After the most appropriate online community was identified – "Trendy" – the researcher spent a lot of time in the community, in order to learn more about the social norms, codes, and conventions, hence became familiarised with the community and its members. This community has been present on Facebook since July 2016; it is the largest fashion-related online community in the region. It is administered by four admins, and a moderator. At the beginning of the research, the community had 115,787 members; by the end of the three-month analysis, the group attracted 364 new members, 116,151 in total. The majority of the members are from Southeast Europe. The community is very famous among the people, especially younger generations. The average age of members is 24 years-old, and there is a clear dominance of females when compared to males – 87 % female users. However, there is a variety of professions - from students, English teachers, graphic designers, journalist, digital media managers, to fashion bloggers, and fashion designers. Members are motivated by a common interest – fashion, therefore, they interact daily in the group and present their opinions on numerous topics related to fashion, such as: 'in and out' outfits, outfits for events, newest trends in fashion, etc. (approximately 200 messages per day). Among others, they ask each other about opinions regarding a product or a particular brand, and the ones who have already purchased a garment from that brand,

tend to share their first-hand experience with other members. Understanding and tracking these discussions is important for fashion designers who are interested in consumer perceptions.

2) Data Collection and Analysis: The data generated was large in number and took a considerable time to be analysed. In order to simplify the process, the data was categorised as on-topic and off-topic, as it is presented in the table below (community’s members were given coded names and their posts were summarised in order to ensure confidentiality for the members).

On-Topic Data	Off-Topic Data
M22: Such a fabric can be found in Skopje or Ferizaj, these cities have the best and cheapest fabrics.	M15: Hello to everyone, I am giving away few clothes that I do not wear anymore, if anyone wants them text me.
M33: Would you please suggest me any dress for a wedding party I have to attend on September? I want something unique. Please send me any suggestion!	M22: I am not sure which nail design to do for my engagement party. Which one do you suggest? [pictures attached]

Table 3: On-topic and Off-Topic Data

Additionally, the community members were put into four categories: tourists, minglers, devotees, and insiders.

Tourists (36%)	Minglers (38%)	Devotees (19%)	Insiders (7%)
Not-Frequent Visitors	Frequent Visitors	Not-Frequent Visitors	Daily Visitors
Not Socially Involved	Socially Involved	Not Socially Involved	Socially Involved
Short-Time Members	Long-time Members	Long-time Members	Long-time Members
Great Interest in the Community	No Interest in Participation	Highly Engaged in Discussions	Highly Engaged in Discussions
			Opinion Leaders

Table 4: Community Members' Categories

After the data was collected, it was analysed through a thematic analysis. Throughout this process, forty-four codes, two themes and several sub-themes were created.

Table 5: Themes and Sub-Themes Created for this Netnographic Research

Codes			
SLB	Suggesting Local Brands	WC-HH	Workout Clothes – High Heels
SFD	Suggesting Fashion Designers	SC	Satisfied Customers
S	Sales	ST	Summer Trends
RO	Requires Opinions	CD	Creative Designers
RS	Requires Suggestions	SC	Satisfied Customers
FE	Friend/Family Experience	UO	Unsatisfactory Outfit
EB	Experience Based	KB	Knitted Bikini
DS	Discounts	HG	Handmade Goods
AV	Availability	EX	Expensive

Table 6: A few of the Codes Created for this Netnographic Research

The table below presents some of the data collected by the researcher. The data collected and analysed is in the written form; but it has to be noted that besides text, members of the online community tend to post pictures and emojis. In many cases, they post exclusively pictures or emojis without any written text. However, the research considered the usage of such pictures for study purpose to be unethical. Therefore, the following table presents only the interactions between members of the community in the written form. Great significance was given to the privacy of community's members, thus, the researcher paraphrased the comments posted by members.

ID#	Response	Code
M2	Did you all see VS's new line for the summer? What do you all think about it? I personally loved it. It's unique as his lines always are. But, a friend of mine was in the shop and tried the "famous black dress" and she said that it was not very comfortable because it is a bit hard to move wearing it. It looks awesome if you only need to pose, but not for a wedding. Did any of you try it? What do you think?	VS; RO; U; FE; UC
M3	I would really appreciate if you help me find a good fashion designer for designing my engagement dress. I need someone, who is good at their job, but not very expensive. Thank you!	RS
M10	My sister and I are knitting women swimwear. We found a great tutorial in YouTube and we did three pairs and we wanted to share them with you. In our opinion, these bikinis look great; but, what do you think? [photo attached]	KB; RO
M12	I think that designing an outfit for your graduation party is too much, and too expensive. I would rather buy an outfit in Mango, either a suit, or a simple dress, than pay for an outfit to be designed by our fashion designers.	EX; SIB; M
M13	I mean, LS' job is great and I guess we all love it, but personally, I cannot afford it. I think they should offer discounts for us because most of us are still not working and we would like to be able to wear such outfits.	EX; DS

M14	Every-day bags with solemn dresses is my favorite thing during this season.	E-DB
M16	You can find the dress in M-PX. I was there yesterday and they still have it.	MP; AV
M22	I truly do not like chockers because nowadays everyone is wearing one and it does not seem cool anymore.	CH

Table 7: Netnography's Data

The data analysis shows the topics that are mostly discussed by members of the community on the issues that the research was interested in during this three-month period. The data provides rich information about members' perceptions regarding the latest trends in fashion and local fashion designers' work. Members thoroughly discussed the trends during this period and offered new suggestions as well. As for the local designers, a large number of members loved their work; a few members criticised their designs and some others offered suggestions and alterations. In general, these insights are valuable and useful for fashion designers because they give them the opportunity to understand consumer perceptions in a natural environment.

3) Providing Trustworthy Interpretation: As it can be seen, netnography is a successful stand-alone interpretation; nevertheless, focus groups or interviews with members of the fashion online community could be conducted in order to assure the credibility of data.

4) Research Ethics: Despite Kozinets' (2002) recommendation to taking an active stance, researchers did not fully disclose their presence to the members of the community. This provided a naturalist analysis because members were not influenced by the presence of the researcher. Nevertheless, the administrators of the online community had been informed about the ongoing research since the first day.

5) Member Checks: Unlike Kozinets (2002), who delivered the final report to the members of the community, the researcher provided such a report only to the administrators, who were informed about the research. Administrators thought that the research is valuable, and it provides a good analysis of the topics discussed.

CONCLUSION

Mainly, the study explains the concept and procedures of netnography to scholars, who intend to employ netnography in their studies for the first time. The literature shows that netnography as a method has gained attention among marketing scholars. Accordingly, the paper presents briefly the work of the main authors who have contributed to the development of the method throughout the years. However, it focuses mostly on the work of Kozinets, the founder of netnography, as he is

among the first ones to propose netnography's conducting guidelines. The study also shows the main strengths and weaknesses of the method that might be encountered by researchers during the process of employing netnography, initially throughout the literature review and lately throughout the discussion of findings.

Overall, the paper provides insights to new researchers on how to conduct this under-applied method – netnography – effectively. By explaining in details each of the steps that should be followed, it intends to make scholars familiar with netnography's procedures and help them in dealing successfully with the organisation around its implementation. The paper shows that the process is easy to follow and netnography, as a research method, provides researchers with access to a large amount of data. Most importantly, it offers them the opportunity to deeply understand consumers' interactions and their views regarding particular brands or products. The paper considers Kozinets (2002) research guidelines to be useful as the researcher is able to understand customer perceptions and consumer behavior. Future research could investigate netnography's role on these two phenomena. The study, among others, shows that a single online community can be effective in gaining consumer insights if the community offers the researcher rich data related to their topic of interest.

By showing the experience of researchers, this study intends to persuade other scholars to apply this method in their future studies. Initially, it increases their knowledge of the concept of netnography. Secondly, it helps researchers understand the process they have to go through when conducting netnography; and lastly, it shows the benefits that netnography provides to them. Further insights on how to navigate in the maze of qualitative research through netnography, and use it as a triangulation technique with other popular qualitative research methods within the fashion sector, will follow in subsequent papers where advice will be given to fashion industry practitioners.

REMEDIES FOR THE HOOLIGANISM FACTOR IN THE FOOTBALL INDUSTRY: THE PARADIGM OF CYPRUS

Yiapanas, George; Thrassou, Alkis; Vrontis, Demetris; Kartakoullis, Nicos

School of Business, University of Nicosia, Nicosia, Cyprus

ABSTRACT

The research relies on an extensive theoretical study taking into consideration the Decisions, Resolutions and Recommendations of the European Union and the Council of Europe, together with the enactments and amendments of the Cyprus law on violence in sports, to identify the key actions taken by the authorities in Cyprus, as a response to football hooliganism in an effort to improve the business of football. A problem, that for decades has been one of the biggest management issues and the main challenge in the industry.

The findings show that the Cyprus authorities managed through a series of key actions to develop a national integrated approach framework, implementing a three-pillar concept on safety management, in an effort to respond positively against football hooliganism. Therefore, the paper provides a valuable theoretical framework that can be adopted by Safety Managers.

An effective safety management is relying on an ongoing risk assessment and Managers must continuously supervise, control and practice all forces and technology systems, separately and together, in order to build an integrated operational readiness and successfully organise such multi-complex events, preserving at the same time, the balance between the three safety management elements. A safe environment creates value and the success of the football business relies on how well fans are treated and how comfortable and safe they feel at the venue.

Additionally, the findings of this research create the urge for empirical research to test the degree of application of the strategic framework and identify the volume and correlation between the created value and football as a business.

Keywords: football, hooliganism, safety management, regulatory framework, Legislation, Council of Europe, business value, integrated approach

INTRODUCTION

For decades hooliganism has been one of the major problems in football. A number of European countries have been affected by hooliganism, with United Kingdom, Germany, Netherlands and Italy being among of the countries that have experienced the biggest problems over the past years (Spaaij,

2007). According to Frosdick and Marsh (2005), hooliganism is defined as the fans' disruptive, antisocial and violent behaviour, intervening with any normal sporting activity. Disorder incidents usually involve clashes between rival fans, insults or racist behaviour, object throwing, flares or other flammable objects usage, pitch invasion, property damages, etc. (Carnibella et al., 1996).

Football hooliganism in Cyprus

The first football hooliganism incident in Cyprus was recorded back in 1939 between rival spectators. As a result, eight fans were arrested by the police and fined by the District Court. Hooliganism in Cyprus is strongly influenced by and directly related to a variety of historical, cultural and political factors. Football-related violence inevitably constitutes a social phenomenon, concerning most of the public opinion, and is always top news in mass media (Cyprus Sociological Association, 2001).

Football hooliganism is one of the main challenges and greater management issues in Cyprus (Kartakoullis and Theophanous, 2009), affecting the football business in terms of attendance and income. There exists a long list of disorder incidents in the last decade, involving street battles, car bombings, pitch invasions, riots, object throwing and many more.

A large amount of disorder incidents in Cyprus serve as examples of bad safety management in the workshops organised by the Union of European Football Associations (UEFA), classifying us as one of the most problematic countries in relation to football violence. According to the UEFA Incident Index, Cyprus has the third worst home record and sixteenth worst away record for the years 2016 - 2018. The incident assessment reports point out anarchic fan behaviour, extensive use of pyrotechnics, use of political banners, etc., and suggest immediate actions by the agencies.

Research methodology and aim of the study

Since 1985, the Council of Europe incited a series of additions and amendments in football grounds safety management, based on European best practices. These Decisions and Resolutions combine a series of theoretical studies and empirical research, staged by the Council of Europe, and currently they constitute a European "safety manual" that every member should implement. Therefore, methodologically, the research relies on an extensive theoretical study taking into consideration the Decisions and Resolutions of the European Union, the Conventions of the Council of Europe, the Recommendations of the Standing Committee and the Cyprus law on violence in sports. Cyprus is one of the first and few countries that harmonized their legal and judicial system with the recommendations made by the council of Europe.

The purpose of this paper is to theoretically recognise the generic football safety management guidelines introduced by the Council of Europe and decode the key actions taken by the authorities in Cyprus as a response to football hooliganism, in order to draw critical lessons from the case study.

Significance of the study

The paradigm of Cyprus as a peculiar field of study, due to its unique characteristics, can be used as a pilot study for countries aiming to resolve the problem of football hooliganism. The findings of this research can provide invaluable insight for small-size football industries and draw explicit theoretical and practical conclusions towards scholarly advancement and managerial implementation in the context of improving the business of football by implementing pre-existing theories and well-established European practices.

THEORETICAL FRAMEWORK

Safety management in football grounds

Most people prefer watching a football game at home, but many of them take the opportunity to travel to the stadium, enjoy the event, be part of the spectacle and support their team. All safety measures must cover the entire event flow, involving every stage, and start from the time the game is officially set, until fans return safely back home. This event flow involves several steps and interconnecting stages with the event itself being the highlight. Match organisers need to structure and implement a safety plan, aiming to provide the best possible welcoming environment (Yiapanas, 2016). The main goal in football grounds safety management is to maintain public order and safety inside and outside the sports facility, before, during and after the sporting event (Great Britain: Department for Culture, Media and Sport, 2018).

Safety is based on an ongoing assessment of risks posed by the operation of the sports venue, identifying those areas that are most vulnerable to these risks, while determining what can be done to limit them to an acceptable level. Since minimizing risk always costs money, the challenge is to minimize them at the lowest possible cost. This involves a sequence of actions and practices aiming to provide a safe and secure environment to every participant. These procedures, guide, advice and support match officials, providing best practices to accomplish their goal (Frosdick and Whalley, 1999). These principles and guidelines are the backbone and the central philosophical foundation for every safety plan, that defines the order of priorities and outlines of the operations and actions. It is the compass of preserving a general direction and strategy in implementing adaptations or improvements to the safety system in every sport venue, and in this respect, will give the relative weight and importance to each of the various elements which together constitute an integrated safety management plan (Whalley, 2008).

According to Frosdick and Chalmers (2005), all partners involved in a football match share the same concern and responsibility to preserve a balance between the three elements of safety management.

Football disasters and aftermath - The emergence of a regulatory framework

Over the past decades, several football tragedies occurred in different venues all around Europe. The official reports fundamentally changed the procedures and the safety management concept. Today, safety is considered a top-level priority for every agency. The causes of the major tragedies vary. Poor safety and security management, closed exit doors, inadequate segregation of fans, overcrowding, bad communication between the agencies, riots, fire, etc. (Darby et al., 2005).

Until the mid-80s, football hooliganism was not an issue of concern for the European institutions. The Heysel disaster in 1985 together with the Hillsborough disaster in 1989, are the two incidents that incited a series of additions and amendments in football grounds safety management (Elliot and Smith, 1993). These disasters led to serious sports grounds redevelopments and to numerous important safety guides publications.

Immediately after the tragic incidents in the European Cup final in Heysel in 1985, the Council of Europe under the Convention on Spectator Violence and Misbehaviour at Sports Events (Rec. 85/No.120), invited all the parties to establish a strong co-operation and unity between their agencies and the authorities, to prevent violence and control any disorder incidents at sports events (Council of Europe, 1985). According to Marsh et al. (1996), the different agencies started making efforts to launch a cross-border cooperation between the police and football authorities against hooliganism. The Council of Europe adopted the European Convention on Spectator Violence and Misbehaviour at Sports Events proposals and asked all member countries to respond immediately to football violence (Tsoukala, 2010; Anderson and Apap, 2002).

The integrated Safety, Security and Service approach strategic framework

The Council of Europe structured a strategic framework aiming to enforce all parties to “adopt an integrated, multi-agency approach towards safety, security and service, based upon an ethos of effective local, national and international partnerships and co-operation; to ensure that all public and private agencies, and other stakeholders, recognise that safety, security and service provision cannot be considered in isolation, and can have a direct influence on delivery of the other two components; and take account of good practices in developing an integrated approach to safety, security and service” (Council of Europe, 2016, p.1).

The trinity of *service*, *safety* and *security* formulates a three-pillar concept. Although these terms are used together and in balance, they are three indeed different elements. Chalmers and Frosdick (2011) define service as the most visible element that refers to any measures designed and implemented with the primary aim of making individuals and groups feel comfortable, appreciated and welcome, providing an exciting spectacle. This implies having suitable facilities, such as sanitary facilities, food and beverages, goods and products, etc.

Safety, as the less visible fragment, refers to any measure designed and implemented with the primary aim of protecting, looking after the health and wellbeing of the fans who attend a football event. Safety mainly deals with the structural design and maintenance of the venue in order to prevent buildings from collapsing. It manages venue capacities and aspects such as human behaviours, emergencies and evacuations in case of serious incidents. Finally, security refers to any measure designed and implemented with the primary aim of preventing and reducing the risk, and responding to any criminal activity, inside and outside the venue. It mainly deals with issues such as crime prevention and detection, terrorist attacks and serious threats (Chalmers and Frosdick, 2011).

The three elements are interconnected (Figure 1) and in cases where an overemphasis on security might happen, this could cause safety and service problems. Therefore, safety and security must always be kept in wide-ranging balance (Frosdick and Whalley, 1999).

Figure 1. Integrated safety management approach (Adopted from UEFA training manual)

The Standing Committee issued a number of Recommendations in regard to the three-pillar concept of safety, security and service. Recommendation Rec.2011/1 involves good practices on how to establish the core functions of safety officers and safety stewards and how to gain the maximum through the appropriate training. In addition, the Standing Committee encouraged clubs and other agencies, to develop a stewarding system, based on specific principles (Rec.91/1), to promote the use of advisory police spotters (Rec.88/1), to adopt effective policies and measures in order to prevent and combat racist, xenophobic, discriminatory and intolerant behaviour in football (Rec.2001/6), and to forbid the use of pyrotechnical devices at sporting events (Rec.2008/3).

RESEARCH FINDINGS

Various committees were appointed, mainly following serious disorder incidents, to resolve the problem, but unfortunately, they were unable to combat football violence. The lack of implementation of the law created a culture of immunity that fans were aware of. It is clear that such a situation influences the behaviour of potential troublemakers. Since there is common agreement that football violence constitutes a serious social phenomenon in Cyprus, then the responsibility for it lies on everyone's shoulders. The Council of Europe and UEFA performed several consultative visits to evaluate the situation and proposed measures that could minimise the problem.

Actions taken, as a response to the football hooliganism problem in Cyprus

Cyprus ratified the European Convention (19.VIII.1985) on Spectator Violence and Misbehaviour at Sports Events and in particular football, on 22nd June 1987 and entered it into force on 1st August 1987. Following the recommendations, resolutions and guidelines of the European Council, the Cyprus government, in 1994, brought into effect the Spectator of Violence, Misbehaviour and Relevant Offences at Sports Events Law, L5(I)/1994, adopting most of the Standing Committee's Recommendations (Rec.93/1) concerning measures to be taken by the organisers and the authorities (Council of Europe, 2015).

The law consists of twenty Articles, securing adequate public order resources to counter-brake violence and disorder incidents, inside and outside the sports venue. It also facilitates strong collaboration between the police and the agencies involved (Spectator of Violence, Misbehaviour and Relevant Offences at Sports Events Law 1994).

The Council of Europe, in 2002 (Decision 2002/348/JHA), imposed on every member state to establish a National Bureau for exchanging information with other member states in connection with football games with an international dimension (Council of Europe, 2002). Cyprus, in order to align with the Resolutions, established in 2005 the National Football Information Point - NFIP and in conjunction to this, the existing law was amended in order to foster several legal procedures and regulations for the operation of the bureau in Cyprus. The amended law incorporates a handbook for the NFIP cooperation and introduces measures to prevent and control violence and disorder incidents in connection to games with an international dimension (Spectator of Violence, Misbehaviour and Relevant Offences at Sports Events (amended) Law 2005).

The enactment of the new law (For the Prevention and Tackle of Violence in Sports Venues Law of 2008, L.48(I)2008) was a massive step forward. It came after a long and painful period of numerous disorder incidents and extensive discussions involving all the agencies and the authorities. After years of hard work, the new law was passed by the House of Representatives on 11th July 2008. This was the

twitch of turning the condition around. The new law was based on the preexisting law and the Recommendations (Rec.93/1) of the Standing Committee (Council of Europe, 2015).

From this point on, stakeholders such as the clubs, the stadium owners, the federation, the police and other public authorities have a clear understanding of their responsibilities. Infrastructure and the suitable technology such as a CCTV system, an access system, an electronic ticketing system and a public audio system are the flagship of the implemented law.

Since infrastructure is considered a vital safety security and service element, ground owners are legally bounded to ensure that all necessary measures have been taken and the venue is able to accommodate safely the fans, having the adequate ingress and egress, wide gangways, proper segregation, clean seats and sufficient services and medical assistance.

In addition, every agency must establish good communication, before, during and after the game, and exchange every necessary information that will assist every party to accomplish its aim. The ground's regulations and procedures must ensure that no alcohol selling is permitted, and dangerous objects are possessed.

Another major asset is the legitimisation of the safety officer (with immediate application) and a stewarding system that would be implemented at a later stage with the preparation of the regulations under which the system will operate (Council of Europe, 2013). The role of the Safety officer was legally introduced, obligating the ground owners to appoint a trained and experienced individual (Article 43) who will be responsible for the safety of the spectators.

The position covers a series of actions such as crowd management and supervision, assessing risks, preparing and executing emergency plans, etc. Together with the stewards, the safety officer has full control of what is happening inside the stadium, while the police have the responsibility of maintaining public order and preventing criminal offences outside the venue (For the Prevention and Tackle of Violence in Sports Venues Law of 2008).

Closing the backlog from the law enactment in 2008 (Article 18, L.48(1)/2008), the House of Representatives passed in 2012, the implementation of safety services and stewarding regulations. As a starting point, the Cyprus Stewarding Commission (CSC) was formed (Article 3, 119(1)/2012), with their main responsibility being to recruit and train stewards and at the same time maintain an adequate stewarding system. Stewards constitute one of the main components of safety and service towards the spectators visiting the venue.

Their duties and responsibilities are now well-defined. Stewards are empowered to perform a variety of tasks such as venue inspections, flow monitoring, ticket control and body search, crowd management, fans segregation, ensure safe exit and prevent overcrowding, maintain free and

uninterrupted access to every exit gate, respond to emergencies and in general terms assists fans in any possible way (Safety services and stewarding regulation 2012).

In 2013, a consultative team delegated by the Standing Committee of the European Council carried out a consultative visit to Cyprus under the program for monitoring commitments on the implementation of the Convention. Their aim was to assist the authorities and other relevant stakeholders in their learning process in the field of safety and security at sport events. The consultative team recognised the progress achieved over the past years, by putting in place, at several levels, a structure which was based on recognised European good practice and which was in line with the Convention and most importantly, the Standing Committee recommendations. (Council of Europe, 2013).

In June 2014, assessing a series of serious disorder incidents, the authorities decided to proceed with explicit law amendments, adopting various recommendations from the consultative delegation of the Council of Europe. The aim was to strengthen the preventing measures and eliminate anonymity inside the sports venues (Yiapanas, 2016).

An independent agency was established, the Stadium Licencing Authority (SLA), to annually check all stadiums on safety and security issues and attest and certificate the appropriateness of the venue to organise sports events. The venue owners are now obliged to submit documents regarding their venue capacities, the evacuation plan procedures, the infrastructure conditions, the ground regulations, the ingress and egress volumes and procedures, the existing technology and systems, etc. (For the Prevention and Tackle of Violence in Sports Venues (unified) Law of 2014).

The pinpoint of the unified law was the institution of the fan card register, as the authorities believe that this measure will end anonymity and exclude trouble-makers from sporting events. This measure was not implemented until 2018, due to a series of questions and issues from several stakeholders, involving data protection and data ownership. The authorities assigned this project to the Cyprus Sports Organisation, a semi-governmental organisation and the highest sport authority in the country, linked to the Ministry of Education and Culture.

The unified law now segregates and defines the duties, the responsibilities and the role of each individual partner agency, establishing in this way a balanced approach towards safety, security and service. Immediately after the House of Representatives passed the amendments, the authorities established a communication strategy, to explain the importance and content of the new Articles and how they will eventually implement the integrated multi-agency safety, security and service approach.

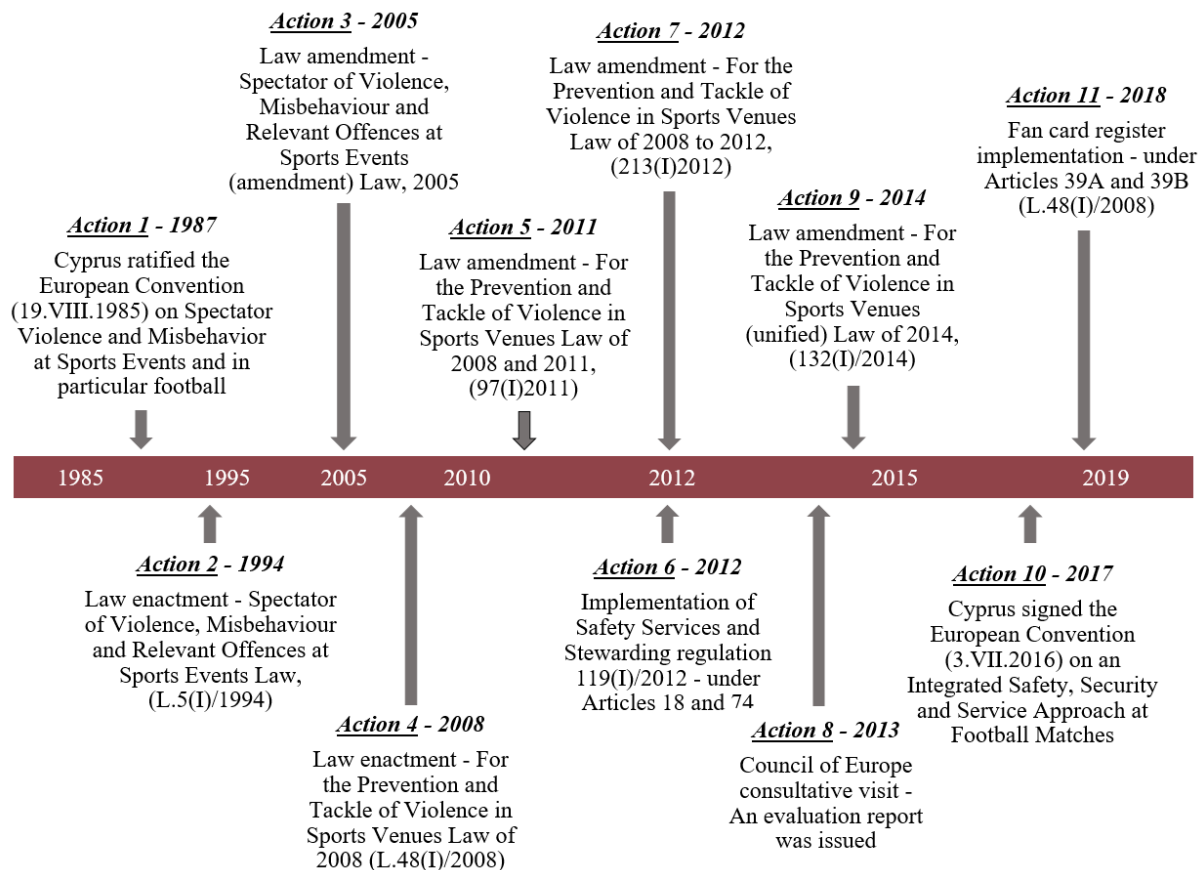

Figure 2. Chronological roadmap of the key actions as a response to the football hooliganism and violence problem in Cyprus

On 4th May 2017, Cyprus signed the European Convention (3.VII.2016) on an Integrated Safety, Security and Service Approach at Football Matches and Other Sports Events. This Convention goes beyond the scope of the Convention of 1985, as it requires the Agencies to implement additional provisions, notably with regard to international co-operation and treatment of offenders. All parties are now required to develop effective exclusion arrangements. European experience evidences that this measure is the most effective for preventing repeat offences. Football-related offenders should receive appropriate sanctions, not only within the country of residence or citizenship, but also within the country where the offence was committed.

The Convention incorporates the key principles and measures through good practices, which are widely held to reduce safety and security risks in football. This approach is aiming to provide a safe, secure and welcoming environment at football matches (Council of Europe, 2016).

Cyprus is now accountable to promote on a national level, a multi-agency, integrated approach, with the responsibilities of each agency clearly specified. The agencies, within the limits of their respective constitutional provisions, must take every necessary step to give effect of this Convention in respect of football games and adopt an integrated, multi-agency approach towards the three-pillar concept of safety, security and service.

CONCLUSIONS

Research implications

It was a common belief that football violence constituted a serious social phenomenon in Cyprus. Disorder incidents evidenced the fact that football venues were not safe, with the authorities to struggle for decades to find a solution to this multi-level problem. Unfortunately, the various committees seemed unable to develop a national strategic framework, and this, over the years, created a culture of immunity.

The authorities turned their hopes to the Council of Europe, who organised a number of consultative visits in order to evaluate the situation and recommend a series of actions. It became apparent that the existing law needed considerable amendments in order to provide the necessary means to the authorities for efficient safety in football grounds. It was also noted that every agency needed to recognise its responsibility and build a strategic framework that takes into consideration the existing international safety management principles and concepts.

The amendment of the law in 2005, but essentially the enactment of the new law in 2008 and the amendments in 2014, were the major actions taken by the authorities as a response to the football hooliganism problem in Cyprus.

Cyprus authorities managed through a series of key actions, and by adopting the Recommendations of the Council of Europe, to develop a national integrated approach framework, implementing the three-pillar concept of safety management, in an effort to respond positively against football hooliganism. Currently a strong legislation exists, and every agency has a clear understanding of their duties and responsibilities, enabling them to provide a safe and secure environment in sports events. It is now documented that these actions fulfil the needs of the safety management principles.

Managerial implications

Overall, the paper presents a number of key actions based to the Recommendations Resolutions and guidelines of the European Council that can be implemented on a national level as a response to football hooliganism. The authorities managed to build a national strategic framework and establish a strong legislation, clearly segregating the duties and responsibilities of each agency.

The theoretical findings of this research are certainly improving the business of football and doubtfully consist a valuable and essential tool for Managers to adopt. The integrated strategic framework, based on European experience and best practices, efficiently supports match officials to accomplish their goals.

An effective safety management is relying on an ongoing risk assessment and Managers must continuously supervise, control and practice all forces and technology systems, separately and together, in order to build an integrated operational readiness and successfully organise such multi-complex

events, preserving at the same time the balance between the safety management elements. A safe environment creates value and the success of the football business relies absolutely on how well fans are treated and how comfortable and safe they feel at the venue and in every stage of the event-flow. Fans need to live the experience of a football match in its wholeness and if they enjoy the event, most probably they will revisit the venue, support their team and spend more money.

Further research

This paper provides the theoretical groundwork for the generic football safety management concepts, identifying the key actions taken by the authorities in Cyprus in order to respond to football hooliganism. The findings of this research create the urge for empirical research, in terms of validating the extensive theoretical findings and test the degree of application and implementation to the explicit environment.

Additionally, there is the need of identifying the volume and correlation between the created value and football as a business and provide practical implementation of the framework as a strategic tool.

THE USE OF EDUCATIONAL TOOLS IN ENVIRONMENTAL EDUCATION: THE CASE OF PRE-SCHOOL EDUCATION

Zafiraki, Kiriaki; Petkou, Daphne; Tsantopoulos, Georgios

Dept. of Forestry and Management of the Environment and Natural Resources, School of Agricultural and Forestry Sciences, Democritus University of Thrace, Greece

ABSTRACT

The aim of the present study is to investigate and reflect the views of the nursery school teachers in the Prefecture of Rhodope on the educational media they make use of within the framework of Environmental Education. Environmental Education resulted from the realization of and the need to address the current environmental problems which threaten our lives. In this context, quality education is required. The selection of the appropriate educational media provides a contribution in this direction by supporting and enriching the educational approach to environmental topics and initiating the achievement of the Environmental Education objectives for a sustainable future. To collect the necessary data, a structured questionnaire consisting of closed-ended questions was developed and was completed by nursery school teachers of the Regional Unit of Rhodope. To analyze the collected data, descriptive statistics and the non-parametric Friedman test were performed. The research findings indicated that the nursery teachers approach mainly topics from the natural environment in their classroom and they regard the selection of the appropriate educational tool as a very important factor in meeting the pursued teaching objectives. Fairytales and photographic material consist the educational tools mostly used by the teachers to approach environmental topics. Finally, it was indicated that there are difficulties in using various educational tools. On the other side, the advantages arising from their use are many and significant making apparent their effectiveness in Environmental Education.

Keywords: Environmental Education, Teaching tools, Elementary Education

INTRODUCTION

The need for rational environmental management, which is linked to our life quality, resulted in the conception of Environmental Education. Since its appearance and throughout its long-term evolution through conferences and summits, as it is highlighted below, Environmental Education aimed and still aims at shaping future citizens with appropriate knowledge, attitudes, values and skills in line with its definitions and objectives. That is, to make citizens aware about and active on addressing

environmental degradation, with sustainability being the main objective. The introduction of Environmental Education in the educational system plays an important role in meeting this objective. Nowadays and despite technological development, the environmental crisis combined with the economic and social crisis undermine not only the planet but also human prosperity. The imprudent use of natural resources by man is constantly undermining the environment causing grave problems which threaten its survival (Katzi and Zachariou, 2013). To address environmental issues, Environmental Education plays a decisive role since it pursues the awareness and activation of individuals with the objective of sustainability (Pedagogical Institute, 2011). Sustainable development will provide the necessary balance among the three pillars "Environment-Economy-Society", improving and preserving this way human prosperity (Katzi and Zachariou, 2013).

Pre-school Education consists the "compass for the subsequent development and course of the child-citizen" (Pikrodimitri, 2002). From a young age, children know and learn to respect the natural world while developing values and attitudes towards it. Consequently, the introduction of Environmental Education in the pre-school age is of vital importance (Bora et al., 2010). Environmental Education should be integrated into the entire educational system and provide knowledge, values and skills (UNESCO, 1978). However, it is very important that education starts in early ages "because children become citizens of the world the moment they are born" (Birbili et al., 2014). Specifically, according to the Study Program of the Nursery School (2014), as an educational and socialization body, the nursery school is called on to "encourage children to be concerned about what is happening around them, to focus on the interdependence of people and the man-nature relationship, to appreciate and respect diversity, to assume their responsibilities and care about the common good" (Birbili et al., 2014). In this context, communication is one of the basic abilities supporting the learning process, which is considered effective when the disseminated message becomes understood. To reach a successful outcome, it is important that individuals who communicate choose the appropriate media, such as computer, images, television, etc. and are capable of using them (Birbili et al., 2014). Hence, in the nursery school, where children by nature observe and discover the world around them, the nursery school teacher can facilitate learning by using the appropriate media-materials, while various phenomena and problems are approached scientifically (Koutsouvanou and Arvaniti-Papadopoulou, 2008). In the Greek school, educators show great interest in Environmental Education compared to other actions and this interest is constantly increasing (Chrisafidis, 2005). "The role of the educator is decisive since the educator helps, mediates and facilitates the entire learning process" (Cross Thematic Curriculum Framework, 2003). According to May (2000), educators involved in environmental actions should have knowledge (ecological, social, cultural) of the environmental topic they approach. However, beside the aforementioned knowledge they should also have pedagogical knowledge and

skills in order to plan, organize and evaluate the learning process according to the objectives of Environmental Education. Moreover, they should listen to their students carefully and guide them by making the right questions (May, 2000). According to Flogaiti and Liarakou (2009), educators assume the role of the leader and are not “mere knowledge depositors”. At the same time, they should allow children to act themselves and take initiatives, that is, “to find a balance between giving up authority and keeping the situation under control”.

In view of the above, the present study attempts to examine and investigate the views of the nursery school teachers in the Prefecture of Rhodope on which media facilitate the achievement of the Environmental Education objectives. At the same time, potential obstacles to the application of educational media in the classroom are explored. Additionally, the nursery teachers’ environmental awareness level is examined since they consist the basic models to be imitated by their students. Thus, the conduct of the present research will provide important data and enrich the already existing body of research. Furthermore, it is expected that it will contribute so that the incumbent operators take the appropriate measures based on the research findings and provide the suitable structures and conditions for the practical application of Environmental Education with its effective support by the appropriate educational media. The aim of the present study is to investigate and record the views of the Pre-school Educators in the Prefecture of Rhodope on the educational media they use in approaching environmental topics in the nursery school. Specifically, the interest of the research is focused on the educational media which the pre-school educators tend to use, the difficulties they face while using them and the benefits these bring in the learning process. In essence, this study can highlight, through the views of the participating teachers, the educational media required to support effectively and qualitatively the teaching of environmental topics.

EDUCATIONAL MEDIA-MATERIALS

As indicated below, educational media play an important role in modern teaching and are an integral part of it. Their supporting and facilitating role promotes the learning process, enabling thus the fulfillment of the learning objectives. In modern school, students experiencing now the digital age receive enriched teaching to approach any subject module. Specifically, oral teaching is enriched with various media whose effectiveness is reinforced thanks to the development of technology (Trilianos, 1992). Moreover, the development of instruction in schools led to the development of teaching which was supported by various educational media (Nima and Kapsalis, 2002).

The term “educational media” is sometimes used in two meanings. In the first meaning of the term, the media convey the information while the material is the information being conveyed. However, in

the second meaning the media are not distinguished from the material while the emphasis is on communication with the help of the media (Ventouris, 2005).

On a general note, the value of educational materials in the learning process was stressed by major pedagogues, such as Montessori (Huxel, 2013), Froebel (Mac Blain, 2018) and Decroly (Dubreucq, 1993).

In the 1960s, scientists, educators and educational media producers expressed interest in the educational media (Kanakis, 1989). To bring out an independent teaching sector, scientists' motives were focused on the teaching of educational-learning media. On the other hand, educators' interest was concentrated on the effective use of educational media in teaching while the producers' interest was on their best possible construction. Specifically, the interest of the latter was "technological", whereas scientists' was "theoretical". Educational media are as important as teaching and one cannot exist without the other. During teaching planning, the educational media, which will facilitate rather and in no case substitute teaching, are defined (Pigiaki, 2004).

The selection of educational media consists therefore an important part of teaching planning (Trilianos, 1992). To be more exact, to ensure his or her teaching is effective, the educator should choose the appropriate educational media according to the content and the respective objectives of the teaching (Panayiotou et al, 2014). As a consequence, the appropriate educational media are those which will in turn enable the educator to approach the objectives of his or her teaching (Nasab et al, 2015). Yet, attention should be paid to the use of each educational medium so that "overuse" is avoided, since overusing a specific medium could cause teaching to fail. Each educational medium contributes to the enhancement of the educational objective and it should not in any case consist the "teaching objective" (Katsikis, 1989).

According to the above, the term "educational media" is defined, and their value in the educational process is emphasized. To have, however, a positive contribution to the learning process, it is necessary to choose the appropriate educational medium, a choice that is specified in the following section. In teaching, there is the ability of using a large number of educational media whose operation varies and differs (Christias, 1992). Research findings (Mupa & Chinooneka, 2015) have indicated that the use of varied educational media consists an important factor in the effective teaching, while at the same time educational media consist the educator's aids to teach and the learner's aids to learn (Chanda et al, 2001). To be effective, teaching does not, however, depend on the number of educational media but rather on their appropriate selection and use (Christias, 1992). According to Simatos (1995), the media to be used in the teaching of a topic are highly dependent on the teaching method which is determined both by the teaching subject and the pursued teaching objectives. Consequently, the teaching method as well as its subject and teaching objectives either determine or

limit the selection of educational media. Students' characteristics (gender, knowledge, interests, etc.), students' number and the level to which teaching is addressed play an important role in the selection of educational media. Before selecting the suitable educational media, the educator should also take into account the possibilities offered by the school space (classroom equipment, dimensions, lighting and other), as well as certain practical limitations (economic, temporal, etc.). Finally, educators' knowledge and ability to use certain educational media, as well as their favorable predisposition towards specific media compared to others, affect and define the selection. In other words, the educator may choose educational media with which he or she has relevant experience and greater familiarity. Hence, it is naturally inferred that the educator by considering the aforementioned factors in educational media selection will be geared toward the successful outcome of his/her teaching.

AREA OF RESEARCH-METHODOLOGY

To carry out the research, the geographical bounds of Primary Education in the Prefecture of Rhodope were defined. The Prefecture of Rhodope is located in Northeastern Greece in the central part of Greece and is bounded to the south by the Thracian Sea. At the same time, it borders to the west on the Prefecture of Xanthi, to the east on the Prefecture of Evros, while to the north it is bounded by the border with Bulgaria. The Prefecture of Rhodope covers an area of 2.543 km² and the population stands at 112,039 habitants according to the last census of 2011 (Hellenic Statistical Authority, 2011). Moreover, the Prefecture of Rhodope belongs to the Administrative Region of Eastern Macedonia and Thrace. The capital of the Prefecture is the city of Komotini. According to Law No 3852/2010 "New Architecture of the Local and Decentralized Administration-Kallikratis Program" (Greek Government Gazette 87A/7-6-2010), the Prefecture of Rhodope was divided into four municipalities. These are the municipality of Komotini with the city of Komotini being the seat of the municipality, the municipality of Maroneia-Sapes with Sapes being the seat of the municipality, the municipality of Iasmos with the town Iasmos being the municipality's seat and the municipality of Arriana where the seat is Filira. In the Prefecture, a total of 46 nursery schools operate where 99 pre-school teachers are employed among whom 18 are substitute teachers in the year 2017-2018. Initially, the first data for the conduct of the study were derived by the literature review. The present study was implemented with the help of structured questionnaire, that is, a questionnaire with a well-defined order of questions, while the researcher is not allowed to alter the order (Zafeiropoulos, 2005). To analyze the data, descriptive statistics and the non-parametric Friedman test were performed (Lupton 1993; Jolliffe 2002). The non-parametric Friedman test enables us to compare the values of three or more correlated groups of a variable and to rank their characteristics. The distribution of the Friedman criterion is χ^2 with degrees of freedom $df=k-1$, where k stands for the number of groups or samples. This criterion

ranks the values of the variables for every subject separately and estimates the mean rank of the ranked values for every variable (Makrakis, 1997).

RESULTS

The following results focus on the nursery teachers' demographic characteristics, the environmental issues they approach in the classroom, the educational tools they tend to use and the various difficulties they face in using them. The whole sample consists of female nursery teachers whose employment is permanent. The highest percentage of the respondents, by 37.7%, are in the age range 51 to 60, while the age groups 31-40 and 41-50 represent about the same proportion of the sample, namely, 31.3%. Regarding the years of service, the biggest share of participants, by 46.9%, have nine to 15 years of service. At the same time, a considerable proportion (32.8%) have more than 15 to 25 years of service and 18.8% have more than 26 years of service. In terms of family situation, 78.1% of the teachers are married, while 10.9% and 9.4% are unmarried and divorced, respectively. Simultaneously, only a very small percentage of participants, by 1.6%, are widows. As for the number of children, the highest percentage of respondents (57.8%) have two children, while 12.5% have no children and only 1.6% have four children. In relation to education level, most nursery teachers (79.7%) are bachelor holders, while 18.8% are master holders and only 1.6% are in possession of a doctoral degree.

Table 1 Hierarchy of environmental issues nursery teachers approach in the classroom after applying the Friedman test

	Mean rank
Natural environment (becoming familiar with the local ecosystem, waste management, etc.)	3.49
Environment and health (pollution, contamination, etc.)	3.41
Biodiversity loss (endangered species, animal protection, etc.)	2.38
Sustainable forest management (meaning of forests, basic causes of destruction, etc.)	3.27
Climate change (weather, global warming, etc.)	2.45
N=64, Chi-Square=46.461 df=4, p<0.001	

In their classroom, the nursery teachers in the Prefecture of Rhodope mainly approach topics on the natural environment (becoming familiar with the local ecosystem, waste management, etc.) with a mean rank of 3.49. This is followed by topics on the environment and health (pollution, contamination, etc.) with a mean rank of 3.41 and topics on sustainable forest management with a mean rank of 3.27. Topics on climate change (weather, global warming, etc.) were then ranked. Finally, the hierarchy has indicated that topics on the loss of biodiversity (endangered species, animal protection, etc.) consist the least approached topics in the classroom (mean rank 2.38) (Table 1).

Table 2 Frequency and percentages regarding the importance of the appropriate educational tools to achieve learning objectives in the approach of environmental topics

	Frequency	Percentage (%)
Moderately important	7	10.9
Important	25	39.1
Very important	32	50.0
Total	64	100.0

A very high percentage of respondents, by 89.1%, consider that the selection of the appropriate educational tool consists a very important factor in meeting the learning objectives in Environmental Education (Table 2).

Table 3 Frequency and percentages concerning the quality of the available educational tools

	Frequency	Percentage (%)
Very poor	4	6.3
Poor	19	29.7
Acceptable	29	45.3
Good	8	12.5
Very good	4	6.3
Total	64	100.0

Only a very small share of the nursery teachers (6.3%) is very satisfied with the quality of the educational tools provided to their nursery school and at the same time the same proportion of participants (6.3%) is totally dissatisfied with the available educational tools. Moreover, 29.7% of the teachers are slightly satisfied. Yet, 18.8% of the respondents appear to be satisfied with the available educational tools (Table 3).

Table 4 Frequency and percentages relating to the quantity of the available educational tools

	Frequency	Percentage (%)
Not at all	3	4.7
Slightly	29	45.3
Moderately	26	40.6
Very	4	6.3
Very much	2	3.1
Total	64	100.0

Half of the respondents in the sample (50%) perceive that the available educational tools for environmental topics in their nursery school are not satisfactory in quantitative terms. Conversely, only 9.4% of the questioned preschool teachers are satisfied with the quantity of the educational tools provided to their nursery school (Table 4).

Table 5 Hierarchy of the sources from which educators derive ideas to select/enhance the educational tools after performing the Friedman test

	Mean rank
Scientific books/journals	2.20
Internet	3.34
Colleagues	2.09
Training seminars	2.38
N=64, Chi-Square=45.055, df=3, p<0.001	

Internet is the main source the nursery school teachers prefer (with a mean rank of 3.34) to find ideas on choosing and enhancing the various educational tools. At the same time, resorting to colleagues for ideas consists the least preferred option with a mean rank of 2.09 (Table 5).

Table 6 Hierarchy of the frequency by which educators use educational tools after applying the Friedman test

	Mean rank
Fairytales	9.96
Knowledge books	8.20
Newspapers or other printed materials	4.97
Reference tables	8.81
Photographic material	9.79
Observation and experimentation instruments (magnifying glass, etc)	6.97
Computer (software, etc)	9.54
Radio/tape recorder/cd player (songs, etc)	7.24
Projector	3.63
Television (educational videos/documentaries etc)	4.17
Realia (animals, plants, etc)	5.10
Theatre-puppetry	5.95
Board or floor games	6.66
N=64, Chi-Square=287.412, df=12, p<0.001	

The application of the Friedman test indicated that for the nursery teachers the most frequently used educational tools to approach environmental topics are fairytales and photographic material, with mean ranks of 9.96 and 9.79, respectively. Then, there is the computer with a mean rank of 9.54, whereas the projector is at the bottom of the hierarchy with a mean rank of 3.63 (Table 6). Afterwards, to rank the characteristics of the variable “advantages of using the appropriate educational tools”, the non-parametric Friedman test was performed. As the ranking indicated, the appropriate educational tools first enrich the teaching of environmental topics with a mean rank of 4.34. Next, they spark the toddlers’ interest and emphasis is placed on their active participation, with mean ranks of 4.29 and 4.28, respectively. At the same time, they consider that the educational tools contribute less to the facilitation of perceiving and absorbing complicated notions with a mean rank of 3.44 (table 7).

Table 7 Hierarchy of the advantages concerning the educational contribution of educational tools in the approach of environmental topics with the application of the Friedman test

	Mean rank
Teaching is facilitated	4.22
Teaching is enriched	4.34
Emphasis is given to the toddlers’ active participation	4.28
Equal acquisition opportunities are provided (to acquire knowledge, skills, attitudes)	3.60
The perception and absorption of complicated notions is facilitated	3.44
The toddlers’ interest is raised	4.29
Toddlers are entertained	3.84
N=64, Chi-Square=29.084, df=6, p<0.001	

Table 8 Frequency and percentages regarding the need for training in using educational tools to approach environmental topics

	Frequency	Percentage (%)
Disagree	5	7.8
Neither agree or disagree	18	28.1
Agree	28	43.8
Totally agree	13	20.3
Total	64	100.0

As shown in Table 8, 64.1% of the nursery teachers consider that special training will contribute to the effective use of educational tools for teaching environmental topics. Conversely, only a small share of respondents, by 7.8%, perceive that special training is not necessary to use educational tools effectively.

Table 9 Hierarchy of the difficulties nursery teachers face in using educational tools for teaching environmental topics after applying the Friedman test

	Mean rank
Structural difficulties (equipment)	3.02
Technical difficulties (defects)	2.60
Lack of suitable/specialized knowledge	2.27
Lack of enough time (planning, preparation, using, etc.)	2.10

N=64, Chi-Square=26.940 df=3 p<0.001

As it can be seen in Table 9, the main difficulty in using educational tools for environmental topics are structural difficulties with a mean rank of 3.02. Then, there are the technical difficulties and the lack of suitable/specialized knowledge with mean ranks of 2.60 and 2.27, respectively. Finally, the teachers consider that the lack of enough time has the smallest influence on the use of educational tools (mean rank 2.10).

Table 10 Frequency and percentages related to the effectiveness of educational tools for achieving learning objectives

	Frequency	Percentage (%)
Neither agree or disagree	2	3.1
Agree	29	45.3
Totally agree	33	51.6
Total	64	100.0

A very high percentage of participants, by 96.9%, embrace the view that the educational tools are effective in fulfilling learning objectives, whereas no respondent disagreed totally with this view (Table 10).

CONCLUSIONS

The present study aimed at investigating and reflecting the views of the nursery school teachers in the Prefecture of Rhodope on the educational tools they use to approach environmental topics in the classroom. According to the research findings, fairytales consist the main educational tool the participants use to approach such topics. Although fairytales foster the dissemination of knowledge, values, behaviors and attitudes towards the environment, Greek ecological fairytales simplify the

environmental issues and present significant deficiencies, possibly due to the authors' effort to correspond to their young readership. That is, the content loses its scientific theme and basic principles of Environmental Education are not followed (Karakitsios, 2005; Beta and Papadopoulou, 2013; Chamalidou and Flogaiti, 2013).

It is also worth noting that the respondents perceive that the selection of the appropriate educational tool consists a very important factor in achieving the learning objectives. In various studies, it has been shown that the selection of educational tools leads to the success or failure of the educational procedure. Namely, regardless of achieving or not the activity objectives, the effective educational tools are in any case highlighted (Kanakis, 1989). In terms of selecting the appropriate educational tools and ways of using them to approach environmental topics, Internet constitutes the main source of ideas to which the teachers resort to derive ideas. A similar finding was indicated in another study on educators of Primary Education in which the majority (70.1%) used the Internet to search on information to correspond to the educational work more effectively (Tokmakidou et al., 2010). Regarding the way of using educational tools, 98.8% of nursery teachers agree that they should be used with flexibility. According to the Cross Thematic Curriculum Framework (2003), flexibility is the main characteristic of the program of Pre-school Education, which should be adapted flexibly to "the needs, interests, inclinations, and skills of young children". Consequently, educational media integrated into the program of Pre-school Education should be used flexibly by nursery teachers.

Generally, the study findings indicated that the pre-school teachers acknowledge the positive influence of educational media on Environmental Education. The main advantages of using them involve: a) the enrichment of teaching, b) interest stimulation, c) active participation, d) facilitation of teaching, e) toddler entertainment, f) provision of equal opportunities to acquire knowledge, skills and attitudes and g) facilitation of the absorption of complicated notions. These advantages consist also the main characteristics of successful teaching.

On the other side, the nursery teachers face certain difficulties in using educational tools which hinder the fulfillment of the educational objectives. More specifically, the main difficulties they face are structural ones. This statement is further reinforced by their general dissatisfaction with the educational tools available to their nursery school both in terms of quality and quantity, which was indicated by the present study. Other difficulties in using educational media involve technical ones which are followed by the lack of specialized knowledge. At this point, it is worth mentioning that most respondents are bachelor holders and most participants' years of service range from nine to 15. Possibly, further studies, such as postgraduate studies on Environmental Education, would enrich their knowledge. Additionally, as educational experience increases, so will the teachers' knowledge level regarding various teaching topics. Lastly, the lack of enough time consists the difficulty which

appears to affect the nursery teachers the least compared to the other difficulties relating to the use of educational tools. As shown in the study of Dimitriou and Zachariou (2005), these difficulties are generally faced in the application of Environmental Education.

In relation to the lack of suitable/specialized knowledge, a significant number of teachers appears to be positive towards special training in using educational tools for approaching environmental topics. The positive attitude towards training is also confirmed by other research works (Mpatsouta and Papagiannidou, 2006; Tsaboukou-Skanavis et al., 2005). Regarding time, the biggest proportion of pre-school teachers consider that time increases when educational tools are used for approaching environmental topics. This is contrary to the existing literature according to which time is saved due to the use of educational media (Christias, 1992). Possibly, this inconsistency results from the fact that in our study the educational media used to achieve the teaching objectives are addressed to younger ages while the planning and application of cross-thematic and experiential activities require more time in the nursery school. Hence, further research could provide significant information.

A STUDY OF ETHICAL BEHAVIOUR AT THE WORKPLACE: SCHOOLS IN THE STATE OF KUWAIT

Zaki Fraij, Waleed

University of Nicosia

ABSTRACT

The purpose: The purpose of this research is to identify the key factors that affect ethical behaviour in the schools in Kuwait, and to present a conceptual framework of ethical behaviour at the workplace applicable to the education system of Kuwait. The model of ethical behaviour was developed by adapting several theories and models.

Design, Methodology, and approach: The researcher follows the Critical Realism philosophical approach in the current study, which justifies the use of a methodology to conduct the research. This research utilizes *sequential exploratory* mixed methods design; the research involves *two sequential stages*, qualitative and quantitative stages. The study starts with the qualitative stage followed by the quantitative stage. Moreover, the study employs mixed methods research, which is a procedure for collecting, analyzing and combining both quantitative and qualitative data at some stage of the research procedure within a single study.

The data collected by means of face-to-face and semi-structured interviews such as in depth interviews, followed by a questionnaire survey. The respondents represented teachers working in the Kuwaiti schools.

Findings: The current study found a significant relationship between the independent variables of the organizational ethical culture such as sanctions, congruence of supervisors, feasibility, discussability, supportability and ethical leadership and the dependent variable of ethical behaviour.

Moreover, the study revealed a significant relationship between the independent variables of personal ethical tendencies such as idealistic tendencies, relativistic tendencies and utilitarianism and the dependent variable.

In addition, the study found a significant relationship between the independent variables of both greed and the national culture such as religious beliefs and *wasta*(favouritism) and the dependent variable of ethical behaviour.

The analysis of the results ended up to the final model of ethical behaviour.

Originality and Value of the Research :To the knowledge of the authors, this type of research is conducted for the first time in the private and public schools in the state of Kuwait.

The empirical study differentiated a model of ethical behaviour valid for the education system in Kuwait and attempts to reinforce ethical behaviour and combat the widespread unethical behaviour in Kuwait as *wasta* (favouritism) and greed.

Keywords: Ethical behaviour, Organizational ethical culture, National culture, Greed, Personal ethical tendencies.

INTRODUCTION

In developing a research around the subject of ethical behaviour, it is fundamental to understand the meaning of ethics and the schools of ethics as well as the importance of ethics.

Ethics started since longtime as the basis of all religions, subsequently taught within the family and society to arrange and control relationships between individuals.

However, it is not only religions that promoted the importance of ethics in governing the human relations; the need for sets of principles was discussed by several thinkers and philosophers.

Jesus referred to ethical behaviour as the Golden Rule "Do unto others, as you would have them do unto you", which means that if you cannot make everyone follow the same rule, your rule is not a moral one. In addition, the Christianity as a religion forbids unethical behaviour, the bible stated "You shall not murder, You should not steal, You shall not commit adultery, You shall not bear false witness against your neighbour".

Furthermore, the religion of Islam elaborates on ethical behaviour "O you who have believed, do not consume one another's wealth unjustly, but only [in lawful] business by mutual consent. And do not kill yourselves [or one another]. Indeed, Allah is to you ever Merciful" (The Holy Quran, Surah Al Nisa' 4:29). This verse forbids against all unclean and corrupt means of making money.

BACKGROUND AND PROBLEM IDENTIFICATION

According to the Central Intelligence Agency (2019), The State of Kuwait is located in the Middle East, bordering the Persian Gulf, and between Saudi Arabia and Iraq.

The state of Kuwait has a geographically small, with a total area of 17,818 sq km, however it is rich country, generally open economy with crude oil reserves of about 102 billion barrels - more than 6% of world reserves. Kuwaiti authorities intend to expand creation to 4 million barrels of oil comparable every day by 2020. Oil accounts for over half of GDP, 92% of export revenues, and 90% of government income. The GDP (official exchange rate) of Kuwait is \$120.7 billion; and the nation's GDP per capita is \$65,800 (2017 est.).

According to the census of the public authority for civil information, Kuwait's total population reached 4,810,914, Kuwaiti people reached 1,417,272 and expatriates reached 3,393,642 in 7/7/2019.

Based on index Mundi, the majority of the people in Kuwait are Muslims, with Christians being a minority, Muslims are 76.7%, Christians are 17.3%, and the other unspecified account for 5.9%.

EDUCATION SYSTEM IN KUWAIT

Education system in Kuwait has its problems. Generally speaking; there is a low output of education teaching system in Kuwait.

Schools and teachers are taken in the consideration in this research due to the plagiarism is expanded in schools in Kuwait in front of some teachers as a result of the nature of the deterioration of ethics and values in the Kuwaiti society.

Al-Shatti (2018) who is a member of the Kuwait national assembly stated in the Arab-times newspaper, the Kuwaiti educational system is deep rooted corruption and fake qualification crisis, and he said when the ministry of education issued the 'Anti-Cheating Charter' to stop cheating in schools, some people were outraged as if cheating is right and they are now asked to do the opposite.

RESEARCH PROBLEM

Because of scandals, collapse of organizations, plagiarism, and unfair treatment, a significant attention has been directed to business ethics. Literature review worldwide have identified different models of ethical behaviour and factors affecting ethical behaviour in the organizations, but it is not clear which factors affect ethical behaviour in Kuwaiti schools.

AIM

The aim of this research is to identify by means of a comprehensive literature study, the factors that impact on ethical behaviour in the schools in Kuwait, and to differentiate a model of ethical behaviour valid for the education system in Kuwait.

ETHICAL THEORIES

Dobrin (2009) summarizes three schools of ethics, virtue ethics, deontological and consequential.

VIRTUE ETHICS

The virtue theory focuses on the person and issues of character and integrity. The central concern of this theory is what makes a good person.

A philosopher Aristotle represents the virtue ethics. He looks for the good life, accordingly, a moral person is not that one who does the right thing once in a while but the moral person is that one who lives life within the framework of ethical virtues.

DEONTOLOGICAL THEORY

The deontological theory attempts to evaluate actions as right or wrong, and focuses on the motive of an action and the intention behind it regardless of the consequences. The theory argues that morality is adhering to a set of rules that guides the action of an individual regardless of the consequences.

CONSEQUENTIAL THEORY

The consequential theory focuses on the external results of an action. This theory desires the greatest good for the greatest number of people. The English philosophers Jeremy Bentham and John Stuart Mill explained it as the theory of utilitarianism.

LITERATURE REVIEW

Ethical behaviour is a huge topic, and a number of factors influence ethical behaviour.

This research will elaborate on the factors influencing ethical behaviour of different aspects such as informal and formal organizational ethical culture, national culture, personal ethical tendencies and individual characteristics.

Organizational ethical culture

Kaptein (2007,2008) conducted a research about the organizational ethical culture that consisting of eight virtues such as clarity of ethical policy, sanctions, congruence of management, congruence of supervisors, transparency, feasibility, discussability and supportability, to understand unethical behaviour in the organization.

The study by Kaptein revealed that only six virtues as sanctions, congruence of management, congruence of supervisors, feasibility, discussability and supportability affect unethical behaviour negatively, on the other hand, the results pointed out that clarity of ethical policy and transparency are not significantly related to unethical behaviour.

Ethical leadership and ethical behaviour

Kaptein (2011) suggests that ethical leadership is one component of ethical culture; so when to assess ethical culture other component as ethical leadership should be included.

As summarized by Mayer et al. (2012), Brown et al.(2005) have defined ethical leadership as "the demonstration of normatively appropriate conduct through personal actions and interpersonal relationships, and the promotion of such conduct to followers through two-way communication, reinforcement, and decision-making".

Mayer et al. (2012) study the antecedents and consequences of ethical leadership in the workplace.

The findings of the study by Mayer et al. (2012), suggest that ethical leadership affect unethical behaviour negatively.

National culture

Hofstede (1993), as summarized by Yu and Miller (2003), defined national culture as a collection of values and beliefs that groups of people have developed over time as a result of their relationship with their environment.

Moreover, Hofstede [6, 7], as summarized by Shore and Cross (2005), argued that individuals in an organization are influenced not only by their job at the workplace but also by the cultural values they bring with them into the organization. Therefore, the cultural values that employees bring with them into an organization are crucial to their ethical behaviour within that organization.

In Hofstede (2015) indicated that globalization and diversity have made cross-cultural management important; he introduced six dimensions of national culture as individualism vs collectivism, masculinity vs femininity, power distance, uncertainty avoidance, long-term vs short-term orientation and indulgence vs constraint.

On the other hand, Obeidat et al. (2012) indicated that Arab countries were not classified in the Hofstede's dimension of long-term vs short-term orientation, they argued that Islam and different levels of familism characterize the Arab culture, where the loyalty of individuals is for their families, tribe, religious sect or to the extended family, furthermore, Hofstede indicated that Arab culture is characterized by having a large power distance, strong uncertainty avoidance, high collectivism, and a moderate Masculine culture and femininity.

Based on Kuwait constitution (1962), Islam is an official religion in Kuwait, it corresponds with the constitution, and it states that Islam is the source of the legislation.

Almutairi (2013) highlighted that that Islam affects different aspects in Kuwait such as family relationship, business etiquette food, drinks, and personal hygiene, and agreed that national culture of Kuwait is affected by Arab tribal traditions.

In the same regard, Ali and Al-Kazemi (2007), indicated that Kuwait is an Islamic country, and Islam is a dominant variable influences the Kuwaiti culture and dictates the way of daily living and behaving in the workplace.

Religious beliefs and ethical behaviour

Commitment to a faith in one's religious belief is crucial to the ethical behaviour of employees; Rawwas et al.(2006) find that religious beliefs affect ethical behaviour positively.

Conroy and Emerson (2004) state that believers in God are less eager to behave unethically, to a great extent since they believe God will see their actions, and their unethical attitudes and thoughts.

In addition, Alleyne et al. (2010) agree with Rawwas et al. (2006) and indicate that there is a significant relationship between religious commitment and ethical behaviour.

Ferrell and Gresham (1985), as cited by Alleyne et al. (2010), stated that moral philosophies played a crucial role in the ethical decision making of an individual. Moreover, Alleyne et al. (2010) suggested that religious commitment significantly affect the ethical decision making of individuals.

In the same regard, Dobrin (2009) agreed that religion stands behind ethics, otherwise morality could be no more than a preference for people.

Furthermore, Shariff (2016) indicates that religion affects ethical behaviour positively, and he says that religious people report more prosocial behaviour than do the non- religious.

Based on the review, religious beliefs affect ethical behaviour positively.

Well-being and ethical behaviour

Fernando and Chowdhury (2010) suggested that the term well-being relates to people's wellness or the totality of their health, including inner resources and how these impact individual and social behaviour. They conducted a research about well-being and pointed out that well-being affects ethical-decision making in the workplace significantly, implying that higher spirituality well-being leads to greater ethical concerns, moreover, spiritual well-being is correlated with and predictive of idealistic decision making.

Overall, well-being contributes to the national culture and has a significant relationship with ethical behaviour.

Kuwait tribal values and ethical behaviour

"Tribalism has defined by Nothwehr (2008, p.5), as cited by Sanou (2015) , as the attitude and practice of harbouring such a strong feeling of loyalty or bonds to one's tribe that one excludes or even demonizes others who do not belong to that group".

Moreover, Nwaigbo (2005) indicates that tribalism prompts one to have positive attitude towards the individuals who are associated with that person through connection or kinship, family and clan.

Hofstede (2001 & 2005) suggested, as cited by Danon-Leva et al. (2010), that Power distance which is one dimension of Hofstede's cultural theory has described dependence relationships in a country, as well as the power distribution among members of groups, organizations, and society it is stated that this dimension affects ethical behaviours of individuals in a society and suggests the high levels of the power distance the less the risk factor for unethical behavior because the actions of individuals, groups, or organizations are more likely to be guided or informed by respect to individuals, groups, or organizations having higher authority.

Individualism–Collectivism is one dimension of Hofstede's cultural theory which considers that the state of Kuwait used to be collectivistic society; collectivism refers to individuals whom from birth are integrated into a close-knit and cohesive society.

Danon-Leva et al. (2010) expect that collectivist dimension influences ethical behaviours of individuals in a society and suggests the higher the individualism the higher the risk factor for unethical behaviour because high individualism implies that loyalty is owed only to the person, i.e., himself or herself.

Arab countries have higher levels of collectivism and lower levels of power distance and uncertainty avoidance.

Accordingly, with respect to collectivism dimension, behaviour of individuals concern with the family or clans more than objectives of the organization.

Furthermore, Bakhtari (1995) indicate that the Arab culture is traditional, family oriented, male dominated and conservative in risk taking.

In addition, It has been argued that Arab tribal values support the idea of consultative and participative decision style, as summarized by Rees and Althakhri (2008), Dedoussis (2004) has pointed out that albeit consultative and participative styles are the most widely recognized basic leadership styles in Arab culture, choices are taken without subordinates and are not designated down the chain of importance.

Furthermore, Abdalla et al. (1998) report that Arab tribal values place a strong assurance on adherence and obedience as both represent essential elements of tribal systems, also, nepotism may be openly allowed in the Arab countries in order to achieve the responsibilities of individuals toward their relatives and extended family members.

Tayeb (1997) points out that participation in decision making in Arab countries may be considered by subordinates as a management weakness in Arab culture and further, managers and subordinates in Arab societies will in general tend to dislike collaboration or teamwork.

Moreover, the managerial problems in Kuwait reveal the relationship between Kuwait tribal values and unethical behaviour, Al-Kazemi and Ali (2002) detect that the most important managerial

problems in state of Kuwait are favouritism and personal loyalty at workplace, unwillingness to take responsibility, rigid administrative systems and policies, primacy of personal relationships over work relationships, subjectivity in appraisal and promotion, reliance on inherited relations and a variety of principles which conflict with one another. They find that these managerial problems are ascribed to tribal thought which is pervasive in Kuwait society.

Overall, there is a significant relationship between Kuwait tribal values and ethical behaviour.

Greed and ethical behaviour

Seuntjensa et al.(2019) indicate that being greedy means taking more than needed, and harming other people particularly in cases of scarcity, moreover, they study the relationship between wanting more and unethical behaviour and detect that dispositional greed is indeed associated with more unethical behavior.

As summarized by Seuntjensa et al.(2019) , Steinel and De Dreu (2004) , have argued that greedy people show more unethical behaviour, and have mentioned that greedy people are more likely to prevent information from other people in a negotiation setting, furthermore, Gilliland and Anderson (2014, p. 99) have indicated that not only religions and philosophers relate greed to unethical behaviour, greed has been broadly examined as one of the reasons of financial scandals and the late 2000s financial crisis.

Accordingly, greed affects ethical behaviour negatively.

Wasta and ethical behaviour

Barnett et al. (2013) suggest that Wasta is an Arabic version, refers to an implicit social contract, which obliges those within one group to provide assistance to others within the group. It is similar to nepotism or favouritism.

In Arabic societies, people feel with pride and fulfilment to the person who has wasta and the person who is doing this wasta for him or her.

Mohamed and Mohamad (2011) define wasta in the Arabic world as the intervention and connection between a patron and client to make favour of a client in attempt to gain privileges or resources from a third party.

Moreover, Adi (2014) considers Wasta as a source of Nepotism and cronyism, and argued that "wasta" works around the rules and deteriorates the concept of fair competition and replaces it with negative relationships, and as a result, it harms the society and makes business credibility weaker. Furthermore, she indicates that Wasta is considered as an unethical behaviour because this behaviour of wasta contradicts with fairness and justice, and those who have Wasta, they can jump queues in acquiring services, while others who do not have wasta are going to struggle with the bureaucratic processes.

As summarized by Adi(2014), Hutchings and Weir (2006) have identified Wasta as an Arabic noun used in the middle east and north Africa to show nepotism or favouritism.

Furthermore, Barnett et al. (2013) indicate that wasta refers to the power of connections between people and this power employed to make favour for somebody.

Tlaiss and Kausar (2011) indicate that despite the perception that wasta is an unfair practice; it plays a key role in people's career, especially regarding development and advancement.

Overall, "wasta" influences ethical behaviour in the workplace negatively.

PERSONAL ETHICAL TENDENCIES AND ETHICAL BEHAVIOUR

IDEALISM , RELATIVISM AND ETHICAL BEHAVIOUR

Personal ethical tendencies are crucial for ethical decision making in the workplace, researchers such as Ferrell and Gresham (1985) and Hunt and Vitell (1986), as summarized by Chan et al. (2011), have reported that personal moral philosophy lies at the core of the process of ethical-decision making process.

Researchers refer Idealism to the people's concern for the welfare for others considering harming others have been always unnecessary, for example as summarized by Chan et al. (2011), Forsyth (1980) has reported that idealism represents individuals concern for the welfare of others; therefore idealistic people believe that harming others have been always avoidable, whereas those who are less idealistic feel that harm is sometimes necessary to produce good, moreover, Forsyth (1980, p.175), identified relativism as the degree to which an individual rejects universal moral rules as appropriate guidelines for ethical decisions, accordingly, relativism is related to how an individual's view differs from the ethical view of the majority.

In addition, Johari et al. (2012) find a positive relationship between idealistic tendencies and ethical behaviour.

Forsyth (1992), as summarized by Karande et al. (2002), has argued that ethical decision-making is influenced by idealism and relativism. Moreover, ethical decision-making and ethical behaviour are affected positively by idealism, and negatively by relativism.

Vitell and Singhapakdi (1993) and Sparks and Hunt (1998), as cited by Alleyne et al. (2010), concluded that relativism had a negative impact on ethical decision making but they found that idealism had a positive impact on ethical decision making.

Utilitarianism

Utilitarianism is another aspect of personal ethical tendencies and its main tenet to seek the greatest happiness of the greatest number of people. Accordingly, the utilitarianism theory judges the action

according to the result of that action, therefore, the action by someone is considered ethical if the ends of the action generate greatest happiness to the greatest number of people.

Therefore, the purpose of utilitarianism is thus the greatest good for the greatest number of people.

This theory focuses on the external results of an action and desiring the greatest good for the greatest number of people.

In addition, as summarized by Eleswed (2016), Northouse (2004) has suggested that utilitarianism is an ethical perspective concentrates on individual's behaviour whereas the behaviour is considered ethical if it generates greatest good for greatest number of people , moreover, Robbins and DeCenzo (2001) have pointed out that utilitarianism promotes the way that the decision making procedure ought to be based on the outcomes of such decision.

Schumann (2001) has stated that a utilitarian conduct inflicts doing the greatest good along with the minimal harm to other people. Thusly, utilitarian practices are viewed as ethical.

Overall, there is a significant relationship between personal ethical tendencies and ethical behaviour.

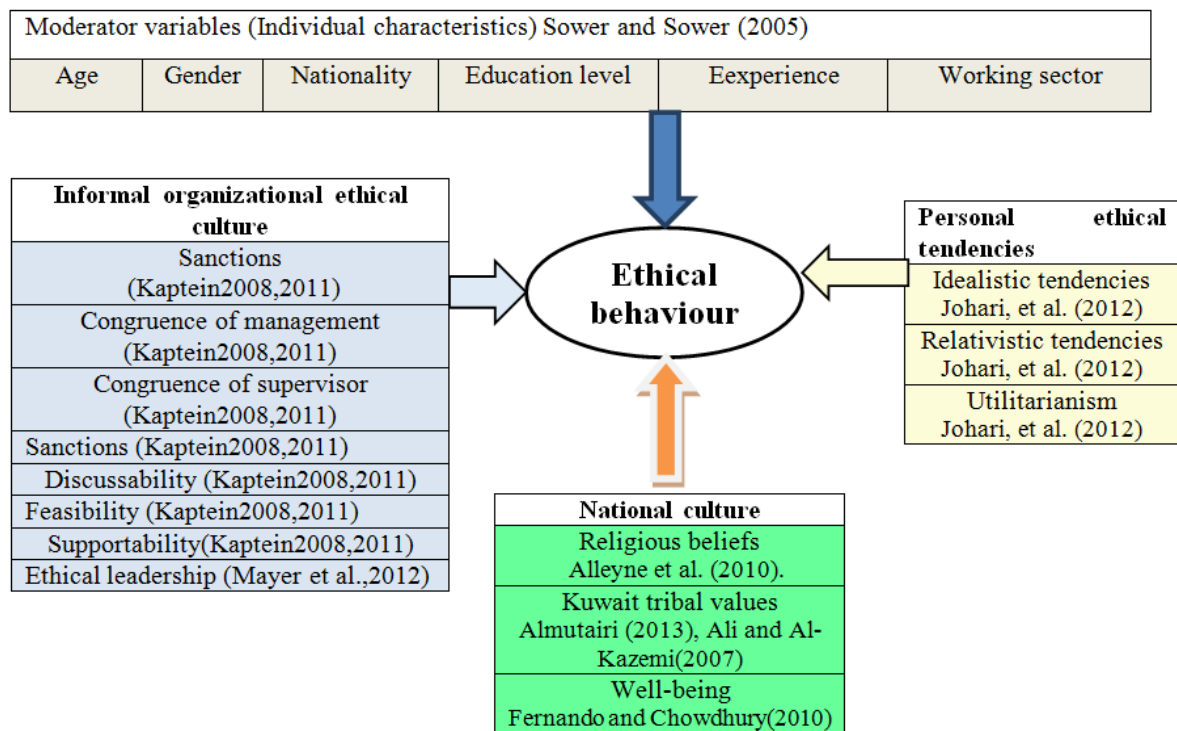

Moderator Individual characteristics and ethical behaviour

Sower and Sower (2005) suggest that demographic moderator variables have no longer been totally disregarded in values and ethics research, and point out that researchers as Franke et al., (1997) and Harris (1990) and Mason et al., (1996) link personal characteristics such as age and gender to ethical behaviour, moreover, other researchers link years of experience, educational level, and public working sector and private working sector, to ethical behaviour.

Overall, various aspects of independent variables will be considered in this research such as moderator individual characteristics, organizational ethical culture elements, national culture elements, greed and personal ethical tendency elements.

Based on the previous review, the following conceptual ethical behaviour of ethical behavior is shown below:

A Conceptual framework of ethical behaviour

Research gap

The conceptual model of ethical behaviour was developed by adapting several theories and models from different business and academic journal articles. However, the research uses different aspects to formulate the conceptual ethical behaviour model, in particular, by improving the ethical models by Kaptein (2008) and Mayer et al. (2012) and combining other variables as illustrated below:

- 1) Kaptein (2008) indicated that his model has been developed to explain ethical and unethical behaviour. However, it was tested only on unethical behaviour. Therefore, the variables will be re-tested on ethical behaviour.
- 2) The sample in Kaptein's model (2008) was drawn from Western organizations, which means that sample did not represent Arabic societies. Adler, (1991), Hofstede (1993) and Mead (1994), as summarized by Yu and Miller (2003), have indicated that national culture has a great impact on all aspects of management behaviour.
Moreover, Hofstede (1993) pointed out that people with different cultural backgrounds would have different work values.

Accordingly, this research will re-test the selected variables in Kuwait.

- 3) As summarized by Kaptein (2008), other researchers such as Baucus and Near(1991) have proposed studying other factors from outside the organization, as well as, the personal characteristics of employees.
- 4) Mayer et al. (2012) studied the effect of ethical leadership on negative outcomes such as unethical behaviour, and Kaptein (2008) related organizational ethical culture to negative

outcomes such as unethical behaviour, but Walumbwa and Schaubroeck (2009), and Piccolo et al. (2010), as summarized by Mayer et al. (2012), suggested that ethical leadership is related to positive behaviours.

RESEARCH PHILOSOPHY, METHODOLOGY AND METHODS

PHILOSOPHICAL POSITION AND JUSTIFICATION

Critical Realism is the position of the philosophy of the researcher, which justifies the use of a methodology to conduct the research. Qualitative and quantitative philosophies have shared in the development of mixed methods research.

The research will start with the qualitative stage, which will value the research by utilizing experiences and human thoughts of people contribute to our knowledge in this field.

The second quantitative stage seeks to validate and generalize the finding of the qualitative stage.

Research questions of the quantitative stage concern with the causal relationships between independent and dependent variables, therefore, there is a need for a tool to measure the phenomenon in terms of the quantitative data and hypotheses testing, therefore, the current research employs mixed methods to make a better understanding of a phenomenon.

Based on Cotty (1998), the following table highlights the framework of the philosophical position of this research as shown in table 1.1:

Table 1.1 Framework of the philosophical position of the research	
Epistemology: The theory of knowledge embedded in the theoretical perspective and methodology.	Mixture of ontological objectivism and epistemological subjectivism
Theoretical perspective: The philosophical position informing the methodology	Critical realism
Methodology: Strategy behind the choice of data collection	Qualitative and quantitative
Methods: Techniques to gather and analyses data	Methods: Case study and surveys. Techniques: Interviews and questionnaires

MIXED METHODS RESEARCH

This research will utilize mixed methods, which is a procedure for collecting, analyzing and combining both quantitative and qualitative data at some stage of the research procedure within a

single study, to communicate the research problem more clearly. Creswell (2002), as cited in Hanson et al. (2005), highlighted reasons for conducting mixed methods research as in table 1.2.

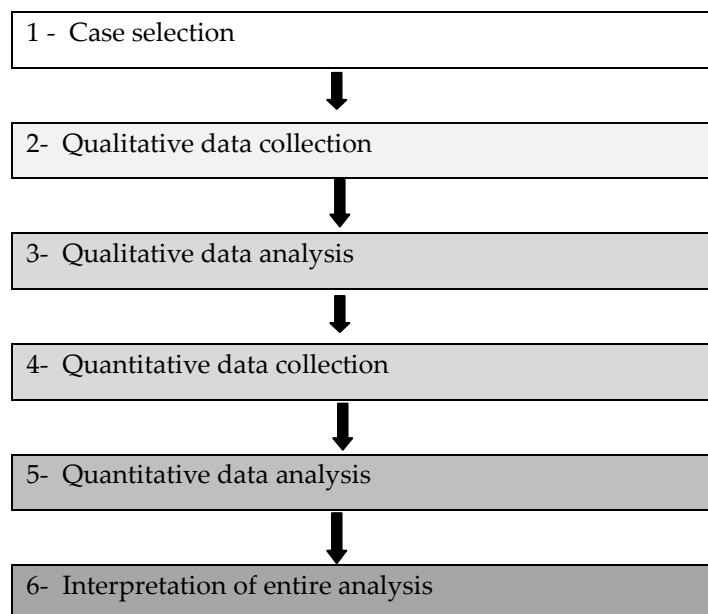

Table 1.2 Reasons for conducting Mixed Methods Research	
Rationale	Description
Triangulation	Better understand a research problem by converging results of two separate methods
Complementarity	Use one study segment to elaborate on another
Development	Use one study part as the basis for subsequent investigation
Initiation	Display results to find out paradox and contradiction by using different methods
Expansion	Investigates different facets of the theme by screening
Generality	Use the independent source of data to contextualize the main study or use quantitative analysis to supply significance of relative importance
Aid interpretation	Use qualitative data to explain quantitative variables
Solving a puzzle	Use an alternative data collection method when the initial method detects unexplainable results or deficient data

RESEARCH DESIGN

This research will utilize **sequential exploratory** mixed methods design; the research involves *two sequential stages*, qualitative and quantitative stages as shown below.

The following figure 1.2 explains the steps of the sequential exploratory mixed methods design:

Figure 1.2: Sequential Exploratory mixed methods design

TARGET POPULATION AND SAMPLE

- The target population in this study will include Kuwaiti and non-Kuwaiti teachers, who are working in public and private schools at different stages in Kuwait.
- According to the Kuwait Central Statistical Bureau, the total number of teachers in Kuwait who are working in public and private schools are (83368) teachers. Of these (40867) are non-Kuwaiti teachers and (42501) are Kuwaiti teachers.

QUALITATIVE STAGE

Qualitative stage seeks to explore phenomena. Krauss (2005) argued that qualitative research is based on a relativistic, constructivist ontology, which posits that there is no single reality, there are multiple realities constructed by human actors who experience phenomena of interest.

Constructivist paradigm claims that truth is relative and that it is dependent on one's perspective, at this STAGE, THE RESEARCH IS CONSIDERED AS INDUCTIVE RESEARCH TO BUILD A THEORY.

DATA COLLECTION

The research will adopt a strategy of a case study method to collect qualitative data.

JUSTIFICATION FOR USING A CASE STUDY

- Tellis (1997) suggested that the advantage of a case study is that it is often conducted from multi-perspectives, and indicated that in a multiple case studies, there is an opportunity for a replication of the one case study, as well as the flexibility to check and distinguish between a large range of results.
- Saunders et al. (2009) suggested that a case study provides the flexibility to answer open questions particularly, how why, and what.

SAMPLING TECHNIQUE

Data will be collected by means of face-to-face and semi-structured interviews such as in-depth interviews.

Non-probability sampling method, a *self-selection sampling technique will be employed* to select (25) participants; twelve (15) teachers and ten (10) directors as well as supervisors and administrative working in public and private schools in Kuwait.

DATA ANALYSES

The current research utilizes a thematic analysis to analyse qualitative data manually.

JUSTIFICATION OF USING THEMATIC ANALYSIS

Alhojailan (2012) highlights four reasons for using thematic analysis as shown below:

- Data interpretation.

Thematic analysis is able to detect and identify factors or variables that affect any issue generated by the participants in the research.

- Deductive and inductive approaches.

Thematic analysis is a flexible method that can be used in both deductive and inductive methodologies

- Analysis different phases.

Thematic analysis is capable to different phases in the research.

- Coding and categorizing.

Thematic Analysis is capable to arrange the data according to its similarities and differences, it provides the opportunity to code and categorise data into themes.

FINDINGS OF QUALITATIVE STAGE

- Organizational ethical culture

The qualitative findings revealed that seven variables of organizational ethical culture such as sanctions, congruence of management, congruence of supervisors, feasibility, discussability, supportability and ethical leadership affect ethical behaviour in the schools significantly.

- Personal ethical tendencies

The qualitative findings of personal ethical tendencies agree with the arguments given by other researchers and theoreticians, therefore, idealistic tendencies, relativistic tendencies and utilitarianism affect ethical behaviour significantly.

- National culture

The qualitative findings agree with the arguments given by other researchers and theoreticians that faith towards religious beliefs affect ethical behaviour significantly but do not agree with other researchers that well-being and tribal traditions affect ethical behaviour.

Moreover, a new independent variable emerged from the qualitative stage such as "wasta", and the findings indicate that wasta affect ethical behaviour negatively.

- Greed.

A new independent variable emerged from the qualitative stage such as "greed" or "loving money", and this result indicates that greed affect ethical behaviour negatively.

QUANTITATIVE STAGE

The quantitative stage seeks to validate findings of qualitative stage and generalize results.

The purpose of positivist or objectivist quantitative researcher is to discover general laws and find relationships between variables, the study will be conducted to test existing theories, and then generate the findings to the population, the researcher is as a scientist and also as a deductive researcher to test existing theories.

According to Krauss(2005),epistemological positivist holds that science is perceived as away to find the truth and to understand the world well enough. Thus, we need to find the suitable scientific approach to understand the world and the universe that operate bylaws of cause and effect.

DATA COLLECTION

The research will employ the survey strategy to collect quantitative data. According to (Saunders et al, 2009), a survey strategy is associated with the deductive approach used to answer who, what, where, how much and how many questions, therefore, it can be used for exploratory and explanatory research. The main benefit of the survey it allows the researcher to collect a large amount of quantitative data from a sizeable population in a highly economical way, which can be analysed using descriptive and inferential statistics.

SAMPLING TECHNIQUE

This research will employ a *random sampling method*, which is a type of a probability sampling technique. The researcher contacted the Ministry of Education in the state of Kuwait, and asked them to provide him with a list of the names of (5) public schools and (5) private schools to conduct my research.

SAMPLE SIZE

According to (Israel, 1999) the minimum sample size can be calculated by using the following formula: $n = p\% * q\% [z / e\%]^2$.

Where, n = minimum sample size required, Z the level of confidence, e % = margin of error, P% the proportion of the specified category q% (1-p) proportion not belonging to specified category.

Based on the assumption of $p=.5$ and $q=.5$, and z value based on 95% confidence and 5% margin of error. Accordingly, the minimum sample size is shown below $n= 50 * 50 * (0.154) n= 385$

The minimum of 400 questionnaires will be considered, the increase of sample size to account for teachers who do not respond or who do not receive the survey invitation.

Overall, (400) questionnaires will be distributed among teachers working in public and private schools in Kuwait.

RESEARCH HYPOTHESES

Research hypotheses are formulated according to the results of the qualitative stage.

Hypothesis1:

Ethical behaviour through the organizational ethical culture is significantly influenced by sanctions, congruence of supervisors, congruence of management, feasibility, supportability, discussability and ethical leadership.

Hypothesis2:

Ethical behaviour in the school is significantly influenced by faith towards religious beliefs and *wasta*, disseminated through the national culture.

Hypothesis3:

Ethical Behaviour in the school, in terms of personal ethical tendencies is significantly influenced by idealistic, relativistic tendencies and utilitarian tendencies.

Hypothesis 4:

Ethical Behaviour in the school is significantly influenced by the greed of teachers.

Hypothesis 5:

Overall ethical behaviour in the workplace is significantly influenced by the ethical organizational cultural orientation and its elements, national culture and its elements, and personal ethical tendencies and their elements.

Hypothesis 6:

There are significant differences between the genders when it comes to cultural orientation, personal tendencies, greed and overall ethical behaviour.

Hypothesis 7:

There are significant differences between age groups when perceiving organizational ethical cultural, national culture, personal tendencies, greed and overall ethical behaviour.

Hypothesis 8:

There are significant differences between types of working experience in the organizational ethical cultural, the national culture, personal tendencies, greed and overall ethical behaviour.

Overall results of hypotheses are displayed in the following table.

Hypothesis	H1	H2	H3	H4	H5	H6	H7	H8
Result	Partially supported	supported	Supported	supported	Partially supported	Partially supported	Partially supported	Partially supported

QUANTITATIVE ANALYSES

Regression analysis, cross tabulation and T-test conducted to test the hypotheses as shown in the Appendix.

SCALE

The researcher will use the five- point Likert scale. Based on Mangal and Mangal(2013) the Likert scale is easy to read and respond and the reliability of this scale has been estimated relatively high than other types of measurement scales.

MEASURING THE DEPENDENT AND INDEPENDENT VARIABLES

Fraedrich (1993) argued that ethical behaviour in the workplace needs to be empirically measured by constructs that measure deviance from organizational standards.

Summary of the variables, correspondent measuring factors and their sources, as shown in the table below:

Variables	Measuring factors	Source
Sanctions	San1,San2,San3,San4	Kaptein (2007)
Congruence of supervisors	Cns1, cns2, cns3, cns4	Kaptein (2007)
Congruence of management	Cgm1, cgm2, cgm3, cgm4	Kaptein (2007)
Feasibility	Fes1, Fes2, Fes3, Fes4	Kaptein (2007)
Supportability	Sup1, sup2, sup3, sup4	Kaptein (2007)
Discussability	Dsc1, Dsc2, Dsc3, Dsc4	Kaptein (2007)
Ethical leadership	Lea1, Lea2, Lea3, Lea4	Mayer et. al. (2012)
Greed	grd1, grd2, grd3, grd4	Seuntjens et al. (2019)
Idealism tendencies	Ide1, Ide2, Ide3, Ide4	Forsyth (1980)
Relativism tendencies	Rel1,Rel2, Rel3, Rel4	Forsyth (1980)
Utilitarianism	Utl1 , utl2, utl3 , utl4	Gokce (2017)

Greed	grd1, grd2, grd3, grd4	Seuntjens et al. (2019)
Faith towards religious beliefs	Fai1, Fai2, Fai3, Fai4	Alleyne et al. (2010)
Wasta	Wst1, wst2, wst3, wst4	Tlaiss and Kauser(2011)
Ethical behaviour	Beh1,beh2, beh3, beh4	Antonaras et al. (2015).

The dependent variable (ethical behaviour) will be measured by means of four items adopted from the scale of ethical behaviour by Antonaras et al. (2015).

DATA ANALYSES

The goal of statistical analysis is to show if there is a significant effect between the variables of interest (to answer whether we can reject the null hypothesis or not) , and how big is the effect when it is available.

SPSS version 22 will be employed to analyse the collected data by utilizing Factor analysis, Reliability analysis (Cronbach's Alpha correlation), linear regression analysis, correlation analysis, ANOVA and cross tabulation analysis.

RESULTS OF QUANTITATIVE STAGE

The findings revealed that just six variables of organizational ethical culture affect ethical behaviour such as sanctions, congruence of supervisors, feasibility, discussability, supportability and ethical leadership.

On the other hand, the independent variable of "congruence of management" was not supported by the quantitative stage while it was supported by the qualitative stage, because the participants in the qualitative stage had a belief that "congruence of management" affects ethical behaviour, but in fact the quantitative analyses found the variable "congruence of management" was not related to ethical behaviour significantly.

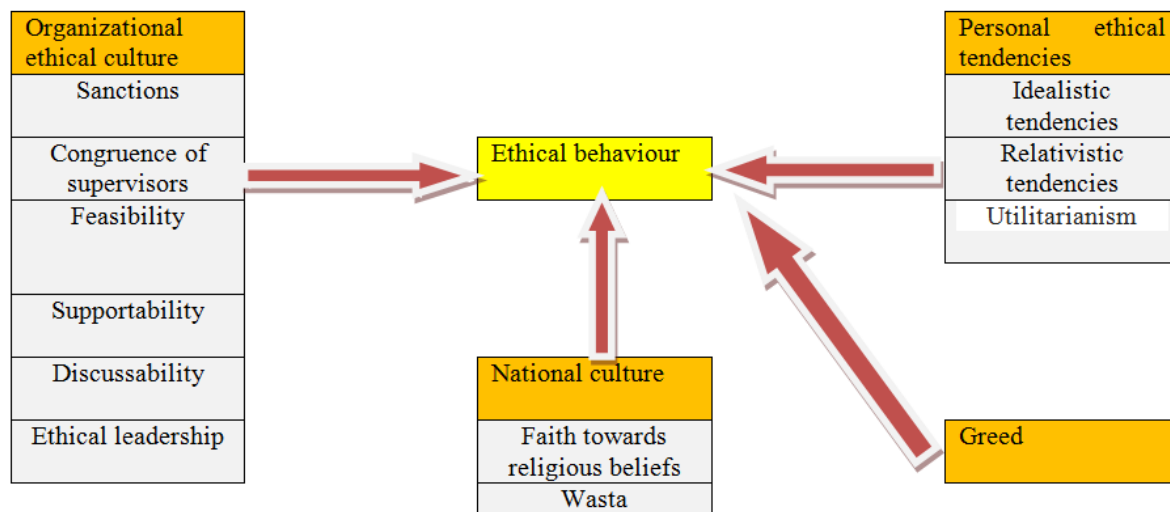

Furthermore, the findings indicated that the variables of personal ethical tendencies such as idealistic tendencies relativistic tendencies and utilitarianism affect ethical behaviour, and these findings agree with the findings of the qualitative stage.

In addition, the study finds that two variables of national culture such as wasta and religious beliefs affect ethical behaviour, and these agree with the results of the qualitative stage.

Moreover, the quantitative stage finds that greed affects ethical behaviour negatively, and this result agrees with the qualitative analysis.

The final model of ethical behaviour in the current research is created as shown below:

The differentiated model of ethical behaviour.

RESEARCH CONTRIBUTION

- This type of research is being conducted for the first time in schools in Kuwait.
- This research will fill the gap in the area of ethics especially in the Arabic region.

Treviño and Brown, (2004) have indicated that because corporate scandals have harmed millions of employees and investors, managers and researchers are beginning to recognize the importance of ethics and pay attention to questions of ethical management.

Robertson et al. (2002); Elsayed-Elkhouly and Buda (1997); and Ali and Schaupp (1992), as summarized by Sidani and Thornberry (2010), have suggested that although the call for better ethics has increased recently, few studies over the past few years have attempted to explain ethics in the workplace within the context of the Arab world.

- This research will differentiate a conceptual ethical behaviour framework valid for state of Kuwait to reinforce ethical behaviour in the workplace and combat unethical behaviour such as wasta and greed.

MANAGERIAL IMPLICATIONS AND CONCLUSION

- Regarding the cost of unethical behaviour to organizations and stakeholders, it is important to prevent or, when it does occur, to detect adequately and pay attention to unethical behavior.
- The current research reports the importance of organizational ethical culture, national culture, greed and the national culture in explaining unethical behavior of managers and employees in the schools in Kuwait.

- Overall, the management first needs to understand and unravel the existing culture and other factors of personal ethical tendencies and national culture to reduce unethical behaviour.
- The model of ethical behaviour and questionnaire that used in this research can be employed to assess the quality of the existing ethical culture in the workplace.
- Moreover, including the scale of ethical behaviour in the questionnaire will make it possible, by conducting a regression analysis, to get an overview of the most important dimensions of the ethical culture of the organization; moreover, regression analysis can be used to find the important dimensions of personal ethical tendencies and national culture.
- Furthermore, this research added a value for the Arabic library since there is a poor literature about ethics in the Arabic region.
- In addition, the current study re-tested different models provided by the literature review, which tested in the western culture, in the Arab culture.

In conclusion, the researcher aimed to identify the key factors that impact on ethical behaviour in the schools in Kuwait that help to combat unethical behaviour, moreover, the current research presents an advanced model for assessing the organizational ethical culture, personal ethical tendencies, greed and national culture.

This study also offers interesting insights into factors of organizational ethical culture, elements of personal ethical tendencies, greed and elements of national culture that affect ethical behaviour in the schools.

In addition, the study revealed that paying attention and greater insight into different dimensions of the ethical behaviour model provides opportunities to manage ethical issues better and, as a result, to lower frequencies of unethical behaviour in and by organizations.

LIMITATIONS

- The existence of limitations is inevitable in any research study as it is highly unlikely that a single research study can address all related factors or all aspects of the topic under one research, particularly in the humanities field in general.
- By employing mixed methods research strategy the researcher gains better understanding of the phenomenon or the relationship between the variables, but using this type of strategy consumes time and resources.

FUTURE RESEARCH

- The reported R square, as depicted in the model summary for overall ethical behaviour that shown in the appendix of the this paper, indicates that the independent variables of the

regression model can predict only 61.5 % of the variance leading to the dependent variable, or it indicates that the model explains 61.5% of the variability of the response data around its mean, which means that there are still other independent variables need to be considered and to be investigated in future research.

Accordingly, the door is opened for researchers and scholars to investigate other related variables and study the effect of them on ethical behaviour in the workplace.

- It is better to consider the variable of "congruence of management" in future research , since the author Kaptein(2008) found the virtue of congruence of management is significantly related to unethical behaviour but the current research found that there is no significant relationship between them.
- The current research studied and considered the demographic variables as moderating variables, we recommend researchers and scholars to study the direct effect of demographic variables on ethical behaviour in the future researches.

APPENDIX

Model summary for overall ethical behaviour in the workplace

Model Summary				
Model	R	R Square	Adjusted Square	R Std. Error of the Estimate
1	.784a	.615	.601	.744

a. Predictors: (Constant), Wasta, Sanctions, Utilitarianism, Ethical leadership, Greed, Congruence of management, Congruence of supervisors, Relativistic tendencies, Faith toward religious beliefs, Supportability, Feasibility, Idealistic tendencies, Discussability

The model summary for overall ethical behaviour in the workplace is depicted in the above table. The reported R square indicates that the independent variables of the regression model can predict 61.5 % of the variance leading to the dependent variable.

Hypothesis 1: Ethical behaviour through the organizational culture orientation is significantly influenced by sanctions, congruence of supervisors, congruence of management, feasibility, supportability, discussability and ethical leadership.

Table: Coefficients for ethical behaviour through cultural orientation.

Coefficientsa						
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	-1.527	.318		-4.805	.000
	Sanctions	.358	.057	.299	6.226	.000
	Congruence of supervisors	.278	.056	.197	4.922	.000
	Congruence of management	.038	.043	.032	.891	.373
	Feasibility	.133	.048	.127	2.805	.005
	Supportability	.140	.042	.137	3.362	.001
	Discussability	.290	.073	.228	3.985	.000
	Ethical leadership	.132	.050	.096	2.666	.008

a. Dependent Variable: Ethical behaviour

The above table indicates that six variables of organizational ethical culture directly influence ethical behaviour through cultural orientation significantly. These independent variables are sanctions, congruence of supervisors, congruence, feasibility, supportability, discussability, and ethical leadership, because the reported P value for each of them is less than .05.

Accordingly, Hypothesis (1) is supported partially.

Hypothesis 2 : Ethical behaviour in the school is significantly influenced by faith in religious beliefs and wasta, disseminated through the national culture.

Table: Coefficients for ethical behaviour through national culture.

Coefficientsa						
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	2.744	.254		10.821	.000
	Faith toward religious beliefs	.445	.061	.363	7.312	.000

	Wasta	-.184-	.048	-.188-	-3.792-	.000
--	-------	--------	------	--------	---------	------

a. Dependent Variable: Ethical behaviour

The above table indicates that two variables such as faith to religious beliefs and wasta directly influence the ethical behaviour through national culture significantly, because the reported P value for each of them is less than .05.

Accordingly, Hypothesis 2 is supported.

Hypothesis 3: Ethical Behaviour in the school, in terms of personal ethical tendencies is significantly influenced by idealistic, relativistic tendencies and utilitarian tendencies.

Table: Coefficients for ethical behaviour through personal ethical tendencies.

Coefficientsa						
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	1.580	.314		5.036	.000
	Idealistic tendencies	.624	.052	.509	11.959	.000
	Relativistic tendencies	-.203-	.040	-.215-	-5.044-	.000
	Utilitarianism	.090	.042	.090	2.134	.034

a. Dependent Variable: Ethical behaviour

The above table indicates that three variables such as idealistic tendencies, relativistic tendencies and utilitarianism directly influence the ethical behaviour through personal ethical tendencies, because the reported P value for each of them is less than .05.

Accordingly, Hypothesis (3) is supported.

Hypothesis 4:

Ethical Behaviour in the school is significantly influenced by the greed of teachers.

Table: Coefficients for ethical behaviour through the variable "Greed".

Model		Unstandardized Coefficients		Standardized Coefficients	T	Sig.
		B	Std. Error	Beta		
1	(Constant)	4.187	.209		19.990	.000
	Greed	-.150-	.058	-.134-	-2.585-	.010

a. Dependent Variable: Ethical behaviour

The above table indicates that the variable "greed" directly influences the ethical behaviour significantly because the reported P value for "Greed" is less than .05, the same table also indicates that the contribution of the independent variable influence ethical behavior is "Greed" with (B= -.134), which means that "greed" affects ethical behaviour negatively.

Accordingly, Hypothesis (4) is supported.

Hypothesis 5:

Overall ethical behaviour in the workplace is significantly influenced by the organizational ethical culture orientation and its elements, national culture and its elements, greed, and personal ethical tendencies and their elements.

Table: Coefficients for overall ethical behaviour in the workplace

Coefficients ^a						
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	-.874	.452		-1.932	.054
	Sanctions	.256	.058	.214	4.395	.000
	Congruence of supervisors	.247	.054	.175	4.540	.000
	Congruence of management	.028	.042	.023	.655	.513
	Feasibility	.128	.046	.122	2.804	.005
	Supportability	.116	.041	.114	2.864	.004
	Discussability	.174	.074	.136	2.335	.020
	Ethical leadership	.107	.048	.078	2.242	.026
	Idealistic tendencies	.208	.056	.170	3.696	.000
	Relativistic tendencies	-.102	.034	-.108	-3.031	.003
	Utilitarianism	.080	.034	.080	2.346	.020
	Greed	-.080	.038	-.072	-2.109	.036
	Faith to religious beliefs	.097	.047	.079	2.086	.038
	Wasta	-.076	.034	-.077	-2.190	.029

a. Dependent Variable: Ethical behaviour

The above table indicates that (12) independent variables such as elements of organizational ethical culture , elements of national culture, greed, and elements of personal ethical tendencies directly influence the ethical behaviour because the reported P value for each of them is less than .05. On the other hand, the same table indicates that the independent variable "congruence of management" does not affect ethical behaviour significantly because the reported P values is greater than .05. Accordingly, Hypothesis (5) is supported partially.

Hypothesis 6:

There are significant differences between genders when it comes to organizational ethical culture, personal ethical tendencies, greed, national culture and overall ethical behaviour.

Table of Group statistics for genders indicates that the mean of males gender (3.76) is higher than females gender mean (3.56) which leads to conclude that males perceiving a higher ethical behaviour than females.

Table: Group statistics for genders

Group Statistics					
	Gender	N	Mean	Std. Deviation	Std. Error Mean
Ethical behaviour	Male	198	3.76	1.216	.086
	Female	171	3.56	1.128	.086

Table 7.26 Genders independent samples t-test

Equal Variances	Levene's Test for Equality of Variances		t-test for Equality of Means						
	F	Sig.	t	Df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
								Lower	Upper

Organizational Ethical Culture	Assumed	18.286	.000	2.862	367	.004	.17371	.06069	.05436	.29306
	Not assumed			2.824	332.039	.005	.17371	.06150	.05273	.29469
National Culture	Assumed	1.776	.183	.644	367	.520	.05712	.08864	-.11719-	.23142
	Not assumed			.650	366.680	.516	.05712	.08788	-.11570-	.22993
Personal Ethical Tendencies	Assumed	.831	.362	-.287-	367	.774	-.01827-	.06357	-.14328-	.10673
	Not assumed			-.286-	348.914	.775	-.01827-	.06395	-.14405-	.10750
Greed	Assumed	.315	.575	-.870-	367	.385	-.095-	.110	-.311-	.120
	Not assumed			-.869-	358.272	.385	-.095-	.110	-.311-	.120
Ethical behaviour	Assumed	.521	.471	1.606	367	.109	.197	.123	-.044-	.439
	Not assumed			1.615	365.132	.107	.197	.122	-.043-	.437

The above table of genders Independent samples t- test indicates that there are significant differences between genders when perceiving organizational ethical culture because the reported P value is less than 0.05 but there are no significant difference when perceiving national culture , personal tendencies, greed and overall ethical behaviour because the reported P value for each of them is greater than 0.05.

Therefore hypothesis 6 is Partially supported.

Hypothesis 7: There are significant differences between age groups when perceiving organizational ethical culture, personal ethical tendencies , greed, , national culture and overall ethical behaviour.

Table: Age groups ANOVA

ANOVA						
		Sum of Squares	df	Mean Square	F	Sig.
Organizational ethical culture	Between Groups	9.312	3	3.104	9.641	.000
	Within Groups	117.509	365	.322		
	Total	126.821	368			
Personal ethical tendencies	Between Groups	9.607	3	3.202	9.239	.000
	Within Groups	126.506	365	.347		
	Total	136.113	368			
Greed	Between Groups	.549	3	.183	.165	.920
	Within Groups	405.333	365	1.111		
	Total	405.882	368			
National culture	Between Groups	10.360	3	3.453	4.953	.002
	Within Groups	254.517	365	.697		
	Total	264.877	368			
Ethical behaviour	Between Groups	51.283	3	17.094	13.563	.000
	Within Groups	460.028	365	1.260		
	Total	511.311	368			

The table of Age Groups ANOVA indicates that there are significant differences between age groups when perceiving organizational ethical culture, personal ethical tendencies, national culture and overall ethical behaviour, because the reported P value for each of them is less than 0.05.

Moreover, the same table indicates that there is no significant differences between age groups when perceiving greed.

Based on these results, Hypothesis 7 is supported partially.

Hypothesis 8:

There are significant differences between working experiences in the organizational ethical cultural, personal ethical tendencies, greed, national culture, and overall ethical behaviour.

Table: Working experience ANOVA

ANOVA						
		Sum of Squares	df	Mean Square	F	Sig.
Organizational ethical culture	Between Groups	1.585	2	.792	2.316	.100
	Within Groups	125.236	366	.342		
	Total	126.821	368			
Personal ethical tendencies	Between Groups	8.891	2	4.445	12.788	.000
	Within Groups	127.222	366	.348		
	Total	136.113	368			
Greed	Between Groups	.080	2	.040	.036	.965
	Within Groups	405.802	366	1.109		
	Total	405.882	368			
National culture	Between Groups	2.251	2	1.125	1.568	.210
	Within Groups	262.626	366	.718		
	Total	264.877	368			
Ethical behaviour	Between Groups	12.114	2	6.057	4.441	.012
	Within Groups	499.197	366	1.364		
	Total	511.311	368			

The table of working experience ANOVA indicates that there are significant differences between working experience when perceiving personal ethical tendencies and overall ethical behaviour, because the reported P value < 0.05, and there are no significant differences between working experience when perceiving organizational ethical culture, greed and national culture because the reported P value > .05.

Based on these results, Hypothesis 8 is supported partially.

DOES IT TAKE TWO TO TANGO? ACQUIRER'S MANAGEMENT BEHAVIOUR AND ACQUIRED EMPLOYEES' ATTITUDES IN EXPLAINING START-UP ACQUISITION PERFORMANCE

Zaks Ofer; Naamati, Schneider Lior

Hadassah Academic College, Israel

ABSTRACT

The acquisition of start-ups is an essential strategy by which many established firms develop their technological base. Given the frequent failure of many acquisition deals, the question of success factors of acquisitions is a critical one. Still, in existing literature there is a visible emphasis on the perspective of the acquiring firm and its characteristics in securing acquisition performance. The present paper builds on quantitative and qualitative data from Israeli start-ups acquired by international firms to shed light on the interplay between both acquiring and acquired company success factors, with a particular emphasis on behavioural factors. With regard to the key findings, on the side of the acquiring company variables, knowledge transfer turns out to be significant. On the acquired company side, it turns out that trust is a key variable for acquisition performance.

Keywords: mergers & acquisitions, performance, start-ups, post-merger integration, knowledge transfer, employee attitudes

INTRODUCTION

The acquisition of start-ups is an essential strategy by which established firms develop their technical capabilities and products, enhance their market power, and achieve strategic renewal (Agarwal and Helfat, 2009; Santos and Eisenhardt, 2009). The literature on mergers and acquisitions (M&A) relies upon a few common assumptions. Most acquisition studies focus on the acquirer as the key decision maker (Beckman and Haunschild, 2002) and his success (Becker et al., 2016; Cheng & Yang, 2017). The seller implicitly has little discretion over the acquisition decision, as being acquired is in addition regarded as a sign of weakness. Organisational behaviour researchers often describe acquisitions as leading to negative outcomes for acquired employees (Buono and Bowditch, 1989). Organisational theorists tend to characterise acquired companies as misfits or even failures (Carroll et al., 1996).

Moreover, M&A have traditionally been explained by motives such as corporate growth & diversification, internationalisation, or shareholder value enhancement (Lim and Lee, 2016). While these motives had been valid until the 1990s, they do not equally apply to recent M&A in hi-tech sectors marked by rapid technological change, shortening product life-cycles and intensive global competition (Ferreira et al., 2015). Thus, continuous innovation constitutes a focal source of value creation and long-term growth (Cheng & Yang, 2017). Firm performance in competitive environments relies on its ability to continuously introduce new products and services (Cafis and Marsili, 2006). Therefore, more mature buyers often pursue technology acquisitions to tap into the innovative potential of young, entrepreneurial firms, which are an increasingly important engine of new knowledge (Kortum and Lerner, 2000).

Yet, despite their strategic relevance, many technology acquisitions fail to create value (King, Slotegraaf, and Kesner, 2008). The knowledge that high-tech buyers hope to gain through acquisition is often complex, tacit and embedded in relationships. These characteristics amplify the strategic advantage that knowledge can provide (Eisenhardt and Martin, 2000), but at the same time they make it difficult to transfer knowledge through more arm's-length relationships. Moreover, most acquired companies nowadays are small and medium-sized enterprises (SMEs), with a preference for creative and entrepreneurial start-ups. The reasons for acquiring such firms are numerous, ranging from the ability to adopt a flexible approach for strategic and operational needs, to the integration of a culture characterised by entrepreneurship and innovation.

The human side of M&A, which arguably explains a significant part of the challenges entailed, has been examined according to a variety of perspectives and theories, including the psychological perspective which looks at the individual and how the merger affects stress levels, coping and commitment (Amiot et al., 2006), the micro-foundations of organizational behaviour affecting the pre-acquisition stage (Angwin et al., 2015), the social perspective focusing on group dynamics, social comparison, and status (Terry, Callan, and Sartori, 1996), as well as the cultural perspective considering culture clashes to be at the core of decreased performance in M&A (Veiga, Lubatkin, Calori, and Very, 2000). However, much of the research into M&A to date remains fragmented (Seo and Hill, 2005).

In light of the above, this paper aims to examine how variables related to the acquired company's management behaviour influence acquisition success, as well as how variables related to the acquired company's employees' behaviour influence M&A success. In order to address these research questions, acquired Israeli start-ups were chosen as the empirical setting. Over the past few decades large companies have been scouting Israel for their technology acquisitions and for innovative ideas. Since the beginning of the 1990s, Israel has experienced an impressive growth in

numbers of start-ups and the venture capital (VC) industry accompanying high tech sectors. Moreover, Israel is well known for its entrepreneurial culture, its strong technological capabilities and its dynamic start-up-intensive high-tech cluster (Avnimelech and Schwartz, 2009).

THEORY AND HYPOTHESES DEVELOPMENT

The acquiring company's management approach

Extant literature indicates that post-acquisition assimilation success is significantly dependent upon individual leadership reaction to changes in authority and decision-making privileges (Bezrukova, et al., 2012; Stahl and Voigt, 2008). Discontinuity with former roles, decision-making allocations and perceived status amongst peers often leads to dysfunctional or unsuccessful outcomes (Krug and Aguilera, 2005). In spite of a large body of literature on the subject, we still know very little about approaches that lead to a successful organisational change prompted by an acquisition (Hitt, Harrison and Ireland, 2001). Nadler, Thies and Nadler (2001) suggest that, for effective change to occur, and in particular cultural change, there is no substitute for the active engagement of the CEO and executive team. Top leaders must assume the role of 'chief architects' of the change process. Cartwright and Cooper (1995) take this one step further, suggesting that it is important for employees at all levels to become involved in the integration or change process.

The effects of an acquisition on employees' levels of stress and anxiety, furthermore, often persist over time (Schweiger and DeNisi, 1991). Nevertheless, frequent and honest communication during the merger process helps minimise the stress and anxiety felt by employees (Marks and Mirvis, 1986). The quality and intensity of communication is a significant factor in managing M&A effectively. Communication is expected to focus on employees' concerns, such as layoffs, changes in work rules or procedures, compensation, pensions, etc. (Ivancerich, Schweiger and Power, 1987). When communication and information are not sufficient or consistent, rumour mills may develop to 'fill in the blanks', lending worst case meanings to the acquiring company's behaviour (Marks, 1982).

Different studies suggest that high quality communication has positive effects for employee outcomes such as satisfaction, commitment and the decision to stay in the organisation (Brahma and Srivastava, 2007). Realistic, supportive and effective communication during a process of change is associated with several positive reactions, such as greater change acceptance and support for the change (Axtell et al., 2002). Correspondingly, the lack of communication during the change process can lead to uncertainty, which may become a key source of change recipients' difficulties during change implementation (Schweiger and DeNisi, 1991). Hence, we propose:

H1: The managers' level of communication with acquired company's employees will have a positive influence on acquisition success.

Apart from the layer of communication, extant literature has also discussed the role of knowledge transfer from the parent company to the subsidiary as its performance driver (Zollo and Meier; 2008). Bresman et al. (1999) argue that acquisition knowledge transfer is a two-dimensional construct that consists of two types of transfers: from the acquiring firm to the target and from the target to the acquiring firm. The first dimension is that of motivation and it relates to the degree of energy and effort organisational members are willing to devote in order to learn from the partner and utilise its knowledge (Minbaeva, 2007). The second, ability dimension of absorptive capacity, relates to the knowledge bases of organisational members (e.g., their skills, competencies, and educational backgrounds), reflecting employees' prior related knowledge which allows them to understand and utilise the partner's knowledge (Juni and Sarala, 2013; Ahammad et al., 2014).

We argue that while the latter dimension has been more closely associated to start-up acquisitions, the former one is less evident as the role of parent knowledge in supporting the acquired firm may result in a higher post-acquisition performance (Oberg and Tarba, 2013; Juni et al., 2015). Scholars have identified a number of factors affecting the success or failure of knowledge transfer, including the individual's perception of the quality of the merging partner which influences the willingness to exchange knowledge with other members of the organisation, the social relationships between the employees of both firms, which can influence their willingness to engage in knowledge transfer; and finally, bi-directional transfer of knowledge between the acquiring and target firms which can enhance the innovativeness, and improve the processes, of both firms (Vaara et al., 2012).

Overall, it appears that the 'give and take' mechanisms of mutual learning transactions are particularly complex. Even though the importance of generating synergy is important to both parties, usually the activation and performance of knowledge transfer 'suffers' from mutual expectancies. Thus, we argue that:

H2: The knowledge transfer level will have a positive influence on acquisition success

The acquired company's employees' behaviour

Readiness and openness to change is extremely important for achieving positive change outcomes (Armenakis et al., 2012). Employee reactions to change can be positive (e.g., expressions of commitment and receptivity to change), or negative (e.g., expressions of resistance, stress, or cynicism regarding change). It is also not entirely uncommon for employees to feel ambivalent, experience conflicting emotions regarding the change (Piderit, 2000), and for the attitudes toward change to vary over time, across the different stages of change implementation. The degree to which employees are

able to offer informed input for the change strategy is largely contingent on whether organisations share information through a variety of communication channels; whether they enable workforce participation at the planning and implementation stages (Elving, 2005); and whether they provide opportunities to raise issues that the staff finds concerning.

In order to understand the employee's adjustment to acquisitions, it is necessary to consider how they cognitively construe and interpret the situation and which emotions are likely to be triggered by the acquisition (Kiefer, 2002). The findings of several studies suggest that committed change recipients tend to report higher levels of readiness to change and change acceptance (Madsen et al., 2005). Organisational commitment, furthermore, serves as a buffer, balancing the detrimental influence of change-related stress regarding change recipients' job satisfaction, intentions to remain in the organisation and work-related irritations (Begley and Czajka, 1993). Unfortunately, with only a few exceptions (Datta, 1991), the notion that negative employee reactions help account for unsuccessful M&A has historically been based on evidence that is more anecdotal than empirical (Larsson and Finkelstein, 1999). Hence, we argue that:

H3: Employees' commitment to change will have a positive influence on acquisition success.

M&A often lead to a change in ownership for acquired firms, which often leads to changes in their organisational and management practices. Hence, inspiring employees and instilling them with a sense of trust appear to be the most effective strategy for avoiding resistance to change.

In relation to M&A, the term 'trust' is usually applied to two partners (i.e., between the acquirer/buyer's firm and the acquired/target/seller's firm). There is a large body of anecdotal evidence in the form of case studies (Chua, Stahl and Engeli, 2005) suggesting that the period following the announcement of an M&A is one of intense risk assessment, when trust is easily damaged and is then difficult to restore. A new organisation, a new top management team and a new superior tend to be accompanied by a lack of trust, whereby employees are left wondering what the next wave of changes will bring and whether they should leave the organisation or not (Hurley, 2006). Some of the most difficult issues faced by employees when confronted with change are uncertainty, ambiguity, complexity and stress associated with the change process and its outcomes (Stanley, Meyer, and Topolnytski's, 2005). Trust can reduce these negative feelings, as it is a resource for managing risk, dispersing complexity and explaining the unfamiliar through the help of others (Van Dam 2005). Conversely, readiness for change will be strongly undermined when the behaviour of important role models (i.e. leaders) is inconsistent with their communication towards employees (Simons, 2002). In other words, management provides an important behavioural example for facilitating employee adjustment during organisational change. Hence, we propose:

H4: Employees' trust in management will have a positive influence on acquisition success.

MIX-METHODS RESEARCH DESIGN

We employed a two-phased, sequential mixed-methods research design with a key role of quantitative results, followed up with qualitative semi-structured interviews. The reason for the qualitative follow-up is to better understand the quantitative results (Creswell and Plano-Clark, 2007). More specifically, the purpose of using qualitative analysis was to obtain frontal and "live" information from TMTs concerning their attitudes, drive, interest and arguments. The interviews allowed us to analyse the processes along the strategic milestones decisions to sell their start-up. Also, the mixed-method design aimed at enhancing the validity and reliability of the study.

Quantitative data

Data Collection and Sample

The sample was comprised of TMT members of Israeli high-tech start-ups that were acquired over a six years' time period (2009-2014). Data analysed by the IVC-research centre (IVC-Meitar Exits Report, 2014) indicates that 547 transactions were executed in Israel during this time period. The research sample was gathered from several sources. Most participants were pulled out of lists containing entrepreneurs' and TMT members' names and positions in Israeli start-up companies which have gone through a process of M&A during a six year's period time (2009- 2014). The survey invitations, including a link to the web-based survey, were e-mailed to current leaders and top managers of acquired companies through Qualtrics^{TM1}. 53 respondents completed the survey, reflecting a 58% response rate.

Table 1 presents the sample characteristics.

Characteristics		# (N=53)	%
Management presence	No	5	9.4
	Yes	48	90.6
Management presence (during the merger process)	No	6	11.3
	Yes	47	88.7
Number of employees (in the acquired company)/size	5-50	24	45.3
	51-200	13	24.5
	201-	16	30.2
Previous experience in M&A	0	25	47.2
	1	14	26.4
	2+	14	26.4
Age (group)	20-39	6	11.3
	40-59	42	79.2
	60+	5	9.4
Education	Bachelor degree	19	35.8
	Master degree +	34	64.2
	1-4	16	30.2

¹ QualtricsTM is a web-based service platform designed for organisations and researchers to manage surveys.

Tenure (years)	5-9	19	35.8
	10-	18	34.0
Time since the merger announcements (years)	-2	16	30.2
	-4 less	22	41.5
	4+ more	15	28.3

Table 1: Sample characteristics *Variables operationalisation*

Dependent variable. Perceived performance was used an indicator of acquisition success. Managers from the acquiring and acquired firms tend to have extensive knowledge about the transaction, as well as the integration phase. Furthermore, numerous studies found clear evidence indicating that the ratings provided by managers correlate with objective success measures (Homburg and Bucerius, 2006).

Secondly, satisfaction with the acquisition can be defined as the extent to which the employee anticipates feeling content after the acquisition. Participants were asked to indicate their satisfaction with the acquisition process, their satisfaction with their involvement in the implementation of the acquisition and their satisfaction with management performance

Independent variables. The first variable, communication during the integration period, can be defined as the process of informing organisational members about the strategic and practical aspects of the integration process (Haspeslagh and Jemison, 1991).

Further, consistent with Schoenberg's (2006) research, in this study knowledge transfer was embodied by the degree to which knowledge has been transmitted from, and to, the acquired firm, after the acquisition was completed, in the following 11 areas: Product and service design, R&D, service manufacturing operations, purchasing/supplier relation, distribution/outlets, personnel/HRM, marketing and sales, strategic planning, customer service, investment appraisal, and financial reporting. Respondents were asked to specify the degree to which transfer skills-based gains were achieved

Readiness for change was measured using a combination of two types of scales: the first to assess readiness at an individual level and the second to assess affective organizational commitment. With regard to trust, the questions pertained to employees' beliefs regarding management's trustworthiness and fairness.

Control variables. Several variables were used to help control for alternative explanations of the findings. Acquired Company's Size, Previous Experience with M&A was binary. Respondents were additionally asked to indicate how many M&A they have experienced.

Qualitative data collection and analysis

The data was gathered from ten acquired firms' managers by means of in-depth interviews. Interviews were carried out between March 2015 and June 2015. In the analysis of the scripts obtained from the recorded interviews we followed the approach of Shkedi (2003). Accordingly, we focused on the inductive connections between the sub-texts as units of analysis, which are referred to as 'Themes'.

A phenomenon can usually only be fully understood within its own nature and culture. Therefore, after interviews with informants were conducted, the data was analysed by splitting the information into categories and by re-arranging the different categories into a specific meaningful analytical order. A 'categories tree', a data driven schematic presentation of the themes, was another tool used in the analysis.

FINDINGS

Quantitative results

Table 2 includes descriptive statistics for the key research variables.

* $p < .05$. ** $p < .01$. *** $p < .001$

Variable	Min	Max	Mean	S. D	1	2	3	4	5	7	8

Table 2: Statistical distribution of the research variables

Next, a series of Pearson correlation tests were conducted between all research variables in order to achieve indications regarding the relationships between them. As shown in Table 2, Pearson correlations are generally consistent with the research hypotheses.

For both dependent variables, on the side of the acquiring company variables, knowledge transfer turns out to be significant. On the acquired company side, it turns out that trust is the key variable, as it is positively significant in both analyses. Surprisingly, communication did not turn out to be significant. While the readiness and commitment to change did not turn out to be significant, one of our control variables, the intention to leave, was negative and significant, partly supporting the relevance of commitment of the acquired firm for acquisition success.

Qualitative results

The aim of this section is to understand that research hypothesis that were denied or found to be non-significant or partly supported (in the analysis of quantitative data), and to look for in-depth explanations. M&A success factors were measured according to two variables, 'perceived performance' and 'satisfaction from merger'. Hypothesis 3, assuming that employees' readiness for change will have a positive influence on merger success and hypothesis 2, assuming that knowledge transfer levels will have a positive influence over merger success, were only partly (or indirectly) supported by the quantitative data gathered. Failure, as might be expected, was described with pessimistic and cynical narratives. For example, one informant asserted: *"when a CEO is replaced, that's a crisis point for an Israeli start-up and [...] the acquirers, which were business unit managers, for them to invest in a product, that they didn't know what to do with, is a waste of energy. Therefore, they prefer to do what they do best - to get their bonuses instead of being smart about it"*. Therefore, amongst those who experienced M&A as a failure, performance was emotionally perceived as disappointing. However, those who experienced M&A as a success did discuss the positive influence of readiness and commitment to change on performance: *"The acquisition was a great success – they [the buyers] got excellent people and the product itself ran and gave the company its unique added value"* and *"The merger is a great success and the same goes for employees who can see it as a tremendous achievement. Almost all of them continue to work there, some as a career path, some as an opportunity and some will slowly leave for other start-ups"*. Thus, it seems that the qualitative data gathered was able to explain the reasons behind why Hypothesis 3 was not fully supported by the quantitative data.

Thus, the continuity of the product development seems to be more important to TMTs than other considerations such as retaining autonomy, revenues from exit, self-reputation etc.: *"as a start-up, our target is to bring 2-3 potential customers and to build the product accordingly. After the merger a change in scalability of development methods and customers orientation is imposed"*. Another interviewee summarised: *"We won a lot of advantages from working according to the American system but we lost elasticity, bastardy and corner rounding"*.

DISCUSSION AND CONCLUSION

Contribution

In general, the findings support the notion that the success factors of start-up acquisitions are rooted both in the acquiring and the acquired firm. In fact, we provide support for the positive role of knowledge transfer by the parent, as well as trust by the acquired firm, for acquisition success, as measured by perceived performance and satisfaction with the acquisition. Conversely, the quantitative findings suggest that readiness and commitment to change have no significant influence

over managers' perceived performance. However, during the post-merger integration period managers tend to adopt a logical and pragmatic attitude, rather than an emotional one. In the absence of operational figures (due to the expected assimilation of the start-up into one or more business units), managers tend to under-estimate their performance evaluation. Another explanation lies in the composition of the sample which included both success and failure cases, start-ups in different stages of maturity, different levels of exposure to effective communication and different levels of employees' involvement in decision making during the pre-acquisition phase.

The findings of this study coincide with previous studies examining trust in that it found congruent behaviour, consensus building, providing feedback and delivering accurate communication to be important tools for developing trustworthiness. The interviewed managers emphasised the significance of two aspects of trust: trust in the management of the start-up itself and trust in the management of the acquiring firm. Moreover, although the acquirers of our sample of start-up managers were all foreign companies, national cultural clashes were not reported as a hurdle for the development of mutual trust. A mutual premise was that: "*it is good for the company, for the technology and for the employees*". This consensus formed a shared vision with enough transparency for all M&A participants. Once a highly credible acquired leader communicates to his or her employees that the TMT of the acquiring organisation is trustworthy, and that it is likely to keep its promises (during and after the integration process), the employees will usually believe their leader.

When the acquiring company is a foreign one, both parties, the acquirer and the acquired, feel more uncertain about the integration process. This, in turn, increases tensions when attempting to build relationships between the employees of the acquired and the acquiring firms (Nikandrou, Papalexandris, and Bourantas, 2000). Most Israeli start-ups are established with an international orientation and can be viewed as 'technology-based born global' firms (Almor, 2013). Nevertheless, this current research found that Israeli start-up managers are not often confronted with resistance caused by national cultural differences.

Further, previous research into M&A implementation has often focused on the challenge of balancing integration and autonomy. While post-acquisition integration and resource reconfiguration may be necessary in order to exploit potential synergies between the acquired and acquiring firms (Larsson and Finkelstein, 1999), the loss of autonomy that typically accompanies integration can itself be detrimental to acquisition performance. In particular, the dilemma between integration and autonomy may be important in acquisitions of technology firms. However, integration may ultimately lead to the destruction of the acquired firm's knowledge-based resources through employee turnover and the disruption of organisational routines. In conclusion, even though autonomy is expected to be

a subject of great importance to start-ups, before, during and after M&A, Israeli TMTs treat retained autonomy as one of many items listed on their negotiation checklist.

A growing body of research aims to explain knowledge transfer in the context of acquisitions. Most studies focus on knowledge characteristics, such as the degree to which knowledge is teachable (Junni, 2011), ambiguity (Junni and Sarala, 2011), and social embeddedness (Ranft and Lord, 2002). Fewer studies address the ways in which sociocultural aspects impact knowledge transfer in acquisitions (Junni and Sarala, 2012; Vaara et al., 2012). Scholars generally point to a positive relationship between post-acquisition performance and effective knowledge transfer (Oberg and Tarba, 2013). Several factors were identified as affecting the success or failure of knowledge transfer: the individual's perception of the quality of the merging partner which influences the willingness to exchange knowledge with other members of the organisation (fear of contamination phenomenon); whether the individual feels that the sharing of knowledge might translate into losing power in the organisation (leading to a fear of exploitation); The social relationships between the employees of both firms, which can influence their willingness to engage in knowledge transfer (communities of practice); and finally, bi-directional transfer of knowledge between the acquiring and target firms which can enhance the innovativeness, and improve the processes, of both firms (Björkman, Stahl, and Vaara 2007). Overall, it seems that the 'give and take' mechanisms of mutual learning transactions are particularly complex. Even though the importance of generating synergy is important to both parties, usually the activation and performance of knowledge transfer 'suffers' from mutual expectancies (especially if the acquired is sensitive and acquirer is heavily progress).

This study concentrates on reactions of high-tech employees to M&A transactions in SMEs and, more specifically, in start-ups. It goes without saying that hi-tech employees are highly aware of the central role they perform in start-ups and of the ways in which the close, friendly and human relationships they develop help preserve passion. They are also aware of the culture of entrepreneurship ambition to invent or create new products, applications or technologies. All of above may play a part when intentions to leave are considered.

Informants asserted that identification with the merger, coincident with the successful formation of a new entity, can act to moderate the effects of M&A cultural clashes over acquired management attitudes and behaviour and thus reduce high levels of key talents' and top management's turnover. Effectively selected and well-trained managers can also improve communication between the two management groups (acquired and acquirer) and, therefore, reduce stress, uncertainty and behavioural problems such as low commitment, poor cooperation and high turnover (Weber and Drori, 2011). This study found that effective acquired leaders may help limit

negative emotions and turnover by engaging in mitigating actions that address employees' problems and concerns.

THE IMPLICATIONS OF ICT USE IN TOURISTS' TRAVEL PATTERNS: CASE OF ZADAR

Zekanović-Korona, Ljiljana; Grzunov, Jurica

Dept. of tourism and communication studies, University of Zadar, Croatia

ABSTRACT

The intense development of modern ICT has induced significant changes in the ways of communication and general behavior of tourists in all stages of tourist travel. Still, the most prominent changes in the patterns of behavior of tourists have occurred in the pre-travel phase and during their stay in a tourist destination. Respectively, ICT facilitates new levels of connectivity between all of the stakeholders involved in tourism, while at the same time alleviating processes related to travel planning, organization and traveling. The use of ICT is in the function of creating rich and sustainable tourism experiences through personalization of services and creation of added values in the destination. Destinations worldwide are investing significant efforts in the implementation of smart tourism applications and enabling access to wireless Internet (Wi-Fi), as well as the development of other digital infrastructure to enable the comprehensive mobile connectivity of "digital" tourists to a physical location.

For the purpose of writing this paper, primary research was conducted to determine whether there is a connection between the tourists' use of modern information and communication technologies and other specific indicators and patterns related to their travel. The tendency of tourists to use technology has been determined using the Technology Readiness Index (TRI) scale, which was adapted for use in tourism. The research was carried out during the high tourist season in 2018 in the Zadar city area, with a special emphasis on Zadar as a destination.

Keywords: ICT, tourism, tourists' travel patterns, tourism destination, Zadar.

INTRODUCTION

Tourism is a complex global phenomenon with different multiplier effects on the entire economy. Incorrect definitions of tourism as an industry or business activity are often found in the literature. Many experts have tried to define tourism, and some of the most famous or most widely used definitions are: "Tourism is the sum of the phenomena and relationships arising from the travel and stay of non-residents, in so far as they do not lead to permanent residence and are not connected with business activity." (Hunziker & Krapf, 1942; according to Čavlek et. al., 2011), and the official one of the World Tourism Organization (UNWTO): "Tourism is a social, cultural and economic

phenomenon which entails the movement of people to countries or places outside their usual environment for personal or business/professional purposes." (UNWTO, 2015). Common to both definitions is that tourism is not connected with any kind of business activity but is defined as "the sum of phenomena and relationships" or "activity". The first travels date back a very long time, more precisely in ancient times. Those were privileged class travels and cannot be considered as classic tourism as this contemporary one we know today is. Much later the famous Grand Tour travels begin which some consider the predecessor of tourism. The characteristic of these travels is that they were intended for the privileged class. The first organized travel tour is the journey of Thomas Cook in 1841, which is also considered to be the beginning of tourism. The rapid development of tourism occurs after the Second World War, parallel to the development of transport.

Technology development contributes to innovations in the market and causes a huge increase in tourism. Technology enables universal globalization and allows people around the world to get closer to every corner of the world. Globalization directly and to a great extent affects the development of tourism and transforms it from the foundation. It also allows the elimination of restrictions of information, goods and services flow. Today, tourism is unimaginable without the use of technology. Tourism development is followed by technology development, both globally and locally. With the help of technology, tourist destinations adapt to trends and tourists' demands. Tourism is extremely complex and dynamic and takes place more directly through the environment.

Attractiveness plays a key role in tourism and is often the main reason for choosing a specific destination. This creates unity in the collision and interaction of tourists' wishes and motives within sophisticated tourist offers. The choice of a tourist destination as a product is considerably less based on rationality and reason, and much more on a unique, unrepeatable and subjective experience that, together with well-known attractions, makes a specific destination desirable. When assessing the attractiveness of a destination, the wealth of experience of the indigenous environment through dimensions of gastronomy, infrastructure, destination security, and natural and cultural heritage should be taken into consideration. All of these elements differentiate tourist destinations according to the degree of attractiveness.

THE ROLE OF ICT IN TOURISM

Information technology enables the collection, distribution, storage and exchange of information. When organizing the travel it is essential to collect as much information as possible, regardless of the form in which the information is collected. ICT plays a major role in the development of tourism in general, and the extremely rapid flow of information on services and products in the

segment of tourism contributes to quality decision-making. Tourist service providers require a constant inflow of information, so it is necessary to estimate the relationship between information delivery and processing, the cost of collecting that information, and the value that the information may have. The extensive application of ICT in tourism enables better information quality and availability of services and, at the same time, increases destination competitiveness. Destinations can be promoted globally, and with the help of ICT, there is much more information on tourist movements and habits available. The methods of presenting tourist destinations and tourist attractions become more diverse and more sophisticated. The customer has the possibility of booking accommodation from the comfort of his own home. Today, that same technology monitors tourists during all stages of booking and consumption of tourist services and products: Information and choice of destinations, decision-making, preparation of travel, and both during and after the travel. Information technology helps to find information and gives value to the information as a business element. Up to 80% of potential tourists seek motivation for tourist travels on the Internet. Tourists get ideas for traveling from media that are popular today such as social networks, tourism portals, blogs about tourist destinations, etc. After initial motivation and decision-making for travel, with the information available on the Internet, a trip is planned and organized. The Internet becomes increasingly important in the presentation of tourism offers and activities.

ICT USE IN TOURISM IN THE REPUBLIC OF CROATIA

ICT is the most dynamic driver of globalization processes and the development of the world economy in all economic sectors. Tourism, as one of the most important and fastest-growing economic sectors worldwide, relies heavily on the use of ICT. The application of new technologies and innovative ICT solutions facilitate adaptation to contemporary trends and an individualized approach to meeting tourist demands. Existing mobile and stationary applications, as well as existing software solutions, are continually and systematically upgraded and the number of new software solutions and applications is also growing significantly. Although according to UHY (an international consultancy network) research, which covered 34 countries around the world, the share of tourist consumption in the GDP of the Republic of Croatia is about 19% (which exceeds the global average of 1.2% by more than 15 times) tourism in Croatia is insufficiently dependent on the support and application of new technologies. There are exceptional potentials of Croatian tourism as well as possibilities for its development in the context of stimulating the overall economic development of Croatia. The tourist consumption growth rate in Croatia was 9.1% in 2017, or USD 9.6 billion, compared to the previous year, when it amounted to USD 8.8 billion. Tourist consumption (together with the cost of the travel)

is presented as a percentage of GDP for the past two years, and Croatia has taken the first position in that category (Poslovni.hr, 2018).

World Tourism Day is traditionally held each year on September 27th, with this year's theme being "Tourism and the Digital Transformation". By choosing the topic, the intention was to raise awareness of the importance of digital technologies in tourism development. The Minister of Tourism of Croatia Gari Cappelli emphasized the great importance of digital transformation in tourism, especially in connecting stakeholders in the tourism industry and in the promotion and establishment of efficient business. Upon the announcement of World Tourism Day, Croatian Minister of Tourism Gari Cappelli stated that "...nowadays the world can be seen in the palm of a hand at any time. Today's tourists are looking for new experiences and the Internet has become the platform for the choice of destination, the travel planning and the creation of experiences (Rihelj, 2018). Similarly, innovations and digitization have also become an important part of the business of every tourist system". He also added the following: "Aware of the importance of digital transformation, we have started the Croatian Digital Tourism project by which we will make our system more efficient and connected. Our wish is that we are not only one of the most popular tourist destinations, but also a leader in tourist innovations". Through these words he announced the project called "Croatian digital tourism: e-tourism" which aims to further connect the user and public administration in tourism through shortening of the time necessary for the processing of requests of citizens, the reduction in the costs of providing public services and the provision of updated tourist information to citizens and e-services. The project will be implemented in several phases and will, via newly-developed public e-services that will upgrade already globally awarded eVisitor system that provides insight into tourist traffic and accommodation capacities, connect the processes of several public administration bodies into one integrated information system. In 2018, the eVisitor system won UNWTO's third prize in the category of innovation and technology in tourism. It is an award that represents great acknowledgment for Croatian tourism, as well as proof that today Croatia is recognized as one of the leaders in the global tourism industry. Croatian Digital Tourism project has the potential to lift the whole tourism system of the Republic of Croatia to an even higher level of efficient business operations and serve as an example of good business practice to tourist employees of other countries.

MARKETING IN TRAVEL AND TOURISM

Marketing becomes a very important economic branch as market competition in the promotion area is tightened. In tourism, marketing must respond to human needs and meet tourists' needs whilst constantly adjusting to new market trends (Gregorić & Vrkljan Muraj, 2017). Tourist destinations should understand and anticipate tourists' needs, and offer them unique and personalized

experiences. Access to tourism service offer should be of high quality and must include informing tourists about the events, the destination, and the possible experience through the activation of different senses. Employees in the tourism sector make the placement of their offers while understanding the outbound markets, limits and reactions of tourists. Contemporary marketing focuses on content marketing and digital media as the main communication channels. Content marketing is a series of activities and techniques aiming to make a destination attractive to tourists. In traditional marketing, it was important to present the destination to tourists, and in contemporary content marketing, the tourist easily finds information about the destination. In the presentation of the destination through content marketing, the starting point is an idea that turns into content which is then used for promotion. Along with the destination promotion, additional interesting content that is relevant to the destination is also created. If the content is created according to the expectations of tourists, the tourists “follow” the content, leave their data, seek additional information and ultimately become visitors. By creating interesting content for tourists, they are better connected to the destination that they are about to visit. In this type of marketing, the application of ICT in destination promotion is no longer a matter of choice but has become mandatory.

Today, in the usual methods of marketing we notice a great influence of information technology. We can often find a brand new name for modern marketing - Electronic marketing. The definition of modern marketing has been proposed by Panian: “Electronic marketing (e-marketing) is a way for effectuating marketing activities of the company by intensive use of information and telecommunication (Internet) technology” (Panian, 2000). Electronic marketing to a large extent depends on the websites of certain locations that provide consumers with concrete information on tourist facilities. They also provide additional information such as details on accommodation capacities, rates, amenities, and accompanying facilities. The Internet is designed as a tool for individuals to be able to publish all kinds of content and thus be at the service to interested users who will view and possibly spread the content.

SOCIAL MEDIA IN TOURISM

More and more in recent years in prominent world media, articles describing beauties of the Republic of Croatia as a tourist destination are being published, while different media publish scales of the best tourist destinations in the Republic of Croatia based on research. On these scales created upon the opinions of readers, the most commonly mentioned Croatian cities are Dubrovnik, Zadar, Mljet, Korčula, Hvar and Zagreb. However, the question of estimating direct benefits for Croatian tourism from the appearance of destinations on such scales arises. The Croatian National Tourist Board points out that “while choosing the destination, modern tourists are paying special attention to

personal recommendations, which is why the posts based on personal experience are the best motive for all potential tourists to come to Croatia.”

European Best Destination organization is a European organization based in Brussels- and aims to promote culture and tourism in cooperation with tourist offices (Potočnik Topler & Zekanović-Korona, 2018). At the global and European level, in cooperation with the EDEN organization, it promotes cultural diversity and lifestyle in the European destinations. The EBD's portal features more than 2.5 million visitors and several thousand followers at various social networks as well. Advent in Zagreb was voted the best in Europe in 2016 thanks to the EBD organization, with exactly 29,901 out of a total of 101,703 votes. Portal readers from 176 countries worldwide voted in ten days. Lagging behind Zagreb on the list, there were Vienna, whose Advent celebration tradition goes as far back as the 13th century, as well as Strasbourg and Brussels. Thanks to this award, Zagreb was placed on the list of the best tourist destinations by various media. A few months before Zagreb, Zadar won the title of the best European destination. With only two mouse clicks at www.birajzadar.com, one could vote for Zadar as the best destination. The campaign included a total of 13 million profiles on social networks and Zadar won the award ahead of renowned European destinations, winning a total of 288,992 votes thanks to the social networks and the *#birajzadar* (eng. *hashtag*) *Vote for Zadar* campaign that lasted for 20 days and was implemented by a volunteering group of young enthusiasts. The campaign was joined by numerous renowned citizens of Zadar who motivated and invited their friends throughout Croatia and the world to vote for Zadar.

RESEARCH METHODOLOGY AND THE ANALYSIS OF RESEARCH RESULTS

The research was conducted by a questionnaire in the city of Zadar during July and August in the 2018 summer tourist season. The questionnaire consisted of 35 open and closed-type questions that sought to determine the profile, satisfaction, and attitudes of guests of the city of Zadar as well as their willingness to use ICT and ways of using technology for planning, organization, and implementation of tourist travels. Prior to conducting a survey on tourists, the survey questionnaire was tested and validated by the employees of the Zadar Tourist Board. A total of 209 tourists from various countries around the world who visited the old city center of Zadar during that period were randomly selected and surveyed. Given the method of selecting the respondents, this sample may be considered as random, but not necessarily representative, as it does not reflect the actual structure of Zadar tourist visitors. Research results were processed using various statistical methods, with some of the more significant results being visualized using MS Excel and the Tableau program package.

Respondents were, for the most part, of younger age, which (given their almost inborn tendency to use technology) could have had a significant impact on the results of this research. Specifically, 140 of them were under the age of 35 (66.99%), more than a quarter of respondents were under the age of 25 (26.79%), and there were only 21 respondents older than 45 (10.05%). As far as gender structure is concerned, nearly equal numbers of male and female respondents (50.24% versus 49.76%, respectively) participated in the research. More than half of respondents (58.85%) were in some kind of a relationship and traveled with their partner or family (53.33%), while more than one-third of respondents (37.8%) were single (traveling alone (14.35%) or with friends (23.45%)). Most of the respondents were employed (72.73%) and earned more than EUR 2000 (55.98%). Also, most of the respondents were from Germany (16.27%), Italy (10.05%), Great Britain (7.18%) and Slovenia, the USA and Poland (5.74% each), which somewhat corresponds to the actual statistical structure of outbound tourist markets of the Republic of Croatia. More than two-thirds of respondents (71.29%) visited the Republic of Croatia earlier, but almost half of them were in Zadar for the first time (35.41%). Respondents, among other things, evaluated the satisfaction with certain components of the city of Zadar as a tourist destination, having to choose between grades from 1 to 5 (grade 1 meant "not satisfied at all" and grade 5 meant "completely satisfied"). Regarding their satisfaction with Zadar as a destination, it was found that they were most satisfied with safety (avg=4.45, st.dev=0.76), natural attractions (avg=4.25, st.dev=0.83), cultural and historical heritage (avg=4.18, st.dev=0.84) and gastronomic offer (avg=4.07, st.dev=0.84), while they were least satisfied with the variety and quality of entertainment events (avg=3.74, st.dev.=0.95) and the amount and quality of information available in paper (offline) form (avg=3.62, st.dev=1.05). Regarding the availability and quality of information about Zadar on the Internet, respondents rated them by average grades 3.85 (st.dev=1.02) and 3.88 (st.dev=1.01), respectively. The average grades and the corresponding standard deviations of the satisfaction ratings of the respondents with main components of Zadar as a tourist destination are shown in Figure 1. There was no significant statistical correlation between the age of respondents and their grade of availability of online information about Zadar ($r=0.09$) and the quality of available information ($r=-0.07$), although younger respondents gave slightly lower grades to the quality of available information.

Figure 4. The average grades and the standard deviations of tourist satisfaction with the main components of Zadar as a tourist destination (source: author's work)

In order to get a better insight into the respondents' readiness to use and adapt to new technologies, the Technology Readiness Index¹ (TRI) was used in the questionnaire. The TRI is based on examining an individual's attitudes and feelings (optimism, discomfort, and insecurity) regarding the use of new technologies. According to the results obtained, it is determined in which of five different categories (laggards, paranoids, skeptics, pioneers, researchers) every respondent belongs to. Respondents with the lowest TRI index (laggards) have extremely negative attitudes towards using new technologies and use them only when that is necessary, while respondents with the highest TRI index (researchers) have extremely positive attitudes toward using new technologies and are happy to adopt and use these technologies as soon as they appear on the market (Parasuraman, 2000). With respect to the calculated TRI indices in the context of the conducted research, the highest number of the respondents were skeptics (67.46%) and pioneers (22.49%), followed by a smaller number of respondents who belonged to the category of researchers (5.26%) and paranoids (4.78%). In the chart below (Figure 2.), it can be seen that almost all of the researchers in this sample are in the age group between 26 and 35, which is somewhat understandable given the fact that this generation (born at the

¹ These questions comprise the Technology Readiness Index 2.0 which is copyrighted by A. Parasuraman and Rockbridge Associates, Inc., 2014. This scale may be duplicated only with written permission from the authors.

end of the 20th century) testified the intensive development of new technologies from the early age, and therefore understands the course and dynamics of that development.

Figure 5. Number of respondents according to their age given the calculated TRI (source: author's work)

Despite the inadequate number of elderly respondents involved in this research, a mild negative correlation between age and the TRI index ($r=-0.1$) has been observed, which is somewhat contrary to the general opinion and public attitudes that younger people are prone to using new technologies.

The next set of questions in the questionnaire related to the use of ICT in the context of decision-making regarding the choice of destination and organization and implementation of travel. When asked about which primary source of information about Zadar as a tourist destination they used before the travel, respondents mostly stated the Internet (37.32%) followed by personal recommendations of friends and relatives (27.75%), while a significant part of respondents (21.05%) stated that they have not been additionally informed since they are already familiar with the destination due to their previous stays. The structure of the responses was similar on how they found out about Zadar as a potential tourist destination, where almost one third of respondents stated the Internet as the primary source (30.14%), followed by friends and relatives (27.27%), while only a small number of respondents stated tourist agencies (5.74%), brochures and posters (4.31%), films and series (4.31%), tourism fairs and exhibitions (3.35%) and other offline sources. It should also be emphasized that almost a quarter of respondents (22.49%) stated that they were not sure where they got the first information about Zadar. When asked about the use of online sources of information (where multiple responses were available) as the most common online source of information respondents stated the Internet search engines (55.98%) such as Google, Yahoo, etc., followed by social networks (32.06%) such as Facebook, Instagram, etc. A smaller number of respondents also used Travel forums (12.92%), Travel guides (11.96%), online booking services (10.53%) and Travel blogs (10.05%), while 11.96% responded that they have not used the Internet as a source of information when planning and organizing the travel. Among those who used the Internet as a source of information, as the primary device used for information seeking on the Internet, respondents mostly stated smartphone (47.85%),

and to a lesser extent a laptop (17.7%) and a tablet (12.92%), while the smallest number was of those who used a desktop computer (6.22%) or some other device (2.39%). Such results confirm already well-known trends of increasing number of tourists who, in order to find information about tourist destinations, use almost exclusively online sources of information (such as Internet search engines and social networks) and access them by using lightweight portable devices such as smartphones and tablets (Kim et al., 2015).

In the context of Internet search, respondents were asked about how they used the search engines to find information about Zadar. Specifically, an open type question was raised where respondents had to indicate which search phrase they would most likely use when seeking information about Zadar. Respondents offered 130 different phrases on this question, while 99 of them contained the keyword Zadar. Specifically, most respondents (16.75%) answered that they would only enter the keyword Zadar while the rest used it in combination with other search terms, such as accommodation, apartments, attractions, beaches, camping, clubs, sea organ, history, info, hotels, best European destination, etc. In addition to the previous question, four photos were offered to respondents, depicting some of the most famous natural and cultural sights of Zadar and its surroundings. Respondents had to select the photo they consider the most attractive in terms of choosing Zadar as tourist destination and the highest number of respondents (41.63%) selected the photo depicting a typical Zadar sunset at a location containing one of the most famous modern installations in the city of Zadar called "Greetings to the sun". Interestingly, this percentage did not vary significantly with respect to the different age groups, from the youngest to the oldest respondents (41.07%, 42.86%, 43.75%, 30.77%, 37.50%, respectively), which in some way suggests that this installation (combined with the Sea organs located at the same location) is one of the most important tourist attractions of the city of Zadar. The second most attractive site, according to the number of selections (24.88%), was represented by a photo depicting the church of St. Donatus which is one of the historical symbols of the city of Zadar.

The remaining two photos, depicting the surrounding islands and the geographical position of Zadar close to the sea and the Velebit mountain, were selected by a slightly smaller number of respondents (13.4% and 19.14% respectively), indicating that in the sense of Zadar's tourism promotion, it is more important to focus on specific tourist attractions than on natural beauty and geographical position of the city. These results could be significant in the context of content marketing and creating online advertising campaigns, with the particular importance of choosing keywords and visuals to target potential guests.

In the next part of the questionnaire, respondents answered questions related to the organization of accommodation and transport for tourists travel to Zadar. Nearly half of respondents (47.52%) booked their accommodation on the Internet via various channels of sale, with the largest number of respondents who used online booking services (29.21%) or e-mail (16.34%), and only a very small number of respondents used social networks (1.49%) or a private renter's website (0.5%) for booking accommodation. Regarding other methods of reserving the accommodation, respondents used tourist agencies (27.72%), telephone bookings (14.36%) or booked personally upon arrival at the destination (6.44%). These data point to the growing influence of new online media in the total share of the sale of accommodation facilities once dominated by travel agencies. Given the omnipresence of social networks and their practicality and simplicity, it is to be expected that they will be more oriented towards the tourism market in the future and take on a more significant share in the total number of tourist accommodation reservations. In support to this, some of the leading online service providers for private accommodation rentals (e.g. Airbnb and TripAdvisor) have been gradually transforming their accommodation booking apps in the past year or two by introducing various functionalities inherent to social networks (e.g., sharing experiences with acquaintances, various interest groups, etc.). The possibility of direct booking via the Internet has also affected the shortening of the period in which the reservation was made, which is visible from respondents' responses. More than half (50.26%) of them booked their accommodation less than a month before the travel, while only a very small number of respondents made reservations more than three months before arrival (6.16%). Of those respondents who booked the accommodation via online booking services, 53.03% used Booking.com, one of the most popular online accommodation reservation platforms, that offers several types of accommodation (hotels, hostels, private accommodation, etc.). The second most used accommodation booking service among the respondents was Airbnb (25.76%). As opposed to the Booking.com, Airbnb offers only private accommodation and therefore has a slightly smaller market share. Respondents also used TripAdvisor (8.33%), Expedia (4.55%), HomeAway (3.79%) and Wimdu (3.79%).

The next set of questions was related to reviews and travel guides. Particularly, 81.12% of respondents answered that they did not use any travel guides, while only a few said they used online (10.71%) or paper/offline (8.16%) guides. The structure of the answers to the question "Did you read any reviews prior to visiting the destination?" was somewhat similar. Almost two-thirds of respondents (65.31%) responded negatively to this question, while just over a quarter (27.04%) stated they read online reviews or used another (offline) review source (7.65%). Respondents who positively responded to the previous question were asked to qualify (using grade from 1= "negative" to 5= "excellent") the reviews in the context of the reputation of the destination, and an average rating of

3.88 was obtained (st.dev=0.75). In addition to that, almost 70% of the ratings were above the average, which suggests the positive connotation of the reviews. Along with the qualification of the reviews in terms of their value, respondents could also answer the question as to how these reviews influenced their decision to finally choose Zadar as a destination. More than half of the respondents (57.43%) stated that the read reviews encouraged them to choose Zadar, while just under one-third of them (31.76%) were made to reconsider. Finally, only one out of ten respondents stated that the reviews they read did not affect their decision at all.

In the final set of questions, respondents could assess the extent to which the award for the Best European Destination that Zadar won in 2016 affected their choice. More than three-quarters (75.62%) responded "very much", while only 6.78% stated that this information did not affect them. Finally, regarding their general satisfaction with Zadar as a destination, respondents mostly gave high positive grades (avg=4.02, st.dev=0.8) as well as to the question assessing their attitude toward coming back to Zadar (avg=4.14, st.dev=0.82) and whether they would recommend Zadar to friends and relatives (avg=4.16, st.dev=0.82).

CONCLUSION

The main objective of this paper was to identify the implications of ICT use to the travel-related behavior of the tourists, with a special emphasis on the city of Zadar as a destination. There is no doubt that the development of ICT, and social media, in particular, has introduced significant changes in the way tourists seek, evaluate and utilize information, products, and services related to travel. However, the extent and the profoundness of these changes are very difficult to measure and categorize in terms of their causative relation with ICT development. Having that in mind, the results presented in this paper can be considered a small contribution to the overwhelming area of research related to the impact of ICT on human behavior.

Some of the main outcomes of the presented research are connected with general technology adoption and the way tourists seek and evaluate travel information. Because most of the respondents were young people, it can be considered noteworthy that their technology readiness index was relatively low. Besides, there were no statistically significant correlations between their TRI and their age or their (mediocre) subjective grades on the quality and quantity of online information about Zadar, which implies that the available information is not necessarily more accessible to those who have an aptitude for ICT use. Likewise, it comes as no surprise that almost all of the respondents used the Internet to some degree to find and/or purchase travel-related information, products or services. Moreover, in doing so, most of them used smartphones as the most accessible and widespread mobile technology present. Considering the pace at which ICT is still developing, and the ubiquitous ways it

is being utilized in tourism, one can easily envision the future in which technology will evolve into an integral part of traveling experience.

BOOK OF CONFERENCE ABSTRACTS

THE EFFECTIVENESS OF COMMUNITIES OF PRACTICE FOR SUSTAINABLE AGRICULTURAL DEVELOPMENT

Adamashvili, Nino; Fiore, Mariantonietta; Colantuono, Fedele; Conto', Francesco

Economics department, University of Foggia, UniFg, Foggia, Italy

ABSTRACT

INTRODUCTION

Nowadays increasingly high importance is given to agricultural activities. The need of the effectiveness and sustainability of the agri-food sector is becoming more and more crucial issue as it is facing the global challenges. Precisely, issues such as depletion of natural resources, limited usability of land, environmental and climate changes, constant increment of world population in need of nourishment and required improvement of the quality products that can simultaneously reduce the harmful impact on the environment. Therefore, sustainability keeps to be one of the principles of agricultural practices (Fischer, et al., 2012).

Agriculture is one of the fastest growing sectors. So, movement towards sustainable development requires strong knowledge bases that will be constantly updated. Lubell, et al. (2011) underlines the role of farmers' knowledge in successful decision-making process that leads to economic, environmental and social benefits simultaneously. Farmers need to be aware of different practices. The necessary information and correct analysis, the cases and experience of other farms are the key factors of right decisions. Similarly, Šūmane, et al. (2018) demonstrates the crucial importance of farmers' education level and learning methods in order to reach the sustainable development of agriculture and its resilience.

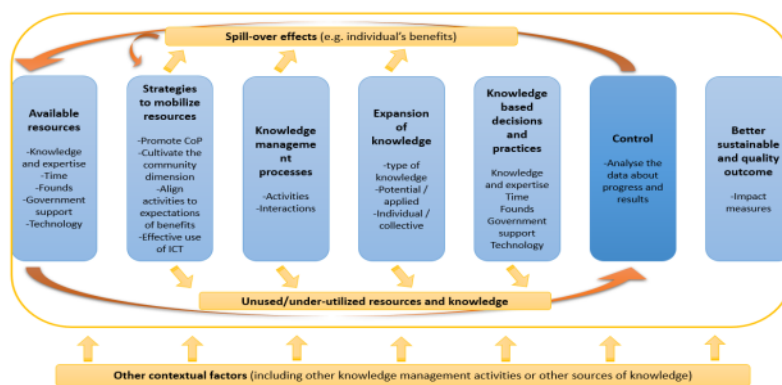

Aim: This tendency poses a question about the ways of knowledge sharing. There are many different methods on how to exchange information and knowledge. Current advances in technologies makes this process easier. In the modern word, Information and Communication Technologies (ICTs) reduce the information gap between people and have a remarkable effect on agricultural activities as well. According to Patii, et al. (2018), transparent peer-to-peer system for information sharing strengthens the networks of all farmers and experts and help them to exchange knowledge in their field. The outcome of the system will be increased efficiency, productivity and sustainability of processes.

METHODOLOGY

In this paper, we introduce the Community of Practice (CoP) as a useful tool to share knowledge, experience and to work together in order to develop new ways for solving different problems and achieving a common goal. It is a group of people with similar interest who meet regularly, share a concern or passion for tasks they work about and learn new ways to do their business better by interacting with each other continuously. In addition, we describe the model of Community of Practice created on base of best practices collected under the project SKIN (Short Supply Chain Knowledge and Innovation Network), and propose additional feature of the application to control progress and results of the community.

RESULTS

After studying different models of CoPs, it is obvious that the models based on the using of ICTs should be more efficient. ICTs make the opportunity to construct the Communities of practice virtually (Herrera, et al., 2017) that simplify the planning of meetings, communication, sharing participants practices and get informed about results as well (Haagensen, et al., 2018). To be complete, CoP should have the part of education. In virtual CoP it is possible to include e-learning courses on the related topics. It will deepen participants' knowledge and provide them with theoretical background, together with practical cases. Lastly, the feature for controlling the progress and results of CoP shows the outcome and makes easier to identify weaknesses in the process and to resolve them as soon as possible. Therefore, considering these all, by the figure 1 we propose new model of CoP created on the basis of Bertone et al.'s (2013) model.

CONCLUSION

To summarize, nowadays the sustainability of agricultural processes is the most important issue. On its side, its main goal is to foster the farmers to adopt best practices for economic, environmental and social wellbeing that will be reached if farmers make right decisions about innovation and cooperation (Lubell, et al., 2011). In this context the importance of information is increasing gradually in today's

agricultural activities (Miller et al., 2018). The multiple information and knowledge sharing, together with good rural infrastructure and networks, can play a remarkable role in sustainable intensification practices (SIPs) and increase farmers' income as well (Kotu et al. 2017). So, we are in the era where knowledge is power, and sharing it is the basis of success (Liu & Chen, 2018). For this process, creating the communities of practice is very helpful tool. Moreover, CoPs are much more effective if there is a support of ICTs that give the opportunity to collect, share, and analyse the data easier, faster and effectively.

ACKNOWLEDGMENT

The result presented in this paper is part of the SKIN project (www.shortfoodchain.eu). This project has received funding from the European Union's Horizon 2020 Research and Innovation programme under grant agreement N. 728055.

Keywords: Sustainable agriculture, CoP, knowledge, collaboration, ICTs.

THE IMPACT OF MORAL EMOTIONS AND PERSONALITY TRAITS ON CONSUMER INTENTION TO BUY COUNTERFEIT PRODUCTS IN LITHUANIA AND UKRAINE

Adomaviciute, Karina; Kirse, Sigita; Huselnykova, Svetlana

Marketing department, Vilnius University, Vilnius, Lithuania

ABSTRACT

The advancement of counterfeit products has become a global concern over the last few decades, affecting world trade in different ways. The range of brands, especially luxury and worldwide famous, have become main objectives of counterfeit production. This results in consumer misbehavior, which has been widely discussed by researchers (Basu et al., 2015; Tang et al., 2014; Vida, 2007; Albers-Miller, 1999). Despite modern technologies, which significantly simplify recognition of fraudulent goods, and the governments' actions toward counterfeiting, the companies keep losing profits and are being damaged due to this phenomenon (Vida, 2007). The manufacturing of fictitious goods provides a solid motivation for counterfeiters, since they avoid investment in marketing research as well as brand management expenses (Stottinger and Penz, 2003).

Numerous studies review antecedents of conscious counterfeit purchasing and consumption, bringing up new affecting factors every time and identifying these factors under different circumstances, therefore the universal and structural approach is yet to be developed (Vida, 2007; Wang and Song, 2013; Tang et al., 2014; Bian et al., 2016). This research focuses on the moral emotions (guilt and pride) and personality traits (materialism and price consciousness) influencing non-deceptive purchasing and consumption of counterfeits, such as luxury brand watches. On the basis that predominant literature indicates singularities inherent to different countries which cause consumer misbehavior through diverse legal restrictions, ethical norms and personal beliefs (Stottinger and Penz, 2003), this study attempts a cross cultural comparison between two selected countries, namely Lithuania and Ukraine.

The purpose of this paper is to examine the impact of moral emotions and personality traits on consumer intention to buy counterfeit products. The study included two steps: a pilot study and the main quantitative study. Online survey and non-probability (convenience) sampling were used for the main study. This study is based on a survey of 346 respondents from Lithuania and Ukraine.

This study provides new insights into the knowledge about the similarity and differences between two countries, namely Lithuania and Ukraine, confirming the importance of moral emotions and personality traits in both instances. It was confirmed that pride had positive impact on intention to purchase counterfeit products in both countries, however the negative impact of guilt was confirmed

only in Lithuania. This allows managers to appeal to different group of emotions in the communications and advertisements as well as applying different approaches for identifying target audiences. Proper and well executed advertisements with emotional appeal may have a higher chance to be noticed, remembered and even discussed among consumers preventing them from the negative consequences coming from the use of counterfeit products.

Analysis of the personality traits revealed, that materialism had no impact on consumer intention to buy counterfeit products, which is compatible with previous studies of Wee et al., (1995), but contradicting to the research of Furnham and Valgeirsson (2007). Such controversial results might be caused by different values across the countries showing that in each particular case materialism affects purchase intentions differently and generalizations are problematic to be made. However, it was confirmed that price consciousness had an impact on intention to purchase counterfeit luxury watches. These results are consistent with previous research of Alford and Biswas (2002), Kim and Karpova (2010) and Poddar et al. (2012) confirming that price is the main trigger to purchase counterfeits, consequently the price conscious consumers are more likely to have intention to buy counterfeits. Despite the fact that personality traits may be influencing the intention to purchase counterfeits and companies are unable to alter human beings, yet businesses might develop quality improvement strategies and also think of preventive actions in order to fight counterfeiters. Hereby, companies might start taking actions and fall back upon intricate manufacturing processes, hologram security images, watermarks, exclusive materials and fabrics, expensive manufacturing equipment.

Keywords: counterfeit product, moral emotions, guilt, pride, materialism, personality traits.

THE RELATION OF STRESS MANAGEMENT AND LEADERSHIP EFFECTIVENESS IN THE HOTEL INDUSTRY OF CYPRUS

Afxentiou Georgios; Malkawi Elena; Antoniadis George

Research and Development, CTL Eurocollege, Limassol, Cyprus

ABSTRACT

The research aims to investigate the relation of stress management and leadership effectiveness through the evaluation of decision making, negotiation and conflict solving competences. The research focuses on the challenges faced by middle-level managers in the hotel industry of Cyprus. Job demands and conflicts among work and non-work priorities are major sources of job-related stress for employees. A large and increasing number of occupational challenges affect the level of stress at the workplace and as a consequence employee well-being, health and performance as well. Stress management is described as employing work and life routines that help manage everyday stresses, maintain work-life balance and ensure time for relaxation (Winwood, Colon, and McEwen, 2013, p.1207; McEwen, 2012, p.156). Questionnaires as a quantitative method and interviews as a qualitative method will be applied to middle-level managers of four-star and five-star hotels in Cyprus. The questionnaires use the likert scale and contain one hundred and ten questions of which twenty five refer to stress management, twenty eight to decision making, twenty seven to negotiation and thirty to conflict resolution. The questionnaire, which takes between thirty and forty minutes to complete, will be given directly by the researchers to eighty three participants. The analysis of the data will be conducted with the use of SPSS software. The interview contains eight questions that cover stress management, decision making, negotiation and conflict resolution. The interview session is expected to last between thirty and forty minutes. The analysis of the interview data will be conducted with the use of Nvivo software. According to the Cyprus Statistical Service (2019), the country's revenues were €7,599.2 mn and the national income from tourism during the period of January through to December 2017 was estimated at €2,639.1 mn. In perspective, the tourism industry contributed 34.7% to the national revenues in 2017. The 2017 tourism revenues showed an increase of 11.7% compared to €2,363.4 mn for the corresponding period in 2016 (Cystat, 2017). This study makes an important contribution by examining such relationships within the managerial work environment in the hotel industry and by identifying specific job demands and requirements for employee selection and training processes.

Keywords: Stress management, leadership effectiveness, hotel industry, decision making, negotiation, conflict solving, job demands.

LINKAGE BETWEEN MODERATE WINE CONSUMPTION AND WELL-BEING: ANALYSIS OF ITALIAN CONSUMERS BY REGIONS OVER TIME

Alaimo, Leonardo¹; Fiore, Mariantonietta²; Adamashvili, Nino²; Conto, Francesco²

¹Sapienza University of Rome and ISTAT, Rome, Italy

²Economics Department, University of Foggia, Foggia, Italy

ABSTRACT

INTRODUCTION

Italy has an old experience in wine production and consumption. Indeed, it is one of the most famous European and worldwide producer together with France and Spain. The country's share on the world market is 20% and 33% on the European one (Romano & Natilli, 2009). As for wine consumption, it depends on different factors including geographical features (Villanueva et al., 2017). Wine characteristics, consumers' preferences and consumption habits as well as wine culture vary territorially. The origin of the wine has a crucial importance for consumers' decisions, sometimes they are willing even to travel for distanced areas with the aim to taste particular products of concrete wine producing regions (Antonazzo et al., 2015).

Wine culture of the region somehow defines also consumers' perception how the consumption of wine affects on their health and wellbeing. For instance, French policies advocate the restriction of wine consumption that indirectly influence on consumers' perception of negative impact of wine on their health (Vecchio et al., 2017). However, firstly the importance has to be given to consumption frequency. Usually, heavy wine consumers decrease consumption in later years for health purposes (Stockley et al., 2017). Though, wine is a healthy product when it is consumed moderately; its impact on health depends on wine characteristics and attributes as well, whether it is red or white, variety of grapes and other variables (Artero et al., 2015).

AIM

The purpose of this work is to investigate and prove the connection among wine consumption, health and well-being. We intend to analyze also how this link varies over time and territory on the example of Italian 21 regions, so to compare these regions in two different years, 2010 and 2017, based on different variables.

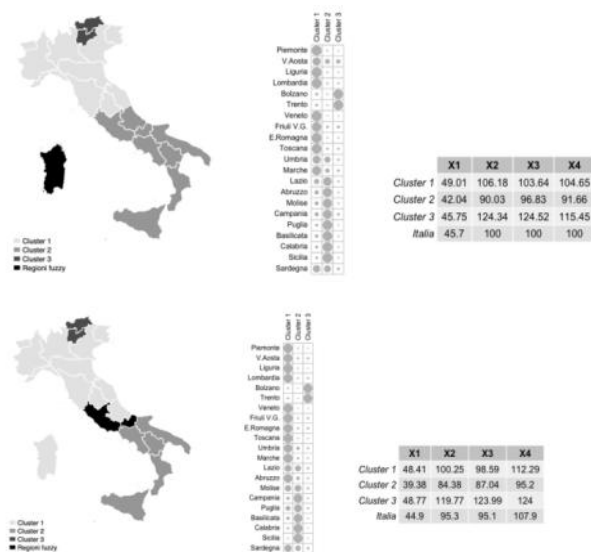

METHODOLOGY

In order to meet the paper objectives, we analyze data of the Italian National Institute of Statistics – ISTAT (2018 a and b) that gathers the statistical surveys. The research is based on the following variables: (1) Moderate wine consumption; (2) Health composite index; (3) Social relationship composite index; (4) Subjective wellbeing composite index.

We have used the cluster analysis and a set of statistical unsupervised methods for classifying the units into homogeneous groups. More precisely, we have used fuzzy clustering instead of classical method that does not allow units to belong to more clusters simultaneously. As for cluster validity, we decided to use different cluster validity methods to have different meters of comparison to evaluate our procedure. They are as follows: (1) Xie-Beni index – XBI (Xie & Beni, 1991; Pal & Bezdek, 1995); (2) the modified partition coefficient – MPC (Dave, 1996) and fuzzy silhouette index – FSIL (Campello and Hruschka, 2006).

RESULTS

With regard of the quantity of clusters, all three indices show the same result of three clusters as optimal solution. Nevertheless, they have different consistent of regions in 2010 and 2017 years (fig. 1 a and b). However, it is possible to make comparisons, taking into account for each year the link between the centroids describing the different clusters and the Italian values in the variables considered. In this way, we can characterize the 3 clusters: Cluster 1 as the one with the best values, Cluster 2 as the one with the worst values and Cluster 3 as the one with peculiar values compared to the national data, in both years considered.

a - Year 2010

b - Year 2017

Figure 1 – Wine consumption, hedonism style and health: clusters composition; membership degrees; centroids.

We can observe the so-called *North-South gap*, with the Northern and Central Regions with values higher than those of the Southern ones in all indicators (except in the Health composite index, in which the differences are less marked). The moderate wine consumption shows almost similar values in 2010 and 2017.

CONCLUSION

In general, both the 2010 and 2017 analysis in all regions of the country confirm the existence of a relationship between moderate wine consumption and composite indicators of health, social relations and subjective wellbeing. Results showed North-South gap meaning the strong difference between the different areas of the country. In fact, northern and middle regions entered in a Cluster 1, described as having best values while in southern Italy the situation is worse than average of the country so they entered in second Cluster with the worst values.

After cluster analysis. It is possible to conclude that the overall situation in the country is improved over time since Cluster 1 increased from 10 to 12 regions with Sardegna and Abruzzo in addition and Cluster 2 decreased from 8 to 5 regions from 2010 to 2017.

**AN INVESTIGATION OF THE IMPACT OF PERCEIVED MANAGER'S
EMOTIONAL INTELLIGENCE ON TURNOVER OF EMPLOYEE IN SAUDI
SMALL- AND MEDIUM-SIZED ENTERPRISE (SMES)**

Albalawi, Abdulmajeed Saad; Naughton, Shahnaz

Victoria University, Melbourne, Australia

ABSTRACT

In today's competitive and increasingly internationalised business environment, the Small and Medium Enterprise (SME) sector contributes prominently to most national economies by creating a wide pool of employment opportunities and by introducing micro-innovation and entrepreneurship skills (Ardic, Mylenko, & Saltane, 2011). However, in this somewhat unstable area, employee turnover is considered to be one of the most pressing challenges facing these small organizations.

This study will focus on Saudi Arabia, where the role of the SMEs in Saudi Arabia is still in its development stage given the economy has been controlled predominantly by the oil sector. In these kinds of enterprises, leaders and managers play a significant role in the decision-making process that involves the adoption of crucial decisions that can significantly contribute to the development of such organizations and within an entrepreneurial orientation that can make such processes more efficient and profitable.

The study aims to investigate to what extent Emotional Intelligence (EI) of managers of SMEs can be shown to affect (indirectly via job satisfaction), employee turnover in Saudi SMEs. The focus of this study is to investigate the impact of employee perception of leader's EI on their job satisfaction. Furthermore, it will be examined how employee view of their managers' EI differs from managers' objective self-rating.

The research methodology applied in this study will be quantitative approach attempting to verify the theory of the role of EI in the workplace and exploring the degree of the relationship between the EI of managers and employee turnover via job satisfaction. The findings of the study will benefit the SME sector by helping managers of SMEs to increase employee's job satisfaction and retention of skilled employee.

ABSTRACT

This mixed methods study focuses on one category of luxury female consumer products and investigates its relationship with Muslim consumer religiosity and other demographic variables to provide greater understanding of the consumer behaviour of this largely unknown consumer segment. Building on the recommendations of two related earlier studies, this paper tests the four key propositions of complexity theory. Symmetrical testing was done using correlation, cross-tabulation and contrarian case analysis to examine the association among the constructs of Religiosity, Demographics and Self-Expression. Then, Asymmetrical fsQCA data analyses were done to test major tenets of the theory of complexity. Findings provide further support that utilising a combination of complexity theory, fsQCA and pattern research in service dominant logic is a proper fit for advancing theory, method and practice in service research. The results show that relationships in the emotions-brand domain are not as straightforward as previously thought.

Keywords: Complexity theory, nuanced theory, self-expression, religiosity, luxury brands, Arab women consumers.

ONLINE MARKETING CHANNELS: A SYSTEMATIC LITERATURE REVIEW OF MARKETING MODELS FOR INTERNET ADVERTISING AND A NEW COMPARATIVE APPROACH

Angeloni, Silvia¹; Rossi, Claudio²

¹Department of Economics, University of Molise, Campobasso, Italy

²Department of Sciences for Economy and Business, University of Firenze, Firenze, Italy

ABSTRACT

Digital marketing offers entrepreneurs a variety of alternatives and opportunities to market globally and improve their revenues. The complexity of digital advertising also creates new challenges and it explains the increased research interest in developing marketing models for supporting managers in making decisions. A systematic overview of recent studies on marketing models allows to appreciate the remarkable progress in knowledge about what is required to improve firm profits. However, since most of those studies consider specific advertising forms in isolation, they offer little guidance for driving budget allocation decisions. For this reason, the present research proposes a new model to adequately account for a variety of digital channels that firms usually rely upon to increase their profits. Despite their different models, the search engine Google and the e-commerce platform Amazon can be seen as competing in the same market when they are targeting the same set of consumers. Shoppers often use search engines and e-commerce platforms in a very similar way. The aim and sequence of actions consumers perform on Google or Amazon are very similar, but for the potential sellers each online channel presents different prices and attributes. Under budget constraints, one of the first problems a company may encounter is determining resource allocation to different channels. Assuming a trade-off between different online marketing channels, the present study compares the two models, suggesting the maximum cost per click that a firm should pay to benefit from Google AdWords as much as from Amazon.

Keywords: Advertising, Amazon, Cost per click, E-commerce, Google AdWords, Intermediaries, Marketing models, Online marketing channels, Search engine marketing, Small and medium-sized enterprises.

HOW GLOBALIZATION INFLUENCES THE DEVELOPING COUNTRIES' HUMAN RESOURCES STRATEGIC POLICY

Asadi, Rahil¹; Marin, Gabriel Octavian²

¹The Bucharest University of Economic Studies, Romania

²RoAssurance Bucharest, Romania

ABSTRACT

The globalization process is, in fact, a part of a historical process of social evolution and, in the opinion of some economist, it is due to the nature and essence of capital growth, the effort to survive and acquire new and profitable markets and the need to export capital from saturated markets to potential markets. While these funds and capital transfer has many positive and negative consequences for the underdeveloped and developing countries. In general, we can say that the economic basis of the globalization phenomenon is the neoliberalism economic. The social and cultural dimension is the main aspect of conflict and opposition at the process of globalization because the migration and brain drainage will increase, which leads to demographic deformation of many countries of the world. There is no consensus, among those who have addressed the issue of globalization from the social dimension and culture, some people have considered it a plausible phenomenon and all have to submit that sooner or later and they should give up and accept it. Development of human resources is one of the key issues of today's economics and management scholars. In this research at first, the definition of human resource development and its related indicators under three components: education, life expectancy and gross domestic product per capita has been studied and then, according to the data on the ranking of countries in terms of globalization index [1] and The UN Human Development Index (HDI) was calculated with the STATGRAF statistical software, the Spearman correlation coefficient was calculated and correlation intensity was calculated between the two variables ($R=76\%$), it is indicating that there is a close relationship between the Globalization Index and Human Resource Development. That is, as much as the countries developing in the direction of globalization, they can be more successful in the development of human resources.

DEVELOPMENT OF EFFECTIVE RELATIONS BETWEEN LEADERSHIP STYLES AND ORGANIZATIONAL CULTURE'S GROWTH

Asadi, Rahil; Stefanescu, Dumitru

Business Administration Doctoral School, The Bucharest University of Economic Studies

ABSTRACT

Leadership performance is intricately uptight with the organizational culture (Bell *et al*, 2014).

It is the leadership processes and leaders' behaviour that can create the culture in any organization, change the culture and attitude of people or simply reinforce the existing norms and actions in the right, future direction of movement. The effective leadership style is one of the main factors for achievement, resuming at the full success of organizational goals.

In the organization with a different culture, the leader is exposed to various kinds of performance and behaviours for leading and managing the employees. Therefore, the main purpose of this study is to discover and investigate the dimensions of organizational culture and its impact on the leadership style to better contribute to the development and growth of their effective relations.

Correlated to this research, 550 leaders and employees of the power plants and headquarters were selected from the operation and Maintenance Company of MAPNA (Q&M).

Data and information have been collected within designed questioners, MLQ leadership style questionnaire and Denison's Organizational Culture Questionnaire, and the responses analysed with SPSS and Smart Plus software.

The findings result demonstrates substantial and significant relationship between the leadership style and the organizational culture in the selected company. According to the result, we can simply conclude that the leaders who use transformational style and those who have changed or have a tendency to change performance and behaviours from transactional style to transformational style put their mark on the organization style and future. Companies also moves to the culture of adaptability, mission, and to the top of the Denison model, based on the external focus. In this state, the organization additionally will settle faster and easier the existing changes within the system and more synergistic with the community, which it 'll make a positive change in the organizational culture and developing the leaders' behaviours and performance of employees in the organization.

ABSTRACT

INTRODUCTION

The prolongation of life expectancy has opened unprecedented opportunities for the growth of aggregate resources, accumulation of human capital, and the use of individual human potential. Moreover, as the measure of human responsibility for personal development throughout life increases (Blair and Schroeder 2000), the importance of education level increases, especially with regard to ensuring the continued social, economic, psychological, and emotional well-being of older adults. The focus on the association between education level and the subjective perception of well-being among older adults is motivated by the fact that this is currently the fastest growing age group in the world. Regarding Russia, the number of people past retirement age is 24% of the population now. An aging society requires fundamental changes in socioeconomic policies, especially those that focus on the needs of senior citizens. However, it is important to consider regional differences. In particular, the Tomsk region has been recognized as one of the country's top producers of university students. In fact, the region exceeds the Russian average by more than one-and-a half. In addition, one in five citizens is in the older age group while the proportion of those aged 60 years and above is steadily increasing.

THE PRESENT STUDY

International studies on the well-being of older adults have been generally based on international/national databases or multi-year statistical samples (international/national). For example, the Gallup Institute conducts annual surveys and analyzes the subjective assessments of well-being among citizens in more than 160 countries. The factors associated with the risk of hospitalization among the elderly have been investigated by using a multifactorial regression model (Hallgren et al. 2016). Moreover, comparative statistical analyses have been conducted to assess the well-being of

older adults in Thailand (Sobieszczyk et al. 2003) and determine the impact of nursing home staff on the quality of care (Kjellström and Sjölander 2014). Finally, it has been shown that the role of education has a direct impact on older adults and their risk of Alzheimer's disease (Letenneur et al. 1999). Subsequently, the study by Huisman et al. (2004) used the statistical model of Poisson to identify the differences in European mortality rates on the basis of the socioeconomic status of certain individuals and their education levels. In addition, Darin-Mattsson et al. (2017) examined education levels in their statistical analysis of older adults' socioeconomic status. The present study continues and develops a similar approach, including a focus on regional specifics.

THE PURPOSE

The purpose was two-fold: 1) to use a specially designed questionnaire that assesses the educational background of the older generation, which can be replicated in other regional studies of different countries, and 2) to conduct a regional case study about the correlation between the education level and subjective aspects of older adults' well-being, which can be used in similar studies for international comparisons and generalizations.

METHOD

The authors interviewed 400 individuals who reached (in accordance with Russian legislation) retirement age, i.e., 55 years for women and 60 years for men. The participants provided informed consent for the study. The survey included 78 questions related to demographics, social and economic conditions, and physical and psychological indicators. Taking into account the limited knowledge about the factors that (directly/indirectly) characterize the quality of life of Russian senior citizens, this study aims to identify the association between education level and various aspects of older adults' well-being in the Tomsk region, Russia. The sample in this study comprised 400 individuals at retirement age (i.e., 55 years for women and 60 for men) and living in five settlements and three districts in the Tomsk region. The survey included 78 questions reflecting the social, economic, psychological, and physiological characteristics of retired individuals. Some of the questions also included up to nine sub-questions.

STATISTICAL ANALYSES

Nominal (categorical) variables (gender, names of settlements, etc.), the following statistical operations were used: the calculation of frequencies (specific weights); the defining mode of the studied characteristics; the use of different statistical analysis methods on the basis of operating

frequencies (contingency tables); and the x-squared criterion for analyzing the links between the nominal characteristics. Regarding the ordinal variables, this study used medians and percentiles as measures of variation, Spearman's rank correlations, the Mann-Whitney U test, and the Kruskal-Wallis test. Finally, for the interval scale variables, this study used arithmetic average, variance, Pearson's linear correlation coefficient, the t-student test, the f-test parametric analysis of variance, and cluster and factor analyses.

CONCLUSION

This study examined the impact of education level on the well-being of older adults in the Tomsk region (Siberia, Russia). In addition, a comparative analysis of the distribution of older adults in the Tomsk region was conducted by comparing the findings of this regional study with those of the "Comprehensive Survey of Living Conditions" for the Tomsk region, which was conducted under the Federal Complex Statistical Observation Program in October 2014. The results of the regression analysis showed that education level is significantly correlated with subjective aspects of older adults' well-being such as the ability to use a computer, the sense of optimism, involvement in social activities, and financial capacity. It is important to use the generated database to statistically analyze the specific characteristics of working pensioners, to determine the level of trust between the elderly and the government, and to conduct a variance analysis that compares the statistical data regarding the well-being of older adults based on different databases (e.g., federal and regional).

WINE, ART AND INNOVATION: A MATTER OF PROCESS AND PRODUCT?**Begalli, D.¹; Lazzaro, E.²; Sidali, K. L.¹**¹Dept. of Business Economics, University of Verona, Verona, Italy²University of Arts, Utrecht**ABSTRACT**

The globalization of the markets and the standardization of products reduce the visibility of small entrepreneurs also in the wine sector. While this situation has endangered the existence of many, it is also true that many producers of high quality wines have been able to react in an innovative way, for example by using or integrating the promotion of their products through artistic craftsmanship. What are the characteristics of this agro-artistic marketing? Is it applicable only to a product or can it be extended to other agri-food sectors? What are the artistic innovations of process and of product that best visualize the cultural bond of the product with the territory? Through which channels can artistic craftsmanship co-create value with the consumer? The present study therefore wants to answer these questions by using an exploratory approach that involves a qualitative experimental design. Specifically, we interviewed 12 wine entrepreneurs located in the Italian region of Veneto who use their company as an experiential stage and that have developed partnerships with art and artistic craft intermediaries. The expected results are the following 1) creation of a taxonomy of entrepreneurial figures specialized in the promotion of wine through artefacts and / or artistic practices 2) presentation of a conceptual grid functional to the mapping of these case studies in order to start a discussion in view also of possible policies for the protection of quality craftsmanship applied to culinary (see current proposal of the European Commission for extending the PDO to local traditional handicraft products) also through the promotion of artistic certifications strongly linked to the terroir.

THE ROLE OF SUSTAINABLE HRM IN THE CONTEXT OF EMERGING TECHNOLOGIES: THE CASE OF INDUSTRIAL ROBOTS

Bučionienė, Ilona¹; Goštautaitė, Bernadeta¹; Moniz, Antonio^{1,2}; Stankevičiūtė, Živilė¹; Liubertė, Irina¹; Patricia Reay³

³Alberta School of Business, University of Alberta, Alberta, Canada

ABSTRACT

RELEVANCE AND THE AIM OF STUDY

Robotics as one of the emerging technologies has led to successful innovations as well as economic growth within modern societies. The adoption of robots is increasing worldwide with 23% to 37% of firms (depending on industry) planning robot implementation for 2018–2022 period (WEF, 2018). New technologies disrupt work processes, change job design and impose new forms of work organization (Moniz and Krings, 2016), which in turn may generate some negative effects on employees (Hollan and Bardoel, 2016; Murashov *et. al.*, 2016). Thus, emerging technologies raise new challenges for human resources management (HRM) in organizations. However, both theoretical and empirical research on these transformations in organizations is scant (Fleming, 2018). In this research, we seek to explore how robotics changes work processes and operating systems, and what is the role of HRM in the implementation of new technology.

METHODS

The study is based on a large scale qualitative data from two respondent groups (robot users and experts). First, we interviewed robot operators, other production line employees, their supervisors, top managers, and main shareholders (56 interviews in total) at a large furniture company operating in Lithuania which recently adopted industrial robots and successfully competes in the global market. Second, we interviewed robotics experts and robot developers representing academia and a leading manufacturing company of industrial robots in Germany.

FINDINGS

Our findings portray a paradoxical situation: although the main objective of robotization is to eliminate humans from manufacturing processes in order to increase efficiency, yet, the role of employees becomes even more critical after robots are installed. Highly skilled and committed employees

guarantee an effective exploitation of robots to obtain their maximum value, leading to financial outcomes as well as to sustainability of a company.

Industrial robots' adoption leads to higher work intensity (what increases strain and stress at work), night shifts, as well as other risk factors affecting employee health (noise, dustiness, etc.) and safety at work. Thus, maintaining employee health, safety, and commitment becomes the main objective of HRM in organizations implementing industrial robots. Companies need to reconsider people management practices in order to sustain their human resources. The neutralization of negative work-related outcomes and balancing of social and economic issues of a company are main objectives of Sustainable HRM (Ehnert and Harry, 2012; Ehnert et al. 2014). Our study discloses HRM practices related to sustainable management of workforce and showcases that sustainable HRM and corporate sustainability are vitally interconnected.

CONTRIBUTIONS

Our study contributes to HRM research in several ways. First, we explore the changes in organizations related to implementation of industrial robots and the role of HRM in assuring companies' sustainability. Hereby, we further enrich the existing HRM literature with the context of emerging technologies. Second, we reveal Sustainable HRM practices in the context of robotization and, in this way, add empirical evidence to Sustainable HRM theory, which is still under development.

ACKNOWLEDGMENT

This research is funded by the European Social Fund according to the activity 'Improvement of researchers' qualification by implementing world-class R&D projects' of Measure No. 09.3.3-LMT-K-712 project 'Sustainable human resource management in the context of emerging technologies'.

IMPACT OF THE INTERNAL AND EXTERNAL CONTEXT ON THE INTERNATIONALIZATION TRAJECTORIES OF MULTINATIONALS

Cherbib, J.¹; Chebbi, H.²; Yahiaoui, D.³

ABSTRACT

In a context of globalization and uncertainty, many companies affected by these challenges are choosing the international development. This choice is often justified either by the potential growth of the targeted international market or by the local competition and low benefit of domestic market. It's the case of several American multinationals such as Apple, Avon, Boeing, IBM, Intel, Johnson & Johnson, and Mondelēz, more than fifty percent of their benefits from foreign market and demonstrate strong potential development (Casteora, Gilly, Graham & Money, 2016).

When considering the international business (IB) field and particularly the studies dealing with the internationalization of multinational companies and SMEs, the Uppsala model is dominating (Johanson & Vahlne, 1977, 1990, 2003). The U model describes the internationalization process of SMEs as "*a gradual acquisition, integration and use of knowledge about international markets and operations... and a growing and successive engagement with foreign markets*" (Gankema, Snuiff, & Zwart, 2000, p. 16). The U model assumes that the internationalization process is strongly linked to the level of knowledge held and related to the target market. The level of corporate engagement changes gradually and proportionally to the quality of knowledge about the foreign market.

Uppsala remains, however, the most cited and criticized model for its determinism, linearity and non-reversibility. The literature on international small businesses (Born Globals and International NewVentures, INV) questions the relevance of the gradual and staged approach and believes that companies are able to fit into a faster internationalization model, avoiding all the steps proposed by the Uppsala model, thanks to the integration of the intensive knowledge dimension (Oviatt & McDougall, 1994, 2005). Another criticism of the model is linked to the lack of explanation regarding the initiating circumstances and the evolution circumstances of the internationalization process, especially that the speed of internationalization can be neither linear nor constant (Coviello & McAuley, 1999; Forsgren, 2002; Turnbull, 1987).

To be able to deepen the understanding of international business movements and explain their success and diversity, several dimensions can be integrated, including the strategic dimension, the networks size and the profile of internal resources, the quality of inter-firm collaboration (information exchange-commitment and trust) and the quality of the external environment (economic-political and social

stability). The nature of commitment, trust, reciprocity of foreign partners and the ability to adapt to new situation are considered as the main drivers of success in the internationalization process (Kalinic and Forza, 2012).

Despite the abundance of literature on the internationalization process of companies, there are still some discrepancies, with limited understanding, between what can be observed and what the literature indicates. This research aims to explore the internationalization process of multinationals in a new context: Tunisia. Few empirical studies has been conducted on this subject. In fact, to our knowledge, the understanding of the internationalization process in the context of North African countries, is still very limited, in particular regarding the factors that can influence the trajectory of the internationalization process. Sarasvathy (2001) points out that, particularly in the early stages of the internationalization process, policy makers focus more on the costs involved, act in an opportunistic way, and follow their intuitions rather than rational calculations. This type of behavior can affect the quality of collaboration with local partners and hinder the evolution of the internationalization process. Sarasvathy (2001) notes the lack of research discussing and analyzing the emergence of new internationalization models that can provide a better insight into the international behavior of companies in such a context (Sarasvathy et al. 2014). In a similar vein, Dominiguez and Mayrofer (2017) emphasize the usefulness of perceiving the internal and external factors that change internationalization patterns over time, leading to new trajectories.

To bridge this gap and understand/explain the diversity of internationalization trajectories, we choose to explore the influence of internal and external environment on the internationalization process of Western multinationals operating in Tunisia under a collaboration process with local partners. This paper will focus mainly on two dimensions: the quality of inter-firm collaboration (information exchange-commitment and trust) and the quality of the external environment (economic, political and social stability). The aim is to answer the following research question : *how the internal and external environment impact the multinational's initial internationalization process, leading to new trajectories?*

To meet this research objective and the recommendations of Kalinic and Forza (2012), we conducted a longitudinal study (2006-2016) within 6 cases of companies from different nationalities (German, Swedish, French, American and Dutch) operating in different sectors of activity (pharmaceutical, agri-food, maintenance, hygiene and chemical). The case-based methodology is particularly useful in research contexts where previous theory appears inadequate or incomplete and where further theoretical development is needed (Eisenhardt, 1989a; Yin, 1984). A longitudinal study makes it possible to highlight the evolution of the internationalization process over time, to identify the factors that may affect it and to distinguish the differences between trajectories and their diversity. Data

collection is mainly based on 60 semi-directive interviews conducted with a range of interviewees within local and Western companies in order to reduce the bias of unilateral appreciations, and to generate more reliable conclusions (Linwei & al, 2017). These interviews include Chief Executive Officer, General Manager, Manager belonging to different departments and Head of the region responsible of company local partnership. For data analysis, we used the qualitative data processing software Nvivo12. The analysis of the results showed the existence of four trajectories resulting from the crossover between the quality of inter-firm collaboration and the quality of the external environment. The first contribution of our research is related to the exploration of a new geographical area rarely studied by previous research, especially on the internationalization process of multinationals through a longitudinal study. The second added value of our research is linked to the identification of new internationalization form used by multinationals operating in high level of environment uncertainty and characterized by a high quality of inter firm collaboration. This new form of internationalization is not included within the Uppsala steps model.

APPLYING A SELF-DETERMINATION THEORY PERSPECTIVE TO UNDERSTAND THE IMPACT OF STUDENT LEIFEWORLD ON STUDENT ATTENDANCE

Claxton, Julia¹; Sharifi, Sudi²

¹Leeds Business School, Leeds Beckett University, Leeds, UK

²Salford Business School, University of Salford, Salford, Greater Manchester, UK

ABSTRACT

PAPER'S IMPORTANCE

Student attendance is reported as an important factor in student academic performance (Levshankova et al 2018, Thatcher et al 2007, Paisey & Paisey 2004) and this makes intuitive sense as class attendance enables tutors to engage directly with students, get to know them individually, monitor their progress and support their learning needs. It enables students the opportunity to understand their topic, check the requirements for their assessment and to learn from other students in class. However, increased pressure to miss classes has increased with the increased pressure on the 'lifeworld' (Edmund Husserl, 1970) of students today. In particular, time pressures that come from the financial need to take up employment (Dennis et al 2018, Paisey & Paisey 2004) and the energy pressures that paid employment produces. It is not only students who miss class who suffer but those who, sometimes at great sacrifice, do attend. Part of the preliminary research for this paper, carried out by the author, has shown that lack of attendance from some students impacts negatively on those students who *do* attend. The latter report they become anxious if low attenders are in their assessment group and do not attend group meetings resulting in the attenders doing extra work or accepting a lower grade for the groupwork. Non-attendance is seen by the attenders as negatively impacting their circa £60k investment and the 3 or 4 years of their life taken doing their degree and they feel the university should take responsibility for this. Attenders also complain that they are plagued with messages from non-attenders asking them what they have missed (despite it being available on learning platforms) and what they need to do etc. They also complain non-attenders take up most of the tutor support times, using the tutor times to catch up on their missed learning etc, leaving the good attenders with less time with the tutor.

THEORETICAL BASE

Self-determination Theory (SDT), an empirically based motivational theory, (Deci and Ryan 1985, Ryan and Deci 2017) was first developed by Professor Edward Deci and Richard Ryan, with some

other associates along the way. In a Henry Stewart Talks video in 2010 he describes his original work as from 30 years ago (Deci 2010) which means in 2019, with continuous research being produced, the theory is nearly 40 years strong. The theory explains the relationship of the human needs of autonomy, competence and relatedness to self-determined motivation and self-regulated behaviour and wellbeing (Deci and Ryan 2008, Hu & Zhang 2017). The important of SDT is the concept of 'regulation' and the ascribing of different types of regulation in a continuum (external regulation, introjected regulation, identified regulation, integrated regulation and intrinsic regulation) (Vansteenkiste et al 2017) to a person's approach to learning. These are useful in distinguishing types of student motivation to attend class.

Intrinsic regulation is the tutor's dream where students are motivated purely by their intense interest of their topic so the tutor's enthusiasm and skill may be enough for the student to be motivated to learn. The next level is *Integrated regulation* when students believe the learning in class has value in terms of their sense of personal meaning. *Identified regulation* is when students can appreciate there is a reason they need to learn something but there is no real interest and no sense of it linking to personal meaning. An example of this might be learning how to Harvard reference their work. Tutors' would need to motivate the students by emphasising the importance of learning the skill to gain higher marks. *External regulation* and *introjected regulation* are controlled motivation where the student is attending class because it is compulsory or they would feel guilty not doing so. There is also the concept 'perceived instrumentality' which is defined as 'the connection between successfully completing a present task and reaching a long term future goal' (Husman and Hilpert, 2007, p230 cited in Vansteenkiste et al 2018)

A variety of variables affecting class attendance have been researched eg classroom management (Al-Shammari 2016), types of student (Dulcinar 2005), which subject is being studied (eg pragmatic business topic encouraging pragmatic approach to learning or richer discipline encouraging discovery), availability of transport (Kottasz 2005) and closeness of living accommodation and difficulties with employment (Kottasz 2005) is another factor. Khong et al (2016), key researchers on which this work builds, have looked at reasons why students attend lectures and report: availability of class materials online tempting students to miss class (citing Lundgren and Nantz 2003), whether the module is a chosen one or a compulsory one (citing Devadoss & Foltz 1996), the size of the class (citing Friedman et al 2001), the student perceived quality of the lecture (citing Massingham & Herrington 2006), the students' past academic performance (citing Friedman et al 2001, kottasz 2005, Massingham & Herrington 2006 and Romer 1993) all of which comprise or impact the 'lifeworld' of the student as they experience the learning and teaching they are offered at their university.

For the purpose of the paper the variables are explored as groupings:

- Government led HE changes
- student demographics
- pedagogical approach
- classroom management
- employment obligations
- financial obligations
- responsibility for dependants
- university IT systems
- individual difference (personality, previous academic performance etc)
- student type (approach to learning Greasley and Ashworth, 2007)
- university timetabling
- type of subject being studied (relating to 'deep' and 'surface' learning: Marton and Saljo, 1976)

RESEARCH PURPOSE

The research purpose is to find out to what extent a SDT perspective can support student attendance. In order to do this, it scopes all the factors that have been found to affect student attendance alongside an analysis of the complexity of today's 'student lifeworld' and how this impacts attendance. Following this it considers how SDT provides understanding of ways tutors can improve teaching and learning strategies and students can increase their motivation to attend classes. In turn and alongside, enabling students to reach their potential, make the most of their investment in their degree and protect and support their wellbeing. It will provide a theoretical model for tutors and students (based on the understanding of the 'lifeworld' and application of SDT) and practical co-created and co-developed (by tutors with students) exercises for students.

RESEARCH QUESTION

How can the application of the Self-Determination Theory perspective support an understanding of and address the impact of the university student Lifeworld on student attendance?

IMPLICATIONS

Implications are that:

- a) Students can understand their own 'lifeworld' and how this impacts their attendance, learning and wellbeing

- b) tutors can better understand the 'lifeworld' of their students and be encouraged to show empathy and legitimacy, rather than disaffection, of student lifestyle choices and even incorporate employment skill development into their teaching and learning strategy.
- c) SDT can provide an underpinning support framework to improving student attendance, learning and wellbeing
- d) universities need to consider their moral obligations to be procedurally fair to standard students, who take up employment due to poverty, as to apprenticeship students who are financially secure with employer sponsorship. On the one hand student's employment is seen as a nuisance and on the other hand the employment is revered.

CHALLENGES TO KNOWLEDGE TRANSFER WITHIN A BUSINESS INCUBATOR: THE ROLE OF NETWORKS

Corbo, Leonardo

Católica Porto Business School & CEGE, Porto, Portugal

ABSTRACT

Start-ups have been widely recognized as an important contributor to the growth and development of national economies. For instance, in the UK alone it has been reported that start-ups account for more than three million jobs (12% of the country's employment) and contribute 196 billion £ to the country's economic output as measured by gross value added (GVA) (Cebr, 2016). Despite such positive contribution, however, it is well-known in the literature that start-ups face unique challenges which can be summarized by the concepts of liability of newness and smallness (Aldrich and Auster, 1986; Stinchcombe, 1965). More specifically, mentoring, marketing expertise, contact with investors and legal advice are among the issues that start-ups typically face in the early stages of their life cycle. Access to valuable resources is often difficult since co-founders typically lack a vast and heterogeneous pool of people on whom they can rely to overcome such obstacles.

One solution to address some of these obstacles is the establishment of a supportive environment which in the start-up context has often coincided with the creation of business incubators (BI) (Bollingtoft, 2012). Given their role, business incubators have been attracting significant attention in the last decades from both academics and practitioners alike although a single definition of what BIs are is still lacking (Hausberg and Korreck, 2018). According to a recent study, between 2007 and 2013 the number of European accelerators and incubators has increased by nearly 400% (Telefonica, 2013). Their widespread diffusion can be ascribed to four main reasons (Smilor and Gill, 1986). First, incubators are often tied to a university or a corporate therefore benefiting from brand reputation which ultimately leads to a higher credibility of those who reside in them. Second, they allow start-ups to get access to useful knowledge and information which can be useful to shorten start-ups' learning curve. Third, incubators often rely on a wide array of mentors as well as tenants with heterogeneous levels of experience which can help entrepreneurs get quicker access to solutions of the problems they face. Finally, physical proximity within the BI is generally associated with networking which is a crucial activity for any entrepreneur (Rubin *et al.*, 2015). Yet, despite the acknowledgement that BIs play a relevant role for the establishment of ties between entrepreneurs which in turn facilitate knowledge transfer, there is surprisingly limited empirical evidence on how and why networks develop within business incubators (Bollingtoft, 2012), and how in turn they affect knowledge transfer.

Therefore, the main goal of this study is to identify the drivers of and the obstacles to knowledge tie formation within a business incubator located in Portugal. The premise is that while individuals belong to different entrepreneurial initiatives that identify tasks, objectives, reporting lines and expected patterns of collaboration, much of what allows them to leverage knowledge to run their projects and to generate innovation hinges upon the existence of networks that are facilitated by spatial proximity. Previous research has found that boundary-spanning relationships allow individuals to mobilize knowledge and information more effectively, and to identify possible synergies in the type and nature of knowledge necessary to accomplish the objectives of development and growth of different initiatives (e.g. Tortoriello *et al.*, 2012). Following these intuitions, we collected data on knowledge networks by conducting 25 face-to-face interviews with co-founders of start-ups located in the same BI. The interview protocol was designed to gather information about the motivations behind entrepreneurs' decision to interact with other tenants, the content of such interactions as well as any obstacles that they faced while sharing knowledge and information within the BI. This type of interview format gave interviewees more control over the discussion and allowed for more description by the participants (Lindlof and Taylor, 2002). Data were analyzed through an inductive approach (Gioia *et al.*, 2013) following an open coding procedure. An iterative process between theory and evidence led to the identification of specific drivers and obstacles to knowledge tie formation.

The preliminary findings of the study offer some interesting insights on the relationship between networking and knowledge transfer within a BI. In contrast with previous studies highlighting physical co-location as a facilitator of knowledge spill-overs (Monge *et al.*, 1985), our data showed that the concentration of start-ups within a geographically constrained space was not a sufficient condition for knowledge sharing ties to be created. Our interviews revealed that several obstacles, both tangible and intangible, were often preventing the possibility to successfully exchange knowledge. A major barrier was represented by the configuration of the building itself. Contrary to the traditional layout of incubators characterized by open spaces and lack of physical barriers, the BI we studied resembled the architectural design of a large corporate building. The majority of start-ups had their own office space with restricted access doors through which entry was possible via a code available only to the start-up's employees. As most of our interviewees revealed, this was a major barrier to communication. Other barriers included the lack of awareness of the activities conducted by other tenants, the size of the incubator, and the lack of time by entrepreneurs to dedicate to networking and knowledge-sharing. Interestingly, culture was also mentioned as a barrier to communication which contrasts with the expectation that entrepreneurs are generally more inclined than other individuals to share ideas openly. Social networks have often been identified as a solution to compensate for communication obstacles (e.g. Reagans and McEvily, 2003). In our setting, both formal and informal networks

influenced the communication processes within the BI. Formal networks were usually made of dyadic interactions between tenants and were initiated by the BI's management who acted as a connector. However, our data provide evidence that the BI's tenants often initiated ties on an informal basis through a referral from a common acquaintance, a casual meeting in one of the BI's events or while waiting in the queue at the BI's cafeteria. These informal networks often resulted in the formation of small cliques within the BI. More importantly, both formally-initiated and informal networks were instrumental to overcoming knowledge transfer barriers resulting in knowledge transfer of three types: 1) product-related knowledge, 2) business development knowledge (e.g. access to relevant contacts) and 3) administrative knowledge (e.g. information related to legal issues).

Based on the findings above, this study contributes to the growing research on business incubators by exploring how processes of interaction between co-founders shape the ability of these actors to exchange knowledge despite existing impediments within the incubator. The ability to successfully transfer knowledge between individuals has been indicated as a critical issue for several organizational outcomes including an organization's ability to be innovative (Tortoriello and Krackhardt, 2010). In reality, however, the successful exchange of knowledge has proven to be a difficult task. Our study indicates that social networks can be a good solution to overcome the obstacles that incubated firms face when exchanging knowledge. By so doing, this study also contributes to the business incubators literature by adopting a tenant perspective to assess the value of being in an incubator, therefore addressing a recent call to study business incubators not solely from the perspective of incubator managers (Bollingtoft, 2012).

FOOD EVENTS AND CULTURAL HERITAGE: COOPETITION STRATEGIES TO INNOVATE SLOW FOOD'S TERRA MADRE SALONE DEL GUSTO

ABSTRACT

UNESCO defines heritage "our legacy from the past, what we live on today, and what we pass on to future generations. Our cultural and natural heritage are both irreplaceable sources of life and inspiration". According to Barney *et al.* (2001), heritage is valuable, rare, inimitable, non-substitutable resource that calls for a preservation and to be used as a driver for sustainable economic growth, employment and social cohesion (Council of Europe, 2015; UNWTO, 2015; OECD, 2009; Elkington, 2013; 1997).

Heritage conservation requires a steady flow of financial resources, not always available and often not allocated on this topic. Therefore, a more systemic view of the heritage is necessary, both talking about resources key to maintain it, and about its conception as a resource *per se*. Stressing this second aspect means turning the heritage into a lever that generates the financial resources for its maintenance and, by extension, to create value for its territory. Thus, the potential paradox of the lack of resources to exploit a source of enormous potential is resolved autonomously: heritage is a form of investment with a very high and often unsuccessful return on investment. In this sense, the most obvious and immediately perceived use of the heritage – that generates an economic impact and therefore produces resources – is tourism (Wuepper and Patry, 2017; Richards, 2011; Urry, 2011, 2002, 1990; Briedenhann and Wickens, 2004; Timothy and Boyd, 2003; Pine and Gilmore, 1999).

Tourism events are, in this sense, a particular tourist declination representing, for a destination, a triple opportunity, as animators of the attraction on the territory; key moments in the local programming (Getz and Page, 2016); incremental opportunities to money spending at the local level, thanks to the flows of intercepted visitors (Chhabra *et al.*, 2003; Dwyer and Forsyth, 2009). Events are representative of tourists' desire to directly experience and consume cultural performances, foods, participatory activities: an opportunity to feel authenticity (MacCannell and Lippard, 1999; Cohen and Cohen, 2012). They are, therefore, a relevant source to generate resources for the sustainability of the local heritage. Events related to food are a relevant trend in this regard: the need for a neo-localism has contributed to the success of international food events such as Terra Madre Salone del Gusto, the biennial initiative of the International Association Slow Food.

This paper is based on a comparison of the economic impact of three editions of Terra Madre Salone del Gusto (2014, 2016, 2018). There is a clear alignment between heritage and food as cultural elements in the perception of and in the need for tourists participating to the event. Food is, in fact, a cultural element as well as the most important tourist driver, generating a flow of visitors to the city of Turin (Italy) – which hosts the event – up to about 1 million people in five days of the event during the 2016 edition, which took place in the whole city (not in the fairgrounds). Conversely, the previous (2014) and the following (2018) editions, both indoor, lead to a result of around 200,000. The average expenditure and the budget allocation of the tourists are almost comparable, but the formula definitely affects the number of visitors reached. This translates into a much larger impact – for hotels, restaurants, shops and local cultural attractions – if and when it takes place outside the exhibition grounds. The total economic impact fluctuates, for example, from 9 (for indoor edition) to 38 million euros (for outdoor edition), with an added value that goes from 3.5 to 11 million euros.

This specific tourism event, stable and mature, with an unchanged and typically local visitors' profile and an inability to attract people from abroad during the editions, could therefore focus on a variation of the formula, returning to the outdoor one. This can generate a remarkable result on the territory, helping to maintain its heritage, not only in its eno gastronomic form. In this sense, it is fundamental that all the actors of the local tourism system cooperate for the creation, promotion and cross-fertilization of a new event formula: a local coopetition that maintains the competitiveness of the event, the destination and stimulates the generation of resources for its heritage thanks to the growth of fundamental knowledge to its development (Fong *et al.*, 2018; Anderson and Hardwick 2017; Haugland *et al.*, 2011).

Broadly, this formula variation, as an innovation in the fruition of heritage, is easily extendable to other forms of heritage and this makes the emerging strategies extendable and replicable – contributing both to the academic and the managerial point of view – to other sectors. Stimulating the participation of the whole local touristic system, making clear the return of investment through the assessment of economic impact is a good strategy to leverage the participation of public and private organizations. This can lead to an innovation in the tourism offer and, consequently, to a more competitive destination territory, based on the valorization of its heritage (Liu *et al.*, 2017; Briassoulis, 2017; Novani *et al.*, 2015; van der Zee and Vanneste, 2015; McCabe *et al.*, 2012).

RECONFIGURING STAKEHOLDER RELATIONSHIPS AND SOCIAL INNOVATION: THE RISE OF COLLABORATIVE ENGAGEMENT BETWEEN HEINEKEN AND LOCAL ENTREPRENEURS IN DEVELOPING COUNTRIES

Cortese, Damiano¹; Chiara, Civera¹; Murdock, Alex²

¹University of Turin, Italy

ABSTRACT

One of the main arguments raised to increasing the applications of stakeholder theory (Freeman, 1984; Freeman, 2010; Freeman et al., 2007) and shedding light on its broader meaning (Crane and Ruebottom, 2011; McVea and Freeman, 2005) is that a stakeholder thinking that transcends from the mere economic role of the actors relating to the company through a firm-centrism model should be developed. That is because an economic-firm centric view of stakeholder groups might overlook key factors, mechanisms, identities and needs that can enable higher stakeholder participation, proactive actions, and higher value creation (Hond and de Bakker, 2007; Rowley and Moldoveanu, 2003). This is particularly true when large multinational companies establish relationships with stakeholders in contexts that can favour the spread of unfair practices, such as powerless communities in developing countries where the MNC outsources some of its production, partners with local entrepreneurs for products or services development or extracts key resources for its business. In this specific case, it is most likely that the relationships between the company and the vulnerable stakeholder are seen as unbalanced and merely based on resource dependency by as well underestimating the potential of collaborations for greater value creation. In such a context, it is typical for large multinationals to implement Corporate Social Responsibility (CSR) and Social Innovation (SI) projects with the intent of improving the wellbeing of local communities and contribute to the business enhancement as well, in a philanthropic logic key to develop certain competitive advantages (Van Cranenburgh and Arenas, 2014; Porter and Kramer, 2011).

To provide an opposite view to such residual way of creating value in key developing contexts for the business, we propose a reconfiguration of stakeholder relationships as a result of more integrated view of CSR and SI practices by an MNC toward vulnerable stakeholders in developing countries. For clarity, we consider vulnerable stakeholders being in a given situation of inequality linked to their geographical context (Mongelli and Rullani, 2017), who suffer from: low income (Ahen, 2017); inequality in business power (Dawkins, 2014; 2015); vulnerability and unfairness in relationships with other stakeholders, even local (Candelo et al., 2018; Dawkins, 2015); lower power in decision making (Dawkins, 2015); incapacity to replicate business rules and models on the local

territory and exert influence (Greenwood & Van Buren III, 2010); marginalized and vulnerable conditions (Derry, 2012); poorer structural condition (Mena et al., 2010); lower access to basic needs (Mena et al., 2010) and sometimes denied human rights (Mena et al., 2010); inability to autonomously develop whatever they think is valuable (Sen, 1992); impossibility to transform ideas into successful business practices (Greenwood & Van Buren III, 2010).

Social innovation refers to practices conducted within the broader CSR strategy or belongs to the Social Entrepreneurship model (Dees & Anderson, 2006) to reach: financial performances; social performances; environmental performances. Some scholars talk about Corporate Social Innovation (Mirvis et al., 2016; Mirvis et al., 2012) to outline activities that involve deeper collaboration (and not just partnerships) “across functions within a firm and with external parties to co-create something new that provides a sustainable solution to social ills” (Mirvis et al., 2016; p. 5014). In this view, Corporate Social Innovation differs from Corporate Social Responsibility initiatives that are residual and mainly centred on philanthropy and are, still, dichotomous *à la Porter* (Freeman et al., 2018; Civera et al., 2018). If managers of organizations are to deliver more value from CSR, they need to understand how they can better incorporate social innovations into their CSR agendas, by managing the duality of applying a business approach to create a social outcome (Phillips et al., 2015). To this end, we argue that Integrated CSR (Freeman et al., 2010) is the framework for allowing a more effective social innovation and reconfigure fairer and more balanced stakeholder relationships. In particular, we put the focus on the creation of entrepreneurial activities in developing countries, favoured by MNCs within their CSR and social innovation projects, since as Zahra and Wright (2016) argue, entrepreneurship can create positive impact when “connecting entrepreneurial activities to other societal efforts aimed at improving the quality of life, achieving progress, and enriching human existence” (p. 610).

We keep up with the argument that stakeholder identification and stakeholder relationships should be configured in a way that goes beyond their economic role and their dependency on the company to include the moral personhood of stakeholders (McVea and Freeman 2005; Werhane 2008) as well as their multiple roles, identities, interests, and interdependencies in relation to a variety of environments rather than just the company economic-based (Freeman et al., 2010; Civera et al., 2018). We, therefore, argue that models and frameworks aimed at categorizing stakeholders based on the urgency, power, and legitimacy of their claims with respect to the economic relationship with the company (Mitchell et al., 1997) might eventually risk to underestimate the broader role that stakeholders can play as identities in the society and might lead to the failure of social innovation projects, CSR actions, and even lower performances in trade (McVea and Freeman 2005). As Derry et al. (2012) underline, prioritizing stakeholders’ claims and interests based on an economic assumption

of dependency on the company, might as well detract the company and all other actors to consider the voices of stakeholders that are not deemed to be legitimate or powerful and, therefore, deny the possibility of valuable collaborations leading to effective societal changes and improvements.

Our study stems from such egalitarian and identity-based stakeholder approach and amalgamates it with the literature of Integrated CSR and Social Innovation, in the attempt to predict which practices by an MNC can enable stakeholder relationships reconfiguration in the interest of higher value creation. Our discourse begins, still, with the perspective of the multinational company, but not in a centric-view; instead, we focus on an integrated approach of multi-stakeholder interdependency based on joint-ness of interest, strategic collaborations, empowerment, collaborative engagement, and value co-creation (Desai, 2018; Freeman et al., 2010; Montiel, Husted, & Christmann, 2012; Sampson, 2005; Shams, 2016; Strand and Freeman, 2015).

The idea is that there are some key company approaches toward stakeholders that, more effectively than others, contribute to shape the way CSR and social innovation projects are set up in developing countries and prevent the paternalistic and centric company-vulnerable stakeholders' relationship to create a new autonomous identity to local stakeholders. We argue that the new autonomy of stakeholders expressed in new local enterprises creation, as a result of integrated CSR and social innovation, is key to enhance the effectiveness of value co-creation outcomes in local communities.

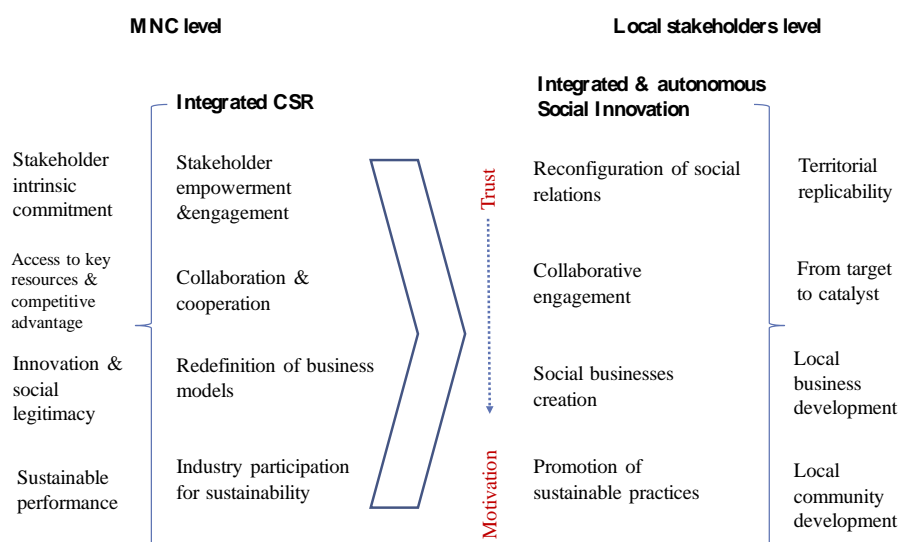

Our aim is to advance theory on how social innovation and CSR initiatives by a large multinational company can allow a reconfiguration of stakeholder relationships through a shift of responsibility and increased autonomy of new enterprises in developing contexts, which are created out of the large MNC's strategic plans, but are grown by local stakeholders under a new perspective: to become themselves the catalysts of social innovations with a stronger motivation to contribute to local development and autonomy of their communities.

We developed an illustrative case study (Eisenhardt and Graebner, 2007; Yin 2013) around Heineken, the second largest group of beer producers with more than 78 ongoing CSR and social innovation projects globally, conducted under the label of "Brewing a Better World" (Reinhardt et al., 2016). Out of the 78 projects, we carefully selected 14 cases within the "Growing with Communities" project that are relevant to our topic: stakeholder relationships' reconfiguration through new business creation in developing countries. We conducted semi-structured interviews with the Director of Communication and Institutional Affairs, Corporate Affairs manager, Digital PR manager, Media relations manager, Sustainability manager, Senior Corporate Affairs specialist, three local entrepreneurs in Africa and Indonesia. Furthermore, we observed reports and data available on the institutional website and the HEINEKEN Africa Foundation's set of available documents around the 14 projects of social innovation.

Data triangulation among primary and secondary sources and the literature review allowed the identification of key company's integrated approaches that have successfully favoured a widespread autonomous local stakeholder identity and guaranteed that vulnerable stakeholders had access to entrepreneurial projects designed around their capabilities. This allowed the increase in their self-initiatives, productivity, profits, facilitated integration (and re-integration), established a societal role (Mongelli and Rullani, 2017) and, ultimately, increased motivation to achieve greater goals and be the drivers of social improvement.

Table 1 summarizes our findings and outlines the key mechanisms within integrated CSR to foster an integrated and autonomous social innovation locally and therefore enable reconfigured stakeholder relationships that are not based on an economic firm-centric logic anymore. Instead, relationships stem from a new stakeholder identity that is itself catalyst of social innovation to deal with grand local societal challenges autonomously.

Table 1: Conceptual contribution

Through our study, we provided a new perspective of stakeholder relationships and social innovation, by changing the dominant business-owned projects argument into a logic of vulnerable stakeholders changing from being the target of the projects to being catalysts and owners of further social innovations; This concept has only been applied to employees so far (Mirvis and Googins, 2018).

THE POWER OF PEOPLE: WHEN PEOPLE AND CULTURE ARE THE KEY TO ORGANISATIONS SUCCESS

da Costa, Liliana Rodrigues; Loureiro, Sandra Maria Correia

Instituto Universitário de Lisboa (ISCTE-IUL and BRU/UNIDE), Lisbon, Portugal

ABSTRACT

INTRODUCTION

This study intends to analyse the impact of people and culture's management through engagement and employee experience towards the organisation's success. In fact, after some research the data demonstrate that organisations understand the importance of retain and create happiness at work. The same organisations are starting to create a journey for their workforce: since the first day people have contact with the brand until the last day when they decide to leave or they go on the retirement and they take with them all the memories and experience, heritage with them. Organisations want and understand the need of having employees engaged, attract new talent, and retain team members, especially high performers and key people. This study reveals that when employees are more committed to be happier at work, they tend to take part of the ownership of their organisations. Today organisations are more focused on people and the value that they can add to every single product and/or service they design, create and deliver. Organisations want to feed a better and healthier culture founded on an inside-out mission and real values. All this investment on internal management is taking the consumer experience to a higher level. Happy and committed employees will create happier and more loyal clients.

THEORETICAL DEVELOPMENT

The main goal is to verify how the people and culture management is attaining more importance on both sides: employee and employer. Employee experience and engagement is gaining more space and impact on the organisations' strategies. From the transactional economy, organisations are walking to an emotional, experience economy. In the customer-centric dynamics, organisations are putting employees first because these, once deep involved with the mission and goals of the organisation, will be more devoted to customers. People "who love going to work are more productive and more creative. They go home happier and have happier families. They treat their colleagues and customers better. Inspired employees make stronger economies." (Sinek, 2009, p.14). Every single company "can (should) focus on its value creators – the frontline employees. (...) in his or her knowledge, creativity

commitment to tasks, and capacity to collaborate. In fact, (...) “the true value is created in the interface between the customer and the employee. (...) When a company puts its employees first, the customer actually does ultimately come first and gains the greatest benefit.” (Nayar, 2010, p.7). The way people are engaged, internally, will impact the way people see the organisation externally. This will influence companies’ reputation, brand/service perception and ultimately the business survival and its future: “Employees who are dispositionally self-efficacious and proactive are likely to use their initiative, engage in proactive service performance, take charge to bring about change, proactively solve problems and implement ideas.” (Patterson *et al.*, 2009). When people and culture are the spine, the nuclear atom of an organisation, the service, the product and their customers are the most advantaged elements.

RESEARCH DESIGN

On our research we have decided to apply the model from Kumar and Pansari. According to the authors “we define engagement as the attitude, behaviour, the level of connectedness among customers, between customers and employees and of customers and employees with the firm.” (Kumar and Pansari, 2016, p. 498). This was the trigger for our study. With this in mind we have started our interviews. To complete this exploratory study, we’ve decided to follow a qualitative research by creating a script and interviewed 4 people in 10 organisations based in Lisbon. “Qualitative research starts from and returns to words, talk, and texts as meaningful representations of concepts.” (Pratt, 2009, p.856). The original script was written in English, then translated to Portuguese to be applied on the organisations. Each interview was fully transcript in Portuguese and the main findings and relevant content were enlightened in English to produce this paper. On each organisation, four employees were chosen: two women and two men from different departments and positions - board management, executive leadership, line managers and individual contributors. All interviewed people have Portuguese nationality and have a labour contract with their employer organisation. None outsourced employees have been selected to this study. All employees have between 25 and 50 years old. Interviews were done individually on the headquarters of each organisation. Interviews took between 45 and 60 minutes each. All conversations have been recorded with the individual’s authorisation. The note of confidentiality was explained and applied to all of them. The interviews followed the same script: three main blocks on a semi-structure script. Participants were asked to think about engagement and experience and share their thoughts and examples. Different organisations were chosen, multinational companies, agencies, national companies, private funds. The diversity of the organisations was accepted and taken as an added value to our work. To convert all audio into text, we’ve applied the google audio tool and a Huawei

phone app that can transform audio into text. A final check was done in order to verify all sentences and avoid mishaps. After all transcription, a content analysis has been done and the most relevant facts, insights and details have been listed. The content analysis was done using the MAXQDA software.

RESULTS AND CONCLUSIONS

The main purpose of this exploratory study was to understand how engagement and experience, people and culture, are taking such a crucial role on organisations' success. Today employees are more committed and accountable as they want to be more recognised, happy and part of something bigger than themselves as individuals. In the same equation, and to attract and retain more talent, organisations are more focused on employees, on their people and culture, and how to design and deliver a better internal experience - since the beginning until the end of team-member's journey. According to our content analysis, the principal finding confirm that happier and recognised employees work better, work more and have the ownership of the organisations they work for. Once people are happy and have good work conditions – financial, physic and technological – they will go further and beyond to complete their tasks, deliver their inputs, data, information and when needed they will internally collaborate with their teammates or with other departments. To raise this good environment and to keep workforce aligned with them, employers are changing and investing on the future of work. Nevertheless a few organisations are not applying this or taking these questions as a priority. Below the list of the most important and highlighted findings extracted from the content analysis done:

- 1) Most of the interviewees say they like their jobs and they are happy at work. They feel that they are part of something: family, team, organisation, culture.
- 2) The feeling of belonging was mentioned multiple times – the emotional link and the human aspect of being accepted and valuable inside the organisation.
- 3) All interviewed people, despite the job and the position they have, spoke about the power of recognition and the importance of this aspect to retain talent.
- 4) All interviewed people raised the importance of happiness at work, the wellbeing variable and the crucial aspect of work/life balance.
- 5) All interviewed employees agreed that their organisations value more the individual, their soft skills, than the job position and the tasks that there are committed and designated to do.
- 6) From the point of view of organisations, as leaders and builders of a strategy, we could note that only a few are planning and designing a structured employee experience. Nevertheless, all companies have a list of benefits and create events to get together their employees and

promote a better life for them. Following a more structured or more informal way, all interviewed organisations implement a list of actions to create a good work environment: flexibility on the work hours, the possibility to work from home, the team/company dinners and parties; the physical structure with infrastructures to have lunch or to have a break; the empowerment of the employees by asking them to be part of the decisions.

- 7) Only a few of the interviewed claim that their organisations are promoting situations of work mobility and career progression. Most of the people explained that is difficult to grow or to move from departments.
- 8) Both, organisations and employees, understand that the salary is not an imperative condition to work or to retain people. Employees value more other work conditions and benefits.

More than ever organisations understand that taking care of their people and on the importance of retain their employees is key. People and culture are two of the hot topics on organisation's strategies, missions and visions. After more than 40 employees interviewed, aside their gender, ages, under all circumstances and positions, every single individual want the same: recognition, to be happy and to balance, the best way possible, their work and their life. People want to be treated as people, as an unique human being. These people will create and found the best of the cultures and the values they will read, feel, live and believe. This is the key for the success of employers and employees. People and Culture are the key for organisation's success. It's all about people (see figure 1).

INTERGENERATIONAL COMMUNICATION IN THE WORKPLACE: RECOMMENDATIONS FOR MORE EFFECTIVE LEADERSHIP COMMUNICATION

De Lange, Lucrezea

Department of Communication Science, University of the Free State, Bloemfontein, South Africa

ABSTRACT

Effective leadership communication that is relational in nature is a prerequisite for successful organizational functioning (De Lange 2017). One of the many challenges that contemporary leadership are faced with, is the large number of generational cohorts who are currently present in the workplace. Intergenerational diversity affects the organization in many ways, but is experienced acutely in internal communication as different generational cohorts interact (Mc Elfresh & Stark 2018). Existing literature often indicates that communication between different generations are problematic in the workplace and that especially the communication between leadership and the centennial generation requires attention (Rudolph, Rauvola & Zacher 2018). The assumption is made that leadership communication needs to be approached differently if leaders wish to successfully engage with this generation.

To address this issue, a qualitative approach was employed and the research comprised four phases. Phase I entailed Rodgers' (2000) evolutionary concept analysis of leadership communication to discover what the conceptual foundation of leadership communication was. Phase II comprised a hermeneutic phenomenological study. During this phase in-depth phenomenological interviews were conducted with respondents from different generations who are regularly exposed to leadership communication. An adapted version of Groenewald's (2004) five step explication process was employed during this phase.

The third phase entailed a literature review of the communication behavior of the centennial generation in order to gain insight into this generation. This was followed by phenomenological interviews with 10 respondents from the centennial generation regarding their experiences and expectations of leadership communication (Phase IV).

To conclude this study, the guidelines for effective leadership communication identified during Phase I and II were compared with the outcomes of Phase IV to develop recommendations for leadership on how to communicate more effectively with the centennial generation in the workplace.

It was concluded that most of the guidelines concerning effective leadership communication that were referred to by participants in Phase II of the research, also addressed generation Z's expectations of leadership communication. They also emphasized the importance of relational communication. The

centennial generation expect leadership to trust in their abilities, and they prefer communication that engages them personally. Extra emphasis was placed on the fact that communication from leadership should create a culture that allows room for individual expression and face-to-face interaction.

THE BUSINESS MODEL FROM A SMALL AND MEDIUM-SIZED ENTERPRISES PERSPECTIVE – A SYSTEMATIC LITERATURE REVIEW

Di Tullio, Patrizia; Tarquinio, Lara

Department of Economic Studies (DEc), University “G. d’Annunzio” of Chieti-Pescara, Italy

ABSTRACT

INTRODUCTION

The Business Model (BM) and the Small and Medium-sized Enterprises (SMEs), whether considered individually, are two issues deeply investigated in scientific literature. Many authors have analysed the BM of big firms (e.g., Matzler *et al.*, 2013) or developed frameworks (e.g., Osterwalder and Pigneur, 2010) and theories (e.g., Markides and Sosa, 2013) in order to drive large companies towards the adoption of a BM.

Large companies are generally considered to be the heart of the economy, whilst SMEs are only “little big companies” (Tilley, 2000, p.33). Nevertheless, several articles have concentrated their attention on the peculiarities, weaknesses, and strengths of the SMEs, since they are an important economic force that contributes to the value creation of most countries. In particular, SMEs are heterogeneous in size, resources and management style (Jenkins, 2004). It is worth noting that in SMEs, ownership and management are not separated since the control remains in the hands of owner, who has a direct and personal relationship with the local communities. In this way, SMEs build and enhance their reputation and competitiveness. Moreover, since small firms are independent, multitasking, flexible and adaptive, they are less bureaucratic and more capable of enduring change and providing an innovation (Jenkins, 2009; Arbussa *et al.*, 2017). In this context, the BM theory cannot be simply scaled down to fit SMEs, given that the way in which SMEs generate, capture and deliver value may be very different from large companies.

Recently, the theme of BM in SMEs has been receiving increasing attention within academic literature but, to the best of the authors’ knowledge, a systematic examination of this topic is still lacking. For these reasons, this paper attempts to answer a recent call when it comes to extending the BM research agenda to SMEs (Nielsen *et al.*, 2019).

METHOD

A systematic literature review was carried out following the method proposed by Tranfield *et al.* (2003).

The questions to which this review seeks to reply are:

RQ1: What is the current state of the art of the literature on the Business Model in the Small and Medium-sized Enterprises?

RQ2: What issues have emerged in the literature on the Business Model in the Small and Medium-sized Enterprises?

As far as the review is concerned, the terms “Business model” and “SMEs” were searched in the fields of article title, abstract, and keywords, by selecting article, article in press, review, and conference papers as document type. Since “Business, Management and Accounting” is the “Subject Area” with the most contributions, this was the only one that was chosen. For this search both Scopus database and ISI Web Of Science search engines were used, thus including papers published in different Journals. After excluding the contributions that were present in both databases, 126 articles were selected. All the abstracts were studied and some of them that mentioned one of the keywords only once, or addressed the topic marginally, or were not in English, were discarded. Therefore, 55 articles were considered for the literature review.

FINDINGS

The findings were obtained through a descriptive and thematic analysis. The descriptive analysis provided the first insights for the topic and was performed by following the criteria used in Seuring *et al.* (2005) (e.g., applied methods, the distribution of publications across the time period), whereas the thematic analysis identified the key emerging issues. Through the descriptive analysis, it was noted that the theme of the BM in the SMEs has experienced increasing attention starting from 2014, whilst in the previous period, interest appeared to be intermittent. As far as the methods are concerned, the most popular include survey (20) and case study (17), whilst there were fewer conceptual papers (11). Finally, the empirical papers focused on specific countries, such as the UK, China, and Australia.

In the thematic analysis, four recurring themes were observed in the literature on the BM in the SMEs: collaboration, innovation, corporate sustainability, and internationalisation.

The analysis highlighted that a distinguished element is certainly the SMEs’ entrepreneur who, at the same time, is also owner and manager. Control remains in the hands of the owners and this somehow legitimates their personal choices on how to use company resources. Informal and interpersonal relations and communication are predominant. Literature also noted that SMEs are very adaptive. The specificities of SMEs affect their BM. The BM “elucidates how an organization is linked to external stakeholders, and how it engages in economic exchanges with them to create value for all exchange partners” (Zott and Amit, 2007, p. 181). The position of the single owner-manager is ideal for interacting with stakeholders and seizing new opportunities. The dominance of informal and interpersonal relations between SMEs and stakeholders of the local communities may be considered an

important value added for the construction, along with the stakeholders, of an SMEs business network. In this way, an SME can effectively exploit opportunities and capture value (Zott and Amit, 2013). Moreover, the owner-manager has the decision authority, a position useful for a flexible organisational structure and for the creation of a transformation in a rapid and radical way. Consequently, SMEs have “structural” advantages when it comes to introducing innovation in their BM (Chesbrough, 2010) so as to capitalise on recognised opportunities (Guo *et al.*, 2016). As several researchers have shown, SMEs experience a lack of resources, which impedes investment in innovation. The solution to these obstacles might be the creation of clusters that are characterised by the collaboration amongst companies operating in the same geographic area (Lepoutre and Heene, 2006). Moreover, the interactions between the SMEs and the network could encourage the pursuit of socio-environmental issues (Murillo and Lozano, 2009; Avram *et al.*, 2018) and the establishment of internationalisation strategies (Child *et al.*, 2017).

CONCLUSION

The review shows that there are only a few papers in literature in order to help enhance our understanding of SMEs’ BM. Indeed, much of the academic literature on BM focuses on large corporate organisations. In addition, there is a clear need for more research that will promote knowledge in this research area. Finally, the four topics identified through this review may provide guidance for the owner-manager of SMEs to understand BM in the context of their business, in order to seize opportunities and reduce barriers deriving from SMEs peculiar characteristics.

THE VALUE OF CREATING A HEALTHY FRAMEWORK FOR SUSTAINABLE LIFE

Dinu, Marinel Cornelius

Business Administration Doctoral School, The Bucharest University of Economic Studies

ABSTRACT

The present study is focused on the results of a pilot survey about the influence of different styles of living on the people's health. The results were extrapolated to identify specific socio-economic benefits of people healthy lifestyle meant to increase savings for healthy activities and make people competitive at work, etc.

This paper outlines the relation between the healthy lifestyle and the decrease of associative diseases development, with accents on the connections between the healthy living style and the socio-economic effects on the individual and society budgets (savings of health expenditures, improving the perspective of returning at work). The research has been limited to quantify the consequences of heart problems, diabetes and depression - the most influential diseases generated by lack of consideration for own body and lack of caringness for the health safe keeping because of bad behaviours adopted: smoking, drinking alcohol, over-using coffee, over-eating, lack of physical activity

The conclusion is that people from rural areas working physically in open air, sunlight and nature, no matter how difficult their work is, are less stressed and suffer less from cardiovascular and nutritional diseases compared to urban people larger exposed to over-working programs and pollution.

Keywords: life style, healthy framework, economic effects

THE COMPETITIVE ADVANTAGE ACQUIRED THROUGH EMPLOYEES' HEALTHCARE: ACTIONABLE HEALTH CARE STRATEGIES CREATING COMPETITIVE EDGE

Dinu, Daniel Gabriel; Dinu, Marinel Cornelius

Business Administration Doctoral School, The Bucharest University of Economic Studies

ABSTRACT

The employees' safety and welfare are conditions for higher quality and improved productivity – as socio-economic levers of development. Healthy employees have higher motivation, greater job satisfaction, better contribution at work.

The correct identification of occupational hazards and their supervision at workplace, as employers' responsibility, are the labour medicine's drivers. Compulsory by law, organized medical services serve occupational safety and health as part of general improvement in working conditions. A related strategy is necessary not only to ensure employees' security, but to increase productivity too. It is proved that healthy employees have higher motivation to work, greater job satisfaction and better contribution to delivering products and services, favouring the quality of their work and life's satisfaction.

The correct identification of occupational hazards and their monitoring at the workplace as employers' responsibility, allow the identification of potential damages of individuals - physical capacities and capabilities as physical capital, the relational capacity to develop relations within the society, and the professional valuable capital of the company (Karasek, 1998).

The health principles, built on behaviours and attitudes (Warr, 1990), sustain that healthy lifestyle and help creating the competitive advantages for employee's care. A sustainable environment, individuals' attractive skills development and logistic support for employees increase the interest in productivity, work enjoyment and build a friendly environment (Bond, 2001).

Highlighting plans and strategies for a healthy lifestyle for employees plays an important role (Giga, 2003). Consequently, some directions are highlighted, starting with the state-of-the-art of health policies, plans and strategies, to later address new directions to achieve the expected results.

COMPETITIVE INTELLIGENCE IN THE DIGITAL AGE: NEUROTECHNOLOGIES FOR HUMAN COGNITIVE AUGMENTATION

Dinu, Daniel-Gabriel¹; Stoian-Karadeli, Andreea²

¹Business Administration Doctoral School, The Bucharest University of Economic Studies,

²"Mihai Viteazul" National Intelligence Academy, Bucharest, Romania

ABSTRACT

The early period of Competitive Intelligence - the 80's - was the pre-internet period and was characterized mostly by analogue systems. Most of the data and information were gathered from primary sources. The data and information that were collected from secondary sources needed the intervention of the human factor to process, analyse and extract meaning from them. As technology evolved, most of today's data and information is generated and stored in digital format - this period known as Digital Age. Digitized

ion is a process that generates a huge amount of data that cannot be analysed in real-time by human users. This context has led to the accelerated development of solutions that process and analyses a huge volume of data that bears the generic name of "cognitive solutions". 'Cognitization' was a logical step in the digitization advancement and expansion of gobbling. IBM's Cognitive Business (IBM, 2015), as an application of the Watson platform, revolutionizes how to obtain, analyse, store and use digital information for economic and financial decisions. The Microsoft Brainwave (Microsoft, 2017) project promises access to real-time artificial intelligence (AI) services, especially in the financial and research environment. Immersive cognitive systems allow corporations to lead from a veritable "cockpit" or "bridge" with situational assessment rooms, cognitive boardrooms, immersive classes etc. in which human staff will constantly interact with artificial cognitive agents. For smaller businesses (national, regional), it is estimated that in the coming years, access to AI services over the internet (InternetDeliver AI) will be the standard for the civil business domain (Mary, 2015).

In the field of Competitive Intelligence, the goal of practitioners is to collect data and information that they process and analyse, then transform them into intelligence suggesting actions, strategies or decisions. To respond rapidly to the urgent need to collect relevant data and information from an increasingly volatile, uncertain, complex and ambiguous environment, as characterized by the current economy, Competitive Intelligence practitioners need to build fast and efficient work systems such as those described above. At the same time, they need to develop new skills, such as agility and attention. Attention is a mandatory condition for Competitive Intelligence practitioners while agility often depends on the ability to maintain a high level of attention (focus) and at the same time the

rapid response to the stimulus (alertness). The ability of analysts to remain focused on a particular goal is what ensures their success or failure.

For the Intelligence Competitive practitioner to remain relevant, efficient and to keep up with an environment that contains a large volume of information, while the field of Artificial Intelligence develops, it needs to enhance his cognitive abilities through optimization, stimulation and augmentation. Among these three methods, the one that represents the subject of this paper is augmentation.

Augmentation implies enhancing the cognitive abilities within while optimizing and stimulating the factors of intervention. For optimization, intervention can be done through pharmacological means such as nootropic drugs or smart drugs. Stimulation can be obtained through neuro-technology: electrical and magnetic transcranial stimulation (Wingeier, 2017). Another way to classify brain stimulation methods is to divide them into two broad categories: invasive methods and non-invasive methods. Invasive methods involve direct brain intervention such as Deep Brain Stimulation (DBS) and have been used for learning enhancement (Clark & Parasuraman, 2014; Suthana & Fried, 2014). The most popular non-invasive brain-stimulation technologies are transcranial electrical stimulation (TES), transcranial magnetic stimulation (TMS), and focused ultrasound (FUS). While the three of them – optimization, stimulation, augmentation – are means of brain enhancement, augmentation is non-invasive, risk-free and it is the only one that is based on neuroplasticity – which means the ability of the brain to learn new things. Much recent research (Edmonds & Tenenbaum, 2012) has led to amazing understandings about the relationship between pleasure, learning and motivation in the brain. It is now known that there is a centre of pleasure in the medial part of the prefrontal cortex, right in the middle of the forehead, a part that is involved in the process of focus attention, alertness, learning and that motivates us to go forward.

Pleasure and happiness are the basic motivators for our lives. We want to expand happiness and pleasure develops momentum. We learn to associate many types of events with these feelings. Living in a sense of happiness, we change our vision of life, the reaction to events and situations, our memory, our learning and our general well-being. When we are happy, we connect much more easily to others. As we know, the maintenance of positive emotions stimulates health while maintenance of the negative benefits of the disease.

Mental training is based on biofeedback – it is a method that uses the mind to control a function of the body that is normally regulated automatically, such as body temperature, heart rate, happiness and pleasure etc. to increase the production of high-frequency (gamma) brainwaves from the medial part of the prefrontal cortex. In short, people can teach their brains how to raise their attention, alertness happiness and other positive feelings that are associated with the production of chemicals

(endorphins and dopamine). Based on a device that measures the frequency of brain waves and software that interprets this information, we can tell when the brain (based on the fact that certain activities and certain states are associated with certain types of waves) is concentrated when it secretes dopamine when it is happy and other. This type of training is called neuro-feedback.

Advances in neuroscience and the development of neuro-technologies have progressively raised new and unique ethical issues (“neuroethics”), in addition to the more traditional aspects related to human participation in research studies.

The most important ethical issues are related to: Mind Reading and Privacy; Agency, Responsibility and Liability; Safety and Invasiveness of Brain Enhancement, Society

Keywords: Competitive Intelligence, Digital Age, neurotechnology, cognitive business, strategy, artificial intelligence, cognitive augmentation, decision-making.

RE-EXAMINING THE LEARNING PROCESS IN SMALL FIRMS: MULTI-CASE ANALYSIS ON THE USE OF SOCIAL MEDIA

Ekanem, Ignatius; Jin, Zhongqi

Middlesex University Business School, The Burroughs, London NW4 4BT

ABSTRACT

This paper is aimed at exploring the merits of an organisational learning perspective as a framework for analysing the continuous use of social media (SM) technology in small firms. Despite the scholarly call for building entrepreneurial learning theory, the entrepreneurial literature remains highly individualistic, ad hoc and fragmented, calling for both theoretical and empirical development (Wang and Chugh, 2014). Wang and Chugh (2014) argue that despite the insights from entrepreneurship and organizational learning on the integration of individual and collective learning, several questions deserve more attention in future research: for example, 'How do small firms learn to use Social media?' 'How do small firms manage the risks associated with the use of social media?' This study is intended to provide empirical evidence to fill these gaps.

There is also a gap in the literature with regards to the lack of a longitudinal study in this area and a deeper understanding of behaviour and beliefs. In their study of how a social venture forms reference points for social performance, Andre et al. (2018) used a longitudinal qualitative case study and suggest that a longitudinal study would provide more conclusive evidence as to the process through which beliefs, attitudes, norms, and intentions are formed and temporally evolve. They suggest that further research should look into how individuals receive, make sense of and assess feedbacks, while Mathias and Williams (2018) encourage future longitudinal exploratory studies.

A longitudinal multiple case studies approach is chosen because extant literature indicates that it is an appropriate method for having a clear understanding of observable phenomena (Gummeson, 2005; Yin, 2014). The case study firms were purposively selected to provide data pertinent to understanding the research objective (Shaw, 1999). The ten case study firms were drawn from different business sectors. To be included in the study the firms had to be in existence for five years; be independently owned; and have adopted social media for at least a year. Each firm had to meet the EU's (2008) definition of SMEs. A case material is built up on each company. In the UK, the majority of businesses are engaging with social media in some form. However, in certain sectors there is a huge lack of proper integration of social media to the business as a whole and limited value on offer to the consumer (McGrory, 2016).

The findings in the study suggested that small firms only learned to manage risks after things have gone wrong and either caused embarrassments or reputational damage. They learned through

experience/mistakes and the experiences of others to manage risks through a number of ways such as providing staff guidelines, creating social media policy for staff, monitoring and listening to customers' complaints, keeping record of passwords and establishing ownership of social media accounts.

The study contributes to the broader body of literature by providing evidence to illustrate the learning process involved in the use of social media by small firms, thus helping to advance entrepreneurial research. It contributes to knowledge by identifying the key learning features in relation to social media technology and SMEs and how they evolve around the managers. Finally, it discusses how organizational factors in small firms influence the aspect of learning and relearning from past and potential future behaviors. Simply put, how learning takes place and when learning takes place are fundamental to the understanding of entrepreneurial process (Wang and Chugh, 2014). Thus, this study illustrates how small firms learn to develop a social media competence. The paper suggests that conceptualizing the use of social media in small firms within the context of organizational learning holds promise as an explanatory framework.

CRITICAL SUCCESS FACTORS AND RISKS FOR INTERNATIONALIZATION OF SMES: COMPARISON BETWEEN DEVELOPED AND DEVELOPING COUNTRIES

Evrosimovska, Tanja¹; Graham, Wayne²; Neuert, Josef¹

¹SMBS, University of Salzburg, Austria

²USC Business School, University of the Sunshine Coast, Maroochydore DC, Australia

ABSTRACT

In the past, international business researchers have predominantly engaged their research upon multinational companies, mainly in the developed countries. Then over the years as the importance of SMEs grew in general, internationalization of SMEs grew as a topic as well, more in developed countries, but also in emerging markets or newly industrialized economies as well (Chiao et al., 2006). This abstract is part of a current research that analyzes the most significant successful factors and barriers for internationalization of SMEs in general, making a comparison between the ones from developed and developing countries. In the dissertation the author gives a detailed literature review of development of internationalization theories of SMEs throughout the years, while in this abstract, the authors provide short literature review with examples of some of the most significant factors and barriers for success. In addition to this as the dissertation is work in progress, the abstract concludes with discussion about the future development of the dissertation, with its methodology, data analysis and contributions to be gained by it.

One of the most important factors for successful internationalization of small and medium sized companies if compared to multinational companies has been networking. Many scholars have researched the networking occurrence, that is, the inter-connection of the firm with its foreign partners, customers and suppliers, as the most significant success determinant in internationalization (Sekliuckiene et al 2016, Johanson & Vahlne 2009). Several opportunities are created with the international networking incremental for success: foreign market possibility identification, potential partners, reductions of foreignness and newness on the market, etc. Networking can have different forms, such as strategic alliances, joint ventures, licensing agreements, subcontracting, joint R&D, joint marketing activities, etc. (Shirec and Bradach, 2009). Incorporating the customers, suppliers, higher education institutions, research laboratories, public organizations, clusters, public groups and communities in the innovation process (called open innovation strategy) is another form of networking that can greatly assist the internationalization process (Sekliuckiene et al, 2016). Therefore, various forms of international networking exist and SMEs should be open minded and embrace as many forms as possible in order to successfully enter in foreign markets.

Another significant factor of successful internationalization is outsourcing some of the activities, especially lately offshore outsourcing. Companies are struggling to gain innovative ideas and products in order to be able to compete against multinationals and low-priced competition coming from the emerging economies. (Tiwari et al., 2007). Especially for SMEs it is very difficult to be in line with the new trends and new technologies, because of several reasons, out of which most important are limited resources. SMEs have the opportunities with the globalization to hire companies internationally and engage them in some of their core activities, such as even R&D activities as many industrialized countries have shortages of skilled labor (Tiwari et al., 2007; Di Gregorio et al, 2009). Research done by the Fraunhofer Institute for Systems and Innovation Research upon 13295 German SMEs in 2003 confirms positive trends in almost one third of companies doing offshoring outsourcing (Kinkel et al, 2008). Therefore, offshore outsourcing should be evaluated as one of the valuable success factors for internationalization of SMEs.

The literature review will continue with investigating further success factors such as entrepreneurial skills of the owners, training of people in international business, cultural closeness, international market monitoring, governmental funding programs and other assisting mechanisms, financial managerial skills, technology levels and investments in technology, niche markets specialization, imitating successful competition, etc.

To continue with the search for all important factors of success, one needs to study not only the success positive factors, but also the difficulties when companies internationalize. Shortages of capital and limitations of banking support have been a major difficulty for going abroad, for all companies in general, but especially for small and medium sized enterprises. SMEs have been viewed as weak and insecure enterprises when compared to bigger companies and crediting organizations are not very willing to finance exporting activities of SMEs (Ruiz and Perez, 2017). Internationalization means confronting unknown markets, new competitors, unknown institutions and banks do not like to credit such uncertainties or usually would charge SMEs bigger interest rates if compared to MNEs (Ruiz and Perez, 2017; OECD, 2009). Therefore, lack of capital and shortages of working capital to finance exports has been one of the major challenge for internationalization of SMEs and SMEs should invest in better financial managerial knowledge and expertise in order to efficiently manage the scarce resources and become successful in the international markets.

The next significant barrier that has emerged from current research is limited managerial internationalization knowledge (OECD, 2009). Managerial risk perceptions were one of the major reasons why companies did not go abroad. Human capital, the founders international background and global network and his/her entrepreneurial characteristics were biggest challenges for the success of the companies abroad (Filatotchev et al, 2009). Further research will analyze additional difficulties

and barriers such as limited information to markets, the inability to contact potential overseas customers, difficulties of finding the right distribution channels and representation distributors, bureaucracy and local legislation, differences in product and service range, language barriers and cultural differences, lack of government incentives, etc.

The methodology of the research will be a case study approach done upon 20-30 companies from 4 countries evenly distributed among countries. Two countries will be developed ones, that is Germany and Austria; and two countries will be developing ones, Serbia and North Macedonia. Interviews and questionnaires will try to depict the most significant success factors and difficulties of internationalization of SMEs and comparison between developing and developed countries will be searched for. SMEs will be selected that have over 5 years of experience in international markets and that successfully export or invest in 3 foreign markets. In addition to this data, the research will try to gain qualitative valuable information from interviews done with local experts in internationalization of SMEs, professors from local universities in this sector, public chiefs of export departments of local ministries or chambers of commerce, etc. After the analysis of both data, the author will try to gather all information in a valuable roadmap for successful internationalization of SMEs from both developed and developing countries. This roadmap will contribute to the academic knowledge of internationalization of SMEs, especially from developing countries. In addition, this research will be very significant for the SMEs that are speculating going abroad and of course to the governmental relevant institutions that aim to increase exports of local companies. Limitations could be limited number of countries and companies, coming all from the EU market. The author is considering to limit the research upon 2 industries, because differences among sectors have been evident. In addition, the author is considering to analyze factors and barriers at entrance in a foreign market, but also factors and barriers after 3 to 5 years of existence in the foreign markets, as differences have been evident here as well.

EFFECTS OF INDIVIDUAL DIFFERENCES ON EVALUATING TECHNOLOGICAL PRODUCTS

Eytam, Eleanor

Industrial Engineering and Management, Sami Shamoon College of Engineering, Ashdod, Israel

ABSTRACT

Individual differences influence motives for interacting with products and in turn preference for these products. Human-computer interaction (HCI) experts overlook these differences when suggesting general guidelines for a fruitful interaction. One evidence to the gap between what people want and what design experts advocate for, is evident in the complexity crisis business experts warn against. While HCI experts advocate for simplicity in interactive product designs, people want more complexity, as stated by the paradox of simplicity. In this paper we suggest that unravelling differences between individuals is crucial for technology management because the understanding of preference formation, can help in resolving paradoxes such as the paradox of simplicity. Our model explains how demographic variables (age and gender) and trait-related individual differences influence product evaluation process.

INTRODUCTION

Product visual design provides information for potential users and consumers about the product (Eytam et al., 2017). While Human Computer Interaction (HCI) researchers' have identified the impact of the design on product perception, there is still a gap between the conceptual models of designers and users in relation to interactive products. Experts advocate for simple designs, but users and consumers often choose complex product designs, which brings about a complexity crisis. Complexity crisis in technological products is caused because people want more features and manufacturers are often tempted to supply overly complex products, to meet market demand. It is important to understand how visual simplicity level (VSL) effects product perception and preference because inclusion of too many features in products, potentially decreases customer lifetime value (Thompson et al., 2005). The paradox of simplicity states that although simplicity is supposed to help people in achieving their goals efficiently and effectively, it may not always be chosen over the complex overladen alternatives (Eytam et al., 2017). Several explanations were suggested to resolve this paradox, such as goal-oriented versus experiential motivations (Nadkarni and Gupta, 2007). The effect of individual differences on the perception of VSL was neglect from this analysis. Still, previous research has identified the moderating effect of age, level of education, and prior experience on technology use (e.g., Agarwal and Prasad, 1999). Social factors were found to influence intentions to use information technology (e.g. Thompson

et al., 2008). Finally, trait-related individual differences such as novelty seeking, technological self-efficacy, self-consciousness, and the need for interaction influence technology-based self-service. In this paper we argue that including individual differences in models explaining the paradox of simplicity may provide a more comprehensive understanding of how VSL influences product perception and interactive product preference. Some researchers introduce demographic characteristics as factors influencing perceived interactive product attributes (e.g., Venkatesh, 2000). Age was widely studied in relation to the technology acceptance model (TAM) (for a complete review see Chen and Chan, 2011). Age differences were found to influence various factors in technology adoption. Researcher report that older people are likely to accept technologies that are easy to use and have a simple interface design because of lower computer self-efficacy and a higher degree of anxiety about technology, compared to younger adults. Segmentation to gender influences interactive product judgments and preference. Specifically, women have lower confidence in their computer-related abilities and are more risk averse compared to men and thus they may be less willing to explore and adopt new features. Men give greater weight to practical utility than do women (Friedmann and Lowengart, 2013).

METHOD

HCI literature suggests that characteristics of the beholder moderate the relationships between perceived design attributes and preference. In an experiment 16 participants were interviewed (median age: 35; range 5–70; 56% females) about their attitudes and preferences of technology. A following literature review helped identify traits that may influences the perceptions and preference of interactive products. Five trait-related individual differences were included in the analysis: personal innovativeness and technological self-efficacy (measured by PIIT, ICSE scales respectively), social factor (measured by SCO scale) and general personality traits (measured by maximization and CVPA scales). Then Three hundred participants from a convenience sample (age: $M = 29.86$; $SD = 8.09$, range 14-66; 49% female) took part in filling out a survey assessing three different designs of the same technological product, and five measures taken from the literature assessing the five trait-related individual differences.

RESULTS AND CONCLUSION

Exploratory factor analyses with maximum likelihood analysis extraction (eigenvalue > 1) method using direct oblimin for oblique rotation (Kaiser Normalization) were applied to all individual differences measures. Items were loaded on their initially hypothesized factor. Cronbach's Alpha reliabilities of were adequate (between .74 and .89). Correlations between individual differences scales were relatively low, indicating their discriminant validity of those scales. Exploratory factor analysis

with maximum likelihood analysis extraction method (three factors specified for retention) and oblique rotation (direct oblimin with Kaiser Normalization) was applied to the responses of the nine items at each VSL tested. Items were loaded on three distinct factors according to their original categorization: ease-of-use, functionality, and aesthetics. The three factors explained between 66% and 70% in, and between 68% and 71% of the variance in the simple and complex design analysis, respectively. The item loadings on each factor ranged from .50 to .99, and from .58 to .99 in the simple and complex design analysis, respectively. The results reveal that differences between individuals influence the evaluation process in two manners: high social comparison orientation and maximization scores exert a positive effect on perceived functionality, aesthetics, and product preference; age and all recorded individual differences effect the saliency of major product attributes in the evaluation models of the different groups.

Keywords: User interface; individual differences; preference; ease-of-use; functionality; aesthetics.

ACQUISITIONS IN THE FOOD FAMILY BUSINESS CONTEXT: EFFECTS ON PRODUCTS AND PROCESS INNOVATION

Ferraris, Alberto¹; Giacosa, Elisa²; Alberto Mazzoleni³

ABSTRACT

RESEARCH GAP AND AIM

The food sector represents one of the most relevant pillars within the European Union, with an important effect on growth and employability as well as companies' revenues (Bigliardi & Galati, 2013; FoodDrinkEurope, 2016; Menrad, 2004).

A rich literature on the food sector examined different typologies of innovation applied (Baregheh et al., 2012; Capitano et al., 2010) and correlated business models (Giacosa et al., 2017). Also, the innovation literature within the food industry is quite well developed and established, highlighting even more the need to adopt an effective innovation process and opening it also to external stakeholders in order to speed up the successful introduction of new products and processes with the aim to be continuously competitive (Bresciani, 2010; Vrontis et al., 2016).

However, the introduction of new or improved products and processes in the food sector is still vague if we consider the impact of a merger and acquisition (Giacosa, 2012). This because most of the studies on innovation in this sector traditionally focused on the role of firm internal activities and skills (Chandler, 1990) and market driven factors (Arora et al., 2001).

Nevertheless, acquisitions in this industry increase in the last decades making interesting and intriguing to understand which are the effects on firm innovations. While much more studies have been developed in high tech sector, there is an emerging need to address this phenomenon in the food industry.

METHODOLOGY

Based on literature review, we proposed the following two main RQs of this study that aims at fill up the above research gap:

- What are the main changes in product development after the acquisition process?
- How the acquisition process changed the company's business model?

We adopted a qualitative methodology (single case study) methodology. As stated by Leppäaho et al. (2016), a single explanatory case study is a prominent methodological approach for making qualitative analysis of the family business phenomenon, as this is a particular area that allow the researcher to analyse the investigated phenomenon from numerous and different perspectives.

The subject of the case study under analysis is an Italian fine food company based on the production of typical Italian food, such as chocolate and panettone. This is a company established after a M&A between two local Italian family food: the first one focused on the production of panettoni, while the second one on chocolate. The acquisition has been made in 2014. This case study is prominent as it permits to identify how an acquisition in food industry is a strategy for developing product and processes innovativeness and sustaining competitiveness.

In particular, multiple information sources have been used. Primary data came from semi-structured interviews conducted in 2016, 2017 and 2018 to the founder, to the managers and to the employees involved in the products and processes innovation, for a total of twenty interviews. The interviews lasted two hours and they have been conducted by the authors. Then, we transcribed the answers and analysed autonomously. In the end, each interpretation has been compared.

MAIN FINDINGS AND IMPLICATIONS

In terms of products, the birth of the new company permitted a complete offer to customers, thanks to a varied range of typical Italian products, such as panettone, chocolate and delicacies. Tradition values have been preserved with regard to the raw materials selection as well as productive process. Nevertheless, an innovative approach has been followed, permitting to improve production efficiency within the respect of traditional values.

Also in terms of processes (such as research and development, production and commercialization), some benefits emerged. First, a combination between tradition and innovation happened, thanks to the reinforcement of attitudes, skills and productive infrastructures and machineries. It permitted to reach relevant economies of scale, without reducing the product quality. Indeed, manufacturing processes is still developed in the traditional way but with a great attention to new technologies and a deep focus on an effective combination between products and processes. Therefore, the familiness factor is so strong (Arregle et al., 2007; Carnes and Ireland, 2013; Sirmon and Hitt, 2003). At the same time, innovation involves the production processes. In particular, some innovative raw materials have been used, safeguarding the customers wealth. In addition, new production process methods have been used for achieving high productivity, but respecting a high-quality level. Innovative strategy is conducted internally (Chesbrough, 2003). It is usual for small and medium family firms in which R&D is not typically formalized (De Massis et al., 2013; Bresciani and Ferraris, 2014; Dias and Bresciani,

2006). Secondly, a creation of the new company permitted several benefits in terms of relevant economies of scale in production, sales and administration. This is due to the complementariness of the companies involved (Ahuja and Katira, 2001; Bower, 2001). In particular, employees are able to operate on different lines, if needed, while promotion is handled by the same team on all the products. Also in terms of administration processes, the creation of the new company led to significant cost reductions, thanks to a reorganization of activities.

In terms of the theoretical implications, the research emphasized the role of the combination between tradition and innovation in the case of an acquisition of a family business characterized by a strong familiness factor. In terms of practical implications, several categories of stakeholders may be identified. First, the owners and the management, as the research permits to handle the impacts and opportunities becoming from the acquisition of a new food company both in the short and long term. Second, the investors, as the study may guide their decision-making process in terms of their investment policy. Third, entities, institutions, politicians and local authorities involved in the territorial promotion; indeed, the cooperation with food companies could develop the territory opportunities, valorise its commons and also favour the tourism phenomenon.

AN EMPIRICAL STUDY ON THE IMPLEMENTATION OF PROJECT RISK MANAGEMENT IN SPANISH SMES

Ferreira de Araújo Lima, Priscila¹; Marcelino-Sadaba, Sara²; Echeverria-Lazcano, Angel Maria²;
Verbano, Chiara¹

¹Dept. Management and Engineering, University of Padova, Vicenza, Italy

ABSTRACT

INTRODUCTION

Risk management (RM) is a fundamental knowledge area of Project Management (PM), essential to execute a project successfully and widely discussed in PM guides such as the Project Management Body of Knowledge (PMI, 2017). A risk is an uncertain event that, if occurs, will affect positively or negatively the achievement of one or more of the project's objectives. RM is adopted to face these threats as well as to pursuit opportunities (Bartlett et al., 2004). The objective of Project Risk Management (PRM) is to systematically identify, analyse, treat and monitor & control project-related risks during the project lifecycle (Borge, 2002; PMI, 2017). Risks and uncertainties are inherent to projects since a project is always unique venture and therefore faces unknown factors (Carvalho & Rabechini, 2015).

The positive effects of PRM have widely been acknowledged in PM literature (de Bakker et al., 2011), but little has been studied in the specific context of SMEs. In Europe, and also specifically in Spain, nine out of ten enterprises are SMEs and they generate two out of every three jobs (European Commission, 2015; Spanish Ministry of Industry, 2018). The PRM studied and developed in large companies, must be adapted to the SMEs, so that they can efficiently implement it, but little attention has been devoted to this purpose so far.

Asking Scopus and Web of Science databases using different combinations of the keywords "risk management", "SMEs" and "small business", and excluding proceedings, editorial materials, non-English language papers and non-pertinent articles, the obtained papers were classified into the different RM streams, resulting only six papers about PRM in SMEs.

These were all empirical studies, being half of them case studies and the other half model proposals with model testing. The applications regarded specific industrial sectors and, in most of the cases, not all PRM phases or project risk types were considered. Given the importance of the theme and the abovementioned results, it can be affirmed that there is a significant gap in the literature. To contribute into filling in this gap, the main objective of this research is to analyse how is it possible for

SMEs to adopt PRM with a positive cost-benefit ratio. More specifically, PRM phases, activities, tools, techniques, procedures and organizational aspects implemented will be investigated.

METHODOLOGY

To investigate the characteristics of the adoption of PRM in SMEs, an exploratory and explanatory research through case studies was conducted, as it is a coherent methodology to be followed when facing “how” research questions (Yin, 1994). To conduct the case studies, a robust research protocol was built, and an empirical framework of analysis was created. To construct the framework defining the fundamental dimensions, books and articles about research methodologies (Eisenhardt, 1989; Yin, 1994; Voss, 2002), and about PM and PRM were consulted, and empirical papers regarding PRM in SMEs were examined (Alquier and Tignol, 2006; Leopoulos et al., 2006, Tang et al., 2010; Neves et al., 2014, Marcelino-Sádaba et al., 2014; Pereira et al., 2015).

The final questionnaire, obtained after the testing and refinement through a pilot case, includes close-ended and open-ended questions divided into 9 sections regarding the company, the project, the PRM organization and roles, phases, activities, tools, procedures and outcomes. The case studies were conducted in eight Spanish SMEs located in the Navarre region, which has highly invested on innovation, especially for SMEs. In order to cover a wide range of project types, the projects were selected based on the size of the company, the production organization, the type of industry and the PRM experience of the respondents. Using these selection criteria, it was possible to cover a breadth of perspectives regarding PRM in SMEs.

The interviews, with multiple respondents, were always conducted in person by at least one of the researchers and integrated with documents related to the PRM plan, in order to ensure the project’s internal validity, using triangulation, and increase data reliability (Voss, 2002). A two-step analysis was then conducted: within case, to analyse the pattern of data within the case, and cross-case, to search for patterns among the cases (Eisenhardt, 1989; Voss, 2002).

PRELIMINARY RESULTS AND CONTRIBUTIONS

The companies selected for the research were: two micro-sized manufacturing companies (one organized by project and one by process), three small-sized companies (two manufacturing ones organized by process and one of services organized by project) and three medium-sized companies (a manufacturing one organized by process and a consultancy one organized by project). In every company, it was asked to talk about a successful project in which the PRM had been adopted. In all the cases, the entire PRM process had been followed, and usually the CEO or the PM were responsible for the PRM implementation.

During the identification phase, the companies carried context analysis, risk identification, and applied several tools, being brainstorming, checklist and risk register the most used ones. The technical-operative and the organizational risks were always considered and identified, while other types of risks were considered only in the service firms. Many risks of the manufacturing companies were related to the material and the design of the product, which was expected since all projects involved the development of a new product or a new machine. Besides the risks, 63% of all the firms have also identified (and pursued) the opportunities. These were mainly the services companies, since only 40% of the process-manufacturing ones, which projects had a lower managerial complexity, have identified opportunities.

As for the risk analysis phase, in all companies many project meetings took place, and most of the companies used the risk matrix, risk ranking and risk register tools. No quantitative analyses were performed, and the measurements of the probability and effects of the risk were subjectively based on experience and feelings. In seven of the eight cases the risks were prioritized based on the results of the risk matrix or of the risk ranking.

During the risk treatment, the risk mitigation technique was applied by all companies, while risk avoidance, risk transfer and risk retention were used by most but not all of them. Generally, the risk treatment was partially planned: the tools were used, and the activities were carried on depending on the emergence of the risk triggers. As for the manufacturing firms, the treatment phase has involved designing and prototyping; these activities were repeated until the testing satisfied the product quality requirements; their development has allowed the companies to avoid potential failures in the final product.

In the last PRM phase, monitoring & control, while facing difficulties such as lack of time and lack of knowledge, in all projects the risks were constantly reevaluated and periodic monitoring meetings were organized, impacting positively on the PRM results.

Overall, the PRM adoption by these firms in these projects was successful. In 63% of the cases, the adoption was motivated by the fact that these projects were subsidized by the government of Navarre, which requires periodic reports about the project progress. All interviewees affirmed that there was a positive cost-benefit ratio in the PRM implementation and that it should be adopted in all strategic projects. According to their perception, the benefits provided by PRM were mainly high, especially in terms of lower risk impact, greater probability of project success and improvement of the decision-making process.

It has also emerged that the projects of manufacturing companies with a high level of both technology and market innovativeness have carried on similar activities using similar tools since they have identified similar types of risks and, finally, the perceived benefits were also similar. On the other hand,

when the project complexity is low, the simplest PRM tools tend to be adopted. Lessons learned from previous projects have also played an important role in the analyses, both in the manufacturing and in the service companies.

These results offer a significant contribution to the academic literature, given the over-mentioned gap of studies, and to practitioners highlighting how, with simple tools and constant monitoring, it is possible to implement PRM in different types of SMEs with a positive cost-benefit ratio.

BUSINESS MODEL INNOVATION: THE ROLE OF INTERNAL AND EXTERNAL DRIVERS

Fiorini, Niccolò; Devigili, Matteo; Pucci, Tommaso; Zanni, Lorenzo;

Department of Business and Law, University of Siena, Siena, Italy

ABSTRACT

Many contributions examine the concept of Business Model Innovation (BMI), underlying that BMI enhances a firm's competitive advantage (Mitchell and Coles, 2003) exploiting both newly and already existing internal/external resources without investing significantly in R&D (Amit and Zott, 2010), and rethinking the firm's purpose, value creation and value perception (Bocken *et al.*, 2014). Moreover, when dealing with BM and its innovation, the literature suggests a linkage with new technologies or existing technologies applied to other purposes (Casprini *et al.*, 2014), and the appearance of new business models (Baden-Fuller and Haefliger, 2013; Zott *et al.*, 2011). From the internal perspective, many scholars described the key role of internal drivers (Achtenhagen *et al.*, 2013; Zhang *et al.*, 2016), highlighting that new and distinctive resources can not only reconfigure the BM (Morris *et al.*, 2005), but also enhance efficiency and efficacy of value creation, provision, and capture (Pucci *et al.*, 2013; Pucci *et al.*, 2017). However, the ability to choose, integrate and adapt new resources determines the level of efficacy and efficiency in terms of value creation (George and Bock, 2011). Since Process Innovation (PI) acts as a crucial driver to obtain the sought efficiency and productivity improvement and effective competitive advantage (Terjesen and Patel, 2017; Trantopoulos *et al.*, 2017), we aim to test the following hypothesis: (Hp.1) *PI increases the probability to have BMI*. From the external perspective, the literature showed the ability of external drivers to change BMs (De Reuver *et al.*, 2009). Indeed, co-creation and co-innovation networks (Romero and Molina, 2011), with higher Supply Chain (SC) integration (Atti, 2018), and social innovation (Alegre and Berbegal-Mirabent, 2016), may offer new opportunities and BMs re-configuration. Focusing on SC, since collaborations within SC are fruitful for any player involved (Chen and Paulraj, 2004), we identified and investigated three set of external stimuli, namely: upstream (e.g. suppliers), downstream (e.g. customers) and horizontal (e.g. universities). Thus, we tested the following hypothesis: (Hp.2) *stimuli coming from SC increase the probability to have BMI*. Furthermore, since proximity can be viewed as a pre-condition for innovation especially because of its role in fostering knowledge and technology transfer among actors (Knoben and Oerlemans, 2006), we investigated the impact of the following proximity dimensions on BMI: geographical (GP), technological (TP), organisational (OP), and social proximity (SP) (Geldes *et al.* 2017; Marrocu *et al.*, 2013). Our analysis does not investigate: institutional proximity, as differences in formal institutions are not relevant on this research contest and informal institutions are likely to overlap the

notion of OP (Knobben and Oerlemans, 2006); cognitive proximity, since we are investigating specific technologies and their related knowledge. Thus, our last hypothesis is: (Hp.3) *GP, TP, OP, and SP increase the probability to have BMI*. Data collection has been performed through a structured survey, submitted to 107 Italian manufacturing firms between July and October 2018. In particular, since BMI (Foss and Saebi, 2017) has been defined and measured in several ways (Casprini, 2015), we rely upon a definition considering the firms' own perception about their innovations and BMI. For what concerns Hp. 1, PI shows a positive and significant effect on the probability of having BMI, thus Hp. 1 is supported. This shades the light on the possibility of a double positive effect of PI for firms. Not only PI is directly beneficial for firms, it also has additional positive effects by increasing the probability of having BMI. On the other hand, Hp. 2 is partially supported since only Downstream Stimuli show a positive and significant effect on the likelihood of having BMI. Conversely, for Hp. 3, while the effect is positive and significant for TP, it is negative and significant for SP and not significant for OP. A peculiar result comes from GP which shows a significant curvilinear effect, therefore both a too high or a too low GP is detrimental to the probability of having BMI. Hence, only an adequate distance fosters BMI. Therefore, Hp. 3 is partially supported. This research contributes both to academical and practical understanding of factors fostering, or hindering, BMI. It underlines that firms may innovate their business model not only relying on internal resources, but also taking advantage of stimuli coming from different SC actors at the right geographical distance and with whom they share technological affinity.

LINKING HRM IMPLEMENTATION, PERCEPTION AND EMPLOYEE OUTCOMES VIA PSYCHOLOGICAL CONTRACT FULFILMENT

Fu, Na¹; Conway Edel²

¹Trinity Business School, Trinity College Dublin, the University of Dublin, Dublin, Ireland

²DCU Business School, Dublin City University, Dublin, Ireland

ABSTRACT

This study aims to investigate the indirect impact of HRM on employee outcomes. The novelty of this study is to adopt a linkage model and to examine the relationships between implemented HRM by line managers, experienced HRM by employees, psychological contract fulfilment and employee outcomes. Using data collected from 1810 employees working in professional service context including accounting, consulting, ICT, law, marketing etc., a double mediation model with the studied variables was tested using Hayes's (2013) PROCESS syntax. Support was found for proposed linkage model where implemented HRM is positively associated with experienced HRM, which increases psychological contract fulfilment, ultimately reducing employees' intention to leave.

This study contributes to the strategic human resource management research by systematically investigating the linkage model of implemented HRM, perceived HRM and employee experience (psychological contract fulfilment) and outcome (intention to leave). By doing so, this study answers the call by Jiang, Takeuchi and Lepak (2013) and Fu *et al.* (2017) for exploring how SHRM influences organizations at different levels.

Human resource management practices have been found to be positively associated with organisational outcomes such as financial performance (Huselid, 1995; Guthrie, 2001), and innovation (Chen and Huang, 2009; Fu *et al.*, 2015). According to Wright and Nishii (2013), these HRM practices are categorized as the "intended" HRM, which are not necessarily translated to employees in most of cases. In order to enable the "intended" HRM to be effective, these HRM practices need to be implemented by line managers and translated to employees to have experienced HRM expected by the organisations (Jiang, Takeuchi and Lepak, 2013; Wright and Nishii, 2013). This suggesting a link between implemented HRM and experienced HRM. Based on this, McDermott and her colleagues have theorized the implemented and experienced HRM influences employees' attitude and behaviours, e.g. intention to leave, via the mediating role of psychological contract fulfilment (McDermott *et al.*, 2013). In the context of employment, psychological contract refers to an employee's beliefs regarding mutual expectations and obligations between that person and their employer (McDermott *et al.*, 2013). When employees experience the HRM practices positively, they feel their

employers have fulfilled their psychological contract. Employees who feel their psychological contract being fulfilled will less likely to leave their employer.

Figure 1 presents our research model which links the implemented HRM, experienced HRM by employees, psychological contract fulfilment and intention to leave.

Figure 1. Research Model

An online survey was sent to 43,478 professionals who have registered their details with one agency organisation based in Ireland. Overall, 2734 responses were received with a response rate of 6%. After deleting missing data as well as the responses who were not working at the survey time, 1903 respondents (4%) were used in this study. The key variables in this study were measured based on the well-established scale from literature and were found with high reliability in this study. Results provide support for the impact of implemented HRM on experienced HRM ($\beta = .71, p < .001$), experienced HRM on psychological contract fulfilment ($\beta = .43, p < .001$), and psychological contract fulfilment on intention to leave ($B = -.59, SE = .08, p < .001$). Using Hayes' (2013) PROCESS, the indirect effect of implemented HRM on intention to leave via experienced HRM on psychological contract fulfilment was $-.18$ with 95% of confidence interval between $-.23$ and $-.13$, supporting hypothesis 4.

This study set to reveal how HRM influences employees' attitude by proposing and testing a linkage model where implemented HRM by line managers increases employees' experienced HRM, which in turn develops their psychological contract fulfilment, ultimately reducing their intention to leave. Using data collected from 1903 professional workers in the accounting, consulting, ICT, law, marketing etc., support was found for the above linkage model. This study empirically tests the theoretical model proposed by McDermott et al. (2013). It contributes to our understanding of the line manager HRM implementation as a key driver for employees' positive experience with organisational HRM practices, fulfilling their psychological contract and retaining them in the organisation. Organisations need to invest in their managers to be able and motivated to implement organisational HRM practices effectively.

HEALTH PREVENTION UNDER LENS: PRINCIPLES, BEHAVIORS, NEW APPROACHES OF RISKS AND STRATEGIC POLICIES

Gabara Pascu, Iuliana-Elena¹; Mihoreanu, Larisa²

¹Sanamed Hospital Bucharest

²UTM Bucharest, Romania

ABSTRACT

Health prevention is linked to specific sets of measures designed to promote the individuals and populations' health. Starting from the World Health Organization's definitions of health prevention and rigor of implementation to be assumed by all governments, the aim of this paper is to emphasize the health risks' typology and related behaviors to prevent individuals, based on sustainable approaches of prevention and adequate strategic policies.

The originality consists in the *modus operandi* and the way concepts are addressed to jointhe societal issues. Several theories have been developed on the implementation of preventive programs, but the views of experts in the field are still divided; we agree that only in time a consensus will be reached on this issue.

Strategies and implementation models often integrate components of different theories and determinants as tools to be used to develop better strategic policies for global health promotion programs and disease prevention. Thus, communities use the last models to implement programs that allow people to better manage their health capital. If correctly understood, such models can serve as a framework for the organization of health promotion and disease prevention activities.

Thus the aim of this paper is to emphasize the health risks' typology and related behaviors, in close connection with individuals' duty to recognize the need to build their preventative health, rooted in sustainable public knowledge and profit oriented policies.

INTRODUCTION

Health prevention is linked to both the fundamental of the health systems and different sets of measures designed to promote the individuals and populations' health. They are also related to those risk factors engendering behaviors, diseases' transmission and pandemics' apparition. Prevention has, first and foremost, two main purposes: to make people aware of the importance of their health as an individual capital of incalculable worth and price (Grossman, 2000) and to maintain and develop their health as the most precious societal asset.

The World Health Organization (WHO) distinguishes three main types of health risk prevention.

Primary prevention aims to raise the awareness of the risks of certain behaviors before they exist to reduce the incidence of a disease. It addresses to people who have no symptoms at all, to reduce the likelihood of any health problem. Primary prevention includes medical and non-medical actions (eg. immunization against infectious diseases, health education and road safety such as the use of safety belts and cycling helmets). Dietary counseling and hygiene advice during a medical consultation, vaccination and screening campaigns are also part of primary prevention.

Secondary prevention includes the actions to be taken by ill people; it is meant to prevent the worsening of the underlying disease and to limit the extent of the progression through early diagnosis. Secondary prevention aims to detect the disease or the lesion that precedes it, at a stage where it is possible to effectively intervene and avoid the development of clinical symptoms or biological markers. This type of prevention can lessen the severity of the disease or stop it before it develops. As examples we mention rehabilitation exercises or various controls after treatment of a heart problem, mammograms for breast cancer detection. Treatments like vaccination postexposure or diagnostic tests such as mammography for breast cancer detection, for example.

Finally, *tertiary prevention* reduces chronic disease associated disabilities (Kenkel, 1994). It refers to prevention activities that avoid relapse. For example, chronic disease programs (for diabetes, arthritis, depression and others), support groups that allow members to learn strategies to improve quality of life, professional rehabilitation programs to retrain workers for new jobs when they -recurred after a professional accident.

Risk factors encompass those elements that trigger a condition or disrupt a person's health at any given time. A priority in the field of public health is represented by all actions and decisions (policies) aimed at improving (nurturing) or protecting the health of the general population. Three types of risk factors have been identified: • individual (endogenous): age, gender, ethnicity, heredity, immunity; • non exogenous factors: pollution, income level, cultural level, psychosocial influences (stress), and ultimately, • behavioral factors: smoking, sports, nutrition. Recently, many opinions issued in the medical world argue over which place prevention should occupy in the global health system, parallel with the advancement of curative medicine research that becomes more and more important. Since the primary goal remains still open to care and to a better access to treatment services, the present context turned efforts away from building a strong culture of preventive behavior. In the past years, the health systems of developed countries were rather curative, than preventive. The need for immediate results and improvements, together with the emergence of technological and medical innovations brought the switch that the health systems needed enacting the knowledge and sanogenic behaviors' implementation, for individual and societal sake (Kryzhanovsky , 2004).

ABOUT DIFFERENT ATTITUDES AND RISKS IN APPROACHING/SHAPING PREVENTION

There are untold dimensions of attitudes towards a known health risk; therefore, individual attitudes of declared preferences (risk aversion, prudence, temperance, exaggeration, panic attacks and others) arise. Scientific researches distinguish between different types of health risks (at individual or large-scale population level, with irreversible or reversible evolution) and describe people's behaviors depending on the field in question and contextual effects.

Risk aversion is the basic concept of risk theory, a concept developed by Pratt (1964), which claims that a person is afraid of a risk that he considers important. This theory reflects an attitude of denying the risk and of privileging certain situations. Accepting that people can be grouped according to their attitude to risk, three attitudes are then possible: • affinity for risk (risk-seeking), • risk aversion (risk fear) or • indifference to risk. In fact, the introduction of the uncertainty in many situations affecting health and medical decisions, where risks are poorly understood can help understanding how people are confronted with uncertainty beyond the choice of, public information, communication, and of prevention programs for maintaining health.

Technological innovations of the recent decades, together with the climate changes occurred in the last years brought about health effects that are not yet fully studied. In fact, people's existence is constantly changing through technology innovation; more automation, fewer people in effective production, versatile work team, many-sided jobs, more passivity, more loneliness despite the development of online communication, more responsibility. As a result of these changes in the scientific community, it has become imperative to analyze more objectively the real progress of today's society through man's activity versus the skills of machinery on one side and machinery versus the health risks on the other side.

First of all, people are better at perceiving patterns, detecting small visual or acoustic signals, improvising, are more flexible in approaching and exercising judgment while machines are better at reacting quickly to control signals, applying a precise and constant force in performing repetitive tasks in handling extremely complex situations is based on a standard error whose threshold is known.

This analysis exercise reveals the need to introduce the concept of "human factor" and to explain its implication in the state of health. Why are the humans important? Up to 80% of the causes of accidents can be attributed to humans and this shows that the human factor is the most important risk factor for human health, given the contemporary lifestyle springing in new behaviors at work and outside it.

All major accidents involve a series of human failures. Human factors are concerned about understanding the causes of human failures. Human errors' causes are work-related factors, individual factors and organizational and management factors. They come along with: • incompatible

equipment, • disruptions and interruptions in the course of activity, • incomplete or unclear instructions, • inadequate or damaged instruments, • a high volume of work or noisy and • unpleasant working conditions.

At work, individuals can reveal inadequate skills or competences, exhausted staff, discouraged working team or without a clear motivation, lack of a concrete work plan, individual personal problems.

Organizational and management factors include lack of safety at work, lack of standards to deal with emergencies, poor work planning leading to high work pressure on employees, poor health and safety culture.

All of these risk factors act on the mature, active population that is in full swing. This category of population is the best represented, globally. In addition to the active population, special categories of people have the right to be considered: children and adolescents, seniors, pregnant women, all usually being known as vulnerable categories. Although not subject to the health risks caused by the human factor influenced by the time spent at the workplace, all those category of people can have special health risks that may cause the onset of illness. However, clear delimitations between risks' categories hardly operate. Knowing that they can exist, the main role goes to health prevention and management to be improved by adequate measures to reduce the incidence of severe cases of illness.

The recent years brought to general attention various dramas generating others even bigger: • organ donor shortages in the absence of population information programs, • lack of incubators for infants born in hospitals, • lack of blood needed for hospital transfusions, • climate change, • genetically modified food, • epidemics of disease and inappropriate vaccinations. All this generated the concept of "health security" in order to identify measures to raise awareness of preventive medicine issues.

Citizens' demand for a right to health, which extends even beyond the health security framework, cannot be achieved by ignoring the medical school that has been protected so far by its technical and curative health systems, which unfortunately have no capacity to anticipate the consequences of globalization or counteract pathologies generated by contemporary lifestyle. In such situations, it is difficult to accurately quantify and analyze possible interactions between risk factors given the uncertainty of evolution in the modern society.

To eradicate health risks people and specialists need firstly to know them. It is quite difficult to demonstrate their interdependences and effects on health status in order to adopt appropriate prevention behavior. Confusions are sustained by the incomplete knowledge, irrational manipulation of news and contradictory medical information on the likelihood of health risks. Thus, we aimed at identifying the determinants of risks and factors, as seen in table 1, to act against negative effects by preventive measures.

Table 1. The Risk Factors and the Health Problems' Causality

I. Determinants linked to Society, Family, Environment	II. Prevalent Risk Factors
<ul style="list-style-type: none"> o Globalization o Urbanization o Population aging o Social determinants 	<ul style="list-style-type: none"> o Smoking o Detrimental diet and food regime o Lack of motivation towards work; inactivity o Chronic alcohol and other drugs' consumption o Environmental pollution o Cultural and religious traditions o Age and congenital characteristics
III. Transitional Risk Factors	IV. Health Fields with High Benefits from Prevention Programs
<ul style="list-style-type: none"> o Prohibitive figures of blood pressure and glucose o Abnormal blood lipids o Corpulence, obesity/ morbid obesity 	<ul style="list-style-type: none"> o Cardiovascular disease and stroke o Cancer o Diabetes o Chronic respiratory disease

Source: Adaptation after OMS (2005) *The Chronicle disease Prevention: A vital investment*

The medical researches present different probabilities for patients who are in similar situations with the same underlying condition, and this can be explained by the peculiarities of the subject groups, for example the geographical area where they originate, the type of diet, the genetic predisposition, the associated comorbidities, and many others.

The theories developed on the implementation of preventive programs brought out different new views; however, specialists are still looking for a consensus to reach on this issue. Strategies and implementation models often integrate components of different theories and determinant factors to be used as tools to develop better strategic policies for global health promotion programs and disease prevention.

CONCLUSIONS

Applying appropriate policies of prevention through viable and sustainable programs designed to foster preventive behavior allows the members of a society to control their health risks and take appropriate measures to maintain or improve their health. If the likelihood of being ill is uncommon, people tend to change their daily behavior by taking less precautionary action in all their actions; in fact they can underestimate the effects of risk factors exposing themselves to their health.

Communities can use the last theories, realistic strategies and new models to develop and implement sustainable programs that allow people to improve and better manage their health capital. The models can serve as a framework for the organization of health promotion and disease prevention activities.

CONTEXTUAL EFFECTS ON PERFORMANCE APPRAISAL PROCESS OUTCOMES: A SOCIAL EXCHANGE PERSPECTIVE

Ghani, Bilqees¹; Malik, Muhammad A. R.²

¹Business School, Institute of Business and Management (IoBM), Karachi, Pakistan

²Suleman Dawood School of Business, Lahore University of Management Sciences, LUMS, Lahore, Pakistan

ABSTRACT

Performance appraisal process (PAP) is considered to be one of the most important human resource management tools. Besides being an assessment tool, PAP provides a way of involving employees in the appraisal through goal setting, development of the employees, evaluation, feedback, and rewards. Hence, due to its strategic importance, the effective execution of PAP plays an important role in bringing about valuable organizational outcomes.

Research indicates that the contextual settings, within which performance appraisal takes place, significantly affect the socio-psychological processes through which individuals make sense of the appraisal process. Hence, the context plays an important role in shaping employees' experiences regarding the appraisal process (Elamin & Tlaiss, 2015). However, thus far, this area has received significantly less research attention. There are only a handful of studies that theorised and empirically tested the effects of contextual factors on the relationship between PAP and important organizational outcomes. This is particularly true for developing countries, which are less represented in contemporary research.

The current study aims to fill these gaps by investigating the relationship of PAP with three important outcomes, i.e., voice behavior (VB), organizational citizenship behavior (OCB), and turnover intention (TOI) by using a three source data (employee, supervisor, and organization) to have a well-rounded knowledge of PAP and associated outcomes. For this, the study followed the line of arguments presented by Murphy et al., (2003), who suggested that VB, OCB, and TOI are the key job behaviors and intentions which are affected by the appraisal process. However, these authors didn't aim at identifying the contextual processes that affect the PAP – outcome relationship.

Acknowledging the immense importance of appraisal process in enhancing the competitive position and performance of an organization and heeding the calls of researchers to explore the important contextual factors in this process, we investigate the effects of three theoretically relevant contextual factors, i.e., LMX, justice perceptions, and trust as important boundary conditions for outcomes associated with PAP. Since the exchange relationships between employee and organization take place within a social context, understanding the elements that constitute and affect their social

milieu is of utmost importance to predict how PAP affects employees' attitudes and behaviors. Thus, we take a social exchange perspective to theorise and explain these relationships.

The results of this study revealed that the effects of PAP are positive only for employees that are high on LMX, organizational trust, and perceived fairness of appraisal process. For employees with low LMX, trust, and perceived fairness, the effects of PAP are either insignificant or even negative. This suggests the presence of a synergistic interplay between PAP and contextual factors. Hence focusing on PAP while ignoring contextual factors may result in undesirable outcomes.

The current study claims significant contributions for scholars and practitioners in the organizational and behavioral science domains. Firstly, under the framework of social exchange theory as an overreaching framework, this study examines three important contextual factors (LMX, justice perceptions, and trust) as they are socially constructed and hold a central position in the social interface of appraisal process. Thus, by using a different theoretical lens, the study provides new insights for PAP research.

Secondly, this is amongst the earliest studies to empirically verifying the role of contextual factors in PAP – outcome relationship. This shows that PAP – outcome relationship doesn't operate in a vacuum, and the contextual factors have a significant effect on the outcomes of the appraisal process. These findings have significant implications for research and practice.

Finally, the study extends the work of Murphy et al. (2003) by studying the relationship between appraisal – employee intentions and behaviors (i.e., OCB, VB, & TOI) in a different context, i.e., in Pakistan. Hence, it holds promise for HR practitioners to direct their attention to different cultural dynamics in terms of their effects on performance appraisal as a socio-emotional process.

**EXPLORING TECHNOLOGICAL ADVANCEMENTS DILEMMAS & RELATIONSHIP
MARKETING PRACTICES IN THE PHARMACEUTICAL INDUSTRY OF GREECE**

Giannakopoulos, Konstantinos¹; Kapoulas, Alexandros²

¹Computer Science Department, The University of Sheffield International Faculty – CITY College Thessaloniki, Greece

²Business Administration and Economics Department, The University of Sheffield International Faculty – CITY College Thessaloniki, Greece

ABSTRACT

Increased use of technology has an immediate effect on established business operations (Li, 2010). Marketing over the last years, has been heavily remodeled and contemporary literature correlates these alterations to the proliferated use of digital means (Baird & Parasnis, 2011). Consequently, this paper intends to investigate the marketing environment as applied in the pharmaceutical sector of Greece, focusing on the emerging phenomenon of integrating digital tools within the heavily regulated marketing strategies of the field.

This study takes an interpretivist research stance and it conducts elite interviews with high managerial executives of the field. It is through the use of this approach that the study seeks to reflect the current status of what is today called digital marketing and understand its effect on traditional marketing tactics.

Preliminary findings indicate an overall positive, yet indecisive perception for the under-investigation topic, highlighting the importance of digital mediums in the new marketplace model. Regardless of the aforementioned, managers still appear to be hesitant with the level of understanding within pharmaceutical organizations and specifically regulatory departments and executives of past generations (Panigyrakis & Veloutsou, 1999). Finally, the use of digital initiatives, remains limited as the research presented a number of challenges. Particularly, the concept of digital marketing is yet misconceived within the Greek pharmaceutical firms, an assumption further established when compared to perceptions of multinational organizations. Although the investigation set the basis of understanding an emerging phenomenon, the assumptions drawn lead to even bigger questions regarding the under explored topic.

Overall, the legal environment of this new marketplace lacks a clear regulatory framework. The lack of such a framework creates a great risk for the industry as regulatory departments hold a crucial role in the successful implementation of digital marketing in this market. On top of that, regulatory departments prevent the use of new channels and they even promote a sense of fear. On the other hand, HCPs (Health Care Professionals) understand the positive outcome of using such channels.

They, nevertheless, are not familiar enough with the use of such means and neither can they fully understand how to capitalize on it.

Additionally, the study explored in-depth the main differences among national and multinational firms' views on the usage of digital marketing. There exists a huge gap between the national and multinational business environment and it is still expanding. Greek managers are still driven by the amount of the budget and they do not take advantage of new opportunities, such as the use of digital channels. Nevertheless, they agree that the integration of digital channels plays a crucial role in the internal environment and commercial operations of an organization. In general, this study suggested deploying immediate training on the digital landscape among pharmaceutical businesses, and it recommended managers to incorporate digital initiatives in financial planning.

ASSESSING THE RESPONSIVENESS OF OUT OF POCKET HEALTHCARE SPENDING TO MACROECONOMY AND DIFFERENT HEALTH FINANCING SCHEMES: EVIDENCE FROM 49 EUROPEAN AND OECD COUNTRIES.

Grigorakis, Nikolaos^{1,2}; Galyfianakis, Georgios¹; Tsoukatos, Evangelos¹

ABSTRACT

AIM OF THE STUDY

This study aims to examine the responsiveness of out of pocket (OOP) healthcare spending to macroeconomic factors, as well to tax-based, compulsory-social health insurance (SHI), mixed health systems and Private Health Insurance (PHI) financing, by elaborating fixed-random effects and dynamic panel data methodology to a dataset of 49 European and OECD countries over the period of 2000 to 2015.

RATIONALE

Enhancing knowledge about the potential impact of several macroeconomic and health financing factors on OOP healthcare expenditures is an important tool for policy-makers, when designing national health systems reforms aiming at accelerating financial protection towards Universal Health Coverage (UHC). So far, the recent financial crisis and its deep fiscal recession for several European and OECD countries, provide an opportunity for further empirical examination concerning the potential effect of public and private pre-paid financing schemes on OOP spending.

Previous empirical work has already well documented the responsiveness of OOP healthcare payments to a multitude of explanatory macroeconomic parameters (e.g. GDP, government debt, unemployment) and health financing disaggregated components (e.g. aggregate public and PHI funding) (Grigorakis et al., 2018; Younsi et al., 2016; Fan and Savedoff, 2014; Keegan et al., 2013; Xu et al., 2011; Clemente et al., 2004; Musgrove et al., 2002). Nevertheless, there is no empirical consensus on the effect of macroeconomy, the existence of different public health systems arrangements associated with the voluntary PHI institution funding on OOP expenditure, by using a large sample of countries.

BACKGROUND OF THE STUDY

Health financing objective is to provide equitable access of population to needed healthcare alongside with ensuring efficient safe-nets against the risk of financial hardship (WHO, 2008).

Offsetting high households' OOP payments as a result of seeking care is regarded by the World Health Assembly (WHA) as a core indicator of health systems performance assessment (WHA, 2011).

The concept of financial protection implies to health systems to ensure risk pooling among the population in order to reduce the reliance on OOP spending and thus to diminish households' exposure to financial hardship due to health care use (Saksena et al., 2014; Moreno-Serra et al., 2011).

WHO's, WHA's and United Nations' health financing agenda suggest that countries have to promote financial protection against OOP payments for healthcare. Nevertheless, government decision making in several European and OECD countries proceeded on fiscal stability measures rather than ensuring state health funding post to the 2008 crisis era (WHO and World Bank, 2017; WHA, 2011).

Health systems worldwide make remarkable progress towards UHC by raising the share of domestic general government health expenditure (GGHE-D) in their current health expenditure (CHE). At the same time countries' reliance on OOP healthcare payments follows a downward trend (Xu et al., 2018). According to WHO's official database (WHO, 2019), public health spending corresponds almost to an average of 52% of per country CHE, whereas 32% derives from OOP payments in 2015, respectively. Nevertheless, the phenomenon of households' financial hardship, catastrophe or even impoverishment due to OOP healthcare spending is borderless, irrespective of region or national income level classification (Wagstaff et al., 2018; Xu et al., 2003).

Given that the majority of population in European and OECD countries is compulsorily or privately health insurance covered, the reasonable situation that everyone should expect is OOP payments to be accounted for low proportion to CHE. Nevertheless, OOP payments over the time range from 25% to almost 50% of CHE for several European and OECD economies, such as Cyprus, Bulgaria, Chile, Greece, Hungary, Korea Republic, Latvia, Lithuania, Mexico, Portugal and Spain (WHO, 2019).

METHODOLOGY

We elaborate both fixed and random effects, as well as dynamic panel data methodology to examine several macroeconomic and different health systems financing arrangements associated with OOP expenditures, using data for 49 European and OECD countries from 2000 to 2015. Our analysis uses annual data for several explanatory variables that have been evinced by the existing literature to have a statistically significant impact on determining OOP spending, gathered from three international databases (IMF, 2019; World Bank, 2019a; WHO, 2019).

Moreover, we test for validation of our findings by using several econometric diagnostic tests (Hausman test, panel unit root tests, panel co-integration tests, cross-sectional dependence tests, serial correlation testing, Wald's and Sargan's tests). Furthermore, we apply robustness check to test our econometric approaches in several additional ways.

KEY FINDINGS

Except of unemployment rate, macroeconomic drivers, such as national income and general government debt do not have a significant effect on OOP payments variation, based on our study econometric results. OOP spending is significantly influenced by a country's fiscal capacity to raise general government expenditure to GDP only in tax-based health schemes. Additionally, we find that public associated with voluntary PHI financing has a remarkable negative impact on OOP spending in tax-based and mixed health insurance systems. Our findings are robust since different changes in specifications and samples are implemented in our models.

CONTRIBUTIONS

To Theory

The proposed study contributes to the existing literature on the topic in several ways; a) by extending the empirical knowledge concerning the effect of several macroeconomic drivers on OOP spending and b) by filling the gap in the literature concerning the impact of different compulsory national health systems financing supplemented by voluntary PHI on OOP expenditures, based on a macro-level explanation modeling.

To Policy-making

Gaining more insight on factors associated to households' healthcare payments might help policy-makers to revise their fiscal adjustment planning in order to reduce the reliance of total health financing on OOP spending for several countries.

Our findings indicate that governments have to desist from total commitments for decreasing public health funding in order to exclusively comply with severe structural reforms for achieving fiscal stability objectives. Furthermore, voluntary PHI provides as an additional funding option to national compulsory health system schemes, especially for countries with tight restrictions on their social-welfare budgets.

ORIGINALITY

To the best of our knowledge, there is no an empirical study for examining the potential responsiveness of OOP expenditure to our proposed explanatory parameters nearly to the majority of European and OECD countries based on WHO's region taxonomy. Against this empirical background, we assess the effect of macroeconomy, as well of different national health systems and PHI financing on OOP healthcare spending, for countries with population 1.52 billion (World Bank, 2019b).

INTER-ORGANIZATIONAL COMMUNITIES OF PRACTICE: NEED FOR THEORY?

Gunta, Srinivas

Strategic Management Department, Indian Institute of Management Indore, Indore, India

ABSTRACT

THE PHENOMENON

Communities-of-practice (CoPs) have been acknowledged as a fruitful area for research, spanning several fields, ranging from knowledge management at one end and strategy-as-practice at the other. CoPs are characterized by a shared identity and values, apart from building on a common body of knowledge (Wenger and Snyder, 2000). Understood as informal and interstitial groups of people working together towards a common goal or endeavor, CoPs could be conceptualized as communities within an organization/ firm or transcending organizational boundaries. Yet, the latter conceptualization is scarce in comparison to the former.

THE MOTIVATION

A search for papers on CoPs on Google Scholar throws up several empirical studies that deal with inter-organizational CoPs. This is not surprising, since at least three different types of inter-organizational CoPs can be found thriving: (a) via self-interest communities; (b) through industry bodies and (c) as part of an organization's network with its suppliers, customers and the like. While (c) has been prominent over a period of time and (b) so, in the context of standard setting and lobbying, there have been increasing examples of (a) as well of late, with communities hosted on the likes of Kaggle and GitHub. Yet, each of these types of inter-organizational CoPs is very different from any intra-firm or intra-organizational CoP due to factors such as lower levels of hierarchy and lesser pressures of immediacy. Arguably, these differences are more a matter of distinction than a degree. This calls for theorization of and conceptualization for inter-organizational CoPs.

THE CONTOURS OF THE THEORY

Apart from the above conceptualization of inter-organizational CoPs that deals with issues such as hierarchy, urgency of decision-making and types of inter-organizational CoPs, the extant literature on CoPs itself provides us contours for a theory on inter-organizational CoPs.

Brown and Duguid (1991) suggest that canonical practices should not impede emergence of CoPs – their weakened state in an inter-organizational or extra-organizational setting is an indicator for emergence of inter-organizational CoPs.

However, there still remains a coordination challenge in such CoPs; yet, availability of ICTs such as discussion boards and groupware can double up as knowledge management systems, thus alleviating this concern (cf. Alavi & Leidner, 2001).

Wenger and Snyder (2000) suggest that CoPs emerge due to passionate members committed towards a particular area coming and working together in informal ways – in a world increasingly dominated by professionals and white collar workers, it is not unconceivable that professionals with common interests can be found outside the organization as well. Further, as knowledge is embedded in practice, it stands to reason that professionals engaging in similar technologies may view themselves as members of an interstitial community (cf. Brown and Duguid, 1991).

The lack of immediacy in the context of most inter-organizational CoPs may play a beneficial role in the sustenance of the CoP as well. Becoming a member of a CoP takes time due to the process of socialization – LPP (legitimate peripheral participation), a term suggested by Lave and Wenger (1991) indicates that participants become central to a CoP by starting at the periphery but gradually increasing participation.

Finally, building on Granovetter (1977), one could believe that inter-organizational CoPs maybe most suitable for information (and by extension, knowledge) transfer due to the weak ties that abound as opposed to much stronger ties in a firm-specific CoP.

Going further in this conceptual study, an attempt would be made to also differentiate between the different types of inter-organizational CoPs: (a) via self-interest communities; (b) through industry bodies and (c) as part of an organization's network with its suppliers, customers and the like. Terming them as extra-organizational, supra-organizational and multi-organizational CoPs respectively, we look at differences within these different types of inter-firm CoPs and what drives these differences – professionalism, industry structure and goal congruence. A key objective in this paper would be to develop the inter-firm CoPs as a distinctive class of CoPs and to propose a typology of different inter-firm CoPs. It is believed that this would lead to an overall better understanding of CoPs, especially those of the inter-firm variety, apart from clarifying the conceptualization of CoPs itself.

FUNDING INNOVATIVE SMES OPERATING IN TRADITIONAL SECTORS

Harel, Ronen¹; Kaufmann, Dan²

¹Peres Academic Center, School of Business and Administration, Rehovot, Israel

²Sapir Innovation and Entrepreneurship Center, Sapir College, Sderot, Israel

ABSTRACT

The growing interest in SMEs stems from the fact that they are perceived as a main engine of economic growth and job creation. Still, these companies face obstacles in the form of inaccessibility to financing, especially those companies that are based on knowledge and innovation and whose primary assets are intangible in nature.

The present study is a continuation of the research of Harel and Kaufmann, who investigated the funding difficulties of Innovative SMEs in Traditional Sectors (ISTS) from the supply side, focusing on existing funding sources in the market. The current research aim is to assess the earlier study's ISTS funding market-failure argument, from the demand side as well, that is, from the perspective of the relevant businesses.

This work is based on an analysis of case studies conducted in Israel in 2016. The study findings show similar reports of lack of funding access, despite the great diversity and variety of the companies in the sample, as manifested in their activities across an array of industrial sectors, their levels of innovation, their present lifecycle stages, and their broad size and age range.

The present study contributes to an understanding of the existing market failure from the personal perspective of the company executives. The in-depth interviews provided a first-ever opportunity to obtain sensitive, seldom-revealed information and data, and afforded the opportunity to shed light from a different perspective on the difficulties ISTS face in obtaining financing for innovation. The study also has a practical application. In view of the importance of these businesses to the economy on one hand, and the funding difficulties presented on the other, the findings suggest that a solution to this market failure should be based on government intervention in developing new financing tools suitable for those companies.

THE EFFECTS OF THE BOARD COMPOSITION ON TAX PLANNING STRATEGIES: AN EMPIRICAL ANALYSIS ON ITALIAN LISTED FIRMS

Iazzi Antonio; Vacca Andrea; Maizza Amedeo

Department of Management, Economics, Mathematics and Statistics, University of Salento, 73100 Lecce LE, Italy

ABSTRACT

INTRODUCTION

Aggressive tax planning strategies or Tax Aggressiveness (TA) represent a common feature within the corporate environment, as taxes are a critical factor in the decision-making process of a company (Lanis and Richardson, 2011). The tax planning practice is a managerial strategy adopted by a company in order to reduce its taxable income and consequently minimizing its tax burden in compliance with the country regulatory framework (Bruce, 2007). The adoption of these strategies entails some benefits for companies through the availability of more resources to invest. This enables companies to create value (Desai and Dharmapala, 2006) and to improve their performances (Hanlon and Slemrod, 2009).

The TA strategy involves two main consequences for companies: the first one is a compliance cost as a consequence of the relationship with the tax authority (Scholes et al., 2005); the second one is a reputational cost due to the increase of social and political pressure on corporate decisions (Hanlon et al., 2009; Ayers et al., 2008). The board of directors covers an important role to adopt the TA strategy, thus a good board enables a company to reach economical and financial efficiency; it helps also to ensure equal support to the stakeholders (OECD, 2015). Accordingly to the previous studies, this research aims to investigate the possible consequences that tax planning has within and outside companies. We focused our work on analyzing the consequences that a company corporate governance aiming to adopt aggressive TA - with the scope of having appropriate remuneration for the shareholders - has on the internal decision-making process.

SHORT DISCUSSION ON THE EXISTING LITERATURE

The debate on the role played by governance mechanisms in recent years is constantly growing. There are few studies that investigate the relationships between TA and the characteristics of a firm's corporate governance, in particular in the European context.

Recent empirical studies, show that some characteristics of the board of directors are negatively associated with the decision of the management of making a TA strategy, such as: board size (Lanis

and Richardson, 2011; Minnik and Noga, 2010), the presence of a BIG4 as an independent auditor (Richardson et al., 2013) and the presence of women within the board (Aliani et al., 2012). The literature shows that the presence of independent directors is positively associated with a high level of tax aggressiveness of a firm (Yeung, 2010). Accordingly with the mentioned literature, we can develop the following research hypothesis:

H1. Board's size is negatively associated with a high level of TA of a firm.

H2. The presence of independent directors is positively associated with a high level of TA of a firm.

H3. The presence of women within the board of directors is negatively associated with a high level of TA of a firm.

H4. The presence of a BIG4 is negatively associated with a high level of TA of a firm.

RESEARCH METHODOLOGY

The population under investigation and the financial data have been taken from the database *AIDA – Bureau Van Dijk* and it is made up of 149 listed firms on the Milano Stock Exchange.

In order to analyze a homogeneous group of firms, we have considered the units that hold shares in at least one foreign subsidiary in countries other than Italy in the 2017 financial year. The analysis carried out used a mixed method. We have used the research methodology "Document Analysis"; this research method is based on the evaluation of public documents characterized by stability and exactness of the data (Bowen, 2009) in order to detect the characteristics of the board of directors.

We have chosen this methodology to comply with art. 123-bis of D. Lgs n. 58/98 of the Italian legislation, which forces companies to communicate the information about the composition of the board of directors and the ownership structure. To investigate the relationships between TA and the composition of the board of directors, we adopted a panel data with fixed effects on a time interval of 6 years (2011-2017) with the determination of 894 overall observations.

REGRESSION MODEL

This study measures the Tax Aggressiveness with two dependent variables: "Effective Tax Rate" (ETR) and "Cash Effective Tax Rate" (CETR).

ETR is calculated by the ratio between the total tax expenses and the accounting income before tax.

CETR is calculated by the ratio between the current-year tax expenses and the accounting income before tax (Dyreng et al., 2008; Minnik and Noga, 2010, Richardson et al., 2013; Desai and Dharmapala, 2006; Rego, 2003). The aggressive tax planning strategy of a firm reduces its taxable income and consequentially both ETR and CETR. (Rego, 2003; Zimmerman, 1983).

This research considers the dependent variables ETR and CETR as *dummy variable*, which might take the value of 0 or 1. We consider a firm aggressive and we give to ETR and CETR value of 1 if the firm has a value of ETR o CETR lower than the Italian tax rate of 27,9%, otherwise we give value 0. The Italian tax rate of 27,9% takes into account the tax rate of 24% of the corporate income tax (IRES) and the tax rate of 3,9% of the regional production tax (IRAP).

Accordingly to the previous studies (Minnik e Noga, 2010; Lanis e Richardson, 2011, Aliani et al., 2011) the independent variables *SIZEB*, *%WOMAN*, *%INDCONS*, *CEODUALITY*, *CEOW*, *BIG4* represent the internal and external characteristics of a board of directors of a listed firm. The control variables of this study are represented by *SIZET*, *LEV*, *ROA*, *FCONTR*, *MKTB*, accordingly to the previous studies on corporate governance and tax planning (Adhikari et al., 2006, Dyreng et al., 2010; Richardson et al., 2013, Mills, 1991).

Tab. 2. Description of the variables

Codice	Previsione	Variabile	Valore
ETR		Effective Tax Rate	1= aggressive 0= no aggressive
CETR		Cash Effective Tax Rate	1= aggressive 0= no aggressive
SIZET	+/-	Totale Assets	Log
ROA	+/-	ROA	%
LEV	+/-	Leverage	%
MKTB	-	Market Value	Log
FCONTR	+/-	Foreign subsidiaries	1= >50% 0= <50%
SIZEB	-	Size Board	Log
%WOMAN	-	Percentage of woman	%
%INDCONS	+/-	Percentage of independent directors	%
BIG4	-	Independent auditor: PWC, Deloitte, KPMG, EY	1=Yes 0=NO

In order to analyze the relationship between the composition of board of directors and the tax aggressiveness, we have estimated the following logistic regression models for each dependent variable.

Model 1.:

$$ETR_{it} = \alpha_{it} + \beta_{1t} SIZET_i + \beta_{2t} ROA + \beta_{3t} LEV + \beta_{4t} MKTB + \beta_{5t} FCONTR + \beta_{6t} SIZEB + \beta_{7t} \%WOMAN + \beta_{8t} \%INDCONS + \beta_{9t} BIG4$$

Model2.:

$$CETR_{it} = \alpha_{it} + \beta_{1t} SIZET_i + \beta_{2t} ROA + \beta_{3t} LEV + \beta_{4t} MKTB + \beta_{5t} FCONTR + \beta_{6t} SIZEB + \beta_{7t} \%WOMAN + \beta_{8t} \%INDCONS + \beta_{9t} BIG4$$

RESULTS

The logistic regression analysis carried out shows a positive association between the firm size (SIZET) and a high value of TA of a firm accordingly to Dyreng et al. (2008), Richardson and Lanis (2007) and Rego (2003). Furthermore, the analysis shows a negative relationship of ROA and of the high percentage of foreign subsidiaries (FCONTR) with a high level of Tax Aggressiveness of a firm, accordingly respectively to Minnik and Noga (2010) and Mills (1991). For the independent variables, we show a positive relation between the size of board of directors and the decision of the management planning a TA. The lack of validation of the remaining research hypotheses is consistent with Minnik and Noga (2010).

MANAGERIAL IMPLICATIONS AND FUTURE PROSPECTS

This study offers important managerial implications and it contributes to the existing literature in different ways. In particular, the positive association between the firm size and the TA shows how the large firms with longer histories have greater resources to influence the economic and political process (Gupta and Newberry, 1997). This allows the large firms to engage in a tax planning strategy in order to reduce their tax burdens relative to smaller firms.

Furthermore, this work shows how the characteristics of the governance mechanisms are relevant in the study of the tax planning strategy of a firm. The analysis shows how a board made up by a large number of directors is able to invest more resources in order to adopt a tax planning strategy. This data shows how the strategic choices made by a large board of directors are more oriented to guarantee the interests of the shareholders. For the future researches might be important to know more about the role of the CEO. The literature is focused on detecting the effects of the size and composition of a board of directors on the adoption of a TA, without taking into account specific topics related the possible dual role within the board of the CEO and the gender that could characterize this figure.

LITERARY ENGLAND: A TOURISM DESTINATION FOR THE US TRAVELLER

Ingram, Claire; Themistocleous, Christos; Rickly, Jillian; McCabe, Scott

Nottingham University Business School, University of Nottingham, Nottingham, UK.

ABSTRACT

England is the birthplace of many of literature's well-known authors and their characters: be that Jane Austen and Elizabeth Bennet; Charles Dickens and *Oliver Twist*; or Beatrix Potter and *Peter Rabbit*. It is unsurprising, therefore, that the UK has been constructed as a prime literary destination for international tourists (Iwashita, 2006).

Agarwal and Shaw (2018) present literary tourism as a form of travel for the purpose of visiting sites associated with an author's writing and/or real-life. Within literary tourism research, focus has thus been given to the importance of place. Lee (2012) highlights the demand for visiting fantasy and fictional sites (i.e. Harry Potter's United (Magical) Kingdom), while van Es and Reijnders (2016) examine tourists' activities within cities (i.e. Sherlock Holmes' crime-detective tours). Elsewhere, spotlighting the tourists themselves, research has attended to literary "fans" (Herbert, 2001: 326); with studies foregrounding the demographics, motivations and experiences of what MacLeod *et. al.* (2018) label as the 'touring reader'. However, less attention has been paid to literary tourism through the lens of the non-bibliophile. The question remains as to whether the typical tourist would actively seek out, be interested in, or even aware of, English literary sites and attractions. This has important implications for the tourism industry in terms of how the literary tourism product specifically – and England as a destination more broadly – is presented to the average international traveller.

The purpose of this paper is to examine the likelihood of US tourists visiting England to engage in literary tourism. The paper employs an inductive between-subjects experimental design and compares findings from two surveys: one targeting a General Sample (GS) of the US outbound market (GS, n=2033), and the other targeting a Literary Society Sample (LSS) based in the US (LSS, n=220). The above data is supplemented with interviews undertaken with key stakeholders in the US outbound market, mostly tour operators (n=8).

Analyses from the first set of comparisons focused on whether likelihood to visit England would be affected by the experiment's manipulation variable, which heightened awareness of possible literary tourism destinations in the UK. Results from the paired sample t-tests which examined likelihood to visit, both before and after the survey, indicate that the LSS was unaffected by the manipulation [$t(219)=1.525$, $p=.129$, ($p>.05$)]. This suggests that literary society members possess significantly greater prior knowledge of English literary tourism destinations than the general US tourist, who were found to have been significantly influenced by the manipulation [$t(2032)=25.815$, $p=.000$, ($p<.01$)]. Further

unpaired t-test comparisons demonstrated that likelihood to visit a specific literary tourism destination (e.g. Brontë sisters' birthplace) was higher for the LSS compared to the GS, even when they had little knowledge of an associated book or film [$t(2251)=7.1759$, $p=.000$, $p<0.01$]. This highlights that the general US tourist's potential visit to a literary tourism attraction was more dependent on them having read/watched the associated book/film. The final round of analyses examined the preference of each sample to travel independently or with an organised tour. Results showed that both samples had an identical preference for independent travel instead of guided tours should they engage in English literary tourism in the future, with insignificant differences between the two samples [$t(2251)=0.2844$, $p>0.05$, $p=.776$]. This was supported by interview data, which highlighted that independent travel is becoming increasingly popular with American tourists.

This research contributes to a broader understanding of the US outbound market in relation to literary tourism. The experimental design allowed a closer comparison between US members and non-members of a literary society, in an attempt to understand what drives literary tourism amongst bibliophiles and non-bibliophiles. Overall, the findings suggest that literary society members will likely visit literary attractions regardless of knowledge or a tour-guide; and that non-members – when aware and/or made aware – will not only visit, but will also visit independently. This latter point highlights the importance of improved marketing efforts to better emphasise the literary attractions available in England, in order to best capitalise on the opportunities within the US outbound tourism market.

A REVIEW OF THE ANTECEDENTS AND PERFORMANCE OUTCOMES OF INTERNATIONAL ENVIRONMENTAL MARKETING/MANAGEMENT STRATEGY

Ioannidis, Alexis¹²; Feng, Zhiteng¹; Chalvatzis J. Konstantinos¹²; Leonidou C. Leonidas³

¹Norwich Business School, University of East Anglia, UEA, Norwich, UK

ABSTRACT

1. INTRODUCTION, GAPS, AND OBJECTIVES

Decades of environmental degradation have contributed to transitioning the sustainability discourse from the scientific and technological (Ioannidis and Chalvatzis 2017; Pappas et al. 2018) to the public and corporate domains. Within this context, stakeholders aim to control and mitigate environmental degradation represent wide-ranging institutions and organisations (Goworek et al. 2018; Kumar 2016). Among them, corporate organisations are under pressure to implement strategies that will lead to improved environmental and business performance, which have attracted strong attention in the marketing/management field (Tollin and Christensen 2019). This is particularly true in an international business context, where due to growing globalization trends, firms have to demonstrate responsible citizenship for sustainability not only in their home market, but also in host countries. However, sustainability has been conceptualized in a relatively vague way by researchers, which, coupled with the great diversity of its drivers and outcomes (Chalvatzis et al. 2018) reported by the sizable literature in the field, causes confusion in promoting best practice and advancing theory (Eccles, Ioannou, and Serafeim 2012). In light of these problems, there is a need to systematically review and assess the extant body of research on the antecedents and performance outcomes of international environmental marketing/management strategies. In doing so, our review intends to: (a) identify and analyse the theoretical background of this line of research; (b) assess the research methodologies employed by previous empirical studies; (c) identify and assimilate the key thematic areas and specific topics addressed by prior research; and (d) identify the key variables used in the existing literature (e) develop an agenda for future research on the subject.

2. METHODOLOGY

A two-stage process was adopted for the present review: article identification and article analysis. In order to identify the initial pool of articles, we adopted the concept-driven systematic review method

approach (Webster and Watson 2002). To accumulate a complete census of relevant literature and build the initial pool of studies, articles with relevant topics were searched in various electronic databases, such as Ebsco, Scopus and Science Direct, which provide a comprehensive coverage with full access. We have used the following keywords to identify relevant articles: environmental marketing; environmental strategy; green marketing; environmentally friendly; sustainable marketing; natural environment; environmental orientation; environmental proactivity; environmental awareness; and environmental management. This was done in conjunction with international-related keywords, namely multinational firms; global corporations; global consumers; international marketing; cross-cultural marketing; and cross-national marketing. These keywords were identified from previous reviews on the subject and were refined by two established scholars in the field. We searched these pre-defined keywords in article title, author supplied keywords, and author supplied abstract. We limited our search to articles published in English in academic peer-reviewed journals, since the inception of this field of research in the early 1960s. This initial search from the various electronic databases yielded 949 articles, of which 498 had to be removed because of being duplicated while another 167 were found irrelevant after carefully screening the title and the abstract.

2.1 Article identification

We critically appraised the full text of the remaining 284 potentially relevant articles, by taking into consideration the following four criteria with regard to the studies contained: (1) to be published in an academic journal rather than a book, book chapters or conference proceedings; (2) to focus on environmental marketing/management strategies as an independent concept, rather than as a sub-dimension of Corporate Social Responsibility; (3) to be of an international nature, by examining the sustainability strategies of firms (e.g., exporters, MNEs, etc.) when crossing their national boundaries; and (4) to have empirical nature, with papers having a conceptual, methodological, review, or meta-analytical nature being excluded. Only 68 articles met these pre-defined selection criteria, which were subsequently examined by two academic experts in order to verify their appropriateness. The outcome of this process was to exclude another seven articles. We have carefully reviewed the reference lists of the 61 articles that passed the cross check, revealing another 34 articles fulfilling the eligibility criteria set, thus bringing the final sample of articles useful for the review to 95.

2.2 Article analysis

To map research on the antecedents and outcomes of environmental marketing/management strategy within the international marketing context, we proceeded with a content analysis of the selected articles. In doing so, we have designed a coding frame incorporating publication details, theories

used, time emphasis, variable association, countries involved, industry, unit of analysis, sampling design, data collection, sample size, statistical analysis, topical areas and suggested future research. Two researchers, who worked independently from each other, were involved in the data extraction process, and inter-coder reliability rates on the issues assessed ranged from 85% to 100%.

2.3 Conceptual framework of the review

Building upon stakeholder theory, Resource Based View and Natural Resource Based view of a firm theories (Barney 1991; Donaldson and Preston 1995; Hart 1995) this study proposes a conceptual framework to structure and organize the analysis. Our framework (Figure 1) suggests that internal and external forces can shape a company's environmental strategies which therefore can be categorized into sub-categories based on the nature of the strategy followed which can therefore lead to a competitive advantage.

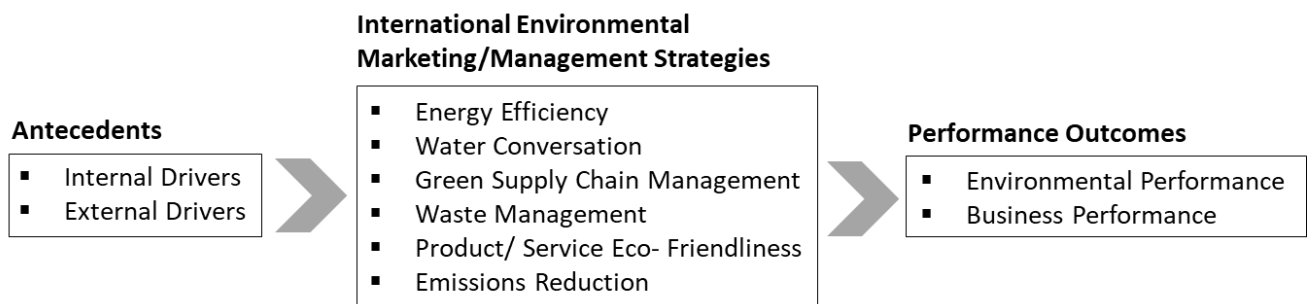

Figure 1: Conceptual Framework for the Systematic Review.

3. FINDINGS

3.1 Overview

The general findings sourced from the systematic review analysis of 95 empirical studies revealed a strong focus on the internal drivers and the financial outcomes of environmental practices of ecological sustainable practices. The main theories identified within the systematic review were 1) the stakeholder theory 2) natural resource-based view 3) institutional theory 4) resource-based view 5) Neo-classical microeconomics. The majority of the studies employed structural equation modelling (SEM), partial least square path model PSL-PM, factor analysis and multi-regression analysis. A large number of antecedents are found to initiate environmental strategies adopted by companies. Drawing upon the stakeholder theory those can be classified into internal antecedents (such as firm demographics, firm financial resources and finally capabilities developed within the firm) and external antecedents (such as societal and regulatory pressures, sectoral pressures, mass media, Non-profit organizations pressures and Quality Assurance Systems). In terms of the fieldwork, the studies

undertaken located mainly in developed economies with less attention paid on emerging and developing economies. The majority of the reviewed studies had a particular focus on manufacturing industries where there are studies where multiple industries are included which allows for examination of industry type control effects. More recent studies start to examine other industries such as energy, tourism, transportation, and other service industries. The vast majority of the research is undertaken using primary data and few studies used secondary ESG data sourced by national or third-party institutions. The articles were classified into six broad thematic categories and multiple sub-categories such as (1) energy efficiency; (2) water conservation; (3) green supply chain management; (4) waste management; (5) product/ service eco- friendliness; and (6) emissions reduction.

3.2 Study Implications

Based on the thematic clustering undertaken, we developed an integrative framework for environmental marketing and management practices and a coherent agenda for future research directions. The systematic review confirms that managers might adopt environmentally friendly marketing/ management strategy as a means of increasing their performance. Competences such knowledge, systems and routines developed within the company are found to stimulate a proactive environmental strategy which research has shown that can enhance different performance outcomes.

OBTAINING INNOVATION THROUGH TECHNOLOGY-BASED ALLIANCES: A DEVELOPING COUNTRIES' PERSPECTIVE

Isnaini, Muhammad Fariz; Kroon, David; Gilsing, Victor

Vrije Universiteit Amsterdam

ABSTRACT

Drawing on a developing country perspective, this paper suggests that technology-based alliances serve a crucial role in influencing firms' innovative performance. Based on their specific market contexts, i.e., developing versus developed market, we categorize technology-based alliances into local, international, and combined technology-based alliances. We propose that each type of technology-based alliance has distinct effects on developing country firm's innovation output. We furthermore discuss the moderating effects of cultural distance and geographical distance on the relationship between international technology-based alliances and developing country firms' innovative performance. Our developed theoretical framework and propositions contribute not only to research on alliances but also to the larger body of literature on innovation and international management.

Keywords: technology, innovation, developing countries

DOES THE PRIMARY AGRICULTURAL PRODUCTION IMPACTS EXPORTING FIRMS' PERFORMANCE?

Karipidis, Phillipos¹; Chrysochou, Polymeros²; Tabakis, Nikolaos¹

¹Department of Agricultural Economics & Entrepreneurship, International Hellenic University, School of Agriculture, Thessaloniki, Greece

²Department of Management, Aarhus University, Denmark

ABSTRACT

The study aims to explore the factors located at the upstream side of the food supply chain, that impact food exporting firm's performance. Thus, it contributes to cover a gap in the food export performance literature. In a first step we analyse the concept of export performance as it is perceived by the staff of food exporting firms. Next, we identify the drivers and barriers of food exporting firm's performance related with primary production, searching also for differences that can be attributed to the kind of suppliers of primary agricultural products, such as cooperatives and farm businesses. Because firms' owned brands help the food suppliers to improve market penetration and internationalization (Juliá-Igual et al. 2012), we further explore the factors impacting performance in the case of firms exporting high shares of branded products. The results support actors of the supply chain (farmers, cooperatives, exporting firms) in effectively planning their export related strategies as well as public authorities, by providing them with input to facilitate exports.

Based on the findings of a previous qualitative research (Karipidis, Chrysochou, and Karypidou 2017), we adopt the Best-Worst scaling method (Marley and Louviere, 2005) for the data collection. The data are collected with the help of a questionnaire distributed electronically to food exporting firms in Greece. 83 fully completed questionnaires have been received until February of 2018.

The findings indicate that seven measures are perceived by the staff of the food exporting firms as indices of the firm's export performance in the last five years. The research reveals the most important factors related with primary production that the firms' staff perceives that impact performance. Thus, five factors identified that positively impact performance, which are related with primary product quality and food safety, certification and quality control process, as well as with farmers. The most important (six) factors that negatively impact performance are related with producers' prices and cost of product collection, product quality inconsistency as well as the geographic dispersion of production and insufficient product quantities.

The research also reveals differences between the groups of firms regarding the importance of factors impacting performance. More specifically, it is found that high involvement of agricultural cooperatives in supplying process is connected with a decrease of the drivers of the exporting firm's performance, while the barriers of performance increase. Opposite to that, it is found that when the

involvement of farm businesses in the supplying process increases the drivers of the exporting firm's performance increase, while the factors negatively impacting performance decrease. These findings could constitute indications that effective co-operations emerge between food firms and farm businesses that favour the enhancement of the export performance but not between cooperatives and exporting firms.

In regards to the food chains supplying high shares of branded products, it is found that seven drivers are considered as most important, while five barriers are considered as most important. The drivers are linked with the high quality, hygiene and certification of primary products, the controls conducted by exporting firms, the selection of suppliers (farmers), the local as well as the innovative character of the purchased primary products. The barriers are linked with the product quality uncertainties, the high cost of product collection, the high producers' prices, the geographic dispersion of production as well as the degradation of product quality. The findings of the study help farmers to properly respond to the international food supply chains requirements, the exporting firms to form their relationships with farm businesses and cooperatives and the public authorities to form an effective policy mix for food exports.

Keywords: food supply; export performance; drivers; barriers; best-worst; primary production.

EXAMINING CONSUMERS' CONTINUOUS USAGE INTENTION OF CONTACTLESS MOBILE PAYMENT SYSTEMS

Karjaluoto, Heikki; Shaikh, Aijaz A.; Leppäniemi, Matti; Luomala, Roope

School of Business and Economics at the University of Jyväskylä, Jyväskylä, Finland

ABSTRACT

STUDY OBJECTIVE AND BACKGROUND

Recent developments in mobile payment (m-payment) technologies have provided consumers with an innovative way to access and use information both anytime and anywhere using various handheld devices, including smartphones and tablets. M-payments have changed consumer behaviors toward payments and shopping. As a result, m-payment technology has started to occupy an important position in the everyday lives of consumers in many countries. Moreover, the resulting increasing mobility and convenience of use have disrupted the use of traditional payment channels (ATMs, Internet, POS) and instruments (cash, debit, credit cards). Literature has defined m-payment technologies as individual or business activities that involve an electronic device being connected to a mobile network to enable the successful completion of an economic transaction.

This study augments the extent literature in several ways. For example, it contributes to the debate on innovative technologies, such as contactless mobile payments (CMP) adoption and use. Prior studies have focused on factors that affect intention to use m-banking and m-payment technologies in general, and only a few have explored specific forms of m-payments, such as CMP. In addition, to understand the adoption and usage of CMP, we build our model on two theoretical premises: We test the effects of core marketing constructs, namely perceived risk (PR), consumer brand engagement (CBE), brand commitment, and overall satisfaction, on continuous usage intention of CMP, and we build our model on the UTAUT2 to obtain further insights regarding the variance of continuous usage intention. From the UTAUT2 model, we adopt performance expectancy (PE), effort expectancy (EE), hedonic motivation (HM), and habit as antecedents to continuous intention to use CMP.

Methodology and results

All the scales that were used to measure the study variables were derived from prior studies. In collecting the data, we cooperated with one national telecommunications provider in Finland and sent a survey link to 22,000 of their customers. In total 1165 responses were obtained, making the response rate 5.2%. SmartPLS 3 was utilized in assessing the measurement and structural model. Reliability and validity of the model was acceptable. The model's predictive relevance was high for brand commitment ($R^2 = 0.659$) and intention to use ($R^2 = 0.698$). The results supported either partially or

fully all the hypotheses and revealed for instance that PR has a negative effect of CBE, CBE is positive related to brand commitment, brand commitment drives overall satisfaction, and that overall satisfaction explains intention. Furthermore, of the UTAUT2 variables, habit and PE exhibits the strongest effects on intention. Finally, our results confirm that intention to use CMP has a positive effect on actual use of CMP.

DISCUSSION

This study makes three important contribution to theory. First, the main theoretical contribution is that we propose and validate an integrated model combining consumer brand engagement model with UTAUT2. Second, we add to the literature on UTAUT2 in testing and validating a modified model of it in a new context. Third, we make a contextual contribution by testing our model in the context of CMP adoption. Thus, the study adds to the literature on m-banking and m-payment adoption by examining user adoption of contactless payments.

The key managerial implication of this study is that our study reveals several specific insights on the adoption and use of CMP in a developed market context.

The key limitations of this study are the cross-sectional nature of the study and convenience sample. There is also always the possibility that other factors influence the study outcome variables than the ones proposed. Future studies should also test the research model and hypotheses in markets in which adoption is not as advanced.

Keywords: Contactless mobile payments, UTAUT2, consumer brand engagement, continuous use intention

ABSTRACT

Embracing a diverse range of topics, such as citizen inclusion, digitalization, sustainability and welfare creation Smart Cities (SC) are a strongly debated trend phenomenon in the present day and an essential research avenue for the future. The design of smart cities requires a diverse set of competences to improve the quality of life of their citizens in the most efficient and sustainable way. Therefore, the strategic and operational actors behind this development need to enhance competences in order to ultimately achieve their duties for the smart city ecosystem.

The research aims to bridge the currently existing research gap of integrating SC Planning and DevOps competences as well as the citizen perspective. It addresses the shortage of digital and transferrable skills that are needed for the various smart cities' sectors and the different SC administrative profiles distinguishing between Smart City Planner, Chief Digital Officer/IT Officer. Based on a wide-ranging literature review on smart city planning and DevOps competences as well as on citizen inclusion, the following research objectives were developed:

1. To investigate how the SC philosophy (citizen/identity driven, or technology driven or both) influences the competences of SC team members.
2. To investigate how the SC philosophy (citizen/identity driven, or technology driven or both) influences SC service priorities and DevOps related decisions.
3. To research to what extent different SC administrative profiles (Smart City Planner, Chief Digital Officer and IT Officer) require different IT/IoT specific and General/Transversal competences.
4. To identify to what extent different SC Service priorities (creating different SC categories) require different competences (specifically as to DevOps) and training.
6. To develop a conceptual framework explaining the nature of relationships between the three focal themes of the project via multivariate analysis.

Furthermore, from the literature review, the following research hypotheses were derived:

- a. Citizen and identity driven strategies require different competences than technology driven SC strategies.

- b. There is a relationship between a citizen and identity centered approach and DevOps related decisions.
- c. There is a relationship between different SC administrative profiles and required general/transversal and IT specific competences.
- d. There is a relationship between SC services and competences/DevOps related decisions.
- e. SC administrative competences will differ according to their level of external co-operation.
- f. Different SC services require different Software architectures and platforms.
- g. Different SC services require different general/transversal and It specific competences.

The research philosophy pursues a triangulated approach combining quantitative and qualitative research methods conducting, in the first stage, a quantitative survey on competence requirements and gaps. Two extensive questionnaires have been developed differentiating between SC Planners and Digital Chief Officers/IT Officers and distributed to respective city representative from Cyprus, Greece, Italy and Germany. The gathered data will be analyzed via multivariate analysis (Structural Equation Modeling; Partial least Square Analysis; Multiple Regression Analysis). This research is being part of the European Project Erasmus + Project number 601015-EPP-1-2018-EL-EPPKA2-SSA. The final objective of the research will be developing MOOCs courses to provide the SC representatives with the elicited set of necessary competences. The results of the research are still an ongoing process and will partially be presented at the EuroMed conference in September 2019.

Keywords: SmarAt City, IT/IoT specific competences, General/Transversal competences, SC Profiles

TITLE: WHAT WORKS FOR WHOM AND WHY FOR TEACHER FELLOW RECOGNITION?

Kershaw-Solomon, Hazel; Claxton, Julia; Beech, Nicolas

School of Leadership, Governance & People Management, Leeds Beckett University, Leeds, UK

ABSTRACT

PURPOSE

The purpose of this paper is to conduct empirical study following a systematic literature review on standards frameworks for professional staff and the relationship between continuous professional development (CPD) and employee engagement. The literature review culminated in a conceptual model which mapped individual, team and organisational antecedents for effective competency frameworks and CPD to engagement.

This study has evaluated this change intervention using Realist Evaluation, part of a family of theory driven evaluations or white box evaluations (Suchman, 1967; Chen, 1990) to identify the underlying causal mechanisms (Astbury & Leeuw, 2010) which generate outcomes in line with the original aims of the intervention and how this affects the levels of engagement of academic staff in engaging in the teacher fellow process.

DESIGN/METHODOLOGY/APPROACH

the research review the teacher fellow scheme linking to United Kingdom Professional Standards Framework (UKPSF), a standard implemented at a post 1992 University. The work employed a Realist Evaluation (RE) (Pawson & Tilley, 1997) with a view to identifying the mechanisms at work that generate the different responses from academic staff to this CPD process. With the aim to gain a deeper and more fine-grained explanations of social phenomena" (Astbury & Leeuw, 2010) and to identify whether those staff responses indicate job or organisational engagement.

FINDINGS

The paper notes the relevance of training programme as an enabling structure, however the importance of informal peer relationships and collegial bounding played a highly significant role in supporting successful teacher fellowship applications. This observations raises the challenges the mechanistic and didactic professional process with proposing that greater focus should be given to the intersubjective nature of collegial learning and its impact on personal development and reflexive

practice and institutional cultural change. This further reinforces the value and significance of realistic evaluation as it identifies what works, for whom, in what context, and why?

ORIGINALITY/VALUE

The paper provides a critical approach in reviewing the impact of CPD and its link to professional status and thus help British university and others to understand how the mechanisms at work affect engagement levels of academic staff. Armed with this depth of understanding of how the change initiative works, with whom and under what circumstances, Universities will be better able to meet target UKPSF membership levels required by the HEA and subsequently, the HEA to meet their targets for the Government.

Keywords: Realist Evaluation; professional recognition, Teacher Fellow recognition; employee engagement; Higher Education; CPD; competency frameworks; peer relationships.

WHEN EMPLOYEE OWNERSHIP IS EFFECTIVE?

Kim, Kyoung Yong¹; Patel, Pankaj²

¹Department of Management, City University of Hong Kong, Kowloon Tong, Hong Kong

²Department of Management and Operations, Villanova University, Villanova, United States of America

ABSTRACT

Defined as “ownership of company stock by employees” (Sesil *et al.*, 2003, p. 96), employee ownership is a popular management practice. In 2015, 52.8% of large European companies had broad-based employee ownership plans, and more than eight million employees in the EU participated in such plans (Mathieu, 2015). Similarly, in the U.S., 15.1 million employees participated in employee ownership plans in 2014 (NCEO, 2016). According to Form 5500 filings in the U.S. in 2014, total assets in employee ownership plans were valued at \$1.4 trillion (NCEO, 2016). The rationale behind employee ownership plans is that they influence employee attitudes and behaviors, promote investments in firm-specific human capital, and consequently improve firm performance (e.g., Blasi *et al.*, 1996; Kim and Patel, 2017).

Employee ownership has been a prominent research topic for many management scholars as well (Dunford *et al.*, 2005; Jackson *et al.*, 1989). During the past few decades, a plethora of research has examined how employee ownership affects firm performance (e.g., Blasi *et al.*, 1996). To summarize these studies, a recent meta-analysis found that despite small effect sizes, employee ownership was indeed significantly and positively associated with firm performance ($r = .04$) (O’Boyle *et al.*, 2016). Whereas significant progress has been made in understanding the employee ownership mechanism at the firm level, little is known about how national culture influences the effectiveness of employee ownership in enhancing firm performance.

This is an important oversight to address theoretically and practically. Theoretically, according to the recent meta-analysis, a considerable amount of variance was left unexplained in the employee ownership-performance relationship, indicating the probable existence of moderators (O’Boyle *et al.*, 2016). Given that employee ownership studies have been carried out in many different countries, the heterogeneity may be related to national culture. Studies in the cross-cultural management literature suggest that national culture explains differences in efficacy of management practices such as employee ownership (Schuler and Rogovsky, 1998), as well as variations in employees’ attitudes and behaviors. Although the role of culture in the employee ownership-firm performance relationship has been suggested in the literature (e.g., Caramelli and Briole, 2007; Kim and Patel, 2017), no study has empirically examined the influence of national culture on the effectiveness of employee ownership. Practically, employee ownership positively contributes to firm

performance (O'Boyle *et al.*, 2016) and is being implemented globally. If the effectiveness of employee ownership varies depending upon national culture, as we expect, then managers should carefully consider national culture when designing employee ownership programs because it can have a significant impact on firm performance. Therefore, the main purpose of our study is to address this gap by examining how national culture influences the relationship between employee ownership and firm performance.

We test the moderating role of national culture on the relationship between employee ownership and firm performance in a sample of 1,486 firms representing 9,893 firm-years between 2006 and 2014. We find that employee ownership is positively associated with firm performance in cultures with high individualism, low power distance, or low uncertainty avoidance. These findings are noteworthy because, in drawing on instruments proposed for cultural dimensions, we control for endogeneity from firm-level adoption of employee ownership and from the influence of cultural dimensions on the employee ownership-firm performance relationship.

Keywords: Employee Stock Ownership; Employee Ownership; Shared Capitalism; National Culture.

IMPACT INVESTMENT EFFECTS ON PROFITABILITY OF COMPANIES IN BRICS COUNTRIES

Kobzeva, Anastasia; Belyaeva, Zhanna

Graduate School of Economics and management, UrFU, Yekaterinburg, Russia

ABSTRACT

Over the past 30 years, completely new concepts of social and impact investments have been introduced, which are still little studied from the standpoint of measuring the effects of their introduction. At the same time, impact-investment contributes to the stabilization of economic imbalance in both developed and developing countries. Impact investments underlie a wide “continuum of influence” that comes from philanthropy to sustainable investments that are being pursued in the modern world by companies that want to achieve not only a positive financial effect, but also a social one. The number of deals with impact investments is growing every year, and the BRICS countries are also increasing their share in the total impact investments. Impact investments are those that are deliberately aimed at achieving social goals along with financial returns.(GIIN, 2016)

The literature actively discusses the possibility of financial returns from impact investment. Part of the researches empirically confirm the presence of effect and influence on the financial results of the company. The works of other authors have revealed positive effects only in the long term. According to a number of researchers, impact investment is an innovative economic tool that allows to select priority projects with measurable added environmental social values that have the greatest potential to achieve sustainable development of the world economy.(Ankudinov,2016; Bentsion and Belyaeva, 2015; Born,2013; Bragdon,1972; Gizatullin,2016; Heinze,1976) The paper attempts to study the state of the market of impact investments in the BRICS countries characterized by a heterogeneous socio-economic environment. Large companies in the BRICS countries are already actively involved in transactions with impact investment. It is the possibility of impact investment to make a profit in emerging markets that determines the relevance of the study. The proposed methodology for assessing the level of impact investment in the BRICS countries and the database of the types of impact investment reported by the BRICS companies collected by the author has elements of scientific novelty. The initial information base is taken from the Annual and Sustainability reports of the companies - leaders of impact investments for 2013-2017, non-financial reports and a review of available literature. The collected database can serve as a foundation for further assessing the prospects for regulating impact investments in the BRICS countries. As the main methodology, econometric analysis was used based on the method of ordinary least - squares and regression with fixed effects.

On the basis of an extensive literature review that identifies key features of impact investment, not only globally, but also for companies, it would be worthwhile to consider the following variables for constructing a model: as a dependent variable, ROA is the ratio of net income to total assets involved in the company's activities, and for the study of the Social effect - Prosperity Index of the Legatum Institute. As explanatory variables: investment in education, cultural events and facilities, in the protection of the environment, in the protection of health, in R & D and in occupational safety. The control variables - revenue, company size (number of employees) and liquidity; they are not the main priority for interpretation and obtaining results, but are related to the dependent variable, so they can complement and statistically improve the sample. Lags for 4 years for both dependent variables are considered.

Impact investments have a negative impact on ROA, and are not very significant. There is a strong relationship between investment rates. This gives us the right to assume that the social areas in which such investments are made are interconnected with each other. That is, if a firm invests in health care, then it also affects culture and education, since a healthy population participates more actively in cultural events and has wider access to education. And when a firm invests in education, it turns out that it simultaneously affects culture and R & D. Broysch-Pagan test, heteroscedasticity corrected. To avoid a correlation between impact investments and eliminate multicollinearity, only impact investments in culture and investment in safety are left in the first model, the remaining investments are considered in the second model. The results are presented in Table 1.

Table 1. Results of econometric analysis

Dependent variable	Specification	Relationship	Hypothesis
ROA (model with two types investments)	$ROA = -1.333566 * TA + 1.095049 * NoEmpl - .7295319 * INV_{sft} + .6702151 * INV_{cult} + \varepsilon$	-	+
ROA (model with four types investments)	$ROA = -1.271773 * TA + 1.111121 * NoEmpl - .1051281 * INV_{env} - .0650278 * INV_{rd} + .4147768 * INV_{educ} + .2101787 * INV_{hlth} + \varepsilon$	-	+
Prosperity Index (model with four types investments)	$ProspInd = -4.257503 * TA + 6.123199 * NoEmpl + 2.397104 * INV_{env} - .1557811 * INV_{rd} + 1.0846 * .0039213 * + \varepsilon$	+	+

Investment in culture has a positive effect on the company's profits. Safety indicator has a negative value, but this can be explained by the fact that these investments do not have a financial effect in the short term. Again, it is confirmed that the indicators of impact investments give an effect only in the aggregate, since, when considered one by one, they lose their significance. The remaining

investments, namely: investments in health care, environmental protection and R & D, were not significant by the results of the regression. At the same time, a negative sign with their coefficients may indicate that if we consider the impact of these types of investments for the current period, then it will negatively affect the ROA. This can be explained by the fact that the fact of investment in the current period indicates high costs, which leads to a decrease in the ROA.

A 4-year forecast was made, which showed that investment in cultural facilities has a positive effect on ROA, that is, the higher the investment in cultural facilities, the greater the return on assets. Investments in safety have a negative effect. This can be explained by the fact that after a year the costs of these investments are still expenses of the enterprise, and despite the sign of the coefficient, the coefficient itself decreases, therefore, the negative impact weakens. Investment in cultural facilities has a positive effect, but the effect is gradually waning, and investment in safety has a negative effect. After three and four years, investment in culture and in labor safety becomes insignificant at all, therefore, the effect of them disappears. Investments in research and development in the medium term will not bring a positive effect to the company.

From the results of the regression with the Prosperity Index, we obtained the following results: the effect of investments in environmental protection lasts for 3 years; in the long term, such investments are significant, but over time, the effect of them decreases. Investment in R & D and investment in occupational safety and health remain insignificant for 3 years. But it is noteworthy that investment in education will affect the Prosperity Index only when there is an investment in R & D, as these indicators are interrelated. Labor safety investments had a negative impact, in the second year the impact becomes positive, and in the third year, the dynamics remain, but such investments do not affect the Prosperity Index.

Researchers are still arguing about the impact of impact investments on companies' financial results, since the availability of a philanthropic component in an innovative instrument makes one doubt whether it is possible to achieve a positive financial effect. As a result of the econometric study, we found that in the current year only two types of investments have a positive impact on ROA, these are investments in cultural facilities and investments in education. During the preparation of the forecast for the medium term, we found that investments in research and development and health care tend to increase the effect, which means that in the long run such investments can bring a positive effect for the company.

We also looked at the effect of impact investments on welfare in the country. The Prosperity Index from the Legatum Institute was chosen as a welfare indicator. During the econometric study, we found that the Prosperity Index is positively influenced by investments in education and investments in environmental protection. These investments also tend to increase in the medium and long term.

Thus, it can be concluded that the opinions of researchers are supported by impact - investments really have a positive effect on financial results. In the current year, at the time of investment, they have a negative impact, as they are expenses of the company. But if you look at the medium-term and long-term outlook, such investments can contribute to an increase in the company's profitability. Therefore, it can be concluded that companies from the BRICS countries need to use such a tool to increase their profitability, as well as to achieve the Sustainable Development Goals of the UN.

EXAMINING THE IMPACT OF EMPLOYEE ENGAGEMENT IN MEDIUM SIZE ORGANIZATIONS IN TIMES OF CHALLENGING ECONOMIC CONDITIONS

Komodromos, Marcos

Department of Communications, School of Humanities, Social Sciences & Law
University of Nicosia, Cyprus

ABSTRACT

Internal communication evolved in the last years in an attempt to adapt to the new globalisation era, new business operational models and technology. Many companies in Cyprus recognize the importance of employee engagement, especially in times of difficulties and strategic changes. Public relations practitioners support that during strategic changes communications is the most important factor in keeping employees informed whether they request the information or not (Nicoli and Komodromos, 2013). Keeping open lines of communication is good in order to anticipate what employees want to know and any information they ask for, the management should be ready to give to them. Richmond (2010, p.18) argues that internal communication shifted from simply sharing information to “helping organisations to deliver better performance, contributing to levels of employee engagement and facilitating collaborative approach to problem solving or innovation”. Albrecht (2010, p.7) considers that “employee engagement is seen as apposite and desirable, expected with higher levels of employee well-being, increased pro-activity, increased creativity and innovation, higher productivity and better bottom-line results”.

Within an organisation, regardless dimension or industry, collaboration and internal communication in times of strategic changes is about building, maintaining, strengthening relationships. Company’s goal and objectives should team up the members of the organisation and collaboration (relationships) should be the main ingredient for achieving that. According to Hansen (2009) collaboration across organisation units, including across divisions, business units, product lines, country subsidiaries, department, functions, factories and sales offices in a company is companywide collaboration (p.15). Wamble-King (2009) suggest that for achieving its goal an organisation needs informed and engaged employees. This can be achieved by infusing and reinforcing the right communication behaviours and attitudes in the organisation’s DNA. Albrecht (2010) confirms that employee engagement contributes to achieving organisational success, and can be considered as a positive work-related psychological state (reflected in words like enthusiasm, energy, passion and vigour), concluding that engagement is also motivational toward organisational goals and success. On the other hand, internal communication practitioners become more and more innovative when engaging employees and increasing collaboration. The

globalisation and employees' dispersion enforced an evolution in internal communication approach (strategy, tactics, tools).

Mellor and Dewhurst (2009, p.18) suggest that internal communication field has more and more functions and state that an effective communication function helps to foster cross-functional collaboration and facilitates dialogue by helping to connect people across the organisation. L'Etang (2008, p.190) confirms that "organisations all require some degree of organisation and collaboration to achieve collective aims". Welch (2012, p.247) also considers that internal communication extended its role and quotes Welch & Jackson who proposed an internal communication matrix consisting of four dimensions: line management, team peer, project peer and internal corporate communication. Many authors support that building a cross collaboration culture is demanding and it is a long term process. The resource allocation is an important element when planning cross collaboration. According to Richmond (2010, p.20) engaging employees in meaningful, productive conversation takes time and effort across entire organisation (communication infrastructure, develop manager's skills, proper IT tools). Providing the complete infrastructure and building a collaborative behaviour in an organisation is not an easy job to do. First because a complex design and infrastructure is required in order to ensure an efficient cross collaboration (varying on the dimensions of the organisations: the larger organisation, the more complex and expensive infrastructure). Second, because a collaborative behaviour or a collaboration culture can only be built in time: people need to understand the overall image of the company and also their role in achieving organisational goals, to understand the benefits of collaboration and their role in collaboration process.

De Bussy and Suprawan's research (2012, p.286) provide the evidence that employee orientation makes a strong contribution to corporate financial performance. Employees, it appears, are indeed the most valuable stakeholders in business organizations". The effect that large-scale change could have on morale and engagement of employees is a major concern and potential risk for operational leaders. A decrease in morale and engagement may impact productivity and organizational productivity, which is also a significant risk. Due to the sudden financial shock over the past three years in Cyprus many employers rushed to downsize or restructure their organizations to capture possible profits. They were so focused on immediate cost cuts through layoffs, legal compliance that they failed to consider broader change management issues that might had an impact on employee engagement. The aim of this research paper is to examine the impact of employee engagement in four medium size organizations in Cyprus, in times of challenging economic conditions. This paper opens the way to building a body of literature and empirical research in this field in Cyprus and will contribute to an enriched

understanding of the impact of employees' engagement in medium size organizations in Cyprus in times of changes. This research employs a multiple-case study research design of ten in-depth individual interviews of non-managerial employees, in four medium size organizations.

Keywords: Employee engagement; internal communication; organizational change; strategic change; management of change; medium size organizations; Cyprus

THE IMPORTANCE OF USING NEW MEDIA AWARENESS STRATEGIES IN THE FIELD OF PHYSIOTHERAPY PRACTICE: THE CASE OF CYPRUS

Komodromos, Marcos; Papacharalambous, Charalambos

Department of Communications, School of Humanities, Social Sciences & Law, University of Nicosia, Cyprus
European University Cyprus

ABSTRACT

The use of online technologies in health professionals' practice, including physiotherapy, has been advocated as effective and well-accepted tools for enhancing professional learning and awareness (BMA, 2011). Health practitioners meet people and other health professionals via social media to share ideas and debate, using social media platforms as a great source of information for various things like news, jobs, announcements, articles, updates, etc. (Scott, 2007). Social media has become a necessity for the healthcare industry, because healthcare organizations can reach target audiences, boost patient engagement, and improve health outcomes (Gillmor, 2018). Their main target is to educate the public on innovative medical cases and more importantly, engage customers.

In the patient-physiotherapist relationship, new media is used as a tool for information, promotion and education. Social networking sites, such as Facebook, Twitter, Instagram and LinkedIn allow professionals to create profiles and become active members, and health care professionals have started incorporating social networks into their public relations strategy in Cyprus. For physiotherapy professional's new media is important to use these sites and engage more with their patients enhancing their skills and knowledge; however, little is known about the perceptions of physiotherapy professionals and students on the use of online technology (Wright, 2018).

Technology and social media affect health behaviors and decision making. With the continuous flow and discovery of health information, social media provide patients and physicians with the ability to filter available data and streamline their search (Reich & Solomon, 2008). In addition, physio practitioners suggest that new media strategies may provide ease and accessibility for knowledge translation with their patients and other health professionals through webinars, podcasts, discussion boards and video-sharing (Farnan, Snyder & Worster, 2013; Grajales, Sheps, & Ho, 2014).

SIGNIFICANCE AND PURPOSE OF THE STUDY

Social media is an effective, powerful and useful tool, that helps organizations and individuals to be innovative in the delivery of education, service provision, or in undertaking research. For the past 2 years, there is an increase in the use of digital media from publics that get informed about issues any

issues and trends in the physiotherapy practice and change how people communicate. The aim of this study is to first critically review the effectiveness, and user perceptions of online technology for patients and professionals and how social media has impacted the Health Care Industry in Cyprus.

The second purpose of this study is to determine new media awareness strategies that can be used in the field of the physiotherapy practice in Cyprus. There is no empirical research that can identify which new media strategies can be used more effectively in the Cyprus market to increase better understanding into the three categories: personal, patients and profession-oriented. In addition, this paper opens the way to building a body of literature and empirical research in the field of physiotherapy practice in Cyprus and will contribute to an enriched understanding of the opportunities to further engage health professionals with their patients and colleagues via new social media strategies.

Following, this research will add to the literature of physiotherapy practice on how physiotherapists and health professionals can actively get involved in the progression of digital trends, using new media strategies, as innovative and driven practitioners to network, develop professionally, educate and grow business when online (Froese, 2011).

RESEARCH METHOD

This qualitative study examined 58 health care professionals and physiotherapy students in Cyprus on how they use these social networking sites to create or share educational content about health-related issues and increase engagement with their patients or and other professionals. This research employs a multiple-case study research design and the researcher used SurveyMonkey platform to collect the data from the participants. The researcher assessed participant's perceptions, using the following questions:

Q1: Which social media channels and networking practices you currently use in physio practice and why?

Q2: What topics and sources of information are most important for you to communicate with patients and other practitioners?

Q3: What type of content you think best support your content marketing mission as health professional (or student)?

Q4: How do you ensure patient privacy when using social media as part of your work in practice?

The results aim to highlight the importance of new media and social networking as a platform to engage and connect with the audience in the healthcare industry and their consideration as a social media management tool.

RESEARCH FINDINGS

Research results highlighted the critical role of new media in the physiotherapy practice for both physio practitioners and students, in communication with their patients and other professionals, as social networking sites continue to grow in Cyprus in terms of number and importance. Participants revealed that when users maintain regularly and correctly their communication with the different publics and adhere to ethical and professional guidelines, new media can be a valuable and effective tool for physiotherapy practitioners, students, physio clinics and health professionals to better serve and communicate with their patients and with other professionals in the field.

Following, regarding the patient privacy in the current new media strategy that participants use to interact with their publics, they suggested that practitioners and other users must avoid writing on social media and obtain patient consent when required. In addition, physio practitioners must use a respectful tone when discussing patients and protect patient information through “de-identification” to make sure that their privacy is secured. Also, the networking practices currently use is that they do not contact patients with requests to join their networks and they rather prefer to direct patients who want to join their professional networks to a more secure means of communication or to their professional sites.

On the other hand, participants said that in order to increase awareness and information via new media, which they find critical to grow their business, they mostly use visual content from physio practice in order to develop a unique voice and personality for their audiences, and they find important the use of creating articles and other content to engage more with their publics. A large percentage of the participants (78%) agreed that they use hashtags in the communication of their messages and posts, create their own branded infographics to provide helpful and insightful information and they make and share short videos. One important factor in the use of any social media tool is to provide immediate feedback to their audience when they receive messages from the them.

Research results proved that careful planning and research will greatly benefit health care professionals and physiotherapy students to effectively use new media tools as they attempt to develop social networking relationships and increase engagement with their audiences. Healthcare organizations need to remain vigilant about the evolving world of social media so that they can utilize it as well as possible. Research results provide insights into the emerging utilization of social media in the physiotherapy practice in Cyprus. Following, the findings showed that more health professionals and physio students are choosing new media, as part of their communication and informational strategy, to share information, to debate practice issues, to promote health behaviors, to engage with

their publics, and to educate and interact with patients and other professionals in the field (Canadian Medical Association, 2012; Reich & Solomon, 2008; Scott, 2007).

ORIGINALITY/VALUE

This critical research provides public relations and marketing academics and practitioners insights into the current body of knowledge of the new media tools used from physio professionals and students as part of their online communication strategy. It also contributes in the theory of new media, social media and engagement in the physiotherapy practice in Cyprus. In addition, the paper introduces the types of social media use by patients and which of these types were found to most commonly lead to patient empowerment. Lack of clear evidence was evident in the case of evaluation of the usability of social media tools, as part of a strategy, that can be used in the field of the physiotherapy practice from physio practitioners and students that are in this field of practice. Future research could examine whether new media is effective or professional for educational purposes in the physiotherapy practice through qualitative and quantitative research and must focus on innovation to capitalize on the potential held by new media from physio practitioners in Europe.

INTERNATIONALIZATION, BRAND INNOVATION AND BRAND EQUITY: A SYSTEMATIC LITERATURE REVIEW

Kyanides, Yannis; Hajidimitriou, Yannis

Dept. of Business Administration, University of Macedonia, Thessaloniki, Greece

ABSTRACT

Background

Nowadays, brand innovation is one of the most important issues to brand management. Managers are aware of the fact that the only way to maintain the vitality of a brand is continuity of innovation. However, Brand Innovation (BI) receives little attention in the branding literature. Most research studies in the international literature focus on product innovation. Brand Innovation is a field that has not been adequately explored, resulting in a significant gap in the literature and a clear framework on BI has not been developed (Grant 2007; Chien and Yuan, 2013). On the other hand, the concept of internationalization is broadly used and examined in international business research (Sullivan, 1994; Hassel *et al.*, 2001; Letto-Gillies, 2002). While there are several studies on the impact of internationalization on innovation in general, there has been no extensive research on the relationship between internationalization and BI. In addition, a limited number of studies examine the impact of internationalization and BI on brand equity, which is the ultimate goal of all business endeavors.

OBJECTIVES

In this context, the purpose of this paper is to review the literature on:

- 1) Brand Innovation providing a conceptual framework.
- 2) The relationship between Internationalization and Brand Innovation.
- 3) The impact of Brand Innovation on Brand Equity.

METHODOLOGY

Searches were conducted in several databases including Business Source Premier (EBSCO), ProQuest, Emerald Insight and Science Direct. Google Scholar was also mined for published articles and full conference papers. Two reviewers independently conducted screening, data extraction and risk of bias assessment. Search results were assessed for relevance in a three step process of comparing title, abstract and the full text against stipulated criteria for in- and exclusion. A total of 153 articles were found that met our initial search criteria. A total of 35 articles were subsequently excluded from the

search because they did not have any significant mention of the issues under study. Articles selected are published in 62 different journals.

FINDINGS

The relationship between internationalization and BI is examined in very few studies. Several authors (Kumar and Saqib 1996; Buesa and Molero 1998) examine the relationship between internationalization and innovation in general, considering that firms' international activity is one of the main determinants of regularity in innovation (Chiva *et al.*, 2011). Hitt *et al.* (1994) showed that highly internationalized firms can improve their ability to innovate by having greater opportunities to learn (Kafouros *et al.*, 2008; Nooteboom, 2000). In addition, Kylaheiko *et al.* (2011) conclude that firms' internationalization orientation leads to more novel ideas, products and services, through the understanding of foreign firms' capabilities and customers' needs. Vrontis and Christofi (2019) provide a systematic literature review concerning the impact of R&D internationalization on innovation. Nguyen *et al.* (2016) studied the impact of internationalization on BI and conclude that internationalization is positively related to BI in the industrial service sector.

Concerning the relationship between BI and brand equity, Chien and Yuan (2013) in their research concluded that BI positively and directly affects brand equity. Other authors (Brunello, 2014; Nørskov *et al.*, 2015; Shriedeh and Ghani, 2016) conclude that innovation in general has a positive influence on brand equity.

CONCLUSIONS AND IMPLICATIONS

The systematic review we conducted found that most scholars agree that internationalization has a positive impact on innovation in general. However, there are very few studies that examine the impact of internationalization on BI in particular. In these studies findings are contradicting. Furthermore, international literature is very poor in exploring the relationship between BI and brand equity. Through the proposed literature review, we will suggest a conceptual framework for BI and reveal issues that are understudied or there are contradicting empirical findings and, therefore, further empirical research needs to be undertaken.

COLLECTIVE AND SOCIAL ENTREPRENEURSHIP: THE BASIS FOR MORE INNOVATION AND CORPORATE SOCIAL RESPONSIBILITY ?

Lachapelle, Nathalie; Tremblay, Diane-Gabrielle; Laurent Sauvage

Ecole des sciences de l'administration, Université TÉLUQ, Université du Québec, Montréal, Canada

ABSTRACT

The objective of our presentation will be to discuss the similarities and differences between collective and social entrepreneurship, and to compare them to classic forms of entrepreneurship, which was the objective of our research, based on a method of systematic literature review. We are particularly interested in the elements which distinguish these forms of entrepreneurship in terms of governance (individual or collective), of participation and other similar elements which appear to distinguish these forms of entrepreneurship.

The **purpose** of the research and presentation are the following:

- Differentiate social and collective entrepreneur and entrepreneurship, find similarities and differences;
- Compare North American and European perspectives on these forms of businesses;
- and determine the sources of innovation and possible better CSR associated with these forms

The presentation will proceed as follows. We will start by defining forms of innovation, according to Schumpeter's definition, and will include social innovation to Schumpeter's product, process and combination innovations. Then we will present the social economy sector in Québec, and its contribution to collective entrepreneurship. We will then go on to the analysis of literature and results.

The **methodology** is based on systematic literature review and on interviews. The literature review search was done with the following keywords : « social entrepreneurship », « collective entrepreneurship », « social entrepreneur », « social economy entrepreneur », « entreprise collective », « entrepreneuriat collectif », « entrepreneur collectif », « entreprise sociale », « entrepreneuriat social », « entrepreneur social ». This led us to find some 807 references, and after a selection we retained 63 references which were more appropriate for our research question. This part of the research is finalized and makes it possible to establish definitions, similarities and differences between social and collective entrepreneurship, as well as to develop an interview guide for the interviews, which are presently ongoing. The research questions for the interviews cover the following: sources of project, resources available, objectives, forms of governance, ownership, innovation, etc.

As concerns the social economy in Québec, it is composed of the following:

- About 7 000 social economy firms (3 300 Cooperatives and 3 700 NPO with market activities).

- 210 000 persons, i.e. 5 % of total employment in Québec.
- 40 billion dollars business for cooperatives and *mutuelles*.

In terms of **findings**, various authors have defined the social economy and collective enterprises it covers, in these terms: Neamtam (2002 : 3) defines the social economy as: 'It is all which is not part of the public or traditional private economy'. Lévesque (2002:3) says it integrates and affirms the social dimensions of the economy, whether at the level of the firm or of society; finally, Laville (1994) talks of the Plural Economy as a combination of market, non market and non monetary resources.

The research leads to the following **contributions** as concerns the characteristics of the social economy. In terms of values and vision, persons are more important than capital in the sharing of revenues and surpluses. As concerns governance, there is a democratic and collective decision making process, which is not the case in the social enterprise.

As for Social Entrepreneurship, the entrepreneur has social objectives and values, but the mode of governance is different as it is the individual entrepreneur who makes all decisions and he does not share the power of decision making.

This is an **original contribution** as not much research has analyzed the governance structures and put forward the governance, decision making and property type as important differentiating elements between the two types of social and collective entrepreneurship. In our presentation, we will develop more on the distinctions and similarities between these two concepts of collective and social entrepreneurship, on the basis of some of the main authors in the field (Lévesque, 2016, 2002; Santoro, G., Ferraris, A., & Vrontis, D.; 2018; Mair & Marti, 2006; Shapero, A., & Sokol, L., 1982). We will also highlight similarities and differences with classic entrepreneurship. We will also present some elements from the ongoing interviews.

Keywords: Corporate Social Responsibility, social economy, collective entrepreneurship, social entrepreneurship, innovation, business performance, governance, business ownership,

ACCOUNTING HISTORY COURSES IN ITALIAN UNIVERSITIES

Lazzini, Simone; Nicolliello Mario

Dept. Economics and Management, University of Pisa, Pisa, Italy

ABSTRACT

The paper aims to analyze the importance that the Italian Universities has given to the History of Accounting in Italy, investigating the evolution of the teaching of "Accounting History" in educational programs, in light of the various changes that they have succeeded over time.

The goal is to understand if, in Italian Universities, the teaching (or the module) of "Accounting History" has managed to maintain its status over time, or has lost importance.

The research question is: Is there a correlation between the presence in the courses of teaching "Accounting History" and the different reforms of the University that have succeeded over time?

The research starts with an analysis of the normative evolution of Italian Universities, in order to understand the periods to be considered in the study: it follows with an Analysis of the teaching programs of the Italian Faculty of Economics and Commerce in the years in which the various reforms of the University were implemented; it finishes with a search for a possible correlation between reforms and status of Accounting History.

Our paper seeks to provide a historical perspective on Accounting Education in Italy. Our aim is to contribute to the literature on accounting change more generally (Burns, 2000). Following Robson (2006, p. 272), the approach to historical investigation adopted in this paper is analogous to that which accounting scholars label "contextual" (Hopwood, 1983, 1987; Napier, 1989) and more recently "processual" (Burns, 2000). Bhimani (1993) considers that in contextual studies, "accounting is a social practice subject to being influenced by a wide array of forces and itself effecting social changes of its own account" (Bhimani, 1993, p. 3). There is a well-established and wide-ranging literature of accounting change in its context (Burchell et al., 1985; Loft, 1986; Hopwood, 1987) and it is increasingly recognised that examining accounting change over a long timeframe, with a detailed analysis of the decision-making processes can provide a fuller understanding of how accounting practice is devised and implemented (Hopwood, 1983; Bhimani, 1993; Ryan, 1999; Burns, 2000; Scott et al., 2003). As Burns (2000) states, this focus, on context and process, has also been a preoccupation for researchers of strategic organisational change and many of their ideas can be applied to accounting history (Pettigrew, 1987; Pettigrew et al., 1992; Dawson, 2003).

Following the formulation of Scott et al. 2003, the analytical framework used in this study draws on processual and contextual changes. Change has both temporal and spatial elements. Recognition of this in accounting change research is provided by Carnegie and Napier (1996, p, 7) who argue that

“accounting is to be understood in the context in which it operates, as a phenomenon local in both space and time”.

The emphasis on studying accounting “in the contexts in which it operates” was promulgated by Hopwood (1983), and has subsequently informed many studies of accounting change. Scott et al, 2003, cite Robson (1992), Bhimani (1993) and Bryer 1993 p. 649), who summaries this approach by stating “the increasingly accepted view amongst accounting scholars is that the technical practices of accounting must be understood, not as the expression of some transcendental rationality, but as reflection and reinforcement of social, political, and economic relationships”.

Regarding the methodology, following the Previts et al (1990) definitions, with respect to the nature of historical research this is a narrative study because it is direct towards establishing and describe items of fact. In particular this paper describe how the teaching of Accounting History was changed inside the Italian Universities.

Regarding the method, always following the Previts et al (1990) definitions, this paper uses the case study research, because it is a longitudinal study of several Italian Universities over a lengthy period of time.

MARKETING PERFORMANCE MEASUREMENT AS A STRATEGY TOOL: EXPLORING ITS IMPACT ON FIRMS' ARCHITECTURAL MARKETING CAPABILITY

Liang, Xiaoning

Trinity Business School, Trinity College Dublin, the University of Dublin, Dublin, Ireland

ABSTRACT

Architectural marketing capability is a planning-related capability that is involved in selecting strategic marketing objectives (Morgan, 2012) and implementing-related capability that is associated with the achievement of marketing strategies (Vorhies and Morgan, 2005). Previous studies have highlighted architectural marketing capability as a prominent capability because of its vital role in the improvement of firm performance (e.g., Chang et al., 2010). Evidence has shown that firms with a superior architectural marketing capability are more likely to outperform others due to their strong skills in anticipating and responding to environmental changes (Slotegraaf and Dickson, 2004). However, despite the recognition of the contributions of such capability to firm performance, previous studies have failed to investigate how firms can develop such capability (Zhou and Li, 2010).

To fill in the research gap, this study aims to explore how a firm's marketing performance measurement practice can influence the development of architectural marketing capability. Drawing on survey data collected from over 200 Chinese firms, this study finds that the measurement breadth and legitimization use of marketing metrics can positively influence a firm's architectural marketing, and thereby its firm performance. While architectural marketing capability partially mediates the relationship between the measurement breadth of marketing metrics and firm performance, it fully mediates the impact of the legitimization use of marketing metrics on firm performance. The results confirm the role of marketing performance measurement as a strategy tool to improve the planning and implementation of marketing strategies. This extends previous studies (e.g., Homburg et al., 2012), in which the antecedents of architectural marketing capability and marketing performance measurement are connected, and empirically confirms that the role of marketing performance measurement as a strategy tool (Pauwels et al., 2009). One practical implication is that firms can adopt a wide range of marketing metrics and use them to justify decisions made/to-be-made in order to improve its architectural marketing capability. In addition, market turbulence is found to positively moderate the effect of the measurement breadth of marketing metrics on architectural marketing capability and the effect of the latter on firm performance, suggesting that companies need to align their capability and organizational practices with external environment to reap more benefits (see also Frösén et al. 2016; Homburg et al. 2012).

This study has several limitations, which may lead to future research opportunities. First, the use of cross-sectional design is not suitable to test causality hypothesized in this study. So future research can adopt a longitudinal research design. Second, collecting data from single informants is not ideal given that the strong relationships among variables may be caused by single-informant bias. Thus, it is worthwhile for future research to use multiple-informant for data collection. Third, since the data were only collected from China, the results should be generalized with caution. To get a more holistic view of the research phenomenon, a cross-cultural comparison may be warranted.

Keywords: architectural marketing capability, marketing performance measurement, market turbulence, firm performance

³Department of Business Administration, University of Macedonia, Greece

ABSTRACT

Background and statement of the problem: This study examines the impact of mergers and acquisitions (M&As) on the post-merger performance of Greek listed firms using accounting variables (profitability ratios). We examine firm profitability for the first years after M&As and in the long-run (before and after the onslaught of the economic crisis, respectively, which are in the selected periods: 2003-2006 and 2007-2014).

Research methodology and data: For the purpose of the study, a set of five profitability ratios is employed for the examination of fifty mergers, in order to measure firms' post-merger performance and to compare pre- and post-merger firm profitability before and after the M&As announcements. To delve deeper, we analyze with nonparametric tests seven qualitative variables as strategic choices of the sample firms in M&As' past decisions: selection of merger or acquisition, hostile takeovers or friendly M&As, legal form and valuation of the target firm, method of payment, decision for an international merger or not and the type of the target's production line.

Research findings: We find these ratios to be statistically insignificant indicating firms do not experience a post-merger improvement in accounting performance the first years after M&As (before the outbreak of the economic crisis in Greece), but there is a partial deterioration of the post-merger performance in the long-run (during the economic crisis). In contrary, regarding the strategic choices during the first years after M&As, we provide evidence that the selection of acquisitions than mergers, as well as hostile takeovers than friendly M&As, affect positively firm profitability. Similar positive effects we have found concerning legal form of the target firm and method of the target valuation. We found no change in other examined strategic choices as method of payment, international merger or not, target's production line.

Policy implications: The present study could be useful to several interested parties as a recent empirical result. Firstly, to business executives, consultants or potential investors that want to proceed on a possible investment through mergers or acquisitions in Greece, as several business characteristics for successful business strategies have been proposed. Secondly, for policy makers, tax and other state authorities paints a recent picture for M&As activities in Greece before and after the outbreak of economic crisis.

ABSTRACT

In light of a troubled economy and the new perspective of ethics, internal audit is considered a valuable tool in the hands of private and public administrations. Internal control systems can counterbalance the increasing number of destabilizing elements, incurred from fiscal recessions, by redesigned activities or impropriety audit. It is due to these attributes that internal audit as a prudent method can facilitate the public sector toward molding procedures and socially just governance models ingrained with scrutiny. This paper aims to highlight the key role; the internal audit has to play in the public sector. Furthermore, it attempts to display some basic factors that influence audit effectiveness as well as the contribution that the Court of Auditors has to offer. A questionnaire was sent to all Commissioners in Greece, while the analysis was carried through the statistical data analysis program of SPSS. Data demonstrate a tendency for human resources, central service support, standard control procedures and utility to affect internal audit.

Keywords: Court of Auditors, Internal Audit, Public Sector, Effectiveness, Control Procedures.

GLOBAL SUSTAINABILITY AND DIGITALIZATION LINKAGE

Lopatkova, Yana; Belyaeva, Zhanna; Sohag, Kazi

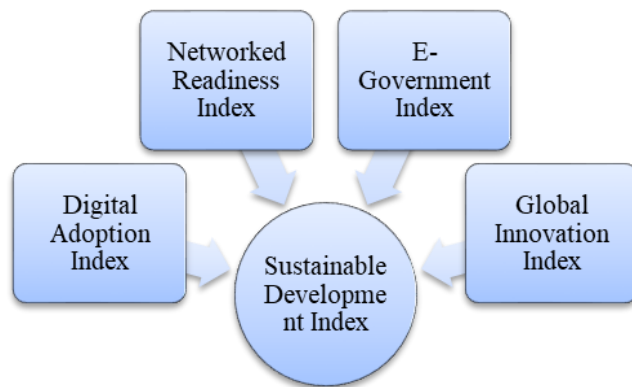

Graduate School of Economics and Management, Ural Federal University, GSEM-UrFU, Yekaterinburg, Russia

ABSTRACT

The world economic and social paradigms are changing due to the significant influence of digitalization. This abstract pinpoints the impact of digitalization on global sustainable development incorporating the role of digital adoption, e-government, networked readiness and innovations. Although, digitalization and sustainable development are the most important trends in modern life (Kiron and Unruh, 2018), the intersection of these two aspects remains a largely unexplored area. Existing literature argues that digitization has twofold impact on sustainable development. First, innovation is a key driver for achieving sustainable development goals (Silvestre and Tirca, 2019) while digitalization functions as tool for innovation can ensure and improve the security, performance, transparency of operations, and the efficiency of systems worldwide (citation needed). Second, new digital technologies appear to be a potential threat in the form of cybercrime, financial crime, and loss of privacy. In addition, digitalization opens up opportunities for total supervision, which might in a way limit the legal rights of individuals and organization privacy (Seele and Lock, 2017). Moreover, digitalization brings rebound effects while potentially working for sustainable development, hence digitalization should be understood as a social phenomenon and a driving force of social innovation (Reichel, 2018). Still current research stream does not specify nature and drivers of sustainable development at macro and mezzo levels, although selected work were devoted to big and small businesses, finding positive correlation in applying digital effects in SMEs and in global corporations (Lopatkova and Belyaeva, 2019; Cagno et al, 2015; Presenza et al, 2019; Chou et al, 2015) Due to the contrasting strands of arguments, we aim to re-investigate the impact of digitalization on sustainable development incorporating the role of e-government, networked readiness and innovations following the below adjusted research design (figure 1). To this end, we apply robust cross-sectional regression in analysing the data for the year of 2016 in the context of 157 countries by stratifying the different socio-economic levels of development.

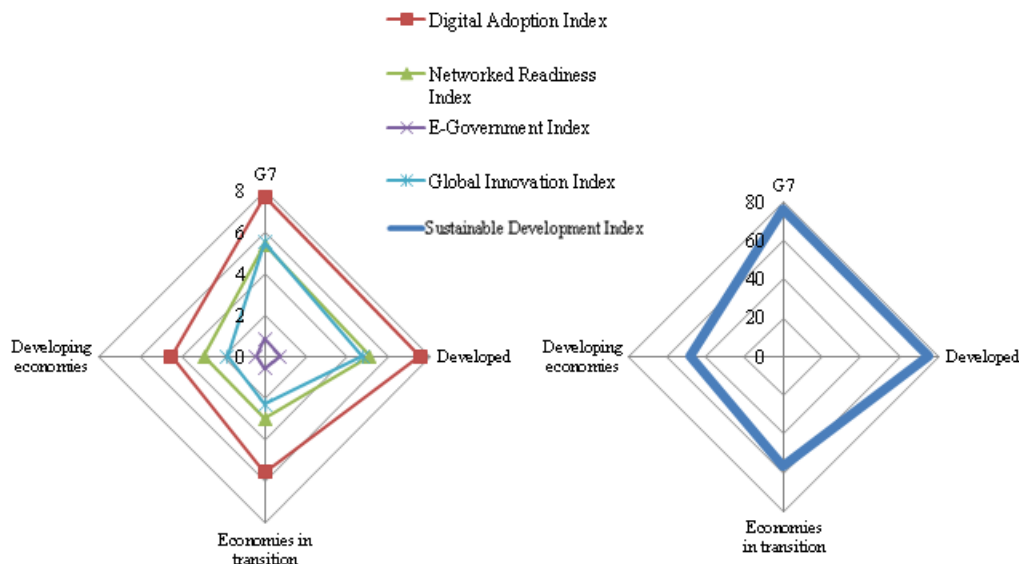

The research is based on analysis of digitalization factors affecting sustainable development based on sample of 157 countries with different socio-economic levels of development. The study implies the descriptive research and cross-sectional regression for the year of 2016.

Figure 1. Research design

The descriptive analysis indicates that the trend of sustainable development is associated with the trend of digitalization development. The level of sustainable development and digitalization are proportional to the level of socio-economic development of countries (figure 2).

Figure 2. Average value of sustainable and digital development

The cross-sectional regression (robust regression) used to measure the impact of digital factors on sustainable development. Due to presence of perfect multi-collinearity between digital adoption index and e-governance development index, we formulate two different models:

$$\text{Sustainable development} = \beta_0 + \beta_1 \times \text{Digital adoption} + \beta_2 \times \text{Networked readiness} + \beta_3 \times \text{Innovation} + E \quad (\text{M1})$$

$$\text{Sustainable development} = \beta_0 + \beta_1 \times \text{eGovernment} + \beta_2 \times \text{Network readiness} + \beta_3 \times \text{Innovation} + E \quad (\text{M2})$$

Estimated results are presented in Table 1 and 2 for M1 and M2 respectively.

Model 1: Digital adoption, networked readiness and innovations (Model 1Panel A);

Model 2: D-government, networked readiness and innovations (Model 2 Panel B)

Table 1. Results of testing models

Model	Variable	Coef.	Description
Model 1Panel A	Digital Adoption	30,9*** (12.77)	Factors influence positively on sustainable development
	Networked Readiness	4,4*** (1.66)	
	Innovation	0,13** (0.06)	
Model 2 Panel B	E-Governance	24,41** (11.24)	Factors influence positively on sustainable development
	Networked Readiness	4,85*** (1.57)	
	Innovation	0,14*** (0.08)	

*** 1% level of significance; ** 5% level of significance. In brackets are robust errors. The number of observations – 157. Model 1: Breusch-Pagan Test: 30.81***; Ramsey RESET: 1.52; VIF: 2.83; R2 : 0.62.

Model 2: Breusch-Pagan Test: 32.55***; Ramsey RESET: 0.65; VIF: 2.84; R2 :0.61

Our finding demonstrates that digital adaptation index positively and significantly explains global sustainability (Table 1). In addition, e-governance is also found to be conducive to promote the global sustainability. Concerning our control variables, both network readiness and innovation play crucial role to enhance the global sustainability. Our study provides several policy implications based on our empirical findings. Thus, digitalization can ensure and improve global sustainable development.

The findings of this study indicate that if the concept of digitalization can to be an effective factor of the sustainable development, it should be embedded into the business, government and society core statement. The positive results of this study suggest that it is necessary to conduct research in the field of sustainable development and digitalization in order to fill the gap of theoretical and practical knowledge

GAMIFICATION IN HIGHER EDUCATION:TEXT MINING APPROACH

Loureiro, Sandra Maria Correia; Angelino, Fernando; Bilro, Ricardo Godinho

Dept. of Marketing, Operations and General Management, Instituto Universitário de Lisboa (ISCTE-IU) and Business Research Unit (BRU/UNIDE) Lisbon, Portugal

ABSTRACT

BACKGROUND

Gamification is a growing trend in research (Caponetto, Earp, and Ott, 2014; Erenli, 2013; Kasurinen and Knutas, 2017) as well as in educational settings (Azmi, Ahmad, Iahad, and Yusof, 2017; Dicheva, Dichev, Agre, and Angelova, 2015). While a more common definition of gamification is still under evaluation throughout the research community, for this research we adopt the definition from (Deterding, Dixon, Khaled, and Nacke, 2011) - gamification is “*the use of game design elements in non-game contexts*”.

Higher education is among one of those “*non-game contexts*” where the implementation and usage of gamification techniques, is evolving in an ascending trend and in various educational settings (e.g., Faghihi et al., 2014; Galbis-Córdova, Martí-Parreño, and Currás-Pérez, 2017).

Different research methods have been used to explore not only the potential of gamification but also its pros & cons, regarding all areas of valuable application. In the present research, text mining techniques were used to perform an automated literature analysis, from 2011 to 2017, of gamification application in higher education settings.

METHOD

To carry out this research, a single query was applied in a single data source (Proquest database). The query used was unique and consisted in a simple Boolean expression containing two terms/expressions connected through an AND, which means that both terms/expressions had to be present in every article: “gamification” AND “higher education”. The search was performed in October 2018 and included only *peer reviewed* articles with available *full text*, published in *Scholarly Journals*. Only the article title, abstract, and keywords were analyzed since those are the most relevant article areas where more important terms and concepts, should be mentioned. The search results returned a total of 187 articles that, after a unitary manual analysis, a total of 9 articles could not be considered for this research due to the following reasons: 3 articles were digitized images; 2 articles were in Spanish language; 4 articles were in Portuguese language. After this unitary manual analysis, the final number of articles considered for this research was 178.

All 178 articles were converted into text (.txt) files, using a free pdf to text converter solution and, all the bibliographic references were pruned from all articles, to avoid non-significant term duplications while running the text mining procedure.

MAIN FINDINGS

We found 8 topics. The first topic, with a total of 66 matching articles stands out as the most relevant topic for “gaming”, which indicates the predominance of gaming related technologies and methodologies through the set of the researched articles. The term “gaming” is also present in 7 out the total 8 topics, which seems to confirm its relevance and impact through learning. As stated by (Erenli, 2013), the gaming industry has a huge impact on society and the increasing number of players, can also be considered as an evidence that most students are familiar with gaming and feel it as a joyful experience. Hamari and Keronen (2017) also point that games have become the “largest form of leisure information systems [providing] enjoyment and usefulness” to players. For the second topic, with a total of 41 matching articles, the term “learning” is also highly related with this topic, which seems to suggest a relevant presence of these related subjects in the set of the researched articles. In the same topic the terms “gaming” and “ai” also show a significant relation with “learning” due to their correspondent low beta values. According to Williams and McOwan (2016), artificial intelligence methods together with human perceptual observations, can provide some “insight into certain high-level human perceptual and cognitive processes.”.

The third topic, with 24 matching articles, shows a good relation between software quality assurance, gaming and gamification, which seems to confirm some of the main concerns from educators when starting to implement gamification classes supported in information technologies (LMS – Learning Management Systems software). As mentioned by Azmi & Singh (2015), some of those concerns are related with the fact that, despite all the importance and capacities of LMS in learning, most students do not utilize the system to its fullest potential. LMS’s are not being used effectively and efficiently. Rucker and Edward (2015) in their study also support that faculty, most of the times, as some specific needs for additional LMS’s training and support.

Topic 4, with 16 articles, seems to indicate a significant relation between software and education, what suggests the usage of software-based tools for educational purposes. Stanisavljević-Petrović, Stanković, and Jevtić (2015) corroborate the relevance of using software for educational purposes, as well as its positive impact in learning. Topic 5 with 8 articles and topic 5 with 7 articles. Topic 7 (11 articles) highlights the need to study critical success factors in gamification, with an emphasis on gaming. Topic 8 comprises only 5 articles. Despite the relation with gaming and learning.

Observing the yearly distribution of the articles, through the period under analysis, the years of 2015 (50 articles) and 2016 (61 articles) stand out as the years with more published research on *gamification* and, *gamification AND higher education*.

According to the results, the most relevant conclusion seems to be that gaming and learning are closely linked together. Gamification has also been playing a growing role in teaching and learning over the years and revealing a tendency of growth in attention from academic research.

This research also seems to highlight that further research must be carried out looking for results and relevance of gaming and gamification for learning purposes, giving special attention to student performance and results.

THE ROLE OF ACCRUAL ACCOUNTING FOR FINANCIAL SUSTAINABILITY IN LOCAL GOVERNMENTS: A CASE STUDY

Lucianelli, Giovanna; Fazzari, Amalia Lucia; Cavalieri, Matteo

University of Rome "Tor Vergata", Italy

ABSTRACT

PURPOSE

In the last years, many countries were involved by the financial crisis both at the central and local level. In this context, international authorities have highlighted the need for sustainable strategies to be developed to create the necessary conditions to achieve financial health as well as ensure intergenerational equity (Cabaleiro et al., 2013).

Local Governments (LGs) in poor financial health become unable to deal with their financial obligations and still provide public services, given that quality or quantity of these services often results damaged (Raphael et al., 2010). At first glance, the weakening of the financial condition can be observed particularly in LGs with a reduction of public revenues followed by public expenditure cuts (Pérez-López et al., 2013; Bailey et al., 2014; Checherita-Westphal et al., 2014; IMF 2014;).

The level of a suitable financial condition is not easy to represent since it cannot be readily measured with a single performance indicator but rather is determined by different measures which are directly observable. It is worth noting that some factors are under the control of managers (as well as politicians) of a local government, while others are not (Bisogno et al., 2014).

Accordingly, the literature has investigated the determinants of financial health to measure the financial condition proposing three indicators. These are the level of sustainability, flexibility, and vulnerability, to represent the ability of an entity to preserve the social welfare of citizens with the available resources (Greenberg and Hiller, 1995, the CICA, 1997; Zafra-Gómez et al., 2009; Bisogno et al., 2017).

This paper aims to deepen the financial condition in the municipality of Rome analyzing the effects of accrual accounting in the financial reports. The study has been focused on a first plan of rebalancing the debts collected over the years, launched in 2008, and on a second one of reducing the expenditures, started in 2015.

The city of Rome represents an interesting case-study because the implemented strategies on financial sustainability have brought some positive effects in a situation of financial crisis. The case study pursues the financial resilience through the combination of capacities and reactions such as

management of slack resources, income generation (Barbera et al., 2015) and more attention on the meaning of the measures and indicators coming from the public accounting system.

DESIGN/METHODOLOGY/APPROACH

From a methodological point of view, the paper is based on a case study, which offers the opportunity to understand what happens instead of what ought to happen (Scapens, 1990) in a specific context.

Scholars have been debating approaches to analyze the contents of financial sustainability. Our analysis has taken into account the peculiarities of financial plans imposed by the specific legislation for Rome as the capital of Italy. It represents an explanatory case study, where the theory is used to understand and explain the particular, rather than to produce generalizations.

The framework presented is based on (a) an in-depth literature review of financial sustainability of public organizations (b) analysis of financial reports collected on the institutional web site of the municipality of Rome related to the last three years (c) analysis of the first results.

FINDINGS

The data collected showed a good result for the plan "*Rebalance the debts*" but also revealed quite a difficulty to reach the goal of the "*Cost-efficiency Plan*". In 2015, the mayor started a strict cost-cutting plan with a 10% cut of structural expenditures over three years. The analysis of the income statements of the last two years (2016-2017) has clarified the critical aspects of the new policies. These first findings could be particularly useful for administrators and sustainability offices for planning and giving more relevance to financial sustainability reports. More details about the emerging trend in managing the crisis with the new accounting system are analyzed in the paper.

PRACTICAL IMPLICATION

The framework opens the door to follow-up research: data collection of best practices in the management and accrual accounting of LGs that may improve the financial sustainability of public institutions.

ORIGINALITY AND VALUE

The municipality of Rome represents an interesting case study because the City of Rome is the capital of Italy and the home of the Italian government with 2,870,336 residents. In a further step, these findings could be compared with other large municipalities data sources. This deepening may lead to a new approach to management as an innovation key for the sustainability of the public sector where

public managers and policy-makers become substantially more and more aware of the immediate and long term impact of their decisions on economic and financial results.

SHARED LEADERSHIP: PROPOSITIONS AND CONCEPTUAL FRAMEWORK

Lyndon, S; Pandey, A

Shailesh J Mehta School of Management, IIT Bombay, Mumbai, India.

ABSTRACT

Leadership is one of the most widely and frequently studied topics in the area of organizational behavior. The concept of leadership has received considerable attention in research because of its impact on individual performance; team effectiveness and its relationship with desirable work outcomes. However, the traditional approach to leadership is restrictive and does not adequately explain the function of leadership (Pearce and Conger, 2003). Shared approach to leadership advocates leadership as a group phenomenon where the leadership occurs when roles, responsibilities and functions are shared among the members of the team (Pearce and Sims, 2002). The objective of this paper is to propose a conceptual model of shared leadership with the propositions about various levels of antecedents, mediator, moderators and its consequence.

The paper begins with review of the concept of shared leadership based on literature. Further the defining characteristics of shared leadership are discussed. The paper also distinguishes shared leadership from other similar constructs such as team work, distributive leadership, and emergent leadership. It also describes various methods adopted by past research to measure shared leadership.

The paper proposes a model of shared leadership (Figure 1) based on the existing literature. It describes various variables which could explain the emergence of shared leadership in team and also the process through which shared leadership produces positive organizational outcomes. The antecedent of shared leadership has been identified in terms of individual level, team level and organizational level factors. Further the moderators and consequence of shared leadership are discussed. The framework proposed in this study was developed with the objective of better explain the phenomenon of shared leadership. Future research can validate the model proposed in this study. Given its potential benefits, validation of the model would help the practitioners to devise strategies to implement shared leadership in various organizational settings.

COMPETING FOR PUBLIC SERVICE CONTRACTS: SOCIAL ENTERPRISES' STRATEGIES

Maher, Chi

St Mary's University Twickenham, London

ABSTRACT

PURPOSE

The purpose of this paper is to examine strategies employed by small third sector social enterprises to compete for public service contracts in the UK. Public service contracts refers to the process by which public authorities, such as Government departments, Local Authorities, National Health Service, purchase work, goods or services from organisations (Office of the UK Deputy Prime Minister / Local Government Association 2003, p. 17). The process is understood to benefit citizens from getting value for money and on time delivery of services (Maher, 2016, 2017).

Since the 1980's the UK government introduced public service contract processes with the third sector as the main mechanism to coordinate and ensure service delivery and accountability to government. For the government, the process enables market-based competition, and opens opportunity for a wide range of suppliers (Funding Commission, 2010). Successive UK Government have encouraged third sector organisations (including social enterprises) to bid for contracts to deliver public services in the community (such as, counselling services, day programmes for older people, young people, drug and alcohol misusers and their carers) (Maher, 2019; Watson and Roberts, 2019). This led to the implementation of the 1990 National Health Service and Community Care Act in April 1993. This resulted in the a reduction in grant funding to third sector organisations and to the introduction of the use of formal contract processes to govern funding flows to these organisations (Plummer, 2009; Mold and Berridge, 2010). The Government made explicit recommendations that third sector organisations should take a greater role in delivering public services with formal contractual arrangements (Funding Commission, 2010). For the government, formal contracts means that the same process is adopted for contracting-out service provision for all providers, irrespective of whether they are private sector or third sector social enterprise providers.

In 1998 New Labour Government introduced policies such as the Compact. The compact set out the agreement between government and the sector to improve their relationship for mutual advantage and mainstream the sector into the Government's policy agenda (Kendall, 2004; Howlett, 2019). It defined how government and sector organisations should engage, and endorsed the fundamental importance of sector organisations to the well-being of society and their role in public services

delivery. As a result an increasing number of the sector organisations engaged in contracting with the government for the first time.

Under the new contacting process, the sector organisations had to accept competitive tendering processes and deal with the pressure of balancing the needs of service users, demands of the funders and the needs of their staff (Maher, 2015b; Mold, 2018). The government further introduced several procurement policies such as, Payment by Result (PbR) schemes to allow the transfer of practical and financial risk to providers; by linking payment to defined results (Battye and Sunderland, 2011; Maher, 2017). The provider is often expected to cover early start-up and running costs until payments for success reimburse this outlay. PbR is often unfavourable to small third sector social enterprises as they are less likely to have extra funds to cover the period between starting work and receiving payment. However, the Government and policy makers have increasingly seen this particular payment system as an important lever for influencing provider behaviour to comply with contract agreements (Battye and Sunderland, 2011; Maher, 2018b).

In 2001 the government launched a strategy for an “enabling environment”. The strategy document sets out the government strategic vision for social enterprises. The Government explained the characteristics of social enterprise that it valued as “being able to gain independence and autonomy through trading; possessing entrepreneurial, innovative, and risk taking behavior; adopting flexible and adaptable practices; maintaining a focus on customers and community; promoting stakeholder engagement; encourage democratic participative management; delivering socially and/or environmental and financial benefits; and were deemed financially viable gaining their income from selling goods and services” (DTI, 2002:16). The government added that many social enterprises are already showing how this can be achieved.

The Conservatives party-Liberal party Coalition Government introduced the 2015 Public Contracts Regulations, which aims to promote opportunities for the sector organisations. This led to reservation of certain public contracts specifically for social enterprises and mutuals; and the removal of PQQs (pre-qualification questionnaire) for procurement below EU thresholds (EU procurement thresholds include: Supply and service contracts awarded by central government bodies subject to the WTO GPA, the threshold is £118,133 (Official Journal of the European Union (OJEU) will come into force on 1 January 2018).

The review of UK public services contract literature suggests that several government strategies and policies were designed to influence the procurement of services and goods from third sector organisations (including social enterprises). There is scarcity of literature expounding the challenges small third sector social enterprises are experiencing tendering for public services’ contactors in a highly competitive environment. Thus, this paper will address the following research questions:

- i. What are the challenges small third sector social enterprises experiencing when competing for public service' contracts?
- ii. Are there organisational factors that enable small third sector social enterprises to gain public services contracts?
- iii. What strategies are employed by small third sector social enterprises to gain public services contracts?

METHODOLOGY

The research methodology was designed to allow the collection of data from four case study organisations. The exploratory nature of this research influenced the decision to choose a multiple case study design (Stake, 2013; Maher, 2018). The most unique aspect of the adopted case study design (Yin, 2009; Stake, 2013) is its ability to deal with a variety of evidence that will contribute to understanding strategies employed by small third sector social enterprises to competitive for public services contracts.

In terms of data collection, multiple sources were used to enable triangulation as a necessary requirement for ascertaining reliability in qualitative research (Yin, 2009; Stake, 2013). Data sources included documentary evidence, such as organisation's annual report, newsletter, website, etc. Semi-structured interviews with 16 key informants responsible for fundraising/contract management.

All interviews were recorded and transcribed under conditions of confidentiality – thus quotations in this paper are anonymized – and their exploitation was assisted by NVIVO software. The fieldnotes data are an on-going, crucial part of collecting research data. In this research, they took the form of a brief description of the physical setting where each interview took place, self-reminders about specific events during the interviews (such as participants nodding or smiling) and notes about personal reflections as well as reactions arising from and captured during the interviews. Using three sources of data source (documentary evidence, semi-structured interviews and field notes) increases the validity of the findings as the strengths of one approach compensated for the limitations of the other evidence source (Miles and Huberman, 1994, Yin, 2009).

FINDINGS

Despite limited capacity of small third sector social enterprises, the findings highlight the importance of organisational resources (Maher, 2019) and collaborations. This paper assists the progression of academic discussion in social enterprises from definitional debates to understanding strategies to develop critical organisational capacity and capabilities in readiness to bid for public services

contracts. It informs practice by highlighting public policy and internal organisational factors influencing small third sector social enterprises ability to secure public service contracts.

Q1

What are the challenges small third sector organisations are experiencing when competing for public service' contracts?

Lack of know how to win the tender

Q2

Are there organisational factors that enable small third sector organisations to gain public services contracts?

I think they have a better to chance to bid as part of a consortium

Q3

What strategies are employed by small third sector organisations to gain public services contracts?

Partner with larger businesses

HOW MENTORSHIP AND DIGITIZATION CAN ASSIST THE REVOLUTION OF HUMAN RESOURCES ACTIVITIES

Majid, Hamid Hazim

The Business Administration Doctoral School, Bucharest University of Economic Studies

ABSTRACT

Human capital is part of the establishments' assets and reflects their activity outwards, to the market and the world. The work of the human resource departments (HRD) is vital to shape the employees' understanding and activity, towards sustaining the company's vision and strategy and assimilate the best trends of the market in the field. Correctly designed, HRD represents the core of the institutional strategic and economic survival, sustainable development, market recognition and contribute to the successful consolidation of the organization in the business competition. The HR activity benefits more in terms of knowledge and importance while digitization turns into smart becoming the most precious consolidated tool in increasing the company value, safety and efficiency. *The HR staffs benefit from a profound transformation due to the technological change, from the legislative dynamics, from the operational developments and people's adapting with new times. The challenges this sector is facing are linked to the mentoring of the actual professionals, to finding the best qualified specialists and to retaining the appropriate employees capable to bring together the personal value with the returned added value of the company or the team.*

Nowadays, HR faces a high need for a strategic shift -from transactions' oriented basis towards a practical, transformational one, assuming new roles and dedicating contribution to the company. In this evolutive process . the most important driver is technology and data safety, that take over from the burden of routine processes from HR team's shoulders, allowing the operational advances to be implemented in any field or activity of the company.

*Due to the high technology need, the digitisation improvement and automation implementation, the professional skills require upgrades and faster harmonisation with the real-world demands. The profit increase can't be obtained without **up running** operational digitisation, increasing specialists' accountability towards work and results, and adapting to this new landscape. Based on a survey, the present paper outpaces the hidden faces of reality when digital technology impose the HR departments' transformation and shows how mentorship, as a sustainable tool can influence the dynamic and the full achievement of companies' objectives. The paper presents the result of a study on HR departments approach and development in some chosen Romanian companies he ways they use the budget for digitalisation and mentoring activities are emphasised.*

In conclusion, at a time of digital transformation in the Big Data era, it is mandatory to adopt rapid and significant changes in the employees' engagement and mentality. The biggest challenges faced by

HR departments are to match the appropriate top management vision in finding the right specialists, the high-potential employees, appropriately skilled, that could remain with the company beyond any external political interference, to grow within the company' values and increase the staffs' proactive involvement at any levels.

Keywords: human resource management, competence development, qualification and mentoring digitization, Industry 4.0.

THE IMPACT OF COMPETITIVE ADVANTAGE ON THE UTILISATION OF THE GREEN ENERGY RESOURCES

Majid, Layth Hazim

Accountability Doctoral School, The Bucharest University of Economic Studies, Romania

ABSTRACT

Strengthening the medium to long-term development and growth process in Romania could be done simultaneously with the shift towards an economic model that has the least negative impact on the environment and the natural ecosystem balances. The smart capitalization of the natural and human capital potential could provide Romania with sustainable economic growth, well-being and a decent living for its citizens, in total equilibrium with the natural environment. The transition to a green economy can have a considerable social impact in terms of creating new jobs; therefore, the policy coordination in this context outlines the priorities for the social cohesion policies to design the National Strategy for Green Jobs. This will be the first step of the transition process to the Green Economy. Based on the European Observatory for Employment survey conducted in 2013 that shows that the Romanian ecological sectors will hardly account 25% of the total employment in 2018, the Romanian Ministry of Labor and Social Justice initiated various initiatives to develop a policy paper in order to guide and coordinate the social policies and facilitate green job creation. Unfortunately, the political intrusion in the labour market is not always either strategical nor healthy. Any public policy document should be based on a multisectoral approach, and developed under inter-institutional working group analysis, prior to elaborate a final national strategy for green jobs. The present article takes the opportunity to analyse the human components of such working group, its social and societal values for the correctness of complex forecasting together with their work impact on the accuracy of the transition to a sustainable economy dominated by green companies and jobs.

The conclusions of this research emphasise the superficial understanding of the green side of a sustainable economy, the companies' trajectory in the smart market and the negative sides of the political intrusion in the sustainable development. Given the political orientation in establishing structural budgets the article identifies some ways to retain the high professional staffs from emigrating to countries where peoples' skills are better recognised and respected.

THE WELL BEING SEE-SAW: THE PSYCHOSOCIAL TOLL OF SOCIAL MEDIA

Makrides, Anna; Vrontis, Demetris; Christofi, Michael

School of Business, University of Nicosia, Nicosia, Cyprus

ABSTRACT

Social media platforms have become embedded in our everyday lives and users who are constantly increasing worldwide dedicate a great amount of time every day on them – a time that is constantly increasing. Although there are a number of studies about the addictive as well as beneficial qualities of social media (e.g., Ellison, Steinfield and Lampe, 2007; McEwan, 2013; Nabi, Prestin and So, 2013; Verduyn *et al.*, 2017; Appel *et al.*, 2016; Griffiths, Kuss and Demetrovics, 2014; Kuss and Griffiths, 2011; Bharucha, 2018), the literature about the impact of social networking sites (SNSs) on psychosocial well-being is scarce and sparse (Griffiths, Kuss and Demetrovics, 2014; Kuss and Griffiths, 2011). Given the evidence that positive and negative indicators of psychological well-being had differential correlations with SNS use (Huang, 2017), Huang (2017) suggests that future studies should examine and explore the consequences of SNS use by incorporating both positive and negative indicators to better understand the relationship between SNS use and mental health. Moreover, according to Huang (2017) no studies have compared the relationship between time spent on social networking sites and well-being across life stages and whether this relationship changes over lifetime. Although psychosocial well-being is a topic of increasing importance, it is apparent that the area that surrounds psychosocial well-being and its relationship with social media use deserves further examination since empirical relationships are currently not known. The present study addresses this gap to contextualize psychosocial well-being within social media contexts and foreground issues like life satisfaction, happiness, loneliness, self-esteem and social competence. More specifically, this research will examine secondary data following a systematic process to identify the positive effects and negative risks of social media use on consumers' psychosocial well-being and discover how the impact of social media use on distinct domains of life can shape or alter psychosocial well-being; thus establishing a causal relationship between social media use and psychosocial well-being.

In order to ensure the attainment of the aim and objectives of the study, this paper will apply a systematic review methodology in order to thoroughly and reliably assess the existing literature (Tranfield *et al.*, 2003). Gathering existing studies in a systematic way enables a greater breadth of perspectives and a deeper understanding of psychosocial well-being within social media contexts. If a review is not systematic there is a high risk of bias since authors can choose papers that can provide support to their viewpoint (McDonnell *et al.*, 2017). Electronic databases including Science Direct, Emerald, EBSCO and JSTOR will be searched using keywords that best describe the topic - for

example, "psychosocial wellbeing" AND "social media". Synonyms for the main keywords will be also considered. In order to enhance as well as narrow results and retrieve articles that are most relevant exclusion and inclusion criteria such as publication type and dates, ABS journal rankings, and duplicates will be used.

The expected outcome of the systematic review is to help determine what is already known on the topic but also document knowledge gaps in the literature. These identified gaps will serve as data-based rationales for establishing the need for a particular research agenda. (Eagly and Wood, 1994)

Keywords: Well-being, social media, systematic review.

RADICAL AND INCREMENTAL CREATIVITY - THE ROLE OF ENJOYMENT, INNOVATIVE CLIMATE AND REWARDS IMPORTANCE

Malik, Muhammad A. R.; Butt, Arif N.; Zahid, Fariha

Suleman Dawood School of Business, Lahore University of Management Sciences, LUMS, Lahore, Pakistan.

ABSTRACT

Employees' innovative and creative behavior has become a source of major competitive advantage and one of the most important predictors of organizational success and survival. Consequently, high research attention has been focused towards identifying various predictors of creative behavior. However, there are still unanswered questions and issues that the creativity researchers are facing. One such issue concerns with treatment of creativity as a unidimensional construct, whereas another is concerned with the mechanisms through which intrinsic and extrinsic rewards affect creative behavior of employees (Malik & Butt, 2017).

Research studying reward – creativity relationship has generated non-conclusive and conflicting findings, suggesting that the effects of rewards on creativity can be positive, neutral, and even negative (Byron & Khazanchi, 2012). These results have led to a lack of a wholesome and conclusive account of how various kinds of rewards and their underlying process affect creativity and its various dimensions. Moreover, the narrow conception of creativity as a unidimensional construct has also been pointed out as one of the reasons of inconclusive research findings about the predictors and consequences of creative behavior (Gilson & Madjar, 2011).

Among the several studies who have tried to summarize reward - creativity research, one of the more recent reviews (Malik & Butt, 2017) has forwarded three suggestions to resolve the debate concerning rewards and creativity. They entail the exploration of relationship between different types of rewards and different types of creative behavior, identification of the processes and cognitive states through which rewards affect creative behavior, and the boundary conditions within which these effects take place. Without understanding these cognitive states and without the knowledge of these boundary conditions, valuable resources that organizations deploy to reward creative behavior can not only become ineffective, but can also backfire. The current study tried to answer all these concerns in this investigation. Hence, the main objective of this study were threefold.

First, we aimed to explore the type of creative behavior that intrinsic and extrinsic rewards produce. Given an increasing research interest in categorizing creative behaviors in distinct types and their specific predictors, it is important to dig out such distinctions for a better understanding of rewards and associated creative behavior. Secondly, we made an attempt to identify the cognitive states and processes triggered by rewards, which in turn invoke these distinct creative behaviors. Finally, we

investigated the boundary conditions, which facilitate the effects of extrinsic rewards to inspire creative behavior.

This research makes significant theoretical and empirical contributions in advancing the rewards creativity scholarship. The first contribution it claims is to investigate the mechanisms through which these rewards are translated into creative outcomes. The study hypothesized and tested enjoyment and perceptions of innovative climate as mediators of reward – creativity relationship. Results supported these hypotheses, and provide a deeper understanding of how different types of creative behaviors are evoked, with each type having its own underlying mechanism and explanation.

Secondly, we investigated creativity in form of two distinct creative behaviors (radical and incremental creativity) and identified their specific drivers. Results showed that intrinsic rewards trigger radical creative behavior, whereas extrinsic rewards trigger both radical and incremental creative behavior, but only when rewards' importance is high. Hence the results informed about distinct drivers that can be used to enhance different types of creative behaviors.

Finally, although intrinsic motivation theory (Amabile, 1985) suggests that intrinsic rewards produce higher level of enjoyment and involvement in the activity, this is probably the first time that this relationship has been empirically verified. Hence, this study, to our knowledge, is the first one to test one of the most important theoretical assumption of intrinsic motivation theory (Amabile, 1985). These results not only make significant contributions to the research on creativity, but also point towards future research directions.

THE APPLICATION OF THE PACK-SYSTEM MODEL IN THE FRAMEWORK OF CITY LOGISTICS AND MOBILITY

Malindretos, George¹; Manikas, Ioannis²; Dimoulakis, Andreas¹

¹School of Environment, Geography & Applied Economics, Harokopio University, Athens, Greece

²Faculty of Business, University of Wollongong, Dubai, UAE

ABSTRACT

As more and more people migrate to cities to seek for jobs and better living conditions, the growth of cities and urban areas in the 21st century is expected to put more pressure on resources and conditions of urban life. The urban environment is characterized by high settlement and population densities while the utilisation of same infrastructure for both citizens and goods transport, have resulted in aggravating the problem. In major French cities for example, it has been found that freight vehicles consume on average, 30% of the city street capacity, two thirds representing parking for delivery and pick up operations (Gabriel et al., 2009).

In response to the above outlined pressures, a new area of Logistics has emerged, the so called City Logistics, encompassing the increasing awareness of the sustainability imperatives from researchers together with the rise in cities infrastructure and movements limitations. Thus, the trend of continuing growth of urban populations calls for integrated policy concerning the improvement in mobility for both citizens and freight. In this sense, academics and practitioners in Europe have attempted to identify smart-sustainable solutions within the cities, in the framework of urban freight transport and city logistics. In the past few years interest in sustainability has risen considerably alongside the global trend towards urbanization with multiple environmental and economic impacts. The local city authorities around the world face the challenge to improve infrastructure, attract innovative investments and knowledge activities in order to ensure sustainable city development through projects assignments or building-up collaborative strategic partnerships.

A number of projects have been implemented concerning the introduction of modern distribution models and solutions, some of which could be broadly applicable (Benjelloun et al., 2009). One critical goal of is the reduction of the total number of truck-trips in an urban area, towards mitigating their negative impacts, usually through involvement of a public agency (Taniguchi et al., 2003). In this sense, this paper aims to shift the emphasis toward more practical aspects of the topic through the implementation of an integrated city logistics model in a specific area of Athens-Greece Metropolitan area, the so called "pack-station" system, first applied in Germany. Pack-station systems, located in popular city positions prevent citizens from moving to and from the post offices, offering 24 to citizens the possibility of access to their parcels 7 days per week, 24 hours per day. According to the

Sustainability Report of the Deutsche Post (2006), the introduction of such system in the city of Koln led to a saving of 35,000km in one year. Since then DHL Parcel has expanded its network to include roughly 3,400 pack-stations, with more than 340,000 compartments in over 1,600 cities and municipalities nationwide (<https://www.ipc.be/news-portal/general-news/2017/11/07/14/57/dhl-packstation-on-course-for-continued-success>).

Thus, in this paper aims at identifying the financial as well as the environmental benefits derived from the application of the model in a Papagou-Cholargos Municipality, in Athens, Greece Metropolitan area (Map 1).

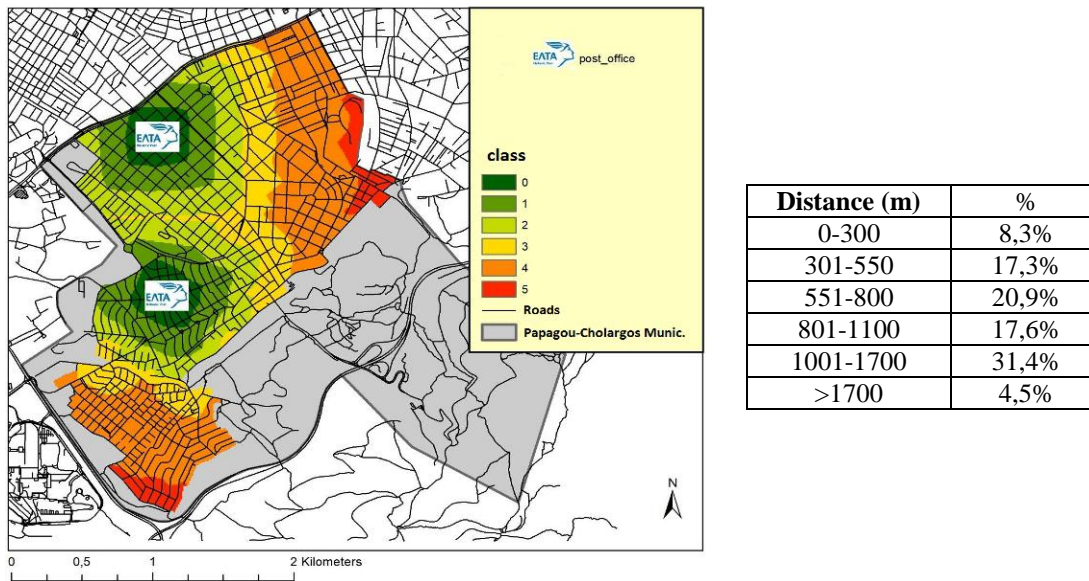

Map 1- Pack station model application area

The methodological framework applied in this paper, included

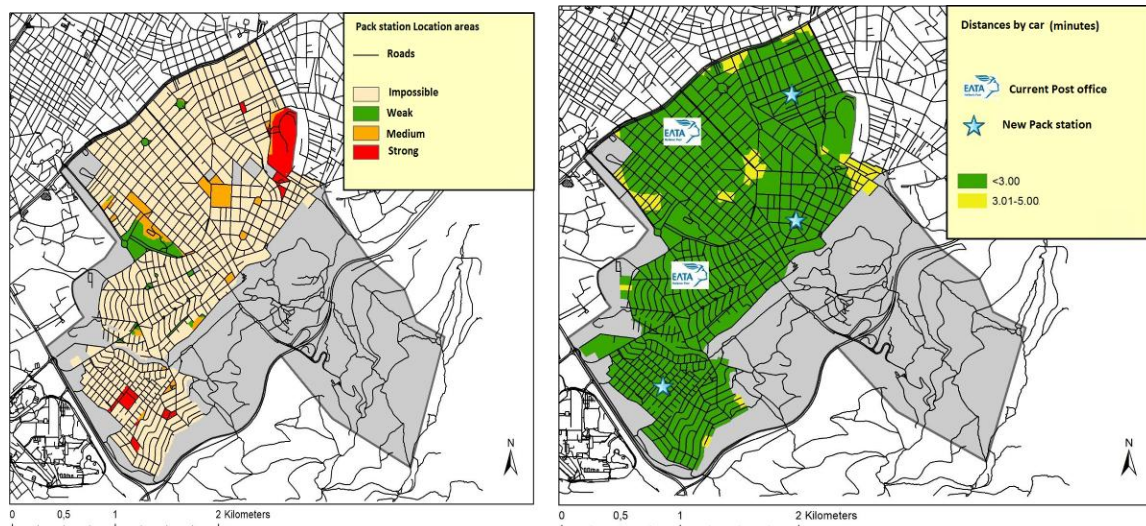

- a survey in the examined area for identifying the frequency and type of citizens' movements to the local post offices (walking, means of transportation)
- the use of arc-gis software tool for illustrating the distances/times (in classes) (Map2) as well as the constraints of setting up a packing station in the area (Map 3a).

The proposed location for the new pack-stations (Map 3b), was based on the spatial analysis provided that the maximum distance would be 5 minutes by car. The new packing stations provide significant savings in the kms spent to and from the post office. In particular, almost 50% less kms will derive from the setting up of 3 pack-stations in the examined Municipality (currently 96,928kms , future 49,504kms). It is noticeable, the reduction of distances from the new pack-station points will improve mobility in the city, since they will result in more walking distances and bicycles' use (instead of using a car), for the sake of the significant environmental footprint reduction as well.

In retrospect, this paper provides useful insights that could be helpful for future research in the field of sustainable city Logistics practices. Every model, idea or initiative has to be thoroughly explored in view of the increasing awareness of the mobility problems within the cities and the sufficient understanding of its prerequisites and attaining their potential benefits.

Map 2- Citizens distances from Post offices

Map 3- (a) Potential Pack station location areas (b) Distances by car from proposed PS

PSYCHOLOGICAL DISTANCE IN THE ONLINE CONTEXT: A THEORETICAL FRAMEWORK

Matarazzo, Michela¹; Resciniti, Riccardo²; De Vanna, Federica²

¹dept. of Management, Marconi University, Rome, Italy

²dept. of Law, Economics, Management and Quantitative Methods, Sannio University, Benevento, Italy

ABSTRACT

The study offers a conceptual framework that analyzes the buying intentions of foreign consumers according to the presence of online retailers from different countries. The study relates the buying intentions to the nature of the products sold (in particular, to the presence or absence of branded products). This element moderates the relationship between psychological distance and trust. In addition, the relation between distance and trust is moderated by Corporate Social Responsibility. The analysis allows us to evaluate the relationships among the variables analyzed in the literature in order to study the relative constructs and derive a basic project for the empirical analysis. There are few studies that currently have dealt and mixed the concepts of online retailing, brand reputation and corporate social responsibility. The topic is of interest for marketing as it is appropriate to analyze the intentions and the propensity to purchase in a context that includes different types of online retailers and different levels of trust in the brand and in the company. This is useful in order to stimulate future studies on the topic and in order to stimulate practitioners' interest in the integration of channels that many opportunities offer to businesses of all types and countries.

Keywords: psychological distance, brand reputation, corporate social responsibility, online purchase intention.

PRIVACY VERSUS SECURITY CONSIDERATIONS. A POLICY DILEMMA FOR TOURIST DESTINATIONS

Messaritaki Barbara¹; Apostolakis Alexandros²; Stergiou Dimitrios¹

¹School of Social Sciences, Hellenic Open University, Patras, Greece

²Dept. of Business Administration, Technological Educational Institute (TEI) of Crete, Greece

ABSTRACT

Crete is considered to be one of the primary tourist destinations in Greece. In fact, Crete is the single most important (island) destination in Greece outside the mainland. As a traditional tourist destination relies heavily upon its natural environment (weather, sunny beaches), cultural resources (Minoan civilization), as well as its culinary tradition (Mediterranean diet) to attract visitors from around the world. At the same time, Crete has long been promoted as a family friendly and relatively safe tourist destination.

As an island destination located at the eastern-front part of the Mediterranean, the overwhelming majority of visitors to Crete arrive through air. With this in mind, better and more secure |safe airport operations, are a necessary prerequisite for developing and improving the competitiveness of a tourist destination. This is because security is one of the most important reasons for choosing a destination (Chan and Lam, 2013; Hsu *et al.*, 2008). The lack of safety in a tourist destination can cause fluctuations in tourist flows, which can be a determining factor in the development of any destination (Mawby *et al.*, 2016).

The issue of safety has become a major issue for the tourism industry, especially since the terrorist hit of 11 September 2001 in the US, which had a direct impact on tourist flows, especially in aviation-dependent destinations. The same applies in Europe bearing in mind recent incidents of violence and terrorist attacks on metro stations, trains and airports in major European countries such as Brussels (2016), Madrid (2004), Paris (2015) (Global Terrorism Data Base, 2016). These incidents reveal how vulnerable tourist entry points are for tourist destinations. Based upon these considerations, safety measures have been developed and monitoring technologies have been developed to prevent such incidents (Paraskevas and Arendell, 2007; Patil *et al.*, 2016).

As a side-effect of these policy developments, often visitors face the dilemma of choosing between high levels of security against 'sacrificing' their privacy (Anuar and Gretzel, 2011; Potoglou *et al.*, 2010; Potoglou *et al.*, 2014). Managing concepts related to personal freedoms often portray the need to balance them so that everyone can feel secure without feeling that they are losing their privacy (Waldron 2003).

The empirical results presented in the current paper are based on a qualitative questionnaire that has been distributed to a sample of 24 stakeholders. Considering that the current research question has received very little attention in the literature, the purpose of the current research is exploratory rather than confirmatory. The objective of the qualitative research was set twofold. *On the one hand*, the main objective of the research was to examine how potential tourists | travelers weighted the policy dilemma of security versus privacy. What were the factors affecting their preferences either way. *On the other hand*, the research examined which attributes in particular were considered to be most|least intrusive for their privacy and why.

The empirical results indicate that respondents were very keen to safeguard their privacy, often at the expense of security. Additionally, most of them were apprehensive regarding accessibility issues (where would sensitive personal information be disclosed). On the other hand, respondents were positive towards longer waiting times at airports and a higher transportation cost to cover for security provisions.

EQUITY CROWDFUNDING AND SOCIAL IMPACT INVESTING IN REAL ESTATE

Miglietta, Nicola; Battisti, Enrico; Creta, Fabio

Department of Management, School of Management and Economy, SME, Turin, Italy

ABSTRACT

In the period of change, where innovation plays an important role in proposing new models of response to the social challenges of our time, it is also necessary to rethink the ways in which these processes can be sustained, both in the phase of conception and development, and in terms of overall sustainability.

In financial literature, social impact investing can be defined as the union of objectives between profit-making private companies and those that are non-profit, or philanthropic. The goal is to create a return for the investor, but at the same time to have a social return, with features that are not financial. For example, an impact on the territory to improve people's living conditions (e.g. Olsen and Galimidi, 2009; Freirich and Fulton, 2009; Brest 2013; Combs 2014; Duncan and Wong, 2010).

Currently, within the financial markets, globally it is estimated there are more than 200 funds committed to investments with social impact. In fact, JP Morgan, in his report, estimated that social impact investments could increase from \$ 400 million to \$ 2 billion by 2020 (Saltuk and El Idrissi, 2014). In the actual scenario, also the concept of crowdfunding is in a state of evolution (e.g. De Buysere et al., 2012; European Council, 2014; Pais et al., 2014; Quaranta, 2016; Tencalla, 2017). Starting in 2010, crowdfunding has emerged as a new method for financing new ventures by allowing individual founders of for-profit, social or cultural projects to request funding via small sums from multiple people (Mollick, 2014) rather than raising large amounts from a limited number of large investors and/or backers (Belleflamme et al., 2014). In literature there are currently five standard models of crowdfunding: donation based, equity based, reward based, royalty based and lending based. Crowdfunding is used in different fields, and one of these is real estate (Battisti, 2018). The European real estate crowdfunding market, in 2017 (equity and lending) has raised 1.2 billion dollars, with four nations that have driven: Germany (234 million), Great Britain (215 million), France (180 million) and Switzerland (153 million) and an average collection for each real estate project of 590 thousand euros for the equity and 700 thousand for lending. In Italy, crowdfunding in real estate totaled over 6.6 million euro in 2017 (Politecnico of Milan, 2017).

This paper therefore seeks to gather initial evidence about the nature and features of the equity crowdfunding model and social impact investing in Italy, with especial reference to the real estate sector.

In particular, this paper analyzes the different types of investments in social impact investing through equity crowdfunding platforms, in the Italian real estate sector, in order to define a new theoretical model based on the impact investing and crowdfunding.

To the best of our knowledge, no previous study focused on the potential effects of social impact investing through equity crowdfunding in Italy, particularly in relation to the real estate sector. The contribution of this paper is twofold. First, we extend the literature examining equity crowdfunding model in real estate. Second, we highlight how equity crowdfunding can represent an important source/instrument for financing social impact projects, that could revitalize the real estate sector in Italy.

Keywords: equity crowdfunding; social impact investing; real estate; crowdfunding platforms.

HOW BRANDING CAPABILITIES HELP MANUFACTURING COMPANIES IN INNOVATIVE DEVELOPMENT? –DYNAMIC CAPABILITIES APPROACH

Mitreġa, Maciej

Department of Organizational Relationship Management, University of Economics in Katowice, Katowice, Poland

ABSTRACT

The literature illustrates growing interest in developing and applying dynamic strategies in marketing. This trend originates probably from increased volatility observable of markets and popularization of so called dynamic capabilities (DCV) in strategy research (Eisenhardt and Martin 2000; Teece et al. 1997). Being originally perceived as strategic paradigm applicable mainly to big companies operating in diversified and highly volatile industries, DC is nowadays treated rather as universal approach and there is growing evidence that DCV brings increased competitiveness to companies operating in business to business markets (e.g. Kindström et al. 2013; Macher and Mowery 2009).

Recent studies have demonstrated that so-called dynamic marketing capabilities (DMC) have a positive impact on various aspects of company performance, including competitive advantage of international joint ventures (Fang and Zou 2009), profit growth (Morgan et al. 2009a) and innovation performance (Falasca et al. 2017; Weerawardena et al. 2015). There is a consensus that market orientation itself which was treated for some time as a main marketing competence is not enough anymore to sustain advantage over competitors (Day 2011; Merrilees et al. 2011; Morgan et al. 2009b; Narver et al. 2004) and this competence must be complemented by other competencies, which enable dynamic fit between an organization and its business ecosystem. However, we lack consensus on how these capabilities are defined and measured and prior studies in this area are not necessarily consistent with general DCV framework.

This paper aims at extending knowledge on dynamic marketing capabilities (DMC) in two ways. Firstly, considering early stage of development and fragmented character of this research area we propose here dynamic marketing capabilities in B2B context consistent with DCV fundamentals (Eisenhardt and Martin 2000; Teece et al. 1997). Specifically, we conceptualize Dynamic Branding Capabilities (DBC) in the context of manufacturing companies operating mostly in Business-to-Business markets. We treat DBC as a latent feature of a company, which articulates in behavioural routines oriented at evaluating and reorganizing company brand as the strategic resource. Secondly, we present and test empirically research model, which combines DMC and its consequences, namely

company innovation success and company market expansion, which are together linked to company financial performance.

Although DCV as strategy paradigm is not a monolith (Di Stefano et al. 2014), this approach proposes dynamic capabilities as environment driven processes that enable reconfiguration of company resources. Therefore, the focus of DCV's building blocks remain in the processes themselves not their resource-outcomes. Moreover, conceptualizing and measuring DCs through their outputs justifies controversies enacted by the whole DCV, which is criticized for tautology. Morgan (2012) and Barrales - Molina et al. (2014), suggested that in comparison to other DCs, DBC are cross-functional branding processes (crossing and integrating various departments) strongly based on market knowledge, which is used to reconfigure company brand.

Following DCV, we treat brand reconfiguration and expansion routines as the cornerstone of DBC. Specifically, we define DBC in B2B context as *market knowledge-dependent processes oriented at reconfiguration of firm's brand resources*. This definition is broad in scope, because there are various marketing tools and resources, which may lead to competitive advantage (Morgan, 2012). Our definition is also similar to recent definition proposed recently by Falasca et al. (2017), but in contrast to Falasca et al. (2017) DBC is focuses only on branding among other marketing strategizing (e.g. marketing mix, CRM).

We test DMC concept on the cross-sectional survey data based on the random multi-industry sample of 410 manufacturing companies operating on Business-to-Business markets only. We selected purposively only these companies that have introduced product innovations to the market in last 5 years.

While developing measures for our study, we either adapted existing items to the context of our research or developed new ones. Developing revised measurement model was necessary, because in our research we used different conceptualization of DBC consistent with DCV origins of this construct. All other measures for constructs in our research model were adapted from prior studies, except Market Expansion that was developed specifically for our research.

We used EFA to purify our research model and then we conducted PLS-SEM analysis for our structural model with DBC as a focal construct following Hair et al. (2013). T-statistics were computed by bootstrapping procedure with 5000 bootstrap samples.

Our empirical research results provide the evidence that DBC is a valid and reliable construct in the context of Business-to-Business companies. We discuss our research results with other studies about dynamic marketing capabilities and dynamic capabilities in general, as well as our understanding B2B marketing. We also propose some directions for further research.

A CONTROVERSIAL POINT OF VIEW ON THE AMERICAN STRATEGY ON THE WAR IN IRAQ

Mohamed, Raghad Raeed

The Department of International Relations and European Integration. The National School of Political and Administrative Studies, Bucharest, Romania

ABSTRACT

Over the past decades, the Middle East is a region characterized by conflicts. To a large extent, this is caused by the issues associated with nuclear weapons, terrorism and natural resources. On March 20th 2003, the *war on terror* took shape, with the Bush Administration announcing the start of a war against Iraq.

This paper describes and evaluates some of the central elements of the US strategy in Iraq, from the beginning of the war until today, together with their complex consequences. In order to establish a theoretical basis for the US intervention in Iraq, the paper emphasizes and analyses the situation through the perspective of realism, as a theory of international relations. A particularly important feature of events occurring amidst the US intervention in Iraq is the very strong American phobia, a phenomenon that is also carefully analyzed in this article. The paper facilitates the understanding of both the Iraq's point of view on the perspective of the American invasion and the US strategic position that engendered them to assure the global hegemony and economic power in the international system.

Keywords: Iraq-war, US strategy, realism theory, terrorism theory, political interest, international relations, economic power, democracy, American phobia

PLANNING A NEW COLLEGE IN EAST JERUSALEM

Moore, Dahlia

East Jerusalem College, Israel

ABSTRACT

INTRODUCTION

The East Jerusalem College (EJC) aims to be an academic institution, approved by the Israeli Council for Higher Education, teaching academic programs, in Hebrew, that are in accord with the highest Israeli and international standards. It will operate as a private, non-profit organization.

The college will focus on professional fields that are necessary in both Israeli and Palestinian societies. Its objectives are to advance the professional potential of the young East Jerusalem population, to assist both Israeli and Palestinian societies to fill shortages in occupations that are both needed and lucrative, and to build bridges between the diverse populations in the area.

Once established, of EJC focuses on attaining three main goals:

1. Academic goal – to increase the potential of the higher education system in the area, both quantitatively and qualitatively.
2. Economic goal – to enhance the economic potential of the population of East Jerusalem in professions that are in accord with the growing needs of both Israel and the Palestinian Authority.
3. Social goal – to provide access to higher education to the population of East Jerusalem, whose educational options are limited due to language and geographic constraints, and inadequacy of some of the local schools.

Other students from wider areas, who possess the required qualifications and adequate potential, will also be welcomed. At present, there are neither public nor private colleges in the area that teach according to Israeli standards, in Hebrew, the programs we plan to focus on.

BACKGROUND AND RATIONALE

The East Jerusalem College (EJC) will be a non-profit private academic institution, initiated by "Renaissance", an organization created by Israeli Jewish and Arab citizens, and will operate in accord with standards of the Council for Higher Education.

The main goal of the college is to provide access to higher education to the population of East Jerusalem, but it will also be welcome students from other areas.

According to the data of Jerusalem's Education Authority, 7,500 high school students graduate each year from schools in east Jerusalem. The majority still study according to the Palestinian program and obtain the Tawjihi¹ (85% of them study in the arts and humanities stream, and 15% study for a scientific Tawjihi).

In all the high school grades, there are 1,934 students who are currently studying in classes that teach the Israeli programs (about 8% of all high school students in East Jerusalem).

A survey conducted by the Jerusalem Municipality among parents of high school students in East Jerusalem, indicates that 52% of them prefer that their children study the Israeli program and in Hebrew, to facilitate their admission to Israeli academic institutions and to enhance their ability to find better jobs with higher wages.

Despite the high demand for higher education, there are but a few academic institutions in east Jerusalem, and none of them teach in Hebrew. The basic requirements in Israeli institutions are prohibitive for most Palestinians, and they receive little support (academic and financial) when they encounter difficulties in these institutions. Moreover, young Palestinians constitute a very small minority in academic institutions and, therefore, they are often alienated and socially isolated. Consequently, the majority of Palestinian high school graduates who wish to continue studying, are forced to do so in other countries. Most of them choose Jordan or East Europe although this makes higher education very expensive.

Opening an academic college that will teach a variety of professions, according to approved Israeli programs, will significantly increase the academic options in the area, enhancing the human capital of East Jerusalem youth.

The proposed college will begin teaching professions that are in high demand: Nursing, software engineering, and psychology. These programs will form the basis for the development of three central schools: Health sciences, computer engineering, and social sciences. In the future, diverse departments will be developed in each school. This structure will provide long term stability.

¹ Tawjihi is the General Secondary Education Certificate Examination in Jordan. To sit for the exam, students are required to finish 2 years of pre-school education, 10 years of basic education, and 2 years of secondary academic or vocational education. Only those who pass the exam with a good mark may apply to universities. To be accepted to study sciences, one must take the scientific stream in the last 3 years of the secondary education and get a mark of at least 95 out of 100.

All fields of study will be based on a strong academic foundation upon which practical professional knowledge will be taught, so that graduates will be able to find work easily in highly demanded occupations. They will also have the requirements necessary to continue to advanced degrees.

GOALS AND OBJECTIVES

1. Academic Goals

- a. To ensure high academic standards. The emphasis will be on recruiting highly qualified academic staff, advancing applied research infrastructure, and creating a stimulating academic environment.
- b. The college will focus on both disciplinary and interdisciplinary programs in order to develop innovative fields of knowledge which are relevant to the changing world of the 21st century.
- c. Academic knowledge and practical professional tools will be developed and integrated to improve graduates' relevance to both advanced academic degrees and the labor market.

2. National Economic Goals

- a. The college will operate in East Jerusalem (in Zur Baher). At present, there are no colleges in East Jerusalem that teach these professions in Hebrew, according to the standards of the Commission for Higher Education. Therefore, the proposed college is not in competition with other Israeli academic institutions in the area.¹
- b. Increasing the human capital in East Jerusalem will benefit both Israel and the Palestinian Authority, as it will provide highly qualified workers in diverse occupations, where they are gravely needed (nursing, human resources, engineering, computer software, etc.).

3. Social Goals

- a. Acquiring higher education and better-paying, highly needed professions will increase equality between the Jewish and Palestinian segments of the population.
- b. Teaching in Hebrew will increase the employability of Palestinian youth, and will enhance their integration.

¹ It should be noted that there are Israeli academic institutions in the west side of Jerusalem but only a few of the Palestinians from the east side join them either because of the high academic demands (demanding psychometric exams and high grades in the Israeli matriculation exams, and lesser credit and consideration of the Tawjihi), or because they are considered part of the occupation.

- c. Constructing such a college, in this particular area, may enhance the relationships between Israel and a variety of international organizations (like the OECD, the UN, associations in the US and Europe).

TARGET POPULATIONS

Since 2017, more than 880,000 people live in Jerusalem. Over 62% of them (542,400) live in East Jerusalem. 327,700 are Palestinians and 214,600 are Jews. The intended college's students are, therefore, mostly from the Palestinian neighborhoods. Students from other areas, with the right qualifications will, of course, be welcome too.

As some of the high school graduates in the area are not proficient in Hebrew, a year-long preparatory program will be established to improve their control of the Hebrew language and to expand their academic studies skills.

UNRAVELING RELATIONS OF INFORMAL INTELLECTUAL PROPERTY PROTECTION

Mueller, Toni

Chair of international Management, Otto-von-Guericke University, Magdeburg, Germany

ABSTRACT

The purpose of this paper is to evaluate previous research findings connected to informal intellectual property protection. The scope of protection, underlying theories and data used are analyzed to identify initial findings benefiting from retesting on the basis of larger datasets or different datatype. After conducting a systematic literature review identifying papers containing informal intellectual property protection, the result of 71 studies are summarized. The applicability of the data on the research purpose are analyzed. Secrecy and lead time are general accepted forms of informal protection. There are different views on dimensions counting as protection methods, influencing methods or additional capabilities. The authors limited their findings of effects of intellectual property protection in terms of causality. While the use of cross-sectional data is limited in terms of causality, the use of larger datasets could indicate the reliability of initial findings further. Utilizing the commonly chosen Community Innovation Survey data of multiple countries simultaneously, gives attention to possibly hidden cross-cultural effects. This study deepens the understanding of the current state of informal intellectual property protection taking the used data and underlying theory into account and states the need for future research.

ENHANCING BRAND ENGAGEMENT THROUGH EXPERIENTIAL MARKETING

Mulder, Dalmé; de Jager, Jana

Department of Communication Science, University of the Free State, South Africa

ABSTRACT

Consumer engagement is an important factor in marketing success. Marketers have to be creative to find new ways to engage with their customers, and ultimately enhance the effectiveness of communication between them. The purpose of this study was to explore the utilisation of one such creative way of marketing communication, namely experiential marketing (ExM). According to Same and Larimo (2012:485) experiential marketing is a tactical marketing planning technique concerned with the way in which marketing is done experientially. In this study a conceptual analysis of ExM was conducted to determine the essence of this concept. The conceptual analysis was done by means of Walker and Avant's (2005) methodology. The concepts identified through this analysis were used to select videos that represented experiential marketing activations implemented by Coca Cola. To be included in the sample, at least one of these concepts had to be present in the video. Twenty-one (21) videos, that represented ExM activations, were included in this study. The videos of these activations were analysed to determine how many of the attributes identified through the conceptual analysis were present, and to investigate if any other attributes could be identified as common denominators in the ExM activations. Braun and Clarke's (2006) thematic analysis was used in the video analyses, while Kolb's experiential model served as theoretical point of departure in the research. Five (5) attributes of ExM were identified through the conceptual analysis. An additional five (5) attributes of ExM were discovered through the thematic analysis of the videos of Coca Cola activations. These ten (10) characteristics of ExM served as point of departure for the guidelines proposed to improve a brand's engagement through an ExM activation.

COMMUNICATION COMPETENCE IN THE WORKPLACE

Mulder, Dalmé

Department of Communication Science, University of the Free State, South Africa

ABSTRACT

Interest in the impact of communication in the business environment has increased substantially during the last few decades. It is often claimed that effective communication contributes to organisational effectiveness and performance (Moreno, 2010). In today's dynamic business environment, every avenue that can contribute to fostering efficiency and business performance has to be embraced. It is argued that when individuals improve their communication competence, it will contribute to improved business performance (Stigall, 2005). Effective communication can be described as the process of creating meaning between two or more people (Tubbs, Moss, & Papastefanou, 2011). Communication competence is therefore the "know-how" to establish this shared meaning. Çetin *et al.* (2012) described communication competence as the fundamental dynamics affecting the job satisfaction of employees, and therefore the performance of an organisation. Assisting individuals to improve their communication competency should therefore be a priority. Although there is an abundance of literature on effective communication in the business environment, literature on interpersonal communication competence in the workplace is very limited. The purpose of this study was to address this gap, and to employ a literature review to establish what communication competence in the workplace entails. A number of constructs of communication competence were identified, amongst others adaptability and appropriateness which were significant to explain the scope of communication competence. It was also established that the behavioural and cognitive dimensions were meaningful in grasping the essence of this concept. The study concludes with a framework to demonstrate the main constructs of communication competence and enrich the comprehension of this dynamic concept.

ADOPTING BUSINESS MODELS AND STRATEGIES IN MANAGEMENT OF HEALTHCARE ORGANIZATIONS: ARE ISRAELI HOSPITALS BECOMING BUSINESS ENTERPRISES?

Naamati Schneider, Lior; Zaks, Ofer

Management of Service Organizations, Interdisciplinary School for Society & Community, Hadassah Academic College

ABSTRACT

Health systems worldwide differ from each other depending on their country's socioeconomic policy and the structure of various Healthcare organizations, their ownership, and their financial behavior. But all health systems must contend with economic, demographic, and technological changes that are constantly driving up per capita health costs, which must be reined in. Consequently, these systems have had to learn to contend with dynamic, changing, and competitive states of the market (Ginter, 2018). A manifestation of these changes can be seen in the health systems' attempts to adopt the values and organizational culture of the business sector. Budgetary considerations have started competing with medical considerations and adopting business-sector strategies has become necessary for survival (Kash *et al* 2014). But such strategies are relatively foreign to the realm of health services and are not necessarily suited to the ethical, cultural-organizational, and management systems of health-service organizations. Responding to these changes, Israel instituted a reform of its public health services, the prime element of which is the National Health Insurance Law, 1995. Its far-reaching changes in the health system included ensuring health coverage for every citizen and increasing the choice in health services (Rosen, 2015). This increased competition between the health and insurance providers, making the market dynamic, more competitive, and less secure for all medical service organizations, including hospitals (Rosen, 2003).

The current study examined the extent, components and implementation of a business strategy to cope with the changing environment. Understanding their ramifications for the business, strategic, and marketing behavior of various levels of management in hospitals, including directors and department heads. The study has assessed how hospital managers in Israel coped with the new competition between hospitals and the need to become more business orientated in order to survive. Whether this process is managed strategically? did management define clear goals the hospital's strategy should focus on? did they design a detailed action plan that all employees are aware of and what they are expected to do? are short- and long-term objectives defined? and finally - to what degree is the plan implemented?

RESEARCH METHODS

The research was qualitative as the strategical changes and the situation hospitals were facing are complex, thus it seemed the best way to fully comprehend the way hospital managers are coping with it was to let them express it in their own term.

Participants: Six of the large hospitals in Israel were chosen for the study based on their size, location, number of beds and ownership in order to achieve a good representation of the diversity existing between different hospitals. The study was based on 40 in-depth open interviews which were conducted with key figures in the health system and individuals at various levels of management in the chosen hospitals. The interviews were analyzed with qualitative methods, recorded (with the subject's consent) and transcribed. Data was collected using semi-structured interviews conducted at the subject's work place. The interview questions examined their hospital's long-term strategy, competition between hospitals, contracts with health plans, marketing activities by the hospital and the effects of capping of hospital's management. The data collected was analyzed in a thematic analysis: first initial categories were generated from the data, Second stage, a searching of common themes that fit well with the data was conducted. Looking at the relationships between the different levels of existing themes, allowed the researcher to define over-reaching themes and get a more comprehensive picture of the data collected.

MAIN RESULTS

In sum, the hospital stakeholders interviewed discussed how their hospital is coping with the competitive market and its management's changes into a business mindset. The main findings are that the health market and the hospitals are constantly making far-reaching changes in their strategic, business, and marketing behavior, and that these changes are escalating as part of the reforms and increased competition in Israel and worldwide. This trend is manifested in the adoption of business patterns and the transformation of hospitals into customer-directed and competitive organizations. Hospital management is becoming more focused on strategy and goals, and business considerations drive managerial decisions. However a comparison of strategic planning in hospitals and in strictly business organizations reveals that hospitals have only partially_adopted strategic and business processes and that there is no clear direction of long-term, system-wide strategic management. Conflicts of interest between the various levels of management affect the degree to which business strategies are adopted and the ambivalence toward the profit motive in medicine.

DISCUSSION AND CONCLUSIONS

This study makes an important contribution toward understanding health systems management all over the world. Mapping the degree to which business strategies are adopted in service organizations and understanding the accompanying problems is important for an organizational and even system-wide view in considering management planning of health organizations. It is also of prime importance for understanding the complexity for health organization managers who must contend with budgets and the constant increase in per capita health expenditure. This understanding will make it possible to estimate future developments, examine problems in the system, and explore future options and optimal scenarios for contending with change.

THE ROLE OF KNOWLEDGE MANAGEMENT ON JOB ENGAGEMENT AND ORGANIZATIONAL COMMITMENT OF THE EMPLOYEES

Özek, Hande; Ferraris, Alberto

Department of Business, Yenyüzüyl University, Istanbul, Turkey

Department of Management, University of Torino and Laboratory for International and Regional Economics, Graduate School of Economics and Management, Ural Federal University

ABSTRACT

INTRODUCTION

Knowledge management (KM) is an organisation's most valuable resource based on employees' knowledge and organizational practices and routines. The way employees create new knowledge, share it around the organisation, and use that knowledge in the most effective way is crucial in the achievement of a sustainable competitive advantage. Fundamentally, knowledge management is about applying the collective knowledge of the entire workforce to achieve specific organisational goals. Achieving these goals largely depends on employees' attitude and behaviours, e.g. employee engagement, that is higher when an employee develops positive affective relationship with its own work. In fact, employees who are engaged in their work and committed to their organizations give companies crucial competitive advantages.

Within the literature, there are a lot of researches about each of these subjects and how these factors create competitive advantages. However, very few studies analyzed the effect of knowledge management on job engagement and job commitment that represent a key determinants as well as a strategic tool for firms. So, in order to fill this gap, the present study aimed to investigate the positive effects of knowledge management on employees' job engagement and organizational commitment. Overall, in our study, we are willing to add value to literature not only by highlighting the role of KM in this sepcific context of analysis, but also to cross cultural studies on knowledge management and employee's engagement and commitment.

RELEVANT LITERATURE

Knowledge management has been described for its possible role in creating sustained competitive advantages for organizations (Grant, 1996; Johannessen and Olsen, 2003; Lado and Wilson, 1994). The resource-based view is one of the theoretical perspective in strategic management literature, and focuses on costly attributes of a firm which are seen as the fundamental drivers of competitive advantage (Becker and Huselid, 1998; Nahapiet and Ghoshal, 1998). Therefore, from the resource

based view of organizational capability, a firm's knowledge management function is a firm's ability to use relevant knowledge based on resources in combination with others.

Correspondingly and strictly connected, one of the most important resource of the organization is its human resources. The quality of human resources is closely related to the contingency to reach the goals and objectives of an organization. There are many researches explaining the work attitudes of the individual that is influenced by employees' disposition and mood. For example, employees who are more satisfied with and committed to their jobs are: a) absent less (Hackett and Guion, 1985); b) less likely to leave (Carsten and Spector, 1987); c) more likely to display organizational citizenship behavior (Organ and Konovsky, 1989); d) satisfied with their lives overall (Judge and Watanabe, 1993); e) less likely to experience stress (Begley and Czajka, 1993); and f) more likely to perform well (Mathieu and Zajac, 1990) and behave prosocially (O'Reilly and Chatman, 1986).

Job engagement is defined as a 'persistent, positive affective-motivational state of fulfilment' (Maslach et al., 2001) or –in simpler words –being charged with energy and fully dedicated to one's work. Job engagement stresses the assumption of 'optimal functioning' at work in terms of well-being. Theoretically (Schaufeli and Bakker, 2004), job engagement is proposed to develop as a function of the same job resources that fuel motivation (Hackman and Oldham, 1980) and inspire positive emotions toward the organization, thus employees who feel engaged are more willing to stay on the job.

Organizational commitment is defined as an individual's psychological bond with an organization, and it has been linked to a number of positive outcomes such as job performance (Cooper-Hakim and Viswesvaran, 2005; Meyer et al., 2002; Riketta, 2002), organizational citizenship behavior (Meyer et al., 2002; LePine et al., 2002), and turnover (Meyer et al., 2002; Mathieu and Zajac, 1990). In fact, for many organizations, hiring and retaining highly committed employees is a key part of their human resource management strategy (Gong et al., 2009; Kehoe and Wright, 2013).

METHODOLOGY

Responses are collected from employees from different sectors in İstanbul (Turkey) and in Turin (Italy). OLS analysis will be carried out in order to test for the positive effects of KM on both organizational outcomes (employees' engagement and commitment). All items were developed basing on items draw from existing instruments and inputs from knowledge management experts. The research evaluated knowledge management by the scale used by Shu-Hui Chuang (2004) while, respectively, to evaluate job engagement the Job Engagement Scale (Rich et al., 2010) and to evaluate job commitment the Organizational Commitment Scale (Allen and Meyer, 1990) have been used.

MAIN FINDINGS AND IMPLICATIONS

In our research we investigated the role of knowledge management on job engagement and organisational commitment of the employees. We found that KM has a very important supportive role in creating higher organisational performances of employees. This study aims to prove that knowledge management has an effect on creating positive, affective and motivational state in an employee and psychological bond with his/her organization. We add value to the literature by deepening the positive effects of knowledge management from a different view, pointing out its role on behavioral outcomes as job engagement and organizational commitment. We also identified several cross cultural differences. The results are also crucial for the managers as the higher level of knowledge management in the companies provide to have better and more competitive advantages, in consequence of creating more engaged and committed employees.

THE ROLE OF TALENT MANAGEMENT IN AFFECTIVE COMMITMENT AND TURNOVER INTENTIONS OF THE EMPLOYEES

Özek, Hande; Del Conte, Paolo

Department of Business, Yenyuzuyl University, Istanbul, Turkey

Assioma Search and Selaction, Milano, Lombardy, Italy

ABSTRACT

INTRODUCTION

The present study aimed at finding out the factors which are similar or different in talent management in two different culture (italian and turkish). Furthermore, we wanted to add value to literature by revealing the relevance between talent management, affective commitment and turnover intentions of the employees. Thus, the research evaluated Integrated Talent Management Scale (Jayaraman, Talib, Khan, 2018) and Affective Commitment (Allen and Meyer,1990). Turnover Intention was measured with three items (Arnold and Davey, 1999) which were written after consulting relevant literature (Farkas & Tetric, 1989; Mobley, Horner, & Hollingsworth, 1978; Muchinsky & Tuttle, 1979). Responses are collected from private sector employees both in İstanbul (Turkey) and in Milan (Italy). The objective of this study is to reveal the importance of talent management in developing affective commitment and decreasing turnover intentions of the employees in different cultural contexts.

Overall, we are willing to add value to literature by pointing out that the companies which practice talent management would have more committed employees and on the other hand the intention to leave the company would be less. Moreover, we also wanted to reveal the differences between two different cultures in talent management and the effects of talent management according to different demographical factors (age, gender, seniority, status et.). The research would give a more explanotary information about the factors that are having an effect upon affective commitment and turnover intentions.

LITERATURE EVIDENCES & RESEARCH OBJECTIVES

In 1997, a group of consultants from McKinsey & Co declared a war on talent (Chambers et al.1998, Michaels, Handfield-Jones & Axelrod, 2001). After interviewing thousands of managers, the researchers noted that one of the primary differences between successful and unsuccessful organizations was that the most successful organizations had leaders who were ruthlessly focused on talent. Since then, it also has become a topic of considerable debate in the academic literature and a

central element of managerial discourse and organisational practice (Boudreau and Ramstad, 2007; Collings and Mellahi, 2009; Groysberg, 2010; Lewis and Heckman, 2006; McDonnell, 2011).

Its growing significance appears premised on the assumption that superior talent management is a key source of competitive advantage for the companies. This coupled with changes in worldwide demographics that have reportedly led to talent supply issues, have been key driving forces of interest in talent management (Tarique and Schuler, 2010).

Talent management is a term, covering a range of long-standing practices that aim at getting the right person in the right job at the right time. These include workforce planning, succession planning, employee development, and career management. Collings and Mellahi (2009) have broadly defined talent management as “talent management involves systematic identification of key positions which differentially contribute to the organization’s sustainable competitive advantage, the development of a talented pool of high potential and high performing incumbents to fill these roles and the development of a differentiated human resource architecture to facilitate filling these positions to ensure their continued commitment to the organization”.

Companies that have put into practice talent management have done so much to solve their employee retention problem (Rani, Joshi, 2012). The issue with many companies today is that their organizations put tremendous effort into attracting employees to their company, but spend little time into retaining and developing. From the strategic management view, it is important to make performance sustainable, permanent and high and it is possible with employee commitment. Starting from this point, we wanted to determine the relationship between talent management, organizational commitment and turnover intention.

Organizational commitment refers to a psychological attachment that employees develop toward membership in their organizations (Allen and Meyer 1990; Mowday, Steers, and Porter 1979; O’Reilly and Chatman 1986). The context of an employees’ commitment might be to a company as a whole or to some part of it. That is, employees may be committed to specific features of their work (Becker 1992; Becker et al. 1996; Hunt and Morgan 1994; Siders, George, and Dhawadkar 2001). In our reasearch we wanted to reveal if one of these features is talent management and hypothesized that talent management has a positive effect on organisational commitment.

As a result of recognizing specific skills and abilities of employees, and assigning them tasks that allow for the maximum usage of these skills, talent management leads to a sense of fulfilment of employees, increases their commitment, motivation, and greater loyalty to the employer. This in turn should translate into hard results: increased efficiency, increased innovation, and decrease in absenteeism and employee turnover. (Cannon, McGee, 2007). Starting from this point we composed

our second hypothesis which is talent management has a negative effect on turnover intentions of the employees.

Moreover, employees with a strong level of commitment remain with the organization because they want to (Meyer & Allen, 1997; Meyer, Paunonen, Gellatly, Goffin, & Jackson, 1989). Thus we composed our third hypothesis which is organisational commitment has a negative effect on turnover intentions of the employees.

Concluding, in our research we wanted to add value to literature by investigating the relevance between talent management, organisational commitment and turnover intentions of the employees. We found that talent management has a very important role in creating higher organisational commitment of employees. Moreover, in this research we aim at highlighting the similarities and differences in talent management of two different cultural contexts.

UNDERSTANDING THE RELATION BETWEEN TASK INTERDEPENDENCE AND COMMUNICATION STYLES

Pandey, Aparna; Karve, Shailaja

K J Somaiya Institute of Management Studies and Research

EXTENDED ABSTRACT

Teams are common in organizations (Rico et al., 2007; Cross et al., 2008), and therefore scholars are increasingly interested in team work (Mathieu et al., 2008). Interdependence of team members is what distinguishes teams from other kind of groups of individuals (Saavedra et al., 1993, Katzenbach & Smith, 2005) that implies that team tasks cannot be accomplished by individual team members alone without cooperation from others. Task Interdependence indicates the degree to which “team members interact and depend upon each other to attain their goals “(Campion et al., 1993). Maznewski and Chudoba (2000) found that in most of the effective teams a higher frequency of communication among team members was associated with tasks that required greater interdependence.

“A team is a collection of people who must work interdependently to achieve a common goal or output.”(Eunson , 2008) and communication is the foundation of team collaboration. Irrespective of the team type and team task, all team members need to constantly interact and exchange information for goal accomplishment goal and for this, each one has their own unique style of communication. The current research focuses on the communication styles of team members and the ability of team members to handle different tasks interdependencies.

THEORETICAL BACKGROUND AND HYPOTHESES

Task Interdependence

Interdependence is a concept that is fundamental to the definition of teams, which may lead to their success, and which encapsulates the interaction between team members and those features of the team that are responsible for determining how much team members rely on each other (Wageman, 1999). Task interdependence measures the degree of work team collaboration and reflects the extent of information exchange and/or means for their contribution for team task completion (Thompson, 1967). Many scholars analysed the influence of the degree of task interdependence on team effectiveness (Wageman, 1995; Saavedra et al., 1993; Van der Vegt et al., 2000; Stewart, 2006; Van der Vegt & Janssen, 2003), and performance (Burke et al. 2006). Task interdependence may “not only be related to task characteristics, and the way work is organized, but also to the way in which people work together” (Ramamoorthy & Flood, 2004) and team members also focus on social cues, like the behaviors of leaders and other team members and their signals (Drach-Zahavy & Somech, 2010).

Communication Styles

As Communication styles are an expression of one's personality, they play an important role in personal relations (De Vries et al,2009). Communication style refers to a "meta-message" that is a way of reflecting on how individuals convey and interpret a verbal message (Gudykunst et al, 1988). The communication styles of individual team members may be uniquely associated with their personalities and different communication style models have been developed and presented by different studies (Mitchel's and Winick's Colour Model, 2006; DeBakey's Adaptive Matrice, 2007; De Vries et al. (2009).The Lexical approach followed by De Vries et al. (2009) helps to identify the content and the different dimensions in communication styles and the unique way in which each individual sends paraverbal, nonverbal and verbal signals in social interactions. Communication style is a "characteristic way a person sends verbal, paraverbal, and nonverbal signals in social interactions" (De Vries, Bakker-Pieper, et al., 2009,)

Theoretical Background

Interdependence theory (Kelley & Thibaut 1959) analyses the relations between people in different situation structures. Individual differences are commonly represented in terms of the consistent patterns of behavior that a person displays across situations. Mischel and Shoda's (1995) cognitive-affective processing systems (CAPS) model proposes that situations activate typical patterns of cognition and affect that in turn constitute behavioral "signatures": or predictable patterns of response to critical features of situations.

Systems theory outlined by von Bertalanffy (1950) emphasizes that real systems work in concurrence with their surroundings and focuses on "the collection of as well as relations between the parts" that attach them into a unit (Kast & Rosenzweig, 1972). Mulej et al. (2004) suggested that interdependence is one of the seven principles of systems theory thinking that are relevant to organizations. According to Buble, (2012) Interdependence relates to varied systems within an organization that work autonomously towards task completion.

Purpose – This paper attempts to study the relationship between task interdependence in teams and communication styles of team members. The research question that guided our research was:-

- What is the relationship between communication styles and task interdependencies in work teams?

The variables under study are :

Task Interdependence – Task interdependence in teams is the degree of dependence of team members on each other to complete team task responsibilities and can be of three types

- *Pooled interdependence* occurs when team members function with relative independence but their combined output contributes to the team's or organization's overall goals.

- *Sequential interdependence* occurs when one unit in the overall team task process produces an output necessary for the performance by the next unit.
- *Reciprocal interdependence* involves a continuous to and fro of information and interaction and the output of one department becomes the input of another, with the addition of being cyclical.

Communication Styles –Indicates the manner in which you give and receive information, each style has its own unique suitability and effectiveness for a specific situation and task with advantages and challenges.

- *Expressive* - Relates to how expressive one is while communicating in different situations and with different people. The facets of this style are dominant, humorous, informal and talkative
- *Precise* -relates to how precisely one communicates. Facets are thoughtful, concise, structured, substantive.
- *Verbally Aggressive* - Relates to how verbally aggressive one communicates. The facets studied are authoritarian, angry, harsh and supportive.
- *Questioning* - Relates to how questioning one's communication style is. The facets are argumentative, philosophical, unconventional and inquisitive.
- *Emotional* - Relates to how emotional one is in the way one communicates and this includes facets like worrisome, defensive, tense, and sentimental.
- *Impression Focused* -Relates to how focussed one is on making an impression ad/or manipulating impressions and facets are charming, inscrutable, concealing and flattering.

PROPOSITION

- Type of Task Interdependencies (Pooled, Sequential or Reciprocal) will determine the communication style adopted by the Team members.

Research Model (Figure 1)

METHODOLOGY

The researchers attempted to see if certain different communication styles were adopted by managers when they handled task responsibilities with different interdependencies in teams. The researchers measure task interdependencies with relation to Team member communication styles through a self-report questionnaire. Data was captured from 510 managers working in various teams in different organizations and industry sectors. Through a six point Likert type scale (with 1 = strongly disagree and 6 = strongly agree) Individual Team member behaviour for Task Interdependence was measured along with the dimensions of communication styles as outlined by the *Communication Styles Inventory* (CSI), (De Vries et al, 2009) which distinguishes between six communication behavior dimensions of Expressiveness, Preciseness, Verbal Aggressiveness, Questioningness, Emotionality, and Impression Manipulativeness.

To investigate the relationship between two quantitative variables the most commonly used techniques are Correlation and linear regression , that indicate both the direction and strength of relationship. The task interdependencies (pooled sequential and reciprocal) were studied with relation to the six communication styles (expressiveness, preciseness, verbally expressive, questioning, emotional and impression focussed) displayed by the managers to understand which communication style was most likely to be activated with the different interdependencies. As this is an ongoing study the results are still in the process of being computed. The data is being analysed to understand the relationship between task interdependencies and communication styles by using appropriate statistical tools like AMOS or SMART PLS.

CONTRIBUTIONS TO OF THE RESEARCH TO THEORY AND PRACTICE

The researchers feel that the study will bring forth important understanding of the way people behave in teams that have task responsibilities of interdependent nature. These interdependencies could be of different kind and likewise team members will display different communication styles. A team members may display different communication style when the task interdependency is different.

ORIGINALITY OF STUDY

Many studies have studied the team interdependencies and this study attempts to take the study of teams and the interdependent nature of team tasks further with its focus on individual communication styles of team members.

CONCLUSIONS AND FUTURE DIRECTIONS

Based on the findings of the study, the researchers will arrive at certain conclusions and scope for future. The researchers hope that interesting observations from the results of the current research analysis will encourage taking the research further to study other interdependencies at play while handling team task responsibilities like Resource, Reward, and Goal interdependencies.

BRAND POST CHARACTERISTICS AND POPULARITY: A STUDY OF FACEBOOK BRAND PAGES OF FOOD AND BEVERAGE COMPANIES

Petrakis, Manolis; Melanthiou, Yioula; Papasolomou, Ioanna; Dekoulou, Evi

University of Nicosia

ABSTRACT

Social Media, as a tool of information, communication and social interaction plays an important role in marketing, enhancing brand awareness and brand engagement. For this reason, more and more companies publish brand posts and interact with consumers through brand profiles and pages in Social Media.

The current research aims to investigate which features of brand posts enhance their popularity, resulting in more 'liking', commenting, and sharing, thus provoking online "word-of-mouth" communication. 451 corporate posts were analysed from 9 leading Greek companies in the Food and Beverage sector, during a three (3) month period. The results show that message irritability, interactivity and thematic content cause online reactions of different intensity, revealing in parallel a different grading of commitment to companies and products.

Particularly, 'liking' is positively influenced by publications with tips about products use and healthy nutrition, contests, corporate news/CSR, videos, advertising messages, festive and anniversary posts, and less with links and images. Additionally, post commenting can be triggered through contests, video / GIF, festive and anniversary posts, corporate news / CSR, images, calls for commenting and links to other SM pages or sites. Finally, post sharing is enhanced by contests, video / GIF, social and leisure activities, photos and links.

The findings of this study can guide digital marketers managing brand fan pages to focus on those characteristics or content that trigger e-WOM communication and strengthen engagement of SM users.

THE IMPACT OF RISK ON SUPPLY CHAIN PERFORMANCE: A STRUCTURED LITERATURE REVIEW

Pham, Hai; Verbano, Chiara

Department of Management and Engineering, University of Padova, Vicenza, Italy

ABSTRACT

INTRODUCTION

The current globalization has brought to firms not only opportunities but many challenges as well. At the global level, firms have built production plants, warehouse facilities, and distribution centers in many countries for multiple reasons: access to raw material sources, cost advantages or specialist skills and capabilities (Choi et al., 2012). However, this globalization has also resulted in challenges for supply chains, e.g. increasing complexity and risks (Tang, 2006; Chopra and Sodhi, 2004).

Many works have concluded that risk sharing mechanism and risk information sharing affect financial performance (Li et al., 2015); other scholars reported that risk sharing mechanism, risk analysis and assessment, and risk information sharing impact on operational performance (Fan et al., 2017). However, this study argues that to manage supply chain (SC) risk and then to improve performance, it is really necessary to determine whether there is a relationship between risk and SC performance. In this regard, many investigations have been performed to prove this relationship, yet their findings are still fragmented. In other words, to our knowledge the extant literature still lacks reviews which can provide a whole picture on the interaction between risk and SC performance. Therefore, this study is conducted to fill this gap of knowledge.

OBJECTIVES

In order to present a state-of-the-art review of the relationship between risk and SC performance, two main objectives are pursued. First, to explore interactions between risk and performance. Second, to identify specific gaps of knowledge in the extant literature. To extract the paper sample investigating the relationship between SC performance and risk, Scopus and Web of Science databases have been used since their coverage significantly differs (Mongeon and Paul-Hus, 2016). The keywords selected to create the first search string are: "supply", "chain*", (risk* OR operation* OR disruption*), (performance OR competitive*); the asterisk "*" denotes a fuzzy search. According to Tang (2006), SC risk can be classified into two main categories: disruption and

operational, hence two keywords namely disruption and operational have been included. Selection of competitive priorities (quality, cost, delivery, flexibility) has been considered important in developing and implementing the firm's operations strategy in the SC (Ho et al., 2002), thus the keyword "competitive" also appears in the search. In the SC risk literature, SC risk management has been a main stream of research. Its aim is to develop strategies for identification, assessment, treatment, as well as monitoring of risks in the SC (Ho et al., 2015). Hence, the second string "supply chain risk management" has also been applied.

A total of 775 publications were identified, 302 and 473 from Web of Science and Scopus respectively. However, only journal papers have been chosen since they provide more comprehensive and higher-quality information than other publication types (Zhao, 2017), whilst conference papers, book reviews, book chapters, and non-English publications were excluded. Then, 474 journal papers have been retained. Moreover, 88 duplicates between the two databases were found and eliminated from the paper sample. In the last step, title, abstract and full paper have been screened; the result shows that there are 63 papers empirically investigating the impact of risk on SC performance.

PRELIMINARY FINDINGS

It is observed that four journals including International Journal of Production Economics, Supply Chain Management: An International Journal, International Journal Of Operations And Production Management, and International Journal of Production Research have the most published papers, compared to other journals in the paper sample. The most productive countries consist of United States, United Kingdom, and China with 14, 11, and 10 papers published. Regarding categories of risk, 20 papers investigate the impact of external (macro) risk on performance, while the remaining papers focus on the impact of internal (micro) risk. External risk is related to natural and man-made disasters (e.g. economic downturns, wars, earthquakes), internal risk is divided into four types: supply, manufacturing, demand, and infrastructure risks (Ho et al., 2015). In terms of research methodology, 6, 10, and 12 papers adopt interview and case study, conceptual framework, and modelling respectively. Most of the paper sample apply survey to collect data. Remarkably, very limited literature review has been done to comprehensively present the impact of risk on SC performance. Additionally, papers mostly concentrate on SC performance; only 14 papers concentrate on firm performance in the supply chain.

From an in depth content analysis, this study found that SC risk impacts on performance in two forms: direct and indirect (mediating and moderating) impacts. The majority of papers examines the direct impact of SC risk, whilst few papers examine the indirect impact of risk. Regarding the direct impact, many studies concluded that SC performance is impacted by many dimensions of risk (for

example, Mishra et al., 2016; Hendricks and Singhal, 2005; Wang, 2018; Truong Quang and Hara, 2018; Chen, 2018; Avelar-Sosa et al., 2014; Wilson, 2007; Klassen and Vereecke, 2012; Donadoni et al., 2018; Wagner and Bode, 2008). In terms of the indirect impact, risk can act as a moderator, meaning that the effect of SC management on performance can be moderated by risk (e.g. Srinivasan et al., 2011; Brusset and Teller, 2017). Meanwhile, the risk impact on performance can also be mediated by various factors (e.g. supply chain integration) (e.g. Jajja et al., 2018; Zhao et al., 2013).

By conducting a content analysis of the paper sample, some gaps of the literature are identified by this study. First, studies mostly focus on the impact of risk on SC performance, overlooking the importance of single firm performance in the SC. SC performance largely depends on the ability of its members in aligning their strategies, yet supply chain performance may not be enhanced if the single firm's interests are not aligned with those of supply chain members. Only best firms in terms of profits and sales from product are able to exhibit the ability to effectively collaborate with other SC members to satisfy customers. The ultimate objectives of each firm are to improve market share and profit for all SC members, yet to achieve these objectives, each firm needs to manage supplies to improve its productivity and minimize cycle time and inventory. The firm's SC strategy should be based on products it provides as well as its demand characteristics. Therefore, this study argues that research on the impact of risk on firm performance in the SC should receive more attention by future research. Second, many scholars just consider one dimension of performance, e.g. logistics (Wang, 2018); or just some types of risk such as supply and demand risk (Zhao et al., 2013). Although many studies have found the empirical evidence for the connection between supply chain risk and performance, they usually do not propose strategies for mitigating risks (Wagner and Bode, 2008; Truong Quang and Hara, 2018; Wang, 2018). Third, SC management practices (e.g. integration, collaboration) mostly improve the overall SC performance, not focusing much on performance of the single firm.

In addition, very limited research has empirically investigated the impact of operational risks (supply risk, manufacturing risk, and delivery risk) on single firm performance. Since the current literature still lacks reviews that comprehensively present the impact of risk on SC performance, this study is conducted to fill this gap. Through a systematic literature review, this work attempts to synthesize findings from previous studies and provide an insight for researchers and practitioners on how research on the relationship between risk and SC performance has developed in the past.

CUSTOMER ENGAGEMENT: GROWING RELEVANCE IN MARKETING RESEARCH

Pinto, Filipa Rosado; Loureiro, Sandra Maria Correia

Instituto Universitário de Lisboa (ISCTE-IUL), Business Research Unit (BRU-IUL), Lisbon, Portugal

ABSTRACT

Within marketing research, the number of studies about customer engagement has been growing, emerging mainly after 2005 (Brodie *et al.*, 2011), which reflects the increasing interest of researchers on the topic. The purpose of this study is to provide a systematic literature review to answer to the research question: “What marketing research has been conducted on customer engagement until now and what could be future avenues for research?”

In what concerns methodology, this study applied a systematic literature review which is considered a scientific, replicable and transparent process (De Menezes and Kelliher, 2011). Two dominant academic databases, Web of Science (WoS) (core collection) and Scopus, were used. The search was done on 24/07/2018 and on 25/07/2018. The keywords used were: “customer engagement”, “consumer engagement” and “brand engagement” and several filters were applied. Starting with 617 articles from WoS electronic database and 767 articles from Scopus, after taking out the duplicated articles, applying the exclusion criteria and combining both databases, a total of 648 papers remained. After performing the abstract and the full text reading, 144 articles were finally included for analysis.

Figure 1. Methodologies used: evolution along the years

Based on the literature review performed, it can be concluded that customer engagement has been a key area of research within the marketing field. The growing number of articles published about the topic and the diversity of authors studying it, together with the different countries where studies are taking place and the diversity of the research context (industries analyzed) seem to reflect the

importance that the topic has gained worldwide. In what concerns the methodologies used, Figure 1 shows that, mainly after 2012, empirical studies have been the most common studies.

It can also be concluded that although different theoretical backgrounds have been presented, relationship marketing and the service-dominant logic are the most common theoretical perspectives from which customer engagement emerges (e.g., Brodie *et al.*, 2013; Fehrer *et al.*, 2018). In what concerns the conceptual roots of engagement and its sub-forms, several definitions of customer engagement are presented in the marketing literature. It is described, for instance, as a psychological state (Brodie *et al.*, 2011) and as a "...behavioral manifestation toward the brand or firm that goes beyond transactions" (Verhoef *et al.*, 2010, p. 247). Many other sub-forms of engagement are found in the literature like "consumer engagement", "brand engagement", "customer engagement behaviors" and "actor engagement", among others. This diversity is also present when authors refer to the dimensions of engagement. Although a significant proportion of the analyzed studies conceptualize customer engagement as a multidimensional construct (e.g., Hollebeek, 2011; Dessart *et al.*, 2016) with the cognitive, emotional and behavioral components, other dimensions have also been referred by different authors (e.g., Vivek *et al.*, 2012; So *et al.*, 2014). The literature review also reveals several gaps for future research: exploration of customer engagement in different industries, undertaking a longitudinal approach, performing a cross-cultural analysis and further investigation about engagement valence, actor engagement, customer engagement in the hospitality setting and about the relationship of customer engagement and other related constructs.

This study has some limitations related to the possibility of human error while performing the analysis, a certain degree of subjectivity in the choice of relevant studies and the possibility that some articles are omitted due to the databases used or the filters applied. Despite the limitations, an important contribution is made as the study presents a review about customer engagement research, highlighting the main conclusions and future avenues for research. The analysis is not only useful for researchers, but also for managers whose objective is to have engaged consumers.

CULTURAL TOURISM AND ITS ASPECTS IN TOURISM INDUSTRY OF ALBANIA

Pjero, Elenica¹; Gjermëni, Orgeta²

¹Dept. of Business Administration, Faculty of Economy, University "Ismail Qemali"

²Dept. of Mathematics, Faculty of Technical Sciences, University "Ismail Qemali"

ABSTRACT

Cultural tourism plays a major role in the global tourism today. Cultural tourism is less seasonal than other forms of holiday travel, the reason why particular places have tended to be associated with specific forms of culture, and therefore, different types of cultural tourism practice. This research aims to present cultural tourism benefits for Albania reality. The cultural season often runs counter to the tourist season, so cultural tourists can be attracted at times when other markets may be weak while culturally-motivated tourists will tend to travel all year round to follow their specific cultural interests. The methodology is based on secondary data, literature review and a total of 381 visitors from Albania and abroad surveyed. The research demonstrates that travelling to experience the culture of others also means gaining a direct appreciation of cultural diversity, establishing new cultural ties, and helping to keep the cultural heritage alive. The research indicated that the combination of culture and tourism can be a powerful driver of economic activity. It also the factor of buying power should be consider during the development of cultural tourism products. The important contribution of this study is made in evidence by investigation of the links between culture and tourism, which goes beyond the economic returns, such as the increasing role of the internet both in travel booking and in finding the necessary information and the issues of creative tourism as closely linked to cultural tourism.

Keywords: cultural tourism, tourism products, travelling, cultural diversity, experience, heritage, economic returns, internet.

IN ART SOCIAL MEDIA MARKETING: A TOOL FOR DESTINATION MARKETING

Pucciarelli, Francesca¹; Giachino, Chiara²

¹ESCP Europe Torino, European Department of Marketing, Turin, Italy

²Department of Management, School of Management and Economy, SME, Turin, Italy

ABSTRACT

Web 2.0 has changed the way individuals take decisions (Pucciarelli, 2017), and Social Media have become a source of inspiration in choosing the next-destination and cultural attraction to be visited (Belenioti & Vassiliadis, 2017; Liasidou, 2017). Social Networks Sites are an ideal platform for inspiring travellers, by both User Generated Contents and tourism providers social presences (Giachino et al., 2017). A clearly defined multi-channel social strategy can give destination marketers an edge and keep their brand top-of-mind for travellers. Nevertheless, destination and tourism marketers face a unique set of challenges and opportunities when using social media to attract and empower visitors (Lazzaretti, Sartori & Innocenti, 2015). In the cultural context, the digital and technological dimension allows the museum, for example, to carry out participatory activities, useful to eliminate the traditionally binary nature of the fruition experience (Bollo, 2015) and to create a relationship with visitors focused on the long term, perhaps based on the creation of partnerships and on the strengthening of trust (Garbarino & Johnson, 1999; Camarero & Garrido, 2011). New technologies allow to create and manage relationships as well as information contents in real time and can be exploited both online and on-site, favouring the connection between museum and people of any age and social background. Digital tools also represent an exaltation of the role of word of mouth (Dobele et al., 2005; Cova & White, 2010) or of the more contemporary word online - word of mouse - considered an element of absolute importance that can bring many people positively influenced by the experience of friends to the museum (Mosca et al., 2018). Despite the increasing interest about the role of social media in tourism and destination marketing in general, calls for further investigation arises from extant literature (e.g. Kislali, Kavartzis & Saren, 2016, call for a better understanding of the role of the social media and user generated content in Destination Image formation).

This study aims to investigate the role of social media as a tool to enhance destination marketing. The research analyse how a given touristic attraction –i.e. a museum- is promoted online and to identify specificities, at both strategic and tactical level of the use of social media marketing applied to tourism marketing with the aim of advance the understanding of the Social Media Marketing strategy for museum to engage old and new visitors.

The paper presents a case study of an Italian Museum Foundation; the case has been chosen for five main motivations: first the Italian Museum Foundation (IMF) has the mission of promoting both museums and destination at large; second the IMF manages three Museum having three distinct and complementary cultural offer (from Asian Art, to modern Art, passing from Ancient Art); third the IMF is focusing heavily on online and Social Media Marketing as demonstrated by the creation and hiring of a dedicated figure in the organization; fourth, case based approach is used in the exploring the role of Social Media in many industries, tourism and cultural tourism included (Lazzeretti, Sartori & Innocenti, 2015); fifth, direct access to IMF Communication team and Social Media insights. The use and effectiveness of Social Media engagement strategies and tactics is thus analysed through both direct interviews and contents marketing engagement results.

Results confirm that Social Media presence appear to be now a mandatory part of Destination Marketing effort. Moreover, it is important to highlight that Social Media Museum exposure has different scopes: starting from brand awareness; to the educational scope of cultivating audience and art insiders knowledge and learning of the given art stream; to, enlarging the view, contributing to establishment of destination branding of city/region of belongings. These complementary scopes translates into the need of adopting Social Media marketing generic best practices for community engagements with the due adaptations to Museum Marketing.

Results indicate that mainstream Social Media, such as Facebook, Instagram and Twitter are the ones preferred in communicating Museums. And if in line with previous studies, the importance to participate in (in Social Media) is considered important by Museums professionals (Fletcher & Lee, 2012), most of the focus remain on one-way communication strategy –exhibitions and events listing, sponsored posts, etc.-, missing some of the opportunities of Web 2.0 to better understand and engage with audience –such as Social Media listening, re-grams, etc.-. This study contributes to the growing area of Destination Marketing cross-channel and multi-way communication strategies by advancing our understanding of Social Media Marketing audience engagement strategies. Furthermore, this study contribute to the field of tourist and cultural marketing by providing an up-to-date picture of Social Media Museum branding and by proposing valuable managerial implications to museums practitioners and scholars. Last but not least the study shed light on the challenges and organization constraint cultural tourism providers will have to overcome when participate in Social Media.

ETHICS, LEADERSHIP AND CULTURE AS A BASIS FOR THE SUSTAINABILITY OF FAMILY COMPANIES, THE CASE OF PERU

Ramirez Lozano, J.P.¹; Sanagustín-Fons, V.¹; Peñaflores Guerra, R.²

¹Faculty of Administration, University of Lina, Lima, Peru.

²Family businesses, culture, leadership, ethics, sustainability

ABSTRACT

The management of family businesses in countries of emerging economies turns out to be a great challenge that has two variables in particular. The first is to remain in the market and not disappear in the first years and the second is the formalization of the business. Therefore, it is important to know what are the differentiating attributes or elements that allow companies to survive in the market.

In this way we have carried out a study taking the case of 3 family businesses whose main characteristic is to be profitable and sustainable businesses in time, with 30, 50 and 70 years in the Peruvian market. This is the case of the company Liderman, Tailoy and Arti. These companies have managed to maintain themselves over time due to their ethical management, since over the years they have had no management problems. They are also companies that present ethical leaders, responsible, close to their employees, who above all have managed to delineate a good management of corporate culture. Knowing how to take their personal values to the values of the company and turning their companies into a good example of corporate culture.

VALUES AND LEADERSHIP: RHETORIC AND REALITY, A COACHING PERSPECTIVE.

Rodgers, Helen¹; White, Annemarie²

²Learning in Business Limited.

ABSTRACT

INTRODUCTION

The research and measurement of values in organisational and group settings and within individual contexts is a very complex and contradictory terrain (Hechter, 1993). In their seminal paper on values research, Hitlin and Piliavin (2004) outlined the difficulties involved in defining and measuring values and the distinctive divide between the subject disciplines of psychology and sociology. Values are difficult to define, influenced by multiple variables; including parental influence and family characteristics, social class, occupation and education, age, religion and national and demographic factors. Moreover, values may exist in a hierarchy of attachment and order Schwartz and Bardi (2001), are cognitive and affective in relation to social memberships and are structurally and culturally relative. Variations in the identification and measurement of values are beset with differences of opinion on methods of data collection and analysis. Rokeach's (1967, 1973) ranking system and Schwartz's (1992, 1994) rating system are indicative of the quest to refine methods to explore and understand individual associations to values via survey methods.

With calls for a more incisive focus on culture, responsibility and values within the broader governance narrative, policy and literature; Hitlin (2003, p.123) suggests that "we feel authentic when we behave in keeping with our values" yet at times we often feel at conflict within the ethical paradoxes associated with leadership roles and responsibilities in the workspace (Ciulla, 2018; Boulden, 2016; Francke, 2016). A central idea in our understanding of values within the extant research, is that "values play an important role in action" (Kluckhorn, 1951, Hitlin and Piliavin, 2004, p.364). Moreover, values may be conceived of as an internal moral compass giving meaning to action (Rokeach, 1973). It is the dual aspects of action and meaning that hold relevance within the context of leadership research and leadership development.

Key research questions arising from the literature in broad terms are:

What kinds of values have meaning to leaders in organisations?

How are values associated with action, meaning and choice?

How do values relate to broader socio-cultural contexts?

And finally, what is the adaptive nature of action and meaning in relation to key leadership career points?

METHODOLOGY

The research follows an interpretivist methodology using interviews undertaken within a coaching approach. Within this approach, a semi-structured interview schedule (based upon professional executive coaching principles) is used to build interaction and trust with participants in order to explore participants' individual associations with the concept of values, both personal and organisational, in relation to key leadership and career decision events.

The coaching approach was chosen for this research, as it raises self-awareness, allowing for deeper levels of reflection during the interviews (compared to a standard question and answer format).

There are 4 principles that underpin the coaching model used by the coach:

1. The coach works alongside the client to create a partnership. The participant brings the desire and motivation to explore their values in the session; they are in charge of the content and the coach is in charge of the process elements of the interview. This principle is based on the work of Rogers (1957) and his person-centred stance, where the same 'core conditions' that determine the quality of the therapeutic relationship help create a coaching environment for growth and development, allowing the client to share their feelings and thoughts and not feel judged:
 - Unconditional positive regard and acceptance
 - Accurate empathy
 - Congruence /genuineness
2. The coach meets the client where they are. The coach doesn't introduce any material; they use reflection to help the participant to become more aware of how they are feeling. This goes beyond reflective listening to the Gestalt concept of Undirected Awareness (Leary-Joyce 2014); staying in the present and focusing on the whole of the client, themselves and what's happening between them.
3. The freedom to work with the here and now is held within an overarching structure. The interview framework and the five questions developed within the semi-structured coaching interview schedule, provide the structure and the coach works with what the participant says and how they are being. In de Haan's (2008) Relational Coaching book, he writes, "the only thing the coach can actually influence, the only thing the coach can use to exert albeit an

indirect influence on the outcome of the coaching is the relationship between coach and coachee" (de Haan, 2008, p.53).

4. The client doesn't operate in isolation. The coach and participant explore other elements of the system; who was involved and their reactions, as they can trigger new insights

Participants for the research are recruited as either existing or past coaching clients or through volunteering, following a "snowballing" technique used in emergent, inductive, qualitative research (Bryman, Bell and Harley, 2018).

The participant pack was designed and disseminated to participants, in advance of the research interviews, outlining the key foci and purpose of the research following ICF (International Coaching Federation) and CIPD (Chartered Institute of Personnel Development) ethical guidelines; including informed consent, assured anonymity, confidentiality and the right to withdraw at any point in the research process up to the final draft submission of journal papers.

A pilot interview was undertaken with a past coaching client to establish the sequencing, pace, timing and comprehension of the interview design. Key findings from the pilot interview were: An acknowledgment that the sequencing of questions relating to values required sensitive and expert structuring, handling and timing within the frame of the interview process. This ensured that participants values were emergent and restricted the potential for any influence. The requirement for the researchers to clarify individual definitions of terms, relating to values, principles and associations to moral codes underpinning action and meaning in leadership choices. In addition to this, the pilot identified the need to undertake a form of rating process within the interview (Hitlin and Piliavin, 2004), in order to gain an appreciation of varying importance of different values to the individuals ethical and moral code and different points within the specific leadership journey. Finally, the pilot revealed the need for researcher sensitivity to the depth of emotion invoked during the interview process with the requisite and accurate coaching response. Understanding the coaches need to listen, probe and reflect with the participant in building the research conversation was imperative as was recognising the ongoing nature of the research intervention in relation to the ongoing nature of career choices and the connection to broader socio-cultural contexts.

INITIAL ANALYSIS

Due to the in-depth nature of the research intervention, the research adopted an emergent three-stage analysis.

- 1) Interviews were recorded and subsequently listened to, by both researchers at least twice before full transcription took place. Then, detailed, initial research meetings about the content and meaning of

the interviews were held by the two researchers to establish understanding of the content and context of the interview data.

2) Once fully transcribed, both researchers annotate and highlight areas of specific interest within the data, relating to key research questions and the extant literature, in order to establish patterns within the data that related to the key research questions.

3) Another detailed meeting was held to build a further appreciation of the data, continuing the iterative process required for an empirical data analysis and to enable connection to the broader theoretical base.

Whilst the empirical data collection is still in progress, key learning from the research thus far indicates that this research study adds to the debate about definition and measurement of values in leadership research and leadership development and demonstrates the utility of adopting a coaching approach for such research, in gaining deep understanding of the relational nature of values and action. The approach presents an (hitherto) underused research tool to explore how leaders navigate the varied and challenging terrain of personal and organisational values in relation to action, meaning, judgement and decision making, in leading organisations and in personal career development. Working with how the participant is 'being', can cause them to suddenly pause to reflect and gain a new realisation or deeper understanding. Beisser's (1970) Paradoxical Theory of Change (an influence on Gestalt theory), holds that change occurs when "I fully become what I am, rather than trying to be what I am not" (Beisser, 1970 in Gillie, 2009, p.). Within this frame of reference, our research takes the coaching intervention as an opportunity to explore "turning points and momentous turning points" (Hemingway and Starkey, 2018) in individual leadership journeys in order to unveil associations and identification with values as a central influence on decision-making and career choices. Further, the research seeks to examine professionals' association to values as a barometer of both character and ethics, in order to develop further empirical understanding of the eleven-dimension framework developed by Crossan, Seitjs and Gandz (2016).

Keywords: leadership, values, coaching, character.

ABSTRACT

PURPOSE OF THE RESEARCH

The aim of this work is to verify if the technological innovativeness, mediated by the visual aesthetic aspect – value, acumen and response - of luxury brands, increases the consumers' pleasure of owning a new luxury fashion brand: Apple brand.

THEORETICAL BACKGROUND AND HYPOTHESES

Nowadays, although luxury continues to be seen as something that is excellent, creative and exclusive, something has been changing: what was once related to art, today is related to business (Thomas, 2007). This implies that the influence of creativity has changed, not the creativity itself, the way artists come the luxury is that has changed from creativity to profitability (Kafpefer, 2017; Cristini et al., 2017). Thus, the aspect of technological innovation must be associated with the design and visual aesthetics of new luxury brands (Makkar and Yap, 2018; Bloch et al., 2003).

The innovation researchers have observed that customers encounter considerable difficulties in recognizing the value of truly novel products, and have stressed repeatedly the need to better understand the socio-cognitive processes involved in the adoption of new technologies (Dougherty 2001; Hargadon and Douglas 2001; Leonard-Barton 1995). Technological innovativeness can be considered as the degree of newness of technologies embodied in a new product and is assumed to be a driver of new product success because new technologies promise higher technical performance, and offer additional functionality and increased benefits to customers (Hill and Rothaermel, 2003; Zhou, Yim, and Tse, 2005; Kock et al., 2011). Synchronizing technological innovation and product form design is important because the underlying technological change and the outer product form jointly determine the novelty with which a product innovation presents customers (Rindova and Petkova, 2007; Rafaeli and Vilnai-Yavetz 2004).

The centrality of visual product aesthetics (CVPA) is defined as “the overall level of significance that visual aesthetics hold for a particular consumer in his/her relationship with products” (Bloch, Brunel and Arnold, 2003, p. 552). For this research, it was consider three dimensions of CPVA: (1) the value dimension where a consumer assign to product appearances in enhancing personal and societal well-being; (2) acumen or the ability to recognize or evaluate product designs and (3) the level response to visual design aspects of products.

The form or design of a product, associated with a strong emotional consumer-brand relationship (Fetcherin & Heinrich, 2015; Langner et al., 2015; Alvarez & Fournier, 2016; Aro et al., 2018; Bairrada et al., 2018), contributes to its success in several way (Block, 1993). Aesthetics is a holistic perception concerning both design principles and individual objects (Cai and Xu, 2011). Any object can be aesthetically appreciated, and objects are often deliberately designed to induce aesthetic pleasure (Postrel, 2003; Casais et al., 2016).

Product form design and the underlying technological change interact in defining how users may conceptualize a product’s functions (Christensen 1995, Hargadon and Douglas 2001), and how they may respond to it emotionally and give consumer pleasure (Rindova and Petkova, 2007). Then it can hypothesize that:

H1: The innovativeness technological – personal knowledge of high-tech product (IT_A) has a positive effect in the value of visual brand aesthetics (V)

H2: The innovativeness technological - personal knowledge of high-tech product (IT_A) has a positive effect in the acumen of visual brand aesthetics (A)

H3: The innovativeness technological - personal knowledge of high-tech product (IT_A) has a positive effect in the response of visual brand aesthetics (R)

H4: The innovativeness technological - self-perception of high-tech product (IT_B) has a positive effect in the value of visual brand aesthetics (V)

H5: The innovativeness technological - self-perception of high-tech product (IT_B) has a positive effect in the acumen of visual brand aesthetics (A)

H6: The innovativeness technological - self-perception of high-tech product (IT_B) has a positive effect in the response of visual brand aesthetics (R)

H7: The value of visual brand aesthetics (V) has a positive effect in the consumer pleasure (P)

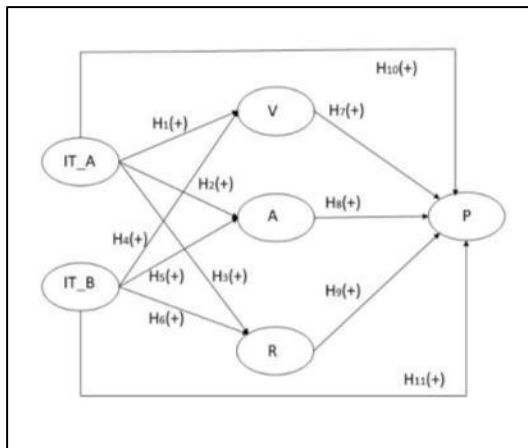

H8: The acumen of visual brand aesthetics (A) has a positive effect in the consumer pleasure (P)

H9: The response of visual brand aesthetics (R) has a positive effect in the consumer pleasure (P)

H10: The innovativeness technological - personal knowledge of high-tech product (IT_A) has a positive effect in the consumer pleasure (P)

H11: The innovativeness technological – self-perception of high-tech product (IT_B) has a positive effect in the consumer pleasure (P)

Figure 1 – Conceptual Model

METHODOLOGY

A quantitative methodology was employed for this research. It was used a survey to measure relationships between constructs on a theoretical model, about Apple brand, in the Portuguese consumers. The study follows the two-step structural equation modelling methodology recommended by Anderson and Gerbing (1988) and using SPSS/AMOS 21 software. The measurement model is developed according to the constructs considered in the theory and then to estimate the causal relations that validate or not the hypotheses raised. The relevant constructs in the theoretical model were operationalised measures from existing literature, advocated by Podsakoff *et al.* (2003) as a procedural method to reduce the common method bias. We used Shalev and Morwitz (2012) scale to measure technological innovativeness, Bloch, Brunel and Arnold (2003) three dimensions scale to measure the centrality of visual product aesthetics – value, acumen and response and Raghunathan and Irwin (2001) scale to measure pleasure. All the variables was measured by 5-point Likert scales. The respondents could choose between “Totally Disagree” (1) and “Totally Agree” (5) except the pleasure that we ask to the respondents to rate their emotions according to the way the brand made they feel between “Very Bad” to “Very Good”.

FINDINGS

A total of 193 valid questionnaires were collected. 64.8% of the respondents have less than 19 years, 13.5% have 20 years, 9.8% have 21 years and the rest of the respondents have more than 21 years. The oldest have 47 years. 34.2% of the respondent are male and 65.8% female. All the respondents knows the Apple brand.

The survey questions were tested through exploratory factor analysis (EFA) and confirmatory factor analysis (CFA). Beginning with the EFA and in order to simplify the findings, an estimation with principal components with varimax rotation was performed on an initial factor solution. The items in the EFA that did not meet the criteria (factor loaded > 0.5) were eliminated from the scale.

To evaluate the measurement model, we considered the reliability and validity of the scales chosen to measure each of the constructs and, performed a confirmatory factor analysis (CFA) by maximum likelihood estimation method and Hair's et al. (2006) criteria. The measurement model's psychometric values are: $\chi^2/df = 1.787$, RMSEA = 0.064, CFI = 0.944; TLI = 0.930; IFI = 0.945. For all constructs, Cronbach's alpha is above of 0.819 and CR values are greater than 0.902 and AVE value are greater than 0.693. All standardized regression weights are significant at $p < 0.001$. All composite reliabilities are greater than the minimum criteria of 0.70 (Nunnally and Bernstein, 1994). The average variance extracted (AVE) provides evidence of the overall convergent validity of each construct as indicates the amount of variance explained by the construct relative to the amount of variance that may be attributed to measurement error and should exceed 0.50 (Fornell and Larcker, 1981). The squared correlation between constructs did not exceed the average variance extracted in any of the cases, indicating that the model meets the criterion for discriminant validity among latent variables (Fornell and Larcker, 1981). Hence, it can be concluded that all latent variables have convergent and discriminant validity.

Structural Equation Modelling (SEM) using maximum likelihood estimation and bootstrapping method was conducted to test for the validity of the model and the formulated hypotheses. The structural model's psychometric values are: $\chi^2/df = 1.999$; RMSEA = 0.072; CFI = 0.928; TLI = 0.911; IFI = 0.929, allow us to conclude that the model fit was good.

The results obtained in the estimation of the proposed conceptual model show that in respect to innovativeness technological - personal knowledge of high-tech product has a positive effect in the value of visual brand aesthetics ($\gamma = 0.276$; $p = 0.004$) validated H1. The same occurs in the hypothesis H2, when the innovativeness technological - personal knowledge of high-tech product has a positive effect in the acumen of visual brand aesthetics ($\gamma = 0.290$; $p < 0.001$) validated H2. At the contrary, the innovativeness technological - personal knowledge of high-tech product do not have a positive effect in the response of visual brand aesthetics ($\gamma = 0.063$; $p = 0.555$) rejected H3. With regard to the innovativeness technological - self-perception of high-tech product, the results show us that the innovativeness technological - self-perception of high-tech product have a positive effect in all the dimensions of visual aesthetics – value ($\gamma = 0.588$; $p < 0.001$); acumen ($\gamma = 0.356$; $p < 0.001$) and response ($\gamma = 0.565$; $p < 0.001$), validated H4, H5 and H6. Contrary to the expectations, none of the dimension of the visual aesthetics has a positive effect in consumer pleasure of use the brand.

The value, acumen and response of visual brand aesthetics do not have a positive effect in the consumer pleasure ($\beta = -0.141$, $p = 0.424$; $\beta = -0.258$, $p = 0.120$; and $\beta = -0.258$, $p = 0.046$, respectively), rejecting H7, H8 and H9. Finally, the direct effect of technological innovativeness on consumer pleasure was estimated. The innovativeness technological - personal knowledge of high-tech product has a positive effect in consumer pleasure ($\beta = 0.271$, $p = 0.068$) at a p-value < 0.1 , validated H10 and innovativeness technological - self-perception of high-tech product do not has a positive effect in consumer pleasure ($\beta = -0.101$, $p = 0.625$) who lead us to reject H11.

CONCLUSION, CONTRIBUTIONS AND LIMITATIONS

In summary, the results of this investigation show that innovativeness technological - personal knowledge of high-tech product don't have effect in one dimension of CVPA – response dimension and the innovativeness technological - self-perception of high-tech product have a positive effect in all the dimension of CPVA. This means that the innovativeness in new luxury brand are important for the visual aesthetics of the brand, as defended by Makkar and Yap (2018) and Bloch et al. (2003). By other hand, the visual aesthetics of the new luxury brand seems that don't have any effect in the consumer pleasure of the use of the brand. This results are different of what was defended by Postrel (2003) and Casais et al. (2016). Yet, the innovativeness technological - personal knowledge of high-tech product was a positive effect in consumer pleasure of the new luxury brand, on the contrary of the innovativeness technological - self-perception of high-tech product. This is a very interesting result that need to be more explored in the future.

This research has as originality to relate the technological innovativeness, the centrality of visual product aesthetic aspects and the pleasure of the consumer when they consuming a new luxury brand. In this sense, contributes to the theoretical development in this area of research. The practical implication of this research lies to the importance to analyze the relationship between these variables becomes pertinent, since with increasingly of more informed consumers, in a globalized world, with e-commerce, co-creation, and social media, this make management strategies and the creation of value each time more difficult.

One of the limitation of this research is the limitation is the use of a convenience sample with limited data collection, in one country. Another limitation is concerns the fact that only one new luxury brand has been chosen for the model testing. Limitations become opportunities for future development research.

THE EFFECT OF NEGATIVE EMOTIONS TOWARD A CONSUMERS' PERCEPTION OF CSR

Rodrigues, Paula¹; Borges, Ana Pinto²

¹Faculty of Economics and Management, Lusíada University North, Porto, Portugal

²ISAG, European School of Business and and Research Group of ISAG (NIDISAG), Porto, Portugal

ABSTRACT

INTRODUCTION

This research intends to verify if the scandals in the financial sector in one well know Portuguese bank produced negative emotions in the consumers that influenced their perceptions on the practices of corporate social responsibility (CSR) of the brands. But to do this, it was first necessary to know if the consumers knew the practices of corporate social responsibility in its various components: Community, Employee, Shareholders, Environment, Societal, Customer and Supplier Domain. Then, we have two studies.

BACKGROUND

Research has mostly ignored consumers' negative emotions toward brands (Romani, Grappi and Dalli, 2012). The psychological theories on emotions (Roseman, Wiest and Swartz, 1994; Zeelenberg and Pieters, 2006) suggest that the nature of the emotion experienced has a highly determinant effect on an individual's subsequent actions. This makes it relevant to analyse consumer experiences with negative emotions towards brands.

Researchers have studied negative emotions generated by products (Laros and Steenkamp, 2005), services (Bougie, Pieters and Zeelenberg, 2003; Soscia, 2007; Zeelenberg and Pieters, 2004), and purchase-related situations (Dahl, Manchanda and Argo, 2001; Yi and Baumgartner, 2004). However, few have considered negative emotions toward brands (Romani et al., 2012) and specifically financial brands. Although some brand research studies analyse this phenomena closely related to negative emotions and feelings (Dalli, Romani and Gistri, 2006; Grant and Walsh, 2009), a clear consideration of negative emotions toward brands and of the emotion-brand behaviour connecting is still missing in the literature.

In the market, little is known about how consumers understand CSR activities and the effects on their behaviour (Sen and Bhattacharya, 2001; Fatma and Moon, 2015). After more than 60 years of CSR discussion in several contexts, no single commonly accepted definition of this concept exists (Freeman et al., 2010). Above 35 definitions of CSR are suggested in the literature (Dahlsrud, 2008; Matten and

Moon, 2008). The European Commission defines CSR as “a concept whereby companies integrate social and environmental concerns in their business operations and in their interaction with their stakeholders on a voluntary basis” (European Commission 2001, p. 6). Oberseder et al. (2014, p. 103) define CSR as “A socially responsible company integrates social and environmental topics in its core business activities and acts responsibly towards its employees, its customers, the environment, its suppliers, the local community, its shareholders and society at large.” The authors distinguishing different domains of CSR. The employee domain includes issues such as working conditions, non-discrimination of employees or acceptable remuneration. The customer domain reports topics like fair prices, comprehensive product labelling, safe and high quality products, etc. About the environment, consumers perceive many responsibilities such as reduction of energy consumption, waste, and emissions. The supplier domain emphasizes on the topic of fairness with issues like fair terms and conditions, supplier choice, and auditing. These domains are of changing importance according to consumers (Megicks et al. 2008; Pomeroy and Dolnicar 2009; Singh et al. 2008). Consumers who proactively react to CSR initiatives are more likely to make a responsible decision on their buying behaviour (Mohr and Webb, 2005). Therefore, it may be hypothesized that consumers who have negative emotions towards CSR activities have negative behaviour towards brands. Then:

H1: Negative emotions toward a brand has a negative effect on the perception of CSR – Community Domain

H2: Negative emotions toward a brand has a negative effect on the perception of CSR – Employee Domain

H3: Negative emotions toward a brand has a negative effect on the perception of CSR – Shareholders Domain

H4: Negative emotions toward a brand has a negative effect on the perception of CSR – Environment Domain

H5: Negative emotions toward a brand has a negative effect on the perception of CSR – Societal Domain

H6: Negative emotions toward a brand has a negative effect on the perception of CSR – Customer Domain

H7: Negative emotions toward a brand has a negative effect on the perception of CSR – Supplier Domain

METHODOLOGY

A quantitative methodology was employed for this research in study 1 and 2. We apply a logit model for study 1 and to test our specified hypotheses, we examined our proposed models using structural

equation modeling for study 2. We follow the assumption of Anderson and Gerbing (1982) that the modelling of structural equations must be done through two conceptual distinct models: confirmatory factor analysis to validate the measurement model and the estimation of structural equation model to test the proposed hypotheses. A total of 171 participants completed the survey. The hypotheses were tested with data from an online survey collected in June 2018, to Portuguese consumers. This was carried out through social media, where link to the survey was posted and advertised.

Questionnaire items were adapted from validates studies to develop a survey measuring. CSR items by Öberseder et al. (2014) are utilised and negative emotions toward a brand was measured using Romani, Grappi and Dalli (2012) scale. The survey was then reviewed and revised by three professors of marketing to confirm the overall adequacy and applicability of the questionnaire items to the context of this study. Respondents completed the survey by answering questions on a 1 = “strong disagree” to 5 = “strongly agree”, except the scale to measured brand love at where 1 = “I do not think/feel anything” to 5 = “I think/feel completely”.

RESULTS AND DISCUSSION

For the study 1, we apply a logit model, to the dummy dependent variable, that assumes the value 1 if respondent knows the CGD's (Caixa Geral de Depósitos, a well know Portuguese bank brand) social responsibility practices. The explanatory variables used in the model are defined in table 1, as well as the dependent variables, which include respondents characteristics, the information if they are (or not) client of CGD and the dimensions of CSR. Statistical analysis was performed using STATA version 13.

Table I List of explanatory and dependent variables

Explanatory Variable	Description
Demographic characteristics	
Gender	Dummy: 1 = Female; 0 = Male
Age	Scale 1–5: 1 = 18-23; 2 = 23-25; 3 = 25-35; 4 = 35-55; 5 = more than 55 years old
Income	Monthly income. Scale 1–4: 1 = less or equal than 1000; 2 = 1001- 2000; 3 = 2001-3000; 4 = more than 3000 EUR
Education	Scale: 1 = Basic; 2 = Secondary; 3 = Degree
CGD Customer	
Client	Are you a CGD customer?. Dummy, 1 = Yes; 0 = No
CSR dimensions	
CSR_CD	Community Domain
CSR_ED	Employee Domain
CSR_SD	Shareholders Domain
CSR_EN	Environmental Domain
CSR_SO	Societal Domain

CSR_CU	Customer Domain
CSR_SU	Supplier Domain
Dependent variable	Description
KCSR	Do you know CGD's social responsibility practices? Dummy: 1 = Yes; 0 = No.

Logit estimation results includes average marginal effects. Concerning self-reported of knowledge of CGD's social responsibility practices, the age ranges of 35-55 and more than 55 years old increase the probability of knowing, for the age range between 18 and 23 years, of 4.6% and 24.4%, respectively. In scope education, we also observe that the respondents with the degree are more likely to know CGD's social responsibility practices, compared to those with the basic level of education, from 43.8%. Being a CGD customer increases the likelihood of knowing the company's CSR practices by 1.1%. In scope of CSR dimensions, we observe that the community domain, environmental domain and customer have a positive and significant effect on the knowledge of CGD's social responsibility practices. The other explanatory variables do not have a statistically significant effect.

With the study 2, we intended to test whether the negative emotions towards the brand negatively affect the perception of consumers about the different dimensions of CGD's social responsibility. To test the hypotheses, we performed both exploratory and confirmatory factor analyses using IBM-SPSS and AMOS 22.0. To evaluate the measurement model, we considered the reliability and validity of the scales chosen to measure each of the constructs and, performed a confirmatory factor analysis (CFA) by maximum likelihood estimation method and Hair's et al. (2006) criteria. The fitness of the measurement model shows to be $X^2/df = 2.387$, RMSEA = 0.068, CFI = 0.907, TLI = 0.901 and IFI = 0.908 that is in generally a good measurement fitness (Hair et al., 2006). The average variance extracted (AVE) provides evidence of overall convergent validity of each construct as it indicates the amount of variance explained by the construct relative to the amount of variance that may be attributed to measurement error, and should exceed 0.50 (Fornell and Larcker, 1981).

The hypotheses were tested by running the structural model by using SPSS AMOS. The fitness of the measurement model shows to be $X^2/df = 1.519$, RMSEA = 0.061, CFI = 0.935, TLI = 0.911 and IFI = 0.938 that is in generally a good measurement fitness (Hair et al., 2006). The model's explanatory power was high for all CRS domains (CSR - Community Domain: $R^2 = 0.661$; CSR - Employee Domain: $R^2 = 0.709$; CSR - Shareholders Domain: $R^2 = 0.724$; CSR - Environmental Domain: $R^2 = 0.626$; CSR - Societal Domain: $R^2 = 0.694$; CSR - Customer Domain: $R^2 = 0.646$ and CSR - Supplier Domain: $R^2 = 0.700$). H1, which suggests that the negative emotions toward a brand has a negative effect on the perception of CSR - Community Domain, received support from the data ($\gamma = -1.494$, $p < 0.01$). All other hypotheses received support from the data, negative emotions toward a brand has a negative effect on the

perception of CSR - Employee Domain ($\gamma = -1.452$, $p < 0.01$), CSR - Shareholders Domain ($\gamma = -1.818$, $p < 0.01$), CSR - Environmental Domain ($\gamma = -1.562$, $p < 0.01$), CSR - Societal Domain ($\gamma = -1.669$, $p < 0.01$), CSR - Customer Domain ($\gamma = -1.458$, $p < 0.01$) and CSR - Supplier Domain ($\gamma = -1.335$, $p < 0.01$).

CONCLUSIONS AND IMPLICATIONS FOR THEORY AND PRACTICE

In summary, the results of this investigation show that the community domain, environmental domain and customer have a positive and significant effect on the knowledge of CGD's social responsibility practices and the negative emotions toward the brand has a negative effect on the perception of CSR - Employee Domain, CSR - Shareholders Domain, CSR - Environmental Domain, CSR - Societal Domain, CSR - Customer Domain and CSR - Supplier Domain. The theoretical contribution of this research lies to understanding the consumers' perception of the CSR activities in the financial sector and how negative emotions resulting from financial scandals affect these perceptions. The practical contribution of this research lies to the importance that managers needs carefully ability their promises to consumers and the communication of the practices of CSR needs to have greater visibility and correspondence with the promises that makes.

DIFFERENT ATTITUDES TOWARDS BUSINESS FAILURE BETWEEN CULTURES

Roeck, E.; Bengoa, D. S.

University of Applied Management Studies, Mannheim, Germany

ABSTRACT

Globalization's new opportunities has overwhelmed individuals and whole companies. Many are moving abroad with the ambition of success and wealth. Unschooled minds draw negative behavioural assumptions of the new environment representing a danger in business terms. Relationships can get harmed and opportunities can turn into threats. Especially failures, which are unavoidable, should be treated with caution. The research aims to explore the different attitudes towards business failure amongst different cultures, with special regard to two cultural clusters of the GLOBE study: Confucian Asia and Germanic Europe and the cultural dimensions of Hofstede, Trompenaars, focusing on 'Power Distance', 'Individualism and Collectivism', 'Universalism and Pragmatism', and 'Achievement and Ascription'.

With a qualitative method conducting fourteen interviews; seven interviewees from each cultural cluster have contributed to discover these differences. They, together with former studies, identified differences on all stages of the failure process in the business. Starting from failure perception to failure related consequences, mainly related to cultural influences. Furthermore, some behavioural traits like the concept of 'face' in Confucian Asia and 'directness' in Germanic Europe guide through all stages of the failure process. The research concludes with a set of recommendations for companies with a variety of systems and procedures which help managing a diverse workforce. These include feedback, open communication, schooling and a supportive organizational culture.

IDENTITY PROJECTS IN SCREEN CULTURE

Rolo, Ema; Nobre, Helena

GOVCOPP, University of Aveiro, Aveiro, Portugal

ABSTRACT

At every stage of life, consumers have long been understood as identity-seekers (Arnould and Thompson, 2005; Gabriel and Lang, 2006), while using the material, symbolic and experiential resources of the marketplace. Identity is a complex but relational phenomenon, always based upon social relations and symbolic representations (Drenten, 2012). Identity projects become manifest as self-performances and comprise the strategic configuration of objects, symbols, and practices to claim a particular identity position (Schau, 2018). The digital world has revolutionized consumer identity and imagination. More than any contemporary object, the screen (Monteiro, 2017) became a source of mythic and symbolic resources, depicting the most diversified realities that fuel consumer imagination while opens a host of new means for identity performance. Visual storytelling on image-based networks empowered by products, practices, signs, and symbols can be seen as a productive force of the screen marketplace, while it provides a *substrate* for imagination. Narratives and means now reach broader audiences that incite identity goals outside consumers' cultural contexts allowing even those who lack resources to participate in the market as *full-fledged* consumers, can construct their narratives of identity.

Through relating the concept of imagination according to Appadurai (1996) and visual storytelling within consumer culture research, this review aims to explore how consumer's identity projects on-screen relate or collide with their *off-screen* practices. How globally mediated imagined worlds affect consumer reality of self? Therefore, how mediated realities produce cultural tensions in addition to identity-related concerns? It is necessarily a work in progress, for the mediated contexts and our behavior within it continue to evolve.

Thus the conceptual review proposed will set the stage to future data collection on the topic of consumer behavior in screen culture via individual interviews and participant observation. Interpretive research employing naturalistic modes of inquiry via nethnographic fieldwork (Kozinets, 2002) will be appropriate for triangulation purposes, to observe the relationship between performed identity on social media and consumer's lived tensions on a specific cultural context.

AUTHENTICITY IN INTERNATIONAL MARKETING FIELD: SYSTEMATIC LITERATURE REVIEW

Rosado-Pinto, Filipa; Correia Loureiro, Sandra Maria

Instituto Universitário de Lisboa (ISCTE-IUL) and Business Research Unit (IBRU-IUL)

ABSTRACT

PURPOSE

This study aims to use a systematic literature review process to get the state of the art on the concept of authenticity in marketing field. The review question defined is: “What marketing research has been conducted on authenticity in international marketing until now and what could be future avenues for research?”.

BACKGROUND

Authenticity has been considered a key attribute of contemporary life, occupying a very important position in contemporary culture (Fine, 2003; Grayson & Martinec, 2004). The roots of the term *authentic* come from *Authenticus* (Latin word) and *Authentikos* (Greek word), meaning “worthy of acceptance, authoritative, trustworthy, not imaginary, false or imitation and conforming to an original” (Cappannelli & Cappannelli, 2004, p. 1). However, in the literature, the word has been applied with different meanings (Beverland, 2005; Grayson & Martinec, 2004).

The importance of the topic has led many scholars to study it in different fields of knowledge like philosophy, sociology, anthropology and psychology (Bruhn, Schoenmüller, Schäfer, & Heinrich, 2012; Fritz, Schoenmueller, & Bruhn, 2017). Within the marketing field, authenticity has been considered “one of the cornerstones of contemporary marketing” (Brown, Kozinets, & Sherry, 2003, p. 21). The concept is recognised as an important human aspiration because people look for authenticity in their daily lives, in the products and in brands they consume (Bruhn et al., 2012). When referring to consumers, authenticity can be found in consumption experiences, in objects or in brands (Beverland & Farrelly, 2010). In fact, within the international marketing field, two important streams of research have been developed: authenticity as an attribute of a subject (for instance, employees’ emotional authenticity) and authenticity as an attribute of an object (e.g. brand authenticity) (Fritz et al., 2017).

Methodology: Two dominant academic databases, Web of Science and Scopus, were used to explore and identify the main articles related to the analysed topic. These databases were chosen amongst others because they provide the greatest coverage with peer-reviewed articles published in high quality journals. The search for this study was done on 08/03/2019 and on 12/03/2019 and the

keywords used were: "Brand" AND "Authentic*". Firstly, an attempt was done with the keywords "Brand authenticity". However, we realised that the number of articles found was much reduced and that very important articles were not being included. Hence, we decided to use "Brand" AND "Authentic*" as it seemed the best combination to find relevant studies related to the topic. The research performed, both in Web of Science and in Scopus, was not limited to a specific publication year, including all relevant studies (related to the topic), independently of their publication year.

In Web of Science, the search was done within the core collection. Articles were identified using the specific keywords in the "Topic". Moreover, some filters have been applied. On the one hand, the type of documents analysed were articles and reviews. On the other hand, to keep the search process specific to the objective, the Web of Science categories that were used were: business; management; hospitality, leisure, sport & tourism; communication; ethics; psychology applied; psychology multidisciplinary and psychology experimental. Another filter that was applied was the Quartile of the Journal as the objective was to include only high ranked journals. For articles found in the Web of Science database, only articles of journals listed in JCR 2017 in the Quartiles Q1, Q2 or Q3, were included in the analysis. In Scopus, the search was done introducing the keywords in the "article title, abstract, keywords". The subject area, the document type and the language were used as filters. The subject areas were limited to "Business, Management and Accounting", "Social Sciences" and "Psychology". The document type searched were articles and reviews and the language was English. Finally, only articles belonging to journals placed in Q1, Q2 or Q3 in the ranking of Scimago (SJR 2017) were included in the study.

From the analysis based on the Web of Science electronic database, a total of 324 articles were identified with the keywords "Brand" AND "Authentic*". From these, the articles that were not Q1, Q2 or Q3 in JCR2017 were excluded which led to 229 final articles. In what concerns the analysis from Scopus database, the number of articles identified with the keywords "Brand" AND "Authentic*" were 463. The papers that were not included in Q1, Q2 or Q3 journals from Scimago 2017 (SJR 2017) were excluded, which led to a total of 281 articles. When combining the selected articles from both databases and excluding the duplicated articles (when the same article was in both databases), this led to a total of 375 papers. After reading the abstracts of all the articles, the ones that were not directly related to the topic and were considered irrelevant were excluded which led to 115 papers. After reading the full text, some articles were excluded and 75 papers remained to be included in the analysis. However, after reading the reference lists of several articles, we realised that some reference articles and books related to the topic were not being included in the scope of the systematic review due to the filters applied. Therefore, there was a need to include, afterwards, these articles and books. Some reasons for this to happen can be pointed out. On the one hand, some of these reference articles

have not been published in peer-reviewed journals and, on the other hand, as several reference “authenticity” articles do not include the word “brand”, they do not appear in the systematic search. However, as these articles are important to understand the context of authenticity, they were included, afterwards, in the analysis. Moreover, there were also some important books about the concept that were included as they are key to analyze the topic. Therefore, to the 75 articles that came out from the systematic review, 14 additional articles and 3 books/book chapters were added and included in the analysis. After the final decision about which articles to analyse, data were extracted from the selected articles and the analysis was performed. The data extracted included article title, scientific journal, authors, publication year, methodology, methodology description, industry, country, theories, brand authenticity definition, brand authenticity dimensions, scales used, main objective of the study, constructs, antecedents and consequences, main conclusions, limitations/gaps and future research, among others.

MAJOR FINDINGS

As the literature review performed highlights, authenticity and, in concrete, brand authenticity, seems to be an important area of research within the marketing field. The growing number of studies about the topic, published in different peer-reviewed journals, especially since 2012 on, shows the increasing interest of researchers on the topic. Furthermore, there is a diversity of authors studying brand authenticity, with the majority of articles being published by more than one author. The analysis also shows that research has been done worldwide with a strong focus on Europe and America and in different research contexts (industries analysed). In what concerns the methodologies used, empirical studies have been the most common studies performed.

Based on the 89 peer-reviewed articles and on the 3 books/ book chapters analysed, we can conclude that the research on authenticity and, in concrete, on brand authenticity has been very fragmented, which introduces challenges when trying to synthesize the knowledge around the concept. This fragmentation is mirrored on the different theoretical perspectives that are found in the literature, on the different definitions given by the authors or on the different dimensions that appear associated to the constructs. Despite the challenges found, one of the key objectives of the systematic review performed was to find what has been the common ground among researchers, around the topic. In concrete, on the one hand, to understand what have been the most well accepted perspectives, definitions, dimensions, scales and related constructs and, on the other hand, to analyse the main differences of what has been presented until now. Having that in mind, when analysing the theoretical perspectives and the nature of authenticity, it seems that, three types of authenticity tend to be referred by different authors: objective authenticity, constructive/ constructivist authenticity and

existential authenticity. These types of authenticity are many times associated with the relevance of iconic and indexical cues that are considered important to build the perception of authenticity. However, although there seems to be some common ground among some researchers about the types of authenticity, other perspectives emerge. Therefore, concepts like pure authenticity, approximate authenticity and moral authenticity, also appear. Within tourism and hospitality literature, it seems that the authenticity concept is being organized around three main perspectives: objectivist, constructivist and postmodern.

Authenticity has, in fact, been studied across different research disciplines and, therefore, it is applied to objects, subjects, experiences, places, among others. Within marketing research, and based on the literature review performed, it seems that many studies can be organized around two different streams of research: authenticity as an attribute of a person (e.g. employee authenticity) and authenticity as an attribute of an object (e.g. brand authenticity). In fact, when authenticity is applied in the context of brands, the construct of brand authenticity appears, associated with a specific market offering (object or service). Based on the different definitions of the construct and particularly on the ones that have been mostly referred by the authors, it can be concluded that brand authenticity is, many times, associated with a brand being genuine, real, true to itself and its consumers and with a consistent behaviour, reflecting its values. Many authors also identify key attributes that they consider to be fundamental for a brand to be considered authentic.

The majority of the analysed articles assume that authenticity and brand authenticity are multi-dimensional constructs and, concerning measurement scales, it is possible to conclude that the scales developed by Bruhn et al. (2012), Napoli et al. (2014), Schallehn et al. (2014) and Morhart et al. (2015) are the ones that seem to act as a reference to measure brand authenticity. Although the dimensions integrated in the scales are different, it is possible to find communalities among the different dimensions considered.

Several constructs have also been identified as antecedents and/or consequences of authenticity and brand authenticity, impacting the analysed constructs, separately or in combinations with each other. However, the analysis, especially in the case of the antecedents has not been straight forwards as some constructs have been considered by some authors as an antecedent of brand authenticity and by other authors as a dimension of brand authenticity, which can lead to some confusion. However, also in this topic, some common ground can be found. In the case of the antecedents, it can be concluded that Perception of iconicity/ Iconic cues, Perception of indexicality/ Indexical cues, Rarity, Stability, Family firm image, Manufacturing factors and Marketing factors/ Perceived Brand marketing communications are the constructs that have been studied by more researchers (in two or more studies) as antecedents. In the case of the consequences, the ones that have been studied by more

researchers (in five or more studies) are: Brand attitudes, Purchase intention/ willingness to buy/ brand choice intention/ consumption behavior, Brand attachment, Trust and Loyalty.

IMPORTANCE OF DIVERSITY SEALS FOR ORGANIZATIONAL ATTRACTIVENESS

Rössig, Sarah-Alena; Enke, Susanne

Chair of International Management, Otto-von-Guericke University, Magdeburg, Germany

ABSTRACT

Using signalling theory, social identity theory and previous studies this paper examines the relationship between exposure to a diversity seal and potential employee's perception of organisational attractiveness. Further, this study investigates interaction effects of the possession of such a seal, expected treatment, attitude towards workplace diversity and potential employee's minority status or gender. The theoretically derived research model is empirically tested using data from a survey experiment (n = 298).

Contrary to the expectations, the results from the survey indicate the possession of diversity seals decreases organizational attractiveness (see Table 1). The possession of a gender diversity seal did not increase women's evaluation of organizational attractiveness moderated by expected treatment. General attractiveness increased among minority status employees if the organization possessed a diversity seal and expected treatment moderated the relationship. The study demonstrated the moderating effect of attitude towards workplace diversity for organizational attractiveness when signalling diversity dedication with a diversity seal. Diversity dedication and employer seals were of minor importance when choosing an employer. However, diversity dedication was significantly more important for women than for men. We provide first insights regarding the perceived credibility of the diversity seal and the gender diversity seal which require further investigation in following studies. Further research is necessary to analyze why potential employees showed the negative reactions to the organizations possessing a diversity seal. The study showed organisations have to be cautious signaling diversity dedication with diversity seals to not discourage potential employees from applying at the organization.

CROWDFUNDING FOR CULTURE: A NEW FINANCIAL INSTRUMENT?

Rovera, Cristina; Giachino, Chiara; Battisti, Enrico

Department of Management, School of Management and Economy, SME, Turin, Italy

ABSTRACT

Cultural heritage is a key resource for a country's economic and social development. Culture is a vast range of goods, that - for particular historical and aesthetic significance - are of public interest and represent the wealth of a place and its population. It can be represented by artistic and historical goods (monuments), architectural assets (real estate), archaeological heritage (goods from the ancient past, obtained with technical excavation or not yet found), books and libraries, documents (in archive) and museums (Bonfanti *et al.*, 2016). In Italy, the problem of cutting funding to culture is serious and constantly at the center of the debate of the operators, who have to deal daily with scarce and often insufficient financial resources for a socially crucial sector such as the cultural one. If, until a few years ago, cultural sponsorships and donations made through public procedures appeared to be the only ways in which the support provided by businesses and individuals could materialize, in the last few years a new channel has emerged co-financing of cultural initiatives and projects: crowdfunding. Starting in 2010, crowdfunding has emerged as an innovative method for financing new ventures by allowing individual founders of social, for-profit or cultural projects to request funding from multiple people (Mollick, 2014). Research interest in crowdfunding has been steadily increasing in recent years, but remains limited (Short *et al.*, 2017), also referring to the Italian context (Piattelli, 2013).

In order to contribute to the crowdfunding literature, the purpose of this exploratory research is to introduce the use of the crowdfunding as a new practice of funding for the Italian cultural heritage. In detail, we keep attention to the real estate, in particular to the Italian castles.

The paper can be divided in three main sections. In the first one we show the traditional financial instruments used by the public administration. The information come directly from the public Annual Reports and Budgets. At the end of 2018 more than 50% of the public administration liabilities is represented by mortgages, the residual by public bonds. The large majority of mortgages is offered by Cassa Depositi e Prestiti (CDP), a financial institution controlled by the Ministry for the Economy and Finance (83%) and by banking foundations (16%). The large majority of CDP mortgages are then sponsored by the Italian State; this reduces the reimbursement share for the local public administration. Table 1 shows the situation for Piedmont, the region of the Italian kings, divided in 1.308 municipalities. In average, every Piedmont municipality has at least on castle, one or two churches and one old town. It is really a cultural center. In Piedmont mortgages represent 63% of debt, while bonds

are 37%. 76% of mortgages are offered by CDP, 24% by banks. Thanks to the State intervention, Piedmont has to reimburse only 27% of the debt.

Table 1 – The Piedmont liabilities

Financial Instruments	Number	%	Value (mln euro)	%
Mortgages	23	92	3,494.11	63
Bonds	2	8	2,046.49	37
Total	25	100	5,540.60	100
Mortgages	Number	%	Value (mln euro)	%
CDP	14	61	2,650.44	76
Banks	9	39	843.67	24
Total	23	100	3,494.11	100
CDP mortgages				% share
Reimbursement by the Italian State				73%
Reimbursement by Piemonte				27%
Total				100%

Source: Multi-annual budget, 2017 - 2019

The second part of the paper is focused on the possibility to use crowdfunding for the cultural heritage. The paper shows the most important crowdfunding types and focus on that particularly adapted to culture: donation, reward and lending. As previously introduced, crowdfunding is a topic abundantly dealt on an international literature (e.g. Schwienbacher and Larralde (2010), Joachim (2011), Lawton and Marom (2013), Coocheo (2013), Kim and Hann (2013), Sannajust *et al.* (2014), Borello *et al.* (2014), Belleflamme *et al.* (2014)). In Italy, the situation is completely different. The argument is new and we make reference to the current legislation (based on European documents, like ESMA 2012, EC 2013 and 2014, EBA 2015 and national legal texts, like D.L. 179/2012, L. 221/2012, CONSOB Rule 18592/2013, D.L. 3/2015, L. 33/2015, CONSOB Deliberation 19520/2016, L. 232/2016, D.L. 50/2017, L. 96/2017 and CONSOB Resolution 20264/2018) and to the most important scientific articles, including Giudici *et al.* (2012), Ruozi (2014), Previati *et al.* (2015), Querci (2014), Rovera (2015 and 2016), Rovera *et al.* (2018), Rovera and Damilano (2018).

Given the possibility to finance culture with the crowdfunding, we have a final problem to solve: the public advertising. The most widespread method to raise awareness of crowdfunding initiatives is the use of online platforms. Gerber *et al.* (2011) affirmed that there are several reasons to use the online platforms; in fact, beside the rising of funds maintaining the control of the project, it is possible to gain connection with other people interested in the project, find successful approaches used by other people and, above all, raise the awareness about the project using social media. To obtain success institutions operating in the cultural industry, such as museums, need to change their formal approach trying to

use a more informal and engaging language (D'Amato, 2017). People needs to be engaged and convinced by the storytelling and the value that the project can offer both at emotional and practical level. However, we know that marketing in the cultural field is still evolving and the main players are using new tools and social platforms from few years (Re et al., 2016).

To the best of our knowledge, no previous study focused on the crowdfunding to finance the cultural heritage. In particular, the contribution of this paper is twofold. First, we extend the literature on crowdfunding in a specific market. Second, we highlight how crowdfunding can represent an important source for financing culture that could revitalize the Italian cultural heritage thanks to the innovative approach of crowdfunding platforms and related business models.

DEVELOPING ORGANIZATIONS: AUTHENTIC LEADERSHIP THROUGH ACTION LEARNING

Rowland, Caroline; Pyke, Chris

Business School, University of Central Lancashire, Preston, UK

ABSTRACT

“What is an honest man and how can I become one?” Revans (1971:132)

As the rate of change within society and organizations has accelerated, there is an increased need for more positive forms of leadership, in which actual conduct of the leader is in line with their espoused principles. As a consequence, leaders are faced with the growing challenge of increasing their individual personal and professional capabilities with fewer resources and less time. Action learning with its core premise of improving the individual's ability to learn is well positioned to take advantage of changing leadership development needs. In addition to developing bespoke leadership skills, action learning is effective in developing the competences of collaboration, conflict resolution and sharing skills that are essential for contemporary leaders (Sonpar et al., 2018). As Revans (1998:14) commented “there can be no action without learning and no learning without action.” Leaders who are engaged in meaningful action with enquiry and reflection invariably learn. Baron (2016:296) states “Although exercising Authentic Leadership clearly involves the manager's personal skills, it appears that, despite their importance, such skills are largely ignored by academic training programs, or otherwise addressed with a largely theoretical approach that does not allow for the sort of feedback needed between practice and reflection, making it difficult to acquire and develop these critical skills.”

Leadership during periods of uncertainty has an important role in business strategy. The purpose of this paper is to explore the extent to which authentic leadership may be developed through action learning and how this might contribute to organizational effectiveness in times of austerity and rapid change.

Much has been written concerning leadership styles and practice (Bass and Bass, 2008). It is widely accepted that leadership has a crucial role in the success of organizations. Little has been explored in relation to action learning and authentic leadership yet poor relationships between leaders, managers and others is a major barrier to performance and creativity (Rowland and Hall, 2013).

The methods used in this research were mainly based on the interrogation of literature. This comprised a review of published works on action learning and authentic leadership focusing on management development. This was followed by an analysis of documents produced by regulatory and professional bodies (AMBA, 2015; CIPD, 2010; CMI, 2013) to identify the skills and behaviours embedded in mainstream management programmes such as the MBA and DBA.

The authors, in their roles as external examiners and accreditation panel members or chairs for over 25 years, have drawn on their experiences. Over the last three years they have been directly involved with some 20 UK Universities from a wide spectrum including, former polytechnics and research-intensive institutions, where management curricula reflect the requirements of these regulatory accreditation and professional bodies. Direct observations by the authors and two small purposive employer and employee focus groups were also employed to gather data.

Our findings indicate that employees prefer their leaders to lead consistently with integrity, authenticity and passion which align to their own and family values. It supports the view that Organizations value leadership that matches rhetoric with meaningful actions.

Findings also show an absence of both academic and professional body literature that have linked the constructs of authentic leadership and action learning together. As such, the developmental opportunity remains neglected. Management development processes have focused on developing individuals but perhaps neglected achieving lasting organizational development through leadership.

Conclusions suggest that in the current climate of uncertainty many leaders are adopting austerity approaches. These are in turn leading to higher levels of deviant organizational behaviours, risk-averse practices, inauthentic kindness and a decline in efficiency, effectiveness and productivity. Yet in times when clear vision and leadership in business strategy and values is needed at both national and global levels, an understanding of how to better develop authentic leadership remains underdeveloped and action learning remains marginalized. In addition the implications for future trust and employee engagement are neglected in times where discretionary effort of workers and volunteers is crucial to goal achievement. Leaders have to spend more of their pressured time attempting to bring certainty to uncertain times by communicating and negotiating with staff to gain a wider acceptance and understanding of management practices (Herzig and Jimieson, 2006). Time is now an emotional as well as an economic currency; an authentic leader recognises that spending time with employees demonstrates that they have individual intrinsic value as well as acknowledging their contribution to the organization as a whole. Our work above all concludes that although authentic leadership development may cost in terms of emotional and temporal investment, action learning can embed useful and ethical behaviours within leaders and organizations. Leaders need courage to lead with compassion and help navigate in these turbulent and uncertain times. There is hitherto, an unrealized opportunity to capitalize on the promotion of action learning as a development tool; by acknowledging that the learning process has implications for enhancing a more authentic form of leadership practice. Our research opens up the discussion and offers a template that may enable Organizations to increase their sustainability and competitive advantage. This paper provides additional insights and promotes dialogue between disciplines that has hitherto been neglected.

In terms of practice our research enables Organizations to appreciate the benefits of developing authentic leaders in terms of both the “bottom line” and good citizenship. Consequently, it may help leaders formulate organizational policies that not only enable navigation through the whirlpools and rapids of uncertain times but also ensure healthy workplace cultures that stimulate creativity, employee engagement and sustainability.

COLLABORATIVE CONSUMPTION AS A MANIFESTATION OF THE SHARING ECONOMY IN POLAND

Rudawska, Iga; Kowalik, Joanna

Faculty of Economics and Management, University of Szczecin, Szczecin, Poland

ABSTRACT

BACKGROUND AND THE PURPOSE

Since the end of the last century there has been a growing interest in alternative forms of accessing goods, emphasised by the pursuit of sustainable development. Collaborative consumption is one of them. This mode of consumption can be seen in terms of disruptive innovations (Schor and Fitzmaurice, 2015) and social innovations, as it reflects human being's pursuit of sustainable development defined as a harmonious coexistence and balance of the economy, the environment and the society. Nevertheless, collaborative consumption is not an entirely new concept. In 1978, Felson and Spaeth described this form of consumption as a process in which one or more people consume goods or services by engaging in common activities with others (Felson and Spaeth, 1978, p. 614). The contemporary understanding of this alternative form of accessing goods let new business models based on IT appeared (Munoz and Cohen, 2018).

Access-based consumption is most often defined as a transaction that can take place through the agency of the market but does not entail any transfer of the ownership title (Bardhi and Eckhardt, 2012, p. 881). Contrary to possession, access-based consumption assumes that interaction between the consumer and the object/product is limited in time and dependant on the occurrence of the need and the urgency of its satisfaction (Chen, 2009, p. 927).

Although collaborative consumption has been given a lot of attention in the developed market (Acquier, Daudigeos and Pinkse, 2017), it is not a common field of research in the emerging markets. In order to bridge this gap, the purpose of our study is to discuss alternative forms of accessing goods, with the main focus on collaborative consumption in the Polish market. Firstly, collaborative consumption is conceptualised and contrasted with ownership-based consumption. Secondly, the arguments for developing access-based consumption in the developing markets have been presented. Finally, the authors applied the identified dimensions of collaborative consumption to the Polish market.

METHODOLOGY

A discussion is based on the synthesis of literary references and the descriptive analysis. The paper constitutes a review of the literature and the case studies. The starting point for the analysis is the framework developed by F. Bardhi and G.M. Eckhardt (2012, pp. 884-886), concerning the dimensions of the sharing economy. Based on it, the area of collaborative consumption has been analysed through: 1) the prism of the level of anonymity, 2) the degree of consumer engagement, 3) the duration of the consumption relationship, 4) the agency of the market, 5) the type of the goods made available, and 6) the ideological message. In our work, we tried to apply these dimensions to characterise the sharing economy in the Polish market.

MAIN FINDINGS AND CONTRIBUTIONS

Promoting the model of collaborative consumption as opposed to the ownership-based model can benefit the development of a new economy based on sustainability. An analysis of the dimensions of the collaborative consumption in Poland allows for the conclusion that it is still a relatively underdeveloped area. Most of the experience with sharing economy model come from world-wide platforms like airBnB, although the phenomena of collaborative consumption is expanding in Poland (as shown by, for example, the growing numbers of users of such services as szafa.pl). As we revealed through our research, the spread of collaborative consumption in the emerging market as Polish one is still at an early stage. So far, it is difficult to determine whether the idea behind this expansion is restricted and balanced consumption or the savings-related motivation, typical for developing countries.

The main contributions of our work refer to the description of the collaborative consumption model and the analysis of its success formula. Future possible directions for research can focus on the motivations and attitudes of Polish consumers towards collaborative consumption.

ACKNOWLEDGMENTS

The project is financed within the framework of the program of the Minister of Science and Higher Education under the name "Regional Excellence Initiative" in the years 2019-2022, project number 001/RID/2018/19, the amount of financing PLN 10,684,000.00.

THE RELEVANCE OF CSR ON CROSS BORDER ACQUISITION PERFORMANCE: A SYSTEMATIC LITERATURE REVIEW

Salvi, Antonio¹; Miglietta, Nicola²; Nirino, Niccolò²

¹University LUM Jean Monnet, Bari, Italy – SDA Bocconi, Milan, Italy

²Department of Management, School of Management and Economy, SME, Turin, Italy

ABSTRACT

Corporate Social Responsibility (CSR) has significantly increased its relevance within firms in the past years. CSR has been deeply analyzed in academic literature in the past decades, but it is still not simple to identify a unique definition (Malik, 2015). Some scholars consider CSR as a behavior that the company has to take towards its stakeholders (Campbell, 2007; Cooper, 2017). Meanwhile, others consider CSR as a multidimensional and interdisciplinary set of activities (e.g., social, political, environmental, economic, ethical) (Carroll, 1999; Devinney, 2009). As the CSR topic, cross-border acquisitions are also increasing in value and numbers despite high risk of failure with important consequences for firms' stakeholders (e.g., suppliers, employees, shareholders, etc.) (Risberg and Meglio, 2012). These post-acquisitions consequences are closely related with company's CSR choices, which regard a mix of relationships and interests through a worldwide network of stakeholders (e.g., Battisti et al., 2019; Campbell, 2007; Cooper, 2017).

Considering CSR as a key factor to enhance environmental and social benefits (Carroll, 1999; Devinney, 2009), we analyzed how the CSR activities (e.g., economic, legal, ethical, philanthropic, etc.) have been evaluated in the cross border acquisitions studies with the aim to identify gaps in the existing literature, providing a guideline for future studies.

This study provides a Systematic Literature Review (SRL) about the link between CSR and cross-border acquisitions literature. This approach allows to analyze the sample of studies in a systematic way (e.g. Dezi et al., 2018; Petticrew, 2001; Tranfield et al., 2003; Pittaway et al., 2004; Vrontis and Christofi, 2019) and the adoption of SRL technique is fundamental to enhance the knowledge of subjects that are debated in the academic field.

Based on 78 studies, we systematically divided cross border studies based on CSR, as shown below:

- Methodological approach adopted in each study, quantitative or qualitative;
- Methodologies of CSR measurements (e.g., survey, database, ESG ratings, financial statements, etc.);
- Relevance of CSR components on cross-border performance.

The results have shown an increase in academic interest in the subject of CSR connected with cross-border acquisitions, specifically considering the individual components that are influenced by the CSR logics (e.g., employee retention, gender, renegotiation of contracts, etc.).

Furthermore, we highlighted that the relevance of CSR on post-acquisition performance is not clear in literature, and many studies have inconsistent and divergent results. In particular, there are two streams of literature concerning the relationship between CSR and value creation. Following the shareholder view (Pagano and Volpin, 2005; Friedman, 2007; Surroca and Tribo, 2008) managers use CSR activities to satisfy stakeholders at the expense of shareholders. Meanwhile, the stakeholder value maximization view (Freeman, 1984; Porter and Kramer, 2006) concern the positive effects that the CSR initiatives have on shareholders' wealth, because the positive relevance of CSR policy on the stakeholders can increase the firm reputation and they will be more willing to support firm's operations.

This is the first study that tried to systematize the cross-border studies based on CSR evaluation and its relevance on cross-border performance. This approach allows to find gaps that will enable to contribute from different theoretical points of view for future research. In particular, the contributions are to the stakeholder and shareholder theory, and also to the resource based-view theory and the business ethics theory.

Keywords: Cross-border acquisitions; Corporate Social Responsibility; Systematic literature review; Acquisition performance; value creation.

THE ROLE OF INTELLECTUAL CAPITAL IN MERGERS AND ACQUISITIONS IN EMERGING MARKETS: A LITERATURE REVIEW

Salvi, Antonio¹; Battisti, Enrico²; Nirino, Niccolò²

¹University LUM Jean Monnet, Bari, Italy – SDA Bocconi, Milan, Italy

²Department of Management, School of Management and Economy, SME, Turin, Italy

ABSTRACT

In the current market scenario, characterized by high competition, the M&A operations have assumed a key strategic role in the development of corporate competences in order to create value over time (e.g. Bresciani, 2012; Dallochio et al., 2016; Miglietta et al., 2017; 2018; Battisti et al. 2019). In particular, scholars have focused both on tangible and intangible competences own by companies as success factors of the M&A operations (e.g. Weber and Tarba, 2011; Ahammad et al., 2016).

Considering the intangible aspects, Intellectual Capital (IC) is a common phenomenon still widely debated at both academic and practitioners' level (e.g. Bontis, 1998; Jorgensen, 2006; Capuano, 2010; Pourkiani et al., 2014; Torres et al., 2018). During the last forty-five years, the role of the Intellectual Capital in Mergers and Acquisitions (M&A) has significantly increased (Gupta and Roos, 2001) but in spite of the growth in the relevance of M&A operations, there are still gaps in the academic research that need to be addressed. In particular, general studies about IC in M&A are becoming more usual since the 90s (e.g. Bou-Wen et al., 2006; Pazdzior & Pazdzior, 2012; Ott et al., 2014), but in literature, based on our knowledge, there is not a common language about the role of IC in Mergers and Acquisition.

Therefore, this study aims to provide insights into the development of research on Intellectual Capital in Mergers and Acquisitions studies by reviewing existing literature, in order to analyze in emerging markets, the role of IC in M&As. In particular, through a Systematic literature review (SLR) (Dezi et al., 2018), we proceeded looking in the academic literature in M&A field in order to analyze the role of Intellectual Capital.

In particular, this paper draws on theoretical evidence published in Management and Financial Journals about M&A with reference to the emerging markets. Data were collected from 2001 to 2018, and they were divided into 2 periods: before the subprime crisis (2001-2008) and after the crises (2012-2018). This selection allows to show how the M&A operations have changed their characteristics during time and how the concept of Intellectual capital has been addressed. In this way, 159 publications about M&A and emerging markets were examined, and 26 papers were identified due to their specific focus concerning IC from the point of view of human capital, structural capital, and relational capital.

The analysis allows to hypothesize that the role of Intellectual Capital to reach and maintain a competitive advantage to create value is having more and more attention during the M&A process both from scholars and practitioners, after the financial crises.

Therefore, future researches could examine, using quantitative methods, how Intellectual Capital can contribute to value creation in Mergers & Acquisitions in Emerging Markets. Specifically considering the weight attributed to it during the due diligence process and how to maximize it after M&A operations. Moreover, it would be important to develop a theoretical framework about the relationship between IC and M&A in emerging markets to address future research lines.

SELF-EFFICACY AND SUCCESS OF DISADVANTAGED ENTREPRENEURS: THE MODERATING ROLE OF RESILIENCE

Santoro, Gabriele; Gorla, Mirko; Bresciani, Stefano

Department of Management, University of Turin, Turin, Italy

ABSTRACT

Entrepreneurship has acted as engine in global economies impacting jobs creation, innovations, growth and social integration (Duchek, 2018). In spite of the augmented concern about alternative aspects of entrepreneurship, such as social and gender-based entrepreneurship behaviour, there are still research voids regarding entrepreneurship among disadvantaged individuals. The term “disadvantaged entrepreneurship” does not have a consistent definition. Scholars have traditionally included women, unemployed, ex-prisoners, ethnic minorities, immigrants, and disabled people within disadvantaged entrepreneurs (see for example Marlow & Patton, 2005; Hart & Acs, 2011). There is consistent agreement that positive and environmental factors can actually foster entrepreneurship (Hornsby, Naffziger, Kuratko & Montagno, 1993). However, it is not clear whether hard and alternative circumstances can provide entrepreneurs with stimulus and pushes towards entrepreneurial ideas and paths to success. Following this research stream (Miller & Le Breton-Miller, 2017), this paper has the primary purpose of studying the psychological traits of entrepreneurs with disadvantages, and it aims to evaluate the relationship between self-efficacy and success, and whether resilience enhances that relationship. In this regard, resilience refers to the ability to adapt in the face of trauma, adversity, tragedy or even significant ongoing stressors, the personal quality that grant to thrive in face of adversity, a personality characteristic that mitigate the effects of stress and let the subject adapt (Bullough, Renko, & Myatt, 2014). By contrast, Self-efficacy, that is “beliefs in one’s capabilities to organize and execute the courses of action required to produce given attainments” (Bandura, 1997, p. 3), has been considered an important inherent factor sustaining entrepreneurial activities and has been found significantly correlated with entrepreneurial orientation.

Therefore, the research contributes to the debate of inherent factors fostering entrepreneurship, that is specific facets of individuals, such as psychological traits. The pillars of this study are based on the fact that self-efficacy and resilience have been found positively associated with entrepreneurial orientation in the literature (Sequeira et al., 2007; Wilson et al., 2007; McGee et al., 2009), and therefore they can also push disadvantaged towards entrepreneurial success.

To fill the research gap, this research is based on a survey methodology involving disadvantaged entrepreneurs located in Italy, operating in different sectors. Specifically, a quantitative methodology through ordinary least squares (OLS) has been deployed to test two hypotheses concerning the positive

relationship between self-efficacy and resilience, and the moderating effect of resilience on the above relationship. The hypotheses are tested with a sample of 114 disadvantaged entrepreneurs. Overall, the paper contributes to the literature proposing and evaluating self-efficacy as antecedent of entrepreneurial success in the specific context of disadvantaged entrepreneurs. In this guise, the paper sheds light on the context of disadvantaged entrepreneurs, invigorating this topic often neglected in both theoretical and practical public discussions, re-indicating its social and moral importance for both growth and social inclusion. We add to this body of research highlighting and confirming a positive relationship between self-efficacy and entrepreneurs' success because most of the studies focused on the relationship between entrepreneurial self-efficacy and intentions (Boyd & Vozikis, 1994; Chen, Greene, & Crick, 1998; Fitzsimmons & Douglas, 2011). Second, we contribute to the literature on disadvantaged entrepreneurs highlighting the key role of resilience as moderator of the relationship between self-efficacy and entrepreneurial success.

Keywords: disadvantaged entrepreneurs, self-efficacy, resilience, entrepreneurship.

INNOVATIVE MANAGEMENT OF THE TRADITIONAL RURAL BUILDINGS FOR RURAL DEVELOPMENT IN ITALY

Sardaro Ruggiero; Roselli Luigi

Department of Agricultural and Environmental Science, University of Bari, Bari, Italy

ABSTRACT

The traditional rural buildings are constitutive elements of rural landscape. In the past, these structures were used by farmers as temporary or fixed residence, harvest storehouse, surveillance building, shelter for animals, etc. Nowadays, these constructions are components of the rural cultural heritage, being able to provide a variety of public benefits. However, the market related to the traditional rural buildings does not reflect the real value attached by the community to these goods and related services, so landowners leave them in poor condition or even abandoned.

The aim of this study is to provide knowledge on the economic valuation of the traditional rural buildings in Apulia, southern Italy, through the choice experiments (CE). The results allow defining adequate cultural preservation policies based on the entrustment of the management of these constructions to entrepreneurs able to favour their innovative use for activities characterized by high social value, so fostering rural development on the regional territory.

Keywords: rural cultural heritage; rural development; traditional rural buildings; choice experiments; joint venture; Apulia.

THE EFFECT OF THE OPEN SKIES AGREEMENT BETWEEN ISRAEL AND THE EU ON ISRAEL'S TOURIST INDUSTRY

Andrew Schein

Business School, Netanya Academic College, Netanya Israel

ABSTRACT

When Israel was founded in May 1948, similar to many countries in Western Europe at that time, Israel's economy was based on a socialist model with the government controlling the major industries, and almost inevitably granting government firms monopolies. One example of this was in the aviation industry, that Israel, again similar to Western European countries, established a government firm to provide air traffic to and from Israel. This company was called El Al and it was founded in November 1948. In 1950, El Al along with the national labor union, the Histadrut, formed a domestic aviation company called Arkia. In 1970s, Arkia began limited international service and in 1980, the company was privatized. In 1989, a third aviation company Israil (then called Knafei HaEmek) was founded in Israel. This too began by just offering domestic flights and in 1999 it expanded to also offer international flights. Throughout all these years, Arkia and Israil offered very few international flights and El Al was the dominant carrier with regard to international flights to and from Israel. In 2005, El Al was privatized, but it still remained as the dominant carrier. In 2007, at Ben Gurion airport, which was and is Israel's main airport, El Al's share of international passengers was 36.5%, and the next closest carriers were Onur Air at 6.1% (charter flights to Turkey), Lufthansa 3.98%, Continental Airlines 3.71%, Israil 3.56% and Arkia 3.41% (Israel Airport Authority, 2007).

El Al's privileged position at Ben Gurion airport was only really challenged for the first time with the Open Skies agreement that was signed between Israel and the EU in 2012 and formally ratified in 2013. The agreement called for the EU and Israel to allow unfettered access of Israeli airlines and airlines owned by EU citizens to Israel and the EU countries. At that time, the EU region was the first destination of fifty percent of the international flights that left Israel (author's calculation from Israel Airport Authority, 2012).

The Open Skies agreement was heavily criticized by the head of El Al at that time, Eliezer Shkedi, who said "What is being presented now is liable to cause Israeli aviation to crash" (quoted by Cohen, 2012), and some people agreed with this dire prognosis (Korin-Lieber, 2012). The basis for this pessimism, besides a general fear of competition by monopolists, was that it was claimed by opponents of the agreement that the Open Skies agreement would give the EU airlines an unfair advantage since all three of the Israeli airlines have to pay heavy security costs, which other airlines do not have.

The Israeli government was not swayed by these claims and it proceeded with the agreement, as then Ministry of Transport director general Noaz Bar Nir said, “Besides the interests of the airlines, there is a national interest - the larger number of incoming tourists, and the ability of Israelis to fly at lower prices” (quoted in Cohen, 2012). The Israeli government was choosing not only to help Israeli consumers, but also to help Israel’s tourist industry. However in response to the complaints from the Israeli airlines, the government increased its subsidy of the security costs to 97.5% of the costs, and the implementation of the agreement was phased in slowly for five years (Gulliver, 2014).

Seven years have now elapsed since the first memorandum was signed between Israel and the EU and we can see that some of the changes that have happened and that the dire forecasts of the future Israel’s three airlines have not happened. First, there has been an 80% in international air traffic at Ben Gurion airport from 2012 to 2018, from 12,400,800 passengers to 22,329,850 (Data from Israel Airport Authority, 2012 and 2018). Interestingly, the increase has been greater for Israelis who go abroad than for foreigners who come to Israel. According to Israel’s Central Bureau of Statistics (2018, www.cbs.gov.il), the number of Israelis departing and entering Israel increased by 74% from 2012 to 2017, while the number of foreigners entering and leaving Israel increased by “just” 25%. Secondly, all three of the Israeli airlines had increases in their international passenger traffic, El Al’s passenger traffic increased 38% from 2012 to 2018, Israir’s passenger traffic increased 132%, and Arkia’s passenger traffic increased 47%. Accordingly, in terms of their size, the three firms have not been hurt by the agreement. However, with regard to market share of international passengers travelling to and from Israel, while Israir’s and Arkia’s market share changed slightly, from 2.28% to 2.94% for Israir and from 3.76% to 3.07% for Arkia, the market share of El Al has fallen significantly from 33% in 2012 to 25% in 2018. (Data from Israel Airport Authority, 2012, 2018.) We see that El Al is not adapting sufficiently to the new competitive environment, while Israir and even Arkia have done better at meeting the new challenges of the Open Skies agreement.

Another question of the effects of the Open Skies agreement is how has the agreement affected Israel’s domestic tourist industry? Was the Israeli government correct that the benefits from the agreement for Israel’s tourist industry were larger than the possible damage to Israel’s aviation industry? On the one hand the increase in the number of foreign tourists has led to an increase in demand for tourist services, such as hotel rooms, but what has been the effect on Israel’s domestic tourist industry due to the huge increase in Israelis travelling abroad? Has this travel been at the expense of Israelis taking vacations domestically or is in addition to domestic vacations? It is possible that if the large increase in Israelis travelling abroad is instead of Israelis travelling domestically, then this loss to Israel’s domestic tourist industry could be greater than the gain to Israel’s domestic tourist

industry from the increase in foreign tourists. In this paper, we will attempt to answer this question by examining the changes that have transpired in Israel's hotel industry since 2012.

Keywords: Free trade agreements, Israel, Hotel industry, Hotel occupancy rates.

BREXIT AND THE UNITED KINGDOM TOURISM SECTOR

Scott, Peter

Liverpool John Moores University, Liverpool, United Kingdom

ABSTRACT

This evaluation attempts to briefly analyse an intensely political subject in as apolitical and neutral a manner as possible. That subject is Brexit as the forthcoming exit of Britain from the European Union (EU) is known colloquially. Brexit has excited very strong emotions both within the United Kingdom (UK) and internationally. This brief analysis is specifically concerned with the implications of Brexit for the UK tourism sector.

The UK was due to leave the European Union on 29th March 2019 (BBC News, 2019). After months of negotiation, the EU and the UK reached agreement on a Brexit deal. Nonetheless, that Brexit deal has now been rejected three times by the British Parliament (as at 24th April 2019) and that means that it cannot be implemented. Although it has been rejected three times by the British Parliament that may not necessarily mean that the agreement that was reached between the UK and the EU is now dead. Theresa May, the British Prime Minister is currently trying to find common ground over a deal with other UK political parties, notably the Labour Party. The outcome of those discussions is unknown at the present time and the current situation regarding Brexit is uncertain. The EU leaders have now extended the Brexit date twice, firstly until 12th April 2019 and subsequently until 31st October 2019, although provision exists for the UK to leave the EU before then if the UK and the EU can ratify a withdrawal agreement. If agreement is not reached by 31st October 2019 the prospect of a no-deal Brexit looms large (BBC News, 2019).

Prior to, and especially since, the UK referendum on EU membership took place on 23rd June 2016 (BBC News, 2019) the British media has been utterly dominated by issues relating to Brexit. Although that media domination is probably at its most intense level in the U.K., there is no doubt that the subject will have also provoked much discussion in the traditional media and on social media as well as in cafés, bars, restaurants, homes and in all sorts of other forums throughout the EU and in much of the rest of the world. However the contrast between the media domination and the academic literature (peer-reviewed journal articles) relating to the implications of Brexit for tourism is stark by comparison. Those few papers that do exist tend to focus on the effect that the Brexit decision might have on British tourists visiting other countries (e.g. Amoamo, 2018, Cirer-Costa, 2017, Pirles-Rebas, Ramón-Rodríguez and Ortuño, 2018) rather than on U.K. domestic tourism and inbound tourism into Britain. The effect of the Brexit referendum decision on British tourists visiting other countries is a cause for concern for some countries. In Spain, for example, the U.K. represents the largest

international tourism market by some distance. In 2016, some 17 million British tourists visited Spain and they spent over 16 billion euros, which amounted to almost 21% of total international tourism expenditure in Spain that year (Pirles-Rebas, Ramón-Rodríguez and Ortuño, 2018).

In a survey undertaken by the author, which concluded in April 2017, when asked about future trends in destination marketing, only one of fifteen in-depth interview respondents mentioned Brexit. The interview participants were all chief executives of destination marketing organisations in England or chief executives or directors of their key stakeholder organisations.

A recently published book by Morrison (2019) with the title, 'Marketing and Managing Tourism Destinations' makes copious reference to the U.K. and Britain throughout the text. However despite its 2019 publication date it fails to mention Brexit even though the decision to leave the European Union is likely to have a profound effect (positive or negative or both) on tourism destinations.

Why have academics largely shunned such an important topic? This may partly be explained by the fact that the UK referendum result was a surprise to many people and the subject did not therefore command the attention of academics as much as it might have done. Another factor may be the extreme uncertainty that the Brexit referendum vote has generated. Nobody can predict the outcome and therefore anything that is written about the subject stands a good chance of being judged to be inaccurate at best, or plain wrong over the course of time. A third reason, which is beginning to lose credence with the passage of time, is that the academic writing and review process means that publication can be delayed for some while after the event or phenomena that are being reported on have actually occurred. Whatever the reason, an extensive search failed to locate a single peer-reviewed journal article in which the focus of the article is on the Brexit decision and its effect on the U.K. tourism sector. The lack of published content in the extant academic literature regarding this important issue provides ample justification for its investigation.

Brexit is the main thrust of Professor Jens Hölcher's public lecture in Bournemouth, Dorset (Hölcher, 2017) but its linkage to the U.K. tourism sector is not. Nevertheless, Hölcher does concede that one of the few U.K. sectors that might benefit from Brexit is domestic and inbound tourism. The reason for that is that a drop in the value of the pound (as has already occurred) may encourage more international visitors from the E.U. (and the United States) and may encourage British residents to holiday at home.

Although it is not the main thrust of the paper, a rare reference to Brexit occurs in Hassen and Giovanardi (2018), in which the authors express a fear that Brexit may have the effect of compromising one English city's multicultural image and of rendering it to be less attractive in the eyes of potential international visitors. This is a very real risk as Brexit may give rise to the perception that the U.K. shuns foreigners and is xenophobic. This is a risk factor in respect of holidaymakers but

it is also a risk factor in terms of employment. The U.K. hospitality sector relies a great deal on migrant workers especially from Eastern Europe. If there is a reduction in the number of migrant workers in the hospitality sector both because of legislation or because the UK becomes a less attractive place to live and work for the migrant workers, it might have serious consequences for that sector.

Country destination	Foreign visitor spending	Domestic visitor spending
UK	16.9%	83.1%
Spain	54.5%	45.5%
Netherlands	51.7%	48.3%
France	27.4%	72.6%
Italy	26.6%	73.4%
Germany	12.7%	87.3%

Domestic versus foreign spending contribution to GDP, 2017

Data from World Travel & Tourism Council, 2017 (Adapted from Morrison, 2019)

From the above table it can be seen that in 2017 international visitor spending in the UK (at 16.9%) was dwarfed by domestic visitor spending (at 83.1%).

Although domestic tourism has a much greater value than international tourism in the U.K. in the last year for which full figures are available international tourism to Britain fared well. Visit Britain (the British national tourism agency which is funded by the U.K. government) reported that in 2017 the total number of international tourist visits grew to a record 39.2 million and tourist expenditure increased that year to £24.5 billion which is another record (Visit Britain, 2019).

What will the effect be on the U.K. tourism sector if and when Brexit finally happens? The implications for theory and practice both in the UK and in EU tourism sectors are likely to be profound although they are currently unquantifiable. As with so many other things linked to Brexit we will need to await the final outcome.

A CONSUMER PERSPECTIVE ON MOBILE FINANCIAL SERVICES: STATE-OF-THE-ART, FRAMEWORK AND FUTURE DIRECTIONS

Shaikh, Aijaz A.; Karjaluoto, Heikki

Jyväskylä University School of Business & Economics, University of Jyväskylä, Jyväskylä Finland

ABSTRACT

INTRODUCTION

Due to the increasing importance and usage of mobile financial systems, applications and associated services in various countries worldwide, examining and understanding consumers' intentions, behaviours, preferences and beliefs regarding this industry have become priorities for many scholars in the field of marketing and information systems (Shaikh, 2016). Resultantly, over the last two decades, there has been a veritable explosion of empirical research in the areas of resistance, adoption continuous usage and the post-adoption consequences of mobile financial services (MFS). From the foregoing discussion, we have observed the following: research on MFS is ongoing; the mobile financial and payment market is flooded with a portfolio of offerings (Chawla and Joshi, 2017); and the prior empirical research on banking, payments and consumer behaviour has considered various facets of MFS, including mobile banking, mobile payments and the fast-emerging realm of mobile money.

PURPOSE OF STUDY

This study firstly aims to provide a critical overview of the MFS field through a detailed analysis of a sample of mainstream empirical research that was published in various marketing and interdisciplinary journals (such as *Journal of Consumer Research*, *Journal of Marketing*, *Marketing Science*, *Journal of Marketing Research*, *MIS Quarterly*, *Computers in Human Behaviour*, and so forth) between the years 2000 to 2018 (inclusive). It also aims to provide a better understanding of the constructs that influence consumer technology adoption and usage and post-adoption as well as to develop and propose a framework that presents the MFS ecosystem. Finally, this study will identify future research areas in this field that have been lacking to date.

METHODOLOGY

According to Webster and Watson (2002), searching for and locating the most relevant and valuable literature are significant steps in drafting a literature review that helps advance scientific

knowledge, facilitate theory development, identify areas where a plethora of research exists, and uncover the research gaps. We followed a structural approach, as recommended by Webster and Watson (2002), when identifying the relevant literature for this review article. Using various key terms (mobile financial services, mobile banking, mobile payments, mobile money, mobile payment services, mobile payment applications, contactless mobile payments), a vertical search technique was used to access various online scholarly sources, such as Elsevier/ScienceDirect, EBSCO, Emerald, JSTOR, Wiley, etc. A horizontal search technique, such as the use of Google scholar, generally bears the same results and was therefore avoided. To examine both historical and recent developments in this emerging field, we set the investigation period from 2000 to 2018 (inclusive). A thorough literature search resulted in 80 relevant empirical studies that were published in peer-reviewed journals. These discussed various factors that influenced both consumer adoption and the usage of MFS globally during the target period. A few conference proceedings were also included.

FINDINGS

From a methodological perspective, the synthesis of the information revealed that most of the studies that were included had widely used the technology acceptance model (TAM), the unified theory of acceptance and use of technology model (UTAUT) and their modifications, followed by self-developed hybrid models. These hybrid models were built to predict consumers' behaviour and intention to adopt and use MFS and their related technologies. Several moderators were also used in extending the research to examine their effect on the relationship between key constructs. Synthesis of the past literature suggests that these moderators have been separated into different categories: (1) demographic moderators, such as age, gender and education; (2) cultural moderators, such as individualism, collectivism, uncertainty avoidance, masculinity, femininity, and power distance; (3) psychological moderators, such as self-efficacy, perceived image, subjective norms and personal innovativeness; and (4) personal related moderators, such as trust and perceived risk. The key determinants that affect the consumer decision cycle regarding choosing to adopt and use MFS were also identified, consolidated and reported in this study. For example, from the consumer perspective, product-related factors, such as 'perceived usefulness' (PU) and its close ally 'performance expectancy', have received major attention from researchers. Here, TAM-based research has documented a significant and persistent effect of PU and perceived ease of use on new technology adoption (primarily on usage intention) and sustained use.

FRAMEWORK

A framework is also proposed and suggested in this review (see Figure 1). This comprehensive framework presents the MFS ecosystem and explicitly identifies future research areas that have lacked attention to date. The dark grey highlighted boxes indicate the research gaps that require exploration due to the changing MFS landscape. In this framework, we have divided the MFS into three domains: m-banking, mobile payments, including mobile wallets, and the fast-emerging domain of mobile money. This review has endorsed these three domains, with a projection that mobile money will soon be recognised as a separate digital domain within the fertile ambit of MFS.

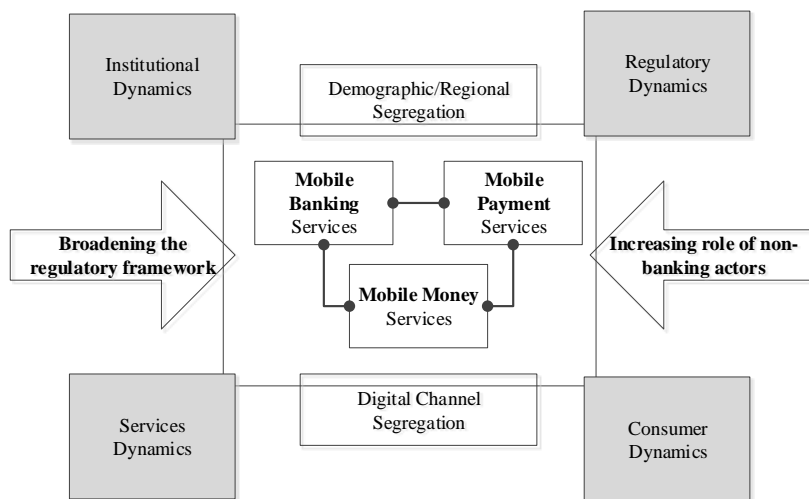

Figure 1: Framework of retail MFS and technologies

Institutional dynamics segregate institutions that develop and deploy MFS. These institutions include governmental and regulatory bodies, banking, microfinance entities and non-banking entities, such as merchants, FinTech and third-party developers. Regulatory dynamics are also important to the development as well as the deployment of MFS in different regions of the world. In addition to banking entities, which are generally diligently regulated, the significance of non-banking entities in the MFS ecosystem has been growing, especially after the promulgation of the Payment Systems Directive (PSD2) and Open Banking regulations in 2018. This changing regulatory landscape will alter the retail banking and payment landscape and further augment the significance of MFS.

NON-FINANCIAL EMPLOYMENT COMMITMENT AMONG MUSLIMS AND JEWS IN ISRAEL

Sharabi, Moshe¹; Shdema, Ilan²; Simonovich, Javier²; Shahor, Tal³

¹Department of Organizational Consulting, Yezreel Valley Academic College, Emek Yezreel, Israel

ABSTRACT

Non-Financial Employment Commitment (NFEC) is an important measure of work ethics. It is measured commonly by the classic "Lottery Question" asking whether a person would continue working if he/she won a lottery or inherited a large sum of money. Employees with high NFEC have high work centrality, show higher job performance, are more involved in their work, more committed to their organization, and there is lower absenteeism and turnover among them than employees who have low NFEC (Snir, 2014; Sharabi and Harpaz, forthcoming). NFEC of Muslims in general and of Arab Muslims in particular, has not been studied yet and the objective of this study is to fill this gap by exploring NFEC among Arab Muslim and comparing them to Israeli Jews. Better understanding of Muslims' work ethic is important today due to a substantial number of Muslim immigrants and refugees from Africa and Asia, particularly from the Middle East, to Western countries (especially to EU countries).

The sample included 898 Jews and 215 Muslims representing the Israeli labor force. Among the Jews, 50.9% were men and 49.1% women and the mean age was 39.5. Among the Muslims, 55.3% were men and 44.7% women and the mean age was 36.9. The findings in table 1, and in regression analysis, reveal higher NFEC among Muslims, particularly among Muslim women, compared to Jews. It seems that the great importance Muslims, especially Muslim women, attribute to work stems from their cultural and religious values and restrictions. Aside from the fact that Muslim society restricts women's opportunities in joining the labor market, Muslim women are dominated by patriarchal values (Kaufman, Abu Baker, and Saar; 2012; Schnell and Shdema, 2016). Work life and occupation is a means of obtaining social status and prestige but for Muslim women it is also a means to fulfill other needs, such as influencing family decisions, working outside of the community, achieving independence, and shaping one's own destiny, in a patriarchal, collectivist, traditional society (Ganaim, 2001).

Both Muslim and Jews in urban areas have lower NFEC than those who live in smaller localities. These findings confirm our core-periphery model regarding NFEC. While the degree of religiosity has an unclear impact on NFEC, education and income levels have the strongest effect on NFEC among both Muslims and Jews.

Table 1: NFEC (Lottery Question) percentage according to demographic distribution among Jews and Muslims

	Jews		Muslims	
	Would stop working	Would continue working	Would stop working	Would continue working
Total Sample	17.9	82.1	10.7	89.3
Men	17.5	82.5	14.4	85.6 ^b
Women	18.4	81.6	6.3	93.8
Degree of Religiosity				
Secular	16.8	83.2 ^b	11.3	88.7
Traditionalist	22.5	77.5	10.2	89.8
Religious	11.0	89.0	12.1	87.9
Area of Residence				
Rural area	11.4	88.6 ^b	6.6	93.4 ^b
Town	17.9	82.1	19.0	81.0
City	20.6	79.4	15.7	84.3
Educational level				
Elementary school	33.3	66.7 ^b	33.3	66.7 ^b
Secondary school	22.3	77.7	16.9	83.1
Additional education	14.5	85.5	8.6	91.4
Academic degree	12.4	87.6	1.4	98.6
Occupational status				
Low status	22.2	77.8 ^b	17.4	82.6 ^b
Middle status	15.8	84.2	6.5	93.5
High status	13.0	87.0	5.0	95.0
Net income (NIS)				
<4000	24.2	75.8 ^b	19.2	80.8
4001-5200	23.3	76.7	15.0	85.0
5201-6400	22.6	77.4	10.0	90.0
6401-7600	17.5	82.5	10.3	89.7
>7600	12.1	87.9	5.3	94.7

^a Differences in NFEC between Jews and Muslims are significant (χ^2 test, $p < .05$).

^b Differences in NFEC between demographic categories are significant among this ethno-religious group (χ^2 test, $p < .05$).

The main application stemming from this study is that governments as well as employers should suit work places for diverse groups of employees. In this case, they should look for ways to preserve high work ethics, as reflected by NFEC, among Arab Muslims employees. Encouraging Muslim women to join organizations can be achieved by coping with social norms and cultural barriers, by financial and non-financial incentives, and by adjusting the work environment to suit religious and cultural expectations and preferences (food, clothing, holidays etc.). Understanding and fulfilling the diverse needs and expectations can lead to better integration of immigrants into society as a whole as well as to organizations while enhancing their productivity and commitment (Wrench 2016; Sharabi and Harpaz 2010). Since NFEC is related to education and occupational satisfaction, inspiring employees, indeed all members of society, to improve their level of education and creating satisfying jobs that includes intrinsic components (e.g. autonomy, interest, variety, responsibility, and empowerment) can increase NFEC.

The findings and their implications for organizations and Western societies are discussed.

LEADER HUMILITY AND EMPLOYEE VOICE: A MODERATED MEDIATION MODEL

Siachou, Evangelia¹; Gkorezis, Panagiotis²

¹dept. of Business, Hellenic American University, Athens Campus, Greece

⁺dept. of Economics, Aristotle University of Thessaloniki, Thessaloniki, Greece

ABSTRACT

Recently, scholars and practitioners have shown an increasing interest in leader humility. In fact, several scholars have argued that leader humility is one of the main determinants of leader effectiveness (e.g., Owens *et al.*, 2013). Despite its lack of clarity regarding its conceptualization (Oc *et al.*, 2015) leader humility is mainly described as an interpersonal characteristic, which encompasses a willingness to see oneself in a more accurate way and acknowledge others' potential strengths and contributions, as well as openness to new ideas (Chiu *et al.* 2016; Owens *et al.*, 2013). In this context, leader humility provides followers with feedback and flexibility, and encourages them to learn continuously (Owens and Heckman, 2012).

In the existing literature, prior research has suggested that leader humility play an important role in fostering both organizational and employee outcomes such as organizational learning (Vera and Rodriguez-Lopez, 2004); successful change outcomes (e.g., Edmondson, 2003; employee engagement (e.g., Chiu *et al.*, 2016). In this vein, previous studies have demonstrated the relationship between leader humility and employee voice (Liu, 2016). However, less is known about the underlying mechanisms and the boundary conditions that explain this relationship. To this end, we developed and tested a moderated mediation model that highlights the mediating role of employee intention to share knowledge and the moderating role of organizational tenure (Figure 1).

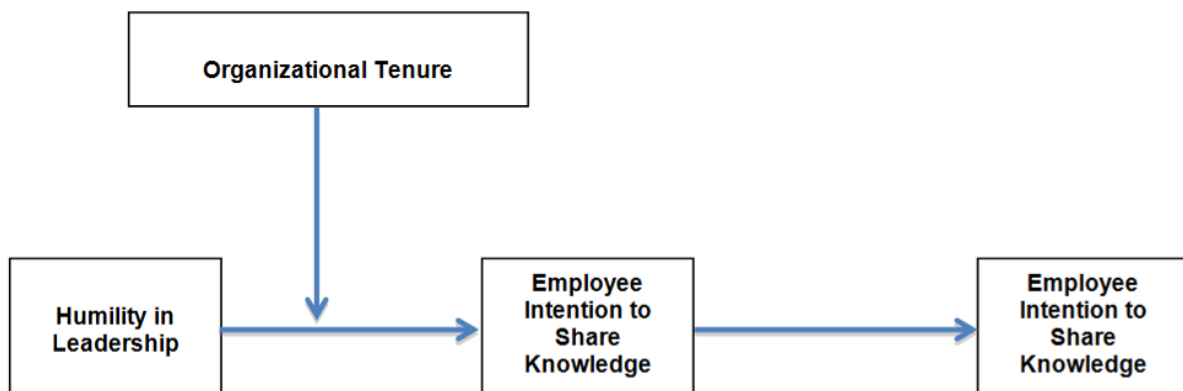

Figure 1: Hypothesized model

Data were collected from 209 medical representatives employed at international pharmaceutical companies operating in Greece. The present hypotheses were examined with SPSS macros developed

by Preacher *et al.*, (2007). Results supported our hypotheses that employee intention to share knowledge mediate the association between leader humility and employee voice and, further, that this indirect effect was contingent on employees' organizational tenure. Namely, the indirect relationship of leader humility with employee voice through employee intention to share knowledge is stronger for short-term employees than for long-term employees.

The study presents interesting implications for both theory and practice. As existing research lacks empirical evidence in support of how and when humility in leadership affects extra-role behavior, our study enhances this understanding. In doing so, it supports that leader humility acts as a contextual factor predicting important employee behaviors such as employee voice. Drawing also on the social exchange theory, the study findings confirm that employees who perceive supportive behaviors from humble leaders counterbalance the cost of sharing their personal knowledge with the benefit they receive of this interaction as a social good. Therefore, employees' intention to share knowledge explains how leader humility promotes employee voice. Besides, we strengthen the path-goal theory estimation that leaders' outcomes are also dependent on employees' characteristics (House, 1996) using organizational tenure as moderator.

Our research strongly encourages executive administration to pay particular attention on promoting leaders' humility to achieve employee extra-role behaviors. As employees' intention to share knowledge associates to their awareness for existing policies and decision-making procedures, leaders should develop and establish effective knowledge sharing policies and practices. Such practices can further motivate employees to voice against unpleasant situations or negative events they experience at work. Our study revealed that short-term employees mitigate the risks of voicing at work because they create more trusting relationships with their leaders than long-term employees. Therefore, equal attention should be paid on the relationships leaders build with long-term employees. Besides, the latter should be equally motivated and encouraged to voice their concerns at work.

As common in academic research the study presents limitations, which should be noted and addressed in future research. Specifically, as we utilized a cross-sectional design, attention should be paid on the causality of the present relationships. Therefore, a longitudinal approach should be considered for future research. Despite scholars' consensus that interaction effects could mitigate common methods bias (e.g., Siemsen *et al.*, 2010) we cannot exclude this possibility. Therefore, future research should analyze the study relationships by controlling for endogeneity effects (Antonakis *et al.*, 2010). As the study conducted in a certain geographical area, namely in Greece, data generalizability in other geographical areas is hardly supported. Future empirical research can expand in different origins as well as in other professions (Owens and Hekman, 2016). Besides, alternative

moderating and mediating effects in the relationship between leader humility and employee voice (Madrid *et al.*, 2015) can be also investigated. These mechanisms can include, among others, the constructs of psychological safety as well as various personality traits such as extroversion vs. introversion.

IMPROVING THE ORGANIZATION DEVELOPMENT THROUGH BUSINESS RESILIENCE: A PROJECT ORIENTED COMPANY

Solomon, Ionela Gabriela

Doctoral School of Business Administration, The Bucharest University of Economic Studies

ABSTRACT

Discussions regarding resilience used to be more common in the psychology academic literature, rather than management, since resilience is a characteristic of individuals to overcome a hostile environment or challenging conditions in their lives.

Each organization that wants to overcome the implication of disruptions within uncertain environment must continually adapt in order to allow development. An organization that focuses on growing and improving through a culture of learning in order to become performing and create value for society is an organization concerned about being sustainable on a long term.

The paper aims to identify how a resilient business or organization can develop in a sustainable way by the help of project management and by involvement and support of the human resources.

INTRODUCTION

At the origin, the term resilience is used in the physical sciences. According to this definition, a material is resilient if it is able to regain its original shape and characteristics after being stretched or pounded (Clegg and Bailey, 2007).

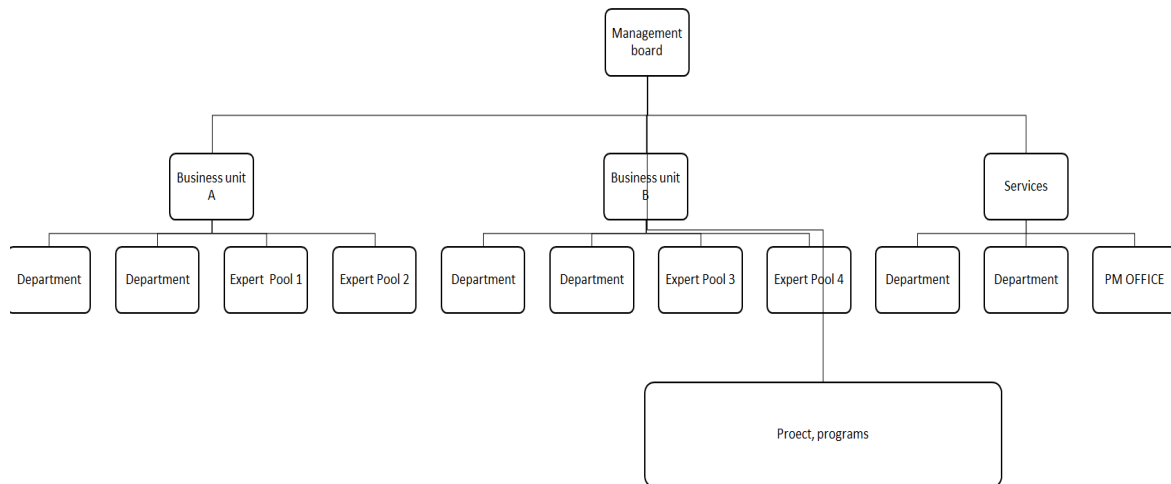

There are two main approaches regarding the concept of organizational resilience and what does it means. One of them defines organizational resilience as “the firm’s ability to sense and correct maladaptive tendencies and cope positively with unexpected situations” (Ortiz, 2016).

Furthermore, McManus (2008) provide three principal attributes for resilience in organization: situation awareness, management of keystone vulnerabilities, and adaptive capacity- resilience, embraces adaptation to the changes in its environment.

On the other hand, organizational resilience is seen simply as an ability to rebound from unexpected, stressful, adverse situations. (Arthur, J. and Moody, L., 2018).

A second perspective of organizational resilience includes the development of new capabilities in order to create new opportunities, due to its adaptive capacity and build a successful future (Lenghnick-Hall *et al*, 2011).

Resilience requires the ability to distinguish between the two situations: 1- there are demanded creative solutions or 2 - well-practiced responses. This is correlated to the fact that a resilient organization is able to manage better the risk and is prepared for the unexpected.

Source: *Organization chart of a project oriented company* (Gareis, 2007, p252)

THE PROJECT-ORIENTED COMPANY

According to Hueman (2010) the project-oriented company can be found under multiple names such as: project business, project intensive, project-led, multi-project.

Project management must become an essential competence of the project-oriented society, explicitly developed by the organization. In this regard the organization defines project management as an organizational strategy (Bollinger and Smith, 2001). Very often a project is related to other planned or ongoing project within the organization. These relationships need to be analyzed due to the fact that understanding the specific project context provides orientation to the project organization.

Business process  *Project managing*

Project managing is a business process of the company that should contribute to successful performance of the project (Prabhakar, 2008). It includes the sub-processes: project starting, project coordinating, project controlling, project transforming and project closing (Gareis *et al*, 2013). The process's objectives in a company are not only the economic objectives but also ecological and social objectives. Ecological objectives refer to local, regional and global impacts of the project considered (Gareis, 2013). Social objectives refer to recruited and allocated personnel and projecting the assessment and development of the personnel (Noe *et al*, 2017). These goals are best achieved in a resilient organization during the growing phase by attracting and retaining motivated staff. An organization that manages to combine their social, environmental, and financial performance in order to create shared value for both business and society is a sustainable organization, according to Baumgartner and Rauter (2017).

In the figure above is presented a model developed by Roland Gareis that helps to assess the status of an organization based on project management. In order to implement a project oriented strategy (Aubry *et al*, 2007) and to develop further project management competencies (Whitty and Maylor, 2009), it is necessary to collaborate and benefit from support of human resources to develop different instruments for individuals, teams and organization as a whole.

These instruments include self-assessments and training in both classroom and on the job, workshops and coaching. (Huemann *et al*, 2007)

CONCLUSIONS

The implementation of a program based on project management leads to the transformation of the management act by streamlining the internal processes. In a public organization, a project-oriented company approach can enhance decision-making process, internal communication and leadership style, leading to an improved and resilient organization. Another benefit of the project-oriented society is that it allows efficient management of the company's activities; thereby it helps optimizing costs and maximizes profits.

ASSESSING THE DIET IMPACT ON LIFE EXPECTANCY IN EUROPEAN UNION

Spada, Alessia; Rana, Roberto Leonardo; Cafarelli, Barbara; Fiore, Mariantonietta

Department of Eco – University of Foggia, Foggia, Italy

ABSTRACT

INTRODUCTION

The increasing life expectancy at birth and generally an improvement of the quality of life currently observed worldwide over is due to many factors. For instance, the US government has proposed a program titled “Healthy People 2020” (www.healthypeople.gov) which consider the health-related quality of life (HRQL) as a multi-dimensional concept related to different aspects such as physical, mental, emotional, and social functioning. However, according to Galilea-Zabalza (2018) a useful tool to help researchers to investigate the HRQL, is the dietary patterns. In general, a study in such field should consider all components of meal since it provide the synergistic or antagonistic effects that foods and nutrients may have when they are consumed together. However, considering every single component of a diet can contribute to better understand the influence of each component on life expectancy of a population.

Diet changes and shapes over time, as social and economic factors and new trends affect it: income, food prices, availability of healthy foods, preferences and cultural heritage, and geographical and environmental aspects (including climate change) (WHO, 2016). The main world top factors of diseases are diet-related. A healthy diet has to contain fruit, vegetables, legumes, nuts and whole grains, less than 10% of total energy intake from free sugars and less than 30% of total energy intake from fats (FAO and WHO, 2014): eating healthily decreases non communicable diseases (NCDs) that are diabetes, heart disease, stroke and cancer) (Lenoir-Wijnkoop et al., 2011). Low fruit and vegetable intake is among the top 10 selected risk factors for global mortality (WHO, 2016; Carlyn Hood et al., 2012) and correlatively several authors demonstrate that moderate intake of alcohol reduces the incidence of heart disease and increases longevity (Snopek et al., 2018; Annunziata et al., 2016). In this contest the present paper intend to analysed, using SEM methodology (Structural equation Model), the relation between life expectancy and some food variables for 29 EU countries in 2014. The goal is to identify some significant food variables on life expectancy in European countries and find out if they have positive or negative impacts on it.

MATERIAL AND METHODS

Life expectancy is a complex variable that depends on several factors. In such cases functional dependency relationships are often difficult to identify with exact mathematical models or statistical regression models. However, the modelling of structural equations (SEM) can detect relationships between variables in a more elastic way than mentioned above models. Indeed the SEM models make it possible to analyse the interrelations between variables, even in the absence of precise functional forms. The authors analysed life expectancy for 29 EU countries in 2014 (Eurostat, 2019). The model SEM proposed relate life expectancy in this countries, with some food variables :*Food Supply by Fats Animals (kcal/capita/day), year 2013* (Source: FAOSTAT, 2019) *Persons eating fruit, vegetables or salad from 4 to 6 times a week (%)*, *Frequency of alcohol every day (%)* *Frequency of alcohol every week (%)* ,*Frequency of alcohol less than once month (%) (year 2014)* (Source: Eurostat, 2019), described in Table 1. The SEM model has been estimated in the Stata 14 package with the application of the maximum likelihood method.

Tab.1 **Observable variables for 29 EU countries.**

Variable	Description of Variables
X1	Healthy life expectancy (year 2014)
X2	Food Supply by Fats Animals (kcal/capita/day) (year 2013)
X3	Persons eating fruit, vegetables or salad every days % (year 2014)
X4	Frequency of alcohol never (%) (year 2014)
X5	Frequency of alcohol less than once month %(year 2014)
X6	Frequency of alcohol more than once month %(year 2014)

(Source: Eurostat and FAOSTAT)

RESULTS

The SEM model shows that the food variables taken into consideration are statistically significant with respect to life expectancy (table 2). In particular, the standardized coefficients show that the daily consumption of fruit, vegetables and salad has a positive impact on life expectancy in European countries. On the contrary the consumption of animal fats have a negative impact. Moreover do not drink alcohol, or less than once can have a negative impact on the life expectancy. This confirm that moderate use of wine is not only harmful behaviour but can have a positive effect on life expectancy.

Tab.2 SEM model for Healthy life expectancy in EU countries

Alcol_never	-.1802225	.08909	-2.02	0.043	-.3548356 -.0056093
Alcol_less_than_once_month	-.3139952	.1577538	-1.99	0.047	-.6231871 -.0048034
_cons	63.41561	9.95997	6.37	0.000	43.89443 82.93679
var(e.Healthy_life_expectancy)	14.32892	4.422			7.825767 26.23614

CONCLUSIONS

According to the SEM the food variables taken into consideration are statistically significant with the life expectancy. In particular daily consumption of fruit, vegetables and salad has a positive impact instead of animal fats. In the next steps a taxonomy analysis could try to identify the shape of structures within data in order to define homogenous groups of cases. Inserting other variables where made available can improve the specification of the model.

DESIGNING THE SMART HOSPITALS - THROUGH INTELLIGENTLY INTEGRATED TOOLS OF QUALITY AND COST EFFECTIVENESS

Stefănescu, Alexandru Mihai

Business Administration Doctoral School, The Bucharest University of Economic Studies

ABSTRACT

The present paper describes a new concept of integrated hospital to be implemented in Romania. The system works in a holistic manner, serving the patients, medical staffs and health institutions by reducing the time of expectation, standardizing the operational activities, treatments and monitoring. The efficiency doubles the results both financially, as profit, and socially, as social satisfaction.

INTRODUCTION

The *Smart Hospital* concept (SMART) assumes the congruence and valorization of the following factors: *Single* (single building, architectural emblem), *Mutual* (for both patients and physicians and researchers), *Adaptative* (thought from the beginning to resist in time), *Respectful* (built with care towards the natural and urban environment) and *Technological* (effective by quality, not by quantity). Patients' acquaintance, communicate with doctors, comprehend patients' situation and expectations, respond to international requirements, support research programs and attract and retain professionals are examples of action to turn a rigid medical institution into a performing, versatile and economically efficient.

THE MEDICAL ASSISTANCE MONITORING SYSTEM

The Medical Assistance Monitoring System is a communication platform, personalized for each hospital unit, integrated into the hospital information management system, which adds value to medical activity. Because of this integration, critical patient information can also be sent to relevant staff in a very short time, thus making response time more efficient.

In terms of hardware, the system has several components: the touch screen control panel and the internal memory card reader, the call unit for each bed, the patient's receiver, the WC call unit, and the corridor lamp on the door. *The working method* is developed under the system of calls - made from cameras can be viewed from the nursing care panel, - and pager signals viewed on mobile phones. The highly integrated system directs the critical patient information precisely to relevant staff. With the IP-based system, management software can be controlled by the operation and stability of the equipment can be connected to it from start to finish. In case of a malfunction, a definition of the

technical personnel in the system can be notified of the situation. By implementing this integrated system, efficiency gains are made in reporting and monitoring the procedures and protocols of medical staff to hospital management, as objective as possible, and in improving the working time and quality of services provided to the patient.

PNEUMATIC TRANSPORT SYSTEM

Applicability and workflow of the pneumatic transport system facilitate hospitals continue to look for internal logistics optimization technologies to improve their ability to deliver expanded hospital services without increasing staff numbers or diminishing quality. *The pneumatic transport system*, integrated with the hospital software, connects the entire hospital. Emergency rooms, laboratories, blood bank, pharmacy and all support areas can now be linked together. A pneumatic tube system can give an immediate and measurable result in this dilemma. An infinite variety of materials can be transported with a pneumatic tube system. Items that once were transported manually using human resources can now automatically reach their destination. Materials such as blood and tissue samples can reach the lab in seconds. Medications sent from the central pharmacy can get to the care stations by pressing a button. Radiographs and their results can get into the hands of technicians and doctors. Even transport of medical and surgical equipment can be done more efficiently through a pneumatic tube system.

In terms of hardware, it assumes the installation of multi-zone pipelines interconnecting multiple workstations with independent operating areas. The system is operated via connected pumps and works on the vacuum line. Materials weighing maximum 28 kg can be transported at speeds of up to 8 meters per second. The advantages are numerous: improving work times, lowering staff costs, limiting human errors that may result from handling and transport (sanitary materials, medicines, biological samples). In addition to releasing vital staff from the routine transport of laboratory samples and medications, pneumatic transport systems deliver the items in a fraction of that time, but more importantly, samples and essential drugs arrive at destinations within seconds of a few minutes. Overall, hospital operation is simplified, and valuable hospital staff can focus on what they do best ... to treat patients.

THE PATIENT MONITORING SYSTEM AND MEDICAL DEVICES (RFID)

RFID is a form of wireless communication that incorporates the use of electromagnetic or electrostatic coupling into the radio frequency spectrum of the electromagnetic spectrum to uniquely identifies an object, person, or object. For patients - the allocation at the time of admission to them of a bracelet equipped with a chip, which allows permanent monitoring of their location and vital signs (heart

rate). This helps to manage urgently the emergency situations that may occur during a patient's hospitalization when it is in the yard, in common areas or areas such as a toilet or a shower. The patient can be found within minutes by medical staff and can receive first aid. These minutes can make the difference between life and death. The system has countless applications. In addition to monitoring vital signs of patients, it can accurately identify the position of infants / babies found in pediatric or neonatology departments or a patient suffering from Alzheimer; can identify if a patient has left the defined perimeter, and in such cases it may be real-time.

The medical devices labeling with tags is based on microchips that allow real-time identification of the equipment in a well-defined area. Enables specific medical activities and reduces the incidence of human accidents and mistakes, or administrative activities such as annual inventory, shortening work times, reducing the human resource allocated to these activities and implicitly costs. The system involves the installation of Wifi Reception Receivers in the defined area and the allocation to patients of bracelets equipped with a chip, which allows permanent monitoring of their location and vital signs (cardiac rate). RFID tags and scanners are also required.

RESULTS AND CONCLUSIONS

The implementation of the SMART Hospital will provide immediate identification of emergency situations in which a patient can be found and rapid intervention to save him / her, improving working times, lowering staff costs, limiting human errors that may result from handling and transport. This system brings important benefits in terms of patient safety.

**IMPACT OF KEY OPINION LEADER AND PEER CONSUMER
RECOMMENDATIONS ON PURCHASE DECISIONS OF GENERATION Z
INSTAGRAM USERS**

Sultanova, Finan¹; Tzavara, Dionisia²; Argyropoulou, Maria²

¹University of Liverpool

²Laureate Online Education and University of Liverpool

ABSTRACT

The research paper aims to understand how external bodies such as key opinion leaders and peer consumers, through social recommendations affect online buying intention of Generation Z Instagram users. Generation Z are a new generation of consumers who are coming to shake our understanding of online shopping and of the way companies use the internet to connect with consumers. Also, social shopping, and the integration of social networking with buying and selling products and services online has introduced new components to the online shopping experience and the decision making process. We use an online survey to capture Generation Z consumers' perceptions about the way key opinion leader and peer consumer recommendations shape their purchase decision. We find that both types of social recommendations have an impact on Gen Z purchase decision, but of smaller magnitude than expected.

VALUE CO-CREATION: A SYSTEMATIC LITERATURE REVIEW OF INTERNATIONAL MARKETING AND BUSINESS ECOSYSTEMS DOMAINS

Tabas, Abdollah Mohammadparast¹; Arslan, Ahmad¹; Tarba, Shlomo Y.²

¹University of Oulu, Finland

²University of Birmingham, UK

ABSTRACT

1. INTRODUCTION

Value co-creation has emerged as an important concept in recent years in both international marketing as well as entrepreneurial and business ecosystems literatures (e.g. Gronroos, 2011; Pitelis, 2011; Jensen and Petersen, 2014; Kaartemo *et al.*, 2017). A key reason referred behind rise of value co-creation is increased consumer awareness and emerging possibilities to work closely with producers of goods or services (Festa *et al.*, 2015; Agrawal and Rahman, 2015; Lacoste, 2016; Meynhardt *et al.*, 2017; Leonidou *et al.*, 2018). Similarly, from an ecosystem (both business and entrepreneurial) and international marketing perspectives, customer is an important part and key stakeholder of the ecosystem who can influence success or failure of such initiatives (e.g. Jensen and Petersen, 2014; Lacoste, 2016; Mack and Mayer, 2016; Leonidou *et al.*, 2018). So far no prior study (at least to our knowledge), has attempted to perform a systematic literature review, where value co-creation in business and entrepreneurial ecosystems is analyzed along with its application in international marketing context. Therefore, our paper aims to fill this gap in literature, and will undertake an in-depth literature review by focusing on top journals. The methodology of our planned literature review is explained as follows.

2. RESEARCH METHODOLOGY

In this paper, we follow a systematic approach of reviewing the literature according to the guidelines suggested by Tranfield *et al.* (2003), which is most referred approach in different fields of social sciences. Using a systematic literature review (SLR) approach helps researchers to summarize existing evidence according to an explicit, rigorous, and transparent step-wise process (Liberati *et al.*, 2009; Tranfield *et al.*, 2003). We further aim to incorporate updated suggestions of Denyer and Tranfield's (2009) by specifically adapting the five-step approach : (1) question formulation, (2) locating studies, (3) study selection and evaluation, (4) analysis and synthesis, and (5) reporting and using the result.

2.1 Locating studies

To identify relevant studies is important and hence suitable search engines and strings play an important role in this concern. To locate relevant articles four search engines are being used: Scopus, Web of Science, and google scholar. We identified the keywords through the brainstorming approach. The keywords constructed into search strings. The search string, we chose is “ecosystem*” AND “entrepreneur*” AND “business*” AND “international* AND market*” AND “value co-creation”. We also plan to seek guidance from relevant librarian in the end to ensure that we complete the full coverage of this kind of research. We further will undertake a manual issue-by-issue search in leading international marketing journals. The journals list will be finalized as the process of SLR develops during the course of time because value co-creation in international marketing and EE context, is an evolving concept where relevant articles are increasingly being published in a number of journals. Following figure presents the process of SLR showing our preliminary results of literature search.

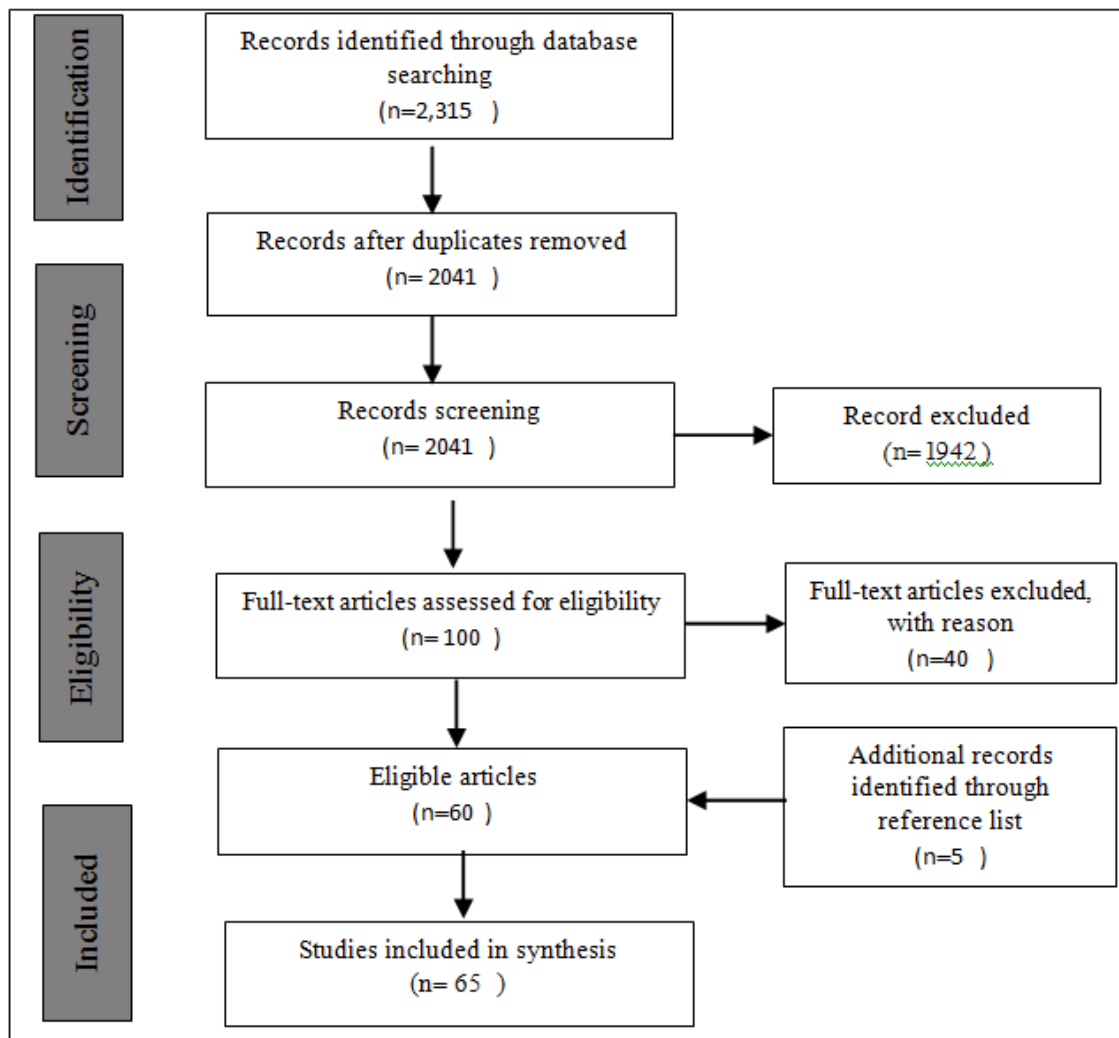

Fig. A PRISMA Flowchart

Source: Adapted from Moher et al.2009)

Finally, it is expected that our SLR will include approximately 65 most relevant and highly cited articles.

Timeline:

Literature Search and Finalization of Papers to be Included: by 15th November, 2019.

First draft write up: by 28th February, 2019.

Final version Ready: by 30th June, 2020.

THE ROLE OF KNOWLEDGE ON ELDERLY INVESTMENT DECISIONS

Teerakapibal, Surat

Thammasat Business School, Thammasat University, Bangkok, Thailand

ABSTRACT

Advancement of medical technologies and the unprecedented decrease in fertility rate contributes to the growing number of ageing societies around the globe. Currently, over 13 percent of global population are 60 years old and above (United Nations, 2018). Interestingly, this population is projected to increase to 1.4 billion in the next decade. At this rate, more than a quarter of world population will be 60 years old and above by 2050. Among the nations turning into an aged society, Thailand is notably one of the fastest countries. That is, it takes Thailand only 20 years to transform from an “ageing society,” where more than 7 percent of the population is aged 65 years old or older, to “aged society,” where more than 14% of the population are elderly. The abrupt shift in demography urges policy makers to encourage its citizens to prepare for financial burdens after retirement.

Literatures have shown that risk tolerance among elderly is much lower than their younger counterparts due to the perception of time (Carstensen et al., 2003). Researches have demonstrated that goal orientation shifts as consumers age as well (see Cole et al., 2008; Ebner, Freund, and Baltes, 2006). According to the selective optimization with compensation theory, consumers must carefully allocate their limited internal and external resources to maximize gains and minimize losses at every point in time throughout their lives (Baltes and Baltes, 1990; Freund and Baltes, 2000). However, as their life span is extended, this loss aversion may cripple the potential returns of asset that they possess.

Extant researches have shown that information processing ability significantly decline with age (Carpenter and Yoon, 2011). Moreover, a decline in working memory has also been associated with increasing age (Moscovitch and Winocur, 1995). As financial decisions often require a great deal of information processing due to its complexity and huge number of alternatives, this paper aims to investigate the benefit of wealth management advisor on risk tolerance. In particular, this paper employs conjoint choice experiment data. The experiment is designed to be balanced and orthogonal to optimize the number of necessary choice decisions for participants. The survey was administered to 220 participants with the following attributes and levels:

1. Risk and Returns has three levels: low, medium, high
2. Availability of Financial Planner has two levels: yes, no.

After data is collected, a logit choice model is estimated. Empirical results illustrate that older consumers exhibit lower level of risk tolerance than their younger counterparts. Interestingly, elderly

are willing to partake in higher risk and return assets when financial planning service is included. These findings provide both academic and managerial implications. First, empirical results show that knowledge provided by wealth management planner is able to alleviate the detrimental effect of the decline in information processing among elderly. In addition, public policy makers shall provide consultation to older consumers in order to shift their preference away from the safe haven of savings.

PROJECT RISK MANAGEMENT FOR SMES: LESSON LEARNT FROM A SYSTEMATIC LITERATURE REVIEW

Testorelli, Raffaele¹; Ferreira de Araujo Lima, Priscila²; Verbano, Chiara²

¹Management and Business Advisor, Milano, Italy

²Dept. Management and Engineering, University of Padova, Vicenza, Italy

ABSTRACT

INTRODUCTION

Risk management (RM) is a fundamental knowledge area of Project Management (PM), essential to execute a project successfully and widely discussed in PM guides such as the Project Management Body of Knowledge (PMI, 2017). A risk is an uncertain event that, if occurs, will affect positively or negatively the achievement of one or more of the project's objectives. RM is adopted to face these threats as well as to pursuit opportunities (Bartlett et al., 2004). The objective of Project Risk Management (PRM) is to systematically identify, analyse, treat and monitor & control project-related risks during the project lifecycle (Borge, 2002; PMI, 2017). Risks and uncertainties are inherent to projects since a project is always unique venture and therefore faces unknown factors (Carvalho & Rabechini, 2015).

The positive effects of PRM have widely been acknowledged in PM literature (de Bakker et al., 2011), but little has been studied in the specific context of SMEs. In Europe, and also specifically in Spain, nine out of ten enterprises are SMEs and they generate two out of every three jobs (European Commission, 2015; Spanish Ministry of Industry, 2018). The PRM studied and developed in large companies, must be adapted to the SMEs, so that they can efficiently implement it, but little attention has been devoted to this purpose so far.

Asking Scopus and Web of Science databases using different combinations of the keywords "risk management", "SMEs" and "small business", and excluding proceedings, editorial materials, non-English language papers and non-pertinent articles, the obtained papers were classified into the different RM streams, resulting only six papers about PRM in SMEs.

These were all empirical studies, being half of them case studies and the other half model proposals with model testing. The applications regarded specific industrial sectors and, in most of the cases, not all PRM phases or project risk types were considered. Given the importance of the theme and the abovementioned results, it can be affirmed that there is a significant gap in the literature. To contribute into filling in this gap, the main objective of this research is to analyse how is it possible for

SMEs to adopt PRM with a positive cost-benefit ratio. More specifically, PRM phases, activities, tools, techniques, procedures and organizational aspects implemented will be investigated.

METHODOLOGY

To investigate the characteristics of the adoption of PRM in SMEs, an exploratory and explanatory research through case studies was conducted, as it is a coherent methodology to be followed when facing “how” research questions (Yin, 1994). To conduct the case studies, a robust research protocol was built, and an empirical framework of analysis was created. To construct the framework defining the fundamental dimensions, books and articles about research methodologies (Eisenhardt, 1989; Yin, 1994; Voss, 2002), and about PM and PRM were consulted, and empirical papers regarding PRM in SMEs were examined (Alquier and Tignol, 2006; Leopoulos et al., 2006, Tang et al., 2010; Neves et al., 2014, Marcelino-Sádaba et al., 2014; Pereira et al., 2015).

The final questionnaire, obtained after the testing and refinement through a pilot case, includes close-ended and open-ended questions divided into 9 sections regarding the company, the project, the PRM organization and roles, phases, activities, tools, procedures and outcomes. The case studies were conducted in eight Spanish SMEs located in the Navarre region, which has highly invested on innovation, especially for SMEs. In order to cover a wide range of project types, the projects were selected based on the size of the company, the production organization, the type of industry and the PRM experience of the respondents. Using these selection criteria, it was possible to cover a breadth of perspectives regarding PRM in SMEs.

The interviews, with multiple respondents, were always conducted in person by at least one of the researchers and integrated with documents related to the PRM plan, in order to ensure the project’s internal validity, using triangulation, and increase data reliability (Voss, 2002). A two-step analysis was then conducted: within case, to analyse the pattern of data within the case, and cross-case, to search for patterns among the cases (Eisenhardt, 1989; Voss, 2002).

PRELIMINARY RESULTS AND CONTRIBUTIONS

The companies selected for the research were: two micro-sized manufacturing companies (one organized by project and one by process), three small-sized companies (two manufacturing ones organized by process and one of services organized by project) and three medium-sized companies (a manufacturing one organized by process and a consultancy one organized by project). In every company, it was asked to talk about a successful project in which the PRM had been adopted. In all the cases, the entire PRM process had been followed, and usually the CEO or the PM were responsible for the PRM implementation.

During the identification phase, the companies carried context analysis, risk identification, and applied several tools, being brainstorming, checklist and risk register the most used ones. The technical-operative and the organizational risks were always considered and identified, while other types of risks were considered only in the service firms. Many risks of the manufacturing companies were related to the material and the design of the product, which was expected since all projects involved the development of a new product or a new machine. Besides the risks, 63% of all the firms have also identified (and pursued) the opportunities. These were mainly the services companies, since only 40% of the process-manufacturing ones, which projects had a lower managerial complexity, have identified opportunities.

As for the risk analysis phase, in all companies many project meetings took place, and most of the companies used the risk matrix, risk ranking and risk register tools. No quantitative analyses were performed, and the measurements of the probability and effects of the risk were subjectively based on experience and feelings. In seven of the eight cases the risks were prioritized based on the results of the risk matrix or of the risk ranking.

During the risk treatment, the risk mitigation technique was applied by all companies, while risk avoidance, risk transfer and risk retention were used by most but not all of them. Generally, the risk treatment was partially planned: the tools were used, and the activities were carried on depending on the emergence of the risk triggers. As for the manufacturing firms, the treatment phase has involved designing and prototyping; these activities were repeated until the testing satisfied the product quality requirements; their development has allowed the companies to avoid potential failures in the final product.

In the last PRM phase, monitoring & control, while facing difficulties such as lack of time and lack of knowledge, in all projects the risks were constantly reevaluated and periodic monitoring meetings were organized, impacting positively on the PRM results.

Overall, the PRM adoption by these firms in these projects was successful. In 63% of the cases, the adoption was motivated by the fact that these projects were subsidized by the government of Navarre, which requires periodic reports about the project progress. All interviewees affirmed that there was a positive cost-benefit ratio in the PRM implementation and that it should be adopted in all strategic projects. According to their perception, the benefits provided by PRM were mainly high, especially in terms of lower risk impact, greater probability of project success and improvement of the decision-making process.

It has also emerged that the projects of manufacturing companies with a high level of both technology and market innovativeness have carried on similar activities using similar tools since they have identified similar types of risks and, finally, the perceived benefits were also similar. On the other hand,

when the project complexity is low, the simplest PRM tools tend to be adopted. Lessons learned from previous projects have also played an important role in the analyses, both in the manufacturing and in the service companies.

These results offer a significant contribution to the academic literature, given the over-mentioned gap of studies, and to practitioners highlighting how, with simple tools and constant monitoring, it is possible to implement PRM in different types of SMEs with a positive cost-benefit ratio.

THE ROLE OF SOCIAL ACTORS IN DEVELOPING “GREEN BUSINESSES”: THE CLEANTECH CLUSTER CASE

Tremblay, Diane-Gabrielle

Ecole des sciences de l'administration, Université TÉLUQ, Université du Québec, Montréal, Canada¹

ABSTRACT

The objective of our presentation will be to discuss the role of clusters as knowledge management structures and to expose the role of a cleantech cluster in addressing the challenges of a green transition. We will start by presenting the concept of clusters, their role in knowledge management and sharing, and we will center the presentation on the issue of how local cluster dynamics and intermediaries define the positions and collective mobilization of actors. The analysis is based on a case study of Québec's cleantech cluster, Écotech Québec, created in 2008 by three entrepreneurs in the local industry.

The presentation will proceed as follows. We will start by considering the current literature on clusters as well as on the green transition. We will present the methods used in the research, and then the Écotech case. Finally, we will discuss the empirical findings as concerns the visions and position of actors on key issues on the green transition, as well as their role in this context. We will conclude by presenting issues for further research.

As a cluster, Écotech Québec is an important agent of change, bringing together various actors and agents involved in the local environmental sector. As an intermediary organization, dedicated to knowledge management and sharing between various actors (businesses, unions, social actors), it tries to bring together various divergent and conflicting interests. The cluster creates the institutional conditions where businesses can come together with other social actors, including unions, in order to try to develop knowledge sharing, and disseminate knowledge, practices and environmental values. Écotech contributes to business change through the creation of relations, new institutional spaces and shared-decision-making processes. It brings to the table a series of actors from different sectors, and develops interesting hybrid governance agreements (Bulkeley and Schroeder (2012)). This cluster makes it possible for a series of actors to mobilize knowledge, coordinate and collaborate, in order to develop new kinds of economic organization (Allen and Cochrane, 2007). The cluster creates a space of knowledge exchange and discussion between various social groups. It thus shapes the visions and collective mobilization of social actors in the transformation to a greener economy.

¹ Research done in collaboration with Carolyn Hatch and Laurence Cazabon

Davies (2103) indicates that the mechanisms of transiting towards a greener economy have translated into a series of grounded coalitions including not only NGOs but also trade unions and workers who want to ensure that such transitions will be fair and sustainable. Often running under the theme of a 'Just Transition', these coalitions support a movement towards a de-carbonized world but they also want to avoid the chaotic transitions of the past, which had huge negative impacts on communities dependent on the traditional industries.

Our research suggests that while unions and businesses have been a bit late in addressing the issue of climate change, they have gained momentum and now see the energy transition as an important issue that needs to be addressed. Clusters are an interesting institutional organization which makes it possible to bring these two social actors together in order to tackle the issue of climate change, but also that of the future of jobs and work.

In our presentation, we will develop on the mechanisms which support this knowledge mobilization and exchange through the Cleantech cluster, and will present conclusions on its results, as well as on directions for future research.

INNOVATIVE ANTHROPOMORPHIC TECHNOLOGY AND ITS EFFECT ON CUSTOMER SERVICE QUALITY

Trichina, Eleni¹; Vrontis, Demetris¹; Christofi, Michael²

¹School of Business, University of Nicosia, Nicosia, Cyprus

²University of Nicosia, Nicosia, Cyprus

ABSTRACT

The purpose of this paper is to systematically identify and analyse how technologies with human characteristics impact consumers from various perspectives. The key focus of the study is the positive and/or negative effect that anthropomorphic technology usage might have on customer service quality. To achieve the primary purpose of the study, a critical review of relevant literature was conducted, using databases such as EBSCO, Emerald and ScienceDirect and following the systematic review methodology of other scholars (Alzahrani et al., 2017; Christofi et al., 2017). For this paper, anthropomorphism is defined as the incorporation of humanlike characteristics, motivations, intentions, behaviours and emotions to nonhuman agents that can positively or negatively affect customer service quality (Fan et al., 2016). Emotionality, warmth, desire and openness are some of the main features that such human-like agents acquire in anthropomorphism (Fan et al., 2016; Hur et al., 2015). People may anthropomorphize other entities due to three psychological determinants; elicited agent knowledge, effectance motivation and sociality motivation (Epley et al., 2007). This trend has been observed in several examples such as electronic devices, advertisements, animals and others (May and Monga, 2014). Anthropomorphic creations and especially anthropomorphic technology abound in the marketplace (Kim and Kramer, 2015). Indeed, to increase customer service quality and strengthen customers' experiences, businesses are increasingly using human-like traits to their services (Hur et al., 2015; Kim and Kramer, 2015; Puzakova et al., 2013). Based on the context and the ways in which anthropomorphism is been employed, it may have positive and/or negative implications on customer service quality. On the one side, anthropomorphic machines can offer customers better interaction experiences due to the psychological mechanisms of effectance motivation and social connectedness (Fan et al., 2016). Similarly, computers' representations with high anthropomorphic features, can lead people to give them positive social judgement, higher capability and trustworthiness and get influenced by them when they are facing a choice dilemma in decision making (Gong, 2008). The presence of an anthropomorphic agent in Web sites has also a favourable effect on consumers' reactions, making customers to consider the Web site as more credible (Nan et al., 2006). At the same time, anthropomorphism is been used as a strategic technique for firms' brands, increasing product likability and creating positive emotions of brands features (Puzakova et al., 2013). On the other side,

anthropomorphism may lead people to think of target products as smarter and more trustworthy (Hur et al., 2015). In addition, examining the psychological factors that affect customers' responses to digital assistants and the sequent influence on game enjoyment, it is noticed that help systems in computer games provided to customers in anthropomorphized ways, they have a negative effect on customers, as they undermine their sense of autonomy in the game (Kim et al., 2016). Following relevant review of anthropomorphism's literature, it is showed that there are no substantive empirical or theoretical accounts, which test the usage of anthropomorphic technology within the higher education industry. Based on these realities the aim of this systematic review is to map extant research and its research paths about the subject, provide a descriptive theoretical analysis of our findings, synthesize and categorize the review findings into a comprehensive framework, provide fruitful directions for future research and discuss the implications of our study in theory and practice.

Keywords: anthropomorphism, innovation, technology, customer service quality, marketing.

A CONTINUOUS-REVIEW INVENTORY MODEL FOR PHARMACEUTICAL PRODUCTS WITH PARTIAL BACKORDERS

Tütüncü, G. Yazgı^{1,2} ; Duymaz, Elif¹

¹Department of Mathematics, Izmir University of Economics, Balçova, Izmir, Turkey

²IESEG School of Management, Department of Operations Management, Lille, France

ABSTRACT

Nowadays, increase in the prevalence of preventable viruses, age-related treatments and similar health problems that are transmitted by non-organic nutrients or environmental factors, enhance drug usage. Therefore, pharmacies typically store pharmaceutical products in their depots before being sold to the customer. On the other hand, if the amount of stock is not planned correctly several problems may occur that increases the cost of inventory such as lack of storage space, shortening of product life, cost of medical waste in non-resale products and the cost of back-ordering. However, the main purpose of inventory control policies is to keep the stock amount that will meet the requirements at optimum cost without keeping the customer waiting and not causing environmental waste. Therefore, for pharmaceutical products, delays and distortions cause problems between the manufacturer, the pharmacist and the customer. In the literature, a wide range of models and solution approaches are recommended for several inventory systems with stochastic demands. These systems are examined in two groups as; continuous review systems and periodic review systems. In those systems, sometimes there are some uncertainties related with the quantity of backordered items. The presence of an uncertain environment depends on multiple parameters, and accurate determination of these parameters as well as analysis with appropriate models is of great importance in creating an effective and efficient process in management of such kind of inventory systems.

In this study, a continuous review inventory model with stochastic demand for pharmaceutical products, which is not in the literature, has been proposed by using realistic parameters to optimize the order quantity and reorder levels which cause problems in inventory systems when not optimized. The first studies on inventory systems were made by Ford Harris in 1915. After the uncertainties in the 1950s were expressed in mathematical models, the foundations of stochastic models began to be laid. In recent literature respectively, Ouyang ve Chuang (2001), Ouyang, Wu ve Ho (2007), Lin (2009), Priyan and Uthayakumar (2015), Braglia, Castellano and Song (2017), Nematollahi, Hosseini -Motlagh and Heydari (2017), they proposed various models on the variable back order ratio concept, which is inversely proportional to the amount of sales, in case the demand complies with the normal distribution. Lee (2005), generalized the demand to the model given by the normal distribution Ouyang and Chuang (2001) by including the variable back order ratio. Because,

for different customers' demands, it is not enough to use a single distribution to define the demand for delivery time when delivery times are not the same. Lee, Wu and Hsu (2006) presented a variable back order rate as a negative exponential function of time. They have proposed an inventory model with variable back-rate ratio, which depends on the amount of sales. Gholami-Qadikolaei et al. (2012) proposed a variable back order ratio in the form of a negative exponential function instead of the matching time. Sarkar and Moon (2014) has developed an optimally sized model with variable supply ratio and lower installation costs and lower error rate in non-distributional environments.

In the proposed model, we consider the demand on a single drug is stochastic and its equivalent drug in the case of shortage can satisfy it. The proportion of using an equivalent drug when the shortage occurs has been introduced to classical (Q,r) model as a new parameter and the effect on the cost has been analyzed. In Figure 1, the situation of shortage partially backordered is presented. In this figure a continuous review (Q,r) model is shown where the demand is stochastic, T represent the cycle time and T' is the lead time. In this figure, when there is a shortage of original product, it is partially lost, and partially backordered. This proportion is introduced the model as a partial backorder parameter.

In the proposed real-life inventory system, during the inventory period, when there is a shortage of original product, some customers accept the equivalent product that the insurance pays or the price may be appropriate. Nevertheless, this situation can cause the loss of customer will in short or long term. In extreme cases, while customer satisfaction is provided in the upper stage, products with short remaining shelf life should be returned to the warehouse and creates an important amount of pharmaceutical waste.

There are various software available for pharmacies that can be used for inventory management. The ordering quantities proposed by these simple inventory management tools is based on results obtained by taking the average of the past months sales and nothing more sophisticated. This situation creates a financial loss for the pharmacist in case of over-demanding or selling against demand, as well as environmental and economic disadvantage. However, it was observed by the practitioners that accurate and effective estimations were not made on examining the stock level calculations even with the most preferred inventory planning and management software. For this reason, in this study a heuristic method is proposed to define the optimal ordering quantity and the reorder point for this new model. It was used to determine the optimal stocking strategies of the two pharmaceutical products with a high density and equivalent in pharmacies. Proposed heuristic presents solutions to prevent the shortage of original drug and to prevent erroneous stockings causing waste. . Results show that the proposed model is efficient and can be used in real life instances.

THE ROLE OF PERSONALIZATION AND HEDONIC MOTIVATION IN DRIVING CUSTOMER EXPERIENCE

Tyrväinen, Olli¹; Karjaluoto, Heikki¹; Saarijärvi, Hannu²

¹School of Business and Economics at the University of Jyväskylä, Jyväskylä, Finland

²Tampere University, Tampere, Finland

ABSTRACT

STUDY OBJECTIVE AND BACKGROUND

Customer experience (CX) has been a topic of interest to researchers and managers for several decades. CX is defined as consumer's internal and subjective response to any direct or indirect contact with a company (Meyer and Schwager, 2007). Rose *et al.* (2011) divided customer experience to two components: affective and cognitive experiences. According to Gentile *et al.* (2007), the emotional component involves consumer's affective system whereas cognitive component is related to consumer's conscious mental processes.

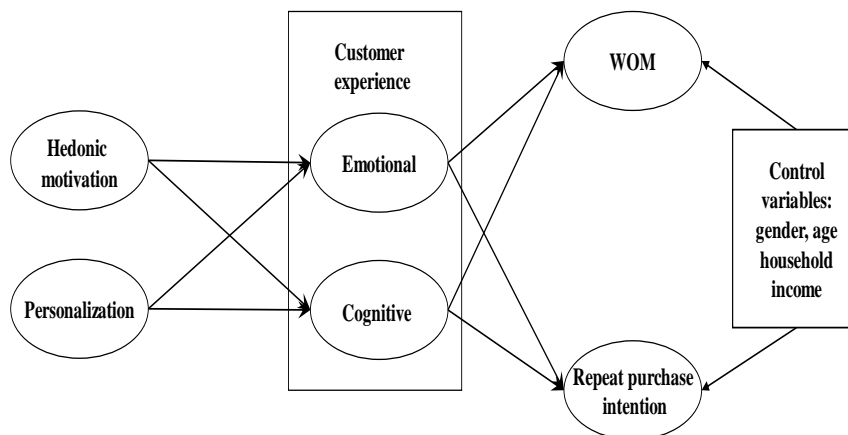

Figure 6. Research model

Prior research has not widely examined the relationships between customer's hedonic motivation and personalization with CX in omnichannel retailing context. Hedonic motivation is defined as fun or pleasure (Venkatesh *et al.* 2012) whereas personalization refers to "providing customers customized content, services, product recommendations, communications and e-commerce interactions based on knowledge about them" (Adomavicius and Tuzhilin, 2005, p.84). The objective of this study is to examine how personalization and hedonic motivation drive CX, and how CX in turn affects word-of-

mouth (WoM) and repurchase intention in an omnichannel retailing context. The Figure 1 shows our research model, which includes in total eight direct effects hypotheses.

METHODOLOGY AND RESULTS

The hypotheses are tested with a sample of 2,084 retailer customers in Finland using Smart PLS 3 software (Ringle, Wende, and Becker, 2015). The scales measuring the constructs were all derived from prior studies. Reliability and validity of the research model were acceptable. The model's predictive relevance (R^2) was 0.472 for cognitive CX, 0.628 for the Emotional CX, 0.439 for the repeated purchase intention and 0.555 for WoM. The results supported fully all the hypotheses. The findings show that both hedonic motivation and personalization have positive direct effects on the components of CX. In addition, the findings show that the emotional and cognitive dimensions of CX have positive effects on WoM and repeated purchase intention.

DISCUSSION

This research contributes to the existing literature in a number of ways. Our findings contribute to the literature of CX by showing that hedonic motivation and personalization are significant drivers of CX, and that CX drives both WoM and repurchase intention. Agreeing with the previous studies, we found support for the viewpoint that hedonic motivation (Hubert *et al.* 2017) and personalization (Rose *et al.* 2012, Pappas *et al.* 2014) have positive influence on CX. In addition our findings confirm the positive effects of CX on WoM (Klaus and Maklan, 2013) and on repurchase intention (Rose *et al.* 2012). In terms of managerial implications, our results indicate that creating more personalized offerings and advertisements improves total CX, which leads to more positive WoM and intentions to repeat purchase.

WEALTH OF NATIONS AND INTELLECTUAL CAPITALS: ADAM SMITH

Uysal, Gürhan

School of Business, Ondokuz Mayıs University, Samsun, Turkey

ABSTRACT

INTRODUCTION

Adam Smith has invisible hands view. It is laissez faire. Adam Smith also has liberal economy view. Thirdly, it has absolute advantage theory view in international marketing. This study discusses comparative advantage theory of Ricardo for international marketing. For example, Cyprus has comparative advantage in grape business against Turkey; while Turkey has comparative advantage in iron industry. Smith discusses those notions as wealth of nations. Further, this study discusses intellectual capitals as wealth of nations.

In international marketing, second important thing is customer value. If firm aims to attract customers, it must have customer value. First important thing is comparative advantage theory. There are central economy and environment economies in global economy. Central economies are, for example, USA-NAFTA, Germany-EU, and China-Asian economies. In exporting, central economy buy and sell every kind of products; however, environment economies apply comparative advantage theory. Finally, there might be two policies of international marketing and economy: comparative advantage theory and customer value perspectives.

INTELLECTUAL CAPITAL

This paper argues intellectual capital as wealth of nations. It may be considered as a new approach in wealth of nations. Adam Smith has two principles: absolute advantage and laissez faire. Absolute Advantage describes competitive advantage of nation. For example, Portugal has absolute advantage in wine business.

Smith discusses both variables as wealth of nations. This study adds third dimension to wealth of nation: It is intellectual Capital. An intellectual capital has knowledge. It makes innovations in company by technical knowledge. In industry 5.0, to become competitive, firms are to possess intellectual capitals and innovations. Industry 5.0 is described with technology development. and an intellectual capital may develop new technologies through their company innovations. Moreover, human resource management field gains priority in industry 5.0; Because HR differentiates firm's products. Because HR are core competence of firms. In industry 4.0 each economy or each firm produces similar products that make competition severe. That policy is called as isomorphism. Because as a technology and capital, economies are closer to each other. Thus, firms are to differentiate

their products in industry 5.0 to become competitive. For example, VW are to develop new engines that runs with air and water or soil. This is differentiation policy. Toyota focuses on developing small, less consumption, hybrid auto's.

Michael Porter (2011) discusses competitive advantage of a nation in Diamond Model. An intellectual capital, such as Muhtar Kent, may be competitive advantage of nation. or Steve Jobs, Jack Welch, Lee Iacocca, Bill Gates become intellectual capital of nations. Because their firms gain competitive advantage in markets. Thus, intellectual capital becomes wealth of nations through firm performance and GDPs. and Intellectual capitals are human resources.

ADAM SMITH AND PRINCIPLES

David Ricardo furthered absolute advantage with comparative advantage theory (Skousen, 2014). For example, England has comparative advantage against Portugal via iron industry.

Adam Smith possess three principles: Laissez faire, liberal economy, invisible hands, and absolute advantage theory. Smith obtained laissez faire from France (Skousen, 2014). In addition, America uses liberal economy principles. Chandler says that corporate managers are visible hands of markets (Livvarçin, Kurt, 2017). Managers manage the markets in USA.

RESEARCH

Lee Iacocca and Steve Jobs are intellectual capitals of their firms. Iacocca and Jobs carried their firms no.1 in markets.

HUMAN RESOURCE MANAGEMENT AND ECONOMY

Connection between HRM and economy appears on talent management (Uysal, 2019). In this case, talents are managers of company.

Assumption is that firms generate GDPs in macro economy. and managers manage the corporate including CEO, CFO, CMO, CKO, others. In USA, there is "oligarşi tunç law". Few people manage the corporate, and make decisions. Therefore, economy-HR relationship is key to organizational success. According to oligarch tounche, 4-5 people manages the country and company in board of directors.

There are several business functions in firm management: marketing, production, finance, logistics, accounting, etc. Each function has manager and departments. Production manager, marketing manager, accounting manager, finance manager, and so on. HR appoints talents to those positions. i.e.

HR determines who become marketing, production, finance manager. Secondly, HR recruits talents for managerial positions in staffing process.

GDP is defines as sum of production and sales of firms. and managers manage the company. and HR recruits and appoints those managers. Therefore, HRM and economy link appears on talent management and GDP variables.

For example, it is slogan that, good for GM is good for America (Parasız, 2002). GM produces part of USA's GDP. And corporate managers manage the company. and HRM appoints, finds, and recruits managers (talents) for company.

There are two contributions of intellectual capital in this study (Savaş, 2007): an intellectual capital might be considered as competitive advantage of nation, and wealth of nations. Because intellectual capital improves GDPs of nations through firms' market success. For example, Steve Jobs improved Apple's earnings through iPad, iPhone inventions. Apple company becomes number1st in market via these innovations. In addition, Lee Iacocha as a CEO saved Chrysler form bankruptcy in early 1980s. Because firms create GDPs in economy, and intellectual capitals contribute the firm's success. Intellectual capitals are bright and brilliant personnel of organization, and it contributes to firm performance positively. HRM field is related with economy discipline via GDP production. Firms affect nation's GDP via production and intellectual capitals.

Intellectual Capitals make innovations in their company. ICs are bright and brilliant person of their company. ICs have accumulated knowledge that is used in innovation.

CONCLUSION

Intellectual capital represents two properties: innovation and star employee. Intellectual capital has innovation capability in firms, and ICs are star employees of their company. Steve Jobs is leader of iPhone inventions, Bill Gates and Marc Zuckerberg are founders of Microsoft and Facebook, and Lee Iacocha developed firm performance in Chrysler in 1980s. In intellectual capital approach, government support is important. Because USA government strictly supports new entrepreneurs such as in Google, Facebook. This study explores intellectual capital variable for firm performance as it considered as a wealth of nation in this study.

THE PECULIARITIES OF THE PROCESS OF INNOVATION CREATION AND IMPLEMENTATION IN SMEs: A CASE OF LITHUANIA

Vaiginiene, Erika; Pauliene, Rasa

Faculty of Economics and business administration, Vilnius university, Vilnius, Lithuania

ABSTRACT

Lithuania was the moderate innovator among EU countries in 2019 (European Innovation Scoreboard, 2019). Due to European Structural funds qualitative changes in Lithuania's innovation ecosystem were achieved, however, according to OECD (2016) – Lithuania's innovation performance, notably business innovation, remains low. Although, Lithuania achieved the highest rate of innovation performance increase (53,9 %) during the period of 2011 - 2018 among EU countries, innovation performance impact onto economy and society (e.g. employment) still is very weak (European Innovation Scoreboard, 2019). Companies' innovativeness process is driven by external and internal factors (Claudino et al, 2017). The above mentioned reports demonstrate high achievements of Lithuanian innovation ecosystem leading to the assumption, that companies' internal factors are the biggest barriers of innovation development.

Considering importance of innovation to the competitiveness of SMEs and the country in general, the *aim of this study* is to identify the peculiarities of innovation creation and implementation process in Lithuanian companies (barriers, sources of innovations, fostering factors, etc.) and to analyse differences of innovation creation and implementation process in the companies which introduce innovations and companies which do not.

A survey of 116 SMEs in Lithuania was done in December of 2018. A convenient sampling approach was used, but efforts were made to reach potentially innovative companies that participate in the Lithuanian innovation ecosystem. A company's innovativeness drivers and barriers were measured by using operationalized Funnel model as well as methodological considerations of Fernando Galindo-Rueda and Adriana van Cruysen's (2016) and Claudino et al (2017). The research was funded by Lithuanian Agency for Science, Innovation and Technology.

The main findings: Micro-enterprises (n = 77, 66.4%) and small enterprises (n = 28, 24.1%) most often demonstrate innovative performances. Those companies mainly reside in the two largest counties of Vilnius and Kaunas.

Data analysis shows statistically significant differences between companies which demonstrate innovative performance and companies which do not demonstrate innovative performance in such factors like appropriate organizational culture and governance to innovate, adequate resources and activity in various forms of partnership with external partners such as other firms, research and higher

education institutions or consultants. During the analysis the characteristics of the innovation process, significant differences emerge from the implementation phase and continue until the end of the process. This shows that companies that do not demonstrate innovative performance get stuck not because of a lack of ideas, but because of their disability to implement them.

Keywords: Innovativeness of SMEs, fostering factors of SMEs innovativeness, innovation creation and implementation process, Funnel model, Lithuania.

INVERTED HOCKEY STICK EFFECT IN THE EUROPEAN INDUSTRY: INVENTORY REDUCTION IN THE LAST FISCAL QUARTER

Vieira, Nuno Guedes; Delgado, Catarina; Moreira, Jose Antonio

Faculty of Economics, University of Porto, Porto, Portugal

ABSTRACT

PURPOSE

Inventory management decisions are critical to industrial companies' efficiency and performance. This paper aims to identify a pattern, coined by (Hoberg et al., 2017) as "Inverted hockey stick effect", of a systematic reduction of inventory (of raw materials, work in progress, finished products and the sum of these) in the last fiscal quarter, in European industrial companies (based on a preliminary 54 companies' sample). Such reduction would correspond to a conscient management decision, with an impact on the supply chain, something that may not be in line with strictly operational needs.

DESIGN / METHODOLOGY / APPROACH

The theoretical basis of this paper is the study from (Hoberg et al., 2017), where a systematical inventory reduction in the last fiscal quarter was detected in a sample of 4877 North American industrial companies between 1990 - 2010. The effect was identified through a multivariate linear regression with inventory days (ID) as a dependent variable. Inventory days, presented in equation (1), is calculated from the end-of-quarter value of inventory (I) and the same quarter COGS (Hoberg et al., 2017, Chen et al., 2005, Chen et al., 2007). Subscript *i* denotes a company observation, *t* denotes the year and *q* denotes the quarter.

$$ID_{itq} = (I_{itq} * 365 \text{ days}) / COGS_{itq}$$

The use of inventory days as a variable, integrates companies' economic activity by taking into consideration the COGS, when analysing inventory behaviour.

As stated in equation (2), total inventory value is given by the sum of the three inventory components:

$$\text{Total inventory} = \text{Raw material (RM)} + \text{Work in progress (WIP)} + \text{Finished product (FP)}$$

Because a reduction of inventory can result from a peak of sales, the "inverted hockey stick effect" reduction of inventory must be noticeable in all three components (RM, WIP, FP).

The quarterly data concerning the period 2008 - 2017, were obtained from Compustat® using the S&P Capital IQ® interface, filtered by region (Europe) and classification (Industry).

In this preliminary study, we state the following propositions:

Proposition 1 – Companies promote inventory reduction in the last fiscal quarter

Proposition 2 – The inventory reduction in the last fiscal quarter is identified in all three components (RM, WIP, FP)

For Proposition 1, the consolidated data from the 54 companies that present complete records for the 40 quarters (2008-2017) are used to calculate inventory days and checked for a reduction in the Q4 when compared with Q3. In parallel, the same analysis is done considering each year of the period.

For Proposition 2, the same calculations from Proposition 1 are done for each inventory component, RM, WIP and FP.

PRELIMINARY RESULTS

The sample (composed by 54 European industrial companies representing a global yearly average COGS of 394.584M€), presents a consolidated reduction of 8,4% in inventory days in Q4 when compared with Q3 (table 1). The reduction is identified, not only for 2008-2017 but also for each year (Proposition 1).

Year	Q1	Q2	Q3	Q4	Q4<Q3	ΔQ4 vs Q3
2008	92,2	89,7	94,6	91,4	Yes	-3%
2009	98,3	86,2	84,6	74,3	Yes	-12%
2010	83,5	77,8	77,3	74,0	Yes	-4%
2011	83,6	79,7	82,7	79,2	Yes	-4%
2012	85,6	84,1	83,0	75,7	Yes	-9%
2013	89,1	82,1	82,3	72,8	Yes	-12%
2014	89,1	87,0	86,4	77,8	Yes	-10%
2015	92,5	86,7	85,1	79,2	Yes	-7%
2016	97,3	90,7	93,7	84,5	Yes	-10%
2017	96,2	91,4	92,2	82,8	Yes	-10%
2008-2017	91,0	85,9	86,5	79,2	Yes	-8,4%

Table 1 – Quarter inventory days and Q4 to Q3 evolution – Total Inventory

For the period 2008-2017, the three inventory components present a reduction of 8.0% - RM, 7.9% - WIP and 8.7% - FP in inventory days in Q4, when compared with Q3 (table 2).

Year	Raw material		Work In Progress		Finished Product		Total	
	Q4<Q3	ΔQ4 vs Q3	Q4<Q3	ΔQ4 vs Q3	Q4<Q3	ΔQ4 vs Q3	Q4<Q3	ΔQ4 vs Q3
2008	Yes	-2%	No	0%	Yes	-5%	Yes	-3%
2009	Yes	-10%	Yes	-14%	Yes	-12%	Yes	-12%
2010	Yes	-7%	Yes	-7%	Yes	-2%	Yes	-4%
2011	Yes	-7%	Yes	-2%	Yes	-4%	Yes	-4%
2012	Yes	-6%	Yes	-10%	Yes	-9%	Yes	-9%
2013	Yes	-10%	Yes	-13%	Yes	-12%	Yes	-12%
2014	Yes	-7%	Yes	-8%	Yes	-11%	Yes	-10%
2015	Yes	-7%	Yes	-6%	Yes	-7%	Yes	-7%
2016	Yes	-11%	Yes	-8%	Yes	-10%	Yes	-10%
2017	Yes	-9%	Yes	-10%	Yes	-11%	Yes	-10%
2008-2017	Yes	-8,0%	Yes	-7,9%	Yes	-8,7%	Yes	-8,4%

Table 2 – Q4 to Q3 evolution – Per inventory type

The reduction is also identified for each year with one exception – WIP in 2008, where there was an increase inferior to 0.2% (proposition 2).

RELEVANCE / CONTRIBUTION

This preliminary study is the first quantitative study of the inverted hockey stick effect in inventory for the European industry and points to a possible conscient management behaviour with impact on the industrial supply chain.

CONCLUSION

This paper finds the same type of behaviour in Europe, like the one identified in the North American case (Hoberg et al., 2017), i.e., a reduction of inventory in the fiscal Q4, both in total inventory and in the three components (RM, WIP and FP). For the studied period, this reduction is in average 8% (total inventory) representing an average reduction of 8.306M€ for each year from Q3 to Q4.

STRATEGIC COMMUNICATION IN DYNAMIC ENVIRONMENTS: HOW DESIGN THINKING CAN COMPLEMENT PLANNING

Vuillermin, Frederic; Huck-Sandhu, Simone

Business School, Pforzheim University, Pforzheim, Germany

ABSTRACT

Communication planning is in transition. While conventional approaches of the 1980s and 1990s focus on linear models, there has been a call for more agile approaches in recent years. Business, societal and political environments have become VUCA. Within a more volatile, uncertain, complex and ambiguous world, strategic communication planning has to adapt to new circumstances. The aim of this presentation is to discuss how and where the conventional toolset of communication planning can be expanded. Based on elements of design thinking, a non-linear, stakeholder-centered model is developed.

BACKGROUND

In a world that is changing, corporate communication is faced with many challenges. Formerly rather stable contexts have become unpredictable (volatility). It is more difficult to anticipate how events will unfold and to forecast the outcome of management decisions and strategic communication (uncertainty). Furthermore, the world seems to be more complex (complexity) and contradictory than ever (ambiguity). Within the VUCA environment (Bennett and Lemoine, 2014), corporate communication has to adapt, too.

As a management function, corporate communication aims at „(...) effectively coordinating all means of communication with the overall purpose of establishing and maintaining favorable reputations with stakeholder groups upon which the organization is dependent“ (Cornelissen, 2014, p. 5). Thus, corporate communication is based on goal-oriented systematic planning. Communication planning frameworks are specific and vary across corporate communication's three subdomains marketing communications (see for example: Holm, 2006; Schultz, 1992), public relations (see for example: Vieira, 2019; Smith, 2017; Cutlip *et al.*, 2006) and internal communications (see for example: Ruck, 2015; FitzPatrick and Valskov, 2014, pp. 41-57). However, all conventional frameworks share the idea of a linear process logic. They mostly derive from a four-step model (Cutlip *et al.*, 2006, p. 283) of analyzing, strategizing, implementing and evaluating. In the first step, a situation analysis is conducted in order to define the communication problem (“What is the problem?”). In the second step, a strategy is designed (“What should we do and say, and why?”) and, in the third step, implemented (“How and when do we do and say it?”). Finally, in the fourth step, the program is evaluated (“How did we do?”).

AIM OF THE PAPER

Conventional planning frameworks draw from milestone-based project management and propose a sequence of closed hierarchical process phases, which follow a predefined order, are strictly separated and often require an extensive documentation. Whenever the circumstances change, former findings or decisions have to be reevaluated and it may be necessary to start the process again. Such frictions could require a substantial amount of time and resources. Within dynamic environments, linear approaches have distinct limitations for an agile strategic corporate communication. As to Doleski (2015, p. 7), “there is now a greater need than ever for innovative complexity management solutions and methods”.

The aim of this paper is to discuss how and where the conventional toolset of communication planning can be expanded. Based on elements of design thinking, a non-linear, stakeholder-centered model is developed. As a result, we propose an integrated model for corporate communication planning which complements conventional communication planning frameworks with multi-sequential iterative proceedings from the design thinking discipline. From a VUCA perspective “(...) design thinking helps to obtain a multi-perspective comprehension of a complex and ambiguous problem.” (Meinel and Leifer, 2011, p. xvii). It is defined as an “approach to creative problem solving” (von Thienen *et al.*, 2019, p. 13). Being deeply rooted in stakeholder orientation (Lindberg *et al.*, 2012, p. 231; Plattner, 2016; Meinel and Leifer, 2011), iterative design thinking frameworks can offer a new spin to conventional planning. A growing number of companies implement design thinking frameworks in order to foster a more agile culture and boost innovation processes (Leifer and Meinel, 2018, p. 4; von Thienen *et al.*, 2019, p. 13).

METHOD

This paper is based on an evaluative literature review and a qualitative study. In the latter, we analyze the communication planning frameworks of selected communication agencies and consultancies in Germany through an exploratory approach. Do these frameworks expand the conventional toolset of communication planning towards a more agile process? If so, how do they address dynamic environments and their effects? Are there any differences between integrated corporate communication frameworks on the one hand and particular models within marketing communication, public relations or internal communication planning on the other hand? Based on these insights from literature and practice, the expansion of the conventional toolset of communication planning is discussed. Furthermore, elements of the design thinking discipline will help develop the non-linear, stakeholder-centered communication planning model.

CONTRIBUTION FOR THEORY AND MANAGEMENT

With regard to theory building, this paper advances the body of literature on strategic corporate communication and in particular agile planning. Addressing VUCA contexts, the proposed model integrates marketing communication, public relations and internal communication by combining analytical techniques with problem solving patterns built upon heuristics and situational reasoning. As a contribution for managerial practice, this model could offer a more agile approach to strategic planning within corporate communication. Based on design thinking, it might help communication managers to “bridge the gap between a company’s need for reliable control of their processes and resource flows and an open and entrepreneurial approach” (Lindberg *et al.*, 2011, p. 15) to communication planning.

THE QUALITY OF FINANCIAL STATEMENTS IN GREEK LISTED FIRMS: THE MAJOR ISSUES

Yiannoulis, Yiannis K.

Department of Accounting and Finance, School of Economics and Business, Technological Educational Institute of Crete, Greece

ABSTRACT

Greek economy has different characteristics from other European and Mediterranean countries, for that reason it is useful to understand how much and in what directions these affected the financial statements quality of Greek listed firms. The Greek firms are characterized by: a) concentrated ownership, b) weak market for corporate control and c) family ownership. In addition, regarding legal framework is a compulsory legislation (Law 3016/2002) rather than a code of best practices (“comply or explain”) as in Anglo-Saxon countries. All the above characteristics make Greek environment to substantially differ from the other developed European countries. This paper attempts to determine these gaps and examine the accounting literature regarding Athens Stock Exchange (ASE) for the years 1991 to 2017.

TOWARDS HUMAN-CENTERED SOCIETY: THE ROLE OF EMOTIONS IN THE COMPANY

“Humans are uniquely able to give and receive love, and that’s what differentiates us from AI. I can responsibly tell you that AI has no love”¹.

ABSTRACT

INTRODUCTION AND THEORETICAL BACKGROUND

We are in the core of the Industry 4.0 era, where the connection between physical and digital systems allows companies to explore new opportunities and make production processes more efficient (Theorin et al., 2017). This transformation has consequences for the use of human capital and for the skills required in the job market. In this context, companies emerge as being oriented towards enhancing soft skills in their training activities and professional paths. These skills refer the set of non-specific skills and abilities that refer to each individual’s knowing to be. More specifically, they are interpersonal qualities, also known as people skills, and personal attributes that one possesses (Robles, 2012). These skills are used by individuals both in work contexts and in the field of interpersonal relations.

Emotional intelligence (EI) has emerge as one of these soft skills. Nowadays, it is considered strategic and vital for companies because it allows to consciously recognize, understand and manage the emotions of those working for the organization at different level (Goleman et al., 2013). Specifically, EI is the ability to motivate oneself, to persist in pursuing a goal despite frustration, to control impulses, to modulate one’s moods, avoiding that suffering prevents one from thinking, being empathetic (Goleman, 2006).

The older literature has emphasized the importance of hard skills in the context of work environment. However, emotionality and soft skills have now acquired a new meaning in business contexts, both at the level of managers and at the one of employees. In this guise, it has been suggested that the organizational climate influences the company’s results and positive emotions can boost productivity (Akgün et al., 2007; Heffernan et al., 2008; Miao et al., 2018). Despite this, there are few empirical studies on EI. Therefore, we still know little about the role of emotions in companies and how they

¹ Kai-Fu Lee at TED2018 - How AI can save our humanity.

affect success, strategies and behaviours in the company. According to this, this paper aims to answer to the following questions:

1. Is it possible to identify company's emotions?
2. Is it possible to intervene in such a way as to restore harmony and promote corporate growth?

METHODOLOGY

To answer to the two research questions, this research employs an empirical research involving in-depth interviews with a group of small and medium enterprises operating in northern Italy and a survey research approach with a group of students of the School of Management and Economics of the University of Turin. The questionnaire was administered to 462 students who were about to graduate and enter the workplace, with the aim of understanding whether and how emotional intelligence and emotions will play a significant role in the world of economic organizations, and to assess the use of this tool for the personal and professional development of human resources within companies. Questions were taken from previous studies (Oatley et al., 1987; Gross, 1998).

Qualitative interview was carried out on a sample of 30 SMEs and structured professional studios in northern Italy with a number of employees between 5 and 60, with the aim of collecting the personal opinions and subjective interpretations of the respondents regarding the relationship and use of their emotions in the business context. Specifically, the qualitative interview is aimed at understanding the degree of awareness and the ability to manage the emotions of the company leader, as well as the real role of emotions within the company context (Goleman, 2013). The interview is divided into 10 open-ended questions designed to leave space for respondents to tell specific episodes and examples.

FINDINGS AND CONCLUSIONS

Overall, the results obtained from questionnaire administrated to students and from the qualitative interviews with entrepreneurs showed a particular attention to the importance of emotional skills, in line with the recent literature on EI (Huy & Zott, 2019).

In particular, from what emerges from the survey, students are self-aware regarding their emotional skills such as resilience, social intuition, perspective and empathy. The same applies to entrepreneurs who have tended to say that emotions play an important role in their daily work, both in their position as leaders and in their relationship with customers. In addition, the entrepreneurs interviewed showed awareness of the importance of emotions to enhance the management of human resources, to create cohesion, promote motivation and, consequently, to increase business productivity.

The survey with students shows how aware and driven they are towards the emotional dimension, and this can only be a positive sign that companies will have to grasp and exploit. Regardless of whether these students become leaders or collaborators, emotional intelligence and emotional management will help them to interact positively with colleagues and customers in future job.

The leaders of the companies interviewed have shown that emotional skills are essential for good management of employees and can become useful indicators to detect the demotivation of staff or any tensions and problems in the work, especially when dealing with change. They also recognized that the emotions of the leader can influence positively or negatively the work team. Therefore, a good leader must first of all work on his or her emotional intelligence so that his or her collaborators can channel his or her emotions and focus his or her energies on completing daily tasks and achieving the company's objectives.

In conclusion, the research findings confirm that it is possible to detect company's emotions (RQ1) as both students and entrepreneurs were able to report specific emotions associated with episodes of professional life, as well as to describe the emotions of employees in certain situations.

Finally, to the question "Is it possible to intervene in order to restore harmony and encourage business growth?" (RQ2) the answer is affirmative because from what emerged from the research, the leader has a fundamental role in terms of harmony of the working group and, consequently, the organizational climate (Goleman et al., 2013). A serene business climate promotes productivity and cohesion, making the teams motivated and aligned with the company's mission and vision. Entrepreneurs should therefore work constantly on the development of their emotional intelligence and use tools, such as questionnaires, interviews or focus groups, to detect the development of emotions within the company to verify the existence of critical issues and intervene quickly. This is especially important for companies that are constantly changing.

In conclusion, emotions in the company play an extremely important role, because what differentiates human beings from AI is precisely the emotions and empathy. AI can be a valid support, but it cannot replace human beings, because emotions and empathy are an integral part of the working method.

ABSTRACT

Emotional labor (EL), i.e. sales employees' display of expected emotions, provides important contribution to the successful customer services (Ashforth & Humphrey, 1993). Since the seminal work of Hochschild (1983), EL has received burgeoning research interest (Brotheridge & Grandey, 2002; Chi & Grandey, 2016; Grandey, 2003; Groth, Hennig-Thurau, & Walsh, 2009; Humphrey, Ashforth, & Diefendorff, 2015). Yet, most of these studies focus on general service encounters of individual service employees (e.g. Allen, Diefendorff, & Ma, 2014). In the marketing practice, team-based selling is increasingly used by organisations in retail stores (Ahearne, MacKenzie, Podsakoff, Mathieu, & Lam, 2010). By integrating organizational behaviour and marketing research, this study will contribute to bridging the two disciplines and enhancing our understanding of how sales teams perform better at both individual and team levels.

The necessity for emotional labor has been seriously called into study with strong evidence linking it to sales team outcomes in the increasing prevalent sales team working environment. However, the distinct working environment and working relationships in the sales team make extant findings in individual-based selling model difficult to draw reliable conclusions about the effects of emotional labor in retail team-based selling model. The aim of this study is to unpack the effects of two emotional labor strategies –surface acting and deep acting–on retail sales teams' performance with a focus on the mediating role of emotional exhaustion.

Figure 1 presents our research model which links the emotional labor, employee exhaustion, task performance and customer loyalty to the sales teams.

Figure 1. Research Model

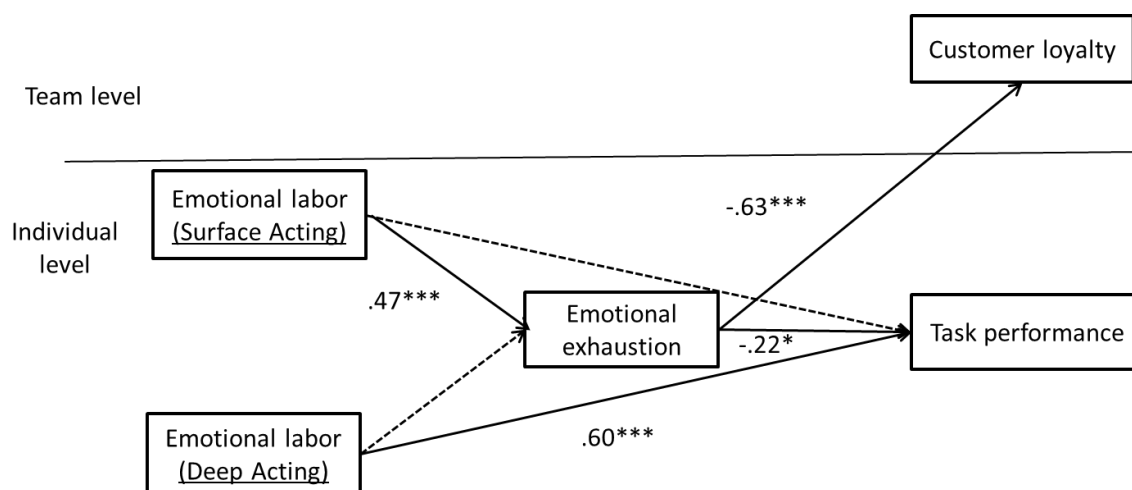

Data were collected from Chinese retail sales team employees and customers via hard-copy survey in a large electronics appliances retailer, which operates an electrical appliances retail chain with more

than 1,700 stores in over 400 cities in China. Due to the strong support from the HR manager in the sample organization, all surveys were returned within one week's time. In total, data were collected from 270 respondents (75%) nested in 89 sales teams (100%) working in different product categories. This study adopts multi-source data collection techniques where in addition to employee data collection, data were collected from customers. In total, 1035 responses were received (78%). After matching the team members and customers, 82 sales teams have both team members and customers and are used in the analysis. All constructs were adopted from published studies.

Figure 2 presents the results from multi-level modelling analysis. It shows that in sales team, the surface acting and deep acting influence customer-related performance and employee-related performance in distinct ways. Specifically, surface acting increases emotional exhaustion more strongly than in individual selling model, which in turn decreases sales team members' task performance and customer loyalty, supporting a full mediation model. Deep acting was not linked to emotional exhaustion but directly and more powerfully increases team members' task performance than in individual selling model.

Figure 2. Results of Multi-level Modelling Analysis

Note: N = 229 * $p < .05$. *** $p < .001$.

This study highlights the impact of deep acting and surface acting in retail sales team. It warns managers to notice the fake displays and provide suggestions on how to build and manage emotional labor strategies for sales teams. This study extends emotional labor effect from the individual perspective to the team perspective. Our findings indicate that there are some differences between the mechanism of emotional labor in the individual-based selling model and the mechanism of emotional labor in team-based selling model.
