our survey.

Contributing to the UN Sustainable Development Goal 'Decent work and economic growth', our findings shed new and interesting light on how to make performance management effective in organizations where the main conclusion is that quality of performance management is more important than quantity. There are however a few limitations to our study. First, our survey includes cross-sectional data at an organisational level. Second, PM effectiveness is a self-reported measurement and gives an idea of how effective the performance management system is considered by the participants. Further research could use multi-source and longitudinal data on an employee level. Furthermore, it could look into the effect of performance management practices on the actual performance of employees.

During the EAWOP conference we want to present the findings from our study and give insights into how practitioners can improve the effectiveness of their performance management approach. We also want to inspire academics for future research.

Personal and Work-related Factors in Workplace Stress and Physical Health Outcomes: Scoping Review

Abigail Bailey, Nina Kupper, Dorien Kooij & Renee de Reuver | Tilburg University

science

Chronic work stress is consistently associated with the development of poor health, most commonly cardiometabolic diseases. Although research into the work stress-health relationship is widespread, differences exist in how this problem is conceptualised and researched. The two main approaches are a work context perspective and a health perspective. The work perspective conceptualises the path from work context to perceived stress and well-being, often based on conservation of resources theory. The health perspective considers the pathway from chronic stress to clinical outcomes, based on allostatic load theory. Therefore, knowledge gaps exist in the integration of the various predictors of physical health.

Interdisciplinary research is necessary to consolidate current knowledge existing in the two perspectives. Within each perspective, literature reviews are common, although there is little cross-over spanning the knowledge of the two. Therefore, a hybrid scoping review has been conducted to examine and map the workplace-related personal and work context factors that influence employees' stress-related physical health outcomes, and the underlying mechanisms of this pathway. The consolidative nature of this review will provide a framework from which research gaps can be identified, and tailored, evidence-based interventions may be constructed; this will be beneficial to both researchers and practitioners.

We are currently conducting a scoping review, following Arksey & O'Malley's (2005) framework. Scoping reviews are beneficial in interdisciplinary research, facilitating the identification of overlaps in concepts that may use different terminology across the two fields. The databases WebOfScience, PubMed, and PsycINFO were searched using terms focused on physical health, personal factors, work-related factors, and workplaces. The scoping review utilises multiple search strategies to capture research from both perspectives. For example, targeting the health perspective, the search terms “coronary artery disease” or “diabetes” were used, whilst for the work context perspective, the terms “physical health” or “health and wellbeing” were used.

17 reviews and 269 empirical papers were included in the scoping review, and the most relevant information was extracted and summarised. Analysis of the papers is still ongoing and is expected to be completed by December 2022.

The most common outcome reported in the included studies is ‘subjective health’, closely followed by diabetes and cardiovascular disease incidence.

Risk factors have been categorised by the authors into four levels of work factors (organisational, team, job, and individual level), and four levels of personal factors (sociodemographic, psychological resources, personality, and behaviour). The organisational level includes policies, culture, and structure, and the team level incorporates leadership, interpersonal relationships, and team perceptions. At the job level, the categories of job characteristics were identified, for example, salary and contract type, as well as working conditions and work demands. Personal factors included sociodemographic variables, such as age, gender, and education level. Psychological resources were identified, such as psychological flexibility, self-efficacy, and resilience. Personality emerged as a large category of personal factors, including traits such as neuroticism, cynicism, proactive, and type

D personality. The final category of personal factors identified was behaviour, such as physical activity, nutrition, and smoking.

A limitation of this review is the large number of included papers limits the depth of analysis that can be reached. This review aims to provide an overarching view of the two perspectives, although this may lead to a loss of detail in explaining the relationships.

Conclusions that can be made about the results are preliminary, but some areas that were highlighted as gaps to be investigated deeper include psychosocial safety climate and psychological capital as predictors of health, and heart rate variability as an indicator of health.

Due to the interdisciplinary nature of the topic, there was extreme heterogeneity in the conduct of the studies. Much of the research from the health perspective investigated objective physiological measurements, whilst research from the work context perspective measured subjective health. Therefore, it is hard to link the contextual predictors (the focus of the work context perspective) to a specific disease outcome (the focus of the health perspective). Hence, more research is needed to link the work context with objective health measures.

In line with the UN's SDG target 3.4, this scoping review focused on the outcome of non-communicable diseases, specifically, stress-related cardiometabolic diseases. By understanding the work contexts related to such diseases, multilevel interventions can be developed within organisations to prevent the development of these diseases.

Personality Metatraits and Managerial Competencies in Assessment Center Performance: The Moderating Effect of Age

Anna Baczyńska, Kozminski University

science

The article examines the relationship between personality and managerial competencies with the moderating effect of age. A group of 327 managers partook in this study. Managerial competencies related to social skills, problem-solving, management and goal striving, openness to change, and employee development were evaluated via the Assessment Center (AC) method with the application of strong and weak simulations of VUCA, an acronym for "volatility, uncertainty, complexity, ambiguity." Personality metatraits were assessed via a self-report questionnaire conceptually based on the Circumplex Model of Personality Metatraits (CPM; Strus et al., 2014), which consists of four bipolar personality metatraits. The results confirmed that two personality metatraits – Passiveness and Disharmony – are negatively linked to all managerial competencies, and the regression models showed that Passiveness was a significant negative predictor of social skills and problem-solving. Moreover, the results showed that the managers' age can be considered a significant moderator in the relationship between personality metatraits and managerial competencies, albeit in specific simulations only. Our research findings help to better understand this relationship by including a moderating variable. For example, age as the moderator of the personality-overall assessment rating (OAR) could be considered a predictor of managerial performance differently for younger and older managers.
