FOREWORD

The Annual Conference of the EuroMed Academy of Business aims to provide a unique international forum to facilitate the exchange of cutting-edge information through multidisciplinary presentations on examining and building new theory and business models for success through management innovation.

It is acknowledged that the conference has established itself as one of the major conferences of its kind in the EuroMed region, in terms of size, quality of content, and standing of attendees. Many of the papers presented contribute significantly to the business knowledge base.

The conference attracts hundreds of leading scholars from leading universities and principal executives and politicians from all over the world with the participation or intervention of Presidents, Prime Ministers, Ministers, Company CEOs, Presidents of Chambers, and other leading figures.

This year the conference attracted about 210 people from over 37 different countries. Academics, practitioners, researchers and Doctoral students throughout the world submitted original papers for conference presentation and for publication in this Book. All papers and abstracts were double blind reviewed. The result of these efforts produced empirical, conceptual and methodological papers and abstracts involving all functional areas of business.

ACKNOWLEDGEMENT

Many people and organizations are responsible for the successful outcome of the 12th Annual Conference of the EuroMed Academy of Business. Special thanks go to the Conference Co-Chairs Prof. Stamatis Angelopoulos (International Hellenic University) and Prof. Christos Floros (Hellenic Mediterranean) for accomplishing an excellent job.

It is acknowledged that a successful conference could not be possible without the special co-operation and care of the Track Chairs and Reviewers for reviewing the many papers that were submitted to this conference. Special thanks to the Session Chairs and Paper Discussants for taking the extra time to make this conference a real success.

The last but not the least important acknowledgment goes to all those who submitted and presented their work at the conference. Their valuable research has highly contributed to the continuous success of the conference.

TABLE OF PAPERS

COMPLEMENTARY ASSETS, ENVIRONMENTAL STRATEGIES AND SMES PERFORMANCE	31
<i>Anagnostopoulou, Evgenia; Eleftheriadis, Iordanis</i>	31
THE IMPACT OF BEHAVIORAL INCONSISTENCIES ON STOCK RETURN: A THEORETICAL FRAMEWORK.....	44
<i>Attia, Silvia¹; Sapuric, Svetlana²; El Gazzar, Sara¹</i>	44
ENHANCING THE CULTURE AND CREATING VALUE FOR THE TERRITORY THROUGH OPEN INNOVATION: A CASE STUDY	58
<i>Baima, Gabriele¹; Santoro, Gabriele¹;Ferraris, Alberto²</i>	58
EDUCATIONAL IMPACT ON OLDER ADULTS' WELL-BEING: A LOCAL CASE FOR GENERAL CONCLUSIONS.....	69
<i>Barysheva, Galina A.¹; Mikhalchuk, Alexander A.¹; Kåreholt, Ingemar ²; Casati, Fabio ³; Nedospasova, Olga P.¹; Terekhina, Lyudmila I.¹</i>	69
THE LINK BETWEEN INSTITUTIONAL FACILITATORS AND GLOCALISATION: THE MEDIATING ROLE OF INNOVATION IN TRANSITIONAL ECONOMIES.....	85
<i>Bašić, Maja</i>	85
AN ANALYSIS OF UK ANDERSEN CLIENTS PRE- AND POST ANDERSEN DEMISE: WHERE HAVE THEY GONE AND DID THEY PAY MORE?.....	105
<i>Basioudis, Ilias</i>	105
ANALYZING BASIC COMPONENTS AND CONTEMPORARY FEATURES OF DEPOSIT INSURANCE: EVIDENCE FROM UKRAINE	124
<i>Berezina, Olena¹; Honcharenko, Iryna¹; Servatynska, Inna¹; Berezna, Lesya¹; Kravchenko, Olha²</i>	124
SMART ENERGY COMMUNITY AND COLLECTIVE AWARENESS: A SYSTEMATIC SCIENTIFIC AND NORMATIVE REVIEW	139
<i>Ceglia, Francesca¹; Esposito, Paolo²; Sasso, Maurizio¹</i>	139
CROSS CULTURAL INFLUENCES UPON PURCHASE INTENTIONS: THE INFLUENCE OF THE COUNTRY OF ORIGIN (COO).....	150
<i>Cheng, Min¹; Halliburton, Chris²</i>	150
ENTREPRENEURIAL CREATIVITY IN SOCIO-ECONOMIC CONTEXT	164
<i>Czarczyńska, Anna</i>	164

TO FORBEAR OR NOT TO FORBEAR: THIS IS THE QUESTION!	174
<i>De Vincentiis, Paola</i>	174
COMPETITIVE ADVANTAGE THROUGH THE USE OF HEALTHY SOLUTIONS IN ROMANIA	190
<i>Dinu, Marinel Cornelius¹; Goga, Nicolae²</i>	190
THE VIRTUAL COMMUNITY'S MOTIVATIONAL SYSTEM TO ENGAGE FIRMS INTO SUSTAINABILITY STRATEGY. THE ITALIAN AGRIFOOD SECTOR	197
<i>Fait, Monica¹; Scorrano, Paola¹; Iaia, Lea²; Cavallo, Federica¹; Maizza, Amedeo¹</i>	197
WINE TOURISM SERVICES AS COMPETITIVE FACTOR FOR DIRECT SALES DEVELOPMENT - EVIDENCE FROM ITALY	214
<i>Festa, Giuseppe¹; Rossi, Matteo²; Panahov, Tariyel³; Benvenuti, Paolo⁴</i>	214
SOCIO-DEMOGRAPHIC FACTORS AND ONLINE SHOPPING FOR FOOD AND BEVERAGE: AN ANALYSIS OF ITALIAN CONSUMERS.....	225
<i>Finotto, Vladi; Mauracher, Christine; Procidano, Isabella</i>	225
THE LEVEL OF PROXIMITY OF LATIN COUNTRIES IN TERMS OF CUSTOMER'S EXPECTATIONS ABOUT SERVICES: APPLICATION TO THE HOTEL SERVICE	240
<i>Franco, Mara¹; Meneses, Raquel²</i>	240
UNDERSTANDING THE DONATING MIND & OPTIMIZING MESSAGING – PUBLIC HOSPITALS	254
<i>Gabay, G.¹; Moskowitz, H.²; Gere, A.³</i>	254
THE ROLE OF CIRCULAR ECONOMY TO IMPROVING UPON THE ECONOMIC GOVERNANCE IN ROMANIA	268
<i>Gabroveanu, Janina Mirela; Asadi, Rahil</i>	268
INTANGIBLE ASSETS – INFLUENCE ON THE “RETURN ON EQUITY ON MARKET VALUE” (S&P100 INDEX)	278
<i>Garcia y, Jair¹; Lopes, Jose²; Nunes, Alcina³</i>	278
PATH DEPENDENT EXPLANATIONS OF A CITY'S CLEANLINESS ACHIEVEMENTS.....	292
<i>Garg, Shivangi¹; Garg, Shaaryana²; Garg, Swapnil³</i>	292
EXAMINING THE INFLUENCE OF EMOTIONAL INTELLIGENCE ON STUDENTS' BURNOUT	304
<i>Georgiou, Dimitra Ap.; Androulakis, George S.</i>	304

ANALYSING FACTORS AFFECTING BURNOUT IN UNIVERSITY STUDENTS: THE PHENOMENON OF DEPERSONALISATION	317
<i>Georgiou, Dimitra Ap.; Androulakis, George S.</i>	<i>317</i>
DELIVERY EXCELLENCE THROUGH PROCESS IMPROVEMENT AND CHANGE MANAGEMENT	330
<i>Gheta, Madalina Ionela</i>	<i>330</i>
THE ENTREPRENEURS' PROPENSITY TO ADOPT ELECTRIC MOBILITY IN THE SHORT FOOD SUPPLY CHAIN.....	336
<i>Giacomarra, Marcella; Tulone, Antonio; Crescimanno, Maria; Galati, Antonino.....</i>	<i>336</i>
THE MEDITERRANEAN'S GOLD: WHICH COMMERCIAL PROSPECTS FOR THE THUNNUS THYNNUS IN ITALY?	351
<i>Giacomarra, Marcella; Crescimanno, Maria; Siggia, Dario; Tulone, Antonio; Galati, Antonino</i>	<i>351</i>
PERFORMANCE OF BIG DATA FIRMS AND THE INFORMATION PRIVACY LAW	362
<i>Gibilaro, Lucia¹; Mattarocci, Gianluca²; Mihai-Yiannaki, Simona³.....</i>	<i>362</i>
SUSTAINABILITY OF COW FARMING SYSTEMS AS AFFECTED BY THE TYPE OF THE FARMS AND THE FARMER'S PROFILE.....	375
<i>Gourdouvelis, Dimitrios¹, Tsiouni, Maria², Mitsopoulos P., Aggelopoulos, Stamatis³</i>	<i>375</i>
ONLINE NEWS RECOMMENDATIONS CREDIBILITY: THE TIE IS MIGHTIER THAN THE SOURCE	386
<i>Hayat, Tsahi; Samuel-Azran, Tal.....</i>	<i>386</i>
DOES THE SIGNAL GAP INDICATE A GROWING RISK OF ECONOMIC RECESSION?.....	402
<i>Hronová, Stanislava¹; Hindls, Richard²; Marek Luboš²</i>	<i>402</i>
PROFITABILITY AND WINE PRODUCTION COMPANIES DURING TEN YEARS: WHAT'S THE ISSUE?.....	414
<i>Iovino, Felicetta</i>	<i>414</i>
GENERATION ENERGY COMPANIES AND ITS FINANCIAL DYNAMICS DURING TEN YEARS	424
<i>Iovino, Felicetta</i>	<i>424</i>
PROFITABILITY STRUCTURE OF TRAVEL AGENCIES AND TOUR OPERATORS DURING TEN YEARS	433

<i>Iovino, Felicetta</i>	433
NETWORK-BASED INCUBATORS: AN INTRODUCTION TO THE CASE OF I2C AND RESEARCH AGENDA	443
<i>Iscaro, Valentina¹; Castaldi, Laura²; Joshi, Rigved³; Turi, Claudio²</i>	443
DEVELOPING ATTRACTING DESTINATIONS FOR GENERATION Z BASED ON DESIRED DESTINATION COMPONENTS.....	457
<i>Kamenidou, Irene; Mamalis, Spyridon; Paolidis, Stavros; Bara, Evangelia-Zoi</i>	457
FOSTERING SUSTAINABILITY IN TOURISM SUPPLY CHAINS: A QFD DECISION FRAMEWORK	468
<i>Kamvysi, Konstantina¹; Andronikidis, Andreas¹; Georgiou C., Andreas²; Gotzamani, Katerina¹</i>	468
LEARNING AS AN OUTCOME OF DYNAMIC CAPABILITIES IN CASE OF STRATEGIC RENEWAL	478
<i>Karagouni, Glykeria¹; Karagiannis, Antonis²</i>	478
IS THE FUTURE GENERATION OF GREEK CONSUMERS WILLING TO INVEST IN RENEWABLE ENERGY?	497
<i>Karasmanaki, Evangelia; Tsantopoulos, Georgios</i>	497
CAN GRATITUDE INCREASE LOYALTY?	511
<i>Kirse, Sigita; Dikcius, Vytautas; Adomaviciute, Karina</i>	511
CASH HOLDINGS, CORPORATE PERFORMANCE AND VIABILITY OF GREEK SMES.....	525
<i>Koronios, Konstantinos¹; Dimitropoulos, Panagiotis¹; Thrassou, Alkis²</i>	525
A CONTEMPORARY SPORT SPONSORSHIP EFFECTIVENESS MODEL: SCALE DEVELOPMENT AND VALIDATION	533
<i>Koronios, Konstantinos¹; Dimitropoulos, Panagiotis¹; Kriemadis, Athanasios¹; Papadopoulos, Andreas¹; Thrassou, Alkis²</i>	533
UNDERSTANDING THE IMPACT OF SOCIAL COMMERCE COMPONENTS ON CONSUMERS' PURCHASE DECISION-MAKING PROCESS: A RESEARCH MODEL.....	539
<i>Kutabish, Saleh; Soares, Ana</i>	539
EXPLORING THE NEED FOR CLINICAL LEADERSHIP DEVELOPMENT. A CROSS NATIONAL STUDY	559
<i>Kyriakidou, Niki; Papagiannopoulos, Kostas²; Pierrakos, George; Turner, Paul; Beech, Nick</i>	559

PREPARATION FOR EXPATRIATION: DO MILLENIALS NEED OTHER CULTURAL TRAINING AND DEVELOPMENTS?	571

BOOK OF CONFERENCE PROCEEDINGS

COMPLEMENTARY ASSETS, ENVIRONMENTAL STRATEGIES AND SMES PERFORMANCE

Anagnostopoulou, Evgenia; Eleftheriadis, Iordanis

Dept. of Business Administration, University of Macedonia, Thessaloniki, Greece

ABSTRACT

The aim of this study is to present the conceptual framework for examining the complementary assets of SMEs that allow them to successfully implement environmental strategies. These assets include innovativeness, environmental collaboration and entrepreneurial attitude. We propose that SMEs, which are innovative and collaborate with their suppliers and customers on the development of environmental-friendly products, are more prone towards adopting environmental strategies than their counterparts. Moreover, the perceptions of the owners of SMEs regarding the adoption of environmental strategies affect their decisions on implementing these strategies. Finally, the impact of environmental strategies on the internationalization, competitiveness and corporate performance of SMEs are discussed. SMEs that adopt environmental strategies are expected to have increased corporate performance, higher competitiveness than their counterparts, and enhance international activity. The first part of this study is dedicated in presenting the above conceptual framework. The second part presents the environmental strategies adopted by SMEs and focuses on the research tools and methods needed to validate our research hypotheses.

Keywords: Environmental Strategy, SMEs, Innovativeness, Environmental Collaboration, Entrepreneurial Attitude, Corporate Performance, Competitiveness, Internationalisation.

INTRODUCTION

Small and Medium Enterprises (SMEs), which form the backbone of the EU's economy were severely affected by the 2008 financial crisis. Regarding Greek SMEs, their number declined by 7,1% from 2009 to 2014, while the number of employees in these enterprises decreased by 10,6%. In 2016, almost all member states recorded growth in SME employment and increase in value added (Annual Report on European SMEs, 2017). However, according to the same report, Greece, along with Croatia, Cyprus, Italy, Portugal and Spain have not yet recovered from the financial crisis, with regard to the number of SME enterprises, SME employment and value added. Based on the above, it is important to examine the characteristics of those SMEs that have endured the crisis as well as those strategies that can enhance the performance of SMEs.

Moreover, during the last two decades, SMEs have been under increasing pressure to improve their environmental performance, which has prompted many of them to adopt environmental strategies (Revell et al., 2010). In this context, the benefits of developing environmental strategies have often been the subject of scientific research, according to which green initiatives can improve not only the environmental performance of enterprises (Lenox and King, 2004, Florida and Davison, 2001) but also their corporate performance through the creation of sustainable competitive advantages (Al-Najjar and Anfimiadou, 2011; Lucas, 2010). While existing literature includes several studies on the relationship between SMEs environmental strategies and corporate performance, these studies are concerned with individual case studies (Sroufe et al., 2002). In addition, no potential factors that affect a company's ability to develop successful SMEs environmental strategies have been identified. From a dynamic perspective, some complementary assets may be required to successfully implement environmental strategies (Kerr, 2006), such as the ability to innovate and to collaborate.

The aim of this study is to record the environmental strategies employed by SMEs and to present the conceptual framework, the research tools and the methods for examining the complementary assets of SMEs that allow the successful implementation of these strategies. These assets include innovativeness, environmental collaboration and entrepreneurial attitude. Finally, the impact of environmental strategies on the internationalization, competitiveness and corporate performance of SMEs will be discussed. In the next section, we present our conceptual framework. Afterwards, we analyse the methods and the research tools necessary for analysing and validating our research hypotheses.

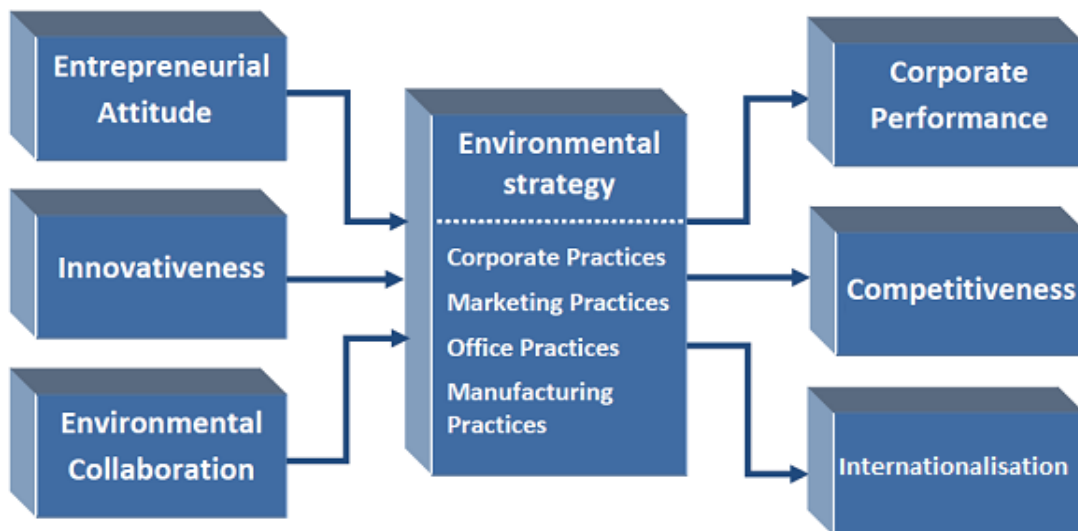

FIGURE 1. Conceptual Research Framework

CONCEPTUAL FRAMEWORK

As we have discussed above, the aim of the research is to present the factors that affect the adoption of environmental strategies in SMEs. We propose that an environmental oriented entrepreneurial attitude, corporate innovativeness and environmental collaboration positively affect the adoption environmental strategies. Finally, we propose that the adoption of environmental strategies positively affects corporate performance, competitiveness and corporate internationalisation. A graphic representation of the proposed research framework is presented in Figure 1. The rest of this section is dedicated into discussing the relationship between the variables of the research framework.

Entrepreneurial Attitude and Environmental Strategy

While empirical evidence shows that larger companies are increasingly integrating environmental strategies into their core business strategies, previous surveys have shown that SMEs are lagging behind in this area. Many SMEs owners are not sufficiently aware of the environmental impact of their business, they do not have the tools and resources to deal with environmental problems, and they believe that taking environmental action or adopting environmental practices has a great cost and little benefit to their business (Hillary, 2004; Revell et al., 2010). However, over the past decade, the media exposure of environmental problems, the social pressure for environmental protection and the focus of policy makers on tackling environmental problems have prompted many SME owners to think more closely about the environmental impact of their businesses. The aim of study is to examine whether the perceptions of the owners or senior executives of SMEs affect the extent to which they promote the adoption of environmental strategies. Based on the above, the following research case is formulated:

H₁: An environment-oriented entrepreneurial attitude is positively related to the adoption of environmental strategies in SMEs.

Innovativeness and Environmental Strategy

Innovation is a crucial factor in achieving and maintaining a competitive advantage. Global research has focused on identifying the determinants of innovation (Lederman, 2010). The present study examines the impact of innovativeness on the successful implementation of environmental strategies. The ability to innovate requires companies to adopt modern business processes and to keep track of technological developments in their external environment. Innovative businesses spend more resources on research and development activities and are usually the first to import new technologies from abroad (Lederman, 2010). Moreover, an innovative business culture fosters internal communication and supports "innovative" executives (Berchicci and Bodewes, 2005).

Finally, companies with innovative capabilities perceive environmental strategies as another source of innovation (Crowe and Brennan, 2007; Berchicci and Bodewes, 2005), providing a strong incentive to

implement such strategies. Also, the ability of an enterprise to develop innovative business processes is positively related to the implementation of environmental business strategies, especially those focusing on the design and development of environmentally friendly products and the elimination of hazardous materials used as inputs into the production process (Dangelico and Pontrandolfo, 2015). The following hypothesis is thus formed:

H₂: Innovativeness is positively related to the adoption of environmental strategies in SMEs.

Collaboration and Environmental Strategy

Although the majority of collaborative efforts are usually aimed at enhancing industrial performance, inter-company relationships have also proved effective in adopting environmental strategies (Florida, 1996). Businesses often describe these strategies as a consequence of wider collaborative efforts. Collaboration can offer companies new opportunities and facilitate the diffusion of know-how to solve problems between the parties involved. Research also suggests that relationships with suppliers influence the adoption of innovative environmental technologies (Geffen and Rothenberg, 2000). For example, many companies have adopted environmental practices, such as re-designing their products and their production processes, with the help of their supply chain partners (Lee and Kim, 2011). These joint efforts accelerate solutions, reduce costs, drive productivity growth, improve environmental performance, and enhance economic performance (Christmann and Taylor, 2002).

Also, resolving environmental issues in collaboration with customers or suppliers can be faster, cheaper and more effective if businesses can successfully use communication channels and gain knowledge and experience that translate into green business strategies (Lee and Kim, 2011; Sharfman et al., 2009).

Therefore:

H₃. Environmental Collaboration is positively related to the adoption of environmental strategies in SMEs.

Environmental Strategy and Corporate Performance

According to Dangelico and Pontrandolfo (2015), the successful implementation of environmental business practices, especially those focusing on energy efficiency and pollution reduction, has a positive impact on corporate performance. Additionally, Al-Najjar and Anfimiadou (2012) also confirm that eco-efficient firms exhibit a higher market value than those lacking environmental strategies. Furthermore, Nakao *et al.* (2007) have shown that a firm's environmental performance has a positive significant impact on its financial performance and vice versa, and estimate that increasing environmental management scores could lead to an increase in a firm's intangible assets in the long-run.

Nevertheless, the relationship between business development and the implementation of environmental strategies is not always clear, especially for SMEs (Simpson et al., 2004). Although there are many business examples that have succeeded in successfully implementing such strategies, these cases are individual and in different industries (Sawhney and Jose, 2003). The aim of the proposed research is to examine the relationship between the adoption of environmental strategies in SMEs and the development of these enterprises. Considering the above we can assume the following:

H₄: The adoption of environmental strategies is positively related to corporate performance.

Environmental Strategy and Competitiveness

Firms have devoted significant resources to the development and implementation of environmental strategies in an effort to control the negative impacts of their business activities on the natural environment. Therefore, it is important to examine the impact of these actions on corporate performance, i.e. whether they put additional cost burdens that cannot be offset by the firm's economic performance or whether they improve the firm's overall corporate performance, for example, through the adoption of energy efficient technologies that reduce the total cost of production or the development of differentiated and environmentally friendly products for which customers are willing to pay a higher price (Porter and van der Linde, 1995; Ruf et al., 2001). Regarding SMEs, Leonidou et al. (2017) have found a positive and significant relationship between green business strategies and competitive advantage regarding cost savings, product/service differentiation, etc. while Jorge et al. (2015) have also found that environmental performance has a positive, direct and significant influence on competitive performance. Based on the above we formulate the following hypothesis:

H₅: The adoption of environmental strategies is positively related to corporate competitiveness.

Environmental Strategy and Internationalisation

According to the Hellenic Federation of Enterprises, internationalisation is the main driver of SME success. Greek small enterprises are mainly importers of goods and services. However, during the last years increased export activity has been reported in medium-sized enterprises. Specifically, in the period 2010-2014, the increase in exports was 40% (from € 4bn to € 5.6bn) while the deficit in the trade balance of SMEs decreased from €15.7 billion to € 10.6 billion (SEV, 2017). The relationship between environmental performance and internationalisation has been examined in the context of international trade and the diffusion of environmental standards from developed countries to countries whose economies are in transition. The term "California Effect," developed by Vogel (1995), is often used to describe the phenomenon in which businesses in developing countries may tighten the standards of their products as a result of adopting the standards of their trading partners in developed countries. Additionally, by adapting their own production standards to standards of the country to which they

export their products, firms are able to maintain and expand their market share. Consequently, the adoption of environmental strategies has a direct impact on the internationalisation of businesses by giving them access to markets of developed countries whose consumers are often sensitive to environmental issues. Based on the above we expect that:

H₆: The adoption of environmental strategies is positively related to corporate internationalisation.

RESEARCH TOOLS AND METHODS

Measuring the Variables

The aim of this study is to discuss the impact of environmental strategies on the competitiveness, internationalization and corporate performance of Greek SMEs. A competitive advantage is defined as the company's ability to maintain its returns at a better level than its competitors and particularly whether the company's customers are willing to pay higher prices for its products / services than that of competitors'. Besides, we propose that customer satisfaction and product quality compared to that of the company's competitors should also be examined as measures of competitiveness (Madueno et al., 2016). Moreover, since SMEs were critically affected by the 2008 crisis, the ability of the company to maintain a market presence in times of crisis should also be taken into account (Duffett et al., 2018). Regarding corporate performance, in addition to key performance indicators such as sales growth, profits and market share, we also take into consideration factors such as increased customer satisfaction and product quality (Jorge et al., 2015; Ko and Liu, 2017; Bagur-Femenias et al., 2013; Cantele and Zardini, 2018). Finally, with regard to internationalization, we propose that internationalization is measured based on the number of countries to which the products are exported, the proportion of international sales to total sales, the development of the company's network of partners as well as the company's relations with its partners abroad (Ruzzier et al., 2007; Dasi et al., 2015; Chetty et al., 2014). For a detailed presentation of the measurement of the above variables as please refer to Table 1.

Variable Measures	Research References
Corporate Performance	
Sales have increased over the last two years.	López-Pérez et al. (2017); Jorge et al. (2015); Ko and Liu (2017); Bagur-Femenias et al. (2013); Cantele and Zardini (2018)
Profits have increased over the last two years.	
Market share has increased over the last two years.	
Customer satisfaction has increased over the last two years.	
Quality of our products/services has increased over the last two years.	
Company's image has improved over the last two years.	
Competitiveness	
Customer satisfaction is higher than that of competitors.	Bagur - Femenias et al. (2013); Duffett et al. (2018); Madueno et al. (2016); Dangelico and Pontradolfo (2015); Brammer et al. (2012); Jorge et al. (2015)
Customers are willing to pay a price premium for our products.	
The quality of our products is better than that of our competitors.	
Sales have increased more than those of competitors.	

Company's ability to maintain a market presence in times of crisis is higher than that of competitors. Company is considered a leader in the market.
Internationalisation
The number of countries to which you export your products/services has increased over the last two years. The proportion of international sales to total sales has increased over the last two years. The company's networks and relationship with its partners abroad have increased over the last two years. The company's international activities have been successful over the last two years.

Ruzzier et al. (2007); Dasi et al. (2015); Chetty et al. (2014); Bausch and Krist (2007);Torkkeli et al. (2012)

TABLE 1. Description of Variable Measures for Corporate Performance, Competitiveness and Internationalisation

FIGURE 2. Corporate Environmental Strategies

Environmental strategy can be described as the systematic business approach to reducing or eliminating the damage created by a company's activities in the natural environment in which it operates. The adoption of environmental strategies is also affected by market and competitor pressure (Kolk and Pinkse, 2008; Christmann and Taylor, 2006) and concerns: (i) the effects of energy prices on the production costs that provides incentives for firms to promote energy efficiency or reduce waste, and (ii) the diversification of products and services with higher social and environmental characteristics and (iii) the environmental and social requirements in the supply chain, associated with specific standards of operation and corporate behavior.

Variable Measures	Research References
Corporate Practices	
Our firm conducts environmental audits at regular intervals.	Brammer et al. (2012); Jorge et al. (2015); Madueno et al. (2016); Hofmann et al. (2012); Revell et al. (2010)
Our firm has a written environmental policy.	
Our firm sets specific environmental goals every year.	
Our firm has an environmental management system at place.	
Marketing Practices	
Our firm is involved in environmental community activities.	Brammer et al. (2012); Madueno et al. (2016); Duffett et al. (2018)
Our firm advertises its environmental efforts.	
Our firm publishes annual environmental reports.	
Office Practices	
Our firm has an in-home paper and/or plastic recycling program.	Revell et al. (2010); Brammer et al. (2012); Bos-Brouwers (2010)
Our firm conducts special training programs on environmental issues for employees.	
Our firm has a car-pooling scheme for employees.	
Our firm uses cleaning products that have reduced harmful effects for the environment.	
Our firm encourages energy efficiency in the offices (turn down unnecessary heating/cooling; use energy efficiency lights; monitor energy and water use).	
Manufacturing Practices	
The amount of waste that our firm produces has been decreasing over the last two years.	Revell et al. (2010); Brammer et al. (2012); Cantele and Zardini (2018); Testa et al. (2016); Jorge et al. (2015); Bagur-Femenias et al. (2013); Dangelico and Pontrodolfo (2015); Bos-Brouwers (2010); Madueno et al. (2016)
The amount of waste recycled has increased over the last two years.	
Our firm has increased the energy efficiency of the production process over the last two years.	
The consumption of water has decreased over the last two years.	
Our firm has reduced harmful emissions over the last two years.	
Our firm has reduced the carbon intensity of the production process over the last two years.	

TABLE 2. Description of Variable Measures for Corporate Environmental Strategies

In response to above, companies have implemented various environmental strategies. In the framework of the proposed research study we will divide these strategies into four categories: *Corporate Practices*, *Marketing Practices*, *Employee Practices*, and *Manufacturing Practices*. The environmental strategies that are implemented at the highest corporate level are included into the *Corporate Practices* category. *Marketing practices* include the environmental strategies that are closely related corporate social and environmental responsibility. *Office practices* include strategies that are concerned with the training of employees and implementation of environmental initiatives that are related to the daily office operational activities, not to the production or manufacturing processes employed by the company. On the contrary, *Manufacturing Practices* includes all strategies related to the production process; such are waste and emissions reduction or energy efficiency. For a graphic presentation of these strategies please refer to Figure 1. For a detailed presentation of the measurement of the above variables as please refer to Table 2.

As mentioned above, this study will also examine the complementary assets of enterprises that determine the implementation and success of these environmental strategies. That includes

innovativeness, entrepreneur attitude and environmental collaboration. In the context of this study, innovation will involve the development of environmentally friendly products, e.g. products that can be converted, reused or recycled, as well as the development of production processes that reduce the environmental footprint of a company (Brammer et al., 2012; Revell et al., 2010; Cantele and Zardini, 2018, Testa et al., 2016). Entrepreneur attitude involves the perceptions and beliefs of the company's owners or senior management. In the context of this research we will examine the perceptions of SMEs owners regarding environmental protection and whether the adoption of environmental strategies can have positive effects on their company, e.g. whether reduction in the environmental impact of a company can lead to a significant reduction in its operating costs (Testa et al., 2016; Revell et al., 2010; Brammer et al., 2012; Cassells and Lewis, 2011; Leonidou et al., 2017). Finally, as environmental collaboration, we examine the ability of the company to collaborate with customers and suppliers for developing environmentally friendly products, setting environmental standards and providing information (Testa et al., 2016; Cantele and Zardini, 2018). For a detailed presentation of the measurement of the above variables as please refer to Table 3.

Variable Measures	Research References
Entrepreneur Attitude	
Environmental issues should be a priority in business management.	Testa et al. (2016); Revell et al. (2010); Brammer et al. (2012); Cassells and Lewis (2011); Leonidou et al. (2017)
My business is too small to have an environmental impact.	
I believe in business as usual leaving the government to tackle environmental issues.	
Reducing the firm's impact on the environment can also lead to a significant reduction in costs.	
Our firm can enter new markets by adopting environmental strategies.	
Our firm can increase market share by making our current products more environmentally friendly.	
Reducing the environmental impacts at our firm's activities will lead to a quality improvement in our products and processes.	
Being environmentally friendly can increase profits.	
Environmental Collaboration	
We collaborate with customers for the development of cleaner processes/recyclable products/use of environmental friendly materials	Testa et al. (2016); Revell et al. (2010); Torkkeli et al. (2012); Cantele and Zardini (2018); Hofmann et al. (2012)
We collaborate with suppliers for the development of cleaner products/processes/recyclable products/use of environmental friendly materials	
We set environmental standards for our suppliers	
We provide customers with the information needed to make sound purchasing decisions	
Innovativeness	
Our firm invests in R&D for environmental friendly products.	Brammer et al. (2012); Revell et al. (2010); Madueno et al. (2016)
Our firm designs products that can be re-used, repaired or recycled.	
Our firm designs/uses packaging that can be re-used or recycled.	
Our firm utilizes renewable energy wherever possible.	

TABLE 3. Description of variable measures for environmental attitude, collaboration and innovativeness

Proposed Survey Methodology

Based on the variable measures developed above, we will create a questionnaire divided in sections respective to the description of the measures we have presented. The questions that will be used to measure the variables will be of a closed type and will be formulated in such a way as to allow the use of Likert scales in their evaluation. At its initial stage, the questionnaire will be piloted in selected businesses where participants will be asked, in addition to answering questions, to assess whether the questions are helpful to measuring the variables. In this way a primary validation of the questionnaire will be achieved based on its content validity. Questionnaires will be sent via the use of an online platform that will allow survey participants to respond to the questionnaire electronically. Before sending the questionnaires, the company representatives will be contacted and asked whether they want to participate to the survey.

Sampling

The survey will focus on Greek SMEs that have "active" export activity according to the database of the Hellenic Exporters' Association. By "active" we mean that only companies with a web site translated into at least one foreign language will be included in the sample. In addition, the sectors to be included in the sample will be: Agricultural Products, Livestock Products, Fisheries, Forestry, Minerals / Metals, Energy Production, Nutritional Products, Drinks / Soft Drinks, Leather / Fur, Plastics, Chemicals / Paints, Paper, Medicines / Cosmetics / Medical Products. The above sector selection is in line with the categorization scheme used by the Hellenic Exporters' Association in its database. Based on a preliminary survey that has been conducted, the number of companies with the above characteristics is about 1700.

Data analysis

Before we use the data collected in survey to create the variables described above, we will conduct a construct validity check of the questionnaire based on the factor analysis method. This methodology allows us to check whether the questions we have included in the questionnaire are a valid measure of the variables they are called to measure. In this research, we are going to use *exploratory* factor analysis since our questionnaires have not been previously validated by other researchers. After the validity check, a statistical analysis of the reliability of the questionnaire will be performed based on the internal consistency method, which calculates in mathematical terms the degree of correlation between the questions used for the construction of the individual variables (Cronbach alpha coefficient). Reliability analysis indicates the extent to which repeating the same survey procedure yields the same results. Finally, the testing of the research hypotheses will be done using the Structural Equation Modeling

(SEM) methodology, which allows us to create an integrated model where the relationships between the variables will be clearly seen.

CONCLUSION

The aim of this study was to propose a conceptual framework for examining the complementary assets of SMEs that allow them to successfully implement environmental strategies. The complementary assets that were analysed were innovativeness, environmental collaboration and entrepreneurial attitude. We proposed that SMEs which are innovative and collaborate with their suppliers and customers are more capable in developing environmental strategies than their counterparts. Moreover, we claim that the perceptions of the owners of SMEs regarding environmental problems and green entrepreneurship affect their decisions on adopting environmental strategies. Finally, we discussed the impact of environmental strategies on the internationalization, competitiveness and corporate performance of SMEs. Based on previous research, we can expect that SMEs, which adopt environmental strategies, will have increased corporate performance, higher competitiveness than their counterparts, and enhanced international activity.

²Economics and Finance, University of Nicosia, Nicosia, Cyprus.

ABSTRACT

After the failure of the traditional asset pricing theories to portend and reflect real performance of markets, behavioral finance has emerged as a savior by highlighting the irrationality behind the unexplained trading behavior executed by investors. Vissing-Jorgensen (2003) documented behavioral finance achievement in asset pricing theories because of its ability to capture the variations in stocks prices which were not explained by traditional views like investor rationality and market efficiency. Also the analysis of the literature revealed that the behaviour of the individual investor has a great effect on the stock prices movements, consequently determining these variables can help in developing a stock pricing model by taking into consideration these variables with the existing asset pricing models. However, till now we are still apart from a complete psychological model describing and covering market anomalies or the behavioural variables that affect stock market prices, accordingly this study intends to bridge the knowledge gap missed by previous researchers and to move with behavioural finance branch from just being criticisms and thoughts against traditional model to a real applicable model.

Hence the aim of this paper is to propose a theoretical framework capturing the behavioral factors that have effects on the stocks' prices and investment decision making through applying a systematic review approach.

Keywords: Behavioral Finance, stock market, Behavioral factors.

INTRODUCTION

Until recently, understanding the basis on which the market participant react and make their investment decision remains a dilemma to researchers. This challenge has emerged after the failure of the classical financial theories in measuring the market behavior practically. Whereas, the classical theories are based on the main assumptions, that investors work on maximizing their utility, they are homogenous, rational or to some extent rational and they use all the available information to make their decision which are equally known to every participant in the market. Also, the traditional

thoughts assume that the decision making process requires making the optimal choice. For example, the Efficient Market Hypothesis expects the investors to act properly to any new information and that the stock prices reflect precisely all the available information, and in case the market deviates away from the fundamental values the arbitrage process will return the prices back to its normal path (Komba, 2016). However, Barberis and Thaler (2003) declared that there are limits to arbitrage, clarifying that even if the arbitrage worked; the prices prediction may not work effectively. This criticism decreases the accuracy of the classical thoughts and led to the emergence of behavioral finance. Moreover, it has been emerged after proving the limited cognitive abilities and the bounded rationality owned by investors which affect their investment decision, and proving that investors' inappropriate and spontaneous actions are based on some biases and heuristics like risk aversion, optimism, framing, anchoring, mental accountancy and other deviations that lead to increase in the supply or demand for limited time and then mispricing some stocks (Ahmed, 2017). Accordingly, behavioral finance is a branch that explains the changes in the stock's prices as a result of investors' unintentional and spontaneous actions. It can be considered as a special mix between finance, economic, psychology and sociology (Ahmed, 2017). Despite that, we are still apart from a complete psychological model describing and covering the behavioural variables that affect stock market prices and investment decision making process (Polak, 2012). Therefore, the aim of this paper is to propose a theoretical framework capturing the behavioral factors that affect stocks' prices and investment decision making. This is achieved through conducting systematic review, which will gather all the relevant articles that investigated the effect of the behavioral aspects of investors and how these variables have affected the stock markets.

The remainder of the paper is organized as follow: section two covers the literature; section three covers the methodology employed, while the analysis and discussion are illustrated in section four. Finally, the conclusion is presented in section five.

LITERATURE REVIEW

The prominent economic approaches ignore the psychological part inherent in human behavior that human owns limited cognitive abilities and power in this crowded and quickly changing environment. The basic thought of behavioral finance is the concept of bounded rationality developed by Simon in 1957, which explains that the knowledge of all information and all possible outcomes is restricted and limited to the cognitive abilities of the investor, while there are doubts about the external and internal factors influencing the market. Then, Tversky and Kahneman on 1974 explained that investors do not have to gather all the information, as they depend on "rules of thumb" and the already available information to make the investment decisions easily and more quickly rather than

using complicated methods. Behavioral finance is able to capture the market anomalies which appear as a result of investors' deviation from the rational behavior to the cognitive biases like loss aversion, overconfidence, regret aversion and others as in Kahneman and Tversky (1979).

Vissing-Jorgensen (2003) documented behavioral finance achievement in asset pricing theories, as it is able to capture variations in stocks prices that were not explained by traditional views of the classical models like investor rationality and market efficiency. Also discussed that arbitrage done by rational investors may be unable to return prices back if it veers away because of the irrational behavior of investors, this phenomenon is explained as limit to arbitrage. While Kaplanski and Levy (2010) proved the negative influence of aviation accidents on stock return, especially the return of small and more volatile industries. These results validate that the negative mood resulting from the aviation accidents has a major effect on the investment decision making process. The effect was measured by \$60 billion dollar loss per aviation accident with actual loss reached \$1 billion. Also Cohen-Charash *et al.*, (2013) employed a study to determine the ability of investors' emotions to predict stock prices movement and proved that the collective mood indices formed has a predicting power in determining whether the stock increasing or decreasing trend will continue or not. The researchers' major contribution was proving that good mood is able to forecast the boost in NASDAQ prices while the bad mood is able to forecast the downtrend in NASDAQ prices.

The analysis of the literature revealed the practicing of investors to various cognitive biases and heuristics variables like: herding, overconfidence, framing, mental accountancy, gambler fallacy and others, (see for example: Amin *et al.*, (2009), Komba, (2016)), also proved that the behaviour of the individual investor has a great effect on the stock prices movements (Komba, 2016). The complete determination of these variables can help in building a theoretical framework that can be used in developing a more relevant behavioural model which could also be added to the already existing asset pricing models. However, no study till now proposed a complete behavioural model covering all the psychological variables that affect the investment decision making process (Polak, 2012) . Accordingly, this study intends to bridge the knowledge gap missed by previous researchers and reaches a widely common acceptable model about the behavioural variables that affect stock market return and investment decision making.

METHODOLOGY

A review was applied based on a systematic review approach using the following steps implemented from Tranfield *et al.* (2003).

Firstly: providing identification for the research need ended by defining the keys words.

Secondly: A broad scanning for the titles and abstracts of the derived citations is done while excluding the studies irrelevant with the present aim.

Thirdly: A strict screen of the remaining studies that passed the previous stage and selection of the most appropriate and relevant ones is done, followed by data extraction, whereas the selection criteria are described later in this section

Fourthly: Providing a summary for the synthesizing and reviewing the relevant articles ending by developing a theoretical framework.

The strategy followed in the systematic review is using an automated search; the following search terms and keywords were employed: "behavioural factors affecting stock return", "psychological factors affecting stock return", 'Investors' sentiment and stock market". While the used search engines were: EBSCO Host, Science Direct, SAGE journal, Emerald Insight and University of Nicosia database. Each of these search engines has its own search strategy; accordingly different search term sequences and methods were employed for each electronic database. This variety has its benefit in enhancing the possibility of including as much as possible relevant articles. Moreover, the choice of the mentioned search terms emanates from their sensitivity with the present research topic and since they represent the most well-known and used search engines by academic researchers, hereupon, this will minimize the possibility of missing any research papers that could be relevant with the aim of this paper.

As for the selection criterion of the accepted articles are according to the following criteria:

- Language: The paper must be written in English.
- Study topic: it is essential for the selected research papers to meet the aim of this study. Thus, the irrelevant studies were excluded.
- Time frame: Since the objective of this study is to develop a theoretical framework through collecting the articles that investigated the effect of investors' behavioral characteristics, the time period was set from the inception of behavioural finance concept in 1970 until 2018.
- Methodology: considering the articles that adopted both qualitative and quantitative methodology
- Quality assessment: to ensure the quality of the retrieved articles, the previous mentioned databases were employed as they include the most well-known and top ranked journals, also only the peer reviewed articles were chosen as relevant articles.

The running of the search engines resulted in 835 articles. Then a broad scanning for the titles and abstract of the derived citations, this resulted in 163 articles. Then the strict screening for the aim, methodology and findings for the articles that passed the previous stage was done resulting in 80 articles. The reviewing and the synthesizing of the reached 80 articles have yielded several phenomenon, heuristics and cognitive biases measured against stock market returns or against investors' decision making process. These variables are presented in the table 1.

Howard (2012) mentioned that the decision making process involves several characteristics that enable categorizing the variables into different schemas, which means that the variable can be categorized as either a bias for one researcher or as a heuristics for another, so it depends on researchers' point of view. Therefore, there is no a widely accepted or a standard way of classification found in the previous articles. This lack of standardization led to confusion, and reduced the potential for developing a complete behavioural model.

Accordingly this study proposes a categorization way for the reached variables with the aim of developing a psychological framework covering the behavioural factors that affect the investment decision making process. Whereas, the variables presented in table 1 are categorized into 3 different subcategories based on different perspectives then within each subcategory similar variables are merged and aggregated into one variable.

Variables	Number of articles that measured each variable
1. Social media sentiment(twitter , Facebook, Google trends)	6 articles
2. Investor sentiment	20 articles
3. negative social mood	2 articles
4. Investors' attention	2 articles
5. Herding behavior	11 articulated
6. Newspaper reports / news sentiment	2 articles
7. Gamblers fallacy	1 article
8. Optimism/ excessive optimism	5 articles
9. Overconfidence/ self confidence	13 articles
10. investors' local bias and home bias/ familiarity	3 articles
11. Risk tolerance	2 articles
12. Risk avoidance	2 articles
13. Sociability	1 article

Table (1): The behavioural variables extracted from the related articles

The next section will cover the critical analysis of the accepted articles and ends with the developed theoretical framework.

DISCUSSION

The categorization and consolidation are done based on the following steps.

Firstly: Integrating the repeated variables (like confidence and overconfidence).

Secondly: Assembling the variables that reflect similar meanings or used to measure same psychological effect but are presented in different terms (like pessimism and negative social mood).

Thirdly: Combining the variables that are interwoven or interrelated (like overconfidence and risk tolerance), then coming up with variables names, where the name of the variable is chosen either based on the most tested one in the accepted articles or according to the main variable that is triggering other variables.

The following figure represents the categorization and the consolidation of the extracted behavioural variables.

The explanation and justification for categorizing and merging the behavioural variables affecting stock market are presented below. The variables are divided into 3 subcategories which are Seasonality, Unconsciousness, and Neurological dimensions.

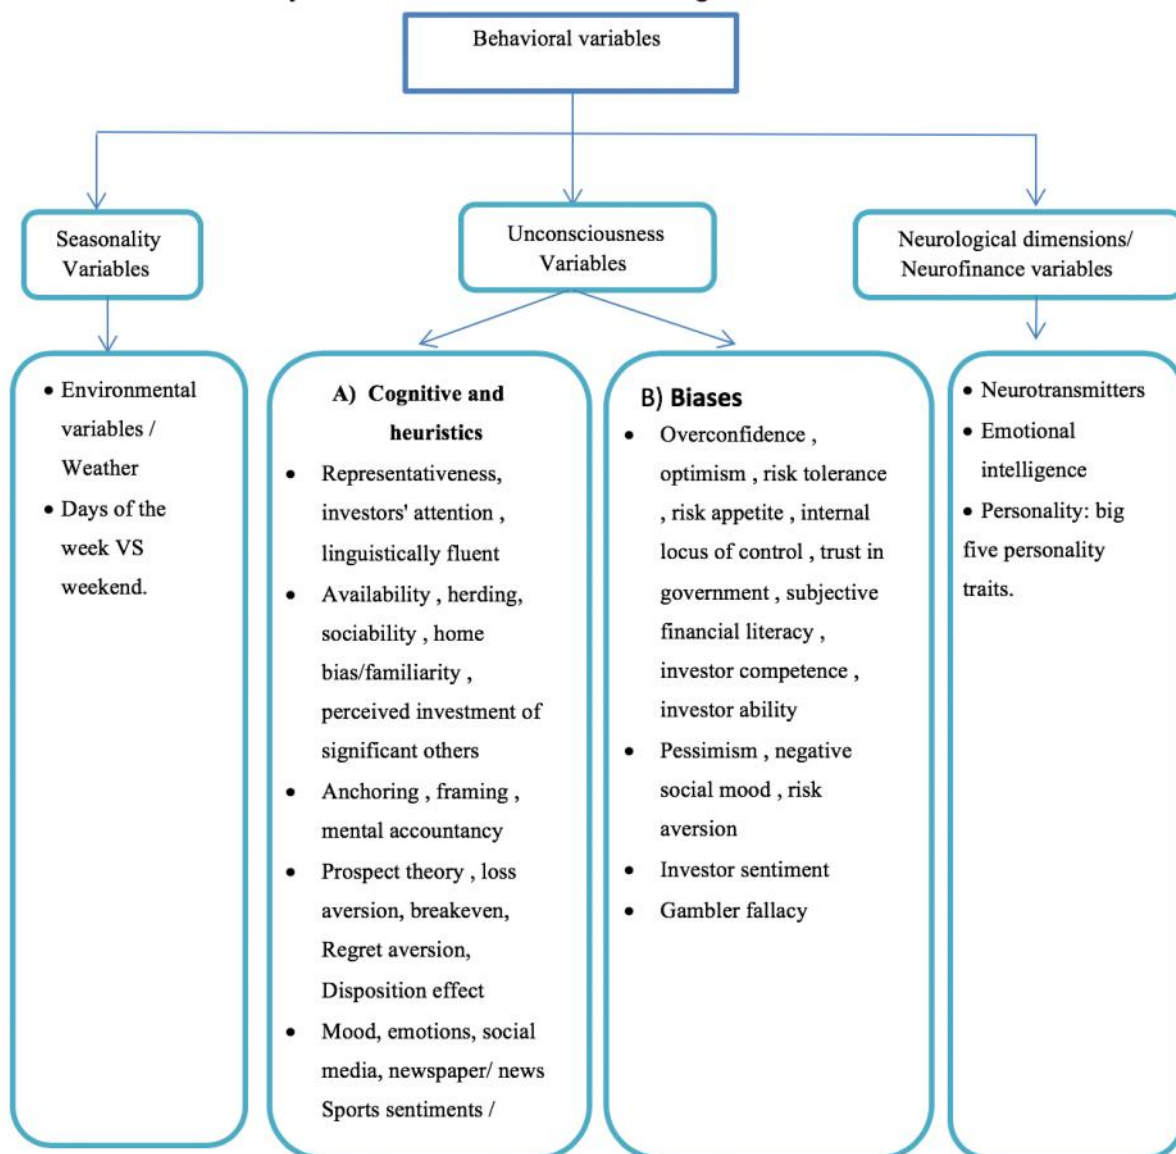

Figure 1: The categories of the behavioural variables affecting stocks' prices.

Seasonality variables:

- *Environmental variables / weather*: Sunshine, cloud cover, daylight, temperature and weather can have impact on investors' mood and accordingly can affect investment decision making. (Li and Peng, 2016) (Kimb *et al.*, 2015)
- *Days of the week vs. weekends*: This variable was examined over a longitudinal time series due to its relation with the investors' general mood (Kaplanski *et al.*, 2015). It is claimed that during weekdays stock market return is low and is high during weekends.

Unconsciousness variables:

Mercier and Sperber (2011) stated that unconsciousness is something inherent in humans mind affecting their behaviour and argued that both heuristics and biases can be categorized under investors' unconsciousness accordingly, it is divided into two subcategories heuristics/cognitive and biases variables which are presented in details in the following part.

- ***Heuristics and Cognitive variables:*** Cognitive abilities are the biggest restriction to reach the best decision rather than most pleasant one (Howard, 2012). While heuristics according to Gigerenzer and Wolfgang (2011) are a rule of thumb, it is an action plan that uses only part of the information available to make decisions easily and more quickly rather than using complicated methods, it is not aiming at reaching the optimal choice but to reach the best decision under the available restrictions. The following parts describe the variables categorized as heuristics and cognitive

- ***Representativeness, attention, linguistically fluent:***

Representativeness is a situation when decision makers' evaluate choices and make decision using cursory characteristics instead of using detailed information (Park and Sohn, 2013), also when investor focus his/her attention on specific information neglecting all other information without any bias (Chandra and Thenmozhi, 2017). In this case representativeness gives the same meaning as to investor attention which is described by Behrmann *et al.* (2004) "as a cognitive process refers to preferential processing for a selected aspect of a given sensory input"; this means that representativeness is triggered by investor attention. While linguistically fluent measures the investor focus and attention to early alphabet stocks rather than to the latter ones. This means that linguistically fluent is directed by investor attention and concentration that is at its peak for the first alphabetical letters and then decrease for the later ones.

- ***Availability, herding, sociability, home bias/familiarity, perceived investment of significant others***

Availability is defined as a situation when investor makes decision based on information that is easily recalled to his mind (Chandra and Thenmozhi, 2017) and when investor depends on information that is already available and intuitive, the easily accessible ones, the reminded or recently occurred events (Howard, 2012), (Redhead, 2011), (Park and Sohn, 2013). As for herding, it is the investor tendency to depend on others' decision instead of depending on his/her own judgment and analysis (Wong and Nwude, 2018). Accordingly, herding can be considered as a specific type of availability, since investor in this situation tend to rely on easily accessible information and is affected by the events that recently occurred or recalled to his/her mind. Whereas sociability and perceived investment of significant others are the same as herding since they represent the effect of society on investors decision and the dependence of investor mind on the already available information and dominant decisions. While home bias and familiarity, they also represent a specific type of availability since investor depends on

the available information about domestic and local stocks rather than searching for new information about international stocks.

▪ *Anchoring, framing, mental accountancy*

Anchoring is a heuristic variable occurs when investor is adhered to specific information and uses it as a reference for example, the stock initial price and historical prices (Chandra and Thenmozhi, 2017). Park and Sohn (2013) explained framing dependence and anchoring effects as a way of providing information in a form that has effect on the decision making process. While (Howard, 2012) defined framing as a situation when different specifications and descriptions for a one situation highlights different aspects of results. While Kooreman and Prast (2010) and Howard (2012) involved mental accounting as an example for the framing effects defining it as a kind of categorizing or framing funds in different ways while ignoring the fungibility of money. The above illustration can conclude that anchoring, framing and mental accounting are describing the same phenomenon.

▪ *Prospect theory, loss aversion, breakeven, Regret aversion, and Disposition effect*

Prospect theory was first introduced by Kahneman and Tversky on 1979; it defines situations when human overestimates losses than gains of the same amounts (Chandra and Thenmozhi, 2017). It is developed as a result of individual stimulation to prevent losses instead of achieving gains (Schilirò, 2012). Loss aversion gives the same meaning as it reflects investors' tendency to value loss more than gains, since a huge amount of pain is resulted from these losses (Redhead, 2011). Loss aversion according to Howard (2012) happens when investor is facing a situation of a sure loss from the beginning of the endowment so he/she has an option to hold investment until break even regardless of whether this will lead to good or bad results in the future. Howard's definition for loss aversion is matched with Wong and Nwude (2018) definition for breakeven which describes a situation when investor is insisting on overcoming losses by taking as much bets to return back to the breakeven position. While disposition effect measures investor willingness to realize gains but not losses, this phenomenon can be explained by prospect theory since the pain felt by investors from losses outweigh the joy of gains, accordingly investors decide to hold on losing stocks while selling winning stocks. As for Regret aversion, it is a heuristic phenomenon representing human action in a way that reduces feeling pain in case an adverse event occurred (Park and Sohn, 2013). Disposition effect can be considered as a decision aimed to avoid regret feelings in case an opposite event occurred since investor decide to sell the winning stock to avoid the remorse feeling in case the prices decrease while holding the losing stock aiming that its price increase.

▪ *Mood, emotions, social media, newspaper sentiment, fear, Sports sentiments / sports fan loyalty*

Nigam *et al.* (2016) considered sentiment as a dimension under heuristic and cognitive effects

and defined it as *"Physical manifestation of interaction and assimilation of five material senses associating them with or as something considered transcendental: feelings and emotions"*

Accordingly mood, emotions and fear are associated with it. As for social media and news sentiments there are a kind of expressing individual feelings and emotions, as now the social media can analyze investors feelings to anger, disgust, fear, joy, and sadness (Xu *et al.*, (2017). Also it was noticed that investor mood is affected by the results achieved by his/her favorite sports team which in turn will affect expected market return and the expected risk. Berument *et al.* (2013) found that the results of sports matches has a big effect on fans' mood and accordingly on their investment decisions.

– **Biases**

Biases are tendencies to engage in specific kinds of mistakes (Howard, 2012).

▪ ***Overconfidence, optimism, risk tolerance, risk appetite, internal locus of control, trust in government, subjective financial literacy, investor competence, Investor ability***

Overconfidence is the overestimation of individuals' capabilities, skills, knowledge and the accuracy of their estimates (Redhead, 2011). This definition is close to Chandra and Thenmozhi (2017) description to excessive optimism, presented as overstatement to one's own qualification induced by illusion of control. The same for internal locus of control which occurs when one is sure that a specific outcome will take place because of his/her own skills and capabilities (Rasheed *et al.*, 2018). Also subjective financial literacy indicates an overestimation of humans own knowledge (Sivaramakrishnan *et al.*, 2017), while investor competence refers to subjective competence owned by investor that will affect his / her decisions (Graham *et al.*, 2009). As for risk tolerance and risk appetite, they give the same meaning, also it was explained by Hardies *et al.* (2013) that risk taking is affected by the level of overconfidence and that they are interwoven. While Investor ability measures the extent to which the investor feels confident about personal abilities in making the right investment decision. The investors' ability increases by increase in the confidence level (Lathif and Aktharsha, 2016)

▪ ***Pessimism , negative social mood , risk aversion***

Pessimism is the opposite case of optimism which is always associated with negative social mood and risk aversion and caution (Redhead, 2011).

▪ ***Investor sentiment:*** Huang *et al.* (2014) stated that investor sentiment is composed of two elements optimism and pessimism. One of the ways for measuring investor sentiments is by using consumer confidence index. Duarte Neves *et al.* (2016) used Consumer Confidence Index (CCI) developed and published by University of Michigan to measure investor level of optimism and pessimism for the current and future economic situation. So this means that investor sentiment is an aggregation for optimism and pessimism.

▪ **Gambler fallacy:** It involves the mistaken belief that if something happened frequently in the past then the probability of its occurrence again in the future will decrease. So if a stock has been increasing in price for a long series of trading, investors may sell it, thinking that it is time for price to go down. This way of analyzing is incorrect as past event won't affect the future probabilities (Amin *et al.*, 2009)

– **Neurological dimensions (Neurofinance)**

Neurofinance is a new field that merge the neurobiology with the financial markets. Researchers awareness about Neurofinance started on 2005 accordingly it is considered the latest research area discussed with the aim of reducing future uncertainties and risks; it integrates neuroscience with behavioral and financial theories which will result in reaching better investment decision. The Neurological dimensions of finance are neurotransmitters, emotional intelligence and personality of investors (Ahmad, 2018).

▪ **Neurotransmitter:** The neurotransmitter has evolved as a result of the changes occurred in the financial system and the transition from normal investing to pure concentration on gain and loss (Ahmad, 2018). While according to Lodish and Zipursky, (2000) cited in (Ahmad, 2018), they are chemical signals that move from neuron to another in human's brain. Neurotransmitters composed of dopamine, serotonin, epinephrine and norepinephrine that are considered to be related to investors' behavior

▪ **Emotional intelligence:** It is humans' mind feeling (Mayer *et al.*, 2001). It measures individual's stimulation to invest; also it was proved that it has important relation with individual behavior like loss aversion, status quo bias and the endowment effect (Rubaltelli *et al.*, 2015). While Maccann *et al.* (2014) described emotional intelligence as the talent of determining and gathering the feelings needed to administer the thinking process also the feelings required to boost everyone power.

▪ **Personality traits:** Investment decision making process is affected by the level of confidence and risk tolerance that everyone possesses which in turn affected by personality traits (Ahmad, 2018). There are five personality features, Tauni *et al.* (2017) tested the effect of personality trait on trading behavior which are openness, consciousness, extraverted, agreeableness, and neuroticism.

The following figure shows the categorization of the extracted behavioural variables after merging and consolidation the same variables and naming them, where the name of the variable was chosen either according to the most tested one in the accepted articles or based on the main variable that is triggering other variables.

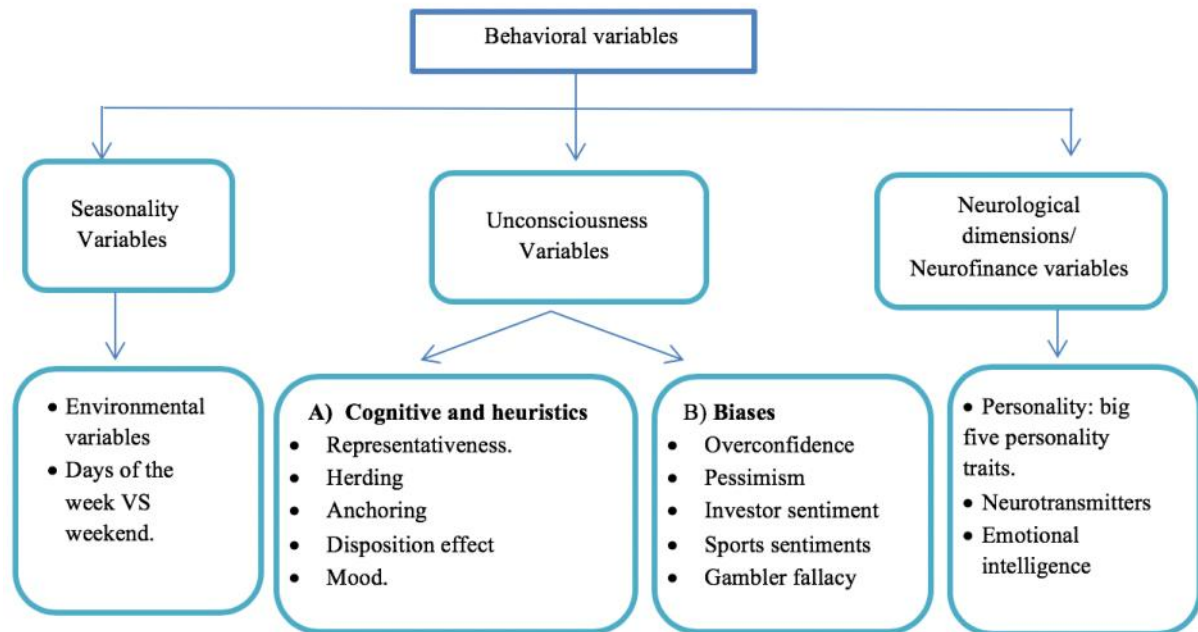

Figure 2: The theoretical framework of the behavioural categories and variables affecting stock return.

CONCLUSION

Behavioral finance is different from the classical traditional theories, it contradicts the thoughts that financial markets are rational and that it is always efficient (Polak, 2012). Most of the behavioral researchers' studies were opposing the idea of investors' rationality, ignoring the fact that there might be some reaction resulting from psychological factors or inherent characteristics and involving rational decision making as someone involved in loss avoidance situation (Kahneman and Tversky, 1979). This implies that the market may not be efficient with the full meaning of efficiency but might involve limited rationality actions that add value directly or not directly to historical data through the formation of market sentiment (Vissing-Jorgensen, 2003).

Based on the reviewing and the synthesizing of the accepted 80 articles, 41 variables were extracted; these variables represented several phenomenon, heuristics and cognitive biases. The variables were categorized into 3 subcategories based on different notions while for each subcategory identical variables were merged and aggregated into one common variable; the name of the variable was chosen either according to the most used or by choosing the main variable that is triggering other variables.

The reached theoretical framework will require further work, it needs to be tested and examined with respect to different economies especially under various degrees of development to reach a conceptual model covering the most significant variables that fit each economy. This will add assist brokerage companies and individual investors, through increasing their understanding to the connection between new concepts especially behavioral thoughts and investment decision making. Also this

would increase the understanding to how investors react to market announcement and movement, how investors plan for their future investments, in addition to the factors that help the investors or their financial advisors in setting appropriate asset distribution policy to achieve the highest gain. The same value will be added to financial managers while making strategies by taking into consideration investors' concerns and judgments.

More importantly, being aware of human behavior and the impact of psychology on decision making, will improve the performance of the traditional model to better explain the real market behavior, by taking these behavioral variables into consideration with the already existing classical theories, this can minimize the appearance of market anomalies and deviations.

ENHANCING THE CULTURE AND CREATING VALUE FOR THE TERRITORY THROUGH OPEN INNOVATION: A CASE STUDY

Baima, Gabriele¹; Santoro, Gabriele¹; Ferraris, Alberto²

¹Department of Management, University of Turin, Turin, Italy

²Department of Management, University of Turin, Turin, Italy, and Laboratory for International and Regional Economics, Graduate School of Economics and Management, Ural Federal University, Russia.

ABSTRACT

This paper aims to understand how external revealing of strategic knowledge by a focal organization can be seen as a meaning of enhancing the culture and creating value for the territory. This strategy regards the phenomenon of outbound open innovation, still under-investigated by the literature so far. In fact, a few studies addressed a specific aspect of outbound open innovation, which regards the revealing of the knowledge for free to external actors. Despite this, previous works are mostly conceptual, and thus there is a lack of empirical studies of about revealing strategies. The aim of this work is to bridge this gap, exploring the objectives of the external knowledge transfer, through a single case study in the context of the craft beer industry. We found that external revealing of strategic knowledge in the craft beer industry can be seen as a strategy for enhancing the culture and creating value for both the focal organization and the whole territory.

Keywords: open innovation, outbound open innovation, culture, territory, external knowledge.

INTRODUCTION

The literature on innovation management suggested that opening to external partners and actors can enhance performance both in terms of small improvements and radical changes (Rothaermel and Alexandre, 2009). This new paradigm, often times called “open innovation”, suggests a new way for reinventing the organization (Santoro et al., 2018). The inbound open innovation occurs when ideas flow into the organization from partners such as customers, suppliers, competitors, universities, or governments and are used with ideas developed inside with the ultimate goal of innovating (Martinez-Conesa et al., 2017). By contrast, outbound open innovation is the process of leveraging internally developed ideas and intellectual property to external partners through licensing, selling intellectual property, spinning off parts of an organization, alliances, and joint ventures (Bellantuono, Pontrandolfo & Scozzi, 2013).

To date, scholars concentrated more on inbound open innovation, while outbound open innovation remains less studied. A few studies addressed a specific aspect of outbound open innovation, which

regards the revealing of the knowledge for free to external actors (Lichtenthaler, 2008; Kutvonen, 2011). Despite this, previous works are mostly conceptual, and thus there is a lack of empirical studies of about revealing strategies. The aim of this work is to bridge this gap, studying with an empirical approach the objectives of the external knowledge transfer, through a single case study. More specifically, we aim to understand how external revealing of strategic knowledge can be seen as a meaning of re-shaping business processes and create radical innovations into business activities. This is explored in the specific context of the craft beer industry, which fits perfectly in the research context, for several reasons. First, the needs of consumers have changed over time and this requires an increasing innovation orientation (Bresciani et al., 2016). Second, the literature shows that firms operating in both food and beverage (F&B) sectors can make use of open innovation strategies in order to differentiate products and gain competitiveness (Sarkar and Costa, 2008), and we think that they might exploit outbound processes too. Third, the whole F&B industry is extremely linked to the culture and heritage of a region (Vrontis et al., 2016), and thus we believe that outbound open innovation strategies can be exploited to achieve some objectives and benefits that are not only monetary.

To achieve the paper's goal, the study uses an explorative qualitative method through in-depth interviews conducted with the founder and CEO of one of the main craft beer producers in Italy. Results show that revealing knowledge is a method to create shared value, strengthening the firm's network, re-shaping the culture, enhancing the territory, gaining access to knowledge and guaranteeing market competitiveness.

The remainder of the paper is organised as follows. The next section offers a review of the literature on open innovation and specifically on outbound. Then, we present data, methodology, and variables used in our study. Finally, we highlight the results of the analysis, proposing a novel discussion in the light of existing literature as well as recommendations to academics, managers and practitioners.

OUTBOUND OPEN INNOVATION

The traditional view of innovation poses that firms developed ideas and knowledge internally and marketed it internally too (March, 1991; Calantone and Stanko, 2007). However, in recent years this idea has evolved, leading innovative firms to acquire new ideas, knowledge and technology from the external environment (Tsai and Wang, 2008).

Therefore, the old philosophy of "closed innovation", according to which "a firm generates, develops and commercializes its own ideas" (Chesbrough, 2006), leaves space to "open innovation", according to which organizational boundaries are porous and firms interact more with their environment (von Hippel and von Krogh, 2006).

Firms may open up their innovation processes in a double way (Lichtenthaler and Ernst, 2009); the inbound open innovation refers to the use by firms of external sources of innovation. This strategy allows firms to broaden their knowledge base through the involvement of different external sources, and consequently to increase their innovative capacity (Gassman and Enkel, 2004). By contrast, outbound open innovation refers to the use of external channels and paths to market, in order to develop and commercialize innovations; in this way firms have the possibility to bring into the market the ideas developed internally through an alternative path. Thus, outbound open innovation can be seen as an external technology exploitation strategy (Lichtenthaler and Ernst, 2006). Dahlander and Gann (2010) proposed a typology for inbound and outbound activities, based on the pecuniary versus non-pecuniary feature; as such, inbound assumes the form of sourcing or acquiring, while outbound assumes the form of revealing or selling.

Regarding inbound open innovation, acquiring is a process that involves money in exchange. Its focus is on acquiring inventions and inputs to the innovative process through informal and formal relationships (e.g. Christensen et al., 2005). By contrast, the inbound open innovation strategy can take the form of sourcing strategy, whereas the firm in-source knowledge and technologies for free (e.g. Laursen and Salter, 2006).

Selling and revealing (Dahlander and Gann 2010) both refer to outbound open innovation. Selling regards the transfer of knowledge and technology through monetary exchange (Chesbrough and Rosenbloom, 2002; Lichtenthaler and Ernst, 2009). The advantages of selling as outbound strategy is the possibility of commercialization of products that are “on the shelf” (Chesbrough and Rosenbloom, 2002). On the other side the disadvantage is the difficulty of out-licensing to the over-commitment to own product and technologies (Lichtenthaler and Ernst, 2009). By contrast, revealing refers to a strategy through which internal resources are revealed to the external environment without monetary benefits, thus seeking indirect benefits.

Whatever the outbound strategy, the revenues generated by an innovative firm are governed by the appropriability regime (Teece, 1986) and firms can use both formal methods (such as patent) as well as informal methods (lead times, first mover advantages, lock-ins) to protect their inventions (Dahlander and Gann 2010). The revelation of knowledge to external firms, does not always reduce the probability of being successful (von Hippel 2005; Henkel, 2006). Studies argued that firms can increase the possibilities to gain interest from other parties if they are more open (Dahlander and Gann, 2010).

Obviously, the disadvantage of revealing is the difficulty to capture the monetary benefits of strategic knowledge. Moreover, competitors can steal internal resources if revealed for free (Laursen and Salter, 2006).

According to Lichtenthaler (2008), external technology commercialization can be pursued for three main objectives: monetary, strategic and compulsory. In fact, firms can view the outward of technology as a strategy to shape their future and also to control environmental factor, instead of only exploit the monetary goal. Of course, the main goal often times could be the monetary compensation (Davis and Harrison, 2001), but studies shed light to strategic objectives, which are three: product-oriented, technology-oriented and mixed (Teece, 2000). Accordingly, external commercialization may lead to indirect benefits for the focal firm. In this guise, Kutvonen (2011) extended the classification of the strategic objectives of external technology commercialization, splitting them into six different categories each divided in one or more strategic benefits. The six categorizations are: gaining access to new knowledge, learning from knowledge transfer, multiplication of own technologies, controlling technological trajectories, external exploitation as a core business model and exerting control over environment (fig. 1).

RESEARCH DESIGN

This work is exploratory in nature and involves a qualitative approach through in-depth interviews conducted with a founder and CEO of a SME operating in the draft beer industry: Baladin, located in Piedmont, specifically in Piozzo, a small village close to Cuneo (Italy). The whole F&B industry is typically considered mature and slow growing compared with other industrial sectors (Hou and Mohnen, 2013). However, we think that exploring the objectives of outbound open innovation strategies in the craft beer industry is appropriate for at least three reasons. First, the needs of

consumers have changed over time and this requires an increasing innovation orientation (Bresciani et al., 2016). Second, the literature shows that firms operating in F&B sectors can make use of open innovation strategies in order to differentiate products and gain competitiveness (Sarkar and Costa, 2008), and we think that they might exploit outbound processes too. Third, the whole F&B industry is extremely linked to the culture and heritage of a region (Vrontis et al., 2016), and thus we believe that outbound open innovation strategies can be exploited to achieve some objectives and benefits that are not only monetary. Outbound open innovation as an attempt to reconnect food, cultures and territories is essential to restore value to the identity that is too often lost in a globalized world, also to rebuild social ties and new forms of knowledge in this society of sharing. Particularly, craftsmanship of the products is a very interesting subject, it serves to generate, through community practices, an economy of the territory. Furthermore, F&B has always contained instances that have involved human action in every aspect, both in its formation and in the sphere of identity. Food is not new, it can satisfy the desire to discover and learn about the tradition and culture of a place through the five senses.

The choice of Piedmont is justified primarily by the importance of this industry in this area. In particular, food is one of the main manufacturing sectors in Piedmont. Similarly, beverage production is at the heart of the Piedmont economy and culture. Piedmont is an ambassador of quality wine to the world. Amongst the European countries, Italy is the one with the longest and strongest tradition in wine production i.e. 48.8 million hectoliters in 2016 (ISTAT, 2018). Indeed, in 2017, Italy was the leading world producer of wine (ANSA, 2017). The craft beer industry is one of the few that in an era of crisis has not only experienced a downturn but has been capable of constant growth, specifically scoring a +4% in the last year. Production and export numbers reach a peak in the history of Italian beer, with 15,6 million and 2,7 million hectoliters (Assobirra, 2017).

The choice of Baladin as unit of analysis is justified by the awards gained by the firm. In fact in 2017 Baladin has been awarded as “brewery of the year 2017”¹. Furthermore, the firm is continuously growing, expanding more and more abroad. To sum up, Baladin is one of the main players operating in this industry, at least in a national context.

Of course, firm choice was not randomly picked. Siggelkow (2007) affirms that “it is often desirable to choose a particular organization precisely because it is very special in the sense of allowing one to gain certain insights that other organizations would not be able to provide”. Baladin in fact is unique in the Italian context and maybe in the world, and needs further investigation;

The authors applied the case study methodology to answer the research question “How can firms create shared value through outbound open innovation?”.

¹ <https://www.baladin.it/it/news/baladin-birrificio-dellanno-2017>

The choice of a qualitative method is driven by the scarcity of studies in this particular field of research, which calls for more in-depth methods. To achieve the purpose, the authors structured the research methodology in three phases (Stake, 1995). First, during the explorative phase, information from secondary sources have been collected, such as news from social media or specialist newspapers, databases and websites. By studying newspapers, websites and other secondary sources of information, it was possible to identify a few target firms. Among these, the authors chose Baladin as the main representative and innovative firm in the craft beer industry regarding open innovation processes. Baladin is a company that since the beginning, is constantly looking for innovation through a “sharing Philosophy”. For these reasons, the authors considered Baladin to be a relevant case study that fits perfectly with the aim of this work.

During the second phase, the primary data were collected through semi-structured interviews held directly with the founder (Teo Musso). He invited one author to visit the establishment in Piozzo. The tour lasted over three hours and it is revealed to be particularly stimulating because, in addition to having the opportunity to see up close the operation of technologically advanced machinery, has given way to come in close contact with the incredibly multifaceted and visionary personality of Teo Musso and to know his origins in detail.

The interviewee was asked first to provide general information about the firm and then to describe open innovation practices, with a focus on the outbound strategy.

The answers were transcribed and then analyzed autonomously by the authors, with a comparison of the results. Later missing details and complementary data were collected through e-mails and phone calls.

RESEARCH FINDINGS

The following paragraphs discuss the findings of the empirical work, result of the interviews conducted and the materials provided. The aim is to describe the outbound open innovation strategy adopted and developed by Baladin, identifying the main objectives that pushes the firm to externalize knowledge and the aim of this managerial approach. The big vision of Teo Musso and Baladin can be summarized as follows: Open Baladin, the beer 'open source', whose recipe is published on the web with the exact directions to replicate it at home; a virtual laboratory with free admission, where everyone can contribute to the search for new blends and flavors to share their taste experience with others. As seen in the literature review, there are several motives for establishing an external commercialization strategy through revealing. In the case of Baladin, we found there are five main motives that push toward this strategy: strengthening the firm's network; culture; enhancing the territory; gaining access to knowledge; guaranteeing market competitiveness (fig. 2).

The visionary-fool personality of Teo Musso pushes Baladin in both directions of open innovation processes, namely inbound and outbound. However, the outbound open innovation strategy is at the core of the Baladin's strategy and vision. A lack of knowledge transfer in the craft beer industry drives Baladin to extend this sharing concept. *"Sharing was and still is, in my opinion, the key of our project, in order to being able to completely affect the market"* (Teo Musso). In this case the concept of open innovation comes from the Belgian master of Teo Musso, who opened the doors of his knowledge and his history to transmit his skills and give him his art. In the open innovation processes, owner's character is a key factor, because a weakness is the fear that one's own ideas are stolen by others. Sharing ideas, recipes and knowledge is a method used for strengthening the firm's network and to enhance the other manufacturers that work with Baladin. The final aim is to contribute to the whole industry. This open innovation strategy helps to increase Baladin's reputation by putting it at the forefront of industry development. Competitors see Baladin as an arrival point but also as a player to work with. Teo Musso highlights the importance of beer. His will is to spread and re-shape the culture of craft beer to make people understand that, like wine, it is a product of the earth that comes from ingredients that must be grown, harvested, processed. From an open innovation perspective, re-shaping the culture can be view as a strategic external knowledge transfer objective, in order to strengthen the cultural concept behind the product, in this case the beer. Baladin has changed the way of thinking (and drinking) the beer, placing it at the same level of the wine, underlying the concept of culture behind the product and the experience of tasting it. He says: *"I am a craftsman set for quality, with a cultural revolution in mind"*.

According to Lichtenthaler (2008), an objective of external knowledge commercialization is "Enhancing the firm's reputation", but in the Baladin's case, the aim is also enhancing the territory linked to the product. Baladin's will is to let the world discover the territory, the products, the history, the description, the thousand initiatives that rotate around the planet Baladin. Moreover, as mentioned above, the founder's goal has always been to create a product that can reflect the culture of the territory. Moreover, the growth of this sector and of all complementary services can lead to a creation of shared value for all stakeholders involved and for the whole territory in general.

The link between product and territory is becoming a factor of fundamental importance, as the consumer is increasingly aware and informed about what he buys and perceives an added value when the product he purchases is linked to the territory of origin.

In our context of reference, Piedmont has always been recognized and celebrated as the Land of Wine. Thus, through our case study we can say that Baladin has been able to pay more attention to beer, placing it as an alternative to wine and enhancing the territory from where the product comes. In fact, the engine that has pushed and supported Baladin's growth over the years is certainly the founder's

ambitious mission: “to restore gastronomic dignity to craft beer and make it a valid alternative to wine”.

Another objective of outbound open innovation strategy that sort out in this case study is the capability of the firm to gaining access to knowledge, according to Kutvonen (2011). The aim of Baladin is create a concept of “Open Philosophy”, wherein all the actors can share knowledge. This philosophy allows Baladin to gain access to knowledge from the environment, and more the other manufacturers grow, more Baladin grows. The problem with this phenomenon is that many actors in this industry have not yet embraced this philosophy, adopting a closed approach to innovation.

Being open to other players allows you to open up the dialogue and then have others share information with Baladin, thus changing their cultural approach in an open direction. By doing so, Baladin not only transfers knowledge but also acquires it.

Baladin has been awarded as “brewery of the year 2017”, it has 6.500 direct clients in Italy and in the Italian “panorama” is the one of the most knows brand. Furthermore, Musso already export in 41 countries (Corriere, 2018). Firm’s will is to continuously grow in order to guaranteeing the market competitiveness, due to high level of competitors. “We want to double the export quota on sales from 17% to 35% in three years” (Teo Musso). In this regard, the outbound open innovation can be seen as a marketing strategy used by the firm to gain competitiveness and to reinforce the brand all over the world. Despite sharing knowledge can bring some problems related to appropriability (because competitors can see and replicate for free the recipes of Baladin), the firm is not scared about this problem, because the strong brand acts as barrier to prevent the issue.

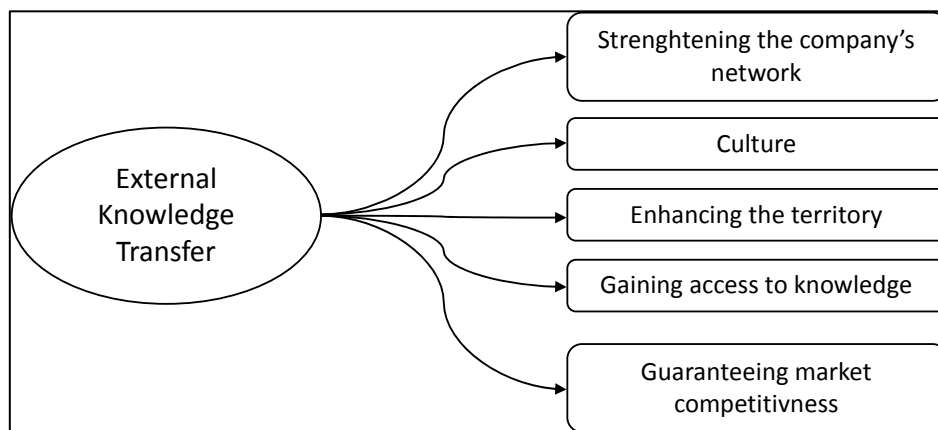

Figure 2. Main findings

CONCLUSIONS

This paper focused on understanding the main objectives of the external knowledge transfer. Results show that firms may externalize knowledge for different reasons: strengthening the firm’s network;

culture; enhancing the territory; gaining access to knowledge; guaranteeing market competitiveness. These findings provide the following theoretical implications. First, the study adds to the literature on open innovation with particular regard to the outbound perspective, often neglected by the literature. Second, the study provides an empirical research to explore the objectives of the external knowledge transfer since the few previous studies were conceptual (Lichtenthaler, 2008; Kutvonen, 2011). Third, this paper offers a specific contribution regarding the craft beer industry, suggesting that external knowledge transfer can be viewed as a meaning of contributing to the whole industry.

Taken together, the findings of our research offer some interesting managerial and policy implications. First of all, due to the high level of competition that affect the F&B industry, including the continuous changes in the consumer behavior and because of the low level of R&D investment in industry, companies need to open up the boundaries of innovation in order to develop and commercialize new product more quickly, effectively and with less risk of failure. Strategically, transferring external knowledge could be a vital strategy to create shared value. Our case study confirm that big and small breweries can benefit from external knowledge transfer, because sharing knowledge can have a big impact on the brewer industry at large.

Second, the study suggests that, to some extent, stakeholders should foster collaborations between the F&B industry and tourism. External knowledge transfer could be a tool to enhance tourism attractivity, in fact creating shared value enhance the territory and tourism.

Moreover, we can look at the F&B industry in a "heritage" perspective, which means that food is a mix of tangible and intangible factors that contribute to the culture and heritage of a place (Timothy & Ron, 2013). Thus, F&B as a heritage can be included with rich culture value belongs to the science, agriculture products, ingredient, dishes, technique and food traditional (Ramli, 2015). Moreover, the role of F&B heritage in the marketing of destination can help to promote this issue and marketing strategies can rely on food.

Fundamental importance should be placed on the breweries, so that firms focus on using as much as possible raw materials of the territory of origin. It is necessary to bring the consumer into the perspective of the link between culture and product. The objective for managers is to enhance the quality of the products, enhancing the nature of the raw material linked to the territory, but trying to make the product sustainable in the market. By doing so, companies will have a multiple role: enhancing their products, culture and territory, thus also encouraging the increase of tourism. Governments could work as a filter between firms and territory, and firms should overpass direct competition, looking with a more open perspective, in order to strengthen the environment. Of course, this study presents some limitations that pave the way for some very interesting future lines of research. First, the research considers just one case study, which does not help to generalize the

findings. Therefore, more case studies are suggested to address the issue of why firms should externalize knowledge. Second, the analysis focused on the specific context of the craft beer industry, which is affected by specific normative and competitive features. The authors acknowledge that these findings cannot be generalized fully to all sectors and challenge researchers to explore this topic in other contexts of analysis.

ABSTRACT

Studies have shown that education is connected to other social indicators of well-being, especially among older adults. Thus, this study examined the impact of education on the well-being of older adults in the Tomsk region (Siberia, Russia). Overall, the purpose was two-fold: 1) to use a specially designed questionnaire that assesses the educational background of the older generation, which can be replicated in other regional studies of different countries, and 2) to conduct a regional case study about the correlation between the education level and subjective aspects of older adults' well-being, which can be used in similar studies for international comparisons and generalizations. The authors interviewed 400 individuals who reached (in accordance with Russian legislation) retirement age, i.e., 55 years for women and 60 years for men. The participants provided informed consent for the study. The survey included 78 questions related to demographics, social and economic conditions, and physical and psychological indicators. The results of the regression analysis showed that education level is significantly correlated with subjective aspects of older adults' well-being such as the ability to use a computer, the sense of optimism, involvement in social activities, and financial capacity.

Keywords: older adults, education level, social indicators, impact, well-being, regression analysis

INTRODUCTION

The global trend of increasing life expectancy is often perceived by the public as an impending disaster or at the least an undesirable phenomenon. More specifically, the aging population in general has created additional resource challenges for national health systems, social protection, and pensions. However, the changes that make the process of population aging inevitable create a foundation for solving the problems generated by it. The prolongation of life expectancy has opened unprecedented opportunities for the growth of aggregate resources, accumulation of human capital, and the use of individual human potential. Moreover, as the measure of human responsibility for personal

development throughout life increases (Blair and Schroeder 2000), the importance of education level increases, especially with regard to ensuring the continued social, economic, psychological, and emotional well-being of older adults.

In modern scientific literature, well-being is increasingly associated with the complex concept of achieving success and a full-value life in society. This concept includes both subjective and objective ideas about health, the environment, civil society, work–life balance, home comfort, security, the area of residence, etc., all of which have been widely studied (Charles et al. 2016; Cummins et al. 2014). Due to the expansion of the plurality of well-being, it is possible to study well-being as a multifactorial construct that combines the social, economic, physical, psychological, cultural, and spiritual determinants of an individual's social life (Hill and Lewicki 2007; Ludwig et al. 2012).

This conclusion is consistent with the views of human capital theory proponents, who, for more than half a century, have been consistently defending the idea that private and public well-being is the result of the increased education level and growth of knowledge, skills, and abilities embodied in humans. Previous studies, on the basis of human capital theory (Hallgren et al. 2016; Härdle and Simar 2015; Manuelli and Seshadri 2014), have shown that it is highly effective to invest in education. Other studies have shown that education is not only related to future income but also provides additional benefits for individuals, households, companies, and society as a whole (Nyberg et al. 2014).

In addition to the transformation of individuals into more productive workers, an increase in educational status makes them better managers because they have the ability to shorten the time lag between new innovations, technologies, and their applications (Flavin 2016). In other words, those with high educational levels can quickly respond to changes in science and technology, and they are more prone to introduce innovations in their professional activities (Rauch and Rijdsdijk 2013). Adair et al. (2013) and Fan et al. (2016) showed that individuals with higher levels of education are better oriented in the consumer goods market and make better purchasing decisions in terms of price/quality tradeoffs. Furthermore, education level has also been proved to be positively correlated with a more rational use of leisure time and an improved quality of life (Oster et al. 2013).

Some studies reveal that high education level contributes to the harmonious development of one's personality because it fosters positive qualities such as independence, self-confidence, sociability (Keep and Mayhew 2004; Von Rueden et al. 2015), flexibility, and tolerance in dealing with others (Manuelli and Seshadri 2014; Miller et al. 2015). In this regard, by studying at an educational institution, a person tends to be more socially active, which, in turn, facilitates the selection of friends and life partners (Barnir 2012; Green and Henseke 2016). In addition, it has been shown that the level of a wife's education has a positive effect on the growth of wages and life expectancy of the husband

(Gudmundsdottir 2013). Furthermore, previous studies have indicated that the level of parental education is an important determinant of the future education and social success of children (Dissou et al. 2016). Thus, according to the aforementioned literature, education level is closely related with various objective and subjective aspects of well-being.

The focus on the association between education level and the subjective perception of well-being among older adults is motivated by the fact that this is currently the fastest growing age group in the world. According to United Nations (UN) estimates, every second, one person reaches the age of 60. In addition, the number of senior citizens is more than that of children under five years of age, and by 2050, their number will exceed the number of children and teenagers under the age of 15. Regarding Russia, as for the first quarter of 2018, the number of people past retirement age is 24% of the population. As stated earlier, an aging society requires fundamental changes in socioeconomic policies, especially those that focus on the needs of senior citizens. However, due to significant variations in the living standards across Russia, it is important to consider regional differences. In particular, the Tomsk region has been recognized as one of the country's top producers of university students. In fact, the region exceeds the Russian average by more than one-and-a-half. In addition, one in five citizens is in the older age group while the proportion of those aged 60 years and above is steadily increasing.

PROBLEM STATEMENT, RESEARCH METHODS, AND DESCRIPTION OF VARIABLES

International studies on the well-being of older adults have been generally based on international/national databases or multi-year statistical samples (international/national). For example, the Gallup Institute conducts annual surveys and analyzes the subjective assessments of well-being among citizens in more than 160 countries. In the studies devoted to the well-being of the elderly, statistical and mathematical methods have been widely used. For instance, correlation and regression analyses have been used to study the quality of life among the elderly in different age groups, including those in nursing homes (Vaarama 2009); the factors associated with the risk of hospitalization among the elderly have been investigated by using a multifactorial regression model (Hallgren et al. 2016). Moreover, comparative statistical analyses have been conducted to assess the well-being of older adults in a particular country (Sobieszczyk et al. 2003) and determine the impact of nursing home staff on the quality of care (Kjellström and Sjölander 2014). On the basis of such findings, governments can justify the allocation of resources between their respective healthcare systems and social assistance programs for the elderly.

Finally, it has been shown that the role of education has a direct impact on older adults and their risk of Alzheimer's disease (Letenneur et al. 1999). Subsequently, the study by Huisman et al. (2004) used the statistical model of Poisson to identify the differences in European mortality rates on the basis of the socioeconomic status of certain individuals and their education levels. In addition, Darin-Mattsson et al. (2017) examined education levels in their statistical analysis of older adults' socioeconomic status. The present study continues and develops a similar approach, including a focus on regional specifics.

Taking into account the limited knowledge about the factors that (directly/indirectly) characterize the quality of life of Russian senior citizens, this study aims to identify the association between education level and various aspects of older adults' well-being in the Tomsk region. This study was carried out by a group of researchers from the International Scientific Educational Laboratory for the Improvement of Well-being Technologies of Older Adults, which was established with financial support from the Russian Federation Ministry of Education and Science at Tomsk Polytechnic University.

Primarily, an examination of the following hypotheses about the homogeneity of education on nominal indicators (e.g., gender, the place of residence, the availability of work, and age) was conducted:

H1: The education levels of men and women do not significantly differ; H2: The education levels in different age groups (age) do not significantly differ; H3: The education levels in different places of residence (place of residence) do not significantly differ; H4: The education levels of workers (work, yes), non-workers (work, no), and pensioners do not significantly differ.

Similar hypotheses were also tested for other indicators related to education and various aspects of older adults' well-being. In particular, the research objective focused on the following two questions:

Q1: Does education level correlate with certain aspects of well-being?

Q2: Is education level related to the social activities of older adults?

The sample in this study comprised 400 individuals at retirement age (i.e., 55 years for women and 60 for men) and living in five settlements and three districts in the Tomsk region. The survey included 78 questions reflecting the social, economic, psychological, and physiological characteristics of retired individuals. Some of the questions also included up to nine sub-questions.

In this study, education level (the main variable) was measured by Question No. 68 ("What is your level of education?"), which included the following five options: E1) Scientific degree (1); E2) University (bachelor's or master's) degree (2); E3) Secondary special (3); E4) Secondary education (4); E5) Incomplete secondary education (5).

Further, the data about education levels was sub-divided into 32 variables, all of which characterized certain social and economic aspects of older adults' well-being, including their physical and psychological health.

The social aspects of older adults' well-being were analyzed according to the following questions and respective answers:

No. 7 ("Do you own a computer (7_2) or a smartphone (7_3)?: I own a personal device (1); It belongs to my family (2); No (3)

No. 34 ("Are you a member of any public organization?"): Yes (1); No, I am not, but I would like to in the future (2); No, I am not, and I am not interested (3).

No. 36_3 ("Do you participate in environmental activities?"): All of the time (1); Occasionally (2); Never (3).

No.37_3 ("Do you communicate with a politician or a government official?"): Always (1); Occasionally (2); Never (3).

No. 53 ("Do you have a desire to learn how to use information technology (53_1)?: Yes, and I already attend classes (1); Yes, there is a desire, but I do not attend any classes (2); No, I do not attend any classes and I have no desire to do so (3).

No. 56_3 ("How often do you communicate with relatives and friends?"): Every day (1); Several times a week (2); Once a week (3); Several times a month (4); Once a month (5); Less than once a month (6); Never (7).

No. 61 ("Can you use modern computer devices and technology?"): Yes I can (1); Yes I can, but I do not use such devices (2); I do not know how to use such devices, but I would like to learn (3); I cannot and do not want to use such devices (4).

No. 62 ("How often do you use modern devices (e.g., computers (62_1), smartphones (62_2), mobile phones (62_3), and/or the Internet (62_4)) in your everyday life?"): Always (1); Occasionally (2); Never (3).

No. 63 ("What is your skill level in social networks (63_1), e.g., searching for the necessary information on the Internet (63_2), making purchases or paying bills via the Internet (63_3), downloading movies or music from the Internet (63_4), using email (63_5), communicating with family or friends via Skype (63_6), playing computer games (63_7), and/or sending SMS messages on a mobile phone (63_8)?: I can easily perform such functions (1); I cannot perform such functions, but I want to learn (2); I cannot perform such functions, and I do not want to learn (3); I am hearing about such functions for the first time (4).

The economic aspects of older adults' well-being were analyzed according to the following questions and respective answers:

No. 32 (“Do you use banking services (32_2), cultural-recreational services (32_5), and/or paid household services (32_7)?”): Always (1); Rarely (2); I do not use such services (3).

No. 60 (“Can you afford to travel (60_1), use paid medical services (60_2), buy high-quality products (60_4), and/or change household appliances (60_5)?”): Yes, I can without restrictions (1); Yes, but with restrictions (2); No, I cannot, but I would like to (3); No, I cannot and I do not wish to (4).

No. 71 (“Do you currently work?”): Yes (1); No (0);

No. 74 (“How much is the monthly average income per member in your family?”): More than 26 thousand rubles (1); From 19 to 25 thousand rubles (2); From 13 to 18 thousand rubles (3); From 6 to 12 thousand rubles (4); Below 6 thousand rubles (5).

No. 75 (“How would you rate your financial situation?”): I can buy anything that I want (1); I can buy a lot, but large acquisitions are not available (2); I can buy new clothes and shoes (3); All of my money goes toward food (4); The amount of money is not enough for food (5).

Physical health, as an important aspect of older adults’ well-being, was analyzed according to the following questions and respective answers:

No. 13 (“How do you estimate your health?”): Very good (1); Good (2); Average (3); Bad (4); Very bad (5).

Psychological health, as an important aspect of older adults’ well-being, was analyzed according to the following questions and respective answers:

No. 1 (“With what mood do you look forward in life?”): With hope and optimism (1); With ease, but without much hope (2); With anxiety and uncertainty (3); With fear and despair (4); It is difficult to provide an answer (5).

No. 6 (“Are you satisfied with your housing conditions?”): I am fully satisfied (1); More yes than no (2); More no than yes (3); Completely dissatisfied (4); It is difficult to provide an answer (5).

The level of education of the older adults in this study was analyzed according to the following variables:

No. 66 (gender)—a nominal variable with two values: M-male (1) and W-female (0).

No. 67 (age)—an interval variable with six values: More than 75 years (1); 70–74 years (2); 65–69 years (3); 60–64 years (4); 55–59 years (5); and less than 55 years (6).

No. 78 (place of residence)—a nominal variable with eight values: Tomsk region, Seversk, Asino, Karagasok, Teguldett, Tomsk district, Asino district, and Karagasok district.

To process the sociological survey data, statistical analysis methods (e.g., dispersion, correlation, cluster, factor, and regression) were used. These methods have been widely applied in similar studies (Hanushek 2016; Heitor et al. 2014; Inglehart et al. 2008; Kjellström and Sjölander 2014). As for the nominal (categorical) variables (gender, names of settlements, etc.), the following statistical operations

were used: the calculation of frequencies (specific weights); the defining mode of the studied characteristics; the use of different statistical analysis methods on the basis of operating frequencies (contingency tables); and the χ^2 criterion for analyzing the links between the nominal characteristics. Regarding the most ordinal variables, this study used medians and percentiles as measures of variation, Spearman's rank correlations, the Mann–Whitney U test, and the Kruskal–Wallis test. Finally, for the interval scale variables, this study used arithmetic average, variance, Pearson's linear correlation coefficient, the t-student test, the f-test parametric analysis of variance, and cluster and factor analyses.

STUDY RESULTS

The general distribution of the participants' education levels is shown in Fig.1. According to the figure, the education level of the participants in the Tomsk region is very high, with 69% having higher or secondary/special education.

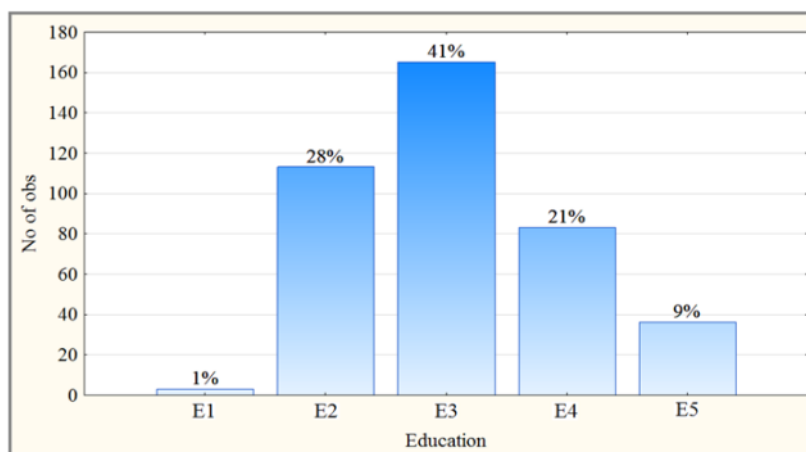

Fig.1. Distribution of the Participants' Education Levels

The researchers had the opportunity to compare these findings (hereafter referred to as "T15") with the results of the "Comprehensive Survey of Living Conditions" for the Tomsk region, which was conducted under the Federal Complex Statistical Observation Program in October 2014 (hereafter referred to as "K14"). The latter study included 354 participants (over 55 years of age) who were asked the question "What level of education do you have?" after which they chose one of the following answers:

Postgraduate education (1); Higher education (specialist or master's degree) (2); Higher education (bachelor's degree) (3); Incomplete higher education (4); Secondary technical school (5); Primary technical school (6); General secondary education (7); Basic general education (8); I do not have basic general education (9).

Because the aforementioned surveys were conducted by different scientific groups with different

goals, ambiguity was expected. Nevertheless, despite the overall differences, an attempt was made to compare the data on the basis of education level. At the same time, the answers for Question I07.01 (K14) were aligned with those for Question No. 68 (T15) by combining the number of responses, i.e., the second and the third; the fourth, fifth, and sixth; and the eighth and ninth.

Note that, according to the theory of measurement scales, the evaluation scale for the level of education refers to the type of ordinal scales that allow the ranking (ordering) of objects and the qualitative evaluation of the results (" $<$," " $>$," and " $=$ "), but not the introduction of a unit for quantitatively measuring the education level. In other words, the rating scale is not a numerical measurement scale. Thus, in the evaluation scale, the use of mathematical averaging (and other specific mathematical formulas) for comparison is incorrect. Moreover, in the evaluation scale, it is reasonable to use the rank (non-parametric) criteria, rather than the average values, in order to compare the samples. However, completely ignoring mathematical averaging is inexpedient due to its habitualness and prevalence. Hence, it is rational to simultaneously use both the methods, i.e., the method of mathematical averaging and the method of median ranking. This recommendation is in agreement with the general scientific concept of sustainability, which recommends the use of different methods to process the same data in order to isolate the conclusions obtained from different methods. In this case, the differences between Question No. 68 and Question I07.01 are considered insignificant by both the Mann–Whitney U test ($p_{M-W} \approx 0.46 > 0.10$) and the t-student test ($p_t \approx 0.29 > 0.10$). In addition, the following assessment scale for the significance levels of the differences was adopted: highly significant ($p < 0.0005$); statistically significant ($0.005 < p < 0.05$); weakly significant ($0.05 < p < 0.10$); and insignificant ($p > 0.10$). Therefore, it was concluded that the estimates of the participants in the Tomsk region, obtained within the framework of the regional (T15) and federal (K14) studies, did not yield contradictory results.

At this point, let us consider the results of the hypotheses tests regarding education homogeneity [No. 68 (T15)] as well as the relationship between the participants' education levels and other rank indicators in this study.

H1: Overall, the education levels of the men and women did not differ. According to the distribution of the education levels (36% male, 64% female), the main difference was found in the levels of E2 (higher education) and E3 (secondary special education). More specifically, among the men, higher education was more common (35% with E2 and 29% with E3), whereas the opposite occurred among the women (25% with E2 and 48% with E3). However, according to the Mann–Whitney U test, these differences were considered insignificant ($p_{M-W} > 0.10$) (see Fig.2).

H2: Overall, the education levels of the different age groups (age) did not differ. According to the non-parametric (rank) criterion of the Kraskel–Wallis test, the education levels in the different age groups

(Age < 65 years, 65 < Age < 75, and 75 < Age) were statistically significant ($0.050 > p_{M-W} \approx 0.009 > 0.005$), weakly significant ($0.10 > p_{M-W} \approx 0.08 > 0.05$), and significantly different ($0.0050 > p_{M-W} \approx 0.0030 > 0.0005$) < Age < 75) (see Fig.2).

H3: Overall, the education levels in different places of residence (place of residence) did not differ. The non-parametric (rank) criterion of the Kraskel–Wallis test distinguished three groups of residences on the basis of education: T {Tomsk, Asino - 56% of the participants}; S {Seversk- 14%}; and R {Karagasok, Teguldett, Tomskrayon, Asinorayon, Karagasokrayon - 30 %}. Moreover, the difference between the education levels in different places of residence was statistically significant (at the level of $0.050 > p_{K-W} \approx 0.007 > 0.005$) due to the significant difference (at the level of $0.0050 > p_{M-W} \approx 0.0009 > 0.0005$) between the education levels of S and R, and the weakly significant difference (at the level of $0.10 > p_{M-W} > 0.05$) between such levels in T, R, and S (see Fig.2).

H4: Overall, the education levels of the employed (work, yes - 33%) and the non-employed (work, no - 67%) did not differ. Based on the ranked Mann–Whitney U test, these differences were statistically significant (at the level of $0.050 > p_{M-W} \approx 0.010 > 0.005$) (see Fig.2).

H5: Overall, the education level had a significant correlation with other rank indicators of the participants’ well-being.

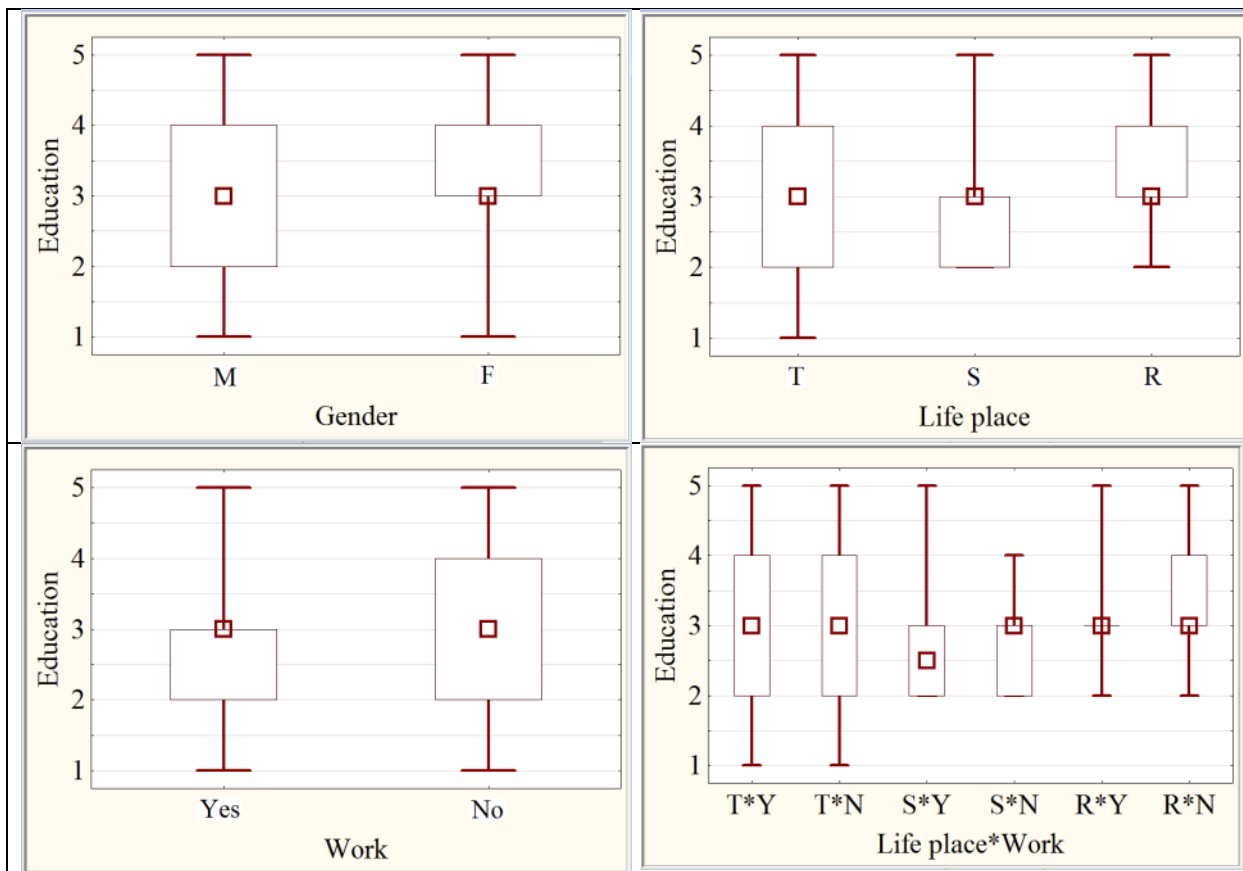

Fig.2. Comparison of the Education Levels on the Basis of Nominal Indicators (gender, life place, work) Note: On the rank scale, the squares and rectangles represent 25%–75% of the quartile range.

For the variables measured in the ordinal scale, there were several types of correlations, which allowed the estimation of the dependencies. Spearman's R -statistics for rank variables can be considered a direct analog of Pearson's r -statistics for variables measured in quantitative scales. Let us consider the basic hypothesis about the correlative connection between the indicator of education level and other indicators that characterize the subjective idea of older adults' well-being. A correlation analysis of these indicators revealed different levels of significance among the different pairs of indicators, one of which was education level (see Table 1).

λ	6.965	2.569	2.064	1.605	1.529	3.008	1.537				
Δ	0.211	0.078	0.063	0.049	0.046	0.091	0.047				

Note: Columns F1–F7 represent the factor indicators, R and r represent the correlation ratio between education level and the 32 indicators, and p_R and p_r represent the significance levels.

It should be noted that the difference between R and r at maximum 0.03 was insignificant ($p > 0.10$). This makes it possible to apply a parametric cluster analysis of indicators on the basis of the correlation distance ($1 - \text{Pearson } r$). In this case, Ward's method was used as a rule for combining clusters on the basis of the parametric variance analysis. The results of such clustering are presented in the dendrogram in Fig.3. The formation of seven correlatively connected groups of indicators (F1–F7) can be considered stable on the basis of Ward's method of clustering.

Fig.3. Dendrogram for the Correlation Matrix of the 32 Indicators

The cluster analysis allowed the researchers to identify significant ($1 - r \leq 1 - 0.1 = 0.9$ - critical for a group of 400 respondents with a significance level of 0.05) clusters. In addition, Table 1 was created by conducting a factor analysis of the principal components of the seven-factor model. The most significant factor loadings are shown in bold while the bottom line shows the weighted coefficients of the factors.

As a result of the factor analysis, seven significant factors were singled out from the 32 initial indicators. The factor indicators can be interpreted as follows:

F₁ is the factor in the use of modern computer technologies, which includes the most essential features of the initial indicators No. 63_1–8, No. 61, and No. 62_1, 4.

F₂ is the factor of the availability of financial opportunities, which includes the most significant features of the initial indicators No. 75, No. 60_2, 4, 5, No. 60_1, and No. 74.

F₃ is the factor of the use of financial opportunities, which includes the most significant features of the initial indicators No. 32_2, 5, 7, No. 53_1, No. 56_3, and No. 7_2.

F₄ is the factor of using a personal tablet or smartphone, which includes the most essential features of the original indicator No. 7_3, No. 62_2, and No. 74.

F₅ is the factor of social activity, which includes the most significant features of the initial indicators No. 34, No. 36_3, and No. 37_3.

F₆ is the factor of the ability to use a computer, which includes the most essential features of the original indicators No. 61, No. 62_1, 4, No. 62_2, 3, and No. 7_2.

F₇ is the factor of optimism, which includes the most significant features of the initial indicators No. 1, No. 13, and No. 6.

Analogous to hypotheses H1–H4 discussed above, the homogeneity of the factor indicators among the participants was tested on the basis of the non-parametric (rank) criteria (see Table 2). Because the factor indicators were measured on a standardized scale, the corresponding main source indicators were also added.

Table 2. Comparative Analysis of the Factor Indicators among the Participants

Indicator	Gender		Place of residence			Work		Age		
	M (n = 143, 35.75%)	F (n = 257, 64.25%)	T (n = 225, 56.25%)	S (n = 55, 13.75%)	R (n = 120, 30%)	Yes (n = 133, 33.25%)	No (n = 267, 66.75%)	<65 (n = 203, 50.75%)	65 ÷ 75 (n = 122, 30.5%)	75< (n = 75, 18.75%)

According to Table 2, regarding the differences in the factor indicators of the participants' well-being, the following can be concluded:

- 1) The skill level of using modern computer technologies (F₁) was the same for the men and women, but it was highly significant for those in Seversk, for working pensioners compared to non-working pensioners, and for the younger group (Age < 65) compared to the average age group (65 < Age < 75) and the oldest age group (75 < Age).
- 2) The availability of financial opportunities (F₂) did not depend on the age of the retired individuals in terms of the income level of 9 thousand rubles. However, it was highly significant for the men with an income of 10.5 thousand rubles compared to the women with an income of 8 thousand rubles; for retired individuals in Seversk with an income of 15 thousand rubles compared to those in other places of residence; and for working retired individuals with an income of 10.5 thousand rubles compared with non-working retired individuals with an income of 8 thousand rubles.
- 3) The use of financial opportunities (F₃) was statistically significant and higher for the women than the men in Seversk; for the working retired individuals compared to the non-working individuals; and for the younger age group (Age < 65) compared to the other age groups. It is important to note that, if the retired individuals used banking services either "always" or "rarely," the cultural and paid household services were (on an average) used "rarely" or "never." Moreover, the use of cultural and recreational services among the women was significantly higher than that among the men while the use of banking services among the younger age group (Age < 65) was significantly higher compared to that among the older age group (75 < Age).

4) The use of a personal tablet or smartphone (F_4) was statistically significant and higher for men than for women; for retired individuals in Seversk than for those in other places of residence; for working retired individuals than for non-working individuals; and for the younger age group ($\text{Age} < 65$) than all of the other age groups. Moreover, the use of a personal tablet or smartphone was almost zero among the oldest age group ($75 < \text{Age}$).

5) Involvement in social activities (F_5) was extremely low for all the retirees, regardless of gender, type of work, and age. However, a relative increase in social activities was observed among the pensioners in Tomsk.

6) The ability to use a computer (F_6) was insignificantly different between men and women, whereas it was statistically significant and higher for the Seversk pensioners compared to that for people in rural places of residence; for working retired individuals than for non-working individuals; and for the younger age group ($\text{Age} < 65$) than for the older group ($75 < \text{Age}$).

7) The sense of optimism (F_7) among all the age groups was roughly characterized by item "With ease, but without much hope." At the same time, the sense of optimism insignificantly differed among those in different places of residence, whereas it was statistically significant and higher for men compared to women; for working retired individuals compared to non-working individuals; and for the average age group ($65 < \text{Age} < 75$) compared to the older age group ($75 < \text{Age}$).

To assess the relationship between the standardized values of the education indicator No. 68ct and the factor indicators, a multiple regression model was constructed as follows:

$$\text{No. 68}_{\text{cr}} = \sum_{k=1}^7 \cdot$$

The estimates of the partial correlation coefficients (b_k) between No. 68ct and the factor indicators as well as the significance levels (p_k) of their difference from zero are presented in Table 3.

Table 3. Multiple Regression Results No. 68ct and F_k ($k = 1, 2, \dots, 7$)

No. 68cr	b_k	Std.Err. b_k	$t_k(392)$	p_k -value
F1	0.235	0.038	6.247	0.000
F2	0.265	0.038	7.047	0.000
F3	0.010	0.038	0.257	0.797
F4	0.038	0.038	1.018	0.309
F5	0.282	0.038	7.476	0.000
F6	0.388	0.038	10.302	0.000
F7	0.294	0.038	7.808	0.000

According to Table 3, No. 68ct was highly significant ($p < 0.00050$) in five out of the seven factor indicators (F1, F2, F5, F6, and F7) and insignificant ($p > 0.10$) in two factor indicators (F3 and F4). Moreover, the consideration of the regression in a standardized scale allowed the researchers to rank

the factors according to the strength of their connection with the education level: $F_6 > F_7 > F_5 > F_2 > F_1$.null.

CONCLUSION

This study examined the impact of education level on the well-being of older adults in the Tomsk region (Siberia, Russia). In addition, a comparative analysis of the distribution of older adults in the Tomsk region was conducted by comparing the findings of this regional study with those of the "Comprehensive Survey of Living Conditions" for the Tomsk region, which was conducted under the Federal Complex Statistical Observation Program in October 2014. An estimate of their insignificant difference (at the level of $p > 0.10$) was obtained by using the ranked Mann–Whitney U test and the parametric *t*-criterion. Based on the variance analysis, the difference in the education levels by gender was insignificant, whereas the difference according to the place of residence and work was statistically significant. The correlation analysis also revealed significant interrelations between the participants' education levels and the 32 rank indicators of their well-being. Moreover, by conducting a factor analysis of the main components, a seven-factor model of the indicators was created, after which a significant correlation with the education level was found. Differences in the factor indicators of the older adults' well-being were also revealed by nominal criteria and age, while a regression analysis revealed significant links between education level and five out of the seven factor indicators. Their ranking, based on the strength of their connection with the education level, was as follows: F_6 (Computer Skills) $>$ F_7 (Sense of Optimism) $>$ F_5 (Involvement in Social Activities) $>$ F_2 (Financial Capabilities) $>$ F_1 (Skill Level in Using Computer Technologies). Finally, it is important that future studies plan to use the generated database to statistically analyze the specific characteristics of working pensioners, to determine the level of trust between the elderly and the government, and to conduct a ternary variance analysis that compares the statistical data regarding the well-being of older adults on the basis of different databases (e.g., federal and regional).

ACKNOWLEDGMENTS

The paper was supported by the Russian Foundation for Basic Research in the framework of the research project "Development of a comprehensive assessment of the effectiveness of the involvement of older people in a regional society", Project No. 19-010-00984

THE LINK BETWEEN INSTITUTIONAL FACILITATORS AND GLOCALISATION: THE MEDIATING ROLE OF INNOVATION IN TRANSITIONAL ECONOMIES

Bašić, Maja

Department of International Economics, University of Zagreb Faculty of Economic and Business, FEB
Zagreb, Zagreb, Croatia

ABSTRACT

Six comparable EU member states are undergoing a transition process from socialist towards a capitalist market system. National innovation systems' perspective portrays a model connecting institutions, firms' innovation and glocalisation. This paper proposes that institutions act as facilitators of firms' value creation process thereby inciting firms' glocal performance. Aggregate national indicators available from the European Innovation Scoreboard database (2018) for six transitional EU member states for the period 2010-2017 determine the effect of institutional-level support on innovation and glocalization, based on three glocalization indicators: glocal sales performance, a 5-year percentage change in export performance, and the real effective exchange rate. After 2012 six transitional EU member states are progressively recovering from the 2008 global recession. The conducted panel analysis showed that: (1) institutional-level support influenced a 5-year percentage change in market share, but its affect was negative in conjunction with innovation; and (2) in the period after 2012 institutional-level support had a positive but insignificant effect on the 5-year percentage change in market share. The results are in line with counter-cyclical institutional-level support and show a long response time necessary for the effect of institutional policies; hence, the necessity of a long-term policy orientation and planning.

Keywords: glocalisation; innovation; institutional facilitators; transitional economies; European Innovation Scoreboard; competitiveness.

INTRODUCTION

Firms face information asymmetries when entering international markets. Information asymmetries are connected with unknown consumer behaviour or regulatory policies and practices. Government export- and innovation-related assistances is channeled through the trade diplomatic networks, export-financing procedures and market research. With only a third of the European Union's small and medium size enterprises that exported to another country within the last three years, it can be stated

that a majority of firms are not aware of export- or innovation- related government policies or choose to disregard them as inappropriate to tackle the challenges of international markets (Kalinic and Clegg, 2017). Hence, the aim of this paper is to examine the link between institutional support, innovation and glocalisation of six comparable transition economies.

Nowadays economies are affected by hypercompetition and mass customization on domestic and international level. Governments assist firms to achieve better international competitiveness not only through policies directed at firms' international performance, but also domestically, through innovation policies, that aim to assist firms in new products and services for the global market. The concept of glocalization depicts global actions, which do not override the local ones, but produce different effects in different locations (Robertson, 1995; Giddens, 1991), relating to the adaptation of goods or services for local needs through networks of potential customers, suppliers and complementors (Carayannis and von Zedwitz, 2005). In order to examine the success of various institutional competitiveness facilitators this paper analysed the link between institutional facilitators and innovation on one side, and innovation and glocalisation of six comparable transition economies on the other side. Three comparable variables represent glocalisation: (1) glocal sales performance, (2) 5-year percentage change in export performance, and (3) the real effective exchange rate. By analyzing the link between institutional facilitators and innovation, and innovation and glocalisation, of the six selected comparable post-socialist EU member states (Czech Republic, Croatia, Hungary, Poland, Slovakia and Slovenia), this paper studies the institutional paths taken by transitional economic systems and examines their effectiveness.

This paper is divided into five sections. The second section explains the appropriateness of national innovation system for this analysis of institutions, innovation and glocalisation. The third section illustrates institutional-level support, innovation and glocalisation indicators in the context of the selected comparable post-socialist EU member states. The fourth section portrays the results of the panel analysis of the six comparable transition EU economies based on three glocal competitiveness indicators: (1) glocal sales performance, (2) a 5 year percentage change of export market share, and (3) real effective exchange rate. The last section concludes the study, provides policy recommendations and research limitations.

THEORETICAL FOUNDATION OF INSTITUTIONAL-INNOVATION-GLOCALISATION NEXUS

Institutions incite or dampen the highly disruptive innovation processes (Freeman 1982, Edquist, 1997; Nelson & Nelson 2002). National innovation system approach explains the role of institutional policies in identifying actors in national innovation processes (Lundvall, 1992; Edquist, 1997; Morgan, 2007). A

central role in the innovation system is given to firms as actors, which transcends innovation inputs, namely R&D expenditure, into outputs, i.e., new products and services (Nelson, 1993; Lundvall, 2007). In line with the growing glocal competitiveness, firms position itself as hubs of innovation processes comprising and using a variety of networks to achieve economic success (Carayannis and Meissner, 2017).

Figure 1 illustrates a conceptual model of the paper, which places firm's innovation capability at the center of an economic system to examine the role of institutional support on its competitiveness, i.e., glocal performance.

Figure 1. *A conceptual framework*

Institutional Support and Firm Innovation Link

Firms from transitional economies need to achieve a level of absorptive capacity comparable with their developed economies' counterparts in order to produce and deliver quality products and services (Nguyen et al., 2013; Wu et al., 2016). Absorptive capacity may be hindered by slow and complex processes stemming from lagging historical socialist processes, inability to adapt to modern diversified internationalization processes or complexity of various geographical markets (North, 1990; Nguyen et al., 2013). Transitional economies' institutions aid in bridging the gap between socialist and capitalist market structures, thereby assisting firms to effectively compete in domestic and international markets. Industrial relations, scientific institutions and government policies form a set of formal and informal structures that assists firm's performance (Freeman, 1995; Marano et al., 2016), which form a foundation for Hypothesis 1.

Hypothesis 1: Institutional-level support has a positive effect on firms' innovation.

Firm Innovation and Glocalisation Link

Absorptive capacity enables firms to successfully transfer market inputs into outputs. Successful absorptive capacity results in innovation processes with products and services, which satisfy customer demands and seize available market opportunities (Soet, 1987; O'Cass & Weerawardena, 2009;

Marques et al., 2017). Customisation of global preferences allows local attributes to form competitive features of the global market, whereby a concept of glocalization depicts firms' international competitiveness on a local level based on which firms develop products and services locally for a global market (Robertson, 1995; Carayannis and Meissner, 2017). This paper uses a concept of glocalization to identify whether competitiveness of 6 transitional economies is influenced by their innovation performance. Glocalisation is represented by three variables that depict their competitive success: (1) glocal sales performance, (2) the percentage change in export performance, and (3) the real effective exchange rate.

Hypothesis 2: Firm's innovation leads to its better glocal performance.

Hypothesis 3: Firm's innovation is supported by institutions to achieve better glocal performance.

INSTITUTIONAL FACILITATORS, INNOVATION AND GLOCALISATION IN THE CONTEXT OF THE SELECTED TRANSITIONAL EU MEMBER STATES

The two-tier Europe discussion stems from the poorer economic performance of the European Union (EU) member states that joined the EU after 2002. This analysis focuses on Croatia, Czech Republic, Hungary, Poland, Slovakia and Slovenia (in alphabetical order) as a list of comparable member states that entered the EU and underwent the transition process from a formerly socialist toward a market system after the fall of the Berlin wall in 1991. This paper's topic spans across institutions, innovation and glocalisation based on the premise that the transitional progress can be measured (EBRD, 1994; Edquist, 1997).

European Innovation Scoreboard (2018) measures innovation performance of the EU member states and differentiates between the EU member states that are: innovation leaders (Denmark, Sweden, the Netherlands, Finland, Luxemburg and the UK), strong innovators (Germany, Belgium, Ireland, Austria, France and Slovenia), moderate innovators (Czech Republic, Poland, Malta, Spain, Cyprus, Italy, Estonia, Lithuania, Greece, Hungary, Latvia, Slovakia and Croatia) and modest innovators (Romania and Bulgaria). This paper compares the institutional, innovation and glocal performance of the six EU comparable member states that are undergoing a transition from a socialist towards a capitalist market system based on the European Innovation Scoreboard data (2018) for the periods between 2010 and 2018.

Institutional-level support of the six transitional EU member states

European Innovation Scoreboard (2018) presents a list of innovation-friendly environment indicators used in this paper as indicators of institutional-level support. Innovation-friendly environment includes two items: broadband penetration and opportunity-driven entrepreneurship. Broadband penetration shows the number of enterprises with a maximum contracted download speed of the

fastest fixed internet connection of at least 100 Mb/s. Broadband penetration is employed as an institutional-level support indicator because faster and higher-quality internet service increases competitiveness. Based on the premise that broadband penetration aids in job creation and economic growth (Katz, 2009; Ericsson, 2013), the EU has made policy and regulatory measures including 15 billion Euro available to the EU member states for that purpose (European Union, 2018).

Opportunity-driven entrepreneurship is an index calculated as the ratio between the share of persons involved in improvement-driven entrepreneurship and the share of persons involved in necessity-driven entrepreneurship based on Global Entrepreneurship Monitor's three-year average data. As opposed to necessity-driven entrepreneurship, opportunity-driven entrepreneurship is pro-cyclical and growth-oriented business (Fairlie & Fossen, 2017), which stems from cultural orientation (Ferrante & Ruiu, 2014). As opportunity-driven entrepreneurship encompasses culturally enabled institutional differences in risk aversion, this paper uses it as institutional-level innovation facilitator indicator together with a broadband penetration indicator. The two indicators are summarized under Innovation-friendly environment index (Figure 2).

Source: European Innovation Scoreboard (2018)

Figure 2. Institutional-level support

Figure 2 shows that for the period 2010-2017 institutional-level support is the highest in Slovenia, then in Czech Republic, while Croatia exhibits the worst institutionally enabled innovation environment.

Innovation activities of the six transitional EU member states

Firms innovation indicators are: (1) innovation input, and (2) innovation output indicators. Innovation input measures firm investment into innovation processes with three items: (1) R&D expenditure in the business sector (% of GDP), (2) non-R&D innovation expenditures (% of turnover), and (3) enterprises providing training to develop or upgrade ICT skills of their personnel (Figure 3).

Source: European Innovation Scoreboard (2018)

Figure 3. Innovation input

Slovenia has the highest innovation input indicator as Slovenian firms spend the largest portion of its GDP on innovation-related activities. These activities were the lowest in 2014, a year that preceded the institutional-level support slump. The Czech Republic ranks second and Croatia third, both of which firms experienced a fall in innovation inputs in 2012 and are on the recovery path since then.

Three items measure innovation output: (1) SMEs with product or process innovations refer to SMEs introducing product or process innovations as % of SMEs, (2) SMEs with marketing or organisational innovations implies SMEs introducing marketing or organisational innovations as % of SMEs, and (3) SMEs innovating in-house, depict SMEs innovating in-house as % of SMEs jointly depicting the Innovation output (Figure 4).

Source: *European Innovation Scoreboard (2018)*

Figure 4. *Innovation output*

Figure 4 shows innovation output activities of firms in the selected transitional EU member states. Innovation output throughout the 2010-2017 period had been fairly constant in Slovenia, does not exhibit large fluctuations, and is the highest among the six comparable member states. Innovation output is the lowest in Poland.

Glocalisation of the six transitional EU member states

Glocalisation measures domestic and international competitiveness of six comparable transitional EU member states. Glocalisation is represented by three comparable variables: (1) glocal sales performance, (2) the percentage change in export performance, and (3) the real effective exchange rate. Glocal sales performance is composed of three indicators: (1) exports of medium and high technology products, (2) knowledge-intensive services exports and sales of new-to-market, and (3) new-to-firm innovations (European Innovation Scoreboard, 2018). Exports of medium and high technology products as a share of total product export include value of medium and high-tech exports, in national currency and current prices. Knowledge-intensive services exports as percentage of total services exports encompass exports of knowledge-intensive services as the sum of credits in Extended Balance of Payments Services 2010. Sales of new-to-market and new-to-firm innovations are measured as percentage of turnover (Figure 5). Glocal sales performance index is a good indicator of competitiveness as it provides data on high value added on domestic and foreign sales.

Source: European Innovation Scoreboard (2018)

Figure 5. *Glocal sales performance*

Figure 5 shows that throughout the period 2012-2017 Slovakia's firms have the greatest glocal sales impact among the examined EU member states. Slovenia shows modest glocal sales impact from its innovation activities regardless of its highest institutional-level support and innovation, behind both Hungary and Czech Republic, while Croatian firms have consistently performed the worst in the period. Croatian firms also exhibit the lowest institutional-level support and modest innovation performance compared to the other six EU member states.

Innovation is often used to increase value of products and services, firms' profits, and ultimately, national competitiveness. National competitiveness is measured by indicators such as real effective exchange rate and export market share. The trend shown in Figure 6 is a five-year percentage change in export market share.

Source: Eurostat(2018a)

Figure 6. Export market shares- 5 year percentage change

The most global competitive transitional economy according to the five-year percentage change in export market share is Poland, which also has the lowest innovation output, followed by Slovakia, which has the best global sales performance, and only after 2016 taken over by Croatia and Slovenia.

Real effective exchange rate (REER) shows the country’s price or cost competitiveness relative to a country’s main competitors on the global market. It is deflated by consumer price indices and expressed as index with base year 2010 (Figure 7).

Source: Eurostat (2018b)

Figure 7. Real effective exchange rate (2010=100)

Similarly, as glocal sales performance, REER shows that Slovakia is the most competitive transitional economy, followed by Slovenia, Czech Republic and Croatia. Hungary is the worst glocal competitiveness performer based on REER.

RESULTS OF HYPOTHESES TESTING OF INSTITUTIONAL-INNOVATION-INTERNATIONALISATION NEXUS IN THE CONTEXT OF THE SIX TRANSITIONAL EU MEMBER STATES

Table 1 shows the descriptive statistics of the six variables used in the analysis of a 48-cross-country data of the six transitional economies for the period between 2010 and 2017, which have been described the previous section.

	N	Mean	Min	Max	Standard deviation	Skewness	Kurtosis	Jarque-Bera	Sum	Sum of square deviations
Institutional facilitators	48	0.29	0.07	0.57	0.12	0.40	2.48	1.85	13.76	0.73
Innovation input	48	0.39	0.24	0.59	0.10	0.50	2.38	2.82	18.68	0.44
Innovation output	48	0.30	0.02	0.60	0.18	-0.03	1.57	4.11	14.44	1.47
Glocal sales performance	48	0.51	0.17	0.72	0.16	-0.51	2.11	3.67	24.39	1.17
5-year % change in market share	48	-1.23	-24.08	28.44	13.05	0.08	2.48	0.60	-59.07	8007.31

Table 2. Correlation coefficients

Correlation coefficients for the given European Innovation Scoreboard (2018) indicators of the six selected EU member states show moderate correlation between institutional-level support and innovation input (0.60), and very small correlation between both institutional-level support and

innovation output (0.28). It is interesting to note that the correlation between innovation input and innovation output is the highest of the examined correlations (0.79), while there is neither correlation between global sales performance and innovation input, nor between global sales performance and innovation output.

The results of unit root tests are given in Table 3.

Method	Institutional-level support	Innovation input	Innovation output	Glocal sales performance	5-year change market share	% in REER

Table 3 Unit root tests

Table 3 shows existence of serial correlation and heteroskedasticity at level in institutional-level support, innovation input, global sales performance, 5-year percentage change in export market share and REER, and their absence in the first difference (I(1)). Panel analysis used the lag of dependent variable to eliminate the effect of serial correlation at level with cross-section weights and coefficient covariance method (PCSE) estimator:

$$Y_{it} = \beta_0 + \beta_1 \times X_{it} + \beta_2 \times Y_{i(t-1)} + \mu_{it}$$

where y_{it} in Hypothesis 1 is: (a) innovation input, (b) innovation output, and in Hypothesis 2 and 3: (c) global sales performance, (d) 5-year percentage change in market share, and e) REER, of each of the six transitional European union member state i at time t ; and x_{it} is institutional-level support in each of the six transitional European union member states i at time t for Hypothesis 1, and innovation input and innovation output for Hypothesis 2; μ_{it} is the error term.

Table 5 Panel analysis: The effect of innovation on glocalization (H2)

Table 5 shows the results of panel analysis of the effect of innovation input and output indicators on glocalization indicators for the six transitional EU member states for the period 2010-2017, i.e., the results of Hypothesis 2 testing. Innovation input affects glocal sales performance and a 5-year percentage change in market share of the six transitional economies but not REER. Moreover, a 5-year

percentage change in market share is the only glocalization indicator affected by innovation output and the share of innovation output in innovation input. The share of innovation output in innovation input has been used to analyze the effect of absorption capacity on glocalization.

Table 6 Panel analysis: Moderation effects (H3)

Finally, Table 6 shows the results of the panel analysis of moderation effects depicted in Hypothesis 3: Firm's innovation is supported by institutions to achieve better glocal performance. The results have been displayed for two indicators that affect a 5-year percentage change in market share: (1) innovation input, and (2) the share of innovation output in innovation input. The results show that in the period

2010-2017 for the six transitional EU member states institutional support affects a 5-year percentage change in market share, but its affect is negative in conjunction with either innovation input (significant effect) or the share of innovation output in innovation input (insignificant effect).

Furthermore, this paper examined the effect of the institutional facilitators in the two periods, before and after 2012, when the noted increase in all indicators is visible (Tables 6a and 6b).

Table 6a Panel analysis: Moderation effects (H3a)

When examining the effect of institutional-level support based on the share of innovation output in innovation input, the results similarly show that before 2012 increase in all indicators, institutional-level support had a negative effect on the 5-year percentage change in market share and positive but insignificant effect thenafter. The interesting fact emerges from the results, and includes a negative significant effect of the share of innovation output in input indicator on the 5-year percentage change in market share.

DISCUSSION AND CONCLUSION

Although it is important for firms to innovate, time and budget often constrain them to do so. Firms are often not acquainted with expansion possibilities on differing global markets nor with threats coming from those markets. This paper uses an analogy of glocalisation to depict the importance of local economy's international competitiveness whereby internationalization influences the internal structure of the economy and is observed in the firms' glocal performance (Murray et al., 2017; Venables, 2018).

This paper examined the effect of institutional-level support on innovation and glocal performance of six member states of the European Union that underwent transition from the socialist to market systems. Descriptive analysis of institutional-level support, innovation and glocalization shows that the six transitional EU member states are recovering after being hit by the 2008 global recession, progressively after 2012. In the period between 2010-2017 institutional-level support for firms was the highest in Slovenia and the Czech Republic, and the lowest level in Croatia. It increased after 2012 in the majority of six transitional member states. Innovation input had also increased after 2012 in all economies apart from Slovakia and the Czech Republic, while innovation output has been lower in all examined transitional member states after 2012 compared with the previous period. Slovenia and the Czech Republic spent the largest portion of their GDP on innovation-related activities, and have the highest innovation output. Glocalisation indicators that, among others, depicted exports of medium and high technology products as a share of total product export and real effective exchange rate, show that Slovakia has the best position among the six examined EU member states, followed by Hungary and the Czech Republic. Glocal sales performance decreased in all examined EU member states after 2012 apart from Slovakia, while the 5-year percentage change in market share and the real effective exchange rate have consistently increased after 2012.

Correlations between institutional-level support and firms' innovation input, and innovation input and innovation output were further examined in panel analysis. Hypothesis 1 examined whether institutional-level support affects firm innovation. The results of the panel analysis show that institutional-level support affects innovation input, but not output indicators of the six transitional EU member states. Hypothesis 2 examined whether firm innovation affects glocal performance. Innovation input affects glocal sales performance and a 5-year percentage change in market share of the six transitional economies, but not REER. Moreover, a 5-year percentage change in market share is the only glocalization indicator affected by innovation input and the share of innovation output in innovation input. Lastly, Hypothesis 3 examined whether firm's innovation is supported by institutions to achieve better glocal performance. The results of the panel analysis show that institutional support affects a 5-year percentage change in market share, but its effect is negative in conjunction with either innovation

input (significant effect) or the share of innovation output in innovation input (insignificant effect). Lastly, the analysis has shown that in the context of the six transitional EU member states institutional-level support's effect on the 5-year percentage change in market share differs in the periods before and after 2012, when an increase in all indicators was noted. Innovation input has a positive effect on the 5-year percentage change in market share in both periods. However, before 2012 institutional-level support had a negative effect on the 5-year percentage change in market share and positive but insignificant effect thereafter.

Policy implications

Underestimation of market failures that occurs due to firms' adverse selection issues (Cimoli et al. 2009; Maloney, 2017) or information asymmetries that occur due to poor governance or low effectiveness of innovation systems (Watkins et al., 2015) can be minimized by institutions in transitional economies. This analysis has shown that affecting spending on innovation in transitional economies will result in greater innovation input. Carvahlo et al. (2015) therefore suggest that the EU should continue to promote policies to support innovation with increasing both private investment incentives and public spending. The rate at which firms' absorptive capacity allows them to transfer innovation inputs into outputs will however be unaffected in the short run. The effects of institutional-level support in the periods 2010-2012 and 2013-2017 show that the effect of institutional-level support was negative in the period 2010-2012, and positive in the period 2013-2017. The lagging effect of institutional-level support is visible only in the long run, whereby a growing market share is the result of both domestic and international circumstances that were impeded by the global recession after 2008. After global economy started to pick up its momentum, and consequently the examined transitional economies as well, it took time for the transitional economies to pick up the pace. Moreover, a negative effect of institutional-level support in the period prior 2012 can be a result of counter-cyclical government policies, which were beneficial in the period after 2012. Nonetheless, the policy response have been too slow, and it is especially meaningful to observe the highest glocal competitiveness of Slovakia, among the observed transitional member states, and which does not portray neither the highest institutional-level support nor innovation input. However, the policy responses seem to be countercyclical when observing the rise in institutional-level support and glocal sales performance, both of which had to be the results of the government policies in the previous periods. Although, a short period of this study needs to be taken into account when making policy recommendation, there is a necessity of a long-term policy orientation and planning.

Recommendations for future research

The presented analysis needs to be taken with caution due to short time period examined. Future analysis should examine longer time periods and particularities of each transitional EU member state.

Moreover, it would be interesting to observe sectoral changes in high-technology sectors to make sector-specific conclusions concerning the institutional facilitators and glocalisation based on firms' innovation activities, as well as cycles of government policies in line with market share expansion of the longer time periods.

AN ANALYSIS OF UK ANDERSEN CLIENTS PRE- AND POST ANDERSEN DEMISE: WHERE HAVE THEY GONE AND DID THEY PAY MORE?

Basioudis, Ilias

Aston Business School, Aston University, United Kingdom

ABSTRACT

The indictment of Arthur Andersen (AA) by the US Department of Justice in March 2002 was a major shock to the audit industry. AA's listed clients, representing about one-eleventh of the UK audit market, needed new auditors quickly. In this paper we examine the new auditor selection of former AA audit clients and whether former AA clients went on to pay significantly more or less to their new auditors in audit and non-audit fees in 2002 relative to year 2001. Predictably, all but two former AA clients in this study went to one of the remaining Big 4 audit firms. Although Deloitte captured about 79% of former AA clients, it was Ernst & Young that gained the bigger former AA clients (based on 2001 mean client sales) and the biggest increase in audit fee rate (35.8%) from former AA clients. The results also indicate a significant average growth in both audit (10%) and non-audit fees (25%) but this is not pervasive across the Big 4 firms. Further, all audit firms increased their audit fees (as a percentage of total fees) by about 6%, and decreased non-audit fees (as a percentage of total fees) by about 7% in 2002 relative to 2001. In addition, despite the absolute increase in audit fees, further econometric analysis reveals that the UK audit market experienced no changes in inflation adjusted audit fees between 2001 and 2002. The results suggest that the audit industry adopted a pricing strategy of auditor fees that should reduce future negative political attention and enhance the perception of auditor independence.

Keywords: Arthur Andersen, audit pricing, inflation adjusted audit fees, auditor independence

1. INTRODUCTION

Since 2001 the market for audit services has changed dramatically. Scandals involving large public companies (mainly in the US) such as Enron and WorldCom emphasised the need for more intensive and thorough audits. The indictment of Arthur Andersen by the US Department of Justice on March 15, 2002 resulted in a major shock to the audit industry. Soon after the verdict was given, Andersen announced it would cease auditing public companies. This decision affected the whole network of Andersen offices around the world, and the Andersen partnership was quickly dissolved.

Within a matter of few weeks, the number of audit firms capable of auditing large multinational companies reduced from five to four. Every Andersen client was forced to switch auditors on short notice.

The demise of Arthur Andersen leaves only four large international accounting firms in the world. This causes significant problems for large international companies, because they are required to use separate accounting firms for their audit work and most non-audit services. Therefore, the loss of the fifth big accounting firm has considerably reduced the competition among the accounting firms, limited choice, and has increased accounting costs for many clients. At about the same time, the Sarbanes Oxley Act was passed in the US, and the additional work required by the Act increased the costs of the auditor. In addition, possible increased liability and financial risk, and the purchase of higher insurance cover for auditors may have the potential to increase audit fees.

In this paper we investigate the effect of the confluence of events such as the Enron debacle, the Andersen demise, and the passage of the Sarbanes Oxley Act on the market for audit services in the UK. In particular we examine the effect of these events on the fees paid by former Andersen clients for their audits, and on the movement of those clients from Andersen to another auditor.

Our results are consistent with the view that auditors in 2002 needed to adopt a pricing strategy for their audit and non-audit services to avoid further political attention and future regulatory interest. The results show no audit fee premiums were paid by the former Andersen clients in 2002 and that the inflation-adjusted non-audit fees declined in the same period.

The paper is organised as follows. The next section provides a brief history of the events surrounding Arthur Andersen's collapse. We develop our hypothesis in section 3, and section 4 contains an analysis of our data. Section 5 discusses the research methodology and section 6 presents the empirical results. The paper concludes in section 7 with a discussion of our results.

2. BACKGROUND – THE ARTHUR ANDERSEN CHRONICLE

Arthur Andersen was founded in 1913 by Arthur Andersen and Clarence DeLany as Andersen, DeLany & Co. The firm changed its name to Arthur Andersen & Co. five years later and its first major client was the Schlitz beer company of Milwaukee. Mr Andersen passed away in 1947, but the firm continued under Leonard Spacek, a reformist who proposed the establishment of a standard 'accounting court' in the 1950's and 60's and which bore fruit in the establishment of today's FASB. By the 80's, Arthur Andersen & Co had become one of the world's biggest professional services firm. Andersen is alleged to have been over the years involved in the fraudulent accounting and auditing of Sunbeam, Waste Management, Asia Pulp and Paper, and the Baptist Foundation of Arizona, among

others in the US.¹ Similarly, in the UK, Andersen was found to have allowed questionable accounting at SSL and MyTravel among others (Nisse 2002).

In 2001, Arthur Andersen LLP, based in Chicago, Illinois, was one of the Big-5 accounting firms, offering auditing, tax services, and consulting, and employing 85,000 professionals in 84 countries, with its U.S. division reporting revenues of \$9.3 billion. The UK division was smaller with about 380 partners and 5,000 staff and revenue of about UK£800 million². One of its largest clients was Enron, the seventh largest corporation in the United States, based on its reported revenues. Arthur Andersen's indictment and ultimate collapse began with Enron's accounting manipulations. At the time that Enron's accounting problems were discovered, Andersen had been Enron's auditor for several decades. Allegedly, Enron had misrepresented their financial performance and condition for a number of years, and Andersen's Houston office had either failed to discover the manipulations or failed to report them.

On October 16, 2001, Enron publicly announced a \$618 million net loss for the third quarter of 2001 and privately informed analysts that it would reduce shareholder equity by approximately \$1.2 billion. Additionally, it reported a \$1.01 billion charge in its earnings to correct accounting errors. The market reacted immediately and the stock price of Enron shares plummeted (Chaney and Philipich 2002). This called the independence of Arthur Andersen into question because the firm had provided significant non-audit services to Enron in addition to its fees associated with the Enron audit. In 2001, Arthur Andersen received from Enron \$47.5 million in fees, \$34.2 million of which was for audit and tax related work and \$13.3 million of which constituted fees for other services. As a result, the Houston office responsible for providing audit services to Enron was severely criticised.

Subsequently, on October 19, the U.S. Security and Exchange Commission (SEC) began an inquiry (an informal originally which quickly became a formal one) regarding Enron's "special purpose entities" and, seeking information about Enron's financial statements that Andersen had audited, and the services it had provided to Enron in 2001. On October 23, Arthur Andersen's Houston office began extensive shredding of Enron-related documents. On November 8, Enron reported that its debt had been significantly understated and that it needed to reduce and restate earnings from 1997 to 2000. On the same date, the SEC issued Andersen with a subpoena on Enron-related documents and stopped the shredding at the Houston office. By then, David Duncan, then senior partner in charge of the Enron account, and his colleagues had already had a significant but

¹ http://en.wikipedia.org/wiki/Arthur_Andersen#Founding

² About 230 partners and 3,300 staff of Andersen UK joined Deloitte in April 2002 as the Andersen partnership came to an end in the UK. Deloitte gained some high-profile UK audit clients from Andersen, such as Cadbury Schweppes, WPP, BSkyB, British Land, Canary Wharf, and Shire Pharma.

undetermined number of electronic and paper documents at Andersen's offices in Houston, Portland, Oregon, Chicago and London in the UK destroyed (Chaney and Philipich, 2002).

On December 2, Enron filed for Chapter 11 bankruptcy protection. On January 11, 2002, Enron shares suspended on the NYSE, and five days later Andersen fired David Duncan, lead audit partner in charge of Enron, three other partners were put on leave, and new management put in place at the Houston office. On March 15, 2002, and in spite of Andersen's attempts to institute internal reform and to negotiate with the U.S. Justice Department, the latter unsealed a criminal indictment against Arthur Andersen. On May 2, a federal jury trial began, and on June 15, Andersen was convicted on one count of obstructing justice¹. From August of that year Andersen was no longer allowed to provide audit services to its clients.

There are several elements of Andersen's demise that are important to our study. First, Andersen's conviction of criminal violation of law was unanticipated and occurred fairly quickly. Within only 7-8 months, Enron's initial report of a problem led to Andersen's indictment. Second, once the criminal indictment occurred, Arthur Andersen went out of business without much delay, and reduced the already small number of large accounting firms capable of auditing complex multinational companies from five to four. Third, Andersen's dissolution led to a massive (at least in the US), involuntary exodus of client firms from Andersen. All of Andersen's approximately 2,000 US clients needed new auditors quickly. This turnover involved roughly one-sixth of all US audit clients. Andersen had a much smaller share of the audit market in the UK. Andersen audited only 63 listed manufacturing and industrial UK companies and, as a result, the indictment of Andersen by the US Department of Justice was not as a major shock to the UK audit industry as in the US. Nonetheless, Andersen's listed clients, representing about one-eleventh of the UK audit market, needed new auditors quickly. Fourth, the Sarbanes-Oxley Act introduced on July 30, 2002 in the US and affected all countries and companies, increased substantially the costs of an auditor due to additional audit work required by the new Act. Further, due to its enlarged requirements, the Act may have caused a number of smaller accounting firms to exit the market, decreasing competition for small audits.

To summarise, with the sudden and quite remarkable disappearance of Andersen's firm, the landscape at the top end of the accounting profession changed dramatically. The disappearance of Arthur Andersen left only four large international accounting firms in the world. This caused significant problems for large international companies, because they are required to use separate accounting firms for their audit work and most non-audit services. Therefore, the loss of the fifth big

¹ Few years later, on May 31, 2005, Andersen's conviction for obstruction of justice was overturned by the U.S. Supreme Court unanimously, largely on technical grounds. By then, however, Andersen had already effectively ceased to exist as an entity and it had disintegrated with its various arms around the world sold off or merged into other Big 4 firms.

accounting firm had considerably increased the amount of work required of auditors, reduced the competition among the accounting firms in the audit market and increased accounting costs for many clients. The effect of all these changes has the potential to increase audit fees.

3. MOTIVATION AND HYPOTHESIS DEVELOPMENT

As we note in the previous section, in a very rapid fashion the market for audit services of listed companies changed from late 2001 to mid 2002. It was mid-October 2001 when Enron reported initially a problem with its financial statements, and it was mid-June 2002 when Arthur Andersen was convicted of obstructing justice in the US. Andersen's collapse in the US was followed by an involuntary departure of audit clients from Andersen around the world, which they were forced to switch auditors. This came as both a surprise and a shock to the audit industry.

The cascading events that led to the Andersen indictment and the subsequent passage of the Sarbanes-Oxley Act had several potential consequences. The rapid demise of Andersen may have alerted other accounting firms to the huge risks that accompany an audit, and may have prompted them to potentially reconsider the rewards for servicing these risks (Nyberg, 2002). In addition, the audits of many Andersen clients that were in progress at the time of the indictment were disrupted by the unanticipated need to replace Andersen, potentially contributing to an increase in their complexity and a reduction in the time available for their completion by successor auditors¹.

Further, many inside and outside of the accounting profession were requesting audits to be more exhaustive with less reliance on management and more testing (McNamee and Weber, 2002), and as a consequence, audits may have cost more because of increased hours put in by audit personnel. For example, Dennis Nally, PricewaterhouseCoopers' U.S. chairman and senior partner, noted that "audit committees are asking us to do more work, visit more locations, and get involved with different types of issues" (PwC, 2002).

Additionally, in the climate of those days and the disarray in the accounting profession and the exodus of clients from Andersen, clients seemed to be desperate to rebuild market confidence in their financial statements and thus may have been more willing to comply with their auditors' changing fee demands. Chaney and Philipich (2002) find that the shredding of documents by Arthur Andersen negatively affected the market perception of Andersen's other audit clients. This negative market perception of Andersen's former audit clients may have influenced the pricing of their 2002

¹ The growth in the successor auditors' audit staff some of which was achieved through the absorption of former Andersen personnel and partners may have alleviated somewhat the lack of resources available to successor auditors to perform adequately the unexpectedly gains of the ex-Andersen audits. To the extent that this was the case, we expect a conservative bias towards the null hypothesis proposed later in the paper. On the other hand, the new staff would have had to be trained and acclimatised in the procedures and processes of the new firm.

audit fees. Likewise, in a further attempt to illustrate that their accounts were robust, clients were requesting that the scope of their audit be extended. For example, some company board panels were even instituting quarterly meetings with their auditors, adding billable hours (McNamee and Weber, 2002).

Another factor that may have contributed towards increased audit fees was a raft of new projects that the Sarbanes-Oxley Act of 2002 along with the stock exchange rules handed to auditors. For example, internal control certifications is an additional audit work mandated by Section 404 of the Sarbanes-Oxley Act. Furthermore, accounting firms became aware that fees from non-audit services – which had driven their growth for a decade or more – looked to be on a downward spiral which was another impact of the Sarbanes-Oxley Act. If auditing was used as a “loss leader” in the past to offset any audit losses against the profits from consulting (Ciesielski and Weirich, 2006), limiting consulting would in equilibrium cause accounting firms to raise the price of their audit services to make up what they would lose on consulting from the same client.

Finally, after the demise of Andersen and the passage of the Sarbanes-Oxley Act, accounting firms started worrying about increased litigation and practice-protection costs, and they were therefore putting a contingency into their prices to cover additional costs for sturdier audits or to pay for litigation expenses when a sturdier audit wasn't enough. Beatty ((1993, p. 296), Simunic and Stein (1996, p. 126) and Willenborg (1999, p. 226) conclude that the evidence is generally consistent with a positive relation between audit fees and litigation risk. Seetharaman et al (2002) examine audit fees paid by U.K. companies that sell their securities in U.S. equity markets. They report evidence consistent with the “litigation risk - audit fee hypothesis”, in that audit fees are adjusted upward to reflect the increase in litigation liability present in the U.S. for auditors of these U.K.-based companies. In a more recent study, Venkataraman et al (2005) note that audit fees are higher in a higher litigation regimes, and audit fees reflect both the amount of audit evidence collected and an additional premium to cover litigation risk.

Individually and jointly, the events described above should increase the fees charged for auditing services. The above arguments lead to the following hypothesis (in the alternative form):

H1: Audit fees increased post Enron, Andersen and Sarbanes-Oxley

On the other hand, a theoretical model of audit pricing developed by DeAngelo (1981) indicates that non-incumbent auditors may “low-ball” or discount the initial audit engagement in order to earn the right to future quasi-rents of auditor fees. Although theoretical audit-pricing models assume that an incumbent auditor is in place, in this study we do not have one, as Andersen's indictment forced Andersen's clients to find a new auditor on short notice. Furthermore, low-balling is unlikely to exist due to collapse of Andersen, which eliminated one major competitor. Reducing the

number of accounting firms, in conjunction with the inundation of former Andersen's audit clients into the market seeking to replace Andersen, limits choice, further mitigates competition among the accounting firms in the audit market and increases the power of the remaining accounting firms *vis-à-vis* their clients. Hence, it is not anticipated that successor auditors low-balled the initial audit engagements for the former Andersen's audit clients.

In addition, the loss of the fifth big accounting firm had increased accounting costs for many clients. The perceived quality of the earnings reports of Andersen's audit clients may be tainted and therefore scrutinised to a greater degree than prior to Andersen's disintegration. As a result, a greater uncertainty by successor auditors and investors may surround the credibility of prior year financial statements of former Andersen's clients. This uncertainty and increased scrutiny is likely to increase the successor auditors' risk assessment and audit effort and, in turn, reflect higher audit prices than the prior year. It also indicates that successor auditors were unlikely to low-ball to gain the audit engagements for the former Andersen clients.

4. SAMPLE AND DESCRIPTIVE STATISTICS

In this section, we discuss the sample and descriptive statistics for our analysis of companies that were forced to change auditors after the demise of Andersen.

4.1. Sample Selection

The sample selection began with all UK publicly held companies and was narrowed down to those companies that were audited by Arthur Andersen LLP at the time the indictment was unsealed in 2002. The initial set of companies comprises all 2,125 active companies listed in the London Stock Exchange and is largely collected on-line from the FAME database, which provides financial and other data for all UK listed companies for the financial years 2001 and 2002. Additionally, a small number of annual reports on the companies included in the sample was downloaded from the Thompson Research on-line library. This is the first UK study using data surrounding the collapse of Arthur Andersen. Table 1 lists the sample selection process.

TABLE 1: Sample Selection

Procedure	Number of Firms	
	Deleted	Left
Companies listed in London Stock Exchange		2125
All Primary UK (SIC) except financial, services and property industries	(1165)	960
Companies with available data on Fame Database for both 2001 and 2002	(185)	775
Companies that were not audited by Arthur Andersen in 2002	(2)	773

The audit fee model used in the current study includes the two consecutive financial periods from 2001 to 2002; therefore, it is essential to obtain adequate data for both years. Financial, service and property industries have fundamentally different operating characteristics and they are normally

excluded from this type of analysis. We also omit observations with incomplete FAME data. Next, we delete two companies that were still audited by Arthur Andersen at the end of 2002. The final usable sample includes 773 companies from which 63 companies had used Arthur Andersen as an external auditor in 2001. The final sample of this study therefore, consists of 63 former clients of Andersen that were forced to switch auditors in 2002.

4.2. Data Analysis

In this section we provide some descriptive evidence of the distribution of former Andersen clients.

Where did former Arthur Andersen's clients go?

In 2001 and prior to the demise of Arthur Andersen, Andersen audited 8% of the usable sample of this study (i.e., the 773 companies listed in the London Stock Exchange), while PricewaterhouseCoopers audited 24%, KPMG 20%, Ernst & Young 12% and Deloitte Touche 11% of the sample. The mean net turnover reported by Andersen's clients in 2001 averaged UK£477.2 million while the average non-Andersen clients' turnover for the Big-4 firms ranged from £876 million for KPMG to £2 billion for EY.

TABLE 2: Year 2001 and 2002 Mean Sales of 773 Audit Clients by accounting firm prior and after the collapse of Arthur Andersen (in thousands)

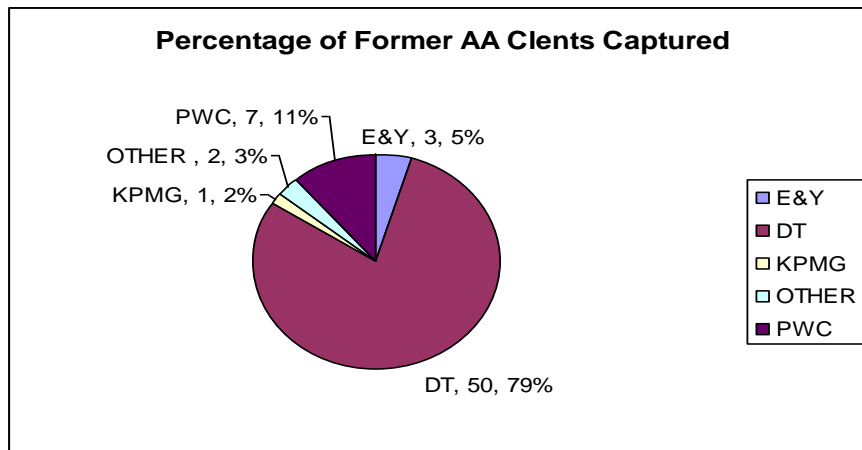

Σφάλμα! Λανθασμένη σύνδεση.

Accounting Firms: AA= Arthur Andersen; E&Y= Ernst & Young; DT= Deloitte & Touché; KPMG= KPMG Peat Marwick; and PWC= PricewaterhouseCoopers

Predictably, all but two former Andersen's clients in this study switched to one of the remaining Big 4 audit firms. Although Deloitte captured about 79% ($n=50$) of former Andersen clients, it was Ernst & Young that gained the bigger former Andersen's clients (UK£624 million, based on 2001 mean client sales) in spite of absorbing only three of the 63 former Arthur Andersen clients. Table 3 shows the distribution of the 63 former Andersen clients among the remaining audit firms and mean turnover for 2001.

TABLE 3

Percentage and Number of Former Arthur Andersen Audit Clients Captured by the Big Four and non-Big Four accounting firms and the Respective 2001 Sales Amounts

	# of Firms	% of Firms	Mean 2001 Sales (in thousand)	% of Sales
KPMG	1	2%	7,800	0.4%
PWC	7	11%	477,838.1	29%
DT	50	79%	495,859.3	31%
EY	3	5%	623,562.7	39%
OTHER	2	3%	22,278.5	1%
TOTAL	63	100%	1,627,338.57	100%

Accounting Firms: AA= Arthur Andersen; E&Y= Ernst & Young; DT= Deloitte & Touché; KPMG= KPMG Peat Marwick; and PWC = PricewaterhouseCoopers

Based on Tables 2 and 3, we can also conclude that the Andersen client companies have followed their then existing auditors who most of them joined Deloitte & Touché, after the collapse of Arthur Andersen. However, the number of companies absorbed by Deloitte & Touché was more than expected according to its mean sales in 2001. Similarly, it becomes evident that the former Andersen's clients were not absorbed by the dominant audit firm in the market, based on mean sales for 2001, which was PwC.

How much did former Arthur Andersen's clients pay?

Table 4 presents descriptive statistics for the audit fees, non-audit fees and total auditor remuneration paid to the new successor auditors in year 2002 by the 63 former Andersen clients. In column (a) of Panel A, the mean audit fees for the 63 companies equals to £292,000 ranging from £20,000 to £3 million. It can be seen that although most of former Andersen clients switched to its

'natural successor in the UK' Deloitte (79%), the mean audit fees gained was much lower than Ernst & Young. Ernst & Young has the highest mean (£674,000) and median (£234,000) audit fees than the other audit firms, although Ernst & Young captured only three of the 63 former Arthur Andersen clients. It is important to note here that the mean audit fees paid to Ernst & Young are remarkably higher than the mean audit fees paid by all other former Arthur Andersen clients to other audit firms. Deloitte & Touché received on average £282,660 in audit fees from each former Andersen client, considerably lower than that of Ernst and Young and slightly lower than the mean audit fees of PwC (£292,710). Amongst the Big 4 firms, KPMG received the lowest average audit fee per client.

In column (b), the mean for total non-audit fees equals to £506,302. Deloitte & Touché has the highest mean (£599,280) and median (£155,000) non-audit fees among the Big Four audit firms. In column (c), the mean total auditor remuneration paid by the former Arthur Andersen clients in 2002 is £798,269 ranging from £21,000 to £12.2 million. Deloitte & Touché, which captured the largest quantity of former Arthur Andersen clients, has the highest overall mean (£881,940) and median (£315,500) total auditor remuneration, and together with E&Y their mean total auditor remuneration exceeded the mean total auditor remuneration to all other audit firms.

Next, in Panel B, we test the mean audit fees, non-audit fees and total auditor remuneration to see if they are proportionally equal across auditors for the 63 former Arthur Andersen clients. To do this, the ANOVA analysis, Kruskal-Wallis test and the Median test procedures are used. All tests indicate that the 2002 mean audit fees across auditors do not significantly differ from one to the other. Moreover, the analysis of variance F-statistic for non-audit fees of 0.201 with probability 93.7% indicates that the mean non-audit fees are not significantly different across the accounting firms. The alternative measures using the Kruskal-Wallis and Median test provide similar results. Finally, the analysis of variance F-statistic, the Kruskal-Wallis and Median test for total auditor remuneration point to there being no significance difference across the accounting firms.

Did the new auditors charge more or less for audit and non-audit services?

In this section we test whether the differences between audit fees, non-audit fees and total auditor remuneration charged in year 2001 by Andersen were significantly different from the fees charged in year 2002 by the successor auditors. In order to test the change in auditor fees on a firm-by-firm basis, the changes per audit fee, non-audit fee, and total auditor remuneration are calculated. The year 2001 fees is subtracted from the year 2002 fees for firm *i* and this is then divided by the year 2001 fees for firm *i*. A positive result indicates a growth in fees in 2002 relative to those of 2001. In contrast, a negative result indicates a decline in fees in 2002 relative to those in 2001.

Panel A of Table 5 presents the change in fees by fee category and by auditor. Panel A shows an overall slight mean growth in audit fees of 10% for the former Arthur Andersen audit clients. Ernst & Young has the greatest absolute growth in audit fees of 38.5% from former Andersen's clients whereas PwC appeared to have charged 2% less to those former Andersen's clients that it audited after the demise of Andersen. In addition, Panel A shows a greater overall mean increase for the non-audit fees of 25% for the former Andersen clients. With the exception of PwC and Deloitte & Touché, who have shown a significant increase in non-audit fees from the former Andersen clients, the other audit firms charged less non-audit fees in 2002 relative to year 2001. Non-audit firms charged the two former Andersen clients that they gained 76% less in non-audit fees. The increase in non-audit fees in 2002 seems to be inconsistent with the Sarbanes Oxley Act prohibition on many non-audit services. It also shows that the Act did not have an immediate effect in the UK. KPMG charged the same amount in 2002 with the one that Andersen was paid in 2001.

As far as total auditor remuneration is concerned, we can see from column (c) of Panel A, that for the former Arthur Andersen clients the mean total auditor remuneration has increased by 9% from year 2001 to year 2002. All Big-4 audit firms increased their total auditor remuneration, apart from KPMG. Notice that the mean change of total auditor remuneration paid to PwC (16%) and Deloitte (12%) is greater than the mean change of total auditor remuneration paid in 2002 by all the other former Arthur Andersen clients. In addition, former Andersen clients of non-Big 4 firms showed an overall decline in total remuneration of 66%.

Panel B of Table 5 presents T-tests that are performed to determine whether the mean total change in auditor fees per category is significantly different from zero. The t-statistic of 1.989 for audit fees indicates that the mean growth in audit fees of 10% is significantly greater than zero with a probability of 5%. In contrast, the mean growth or decline in non-audit fees and total remuneration appears to be insignificant indicating that they are not significantly greater than zero. In Panel C of Table 5, we test whether the mean change in fees is proportionally equal across auditors. The analysis of variance shows that there are no significant differences in the mean change of fees between 2001

and 2002. In other words, the growth in audit fees, non-audit fees and total auditor remuneration is proportional across audit firms.

TABLE 5**Panel A: Change in Auditor Fees**

Change is calculated as [(Year 2002 fees- Year 2001 fees)/ Year 2001 fees]

Ernst & Young	Mean	£	38.52%	-34.13%	4.74%

Did the audit and non-audit percentages change?

This test shows whether the means of audit fees and non-audit fees as a percentage of total auditor remuneration are equal between the years 2001 and 2002. In results not tabulated, the mean audit fee as a percentage of total auditor remuneration increased from 49% in 2001 to 56% in 2002, a rise of 7%. On the other hand, the mean for non-audit services as a percentage of total auditor

remuneration decreased by the same percentage, from 51% in 2001 to 44% in year 2002. However, an F-test does indicate there is no significant change in these fee percentages between the years 2001 and 2002¹. Furthermore, the same pattern of increased audit fees and declined non-audit fees (as a percentage of total auditor remuneration) between the years 2001 and 2002 is pervasive across auditors and industry membership but the results remain insignificant using the F-test. We conclude from the results so far that in the UK the impact of Andersen's demise and the new Sarbanes Oxley Act that came into force in July 2002 did not influence much the pricing strategies of the audit firms in the UK.

4.3. Summary Descriptive Statistics

During the period 2001-2002, the mean inflation-adjusted audit fee for the former Andersen clients rose by a mere 0.2% from £279,319 to £279,887. On the other hand, the mean inflation-adjusted non-audit fee for the former Andersen clients declined by 16.3% from £582,695 to £487,718. The above decline of raw non-audit fee (as a percentage of total auditor remuneration) as well as the decrease in the inflation-adjusted non-audit fee between the years 2001 and 2002 may indicate that the accounting profession and audit firms in the UK were taking self-correcting actions to enhance the perception of auditor independence by imposing a downward adjustment in the pricing structure of non-audit service fees in 2002.

The total mean turnover of Andersen clients grew by 7.1 percent, or 4.4 percent when adjusted for inflation between 2001 and 2002. The average size of Andersen clients, as measured by inflation-adjusted total assets, declined by 7.9 percent from 567 million to 522 million. Andersen had qualified its audit report for five companies in 2001, on the other hand the successor auditors of Andersen qualified only one former Andersen client. The remaining variables have similar characteristics for both years 2001 and 2002.

5. METHODS AND AUDIT FEE MODEL

General monthly retail price indices are used to correct reported audit fees for inflation during the years from 2001 to 2002. In this way, we are able to account for changes in audit fees in addition to those attributable to general inflation². Audit fees, and non-audit fees paid by a company and the company's turnover were adjusted to the January 2001 general price index according to the month of the company's accounting year-end.

¹ The F-test for the audit fee as a percentage of total auditor remuneration is $F\text{-ratio}=0.010$, $p=.921$, and the corresponding F-test for the non-audit fee as a percentage of total auditor remuneration is $F\text{-ratio}=0.066$, $p=.797$. The non-parametric Mann-Whitney tests provide similar results.

² The average inflation rate in 2001 was 2.13%, whilst the average level rose in 2002 by 0.08 of a percentage point to 2.21%.

Following prior research, the cross-sectional audit fee regression model in equation (1) is used to estimate audit fee premia (Francis 1984; Craswell et al. 1995; Ferguson and Stokes 2002; Basioudis and Francis 2007). Audit fee regression models use a set of variables to control for cross-sectional differences in factors that affect fees such as client size, audit complexity and auditor–client risk sharing (Simunic 1980). These models have good explanatory power (adjusted r-squares of 0.70 and higher) and have been robust across different samples, time periods, countries, and sensitivity analyses for model misspecification (Francis and Simon 1987; Chan et al. 1993).

We begin with a pooled analysis of audit fees for the years 2001 and 2002 to examine whether Andersen clients paid a premium when they were forced to switch to new auditors in 2002. Fees are expected to exhibit general inflationary characteristics. These effects are modelled by including a dummy variable for year 2002 to control for time-specific factors occurring across the sample period. Year 2001 is omitted so that the subsequent year represents the relevant increase or decrease in fees relative to year 2001 level. In other words, the research design in equation (1) tests for any percentage changes in audit fees after controlling for other factors affecting fees. Formally, the test determines if there is a significant positive or negative intercept shift (higher or lower audit fees respectively) in the fitted regression model for the former Andersen clients audited in year 2002. The experimental indicator variable included in equation (1) is denoted YEAR2002 and represents the financial year the audit took place.

The OLS regression model is formally specified as follows:

$$\begin{aligned} \text{L-INF-AF} = & b_0 + b_1\text{L-INF-TA} + b_2\text{SQRTSUBS} + b_3\text{CATA} + b_4\text{QUICK} + b_5\text{GEAR} + \\ & b_6\text{ROCE} + b_7\text{FOREIGN} + b_8\text{OPINION} + b_9\text{BUSY} + b_{10}\text{LOSS} + b_{11}\text{L-INF-NAF} + b_{12}\text{LONDON} + \\ & b_{13}\text{YEAR2002} + e \end{aligned} \quad (1)$$

where:

L-INF-AF	= natural log of inflation-adjusted audit fees in GB pounds
L-INF-TA	= natural log of inflation-adjusted total assets
SQRTSUBS	= square root of total subsidiaries
FOREIGN	= foreign sales as a proportion of total sales
ROCE	= return on capital employed
GEAR	= gearing ratio
CATA	= ratio of current assets to total assets
QUICK	= ratio of current assets (less inventories) to current liabilities
OPINION	= indicator variable, 1 = qualified audit report
LOSS	= indicator variable, 1 = loss in any of the past three years
BUSY	= indicator variable, 1 = December 31st or March 31st year end,
L-INF-NAF	= natural log of inflation-adjusted fee paid for non-audit services (in GP Pounds)
LONDON	= indicator variable if observation is a London-based company
YEAR2002	= indicator variable if observation is audited in year 2002
E	= error term

With respect to the 12 control variables in the model, higher fees are expected (positive signs) for larger clients (L-INF-TA), for greater audit complexity (SQRTSUBS and FOREIGN), for greater audit risk (CATA, GEAR and LOSS), and for London-based companies (LONDON) due to higher salaries and other costs. A positive sign is expected for OPINION as prior studies document higher fees associated with modified opinions, possibly due to more investigative efforts in such circumstances. Given prior research, a positive association is also expected between audit fees and non-audit fees (L-INF-NAF). Negative signs are expected for the variables QUICK and ROCE. QUICK is an audit risk variable and clients with a smaller quick ratio are riskier (less liquid) and therefore are expected to have higher audit fees. Prior studies find that clients with higher ROCE have lower fees, which is consistent with auditor–client risk sharing, i.e., more profitable clients pose less risk to the auditor resulting in lower fees. Finally, clients with December 31st or March 31st fiscal year ends (BUSY) are expected to have higher fees as these are the predominant busy seasons in the UK.

6. RESULTS

As in prior audit fee research, the model in Table 7 is significant (F-ratios are significant at $p < .001$) and the models have a high level of explanatory power with adjusted r-squares of around 77%. Looking at the coefficient of interest we see that the coefficient on YEAR2002 is positive indicating a change in audit fees of 0.3 percent. However, the coefficient is not statistically significant. This result is hardly surprising given the little increase of 0.2 percent in the mean inflation-adjusted audit fee for the former Andersen clients. Our results do not provide support for our hypothesis

Briefly looking at the control variables, we find, as expected, audit fees increase with the size, complexity and risk of the clients, i.e., L-INF-TA, FOREIGN, and LOSS are all positive and significant. One risk variable, GEAR, is negative and significant, contrary to expectations, indicating probably that the financial risk bore by the Andersen clients and their level of borrowing was not regarded as high by the successor auditors in order to charge a premium. The LONDON and L-INF-NAF variables are positive and significant indicating higher audit fees for those companies based in London and for the provision of the joint provision of audit and non-audit services to clients. The QUICK variable is negative and significant, as expected. The remaining variables, i.e., SQRTSUBS, ROCE, CATA, OPINION and BUSY, are insignificantly different from zero.

TABLE 6: The effect on year on audit fee premia

Adjusted R2	0.774
Sample size	126

All significance values are two-tail. Industry fixed-effects variables not reported for brevity, and *t*-statistics and significance levels are calculated using White (1980) corrected standard errors.

Control and experimental variables: L-INF-AF = natural log of inflation-adjusted audit fees in GB pounds, L-INF-TA = natural log of inflation-adjusted total assets, SQRTSUBS = square root of total subsidiaries, FOREIGN = foreign sales as a proportion of total sales, ROCE = return on capital employed, GEAR = gearing ratio, CATA = ratio of current assets to total assets, QUICK = ratio of current assets (less inventories) to current liabilities, OPINION, = indicator variable, 1 = qualified audit report, LOSS = indicator variable, 1 = loss in any of the past three years, BUSY = indicator variable, 1 = December 31st or March 31st year end, L-INF-NAF = natural log of inflation-adjusted fee paid for non-audit services (in GP Pounds), LONDON = indicator variable if observation is a London-based company, YEAR2002 = indicator variable if observation is audited in year 2002

7. DISCUSSION AND CONCLUSION

This study examines the effect of changes in audit environment and audit and non-audit service fees in the UK after the collapse of high profile companies, the demise of Arthur Andersen, the passage of Sarbanes Oxley Act and other proposals to strengthen the regulation of audit and non-

audit services. The study presents an analysis of UK Andersen clients pre- and post Andersen demise. It attempts to examine where former Andersen's clients have gone and whether they paid more after Andersen's demise. The evidence is, therefore, based on Andersen clients and on financial and audit data for the period 2001-2002. The results indicate that the former Andersen clients experience no inflation-adjusted audit fee premiums or discounts.

These findings provide further evidence on audit pricing behaviour in the UK following the Andersen acquisition by Deloitte in 2002. Anecdotal evidence of that period (see, for example, Anderson 2003) was anticipating higher fees due to Enron debacle, the demise of Andersen, and the passage of Sarbanes Oxley Act in the US. The fact that there was no real increase in inflation-adjusted audit fees between 2001 and 2002 does appear to be inconsistent with the idea of increased liability and financial risk or purchase of higher insurance cover and, hence, higher audit fees. It seems that the risks (or lack of insurance cover) were exaggerated at that period in the UK. On the other hand, the finding of flat inflation-adjusted audit fees between 2001 and 2002 is consistent with the existence of a price competitive market. Big-4 auditors face the discipline of competitive tenders (or the threat of one), and have to fight off low competing bids aimed at dislodging the incumbent. The incumbent audit firm therefore keeps audit prices low or flat in order to retain the client.

In addition, the collapse of Andersen and the subsequent damage in the reputation of the accounting profession may have forced audit firms to adopt a strategy that influenced the pricing of audit fees. In this way, audit firms and the accounting profession may have made an effort to reduce future negative wealth transfers of control to politicians as well as to ease unwanted negative political attention and future regulatory interest. After all, audit firms have incurred the political costs of negative publicity from the Andersen misconduct, witnessed the number of large suppliers in the market for audit services reduced from five to four, and seen the prohibition of providing certain non-audit services for their audit clients.

There is some evidence provided in this study that the level of non-audit fees (either inflated-adjusted or as a percentage of total auditor remuneration) decreased markedly following the Andersen demise. This change in non-audit fees either as a result of the Sarbanes Oxley Act or the audit committees approving fewer non-audit services can support the assertion that the demise of Andersen has impelled the accounting profession and audit firms to take self-correcting measures to potentially enhance the appearance of auditor independence and minimise future political intervention in the pricing of auditor services. On balance, it seems there was a desire by all participants in the UK audit market to instil confidence about audit quality in the financial markets after this was damaged by Andersen's misconduct.

The findings of this study support the idea of the UK audit market adopting a discriminating response to the events in the US rather than perceiving a general increase in litigation and financial and audit risks which would have been manifested in an across-the-board premium in audit fees. This type of response may provide some comfort to the UK regulators in the sense that the UK audit market internalised the implications of the events in the US without substantial changes to the regulatory framework at least in an immediate fashion.

We appreciate comments received from the European Accounting Association annual conference, the American Accounting Association annual meeting and its anonymous reviewer. We would also like to thank Robert Knechel, Stuart Turley, and Steven C. Hunt (discussant in AAA 07)

ABSTRACT

Purpose The purpose of this paper is to study the basic components and modern features of the deposit insurance system in Ukraine.

Design/methodology/approach The following methods were used: logical, historical, statistical, analysis, synthesis, grouping; economic and mathematical, in particular exponential smoothing and linear Brown model; induction and deduction, analogy, etc.

Findings Context specific macro-factors were found to influence the emotional state of strategists, leading them to adopt a rational approach, rather than use intuitive judgment, to making all five decisions.

Research limitations / implications The study was limited to situation in the banking deposit sector from 2013 m Ukraine in order to maintain these variables relatively constant to make the forecast with proposals for extending studies to improve the situation in the deposit insurance system of Ukraine.

Practical implications The paper provides evidence for the functioning of deposit market in Ukraine and authors' forecast for its development till 2021, which should lead to increased recognition for government, strategists, banks, insurance companies and other market agents of the challenges for deposit insurance development.

Social implications A social implication is that individuals' deposits will be more determined and protected.

Originality/value The paper examines the development and main trends of deposit insurance in Ukraine with forecasting of this process. An explanatory framework is developed which is consistent with an identification of proposals for improving the deposit insurance system in Ukraine. A generalized research framework is proposed to aid future studies of deposit insurance processes.

Keywords: Deposit Insurance, Deposit Guarantee Fund (DGF), Banking System Deposit Market, Financial Resources, Financial Stability, Forecast.

OBJECTIVES

The main purpose of this paper is to study the basic components and modern features of the deposit insurance system in Ukraine. To achieve this goal the following tasks are defined: to find out the basic principles of insurance in the insurance of deposits in Ukraine; to determine the specifics of the functioning of the domestic deposit insurance system, namely the legal and institutional aspects; to analyze the effectiveness of the deposit insurance system in Ukraine; to predict the main indicators for the deposits of individuals and the volume of financial resources of the DGF for 2019-2021; to determine the key areas of improvement of the deposit insurance system in Ukraine.

INTRODUCTION

The modern banking system accumulates a significant share of financial resources of the population, which is a powerful resource for the further development of the economy, in particular its subjects, especially in terms of lending. Therefore, nowadays the state and society face the task of providing an effective mechanism for the protection of temporarily free funds of economic entities. This mechanism is insurance. Given that Ukraine is a state with a socially oriented market economy with a European integration vector of development, there is a need to improve the existing system of deposit insurance of individuals and legal entities in accordance with European standards. In addition, the domestic banking system does not enjoy a sufficient level of trust among citizens, which is caused by shadow schemes in the market of banking services, delaying the procedure for reimbursement of deposits in case of liquidation of banks.

LITERATURE

The problem of deposit insurance of the banking system is relevant, which is represented by a number of scientific papers. The fundamental basis of the study of the national deposit insurance system formation is given in the works of such scientists as Bazylevych, Filonyuk & Bazylevich (2008), Brophy (2013), Mykhailovskaya & Besvukh (2013), Govorushko (2008), Osadets (2002), Plysa (2010), Vovchak (2006), et al. The key principles of functioning and reforming of national and world deposit insurance systems are revealed in the scientific works of such foreign scientists as Akinin (2007), Altuntas & Rauch (2017), Bland (1999), Cecchetti (2007, 2015), Hannafin, McKillop, (2007), Levine (1997), Bikker &

Prast (2001), Senbet, Cull, Sorge (2002, 2005), Masters & Dupont (2002), Golembe (1960), Calomiris (1990), Schich (2008) et al.

Research on cooperation between banks and insurance companies on a mutually beneficial basis in terms of joint implementation of products and services in the market (bancassurance) is becoming particularly popular among domestic scientists Berezina & Goncharenko (2016, 2017), Savluk (1998), Stelmakh (2001), Vasyurenko (2000), Yuri & Fedosov (2006) et al. In world practice most scientists use the concept "deposit insurance". For example, foreign scientists Masloboieva and Fridman (2008) note the following: "the system of deposit insurance is a set of measures aimed at protecting deposits and ensuring their guaranteed return in full (or in part) in the event of bankruptcy of a credit institution".

However, the Ukrainian legislation uses the concept of "guarantee" of deposits. Thus, the Law of Ukraine "On the Deposit guarantee system of individuals" dated 23.02.2012, No. 4452-VI, states that: "the deposit guarantee system of individuals – a set of relations that are regulated by this Law, the subjects of which are the Deposit Guarantee Fund (DGF), the Cabinet of Ministers of Ukraine, the National Bank of Ukraine, banks and depositors".

However, taking into account foreign experience, the concept of "deposit insurance" is increasingly used in domestic scientific works of recent years, excluding the term "guarantee". For example, in the dissertation of Bukhtiarova (2015) "Development of the national deposit insurance system" the author's approach to explaining the essence of the concept "deposit insurance" is presented, according to the author, these are economic relations arising between the Bank and its depositors, the body which is entrusted with the functions of the deposit insurer, and other participants of the financial market in order to ensure the effective operation of the Bank and the provision of guarantees for the return of deposits of individuals in the legally established amount in the case the Bank is recognized as insolvent (Bank). In addition, Bukhtiarova (2015) formulated a new concept of the Deposit insurance system, namely: "an ordered set of elements aimed at preventing financial problems of the Bank, protection of depositors' rights and guarantees for the return of deposits of individuals in the amount established by law in the case of recognition of the Bank as insolvent (bankrupt).

Despite the significant research on this issue, the theoretical and practical areas of the deposit insurance system have accumulated a lot of problems: an effective mechanism of deposit insurance has not been finalized; the best foreign experience in terms of interest rate policy on deposits has not been considered; low rates of economic growth and the like. Given the above, it is advisable to continue scientific research to address the issues outlined.

METHODS

In the course of the work the following methods were used: logical, historical – in the study of the development of deposit insurance system, etymological essence of individual terms and concepts; statistical, analysis, synthesis, grouping – in the analysis of the volume of financial resources of the DGF; economic and mathematical in forecasting the main indicators on deposits of individuals and the volume of financial resources of the DGF for 2019-2021 years by exponential smoothing using the linear brown model; induction and deduction, analogy – in determining the areas of improvement of the deposit insurance system in Ukraine.

FINDINGS AND DISCUSSION

Deposits form the basic component of banks' liabilities and play a determining role in the formation of financial resources of the banking system. Therefore, the state and banks face the task to form a reliable system of protection of deposits of citizens through the improvement of the existing national deposit insurance system, which is represented by the deposit guarantee fund of individuals.

The analysis of the balance sheet structure of commercial banks of Ukraine, conducted on the basis of official data of the National Bank of Ukraine (NBU) showed that the largest share in the Bank's assets is occupied by such articles as loans to individuals and legal entities 40%, and liabilities of deposits of individuals and legal entities 50 %. However, the structure of the balance sheet of the State Bank is slightly different from the commercial joint stock company (Bank), in particular, the share of loans in the Bank's assets is 15 % and the share of deposits in the Bank's liabilities significantly exceeds compared to commercial banks and is 78-80 %.

The stability of the banking system is the protection of the population's funds which is the main resource in the formation of investments in the economy and the like. Funds of the population, attracted to the banking system, are deposits. Consequently, the performance of the deposit market of Ukraine for the period from 2013 to 2018 is presented in table 1.

Indicators	2013	2014	2015	2016	2017	2018
Number of operating banks	180	163	117	96	82	77
of them: with foreign capital	49	51	41	38	38	37
including with 100% foreign capital	19	19	17	17	18	22
GDP, mln. dollars USA	183310	131805	90615	93270	112154	113794
Individuals' funds/GDP, %	25.07%	28.71%	26.24%	20.22%	18.33%	16.02%
Funds of business entities/GDP, %	13.88%	15.43%	16.47%	17.55%	17.30%	14.31%

Table 1. *Key performance indicators of the deposit market of Ukraine in 2013-2018 years*

Source: built by the authors on the basis of official NBU data <https://bank.gov.ua>

Thus, during the study period, the number of operating banks in Ukraine decreased from 180 in 2013 to 77 in 2018. A significant reduction in the number of banking institutions is observed in 2014 –

2016 years from 163 to 96. This is due to the economic and political crisis of these years as well as the policy of the NBU to withdraw from the market unreliable banks. The number of banks with foreign capital also tends to decrease from 51-49 in the years 2013/2014 to 37 in 2017/2018 – this is due to the withdrawal from the market of banks with foreign capital. Analysis of the deposits' level of penetration (%) in the domestic economy showed that the share of deposits of individuals in GDP decreased from 29% in 2012/2013 to 16% in 2017/2018 which is due to the interest rate policy of the NBU. Thus, the interest on deposits in 2012/2013 (in UAH equivalent for 12 months) was 22-24 %, in 2017/2018 14-16%.

The share of deposits of economic entities in the GDP during the analyzed period accounted for 13.88 % in 2012/2013, 17.55 % in 2015/2016 and 14.31 in 2017/2018. The volume of deposits of individuals and businesses tended to increase, namely from 365.8 billion UAH up to 478.1 billion UAH (30.7 %) – for individuals and from 202.6 billion UAH up to 426.9 billion UAH (110.7 %) – for business entities. However, in the dynamics of the volume of deposits of individuals there is a decrease in 2014-2016 which is caused by the crisis in the economy and the banking system, in particular, it affected the confidence of the population in the banking system. The structure of the deposit portfolio of individuals is shown in Fig. 1.

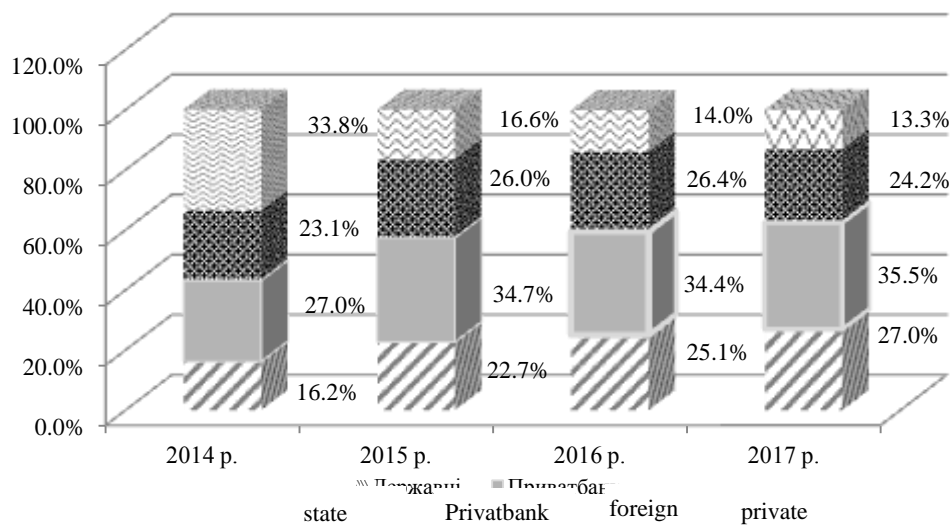

Figure 1. Distribution of deposits of individuals by groups of banks, %

Source: built by the authors on the basis of official NBU data <https://bank.gov.ua>

The analysis of the structure of the deposit portfolio showed that the greatest demands among the population are the deposits for up to 1 year (preferably a period of 3-6 months). Since 2016 the most trusted among the population are state-owned banks because about 60% of deposits are placed in such banks, 25% of depositors trust their savings to banks with foreign capital and 13-15% to private banks. As for the dollarization of deposits, the results are as follows: 50% of deposits of

individuals, as well as 38-40% of deposits of business entities, are placed in dollar equivalent. The number of banks participating in the DGF during 2013 – 2018 decreased from 174 to 78 participants. A serious decrease in the number of banks is due to the liquidation of a significant number of banks. Data on individuals' deposits in the participants for 2013 – 2018 is given in table 2.

Date	The amount of deposits of individuals, billion UAH	Number of depositors, million persons	Average deposit amount, UAH	Percentage of coverage of the number of depositors, %
01.01.2013	338,5	44,4	7619,0	x
01.01.2014	402,6	47,4	8486,0	99,4
01.01.2015	382,1	46,5	8123,0	98,7
01.01.2016	362,3	44,7	8104,0	98,8
01.01.2017	382,1	41,1	9298,0	98,6
01.01.2018	413,8	41,0	10104,0	98,5
01.10.2018	437,0	40,6	10765,0	98,4

Table 2. *Deposits of individuals in the participants of the DGF in 2013-2018*

Source: compiled by the authors according to the official data of the Deposit Guarantee Fund of individuals of Ukraine, <http://www.fg.gov.ua/>

The analysis of the volume of individuals' deposits in the participants of the DGF during 2013-2018 showed that the amount of deposits increased by 98.5 billion UAH or 29.1 %, however, the mass outflow of deposits was observed in 2013-2015 by -40.3 billion UAH or -10 %, then the banking sector of Ukraine faced complex of general economic problems. In total, the increase in the amount of deposits for the study period is associated with an increase in the income of citizens, while the number of depositors decreased by 5-7 million UAH. The average deposit size of individuals in 2013 – 2018 increased from 7.6 to 10.8 thousand UAH. The percentage of coverage of the number of depositors tends to slightly decrease from 99.4 % to 98.4% which is sufficient to cover the risks. Hence, the analysis of the volume of deposits showed that there is a reduction in the number of depositors and a tendency to reduce the percentage of coverage of their number. The dynamics and structure of financial resources of the DGF during 2013 – 2018 were represented in table 3.

Date	Financial resources, million USD	Deviation	
		Abs., million USD.	Relative %
01.01.2013	762.2	150.2	19.7
01.01.2014	912.4		
01.01.2015	1069.9	-483.1	-45,2
01.01.2016	586.8		
01.01.2017	563.3	-51.9	-9.2
01.01.2018	511.4		

Table 3. *Dynamics of financial resources of the DGF in 2013-2018*

Source: calculated by the authors according to the official data of the Deposit Guarantee Fund of Ukraine, <http://www.fg.gov.ua/>

There is a positive dynamics of increasing financial resources of the DGF during 2013-2018 from 6092.1 million UAH up to 14354.4 million UAH – by 8262.3 million UAH or 135.6 %. A significant

increase in the fund's financial resources at the beginning of 2015 is explained by the attraction of external sources of financing in the form of loans from the National Bank of Ukraine and the Cabinet of Ministers of Ukraine in the form of bonds of the internal state loan in the amount of 10.2 billion UAH. However, in 2016/2015 there was a significant reduction in the volume of financial resources of the DGF by -2788.2 million UAH or -16.53 %. At the end of 2016, the total financial resources of the Fund amounted to 15.32 billion UAH. In order to avoid a possible liquidity deficit in 2017 at the end of 2016 the DGF attracted additional sources of financing – a loan from the Cabinet of Ministers of Ukraine at the expense of the state budget of Ukraine in 2016 in the form of bonds of the internal state loan in the amount of 7.94 billion UAH with maturity in 2031. The negative trend in the reduction of financial resources continued in the period 2018/2017, the reduction was -961.5 million UAH or -6.28%.

The analyzing of the sources of formation and structure of the DGF funds for the period 2013-2017 demonstrates, that in 2013 year 78% of the Fund's revenues consisted of a regular collection of about 20% of the net income from investing in government securities. In 2014 the structure of sources of funds changed, in particular 41.6% – loans from the NBU and 41.3% loans from OISL, 13% is a regular collection. During 2016-2017, the structure of sources of funds of the DGF was as follows: about 25-30% of funds were formed through regular collection, 47-57% were fines, penalties from the participants of the DGF, 6-8% is a net income from investing in government securities. That is, the analysis showed that in 2013, the sources of the formation of funds of the DGF consisted in the vast majority of permanent sources, from 2014 to 2017, including variable resources such as credit resources and penalties, fines, etc. DGF resources for the study period were spent in the areas provided for in Article 20 of the Law "On the system of guaranteeing deposits of individuals". Thus, during 2013-2014, 55 % of the Fund's resources were directed to cover the costs associated with the procedure of withdrawal of an insolvent Bank from the market, ensuring the current activities of the DGF; 40% for a target loan to advance payments to the Bank's depositors during the interim administration; 3% for payment of interest on NBU loans; 2% other. In 2015 – 2017, the greater part of funds 65-55 % is directed to payments of the guaranteed amount of compensation to depositors of banks; the share of funds to repay part of the NBU loans increased significantly to 20 %; 7-10% of the funds were spent on payment of interest by the Fund's promissory notes. The assessed financial stability of the DGF shows in Fig. 2.

During 2013-2014 the DGF had sufficient resources to meet its obligations to depositors, at the end of 2014 the financial situation strengthened, as evidenced by the increase in financial stability to 2.54% in December and growth to 3.37% at the end of the year, taking into account borrowed resources, as provided by the Law.

Figure 2. Dynamics of changes in financial stability in relation to the amount of funds of the DGF in 2013-2018, %

Source: built by the authors on the basis of annual reports of the Deposit guarantee Fund for 2013-2017, http://www.fg.gov.ua/images/docs/reports/Annual_report_FGVFO_zvit_2017_ukr.pdf, http://www.fg.gov.ua/images/%D0%97%D0%B2%D1%96%D1%82_2016_.pdf, http://www.fg.gov.ua/images/docs/reports/zvit_2014_ukr.pdf, http://www.fg.gov.ua/files/docs/reports/Zvit_FGVFO_ukr_2013.pdf.

As of 01.01.2017 the financial stability of the Fund amounted to 5.11% which is sufficient according to the requirements of the legislation. The assessment of the Fund's forecast financial stability until the end of 2017 showed a possible significant decrease in the Fund's financial stability to 2.78 % which indicates a potential shortfall.

The forecast of the amount of deposits of individuals is feasible using the exponential smoothing method based on the linear Brown model, described by Berezhnaya & Snytyuk (2016). The function (trend), which approximates the actual data, shown in Fig. 3.

Figure 3. Amount of deposits of individuals, million UAH

Graphical analysis of data, Fig. 3 and the method of least squares determine the analytical function which reflects the trend of change in the studied indicator over time: $y = -76,13 +$

26,70t. The main error is 33.29 billion UAH. The smoothing parameter is $\alpha = 0.4$. The calculated initial conditions (approximation) to define the exponential average: $S_0^{[1]} = -116.18$; $S_0^{[2]} = -156.2$. The predicted values of the amounts of contributions of physical persons bring to table 4.

Year	The amount of deposits of individuals, billion UAH.	The error of the forecast, billion UAH	Deviations (up to 01.01.2018 year.)	
			absol., billion UAH	relative, %
01.01.2018	413,8	-	-	-
01.01.2019	431,23	28,98	17,43	4,21
01.01.2020	449,84	34,44	36,04	8,71
01.01.2021	468,46	40,03	54,66	13,21

Table 4. The dynamics of the expected values of the deposit sum of physical persons in 2019-2021

Source: calculated by the authors

According to the results of the forecast, it is expected a gradual increase in the amount of deposits of individuals by 17.43 billion UAH (4.21 %) on 01.01.2019; by 36.04 billion UAH or 36,04 % on 01.01.2020. As of the beginning of 2021, it is expected that the amount of deposits will increase to the level of 468.46 billion UAH or by 13.21 % compared to the beginning of 2018, which is estimated as a positive dynamics in the functioning of the DGF in the medium term, provided that economic stability is maintained.

The same method of exponential smoothing by the linear Brown models we will forecast the average size of the deposit for 2019-2021 years. The function (trend), which approximates the actual data, set out in Fig. 4.

Figure 4. Average deposit amount, UAH

Source: calculated by the authors

Graphical analysis of data, fig. 4 and the method of least squares find the analytical function which reflects the trend of change in the studied indicator over time: $y = 261,04 + 523,26t$. The main error is 541.44 UAH. The smoothing parameter $\alpha = 0.4$. The initial conditions for defining the exponential average are: $S_0^{[1]} = -523,85$; $S_0^{[2]} = -1308,73$. The forecast values of the average size of the

deposit are summarized in table 5. According to obtained prediction results the expected increase in the average amount of the deposit from 8814.44 UAH in 2018 to 10325.23 UAH in 2021 or 1510.79 UAH (17.14 %), which is estimated as a positive trend in the functioning of the DGF and indicates a gradual increase in income of citizens.

Year	Average deposit amount, UAH	Error of forecast, UAH	Deviations (up to 01.01.2018 year.)	
			absolute, UAH	relative, %
01.01.2018	8814,44	-	-	-
01.01.2019	8609,61	471,34	-204,83	-2,32
01.01.2020	9410,17	560,16	595,73	6,76
01.01.2021	10325,23	650,93	1510,79	17,14

Table 5. Dynamics of forecast values of the average deposit amount for 2019-2021 years

Source: calculated by the authors

Next step is the forecast of the depositors' quantity for 2019-2021 according to the linear Brown model. The function (trend), which approximates the actual data, set out in Fig. 5.

Figure 5. Number of depositors, million persons

Source: calculated by the authors

Graphical analysis of data, Fig. 5 and the method of least squares determine the analytical function showing the trend of change in the studied indicator over time: $y = 2,27 + 2,45t$. The main error is 5.3 billion persons. The smoothing parameter is $\alpha = 0.4$. The initial conditions (approximation) to determine the exponential averages: $S_0^{[1]} = -1.39$; $S_0^{[2]} = -5.06$. Forecast values of the number of depositors are summarized in table 6.

Year	Number of depositors, million persons	The error of the forecast, million persons	Deviations (up to 01.01.2018 year.)	
			absolute, million persons	relative, %
01.01.2018	44.69	-	-	-
01.01.2019	42.51	4.61	-2.18	-4.89
01.01.2020	42.68	5.48	-2.01	-4.49
01.01.2021	42.86	6.37	-1.83	-4.09

Table 6. Dynamics of forecast values of the number of depositors for 2019-2021

Source: calculated by the authors

Forecast of the depositors' number of the DGF for the period of 2019-2021 is a negative trend. Thus, the number of depositors is expected to decrease from 44.69 million to 42.86 million persons. That is, according to the pessimistic scenario annually the number of depositors will systematically decrease by 4.5-5 %. This is a negative trend in the functioning of the Deposit Guarantee Fund. This trend confirms the thesis of the need to apply a number of measures to improve the guarantee of deposits of individuals, improvement of the current deposit insurance system.

Feasible forecast of the volumes of financial resources of the DGF to 2019-2021 were done by the method of exponential smoothing for linear Brown models. The function (trend), which approximates the actual data, set out in Fig. 6.

Figure 6. Financial resources of the DGF, billion UAH

Source: calculated by the authors

The feasible forecast of the volumes of financial resources of the DGF to 2019 –2021 by the method of exponential smoothing for linear Brown models helped to determine the function (trend), which approximates the actual data. The graphical analysis of these data and the method of least squares determine the analytical function showing the trend of change in the studied indicator over time: $y = 6076,15 + 1788,35t$. The main error is 33.29 billion UAH. The smoothing parameter $\alpha = 0.4$. The initial conditions (approximation) to determine the exponential averages: $S_0^{[1]} = 3393,63$; $S_0^{[2]} = 711.1$. The forecast amounts of financial resources are summarized in table 7.

Year	The financial resources of the DGF, billion UAH	The error of the forecast, billion UAH	Deviations (up to 01.01.2018)	
			absolute,, billion UAH	relative, %
01.01.2018	14354,40	-	-	-
01.01.2019	16965,61	1340,33	2611,21	18,19
01.01.2020	18300,09	1592,90	3945,69	27,49
01.01.2021	19634,57	1851,03	5280,17	36,78

Table 7. Dynamics of forecast values of the number of depositors for 2019-2021 years

Source: calculated by the authors

Forecasting the volume of financial resources of the DGF has a positive trend, it is expected that the volume of financial resources at the beginning of 2021 will increase by 5280.17 million UAH or

36.78 % compared to the beginning of 2018. In general, the forecast showed that during next 3 years there will be a systematic increase in the volume of financial resources of the Fund. However, given that according to the forecast, the number of depositors for 2019-2021 will be reduced, it can be assumed that the increase in financial resources will be carried out in the vast majority at the expense of the State budget, the NBU, operations with government securities. Such factors will have a negative impact on the financial sustainability of the Deposit Guarantee Fund.

CONCLUSIONS

The study revealed the following: the number of operating banks in Ukraine decreased from 180 in 2013 to 77 in 2018. The significant reduction in the number of banking institutions was observed in 2014–2016 from 163 to 96 due to the economic and political crisis of these years.

Analysis of the deposits' penetration level (%) in the national economy showed that the share of deposits of individuals in GDP decreased from 29% in 2012/2013 to 16% in 2017/2018, this is caused by the NBU's interest rate policy. The analysis of the structure of the deposit portfolio showed that deposits with a term of up to 1 year are in the greatest demand among the population.

The number of banks participating in the Deposit Guarantee Fund during 2013–2018 decreased from 174 to 77 participants. A significant decrease in the number of banks was caused with the liquidation of a significant number of banks. The average size of the contribution of individuals in 2013-2018 increased from 7.6 to 10.8 thousand UAH. The percentage of investors' coverage tends to decrease insignificantly from 99.4% to 98.4%, which is sufficient to cover risks.

The Financial Stability Index of the DGF for 01.01.2017 was 5.11%, which is complying with the requirements of the legislation. The assessment of the financial sustainability of the DGF until the end of 2017 determined the possible significant decline in the financial sustainability of the Fund to the level of 2.78%. It indicates a potential shortage of funds. The forecast of the DFG financial resources has a positive trend. It is expected that the volume of financial resources at the beginning of 2021 will increase by 5280.17 million UAH (or 36.78% compared with the beginning of 2018). The systematic increase in the financial resources of the Deposit Guarantee Fund is estimated for next three years (2019-2021).

The forecast number of DGF's contributors for 2019-2021 has a negative trend. Thus, the decreasing in the number of depositors from 44.69 million to 42.86 million people is expected. That is, while maintaining the pessimistic scenario, the number of depositors will systematically decrease by 4.5-5% each year during 2019-2021. This is the negative trend in the functioning of the Deposit Guarantee Fund. The results of the study indicate the necessity of providing the number of measures

for improving the guarantee for individuals' deposits, as well as for improving the current deposit insurance system.

Taking into account the above, we consider it appropriate to identify proposals to improve the deposit insurance system in Ukraine. First of all, the proposals will relate directly to the activities of the DGF as an insurer in the current deposit insurance system. The plan of gradually increase the guaranteed amount of deposit reimbursement to 500 thousand UAH in the medium term have to be developed. The increase in the guaranteed amount of compensation to depositors of insolvent banks is possible due to the sale of assets of bankrupt banks. The 100 percent guarantee of both national and foreign currency deposits have to be implemented. This will attract more funds from the population and increase the level of trust.

Since the number of banks annually decreases, it is offered to replace the initial fee of the DGF with 1% of the authorized capital of the Bank by an absolute amount of 5 million UAH. The proposed amount will fully comply with the chosen strategy of the National Bank of Ukraine in terms of increasing the authorized capital of banks of Ukraine to the amount of 500 million UAH until 2024. It is necessary to use the possibility of applying a special fee from the banks-participants of the guarantee system, in particular, it is proposed to introduce legal regulation of the procedure for calculating, charging and paying a special fee in case of violation of the financial stability of the Fund.

IMPLICATIONS FOR ORGANIZATIONS

The paper provides evidence for the functioning of deposit market in Ukraine and authors' forecast for its development till 2021, which should lead to increased recognition for government, strategists, banks, insurance companies and other market agents of the challenges for deposit insurance development. A social implication is that individuals' deposits will be more determined and protected.

For insurance companies it is necessary to develop additional Deposit insurance programs in the amount that exceeds the guaranteed DGF 200 thousand UAH, as well as those positions that are not guaranteed by the DGF, in particular, reimbursement of depositors raised in the form of Bank metals. This step will improve the protection of material interests of the population, as well as increase the level of insurance culture, to attract additional financial resources to the insurance market of Ukraine. At the same time banks have to use marketing strategy aimed at increasing the motivation of customers to place their savings on deposit accounts of banks.

SMART ENERGY COMMUNITY AND COLLECTIVE AWARENESS: A SYSTEMATIC SCIENTIFIC AND NORMATIVE REVIEW

Ceglia, Francesca¹; Esposito, Paolo²; Sasso, Maurizio¹

¹Dept. of Engineering, University of Sannio, Benevento, Italy

² Dept. of Law, Economics, Management and Quantitative Methods-DEMM, Sannio University, Benevento, Italy

ABSTRACT

This article analyzes the world energy context and its difficult in the renewable energy management. The scientific obviousness is that a new energy planning is needed. The theme of energy conditioning of local community is taking off and the diffusion of energy sharing represents the path to the management of intelligent energy systems. Following a description of the intelligent community energy systems through the analysis of some examples, the study will focus on the legislative panorama. The context of the regulations regarding the Smart Energy Community will be analyzed at European and then Italian level, underlining the Italian initiatives that approach the birth of the Smart Energy Municipality.

Keywords: Energy Sharing, Collective Awareness, Smart Municipality, Build sharing, Energy law.

1. INTRODUCTION

Energy is the subject of particular attention in the last years and its planning needed precise redefinition in order to solve the problems linked to multidisciplinary conditions about the environmental aspect as their common element from different points of view, such as excessive energy consumption, health of the population, flora and fauna protection, climate alteration (Dincer and Acar, 2017). Through numerous activities, the strong interest in the issue of sustainability it was evident in the past few years (UNEP, 2014) and the need for collective actions to improve environmental conditions (European Energy Union, 2018), developing low-carbon models (European Commission, 2011). If it is considered the value of energy consumption in the world panorama an analysis from IEA, International Energy Agency (Annual Energy Review, 2018), it is possible

observe that the annual average growth of energy world consumption is 3.6% from 1955 to 2018. In

the

Figure it is showed the perceptual variation of energy world consumptions in a step of five years. This condition is different during 2008-2009 when there was a negative variation caused by serious economic crisis. The analysis shows that from 1950 to 2017 the energy world total consumption increases of 180% moreover because the renewable is more of 11% of total the smart system take hold in every country.

Always from the analysis in the figure it is possible to note that the average increase is reduced in recent decades, this in reality does not depend simply on the reduction of industrial consumption but above all on the improvement of the available energetic technologies. In fact, the higher yields of conversion devices and the introduction of renewables have reduced primary energy demands. In this panorama, the development of technology has enabled us to obtain analytical data on energy, in terms of production and consumption, often provided by the user. This would significantly improve efficiency and reduce congestion in smart grids, thus contributing to the reliability of the power supply system of the future scenario of 100% renewable energy production in all sectors (Reka and Dragicevic, 2018). In detail since 1990, the total renewable energy sources in the world have grown at an average annual rate of 2%, which is slightly higher than the world primary energy growth rate (TPES), 1.7% (IEA, RI 2018). The growth is particularly high for solar photovoltaic and wind energy, which has grown on annual average percentages of 37.3% and 23.6%, respectively, for a long time low bases in 1990. Biogas are in third place for the growth rate at 12.3%, followed by solar thermal (11.5%) and liquid biofuels (10%), like showed in Figure 2.

The pervasion in the energy networks of renewable sources make the system becomes smart and it passed through from passive to active conduct, this in accorded with consumption growth introduces a necessary innovative system to manage energy to go beyond the technologies and the intelligent network but organize and optimize the energy resource. In this article, following a brief introduction on energy consumption and the need to reorganize the energy landscape, an innovative method of

managing the energy will be analyzed based on sharing and the emergence of energy communities. Finally, it will evaluate the existing ones and the possibilities for future development.

2. SMART ENERGY COMMUNITY

The development of renewable energy causes the born of a new figure of consumer the *prosumers*. The prosumer represents a typology of user that can produce energy and also change some part of this with energy common network or stoke this. This new management of energy sector determines the risks that need to be identified and organized (Parag and Sovacool, 2016) with integration of all sectors and infrastructures (Lund et al., 2017). The use of smart grids cannot be looked upon as an isolated dilemma, but should be seen as one out of various means and challenges of approaching sustainable energy systems in general (Lund et al., 2012). The optimum and cheap results are to be devise when the electricity sector is combined with the heating and cooling sectors and/or the transportation sector (Lund et al., 2014). The definition of an energy territorial planning strategy with the aim of optimise the local resources and to satisfy the energy load of particular territory determine the born of a new kind of energy organization, Smart Energy Community (SEC). The SEC means a fusion of energy services (private, public or mixed), based in a particular geographic zone of reference, in which end users (residential, commercial, tertiary and industrial users) decide to share energy loads by preferring high-performance technologies and energy production plants from renewable sources. All this can occur through the exploitation of intelligent technologies and the latest generation computerization systems that allow energy networks to communicate. The consequence of this initially technological approach is the possibility of being able to extend the sharing outside the energy landscape, referring to spaces, mobility, food and more in services. The value of sharing includes all services (energy, scholarship, vehicle, market, cooking, common space), showed in **Σφάλμα! Το αρχείο προέλευσης της αναφοράς δεν βρέθηκε..**

A key point for the birth of the SEC is to understand how energy is perceived by consumers and how to involve them in actively participating in the functioning of the network. This fear has been tackled through the now common aid of the "Internet of Things" and data analysis in the cloud (Mital et al., 2015), by finding information on energy consumers we come to the elaboration of the strategy to determine such communities (Akshay Uttam Nambi and Venkatesha, 2016). This analytical approach is comparable to the concepts of systems theory, in fact it is expected to act on a local system and then contribute to the improvement of the global environment (Mendes et al., 2011).

2.1. *Smart Energy Community themes*

SECs are easily free-standing local systems or communities with aim of optimization of energy consumption. The relevant items in energy context that the SECs take on can be summarized as follows:

- balancing of energy flows;
- reduced peak load during peak hours;
- territorial energy planning;
- limits of the proper functioning of the electricity network;
- interconnection of different energy carriers;
- mitigation of environmental impacts.

The energy independence is interesting for an island or an island or for a system without an external cable connection. In this way, however, a usual dilemma occurs when the self-production of energy is less than its request, which puts in crisis the planners on the best management of the isolated area to be managed with disconnected systems or through traditional network connections, (Osti, 2018). The positive introduction of the SECs concerns the priority of the exploitation of available local resources. Moreover, for about a billion people without access to electricity, it is interesting to analyse the possibility of using decentralized energy conversion systems (REN21, 2017). Since the urban energy planning is a key theme for defining SECs and cities are considered responsible for around 69% of all greenhouse gas emissions can be useful consider the convenience of creating energy community using the local energy resource of a district. Many study in Italy are concentrated on resource of geothermal and solar poly-generative plants to serve energy districts (Calise et al., 2017) (Calise et al., 2015). These objectives have been really implemented in the Danish island of Samsø promises to rid the island of fossil fuels by the year 2030, twenty years ahead of Denmark as a pilot case for the rest of the country. The island started to produce electricity from biomass in the year 2001, and a few years later the electricity production was up to three times greater than the electricity consumption (Jantzen et al., 2018).

2.2. Smart Energy Community targets

Energy Community is defined to include energy conversion, transmission, and consumption on a community scale and all energy systems, such as decentralised, centralised, and islanding unattached energy utilisation systems in a community (Huang et al., 2017).

SEC is a developing topic, but could be important focus some targets:

- massive use of renewable energy technologies (RET): SEC uses the renewable sources of his territory to satisfy the loads of community reducing energy dependence from external sources. In many cases the availability of local renewable energy sources is the most important factor to found the community, like the case of Waita in Japan a Geothermal energy community (Suwa and Sando, 2018) or in electrical energy community (Shinkawa, 2018).
- massive use of ICT: becoming an intelligent community implies that the individual devices of the user are resources that can be dispatched and integrated into the energy networks, so the SEC is a typical energy executive guidance system (Tian et al., 2018). The smart grid Internet of Things (IoT) allow the reaching of smart cities mission worldwide like parking and traffic monitoring by wireless connections are made possible (Morton, 2015);
- energy vector connection and storage: creation of univocal energy system that can include electricity, heating and cooling carriers with aim of reduction of purchase costs from external grid (Xing et al., 2019) and incentive of energy accumulator (Cao et al., 2018);
- sharing: plants that can use energy resources from renewable sources with rewarding management techniques for the community (Cooperatives, Municipal Bonds) also to limit the criticality of social acceptability. The start way can be the cooperative energy (Gao et al., 2016).
- Diffusion of nearly Zero Energy Building (nZEB): energy saving techniques for both the casing and the plant would limit the impact of residential and commercial buildings consumption that cost in the 60% of electricity consumption and 29% of total primary energy (Report BP, 2018).

3. REGULATION PANORAMA

The 2015 was a key year for all the countries of the United Nations General Assembly where the development plans for sustainability were defined with objectives to 2030, in this case also the national research bodies are moving to achieve goals by defining good practices for sustainable cities or even through standards. The decree and the European directive (Directive (EU) 2018/2001) define for the first time the legislation of the energy communities. In particular the Article 22 of this norm raises the pivotal point of the legislation on the energy community plan. In fact, it is clear that the end customers have (even domestic customers) to participate in renewable energy communities by maintaining their rights or duties as end customers. the energy communities will therefore have the possibility to produce, consume, store and sell exchange energy within the same community and access all the appropriate electricity markets, directly or by aggregation, in a non-discriminatory way. It also clarifies the essence of economic support tools for the birth of these same. The renewable energy communities are subject to fair, proportionate and transparent procedures, in particular

registration and authorization procedures and network charges that take into account costs, charges, levies and relevant taxes, ensuring that they contribute appropriately, fair and balanced the general breakdown system costs system in line with a transparent cost-benefit analysis of the distributed energy resources carried out by the competent national authorities.

4. ITALIAN SEC NORM

In Italy, up until a few months ago, there was no type of regulation of the energy communities, in particular the management of the independent prosumers' systems is regulated by the market for on-site exchange. Precisely this determines criticalities in the networks (in particular in the electricity sector), therefore the birth of energy communities able to exchange energy produced from renewable sources is an excellent model for resolving critical issues. However, with data updated to 2017, Italy has exceeded the share of total energy actually produced from renewable sources with respect to that expected there is only one region to date that has moved in the definition of a law dedicated to the SEC (GSE, 2019).

4.1. Regional SEC law Piemonte

The regional decree number 12 of 2018 has defined only for the Piemonte Regione the possibility of creating territorial energy communities with limits on the minimum share of electricity to be consumed equal to 0.5 GWh and the minimum of energy produced from renewable sources to be self-consumed equal to 70% (Regione Piemonte BU11S1 14/03/2019). The main objectives are to increase the self-consumption of energy in order to limit the criticalities of the network caused for example by the Italian mechanism of on-site exchange and also the increase in production from renewable energy sources. The legislation is consistent with European and national standards of environmental sustainability, the Region has approved a fitting provision that provides for the establishment of "energy communities". It is defined as a non-profit bodies established to overcome the use of oil and of its derivatives and to facilitate the production and exchange of energy generated mainly from renewable sources, as well as forms of streamlining and reducing energy consumption. The fundamental points of the regional reference legislation are the definition of the criteria for the adoption of a memorandum of understanding by the municipalities that intend to propose the establishment of an energy community, or to join an existing energy community. The case management requires same actions to fulfil the procedures for the energy balance of the energy communities, which the communities are required to draw up within six months from their establishment. The criteria and characteristics of the strategic document of the energy communities, which the energy communities must draw up within twelve months of their establishment, must

contain the identification of the actions they intend to take to reduce energy consumption or through non-renewable sources and or through efficiency of energy conversion devices. It will also be necessary to draw up a precise classification of the parameters for the regional evaluation of the results deriving from the implementation of the strategic document. Instead, the criteria and methods for regional financial support, first implemented for the year 2019, at the stage of establishment of the energy communities, indulge particular regard to the preparation of projects and documentation related to the constitution of the communities.

5. AN ITALIAN INITIATIVE

The climatic emergency imposes, in all the sectors of development, serious and important reflections of change and push towards the adoption of more sustainable systems capable of profoundly modifying the way of producing and consuming resources. In this scenario, the construction sector can play a central role both from the environmental point of view and from economic development, a key point of the economic revolution and in the fight against climate change. But it also plays a key role in terms of inequalities and quality of life. This sector, in fact, is strongly implicated in the crisis environmental due to its production and disposal processes (energy consumption, polluting factors, waste production) and land use, but also in terms of quality of housing. Not surprisingly, most of the buildings we live and work are been implemented before any legislation on energy efficiency. And the absence of controls, compared to the regulatory obligations on the new building, it has certainly not contributed to improving the real estate assets. For all these reasons the initiative of Lega Ambiente CIVICO 5.0 (Open Condominius Lega Ambiente, 2019), seems to be a new way of living in a condominium where the theme of sharing is put into practice. A new opportunity not only to revive the themes of efficiency, climate and air pollution, and to emphasize the role that administrations, builders, designers and citizens in rethinking ever more sustainable solutions both for new buildings and existing, but also to make families protagonists of change. The project includes around 22 bottom-up good practices ranging from energy efficiency measures, using state incentives such as Eco-bonus and Credit Transfer, to putting the sharing economy into practice: sharing ideas, spaces, services, objects and wishes to increase widespread well-being. Without having a dedicated regulation available, the 22 condominium projects are for the rebuilding of the plants in some cases (preferring the shared conversion devices and plants powered by renewable sources) or rebuilding of the building shells for the building envelope of the condominium. In some cases, such as the case of Padua (Buzz in the Attic), no intervention is foreseen from the point of view of the energetic background plant but only other sharing initiatives are envisaged such as: collaboration for journeys in the city, water dispenser, group of purchase fruit and vegetables from local distributors and

monthly cultural meetings open to the city, shared Wi-Fi. The concept of community is thus fully expressed, moving from a smart energy community to a smart energy municipality or a multidisciplinary organization that collects the life needs of the citizen such as mobility, health, food, energy, the work.

6. CONCLUSION

The panorama, and internationally, includes numerous regulated initiatives that have given rise to the birth of multiple communities as Japan (Kim et al., 2018) or North of Europe (Jantzen et al., 2018). While the Italian contribution makes it possible to identify a multidisciplinary reality that has not been analyzed, which would allow local communities to be obtained that are able to exploit local resources not only from energy or technological point of view but also identifying initiatives that improve the quality of the citizen's life. The analysis of the regulatory context is essential to encourage and regulate this type of reality and will allow in the future the possibility of studies and applications in specific areas that characterize its resources and needs. Subsequent studies will focus on the possibility of simulating with an implementation approach the presence of some energy communities in order to identify the advantages or problems when compared with a traditional management of the energy system.

CROSS CULTURAL INFLUENCES UPON PURCHASE INTENTIONS: THE INFLUENCE OF THE COUNTRY OF ORIGIN (COO)

Cheng, Min¹; Halliburton, Chris²

¹ESCP Europe Business School, London, UK

²Faculty of Marketing, ESCP Europe Business School, London, UK

ABSTRACT

The paper investigates one aspect of the cross-cultural influence upon consumer purchase intentions, namely the relevance and importance of the perceived country of origin (COO). It examines COO effects to explore whether a product or brand's origin country has an influence on consumers' purchase intention, taking the case of Chinese consumers' purchasing preferences for mobile telephones. It uses the Keller brand equity (CBBE) model to examine the relationship between its different components. The study uses a quantitative online survey of 826 effective respondents as well as 25 qualitative in-depth interviews. The results of the study show that: (1) Chinese consumers attached more importance to the 'functional' dimensions of the CBBE model rather than the more 'emotional' aspects. (2) The COO effect does appear to have an influence on purchasing preference, however this effect appears to be declining. Finally, the paper delivers managerial implications for global and domestic brands dealing with cross-cultural decisions, using the international mobile phone market as an example.

Keywords: Cross-cultural management; Country of Origin (COO) effects; international purchasing preference; China

INTRODUCTION

This study aims to investigate cross-cultural purchasing decisions, specifically the role of the perceived country of origin (COO), using Keller's CBBE brand equity model, (Keller, 2001). It examines COO effects for global versus local brands, using the Chinese mobile telephone market as the example.

China represents a tremendous opportunity for both global and domestic brands. Traditionally, Chinese consumers preferred imported goods from developed countries, such as the USA and Europe, and were willing to pay higher prices for them. In contrast, domestic brands were regarded as cheap and low quality. However now many local brands are catching up in quality

with global brands and who also enjoy some special advantages, such as extensive distribution networks and more accurate marketing insights. For example, in China, P&G accounts for 19% of the personal hygiene industry while its global rival Unilever has only 9% with over 70% of the market dominated by Shanghai Jiahua United Company, Nice Group and other domestic companies. Similarly, in the mobile phone industry Oppo has overtaken the iPhone as the most popular mobile phone in China. Hence this paper aims to investigate whether the country of origin still has influence on consumers' purchasing preference.

LITERATURE REVIEW

COO effects and consumer ethnocentrism

Consumer ethnocentrism is defined as a "trait-like property of an individual's personality" and encompasses "the beliefs held by the consumers about appropriateness, indeed morality, of purchasing foreign-made products" (Shimp and Sharma, 1987)

There are many factors which could affect the degree of consumer ethnocentrism, one of them is product category. Sharma et al. (1995, in Piron, 2000), indicated that the less important a product category, the greater the ethnocentric tendencies and behaviour exhibited by consumers. Additionally, the impact of consumer ethnocentrism is also influenced by the development level of consumers' home country. Wang and Chen (2004) pointed out that consumers from a developed country tend to appreciate more favorably domestic products over imported ones. The reverse has been observed in developing countries, where consumers spontaneously perceive products from developed countries as superior. However, the development gap between these countries is decreasing. China could serve as an example with the increasing emergence of Chinese entrepreneurial brands and more and more Chinese manufacturers positioning themselves as high-end providers with upgraded production systems and stricter quality control. Chinese product quality is improving and customer are seeing this change. Although there is still a gap between the new reality of Chinese product and consumer perception, the gap is narrowing, given that the changing perception of China itself. According to Millward Brown's 2018 BrandZ report, the perception is changing fastest for internet-driven brands, but also for traditional categories, such as fashion or food.

Lastly, to some extent, patriotism fosters consumer ethnocentrism, in recent years, the political conflicts between China and neighboring countries, such as Japan and South Korea, may have had an influence on purchasing behaviour of Chinese consumers. On the one hand, radical consumers spontaneously called for boycott of foreign good and disseminate inflammatory comments

through social media platforms, including Sina Weibo, WeChat, and QQ etc. The worst conflict happened in 2012 when China had large anti-Japanese demonstrations across the whole country, the demonstrations turned into violence, and certain protestors smashed Japanese cars and vandalised shops selling Japanese goods. On the other hand, more moderate Chinese customers, especially consumers from the older generation, regard “purchasing domestic goods” as patriotic behaviour and would take “supporting domestic industry” into their purchasing consideration.

The definition of Country of Origin (COO) effect is that consumers’ perceptions about imported products and their attributes are affected by the country of origin, (Andéhn & L'espoir Decosta, 2018; Semaan et.al., 2019; Zeugner-Roth et.al, 2015).

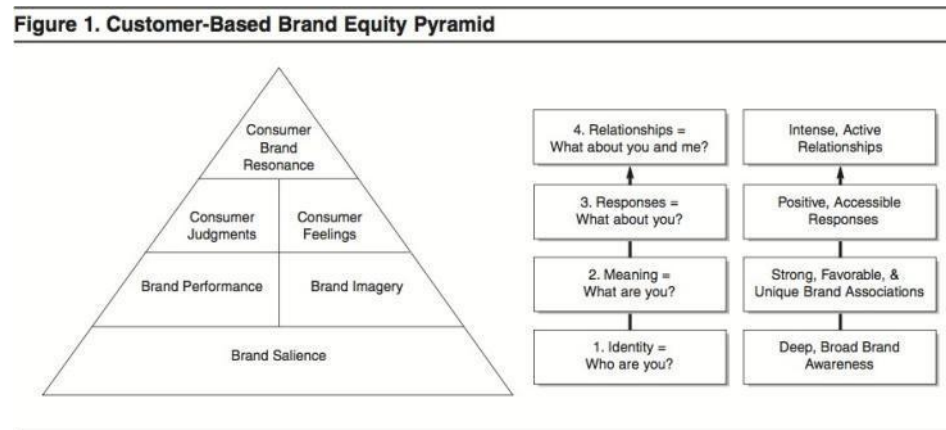

According to the research of Roth and Romeo (1992), the COO effect is attribute-specific. In evaluating the product, people will relate the product attributes to characteristics of the country. For example, France is well-known for its wine and luxury fashion goods whereas French cars could be compared less favourably to German or Japanese cars. Similarly, when brands of clothes, art and jewelry are endorsed by the word “Italian”, they are more likely to be perceived as premium, high quality and stylish, (Aiello, Halliburton et.al. 2015). Additionally, the similarities between two countries, in terms of economic development level, culture and politics can influence the magnitude of COO effect (Watson and Wright 2000). Consumers prefer the product from similar countries or economic superior countries, given that they assume the product quality would be better from those countries.

Brand equity (CBBE model)

The paper uses the CBBE model proposed by Keller, (see Figure 1, Keller, 2001). According to Keller, the basic premise of the model is that the power of a brand lies in what customers have learned, felt, seen and heard about the brand over time. The different elements of CBBE model could help to explore what factors could affect consumers’ behaviour in emerging markets.

The fundamental ‘building block’ is brand salience, which refers to the top of mind awareness when the product category is recalled. Brand performance concerns functional issues such as product attributes or quality. Various studies have shown that consumers from emerging markets are more concerned about fulfilling basic needs, which are more closely related to functional attributes. Brand imagery deals with the intangible and psychological properties of the product. Thirdly, brand equity is also defined by how customers respond to the brand in terms of how they think and feel about the brand, (rational “judgment” versus emotional “feeling”). Finally, brand resonance represents the outcome in terms of behavioural loyalty, attachment, affiliation and engagement.

Fig 1. CBBE model

Global brands

In his seminal 1983 article Levitt argued that companies should exploit the “economies of simplicity” and grow by selling standardised products all over the world. (Levitt, T. 1983). Holt et.al found that consumers associate global brands with three characteristics: as a quality signal, “global myth” and social responsibility. These three dimensions together explained 64% of the reason why consumers choose global brands, (Holt, D. B., Quelch, J. A., & Taylor, E. L. 2004). China has a relatively high number of “global citizens” as well as “Global Agnostics”.

The mobile phone industry in China

China has long been viewed as critical to global mobile phone manufacturers such as Apple and Samsung. China is now the world’s largest mobile phone market, with over 1.4 Bn. Mobile phone subscriptions (Statista, 2018). The iPhone enjoyed great success in China since the launch of iPhone 4, the numbers of iPhones currently in-use in China exceeded even those in the US but in recent years, due to fierce competition from domestic brands and more discerning consumers, iPhone was threatened to some degree in the Chinese market with five consecutive quarters of decline. (Dou, E, the Wall Street Journal, 2018) At present, its iOS operating system accounts for 23% market share versus Android at 73% 86.4% (Statista, 2018), indicating that Chinese market is still dominated by local brands. Samsung’s mobile phone sales also declined in the last two years, mainly due to the deteriorating brand reputation and fierce competition from Chinese manufacturers. As the third largest smartphone manufacturer in the world, Huawei undoubtedly ranks No.1 among domestic brands, holding a 17.8% volume share (Statista, 2018). The brand is perceived as high quality and innovative upgrading its product line mainly focusing on mid-range smartphone segment. Vivo and Oppo are wholly owned by Guangdong BBE Electronics Corporation. In recent years, despite

the overall slowdown, they are the rising stars in the Chinese mobile phone market and continue to see significant growth. Just five years ago, Oppo and Vivo together held a mere 3% of the Chinese smartphone market now accounting for more than 20%. Vivo and Oppo enjoy competitive advantages in terms of distribution network, especially in China's low-tier cities and rural areas. The smartphone market in China's first tier cities is already quite mature, but in smaller markets, there are still many first-time buyers – and thus, more growth opportunities. Additionally, their relatively low prices are favored by the mass of price-sensitive consumers.

HYPOTHESIS STATEMENT

H1: Chinese consumers attach more importance to the functional side of the CBBE model.

As described earlier, from the literature the study assumes that in the purchasing decision-making process, Chinese consumers pay more attention to the functional elements, which refer to Brand Performance and Brand Judgment in the CBBE model.

H2: COO effects do have an influence on Chinese customers' purchasing behaviour, with a preference for global brands over domestic brands.

This hypothesis is derived from the previous review of the COO literature.

RESEARCH METHOD

The study uses the CBBE framework in the Chinese market using an online survey and in-depth interviews. Five mobile phone brands were selected: two global brands, Apple (USA) and Samsung (Korea), and the three main domestic brands: Huawei, Vivo and Oppo.

The research included a quantitative online survey and a qualitative component of in-depth interviews. The target respondents were individual customers who have used at least one of the chosen smartphone brands. A total of 826 effective questionnaires were returned. In addition, 25 respondents spread across the 5 selected brands received a 20-30 minute in-depth interview.

Survey Data collection

The questionnaire was divided into three parts: firstly, demographic information of age and gender, a filter question was included to ensure that respondents are using the smartphone of the chosen brands; secondly, questions regarding COO effects and thirdly, questions to test the influence of different components of the CBBE model. The survey was distributed through the researchers' social networks in China, such as WeChat and Sina Weibo. The survey population is not entirely representative therefore of all Chinese mobile phone users.

Demographic data

Out of a total of 862 effective respondents, 38% are male and 62% are female. In terms of age distribution, 21% of respondents are aged under 22 years, 40% between 22-35, 35% of them between 35-55 and 4% over 55 years.

In the survey, 57% of respondents are using iPhone. Compared to Vivo (5.5%) and Oppo (5.5%), Huawei, used by 17% of respondents, is the most popular domestic mobile phone brand (Fig 2).

Fig 2: respondents current brand users

SURVEY FINDINGS

The first layer of the CBBE model is brand salience, which refers to top-of-mind awareness. 63% of respondents answered iPhone as their most familiar brand, a slightly higher percentage than iPhone users in the survey (57%), indicating that iPhone enjoy the highest brand salience in our sample (Fig3). This was an interesting finding, since traditionally, global brands had weaker brand salience, largely due to their limited access to distribution systems. The product launch of Apple was communicated every year via all kinds of media to consumers in China, almost in real time.

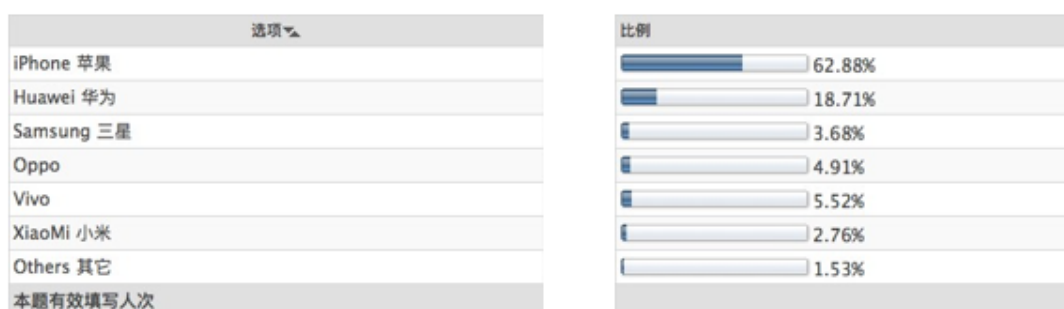

Fig 3: the survey result of the most salient brand

Brand meaning includes functional-related brand performance and brand imagery. Strong brands typically have strong, favorable and unique brand associations with consumers. A previous study

argued that consumers from emerging countries are more concerned about fulfilling basic needs, which are closely related to functional aspects of the brand. (Zarantello et al, 2017). In the survey, this consumer preference is confirmed. The top five choices, appearance/shape (45.4%), performance of the operating system (46.6%), Price (30.6%), Battery life (27.6%) and Screen Size (25.2%) all belong to brand functional performance. In contrast, the brand affinity or emotional attachment only accounts for 14.7% in purchasing consideration, and the percentage for brand loyalty is even lower.

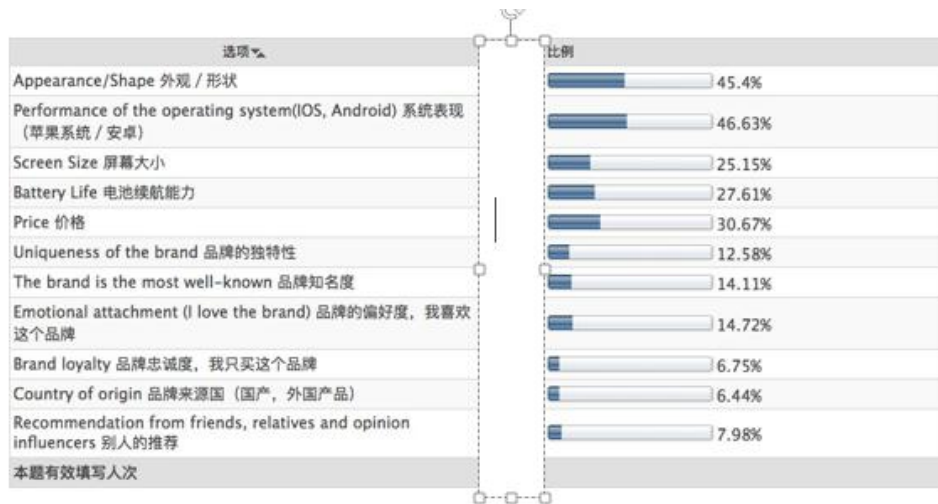

Fig 4: the survey result of most important factor in purchasing consideration

At the top of CBBE pyramid is brand resonance. Cross analysis was used to see whether there was a difference between consumers' relationship with global brands and domestic brands. The result showed that 66.1% of Huawei users identified themselves as loyal customers of this brand and will continue to buy Huawei products. The percentage is significantly higher than Oppo (27.8%), Vivo (27.8%) and Samsung (21.1%), (Fig 5). iPhone users are also loyal, with 42.8% of them expressing their willingness to continue to buy. From the current result, the study could not draw any conclusion on the brand relationship difference between global and domestic brands. Thus, in the qualitative interviews, the study tried to investigate deeper reasons for behavioural loyalty and to explore other categories of brand resonance: attitudinal attachment, sense of community and active engagement.

	Brand loyal	Not loyal	Not sure
Apple 苹果	43	17	40
Huawei 华为	66	7	27
Samsung 三星	21	32	47
Oppo	28	17	56
Vivo	28	11	61
XiaoMi 小米	20	10	70
Others 其它	38	28	33
本题有效填写人次			

Fig 5: Survey result of brand loyalty (%'s)

Finally, four questions were designed to test consumers' perceptions and attitudes towards the origin country. For the first question, "Are you willing to pay a higher price for global brands?", only 43.6% of respondents gave a positive answer, hence rejecting hypothesis 2. In the product category of mobile phones, respondents did not show a strong preference for global brands. When the survey asked "Does the origin country of mobile phone affect your purchasing decision, if yes, which origin country will have a positive influence on your purchase decision?" Surprisingly, 42% of respondents chose the domestic brand, and 34.4% respondents noted that they are indifferent to the origin country. Only a small number of respondents prefer imported products from economically superior countries: 18.4% for USA, 1.8% for Europe and 0.9% for Korea. This might be explained by the improved "Made in China" product quality, since 52.3% of respondent answered "I think Chinese product has already caught up in product quality as well as brand credibility, and global brand mobile phones do not have better quality than Chinese brands", (Fig 6).

Fig 6: the survey result of COO effect

DISCUSSION AND INTERVIEW INTERPRETATION

In the initial online survey, hypothesis 1: Chinese consumers attach more importance to the functional side of CBBE model has been confirmed. However, for hypothesis 2, COO effects, the survey showed contradictory results. Therefore, qualitative interviews were designed to try to get a deeper analysis of these hypotheses. Since the brand positioning and target customer of Xiaomi are very similar to those of Oppo and Vivo, coupled with the fact that only 3.1% of respondents in the survey are using Xiaomi, the study did not interview Xiaomi users. The interview questions include their understanding of the brand, what it means to them, and how they feel about the brand going forward to measure the strength, favorability, and uniqueness of their mobile phone brand.

IPhone and Samsung

IPhone and Samsung are well-known global mobile phone manufacturers, who enjoy a high reputation in the industry. They both target Chinese high-end consumers who are willing to pay a price premium. Despite the recent decreasing market share in China, iPhone remains the most popular mobile phone brand in China. When interviewees think of this product category, iPhone easily comes top of mind. Meanwhile, Samsung face a much more serious brand challenge because of its battery explosion crisis. Ten interviewees mentioned their concern about the quality of Samsung. The main point of uniqueness is Apple's proprietary operating system, which is also a part of functional brand performance. One interviewee responded, "I am used to the iOS system, so it would drive me crazy if I use an Android phone". This point of view is very interesting, because Samsung users noted that "I think Samsung is user-friendly mainly because it's non-proprietary". Although favorable brand images, such as Apple's classic white colour and former CEO Steve Jobs some of the interviewees expressed their strong dependency on iPhone, ranking handset performance as the most important consideration in the purchase.

Additionally, interviewees expressed their willingness to pay a price premium for iPhone, largely due to Apple's operating system and niche applications on App stores. Active engagement of iPhone also showed some decrease – "I no longer follow their news unless I need a new iPhone." The Samsung user is even more function-oriented. "I think Samsung is reliable and its quality is acceptable, but I do not have any emotional attachment with the brand, and I haven't participated in any brand activities".

This response further verified hypothesis 1: Chinese consumers attach more importance to functionalities of a product.

Huawei

Consumers look for high quality, reliability and durability in mobile phones. Huawei traditionally values quality and technology, proving to be superior in offering Chinese consumers with high performance products at reasonable price. However, the consumer preference remains more at the functional level. Long battery life ranked first in consumers' reasons to buy Huawei handsets - "The brand image of Huawei is reliable but ordinary", one interviewee claimed. The lack of strong emotional ties to the brand makes consumers more likely to become frustrated when their needs are not sufficiently met. In the online survey, the result showed that Huawei enjoy highest behavioural loyalty among all the brands, with 66.1% of consumers choosing continue to buy Huawei product. One interviewee gave the answer, "All the mobile phones in the market are quite similar, I would continue to buy Huawei, just because their quality is not bad" In comparison, Huawei failed to build attitudinal loyalty, sense of community or active brand engagement, given that the brand satisfaction is largely based on its functional performance and interviewees never followed the news or social media account of Huawei.

Oppo and Vivo

High salience of these two brands was built on massive distribution network and heavy advertising investment. BBK observe that consumers from rural areas tend to avoid online-shopping of electronic devices. Therefore, the company decided to expand direct stores aggressively across the country, mainly in low-tier cities. Interviewees of Vivo noted that "I can find Vivo everywhere, even in the supermarket in front of our university." Furthermore, Both Oppo and Vivo sponsored popular TV programs, used subtle product placement in movies and invited superstars as brand spokesman. As a result, Oppo increased 157% in millennial loyalty between 2014 and 2017 (Millwardbrown Brand Z report, 2017). The right celebrity can help communicate the attributes consumers seek in brands and the power of celebrity is especially appealing in Asian countries. One of the interviewees answered "My friends and I are quite familiar with Vivo, because Han LU (brand spokesman) appears on TV, holding the Vivo mobile phone everyday".

In the CBBE pyramid, the interviewees of these two brands are quite price-sensitive. They care mostly about basic functions of a mobile phone, such as product appearance, durable battery life and high pixel. There is a lack of strong emotional ties to the brand. In the interview, they are asked to openly describe their feelings about the brand. "It's just a commodity in my life and I only use it to call my friends, send messages and take photos, that's all. I do not have any feelings." The low level of brand affinity and attitudinal loyalty makes the brand very vulnerable in the market, since consumers would shift to other brands quite easily. For instance, interviewees of Oppo users

mentioned that they previously used the mobile phones of Xiaomi and Vivo and that they might continue to change the mobile phone brand in the future, since from their perspective, all the mobile phones are quite similar.

Regarding the COO effect, all the interviewees reached the consensus that Chinese products improved a lot in both product quality as well as brand credibility. For this reason, none of the interviewees perceived domestic brand as less trustworthy and desirable. One of the interviewees noted that "I will not consider the mobile phones from underdeveloped countries, for instance, India or Malaysia but, for me, there is no difference between Chinese brands, Korean brands and American brands". This point of view is aligned with a previously cited study: the similarities between two countries, in terms of economic development level and culture influence the magnitude of the COO effect (Watson and Wright 2000). To some extent, COO effect still exist, but with the developing Chinese economy, the perception gap between domestic brands and global brands is narrowing.

Furthermore, the interviews reflected a tendency of consumer ethnocentrism among Chinese consumers, especially the middle-aged generation. Younger generations in China are arguably less likely to be involved in political topics. For example, one Huawei user, in her 40s, indicated that "one of the important reasons why my friends and I chose Huawei is because we want to support our national brand".

CONCLUSIONS AND RECOMMENDATIONS

Conclusions

The first hypothesis that Chinese consumers attach more importance to the functional side of the CBBE model was confirmed. The study assumes that in the purchasing decision-making process, Chinese consumers pay more attention to the functional elements, which refer to Brand Performance and Brand Judgment. From the online survey, the hypothesis was confirmed given that the top five most important factors when Chinese consumers purchase a mobile handset all belong to brand functional performance. Similarly, in the interviews, interviewees regarded functional performance rather than positive emotional attachment as more important considerations in the purchase.

However, differently from the second hypothesis, the study found out that Chinese consumers' perception of global brands and domestic brands turned out to be very close. In fact, more than half of the respondents believe that Chinese product quality has improved and are not inferior to imported products. At present, COO effects still have an influence on Chinese customers'

purchasing behaviour, but the perception gap between Chinese products and global brand is narrowing.

In summary, the study supported previous studies on CBBE model and COO effects. At the same time, the current study added new insights into the comparison between functional-related and emotional related brand perceptions on Chinese consumers' purchasing behaviour. In addition, the study indirectly confirmed that the magnitude of COO effect would be influenced by similarities of two countries as well as consumer ethnocentrism.

Managerial implications

Becoming more locally responsive

For global brands, the fundamental issue to gain competitive advantages in emerging countries is to balance the pressures for global standardisation versus those for local responsiveness. At present, the local adaptation Apple or Samsung have made is minor, especially when a customer perception shift is observed in emerging countries. For global brands, being foreign is no longer an adequate differentiator, given that the consumer perceived quality gap between global brands and domestic brands are narrowing.

However, customer preference, regulation, economics and values differ across countries. Chinese brands have tried to leverage their core strength: insight about the needs and wants of local consumers, and the capability to act quickly on these insights. For example, Vivo launched special selfie mobile phone, given that the young female, core consumer segment of Vivo, has high requirements for taking selfie photos.

Conversely, Apple partnered with the RED to launch a red iPhone but Chinese consumers called for a boycott of the new product on the Internet because the organisation RED had some relationship with the Dalai Lama, who is seen as an extreme separatist in mainland China.

Therefore, being more locally responsive and understanding local customers' specific needs and preference become crucial in the competition with arising domestic brands.

Strengthening the emotional dimension

For domestic brands, improving top layers in the CBBE pyramid, which refers to favourable and unique brand responses as well as intense and active brand relationship, becomes more crucial in the future. When all the mobile phone brands satisfy the basic standards of quality, the lack of uniqueness and superiority could put the brand into a more 'passive' position. In order to stand out, establishing differentiated brand identity and building emotional attachment with consumers is

crucial. Achieving this objective involves delivering a better consumer experience that helps the brand build deeper loyalty and engagement with selected consumers.

Furthermore, Chinese brands that have established strong presence and consumer acceptance in China still confront challenges when expanding abroad. Although these brands could rival Apple or Samsung in terms of quality or product design, consumers view these brands as inferior. It is important to create more positive brand images and communicate the brand story to global consumers, as evidenced for example by Oppo's sponsorship of Indian cricket.

LIMITATIONS AND FUTURE RESEARCH

Firstly, the online survey was mainly distributed through researchers' social networks in China with 57% of the resulting respondents using iPhone, a much higher percentage than Apple's market share in China. The sample sizes for Samsung, Oppo, Vivo and Xiaomi were relatively smaller, although greater than 50 respondents in each case. The sample had a higher representation of younger and middle-aged females, (females 62%) Thus other consumer groups should be included in a more comprehensive research.

Secondly, only 25 in-depth interviews were conducted, with five interviewees for each chosen brand. The interview results were obviously influenced by the interviewee's personal opinions and user experience for their own brand(s).

Future studies could use larger sample sizes with a more representative coverage across brands and consumer profiles.

ENTREPRENEURIAL CREATIVITY IN SOCIO-ECONOMIC CONTEXT

Czarczyńska, Anna

Sustainable Development Center, Kozminski University, Warsaw, Poland

ABSTRACT

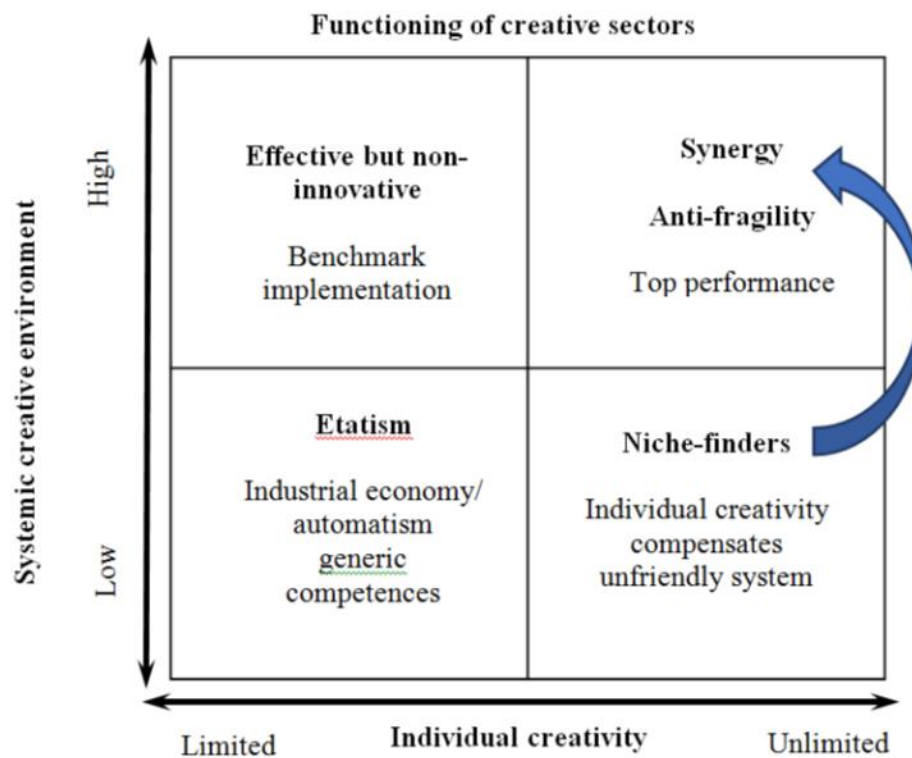

Creativity is taken as a requirement for a personal anti-fragile career path in the context of regional competitive advantage in the terms of socio-economics creative environment. At the personal level, the competence and value-based approach to creativity are proposed, is an elaboration of the resource-based view of the group of individuals selected from given country. Entrepreneurial creativity competence [measured by the Schein anchor questionnaire] is based on an independent way of thinking and empowerment presents one aspect of creative capability, however quickly verified by the market, that's why we treat this as a basic exemplification of average creative attitude combine with the entrepreneurial attitude. This introductory instrument enables further scientific research based on the same group in the context of multi-cultural external creative or the non-creative environment.

Keywords: creativity, entrepreneurship, value-based approach, regional culture

INTRODUCTION - WHY DO WE NEED CREATIVITY?

Creativity is human phenomena, crucial for all type of activity in the XXI century. As a part of nature, society and economy we need to know how to use our limited resources to fulfil planet/social/our needs in a better way. Up to the end of the previous century, economic growth was based mostly on natural resources and constantly expanding economic world due to globalization. Now we are at the moment of almost ending simple methods of growth. Current "game" is based on creative use/reuse of limited resources, and 'how' become much more important than 'how much'. By purpose we do not talk only about the creativity in terms of innovation and commercialization of R&D research – this is economic part [however very important because we all have our basic needs and we need money to meet them]. But we want to concentrate on a broader aspect of creativity so important for the functioning of civil society and sustainable development management. We expect synergy between all these creativity dimensions and appearance of spillover effect boosting local development.

Anti-fragile niche-finders are able to adapt in a creative way to the general uncertainty of global environment/policy/economy. Their anti-fragility, i.e. existent resistance to crises and shocks, results from the fact that they are able to adjust and growth as a result of unexpected changes [Taleb, 2012]. The modern global economy based on open resources of knowledge and growing collective intelligence creates solutions unpredictable even a decade ago. As an individual person, we can take a part in this new accelerating revolution or stand beside. Creativity is based on a collective action so we need the group of people to create with them or for them [and this, unfortunately, can be dispersed like it happens quite often in the IT sector, or concentrated like in major artistic creative activity]. Anyway all the companies profit/or non-profit in the nowadays challenging environment have to act as a startup despite the time of their existence.

THEORETICAL BACKGROUND

More and more chaotic and unregulated world needs new technologies, new knowledge, and solutions for old as well as for new problems. At the individual/ organizational/social level, we have new opportunities for creativity and we invest more and more resources at the personal and at the community level in becoming more innovative and efficient, or just more happy. This is the basic requirement of the modern economy, but are we aware of that? Do we have the potential for

creativity? Or if so do we need any incentives or special socio-economic environment to disclose that? It's quite possible that we repeat old patterns in our organizations and the business model we explore does not fit anymore to the reality [Zott and Amit 2008, Santos and Eisenhardt 2009].

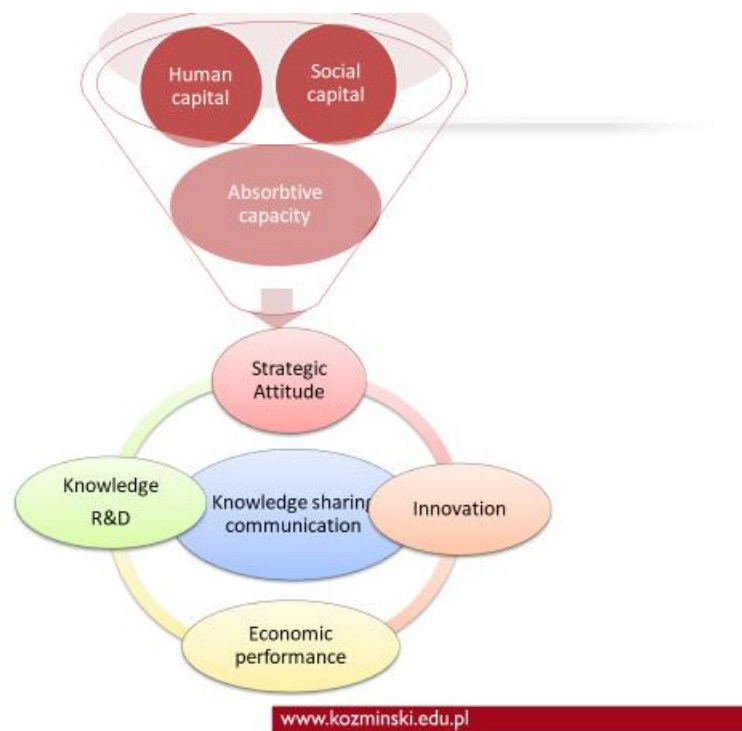

Main organizational science trends would put the creativity in the ecological niche [Baum1996], or as a new construct based on neo-institutional field [Scott 2001], or finally as a product of adaptation to the new equilibrium [Romanelli and Tushman 1994]. From our perspective taking under consideration two different regions, the approach of Krugman is very alluring, because leads to the agglomeration models of industry clusters [Krugman 1995], however the most interesting is how to measure "the connection between the ongoing creative ferment in human societies and the particular realizations of it in organizations" [Aldrich 1999, p. 1], and how the creation of new organizational collectives generates new value by "economic and social transformation of whole societies" [Schoonhoven and Romanelli 2001, pp. 2, 7].

Pro-creative knowledge environment has three main components: social capital in the sense of network quality and diversity, human capital as a sense-making resource, and absorptive capacity in the meaning of systems, structures, and routines. With such a background, the society is able to create the potential for an effective economic performance based on R&D knowledge and innovation. However a high level of innovation and strong research system is not enough when there is a lack of strategic attitudes and effective knowledge sharing communication channels based on competencies [the combined skills acquired during the course of training which condition the efficient performance of tasks in a job, based on the knowledge, experience and predisposition of an individual, and displayed in a sequence of behavior] [Czarczyńska, A., 2017 p.368].

An inclusive and innovated global society is under construction, but the entire process is based on the new evolution of creative potential with three pillars:

- *Human Capital*: ability to communicate ideas to a range of people, both internal and external, in a language they understand;
- *Social Capital*: ability to access learning and knowledge from others through the number and quality of relationships in both formalized networks and informal contacts;
- *Absorptive Capacity*: the ability to embed routines for knowledge exploration, reshaping, and retention of knowledge.

Source: Czarczyńska, A., 2017 p.368

We adapt our business activity to evolving environment by implementing the innovations introduced by companies or acquiring the innovative startups [Markides and Gerosky 2005], directly or indirectly “buying” creative people. At the personal level as well as at the organizational level our success depends on the ability to create. The ideal Schumpeterian market assumes that dynamic distribution mechanism push economies towards the state of the best allocation of resources for societal welfare [Schumpeter 1934], but now to achieve that we need responsible government; does it also valid for the creativity phenomena? Do we need any governance or incentive to release our natural capability of creativity?

Perfect competition assumptions such as perfect information, multiple buyers and sellers and no increasing return to scale and no transaction costs we can find in many activities based on ICT tools, but not in terms of externalities. We need regulatory to secure the rule of law and property rights, at the local and national level dominant position or anti-competitive tactics are controllable, but negative for the society externalities, particularly at the global level, are very problematic [sic!]. Creativity is the phenomena without protection but is worth to protect and support because creativity creates positive externalities not only for the organization [hopefully also for the creative people in the company] but also for the society form their collective nature.

Creativity constitutes the dynamic and strong spillover effect on the whole community and causes positive externalities. Externalities occur when organization activity implies an impact for the society that lies beyond the main activity of the agents in the economy and it should be internalized by

taxation, regulation or market incentives. While in the case of the negative externalities we do not have any doubts that are necessary to regulate it, so why we underestimated the role of the regulatory for enhancing the creativity by positive measures [e.g. education scholarships; R&D incentives; subsidy for creative projects].

The government can support also the social connectivity and knowledge sharing network creation. Cross-organizational networks develop boundaries bringing new opportunities thanks to knowledge exchange and directly influence a firm's strategic direction [Gulati 1999].

COMPLEXITY THEORY

The learning process is taking part in two dimensions – firstly at the individual level [and this level of “readiness” we would like to estimate and compare], and the social contextual level. So learning is the non-linear process that occurs within the collective interactions framework [Chiles et al., 2004]. Therefore we can stimulate it at the personal level and at the community level improving knowledge sharing and finally get better allocation of economic activity thanks to cross-community cooperation. Complexity theory's put attention on “process rather than state”, is a science of “becoming rather than being” [Gleick 1987, p. 5] and the adaptivity of the system consists of semi-autonomous agents interacting inside that complex network. Unfortunately, we cannot use *ceteris paribus* assumption anymore and predict the outcome because the whole system is evolving all the time [only the game theory can be useful to some extent]. But this is what we are looking for – constantly creating better solutions “complex adaptive systems” able to react in any circumstances in an anti-fragile way.

The complexity theory describes the permanent state of emergency, means a self-organizing process [McKelvey 1999], dispersed in four dynamics: fluctuation, positive feedback, stabilization, and recombination. A new order is created spontaneously by interactions among the actors, not by the central planning unit [this is a specific case of the power diffusion from the political governors so there is an internal contradiction for the governments who wants to control the interactions when they supposed to support such economic model]. So thanks to the micro-processes we get macro-order. In the systems, fluctuations means changing in energy as a result of new activities or resources that move the existing order into a new order [Lichtenstein 2000]. Processes of positive feedback intensify the initial fluctuations, facilitating new sub-equilibrium “take hold and gain momentum” [Smith and Gemmill 1991, p. 711]. Stabilization is the mechanism of natural regulation, getting back to the framework of internal structure, based on the core beliefs, values that facilitate collective mind [Smith 1986]. Recombination rearranged system's existing elements by self-evolution [Anderson 1999] and a new wave of creativity [Hodgson 1997].

LOCAL CULTURE

Local culture determinants collective mind with their core beliefs, values and reaction mechanism depended on sharing knowledge and communication patterns. Like in the company where adaptation ability strongly depends on organizational culture, the community/group/local society system is embedded in the common culture determining collective action. Also, regulations reflect the local culture, attitude towards the business and the so-called “entrepreneurial spirit” [AGER 2016]. All this combined with religions, habits, even cuisine have an impact on the system’s complexity. For the simplicity we can assume that all selected groups operate in the framework of the European Union, so the basic cultural pattern and creative industry environment should be generally similar [we are very aware of that simplification, however, we would like to investigate those differences in the further investigation].

Local culture determines also creative industries, especially in peripheral regions. While the creative city model mostly replicate the production practices and business strategies of urban creatives in other globalized universal culture, in non-metropolitan peripheral regions strongly connected with the local culture and tradition settings creativity by adaptations to context [Innerhofer 2018]. Local culture strongly determines the expressions of creativity because the social cohesion is very important, so we can find examples of successful individual artistry business, self-reliance and adaptability, and small companies based on local resources. Creative sectors in regions strongly connected with the culture empower exchange of knowledge and cooperation power, but also spillover creativity.

EMPOWERMENT

Profit organizations focus on value creation through industry value chain according to the five forces strategy framework [Porter 1990]. Most of the economic theories concentrate on the better allocation of resources and profit maximization. It is an optimum from the perspective of the particular organization but is necessary so from the perspective of the local/global community, or from the perspective of the employees. The first abbreviation to the social equilibrium broader than the interest of the single company, we can find in the theory of Nash equilibrium [but in that moment the world was not so complex yet].

Creative ability in the complex world is based on value creation thanks to the higher effectiveness of the whole system. The background for such approach is fundamental within the philosophy of empowerment, which is the opposite of control and ‘*homo sovieticus*’ mentality. Empowerment, according to the World Bank [2009], is the “process of increasing the assets and capabilities of individuals or groups to make purposive choices and to transform those choices into desired actions and outcomes.” So that’s why we need stakeholders’ strategic thinking for new economic model

building a good community of prosperity in a stakeholder society where members of a society are empowered. The key concept is to create interaction between all agents: research, education, and innovation as the key drivers of a creative-based society [Czarczyńska, 2017]. Stakeholders for creativity in a complex system means that perpetual novelty can be created on a participatory base of creation process facilitated by state or other micro institutional solution [sometimes the community is very well structured due to religion or values even without the formal structure] that enables people to deploy these resources and skills.

Empowerment implies also the effect of positive externalities through creation practical and innovative solutions dedicated to the current social needs “creating something from nothing” [Baker and Nelson 2005]. This art of invention by Thomas Edison was described as a process needed “a good imagination and a pile of junk.” So the creativity based on empowerment can be developed in any circumstances and without any barriers of the entrance – in that sense this is one of the most democratic processes.

METHODOLOGY

Many organizations manage their employees' careers according to organization optimum, not the individual. That's why it's so important for individuals to be self-reliant when it comes to career management. A “Career Anchor” is a combination of perceived areas of competence, motives, and values relating to professional work choices. E. Schein, one of the founders of the field of modern organizational psychology, suggests that every one of us has a particular orientation towards work and that we all approach our work with a certain set of priority and values [Schein 1990&1996]. The form of activity compliant with individual true values gives a gain in productivity. We would like to investigate the background for creativity in the context of collective mind allowing to trigger the creative potential. The 40-item questionnaire is not a standardized test. The questions were developed by the legendary Edgar Schein, a leader in the field of career and professional studies. E. Schein at MIT identified eight career anchor themes [see table below].

Career anchor category	Traits
Technical/functional competence	This kind of person likes being good at something and will work to become a guru or expert. They like to be challenged and then use their skills to meet the challenge, doing the job properly and better than almost anyone else
Managerial competence	These people want to be managers. They like problem-solving and dealing with other people. They thrive on responsibility To be successful, they also need emotional competence
Autonomy/independence	These people have a primary need to work under their own rules and ‘steam’. They avoid standards and prefer to work alone
Security/stability	These people seek stability and continuity as a primary factor of their lives. They avoid risk and are generally ‘lifers’ in their job

Entrepreneurial creativity	These people like to invent things, be creative and most of all to run their own businesses. They differ from those who seek autonomy in that they will share the workload. They find ownership very important. They get easily bored. Wealth, for them, is a sign of success.
Service/dedication to a cause	Service-orientated people are driven more by how they can help other people than by using their talents. They may work in public services or in areas such as human resources.
Pure challenge	People driven by challenge seek constant stimulation and difficult problems that they can tackle. Such people will change jobs when the current one gets boring, and their career can be varied.
Lifestyle	Those who are focused first on lifestyle look at their whole pattern of living rather than balance work and life, they are more likely to integrate the two. They may even take long periods of time off work in which to indulge in passions such as travelling.

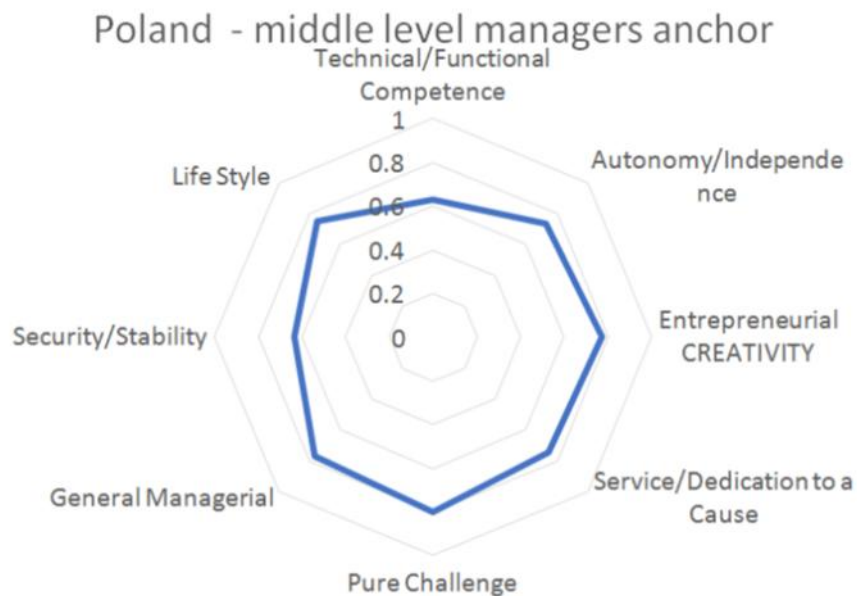

Source: Schein, Edgar H, [1990 & 1996]. *Career Anchors [discovering your real values]*, Jossey-Bass Pfeiffer

We assumed that for random estimation at the personal level we can evaluate 'similarity' of the non-representative group of medium-level managers based on Schein anchors questionnaire measuring motivation for career and development, which is based upon an eight-dimensional conceptualization, in which occupational competencies is complemented with values.

DISCUSSION

In case of Poland, we examined the group of managers to investigate the level of their entrepreneurial creativity in the context of their basic values such as lifestyle, service-orientation or autonomy/independence attitude. The group counted 44 persons in the age of from 22 up to 52 years old – all proactive and looking for personal and corporate development possibilities, from small and medium entrepreneurship [however this was the quite wide range because we have self-employed people and managers working in relatively big companies up to 250 employees]. All of them have uprising career path and are responsible for part of segmented value creation in the company. Male represent 45% of the group and female 55% from the whole group. The observation was made during the first half of the year 2017.

Graph no 3

Source: own estimation

The whole group shows the relatively low level of technical competences [partly it is the low level of self-esteem but still it is a barrier to career development]. Lifestyle is based strongly on traditional values – they are quite important and determine the attitude towards business motivators. We can observe the low level of perceived security/stability - the highest in EU fraction of undeclared work in legal companies. Also the limited ability for independence, pro-service approach, pure challenge and managerial competencies.

In this limited scale we can observe the creation of collective mind which determine the potential for creative ability release. Further investigation is necessary to describe the dynamic of the whole process and the influence of the network connections and local culture catalyst role for entrepreneurial creativity phenomena.

TO FORBEAR OR NOT TO FORBEAR: THIS IS THE QUESTION!

De Vincentiis, Paola

Department of Management, University of Torino

ABSTRACT

After the subprime crisis, with the worsening of asset quality all around Europe, a lack of harmonization emerged concerning credit classification, monitoring, provisioning and writing-off in the banking industry. A wave of analysis and new regulations by the Supervising Authorities aimed at highlighting best practices and creating a common standard, in order to enhance transparency and accounting data comparability across the European Union. A point of particular attention concerned the usage of forbearance measures and the classification and provisioning of forborne positions. This paper deep-dives into this issue leveraging on the public dataset disclosed by the European Banking Authority (EBA), following the 2018 EU-wide Transparency Exercise. The purpose of this paper is twofold. On one side, we want to gauge the extension of the forbearance measures' usage among a sample of major European banks. On the other side, we want to analyze which main factors impact on the loan loss provisioning of forborne positions compared to performing and non-performing exposures.

Keywords: forbearance measures, loan loss provisions, non-performing loans, transparency, asset quality, collateral, credit risk, banking portfolio, accounting data comparability

INTRODUCTION

Banks often approve concessions or modifications to previous loan conditions. Some of these modifications are just motivated by commercial reasons and aim to retain clients who would otherwise move to competitors. Other concessions are related to financial difficulties of the borrowers and are technically called forbearance measures. Their objective should be either to prevent or help resolving problematic loans, safeguarding the bank's exposure. A misuse of forbearance measures may be related to disguising non-performing positions, thus avoiding to burden the profit and loss statement with loan loss provisions.

Forbearance measures are the core topic of this research paper. The purpose of our analysis is twofold. On one side, we want to gauge the extension of the forbearance measures' usage among a sample of major European banks that took part to the EU-wide Transparency Exercise undertaken by the European Banking Authority in 2018. We will compare different types of banks and different countries in order to understand the drivers that lead to a wider or lesser weight of the forborne

exposures as a percentage of the total loan portfolio. On the other side, we want to analyze which main factors impact on the loan loss provisioning of forborne positions compared to performing and non-performing exposures. The final goal of the two analysis is to understand if the forbearance measures are used properly by banks across Europe and if the higher credit risk that is inevitably inherent to forborne positions is well reflected in the level of loan loss provisions. A side purpose is also to gauge if the harmonization effort exerted by European Supervising Authorities reached the goal of smoothing the differences across countries, even though the full effect shall be visible in a few years.

CONTEXT AND LITERATURE REVIEW

The topic of forbearance measures is important and has been studied in literature from two different points of view: micro and macro.

From a microeconomics perspective, the main questions addressed are: how do banks classify forborne positions and provision them to cover for the expected credit losses? Are forbearance measures used in a proper way by banks, i.e. as an instrument to prevent or cure problematic credit exposures?

From a macroeconomics perspective, the issues analyzed are: what are the potential consequences of an extensive usage of forbearance measure on growth and optimal allocation of financial resource? Which are the exogenous factors that may push banks to use forbearance measures more?

The main starting point of the first wave of studies was the subprime crisis which began in 2007 in the United States and had many long lasting effects on the financial and economic environment all over the world. One of these effects was the tremendous worsening of the credit quality of banks' lending portfolios and the consequent increase in the stock of non-performing exposures across Europe. The phenomenon clearly worried the Supervisory Authorities and pushed them to analyze the issue attentively, in order to better evaluate the dimension of the problem and devise potential solutions. In particular, a comprehensive survey was carried out by the Basel Committee for Banking Supervision (2016). What the Supervisors found out during this deep diving exercise scared them even more. They found out a sort of jungle characterized by a wide range of practices in credit evaluation, classification, monitoring, provisioning and writing-off across different banks and national banking systems. The differences were so huge to prevent the possibility to compare different credit institutions, especially if located in different countries. The Basel Committee for Banking Supervision (2016) described the problem in caustic terms: *"One of the lessons learnt from the financial crisis is that supervisors and investors could not always understand and compare information about credit categorization presented in banks financial*

statements. Banks used different (and often undisclosed or insufficiently disclosed) methodologies and assumptions for valuations, provisioning and risk weightings, increasing opacity and reducing comparability for end users”.

Among many other aspects, one crucial issue was the different use and treatment of forbearance measures. The general understanding is that forbearance is a change of the contractual terms of a loan motivated by the financial difficulties of the borrower. Given this general definition, there are many details, which can make a dramatic difference on how the operation is granted, valued and represented in the books: which kind of measures qualify as forbearance? A change in the contractual terms of a loan, negotiated with a client who is not in financial difficulty, is to be considered as a forbearance? How shall a forbore exposure be classified: performing, non-performing or should a special different category be used? May a non-performing position be reclassified to performing status as a consequence of the approval of a forbearance measure? How does the approval of a forbearance measure affect the loan loss provisioning of the exposure?

The consequences of different approaches to the above-mentioned questions may deeply affect the representation of credit risk exposure. The European Banking Authority (2016) well remarked: *“In the current recessionary economic environment, asset quality has been a concern lately through; a) the potential misuse of forbearance to avoid the recognition of some losses; b) the lack of harmonized definition of forbearance and non-performing exposures which prevents meaningful comparisons of asset quality between institutions. [...] This issue also creates uncertainty for the markets: there is no standard against which to compare the soundness of banks’ exposures to enable identification of more robust institutions. As a result, the lack of harmonized definitions contributes to the general feeling of distrust regarding the asset quality of European Banks as a whole.”*

Based on the described findings, the Supervising Authority started a structured harmonization process that gave rise to the issuance, in 2017 and 2018, of various Guidelines, Regulations and Technical Standards, published by the Basel Committee for Banking Supervision (2015), the European Banking Authority (2016) and the European Central Bank (2017). In particular, the forbearance measures were a focus of great interest and much effort was devoted to create a clear normative framework for this tool. The features and the classification of forborne positions were described in extreme details, in order to foster a common understanding and to force banks to use this instrument properly.

The specific empirical literature on the drivers of forbearance and provisioning of forborne positions is very limited. To our knowledge, the most exhaustive contribution on the topic is Homar et al. (2015). This papers analyses the usage of forbearance measure and the coverage of these positions as a

function of various elements: macroeconomic variables, quality of banking supervisions, collateral valuation and bank's financial strength.

Moving to the macroeconomic perspective, the activity of loan restructuring and forbearance is a core focus in the literature stream concerning the so called "zombie firms", i.e. firms that should be dead, but are kept alive by banks that extend, modify and restructure their exposures beyond any reasonable expectation of recovery. There is quite substantial evidence that – during the last two decades – a relevant surge in the phenomenon of zombie firms took place in Europe and in other advanced economies. According to Banerjee, R., Hofmann (2016), the increase amounted approximately to 10 percentage points (from 2 to 12%) from the late 1980s across 14 developed countries.

The most frequent life-supporting machines for these zombie firms are forbearance measures that are approved by financing banks without duly taking into consideration the viability of the new repayment plan and the realistic possibility for the borrower to continue operating as a going concern. Deep-diving into the specific literature on the topic, the first contributions focus on the Japanese market where the zombie firms phenomenon was identified as one of the main root causes of the so called "lost decade".

Moving to the European context, Andrews and Petroulakis (2019) show that zombie firms are more likely to be connected to weak banks that are more reluctant to recognize non-performing positions, thus burdening their already fragile income statements. They also find, similarly to Adalet McGowan et al. (2017) that the phenomenon is stronger in countries where insolvency regimes and creditors' protection are weaker. Banks, in these context, would have less incentive to adopt hard work-out strategies due to the low expected cash flows from recovery.

Storz et al. (2017) claim that zombie firms, when associated to weak banks, tend to increase their debt exposure even further. Any policy intervention shall consequently address the deleveraging of both banks and firms.

Our work belongs to the first described stream of literature, adopting a micro perspective, and builds on the paper of Homar et al. (2015). What we add is a specific focus on how the forborne positions are classified and the drivers of this classification. The new harmonized rules clarify that a forborne position may be classified either performing or non-performing and specify the criteria which should be followed to make this decision. We want to verify if the national context and the bank's financial strength matter not only for the extent of forbearance usage – as already emerged in previous literature – but also on the specific classification of these exposures.

Table 1: Sample distribution by country and total loan portfolio (31 December 2017)

Countries	Banks in the sample		Total Loans		Loans to non-financial corporations	
	#	%	Mln Eur	%	Mln Eur	%
Germany	20	15,38%	2.571.584	13,02%	744.672	28,96%

SAMPLE DESCRIPTION

The data used throughout the paper belong to the EU-wide Transparency Exercise undertaken by the European Banking Authority (EBA) in 2018. The Exercise comprised 130 major banking institutions from 25 countries and collected data from the consolidated accounts at the 31st December 2017 and the

30th June 2018. Along with a Risk Assessment Report, EBA disclosed the entire database of bank-to-bank information on capital positions, risk exposure amounts and asset quality.

Table 1 presents the structure of the dataset by country and total amount of the loan portfolio. First, we can notice a concentration of the sample in four major countries (Germany, Spain, France and Italy) where over 40 percent of the banks are located and approximately 56 percent of total loan portfolio. Confronting the number of banks and their weight on total loans, it is evident that the United Kingdom – even though represented with a limited number of institutions – covers a relevant quota of lending activity. By adding the share of loans granted by British banks, we reach a coverage of 75 percent. The credit exposure towards non-financial companies (last two columns in Table 1) is quite extensive in most countries: 34 percent on average, with peaks above 40 percent in Italy, Austria and Greece. To our goals, this part of the loan portfolio is particularly interesting because the frequency and potential impact of forbearance measures are more relevant.

Table 2 analyses the lending portfolio quality, the weight of positions with approved forbearance measures and the coverage of loan loss provisions over total carrying amount both for non-performing and forborne positions. First, we can notice that the share of positions with a forbearance measure varies sensibly among the different countries taken into consideration. However, at the first sight, the phenomenon seems strictly related to the amount of non-performing loans. Apparently, a change in contractual terms is quite a standard tool to face transitory or structural financial difficulties of the borrowers. The correlation between the NPL and forborne ratio, on a bank-by-bank basis, is very high and amounts to 0,88.

On the contrary, what is quite varied is the share of forborne positions that is classified as non-performing. It is worth to remind here that, even according to the new harmonized framework, banks can maintain a position performing, after approving a forbearance measure, if there are good chances that the borrower will be able to comply regularly, according to the new contractual arrangement. However, it is not possible to upgrade a position to performing status as a mere consequence of the forbearance measure, because a probing period has to pass and some conditions need to be fulfilled before doing so. The data shown in Table 2 seem to indicate that either the compliance to the new harmonized rules is still incomplete or the prevailing interpretation is quite varied on a national basis. The proportion of forborne exposures classified as non-performing goes from levels above the 80 percent in Greece, Poland, Hungary and Bulgaria to levels below 40 per cent in Norway and Finland. Finally, Table 2 shows that the coverage of forborne positions is quite substantial and close to that of the non-performing portfolio. Such an evidence is fully coherent to the fact that the approval of a forbearance measure ultimately indicates a situation of financial difficulty and the need to find a solution either to overcome a non-performing status or to prevent it. Even with this general evidence,

the last column of Table 2 shows that the gap of coverage between non-performing and forbore portfolio varies significantly from country to country. The analysis that follows aims to deepen the understanding of the phenomenon and the drivers underpinning the loan loss provisioning.

Table 2: Loan portfolio's quality, forbearance measures and loan loss provisions (31 December 2017)

Countries	NPL ratio	Forborne ratio	Non performing Forborne	Coverage NPL	Coverage Forborne	Coverage Gap NPL - Forborne

METHODOLOGY

After the qualitative description of the phenomenon presented so far, we want to explore more in depth the usage of forbearance measures and the loan loss provisioning associated to these concessions. In particular, we want to address three main research questions.

First question: Which are the drivers that lead to a wider or lesser usage of forbearance measures by different banks?

The dependent variable in this analysis is the $FORB_RATIO$, which is the proportion of positions with an approved forbearance measure over the total carrying amount of loans to non-financial corporations. We assume that a higher weight of non-performing positions may push the bank to try and solve the situation by rescheduling the debt or otherwise modifying the original terms of the contract. Thus, we expect a positive sign for the regressor NPL_RATIO . We then want to check if banks characterized by a larger loan portfolio and/or by a higher exposure to small-medium companies tend to use more frequently the forbearance measures. We expect larger banks to have a richer set of tools to manage the non-performing portfolio, which could reduce the recourse to forbearance. Likewise, we expect a larger share of SME's loans to be related to a lower frequency of forbearance, since the smaller dimension of single exposures will discourage the administrative burden of a renegotiation and push towards portfolio solutions, based for instance on the sale of non-performing exposures. Finally, based on the results of the survey carried out by the Bank for International Settlement (2016), we expect a different frequency of forborne positions on a country basis, based also on the local normative framework that may make the tools more or less attractive for the banks. In particular, we control through specific dummies the effect of the bank being located in Italy, France, Germany, Spain and Great Britain. We do not consider individually other countries because of the too restricted number of banks in the sample. In line with Homar et al. (2015) we expect to find a higher percentage of forborne positions in countries characterized by worse macroeconomic conditions or lax bank supervision.

$$FORB_{RATIO} = \beta_0 + \beta_1 \times NPL_{RATIO} + \beta_2 \times LOG_{LOANS} + \beta_3 \times SME_{LOANS} + \beta_4 \times D_{COUNTRIES}$$

Second question: Which are the drivers that lead banks to classify forborne positions as non-performing to a wider or lesser extent?

The dependent variable in the second analysis is $FORB_NPL$, which is the percentage of forborne positions classified as non-performing. In this second analysis, the core aspect is the effect of location, i.e. the country dummies. Different national practices and stance by the supervisors could have an

effect on the more or less prudent classification of forborne positions. We control for the FORB_RATIO, the NPL_RATIO and the interaction between the two. We expect a positive sign for the regressor NPL_RATIO, since a lower asset quality of the bank will most probably reflect in a lower asset quality of the forborne portfolio. On the contrary, we expect a negative sign for the regressor FORB_RATIO. In fact, when the forbearance measure are more frequent, they are most probably used both as a strategy to manage non-performing exposures and as a precautionary tool aimed at preventing a borrower from becoming non-performing. In this latter case, the positions may well remain in bonis even after the approval of the concession. Finally, for the interaction between the NPL_RATIO and the FORB_RATIO aims to check if banks burdened by a higher level of non-performing positions tend to use more frequently the forbearance measures as a tool to prevent or delay the recognition of new problematic assets. The expected sign of the interaction is negative, since banks with a lower loan portfolio quality would tend to keep as much as possible the forborne positions into the performing category.

$$FORB_{NPL} = \beta_0 + \beta_1 \times D_{COUNTRIES} + \beta_2 \times FORB_{RATIO} + \beta_3 \times NPL + \beta_4 NPL \\ \times FORBORNE$$

Third question: Which are the drivers that affect the impairment level of forborne positions?

Ultimately, the approval of a forbearance measure points towards an increased riskiness of the borrower. Thus, the loan loss provisions should be substantial on this kind of exposure, which would typically belong to Stage 2 according to IFRS9 accounting standard. In this third analysis, the dependent variable is IMPAIR_FORB that is the percentage impairment on the gross carrying amount of forborne positions. First, we expect the percentage coverage to be positively associated to the FORB_NPL variable. In fact, the amount of loan loss provisions should be higher for forborne exposures classified as non-performing. Second, we expect the impairment level to be negatively correlated to the amount of collateral assisting forborne positions. In fact, the collateral reduces the expected credit loss on the exposures and thus justifies a lower level of provisions. Finally, we control for the effect of LOAN_SME variable. Since the exposures towards small and medium enterprises present in general higher credit risk, we expect a positive sign for the regressor. The usual country dummies are added as controls, even though in this case we do not expect any peculiar local effect.

$$IMPAIR_{FORB} \\ = \beta_0 + \beta_1 \times FORB_{NPL} + \beta_2 \times COLL_{FORB} + \beta_3 \times LOANS_{SME} + \beta_4 \\ \times D_{COUNTRIES}$$

Table 3: Independent variables: definition and expected signs

Name	Definition	Expected sign		
		Regression 1	Regression 2	Regression 3
NPL	Percentage non-performing loans on total carrying amount of the portfolio of loans to non-financial corporations	+	+	
LOG_ASSET	Natural logarithm of bank's total asset	-		
LOANS_SME	Percentage of loans to SMEs on total portfolio of loans to non-financial corporations	+		+
LOANS_ON_ASSET	Percentage of loans on total asset			?
FORB_RATIO	Percentage of exposures with an approved forbearance measure on the total carrying amount of the portfolio of loans to non-financial corporations		-	
FORB_NPL	Percentage of exposures with an approved forbearance measure that are classified as non-performing			+
COLL_FORB	Collateral available in percentage of total carrying amount for forborne exposures			-

RESULTS

Table 4 reports the results concerning the first research question. Both regressions show a strong correlation between the non-performing ratio and the forborne ratio. Thus, it is clear that the forbearance measures are quite a standard strategy to manage the financial difficulty of borrowers, before dismissing or writing-off the position. On the contrary, the usage of this strategy as a preventive tool is less common. A prevailing precautionary nature would in fact lead to a negative correlation between the forborne ratio and the Npl ratio.

The analysis shows a weak positive correlation between the forborne ratio and the dimension of the bank, measured by the logarithm of total asset, in contrast with what we were expecting. Apparently, larger banks make an intensive use of forbearance measures, even though they could in principle access to a richer set of strategies and tools to manage their non-performing portfolio. No significant link emerges between the retail dimension of the loan portfolio and the forborne ratio.

Table 4: Determinants of the forbore positions' weight over total loans to non-financial corporations

C	0,07* (2,32)	0,07** (2,408)
NPL	0,50*** (17,39)	0,53*** (19,08)
LOG_ASSET	-0,012* (-2,12)	-0,012* (-2,07)
LOANS_SME	0,017 (1,18)	0,006 (0,46)
ITALY		-0,04*** (-3,07)
GERMANY		0,005 (0,55)
FRANCE		-0,02 (-0,96)
SPAIN		0,04*** (3,31)
GREAT BRITAIN		0,007 (0,44)
R-SQUARED	0,795	0,837
ADJUSTED R-SQUARED	0,790	0,825
OBSERVATIONS	117	117

This table shows the results of estimating the following OLS regression:

$$FORB_{RATIO} = \beta_0 + \beta_1 \times NPL_{RATIO} + \beta_2 \times LOG_{LOANS} + \beta_3 \times SME_{LOANS} + \beta_4 \times D_{COUNTRIES} + \varepsilon$$

Where the variables are defined as follows: **FORB_RATIO**: percentage of exposures with an approved forbearance measure over the total carrying amount of loans to non-financial corporations, for each individual bank in the sample; **NPL**: percentage of exposures classified non-performing over the total carrying amount of loans to non-financial corporations, for each individual bank in the sample; **LOG_ASSET**: natural logarithm of total asset for each individual bank in the sample; **LOANS_SME**: percentage of loans to small and medium companies over the total carrying amount of loans to non-financial corporation, for each individual bank in the sample; **D_COUNTRIES** (Italy, Germany, France, Spain and Great Britain): dummy variables whose value is equal to 1 if the individual bank is

located in the country and 0 otherwise; ε : assumed normally distributed error term with zero mean and constant variance.

The T-statistics are in brackets under the estimated coefficients. *: two-tailed probability < 0.1; **: two-tailed probability < 0,05; ***: two-tailed probability < 0,01

The R-squared of the first regression, in Table 4, is already very high, reaching the level of 79 per cent. Nonetheless, the explicative power of the regression increases further – to 83 percent – when we add the country dummies. Among these dummies, the two significant ones are Italy and Spain, with different signs. Italian banks use forbearance measures less than the other banks in the sample, whereas Spanish banks use them more. In both cases, the effect is around 4 percent and is highly significant. The explanation brought forward by Homar et al (2015) that links a higher recourse to forbearance to weak macroeconomic conditions is not relevant in this case, because Spain and Italy are quite similar under this profile. The other potential explanation brought forward in the same paper, which refers to lax bank supervision, could apply more. A stricter attitude of the Bank of Italy as opposed to a more flexible treatment of forborne positions by the Bank of Spain could explain why Italian banks refrain from negotiating concessions with borrowers in difficulties while Spanish banks make frequent use of this strategy. To support this hypothesis, Barth, Caprio and Levine (2013) periodical survey on banking supervision around the world shows that, in the period 1999-2011, Italy increased largely both the index of supervisory powers and the index of external governance, whereas Spain remained unvaried on the first and tightened the second index, but to a lower extent than Italy.

Table 5: Determinants of the forborne positions' classification in the non-performing category

This table shows the results of estimating the following OLS regression:

$$FORB_NPL = \beta_0 + \beta_1 \times NPL + \beta_2 \times LOG_ASSET + \beta_3 \times LOAN_SME + \beta_4 \times LOANS_ON_ASSET + \beta_5 \times NPL_RATIO \\ \times FORB_RATIO + \beta_6 \times D_COUNTRIES + \varepsilon$$

Where the variables are defined as follows: **FORB_NPL**: percentage of forborne positions classified as non-performing; **NPL**: percentage of exposures classified non-performing over the total carrying amount of loans to non-financial corporations, for each individual bank in the sample; **LOG_ASSET**: natural logarithm of total asset for each individual bank in the sample; **LOANS_SME**: percentage of loans to small and medium companies over the total carrying amount of loans to non-financial corporation, for each individual bank in the sample; **LOANS_ON_ASSET**: ratio between total loan portfolio and total asset for each individual bank in the sample; **NPL*FORBORNE**: interaction term between NPL Ratio and Forborne ratio; **D_COUNTRIES** (Italy, Germany, France, Spain and Great Britain): dummy variables whose value is equal to 1 if the individual bank is located in the country and 0 otherwise; ε : assumed normally distributed error term with zero mean and constant variance.

The T-statistics are in brackets under the estimated coefficients. *: two-tailed probability < 0.1; **: two-tailed probability < 0,05; ***: two-tailed probability < 0,01

C	0,28 (1,07)	0,44*** (9,03)
NPL	0,83*** (5,54)	2,27*** (4,42)
LOG_ASSET	0,04 (0,91)	
LOANS_SME	-0,05 (-0,41)	
LOANS_ON_ASSET	0,19 (0,91)	
NPL*FORB_RATIO		-5,45*** (-3,42)
ITALY	0,05 (0,96)	-0,04 (-0,61)
GERMANY	0,20*** (3,31)	0,25*** (4,12)
FRANCE	0,07 (0,68)	0,11 (1,97)
SPAIN	0,06 (1,37)	0,03 (0,82)
GREAT BRITAIN	0,07 (0,96)	0,12 (1,62)
R-SQUARED	0,273	0,327
ADJUSTED R-SQUARED	0,208	0,282
OBSERVATIONS	111	111

Table 5 reports the results concerning the second research question. Once again, the variable NPL has strong explicative power and the expected sign. Banks with a higher burden of problematic assets not only tend to use more forbearance measures, but also classify the resulting positions more frequently into the non-performing category. Other variables controlling for the dimension of the bank, the weight of exposures towards small and medium companies, the nature of the business, more or less tilted towards commercial banking, are all not significant under a statistical point of view. Looking at the country dummies, in this case the only significant one is Germany where, apparently, the

percentage of forborne positions classified as non-performing is significantly higher than elsewhere. The explicative power of the regression, as measured by the R-squared, is quite high and reaches the level of 27 per cent.

The R-squared increases quite substantially when, in the second column, the equation includes an interaction term between NPL ratio and forborne ratio. The variable is strongly significant and has a negative sign. This means that, when the burden of problematic loans is higher and the bank uses intensively forbearance measures, a lower percentage of forborne positions is classified as non-performing. The interpretation of this evidence suggests an opportunistic usage of the instrument of forbearance aimed at disguising the poor asset quality of the bank. This opportunistic behavior would intensify when the problem is more severe and the situation of the loan portfolio more deteriorated

Table 6: Determinants of the impairment level of forborne positions

This table shows the results of estimating the following OLS regression:

$$IMPAIR_FORB = \beta_0 + \beta_1 \times FORB_NPL + \beta_2 \times COLL_FORB + \beta_3 \times LOANS_SME + \beta_4 \times D_COUNTRIES$$

Where the variables are defined as follows: **IMPAIR_FORB**: percentage impairment over the total carrying amount of loans to non-financial corporations with approved forbearance measures, for each individual bank in the sample; **FORB_NPL**: percentage of forborne positions classified as non-performing; **COLL_FORB**: collateral assisting forborne positions in percentage of their total carrying amount; **LOANS_SME**: percentage of loans to small and medium companies over the total carrying amount of loans to non-financial corporation, for each individual bank in the sample; **D_COUNTRIES** (Italy, Germany, France, Spain and Great Britain): dummy variables whose value is equal to 1 if the individual bank is located in the country and 0 otherwise; ε : assumed normally distributed error term with zero mean and constant variance.

The T-statistics are in brackets under the estimated coefficients. *: two-tailed probability < 0.1; **: two-tailed probability < 0,05; ***: two-tailed probability < 0,01

CONCLUSIONS

The paper focuses on the usage of forbearance measures, on the classification of the resulting forborne positions and on their loan loss provisioning, based on the dataset of the EU-wide Transparency Exercise carried out by the European Banking Authority on a sample of 130 major banking institutions.

The analysis confirms that forbearance measures are a tool frequently used by European banks. More than a precautionary instrument to prevent default, these measures represent a strategy to manage the non-performing portfolio. In fact, a strong statistical correlation emerges between the NPL ratio and the weight of forborne exposures. In terms of localization, Italian banks tend to use forbearance less and Spanish banks more than the rest of the sample. A potential explanation could lay in the different severity of local Supervisory Authorities.

The analysis concerning the credit classification of forborne positions suggests an opportunistic usage of the instrument of forbearance aimed at disguising the poor asset quality of the bank. In particular, this opportunistic behavior tend to intensify when the problem is more severe and the situation of the loan portfolio more deteriorated.

In terms of provisioning, no particular criticalities emerge. The impairment level is higher when a larger share of forborne exposures is classified non-performing, whereas it is lower when these positions are well collateralized.

²Department of Engineering in Foreign Languages, University Politehnica Bucharest

ABSTRACT

We present here the results of a pilot study that develops on the influence of the life style factors on the health of the rural population from Romanian villages. We use the research to identify the life style economic effects at society and economy level. A keen attention was given to specific unhealthy behaviours related to a specific degree of education in the field of health, prevention, individual safety and specific diseases.

We found that people living in villages enjoy spending life and work in open air have, eat more ecological food than people living in the cities and have healthier life style as compared to people from other regions, allowing them to better counteracts the influence of wrong habits that cause health problems. There is also a direct influence of lifestyle education, movement, healthy eating on diseases level of the respondents from our study. Overall, a better lifestyle implies better health, less expenditure on medical care and generates savings to be used for family, social activities and life's improvements.

Keywords: life style, healthy solutions, economic effects

INTRODUCTION

The influences on lifestyle are complex (Dibsadall *et al*, 2003). Looking at life as a whole, every aspect of building a way of living, affects health, economy and happiness of any person (Hicks *et al*, 2009). The goal of this study is towards an overall picture of what an optimal lifestyle means, is to bring about a healthy investment solution.

Health investment solutions are linked to an optimal diet program (Rashad and Grossman, 2004). In order to avoid complications and then diseases, nutrition tangential to health must be considered. We will see how poor nutrition economically affects people in rural areas. These people, besides having more advantages than those in the city, have problems with food (Contoyannis and Jones, 2004). The fact that they have different skills in the production of zoo technic products, people being households, especially in meat production and its derivatives, it is likely that the food left out of sales it is a

problem with the management of the waste, then takes and eats a large amount of food with high fat content.

Also, besides the fact that people's diet in the country is high in fat, due to overproduction, there are other causal probes, namely tobacco, alcohol and coffee consumption (Topiwala, 2017). People in villages, due to excessive alcohol consumption, have created problems both in the family and in society, causing both moral, material, relational damage and the creation of aggressive behavioural illnesses. This can, however, be prevented from getting accustomed by simple support and prevention mechanisms (Schreck *et al*, 2007). In addition to having an unhealthy lifestyle in terms of dietary food preferences, there is also a high level among those who do not read and are not informed about a healthy diet lifestyle (Sparling *et al*, 2007).

STATE OF ART

It is intended to prepare people cognitively for them to become aware of the health problems that will arise due to a poor lifestyle in terms of harmful dietary intake, the vices of smoking, alcohol, mainly speaking (Plassmann, 2007). The perspectives of a lifestyle change monitoring program would be ideal to be taken into account (Cockerham, 2005). Campaigns to promote economic and healthy solutions could be a lever for implementing an economical and healthy lifestyle (Woolf *et al*, 2015). Also, it could be a showcase program, to improve health in terms of eating habits, inexpensive and healthy cooking, temperance, and other, all in such an event as Expo Health.

RESEARCH METHODS

In order to achieve the above mentioned objectives, we designed and applied a questionnaire, on a number of 108 people from villages from Giurgiu county, Romania. The method used was purposive sampling. Data obtained from the survey-based questionnaire was processed by quantitative, statistical and mathematical analysis. The applied questionnaire was formed by multiple choice questions. The structure of the questionnaire can be easily deduced from the analysis of the answers that is provided in the next section.

FINDINGS

The influence of smoking on the health of people from rural areas in Romania

The first category of questions was related to the influence of smoking on the health of the respondents. People with heart diseases and smoking habits represent 37% from the total number of respondents, while non-smoking holds 63%. Respondents with high blood sugar and smoking are

56% while non-smoking represents 44%. With depression and smoking there is 50% while non-smoking is 50%. As we can see from the percentages above, smoking does not seem to influence too much the general health of the respondents. This can be caused by the fact that the lifestyle of the people from rural areas encompasses by itself more good lifestyle good ingredients than people living into the cities (such as more exposure to nature, more movement, less stress, etc.) which makes the influence of this factor to not be strong on the general health of the people.

Figure 1. Smoking Influence on Diseases

Source: Personal contribution

The influence of drinking on the health of people from rural areas in Romania

The second category of questions was related to the influence of drinking on the health of the respondents. Similar conclusion as for smoking is observed for this category of questions. People with heart diseases and drinking represent 47% while non-drinking have 53%. Respondents with high blood sugar and drinking are in proportion of 64 % while non-drinking represents 36%. With depression and drinking there is a 52% per cent while for non-drinking there is a 48%. The only more notable difference for both drinking and smoking is for the case of high blood sugar, where is a direct influence of those factors on this specific disease. This can be due to the fact that both smoking and drinking seems to have a higher influence on this specific disease, even if the lifestyle of this people are in general more tailored towards a good one as compared to the people living in other areas of the country.

Figure 2. Influence of drinking on diseases

Source: Personal contribution

The influence of coffee on the health of people from rural areas in Romania

The third category of questions was related to the use of coffee and its influence on the health of the respondents. A similar pattern as for the first two categories we see for coffee. People recognised as having heart problems and using to drink coffee represent 48%, while non-coffee users amount 52%. Respondents with high blood sugar and coffee consumers are in proportion of 66 % while non-consumers of coffee represent 34%. People suffering from depression and drink lot of coffee amount 34% while the non-consumers represent 66%. As noted above, the same pattern is repeated: while the number of people using coffee and with heart problems or depression is smaller as the number of people with non-using coffee usage. For the diabetes the situation is vice-versa.

Figure 3. Influence of coffee on diseases

Source: Personal contribution

The influence of lifestyle education, movement, healthy eating on diseases' growth

The last category of questions relate to the influence of lifestyle education, movement, healthy eating on the health of the respondents. As a general conclusion, there seems to be a direct influence of those factors on the health status of the respondents. For example having lifestyle education – reading books or other materials related to healthy life style - and having any of the disease mentioned before (heart related disease, diabetes, or depression), only 34% of the respondents falls in this category, while with non-education and disease we have 66%. Similar pattern can be observed for movement and healthy eating as related to those diseases. Individuals with one or more of the above mentioned diseases, eating healthy and doing sports, accounts for 43% while those who eat unhealthy food or do not practice exercises amount 57% of the respondents. As we can see, there seems to be a direct correlation between those factors and being healthier as opposed to the first three categories.

Source: Personal contribution

CONCLUSIONS

In this paper we did an initial study related to the impact of health style factors to the diseases for the people living in rural areas in Romania. As limitations, we restricted ourselves to few, frequently met diseases in people, respectively heart problems, diabetes and depression. As lifestyle factors we studied the influence of smoking, drinking alcohol, using coffee, education regarding healthy lifestyle, movement and healthy eating on those diseases. Here are some general conclusions of our research. First we noticed that in general, people living in villages in Romania enjoy more than the urban citizens, working and spending time outside in the sun and nature. This lead to a larger exposure to healthier life-style factors than people in the cities and explain why some lifestyle factors with direct

impact on disease levels does not seem to have a direct influence on different diseases, as we find out in our study.

A similar pattern is observed for smoking, drinking and using coffee habits for people in rural areas in Romania. While having heart disease, depression it seems that it is not influenced by those habits, diabetes is directly influenced by them. This can be explained, as noted earlier, by the fact that people from rural areas have healthier life style as compared to people from other regions, and this counteracts the influence of those wrong habits that cause health problems in people.

As opposed to the first categories of factors, there is a direct influence of lifestyle education, movement, healthy eating on diseases level of the respondents from our study.

As regarding economic outlook, although there seems to be not a direct influence for smoking, drinking, using coffee on the general health of the people from rural areas (except diabetes), other factors such as movement, education regarding healthy lifestyle seems to have a direct influence on the health level. Overall, as noted also in the literature (Bloom *et al*, 2003) a better lifestyle will imply better health, with less expenditure on medical care and general savings for the health care system of a country- in our case Romania.

We can state that this is an initial research from this line. We want to extend this pilot research with more types of health problems, economic categories and health lifestyles factors in a future research.

THE VIRTUAL COMMUNITY'S MOTIVATIONAL SYSTEM TO ENGAGE FIRMS INTO SUSTAINABILITY STRATEGY. THE ITALIAN AGRIFOOD SECTOR

Fait, Monica¹; Scorrano, Paola¹; Iaia, Lea²; Cavallo, Federica¹; Maizza, Amedeo¹

¹Department of Management, Economics, Mathematics and Statistics, University of Salento, Lecce, Italy

²Department of Business Administration at 'Gabriele d'Annunzio' University, Chieti-Pescara, Italy

ABSTRACT

Virtual communities are tools able to enhance the firms' know-how, orienting it to a common goal. The paper is based on the idea that there is a relationship between the motivation (engagement) to exchange knowledge in virtual communities and the sustainability shared planning along its three dimensions - social, economic and environmental.

The main research question of the paper is to observe the motivational engagement system of the companies that allows communities of practices to become an innovative strategy to design sustainability. So, we propose a conceptual framework called CDI (*Connection, Discussion and Influence*), along which the motivational dimensions can be formed, as they represent the main elements to join a community which is oriented to the synergistic design of sustainability. The conceptual framework has been tested in the Italian agri-food sector.

To confirm the existence of the proposed framework, a *Survey Method* for data collection was adopted. The 250 questionnaires were revised through a *Confirmatory Factor Analysis* as this technique was found to be suitable for identifying groups of representative variables and the engagement motivations that characterize participation in sustainability-oriented virtual communities.

The pro-social behaviour represented by the exchange of knowledge oriented to sustainability is enhanced through the engagement of the online community members; it happens when the online community is structured in order to activate a virtuous circle between *Connection, Discussion and Influence*.

The hypothesised virtuous circle is, in fact, a driver for managers of virtual communities or for those companies' networks (such as *consortia*) that choose to enhance their relational heritage through the knowledge exchange. In fact, it provides fundamental guidelines to enhance engagement in these virtual environments.

Keywords: Virtual community, engagement, sustainability, Agrifood sector

INTRODUCTION

In the corporate sustainability process, the guiding principle is the systemic integration of the three sustainability's dimensions -economic, environmental and social- (Adams and Frost, 2008; Bansal, 2005; Epstein and Roy, 2001; Hubbard, 2009; Kleine and von Hauff, 2009; Schaltegger and Burritt, 2009; Skouloudis *et al.*, 2009). The key challenge is represented by the need to align the different objectives that emerge from the several perspectives involved in the development issues, so as to make sustainability a key element of the company's value proposition and competitiveness (Porter and Kramer, 2011; Del Giudice *et al.*, 2017; Carayannis *et al.*, 2017). In this sense, the adoption of a participatory and systemic perspective is fundamental, within a relevant role can be assumed by the Knowledge Sharing (Robinson *et al.*, 2006) for its relevant effects in terms of reducing the environmental impact of the management processes and, at the same time, increasing the added value. Ignorance and lack of information (Usai *et al.*, 2018), in particular for what concerns the accountability of environmental and social performance (Spangler *et al.*, 2014), are the main barriers for the organisational change oriented to sustainability (Lozano, 2012).

Today the exchange of knowledge is facilitated by web interactive tools; these have a significant role in virtual community (Madupu and Cooley, 2010; Schau *et al.*, 2009; Arvidsson and Caliandro, 2016; Park and Kim 2014; Tsimonis, and Dimitriadis, 2014), intended as places where individuals interact because they share the same interest (Wirtz *et al.*, 2013; Quinton and Harridge-March, 2010), exchanging information and knowledge (Gabisch and Gwebu, 2011; Brodie *et al.*, 2013).

In the present work, we refer to those communities that can initiate a learning process capable of enhancing the widespread know-how, orienting it to a common goal. In particular, we focus on the communities of practice, informal entities that exist according to the intensity of the relationships that are activated among the members who share a common interest (Lave and Wenger, 1991). In these types of communities, the generation of knowledge is implemented in terms of solving common problems (Wegner, 1998). The key to active participation in these unique sociotechnical environments is the engagement (Ray, Sung, Morris, 2014), assumed as a set of intrinsic motivations that induce people to interact (Baldus *et al.*, 2015; Sukoco and Wu, 2010; McAlexander *et al.*, 2002; Dholakia *et al.*, 2004; Brodie *et al.*, 2013).

In this perspective, the main research question of the paper is to observe the motivational engagement system of companies that allows communities of practice to become an innovative strategy to design sustainability. To this end, we propose a conceptual framework, called CDI (Connection, Discussion and Influence), along which the motivational levers representing the main drivers for participation in a community oriented to the synergistic design of sustainability can be formed. The basic idea is that there must be a relationship between the motivations to exchange knowledge and the shared planning

of sustainability along the three dimensions that characterize it - social, economic and environmental. The model is tested in the agri-food sector, today called to adopt innovative strategies to enhance the offer's quality (Cillo et al., 2019; Fait et al., 2019; Iaia et al., 2019).

The companies involved in the empirical analysis, conducted with the aim to verify the research hypotheses, already joined the *Agri-food Protection Consortia*, which represent a clear example of creation, maintenance and management of organizational networks based on a relational heritage, with the ambition and the desire to increase the awareness of a territory, its products and its values (Maizza, 2010; Maizza, Fait and Scorrano, 2015; Maizza *et al.*, 2019). In fact, they represent a natural meeting place for knowledge, experiences and skills from which exchange can derive a synergistic competitive advantage.

THEORETICAL BACKGROUND

Online community

Nowadays the online community phenomenon is even more discussed in different fields of studies (Li 2004).

The online community or web community are defined as “an aggregation of individuals or business partners who interact based on a shared interest, where the interaction is at least partially supported or mediated by technology and guided by certain protocols and norms” (Porter and Donthu 2008, p. 115).

Web communities are, therefore, digital platforms that encourage collaboration, interaction and knowledge sharing (McAfee, 2006). In this perspective, managerial studies emphasize the communicative dimension defining a social aggregate that emerges from a network of relationships that is activated around a topic of common interest (Rheingold, 1993), a group of individuals who share common norms and policies and interact through the web (Precee, 2000).

In other words, the creation of a community derives from a need of socialization (*relationship community*), access to information of common interest (*community of interest*), or to satisfy both objectives (*learning community*) (Martinez, 2004). In particular, the focus is the communities of practice (CoPs), a «groups of people who share a concern, a set of problems, or a passion about a topic, and who deepen their knowledge and expertise in this area by interacting on an ongoing basis» (Wenger *et al.*, 2002, p. 4). So, in CoPs, members have informal relationships, share common practices (Aggarwal *et al.*, 2006), and help each other solve problems (Pan and Leidner, 2003). In this sense, they create a knowledge domain, with a mutual ground and a mutual intellectual identity (Cortese, 2018), and a proper community's knowledge orientation, made up by theoretical concepts and practical direct

experiences, which consider a mutual engagement (Pan and Leidner, 2003; Scarborough and Swan, 1999).

Engagement in the online community

In the last decade, managers and researchers have shown interest in the way online communities can stimulate users to engage in more collaborations, promotions and purchases (Algesheimer and Dholakia 2006, Ma and Agarwal 2007, Brandtzæg and Heim 2008, Lee *et al.*, 2003). Members of an online community benefit from access to more knowledge and experience than that could be found in traditional social networks (Constant *et al.*, 1996).

In fact, engagement is considered a mental state that stimulates individuals to adopt a pro-social behaviour whose effects are significant for themselves and for the group (Kahn 1990). In the technological perspective of online communities, engagement was considered an abstract concept, instead, it emerged as a relevant theoretical and empirical construct in other fields (Algesheimer *et al.*, 2005, Bakker *et al.*, 2008, Kahn 1990).

CoPs are formed by knowledge, people, organizational processes, and infrastructure (Pan and Leidner, 2003), in which members engage in several initiatives, from problem-solving to knowledge sharing (Hew and Hara 2006). So, engagement permeates each aspect of communities and is the reason why members feel part of the community, the reason they belong to it (Hafeez *et al.*, 2018). Moreover, engagement is one of the elements that sharp the CoPs competences based on three elements (Wenger, 1998): mutual engagement, joint enterprise, and shared repertoire (Wenger, 2000).

Certainly, engagement has a relevant role in the Cop dimensions. It may refer to two activities, as starting a discussion and answering to a message (Hafeez *et al.*, 2018), but is the second to be more recurrent than the first (Anderson 2006). If Lave and Wenger (1991) have coined the three dimensions of a CoP, Diemert (2002) has recognized the main elements which describe the role of the engagement, while Handley *et al.* (2006) focused the connection among the concept of learning in the CoPs through participation, identity and practice. Even if Authors have carried on several research on the topic (Tedjamulia *et al.* 2005; Burnett *et al.* 2003), evolving the existing concept, when the research focus is about the incentives for knowledge sharing in the CoPs, the discussion is on barriers rather than enabling motivators (Homburg and Meijer 2001). Hence, there is not a complete comprehension of the reasons why members choose to share knowledge (Wasko and Faraj 2000; Ridings, Gefen, and Arinze 2002).

Studies have long since shown that intrinsic motivations are much more powerful stimulators of such sharing than are extrinsic stimuli (Osterloh and Frey, 2000).

CONCEPTUAL FRAMEWORK

Objectives of the research and hypothesis

CoPs are formed by knowledge, people, organizational processes, and infrastructure (Pan and Leidner, 2003), in which members engage in several initiatives, from problem-solving to knowledge sharing (Hew and Hara 2006). The key to active participation in these unique sociotechnical environments is the engagement (Ray, Sung, Morris, 2014), a set of intrinsic motivations that induce to interact (Balduš *et al.*, 2015; Sukoco e Wu, 2010; McAlexander *et al.*, 2002; Dholakia *et al.*, 2004; Brodie *et al.*, 2013). In the present study, the interaction regards the companies' willingness to contribute with their knowledge to the online knowledge-sharing communities of practice; in particular, we refer to those communities of practice-oriented to the creation of a sustainability shared planning (Del Giudice *et al.*, 2017; Carayannis *et al.*, 2017).

Therefore, this study was guided by the following research question:

RQ: How is made up the motivational engagement system of the companies that allows to on communities of practice became an innovative strategy to design a sustainability shared planning along its three dimensions - social, economic and environmental?

To this end, the research proposes a conceptual framework, hereinafter referred to as C.D.I - *Connection, Discussion and Influence*-. The basic idea is the existence of a relationship between the motivations to exchange knowledge on the part of companies, and the shared planning of sustainability along its three dimensions - social, economic and environmental. Therefore, a motivational perspective based on three dimensions is proposed (Cfr. fig.1):

- *Connection* is represented as the ability of a community member to understand that knowledge exchange links it to something useful for all members (Balduš *et al.*, 2015), a perspective that implies a relationship and, obviously, the will to expand it. Therefore, the explanatory variables of the Connection have been identified by adopting the relational perspective of social capital concerning: a) the relationships that are created through a continuous system of interactions, such as to generate a specific kind of norms - trust, reciprocity and solidarity; b) the identification process understood as sharing the member's vision within social networks (Krackhardt, 1999; Van Knippenberg, D., and Schippers, 2007; Janowicz-Panjaitan and Noorderhaven, 2009). In this perspective, connection is the driver for working on the social dimension of sustainability, understood as the ability of the subjects to act together, effectively, based on the same conception of the project. The variables that characterize it are: a) avoiding internal conflicts, b) sharing values and traditions, c) assuming a behaviour consistent with the goals of the community; d) attracting and maintaining human

resources with specific skills on the territory; e) reinforcing member's sense of belonging to a community; f) creating a territorial identity.

On this basis, we affirm that:

Hp1: The motivations that characterize the connection dimension are able to influence the decision-making process behind Knowledge Sharing, oriented to a sustainability shared planning.

- *Discussion represents the interest of a community member in talking with similar users about a common topic (Baldus et al., 2015). The explanatory variables have been identified considering the cognitive social theory, according to which the group participation implies the existence of personal or community expectations (Zhang and Hiltz, 2003; Kolekofski and Heminger, 2003; Lesser, 2000), which concern the consequences of a particular behavior (Denler et al., 2014) and the relative perceived advantage (Lin et al., 2009; Chen and Hung, 2010). In the perspective of the economic dimension, these explanatory variables represent the ability to produce and maintain, within the community, the maximum added value, combining resources efficiently, in order to enhance the specificity of local products and services. These variables were, therefore, identified in: a) Strengthening the image of the territory and its productions, b) Generating social innovation, c) Facilitating common strategies aimed at enhancing the territory and its enterprises, d) Maintaining high standard production and supply chain, e) Creating useful services for community members and for the territory, f) Increasing the reputation of the territory and its enterprises.*

Therefore, we consider that:

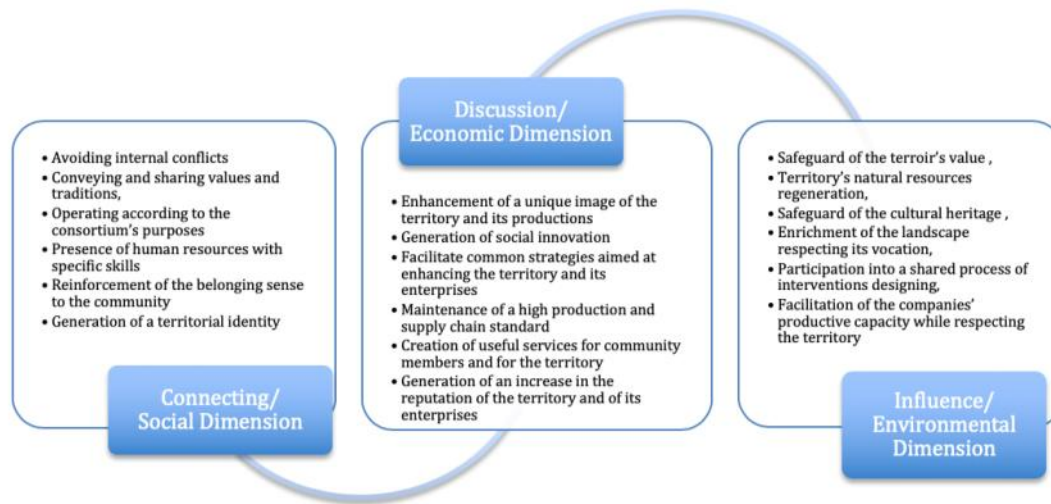

Hp2: The motivations that characterize the discussion leverage are able to influence the decision-making process behind Knowledge Sharing, oriented to a sustainability shared planning.

Influence represents the will degree of a community member to take part and actively influence the path towards sustainability. Recovering a systemic vision of the business-territory relationship (Maizza, 2013; Maizza et al., 2012; Fait et al., 2015), the focus is represented by the ability of companies to safeguard the distinctive elements of a territory through the enhancement of the cultural heritage elements and the protection and renewal of its natural resources and heritage (Peters, 1997; Hall et al., 2000; Telfer, 2001; Siano, 2001; Hall and Mitchell, 2002; Siano et al., 2008; Bresciani et al., 2016; Scorrano et al., 2018). In the environmental perspective, the motivations to exchange knowledge are therefore attributable to: a) Increase the value of the terroir, b) Design and regenerate the natural resources of the territory, c) enrich the cultural heritage, d) enrich the landscape, respecting its vocation, e) participate in the planning of interventions for the territory, f) facilitate production capacity in respect of the territory.

In light of this scenario, we assume that:

Hp3: The motivations that characterize the influence leverage are able to influence the decision-making process behind Knowledge Sharing, oriented to a sustainability shared planning.

Figure 1 C.D.I model

Source: our elaboration

METHODOLOGY

Sample

The conceptual framework described above has been tested in the agri-food sector, which is invested with a growing responsibility concerning the implementation of sustainability paths. In fact, the agri-food sector involves the typically environmental aspects related to terroir and its productions, as well as: i) the *social aspect*, referable to the social capital that traditionally characterizes all companies which operate in it, and to the value of the territorial identity of its productions; ii) the *economic dimension*, inherent to the competitive advantage that it can generate not only for companies but also for the territory on which they operate. Within this sector, the survey focused on the companies belonging to the *Agri-food Protection Consortia* and it was created for the protection of specific agricultural food and production. Not considering the legal motivations that have produced these forms of association, the *Agri-food Protection Consortia* have been formed and consolidated over time through a process of sharing vision, mission and values among entrepreneurs, who feel the ambitious and the desire to let the territory they belong to known, as well as its products and values (Maizza, 2010; Maizza and Iazzi, 2010; Santoro *et al.*, 2019; Caputo *et al.*, 2019). The *Consortia* represent a clear example of the creation, maintenance and management of long-term organizational networks, which are able to pursue the goal of growth and survival through knowledge dissemination and sharing (Maizza *et al.*, 2015; Scuotto *et al.*, 2017; Ferreira *et al.*, 2018).

The Survey Method for data collection was adopted (Singleton *et al.*, 1988; de Leeuw, 2008) preparing a questionnaire, sent by e-mail in the period November - December 2018, to companies' directors of appropriately selected consortia. The 11 *Consortia* were identified in the most important agro-food areas in the Italian economic context - wine production, ham production sector, dairy, olive oil and fruit farming - considering the period of activity and the number of consortium's members. As we carried out exploratory research, conducted on a selected sample of companies, the technique of sampling of convenience was applied and a total number of 250 validly completed questionnaires were collected, considered and analyzed. Table 1 shows information on respondents.

Table 1: Demographic information

Years of membership in the consortium	For less than 10 years	15%
	From 10 to 20 years	35%
	From 21 to 30 years	33%
	Over 30 years	17%
Employees	From 10 to 49 employees	85%
	From 50 to 250 employees	12%
	Over 250 employees	3%
Revenue	Up to 2 mio €	83%
	From 2 to 10 mio €	15%
	Over 10 mio €	2%

Source: our elaboration

Methodology

The questionnaire was structured taking into account the three dimensions of the proposed model - *Connection, Discussion, Influence* - and preparing the questions so that the respondent could express their judgment on a Likert scale (Likert, 1932) from 0 (not important) to 7 (very important). The empirical phase verified whether, in the process of joining an online community oriented to a sustainability strategy, the groups of variables identifying the aforementioned dimensions represent the engagement motivations that justify and nurture participation in the community itself. To this end, to confirm the existence of the proposed structure with the model, a *Confirmatory Factor Analysis* was applied, elaborated by SPSS (Stock and Watson, 2007; Bracalente *et al.*, 2009). This technique allows, in fact, to observe whether the decision to participate in a web community oriented to the design of sustainability is structured on all the items identifying the motivations or, rather, companies choose some items as guidelines of their behaviour. The results of the KMO test (0.564) and the Bartlett test are indicative of a correlation between the variables (p value > 0.05), confirming the sufficient acceptability of the factor analysis.

The analysis has extracted six elements that explain 66.56% of the variance (values of 60-70% considered acceptable in terms of information function) (see Table 2)

Table 2 Total variance explained

Componente	Autovalori iniziali			Caricamenti somme dei quadrati di estrazione			Caricamento delle somme dei quadrati rotazione		
	Totale	% di varianza	% cumulativa	Totale	% di varianza	% cumulativa	Totale	% di varianza	% cumulativa

Extraction method: principal component analysis

Rotation method: Varimax rotations with Kaiser normalization

a. Convergence for the rotation performed in 21 iterations

Source: our elaboration

FINDINGS

The interpretation of the factors takes place through the rotated component matrix (see Table 3), which shows the correlations between the original variables and the components identified (factor loading). Each variable is associated with the factor with which it has the highest correlation and the factor is named considering what the variables associated with it have in common.

Table 3 Rotated Component Matrix

Items	Factor loading
Conveying and sharing values and traditions	.642
Presence of human resources with specific skills	.708
Generation of a territorial identity	.606
Avoiding internal conflicts	.730
Operating according to the consortium's purposes	.635
Reinforcement of the belonging sense to the community	.775
Enhancing a unique image of the territory and its productions	.731
Generation of social innovation	.553
Facilitate common strategies	.698

aimed at enhancing the territory
and its enterprises

Safeguard of the terroir's value	.768
Safeguard of the cultural heritage	.796
Facilitation of the companies' productive capacity while respecting the territory	.573
Territory's natural resources regeneration	.776
Enrichment of the landscape respecting its vocation	.725
Participation into a shared process of interventions designing	.567
Maintenance of a high production and supply chain standard	.792
Creation of useful services for community members and for the territory	.567
Generation of an increase in the reputation of the territory and of its enterprises	.683

Extraction method: Analysis of the main components.

Rotation method: Varimax with Kaiser standardization.

a. Convergence for rotation performed in 12 iterations.

The first two components, respectively called *Territorial identity* and *Sense of belonging*, allow us to confirm the first hypothesis that *the motivations that characterize the connection dimension are able to influence the decision-making process behind Knowledge Sharing, oriented to a sustainability shared planning* (Hp1). This is because the presence of human resources with specific skills (.708), able to convey and share values and traditions (.642), makes it possible to generate a territorial identity (.606) that reinforces those relational elements of the social capital of existing ones.

The availability of community members to exchange knowledge - *Discussion* - is activated through topics that are indicative of personal or community expectations (Hp2). The component called *Enhancement strategies* indicates the perceived relative advantage and is linked to the possibility of generating a unique image of the territory and its productions (.731), to stimulate forms of social

innovation (.553) such as to facilitate common strategies aimed at enhancing of the territory and its enterprises (.698).

The fourth and fifth components - *Production assets* and *Vocation of the territory* - are characterized by items that confirm the third hypothesis (Hp3) for which the motivations that characterize the *Influence dimension* act as levers of the process of knowledge exchange oriented towards sustainability.

DISCUSSION

The objective of this study was to observe the relationship between the motivations involved in the knowledge exchanging within an online community as well as the shared planning of the sustainability. According to the literature that considers engagement the key to an efficient and effective participation in these virtual environments (Ray *et al.*, 2014), a model has been built and tested empirically; it has allowed identifying which areas can be considered relevant for a constant and active engagement of the online community's members, when this is created with the purpose of planning the sustainability of both companies and territory they belong to.

The decision to test it within the companies participating in the Agri-Food Protection Consortia is justified by the particular type of network they represent, characterized by the presence of a relational heritage built through the dissemination of productive and cultural knowledge, and the sharing of common vision, mission, organizational, and territorial values (Maizza, 2010; Maizza, Fait and Scorrano; 2015). An area, therefore, suitable to evaluate the motivational structure underlying the exchange of knowledge, oriented to the sustainability planning.

The Confirmatory factor analysis shows that the engagement of the members is linked to the *Connection dimension*, when it is characterized by a pro-social behaviour based on the strengthening of the relational elements of social capital – human resources, values and traditions, territorial identity – and, the identification process with the community – sense of belonging, mutual understanding, resolution of internal conflicts. In this perspective, the development of this dimension (*Connection*) represents the driver to operate on the social dimension of sustainability, understood as the ability of the subjects to act together, effectively, based on the same conception of the project.

Moreover, results confirm that the advantage connected with the knowledge exchange about a common topic - *Discussion* - lies in the possibility of reconciling personal and community expectations, both in terms of companies and their relations with the territory. The perception of the potential advantage derivable from the exchange of knowledge lies, in fact, in the possibility of defining common strategies aimed at enhancing the territory and its enterprises, to create a univocal image of the territory and its productions, and to generate social innovation; without neglecting the objective of maintaining a high standard of production and supply chain, of creating useful services for the

community members and for the territory that will generate an increase in the reputation of the territory and its enterprises. It is through this coordination between personal and community expectations that economic sustainability can be planned as the capacity to produce and maintain within the community - understood as a business-territory relationship - the maximum of the possible added value.

Lastly, the engagement is linked to the *Influence dimension* when it is activated along the entrepreneurial dimension of environmental protection - value of the terroir, cultural heritage, increase in productive capacity of the companies while respecting the territory – territorial identity - regeneration of the territory's natural resources, enrichment of the landscape in respect its vocation, shared process of the planning of the interventions.

The paper, therefore, helps to confirm that the engagement is the key to active participation in this unique sociotechnical environment (Ray *et al.*, 2014), especially when the goal of sharing knowledge is as specific as the sustainability is.

The proposed theoretical model participates in the literature discussion, talking about the importance of engagement in virtual communities. The reflections that arise from its empirical application suggest, in fact, that the communities cannot be activated as discussion forums on professional interests (Chiu *et al.*, 2006, Wasko and Faraj 2005), specific (Ma and Agarwal 2007) or general (Bateman *et al.*, 2011), but as places for sharing a common project. The sharing is activated through the will to stand in relation (*connection*), to discuss for reaching common objectives (*discussion*) and to influence the path of a common growth (*Influence*).

In other words, the pro-social behaviour represented by the exchange of knowledge (Chiu et al 2006, Law and Chang 2008, Wasko and Faraj 2005) is enriched through the engagement of the online community's members, when it is structured to activate a virtuous circle between *Connection*, *Discussion* and *Influence*.

The cycle must present itself not as a random mechanism, but as refined and well defined, to constantly feed the learning derived from the knowledge exchange, orienting it to the strategic objectives of sustainability, appropriately shared. This logic activates a virtuous circle thanks to which the improvement of the systemic performances generates attractiveness and the search for management improvement for the existing companies, as well as for others potentially aggregable and for the territory they belong to.

LIMITATIONS AND CONCLUSION

The decision to set up and design this study in terms of sustainability, naturally presents the limit that the conclusive data on sustainability cannot be generalized to any sector. However, they provide

important reflections for the networks operating in the agri-food context, today called to intervene in the planning of a sustainable path for the territory and its companies. A second limitation is represented by the fact that the interviewees do not participate in a virtual community but have only been asked if they are potentially interested in participating to it, and the importance they give to specific motivations. Therefore, a possible development of work could be to focus on a sample of companies that actually participate in these types of operations.

Although the model was created by identifying specific items in relation to the key concept of sustainability, its underlying assumptions are, however, also applicable to other contexts. The hypothesised virtuous circle is, in fact, a driver for managers of virtual communities or for those networks of companies (such as *consortia*) that choose to enhance their relational heritage through the exchange of knowledge. So, it suggests fundamental guidelines to enhance the engagement in these virtual environments. Firstly, it is necessary to manage the perception of the own identity of each member by working on the enhancement of the social factors of relational factors - trust, identification, sharing of norms etc.-; therefore, correctly identifying the areas of discussion orienting them to a specific and shared purpose, with the aim to to enhance the interest in the knowledge exchange -; lastly, it is essential to understand the type of influence that the member of the community wants to exercise, in order to achieve the goals of sharing knowledge. The logic is to address the knowledge exchange within web tools towards the design and achievement of specific objectives, avoiding that the participation of some members is dispersed on areas of interest far from the specific objective. Designing a virtual community according to this perspective means devising and stimulating the pro-social behaviour of the members, directing them towards the strengthening of the identity with a community and towards the creation of a culture of knowledge exchange oriented to the generation of systemic performances.

ABSTRACT

Wine tourism is a relevant success factor for wine business. Its influence affects not only the wineries communication through word-of-mouth, most of all on social networks, but also their image, and most of all their direct sales. Very frequently, in fact, the wine tourism performance can be appreciated by the direct sales performance. In this respect, wine tourism service can express some influence, thus assuming a direct link between the service level intensity in the wine tourism offer and the level intensity of direct sales at the winery. However, in the current investigation, even though with an exploratory nature, evidences do not support this direct link. Main implications of the research concern the prominence of logistic services in a potential link with direct sales, and probably that the level of sales could not be the most correct indicator for evaluating a wine tourism experience with high levels of service.

Keywords: Wine business, wine tourism, direct sales, winery, service, Italy.

INTRODUCTION

In 2018, Italy has regained the high levels of wine production quantities for which a considerable suffering in 2017, due to different climatic difficulties (frosts, droughts, and so forth), was instead recorded. In fact, the 2018 Italian harvest has been registered by all major institutions of the sector at around 50 million hectoliters, and perhaps beyond (ISTAT, Assoenologi, Coldiretti, and so on).

These figures represent certainly a good sign, which in truth must be read also in the market perspective, considering that it is not enough to produce much and well: it is necessary to know how to sell and secondly how to sell even better. From this point of view, however, some timid concern seems to affect the Italian wine industry: domestic consumption is declining or at best stable year on year, and encouraging signals are missing even abroad (OIV).

Brexit yet to be deciphered, China still to be focused, a not always peaceful international situation (insecurities, embargoes, tariffs, and so forth) are not exactly favorable scenarios to foreign trade, especially for who has to export (and nowadays the Italian wine sector exports 50% and potentially

even more of its turnover). However, skills and entrepreneurial abilities of micro, small, medium, and large Italian wineries are undoubted and they do not fear any international comparison, especially when regarding quality and variety (Crescimanno and Galati, 2014).

In this daring market competition a role of extraordinary interest concerns wine tourism, which nowadays it is recognized firmly as one of the most interesting segments of the overall Italian tourist offer (Tommasetti and Festa, 2014). In fact, the widespread concept of 'Italian Beauty' (Airoldi and Lojacono, 2014) is due also – if not above all – to the exceptional quality of wine and food that can be found in every region of the nation (Benini, 2018).

More generally, beyond the strict reference to Italy, wine tourism is a substantial marketing driver for increasing sales and a powerful communication lever for brand visibility, recognition, and awareness, especially in such 'social' times (Freitas Santos and Ribeiro, 2012; Capitello *et al.*, 2014; Bonarou *et al.*, 2019; Canovi and Pucciarelli, 2019; Scorrano *et al.*, 2019). In fact, wine tourism nowadays is not secondary in every winery, because it is an activity to put into account, plan, organization, and implementation like any other business activity that is necessary and opportune for the good functioning of the winery (Festa *et al.*, 2015), also from a territorial marketing point of view (Scorrano *et al.*, 2018).

In the research that follows, wine tourism is under investigation as factor that could affect the direct sales dynamics (Connolly, 2018), with specific reference, of course, to the sales that are undertaken in the cellar as direct selling, although, as above-mentioned, wine tourism image affects also sales in the global sense (Pratt, 2019), a fact that however, is not under analysis in the present research. After the literature review, the results of a field survey are object of presentation, having Italy as study perimeter, about the possible interactions between wine tourism services and direct sales at the winery, with consequent findings discussion and subsequent analysis of scientific and managerial implications.

FOCUSED AND ESSENTIAL LITERATURE REVIEW

Direct selling has always been a more or less alternative sales channel for wineries: 'more' alternative with regard to traditional distribution channels, but 'less' alternative if considering that it is a physiological reality for any winery (of course, with due and significant exceptions). This importance has been heightened even more with the development of wine tourism, an activity that, as above-mentioned, only formally is secondary to production and marketing of grapes and wine, again with due and significant exceptions (Festa *et al.*, 2016), but in recent times has been experiencing an impetuous progress all over the world (Gurau and Duquesnois, 2008; Duarte Alonso and Liu, 2012; Duarte Alonso *et al.*, 2015).

One of the most direct and effective indicators for measuring the success of wine tourism, also in terms of global economic sustainability, is the sales performance in the cellar during the visit of wine hikers and / or wine tourists in the strict sense (Pan *et al.*, 2018). In truth, it is a typical performance indicator especially for the New World of Wine (USA, Chile, Argentina, South Africa, Australia, and New Zealand), which, however, precisely by virtue of its immediacy and 'frankness' in terms of customer profitability (Helgesen *et al.*, 2018), is gaining more and more importance also in the Old World of Wine (Europe in general). and therefore also in Italy (D'Amico *et al.*, 2014), while the Third World of Wine (China, India, Russia, and so on) is probably a context still in its infancy from a wine tourism point of view.

Beyond being a direct measure of value generation in the wine tourism context (Remenova *et al.*, 2019), direct sale at the winery is generally a very interesting commercial activity for the cellar, because it allows to fix a price that normally is lower with respect to other channels (always being careful to avoid the 'cannibalization' effect), to get cash instantaneously (while in other selling situations revenue transformation into cash is almost always late, and often uncertain) contributing somehow also to the financing mix of small-medium enterprises (Giacosa and Mazzoleni, 2016), and to benefit potential up-selling and / or cross-selling proposals, as well as to permit direct contact with customers, which is always fundamental (Fiore, 2016).

Therefore, it seems interesting to investigate if, how, and why it is possible to increase the quantity and quality of global sales through direct sales at the winery. In the current research there is assumption that the wine tourism experience, and especially the combined level of service (Dodd and Gustafson, 1997; O'Neill *et al.*, 2002) can be a factor of considerable importance for this competition.

RESEARCH SCOPE AND METHODOLOGY

The survey that follows moves from the XV National Report on the Wine Tourism in Italy, developed by the National Observatory on Wine Tourism of the National Association of 'Wine Cities'. Specifically, this report has focused on three survey perimeters: municipalities, wineries, and wine tourists; what matters in the case in question is the exploratory survey that has been conducted on wineries (42 responding cellars throughout Italy, including 35 that have been strictly considered in this survey for providing all the answers to the questionnaire), with no value of statistical representativeness, because it provides only an exploratory function, namely to better target subsequent more detailed investigations.

It has been used in this case a convenience sampling: in fact, the contacted and responding wineries are enrolled in the database of the National Association of 'Wine Cities', spreading throughout the national territory. However, the number of respondents, with 35 completed questionnaires on 42

replies, allows to state that the so-obtained data are information of great interest (Barile and Metallo, 2007): with the sole purpose of evidence, 19 out of 42 responding wineries and 15 out of 35 'completely' responding wineries are from Tuscany, thus reflecting the wine tourist success of the region in Italy and abroad (Randelli *et al.*, 2014; Marinelli *et al.*, 2016; Randelli and Martellozzo, 2019).

The questionnaire has been designed by the staff of the Postgraduate Course in "Wine Business" of the University of Salerno (Italy), providing 33 questions ("Special Section - Wineries"). Prior to the survey in the field, the questionnaire has been tested, verified, and validated by the staff persons of the National Association of "Wine Cities".

The questionnaire has been administered in completely 'online' mode, using a computer platform that has generated a) the links to get to the questions, b) the web masks for compilation (accessible from computers, tablets, and smart-phones), and c) the spreadsheets display, thus simplifying the filling of the fields, the accuracy of the answers, and the subsequent setting up of the database. Finally, it is to highlight that, for reasons of mere approximation / rounding percentages, some data do not perfectly add up to 100%, but 99.99% or 100.01%.

Besides descriptive survey, also an inferential study has been conducted, trying to answer, with regard to the exploratory nature of the research, the following research question.

RQ: "Can a direct link exist between the service level intensity of the global wine tourism experience and the direct sales at the winery level intensity?"

EVIDENCE FROM THE SURVEY: DESCRIPTIVE ANALYSIS AND INFERENCE ANALYSIS

To provide a general overview of the context, that concerns Italian wineries, following data represent a first evidence of the overall findings of the investigation. Tables from 1 to 4 propose a descriptive representation of the current practice, in responding wineries, about the various activities concerning the wine tourism experience (cf. Table 1) and in more details, the individual category of service (cf. Table 2 for logistics services, Table 2 for hospitality services, and Table 3 for internet services).

It is to highlight that in Table 1 also the "Other" category has been provided, as per the exploratory nature of the research, although that possibility is not present in the single service category analysis. This choice has been practiced primarily because the service categories comprise and detail the individual activities, and secondly to prevent excessive statistical dispersion in the many possible answers.

Wine tourism activities (expressed as percentage of the total equal to 100)	Percentage
Direct sales at the winery	26.06%
Visits for tastings	21.69%
Visits in the cellar	17.03%
Overnight stay (if available)	9.03%
Visits in the vineyard	8.71%
Participation to events in the cellar / winery	5.46%
Catering (if available)	5.17%
Participation to the grape harvest	1.94%
Other	4.91%

Table 1 - Wine tourism activities performed in the winery (source: authors' elaboration).

Logistics services (i.e. road accessibility)	Percentage
Corporate signals widespread on the territory	68.57%
Advertising on billboards	34.29%
Positioning on Google Maps	100.00%
Positioning on Street View	54.29%
Private access road in good condition	85.71%
Availability of parking for vehicles	97.14%
Availability of parking for buses	74.29%
Availability of parking for RVs (recreational vehicles)	54.29%

Table 2 - Currently performed services concerning road accessibility (source: authors' elaboration).

Hospitality services	Percentage
Brochures with information about the winery	97.14%
Guided tours of the wine cellar	94.29%
Accessibility for disabled persons in the cellar	80.00%
Organized paths with information about the winery	62.86%
Guided tours of the vineyards	94.29%
Accessibility for disabled persons to the vineyards	48.57%
Organized paths with information about the vineyard	60.00%
Wine tasting in the cellar	97.14%
Accessibility for disabled persons to the tasting rooms	85.71%
Restaurant	37.14%
Accessibility for disabled persons to the restaurant	34.29%
Cuisine with local products	37.14%
Cuisine with seasonal products	40.00%
Cuisine equipped for various allergies / intolerances	34.29%
Cuisine for vegetarians and / or vegans	34.29%
Overnight stay	40.00%
Overnight stay for disabled persons	31.43%
Organizing events in the cellar / winery	54.29%
Multilingual staff	85.71%
Toilets	97.14%
Toilets for disabled persons	60.00%
Wi-Fi (free or password)	100.00%

Table 3 - Currently performed services concerning hospitality (source: authors' elaboration).

Internet services	Percentage
Corporate website	94.29%
App for mobile devices (tablets, smart-phones, and so on)	5.71%
Online reservations (internet, mobile, and so on)	77.14%
Presence on social networks	73.80%

Table 4 - Currently performed services concerning internet (source: authors' elaboration).

Descriptive analysis shows that the winery activity that absorbs most energies and resources, especially as man / hours, is direct selling indeed. More generally, encouraging responses concerning the service level have emerged, so reflecting the development of wine tourism in Italy and especially in terms of 'tourist', and not only 'wine', phenomenon.

Inferential analysis, in response to the specific research question, has investigated about the possible existence of a direct link between the service level intensity of the wine tourism experience - considered as category (logistics, hospitality, internet, and all together) - and the direct sales at the winery level intensity (considered as man / hours of the total wine tourism activity and not as number of sold and / or invoiced bottles, because too varying degrees would exist from cellar to cellar). In the tables that follow, firstly (cf. Table 5) "how many" services that are practiced by respondent cellars individually have been calculated for each category (as proxy values, every "Yes" in response to the practiced service has been calculated as one point) and secondly (cf. Table n. 6) possible correlation (through the R index by Bravais / Pearson) and the subsequent possible strength of the correlation (R^2) between the service level intensity by category and the direct sales at the winery level intensity have been calculated.

Responding wineries in chronological order	Direct sales in percentage	Logistics services	Hospitality services	Internet services	All services
Winery No. 1	80%	8	10	2	21
Winery No. 2	70%	7	16	2	26
Winery No. 3	30%	6	16	2	25
Winery No. 4	10%	7	19	4	31
Winery No. 5	40%	8	13	2	24
Winery No. 6	10%	3	9	3	16
Winery No. 7	0%	5	15	3	24
Winery No. 8	30%	6	14	3	24
Winery No. 9	30%	7	14	2	24
Winery No. 10	42%	6	12	3	22
Winery No. 11	10%	7	20	3	31
Winery No. 12	17%	4	14	3	22
Winery No. 13	10%	4	11	3	19
Winery No. 14	50%	5	12	2	20
Winery No. 15	10%	8	21	3	33
Winery No. 16	30%	6	8	3	18
Winery No. 17	80%	8	14	3	26
Winery No. 18	80%	5	11	3	20
Winery No. 19	10%	7	15	3	26
Winery No. 20	5%	3	11	3	18
Winery No. 21	20%	7	20	3	31
Winery No. 22	0%	6	9	2	18
Winery No. 23	45%	5	12	2	20

Winery No. 24	5%	3	11	3	18
Winery No. 25	18%	4	21	2	28
Winery No. 26	10%	3	10	2	16
Winery No. 27	25%	7	20	3	31
Winery No. 28	0%	4	19	2	26
Winery No. 29	10%	6	13	3	23
Winery No. 30	60%	8	8	3	20
Winery No. 31	10%	3	8	2	14
Winery No. 32	20%	5	14	4	24
Winery No. 33	5%	8	22	3	34
Winery No. 34	30%	6	19	2	28
Winery No. 35	10%	4	11	2	17

Table 5 - Conversion of provided wine tourism services into proxy values (source: authors' elaboration).

Service category	R	R2
Logistics	0.43	0.18%
Hospitality	-0.22	0.05%
Internet	-0.17	0.03%
All	-0.06	0

Table 6 - Correlation between service level intensity (for each category) and direct sales at the winery level intensity (source: authors' elaboration).

The R index by Bravais / Pearson expresses an evident measure: the more the correlation about the observations is negative, the closer it gets to -1 and of course, the more the correlation about the observations is positive, the closer it gets to +1. Thus, from the above calculations there seems to exist a positive correlation (in other words, if the service level intensity increases, also the direct sales at the winery level intensity increases) only in the case of logistics services.

The robustness of the correlation is expressed by the R² index, calculated as R squared, varying from 0 to 1 and naturally, the negative or positive correlation is much more robust the closer it gets to 1. From the above calculations, the greater robustness between those observed, although very low, it is again the one concerning logistics services.

RESULTS DISCUSSION

In general, at least three fundamental evidences seem to emerge from the descriptive analysis:

- wineries that have responded to the survey are widely distributed throughout the Italian territory (North - Center - South - Islands), but the contribution of Tuscany to wine tourism success and reputation in Italy emerges vehemently, being "Tuscan" almost half of the responding wineries in general (19 of 42, i.e. 45.24%) and in particular, considering only the respondents to the whole questionnaire (15 out of 35, i.e. 42.86%);

- beyond the averages, which can be only indicative assuming the exploratory nature of the research, also because most probably the responding wineries are already responsive to wine tourism, three activities above all emerge in the global wine tourism offer: direct selling at the winery, wine tasting, and visiting vineyards / cellars / tasting rooms (which together sum up nearly 65% of the total time reserved in the winery to wine tourism services);
- very interesting service levels are present, as it is clear from the survey about logistics, hospitality, and internet services: unfortunately, there is still some delay in accessibility for disabled persons to the various wine tourism services.

More specifically, i.e. in response to the peculiar research question of this study (“Can a direct link exist between the service level intensity of the global wine tourism experience and the direct sales at the winery level intensity?”), inferential analysis discloses no evidence to that effect, and thus, from a statistical point of view, it should reject such a possibility. On closer inspection, however, considering that this is an exploratory research, inferential analysis results show that the service category with which the existence of a direct link seems more likely to exist is that one related to logistics services: therefore, starting from the current investigation, more extensive quantitative analyses could / should be focused more successfully precisely on the study of the potential direct link between logistics services and direct sales at the winery.

SCIENTIFIC AND MANAGERIAL IMPLICATIONS

From a theoretical point of view, the main outcome of the research in question is that there is no correlation between the service level intensity of the wine tourism experience (considered both at single service category, and at overall level) and the direct sales at the winery level intensity, in some way not confirming previous studies on the subject (O’Neill *et al.*, 2002). In truth, this evidence seems to infer at least two considerations.

First, as highlighted in the results discussion, considering only the statistical evidence of the investigation would alter the sense of the exploration, which instead gives proof of a stronger link between the logistics services and the direct sales at the winery. Second, it seems possible also to deduce that when the level of service is more intense, it is likely that the direct sales at the winery does not represent the most correct indicator for evaluating the wine tourism experience success (in fact, the correlation values for hospitality services and internet services are even negative), requiring more sophisticated techniques and tools of performance accounting (Mohammad, 2016).

From a managerial point of view, it seems clear, for entrepreneurs and / or managers that are responsible in charge of the wine tourism experience, that if they want to increase the direct sales at

the winery level, they will have to wager at least or especially on the improvement of logistics services. This implication seems consistent with previous studies (Festa *et al.*, 2015).

RESEARCH LIMITATIONS AND FUTURE DEVELOPMENTS

The study in question is exploratory and therefore not suitable from a physiological point of view for revealing factual logic; furthermore, the sample is limited and collected through a convenience procedure, and thus not reliable from a statistical point of view. Hence, quantitative survey that could be carried out on higher (and consequently most reliable) numbers would improve undoubtedly the overall reliability of the research, most of all if conserving the focus on logistics services, as emerged from the current survey.

Another limitation is the geographical perimeter, considering that the survey has been conducted only about Italy. A widening of the territorial context of the study, therefore, could automatically remove some limits concerning international comparison.

CONCLUSION

Fortunately, Italian wineries are increasingly recognizing, in their role as suppliers in the wine tourism market, the importance of the overall service in the wine tourism industry. Very encouraging results have emerged in this respect from the current study, which gives evidence, with all the limitations of an exploratory survey, that Italian wineries are constantly providing essential and accessories services for wine tourism. Unfortunately, there remains yet to heal some delay in the accessibility of disabled persons to vineyards, cellars, and tastings rooms.

If considering the specific research focus, it would seem that there is not a statistical link between the service level intensity of the wine tourism experience and the direct sales at the winery level intensity. Nevertheless, being the research in question exploratory, two very interesting findings seem to emerge: 1) a potential direct is more likely for logistic services; and 2) most probably, the more the wine tourism service level increases, the less direct sales at the winery represent a valid and reliable indicator for evaluating the wine tourism experience performance.

These two considerations, as revealed by the research findings, give additional evidence to how much the wine tourism phenomenon in Italy, but clearly not only in Italy, is evolving and becoming complex. A constantly in progress investigation on methods, techniques, and tools in this field, therefore, is an important encouragement to consolidate and develop the success of the overall business of a modern winery.

SOCIO-DEMOGRAPHIC FACTORS AND ONLINE SHOPPING FOR FOOD AND BEVERAGE: AN ANALYSIS OF ITALIAN CONSUMERS

Finotto, Vladi; Mauracher, Christine; Procidano, Isabella

Department of management, Ca' Foscari University of Venice

ABSTRACT

Understanding the determinants of users' propensity to purchase goods online is urgent for firms in the food industry. Changes in technology, business models and market structure have been disrupting the whole retail experience, creating new winners and new losers. Answering to the changes is the real discriminating factor determining who will survive and who will fade away. The present paper aims at understanding how socio-demographic traits and characteristics influence consumers' predispositions and propensity to buy online. More specifically, the paper aims at understanding whether there are any differences or similarities in online purchases of food and beverage items *vis-à-vis* the purchases of non-food items. We find that a variety of socio-demographic characteristics influence online buying behavior and do so, nonetheless, in nuanced ways. As far as food purchases are concerned, we find that males, aged 40-49 are more inclined to buy food and beverage online. While age and gender explain online shopping for food and beverage, other variables, such as education and place of residence, do play a role in explaining the propensity to buy online non-food items. Several indications related to the preferences of customers in terms of additional services are proffered throughout the paper.

Keywords: e-commerce; online shopping; food and beverage.

INTRODUCTION

Digital channels to purchase goods and services triggered relevant transformations in a variety of industries the last two decades. Digitally-mediated forms of commerce were seen as ripe with opportunities especially for small and medium-sized enterprises that might leverage upon digital tools to expand their reach and thus open new markets. Moreover, the adoption of e-commerce strategies has been seen as a crucial requirement for firms that are dealing with clients that are increasingly familiar with digital devices and services (Kannan, 2017; Merrilees, 2016; Weil, Woerner, 2015). E-commerce and the proliferation of virtual shelves it brought about were heralded as a force for good since they encouraged the explosion of variety in markets for goods and services: as the advocates of concepts such as the *long tail* (e.g. Brynjolfsson et al., 2006)

maintain, the proliferation of online stores and the low cost of expanding catalogues on the Internet, together with the lowering costs of logistics, allowed a variety of niches to become economically viable.

The debate on e-commerce, both in academic discourses as well as in policy-making ones, still faces the need to understand the determinants of online shopping behavior and the variables influencing the use of e-commerce platforms by users. Firms, whether they want to capitalize the potential of e-commerce or aim at finding ways to contrast its advance, still need to make sense of the factors influencing the behavior of customers. Some markets are populated by users that are highly familiar with e-commerce platforms, others are not. Some product categories are commonly bought and sold online, others are not (Carpio, 2015).

The paper contributes to extant knowledge of the attitudes of consumers to buy food and beverage items online and the underlying motivations by shedding light on the socio-demographic variables influencing their behavior.

The paper considers a specific geographical market and a specific set of product categories to shed light on the factors underlying the online shopping behavior of consumers, namely the Italian market for food and beverage products. Italy is an interesting testbed for theories and frameworks aimed at understanding the factors influencing customers' online purchases: in Italy e-commerce has shown signs of growth and increased revenues, but the development of online transactions occurs at a much lower rate than the growth of usage of social networks and other digital services (Casaleggio Associati, 2018). More interestingly, food and beverage items lag behind other product categories in terms of online transactions: Health & Wellness registered +39% in 2017 with respect to 2016, Fashion +28%, Food & Beverage +24%, Electronics +21% and Furniture +19% (Casaleggio Associati, 2018). Despite the positive trend, food and beverage goods are characterized by low absolute numbers (2.7% of the total) and are interesting to be observed as a field where internet usage to make transactions is still at an early stage.

Understanding the determinants of users' propensity to buy food and drinks online, thus, is urgent for firms in the food industry and for players in the food retail industry. Changes in technology, business models and market structure have been disrupting the whole retail experience, creating new winners and new losers: responding quickly to the changes is the real discriminating factor determining who will survive and who will fade away. The present paper aims, specifically, at understanding how socio-demographic traits and characteristics influence consumers' predispositions and propensity to buy online. More specifically, the paper aims at understanding whether there are any differences or similarities in the online purchases of food and beverage *vis-à-vis* the purchases of non-food items. The paper is organized as follows: the first section provides a

brief synthesis of the extant literature on e-commerce and socio-demographic characteristics; the second presents the research design and is followed by a section that illustrates the results of the analysis of empirical data. Finally, the paper considers the results of a logit regression model that attempts at singling out the specific socio-demographic traits and characteristics that are apparently correlated with the propensity to buy food and beverage online. Finally, the paper identifies the limitations of the current research design and its further developments.

1. LITERATURE REVIEW

The multiplication of merchants selling goods and services online and the increasing familiarity of consumers in a variety of markets with digitally-mediated forms of transaction are central to the evolution of many industries. Inquiries in a variety of fields—from business strategy to marketing and consumer research—tackled questions related to the motivations and determinants underlying consumers' online shopping behavior. Socio-demographic characteristics are central in these streams of research: inferring and predicting online buying behaviors from objective data represents a promising avenue of research. Data related to consumers' characteristics and behaviors is increasingly available: individuals release data that are collected in public and private databases and, most of all, feed datasets owned and processed by firms controlling and managing online environments (e.g. websites, company-owned or controlled social media and the like, cf. Hofacker et al. 2016; Heinonen, 2011; Li, 2010). Understanding the role of socio-demographic factors in the use of e-commerce platforms, moreover, resonates with the prevailing posture in literature on technology acceptance model (cf. Hernandez et al., 2011; Venkatesh et al., 2003) that either consider socio-economic variables as predictors of users' acceptance of new technologies or socio-demographic ones.

Age was one of the eminent themes in literature regarding the role of socio-demographic characteristics on online shopping behavior. In an analysis of Israeli online consumers' behavior, for instance, Lissista and Kol (2015) showed how age is only to a certain extent a predictor of online shopping behavior. Despite common sense might bring analysts to consider younger consumers as more prone to buying items online, such a contention needs to be balanced with considerations related to the availability of disposable income. As the authors state, generation X (composed by individuals born between 1960 and 1980) shows a higher propensity to buy online than generation Y (individuals born after 1981) given the higher availability of disposable income and free time. Hence, despite generation Y appears more attractive to marketers given its connectivity, hedonism and search for engaging online experiences, marketing efforts should consider generation X as a primary target. Similarly, Kooti et al. (2016) find that the amount of money spent on online

websites increases sharply with age, reaching a peak when consumers approach the late 30s. In a study on Chinese consumers, Wang et al. (2018) find that they might be grouped in two segments: online-food-conservatives and online-food-pioneers. The authors highlight how the two segments differ in terms of socio-demographic characteristics, singling out age as the most important discriminant factor: pioneers are mainly individuals aged 31 to 40, while conservatives are those that are younger than 30 or older than 40. Bryla (2018) analyzed selected characteristics, attitudes and opinions of organic food e-consumers (online shoppers) in Poland. Through a logistic regression model, age and income turned out to be statistically significant determinants of online shopping behavior: specifically, higher age decreases the likelihood of being an organic e-consumer. Also, Kaur et al. (2017), studying the customer's demographic characteristics on influence on their attitude towards online grocery shopping, demonstrated that age is one of the most significant variables. Other studies, such as those published by Kooti et al. (2016), try to model the interaction of a large set of socio-demographic variables with online shopping behavior. For instance, they find that gender is highly correlated with the propensity to buy online across product categories, with men buying more items and more frequently than women. Moreover, they find that available income, measured through the residence of individuals—in more or less affluent areas—is highly correlated both with online shopping frequency and with the amount of money spent. Also, other Authors (Kaur et al., 2017; Bryla, 2018 and Wang et al., 2018) show that the income variable plays an important role in the interviewee's use of e-commerce.

As far as gender, the first variable examined in Kooti et al. (2016), is concerned, evidence is still mixed in literature. While many studies do infer the impact of gender on specific behaviors in terms of online shopping, more recent examinations such as that of Pascual-Miguel et al. (2015) introduce variables like effort expectancy and social influence as important mediating variables explaining different rates of e-commerce acceptance among women and men. Research the authors did on Spanish consumers suggest that both the variables tend to be more important for women than for men and that such a situation might determine females' low acceptance of e-commerce in some product categories (digital goods and services) and high acceptance in others (non-digital goods). The findings of Wang et al. (2018) and Kaur et al. (2017) have demonstrated indifference between genders and e-commerce adoption.

A host of other socio-demographic variables are considered in the present literature on consumers acceptance of e-commerce and propensity to buy products and services online and an extensive and systematic review is outside the scope of this paper. We refer the interested reader to Kooti et al. 2016 for both a review of the different foci of the existing literature as well as for the attempt to develop and test an integrative model.

What interests the most to the authors of this paper is that literature on the determinants of online shopping behavior is highly fragmented both in terms of industry and market considered, and in terms of geographical area of reference (Hallikainen, Laukkanen, 2018). An increasing number of studies, for instance, consider e-commerce acceptance in emerging economies and highlight how cultural factors in different countries and regions interact with consumers' socio-demographic characteristics in different ways (Kim, Peterson, 2017). Moreover, the fragmentation of literature in hundreds of streams related to different industries suggest that the hope for integrative and unifying views of the online shopping behavior of consumers might be an illusion and that knowledge of the phenomenon is destined to be contextual and industry-specific.

Moving from this hypothesis, the present paper aims at contributing to the debate on the online shopping behavior of consumers in a given geographical area—Italy, characterized by a specific national culture—and in a specific industry: food and beverage. Such a choice is justified by the need to adhere to a prevailing trajectory in the field that privileges contextual and industry-specific analyses and by the aim of producing advanced knowledge on e-commerce to benefit firms in a sector that currently is lagging behind. The remainder of the paper, thus, illustrates the research design motivated and the results of an empirical analyses aimed at answering at the following research question: which socio-demographic characteristics influence, and how, consumer propensity to buy online food and beverage items?

2. METHODS AND DATA

Following the methodological approach proposed by Kaur et al. (2017) a web-based survey was carried out in order to investigate consumers' attitude towards the use of e-commerce to purchase food and beverage online. The empirical analysis aimed at capturing the motivations and expectations underlying consumers' willingness to make use of e-commerce websites (or the absence thereof).

A survey was administered among a sample of consumers living in the Veneto Region (North-East of Italy) aged 20 to 69. A non probabilistic selection method was used to obtain the sample: users of Facebook were contacted and addressed for a period of 18 days in the third quarter of 2016. Groups of citizens gathering around local pages of their municipalities were solicited and asked to distribute the call to fill the survey.

The questionnaire consisted of 29 items, articulated in four main sections: the first aimed at investigating and understanding the habits and routines of consumers in relation to food and beverage purchases, specifically the frequency of their purchases, the places and retail superficies where purchases are made and the main elements influencing their perception of the point of sale.

The second section aimed at understanding how, how frequently and what these consumers buy online, as to understand the degree of familiarity of the sample with e-commerce websites and their use habits, including their preferred payment methods and the reasons behind the eventual interruption of the purchase process once online. The third section of the survey aimed at collecting data specifically on the online purchases of food and beverage items by the selected sample: this section aimed at providing a picture of how many consumers in the sample used e-commerce websites, with which frequency, which specific websites. The final section of the survey allowed the research team to collect socio-demographic information on the individuals included in the sample.

The vast majority of the questions in the survey were closed-ended; the questionnaire was validated with industry experts before being administered online.

2.1 The sample

Female participants to the survey outnumbered men (75%). The ratio is in line with national polls showing that 75% of women in Italian households take responsibility for the procurement of food and beverage. As far as the samples' age distribution is concerned, data from the survey show that the most represented age group is the one aged between 40 and 49 (28%), immediately followed by the 30-39 age group (25%) and by the 20-29 group (21%). The instrument chosen to solicit respondents, a social network, is likely to have determined the lower percentages in the age group 50-59 (18%) and 60-69 (8%). Based on national panel data, Italian citizens below 45 years of age familiar and active on social media, while those over 45 years lag behind (cf. Prato, 2016), with just 17% of over 65 that do possess and account of Facebook.

Another variable that was considered is educational attainment: a large share of interviewees attained medium-to-high credentials, especially if compared with average national values. Specifically, 57% of the informants attained a secondary title, 29% a graduate degree, 14% a lower secondary title. As far as the occupational condition in the sample is concerned, the vast majority of individuals surveyed are employees (52%), followed by free-lance workers (19%), housewives (10%), with other conditions such as students, retired and unemployed being relatively less represented. The sample is concentrated in urban areas (75%) *vis-à-vis* rural areas (25%). As far as households are concerned, 29% of individuals in the sample live in households of four components, 29% in households with three components, 26% are living with one other person. Singles (10%) and people living with four other relatives (7%) are less represented in the sample.

3. RESULTS

3.1 *Shopping for food and beverage: habits and behaviors*

Data from the survey highlights how the vast majority of consumers in the sample shop frequently for food and beverage: 44% of the sample buys groceries at least twice a week, 39% less than twice a week. Smaller percentages shop daily (9%), every two weeks (7%) and monthly. When shopping for food and beverage is concerned, consumers choose different places: supermarkets are the solution of choice for the majority of the sample (51%), larger superficies (e.g. malls) are chosen by 17% of the sample. A contained share of the sample (14%) declared to be erratic in their choices, with no prevalence of one over the others. How do individuals in the sample make their decisions as to where to buy foods and beverages? Prices and promotions (e.g. discounts) are the most important signaling devices used by respondents in making their choices (28%), while quality of products (25%) and geographical contiguity of the shop with their homes (22%) are close followers. Operating hours, availability of parking space and other services (10%) are used by a smaller portion of the sample to make their decisions as to where their purchases will be made. Apparently, factors such as the presence of given brands, trust inspired by the point of sale, being acquainted with the owner of the shop are relatively less important in guiding consumers' behavior in our sample.

3.2 *Online buying behaviors and habits*

Three out of four interviewees (78%) bought something online at least once. More specifically, the sample includes a vast majority of individuals whose buying behavior is mild towards online channels: interviewees made less than six purchases in two months, with 59% of individuals recurring to online e-commerce websites three times in two months, 17% six times, 17% zero purchases in the last two months. Only 8% of the sample bought items online more than 12 times in the last 2 months. As far as categories are concerned, the items that are preferred by the components of the sample are electronic devices and small house appliances (17%), clothing and accessories (17%), published goods (books, magazines, cd, dvd, 14%), trips and hotels (14%), tickets for events or public transport (10%). The question allowed respondents to indicate more than one answer. The analysis of the first (most frequent) answers allowed us to identify the salience of different categories of goods: 41% of the respondents shop frequently (indicate as a first choice) for clothing and accessories, 24% report books, CDs, DVDs and magazines, 19% small house appliances and electronic devices (fig. 1).

Figure 1: Most important categories bought online - first answer

Consumers in the sample use different payment methods and instruments: credit card is used as the preeminent payment method by 36% of the sample, Paypal by 31% of the respondents, pre-paid cards by 26% of the respondents.

The survey aimed also at understanding how frequently and why consumers interrupt their purchasing experience online by abandoning the cart in the process. The phenomenon is quite frequent in the sample with 83% of respondents stating that they left the process at least once. Consumers do not complete the purchases they initiated mainly for reasons related to insecurity: 31% of the interviewees state that they were not sure enough about the quality and features of the product, while 17% were convinced to abandon the process by the shipping costs that were judged as too expensive. As far as this latter reason is concerned, e-commerce platforms and websites that specify shipping costs only at an advanced stage in the process tend to discourage users to buy since they perceive that the final cost is too high. Other recurring reasons explaining the interruption of the purchase process are the presence of the same item at lower prices in other websites (11%), the lack of the preferred method of payment (10%), a mandatory process of subscription to the website or an overly long one (9%), and finally doubts regarding the security of the payment process (6%).

3.3 Food and beverage online purchases

Buying food and beverage online is relatively infrequent among respondents to the survey: in fact, 155 respondents (15% of the total) bought food or drinks on an e-commerce website or platform at least once. Women tend to buy groceries and beverages online more frequently (68%), while age

tends to discriminate buyers vis-à-vis non buyers: 40% of respondents reporting that they bought at least once food and beverages online belong to the age classes 20-29 and 30-39, followed closely by respondents aged 40-49 (39%).

Respondents in the sample buy certain types of items more frequently than others: items with longer expiration dates are those that are preferred and bought repeatedly by respondents in the sample, with a particular emphasis on coffee and tea (14%), sweets and cookies (12.63%), wine (10.88%), pasta (8.07%), beer or other alcoholic beverages (8.07%), oil (7.72%) cereals (7.02%). Consumers in the sample buy groceries online mainly because they cannot find the items they selected in physical stores (30%); some of them rely on e-commerce websites to save time (26%), to save money since online prices are lower than those in physical retail spaces (23%), and finally to purchase typical local foods (10%) from other regions or countries.

When asked whether there are categories of goods that they would not buy online, respondents in the sample indicate fresh vegetables and fruit (20.88%), meat and poultry (17.01%), fish (16.49%), cured meat (8.51%), water (6.70%), frozen foods (6.70%). The reasons behind the exclusion of these categories from their online shopping list are manifold: the risk of receiving deteriorated fresh food (43%), the absence of a physical, direct, non mediated contact with the items to be purchased (33%), the risk that goods might break or lose their quality during transport (9%), the lack of opportunities to read the labels in advance (6%), the lack of the opportunity to be aware of the expiration date before receiving the good at home (5%).

Consumers (n=1361) were then asked to express their judgment on the importance (measured through a 4-point Likert scale, with 1 being absolutely not at all important, 2 slightly important, 3 important, 4 very important) 6 different factors in influencing their purchase decisions related to food and beverage.

The aspects respondents were required to ponder were the following:

- The online availability of items otherwise difficult to be find in physical stores located close to the customer;
- The availability of typical local foods;
- The opportunity to read food labels before the actual purchase of the good;
- The variety of items offered by the website;
- The possibility to clearly define the timing of the delivery of the good purchased online;
- The delivery of food and beverage during weekends and the night.

Figure 2 synthesizes the perception of the respondents. The availability of products that are seldom available in stores close to the customers, the opportunity to read food labels in advance and the

opportunity to buy typical local foods are the factors that most likely motivate customers in shopping online. The last two factors, the possibility to clearly define the timing of delivery and the availability of delivery services at night and in the weekends, do not show a clear predominance in terms of perceived importance.

Figure 2 - Relevant factors in consumers' online purchase decisions

4. LOGISTIC REGRESSION MODEL AND RESULTS

The research question motivating the paper is whether some socio-demographic characteristics explain the propensity of individuals to buy food and beverage online. To attempt at answering the research question we estimated a logistic regression model.

In the remainder of the paper we will present two models: general one that considers "online purchase" as the dependent variable, and a second one that will consider "online purchase of food and beverage" as the dependent variable. Both the models consider the following socio-demographic characteristics: gender, age cohort, level of education, profession, area of residence, size of the family (measured by the number of family members) (see table 1).

Table 1- model variables and categories

Socio-demographic variables	Reference category	Category included in the model
Gender	Female	Male
Age group	Age 5 (60-69)	Age 1 (20-29) Age 2 (30-39) Age 3 (40-49) Age 4 (50-59)
Education	Low level (elementary school license/lower middle school license)	Middle Education (higher secondary school license) High Education (tertiary education credential)
Profession	Employee	Student Unemployed Housekeeper Free lance worker Retired
Area of residence	Urban	Rural
Family size	Large family (5 or more family members)	Small family (1-2 family members) Average family (3-4 family members)

Table 2 – Results: online purchase

	Estimate	Standard Error	p-value	Odds Ratio	Marginal Effects
constant	-0.427	0.234	0.067		
Male	0.359	0.167	0.032	1.433	0.055
Age1	1.056	0.248	<0.00005	2.876	0.141
Age2	1.467	0.251	<0.00005	4.295	0.190
Age3	1.392	0.238	<0.00005	4.023	0.188
Age4	0.635	0.239	0.007	1.890	0.091
Middle Education	0.619	0.179	0.0005	1.858	0.103
High education	0.929	0.217	<0.00005	2.534	0.133

As far as the first model, the general one, is concerned, all coefficients except the constant are positive, indicating that, relative to the reference category, the propensity to buy online is positively influenced. Focusing on the Odds ratio column, all the values are higher than 1, to indicate that the propensity to buy online for the considered categories is always higher than that of the reference category. The odds ratio of the variable “age” is particularly high, with a propensity to buy online that is 2 to 4 times superior that that of the reference category represented by the 60-69 age group. Similar considerations might be done for the education variable: the

propensity to buy online for respondents with a middle or high education is 1.0 to 2.5 superior than that of respondents with lower education attainment.

Table 3 – Results: online purchase of food and beverage

	Estimate	Standard Error	p-value	Odds Ratio	Marginal Effects
constant	-2.000	0.124	<2e-16	0.135	
Male	0.322	0.189	0.0891	1.380	0.0418
Age3	0.435	0.181	0.0173	1.539	0.0564

When the second model is considered, the one focusing on the online purchase of food and beverage, the results indicate that all the coefficients are statistically significant and, the constant aside, are positive. This means that, relative to the reference category, the propensity to buy online is positively influenced. Focusing on the odds ratio column, similarly to the first model, also in this one the values are higher than 1, indicating that the propensity to buy food and beverage online for all of the considered categories is superior to that of the reference category. If gender is considered, males show to be more likely to buy food and beverage online than women. When age is considered, the propensity to buy food and beverage online for respondents aged 40 to 49 is 1.5 times higher than those not belonging to the same age group.

5. DISCUSSION

The findings of our analysis allowed to develop a profile of online consumers according to their general online shopping behavior first and then according to their food online shopping behavior. What emerged from our survey is that males are more willing to buy online, especially those that are employed and are aged 30-49.

The first estimated model singles out three relevant socio-demographic characteristics that influence individuals' online shopping behavior: gender, age and education. As far as the online shopping behavior in general is concerned, the study suggests that women are more inclined to buy goods and services in the "tourism", clothing and apparel, and books/cd/dvd/magazine categories. On the other hand, men, especially in the age group 30-49, are more inclined to buy small home appliances and electronic devices. Age influences the choice among different categories: youngsters in the age group 20-29 are more inclined to buy products belonging to the tourism, clothing and accessories categories.

The second estimated model, then, focused on the online shopping behavior of food and beverage items. In general, data related to the purchase of food and beverage items online allowed us to register that women are more inclined to buy pasta and grains, while men are more inclined to shop for wines and sweets. In both cases, the items are packaged goods, with long expiry dates,

that consumers probably already bought repeatedly and know extensively. When motivations to buy online are concerned, the availability of rare or typical products that are not easily accessible in physical stores in the residence area consumers live in is the most important. Fresh items, such as fruit and vegetables, meat and fish, are not among those preferred by customers since they fear that the logistic process might deteriorate them. The second estimated model highlighted how two socio-demographic variables influence the propensity to buy food and beverage online: gender (with a prevalence of men) and age (with a prevalence of people aged 40-49).

6. CONCLUDING REMARKS

The development of updated and effective e-commerce platforms to sell food and beverage online represents a promising avenue for the development of the industry and for the competitiveness and growth of food and beverage firms, especially in countries like Italy, characterized by a prevalence of small- and medium-sized firms and by the multiplicity of typical local foods appreciated in global markets. Nonetheless, consumers still put a prize on the physical and direct visual contact with food and beverage items, are still worried by the risk of food deterioration during the transport of these items and are still not completely convinced of the reliability and security of e-commerce websites and of online payment methods. These and other impediments are currently slowing the speed of e-commerce adoption by firms and the transformation of firms' business models.

Data in the paper show that the relatively contained share of "high-tech" consumers that more enthusiastically buy on e-commerce websites privilege items that have longer expiry dates, both in known categories as well as new and never tried before, especially when the internet allows them to buy typical local foods of other regions or items that are not easily available in their area of residence.

As far as the consumers' online purchase preferences for specific food categories are concerned, our results are consistent with those of Wang et al. (2018): consumers had weak online purchase intentions toward fresh food products such as meat, eggs, vegetables, fish and seafood.

Italian consumers, as well as consumers from other countries (Chintagunta et al., 2012; Wang et al., 2018) appear to be more willing to purchase packed food when shopping online.

Our results provide some useful bases for customer segmentation and targeting in e-commerce platforms other studies suggest (cf. Lissitsa and Kol, 2016), despite the centrality in the e-commerce discourse of younger generations, the most promising prospects for marketers are relatively older customers. Our findings highlighted how the propensity to buy food and beverage online is affected by the consumer's age, in particular the higher propensity is associated with individuals

aged between 40-49 years. This is in contrast with the findings from a recent study on a specific product category (organic products) (Bryła, 2018) that highlights that being younger increases the chance of shopping online for organic food. Even Kaur et al. (2017) found out that consumers' attitudes towards online grocery shopping differ significantly with respect to their age: in their study, the respondents in the age group 25 to 34 significantly differ from the respondents in the age groups 15 to 24 years and 35 to 44. The middle-aged people have positive attitude towards online grocery shopping as compared to young aged people.

With regard to gender, the estimated model indicates that male consumers have a higher propensity to buy food and beverage online. This is in line with the results of Kooti et al. (2016).

Our investigation allowed us also to collect additional information that might be useful to design the online strategies of food and beverage firms. On the one hand customers claim to appreciate complementary services such as the opportunity to read food labels in advance (especially women), the possibility to receive food at home in specific time slots (especially employees). Finally, the use of e-commerce websites by these consumers is not excluding their loyalty to physical stores: more than half of the sample, in fact, still shops frequently in physical retail spaces and visit physical stores at least once a week.

The study is exploratory and has limitations. In particular the sampling procedure, despite allowing for a large number of respondents, might require an additional wave of data collection among a sample that better fits the social characteristics of the country to validate the emerging results.

THE LEVEL OF PROXIMITY OF LATIN COUNTRIES IN TERMS OF CUSTOMER'S EXPECTATIONS ABOUT SERVICES: APPLICATION TO THE HOTEL SERVICE

Franco, Mara¹; Meneses, Raquel²

²Faculty of Economics, University of Porto, FEP-UP, Porto, Portugal

ABSTRACT

Among the years, the interest in the study of customers' expectations about services has increased, due to its dynamic nature and importance to achieve a high understanding of customers' behaviour. In this sense, the main purpose of this research is to understand if customers from countries with alleged similar culture expect services dimensions equally and to understand the level of proximity among countries. Quantitative methodology was used to test the level of proximity in customers' expectations about a service among different countries with alleged similar cultural patterns and if these customers share similar expectations about a set of service dimensions. This transnational research regarded the hotel service and data was collected from ten Latin countries: Portugal, Spain, France, Italy, Romania, Brazil, Mexico, Uruguay, Bolivia and Chile. About 1262 customers answered a questionnaire about their expectations about service dimensions of the hotel service. Findings show that Latin customers' expectations about services are not equal in these countries with alleged cultural similarity and that there is a low level of proximity or similarity of customers' expectations about service among Latin countries. Theoretically the major contribution is the use of a cross-cultural approach applied in countries with alleged cultural similarity. Furthermore, managers when marketing services internationally in Latin countries need to adapt the service offer to each country.

Keywords: cross-cultural management, Latin countries, customers' expectations, services, hotel service, service dimensions, international marketing, cultural distance

INTRODUCTION

In the last years, services became one of the most important sectors worldwide, in developed countries and in developing countries, pushed by the fast internationalization of service companies (Javalgi and White, 2002, Ghemawat, 2001). A cross-cultural study is very pertinent, because when services are commercialized in foreign countries, the cultural influence plays a major role between customers and

the service provider. As culture affects how people consume, a successful internationalization strategy should anticipate cultural influences in customers' expectations about a service, in each country. In fact, managers select countries that are culturally closer to internationalize their company (Martin and Droegendijk, 2014). And the Latin countries are an example, as Latin companies internationalize to Latin countries based on an alleged proximity and on the presumed cultural similarity. Indeed, authors have performed cross-cultural research to cluster the countries that are culturally similar and the Latin countries emerged without agreement on its constitution. The countries that cluster together according to the expectations about service dimensions, will also have a higher cultural proximity and consequently it is expected that the society and people inside this cluster have similar behaviours, values and beliefs. Therefore, the individuals in the same cluster are expected to act equally and to have a similar way of being. Having in consideration the customer expectations about services, this research tries to uncover the level of proximity/similarity among different countries.

LITERATURE REVIEW

Cultural distance in international marketing

One of the major challenges to market services internationally is the cross-cultural incongruence (Javalgi and White, 2002). Marketing activities when targeting foreign markets become more complex, require an effort in working in cooperation with other people with a different cultural background. Additionally, international marketing managers need to know more about the markets, not only the main and visible differences between the domestic market and the foreign market: they need to understand how people think, what are their wishes and desires and how they act to fulfil those desires (Holzmüller and Stöttinger, 2001). Customers are culturally diverse, with different religious beliefs, language, education, family structure, gender role, and time orientation (Javalgi and White, 2002), this has influence on customer's expectations, perceptions and evaluations about the service and ultimately it will impact customer's behaviour when experiencing the service (Schumann et al., 2010).

Most of the costs and risks of internationalization are created by distance, which influences the attractiveness of a foreign market. The CAGE model (Ghemawat, 2001) takes in account four dimensions to measure distances between countries. One of the dimensions is the cultural distance, related to how people interact with each other and with institutions and how customers build their preferences and choices. The cultural distance is greater when the languages are different, different ethnicities, lack of social networks, different religions and different social norms. More recently Martin and Droegendijk (2014) developed the COD index (country distance index), build on the psychic distance literature based on three basic dimensions: socioeconomic development distance, physical distance and cultural and historical distance. The cultural and historical distance has in consideration

the differences in language that can cause problems in the information flow, compromising communication and interpretation of information. So, speaking the same language is an obvious strength when it comes to choose the international market. Moreover, religious differences shape people's behaviour, values and norms, and these differences can lead to misunderstandings and disagreements. For last, the colonial tie can also build a strong relation between the two countries. As higher the country distance is, higher is the possibility of difficulties in communication, information disturbance and obstacles to the international activities. For example, when it comes to the dimension of cultural and historical distance the Latin American countries and the Latin European countries are the ones with the shortest distance to Spain.

Thus, service providers in these countries make internationalization decisions based on alleged cultural proximity/similarity to other Latin countries. However, there are no agreement in clustering these countries in terms of cultural similarity. So, there is an incongruence, in one side the service providers internationalize to these countries based on cultural similarity, on the other side researchers that tried to cluster Latin countries based on cultural similarity did not reach to an agreement in the countries that constitute the cluster. The development of cross-cultural research was useful to cluster countries (see Hofstede, 1980, House et al., 2004, Trompenaars and Hampden-Turner, 1997, Haire et al., 1966, Sirota and Greenwood, 1971, Ronen and Kraut, 1977, Ronen and Shenkar, 1985, Stankov, 2011). From the previous exercises of country clustering, two clusters emerged without agreement on its constitution: Latin countries, subdivided into Latin Europe and Latin America. The countries were clustered according to the importance given to the cultural dimensions, so the countries with higher cultural proximity are clustered together, as it is expected that the society and people inside this cluster have similar behaviours, values and beliefs. So, Latin countries are assumed to have a cultural similarity, not only in terms of internationalization processes among companies from these countries, as also in the cross-cultural research, where Latin Europeans and Americans share some cultural characteristics. If this Latin cluster really exists, the customers that live in these countries will have similar expectations about a service, more particularly about the service dimensions.

Customer's Expectations

In a basic understanding, customer expectations are about what a service should offer (Parasuraman et al., 1988), an anticipation to a service experience (Wu et al., 2014). Satisfaction is accomplished through the balance between customer expectations and the real experiences or perceptions (Wu et al., 2014). As this difference is lower, between customer expectations and perceptions, the customer has a higher satisfaction level and the company will benefit from it, as the customer will probably return to the company and eventually build a positive feedback about the company to other potential customers.

Therefore managing customer's expectations is critical to service conception and management (Kurtz and Clow, 1992).

Customers' expectations are dynamic and based in several factors (Parasuraman et al., 1991, Pizam and Ellis, 1999), influenced by the customer's view of the providers', provider's image, traditional marketing activities, traditions, ideology or word-of-mouth (Grönroos, 1984). Also, before the initial service encounter every customer has its cultural identity, related to physiognomy, language and demeanour, as a background that influences all the service encounter process (Hopkins et al., 2005). In sum, each country has its own culture, and as culture influences the way that the customer expects the service, there is a need of adapting the service according to the culture of each country. In fact, several sources of information are part of customer expectations formation about a service (Parasuraman et al., 1991, Zeithaml et al., 1993), however other authors (Cunningham et al., 2005, Cunningham et al., 2006, Cunningham et al., 2004, Donthu and Yoo, 1998, Hsu et al., 2013) state that culture is a major influence on customer's expectations about service.

Services dimensions

Customers' have expectations for each one of the service dimensions. So, it is fundamental do understand the service dimensions that authors among the years have identified (eg. Chase, 1981, Cunningham et al., 2006, Lovelock, 1980, Bowen, 1990, Liu et al., 2008, Salegna and Fazel, 2013, Van der Valk and Axelsson, 2015). As this research is outlined from the customers' point of view, only the service dimensions that the service provider can influence and control are taken into account, as these dimensions are the ones that the service provider can design in order to fulfil customers' expectations. Then, it is proposed a new classification for service dimensions:

- Degree of customer involvement: the level of connection and interaction between the service provider and the customers during the service process or system. This is very important for the service provider to manage the service process, to assure service quality, to determine the level of customers' involvement and co-production in the service or if customers only consume the service after the service production (no involvement).
- Convenience level: before and during the service process, customers evaluate the availability of the service and its effort to achieve it (money, time and energy spent in the service process), with the ultimate goal that the service provider will satisfy their needs in the expected time and appropriate space. In this evaluation, customers consider the amount of risk, the physical safety, the financial security and the level of confidentiality.
- Contact personnel performance: the contact personnel are a very important player in the service performance, especially when front line employees can be a source of differentiation of the service

because they know how to fulfil customers' needs. The contact personnel judge and evaluate customers' needs, based on the level of resources that they have at their disposal.

- Complexity degree: the service provider has the power to define and design service encounter steps and their number, according to the customer's degree of repeatability of service steps and to the degree of freedom that customers have in defining them. It is also important for the service provider to define the complexity level of those steps.
- Information and communication power: the information exchange between the service provider and the customers is fundamental to bond, perform a task, clarify doubts, promote and sell the service. The information is a power that can be controlled by customers or by the service provider and who controls information has more power in the service process.
- Environment and social responsibility: the provider can offer a service that has an environmental orientation, with ecological processes and materials. It can also play an educational role, raising customer awareness for environmental protection and social responsibility.

It appears that internationalization strategic decisions between Latin countries are stuck on a "presumed cultural similarity paradox" (Vromans et al., 2013), where Latin countries are assumed to have a cultural similarity and that this similarity eases the internationalization processes between companies from these countries, and with strong previous assumed expectations about the culture from other Latin countries. Therefore, customers from countries culturally closer are likely to act and behave equally and to have equal expectations about service dimensions. Having in consideration the customers' expectations about services dimensions, this research tries to uncover the level of proximity/similarity among different countries. Thus, the following hypothesis are posited:

Hypothesis 1a (H1a): High level of proximity in customers' expectations about a service among different countries with alleged similar cultural patterns.

Hypothesis 1b (H1b): Customers' from all countries, with alleged similar cultural patterns, share similar expectations about a set of service dimensions.

METHODOLOGY

The hypothesis propositions were tested in Latin countries and in the hotel service. In the more recent research, the travel and tourism services are one of the most explored themes. The tourism sector in some countries is the main player in the economic development and also one of the most subjects studied in the service quality research, because of its uniqueness characteristics, as for example in hotel services, customers are part of the service experience (Dortyol et al., 2014).

This research performed a multi country analysis, a gap identified previously in this research area (Engelen and Brettel, 2011). Cardon (2008) advices that cross-cultural research should include a

minimum of 10 to 15 cultures. This research aims to take a step further and make a transcontinental cross-cultural study and due to these gaps, considering 10 different countries with a “presumed cultural similarity paradox” (Vromans et al., 2013). Therefore, the Latin Europeans countries selected for this research are: France, Italy, Portugal, Spain and Romania. And the Latin American countries are: Bolivia, Brazil, Chile, Mexico and Uruguay. The population is composed by university students (attending post-graduate, master and PhD programs) from the selected Latin countries. The objective was to have people that can answer a questionnaire about consumer issues and that are customers of the hotel service, with resources to spend on that service. In fact, Schwartz (2006) stated that “countries are meaningful cultural units” and that students are an ideal sample to make cross-cultural research, as they match on critical characteristics. Data was collected through an online questionnaire and to increase the filling rate and the validity, all questions were of mandatory answer. The questionnaire was made in English and then translated to the native languages of the Latin countries (Portuguese, Spanish, Italian and Romanian) by a local native expert and then it was applied back translation to assure the words have the same meanings in both languages. The questionnaire measured customers’ expectations about each service dimension using a seven-point Likert scale and was based on service quality measurement questionnaires developed by Parasuraman et al. (1994), measuring customers’ expectations about the minimum acceptable level of service for an hotel.

Table 1. *Socio demographic profile by country of residence*

FINDINGS

The sample of this research is adequate with 1262 observations (Portugal (15%), Spain (9%), France (9%), Italy (6%), Romania (9%), Brazil (12%), Mexico (13%), Uruguay (8%), Bolivia (10%) and Chile (7%). In Table 1 is presented the socio-demographic profile of the sample.

Reliability, consistency analysis and outlier detection

The Exploratory Factor Analysis (EFA) and the Cronbach Alpha determination was conducted on the general sample (N = 1262) and results are in Table 2.

Dimension	KMO Test	Cronbach's alpha (score reliability)	AVE	CR
Degree of customer involvement (DCI)	0,879	0,819	0,480	0,820
Convenience level (CL)	0,955	0,947	0,669	0,948
Contact personnel performance (CPP)	0,902	0,941	0,733	0,943
Complexity degree (CD)	0,910	0,895	0,532	0,900
Information and communication power (ICP)	0,840	0,855	0,563	0,865
Environment and social responsibility (ESR)	0,917	0,929	0,611	0,926

Table 2. *Service dimensions: KMO test, score reliability, average variance extracted (AVE) and composite reliability (CR)*

The KMO test indicates of the service dimensions DCI (KMO=0,879) and ICP (KMO=0,840) have a good homogeneity, as the values are between 0,8 and 0,9 (Marôco, 2011), and that the service dimensions CL (KMO=0,955), CPP (KMO=0,902), CD (KMO=0,910) and ESR (KMO=0,917) have an excellent homogeneity, as the values are above 0,9 (Marôco, 2011), so it is recommended the execution of the EFA. All the service dimensions indicate a good internal consistency, as the Cronbach Alpha (score reliability) is above 0,8 (George and Mallery, 2003). All the service dimensions present good values of reliability, as the CR values are all above 0,7 (Hair et al., 1998). Also, all service dimensions have a convergent validity of the construct, as the AVE values are above 0,5 (Hair et al., 1998), with the exception of degree of customer involvement dimension (DCI) that has an AVE near to 0,5 (AVE=0,480). Using the method proposed by Hoaglin and Iglewicz (1987), the “outlier labelling rule”, the outliers were identified and then eliminated. From the sample it was eliminated 227 observations in service dimensions in all the countries of residence.

Results

The Multidimensional Scaling (PROXSCAL and MDPREF) determination was made by using the software SPSS Statistics (v. 24, IBM SPSS, Chicago, IL). The analysis was conducted on the final sample, considering the ten countries of residence: Portugal, Spain, France, Italy, Romania, Brazil, Mexico, Uruguay, Bolivia and Chile. In order to apply the MDS PROXSCAL it was created a matrix of proximities between Latin Countries, presented in Table 3, based on the customers' expectations about

all the service dimensions in all the Latin Countries. In Table 4 are presented the measures for stress and adjustment of the produced solution. According to the quality evaluation criteria STRESS-I and DAF, the solution of two dimensions is classified as reasonable (STRESS-I=0,257) to very good (DAF=0,933), as the DAF (Dispersion Accounted For), has a score higher than 0,7 (Marôco, 2011).

Table 5. Final coordinates for Latin Countries

The perceptual map in Figure 1 illustrates where the ten Latin countries are positioned according to the similarities perceived by the respondents of their expectations about service dimensions. Therefore, and taking into consideration the final coordinates of the Latin Countries in each dimension (see Table 5), it is concluded that Chile and Italy are the most similar and Brazil and Romania are the most dissimilar, regarding the two retained dimensions. Regarding dimension 1, the countries with higher level of similarity are Italy, Chile, Spain and Uruguay. Regarding dimension 2, the countries with higher level of similarity are Portugal and Romania. Consequently, the level of proximity or similarity of customers' expectations about service among Latin countries is not high, therefore Hypothesis H1a is rejected. Although, some countries present high similarity or proximity.

1: Portugal; 2: Spain; 3: France; 4: Italy; 5: Romania; 6: Brazil; 7: Mexico; 8: Uruguay; 9: Bolivia; 10: Chile

Figure 2. Perceptual map for service dimensions and Latin Countries

The multidimensional scaling of preference (MDPREF) was applied in order to get a representation of the service dimensions in multidimensional space, and then relates the set of countries to the same multidimensional space (Figure 2). Regarding the two retained dimensions no country showed similar

customer expectations about any of the service dimensions. Concerning the dimension 1, customers from Italy and France have similar expectations about the *degree of customer involvement*, the *complexity degree* and the *information and communication power* service dimensions. In dimension 2, customers from Mexico, Uruguay and Romania have similar expectations about the *environment and social responsibility*, the *information and communication power* and *complexity degree* service dimensions. Consequently, the Hypothesis H1b is rejected, as customers from Latin countries do not have similar expectations about service dimensions.

DISCUSSION

Results showed that the level of proximity among Latin countries is not high, regarding customers' expectations about service. Still, Chile and Italy have a high level of proximity, this can be partially explained by the HDI level in 2015, as Chile has the highest HDI level of Latin America (0,847) and Italy has the second highest level of HDI in Latin Europe (0,887). In terms of previous cross-cultural research, these two countries scored as high power distance countries, where people believe that power is distributed unequally in the society (Gupta et al., 2002, Jesuino, 2002, Stankov, 2011). Also, Italy, Chile, Spain and Uruguay have a high level of similarity in one dimension, this can be partially explained by historical ties connected to the immigration flows from Spain and Italy to Uruguay and Chile, and also by Italy, Chile and Spain have high scores on power distance cultural dimension (Gupta et al., 2002, Jesuino, 2002, Stankov, 2011). This partially confirms previous findings, that considered a high cultural proximity between Latin countries and Spain (Fernández, 2007, Martin and Drogendijk, 2014). And Portugal and Romania have a high level of similarity in the other dimension, this can be partially explained by the high score that these countries have as inner-directed cultures, that believe that they can and should control nature (Trompenaars and Hampden-Turner, 1997) and by close HDI scores in 2015 (Portugal with 0,843 and Romania with 0,802). This disconfirms that Portugal has high cultural proximity with Brazil, that defined several internationalization processes between these two countries (Anderson and Goffee, 2001, Coelho, 1998, Costa et al., 2013, Fonseca and Silva, 2011, Teixeira and Pires, 2001).

Results also showed that customers from Latin countries do not have similar expectations about any service dimensions. Nevertheless, Italian and French customers have similar expectations about the degree of customer involvement, the complexity degree and the information and communication power of the service. In fact, France and Italy grouping is in agreement with some previous country clustering research, that clustered these two countries together (Gupta et al., 2002, Hofstede, 1976, Hofstede, 1980, House et al., 2004, Jesuino, 2002, Ronen and Kraut, 1977, Ronen and Shenkar, 1985, Stankov, 2011, Trompenaars and Hampden-Turner, 1997). Customers from Mexico, Uruguay and

Romania have similar expectations about the environment and social responsibility, the information and communication power and the complexity degree of the service. Highlight for Uruguay, that have never been considered in the previous country clustering studies, and now Uruguayan, Mexican and Romanian customers have similar expectations about some service dimensions.

CONCLUSION

It was fundamental to understand if countries that compose these groups have cultural similarity or proximity between them, regarding customers' expectations. The level of proximity among Latin countries is not high, in fact, only Chile and Italy have a higher level of proximity, that can be explained by high human development scores and by being high power distance countries. Making a more particular analysis and by dimensions, in terms of historical ties, it can be said that Italy, Chile, Spain and Uruguay have a higher level of proximity. Portugal and Romania have a high level of similarity in terms of being inner-directed cultures, as customers believe that they can control nature when they expect the service. These results disconfirm that Latin countries have a high cultural proximity and that Portugal has high cultural proximity with Brazil. In terms of service dimensions, Latin customers do not have similar expectations about any service dimensions. However, in a unidimensional analysis, it can be stated that the way that Italians and French customers expect to be involved in the service, to define service steps and its complexity and to receive communication is the same. Also, customers from Mexico, Uruguay and Romania are similar in the way that they expect to receive service communication, to define service steps and its complexity and to concern about environmental and social responsibility actions of the service. Summing up, when analysed individually Latin countries have a low level of proximity in terms of expectations of service dimensions and it cannot be considered culturally close. This confirms that there is in fact a "presumed cultural similarity paradox" (Vromans et al., 2013) among Latin countries.

This research contributed to clear the disagreement on previous research of clustering Latin countries into one group based on cultural similarity. The Latin countries have a low level of proximity, regarding customers' expectations about services, and therefore, cannot be considered culturally close. In fact, it can be stated that Latin countries do not cluster together regarding customer's expectations about service dimensions. So, the same service should not be designed and commercialized equally for the Latin customers, managers should adapt the service to each country. By, clearing this cognitive dissonance, managers can now reduce risks in internationalization processes to the Latin countries. Moreover, regarding specifically the way that Latin customers expect service dimensions, the Italian and French customers are very similar in the way that they expect to be involved in the service, to participate in the service steps complexity definition and to receive communication, for example, the

service provider can design the same communication strategy for these countries. Also, Mexican, Uruguayan and Romania are similar in the way that they expect to receive communication from the service provider, to concern about environmental and social responsibilities from the service provider and to participate in definition of the services' level complexity, as for example, the service provider can define the participation of the customer as a co-producer. Hence, involving customers from these countries in the service process and understanding their choices and thoughts will help service providers to create value to customers.

The first limitation is that this research was only applied in one context, on the hotel service. The service dimensions scale was developed in order to be suitable for application in other services. So, future research can test the same relation in other services. The second limitation is also linked to the context, where it was considered a specific group of countries to test hypothesis, the Latin countries. Although, future research can replicate the hypothesis in other groups of countries with alleged cultural proximity or even to extend this research to more Latin countries.

ABSTRACT

This study examines messages which drive the statement ‘*I want to donate to this hospital,*’ and identifies communication messages to promote donations by individual. The study does so by uncover new-to-the-world mind-sets, groups of individuals who respond in similar ways to themes of messages. Rather than presenting prospective donors with messages based on who they ARE, or what they have EXPERIENCED, the approach, Mind Genomics, uncovers these mind-sets, and at the same time discovers the precise theme and language to increase likelihood of donation. The study finishes with the PVI, the personal viewpoint identifier, allowing the organization to understand the mind-set to which a prospective donor belongs, and thus the specific messages expected to be most effective for the specific individual.

Keywords: Communication, Donations, Hospitals, Messages, Mind-set segments, Mind-Genomics, Nonprofit-Organizations

INTRODUCTION

Non-profit organizations such as schools, hospitals, churches, and so forth depend up financial support from publicly supported organizations, governmental units, and foundations (List, 2011), all requiring some level of convincing. A non-profit organization dependent upon such external, public support, must assure the reality and the external perception of its status as a charitable organization. The right language, the right messages, the right audience for those messages, are critical. This paper examines the messages that can be used to motivate donations, presenting a way to understand how to create new campaigns which may be more effective because of the knowledge provided by small-scale studies of the right type, such as the one reported here.

People help worthy causes by donations or by volunteering. Sources of donations are individuals, bequests, corporations, and foundations (List, 2011). Seventy five percent of annual donations were donated by individuals (List, 2011). By understanding what drives people to donate, organizations can learn how to generate the greatest level of donations (Carpenter, Holmes & Matthews, 2008).

Salamon, Sokolowski, and Haddock (2012) reported that the percentage of support for nonprofit organizations coming from governments ranges from 30.5 percent in the United States and 46.7 percent in the United Kingdom to 76.8 percent in Belgium. Differences among these percentages are affected by national tax policies, national income distributions, national attitudes on government responsibility for satisfying social needs, and governments' policies (Andreoni & Payne, 2011; Adelino, Lewellen & Sundaram, 2015). When controlling these sources of variance, however, there still emerges significant variation across donors and donations. Is there a simple, discoverable pattern? What drives differences among individual donors?

Gender makes a difference. UK data on donations of individuals to charitable causes reveal that most women are more generous than are men in terms of the number of causes to which they donate, and the amounts they donate (Mesch, Rooney, Steinberg & Denton, 2006). The percentage of female donors was significantly higher than that of male donors across causes (Breeze & Thornton, 2005.) For example, 55% of male donors supported only one cause each month, compared to 46% of female donors supporting only one cause. Moreover, women tended to give smaller amounts that they distributed among several causes. The patterns differ in terms of the recipient. Women were reported to provide a higher support for animal welfare, education and the elderly, whereas men were reported to provide higher support for religious organizations (Mesch, Rooney, Steinberg & Denton, 2006). These differences remained, even after taking into account characteristics such as household structure, education and income (Piper & Schnepf, 2008).

Marital status also makes a difference, but the picture is complicated by gender, marital status, and amount of donation. In almost all cases, the donor proportion for women has been reported higher than the donor proportion for men, whether the woman is single or married. When the amount of the donation was split, and the 50% of lower donations considered, married women tended to donate more than did married men with similar background characteristics. Among single people, about ninety percent of women gave more than did men (Mesch, Rooney, Steinberg, & Denton, 2006). When it comes to men, married men have been reported to donate nearly twice as much as their unmarried male counterparts (Mesch, Rooney, Steinberg, & Denton, 2006).

Age was interacting with marital status (Wiepking & Bekkers, 2010). For all groups, except for married men and for all causes except for religious organizations, the likelihood to donate *decreased* when the age increased from 55 years to 64 years. More married men donated when age increased to 55-64 years (Wiepking & Bekkers, 2010). Finally, 60% of the total amount donated was given by the top 10% of donors (Micklewright & Schnepf, 2007).

The foregoing discussion of the literature shows the complexity of understanding just WHO is the best donor. We have not even considered the reality that most development officials struggle with this

problem, but at the same time with an even more profound and subtle problem, namely WHAT TO COMMUNICATE. Finding the most likely donor is only part of the task. The harder part is to determine the 'ask'.

Approaching the Giving Issue using the science of Mind-Genomics

Public hospitals have always depended, to some degree, upon the public largesse. Many of them rely to a great degree upon the donations of private citizens. It should come as no surprise, therefore, that most hospitals have an official 'arm' devoted to fundraising, often called development support.' In this study we examine specific word pictures, even specific words to motivate a person to donate. Moskowitz & Onufrey (2012) studied how to assist organizations fighting Cancer, based on data, to increase their donations. The language had to be right. Surprisingly, the, the wrong words inhibited a person from donating. It is this information which motivates the present effort to discover specifically WHAT to say to increase donations.

During the past three decades Galanter, Moskowitz & Silcher (2011) and Gabay, Moskowitz, Silcher and Galanter (2017) researched and published extensively on the topic of what specific messages resonate in the minds of consumers and patients. One chapter was even devoted to communication messages for donations and charity (Galanter, Moskowitz & Silcher, 2011). These books and other studies were based on the Mind Genomics approach.

There were other efforts along this line using Mind-Genomics from 2011 to 2019, some appearing in the literature (Galanter, Moskowitz & Silcher, 2011, Gabay, Moskowitz, Silcher and Galanter, 2017, Prince, Gabay, Priporas, & Moskowitz, 2019, Gabay, Moskowitz, Onufrey & Rappaport, 2017, Gabay & Moskowitz, 2015, Gabay, Moskowitz & Kochman, 2015, Gabay & Moskowitz, 2012) that all share one thing. They all identified communication messages through experiments in which the objective was to use the language necessary to affect behaviors of consumers and patients. Results of studies using Mind-Genomics on donations suggested that when the right communication was applied, the donations could be increased by 10% to 40% (Galanter, Moskowitz & Silcher, 2011).

The Mind Genomics approach can be summarized as using experimentally designed combinations of messages, presenting these messages to prospective donors, obtaining ratings, either of interest to donate and/or amount that would be donated, and then deconstructing the combinations of messages to the contribution of each message. This simple structure ensures that one cannot 'game' the system, providing expected responses to be 'politically correct.'

Mind Genomics works by assembling a set of messages or elements, of different types, following a specific structure. Elements are similar to the types of questions a reporter might ask when composing a story about an event. That is, the questions pertain to WHO, WHAT, WHERE, WHEN, WHY. Mind Genomics asks more topic related questions, specifically those shown in Table 1. The source of the

elements are the professionals working in the field who are familiar with the topic. The Mind Genomics system is simply a structure by which to present stimuli, get responses, and understand what every element contributes to the response. The benefit of the Mind Genomics process are speed (hours and days), specificity (the messages are relevant), cost and simplicity (substantially lower because of a templated system, from start to finish), iterativity and scalability (promoted by the confluence of speed, cost, simplicity.)

METHODS

Sample and Procedure

This explorative study was part of a research project conducted at the NYU Langone Heart Center. We wanted to identify what particular messages might spur donations. Mind Genomics was suggested as a rapid, inexpensive, easily and quickly deployed method to acquire the appropriate knowledge about WHAT to say. Thus, Mind Genomics provided the scientific and technology structure for a feasible, repeatable, and scalable system for knowledge-building.

Respondents were recruited by a company specializing in recruiting and maintaining panelists for participation in on-line studies. The company, Turk Prime, was instructed to recruit respondents for a 17-minute on-line study. The panel was to comprise individuals age 18 and older, but not other requirements were placed on the panel. This 'loose' criterion is relevant for Mind Genomics studies where the focus is on identifying the types of messages to say and to avoid, and the existence and nature of the underlying mind-sets, groups of individuals with different patterns of messages to which they will respond.

Each participating respondent read an orientation page telling them about the study (donations to stop heart disease). The orientation page was simple, conveying primarily information about what the respondent's tasks would be (read the entire vignette, rate as one idea), and telling the respondent the vignettes were all different. Often in Mind Genomics experiments of this type the respondent might complain that the 'vignettes are the same,' principally because the same elements are being recombined. The assurance that all the vignettes differ from each other forestalls that complaint.

Process and measures

The raw material (silos/elements or questions/answers) comprised six silos with four elements each. The silos and the elements were provided by the Development Department at Langone. After raw materials were converted into short phrases, they were combined according to a basic experimental design. The experimental design created 36 unique combinations, vignettes, with each vignette comprising 2-4 elements. The experimental design ensured that each element appeared equally often, that each element was statistically independent of every other element, and each respondent would

evaluate a unique set of 36 vignettes, different from the set evaluated by any other respondent. At the same time, the basic design structure was maintained, so that the only difference was the specific combinations evaluated by each respondent (Gofman & Moskowitz, 2010; Milutinovic, & Salom, 2016; Moskowitz & Gofman, 2014; Moskowitz, Sciacca & Lester, 2018.) Table 1 presents the final list of six silos and 24 elements.

	Silo A – What are relevant statistics about cardiovascular disease to grab attention?
A1	Cardiovascular disease is the leading killer in the United States
A2	At least 1.2 million Americans will have a heart attack this year, 50% of them will die
A3	40 million Americans have high cholesterol and 72 million have high blood pressure
A4	70% of people go on to have a heart attack even after medically lowering their cholesterol and blood pressure
	Silo B – What are relevant shortcomings in our treatment of cardiovascular disease?
B1	Current treatments for cardiovascular disease are only partially effective
B2	Cholesterol lowering drugs are only 30% effective
B3	Current imaging techniques don't tell us who is going to have a heart attack
B4	Current risk factors don't accurately predict who is going to have a heart attack
	Silo C – What is a second expertise, of a patient-centered nature?
C1	Our cardiovascular medical center studies prevention methods from lifestyle modification to dissolving plaque on a cellular level
C2	Our cardiovascular medical center does preventative cardiology research and treatment
C3	The NYU Center for the Prevention of Cardiovascular Disease has an integrated program
C4	Our cardiovascular medical center is expert in hypertension, lipid disorders, diabetes, and nutrition and behavior modification
	Silo D – What is a second expertise, of a patient-centered nature?
D1	Our cardiovascular medical center translates basic research to the clinic
D2	Our cardiovascular medical center performs personalized assessments of risk and response to treatment
D3	Our expert consultations aim to combine lifestyle modification and medical therapy
D4	Our faculty are experts in treatment and research of lipid disorders and are improving the diagnosis of cardiovascular risk factors
	Silo E – What can the center do in the next 10 years?
E1	Within 10 years, we can discover the key factors in the coronary artery wall that cause plaque build-up and heart attacks
E2	Within 10 years, the NYU Center for the Prevention of Cardiovascular Disease can make existing plaques disappear
E3	Within 10 years, our cardiovascular medical center has the potential to identify new targets for treatments, imaging and diagnosis
E4	We can improve imaging so that diagnoses can be determined accurately and non-invasively
	Silo F – Why are we asking you for a donation?
F1	Governmental resources are insufficient
F2	The budget of the NIH, the biggest funder of biomedical research, has declined by 15% over the past 8 years
F3	The NIH, the biggest funder of biomedical research, funds only 10% of proposals, leaving most worthy projects unfunded
F4	Less than 1/3 of projects rated as "Excellent" receive funding from the NIH, the biggest funder of biomedical research

Table 1. The six silos (questions), and the four elements (answers) in each silo

The strategy of combining 2-4 elements by experimental design creates combinations that are easy to read. The ease of reading is achieved because the vignette contains only a modest amount of information, with the information displayed in rows, one atop the other, and without connectives to link the different elements.. Mind Genomics covers a wide number of combinations, emerging with

the patterns because of the wide coverage. The stability of the pattern emerges from the fact that so much of the space is covered that deviations in the pattern emerging from one respondent can be counterbalanced by the deviations in the pattern emerging from another respondent. The strategy we used differs dramatically from the more conventional methods, wherein the research depends upon a large number of replicated experiences to produce a more stable pattern. Mind Genomics achieves stability by space-filling and coverage. Conventional conjoint measurement and really all forms of measurement achieve stability by replication to reduce the variability of the mean.

The respondent was unaware of the underlying design, and simply rated the combination of elements as if the combination represented a single idea. This approach prevents the respondent from providing so-called 'politically-correct' answers, responses that present oneself in a good light, but do not represent reality. The speed of the interview, with one vignette quickly following the previous vignette, ends up requiring the respondent to judge the individual vignette in almost an automatic fashion.

At the end of the 'experiment' comprising the evaluation the aforementioned 36 vignettes, each respondent completed a self-profiling classification questionnaire, which allowed the respondent to define himself or herself in terms of gender, age, education, causes to which the respondent donates, and 'typical' amount of the donation.

1. Analysis

Each rating was transformed to a binary scale. Ratings of 1-6 were transformed to 0. Ratings of 7-9 were transformed to 100. A small random number was added to each transformed rating. The transformation produces an easy-to-read result. Managers and in fact most researchers have an easier time with binary scales, i.e., no/yes (not interested in donating, interested, won't increase the size of the donation, will increase the size of the donation).

RESULTS

Total Panel

Table 2 shows the results for the two questions, after averaging the individual models. The parameters for both questions appear in the table. These parameters are the additive constant, and the coefficients for each of the elements.

The first finding deals with the basic likelihood of in donating to stop heart disease (Question #1) or the basic likelihood of increasing one's donation by 50% (Question #2.) The two 'basic likelihoods' are shown by the respective additive constants, which we interpret at the expected percent of respondents rating the vignette 7-9, with the vignette lacking all elements. In a sense, the additive constant is a baseline value. The first thing which emerges is the very low additive constant, 20 for interest in

donating, and a corresponding low value of 18 for likelihood of a major increase in donation. The additive constants suggest that it will have to be the messages which 'do the work.' The proclivity to donate or to increase one's donations by 50% is simply not present.

The second finding deals with the power of the individual elements to increase the likelihood of a donation (Question #1) or the likelihood to increase one's donation by 50% (Question #2.) Previously studies of this type, whether in charity (Galanter, Moskowitz & Silcher, 2011) or in many other areas ranging from hospitalizations to food to games and house decorations, suggest that coefficients of 0-5 are irrelevant, coefficients of 6-10 begin to become relevant, and coefficients of 11 or higher are relevant. We use the coefficient value of 6.51 or greater to signal a relevant positive response, and a coefficient of -6.51 or lower to signal a relevant negative response. We look at the magnitude of the coefficient, not at the statistical significance of the coefficient. This way of thinking puts Mind Genomics squarely in the world of modeling, rather than in the world of inferential statistics. In traditional research, we would focus on all coefficients beyond 2 because in the world of inferential statistics these elements are all 'statistically significant.' Yet, in the world of practice, these significant but small coefficients do not end up translating to relevance in terms of 'action' later in, such as the translation of interest to purchase or to donation. In this study, with the total panel, none of the elements score highly.

Finally, for the total panel, the coefficients are highlight correlated for Question #1 (Likelihood to donate) and Question #2 (Likelihood to double donation.) Across the 24 coefficients, the Pearson Correlation Coefficient is high (+0.90.). Table 2 presents model parameters.

		Q#1 Donate	Q#2 Increase Donation
	Question #1 (interest in donating), and Question #2 (donating a substantially greater amount, 50% or more, versus last donation) Total (Base size = 75)

Table 2. Average parameters of the models for the 75 respondents

What convinces – a comparison of subgroups

When we look at the strong performing elements across subgroups, specifically elements which generate a coefficient of +6.51 or higher in at least one subgroup, we see different themes communicated by the elements (Table 3). The subgroups are gender, age, income, donation patterns, and donation amounts, respectively.

These are the elements which stand out:

70% of people go on to have a heart attack even after medically lowering their cholesterol and blood pressure

Current risk factors don't accurately predict who is going to have a heart attack

Within 10 years, the NYU Center for the Prevention of Cardiovascular Disease can make existing plaques disappear. Table 3 presents elements by their performance.

A4	70% of people go on to have a heart attack even after medically lowering their cholesterol and blood pressure	7
B4	Current risk factors don't accurately predict who is going to have a heart attack	7
E2	Within 10 years, the NYU Center for the Prevention of Cardiovascular Disease can make existing plaques disappear	7
B3	Current imaging techniques don't tell us who is going to have a heart attack	6
B2	Cholesterol lowering drugs are only 30% effective	5
F2	The budget of the NIH, the biggest funder of biomedical research, has declined by 15% over the past 8 years	5
F4	Less than 1/3 of projects rated as "Excellent" receive funding from the NIH, the biggest funder of biomedical research	5

Table 3. Elements which perform well in at least one of five subgroups driving the interest to donate

Mind-sets

A key tenet of Mind Genomics is that within most situations that people experience there are different dimensions, and that across these dimensions or aspects one can discover groups of ideas which co-vary. One can liken these groups of co-varying ideas to mind-genes of different types. The comparison to genes and genomics is only metaphorical because the 'genes' we discover are not physical genes, but groups of ideas.

We uncover these mind 'genes' by clustering our 75 respondents based upon their individual coefficients for the 24 elements or messages. Recall that each individual generated a unique set of 24 coefficients, emerging from the OLS regression. Clustering allows us to put our 75 individual respondents into groups, with the property that the patterns of the 24 coefficients within a group are 'similar' in a quantitative sense, whereas the centroid or average coefficients of different groups are 'different' from each other in a quantitative sense. The clustering is purely mathematical. The 'mental gene' emerges when we uncover mathematically created clusters which can be interpreted, i.e., which make sense.

The method of k-means clustering groups respondents based upon the pattern of their coefficients. We use two criteria to create the clusters or mind-set segments, our so-called mental genomes, or more correctly the complementary alleles

1. Extract as few clusters or mind-sets as possible.
2. Ensure that the clusters can be interpretable, i.e., that they tell a story.

A two-cluster solution did not make intuitive sense. The patterns did not tell a 'coherent' story. In contrast, the three-cluster solution was clear, and did present the 'coherent' story. Table 4 suggests three clusters or mind-sets of different sizes, and with different patterns of responding to the messages. Table 4 presents strong performing elements. The most important patterns emerging from Table 4 are:

1. The additive constants are low. For these respondents, there is simply not much 'basic interest' in donating. The elements will have to do the work to convince respondents.
2. More than half the respondents (Mind-set A, base size of 43) are simply not responsive, and are a waste of time to pursue. Nothing at all really motivates them, at least nothing that we have tested in this study.
3. The remaining two segments do respond to messages.
4. Mind-set B responds strongly to messages about medical advances, i.e., technology and science.
5. Mind-set C responds to messages which 'seem' to promise hope for the individual over the next decade.

		DONATE			INCREASE DONATION

Table 4. Strong performing elements versus all-others, for three mind-set segments

Finding these mind-sets in the population

Creating and analyzing the strong messages for this study sample enables us to understand the existing mind-sets in the population. The value of the study lies in the ability to use the discovery of mind-sets to identify the mind-set to which a NEW PERSON belongs, and then send that new person the most motivating message to encourage a donation. These mind-sets do not covary with the conventional ways that people are divided. The important thing here is that it is the 'donating mind,' and not the 'donating WHO' which is important to define and target.

Based on the strong messages for the total panel and for the two mind-set segments, we use these obtained results in the real world to classify newly recruited participant, developing a PVI, a 'personal viewpoint identifier.' The objective of the PVI is to ask a new person a few simple questions, the pattern of answers to which define a person as a member of one of the three mind-sets, and thus the appropriate message, if any, to encourage donation. The PVI would be useful personal viewpoint identifier (PVI) would be efficiently during a donation event or for an online campaign to identify those who would be ready to donate.

The requirements of such a tool are

- a. Platform-independent so new participants can use it on their phone, tablet, or computer
- b. Short to avoid fatigue and drop of interest
- c. Provides immediate information to the participant and/or to the researcher.

The PVI was created for this study for demonstration purposes and placed under the following link <http://162.243.165.373838/TT10/>

Figure 1 (left side) presents the welcome screen of the PVI, where participants are greeted. Only a short study explanation is given in order to avoid bias. Binary questions are used to answer the elements instead of vignettes to make the process faster. Each participant completing the one-minute PVI rated whether or not whether she or he is interested in each presented element. The respondent also provides the email address. The answers and the e-mail address are saved by the system, hence later the proper messages can be delivered to the participant. The addition informational fields can be changed, of course, depending on the purpose of the PVI and other demographic or general questions can be included e.g. gender, interest, etc.

After clicking on the Submit button the PVI calculates the mind-set membership and immediately presents a feedback screen. The feedback is always personalized presenting the proper messages. In our case, it is a simple text message containing the name of the mind-set and a short description about

the mind-set (Figure 1, right side.) However, it is technically simple to change the text message to links, images or any kind of material the study requires.

**Welcome to Shiny Typing Tool of study:

Nothing drives interest in donating
More than half of the respondents are simply not responsive, and are a waste of time to pursue. Nothing tested in this study really motivates them.

Focus on medical advances
This mind-set responds strongly to messages about medical advances, i.e., technology and science.

Technical advances with an implication for personalization, possibly for the donor
This mind-set responds to messages which 'seem' to promise hope for the individual over the next decade.

Figure 1. Personal viewpoint identifier. The left panel shows the questions asked. The right panel shows the three different feedbacks, depending upon the mind-set to which the participant is assigned.

DISCUSSION

This exploratory study identified messages which drive the promise of donations to hospitals, looking at the performance of message by subgroups of gender, age and income. This study was part of a research project conducted at the NYU Langone Heart Center. Seventy-five respondents ages 18 and older were recruited by, Turk Prime, a company specializing in recruiting and maintaining panelists for participation in on-line studies. Mind Genomics revealed messages to say and to avoid, as well as uncovering the existence and the nature of underlying mind-sets, groups of individuals with different patterns of messages to which they will respond. We identified mind-set segments of potential donors and the strength of messages for each mind-set.

We identified messages to drive donations to hospital by subgroups of gender, age and income. We identified mind-sets of potential donors and the strong messages that appear to link to their stated likelihood of donating. Finally, using the mind-set data, we created a PVI, a personal viewpoint

identifier, to assign a new person to one of the three mind-sets. That assignment is important because people differ in what they find compelling. Messages which strongly appeal to the mind-set receptive to the state of medical advances do not strongly appeal to the other mind-set, receptive to the emotionality of hope for patients. Public hospitals have always depended, to some degree, upon the public largesse of individual donors. If we continue to focus only on the WHO of respondents, and their previous behavior, we miss out on the discovery of strong but segmented messages. Across all the elements there was no consistent strong messages. It is only when look at mind-sets that we find these 'magic bullets,' messages which resonate in the minds of prospective donors.

Two strong mind-sets emerged. Respondents in the first mind-set segment strongly responded to messages about medical advances. Respondents in the second mind-set segment strongly responded to messages which promising hope for individuals over the next decade. Messages which strongly appealed to people in one mind-set, generally did not appeal to people in the other mind-set. From the mean patterns of responses by the two mind-sets we built a personal viewpoint identifier to assign a new person to one of the two mind-sets. The PVI uses only a few simple questions, albeit questions emerging from the study, and thus immediately applicable to the issue of increasing donations Mind Genomics allowed us to experiment, discovery, and then create, all within the single, limited realm of the topic, donating to Langone.

CONCLUSION

The study and the easy and quickly implemented approach, creates a knowledge-based system for fund-raising campaigns. The speed, simplicity and low cost enables public hospitals to more effectively deploy their fund-raising efforts, by using knowledge about what appeals to donors, and thus what to feature in their fundraising and PR campaigns.

THE ROLE OF CIRCULAR ECONOMY TO IMPROVING UPON THE ECONOMIC GOVERNANCE IN ROMANIA

Gabroveanu, Janina Mirela; Asadi, Rahil

Business Administration Doctoral School, The Bucharest University of Economic Studies

ABSTRACT

This paper presents how the European funds granted to the Member States and aiming to support innovative circular economy, can contribute to a resource-efficient, environmentally friendly and competitive economy in Romania leading to the achievement of the EU objectives in terms of sustainable development.

The method of work used consists mainly in the documentation, analysis, comparison and verification of the existing context, the limitations / constraints identified in the field of cycling economy, and the identified solutions. By accessing European funds for national implementation of the concept of circular economy, Romania can provide best practices for resource efficiency mechanisms.

The transition from the linear economy to the circular one may be affected by the low infrastructure that does not allow the implementation of circular business models. Technological and systemic barriers can be removed by accessing European funds such as Horizon 2020, the European Fund for Strategic Investment – EFSI.

Comparative analysis of the funds allocated to several operational programs that can participate in the insurance and implementation of the circular economy in Romania.

By acting across sectors, investing in innovative technologies and models, stakeholders can lead to the common goal of resource efficiency, sustainable development and waste management.

Keywords: circular economy, innovation, infrastructure, waste management, sustainable development, competitive economy, strategic investment, operational programs, circular business models, European Union.

INTRODUCTION

The circular economy theory comes along with specific advantages provided as a support to make economy more competitive and the environment more sustainable. This can happen by accepting a new vision of life and work inside the society, based on the full good use of resources leading to environmental conditions' improvement. In the European Union countries, the identified limits and constraints that may hinder the development of the circulating economy - such as reduced infrastructure, technological and systemic barriers that do not allow the implementation of business models in the circular economy – come together with levers ready to use to reduce limitations - accessing the non-reimbursable funds, arising the member states' awareness about such handy tools and their advantages.

Bearing in mind the scarce resources and destructive influence of human beings on the environment, the linear economy model is already proved as a non- sustainable and destructive one. Essential bio systems for survival, contributing to the consumption non-regenerative resources have an irreversible impact on the environment too; therefore, measures to raise awareness and involve the human factor in generating fundamental and sustained changes are obligatory and necessary to maintain the rigor of a decent living, if not better for future generations.

At the same time, new approaches are needed to conceive and adapt the economic activities to the circular economy context. We argue this need based on the sustainable development concept that promotes *integrated efficiency* in using the natural resources and leading to the sustainable economy. To become sustainable, the economy needs measures of environmental protection, encouraging support for ecological systems to use wisely the natural resources. At European Commission level, the representatives share the concern, analyze the state of affairs of human activity that affects, directly or indirectly, the environment and provide support to improve the situation by allocating funds to Member States; they also encourage the adoption of circular economy concept for sustainable development (Todor *et al*, 2014).

METHODOLOGY

The method of work used consists mainly in documenting, analysing, comparing and checking the existing context in order to identify the limitations and constraints that prevent the implementation of the measures necessary for a feasible circular economy, the solutions identified in the field of cycling economy that can be implemented with funds which can be accessed within the framework of Horizon 2020, the European Fund for Strategic Investment (EFSI).

APPRAISAL OF LITERATURE

Starting from the current context regarding the efficiency of the use of natural resources to lead to a sustainable economy, the need for transition from the linear economy to the circular economy has been identified. The notion of circular economy, firstly advanced by environmental researchers (Stahel, 2014), has been developed in the UK since 2010, being considered a reliable solution for the protection of natural resources given the long-term negative effects of the linear economy giving rise to waste and environmental pollution, the shortage in natural resources (hardly accessible and more expensive) and climate change.

The circular economy represents the only solution for reviving the economy as it contributes to the elimination of waste and to the reduction of carbon emissions as a result of the recovery of materials through recycling and their reintroduction into the economy. Considered more than recycling, the circular economy is based on upper technological processes that contribute to the waste reduction as a result of a performing management and re-introduction of secondary raw materials use.

The circular economy model is based on 3 principles: • reuse of raw materials disposed of as waste; • optimizing resources' use and • reuse of natural regeneration systems.

The circular economy is a widely circulated topic, a concept debated, promoted and sustained by the European Commission, which considers that the adoption of the circular economy and the proposed measures will maximize the value of all raw materials, products and waste, favouring the energy saving and the reduction of greenhouse gas emissions. Its circular package covers the entire life cycle: from production and consumption, to waste management and the secondary raw material market (Bekeken, 2015).

For this transition, the European Commission adopted on December 2, 2015 the Circular Economy Package in the EU that includes: • the action plan, • the list of actions to be taken during the term of the current Commission and • the legislative proposals.

The Action Plan is addressed to all the sectors: production, consumption, waste management, priority sectors, innovation and investment. In this respect, the main actions taken for the production sector were: • sustainability (repair and recycling products, in line with the Ecodesign Directive and extensive producer responsibility); • best practices for waste management and resource efficiency in industrial sectors; • industrial symbiosis, reprocessing; • coherent policy and tools' framework for SMEs' products.

- The main actions taken for the consumer sector refer to eco-label and environmental footprint, new forms of consumption (collaborative economy, digital platforms); warranties, complaints' solutions for fake ecological products; green procurement.
- The main actions taken for the waste management sector deal with EU revised targets for recycling (65% of municipal waste and 75% of packaging waste by 2030 - Bekeken, 2015); consolidate reduction

of landfills to max 10% of total waste by 2030 (Nistor & Herman, 2017), new investments in waste management policy - recycling capacities, avoidance overcapacity at incineration and mechanic-biological treatment (Masi *et al*,2017), ensuring coherence between waste investments and waste hierarchy.

- The main actions taken for the sector - waste priority sectors target: the strategy addressing issues such as the recycling potential, biodegradability, the presence of hazardous substances in plastics, and the significant reduction target for marine waste, as set out in the Sustainable Development Objectives.

Given the opportunity to use innovation and investment to overcome technological and systemic barriers and to implement business models in the circular economy, EU funds have been allocated to finance projects and support the achievement of circular economy objectives and industrial competitiveness. The Horizon 2020 pilot program "*Innovative Agreements in the circular economy*" support the development of innovative solutions when innovators face uncertainty at EU level. In conjunction with this program, legislative changes are harmonised to meet the circular economy European objectives. A wise investment policy is essential to allow the shift to the circular economy and refer specifically to smart technologies and block chain logistics for innovative business models meeting the environmental conditions.

Another element of the Circular Economy Package sets clear targets and quotes to 2030, for waste management and recycling to be transposed into legislative proposals (Bekeken, 2015): 65% of municipal waste by 2030, 75% of packaging waste by 2030, reduce landfill to 10% of municipal waste by 2030 (consolidated target); prohibition of burying separately collected waste; • promoting tools to discourage waste burying; • simplified and harmonized definitions and methods for calculating recycling rates in all EU countries; promote re-use and stimulate the "*industrial symbiosis*" of transforming the by-products of a raw materials industry into another industry; increase green products' supply and support recovery using specific and recycling schemes (packaging, batteries, electrical and electronic equipment, vehicles).

Such proposals send positive signals to those who want to invest in the European circular economy (Katainen, 2016) considered the best place to develop a sustainable and environmentally friendly business. The transition means restructuring the market economy and improving competitiveness. In an economy resource-efficient with reduced dependence on rare raw materials, the competitive advantage is applicable for job creation, for more efficient products and services booming (Katainen, 2016).

In order to fulfill the conditionality as well as the actions proposed to the Member States to implement them as much as possible in the circular economy, the European Commission provides the Member

States, as a horizontal measure, with different sources of funding, including new ones such as the European Fund for Strategic Investment - EFSI for funding and project development support, providing funding platforms for the circular economy but also for disseminating knowledge and sharing expertise. The European Regional Development Fund and the Cohesion Fund will invest € 5.5 billion to improve waste management for the development of new production processes, but last but not least to support the efficiency of innovative resources and technologies by SMEs (Katainen, 2016). At the same time, business innovation models in circular economy will also be supported. To this end, the European Commission has entered into a partnership with the European Investment Bank on the InovyFin Advisory program to provide access to loans (24 billion euros) to business and financial communities for innovative investment in the field of the circular economy. Taking into account the measures already taken, in January 2018, the European Commission analysed the degree of circular economy in the Member States, analysed on the basis of 7 relevant indicators respectively: municipal waste (per year per person), food waste (per year per person), municipal recycling rate, share of goods traded that are recyclable raw materials, material reuse rates, patents related to circular economy (since 2000), investment in circular economy sectors. For each indicator, a hierarchy of 1 to 28 was established, the final index being calculated by the arithmetic mean of the seven components.

The countries with the circular economy best scores are: Germany, U.K. and France, as shown below:

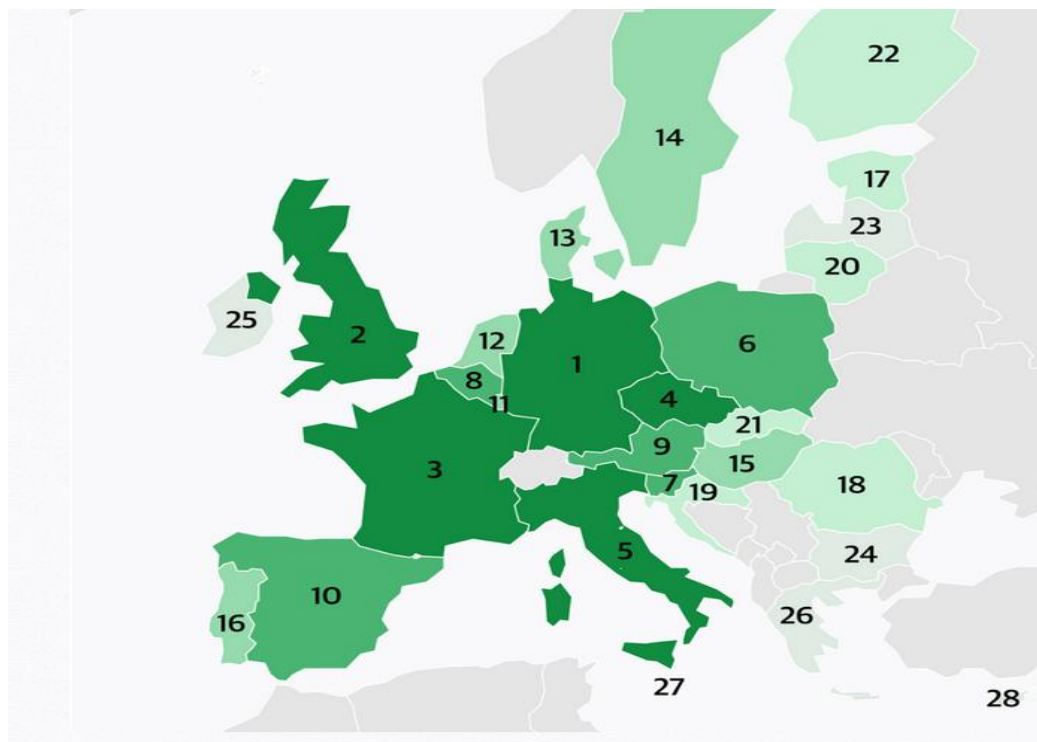

Figure 1. The countries with the best scores of the circular economy

The details of the 7 indicators for each Member State are presented in Table 1, as follows:

Country	Municipal waste (year/person)	Food waste (year/person)	Municipal recycling rate	Recyclable raw material	Material re-used rate	Patents for circular economy since 2000	Investment in circular economy sectors
Austria	564 kg	209 kg	58%	0.32%	9%	122	€3.50 M
Belgium	420kg	345 kg	54%	22.00%	17%	105	€2.80 M
Bulgaria	404 kg	105 kg	32%	0.11%	3%	10	€0.50 M
Croatia	403 kg	91 kg	21%	23.00%	5%	4	€0.60 M
Cyprus	640 kg	327 kg	17%	0.13%	3%	4	€0.10 M
Czech R.	339 kg	81 kg	34%	25.00%	7%	72	-
Denmark	777 kg	146 kg	48%	0.31%	10%	53	€2.30M
Estonia	376 kg	265 kg	28%	26.00%	11%	3	-
Finland	504 kg	189 kg	42%	0.06%	7%	111	€2.00 M
France	511 kg	136 kg	42%	24.00%	18%	542	€21.30 M
Germany	627 kg	149 kg	66%	25.00%	11%	1260	€28.70 M
Greece	498 kg	80 kg	17%	0.14%	1%	5	€0.60 M
Hungary	379 kg	175 kg	35%	23.00%	5%	36	€0.90 M
Ireland	563kg	216 kg	41%	0.18%	2%	38	-
Italy	497 kg	179 kg	45%	0.19%	19%	294	€17.80 M
Latvia	410 kg	110 kg	25%	0.18%	3%	11	€02.00M
Lithuania	444 kg	119 kg	48%	0.15%	4%	19	€0.40M
Luxembourg	614 kg	175 kg	48%	0.97%	11%	24	-
Malta	621 kg	76 kg	7%	0.12%	10%	-	-
Netherlands	520 kg	541 kg	53%	0.17%	27%	169	€5.20 M
Poland	307 kg	247 kg	44%	0.18%	13%	298	€4.70 M
Portugal	461 kg	132 kg	31%	0.26%	2%	22	€1.40 M
Romania	261 kg	76 kg	13%	0.13%	2%	34	€11.00 M
Slovakia	348 kg	111 kg	23%	0.15%	5%	10	€0.60 M
Slovenia	466 kg	72 kg	58%	0.41%	8%	8	€0.50 M
Spain	443 kg	135 kg	30%	20.00%	8%	210	€11.00M
Sweden	443 kg	212 kg	49%	0.19%	7%	49	€4.10M
United Kingdom	483 kg	236 kg	44%	0.35%	15%	292	€31.00M

Table 1: The details of the 7 indicators for each Member State

Analysing the current context of how to implement the circular economy, restrictions have been identified on the cross-border waste shipment that is not possible without “prior notification and preliminary agreement” and which hinders the implementation of the Commission's proposed reduction targets for waste disposal up to in 2030.

When waste generation cannot be prevented or recycled, it is preferable, both economically and environmentally, to capitalize on their energy content rather than opting for storage. To this end, the E.C. Energy Efficiency Initiative within the Energy Union will allow the full exploitation of the energy potential without compromising higher levels of reuse and recycling. The E.C. solutions occurring

measures and actions for the implementation of the cyclical economy and the financial allocations have increasingly encouraged investments in high performance technologies and innovative efficient ways of production and consumption to reduce the environmental impact of resource use and valorise waste by turning it into products.

The benefits of the economy are felt first and foremost as a result of the creation of many jobs, the preservation of precious and increasingly scarce resources, the reduction of the effects of their processing on the environment, the valorisation of waste through their transformation into secondary products, the improvement of quality standards.

In addition to the sustainable development objectives, the strategy on plastics adopted in the field of circular economy addresses issues such as the recycling potential, biodegradability, the presence of hazardous substances in plastics, and the significant reduction target for marine waste. To stimulate EU industry's competitiveness for public and private investment The European Commission has made financial allocations available to Member States through programs such as Horizon 2020, COSME, Structural and Investment Funds, the European Investment Fund as well as other EU programs considered as instruments important support for inclusive stakeholders for SMEs or social businesses that are particularly active in areas such as recycling, repair and innovation. Through Horizon 2020 (2016-2017), the E. C. and European Bank of Investments allocated 650 million € to finance projects relevant to the field. They also assess the possibility of launching a platform together with the national banks to support the financing of the circular economy that will create business opportunities to attract private funding.

RESULTS

Starting from the Commission's goal of transforming the current model of linear economy into the circular economy model, the package promoted to support the circular economy addresses all stakeholders including economic operators and targets innovative and more efficient production and consumption patterns paving the way for new opportunities business and boosting competitiveness.

Circular economy has a high potential to create many jobs in Europe while preserving precious resources and fewer resources, reducing the environmental impact of resource use and valorizing waste by turning them into products. Sectoral measures as well as quality standards for secondary raw materials are foreseen. Among the circumstances that led to the transfer from the linear economy model to the circular economy model, we can exemplify:

- the linear economy generates massive misuse, dissipation and losses in products and waste of natural resources. In this respect, according to Girling R (2005), 90% of the raw materials used in the manufacturing industry become waste, while 80% of the finished products drop in the first 6 months

of their life cycle. Given the trend of population growth along with the demand for resources (land, water, food, raw materials, energy), which are becoming more and more difficult to access and more expensive than the climate of political and economic tensions, the model of linear economy will no longer could be continued in the long run. As a result of the linear economy, there is a shortage of resources, the volatility of their prices on the international market, but also the generation of waste, environmental pollution and, ultimately, climate change.

- compared to the linear economy, the circular economy remains the single best future solution take, given the holistic impact on the resources and the integrative effects that can be gained on the environment. The circular economy is based on the fact that end-of-life products recuperate materials through recycling and dismantling, which then "reuse" as raw materials in other early-life products. The major advantage of the circular economy is that, on the one hand, waste and its impact on the environment are reduced, and on the other hand, production costs are reduced. Circular economy means "closing the loop" of the value chain, from production to consumption, through repairs and refurbishment, waste management and secondary raw materials that are reintroduced into the economy.

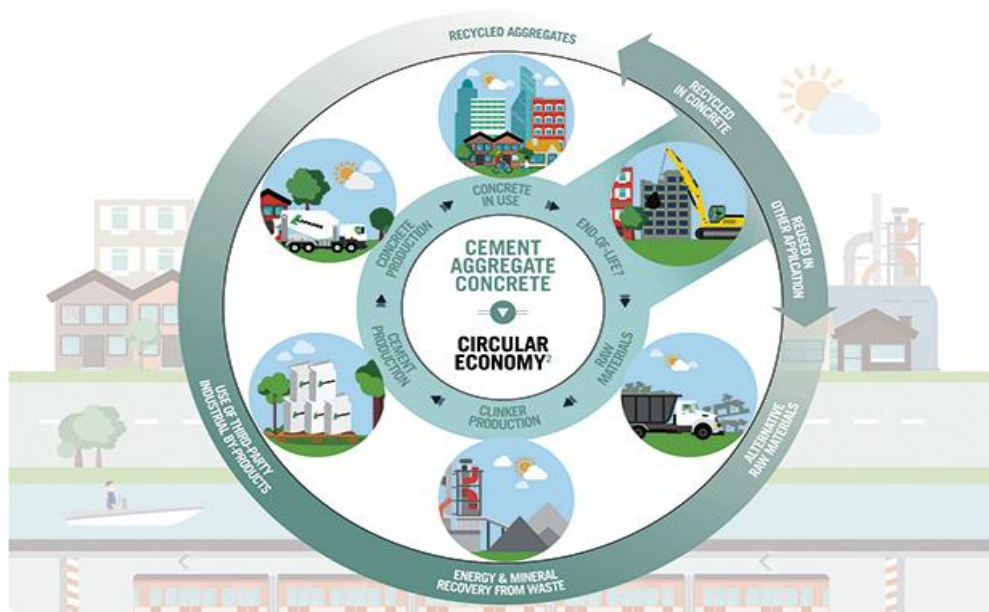

Figure 2: *The life cycle of the product in the circular economy*

Starting from the premise that man has a central place in decision-making and is actively involved in the community life, it is extremely important to know the incentives that people respond to, and how they can change the general behaviour when environmental issues are aware. In this sense, civil society organizations can become important factors in creating positive incentives, promoting good practices by conducting information campaigns to educate the population, increase accountability and generate feedback.

CONCLUSIONS

The European Commission's concern for a circular economy, corroborated with the concrete action plan presented in this paper, taking into account the stages of the cyclical economy, from production to consumption, repair and refurbishment, waste management and the secondary raw material market for reintegration into the economy, manage us to emphasize the importance to the EU economy in general and of member states in particular; the benefits of promoting the circular economy in each Member State are obvious and **straight** to the integrated efficiency's vision.

To diminish the damages caused by the technological and systemic barriers faced by the Member States, the European Union makes available financial allocations through different calls and programs (Horizon 2020, InovFin Advisory Program, European Investment Fund, European Regional Development Fund and Cohesion Fund) to implement innovative, performing technologies, to emerge eco-business models and implement the circular economy integrated efficiency by competitiveness. It is up to the Member States to support the Commission's legislative proposals on waste management in the light of the targets proposed by 2030.

Romania, as a member of the European Union, has the high duty to become more pro-active and participate in the actions demarcated by the European Commission by undertaking the more visible measures for the gradual transfer from the linear economy to the circular economy model, including the adoption of the EU waste management directives.

ABSTRACT

This study aims to analyze the effect of IA (exclusively those that are recognized and shown in the balance sheet) on the return on equity (ROE) using a market value approach. In order to analyze the influence of IA on ROE using market value, the study used components of the Standard and Poor 100 Index (S&P100). The S&P100 index comprises 101 companies across multiple industry groups; however, due to the research restrictions, only 68 companies were selected as the study's sample. The research results were obtained using the Ordinary Least Square (OLS) method. The Pearson correlation test indicates a strong relationship of the IA to the ROE (excluding goodwill). According to our findings the influence of IA on ROEmv is 23% excluding goodwill. Additionally, the results indicated a significant gap between the models used. The limitations and future research directions are found at the bottom of the conclusion.

Keywords: Intangible Assets, Return On Equity, Ratio Analysis, Dupont Model.

INTRODUCTION

Nowadays, companies are acquiring and develop more non-physical assets. Therefore, a question arises – what is the effect of the intangible assets in companies' performance? A study performed by Aboody and Lev shows that companies who had intense research and development programs (R&D) obtained bigger gains than those without them (Aboody and Lev, 2000). Considering the relevance of the issue, this research aims to study the influence of the Intangible Assets (IA) - exclusively those that are recognized and showed in the balance sheet - on the Return on Equity (ROE) using market values. Due to the accounting segregation of the IA and the goodwill, the analysis considers both IA and “IA including goodwill”. Therefore, the main research question can be stated as follows: what is the influence of IA (recognized in the balance sheet) on companies' performance, and, in particular, on the return on equity using market values? In order to answer the question, 2 operational objectives were established: analyze the impact of IA on ROEmv and analyze the impact of IA including the goodwill

on ROEmv. In order to analyze the influence of the IA on ROEmv, the study is based on a group of companies that are components of Standard and Poor 100 Index (S&P100). The S&P100 index comprises 101 companies across multiple industry groups; however, due to the requirements established for this project, only 68 companies were selected as the study's sample. The Three-Step Dupont Model, which lies in a broken form of Return on Equity (ROE) original formula, is used as a starting point. The model comprises the three following factors: net profit margin, asset turnover and equity multiplier. For the study purposes the equity multiplier was modified to isolate the intangible assets, obtaining a modified version of the Dupont model. Next, the Ordinary Least Square (OLS) was used to analyze the impact of the intangible assets (recognized in the balance sheet) over the return equity using market values.

INTANGIBLE ASSETS AND RETURN ON EQUITY

Intangible Assets

The article has a comprehensive revision of the literature available and previous studies regarding intangibles and returns. Intangibles gained more importance in firms' accountancy at the end of the past century. Further, IA are a fundamental factor of value (Cañibano, *et al.*, 2000). International Accounting Standard (IAS) and International Forms of Reporting Standards (IFRS) have made major advances in defining and recognizing IA on financial statements. Although, today's accounting framework is distant to comprehends all intangibles resources. The term IA was first introduced in the mid-80's (Artsberg & Mehtiyeva, 2010; Bryan, *et al.*, 2017). Until the year 1997, the International Accounting Standards Board (IASB) issued the IAS No. 38. IA are contained in "other assets" section, that consist of permanent investments and the IA (Guerard & Schwartz, 2007), at the bottom of the assets section in the Balance Sheet financial statement. The Financial Accounting Standards Board (FASB) framework defines assets as the possible future economic benefits obtained as a result of past transactions and IA as an identifiable non-monetary asset without physical substance. This standard outlines the recognition, valuation and disclosure of IA on financial statements. Additionally, the IAS 38 provides the scope were the IA are to be found. The issue of this standard was in responds to the demand of an international demand on recognizing intangible resources. This demand came along with the surge of the Knowledge -based Economy (KE) The IA gained more importance after the surge of the KE. Aligned to the globalized economy, this microeconomic model is focused on intangible resources such as expertise, patents, data and information (Bratianu, 2017; Carrillo, 2015).

This economy framework is stimulating firms to drive their business from massive production processes to fostering knowledge that produces innovative and cutting-edge products. Furthermore, this framework promotes a change in businesses' sources of value pivoting to intangibles (Pucci, *et al.*,

2015). KE is habitually associated with technological, media, financial and medical industries. Nevertheless, this economic model affects all industries. The influence of this model can be seen by in the rise of IA, which has almost doubled in the last 16 years, from \$19.8 trillion to \$47.6 trillion. Most of the high-tech and pharmaceutical companies in 2005 had more than 90% of their assets in intangibles (Bryan *et al.*, 2017).

One of today's problems regarding IA is the disclosure of some intangibles. Scholars, professionals and audit firms have been discussing the need for a modern form of reporting of IA due to the improper recognition and valuation of some IA (Bryan *et al.*, 2017; Niculita, *et al.*, 2012; Pucci *et al.*, 2015; Tahat, *et al.*, 2017). This is to say that within the current accounting standards most of the intangibles are not recognized, leaving many intangibles unacknowledged.

The study conducted by Heiens *et al.*, (2007) regarding the implication of the IA on firms' holding returns suggests that IA other than goodwill have a significant positive impact, in contrast, high accumulation of goodwill and R&D expenditures have a negative impact on shareholders' returns. Heiens' study proceed using the resourced-base view, the mentioned study obtained data from 1.675 companies recorded by the Center for Research in Security Prices in 2001. The results support the premise for a positive relationship between the IA and shareholders' returns, specifically those intangibles that are used for advertising have a slight impact on long-term returns.

Tahat *et al.*, (2017) studied the impact of intangibles on firms' current and future financial and market performance within the companies constituting the United Kingdom's Index FTSE 150 from 1995 to 2015. The study was focused on the role of goodwill and R&D on firms' performance. The authors support the idea that financial statements are not revealing accurate present information regarding financial performance. Moreover, the study emphasizes the need for studies targeting future performance. The proxies employed in earnings per share were return on assets (ROA) and ROE. The findings display a positive impact of investments in intangibles on company's future performance, yet for the short term, the relationship goes in the opposite way. The results are consistent with market-based and resource-based theories, assuming IA are a relevant factor for sustainability of earnings and boost future performance. Additionally, the study though not significantly negative relationship between R&D and companies' current market operation.

A universal definition of IA has not been established hitherto, however identifiable IA have much in common with tangible long-lived assets. Assets are recognized only if they will bring future benefit to the firm (Tahat *et al.*, 2017), yet intangibles have the peculiar characteristic that besides providing future benefit, they are also recognized if they could prevent or block other competitors to enter in the market, e.g., patents, or licenses. The following characteristics must be present to qualify an item as an asset (Wittsiepe, 2008): The asset must provide probable future economic benefits that enable it to provide

future net cash inflows, the entity is able to receive the benefit and restrict other entities' access to that benefit and the event that provides the entity with the right to the benefit has occurred.

As it was said before, a more complex framework is used to define IA. One case study had to integrate the federal court, local real estate laws, international financial standards and industry literature about IA to provide not a definition but a scheme to identify intangibles as assets (Understanding Intangible Assets and Real Estate: A Guide for Real Property Valuation Professionals, 2016). This exercise produced a 4-step test that helps managers and assessors to recognize easily if an intangible is subject to be considered part of the assets.

- Intangibles should be identifiable.
- Intangibles should possess evidence of legal ownership.
- Intangibles should be capable of being separate and divisible from the real estate.
- Intangibles should be able to be legally transferred.

These four qualifications in addition to the 3 previously mentioned must be present to determine an intangible as an asset. The IAS 38 (IFRS Foundation, 2014) defines an "intangible asset as an identifiable non-monetary asset without physical substance". For the purposes of this study, IA are defined as all identifiable resources that lack of physical substance that could be self-generated or traded, and for those intangibles that were acquired by past trade transactions their usage could last for a limited or unlimited period and are shown in the balance sheet financial statement. It is necessary to mention that only those IA which are recognized in the financial statements were used in this study. Intangible resources provide a composition of knowledge, information, intellectual property, and experience. IA could be acquired as a result of market transactions or self-generated and they could have a definitive or indefinite life (El-Tawy & Tollington, 2013; Wittsiepe, 2008). Goodwill has a singular treatment. It is, indeed, an intangible asset; nonetheless, depending on how it was gained (Saunders & Brynjolfsson, 2016), it could be treated as part of business combinations (IAS 3 and FAS 141) or as any other IA. The reason that self-generated goodwill is not recognized is, in most of the cases, because it is still under development and cannot be separated (Artsberg & Mehtiyeva, 2010; Saunders & Brynjolfsson, 2016). The literature reviewed of IA point towards IA as a strong component of a company's financial potential. However, it should be pointed out that IA by themselves are not enough to maximize profit or significantly increase ROE. IA must come along with tangible assets to develop continuous growth. Is also necessary to emphasize the need for proper classification and early recognition of IA.

Return on Equity

Many financial tools are available to measure companies' financial performance. On the one hand, investors, managers and shareholders can perform a financial statement analysis to determine if a

company is profitable or not. On the other hand, ratios are useful tools to measure the extent of profit earned by companies in a certain period of time (Jensen, 2008). Financial ratios were created to provide quick indicators regarding companies' financial situation and to measure economic effectiveness. Most ratios use book values. This means that information is taken from companies' financial statements. Some other ratios use market value for forecasting purposes and better decision making. Financial ratios that use market values provide more accurate information about companies in "real time", compared to the historical information provided by financial statements. One of the most used and well-known profitability ratios is the return on shareholders' equity (ROE). This ratio has been used to measure companies' efficiency in profit generation, and due to the ratio uses the net income as a benchmark to measure profitability (Kijewska, 2016). Profitability ratios, as ROE is, are likely to confirm that a company is able to efficiently use available resources available to increase sales or/and net profit (Ciurariu, 2015). The simple formula for this ratio is as the Eq. 1 displays:

$$\text{Return on Equity} = \frac{\text{Net income}}{\text{Total Equity}} \quad (1)$$

Approximately a century ago, the DuPont Corporation designed a formula to understand company's profitability and performance, the formula was first called return on equity. Thereafter, this ratio was fragmented into several more sub-ratios to obtain a better analysis of companies' corporate performance. Due to their simplicity and versatility in fulfilling almost every company's needs, these ratios were easily implemented (Stockert, Kavan, & Gruber, 2016). Measuring profitability responds to the need of every firm's intention: to increase profit. Therefore, how to maximize ROE? the question could not be answered without identifying the factors that affect net income and the relation to equity. These factors are known as profit margin (PM), assets turnover and equity multiplier. Eq. 2 shows the 3 factors described affecting ROE.

$$\text{ROE} = \frac{\text{Net Income}}{\text{Total Equity}} = \frac{\text{Net Income}}{\text{Sales}} \times \frac{\text{Sales}}{\text{Assets}} \times \frac{\text{Assets}}{\text{Equity}} \quad (2)$$

PM presents how much profit the company can generate per unit sold (net income/sales). AT shows the percentage of sales a company produces from a unit of assets (sales/assets). Equity multiplier represents the leverage used by the company to finance its assets (assets/equity). Having the ratios separated enables a precise examination of the factors that affect the companies' increment of profit. Furthermore, by analyzing those ratios separately, a company's strategies are clearly revealed: for each of the previously mentioned ratios - PM, assets turnover and equity multiplier - correspond to the following financial strategies: volume of sales strategy, margin assets strategy or leverage strategy. These strategies play an important role in the organization's planning, and managers should wisely consider which of those strategies would fulfil the company's demands. For example, a company could use leverage to finance more equipment; by doing this, the assets turnover rate would be reduced while

the equity multiplier would increase. This example exhibits the correlation between the ratios, and hence the strategies, to maximize ROE. A high result of ROE represents a favourable financial position of a studied company (Rutkowska-Ziarko, 2015). The third factor, equity multiplier, has considerable relevance to this study because this factor evidences the impact of intangibles on the ROE.

METHODOLOGY

Data and Sample

Data was collected from the companies that composed the Standard & Poor 100 Index (S&P 100) in 2016. The S&P 100 consists of 101 companies blue chip companies across multiple industry groups. The study decided to choose this index due to the relevance of the USA economy and its impact on the global economy. A full list of the companies was obtained from the official website of Standard and Poor Index. Microsoft Excel was used to create a database that shows the companies' net profit, sales, total assets, intangible assets, goodwill and total equity. This data was collected from the firms' financial statements, those financial statements were extracted from the annual report known as the 10k form. The 10k forms were extracted using the Electronic Data Gathering, Analysis, and Retrieval system (EDGAR). Most of the financial statements are issued for the calendar year, compelling from January first 1st to December 31st of 2016. The firms Starbucks, Target, The Home Depot and Wal-Mart Stores issued their financial statements in January 2017. Lowes Companies in March 2017. Medtronic in April 2017. For FedEx, Nike and Oracle the month was May 2017. Microsoft, Procter & Gamble and Twenty-First Century Fox, Inc. issued in June 2017. In July 2017, SISCO Systems issued its financial statements. The companies Accenture, Monsanto Co. and Walgreens Boots Alliance, Inc. issued in August 2017. On September 2017 Qualcomm, Apple, Emerson Electric, Visa and Walt Disney allotted theirs.

During the data analysis process, 2 companies were left out of the selection due to the lack of information. The companies were Google Inc (GOOG. Symbol) and Twenty-First Century Fox, Inc. (FOX. Symbol). This due to in the 2016-year Twenty-First Century Fox, Inc. changed its symbol to FOXA. For Google Inc., the firm changes its name to Alphabet Inc. using the symbol GOOGL. The following firms were put aside as well: American Intl, Chevron, Conocophillips, Costco Whole Sale, Duke Energy, Halliburton, Metlife, Occidental Petroleum, The Allstate And Union Pacific. The mentioned companies did not disclose the amount of their intangible assets on their financial statements nor in their annual reports. Thus, these firms were irrelevant to our study. Three more firms were taken out of the scoop due to their deficit in total equity, the reason was a repurchased of more than 70% on their own shares. The magnitude of this buyback action affected the financial ratios

results. The companies were: Colgate-Palmolive, McDonald's and Philip Morris. 85 organizations comprised the study's final sample.

The data refers to the business year 2016, all variables were measured at the same moment in time, making this a cross sectional database. All the variables are presented and defined in detail in the next section where their importance for achieving the objective of the research study is explained.

DuPont Model

The DuPont analysis was chosen to this study because it goes further on the financial analysis, recognizing that ROE can be separated into return on sales, asset turnover and equity multiplier, this delves deeper into the cause of the ROE results. The DuPont Analysis gives us exceptional insight into the reasons for a company's performance. Perhaps the most important consequence of the DuPont Analysis is that it suggests to an analyst that he or she has the ability, and license, to develop specific ratios that enable him or her to see indicators relevant to a specific analysis being performed or particularly relevant to the company being analyzed (Sherman, 2015). This study used reported information in financial statements, such as, balance sheet and income statement. Additionally, stock price and shares outstanding were some of the values used to calculate market ratios. By separating the factors composing the net income on the main ROE formula (3), the factors are net profit, sales and total assets. The formula is as follows:

$$\text{Return on Equity} = \frac{\text{Net Profit}}{\text{Sales}} \times \frac{\text{Sales}}{\text{Total Assets}} \times \frac{\text{Total Assets}}{\text{Shareholders' equity}} \quad (3)$$

For our purposes, we will break down the formula to separate the intangible assets from the total assets. The intangibles were isolated by tearing the assets turnover ratio (Sales/total assets) (4). The financial leverage was modified as well. The result divides tangible assets over shareholders' equity.

$$\text{Return on Equity} = \frac{\text{Net Profit}}{\text{Sales}} \times \frac{\text{Sales}}{\text{Intangible Assets}} \times \frac{\text{Intangible Assets}}{\text{Total Assets}} \times \frac{\text{Tangible Assets}}{\text{Shareholders' equity}} \quad (4)$$

As the result of this split, the formula now provides the framework of the variables used. The formula shows the 4 independent variables: 1) Profit Margin, 2) Intangible assets turnover, 3) Intangibles ratio and 4) Financial leverage ratio (modified). See table 1.

Ratio	Description	Ratio Formula
Return on equity (ROEmv)	Return on the shareholders' investment over a year. Measuring profitability, using market value.	$ROEmv = \frac{\text{Net Profit}}{\text{Shareholders' equity}} \times 100\%$
Profit Margin (PM)	Expresses the percentage of money collected from net sales turned into profit.	$PM = \frac{\text{Net Profit}}{\text{Sales}} \times 100\%$
Intangible assets turnover (IAT)	Shows how intangible assets are deploying in generating revenue.	$IAT = \frac{\text{Sales}}{\text{Intangible Assets}} \times 100\%$
Intangible assets turnover + goodwill (IATg)	Shows how IA and goodwill are deploying in generating revenue.	$IAT_g = \frac{\text{Sales}}{\text{Intangible Assets}} \times 100$
Intangible assets ratio (IAR)	This one represents the amount of IA from the total assets ¹ .	$IAR = \frac{\text{Intangible Assets}}{\text{Total Assets}} \times 100\%$

Intangible assets ratio + goodwill (IAR _g)	This variable represents the amount of IA plus goodwill from the total assets.	$IAR_g = \frac{\text{Intangible Assets}}{\text{Total Assets}} \times 100$
Financial leverage (FL)	Represents how much of the equity was used to fund tangible assets.	$FL = \frac{\text{Tangible Assets}}{\text{Shareholders' equity}}$

Table 1. *Independent and dependent variables description**Ordinary Least-Squares*

The econometric method used in this study to process the selected data was The Ordinary Least-Squares (OLS) method. This method is attributed to Carl Friedrich Gauss and is well known as a useful, reliable and compelling regression analysis method. This method is a variation of the Least Squares Principle and is one of the most used linear regression models in econometrics. Heij *et al.*, (2004) described the OLS as the first step in estimating economic relations and could provide a valuable insight in the essence of the relation between variables.

The main objective by using the OLS method is to minimize the remains of the estimated errors. As was said before, the main objective of this study is to identify whether there is a positive effect of IA on the return of the shareholders' investments of the 68 selected companies on the S&P100 index, as was outlined in the literature review. Since independent variables are presented in the adjusted formula of DuPont, this study fits the independent variables on a multiple linear regression analysis.

Of note for this study is that the growth rate of the dependent variable (ROE) is linearly related to the 4 independent variables - profit margin (PM), IA turnover (AT), IA ratio (AR) and financial leverage (FL). The following formula, Eq. 6, show the OLS equations adapted for the study purposes using the logarithmic function. Indeed, all the previous variables were transformed into are the logarithmic values (IROE, lPM, lIAT, lIAR and lFL) used in each of the formulas. Formula of the OLS analysis (6):

$$IROEmv_i = \alpha + \beta_i lPM_i + \beta_i lIAT + \beta_i lIAR_i + \beta_i lFL_i + \varepsilon_i \quad (6)$$

The formula shows the constant is displayed as α , the coefficient of the estimator of the population intercept of each independent variable is represented by β , the estimation errors are projected by the OLS method and shows the impact of each independent variable on the dependent one and the error term, ε . Lastly, the symbol i represents each one of the observations in the dataset, in other words, it represents every single firm in the study's sample.

In order to keep the results of the OLS in this cross-sectional study unbiased, the model takes the following assumptions: first, the models are linear in their parameters; second, data is a randomly selected sample of the population; third, independent variables are measured exactly such that measurement error is negligible; and, finally, independent variables are not too rigidly collinear.

RESULTS

Descriptive Statistics

It is necessary to understand the indicator values before this study undertakes analysis of the results of the OLS Method. Table 2 was elaborated using the sample to provide a clear understanding of the indicators' distribution of values of the descriptive statistics. Furthermore, indicators of central tendency, variability and shape can be observed in Table 2. The second column presents the statistical mean, which is the most widely used measure of central tendency, while the median, represented in the third column, halves the data. The minimum (min) and the maximum (max) are displayed on the fourth and fifth columns. The standard deviation (the sixth column) and coefficient of variation (seventh column, expressed in percentage) are indicators of dispersion, and are both based on the average squared distance between the elements of a data set and the mean. Skewness and kurtosis, in the eighth and ninth columns, are indicators of distribution shape. Kurtosis measures the tailedness and flatness of the normal distribution: in other words, the relative amount of observations in the tails as compared to the number of observations around the mean. Skewness is a measure of the symmetry of the mean for a given studied variable.

Indicator	Mean	Median	Min	Max	Standard Deviation	Coefficient of Variation	Skewness	Kurtosis
ROEmv	0,07	0,05	-0,01	1,48	0,18	2,44%	7,05	51,30
PM	0,15	0,13	-0,06	0,55	0,11	0,75%	1,26	2,19
IAT	44,57	8,69	0,45	766,67	116,51	2,61%	4,58	22,79
IATg	24,95	2,20	0,26	766,67	108,65	4,36%	5,88	34,54
IAR	0,11	0,07	<0,001	0,49	0,12	1,08%	1,43	1,35
IARg	0,30	0,28	<0,001	0,86	0,21	0,69%	0,46	-0,41
FL	3,47	2,84	1,10	14,26	2,19	0,63%	2,68	8,78

Note: All values are presented in the same unit of measurement of the variables except the coefficient of variation that is presented in percentage.

Table 2. *Descriptive statistics of all variables (Autor's calculatoins)*

The variables "IAT" and "IATg" project the longest distance between their means and maximums. IAT exhibits an outstanding maximum value close to 767% whereas its mean is close to 45%. The distance from the mean to the maximum value is more than 17 times its mean. On the other hand, the minimum values from all the indicators are not far away from their means, with the exception of IAR and IARg. IAT and IATg present the highest values of standard deviation regarding their means. Therefore, their coefficient of variation shows a high degree of dispersion; in particular the result of IATg presented 108,65% of deviation.

That means the data for IATg is broadly spread out. Furthermore, these variables present an abnormal skewness, that is to say, their distributions are asymmetric. Additionally, their long right tails mean

that the samples are positively skewed; simply put, the data are distributed mainly around the mean. Nevertheless, some data is distant from the mean representing a longer right tail in a graph. The variables' kurtosis results exhibit a property known as "fat-tails" due to the spread distribution. Fat tails occur where the actual probability of extreme outcomes is greater than the normal distribution: put in short, the extreme outcomes of the data is expected to be greater than the normal distribution. The variables PM and IAR present low values in contrast with the rest of the variables. Their deviations are close to their respective means and their dispersion is short, as their coefficient of variation is close to 0,8% for PM and almost 100% for IAR. Kurtosis values are 220% for PM and for IAR is almost 135%.

These results indicate a platykurtic or long tail distribution, meaning that the normal distribution is flat. Regarding the Skewness values, the results show a narrow dispersion around the means.

In summary, all variables are positively skewed due to median values being lower than the means, most of them having maximum values in their data far away from their means (outlier values). Moreover, IAR and PM have narrower dispersions in contrast to IAT and FL. To wit, the variables IAT and PM have values that are close to each other, which is not present in the IAR and FL.

Note that the descriptive statistical analysis showed that some variables present high range values. Therefore, the linear functional form adjusted into a logarithmic functional form has another added advantage. Logarithmic values are known to decrease the degree of dispersion of a variable's values.

OLS regression analysis results

The test is used to assess a possible linear association between two or more variables. For the purpose of this research, the test will help the study to explore which of the 4 independent variables are positively or negatively related to IROE, and the magnitude of such relations. The results of the Pearson correlation coefficient test for all the variables using logarithmic values, see Table 3.

The table shows in the first column the name of the logarithmic function of the dependent variable (IROEmv), and the following columns display the independent variables and the results of the Pearson correlation test.

Dependent variables	Independent variables					
	IPM	IIAT	IIAR	IIATg	IIARg	IFL
Logarithmic ROEmv	0,15*	0,02	0,12*	-0,03	0,108	0,20*

Note. The symbol (*) stands for a 10% level of significance. A set of 66 observations were used to perform this test, two observations presenting negative values were left out. The symbol (-) stands for not applicable.

Table 3. *Results of Pearson correlation coefficient between independent variables and the ROE (Autor's calculatoins)*

The results show an intense and positive relation between the logarithmic version of the variables IROEmv and IFL in comparison to the rest of the independent variables; this means that the observations in the financial leverage correspond with observations of IROEmv. IIAR, IIARg, IIAT and

IATg present low correlation coefficient for ROEmv. Until this point, the IA recognized in the financial statements show almost insignificant influence on ROE.

The following models, Table 4 and 5, show the regression tests for the dataset selected by this study. The models have been estimated using information from the total sample - 66 companies (two of them were taken out of the test for presenting negative values on the ROEmv). The format of the tables displays in their first column the adjusted independent variables. The second column shows the results obtained for the estimated coefficients. The third column displays the outcomes of the standard robust errors to assure that the assumption of the homoscedasticity of the error term is not infringed and the results are robust, accurate and it is possible to trust them. The fourth column presents the results of the p-values. This column is related to the fifth column, which indicates the statistical significance of the estimated coefficient. The last column shows the results of the Variance Inflation Factor (VIF). The table correspondingly displays the results for the joint statistical significance test (F-test) and the Adjusted R-squared (adjusted for the degrees of freedom)

Variables	Estimated coefficient	Standard robust error	P-value	Statistical Significance	VIF
Constant	-2,84	0,31	<0,001	***	-
IPM	0,26	0,12	0,04	**	1,20
IAT	0,23	0,06	<0,001	***	3,81
IAR	0,20	0,05	<0,001	***	3,52
IFL	0,37	0,16	0,03	**	1,02
n=66					
F-Test (4, 61) = 6,74***					
Adjusted R-squared = 0,11					
Note. The symbol (***) means 1% level of significance and (**) means 5% of level of significance. The symbol (-) stands for "not applicable".					

Table 4. Results of the OLS regression analysis. Excluding goodwill (Autor's calculations)

Table 4 displays the presence of statistically significant variables, including the constant. The outcomes for the variables IAT, IAR and constant display a 99% of confidence. For IPM and the IFL, the level is 95%, implying that if the logarithmic function of the IAT grows 1%, the return on the equity market value (IROEmv) will grow by almost 0,23% in the same direction. The variable IAR will influence the growth of the return on equity market value by 0,20% if it changes 1%. Regarding the logarithmic function of the profit margin, it is possible to say that if it grows 1% the return on equity market value will also grow by 0,26%. In regard to the financial leverage variable, the result shows that if it grows 1% it causes a growth in the logarithmic function of the return on equity market value by 0,37%.

The sample used for Model 2 was composed of 66 observations (n), 2 companies were left out of the test due to presenting negative values on the ROEmv. The result of the F-test implies the existence of statistical significance. Despite the fact that the F-test presents statistical significance, the result of the adjusted R-squared does not confirm the model as a strong model, due to this indicator showing that 11% of the growth on the IROEmv is caused by changes in the independent variables. The reason for this low indicator is that accounting does not explain the changes in the market information. The values

of the VIF come are presented in the last column, for all variables the results are not higher than 10, which excludes any collinearity problems among the independent variables.

The following model, Table5, presents the same format as in the previous table. However, this table presents the logarithmic function of the variables including goodwill.

Variables	Estimated coefficient	Standard robust error	P-value	Statistical Significance	VIF
Constant	-2,59	0,32	<0,001	***	-
IPM	0,36	0,13	<0,001	***	1,49
IIATg	0,36	0,10	<0,001	***	12,07
IIARg	0,36	0,12	<0,001	***	10,88
IFL	0,47	0,19	0,02	**	1,08
n=66					
F-Test (4, 61) = 17,80***					
Adjusted R-squared = 0,72					
Note. The symbol (***) means 1% level of significance. The symbol (-) stands for "not applicable".					

Table 5. Results of the OLS regression analysis. Including goodwill (Autor's calculatoins)

Table 5 shows that all the variables present estimated coefficients with high statistical significance. All independent variables, the constant included, exhibit a level of trustworthiness at 99% for the values computed. For this model, the independent variable which presents the highest estimated coefficient is the logarithmic function of the financial leverage. That is to say that if the variables change 1% the return on equity market value will change in the same direction. For the IFL variable, the growth on IROEmv will grow 0,47%. In the case of IIARg, the change will be 0,38%. Regarding IIATg and IPM, if they change the growth in the ROE will be close to 0,36%. The model presented in Table 10 was estimated using 66 companies, as for the previous models. The result of the F-test implies the existence of a statistical significance. Despite the fact that the F-test presents statistical significance with 95% confidence level, the result of the adjusted R-squared does not confirm the Model 4 as a strong model, due to this indicator showing that 10% of the growth on the IROEmv is caused by changes in the independent variables. The reason for this low indicator is that accounting does not explain the changes in market information. The values of the VIF are presented in the last column, the variables IIAT and IIAR present results higher than 10 which could indicate collinearity problems among them.

CONCLUSION

The main purpose of the study was to find out if the intangible assets, recognized in the balance sheet, have a positive influence on the return on equity using market value. The literature review showed that, on the one hand, there are studies that indicate a considerable influence of the IA on the ROE, while on the other hand, there are studies that did not find a relevant influence of the IA on the ROE. The model exhibited in Table 4 shows an adjusted R-squared of 11%; therefore, the model holds a very weak explanatory power. In general, in this model the coefficients of the independent variables are low. In the "IA excluding goodwill" alternative the IIAR ratio presents the lowest value: 20%. Which means

that a growth of 1% of the ratio will lead to an increase of 0,20% on the ROEmv. Testing the “IA including goodwill” shows the IIARg ratio with a value of 0,38%, a significantly higher value than the “IA excluding goodwill”. However, the model presents a collinearity problem on two variables. Consequently, the model is not trustworthy to study the growth on the ROEmv. Therefore, the model is not suitable for conclusions.

The study used only a cross-sectional method to analyze the impact of the IA for a single year. We have a strong belief that future studies should add a time-series approach and use broad indexes.

³Strategic Management, Indian Institute of Management, Indore, India

ABSTRACT

Cities in India are reporting new achievement milestones across public service domains (sanitation, smart configurations, traffic management, sustainable practices etc.). The efficient delivery of public services requires management of a complex configuration of stakeholders, often making it difficult to identify the salient contributions of the different constituents. This paper studies an exemplary public service delivery i.e., the city of Indore topping the nation's cleanliness survey charts thrice successively. We make necessary and sufficiency arguments to identify the contributions of politics, administration, legal and history, as the salient stakeholders, in the city achieving exemplary public service delivery. Our arguments lead us to believe that; firstly, the stakeholders interact in complex ways for exemplar delivery, and secondly, history i.e., path dependency, has an important yet unrecognized role to play.

Keywords : Clean City, Public Service Delivery, Public Management, Path Dependence, History, Exemplar Public Performance

INTRODUCTION

As India proudly marches into the 21st century, to become a developed nation from a developing one, it faces numerous socio-economic challenges. These stretch from poverty, corruption, inequality, literacy, skill development, health, primary education, to things even as basic as cleanliness. To bring back focus on these fundamental issues, while at the same time implementing a decentralized approach, the Indian Government launched numerous development initiatives, which it proposed to manage through a competitive route -- government funds and efforts to be spent based upon achievements made. This approach has resulted in changing the existing mindset and in not only successfully aligning the numerous stakeholders but also in delegating the responsibility for reporting development to the grass-root level. One particular domain in which these efforts have resulted in visible change is in changing perceptions about cleanliness. This paper studies this context from a public management perspective.

India, which is home to one of the oldest civilizations in the world, has "borne the burden of sanitation for centuries," such that *"Wherever a man touches, there are feces and fecal organisms present."* (Tierno, 2004). While such recognition has been existing for long, it was only recently that the country decided to do something about this on a war footing. Over time, numerous initiatives have been taken to address this fundamental problem and its associated aspects in a comprehensive manner, with the aim to bury the statements like the above in history. On October 2, 2014, the birth anniversary of Mahatma Gandhi, the father of our Nation (Jha, 2015) a path-breaking initiative was launched by the Prime Minister of India in the form of Swachh Bharat Abhiyan (SBA - Clean India Mission). The country has not looked back since.

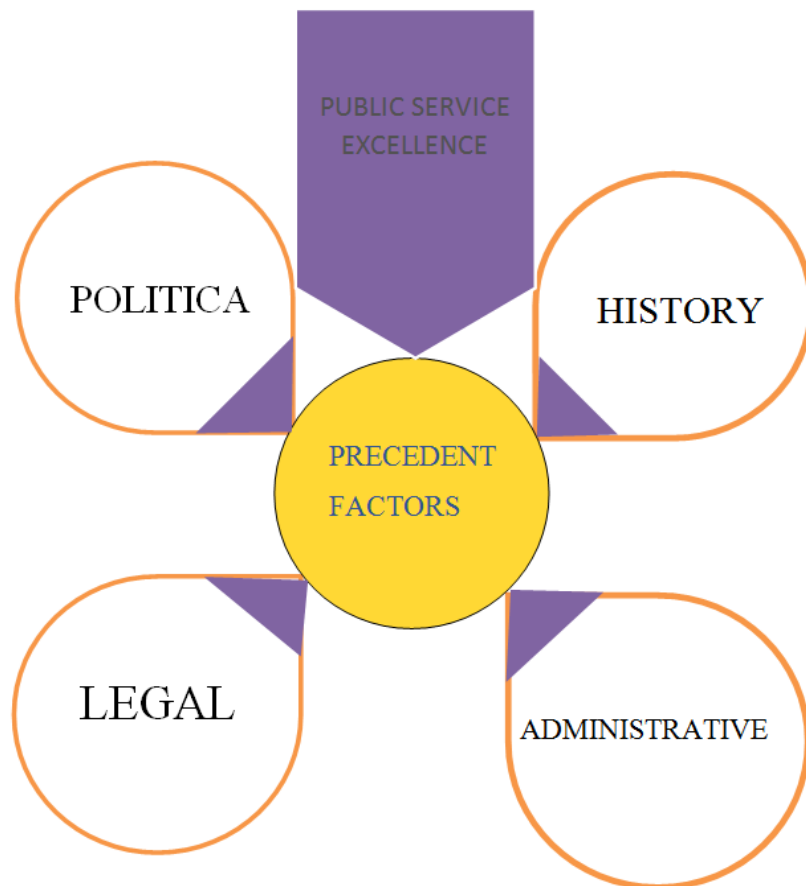

The SBA initiatives were taken at all levels, aiming to make villages, towns, and cities Open Defecation Free. The SBA introduced a competitive spirit to better one another in cleanliness and sanitation measures, reduce waste generation, recycle waste, develop a consciousness in the younger generation, and the like. The competitive spirit was brought in through an Annual Cleanliness Survey of towns and cities (Annual Swachh Survekshan Assessment). The public service initiative aimed to delegate the responsibility for cleanliness to the ground level -- village, town, city and district, rather than centrally conceiving and implementing action plans. That is delegating actions and ownership to the front line for public services management.

Public service management is a complex context, as it includes numerous powerful actors, each with their own set of priorities. Politicians play an important role in providing direction to the public, which are politically motivated, and often biased. Public executive machinery, known to be risk averse, while being perpetually burdened by more than what they can do, is plagued with resource shortfalls and complex network of procedures and policies. Legal seeks to influence and control political and executive decision making, while ensuring fairness and equity in the delivery of public services. The three converge into the office of the Mayor, who is ultimately responsible for the cities development and upkeep. However, each of them not only acts alone but also interacts in more ways than one. When it comes to owning responsibility for making the city clean, and making resource contribution, ambiguity prevails, with overlapping and cross-cutting roles and responsibilities. Furthermore, achievements in cleanliness require an enthralling focus on behavioural change with equity, reminding us that those left behind are the ones who were the first in need of improved sanitation - the poor and the under-privileged.

The paper employs set theoretic arguments of necessity and sufficiency, to identify the role of political, executive, and judiciary and history in bringing about exemplary public service delivery. It contextualizes the study of the cleanliness achievements of Indore city, which rose from outside the list of the top hundred cleanest cities in India, to top the ranks for three continuous years i.e., 2017,

2018, and 2019. Whereas political, executive and judiciary conditions were not individually sufficient, they formed a configuration for providing superior cleanliness performance, which when boosted by historical aspects, enabled Indore to top the surveys, and maintain its top position.

The paper next carries out a literature review for the antecedents of public service delivery achievements, which is followed up with a brief description of Indore cities achievements. It next makes necessity and sufficiency arguments for the various key antecedents for superior public service delivery and presents our conclusions.

The above diagram depicts several salient contributions which already exist in the case of Indore city. The precedent factors show us the convergence of the past and the future alignments.

DRIVERS OF SUPERIOR PERFORMANCE IN PUBLIC SERVICE DELIVERY

“ When individuals take ownership of public space they become citizens (referring to Singapore). But there is a problem when we look at it from the Indian perspective. Civic virtue does not come naturally to us. We think of ourselves first; we don’t think of the public space. That is why an Indian’s horizon of concern should extend beyond his or her door,”

Gurcharan Das, while citing Singapore as an example for India to follow.

The above quotation highlights that cleanliness- a public service attribute is a complex subject, which has antecedents lying in political, bureaucratic and judicial priorities, the three pillars of democracy.

NATIONAL SWACHATA (CLEANLINESS) MISSION

When the Indian Prime Minister launched the SBA in 2014, he vowed that by October 2019 every Indian will have access to a toilet, and the country will be free of the scourge of open defecation. While transitioning from squatting in an open field to squatting on a concrete laid hole in a 1 meter x 1 meter cubicle, India metamorphosed multiple attitudes to reflect social change and economic growth. Most of these aspects have been beautifully captured in a Bollywood Blockbuster film (i.e., TOILET), which depicts the struggles of a newly married village man who seeks to break social dogma to provide a toilet for his newly married (but well educated) wife who hails from the city. The film captures the deep social and cultural system in which open defecation has over a period of time gained acceptance in society. It highlights the need for emphasizing the need for public shaming of citizens, which are beyond building public consensus and imposing fines for open defecation. From a deeper social context, the laid down Shastras by the Brahmin men (the guardian of social conduct in the Hindu Indian society) were openly rejected. The Prime Minister publicly wielded a broom and cleaned garbage from a street. This very act shattered preconceived notions about cleanliness, where the act of cleaning was viewed with contempt or disdain for centuries. To build a wider social consensus, the head of state administered pledges to students, and asked them to become politically vigilant and conscious citizens. While history provides evidence that India lacks a sense of brotherhood and has remained a segmented society, community initiatives require action to be undertaken in a shared public space, necessitating widespread collaboration. On the other hand, menaces like extensive use of plastic led to tragedy of the commons in the shared public space.

INDORE CITY'S RENDEZVOUS WITH CLEANLINESS

About 60% of the population of Indore city (i.e., 2.7 million of its 4.5 million residents) is governed by the Indore Municipal Corporation (IMC). The corporation, first decided to make the city open defecation free, and based upon its achievements on this front it won the national competition for the first year in 2017. For the second year, the city adopted the "binless city model". This model argues for a paradoxical situation -- withdrawing public dustbins rather than adding more bins to improve cleanliness. Rag pickers, beggars, strays, and trash jockeys poke around public bins, making them agents for propagation of contagious diseases. Movement of large amount of trash leaves trails of trash all across the city, making it unhygienic. Smaller litter bag bins if adopted, make the city free of big public dustbins, thus consuming less money (in clearing public dustbins) and improving sanitary

standards. However, this required a massive change in public behavior, as public garbage disposal bins were removed from the cities landscape, often with difficult alternative modes of garbage disposal. Overtime, the city decided to make each bin location (which was viewed as the most dirty spot in any locality) as selfie points and as a garden.

As a substitute for the public dustbins, door-to-door garbage collection service was started in January 2016, as a pilot project in two of the 84 wards in the city. In just a year's time 100% door-to-door garbage collection was achieved. For the third year, the city put in place a collaborative initiative which aimed at 100% segregation of waste at source -- individual households and commercial units. Collection services were introduced by municipal authorities to carry out this (including slum areas and illegal colonies) at under ₹60 , which was significantly less than what was charged by previous private garbage collection services. The municipality's trash pickup vehicles made a huge impact on how garbage collection got done in the city of Indore.

All these initiatives had a historic precedent. During the reign of Devi Ahilya Bai Holkar (the Hindu ruler of the province of Indore), almost two centuries back, trash pickers visited every colony and later deposited it at the trenching grounds (Wangchuk, 2018). At the time this was an informal practice. With a population density of 9,718/km², each ward has on an average 6,000 households and 600 commercial establishments, making the adoption and propagation of the model a herculean enterprise. However, the city administration successfully achieved this to become the cleanest city, in 2019.

Numerous other initiatives were also taken during this time. The city's roads were made free of stray animals such as cows and dogs. The stray animal population polluted the city by their feces and spread trash from public dustbins. While initially cattle sheds were built to sustain the population of stray cows, overtime cows were domesticated and transferred to farms rather than being sent to these sheds. Similarly, the city, in a collaborative effort, decreased the use of plastic by over 90%. Plastic bag rallies have taken over the city, convincing the public that plastic should be used at a bare minimum. The utilization of single use plastic has been abolished over the city. To urge citizens to the cause, the use of plastic bags was made more expensive than the use of paper or jute bags. Cloth bags were distributed, trash bags for use in cars were encouraged, and even use of disposable cutlery actively discouraged. Most recently, a cutlery bank has been created, from where one can rent cutlery for large gathering, rather than use disposable cutlery.

One of the biggest achievements was the large number of people who were made conscious about the importance of cleanliness. This has resulted in a large part of the city's population becoming conscious about cleanliness , and contributing to the cause in their own ways. One of the significant benefits of cleanliness, but an indirect one is the significant fall in water and air borne diseases in the city. The

reported number of cases has fallen by almost 50%. The biggest change has been come about in how people perceive cleanliness jobs. Earlier when the municipality advertised for manning cleaning jobs at the municipality, hardly 3500 people applied. It has now doubled to 6500, with people vying to get a cleaning job at the municipality (SWACHH SURVEKSHAN 2017: INDORE'S RISE TO NUMBER 1 RANK).

For years, the disposal of the city's municipal waste was a menace, as it was done in open areas without taking measurable controls. This led to massive health hazards from improperly treated natural waste. In 2019, Indore was generating over a thousand metric tons of municipal solid waste in a day (Ministry of Housing and Urban Affairs, 2019). Over a century back, the Municipal Corporation identified a disposal site 15 km away from the city centre of Indore (i.e., Devguradia) for disposal of this waste. The solid waste, once collected from all over the city, was brought to this ground for dumping. The waste which reached the trenching ground constituted of blue waste (dry) and green waste (wet waste). Over time this waste came to the trenching ground fully segregated into dry and wet waste, so that it could be treated differently.

The city put in place a state of the art dry waste segregation system, which segregated the dry waste into 16 different categories, each of which could be taken up for recycling. Post this segregation, only 1 % of inert waste is left which needs to be sent for landfill. This has enabled Indore to achieve the hallmark of becoming a near zero landfill city.

For wet waste treatment, the city innovated and put in place a new system. The new system was innovated from the Indore method of solid waste management. The INDORE METHOD is an old and textbook method of compost preparation in pits size of 9'x5'x3'. The pit is filled with farm wastes layer by layer. Each layer is around 3" thick, with a 2" layer of cow dung slurry mixed with urine. The pits are filled with farm wastes and plastered with 2"-4" thick layer of soil and dung. This prevented moisture loss and allowed the temperature to rise up to 60-65°C within 3-4 days, and enable its decomposition. Material inside the pit was turned after 15-30 days and the level of moisture maintained by adding water. Another turning is given after an interval of 30 days. By this process, good quality compost was generated within 3-4 months. The wet waste treatment process that the city put in place now, innovated over this age old method. This exploited the Indore method's use of chemical, bacteriological and physical changes in buried refuse.

To systematize the process, a new facility for wet waste treatment was constructed, which could handle 600 MT of wet waste every day. Infrastructure was put in place to let wet waste dry and decompose in the open, and decompose in 7-10 days. During this period, the temperature of the decomposing waste rises to over 60 °C, killing all the pathogens and hastening the decomposition process. A method of controlled tipping was also introduced, which revolutionized the method by

introducing mechanization. The principal method of refuse disposal through controlled tipping or sanitary landfill was introduced, which differed from ordinary dumping in that the material is placed in a trench, adequately compacted and then covered in earth. Over time, the old landfill has also been re-excavated and treated, releasing over 100 acres of land fill area, which is proposed to be developed into a Golf course, city forest, or a wedding location.

WHY DID INDORE EXCEL IN PUBLIC SERVICE DELIVERY?

Political alignment

The political factors favorably aligned, reinforcing one another, and this was an important factor that made Indore into a role model as a clean city. Following the win of Bharatiya Janata Party (A national party) at the federal and state level, Mrs Mailin Gaur, a soft-spoken lady who had entered politics following the death of her husband in a road accident, won the Mayoral Elections of Indore in February 2015, with an overwhelming majority. Her first announcement on winning the Mayor's position was to follow a developmental agenda for the city and make it one of the Smart Cities in the country (Ministry of Housing and Urban Affairs, 2019).

However, soon after taking up her role as the Mayor of the city she started getting balked down by routine administrative issues, which often revolved around rag pickers, petty corruption issues, court mandates for cleaning, street dog menaces, litigations on encroachments, sanitation workers problems, etc. As per her, all of these issues can be traced back to the fundamental issue of CLEANLINESS! When she got together with her team of confidants in the bureaucracy, she assured that everything was possible and all issues could be addressed, if politics was taken care of. Her overwhelming win in the elections and her relatively newer political roots led her to commit to taking care of political issues head-on, and provide a free hand to a team headed by the Municipality Commissioner to clean the city up.

The presence of a single party at Center, State, and City levels helped align political priorities and have often been argued to be central to Indore's achievements. However, such an alignment also existed in at least 500 other municipalities in the country. Also, a closer analysis of the winners also shows that such an alignment is not necessary. For instance, cities like NDMC, Chandigarh, followed by Bhopal and Jharkhand figured in the top ranks but had different political parties involved at different levels. Hence, it is argued that,

Proposition 1: Political alignments are important, but not a sufficient or a necessary condition for achieving excellence in public service delivery.

Bureaucratic priority

“Nothing comes easily; let alone the title of cleanest city. Indore shed both sweat and blood to achieve the title.” Indore municipal commissioner Manish Singh while addressing 138 representatives from 22 states to study the efforts put in by the city to top Swachh Survekshan-2017.

The people who manned the key bureaucratic posts in 2015, were a little different. Manish Singh, the Municipality Commissioner, who spent 80% of his working time on the field. The commitment of the bureaucratic machinery is evident from the efforts required to free the city of stray cattle. *“Even an IMC official had to pay with his life in our effort to free city from cattle menace. He was murdered by cattle rearers. Still, it failed to stop us,”* Manish Singh.

To supplement the bureaucracy, the Municipality decided to appoint a consultant. The consultant provided 400 Sanitation Consultants, who were trained in the new methods of sanitation and public involvement and who could be used by the bureaucracy flexibly to convey their message to the grassroots. This team was on standby 24X7, and usually worked 12 hours a day.

Indore being the commercial capital of the state, Parliamentary Speakers Constituency, and the most populated city of the state, it had always been an important place of posting for the bureaucratic cadres. Hence, the city had always been manned by active and highly motivated bureaucratic machinery. Also, as the city provided a career growth path to the capital city of Bhopal and later to the state headquarters, only the best were posted at Indore. Consequently, a strong bureaucratic cadre is not unique to Indore, though the group of officers, present at that time were unique in their own ways.

Proposition 2: Bureaucratic priority is important, but not a sufficient or a necessary condition for achieving excellence in public service delivery.

When numerous stakeholders are involved, ensuring equity and fairness at all times can often be problematic. Actions even when taken with the best of intentions and in public interest can be questioned and found fault with as one evaluates them against different conceptualizations and measurements of equity and fairness. In such situations, judiciary plays an important role in ensuring equity and fairness. This has been difficult in the Indian scenario, where judicial activism has been evident of late. However, in the case of Indore the judiciary provided full support to political and bureaucratic actions, and placed public interest above everything else, providing a free hand to the city officials to take unpopular decisions, and stand scrutiny for the same. While, such judicial support is uncommon, in this case it served as an enabler of actions taken. As by itself, judicial support has little to achieve, hence we argue that

Proposition 3: Judicial support is important, but not a sufficient or a necessary condition for achieving excellence in public service delivery.

It goes without a doubt, that in the case of Indore all the three pillars of democracy came together to enable the city to achieve a hat-trick in cleanliness. In the case of Indore city this was nothing less than a mini revolution for the city and, in particular for its citizenry. This contemporary take on the issue of cleanliness is evident from the rally, which was taken out on the third day of a seven days special camp of National Service Scheme of Jai Maa Bhagwati Sonanchal Post Graduate College. Through the rally, people were given a message of hygiene and the concept of sanitation spread through the voices of students of a public school. This strategy was very similar and in line with the approach adopted by Devi Ahilya Bai Holkar, who took numerous steps to involve the public while attempting to address issues which lay at the core of the society. The city's solid waste management system also bears the mark of the policies and practices put forth at that time, making us wonder if history and path dependence had a role to play here.

PATH DEPENDENT DETERMINANTS TO INDORE'S ACHIEVEMENTS

Indore has a unique historical background. Though being located in one of the most fertile areas of central India, it was never a significant seat of power for either the Mughals or the British, even when they ruled over the entire country. This historical background had a rather strange implication for the city. While being one of the most important cities in central India, its public governance almost always lay with the local leaders, with only a distal impact of alien/ foreign ways of public governance. The founders of Indore were hereditary Zamindars and aboriginal landholders of Malwa who retained their possessions of royalty even after the advent of Holkars. Between Mughal rule, these families were granted confirmatory sanads by Aurangzeb, Alamgir and Farukhshayar, confirming their 'Jagir' rights.

Indore being one of the most fertile areas in the arid Central India, it was made the capital by the Holkars. Rao Nandlal Chaudhary, founder of the city, named it as 'Indrapur' after Lord Indra, the deity of Indreshwar temple. During the Maratha regime, the city was renamed 'Indur', a label which the local Marathi community continues to use. It was later Anglicised to 'Indore' during the British era.

The Maratha confederacy, in 1733 came into conflict with the East India Company during their war with the British and the Scindias. The Holkars signed the Treaty of Mahidpur in 1818, as per which they retained the rights to rule. Ahilya Bai took charge of civil administration and directly looked after it. She beautified her capital, Maheshwar, a town on the banks of the Narmada river. As stated by a contemporary American historian, Stewart Gordon, "*Ahilyabai had one of the most stable reigns of the 18th century.*" Devi built roads, temples, *ghats*, wells, tanks and rest-houses not only in the Malwa region, but across an area stretching from the Himalayas to pilgrimage centres in South India. One of the most

sacred Hindu temples at Varanasi, the Kashi Vishwanath temple, was built by her, although it was 1000 miles from her capital.

The *Bharatiya Sanskritikosh* lists the sites that she embellished - Kashi, Gaya, Somnath, Ayodhya, Mathura, Hardwar, Kanchi, Avanti, Dwarka, Badrinarayan, Rameshwar and Jagannath Puri. Ahilya Bai encouraged affluence of her bankers, merchants, farmers and cultivators, and did not consider that she had any legitimate claim to any of their wealth, be it through inappropriately high taxes or feudal right. Hence, business prospered under her reign. The flourishing of the business community provided a rich source of tax, providing her with sufficient funds to carry out public services and development, of which sanitation comprised of a good part. As it became the predominant city of Malwa, thanks to good civic amenities it became the most happening place and gradually became the preeminent city of Malwa and present day Madhya Pradesh.

The focus on sanitation can also be partially attributed to the agglomeration attached to the borders of the city - Mhow, a cantonment area. Mhow, is a major centre of Military training in the country, and it is one of the largest and cleanest cantonments of Indian Army. Mhow originally was part of the Indian State of Maharaja of Holkar. In 1818, Maharaja of Holkar signed the Treaty of Mandsaur. Under Article VII of this treaty, the Crown's representative included the cantonment of Mhow in the 'administered areas' and applied the Cantonments Act, 1924, to the Cantonment of Mhow. Such 'administered areas' were recognized for their well laid down planning of underground drainage.

The pre-independence railway link joining the Pilgrimage route fueled the growth of trade and commerce making Indore city the commercial capital of central province. After independence, the first ever-planning intervention for Indore in the post-independence period was in the form of Indore Development Plan (1974- 1991), which was adopted under Section 18 & 19 of Town & Country Planning Organization Act – 1973. The plan envisaged a planning area of 21,410 hectare, of which 12,145 hectare was to be provided for common use of the 12.5 lakhs population.

Proposition 4: Historical antecedents serve as guideposts for excellence in public service delivery. Sooner or later, they propel the existing systems towards excellence, making them necessary for achieving excellence in public service delivery, but not sufficient in themselves.

The condition of the defunct rule, of internal dissents and of stalemate continued through the first decade of the nineteenth century. "The New Industrial Town was beginning on a larger scale than is the type Garden City, Letchworth. And with all the corresponding provisions for increase of water supply, with thorough-going Sanitation and River Purification, with re-planned and simplified drainage. With this again, development of Gardens, on a scale fuller than that of other Garden Suburbs and Garden Cities are these of every kind, from simple sanitarian... materially improving environment, their neighbourhoods improved with the rest, and their ideal claims also advanced; as notably with

the improvement of the Chhatri Bagh as Sacred Park of 'Indore.'" (Town Planning towards City Development: A REPORT TO THE DURBAR OF INDORE by Patrick Geddes)

Proposition 5: Town planning is important, but not a sufficient or a necessary condition for achieving excellence in public service delivery.

Patrick Geddes in Town Planning towards City Development: A REPORT TO THE DURBAR OF INDORE, argues that the uprising of the new industrial town, and the residential suburbs gave legitimate birth to Indore. The depiction and imposition of schemes in the late eighteenth and the early nineteenth century marked to be contributive in the legitimate developments of Indore. "The Cleansing and Sanitation, the Repair and Renewal of the Old City, and the improvement of Road Communications, and of Railway Station, are similarly definite needs. The purified Rivers, the Park and Garden system, are a once measures towards Public Health, and provision towards its development to the highest levels." This citation proves to be a portrayal of the laid down path and the very genetic transformatory evidence of the citizens of Indore.

Proposition 6: Schemes are important, but not a sufficient or a necessary condition for achieving excellence in public service delivery.

Schemes implemented several decades ago help us solidify the basic structure of a clean city which is intertwined in its history.

"Though the cost and scale of each house is a matter for each householder according to his means, its construction, sanitation is always under municipal control. Still more is municipal vigilance needed with New Schemes; for what use can be the best of plans, unless guided in execution. The resultant increase of real estate, and of taxable value accordingly is thus encouraged as far as may be." This very scheme illustrates the politics and the imposition of schemes at state level. This ties up another scheme of 1912, the concept of 'Plaque Camps' was imposed on the population. Town Planning Scheme of 1912, a concept was adapted from an ancient tradition, where a systematic rotation between the occupied and unoccupied areas in formation. This leads to public health and sanitation.

The regular funds were allocated under the belt of cleansing expenditure, as documented by Patrick Geddes. These expenditures included cleansing of rivers and nullas, before the plaque season started. Therefore this eludes that the concept of sanitation is inbred in the Indorean population.

Proposition 7: Traditions, Schemes, and Town planning, each being necessary in itself, together can become sufficient conditions for excellence in public service delivery.

CONCLUSION

This makes us argue that Indore's journey to become the cleanest city in the nation, and maintain that position for three consecutive years, may have something to do with the history of the city. That is an

element of path dependency, the idea that tries to explain the continued use of a product or practice based on historical preference or use, has had a key role to play in the city achievements, which was over and above the influence of political, bureaucratic and judicial alignments and consensus that the city witnessed. Such path dependency emerges spontaneously, even if newer, more efficient practices emerge, often because it is easier or more cost effective to simply continue along an already set path than to create an entirely new one.

EXAMINING THE INFLUENCE OF EMOTIONAL INTELLIGENCE ON STUDENTS' BURNOUT

Georgiou, Dimitra Ap.; Androulakis, George S.

Department of Business Administration, University of Patras, Greece

ABSTRACT

In this paper an attempt is made to analyse the effect of emotional intelligence on students' burnout syndrome. In particular, emotional intelligence was decomposed into four components using exploratory factor analysis (EFA). Respectively, students' burnout syndrome was decomposed into seven elements based on the same technique. By using hierarchical regression trees, the structural elements of emotional intelligence were ranked in terms of the importance of their effect on burnout. Furthermore, given that only indirect effects of factors exist because of the existence of burnout structural components, the contribution of each element of emotional intelligence towards students' burnout was evaluated using a structural equation model. The results indicated that the most important aspects of the emotional intelligence on students' burnout are the difficulty in empathy - heteroconsciousness and in particular their inability to see things from the point of view of others and to understand why others feel what they feel and also the lack of emotional self-determination that is their weakness to understand and express their own feelings.

Keywords: student burnout, emotional intelligence, recursive regression trees, structural equation modelling.

INTRODUCTION

The burnout syndrome has been the focus of research in recent years (Cordes and Dougherty, 1993; Leiter and Maslach, 2003; Maslach et al., 2001; Maslach and Jackson, 1981; Schaufeli et al., 2002b, 2002a). According to Maslach the burnout syndrome consists of three elements, this one of emotional exhaustion, depersonalization and lack of personal achievement (Maslach and Jackson, 1981; Maslach and Leiter, 2008). In particular: (a) emotional exhaustion manifests with a sense of mental fatigue of the person who no longer has the necessary energy to invest in his/her work; (b) depersonalization manifests itself by the removal of the individual from the public he/she serves and (c) the lack of personal achievement expressed by the weakness of performance and the resignation of any attempt to deal effectively with problems (Guthrie and Black, 1997).

Parallely, a new dimension of intelligence, called emotional intelligence (Goleman, 2006), was developed. The term “emotional intelligence” describes qualitative features such as self-understanding of emotion and comprehension of others' feelings as axes of actions and thoughts (Salovey and Mayer, 1990). The notion of emotional intelligence displays negative correlation with burnout and stress (Antoniou and Koronaiou, 2018). Emotional intelligence qualities could be considered skills such as self-control, determination, motivation and sensitivity to the feelings of others. Several scholars have defined and explained the concept of emotional intelligence in terms of models consisted of various emotional competences. However, these models share the common core of the basic concepts (Goleman, 2001).

Some researchers focus on the study of students' burnout syndrome, (Capri et al., 2012; Dyrbye et al., 2008; Guthrie and Black, 1997; Schaufeli et al., 2002a; Zhang et al., 2007). In particular, Cazan and Năstasă 2014 examined the relationship between the triptych of emotional intelligence, burnout and student satisfaction concluding that high levels of emotional intelligence are associated with low levels of stress, exhaustion and high levels of life satisfaction, (Cazan and Năstasă, 2015). Benson *et al.* 2010 looked into the phenomenon of emotional intelligence of nursing students finding out their capability of coping with interpersonal relationships and working efficiently under stressful conditions, (Benson et al., 2010). The research by Nasir and Masrur 2010 led to the existence of a strong correlation between emotional intelligence and students' academic achievement, (Nasir and Masrur, 2010). Duran *et al.* 2006 focused their research on the predictive factors of academic burnout and student commitment, concluding that stress and the overall efficacy are strongly associated with the exhaustion and the dedication of students and therefore through the control of these two variables emotional intelligence may also act as a predictive factor in the students' burnout syndrome, (Durán et al., 2006).

In this paper, using exploratory factor analysis, both the students' burnout syndrome and emotional intelligence were analysed. In further, their correlation was thoroughly examined and the burnout syndrome was interpreted under the spectrum of emotional intelligence' structural elements.

METHODOLOGICAL APPROACH

The students of the University of Patras, which consists of 24 Departments belonging to 5 Schools, School of Business Administration, School of Engineering, School of Health Sciences, School of Humanities and Social Sciences and School of Natural Sciences, consist the statistical population. It should be noted that the University of Patras is regional and accepts admission students from all over the country through a national system of examinations. Therefore, on the basis of the criterion of geographic distribution, the students of the University of Patras are a representative sample of the population.

A structured questionnaire was responded by 582 students on December 2018. The sample is representative on two criteria this one of the geographical distribution and of the university departments. In terms of gender, 51.5% of the students were women and 48.5% were men. The distribution of students in study years is almost uniform and corresponds to approximately 16% of the sample for each year of study.

The questionnaire includes the following thematic areas: (a) Demographic data, (b) Student Life, (c) Intensification and Satisfaction of Studying, (d) Student Burnout Syndrome (e) Student Emotional Intelligence. Most of the items are based on the following validated questionnaires: (a) Maslach Burnout Inventory - Student Survey (MBI-SS) measuring the three characteristic dimensions of the burnout syndrome (Hu and Schaufeli, 2009; Schaufeli et al., 2002a) namely emotional exhaustion, depersonalisation and lack of personal accomplishment, (b) the Trait Emotional Intelligence Questionnaire (TEIQue-SF) (Petrides, 2009), (c) the Employee Satisfaction Inventory (Koustelios, 1991; Koustelios and Bagiatis, 1997), and (d) the Self-Rated Emotional Intelligence Scale (Brackett et al., 2006). All items are measured by the use of a 7-point Likert scale. The Cronbach α for the present study is calculated 0.92.

Initially, using exploratory factor analysis, the students' burnout syndrome was decomposed into the following seven factors:

- (1) B1 physical-psychoemotional exhaustion,
- (2) B2 efficacy and self-accomplishment of studies,
- (3) B3 cynicism – lack of interest in others,
- (4) B4 empathy - understanding others' feelings,
- (5) B5 lack of interest in studying and absenteeism,
- (6) B6 difficulty in working with others,
- (7) B7 depersonalization.

In addition, a separate exploratory factor analysis (EFA) for the students' emotional intelligence was performed, resulting in four factors, two positive ones concerning the EI1 (self-control ability) and EI4 (heteroawareness ability) respectively, and two negative ones EI2 (lack of empathy - heteroconsciousness) and EI3 (lack of emotional self-determination).

The study of the emotional intelligence influential factors on students' burnout was accomplished by means of a multiple linear regression, a structural equational model (SEM), (Kline, 2015) and a hierarchical regression tree (Breiman et al., 1984).

By the usage of the hierarchical regression tree, the hierarchy of the effect of all the structural elements of emotional intelligence on students' burnout syndrome was realised. Based on the above hierarchical tree, multiple regression was performed to assess the significance of each element of emotional

intelligence towards the interpretation of the change in the students' burnout syndrome and their interdependencies.

A suitable structural equation model was adapted on the basis of the exploratory factorial analysis on the students' burnout syndrome. The purpose was to enlighten the indirect effects of emotional intelligence on the students' burnout mainly via the seven elements that emerged from the additional decomposition of the burnout syndrome.

Items for Student Burnout	B1	B2	B3	B4	B5	B6	B7
Absenteeism	0.601				0.446		
Physical exhaustion							
Lack of concentration					0.347		
Dedication on studies		0.632					
Department culture				0.340			
Stress and efficacy	0.531						
Mental exhaustion	0.616						
Wake up exhausted	0.369				0.321		
Tired of student cooperation						0.658	
Tired of teacher cooperation						0.490	
Study frustration					0.420		
Stressed with student cooperation						0.620	
Stressed with teacher cooperation						0.605	
Understand students' feelings				0.554			
Understand teachers' feelings				0.547			
Facing study problems		0.421					
Rejuvenated working with students				0.463			
Rejuvenated working with teachers				0.310			
Impersonal behaviour towards students							0.791
Impersonal behaviour towards teachers							0.581
Emotional hardening							
Lack of caring for students			0.625				
Lack of caring for teachers			0.734				
Forgetting study troubles	-0.558						
Irritability	0.584						
Lack of time for social meetings	0.614						
Drained by studies	0.419					0.393	
Pressure from studies	0.437						
Less interest in studies					0.442		
Excited about studies		0.722					
Self-efficacy					-0.520		
Accomplishment of important things		0.655					
Doubt about the importance of studies		-0.525					
Cynical about the importance of studies		-0.305					
Drop out studies		-0.427					

Table 1. Loadings greater than 0.3 of the items corresponding to each of the seven factors of the exploratory factor analysis on students' burnout syndrome. Fit measures of the exploratory factor analysis: TLI (0.896), RMSEA (0.072).

RESULTS AND DISCUSSION

For the Exploratory Analysis of Factors (EFA) on students' burnout, the psych library of the R package (Revelle, 2018; Team, 2017) was used. Table 1 presents loadings greater than 0.3 for all of the factors composing the students' burnout syndrome.

Table 2 presents the items' loadings corresponding to the structural components of the emotional intelligence.

Figure 1 shows the hierarchical regression tree for the burnout syndrome using the structural elements of the emotional intelligence. The library rpart of R package (Therneau et al., 2018) was used for the regression tree.

According to the hierarchical tree of Figure 1, the most crucial factor influencing the burnout syndrome is EI3 (lack of emotional self-determination). The second factor responsible for the high values of students' burnout - right part of the tree - is EI2 (lack of empathy - heteroconsciousness), while for the low values of the burnout - left part of the tree - EI4 factor (heteroawareness ability) contributes.

Focusing on tree branches showing the highest values, three case scenarios are noted. In particular, following the two right branches of the tree, it is clear that high burnout rates concerning the 4% percentage of students, exist as long as high values greater than 1.4 of the EI2 (lack of empathy-heteroconsciousness) and greater than or equal to the average -0.31 of EI3 index (lack of emotional self-determination) occur. It is noteworthy that the same result as the two previous conditions indicate is also present if EI4 factor (heteroawareness ability) is absent. However, if EI4 factor exists at high values greater than 1.7 then the students' burnout syndrome also displays extremely high values.

The third branch concerns the condition where there is intense emotional self-determination ($EI3 < -0.31$) and at the same time high level of heteroawareness ability ($EI4 > 1.9$), conditions that enhance the burnout syndrome. Perhaps, this condition raises reflection because one could expect strong emotional self-determination accompanied by high heteroawareness ability to be far from the burnout situation. However, this conceptual approach could be of some interest if we consider that students who can recognise the feelings of others, see things from others' perspective, dive into the reasons of others' behavior and realise their own feelings, then it is likely that they charge themselves with psycho-emotional exhaustion; the ability to recognise and understand their own feelings and others' motions preassumes in one way or another, emotional spending. The same conclusion is drawn from the principal components analysis (PCA) of the structural elements of emotional intelligence. As it can be noticed in Figure 2, the projection of the structural elements of emotional intelligence on the two principal axes (left-hand figure) namely EI3 (lack of emotional self-determination) and EI4 (heteroawareness ability) are almost vertical to one another and thus, the state of the existing burnout is determined by them. The projections on the second and third principal components (figure on the

right) namely E11 (self-control ability) and EI2 (lack of empathy-heteroconsciousness) being vertical to EI3 and EI4, are not capable to influence the existence or not of the burnout state.

Questions about the emotional intelligence of students	EI1	EI2	EI3	EI4
Difficulty in expressing my feelings			0.703	
Difficulty in seeing things from others' perspective		0.686		
Difficulty in controlling my feelings	-0.304	0.433		
Difficulty in figuring out what I feel		0.368	0.479	
Ability to understand others' feelings				0.700
Ability to acknowledge my feelings clearly	0.539			
Ability to express my feelings clearly	0.439		-0.428	
Ability to manage my feelings	0.704			
Ability to acknowledge others' feelings successfully				0.741
Difficulty in understanding others' messages		0.469		
Some of the most important events of my life have led me to review what is important and what not in life	0.451		0.368	
Ability to control my feelings	0.641			
Difficulty in understanding why others feel what they feel		0.625		
Ability to implement these which I am engaged to	0.659			
Ability to be aware of my abilities and weaknesses	0.537			
Ability to recognize how my feelings influence my performance	0.404		0.333	
Ability to understand the reasons behind others' behaviour				0.660

Table 2. *Loadings of the items corresponding to the four factors of the exploratory factor analysis on students' emotional intelligence (loadings > 0.3). Fit measures of the exploratory factor analysis: TLI (0.906), RMSEA (0.092).*

To determine the degree of synergy of emotional intelligence structural elements in modulating the state of burnout syndrome, a multiple linear regression was performed. Table 3 presents the independent variables of the multiple regression, their interdependencies, the beta coefficients for each variable and the indication of their statistical significance. The R-squared measure of the multiple regression is 0.31. Therefore, emotional intelligence is a factor indeed, in interpreting the change of the burnout syndrome, but yet not the major one. Given that the values of the emotional intelligence components are normalized, the effect of each one was compared based on the absolute value of the linear beta coefficient for each. It follows that the most significant factor in terms of the effect on burnout is EI2 (lack of empathy-heteroconsciousness) presenting a positive correlation (0.461). EI3 (lack of emotional self-determination) factor follows up correlated positively with burnout (0.406). EI1 (self-control ability) develops in turn, a negative correlation with students' burnout syndrome (-0.309). EI4 (heteroawareness ability) as an additional influencing factor is positively correlated with the state of students' burnout (0.192).

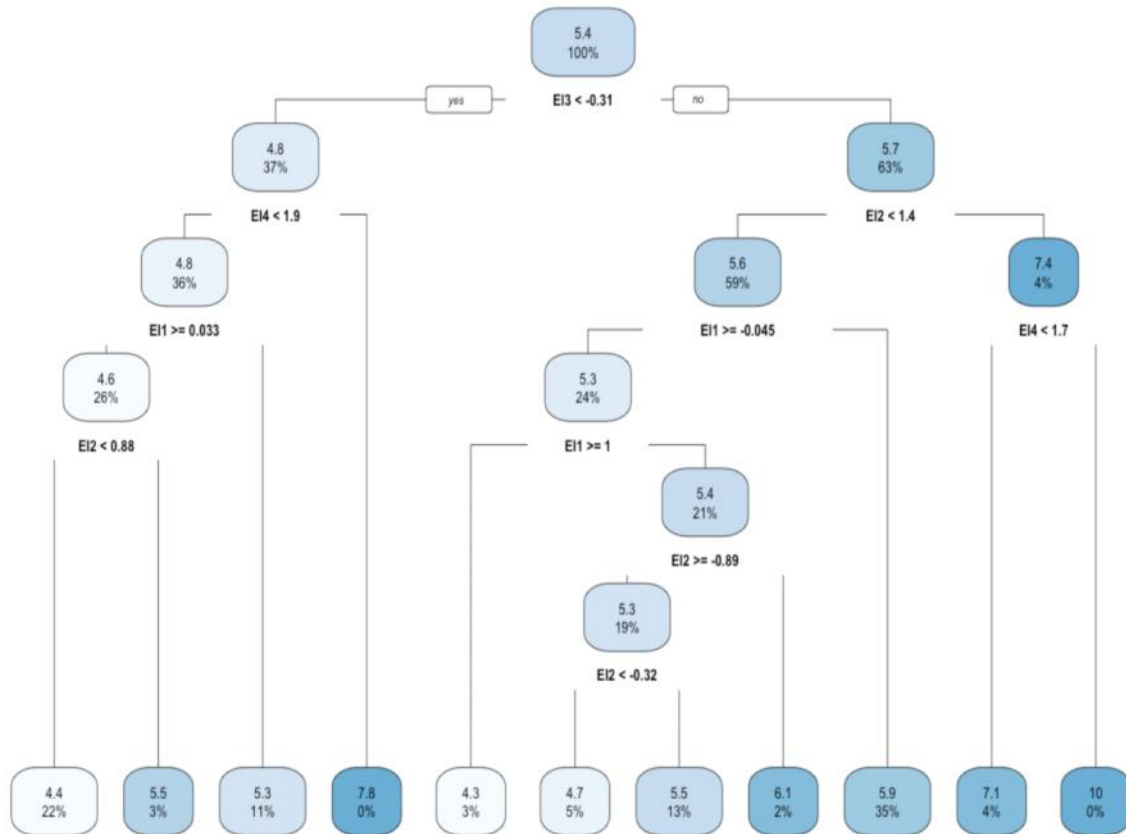

Figure 1. The hierarchical regression tree of the burnout syndrome using the elements of emotional intelligence. The number inside the eclipsis refers to the mean values of students; burnout for the particular branch or leaf. The number under the eclipsis refers to the percentage of the student sample corresponding to the branch or leaf. When the indicated condition is true, we are led to the left branch.

Nevertheless, the burnout syndrome is the resultant of its structural elements. Thus, any other factor only indirect effect, could exert. To assess how the indirect effect of emotional intelligence’s components on the burnout syndrome mediate, a structural equation model (SEM) is used (Figure 3). In particular, every structural element of the burnout syndrome has been matched accordingly with all of the structural elements of emotional intelligence. For comparability purposes, all the coefficients listed in the structural model have been normalized.

Figure2. Projections of emotional intelligence components on the principal axes. To the left are the projections on the two principal axes and on the right on the second and on the third principal axes.

Independent variables	Beta
EI1 self-control ability	-0.309 ***
EI2 lack of empathy - heteroconsciousness	0.461 ***
EI3 lack of emotional self-determination	0.406 ***
EI4 heteroawareness ability	0.192 ***
EI1 self-control ability: EI2 lack of empathy - heteroconsciousness	0.201 ***
EI1 self-control ability: EI3 lack of emotional self-determination	-0.049 **
EI1 self-control ability: EI4 heteroawareness ability	0.055 ***
EI2 lack of empathy - heteroconsciousness: EI4 heteroawareness ability	-0.082 ***
EI1 self-control ability: EI2 lack of empathy - heteroconsciousness: EI3 lack of emotional self-determination	0.133 ***
EI1 self-control ability: EI2 lack of empathy - heteroconsciousness: EI4 heteroawareness ability	-0.063 ***
EI2 lack of empathy - heteroconsciousness: EI3 lack of emotional self-determination: EI4 heteroawareness ability	0.028 *
EI1 self-control ability: EI2 lack of empathy - heteroconsciousness: EI3 lack of emotional self-determination: EI4 heteroawareness ability	0.038 ***

Table 3. Results of multiple regression on burnout syndrome with the structural elements of emotional intelligence. (Signif. codes: 0 '***' 0.001 '**' 0.01 '*' 0.05)

Table 4 shows all estimates of the structural equation model coefficients normalized for comparability purposes. In each row the structural elements of burnout are mentioned, while in the columns the structural elements of emotional intelligence are presented.

It can be observed that EI2 factor (lack of empathy-heteroconsciousness) exerts a positive effect on the total burnout level via factor B7 (depersonalization). Therefore, students who have difficulty in seeing things from the others' point of view, may be led to the state of burnout mainly because these students tend to be depersonalised. Factors B1 (physical and psycho-emotional exhaustion), B4 (empathy - understanding others' feelings) and B3 (cynicism - lack of interest in others) could be viewed as secondary channels of the indirect positive effect by EI2 (lack of empathy - heteroconsciousness) on burnout. In other words, students who have difficulty in empathy are likely to experience the burnout

syndrome especially if they are already psycho-emotionally exhausted; another scenario is that students may simply realise how others feel but might not delve deeper into “why” or sympathise others’ motions; or based on the third scenario, they might be characterised by severe lack of interest in others predicting possible existence of burnout. Similarly, a positive effect is exerted by EI2 factor (lack of empathy – heteroconsciousness) indirectly on burnout via factor B6 (difficulty in working with others). This could be interpreted in the sense that students lacking the ability to empathize could be led to the state of burnout provided that the interpersonal relationships fatigue them. In addition, students characterised by weakness in “empathy” could get into the state of burnout especially when they perceive themselves as being ineffective in their studies; this is illustrated by the “route” of the indirect negative effect exerted by factor EI2 (lack of empathy - heteroconsciousness) via factor B2 (efficacy and self-accomplishment of studies) on burnout.

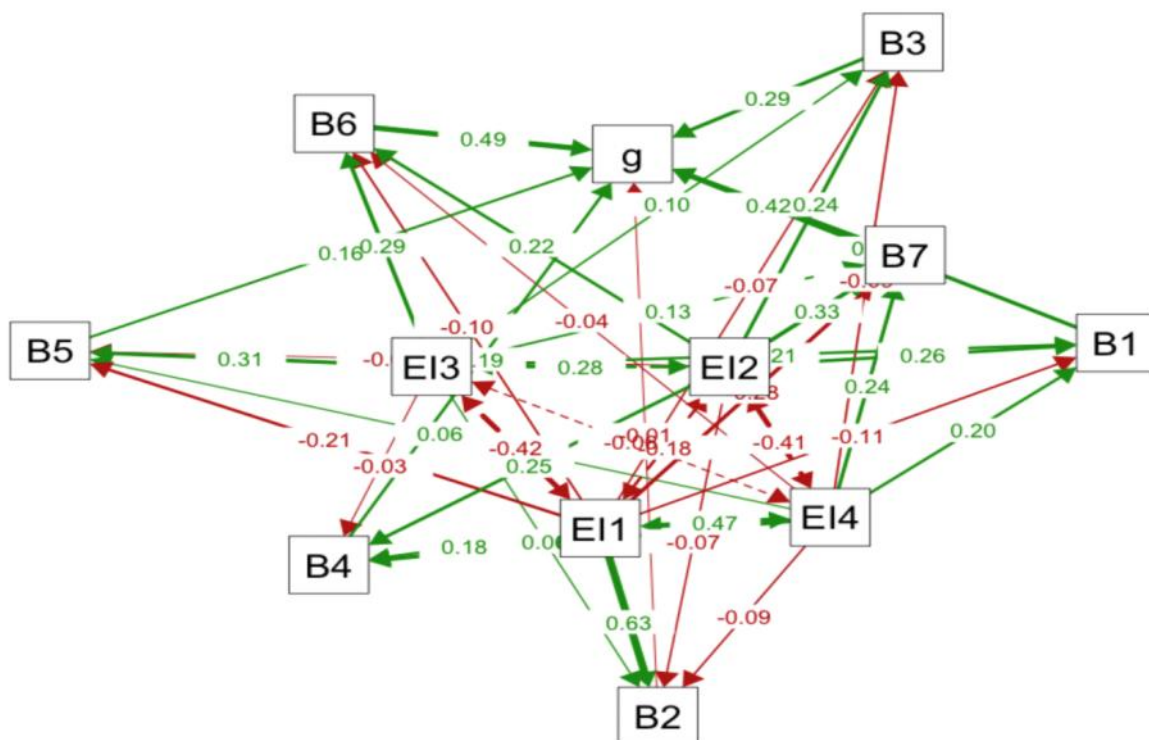

Figure 3. Structural Equation Model (SEM) of factor *g* (burnout) with its structural elements B1 to B7, and the structural elements of emotional intelligence EI1 to EI4. Fit measures CFI (0.9410), RMSEA (0.043), SRMR (0.041).

It can also be observed that EI3 factor (lack of emotional self-determination) exerts an indirect positive effect on burnout through four channels; B5 (lack of interest in studying and absenteeism), B6 (difficulty in working with others), B1 (physical - psycho-emotional exhaustion) and B7 (depersonalization). This could be interpreted under the spectrum of the idea that students who have weakness in their emotional “self-determination” can be led to burnout under the assumption that they

feel inefficient in their studies or find it difficult to cooperate with others or feel exhausted from their studies or even behave to others impersonally.

Normalized indirect effect factors from SEM	EI1	EI2	EI3	EI4
B1 physical - psychoemotional exhaustion	-0.113	0.258	0.206	0.198
B2 efficacy and self-accomplishment of studies	0.628	-0.066	0.056	-0.086
B3 cynicism - lack of interest in others	-0.072	0.244	0.099	-0.090
B4 empathy – understanding others’ feelings	0.181	0.251	-0.026	0.326
B5 lack of interest in studying and absenteeism	-0.214		0.312	0.057
B6 difficulty in working with others	-0.104	0.225	0.287	-0.039
B7 depersonalisation	-0.279	0.329	0.133	0.244

Table 4. *The normalized estimates of the coefficients of the structural equation model of Figure 3.*

Furthermore, EI1 factor (self-control ability) exerts indirect influence on the burnout syndrome via two positive channels; B2 (efficacy and self-accomplishment of studies) and B4 (empathy - understanding others’ emotions) and through two negative channels; B7 (depersonalization) and B5 (lack of interest in studying and absenteeism). It could be noted that the resultant of all the above components is negative after all. Indeed, it is possible that students experience burnout despite their ability to manage effectively their own motions as long as they treat others impersonally or feel ineffective in their studies.

Similarly, EI4 factor (heteroawareness ability) indirectly affects burnout syndrome following three positive routes; B4 (empathy - understanding others’ feelings), B7 (depersonalization) and B1 (physical and psycho-emotional exhaustion). In this sense, students who have the ability to recognise and at the same time understand how others feel are prone to burnout perhaps because these processes require “emotional spending”. Additionally, students who encompass the “heteroawareness ability” could be led to the state of burnout as long as they behave to others impersonally or have experienced physical - psycho-emotional exhaustion.

CONCLUSION, IMPLICATIONS AND FURTHER RESEARCH

In this paper the effect of students’ emotional intelligence on students’ burnout syndrome was analysed. Both phenomena were decomposed by using exploratory factor analysis, respectively. In particular, emotional intelligence was decomposed into four components and students’ burnout syndrome was decomposed into seven elements. Via hierarchical regression trees, the structural elements of emotional intelligence as they emerged, were ranked in terms of the importance of their direct effect on students’ burnout. Likewise, the indirect effect of emotional intelligence’s structural components on students’ burnout syndrome was analysed using an appropriately adjusted structural equational model.

The analysis showed that two structural components of emotional intelligence outrival in terms of the direct effect on students’ burnout syndrome; the inability of students to see things from others’ point of

view and to understand “why” others feel what they feel. Also, the inability of students to understand and express their own feelings.

Furthermore, the research showed that there exist certain paths exerting indirect influence on students’ burnout syndrome via emotional intelligence’s structural elements; in particular, students who lack the ability in seeing things from the others’ point of view could be led to the state of burnout mainly due to their tendency to be depersonalised. Under the same assumption that is lack of empathy, the students are likely to experience burnout especially if are already psycho-emotionally exhausted. In addition, it emerged that students who lack empathy could get into the state of burnout especially when they perceive themselves as being ineffective in their studies. It also emerged that students whose emotional “self-determination” is weak can be led to burnout under the assumption that they feel inefficient in their studies or have difficulty in cooperate with others or feel exhausted from their studies or behave to others in impersonal ways.

The correlation between students’ emotional intelligence and burnout is confirmed in this research and this inversely proportional conjunction is examined and supported in literature. The structural elements of emotional intelligence that emerged from this work as the direct causes of students’ burnout revolve around two axes; understanding the emotions of others and understanding the emotions of self. In relation to the literature, these are the core axes of emotional intelligence and thus its qualitative features. Consistent with the literature are also the interrelationship among emotional intelligence, burnout and students’ satisfaction, concluding that high levels of emotional intelligence are associated with low levels of students’ exhaustion and high levels of satisfaction. Furthermore, the analogous association among students’ emotional intelligence and their ability of coping with interpersonal relationships and working efficiently was emerged in this paper and is in line with the literature. This paper adds to the hierarchy of the factors’ influence and their categorization into direct and indirect variables. It is interesting the diverse mediation exerted that emerged from this work; factors such as exhaustion, lack of satisfaction from studies, disability in cooperation, cynical and detached behavior intermediate between students’ emotional intelligence and students’ burnout, detail which indicates both direct and indirect influences of students’ emotional intelligence on students’ burnout syndrome.

An innovative element in the methodological approach is that both the phenomena of students’ burnout and emotional intelligence were analysed via exploratory factor analysis and their structural elements were examined as separate influential factors. The same methodological approach could be followed towards the interpretation of students’ burnout syndrome on the basis of the structural elements of student satisfaction. Analogously, student engagement could be interpreted under the spectrum of the decomposition of emotional intelligence.

Therefore, the academic environment could accomplish appropriate interventions towards the enhancement of students' emotional intelligence mainly on the basis of explicit academic modules that cultivate students' skills towards this direction so as students meet best the goals of personal balance, spiritual improvement and interpersonal harmony.

ANALYSING FACTORS AFFECTING BURNOUT IN UNIVERSITY STUDENTS: THE PHENOMENON OF DEPERSONALISATION

Georgiou, Dimitra Ap.; Androulakis, George S.

Department of Business Administration, University of Patras, Greece.

ABSTRACT

In this paper an attempt is made to analyse the factors that affect the phenomenon of depersonalization as a result of the burnout syndrome in students. In particular, the phenomenon of depersonalisation was examined as a result of the main factors that emerged from nested hierarchical regression trees. The most important factors were similarly analysed with hierarchical regression trees and examined with the use of a structural equation model. The results showed that the main factors influencing the phenomenon of depersonalization among students are the difficulty of cooperation, cynicism - lack of interest in others and physical – psychoemotional exhaustion. Furthermore, emotional intelligence, student satisfaction and the university department appear to be additional factors that affect the phenomenon of depersonalization.

Keywords: student burnout, depersonalisation, emotional intelligence, student satisfaction, structural equation modelling, recursive regression trees.

INTRODUCTION

In recent years, many researchers have dealt with the burnout syndrome in the workplace (Cordes and Dougherty, 1993; Leiter and Maslach, 2003; Maslach et al., 2001; Maslach and Jackson, 1981; Nia and Zadeh, 2019; Schaufeli et al., 2002). Initially, in 1980 Maslach assessed the three dimensions of burnout; emotional exhaustion, depersonalisation and lack of personal achievements (Maslach and Jackson, 1981; Maslach and Leiter, 2008). In particular: (a) emotional exhaustion manifests with a sense of mental fatigue of the worker, who no longer has the necessary energy to invest in his/her work; (b) depersonalisation manifests itself by the removal of the individual from the people he/she serves and the creation of impersonal relationships with them, (c) lack of personal achievements is expressed by the weakness of performance and the resignation of any attempt to deal effectively with problems (Guthrie and Black, 1997).

The phenomenon of depersonalization often manifests itself with negative attitudes, irritability and inappropriate behavior towards the people served. It is often described as cynicism, loss of ideals and the treatment of others as if they were impersonal objects (Maslach et al., 1997). One of the most

important factors with a strong link to depersonalization is the confusion and overload of roles involving multiple and usually conflicting tasks without sufficient implementation time (Green et al., 2014). Also, the "non-functional climate" where there is no cooperation and support by colleagues and leadership (Green et al., 2014) and poor interpersonal relationships at the workplace (Brouskeli et al., 2017) can lead to a loss of interest in others and isolation (Green et al., 2014). In general, a lack of support from colleagues, supervisors, friends, family (Jones et al., 2001) can lead to an increase in absenteeism or even abandonment of work, (Guthrie and Black, 1997). In the same line of argument the lack of participation in decision-making of continuous education and of the sense of justice and autonomy (Tsounis et al., 2014) may also be an aggravating factor in the status of depersonalisation (Green et al., 2014).

Some researchers focus on the study of students' burnout syndrome, (Capri et al., 2012; Dyrbye et al., 2008). Young people such as students are more prone to emotional exhaustion under the circumstance of expectations for the future (Cordes and Dougherty, 1993), in conjunction with the transition period they experience (Maslach and Goldberg, 1998). Particularly first-year students may experience problems in adapting to the new environment, changing lives and creating new interpersonal relationships which encompasses uncertainty (Hicks and Heastie, 2008).

Negative correlation is presented between depersonalization and emotional intelligence, ie the ability to self-identify and control emotions but also to recognize the emotions of others (Antoniou and Koronaiou, 2018). There is also connectivity between the levels of life satisfaction and the burnout syndrome. In particular, it has been shown that the higher students' satisfaction level, the lower their exhaustion is (Capri et al., 2012), while the levels of the academic performance and persistence are increasing. Factors such as students' interaction with each other and their tutors, social life, intellectual development, academic performance are indeed structural elements of their overall satisfaction with student life (Lee et al., 2000).

Additionally, the frequency and intensity of interaction with the public is a strong predictive factor that can lead to depersonalization, (Watts and Robertson, 2011). For instance, it is indicated that nursing students' intense contact with patients is considered as a serious cause of perceived anxiety and a potential cause of students' depersonalisation (Prinz et al., 2012). At the same time, rapid consumption of energy reserves, (Koustelios and Kousteliou, 2001) implies psycho-emotional exhaustion and physical fatigue that may lead to depersonalisation (Green et al., 2014).

In this work, students' burnout syndrome is analysed using exploratory factor analysis and the phenomenon of depersonalisation as a crucial component of students' burnout syndrome is confirmed. In addition, a detailed analysis was exhibited on the factors affecting depersonalisation itself and their hierarchy in terms of their influential correlations.

METHODOLOGY

The population of this work consists of the students of the University of Patras. The University of Patras has 24 Departments which belong to 5 Schools, School of Business Administration, School of Engineering, School of Health Sciences, School of Humanities and Social Sciences and School of Natural Sciences. Patra's University is regional with students from all over the country who enter the university based on the criterion of successful national examinations. Therefore, a representative sample of the geographic distribution criterion can be derived from its students.

The survey took place in December 2018. The questionnaire was answered by 582 students, using stratified sampling based on the geographical distribution and the university departments. 51.5% of the sample are women and 48.5% are men. The students' distribution is uniform in semesters, approximately analogous to 8% of the sample for each semester.

The questionnaire includes the following eniological categories: (a) Demographic data, (b) Student Life, (c) Intensification and Satisfaction of Studying, (d) Student Burnout Syndrome (e) Student Emotional Intelligence. Most of the questionnaire items are based on the following validated questionnaires: (a) Maslach Burnout Inventory - Student Survey (MBI-SS) measuring the three characteristic dimensions of the burnout syndrome (Hu and Schaufeli, 2009; Schaufeli et al., 2002) namely emotional exhaustion, depersonalisation and lack of personal accomplishment, (b) the Trait Emotional Intelligence Questionnaire (TEIQue-SF) (Petrides, 2009), (c) the Employee Satisfaction Inventory (Koustelios, 1991; Koustelios and Bagiatis, 1997), and (d) the Self-Rated Emotional Intelligence Scale (Brackett et al., 2006). All items are measured by the use of a 7-point Likert scale. The Cronbach a for the present study is calculated 0.92.

In order to find out the factors which students' burnout syndrome is analysed to, an exploratory factor analysis (EFA) of all items took place in terms of burnout. From this exploratory factor analysis seven factors emerged: a) B1 physical - psychoemotional exhaustion, b) B2 efficacy and self-accomplishment of studies, c) B3 cynicism - lack of interest in others, d) B4 empathy – understanding others' feelings, e) B5 lack of interest in studying and absenteeism, f) B6 difficulty in working with others, g) B7 depersonalisation.

A separate exploratory factor analysis (EFA) was conducted for the emotional intelligence of the students resulting in 4 factors, two positive abilities self-control (EI1) and heteroawareness (EI4) and two negative ones lack of empathy - heteroconsciousness (EI2) and lack of emotional self-determination (EI3).

In addition, the following factors emerged as crucial ones when focusing on student satisfaction, by the usage of an exploratory factor analysis (EFA): a) A1 workload pressure, b) A2 learning infrastructure sufficiency, c) A3 existence of justice and reward, d) A4 adequate information and organisation, e) SL1

total studying level satisfaction, f) SL2 level-procedures satisfaction, and g) SL3 satisfaction from the studies within the departments.

In order to prioritise the independent variables as to the significance of their effect on depersonalisation, hierarchical regression trees were applied (Breiman et al., 1984). The most important hierarchical factors that emerged were similarly analysed using hierarchical regression trees for each of them, separately. Using all the independent variables derived from the above complex sequential approach of nested regression trees, a structural equational model (SEM), (Kline, 2015), was conducted in order to assess the indirect as well as the direct effect on overall, of the most crucial factors formatting factor B7 (depersonalisation).

RESULTS AND DISCUSSION

For the Exploratory Factor Analysis (EFA) of the students' burnout syndrome, the library *psych* of the R statistical package (Revelle, 2018; Team, 2017) is used. Table 1 shows the exploratory factor analysis loadings greater than 0.3.

The factors that statistically affect the values of B7 (depersonalisation) are presented in the last column of Table 2 and are in certain details in accordance with the literature: a) **A3 existence of justice and reward**: it is about rewarding student achievements and the perception of the fairness of tutors' judgment, having negative correlation with B7 (depersonalisation); therefore, as factor A3 increases, there is a decrease in factor B7, b) **A4 adequate information and organization**: it is about the adequacy of academic information and organization and has a negative correlation with B7 (depersonalisation); therefore, the increase in A4 values corresponds to a decrease in B7 (depersonalisation) value, c) **B1 physical-psychoemotional exhaustion**: a positive correlation with B7 (depersonalisation) is computed. That is, as the emotional burnout of students increases, the value of depersonalisation increases accordingly, d) **B2 efficacy and self-accomplishment of studies**: a negative correlation with B7 (depersonalisation) is resulting; when the value of index of efficacy and self-accomplishment of studies increases, the phenomenon of depersonalisation is recessed, e) **B3 cynicism - lack of interest in others**: there is a positive correlation with B7 (depersonalisation); the more lack of interest for others is observed, the more the status of depersonalisation is intensified, f) **B6 difficulty in working with others**: there is a positive correlation with B7 (depersonalisation), so as the difficulty in students' interpersonal cooperation increases, the phenomenon of depersonalisation is intensified, g) **Department**: three departmental categories are presented according to B7 (depersonalisation) levels. In particular, Chemical Engineering, Material Science, Pharmacy and Science Sciences of Education and Early Childhood Education show the smallest values for factor B7 (depersonalisation). On the other hand, the Philosophical, Environmental and Natural Resources, Physics, Biology, Electrical and

Computer Technology, Environmental Management and New Technologies, Mechanical and Aeronautical Engineering and Mathematics departments show the highest values for factor B7 (depersonalisation). Finally, the Department of Architecture, Computer Engineering and Informatics, Civil Engineering, Theatre Studies, Primary Education, Philology, Medicine, Geology, Chemistry, Business Administration, Business Administration of Agricultural Products and Food and Economics show prices around the mean value of B7 (depersonalisation), h) **EI1 self-control ability**: a negative correlation with the factor B7 (depersonalisation) is calculated and therefore an increase in the self-management ability of the students' emotions corresponds to a decrease in the values of their depersonalisation levels, i) **EI2 lack of empathy - heteroconsciousness**: it is positively correlated with the factor B7 (depersonalisation) and thus as the difficulty in understanding others' feelings increases, the levels of student depersonalisation increase accordingly.

Figure 1 shows the hierarchical regression tree for factor B7 (depersonalisation) illustrating the statistically significant factors. The library rpart of R is used to create the regression tree (Therneau et al., 2018). Regarding the hierarchy of factors based on the criterion of their influence on the factor B7 (depersonalisation), the most important ones appear higher in the branches of the regression tree. Therefore, the hierarchically most important factor is B3 (cynicism - lack of interest in others), followed by B1 (physical - psychoemotional exhaustion) and B6 (difficulty in working with others). EI3 (lack of emotional self-determination) and the Department are in the fourth place. The "importance of work stability" variable (importance.workstab), the A4 factor (adequate information and organization), the B2 factor (efficacy and self-accomplishment of studies) and EI2 (lack of empathy - heteroconsciousness) follow up.

Focusing on the right side of the regression tree (Figure 1) that corresponds to the large mean values of B7 (depersonalisation), it can be noticed that high values for the factor B7 (depersonalisation) appear on the right leaf, with an average of 2.00 concerning 3% percent of the population. Following the nodes leading to this leaf, high values of factor B7 (depersonalisation) are observed as long as the following combination of conditions exists:

- (a) **B3 (cynicism - lack of interest in others)** which is the most important factor towards the formation of B7 level (depersonalization) when displays values greater than 0.83.
- (b) **B1 (physical and psychoemotional exhaustion)** is the second most significant factor since its values are greater than or equal to the mean value, -0.25.
- (c) The **university department** is the third most crucial factor with increased values of depersonalisation in the following departments: Biological, Environmental and Natural Resources, Geology, Medicine, Architecture and Physics.

Items for Student Burnout	B1	B2	B3	B4	B5	B6	B7
Absenteeism	0.601				0.446		
Physical exhaustion							
Lack of concentration					0.347		
Dedication on studies		0.632					
Department culture				0.340			
Stress and efficacy	0.531						
Mental exhaustion	0.616						
Wake up exhausted	0.369				0.321		
Tired of student cooperation						0.658	
Tired of teacher cooperation						0.490	
Study frustration					0.420		
Stressed with student cooperation						0.620	
Stressed with teacher cooperation						0.605	
Understand students' feelings				0.554			
Understand teachers' feelings				0.547			
Facing study problems		0.421					
Rejuvenated working with students				0.463			
Rejuvenated working with teachers				0.310			
Impersonal behaviour towards students							0.791
Impersonal behaviour towards teachers							0.581
Emotional hardening							
Lack of caring for students			0.625				
Lack of caring for teachers			0.734				
Forgetting study troubles	-0.558						
Irritability	0.584						
Lack of time for social meetings	0.614						
Drained by studies	0.419					0.393	
Pressure from studies	0.437						
Less interest in studies					0.442		
Excited about studies		0.722					
Self-efficacy					-0.520		
Accomplishment of important things		0.655					
Doubt about the importance of studies		-0.525					
Cynical about the importance of studies		-0.305					
Drop out studies		-0.427					

Table 1. Loadings greater than 0.3 of the items corresponding to each of the seven factors of the exploratory factor analysis on students' burnout syndrome. Fit measures of the exploratory factor analysis: TLI (0.896), RMSEA (0.072)

In order to assess the overall indirect and direct effect of the most important factors in the values of B7 (depersonalization) a structural equation model (SEM) was adapted (Figure 2). For comparability purposes all the coefficients listed have been standardised.

For the examination of the direct effects on factor B7 (depersonalisation), exclusively the factors of the hierarchical regression tree which correspond to the 75% of the overall cause of the change of B7 (depersonalization) were selected. Therefore, the factors B3 (cynicism - lack of interest in others), B6 (difficulty in working with others), B1 (physical - psychoemotional exhaustion), B2 (efficacy and self-accomplishment of studies), EI2 (lack of empathy – heteroconsciousness, A4 (adequate information and organization) and A3 (existence of justice and reward) were used.

Independent variables	Dependent variables			
	B1	B3	B6	B7
A1 workload pressure	0.314 *** 0.091			
A3 existence of justice and reward				-0.170 *** 0.027
A4 adequate information and organization	-0.092 *** 0.006			-0.311 *** 0.085
B1 physical-psychoemotional exhaustion		0.340 *** 0.128	0.499 *** 0.262	0.402 *** 0.177
B2 efficacy and self-accomplishment of studies		-0.261 *** 0.075	-0.301 *** 0.095	-0.386 *** 0.162
B3 cynicism - lack of interest in others				0.548 *** 0.296
B5 lack of interest in studying and absenteeism	0.370 *** 0.123	0.259 *** 0.067	0.446 *** 0.189	
B6 difficulty in working with others		0.541 *** 0.309		0.549 *** 0.313
Department			(categorical) *** 0.106	(categorical) *** 0.041
EI1 self-control ability		-0.192 *** 0.040		-0.272 *** 0.079
EI2 lack of empathy - heteroconsciousness	0.271 *** 0.065	0.322 *** 0.103		0.321 *** 0.101
EI3 lack of emotional self-determination	0.338 *** 0.098	0.207 *** 0.041	0.415 *** 0.156	
SL1 total studying level satisfaction	-0.204 *** 0.041			

Table 2. Results from simple linear regressions. In columns are presented the dependent variables. In rows the independent variables are displayed. Regressions' beta and the R squared coefficients are presented. (Significant codes: 0 '***' 0.001)

In terms of the indirect effects, as can be observed in Figure 1, the factors B1 (physical and psycho-emotional burnout), B3 (cynicism - lack of interest in others) and B6 (difficulty in working with others) emerge as the three most important factors towards the formation of B7 (depersonalisation). For each of the three above factors, an additional hierarchical regression tree was performed. Table 2 lists the beta coefficients and the R-squared coefficient for each simple regression among factors B1, B3 and B6 with their respective independent variables.

Based on the above methodological approach the following variables emerged:

- (1) Variables affecting factor B3 (cynicism - lack of interest in others): (a) B6 (difficulty in working with others) has a positive correlation, (b) B5 (lack of interest in studying and absenteeism) has a positive correlation, (c) B1 (physical and psycho-emotional exhaustion) has a positive correlation, (d) EI3 (lack of emotional self-determination) exhibits positive correlation, (e) EI1 (self-control ability) appears a negative correlation, (f) EI2 (lack of empathy - heteroconsciousness) has positive correlation, and (g) B2 (efficacy and self-accomplishment of studies) exhibits negative correlation.

- (2) Variables affecting factor B6 (difficulty in working with others): (a) B1 (physical and psycho-emotional exhaustion) has a positive correlation; (b) the department, being a categorical variable creates accordingly positive or negative deviations, (c) EI3 (lack of emotional self-determination) calculates a positive correlation; (d) B5 (lack of interest
- (3) Variables affecting factor B1 (physical and psycho-emotional exhaustion): (a) A1 (workload pressure) has a positive correlation; (b) SL1 (total studying level satisfaction) calculates a negative correlation; (c) B5 (lack of interest in studying and absenteeism) has a positive correlation; (d) EI3 (lack of emotional self-determination) exhibits a positive correlation (e) EI2 (lack of empathy-heteroconsciousness) has a positive correlation; (f) A4 (adequate information and organization) shows a negative correlation.

Considering mainly the direct effects of these factors on the change in B7 (depersonalization), the following classification is observed:

- (1) The strongest factor overall is B6 (difficulty in working with others) having a direct positive effect on B7 (depersonalisation) and a positive indirect one through B3 (cynicism - lack of interest in others). Therefore, students who have difficulty in working with others tend to display depersonalisation. However, it is worth noting that the difficulty in working with others can be a foundation stage for the depersonalisation situation manifested by the parallel appearance of cynicism - lack of interest in others.

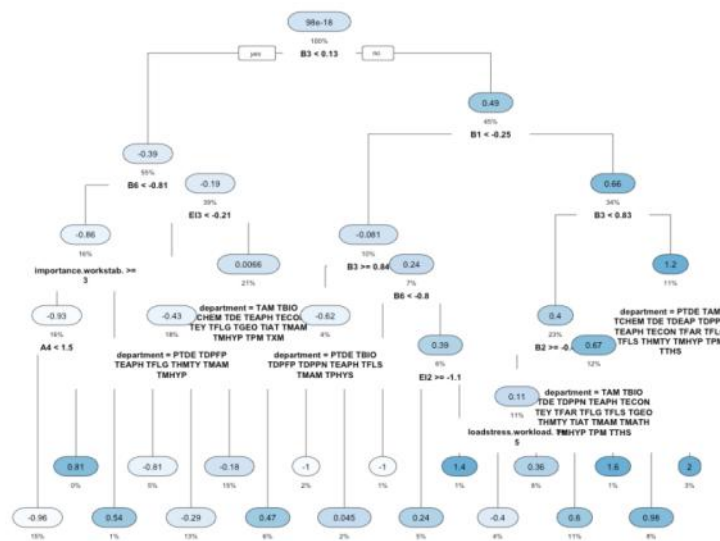

Figure 1. Hierarchical regression tree for the factor B7 depersonalisation. The number inside the eclipsis refers to the mean values of depersonalisation for the particular branch or leaf. The number under the eclipsis refers to the percentage of the student sample corresponding to the branch or leaf. When the indicated condition is true, we are led to the left branch

The second factor is B3 (cynicism - lack of interest for others) having great direct impact on B7 (depersonalisation). This suggests that students exhibiting cynical behaviour towards others tend to experience the situation of depersonalisation.

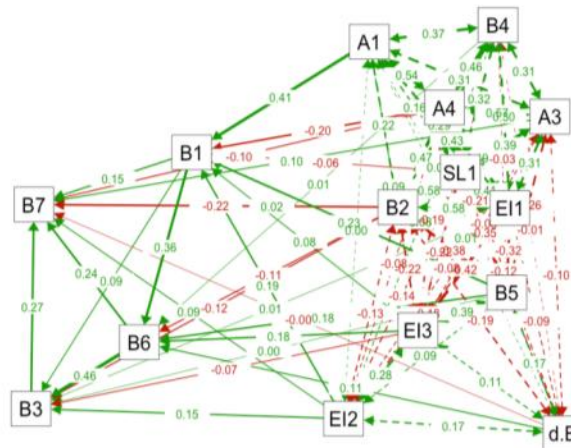

Figure 2. Structural equation model for the factor B7 (depersonalisation). Fit measures: CFI (0.9410), RMSEA (0.043), SRMR (0.041)

- (2) B1 (physical and psycho-emotional exhaustion) follows having a direct positive effect on B7 (depersonalisation) and an indirect dual positive effect mainly through the change of B6 (difficulty in working with others) and secondarily via B3 (cynicism - lack of interest for others). Consequently, students experiencing physical and psycho-emotional exhaustion, especially those with difficulty in working together and those who have lack of interest for others could be led to depersonalisation.
- (3) B2 (efficacy and self-accomplishment from studies) comes next showing a relatively strong negative direct effect on B7 (depersonalisation) and also a small negative indirect one through B3 (cynicism - lack of interest in others) and B6 (difficulty in working with others). Therefore, students who feel excited about their studies are considered to be far from the phenomenon of depersonalisation. However, these students, when governed by the characteristics of cynicism and the difficulty in working with others could be led to depersonalisation.
- (4) A4 (adequate information and organisation) presents a small negative direct effect on B7 (depersonalisation) and a greater indirect negative one via B1 (physical and psycho-emotional exhaustion). Therefore, it can be perceived that the adequacy of information towards students and their organised learning environment could help towards the prevention of their depersonalisation. However, under the same circumstances (adequacy of information and organisation), the same students may be depersonalised provided that they have experienced physical and psycho-emotional exhaustion.

- (5) A3 (existence of justice and reward) has a direct negative impact on B7 (depersonalisation). This implies that students who perceive the sense of rewarding and the sense of fairness could be considered as far from the status of depersonalisation.
- (6) EI2 (lack of empathy - heteroconsciousness) exhibits a small positive direct effect on B7 (depersonalisation) and also a small indirect positive one through B1 (physical and psycho-emotional exhaustion) and via B3 (cynicism – lack of interest in others). This means that students who have difficulty in understanding others and seeing things from others' point of view are likely to experience depersonalisation. Particularly, those who encompass behaviours such as lack of interest in others and also psycho-emotional exhaustion are more prone to be depersonalised.
- (7) The Department factor appears to be as well an influential factor upon depersonalisation, where three department categories are distinguished according to the levels of depersonalisation appeared.

Focusing on the indirect effects exerted by the independent variables (most of them are in accordance with the literature exerting though direct effect) on the formation of B7 (depersonalisation), the following descending order according to the magnitude of the influence, is observed: (a) B5 (lack of interest in studying and absenteeism) shows an exclusive indirect positive effect on B7 (depersonalisation) and in particular via a three-fold influence; B1 (physical and psycho-emotional exhaustion), B3 (cynicism - lack of interest in others) and B6 (difficulty in working with others). Therefore, it could be realised that students who feel frustrated and lack of interest in their studies may be led to a situation of depersonalisation provided that the following conditions are individually or collectively present: physical and psycho-emotional exhaustion, difficulty in working with others and lack of interest in others. (b) EI3 (lack of emotional self-determination) has an indirect effect on B7 (depersonalisation) through the following pathways: B6 (difficulty in working with others) and B1 (physical and psycho-emotional exhaustion) both presenting positive effect and B3 (cynicism - lack of interest in others) presenting though negative effect. The positive correlations are in one way or another, expected as students who have difficulty in recognising and expressing their own feelings are more likely to encounter obstacles in working with others. Under the same line of argument, the same students who have difficulty in recognising their own feelings are more likely to experience physical psychoemotional exhaustion as a stage perhaps before the depersonalisation. The negative correlation between EI3 (lack of emotional self-determination) and B3 (lack of interest in others) could perhaps be viewed as unexpected; a possible interpretation could be the case where students interested in others leave little "space" and time in order to focus on their own feelings. (c) A1 (workload pressure) is positively directly associated with B1 (physical and psycho-emotional burnout). Students who are

under pressure because of the burden of their student obligations might be prone to physical and psycho-emotional exhaustion before the depersonalisation situation occurs. (d)SL1 (total studying level satisfaction) is directly negatively related to factor B1 (physical and psycho-emotional exhaustion). Students who are happy with their level of study are less likely to fall into the situation of burnout either depersonalisation.

CONCLUSION, IMPLICATIONS AND FURTHER RESEARCH

In this paper most of the factors affecting students' depersonalisation were examined. The analysis was based on Structural Equation technique. For the construction of the equations, the most important independent variables were used as emerged from the hierarchical tree of the students' depersonalisation factor. Analogously, the most crucial factors emerged were further analysed on the basis of their independent variables. The corresponding nested regression trees have formatted the final Structural Equation Model. The analysis showed that twelve factors, eight directly and four indirectly, exert influence on students' depersonalisation. In particular, the most significant factor that exerts influence on the status of students' depersonalisation appeared their difficulty in cooperating with their fellow students and could be a foundation stage for the depersonalisation manifested by the parallel appearance of cynicism - lack of interest in others. In addition, it was found that students who exhibit cynical behaviour towards others are more likely to experience the situation of depersonalisation. In addition, the research indicated that prone to depersonalisation are also the students who have difficulty in understanding others and seeing things from others' point of view that is low emotional intelligence. On the other hand, it emerged that students who feel excited about their studies and enjoy an organised learning environment are considered to be far from the phenomenon of depersonalisation as well as these who perceive the sense of rewarding and fairness. The role of the department also emerged pointing out the School of Engineering with the highest average score of students depersonalisation whereas the School of Humanities and Social Sciences with the lowest average score.

Certain factors described above are indeed in accordance with the literature. Nevertheless, this paper adds to the hierarchy of the factors' influence and their categorization into direct and indirect variables. An innovative element in the methodological approach is that since the phenomenon of burnout was initially analysed via exploratory factor analysis, its structural elements were examined as separate factors, and thus as stages of the phenomenon of depersonalisation itself. Based on the analysis, depersonalisation could be viewed as the final stage of burnout, and therefore the remaining six structural elements of burnout were used as independent factors.

The same methodological approach could be followed to interpret other structural factors of the burnout syndrome such as emotional exhaustion, lack of personal accomplishment, difficulty in working with others and cynicism. Therefore, the educational system could elaborate and implement appropriate interventions towards the prevention and confrontation of students' depersonalisation i.e. placing emphasis on the particular characteristics of each academic department, on student life to meet the goals of student involvement, cooperation, socialisation and improvement.

DELIVERY EXCELLENCE THROUGH PROCESS IMPROVEMENT AND CHANGE MANAGEMENT

Gheta, Madalina Ionela

Business Administration Doctoral School The Bucharest University of Economic Studies

ABSTRACT

The globalization has influenced the companies to innovate. Given the circumstances, innovation become a priority for any organization regardless its size, activity or region. The notion of innovation defines the idea of new. The introduction of the "new" concept is the main factor that determines the evolution of economy.

The interest for innovation has grown more and more with the implementation of new efficient systems and methods, that represents a modality to increase the company's profits. The transformation of processes or services is generated by the fact that the organizations are more interested of the new concepts. People have become more competitive and open minded to what means new, innovation being largely influenced by the human mentality.

The leadership, in the context of innovation, can be regarded as an essential element that determines the direction, defines the objectives and motivates the human resources. Approaching a healthy leadership style is extremely important because the success of an organization is based on human resources.

Keywords: Innovation, Leadership, Innovation phases, Change Management.

INTRODUCTION

The process improvement is an essential concept to cope with market competition. The improved process offers client satisfaction based on the results obtained. The interest of the companies to the client requirements is materialized by adopting strategies in order to ensure the increase of productivity. The process improvement differs from a company to another because the entire activity is linked to their own resources, structures, process risks and style of management.

Innovation is not an isolated action; it is a mix of factors involving new management methods, coherent processes and open perspectives. Innovation is closely linked to creativity and inspiration, based on an efficient management related to the concept 'pro' change. Innovation refers to the approach of new ideas in order to generate improved outputs. The results of innovation are most often related to the generation of new products/services but innovation can also be met on updated products/services which have been already implemented.

Innovation is often done on the basis of a project that clearly identifies the objectives, determines the coordination of tasks, organization of resources and offers a control phase that ensures the success of the project. The economy finds itself on a transformation-based period. In the transforming process a big interest is allocated to the creation of new products. Besides of tangible products more and more companies are focused on new management methods, business reorganization or new leadership strategies.

The leadership is a defining aspect on innovation because it represents one of the main factors that bring the success of an initiative. The leader is the main actor that participates to create an organizational culture oriented to innovation. The ideas of improvement can come from any hierarchical level, the manager being able to prioritize the eligible ideas. Being a complex topic, innovation is a top-down concept with the direct involvement of top management. The manager contributes to the alignment of team members with the organization's strategy.

Innovation management is a field of research of specialized management that aims to create strategies in order to introduce new technologies, processes and innovative products within the organization " (Tidd, Bessant, Pavitt, 2005)

ANALYSIS OF INNOVATION REASONS, TYPES OF INNOVATION AND PROJECT PHASES

A big part of the results generated by innovation are identified as tangible products but in the same time the innovation makes its presence in the perimeter of services. The literature provides evidences of different type of innovation in multiple areas:

- Product innovation - refers to the creation of a new product or improvement the existing one.
- Marketing innovation - represents the introduction of new presentation guidelines.
- Organizational innovation - refers to the implementation of new methods of organization and management of human resources.
- In the same time, the literature presents the main reasons for which companies choose to innovate:
- Innovation to improve - is considered the simplest form of innovation and involves improving the existing product through changes.
- Innovation to adapt - it maintains the basic principle of the original product but it occurs in the context of a change and implies a greater improvement of the product / service than initially offered.
- Breakthrough innovation - it involves a radical change of the system, based on updated principles that can be applied to the original product.

- According to multiple analyses who aimed the innovation process, we can find evidence which describe two ways of how innovation rules:
- Closed innovation – it refers to the traditional method, applied for a long period of time, characterized by the flow: research-development-innovation. A number of thought ideas are generated; the ideas are sorted in order to develop only those that produced the best benefits for the company.
- Open innovation – it involves combining internal and external partners in order to obtain the best solutions. Thus, open innovation refers to the introduction of the concept of collaboration, development of partnerships, clients orientation and involvement of employees in the process of developing ideas. The interest for closed innovation has declined in favor of the open innovation for several reasons: competition and higher costs that cannot be sustained by the company.

A key element in increasing performance is the systematic assessment of generated results by using specific indicators to measure the performance. The indicators are the ones that present the real situation of the process, both through a clear picture of the main achievements but also weaknesses.

The analysis of these indicators determines the maturity of the process and helps to define the evolution trends. Since 2000, European Union has introduced a new method of assessing the performance of the innovation process called the European Innovation Scoreboard (EIS). Currently, the EIS contains 25 indicators that refer to three important aspects: the drivers of innovation, the company's activity and the results generated by innovation. In line with the results obtained, EU Member States can fit into one of the four categories of innovation: innovation leaders, followers, moderate innovators and modest innovators.

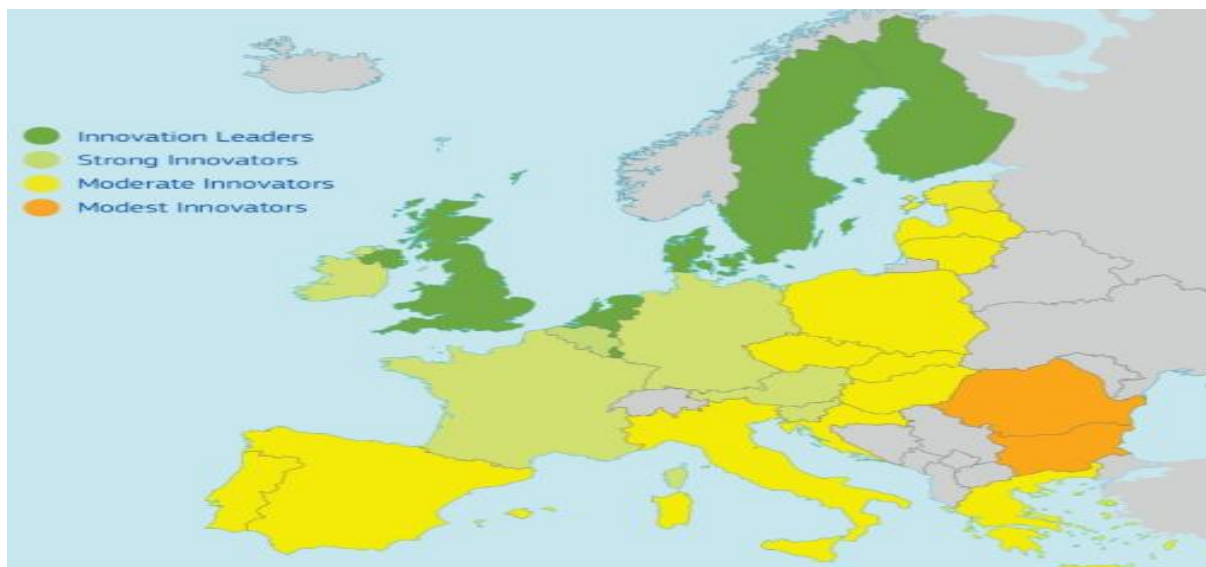

Figure 1. *European Innovation Scoreboard, 2018* / Source: www.europa.eu

Even if the degree of innovation may be different from one company to another, the innovation plan has a well-defined structure: the concept that involves generating ideas, the feasibility study and

the development of selected ideas - which means to put in practice the new concept. The management phases elaborated in 2003 by Mark Turell and Yvonne Lindow are represented by the following activities: establish the strategy and the project plan, collect and analyze the information, identify improvement solutions, put into practice the best solutions and in the end monitor the implementation as well as the results obtained.

Figure 2. *Management phases* / Source: www.globalnpsolutions.com

- The concept stage purposes to identify new ideas or opportunities of improvement. Ideas can be generated both by the internal environment as employees or by outsiders such as customers or suppliers. Ideas may appear spontaneously or can be generated in workshops or brainstorming sessions. In brainstorming sessions the goal is to get as many ideas as possible regardless the nature of the impact or their complexity.
- The development stage is designed to identify constructive solutions and the resources that can be used to achieve the project goals.
- The implementation stage is represented by the results generated by the new concept. It is important to note that most of the new solutions implemented do not work optimally starting to the implementation phase; a process monitoring is done in order to improve the newly implemented solutions in order to achieve a satisfactory process.

ESTIMATED RESULTS

Successful companies have channeled their efforts by using the resources in a more efficient way in order to eliminate the losses. Thus, quality management through ISO 9000 standards, the Kaisen method and the method step-by-step improvement are the effects of the modern management used by companies to achieve customer requirements and gain advantage.

The result of innovation can be measured directly by evaluating the generated performance which can be analyzed on a basis of well-defined indicators, generally grouped into three categories: inputs, process and outputs. Input indicators refer to the resources used for the innovation process as budget or human resources. Process indicators measure the productivity and targets. Time is a

reference parameter transposed in order to determine the duration of the innovation process. Output indicators measure the benefits of the innovation. It should be remembered that although the indicators are some well-defined from the beginning, their nature is established according to the type of services provided by the company.

Innovation can be manifested by either assimilation of new products either through entry into new markets or through radical changes on the business process. In any situation the innovation requires time to understand the need and to assimilate the change. In the same time, for the long-term success of an organization, the early stage of innovation preparation becomes essential.

CONCLUSIONS

The concept of innovation becomes more and more common today because of the fast and growing environment. Characteristics such as competition, client's requests or development of technology make this process more important like before.

Innovation takes place only when the creation generates a new product / service that is more efficient than the original one. It is important to make the difference between what is meant by innovation and what innovation means. The invention led to the emergence of a new concept while innovation represents the commercialization of the new idea. In this case an invention is not an innovation unless it is marketed on the market.

Awareness and implementation of innovation is an essential factor for companies to survive on market, making reference to changes whose effect generates useful results for the company. These changes have a direct impact both in terms of quality and efficiency.

A high emphasis has been placed on process improvement that becomes a new concept for the companies' strategies. In organizations that sustain quality, the process improvement should be done continuously, this initiative being directly encouraged by superior management. Achieving performance means going from one level of performance to a higher lever and systematically developing the competitiveness.

THE ENTREPRENEURS' PROPENSITY TO ADOPT ELECTRIC MOBILITY IN THE SHORT FOOD SUPPLY CHAIN

Giacomarra, Marcella; Tulone, Antonio; Crescimanno, Maria; Galati, Antonino

Department of Agricultural, Food and Forest Sciences, University of Palermo, Palermo, Italy

ABSTRACT

In the last years, Short Food Supply Chain (SFSC) has gained relevant attention among the consumers, for its characteristics of environmental, economic and social sustainability. At the same time, recently some doubts has been raised about the environmental negative impacts that also SFSC is causing, despite the intrinsic "local" label. In particular, the reference is on the transport system and related CO₂ emissions of SFSC that undermines the full achievement of environmental concerns. To deal with this challenge, electric vehicles (EVs) are seen as a viable and very promising alternative. Starting from these considerations, this study investigates the propensity of entrepreneurs operating in the SFSC to introduce EVs inside their business. In particular, in order to understand which factors affect this behaviour, the Theory of Planned Behaviour and New Ecological Paradigm have been used. Results show that farmers with high attitudes towards the shift from carbon transport systems to electrical ones, and which are more sensitive to ecological and environmental sustainability issues, are more willing to adopt EVs in their business. This is the first work that investigates the intention of local producers, operating in the SFSC, to introduce an EV for the freight transports, providing interesting theoretical, managerial and political implication, and addressing scholars towards future researches.

Keywords: Local Food Supply Chain; Electric Vehicles; Farmer's market; Theory of Planned Behaviour; New Ecological Paradigm.

INTRODUCTION

Since the end of the nineties, Short Food Supply Chain (SFSC), a term coined by Marsden *et al.* (2002), has received considerable attention by scholars as a direct consequence of the increasing interest of consumers towards this alternative sale channel (Migliore *et al.*, 2015). The SFSC, as legally defined by EU Regulation 1305/13, is able to reach goals of "sustainable agriculture". However, the environmental dimension of the sustainable character of the SFSC has recently raised some doubts, in particular as regard its contribution to the reduction of CO₂ during the transportation phase (Schmitt *et al.*, 2017). Indeed, if from a hand, if compared to Mass Food Supply Chain, the reduction in travelled km can be

obvious, on the other hand, reflections are growing in relation to the effective contribution of CO₂ reduction at overall local level, on the route where usually entrepreneurs involved in the SFSC operate. Some scholars are attempting to investigate this environmental impact theoretically referring to the food miles concept, initially linked to the overall food supply chain (Paxton, 1994), so from cultivation phase to final distribution one, more recently linked much more explicitly to carbon accounting and the climate change debate (Schmitt *et al.*, 2017; Kissinger, 2012; Coley *et al.*, 2011; Kemp *et al.*, 2010; Smith and Smith, 2000). This is, of course, part of the recent scientific debates on climate change with particular attention on the transport system impact both of goods and people. In this domain, starting with the EU Directive 2014/94/EU on alternative fuels, in 2016 the EU Commission set a new target for road transport according to which within 2050 a reduction of 60% of CO₂ emissions can be achieved. A challenge that is aimed to ensure overall sustainability but at the same time responding to the transport forecasts according to which within 2050 transport will increase of 42%. Then, if we can't stop the transport growth we can reduce the related CO₂ emissions, changing/converting the transport means power systems to greener ones. In this context, the more promising option is the Electric Vehicle (EV) (both hybrid and 100% versions currently available in the market), and towards which the main National, Regional and Local policies around Europe are investing (from public transport means to private and commercial final use).

According to these recent trends, this study investigates the propensity of entrepreneurs operating in the SFSC to introduce EVs inside their business, with a view of overall sustainability. In particular, in order to understand which factors affect this behaviour the Theory of Planned Behaviour (TPB) and New Ecological Paradigm (NEP) have been used. The sample has been selected from the entrepreneurs participating in the farmer's markets of the city of Palermo, in Sicily (Italy). To the best of our knowledge, the present work, which is an exploratory study, is the first one aimed at investigating the behaviour of entrepreneurs operating in the SFSC against the opportunities to introduce an EV for the freight transports to reach farmer's market.

LITERATURE REVIEW

Short Food Supply Chain

At the base of SFCS there is the creation of a trust relation between producers and consumers, usually identifiable in a face-to-face interaction, allowing thus a direct relation that in the global FSC is totally absent. According to the definition of short food supply chains developed by Marsden *et al.* (2002), SFSCs have capacity to "resocialize" or "re-spatialize" food, thus allowing consumers to make value-judgements about foods. Authors make clear that "it is not the number of times a product is handled or the distance over which it is ultimately transported which is necessarily critical, but the fact that the

product reaches the consumer embedded with information”, enabling the consumer to confidently make connections and associations with the place/space of production, “and potentially the values of the people involved and the production methods employed” (Marsden *et al.*, 2002).

The scientific literature has then put into lights further factors and implications attributable to SFCS and directly linked to sustainability goals: economic, social and environmental impacts. As for the SFSC economic impact, authors convene in attributing rural development and economic regeneration to these models (DuPuis and Goodman, 2005; Renting *et al.*, 2003), to stimulate local employment opportunities (Roininen *et al.*, 2006), with multiplier effects (Henneberry *et al.*, 2009). SFSC is also characterized by the ability to increase income for producers (Pearson *et al.*, 2011; Feagan and Morris, 2009). In social terms, several investigations showed the ethical dimension characterizing SFSC. In this meaning, Ilbery and Kneafsey (1998) found that producers often act as “profit sufficers” rather than “profit maximizers”, putting at the top of producer’s intention their contribution to the wellbeing of the community, rather than aspiring to capital maximization (Jarosz, 2008).

As for the environmental impacts evaluation linked to SFSC, several contrasting opinions are currently under discussion at scientific level. Indeed, if from a hand scholars highlighted the positive impacts of SFSC in terms of food miles and carbon footprint reduction (Van Hauwermeiren *et al.*, 2007), other authors support a thesis according to which when in the SFSC local products are stored and purchased out of season, these products may have a greater carbon footprint than non-local goods (Edwards-Jones, 2010; Cowell and Parkinson, 2003). At this regard, the food mile literature opens interesting debates. Originally conceptualized in the nineties (Paxton, 1994), this concept was first linked to the overall food production process (from the cultivation phase to the distribution one). More recently, however, food miles have been linked much more explicitly, and in some cases solely, to carbon accounting and the climate change debate (Schmitt *et al.*, 2017; Kissinger, 2012; Coley *et al.*, 2011; Kemp *et al.*, 2010; Smith and Smith, 2000). This change has led to the shift of the food miles argument away from sustainable agriculture production systems *per se* to food distribution and retailing and, in particular, to the GHG linked to transport. At this regard, Coley *et al.* (2011), looking to the carbon emissions of several delivery systems compared to direct sales for vegetable box schemes, found that customers who have to drive more than 6.7 km in a round trip to buy their organic vegetables have higher levels of emissions when compared to the emissions involved in the system used by the large distributors. Ideas regarding the environmental benefits of local food in terms of the reduction in food miles and GHGs need to be rethought and better reformulated, as stressed by Schmitt *et al.* (2017), which support the argument that despite locally processed food products can be defined as more sustainable, not because of lower carbon footprint, but for localness criteria (e.g. identity, know-how, size and governance) rather than distance concerns. Giving the relevance of consumer’s role in

contributing to the spreading of more sustainable food purchasing practices, a need to further work on the increase of an overall awareness about that is also suggested by Kemp *et al.* (2010), which results suggest that the “food miles” argument has not had great influence on the behaviour of supermarket shoppers.

Electric vehicles adoption

The substantial emission reductions necessary to achieve climate change reduction targets require, among others, a de-carbonization of transport. EVs are seen as a viable and very promising alternative (Hao *et al.*, 2017), especially if electricity is generated in a clean manner (Egbue *et al.*, 2017). To date, no scholars have ever attempted to assess the propensity of entrepreneurs operating in the SFSC in introducing EVs into their business activities. The majority of works carried out in this last decade, in fact, has been addressed to assess the main drivers for the uptake of EV, mainly referring to private traditional car owners and early adopters, with the aim to investigate customer behaviours, intentions and preferences about support schemes (Santos and Davies, 2019; Ramos-Real *et al.*, 2018; Quak *et al.*, 2016; Rezvani *et al.*, 2015; Bunce *et al.*, 2014; Plötz *et al.*, 2014). Santos and Davies (2019), resuming the opinions of 189 respondents, represented by stakeholders and experts, found that 75% of respondents state that the development of charging infrastructure is on the top of the priorities for a mass EVs deployment, followed by purchase subsidies (68%), pilot/trial/demonstrations (66%) and tax incentives (65%). As Ramos-Real *et al.* (2018) suggest, geographic dimension of the area concerned by EVs introduction is also a relevant factor, together with the necessity that end users effectively know technical data on EVs so as to be able to do an aware choice. Authors, studying the feasibility of EVs introduction in the Canary Islands underline how the small size of the territory dictates driver mobility routines, as the short average travel distance reduces the effects of range anxiety. Furthermore, authors underline that willing to pay for an EV purchase is positively correlated with some factors, among others, education attainment and strong environmental concern (Ramos-Real *et al.*, 2018). As for range anxiety limit, defined as one of the main problem facing drivers interested in buying EVs, a recent study carried out in UK found that the initial range anxiety would fade overtime since knowledge and confidence developed through driving for an extensive period of time (Bunce *et al.*, 2014). The profile of consumers has been a topic widely examined, with special attention on EVs early adopters (Rezvani *et al.*, 2015; Plötz *et al.*, 2014), highlighting social, economic and demographic characteristics. Another literature branch investigated the role of the EV in the urban city logistic schemes examining the feasibility of using electrically powered vehicles in urban freight transport from a carrier’s perspective (Quak *et al.*, 2016).

CONCEPTUAL FRAMEWORK

With the aim to investigate the propensity of entrepreneurs operating in the SFSC to introduce EVs inside their business, we started from the consideration that the intention to adopt a specific behaviour depends on individual attitudes towards a given behaviour, subjective norms, and perceived behavioural control (Ajzen, 1991), to which other authors add the role played by environmental concerns (Dunlap *et al.*, 2000). A conceptual framework, based on the Theory of Planned Behaviour and the New Ecological Paradigm, has been used in order to meet this purpose.

Theory of Planned Behaviour

The Theory of Planned Behaviour (TPB) (Ajzen, 1991), an extension of the Theory of Reasoned Action (TRA) (Ajzen and Fishbein, 1980), is based on the premise that individuals make logical and reasoned decisions to engage in specific behaviours, by evaluating the information available to them.

According to the TPB model, an individual's intention to perform a behaviour is a function of that individual's attitude toward the behaviour, social norms and perceived behavioural control. Attitude towards the behaviour (ATT) is conceived by Ajzen and Fishbein (1980) as an "*individual's positive or negative evaluation of the performance of a particular behavior*". A person, who believes that valuable positive outcomes would result from performing the behaviour, will have a positive attitude toward it. According to the TPB model, it must be said that the more favourable attitude toward a behaviour, the more possibility that the individual will perform that certain behaviour (Ajzen, 1991). The second dimension, named Social Norm (SN) is a social pressure exerted on an individual to engage in a particular behaviour (Ajzen and Fishbein, 1980). Indeed, individuals intend to perform a behaviour when they feel that the people who are important for them confirm that behaviour (Shin and Hancer, 2016). Perceived Behavioural Control (PBC) consists in individuals' perceived ease or difficulty of a particular behavioural performance (Ajzen, 1991). This component emphasizes the extent to which that an individual perceives a behaviour to be under his/her volitional control (Fielding *et al.*, 2005). Behavioural control is related to beliefs about the presence of factors that may further or hinder the performance of behaviour (Ajzen, 2002; Ajzen and Madden, 1986). The above mentioned dimensions, affect the Intention (INT) which is an "*individual readiness to perform a given behaviour*" and is recognized as the motivation which is necessary for engagement in a particular behaviour. The intention is the most substantial predictor of behaviour and is assumed to be an immediate antecedent of this (Ajzen, 2002).

A review of literature shows that the TPB has long been successfully used to investigate a wide variety of farmers' intentions such as: adoption of innovations and technologies (Adnan *et al.*, 2019), sustainable practices (Zeweld *et al.*, 2017; Menozzi *et al.*, 2015; Fielding *et al.*, 2008), adaptation to climate change (Arunrat *et al.*, 2017; Dang *et al.*, 2014), engagement in pro-environmental activities

(Van Dijk *et al.*, 2016). Despite the general usefulness of the TPB to identify and understand different behaviours of farmers, some scholars have attempted to enhance the predictive power of the TPB model, by including additional constructs to strengthen the predicting power of the model. Rezaei *et al.*, (2018), extending the TPB model including the two constructs of moral norms and knowledge recognized an increased robustness and explanatory power of the proposed framework in predicting farmer's intention in engaging in farm food safety. Positive remarks as regard the robustness of an extended TPB have been also expressed by Giampietri *et al.* (2018). Authors, adding the trust construct to the original TPB, agree on the greater performance of the model in predicting interviews' intention to purchase food in SFSCs. Employing different constructs allowed Menozzi *et al.* (2015) to better investigate the consumers' intention to purchase traceable chicken and honey in France and Italy. Adding new variables (e.g. habits, trust, past behaviour and socio-demographics) to the original TPB demonstrated how an extended TPB model can be of relevant importance in better predicting behaviours in two different countries. Adnan *et al.* (2019) concluded their work highlighting that if paddy farmers have more concern towards the environment, they will have more attraction towards adopting sustainable agricultural practices. Results have been achieved thanks to the employment, also in this case, of an extended TPB model, including new variables linked to external and economic factors.

To date, far too little attention has been paid to extend the TPB model by incorporating additional constructs mainly pertaining to the environmental sphere, with a particular reference on NEP. To this we add that, despite the growing literature on farmer's behaviours through the application of TPB, no studies have put the attention on the behaviours of entrepreneurs operating in the SFSC as regard the electric mobility intention for managing freight transport.

New Ecological Paradigm

In investigating the environmental attitude of an individual, the environmental psychology can be of relevant support. This last refers to a specific tendency expressed by evaluating a particular object related to the environment with some degree of favour or disfavour (Kaiser *et al.*, 2011). The New Ecological Paradigm (NEP) scale (Dunlap *et al.*, 2000), is considered as the most widely used environmental attitude instrument today. Originally proposed in 1978 by Dunlap and Van Liere (1978), this theory has been revised in 2000 (Dunlap *et al.*, 2000). The NEP scale consists of 15 Likert-scale items, which are intended to measure five core components of individuals' environmental concern: (1) limits to economic growth, (2) anti-anthropocentrism; (3) the fragility of nature's balance; (4) human exemptionalism; and (5) the possibility of potentially catastrophic environmental changes or eco-crises affecting people (Dunlap *et al.*, 2000).

The NEP has been used in previous studies to investigate consumer attitudes about the risks of genetically modified food (Hall and Moran, 2006), to stress how environmental concern affects marine species conservation (Pienaar *et al.*, 2015), to study pro-environmental orientation differences between people living in city areas and rural districts (Berenguer *et al.*, 2005).

For what in our knowledge, this is the first time that the NEP scale is used to assess the environmental orientations of entrepreneurs operating in the SFSC.

METHOD AND DATA

To achieve the aim of the present work, an empirical analysis has been carried in the city of Palermo (Sicily, Italy) during March 2019, involving local Farmer's associations managing the farmer's markets in the Province of Palermo, among which Coldiretti group, currently leading the label "Campagna Amica", the Association "Pianeta Mercati", and the Association "Contadini in Villa".

To investigate the entrepreneurial propensity to introduce EVs inside their business for the distribution of agro-food products, a questionnaire has been developed and organized in four sections. In the first section, main data on firm characteristics have been detected, such as principal production, headquarter, and production methods. The second section collected socio-demographic characteristics of respondents, including specifications about eventual sons/grandchild in their family nucleus and membership to environmental associations. The third section contained specific questions aimed at gathering knowledge about the transport system characteristics of each sampled firms as well as questions attempting to quantify yearly distances travelled to reach selling points. The behaviours towards the EV introduction into their business has been measured through section four, which included a set of questions based on the TPB, appropriately modified according to the research field. The last section, the fifth, has been devoted to acquire data on individuals' environmental concern using questions based on the NEP scale. Questions pertaining to section 4 and 5 included a five points Likert scale. As for the TPB, the questionnaire items were defined, taking into account Ajzen's conceptual and methodological considerations for constructing a TPB questionnaire (Ajzen, 1991) and the previous works carried out in similar field where a 5 point response format has been used (Giampieri *et al.*, 2018; Rezaei *et al.*, 2018; Adnan *et al.*, 2019; Arunrat *et al.*, 2017). While, for the NEP scale, the selection of a 5 point Likert scale has been decided following the results of a meta-analysis on works employing NEP scales, executed by Hawcroft and Milfont (2010), who highlighted that all studies, like the Dunlap *et al.* (2000) one, used a Likert scale and the 83.45% of the sample the one with five-point response format. As a consequence, respondents were asked to specify their opinion respecting each item, using a five-point Likert-type scale from 1 to 5 as follows: 1=strongly disagree; 2=disagree; 3=neither agree nor disagree; 4=agree; and 5=strongly agree.

Giving the innovative nature of the research question and hence of the sample to be involved in order to gain initial primary data regarding this particular SFSC issue, a convenience sample method has been used. Following the research inputs suggested by Creswell and Plano Clark, (2010), according to which employing a convenience sample allows collecting data only from reliable people, in our case really adopting this business model. To this scope, the small sample was made up by 42 entrepreneurs, involved in the SFSC and participating in the farmer's markets of the Palermo Province. All firms have headquarters in rural areas, around 20-100 km far from Palermo city. Questionnaires have been administered directly in loco, visiting farmer' markets. Taking into consideration the scarceness of data collected, solely descriptive statistical analysis was performed, which importance is worth to be considered for future research in this area.

Table 1. Drivers about the introduction of electric mobility in the farm based on the TPB (range 1 to 5)

	Average value
Attitudes	3.49
In my opinion, issues related to climate change are a critical factor, and awareness and knowledge of electric mobility must be increased among farmers as a tool to reduce CO2 emissions.	4.19
In my opinion, the introduction of electric mobility in my farm will contribute to increasing the green image of my company	3.79
In my opinion, the introduction of electric mobility in my farm is a good and wise choice	3.67
I believe that the introduction of electric mobility in my farm is a fundamental step to make the agri-food supply chain more sustainable	3.64
In my opinion, the introduction of electric mobility in my farm is useful and valuable	3.48
Social Norms	2.67
In my opinion, more and more farmers will adopt sustainable practices in the future linked to distribution through the use of electric vehicles	3.33
The people, whose I appreciate opinions, will approve my choice to introduce electric mobility into my farm	3.07
Other farmers I know believe that electric mobility is an important issue and they are engaged in its introduction to their farms	2.26
People whose I appreciate opinions, ask me to introduce electric mobility in my farm	2.00
Perceived Behavioural Control	2.74
The adoption of electric mobility in my farm depends exclusively on me	3.17
I am quite confident in my abilities and skills for introducing electric mobility in my farm	3.14
The introduction of electric mobility in my farm is quite simple and I can easily manage it	2.71
The tangible and intangible resources in my farm are sufficient for the correct management of the distribution of food products through electric mobility	2.48
I am quite aware and informed about the support policies for electric mobility (e.g. incentives, tax systems) and I do not need any other information about it	2.21
Intention	3.52
I would like to introduce electric mobility in my farm in the future	3.52

RESULTS

Table 1 presents the main factors affecting entrepreneurs to introduce or not EVs in their business. Results show a propensity of the interviewees towards the shift from carbon transport systems to

electrical one. On the whole, findings show a greater number of interviewees who are convinced of their intention to introduce electric mobility in the future for the distribution of agro-food products (3.52). The intention to introduce electric mobility in the short chain is mainly linked to the shared opinion among the interviewees that this choice could contribute, on the one hand, to reducing CO2 emissions (4.19) and, on the other hand, to improve the image of the company on the market (3.79). Respondents believe that the strong orientation towards sustainable choices will also concern the introduction of EVs (3.33), and this is in line with the awareness that corporate choices are shared by people (3.07). However, what emerges from the study is a lower awareness, among the interviewees, of the ability to control this new transport system, as emerges from the values obtained, which are all around average values. Furthermore, the results show that, on average, internal resources are not sufficient for an efficient management of this new transport system that can be implemented by the company (2.48).

Table 2. New Ecological Paradigm Scale Items (range 1 to 5).

	Average
Reality of limits to growth	4.60
The Earth has many natural resources if we only learned to exploit them	4.71
We are close to the limit of the maximum number of people that the Earth can bear	3.50
The Earth is like a spaceship with very limited rooms and resources	3.26
Possibility of an eco-crisis	4.21
Humans are seriously abusing the environment	4.60
If things continue to go on like now, we will soon experience a serious ecological disaster	4.05
The so-called ecological crisis has been greatly exaggerated	2.79
Fragility of nature' balance	3.59
When humans interfere with nature, they often produce disastrous consequences	4.50
The balance of nature is very delicate and easily disturbed	4.12
The balance of nature is strong enough to cope with the impacts of modern industrialized nations	2.79
Anti-anthropocentrism	2.94
Plants and animals have the same right to exist as humans	4.48
Humans were destined to rule the rest of nature	2.31
Humans have the right to change the natural environment to meet their needs	2.26
Rejection of exemptionalism	2.21
Despite our abilities, humans suffer the laws of nature	3.98
Human ingenuity will ensure that we do not make the earth unlivable	3.29
Humans will learn how nature works so that they can control it	2.07

Empirical evidences demonstrate that the environmental proactive behaviour of entrepreneurs, in this case associated to the introduction of EVs, is related to the different facets of the possible ecological visions on the nature. Table 2 shows how respondents agree on average on the five NEP ecological visions. In particular, results highlight a great awareness among respondents of the importance of protecting natural resources (4.71), which are exploited by human beings (4.60), causing disastrous

consequences (4.50). Based on mean responses to each of the NEP items, it seems that respondents tend towards a good enough pro-ecological worldview, proved by the positive agreement for “*Possibility of an eco-crisis*” (4.21 out of five) and “*Fragility of nature’ balance*” (3.59 out of five). An opinion further confirmed by the strong support recognized to the item “*Humans are seriously abusing the environment*” (4.60 out of five). The assumption of the presence of a pro-ecological opinion is also linked to the shared disagreement about “*Anti-anthropocentrism*” (2.94) and “*Rejection of exemptionalism*” (2.21).

In order to better understand the behaviour of entrepreneurs participating to the SFSC and their propensity to introduce the electric mobility, respondents have been divided into two groups, one including the entrepreneurs who have a high intention to introduce EVs in their business and respondents who have a low propensity. In particular, individuals with a high propensity to change the carbon transport system with the electrical one show a more positive attitude towards that behaviour (4.15), completed by positive scores in the effects from social norms, with a score that is over the neutral position (3.38), and a better Perceived Behavioural Control (3.55). Furthermore, they also show particular concern about the resources scarcity (4.79), the possible ecological catastrophes that can derive from an inappropriate exploitation of the environment and its resources (4.41), and the delicate balance of the nature (3.85).

An interesting fact arising from the study is that entrepreneurs who frequently participate in the farmers’ markets, since their corporate headquarters is located near the same markets show a greater willingness to introduce electric mobility in the SFCS.

Table 3. Profile of the sample considering two groups: individuals, respectively, with high and low intention to introduce electric mobility in the farm

	Respondent age	Distance from the market	Annual participation in the markets	Attitudes	Social Norms	PBC	Limits	Eco-crisis	Balance	Anti-anthro	Anti-exempt
High intention	25.54	13,346.15	139.38	4.15	3.38	3.55	4.79	4.41	3.85	3.00	2.00
Low intention	44.02	23,513.45	96.76	3.19	2.34	2.38	4.52	4.13	3.47	2.92	2.31
Total sample	38.30	20,366.43	109.95	3.49	2.67	2.74	4.60	4.21	3.59	2.94	2.21

This study also wanted to highlight the potential measures desirable for farmers to encourage the spread of electric mobility. Findings suggest that measures aimed at covering direct costs related to electric mobility (non-repayable grant, incentive for the relief of the insurance premium, and eco-

incentive for the purchase of EVs) are the most preferred by entrepreneurs. On the contrary, support tools related to the reduction of costs associated with circulation are less appreciated by interviewees.

Table 4. Support tools suggested to politicians in order to encourage the introduction of electric mobility in the farms

Support measures	No.	%
Non-repayable grant for the purchase of the electric vehicle	29	29.29
Incentive for the relief of the insurance premium	24	24.24
Eco-incentive for the purchase of an electric vehicle that covers more than 30% of the cost of the vehicle	17	17.17
Eco-incentives in cases where the purchase of one or more electric vehicles takes place between several farms in order to use them in a shared way	14	14.14
Exemption from paying the parking ticket in public areas (e.g. blue strip parking)	6	6.06
Exemptions from the payment of the fee to access the restricted traffic areas of all the municipalities	6	6.06
Right of movement in the lanes reserved for public transport	3	3.03

DISCUSSIONS

The main interesting findings of the present work and worth to be discussed, also for their managerial and political implications, originate from the profiling of interviewees we did according to the high or low intention showed. High social norms scores present in the group with higher intention towards introducing an EV in their business, suggest how in the presence of people with higher environmental concern, also the social context from which they belong to play a relevant role in pushing towards more and more sustainable practices. The higher value of PBC in this group, compared to the score of the overall sample, suggests how social norms and environmental awareness do the difference in the possibility of introducing greener transport means. A similar correlation has been found by Giampieri *et al.* 2018 where, analysing through TPB, the intention of consumers to buying in SFSC, found that the more consumers attitudes are positive toward SFSC and the more the people who are important for them approve the behaviour, the more the PBC increase.

However, entrepreneurs operating in the SFSC most concerned about the environment and the delicate balance of natural ecosystems are those who have the higher intention to reduce their environmental impact through sustainable means of transport, such as electrically powered vehicles. This evidence is also supported by the literature on EVs, according to which Ramos-Real *et al.*, (2018) found that early adopters are, among other features, the one with strong environmental concern. To this we add that by taking into account the social and geographical context from which this group belong to, that is rural area, our findings are in line with Berenguer *et al.* (2015) according to which, applying the NEP scale, authors found that people living in the rural context present more attitudes of environmental responsibility and greater consistency on expressing behavioural intentions compatible with the protection of the environment compared to people living in city areas.

The greater propensity to introduce EVs by entrepreneurs who frequently participate in the farmers' markets closest to the corporate headquarters is probably linked to what in the literature on EV is called

“range anxiety”, according to which the more the distance to be travelled the more the reticence to purchase an EV, as a consequence of fears (not technically founded) linked to the battery charge life and the few charging points along the route (Ramos-Real *et al.*, 2018; Bunce *et al.*, 2014).

Giving the high current market entry costs for EVs, the need for support measures is of relevance importance also for the entrepreneurs involved in the SFSC. Our results, showing a great preference for those measures mainly oriented at covering direct costs related to the purchasing of EVs, are in line with Santos and Davis (2019) which found that, despite the development of charging infrastructure is on the top of the priorities for a mass EV deployment, the main support measure necessary is the one linked to purchase subsidies.

CONCLUSIONS

This is a preliminary analysis aimed to investigate the behaviour of local producers operating in the SFSC against the opportunity to introduce an EV for the freight transports to reach farmer’s markets. Despite the small sample analysed, results are interesting because they contribute to enrich the literature on the pro-environmental behaviour linked to the debate currently open worldwide on how ensure an effective de-carbonization of transport system.

In particular, the research shows that farmers that mostly participate in the farmers’ markets and travel the shortest distance are more willing to introduce EVs for the distribution of their products. The same behaviour is highlighted in farmers whose managers and owners show high attitudes towards the shift from carbon transport systems to electrical ones, and which are more sensitive to ecological and environmental sustainability issues.

In light of this, the study provides interesting theoretical, managerial and political implications.

On the theoretical point of view the employment of an extended model of the TPB to which environmental opinions of entrepreneurs have been incorporated, further contributes to the development of the theory itself. Results show that TPB is a useful theory to investigate behaviours of the entrepreneurs operating in the SFSC as well as to know which characteristics linked to the distribution of goods are identified as main drivers for the effective introduction of EV to be intended here as the greener transport mean currently available in the market.

From a managerial perspective, the research mainly suggests farmers working in the SFSC to seriously consider the opportunity to take into account the introduction of EVs in their business, above all in those cases where distances travelled are on reduced range, so suitable for the actual battery duration. However, giving the growing societal awareness towards the transport system de-carbonization, managers should evaluate the EV purchasing as an added value of the local production model adopted to be properly communicated to consumers.

Switching to a political dimension, the majority of entrepreneurs participating in SFSC indicated as the most favourite support measure, for the introduction of EV into their business, non-repayable grant for the EV purchase. Policy makers in their political planning work should hence consider concrete measures able to provide an answer to this need that, if achieved, could allow the spread of EVs among entrepreneurs working in the SFSC. Having a look on Italy, and with particular attention on Sicily, the infrastructural charging system is ready to function as proved by the National infrastructure plan for the recharge of vehicles powered by electricity (PNIRE), approved by the Government in 2014. Following the PNIRE input, the Sicilian Regional Authority, in 2017 approved the Regional Plan for Infrastructure and Mobility (PIIM), which includes detailed measure for ensuring the electric mobility spread. In this respect, our findings could be useful for policy makers in order to plan programs addressed to promoting a more effective transport system de-carbonization among SFSC network. Taking into account that the intention to introduce electric mobility is greater among entrepreneurs who show both higher attitude for adopting proactive environmental behaviours and wider environmental awareness, an educational program aimed at the public and entrepreneurs to strengthen greater environmental awareness is desirable.

Although this study extended our understanding of farmers' intention to introduce EVs inside their business, it has likewise a number of certain limitations that need to be considered in future studies. Firstly, the present study only examines one Province of an Italian region, with a limited sample. Therefore, results could not be generalized to all farmers participating in SFSC neither in the entire country not in the overall region. Consequently, what is now needed is across-regional and/or a cross-national study involving the sample from a diverse geographic area. Secondly, the study has been performed only inside farmer' market, excluding the other alternative short supply chains. As consequent, future work should engage more entrepreneurs working in other business distribution channels of the SFSC.

THE MEDITERRANEAN'S GOLD: WHICH COMMERCIAL PROSPECTS FOR THE THUNNUS THYNNUS IN ITALY?

Giacomarra, Marcella; Crescimanno, Maria; Siggia, Dario; Tulone, Antonio; Galati,
Antonino

Dept. of Agricultural, Food and Forest Sciences, University of Palermo, Italy

ABSTRACT

By taking into consideration the relevant role, in the international trade of Bluefin Tuna (*Thunnus thynnus*), played by Italy, aim of this work is assess the change in the Italian competitive advantage in the international market over the last decade (2008/2017), as a consequence of the Total Allowable Catch system together with size limits set by the International Commission for the Conservation of Atlantic Tunas (ICCAT). Investigating the main changes occurred in the Italian international trade balance, by focusing the attention on the relations with the main commercial partners operating in this industry, is of relevant importance to make available updated data to policy makers, managers and scholars in order to reflect on alternative solutions to increase profits in the international trade. By applying the Relative Trade Advantage Index, results show that Italy in the last decade, although maintained an overall profitable position in the international market, has been affected by drastic changes at system level, mainly caused by the ICCAT regulations aimed at reducing the *Thunnus thynnus* stock overfishing. Measures that led the country to modify commercial partners relations and also internal production business patterns, such as a fragmentation of the *Thunnus thynnus* supply chain related to the export line. Results suggest to both policy makers and stakeholders to activate alternative solutions to improve the trade volume (in money terms) of this sector, in so doing better exploiting the great potential of product, respecting at the same time the Bluefin Tuna sustainability programs.

Keywords: Bluefin Tuna; international trade; Relative Trade Advantage Index; ICCAT; sustainable capture.

INTRODUCTION

Talking about the economic role played by the Atlantic Bluefin tuna or *Thunnus thynnus* (Linnaeus, 1758) entails the recalling of relevant historical traits characterizing this important marine species. Indeed, it is possible to find traces of the *Thunnus thynnus* in the past works of Latin and Greek scientists as well as philosophers. The main references were linked to the surprising biological

properties of this marine species, with particular reference on the *Thunnus thynnus*' size, able to exceed the length of 3 meters and a weight of around 900 kg. However, works also underlined the longevity of the species, with a life span of more than 35 years, as well as motility speed so great to guarantee the completion of wide migration routes, from the North of the Atlantic Ocean to the Mediterranean Sea. Since the Greek Empire, all these characteristics have been widely praised, adding also the economic relevance for commercialization scopes as well as nutritional ones. At this regards, some authors, like Eliano, Ateneo and Plinio the Old, eulogized the nutritional value of the *Thunnus thynnus*. While, in 400 A.C., the Greek historian Erodoto pointed out the how the *Thunnus thynnus* was the most remunerative marine species. There is trace of Greek and Roman works, belonging respectively to Aristotele (300 A.C.) and Pliny the Elder, in latin *Gaius Plinius Secundus* (90 A.C.), where the *Thunnus thynnus* fishing practices are widely described, underlying the migration routes some of them achieving sea waters located over the Hercules Columns, this last known as the extreme limit of the known world. Passing down over the centuries, the economic relevance of the *Thunnus thynnus* remains and also grown (Porch, 2005). While, most of the properties already outlined in the works of past philosophers and historians found scientific and nutritional confirmations.

The economic relevance of the *Thunnus thynnus* is mainly linked to the high nutritional properties of its fleshes, these last able to be consumed both immediately after the capture, thus crude, or after a cooking passage, then transformed. This characteristic represents the main strength point of the *Thunnus thynnus*, encompassing the economic potential intrinsically included in such marine species. Apart from nutritional concerns, it is important to specify that the increase in the Atlantic bluefin tuna was mainly driven by voracious Japanese demand, this last pushed on by the spread of sushi-sashimi consumption rates, a dish based on raw fish consumed in bars and restaurants. As a direct consequence, as already pointed out in 2006 by Spagnolo (2006), in less than 6 years (1997-2002), Japan's imports from the Mediterranean rose from zero to 70% of total imports (Spagnolo, 2006). A percentage that further increased since 2015, severely impacting the overall Atlantic bluefin tuna fishing sector. From a fishing practices side, overfishing of the largest scale, however, has occurred inside the Mediterranean Sea, the overfishing of this marine species has been almost completely attributable to the activity of purse seine fishing fleets, fuelled by the ever-increasing demand for live fish for fattening in Mediterranean tuna farms (COC/PA2, 2013; WWF, 2008). The direct consequence of the economic and nutritional value of the *Thunnus thynnus* can be seen in the biodiversity impact caused by the overfishing practices recorded worldwide during years (Fromentin & Ravier, 2005).

By taking into consideration the relevant role, in the international trade of Bluefin Tuna, played by Italy, third only to Spain and France, aim of this work is assess the change in the Italian competitive advantage in the international market over the last few year and as a consequence also of the total

allowable catch system promoted by the International Commission for the Conservation of Atlantic Tunas (ICCAT). Investigating the main changes occurred in the Italian international trade balance, by focusing the attention on the relations with the main commercial partners operating in this business sector, the present work intends to provide updated data which could be used by policy makers and scholars in better manage such data in order to reflect on the multiple ways to manage the Atlantic Bluefin tuna by considering both economic and habitat impacts.

The need of a such assessment is based on the necessity to evaluate how worldwide policies, mainly aimed arrest biodiversity lost affecting the BFT, can affect the economic performance of a country. In that case Italy has been identified as one of the main important actor in the fishing and commercialization of *Thunnus thynnus*, for both its geographical location and historical domain role in the Mediterranean players. For the economic analysis, the Relative Trade Advantage Index (RTA) (Vollrach, 1991) has been performed, by using money values of export and import rates in Italy in a time period ten years long (2008/2017).

The paper is structured as follows: the first paragraph presents an overview of the main political tools that in the last years addressed the management of BFT protection; after that, a presentation of the RTA index is released. The section results comment the main findings belonging to the application of the RTA in the Italian economic context. The discussion paragraph provides structured links between our findings and previous scholars results and suggestions. Finally, in the conclusions, specific implications are discussed.

THE ROLE OF THE ATLANTIC BLUEFIN TUNA IN BOTH BIODIVERSITY AND ECONOMIC TERMS

BFT is considered a “culture-specific” product because most of the world’s consumption occurs in Japan with over 45 countries competing to supply this market (Buentello et al., 2016; Hefferman, 2014). The Mediterranean region is one of the main relevant area for the catches and a major exporter of BFT to Japan (Di Natale et al., 2006). Increasing BFT catches have led to rapid stock declines over years. Collecting the environmental and green NGOs claims about the extinction threats of the Atlantic Bluefin Tuna, in 1966, the Food and Agriculture Organisation (FAO) convened a conference to manage the Mediterranean and other Atlantic tuna fisheries. Seventeen States agreed to the Convention, establishing the International Commission for the Conservation of Atlantic Tunas (ICCAT). Since 1966, membership has increased to 48 Contracting Party Countries (CPCs). Of these, 16 CPCs received an allocation of the BTF-E quota in 2013 (with the EU operating as a bloc), representing the major actors in the BTF-E fishing industry. To tackle with this specific challenge, ICCAT set total allowable catch (TAC), allocating shares of the annual TAC to its Contracting Parties, starting its controls and

the issuing of targeted regulations to limit the overfishing practices responsible of the main negative impacts affecting *Thunnus thynnus* overall stocks. The accession of the EU to the ICCAT, which took place in 1997, has also determined for Italy the obligation to adopt annual fishing quotas. Although in principle the ICCAT system of TAC could be seen as a good instrument to fight against the overfishing of BFT, several authors pointed out the weaknesses of a such system, lacking of structured and well-functioning control system on quota respect (Sumaila and Huang, 2012). Authors, in particular, underlines that the reason why ICCAT cannot succeed in combating IUU fishing is also for the lack of an effective detection and penalty system.

The competitive advantage of Italy in the world BFT market, measured during the period 2004/2009, was intercepted by Crescimanno and Galati (2012), underlying the overall positive advantage of Italy above all by taking into consideration the wide export shares towards Japan that in 2007 achieved the 79%, only followed by a lower rate from Spain and Malta, respectively of 10,6% and 3,3%. Giving the predominance of the Japan destination market, authors suggested for the Italian economy a differentiation strategy, trying to focus the attention on new destination markets, like USA and other Mediterranean countries. For sure, the decision of Italy to mainly exporting in Japan was driven by profit factors, giving the high money quotation of the BFT in the Asian country.

Nevertheless, since the end of the '90, Italy has had to respect specific yearly capture quotas, as set by the ICCAT, today the country continues to be one of the main actors in the fishing and commercialization of *Thunnus thynnus* in the Mediterranean area (Figure 1).

Figure 1. Italian captures of Atlantic Bluefin Tuna and ICCAT total allowable catches

Source: Our elaboration of FAO data and EU regulations.

In Italy the TAC system has led to structural changes affecting both vessels and the labour market operating in this business sector (Maringelli et al., 2016). In particular, Italy, differently from the other

countries, is the only country in the Mediterranean that decided to share the quota among the fishing vessels (BMTI, 2019).

This means that, once the TAC is reached, the capture activity is suspended. After the introduction of TAC, as other countries involved in the ICCAT system, experimented substantial economic impact, above all in the amount of captures allowed. Indeed, Mediterranean producers, among them also Italian ones, pointed out how the first TAC, at the end of the '90, were set according to the last year, a year during which captures were lower than usual, so underestimating the potential of the Mediterranean vessels.

The Italian export of Atlantic Bluefin tuna reached in 2017 a value of 7.2 millions of dollars in the face of 4.06 millions of dollars of imports, showing a positive balance of trade. The trade trends in the period 2008/2017 shows that exports were reduced to a greater extent (-7.6%) compared to import (-2.8%) (Figure 2).

METHOD AND DATA

According to Pitts and Lagnevik (1998), the competitiveness of an industry is the “ability to profitably gain and maintain marketshare in domestic and/or in foreign markets”, a general definition that can be adapted to represent our case study. In order to assess the Italian competitive performance for the *Thunnus thynnus* on the international market, taking into account bilateral trade flows and market quotas, the present study employs specific indicators based on the principle of comparative advantage, widely used in economic literature (Traill, Da Silva, 1996; Frohberg, Hartmann, 1997; Havrila, Gunawardana, 2003; Fertö, Hubbard, 2003; Bavororà, 2003; Banterle, Carraresi, op.cit.; Hambalková, 2006). Amongst the indicators most commonly used for measuring

comparative advantage there is the *Revealed Comparative Advantage* (RCA) (Balassa, 1965) which shows the advantage held by a State in exporting a single product or group of products in relation to its total trade. Alternative specification of revealed comparative advantage commonly known in the literature and which is derived from a modified version of Balassa's index, is the *Relative Trade Advantage* (RTA) developed by Vollrath (Vollrath, 1991). The Vollrath's index, that accounts for exports and imports simultaneously, differs from the RCA for the elimination of the double-counting of country and product. Vollrath, in addition, proposes a new version of the index (RC) in which the *Relative Export Advantage* (RXA) and *Relative Import Advantage* (RMP) are expressed in logarithmic form, but this of limited use where trade flux is limited or nil (Havrila, Gunawardana, op.cit.).

To perform the competitiveness analysis of the Italian *Thunnus thynnus*, we have analyzed trade exchanges on the basis of the data on export and import money flows extracted from the UNComtrade database (UNComtrade, 2019) by considering a time span of 10 years (2008 – 2017).

In order to outline the structure and geography of trade in *Thunnus thynnus*, firstly the quota of the market was established for exports (*Export market share*, EMS) and for imports (*Import market share*, IMS), respectively expressed as:

$$EMS = 100(X_{ij}|X_{iw}) \quad [1]$$

$$IMS = 100(M_{ij}|M_{iw}) \quad [2]$$

In the formula, X and M stand for exports and imports. The indices j and w relate to the region, whilst i is the product. Market shares are expressed as values from 0 to 100; thus, a value of zero indicates that the exports (or imports) of a given product i from a given country j are nil; whilst a value of 100 indicates that the entirety of exportation (or importation) of product i is carried out by country j .

In this paper, the RTA index of Vollrath (1991) is used to capture Italy's comparative advantage with respect to the individual world partners and the trade intensity ties between the partners. Establishing the RTA allows us, lastly, to measure Italy's competitiveness in the international market for Atlantic bluefin tuna. The RXA [3] expresses the export share for product i of a given country in the market j compared to the share held for other products; the index has a higher (or lower) unit value if the country's has an advantage (or disadvantage) in its competitive position for exporting product i . In the formula, X stands for exports and M stands for imports. The indices i and n relate to categories of products, whilst j and r relate to region.

$$RXA = \left(\frac{X_{ij}/X_{ir \neq j}}{X_{nj}/X_{nr \neq j}} \right) \quad [3]$$

There is a similar index for imports, the RMP [4], which expresses the import share for product i of a given country in the market j compared to the same share held for the remaining products; this indicator is greater (or less) than 1 if the country in question has an advantage (or disadvantage) in its competitive position for importing product i .

$$RMP = \left(\frac{M_{ij}/M_{ir \neq j}}{M_{nj}/M_{nr \neq j}} \right) \quad [4]$$

The RTA, obtained from the difference between the RXA and RMP, shows positive (or negative) values if the country in question has an advantage (or disadvantage) in its competitive position for trading in product i (Frohberg, Hartmann, op.cit).

$$RTA = RXA - RMP \quad - \quad [5]$$

RESULTS

During the last decade, 2008/2017, the international trade as well as the main Italian commercial partners have been affected by deep changes. Figure 3 shows the main changes, in terms of economic volume, occurred in the trade relations with the main historical Italian's partners.

The main change occurred in this last decade regard the trade relations with Japan, which passed from more than 90% in 2008 to a 1% in 2017. The Japan commercial centrality then passed to Malta, toward which Italy increase the export shares from the 22% on 2009 to an average of 80% above all since the 2014. While Spain, the third historical Italian trade partner for the *Thunnus thynnus* has remained quite stable, with different shares recorded during the last decade, and concluding the 2017 with an export share of 14,3%.

A different scenario is the one recorded from the import side, where the historical Italian partners quietly remain stable, without relevant variation (Figure 4).

Figure 3 – Export market share (EMS) of Italy

Source: Our elaboration on UNComtrade data.

Figure 4 – Import market share (IMS) of Italy

Source: Our elaboration on UNComtrade data.

Indeed, as Figure 4 describes, the trade patterns recorded in the last decade, confirms a stable path as regard the *Thunnus thynnus* import shares from the most relevant Italian suppliers, respectively: Spain, France and Greece.

The main results achieved thanks to the employment of the RTA index, as before explained, allowed us to estimate the competitive advantage of Italy towards the world market. Table 1 reports the achieved results.

Table 1. Italian Relative Trade Advantage (RTA) Index towards main trade partner countries (2008/2017)

Relative Trade Advantage index										
Partner/Year	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017
Croatia	-3,28	-1,16	-4,02	-0,73	-0,76	-1,05	-0,40	-0,97	-4,02	-2,62
France	-1,22	-1,11	-2,98	-3,68	-3,99	-6,99	-5,61	-3,60	-1,96	-2,34
Greece	-0,22	-0,60	-1,95	-0,45	0,80	-0,25	-0,75	-1,07	-2,77	-3,99
Japan	1835,77	222,09	122,34	1092,76	1,95	0,53	4,40	-3,53	0,15	5,77
Malta	-0,62	1,52	-24,24	-1,54	-7,37	44,66	148,88	61,05	103,71	78,26
Portugal	-0,36	0,50	1,42	-1,41	-0,21	-0,58	-0,71	-0,52	-0,28	-0,25
Spain	-3,41	-6,56	0,01	-8,09	1,91	-6,46	-10,42	-13,87	-11,69	-9,06

The calculation of the RTA for Italy has been performed in a time period 10 years long, including the decade 2008/2017, so as to intercept the changes occurred in the Italian position as a consequence, above all, of the quotas introduction, according to the ICCAT regulations. In 2017, a positive value of

the index is, as expected, recorded as regard the relation with Malta (78,26), a data confirmed by Figure 3 where, indeed, differently from the first year of the decade, the main Italian export shares were towards Malta (more than 80%). The competitive disadvantage with Japan widely increased during the decade, by leaving space to a new relevant important trade relation, the one with Malta. To that, we add that a worsening of the Italian competitive advantage has been however recorded above all with Spain and Greece, where the negative values of the index grown during years following an increasing path, differently from the negative value recorded with France where the competitive disadvantage occurred through unstable paths.

Apart from a lesser positive value, the one recorded with Japan, a relation recently changed, all the other main partners, such as Spain, Greece, France lead the index to negative values, as a direct effect of the fact that Italy is more and more dependent on their imports of *Thunnus thynnus* (as showed in Figure 4).

DISCUSSIONS AND CONCLUSIONS

The analysis carried out highlighted a deep change of the reference competitive scenario. By taking into consideration the results of Crescimanno and Galati (2012), which highlighted a relevant growth of the Italian competitive advantage for the commercialization of *Thunnus thynnus* above all towards Japan, our findings updated such data. Indeed, compared to the time period, 2004/2009, analyzed by the above-mentioned authors, although Italy according to the TAC limits, continues to record a competitive advantage in this industry, its competitive positioning in the world market has changed. If on the one hand, Italy gained a greater profit in the Maltese market, where live tuna is sold, on the other hand, the most important economic value is for Malta selling in Japan of BFT for the final consumption, where according to the last Japanese auctions an exemplar of BFT, with a weight of 278 kg, has been sold for 3.1 thousand of dollars (The Guardian, 2019). Indeed, the Italian BFT sector differently from the first decade of the 2000, now is suffering a depreciation represented by the huge captures carried out by Italian fleets in the Mediterranean Sea which are after sold to Malta, where BFT are fattening, and finally sell to Japan with a net competitive advantage for the Maltese economy. What happened after the introduction of the TAC but also size and weight limits set, which affect the Italian export shares from Japan to Malta, was mainly due to the national economic industry system not well prepared from bureaucratic and climate variability sides to the mass fattening systems necessary to suitably farm BFT according to the Japanese standards. However, forced changes in trade partners for international relations, together with changes also at the economic system level, at the country level, where in order to respect TAC quotas, producers change their vessel operations. To that, it is also worth to mention the illicit market strictly linked to the TAC limits that call for a more

stringent control from regulators. At this regard, it is relevant to in-depth investigate the BFT black market, a phenomenon that recently led the European Union to carry out severe investigations, as a recent Europol operation, called Operation Tarantelo, conducted with the Spanish Guardia Civil and with support of French, Italian, Maltese and Portuguese authorities, which led to discover huge irregularities relating to BFT fishing in the Mediterranean Sea (EUROPOOL, 2018).

Nevertheless, the biodiversity threats are still present, and the ICCAT control system should be improved above all adding cooperation models among countries and in particular vessels, it is worth to mention that the stock has started to recover recently and, as a result, stakeholders have raised catch quotas by 50% for the period 2017–2020 (Failletaz et al., 2019). Today, indeed, as reported in the recent EU Council Regulation 2019/124, the quotas for Italy have been set at: 2018 with 3.894,13 tonnes; 2019 with 4.308,59 tonnes; and, 2020 with 4.756,7 5tonnes (Council Regulation (EU) 2019/124). By analyzing the Italian case and the partial loss of economic value related to the export, today almost totally addressed to Malta, it is time to reflect on the need to change business strategy so as to close the entire BFT supply chain and achieve a greater economic return in Italy.

The future of the BFT industry is not anyway free of other threats, indeed, also in this sector climate change is affecting the migration routes of BFT (Failletaz et al., 2019) as well as other aspects linked to the overall supply chain. The climatic variability becomes then a factor that, together with other political, judicial and business aspects before discussed, should be integrated in the current planning efforts. Our results, following the ones of Buentello et al. (2016) more and more pointed out that quota systems and the banning of international tuna trade are not enough to achieve management of tuna stocks for sustainability; it is now time to activate proactive strategies rather than just reactive approaches, involving several relevant stakeholders, from international tuna markets, fishing fleets, to tuna farmers as well as regulatory agencies and environmentalists.

Concluding, the main challenge to effectively cope with the extinction threat of the BFT cannot be managed only through quotas systems, giving that the economic value of this production sector is highly profitable, as Japan growing demand confirm. Concrete actions to really preserve this marine species should involve also a political commitment from all the main countries involved in such market, from demand to supply side actors, as previously suggested by Heffernan (2014). As for Italy, policymakers should reflect on how avoid the loss of competitive advantage in this highly profitable industry, trying to make available targeted investments and support for local companies engaged in such business sector, with the final aim to sustain the export line of the Italian BFT supply chain so as to increase profits, limiting delocalization into other more bureaucratic free countries, like Malta.

ABSTRACT

Big data firms are growing worldwide because, independently with respect for the industry and the business model adopted, data analysis is currently a key asset for every service and product offered. This study novelty consists in the attempt to connect the dots of the relationship between Big Data impact on performance of a company in the context of the existing information privacy law for a sample of 1040 listed firms operating in the IT services, which were active in the market for the past decade.

Although we have utilized a World sample, the majority of the firms are from Asia, Europe and the America, while the legislative changes are the cases of the SWISS-USA Privacy Shield, the EU-USA Privacy Shield and the General Data Protection Regulation). We have evaluated the abnormal performance of these firms near to the change in the regulation applied and results show that the impact of regulatory innovation is larger for big data firms with respect to other IT firms.

Keywords: Big Data, Data protection, Privacy, Performance

INTRODUCTION

In December 2018 Google company found another data breach in a Google+ API that left the name, email address, occupation, and age of 52.5 million Google+ users exposed for six days (Fastcompany.com, 2018), thus totaling over €8.24 billion penalty fees over the past 2 years in various breaches related to competition pricing, illegally tying its Android operating System, abusing monopoly advertising, (The Guardian, 2019). Also, a larger scandal Facebook/Cambridge Analytica in Spring 2018 shocked the general public, reducing by more than \$100 billion the company share price in just days.

Thanks to GDPR, companies must now disclose data breaches promptly or face massive fines. The downside: Americans don't have any such protections—even as cyberattacks intensify.

According to DarkReading, (2018), “there were an estimated 3,676 data breaches in the first nine months of 2018 alone, putting it on track to have the second-most number of reported breaches in a single year.” (Grothouse, 2018).

In light of such severe changes in the world of information, we aimed at seeing how themselves the IT firms are responding to the legislative changes and how affected is their performance. In particular, the following regulatory innovations capable to raise entry barriers are considered: EU-USA Privacy Shield; SWISS-USA Privacy Shield; General Data Protection Rule. By taking a global perspective, the analysis focuses on the performance of all IT services companies that are active at the end of 2018. The analysis is released for Data processing & Outsourced services compared with the IT industry overall by implementing both single factor and multifactor models over the time period 2014-2018. In order to assess the impact of regulatory innovations on the performance of the IT companies, we perform an event study. Results suggest that Big Data companies are better in managing regulatory innovations due to diversification opportunities, but when the regulatory innovation is implemented at global level the losses for such companies are higher than other firms.

The paper is organized as it follows: section 2 presents a detailed literature review on Big data companies and regulatory innovations affecting the data value chain while section 3 presents the sample, the methodology and the main results of the empirical analysis. Section 4 states closing remarks and further research development of the paper.

LITERATURE REVIEW

While the term Big Data is relatively new, the act of gathering and storing large amounts of information for eventual analysis is ages old. The concept gained momentum in the early 2000s when industry analyst Doug Laney articulated the now-mainstream definition of big data with initially three Vs : *Volume*: Organizations collect data from a variety of sources, including business transactions, social media and information from sensor or machine-to-machine data. In the past, storing it would've been a problem – but new technologies (such as Hadoop) have eased the burden. *Velocity*. Data streams in at an unprecedented speed and must be dealt with in a timely manner. RFID tags, sensors and smart metering are driving the need to deal with torrents of data in near-real time. *Variety*. Data comes in all types of formats – from structured, numeric data in traditional databases to unstructured text documents, email, video, audio, stock ticker data and financial transactions (Laney, 2001). Others (De Mauro et al, 2016) have considered two additional dimensions when it comes to big data: *Variability*. In addition to the increasing velocities and varieties of data, data flows can be highly inconsistent with periodic peaks. Is something trending in social media? Daily, seasonal and event-

triggered peak data loads can be challenging to manage. Even more so with unstructured data. *Complexity*. Today's data comes from multiple sources, which makes it difficult to link, match, cleanse and transform data across systems. However, it's necessary to connect and correlate relationships, hierarchies and multiple data linkages or your data can quickly spiral out of control. (Sas, 2019). Recently, it seems more realistic to add another important trait: visualization. (Hila, 2017).

Big Data markets are comprised of several links along the data value chain, that is the collection, storage, synthesis and analysis, usage of data (Rubinfeld and Gal, 2017). In order to facilitate the informed decision making of final users, Big Data companies activity develops through collection, storage and architecture and analytics processing, and, finally, the analysis for knowledge discovery (Elgendy and Elgaral, 2014).

Considerable attention has been devoted in recent years to studying the legal challenges associated with Big Data, that may concern either unfair outcomes that lead to discrimination, or transformative effects that impact social and individual autonomy (Pagallo, 2017). Following the normative intervention in the Big Data market, entry barriers raised along the data value chain. In particular, the collection of data is regulated by the introduction of data protection and privacy laws in most jurisdictions worldwide. Namely, in Europe, while privacy is a fundamental right with an established protection in the electronic communication sector with the Directive 2002/58, in 2016 the General Data Protection Regulation (GDPR)¹ was adopted to discipline the life cycle of information regarding the production of information through Big Data sets and techniques. Additionally, the collection of data can be hindered by issues concerning the ownership of the data, like showed by the famous judgment in 2015 by the European Court of Justice following the complaint by Maximilian Schrems versus Facebook² stating that collecting data using one's own algorithms does not automatically make the collected data the property of the collector (Drexler, 2017). Looking at the storage of data, on the base of privacy issues, the Schrems judgment invalidated the Safe Harbor Agreement³ between the EU and the United States of America allowing the free transfer of data. As a consequence, in 2016, the United States signed a new agreement, the EU-US Privacy Shield⁴, clarifying the strict circumstances under which European data may be transferred to US servers. Furtherly, in 2017, the United States extended such agreement also on the exchange of data with Switzerland (Swiss-USA Privacy Shield).

Finally, the analysis and processing of data is interested by the GDPR but it involves also the legal issue of the protection of the intellectual property of databases, in addition or in place of raw data (Rubinfeld and Gal, 2017).

EMPIRICAL ANALYSIS

Sample

The sample considers all listed firms in the IT industry (GICS Industry Name: IT services) that are active at the end of the 2018 and collects information about their performance during the last decade (Table 1).

Table 1. Sample description

Geographical area	Overall	IT Consulting & Other Services	Internet Services & Infrastructure	Data Processing & Outsourced Services
Africa	18	11	0	7
America	213	84	35	94
Asia	507	391	44	72
Australia	3	1	0	2
Europe	299	215	40	44
Overall	1040	702	119	219

Source: Bloomberg data processed by the authors

The overall sample of listed IT firms considers 1040 firms that attain to the subsector IT Consulting & Other Services, Internet Services & Infrastructure or Data Processing & Outsourced Services. The most represented countries are the Asian ones, followed by Europe and America and the majority for the firms (702/1040) works in the IT consulting and related services, followed by Data processing & Outsourced Services, and Internet services & infrastructure.

The focus of the analysis will be on firms that are working in the subsector of Data processing & Outsourced services and the analysis will focus on the performance achieved by these players with respect to the rest of the IT industry near to some events that changed the rules for collecting and processing big data on private customer. The main events considered are:

Table 2. New privacy law implemented for the IT industry

Law	Effective from
EU-USA Privacy Shield	July 12th, 2016
SWISS-USA Privacy Shield	January 12th, 2017
General Data Protection Rule	May 25th, 2018

The analysis will present the abnormal performance of the IT firms near to the event dates and will compare results obtained for the three subsectors identified in the industry in order to evaluate if the new rules have more effects on the data processing firms with respect to other players.

Methodology

The focus of the analysis is an empirical study on the performance achieved by different types of IT firms nearby changes in the regulation for customer data disclosure and usage in order to underline

any difference in the performance for companies working in big data processing with respect to other IT companies.

The analysis of the performance for the sample of listed firms is performed by considering different approaches for the estimation of the expected return for the company. In formulas:

$$E(r_{it})^I = r_{ft} + \beta_{it}^m(R_{m,t} - R_{ft}) \quad (1)$$

$$E(r_{it})^{II} = r_{ft} + \beta_{it}^m(R_{m,t} - R_{ft}) + \beta_{it}^{SMB}(SMB_t) + \beta_{it}^{HML}(HML_t) \quad (2)$$

$$E(r_{it})^{III} = r_{ft} + \beta_{it}^m(R_{m,t} - R_{ft}) + \beta_{it}^{SMB}(SMB_t) + \beta_{it}^{HML}(HML_t) + \beta_{it}^{MOM}(MOM_t) \quad (3)$$

where $E(r_{it})^I$, $E(r_{it})^{II}$, $E(r_{it})^{III}$, and $E(r_{it})^{IV}$ are, respectively, the expected returns on the basis of the single-factor model (Sharpe, 1964), the three-factor model (Fama and French, 1993), the four-factor model (Carhart, 1997), and the five-factor model (Fama and French, 2015).

The single-factor model (equation (1)) defines the expected return on the basis of the risk-free rate (the three-month Treasury bond rate) and the market return (the value-weighted market index of all the Firms in the sample).

The three-factor model (equation (2)) considers two additional explanatory factors related to the size perspective (SMB) and growth perspective (HML), where SMB is the difference in returns achieved by two value-weighted portfolios constructed considering, respectively, all the Firms with a market value below the median value (i.e. small) and those with a market value above the median value (i.e. big) and HML is the difference in returns achieved by two value-weighted portfolios constructed considering, respectively, all the companies with a book-to-market value above the median value (i.e. high) and those with a book-to-market value below the median value (i.e. low).

The four-factor model (equation (3)) adds to the Fama–French factors a factor related to momentum (MOM), while the five-factor model (equation (4)) considers as additional factors to the three-factor model two proxies related to firm accounting profitability (RMW) and the investment strategy (CMA). Here, MOM is the difference in returns achieved by two value-weighted portfolios constructed considering, respectively, all the Firms that achieved a past performance above and below the median value and RMW is the difference in returns achieved by two value-weighted portfolios constructed considering, respectively, all the Firms that achieved an operating profit above the median value (i.e. robust) and below the median value (i.e. weak). Here, CMA is the difference in returns achieved by two value-weighted portfolios constructed considering, respectively, all the Firms that registered a growth of assets under management below the median value (i.e. conservative) and above the median value (i.e. aggressive).

All the betas are computed on the basis of a linear regression model constructed on weekly data for a two-year time horizon using a backward estimation procedure (data are collected from $t - 2$ to t).

The analysis of the performance is performed by using the standard Abnormal Return (AR) and Cumulative Abnormal Return (CAR) (e.g. Strong, 1992). In formulas:

$$AR_{it}^k = r_{it} - E(r_{it})^k \quad (4)$$

where the abnormal return is the difference of the current return of the company *i* at time *t* with respect to the expected return computed with the *k* model (*k* that varies from I to IV). The abnormal return is computed for different time horizons with respect to the event date:

$$CAR_{it}^k = \sum_{j=t-l}^{t+m} AR_{ij}^k \quad (5)$$

$$t - test_{it}^k = \frac{E(CAR_{it}^k)}{SD(CAR_{it}^k)} \quad (6)$$

where the cumulative abnormal return (formula (6)) is computed for the time horizon *m-l* and the significance of the result is performed by using standard t-test on the CAR.

Results

A preliminary analysis of the performance of big data companies show that the gross performance achieved by the firms is not always directly affected by the event but when there is a loss (SWISS-USA Privacy Shield and General Data Protection Regulation) the big data companies are those that suffer the most from the change in the regulatory framework (Figure 1).

Figure 1. Equally weighted index for IT companies (index with a base year 2014)

	Overall	Data Processing & Outsourced Services	Internet Services & Infrastructure	IT Consulting & Other Services
EU-USA Privacy Shield	0.40%	0.56%	0.39%	0.35%
SWISS-USA Privacy Shield	-0.17%	-0.33%	-0.12%	-0.13%
General Data Protection Regulation	+0.14%	-0.12%	+0.56%	+0.01%

Source: Bloomberg data processed by the authors

The performance over the 2014-2018 period is on average positive but the trend registered during the event dates for some IT subsector a negative performance is registered especially for big data companies. A more interesting analysis could be performed by considering the abnormal performance of the IT companies near to the event and by using the three different approaches for abnormal performance measurement (tables 3, 4 and 5).

Table 3. Event study analysis for IT firms - EU-USA Privacy Shield

The following table presents an analysis of the abnormal return computed by using the CAPM formula (1) and presenting the CAR on different time horizons (from -5 to +5 days) and a t test on the average different with respect to the overall IT market for different sub-types of IT firms (Data Processing & Outsourced Services, Internet Services & Infrastructure, and IT Consulting & Other Services) with respect to the market average (Overall).

Source: Bloomberg data processed by the authors

The event that affected the most the IT sector was the GDPR regulation that for the overall IT sector causes a decrease of the abnormal performance for all the sub-sectors and the big data firms are those that were affected the most in the day of the change in the privacy regulation. The EU-USA Privacy Shield and SWISS-USA Privacy Shield have not a negative effect on the abnormal performance in the big data firms but all other IT firms have suffered of losses after the implementation of the new regulation when the Fama & French and Carhart models are considered. Results suggest that big data firms are better able to manage a regulatory innovation due to the opportunity to diversify in markets that are not affected by the same regulatory constraints but when the regulatory innovation became a worldwide standard the losses for big data providers are higher than other firms.

CONCLUSIONS

Our study's literature review indicated both a need of change in the bilateral agreements EU-USA, SWISS-USA and further internationalization of legislative base related to the governance of Big Data firms in regards to the protection of data privacy, storage, transfer, but also of the fair competition. This became more ardent with the 2018 implementation of the GDPR in the EU, due to variability, further complexity and visualization of Big Data firms' activities.

On a sample of 1040 listed firms from the GICS sector- IT services related, in the last decade, we run the analysis of their financial performance by utilizing the expected returns on the basis of a single-factor Model (Sharpe, 1964), the three-factor model (Fama and French, 1993), the four-factor model (Carhart, 1997) and the five-factor model (Fama and French, 2015). The analysis of their performance was done via: standard Abnormal Return and Cumulative Abnormal Return (e.g. Strong, 1992) and the standard t-test, with presenting the CAR on different time horizons (from -5 to +5 days) and a t-test on the average different with respect to the overall IT market for different sub-types of IT firms. The categories used in our analysis were: Data Processing & Outsourced services, Internet Services & Infrastructure, and IT Consulting & Other Services.

Initially, although the results show that the gross performance achieved by the firms is not always directly affected by the event except for when there is a loss (SWISS-USA Privacy Shield and General Data Protection Regulation) the big data companies seem those that are affected the most from the enhancement of the regulatory framework.

The performance over the 2014-2018 period was on average positive for EU-USA Privacy Shield, but the trend registered during the event dates for all IT subsectors under the SWISS-EU Privacy Shield

was a negative one, which was registered especially for big data companies. The only category that has shown mixed results, but on average positive, was the GDPR Protection Regulation.

From the analysis performed on the three categories of regulation, by utilizing the three performance tools and the analysis of the performance, it seems that the event that negatively affected the most the IT sector was the GDPR regulation, with the big data firms being most hit by in the day of the change in the privacy regulation.

When the Fama & French and Carhart models were applied it showed that the EU-USA Privacy Shield and SWISS-USA Privacy Shield have not a negative effect on the abnormal performance in the big data firms. However, all other IT firms have incurred losses after the implementation of the new regulation.

The study results suggest that big data firms seem better fit to deal with a regulatory change or innovation due to their access and opportunity to diversification in markets that are not affected by the same regulatory constraints. However, when the regulatory intervention/innovation got implemented worldwide, big data providers incurred higher losses than other firms.

In terms of the study limitations, perhaps the size of the firm can be further compounded in the analysis, and perhaps cross-sector analysis can be utilized. Also, looking at the performance of such firms after 2018 implementation of GDPR offers limited insights on the matter. More insightful results could be obtained by running the tests for abnormal performance of the IT companies nearer to the event and by using the three different approaches mentioned for abnormal performance measurement.

ABSTRACT

The aim of this study was to create a representative and update farm typology for the suckler cow sector in the region of Central Macedonia, Northern Greece. The identification of the types was done both for the farming system and the farmer's profile, based on the data obtained from a Neyman stratified random sample of 66 farms. The stratification was made by size class at the level of Regional Unity. Primary data were collected through personal interviews with the cattle farmers by completing questionnaires concerning (a) social, environmental, zootechnical and economic parameters of suckler cow holdings and (b) attitudes, decisions and views of farm owners. The statistical approach of hierarchical cluster analysis was applied in two successive analyzes exploiting (a) 17 initial and composite variables that characterize farming system and (b) 9 initial variables of farmer profile classification. The purpose of cluster analysis was to characterize and classify the farms into different clusters of farming types and farmer types. Differences between clusters were assessed using one-way ANOVA and χ^2 test. In the first cluster analysis four principal farming systems and one diversified were highlighted. The second cluster analysis highlighted three main types of farmers and a diversified one. They were then associated with two-way Anova tests, farming systems with the main types of farmers. This resulted in 5 combinations with statistically significant correlations. Finally depends on gross profit, cost of feeding and subsidies, the combination of multifunctional young farmers that own medium-sized farms with the application of a semi-intensive farming system demonstrates the highest sustainability perspective.

Keywords: Farming system, farmer typology, pasture availability, self-produce feedstuffs

INTRODUCTION

Farming systems in Mediterranean countries is characterized by a decrease in the number of farms, along with the enlargement of individual farms, specialization, and an increase in labor productivity (Choisi et al 2012). Furthermore another reason for the disappearance of livestock farming in

Mediterranean countries was lack of generational succession and/or the high opportunity cost of labour (Bernués et al., 2005).

The continuing need to improve the efficiency of production systems was mainly based on the intensification of the farming type (Emtage et al. 2006 & 2007). Thus, traditional pasture-based livestock activities such as suckler cow farming have intensified calf production and continued the nomadic way of rearing cows during summer grazing (Milan et al. 2006).

An important role in the development of the above model in Greece was played by the Common Agricultural Policy (CAP) of the European Union. CAP increased farm inputs, either through direct subsidies per capita or by joining development projects (Karagiannis & Sarris 2002). The main purpose of the support and development programs targeting on cattle farming was the upgrading of indigenous genetic material and the improvement of existing livestock facilities.

What is not predicted in this transformation of the traditional beef cattle farming way was the increased level of annual variable costs resulting from the high purchase cost of feedstuffs to meet the nutritional needs of the animals (Kitsopanidis 2005).

The suckler cow farmers who chose to intensify their productive system or the intensive fattening of their calves, in order to reduce their dietary costs started to be active in the cultivation and self production of feedstuffs (Alemu et al. 2016).

According to the above mentioned suckler cow-calf production is sensitive to the amount of supplementary feed, in addition to grazing, that is required to overcome the lack of grazing matter during winter (Sollenberger et al 2005). This process was also led to a greater utilization of natural resources, increasing the average grazing period, accompanied by an increment of grazing areas and decrement of forage crops (Bernués et al. 2011).

It is obviously that the cultivation of utilized agricultural areas combined with the rational management of pastures, is an important factor in carrying out sustainable cattle farming.

The aim of the present paper is to develop a typology of both suckler cow farmers and the farming systems, according to their social-economical profile and their decision making plans for sustainable farming management.

MATERIALS AND METHODS

The region of central Macedonia that is being studied consists of seven regional units and is located in the center of Northern Greece. In the sampling area there are 129 holdings of suckler cows with a size of more than 20 cows. The total sample was divided into 3 categories according to farm size. Size is one of the most important stratification variables because it determines significant differences between farms (Daskalopoulou & Petrou 2002, Acosta-Alba et al. 2012). The first category consisted of

farms of 20-50 cows, the second of 51-100 cows, and the third of more than 100 cows (Ruiz et al. 2008).. The final proportionate stratified Neyman's sample includes 66 suckler cow farms with 6.122 suckler cows, accounting the 51% of all suckler cow holdings in the research area. According to the above methodology, was selected proportionally from the 7 regional units of the region for all three classes of size (Madry et al. 2013).

The primary data (which concerned the financial year 2014) were collected by a questionnaire taking into account similar surveys in other countries (Solano et al. 2011, Soini et al. 2012 & Martin-Collado et al. 2014) and some related studies in Greece (Aggelopoulos et al. 2011 & 2014, Gelasakis et al. 2013). There were recorded the farm structure characteristics, the farmer's profile and the techno-economic indicators were used to estimate the sustainability of suckler cow holdings (Gibon et al. 1999).

According to Kostrowicki (1977), wherever possible, the variables used in farm animal typologies must be quantified. The data were recorded on Ms Excel encoded sheets in order to create a data matrix for further statistical analysis with SPSS version 23 software.

The multivariate statistical analysis was used in two analytical fields. The first field investigated the correlations between variables that characterize the production system (Table 1).

Thematic Unity	Variable	Abbreviation	Type	Number of classes	Formulation
Herd size	Livestock units (cows)	LU	Quant.		Number of suckler cows
	Total livestock units	TLU	Quant.		Suckler cows LU + Calves LU + Heifers < 1 year LU

Table 1: Variables selected for the 1st cluster analysis on farm type

In the second field, a socio-economic typology was developed for the profile of the farm owner, in order to analyze its capacity, decision-making and design of practices for the development and improvement of the management level of its holding (Table 2).

Thematic Unity	Variable	Type	Number of classes	Formulation
Farmer demographics	Age of farmer	Qual.	3	
	Family status	Qual.	3	1(Single man), 2(couple without children), 3(couple with children)
	Farmer succession	Qual.	2	Yes/No
Arable Land use	Level of farmer education	Qual.	4	1(University), 2(Technological Institute), 3(High School), 4(Primary School)
	Cultivated agricultural area (ha)	Quant.		
	Category of cultivated feedstuffs	Qual.	5	1(Only cereal grains-CG), 2(Only hay & silage-HS), 3(Both CG & HS, but CG economic value > HS economic value), 4(Both CG & HS, but HS economic value > CG economic value), 5(Nothing)
Economics	Estimated value of cultivated feedstuffs (€)	Quant.		
	Cost of purchased feedstuffs /LU (€)	Quant.		
	Gross income / LU (€)	Quant.		

Table 2: Variables selected for the 2nd cluster analysis of farmer's type

The multivariate statistical techniques used in this study was hierarchical cluster analysis. In hierarchical cluster analysis the algorithm used was based on Ward method and Euclidean distances (Norusis 2011). The selection of the number of clusters is usually done by empirical criteria, although some statistical criteria have been developed (Everitt et al. 2011). The study of the cluster analysis dendrogram is the basic tool to determine the number of groups that will result from the analysis. Finally, univariate techniques, such as one-way ANOVA and Tukey (post-hoc tests), were used to investigate the differences between different typologies, in a significance level $p < 0.05$.

The main indicator used in the technical and economic examination of suckler cow holdings to highlight the differences between clusters was the gross profit, which is the imprinting of the monetary value of the productive factors (Papanagiotou 2008). This indicator is the result of deducting from the annual gross income the annual variable costs at the holding level.

RESULTS

Initially, total gross income was estimated for both 66 holdings and per cow (LU), (Table 3). Data in Table 3 relate to the financial year 2014, but corresponding data were collected in the questionnaire for

the 2013 financial year. In 2013, the average production value for the 66 holdings reached €64,032 per holding, which is at the same level as the 2014. The percentage of subsidies in the gross income reaches 30.6%. The estimation of the total variable costs for the year 2014 highlighted in Table 4.

2014	Average value of 66 holdings (€)	Average value per cow (€)
Gross income from sales of fattened calves	63,330.67	682.81
Gross income from sales of purchased-fattened calves	2,069.70	22.31
Total subsidies	28,822.73	310.76
Total gross income	94,223.19	1,015.88

Table 3: Total gross income of 66 holdings.

Types of expenses (2014)	Average value of 66 holdings (€)	Average value per cow (€)
Purchase cost of fertilizers and seeds	2,512.12	27.09
Cost of purchased feedstuffs	39,611.21	427.07
Cost of rented arable land	500.00	5.39
Cost of annual electricity consumption	1,238.63	13.35
Purchase cost of fuel-lubricant-transport	3,656.06	39.42
Purchase cost of fattened animals	689.39	7.43
Purchase cost of veterinary medicines	530.12	5.72
Cost of rented pastureland	151.66	1.64
Cost of seasonal workers	2,100.02	22.64
Short-term borrowing interest	2,804.41	30.24
Total variable costs	53,793.62	579.99

Table 4: Total variable costs of 66 holding

The average gross profit of the 66 holdings is calculated by subtracting the average total variable costs from the average total gross income shown in Tables 3 and 4 respectively. This calculation shows that the gross profit of the sample is on average for the financial year 2014 of €40,429.57 per holding and €435,79 per cow (LU). According to Table 3, subsidies accounted for 71.3% of gross profit.

The results of first typology showed that suckler cow farms in Central Macedonia region can be classified into eight clusters [C1(n=9), C2(n=14), C3(n=3), C4(n=24), C5(n=9), C6(n=3), C7(n=2) & C8(n=2)]. The main characteristics of the clusters are shown in Table 5. A further classification concerning the farming system highlights four principal farming systems and a diversified one.

Characteristics	Clusters							
	C1 (n=9)	C2 (n=14)	C3 (n=3)	C4 (n=24)	C5 (n=9)	C6 (n=3)	C7 (n=2)	C8 (n=2)
Herd size	small	large	medium	medium	medium-large	large	very large	medium
Farming system characterization	semi-extensive	semi-extensive	semi-intensive	semi-intensive	intensive	intensive	intensive	semi-intensive

Pasture availability	high	medium	very high	medium	low	low	low	high
Exploitation of labour	low	medium	high	low	high	high	high	low
Modernization score	semi-modernized	traditional	semi-modernized	semi-modernized	modernized	semi-modernized	modernized	modernized
Cow productivity	medium	low	high	medium	high	low	high	low
Dependence on subsidies	high	high	low	high	low	low	low	low
Profitability	very low	low	medium	medium	no profit	with damage	medium-high	high
Veterinary & husbandry support	high	high	high	low	low-medium	χαμηλή-μεσαία	high	very high
Pastureland safety	dangerous	unsafe-dangerous	safe-unsafe	safe	unsafe	very safe	safe	safe
Genetic material	adapted	improved	adapted-improved	mainly adapted	mainly improved	unimproved	adapted-improved	improved

Table 5.: Classification of the farming type clusters.

The first system is represented by the *semi-extensive* C1 and C2 with low structural and productive levels, mainly based on the exploitation of mountainous pastures. This system illustrates the most diverging trend of extensification in the suckler herd linked to land resources. Family labour and low or medium stocking rate are important factors that allow the future existence of this system. Genetic material seems to be adapted to farm management practices. Therefore, farms of these clusters show a low profitability only due to the contribution of subsidies. It seems that direct subsidies have not improved the productivity of this farming system.

The second system represented by the most numerous and *semi-intensified* C4 is the dominant type of farming systems as it achieves satisfactory economic results and becomes more viable despite its lack of grazing areas. However system viability strongly depends on subsidies. That strong dependence hinders the future competitiveness and sustainability of C4 farms unless they improve the efficiency of work and infrastructure and use the know-how of specialist scientists.

C3 and its branch C7 constitute the third type of *semi-intensive* farming system. Its main difference from the previous system is the high availability of herbaceous pastures that makes the land factor

non-limiting. These holdings have increased the scale of their activities by optimizing labour efficiency and cow productivity. Although they have met the lowest dependence on subsidies, they failed to combine it with a better income because of the high operating cost resulting from the increased farming size.

The fourth farming system expressed by the *intensive* C5 and its branch C6 faces difficulties to achieve its viability, with or without subsidies, due to the complete lack of grazing area.

The C8 represents a mixed and diversified farming system that is mainly based on purchased calves fattening that cannot be considered as a pure suckler cow breeding system.

The second typology developed in this study has revealed six main types of breeders [F1(n=10), F2(n=12), F3(n=6), F4(n=30), F5(n=6) & F6(n=2)] which occupied mainly on calves fattening. The main characteristics of the clusters are presented in Table 6. In the sample of this study, only one is *hobby-farmer* and keeps his animals for recreational and demonstration purposes. The above types respond relatively well to the characteristics of the breeders model developed by Burton & Wilson (2006). Based on the analysis of these researchers the basic separation of farmers can be made in (1) farmers exclusively engaged in cattle breeding, (2) *multifunctional* farmers (3) *traditional* farmers and (4) *diversified* farmers.

The majority of suckler cows farmers in the Central Macedonia region, regardless the size of the holding and the owned land, did not adopt the diversification of farms, preferring to maintain their traditional breeding orientation as in F4 (n = 30) separated from other breeders as *traditional* (3).

F3 and F5 breeders are exclusively engaged in suckler cow farming, and if they do not adopt rational management practices, they will hardly achieve prospect of sustainability.

F1, F2 and F6 farmers can be described as multifunctional, with the latter having adopted a completely different production model and considered diversified.

Characteristics	Clusters					
	F1 (n=10)	F2 (n=12)	F3 (n=6)	F4 (n=30)	F5 (n=6)	F6 (n=2)
Age of farmer	young- middle aged	young	middle aged	middle older	aged- young	young
Family status	unmarried	married children	+ married children	+ married children	+ unmarried	married children

DISCUSSION-CONCLUSION

The relationship between farmer type and farming type

The results showed (Table 7) statistically significant dependence between the breeder type and breeding type ($\chi^2(49) = 70.82, p = 0.022 < 0.05$).

Farming systems		Farmer types			
		Multifunctional farmers (n=22)	Farmers exclusively engaged in breeding (n=12)	Traditional farmers F4 (n=30)	Diversified farmers F6 (n=2)
Semi-extensive (n=23)	C1+ C2n	10	3	10	0
	%	45,5%	25%	33,3%	0,0%
Semi-intensive (n=5)	C3+ C7n	1	0	4	0
	%	4,5%	0%	13,3%	0,0%
Semi-intensive (n=24)	C4n	8	2	13	1
	%	36,4%	16,7%	43,3%	50,0%
Intensive (n=12)	C5+ C6n	3	7	2	0
	%	13,6%	58,3	6,7%	0,0%
Diversified (n=2)	C8n	0	0	1	1
	%	0,0%	0%	3,3%	50,0%

Table 7: Final table of correlations between farmer types and farming systems.

The traditional middle-aged farmers of the F4 group that apply the semi-intensive C4 farming system are the most numerous farmers- farming system combination (n = 13). This combination greatly relies on meeting the nutritional needs of livestock in grazing, while a significant part of the variable costs is directed to purchased feedstuffs because self-produced feeds, that are mainly concentrate feeds, are a small part (about 20%) of complementary to grazing feedstuffs. This combination, which shows good gross income and gross profit with the participation of subsidies, in a possible future loss of subsidies should increase the size of the herd to continue to provide adequate income to the farmer and his family.

The second combination (n = 10) where traditional middle-aged farmers of the F4 group are associated with the application of semi-intensive systems mainly C2 and less C1 does not seem able to become viable unless it improves the low productivity of cows and its infrastructure because it is vulnerable to future changes on subsidies system.

Another option for traditional farmers in the F4 group (n = 4) is the application of a semi-intensive system (C3 and C7) to a large-scale herd. This is the implementation of the proposed future development of the 1st combination, which achieves good gross profitability per female reproductive animal (LU) and without subsidies.

Most multifunctional young farmers of the F1 + F2 groups (n = 10) are associated with the semi-intensive systems of the C1 + C2 groups. Despite the fact that most of the animal feed is self-produced, it does not seem to have an impact on profitability as Group C1 has a very low performance on labour factor, and C2 has very low cow productivity. If these two very critical parameters are improved, then this farmer type-farm type combination can become viable without the participation of subsidies.

The combination of multifunctional young farmers (n = 8) with the application of medium sized semi-intensive farming system represented by C4 cluster, has a great prospect of sustainability in a future wider application framework in the majority of suckler cow holdings. Multifunctional farmers, especially those of F2 cluster who have probably ensured their succession in the profession, and have a relatively good educational level if (a) change the type of feedstuffs they produce, (b) optimize cow productivity through improved genetic material, and (c) with the guidance of experienced technical consultants, in the future will achieve very satisfactory financial results without subsidies.

Finally, farmers who are only engaged in suckler cows breeding such as those of F3 + F5 groups and have intensified their farming system (C5 + C6 groups) cannot ensure their sustainability at this time due to the low availability of pastures and the high purchase cost of almost all supplementary feedstuffs.

The economic data and results of the combinations of both the farmer type and the farming system are illustrated in Figure 1.

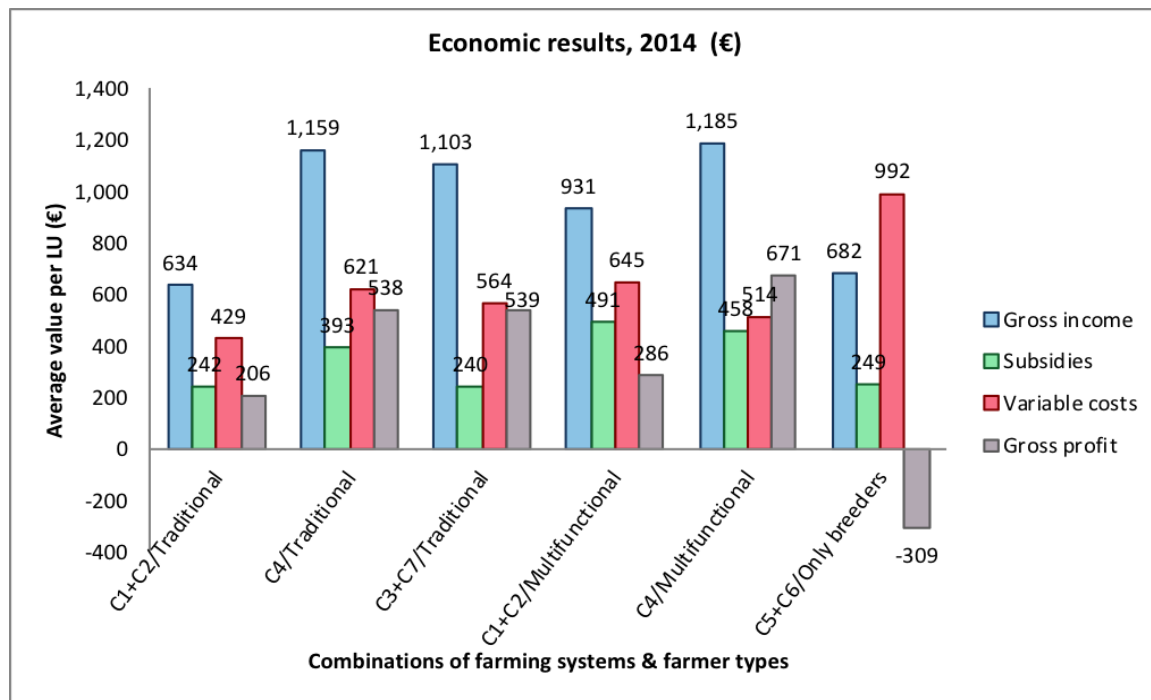

Figure 1: Final table of correlations between farmer types and farming systems.

* C1+C2= semi-extensive systems

** C4, C3+C7= semi-intensive systems

*** C5+C6= intensive systems

ONLINE NEWS RECOMMENDATIONS CREDIBILITY: THE TIE IS MIGHTIER THAN THE SOURCE

Hayat, Tsahi; Samuel-Azran, Tal

Sammy Ofer School of communications, the interdisciplinary Center, Israel

ABSTRACT

In recent years, news consumers have become increasingly exposed to news items shared by their friends on different social networking sites (SNS). In this paper, we wish to examine the perceived credibility of these shared news content – specifically, as a function of tie strength and perceived credibility of the media source from which the content originated.

We utilized a between-subjects design. The Facebook account of each participant (N=217) was analyzed. Based on this analysis, our participants were shown a fictitious Facebook post that was presumably shared by one of their Facebook friends with whom they had either a strong social tie (experiment group), or a weak social tie (control group). All recipients were then asked about their perceptions regarding the news source (from which the item presumably originated), and their perception regarding the credibility of the presented item.

Our findings indicate that the strength of the social tie between the sharer of the item and its recipient mediates the effect of the credibility perception regarding the news source, and (1) the perceived item credibility; as well as (2) the likelihood of searching for additional information regarding the topic presented in the shared item. The relevancy of these results is discussed.

Keywords: Credibility, Social networking sites, Social network analysis, News consumption, Information search, Experiment, Quantitative analysis, Influence

INTRODUCTION

News consumption has changed dramatically with the rise of online social networking sites. A 2017 Pew Research Center survey found that two-thirds of US adults report receiving their news from their SNS-based social ties (Shearer and Gottfried, 2017). In other words, this way, news reaches individuals via their SNS feed, from diverse social ties rather than directly from a large media organization. The most popular platform for receiving news recommendations is Facebook, with 45% of US adults reporting that they receive news specifically from social ties (Shearer and Gottfried, 2017). Clearly, when news is spread via SNS ties, a new factor is introduced into the process of credibility assessment. An interplay between the credibility of the social tie sending the news item and that of the

original source of the news item comes into effect. The analysis of this interplay can illuminate various situations and decisions made regularly by contemporary news readers on SNS. For example, it explores how online SNS users judge the credibility of a news item when there is a clash between their trust in the news media source and that of the social tie sharing the news recommendation. The analysis of this type of situation can teach us a great deal about contemporary processes of news credibility evaluation.

Importantly, understanding SNS news credibility evaluation is highly timely in light of the growing awareness of the spread of questionable information on SNS. A recent study identified that a great part of the news shared and recommended on SNS falls under the definition of fake news (Frier, 2017). A recent study further showed that the average American adult saw several fake news stories around the time of the election, with just over half of those who recalled seeing them indicating they believed them (Allcott and Gentzkow, 2017). In light of the increasing interest in the evaluation of fabricated items in the political realm, we designed an experiment analyzing the credibility assessment of news item – while specifically focusing on the effect of the person sharing the content has over the perception of the credibility of the shared content.

Furthermore, the study aims to extend our understanding of the impact of the credibility assessment process on future actions and behavior. Thus, we also examined the participants' motivation to seek further information about the issue raised in the recommended news item. Such behavior would indicate that the issue raised the curiosity of the participants and might have even affected their beliefs. This part of the analysis contributes to the search for the link between information exposure and online behavior. It also sheds light on the interplay between information seeking and news credibility (e.g., Silverman, et al., 2016).

THE INTERPLAY BETWEEN INFORMATION SOURCES AND TRUST: FROM TRADITIONAL MEDIA TO SNS

The question of the role of source credibility in news credibility assessment has preoccupied scholars since the two World Wars' propaganda days (Honey, 1985; Messinger, 1992) through the golden age of traditional media (Bucy, 2003; Pornpitakpan, 2004) and well into the contemporary so-called web 2.0 era (Kenski, Jamieson, Flanagin, & Metzger; Westerman, Spence, & Van Der Heide, 2014). Early studies of source credibility identified several features as playing an important role in determining the source credibility, these include: the sources' perceived expertise and trustworthiness (Hovland, Janis, & Kelley, 1953); journalists' knowledge, education, intelligence, social status, and professional achievement (Hass, 1981; McGuire, 1985); and perceived source motivation (Harmon and Coney, 1982; McGinnies and Ward, 1980; Roy Dholakia and Sternthal, 1977).

In contrast, several studies found that variables predicting credibility are more likely to be associated with the receiver rather than with source features. Gunther (1992) found that respondents' own group identification — whether religious, national, or political — proved to be the strongest predictor of their perceptions of media credibility (see also Salmon, 1986; Sherif and Hovland, 1961). Similar studies found that other demographic variables such as age, education, and gender mediated perceived channel credibility (Abel and Wirth, 1977; Gunther, 1992; Johnson and Kaye, 1998; Westley and Severin, 1964).

However, these sender-versus-receiver models are now being challenged with the addition of several other elements and mediators in the news spread process. In online social networks in particular, users are constantly exposed to news recommendations in their news feed (Amichai-Hamburger & Hayat, 2017). This new form of news reception and consumption often takes the form of routine news recommendations from the recipient online social ties. These ties range from strong ties such as a close family member or friend to weak ties such as a distant work colleague or a distant family member. When assessing the items' credibility, the receivers can assess both the legitimacy of the news source, which is often part of the so-called old or traditional news media, as well as the extent to which he trust the person sharing the content (Hayat, HersHKovitz, & Samuel-Azran, 2018). Thus, studies suggest that credibility assessment of news items shared on SNS requires new research methods and approaches addressing not only the credibility of the traditional media source but also the credibility of the SNS tie sharing the news item (e.g., Hayat, HersHKovitz, & Samuel-Azran, 2018; Johnson and Kaye, 2014). This body of work has played a major part in the design of our study.

Indeed, so far, the few studies addressing this call have provided several new insights on the importance of social ties in the news credibility assessment process. Turcotte, York, Irving, Scholl, & Pingree (2015) found that when the person sharing the news item is considered by the receiver as an opinion leader, the trustability level of the item is amplified, as is the desire to search for further information from the news organization that originally published the item. Another study found that credibility is enhanced when the content is shared publicly on the sharer's Facebook "wall" (rather than as a private message), and when the messenger poses a question relevant to the issue when sharing the content (Oeldorf-Hirsch, 2011). In 2013, Xu examined the issue of source credibility in the news aggregation platform Digg, and identified that the receipt of a news item via a social recommendation was the primary factor influencing its perceived credibility and likelihood that the receiver would click and open the news item. More recently, Anspach (2017) found that endorsements and discussions were consumed, shared and endorsed more significantly when they came from

friends or family members (i.e., a strong social tie) in comparison to other contacts, and they were hardly shared or endorsed when received from un-known individuals.

Our study adds an important component to these analyses by focusing on the impact of tie strength (weak versus strong) on the perceived credibility of a news item. Particularly, it pays special attention to the *impact of the interplay between the tie strength's credibility and the credibility assigned to the traditional news media source on the evaluation of the news recommendation*.

As early as 1973, Granovetter famously noted that social networks are comprised of a combination of weak ties, which should be thought of as "acquaintances", and strong ties which can be regarded as "friends". The question of the interplay between weak/strong ties and source credibility perception is not trivial, as both types of ties contribute different types of information (Putnam, 2000). Notably, Putnam identified that weak ties primarily allow exposure to information that is not yet known and might broaden the receivers' horizons, whereas strong ties are associated with providing emotional and social support – thus highlighting the importance of information received by weak ties.

In contrast, though, recent research has shown that weak ties are evaluated as dispensable and lacking value (Krämer, Rösner, Eimler, Winter, & Neubaum, 2014). Furthermore, another recent study found that SNS users are more likely to unfriend or unfollow weak ties than strong ties (John and Dvir-Gvirsman, 2015). Given this recent evidence, we may deduce that information gained from weak ties will be granted less attention and consideration compared to information provided by strong ties. Hence, our first research hypothesis is as follows:

H1: The stronger the social tie between the recipient and the person sharing the content, the higher the perceived credibility of the content.

Furthermore, we hypothesize that attitudes toward the traditional media source are less predictive of perceived credibility, when the content is shared by an individual with whom the recipient has a strong social tie. On the other hand, attitude toward the media is more predictive of perceived credibility, when the content is shared by an individual with whom the recipient has a weak social tie. Hence, our second hypothesis is:

H2: There will be an interaction between the strength of the social tie and the recipient's attitude toward the media source portraying the content and predicting the perceived credibility attributed to the presented content.

INFORMATION SEEKING AND SOURCE CREDIBILITY

As noted, following the source credibility evaluation analysis, the study moves to examine the participants' motivation to search for further information as a result of the exposure to the shared news item. This segment of the study aims to contribute to analyses of the way source credibility

assessments affect information behavior. This issue became relevant in the 1980s and 1990s with the decreasing trust in traditional news sources (Ladd, 2011, 2013). Analyses of source credibility of traditional media began to identify that high trust in a news source can guide partisan political behavior. One notable example is a study that found a significant effect of the introduction of the Fox News Network in 1996 on the vote share in Presidential elections between 1996 and 2000. The study identified that Republicans gained higher percentage points in the towns that broadcast Fox News and claimed that Fox News affected voter turnout, thus linking between high trust in Fox News and political behavior (DellaVigna and Kaplan, 2007). An additional study also identified a strong link between those watching Fox News and beliefs, finding a strong link between Fox News adherence and higher belief that weapons of mass destruction were found in Iraq during the 2003 war (Kull, Ramsay, & Lewis, 2003).

In the SNS era, the analyses of the interplay between behavior and news trust shifted to other measures of analysis, such as online news consumption behavior (e.g., Hayat and Samuel-Azran, 2017; Hayat, Samuel-Azran, & Galily, 2016), and information seeking patterns. The most relevant example for the latter deals with the assessment of credibility of news recommendations made by SNS opinion leaders, and how such credibility assessment affects information seeking of further items from the same news outlet (Turcotte, et al., 2015). The study found significant correlation between the perceived credibility of an opinion leader sharing an item and the recipient's tendency to search for additional information from the news outlet from which the item originated. The opposite effect was found amongst recipients who perceived the sharer of the content as a poor opinion leader. Accordingly, our third research hypothesis is as follows:

H3: The stronger the social tie with the person sharing the content, the more likely the recipient is to seek additional information regarding the topic presented.

Furthermore, we hypothesize that the attitude toward the traditional media source is less predictive of an individual's likelihood of searching for additional information when the content is shared by an individual with whom the recipient has a strong social tie. On the other hand, attitude toward the traditional media source is more predictive of an individual's likelihood of searching for additional information when the content is shared by an individual with whom the recipient has a weak social tie. Hence, our fourth hypothesis is:

H4: The interaction between the strength of the social tie with the person sharing the content, and the recipient's attitude toward the media source portraying the content and predicting the likelihood of searches for additional information regarding the presented content.

THE CONTEXT OF THE CASE STUDY: AL JAZEERA ENGLISH IN ISRAEL

Before describing our research method, we wish to better contextualize the case study at hand. As the study probed Israeli students' assessment of an Al-Jazeera English item on the Boycott, Divestment and Sanctions (BDS), it is important to mention that Al-Jazeera English has been broadcasting on Israeli satellite provider YES, one of Israel's two main television providers, since its November 2006 launch. Interestingly, the channel is located on the channel list in the same place as the other leading English international news channels (e.g., CNN , Fox News, BBC World and Sky News) rather than in the Arab stations section, thus conferring upon it the same level of institutional legitimacy as other international news channels. Interestingly, Israel has carried Al-Jazeera, in English and Arabic, when its entrance to other markets, including the US and the Canadian markets, was highly challenging (Samuel-Azran, 2016; Samuel-Azran and Hayat, 2017). These factors highlight Israel's openness to accepting it as a legitimate news source. However, it is also important to mention that at the same time many Israeli viewers are highly suspicious of Al-Jazeera , perceiving it as extremely pro-Palestinian and inherently anti-Israeli (Azran, Lavie-Dinur, & Karniel, 2012).

Next, the decision to design a mock article regarding an attempt of BDS activists to block Israeli student exchanges with a US university was aimed to raise interest amongst participants. This is an issue that is bound to interest Israeli students, and is most likely familiar to them, as it serves as a hotbed for pro- and anti-Israel activists. BDS activists have had many successes in anti-Israel actions in the US in the last few years, such as influencing leading artists to cancel their concerts in Israel, protesting vociferously in academic institutions and frequently gaining headlines. This highlights the viability of BDS attempts to ban student exchange with Israeli institutions. Marquette University was selected due to the fact that it is relatively unknown in Israel, making it difficult for the participants to guess the item's credibility.

METHODOLOGY

Sample

Participants in this study were Israeli and international undergraduate students in a private college in the center of Israel (N=217), all of whom had an active Facebook account. Data collection was conducted during February 2017.

Procedure and manipulation

As part of the research questionnaire, participants were presented with a fictitious Facebook status, presumably shared by one of their actual Facebook friends, reporting a story related to BDS (Boycott,

Divestment and Sanctions). The title of the item was: "Student supporters of the BDS movement at Marquette University call to stop all student-exchange programs with Israeli universities".

As part of the recruitment and preparation process for the experiment, participants were asked to become Facebook "friends" with a dedicated study account. After the participants became "friends" of the account, and following their formal consent, we ran a script that collected data from the participants' Facebook profile. Specifically, for each participant and for each of the participants' Facebook friends we counted the **number of mutual friends** the two have, and selected one of the participants' friends with who he had the highest number of mutual friends. This approach is inspired by the model presented by Gilbert and Karahalios (2009), using information that is available via the participants' Facebook profile. Additionally, our script chose for each participant another, random friend (from their Facebook friends list), defined as a 'random tie'.

Finally, the participants were randomly assigned into two groups. The only difference between the groups was in the tie strength of the person who presumably shared the content on Facebook (as presented on the research questionnaire). The participants in the "strongest tie" condition group (n=74) received a version of the questionnaire in which the sharer had the strongest tie strength with them (as calculated by our script); the participants in the second group (n=74) received a version of the questionnaire in which the sharer was a random Facebook friend of theirs.

Measurement

Perceived Item Credibility (dependent variable). Based on the work of Flanagin and Metzger (2007), this variable is comprised of five items: **trustworthiness**, **believability**, **accuracy**, **completeness**, and **unbiasedness**. Each item was measured using a 7-point Likert scale (Cronbach's $\alpha=0.86$). The overall credibility score was calculated as the average of these items (M=2.68, SD=0.72, N=215).

Seek Additional Information (dependent variable). Based on Borah (2014), this variable is comprised of five items: **Seek more information supporting your own side of the issue**, **Seek more information supporting the other side of the issue**, **Seek more information that offers a balanced view on the issue**, **Seek more opinions supporting your own side of the issue**, and **Seek more opinions supporting the other side of the issue**. Each item was measured using a 7-point Likert scale (Cronbach's $\alpha=0.75$). The overall credibility score was calculated as the average of these items (M=2.12, SD=0.37, N=215).

Demographics (background variables). **Age** and **gender** were reported by all participants (N=217). Age range was 19-27 (M=22.12, SD=3.71). Overall, there were 152 females (70%) and 65 males (30%).

Tie Strength (independent variable). To measure the strength of tie between the information recipient (the participant) and the information sharer, we used the **Inclusion of Other in Self Scale** (Aron, Aron, & Smollan, 1992). This visual assessment tool presents participants with seven pictures, each of

which includes two circles—representing the "self" and "the other"— that overlap at different levels, ranging from totally separated (1) to almost fully overlapping (7). The participants are asked to mark the picture that best describes their current relationship with the other person, giving the value for this variable ($M=3.61$, $SD=1.64$, $N=217$).

Perceived Channel Credibility (independent variable). Based on the work of Gaziano and McGrath (1986), this variable is comprised of 12 items: whether the media source is **fair, unbiased**, accurate, factual, **tells the whole story, respects people's privacy, watches out after people's interests, is concerned about the community's well-being, separates fact and opinion, can be trusted, is concerned about the public interest, has well-trained reporters**. Each item was measured using a 7-point Likert scale (Cronbach's $\alpha=0.81$). The results were translated into a score by adding up the ratings of each of the 12 items ($M=23.63$, $SD=7.53$, $N=217$).

Data analysis

We used four regression models to test our hypotheses (see Table 1). We first examined whether perceived tie strength and perceived channel credibility indeed predicted the perceived credibility of the presented item (Models 1). We then examined whether there was an interaction between perceived tie strength and perceived channel credibility in predicting the perceived credibility of the presented item (Model 2). We followed the same procedure to examine whether perceived tie strength, and perceived channel credibility indeed predicted the likelihood of searching for additional information regarding the topic presented (Models 3). We then examined whether there was an interaction between tie strength and perceived channel credibility in predicting the likelihood of searching for additional information regarding the topic presented (Model 4).

The Durbin-Watson statistic test was used to investigate the assumption of independence. Normal probability (P-P) plots were used to investigate the normality of error terms. Homoscedasticity was tested by observing the scatter plot of the residuals and the predicted value. These checks identified no violations of regression assumptions. All statistical tests were one-tailed, and a significance level of $p<0.01$ was set for all analyses.

To facilitate the interpretation of the statistical interaction, all continuous variables used in our model were standardized (Dawson, 2014). To calculate the statistical power of this study to reject false null hypotheses, we conducted a post-hoc statistical power test (Faul, Erdfelder, Buchner, & Lang, 2009). With six predictors in the regression analysis, an observed R^2 of 0.17 (see Table 1), a sample size of 217 and $\alpha = .05$, the test results indicated an observed power of 1.

Model 1 (see Table 1) indicates that tie strength is positively correlated with the perceived credibility of the presented item $\beta = .33$, $t(207) = 7.21$, $p < .05$. In other words, the strength of the tie our participants had with the friend who presumably shared the content positively affected their

perception regarding the credibility of the shared content (a finding which supports H1). Furthermore, perceived channel credibility is also correlated with the perceived credibility of the presented item, $\beta = .23$, $t(207) = 5.752$, $p < .05$. In other words, participants' perceptions regarding the credibility of the channel from which the presented message originated, positively affected their perception regarding the credibility of the shared content.

Model 2 examines whether there is an interaction between tie strength with the person sharing the content and perceived channel credibility. Interaction effects represent the combined effects of variables on the criterion or dependent measure (in our case, on perceived content credibility). When an interaction effect is present, the impact of one variable (in our case, tie strength) depends on the level of the other variable (in our case, perceived channel credibility). There is indeed significant support for interaction between tie strength and perceived channel credibility over the perceived credibility of the content, as we can see in Models 2: $\beta = -.207$, $t(207) = -6.4$, $p < .05$.

The interaction plot, depicted in Figure 1, suggests that high tie strength with the person sharing the content yielded higher perceived credibility when channel credibility was low. The effect of high tie strength was negligible when channel credibility was high. Both slopes were significant ($P < .05$). Thus, our second hypothesis was supported.

Model 3 (see Table 2) indicates that tie strength is correlated with the likelihood of searching for additional information regarding the presented item, $\beta = .23$, $t(207) = 7.24$, $p < .05$. In other words, the strength of the tie between participants and the friend who presumably shared the content positively affected the likelihood of their searching for additional information about the shared content. Thus, our third hypothesis was supported.

Furthermore, perceived channel credibility is also correlated with the likelihood of searching for additional information about the presented item, $\beta = .291$, $t(207) = 5.64$, $p < .05$. In other words, our participants' perceptions regarding the credibility of the channel from which the presented message presumably originated positively affected the likelihood of their searching for additional information regarding the shared content.

Model 4 examines whether there is an interaction between tie strength with the person sharing the content, and perceived channel (AJE) credibility. There is indeed significant support for interaction between tie strength and perceived channel credibility over the likelihood of searching for additional information as we can see in Models 4: $\beta = -.115$, $t(207) = -5.872$, $p < .05$.

The interaction plot, depicted in Figure 2, suggests that high tie strength with the person sharing the content yielded higher likelihood of searching for additional information when the channel credibility was low. The effect of high tie strength was negligible when channel credibility was high. Both slopes were significant ($P < .05$). Thus, our fourth hypothesis was supported.

DISCUSSION

The study examined the interplay between the perceived credibility of a news source (with AJE serving as a case study) and that of sharers of a news recommendation item on Facebook, with special emphasis on the impact of strong versus weak ties within one's network. We designed an experiment in which participants evaluated the credibility of a news recommendation that seemed to emanate from the participants' actual Facebook ties, thus mimicking a real-life scenario. The analysis found that both attitude towards media and tie strengths predicted credibility assessment scores, with stronger trust in the news source (AJE) and stronger tie with the Facebook friend sharing the news recommendation leading to higher credibility assessments. This was true regardless of the participants' characteristics, such as gender, level of education and Facebook activity level.

However, a more interesting finding is that when the participants received the news recommendation from a strong tie within their network, their negative attitudes toward AJE were less predictive of their credibility assessment. This finding illustrates the superiority of strong ties over traditional media networks in credibility assessment of news recommendations. Strong ties have the potential of authenticating news recommendations, including fake news, by contributing to their

perceived credibility. These findings strengthen various former analyses revealing the dramatic power of recommendations by SNS members recommending news to validate and strengthen the credibility of news recommendations (Anspach, 2017; Oeldorf-Hirsch, 2011; Turcotte, et al., 2015). Our findings highlight that in addition to opinion leaders (Turcotte, et al., 2015), strong ties can be highly instrumental in affecting the perceived credibility of a shared news item. The influence of strong ties is in fact more important in the evaluation of an item's credibility than that of the traditional news source portraying the item.

The findings have relevance for source credibility studies and media studies in general, indicating the further decline in credibility and status of traditional news sources. In an age when so many people receive their news via friends, tie strength is more meaningful than the credibility perception of the traditional media source. From a wider perspective, these findings add to the mounting evidence regarding the decreasing credibility of traditional media sources in the last three decades (e.g. Ladd, 2013). While Ladd identified that the 1970s marked a peak in media trust and the 1990s marked a sharp decline in public trust in the media, our analysis identifies another layer of deterioration in the trust in traditional media: The reputation of a strong tie surmounts the reputation of a media channel (despite its various gatekeepers, including editors and reporters, a global spread and endless resources to verify and authenticate news) and plays a more central role in credibility evaluation. . These findings are worrying for news media managers evaluating their contemporary reputation, highlighting the potency of peer-to-peer communication.

The study also contributes to contemporary analyses of fake news credibility evaluation, demonstrating the ability of interested bodies to deliver and spread fake news in SNS with high potency. The findings indicate that a viral item shared by many Facebook members is highly likely to gain credibility due to the likelihood it will be shared by at least some strong ties. These findings thus offer a partial explanation for the high success of fake news in SNS (e.g., Silverman, et al., 2016).

For information studies, the analysis also illustrates that SNS-shared content that is considered credible can guide behavior, specifically the search for further information about the issue. In this respect, our findings support the findings of Turcotte, et al. (2015), one of the only former analyses examining the link between news trust on SNS and the tendency for information-seeking behavior. The scholars found that news that is perceived credible (following submission by opinion leaders) leads to more information searches for content originating from the same media outlet that portrayed the message. Turcotte et al. and our study's combined findings indicate that trusted SNS members can be highly potent in guiding behavior and mobilizing other SNS members.

Our findings are hampered by three main limitations. First, the Facebook friends did not actually share the content. Furthermore, the presumably shared item was fabricated. While this is a common

practice in assessing perceptions regarding SNS content, specifically regarding content credibility and inclination to look for additional information (e.g., Turcotte, et al., 2015), future studies should employ other approaches (e.g., interviews) to further validate the interplay between the various constructs. Second, the survey used in this study was paper-based. The shared content was presented to our participants as an image. Future studies should aim to replicate the findings using online surveys, in which the shared content would be presented on a computer screen. Lastly, the topic of the fabricated content was very specific (BDS-related content, relating to a specific university in the US). Future studies should aim at examining the relevance of our findings within the context of additional knowledge domains.

Given the availability of large scopes of online data, future studies might consider validating the findings using unobtrusive behavior measures that are indicative of credibility assessment (e.g., the opening of links provided in the shared message), and searching patterns (thus providing a stronger measure of participants' active choices to read more about the topic at hand). This type of research will enable the validation of the findings regarding the effect of tie strength and channel credibility, on credibility assessment and the likelihood of further information-seeking in real-world settings.

CONCLUSIONS

Researchers have long recognized the paramount importance of the perceived credibility of the channel from which a message has originated (Harmon and Coney, 1982; McGinnies and Ward, 1980; Roy Dholakia and Sternthal, 1977). Recent work has shown that when being exposed to online content, online readers' most trusted source of information was 'a person like myself' (Edelman, 2018; Harris and Dennis, 2011). We believe that those findings, combined with our findings, can be leveraged to supplement our understanding regarding the importance of the interplay between social tie strength and perceived source credibility. These valuable determinants can be instrumental when examining both perceived credibility of the examined content and likelihood of searching for additional information. As such, this study offers one of the first empirical evidence for the important role played by social tie strength in the rapidly growing realm of contemporary news consumption.

DOES THE SIGNAL GAP INDICATE A GROWING RISK OF ECONOMIC RECESSION?

ABSTRACT

This paper attempts to find a lead-time indicator which would, in advance and at a certain probability level, provide an indication of the economic evolution approaching a recession stage. For such an indicator of a slowdown in the economic performance (expressed by the GDP growth rate), we could take the difference between two key macroeconomic indices: the unemployment rate and the inflation rate. We will call this difference the signal gap in this paper. The goal of the present paper is thus to verify whether decreasing values of the signal gap might be viewed as a signal of approaching recession in the growth dynamics, expressed by the GDP growth rate. Quarterly data of the Czech Republic in the years 1996 through 2018 have been used for verification of our observations.

Keywords: signal gap, unemployment rate, inflation rate, gross domestic product, time series analysis

INTRODUCTION

The existence of the economic cycle is one of the inherent facts of today; economists and the society as a whole are aware of it and take it into their considerations. Of course, despite of this awareness, the phenomenon of economic crises and recessions is a major complication in the life of the society. That is why one of the most demanded tools required from theoretical economists, statisticians and econometricians is a method that would provide us with an indication of a coming recession, regardless of whether methods enabling at least partial signalling are based on theoretical or empirical findings.

The goal of the present study is, on the basis of analysing empirical data, to find an index that would, at a certain level of probability, indicate that the economic evolution is beginning an approach to the recession/crisis stage of the cycle. A sign of a coming recession might be implied by the mutual relationship (a difference) between two key macroeconomic indices: the unemployment and inflation rates. The national-economic nature of both of them is, however, also closely related to the microeconomic sphere and, in the final effect, to behaviour of households as the sector through which about one-half of the GDP passes.

Both the unemployment and inflation rates are among the significant macroeconomic indices and we need not emphasise their importance. Both of them are subject to statistical inference organised by the national statistical offices worldwide; their methodologies (cf. below) are comparable on an international scale. Each of them is also viewed as an index whose values (observed monthly or quarterly) sensitively respond to changes in the economic situation, i.e., the stages of the economic cycle. A recession (or even a crisis) is always manifested by a high value of the unemployment rate, which only slowly gets back after the beginning of recovery. On the contrary, the inflation rate is, as a rule, low during a recession, while economic growth is accompanied by growing prices, i.e., a growing inflation rate. Having these observations in mind, we clearly see that if these two indices are approaching each other, i.e., the gap between them is decreasing (approaching zero), the economy is "overheating" – the economic growth is getting to its apex, after which slowdown or recession must inevitably come. We will call the signal gap the difference between those two indices.

The goal of the present paper is to verify the hypothesis that, if the signal gap values go down to their minimum, it indicates an apex of the economic growth (expressed by the GDP growth rate), and the recession stage is coming. With the aid of methods of time series analysis, we will further estimate the lead time by which the minimum precedes the coming recession. Quarterly data of the Czech Republic in the years 1996 through 2018 (source: Czech Statistical Office) will be used to verify this hypothesis.

THEORETICAL BASIS

The relationship between the unemployment and inflation rates may be one of the most discussed issues in economics; this relationship is visualised by the so-called Phillips curve, which expresses the cause-and-effect dependency of the inflation rate, as the dependent variable, on the unemployment rate, as the independent variable. A. W. Phillips (Phillips, 1958) originally derived a relationship between the wage and unemployment rates, Only later was this relationship expressed in the form of the so-called Phillips price curve, i.e., the relationship between the inflation and unemployment rates. Incidentally, I. Fisher's study dated 1926 (cf. Fisher, 1973) already pointed out a possible cause-and-effect relationship between the inflation and unemployment rates.

This empirically corroborated cause-and-effect relationship led the economic policy creators to simplified conclusions that unemployment might be controlled by supporting demand, thus regulating the increase in prices and keeping the inflation rate within the expected limits. The relative stability of prices after WWII and the high rates of economic growth due to the after-war boom, accompanied by low values of the unemployment rate, led to a loss of concerns with respect to a high value of the inflation rate. A turning point came in the 1970s (the time period of the oil price shock, changes in the structure of the labour market, the growing productivity of work, the expansion of information

technologies, and the introduction of inflation targeting) when one of the most important economic relationships, sometimes even viewed as a law, ceased to prevail. The reasons for that development were summed up by, in particular, M. Friedman (Friedman, 1968) and E. Phelps (Phelps, 1967). They showed that unemployment is caused by a number of economic processes and cannot be affected by mere changes in the aggregate demand. The importance of the Phillips curve has also been diminished by a change in the behaviour of central banks, based on inflation expectations. These expectations cause significant deformations of the relationship between the unemployment and inflation rates; in fact, the expected value of the inflation rate affects the behaviour of economic subjects so that the actual inflation rate is, to a great degree, determined by that behaviour. Nevertheless, M. Friedman and E. Phelps have admitted that the relationship expressed by the Phillips curve is valid on a short-term scale, but is accompanied by growing values of the inflation expectations.

Later – (Atkeson and Ohanian, 2001) or (Lansing, 2002) – doubts were cast on the possibility to predict the inflation rate on the basis of the unemployment rate even on a short-term scale. Atkeson and Ohanian have proved that it is inexact and unsuitable to predict the inflation rate on the basis of the unemployment rate and that such an approach may only randomly bring good results (in backward verification).

The economic policy creators' ability to influence the development of unemployment and prices is rather limited. Regarding the inflation rate, the primary issue is that of targeting this index's value by the central bank. The success rate of such targeting is given not only by the measures applied (which need not always be sufficiently efficient or may even go against the original intention of the respective measure; let us mention, for example, currency interventions), but also by the developments of the international economy, which a central bank's influence is unable to reach. As for the decision-making sphere's ability to regulate the unemployment rate, the situation is somewhat more complicated. Social measures may alleviate the impacts of high unemployment, but do not usually eliminate the causes for its occurrence. Re-qualification and other direct stimuli will only be reflected in decreasing unemployment rates on a medium-time scale, i.e., not immediately.

Quick changes in economic conditions seen in the most recent decades show that the Phillips curve relationship, which was derived statistically, based on observations made in the British economy from the mid-19th to mid-20th centuries, is not easy to apply to the conditions of the up-to-date global economy, which is subject to quick changes. Moreover, we must also consider the statistical nature of the inflation and unemployment rates as such. The methodology for statistical surveys concerning the developments in prices and unemployment have, since the time when Phillips' original work was published, been significantly changed several times. Such changes have also influenced the values of

the indices, interpretations of such values, and their ability to reflect the same reality as decades ago (cf. Hindls and Hronová, 2015).

Another relationship expressed in the form of a law in economic theory is Okun's Law (cf., e.g., Samuelson and Nordhaus, 2010), which defines a relationship between the unemployment rate and a decrease in production. According to that theory, there is inverse linear proportion between the decrease in production and the difference between the actual and potential values of the unemployment rate. This relationship is logical because economic growth is always (even if with a certain time lag) reflected in decreasing unemployment. However, the proportion between the unemployment rate and a decrease in production is not and cannot be given and constant in time. It changes depending on the stage of the economic cycle, economic conditions prevailing in the given country, and other factors.

Despite the reservations we have presented above with respect to the universal validity of basic economic relationships derived from empirical observations, we can formulate a hypothesis that developments in unemployment and prices are sensitive indicators of the changes in the economic cycle stages. If we transform this economic formula onto a relationship between economic indices, we can expect that the mutual relationship between the unemployment and inflation rates (expressed by a difference between those two values, called a signal gap in the present text) to be an indicator of a change in the economic growth dynamics, expressed by the GDP growth rate.

Certain theoretical considerations also support the idea of using the relationship between the developments in unemployment and prices as a sensitive indicator of a change in the economic cycle stages. In general, a long-term decrease in the unemployment rate gradually leads to a lack of labour force, which in turn brings pressure for wage increase in both the corporate and public sectors. Employers (including the government) must, sooner or later, yield and agree with the wage increase within their collective bargaining. The increase in wages causes an increase in demand, growing retail turnover, and consequently growing prices and growing inflation rate. Because of the slowness in the unemployment decrease, the growth of the inflation rate need not be hasty; nonetheless, it will sooner or later, make the central bank moderately increase the interest rates, possibly even repeatedly. In parallel, corporation managements try to partly compensate by technological progress for the lacking labour force; however, this effort may have results only after some time and will not save the central banks from the necessity to operatively increase interest rates. In other words, the unemployment rate value slowly goes down; at the same time, for the above-described reasons, the inflation rate is growing and the signal gap's value is also decreasing.

The subsequent development is more or less straightforward: the increasing interest rates slow down the economic growth, prices of securities are somewhat decreased, by which access to outside financial

resources is made more difficult – especially the financing of investments, but also of operations, is concerned. Simultaneously, a moderate decrease in the GDP growth rate cannot reduce the recently achieved level of wages and salaries, whose increase has begun to be too high with respect to the actual productivity of work; and this aspect further slows down the economic performance.

In a sense, a "vicious circle" occurs, whose outcome is clear: a change in the economic cycle stage. Statisticians and econometricians thus face a task to find the lead-time measure, for which the decreasing value of the signal gap begins to indicate that the economic cycle stage is beginning to change; more specifically, look for a model for such behaviour with the aid of time series analysis.

METHODOLOGY OF OUR ANALYSIS

If we are to verify the hypothesis formulated above, we must first identify and define the indices and their contents and periodicity so that they best correspond to the economic theoretical assumptions and their values reflect the ever-changing conjunctural development in the time period under consideration. We must also decide about the length of the time period to be considered to meet, on the one hand, the formal conditions for application of the methods used in the time series analysis and, on the other hand, the factual requirements for adequate demonstrability and reasoning about the classical stages of the economic cycle. The last problem our analysis has to resolve is to identify the lead time by which the signal gap, or rather the change thereof, precedes the corresponding change in the economy. The definitions of the indices and the subsequent analysis will be based on the data of the Czech Republic, which are available on the Czech Statistical Office's website (cf. www.czso.cz); from the methodological point of view, these indices are comparable on the international scale.

The indices entering the calculations of the signal gap values are the inflation and unemployment rates, the values of which we observe quarterly. The inflation rate is, in general, defined as the relative increase corresponding to the index of consumer prices. The quarterly inflation rate equals the percentage change in the price level in the given quarter as compared with the immediately preceding one. Actually, it is calculated as a ratio between the basic index of consumer prices in the actual quarter and the basic index in the immediately preceding quarter; the basis is the same for both those quarters (namely, the basis in the Czech Republic is the average value of 2015).

The unemployment rate is, in general, defined as a ratio between the number of unemployed people and the number of economically active people (i.e., a sum of the numbers of unemployed and employed people). In our analysis, we have used the so-called general quarterly unemployment rate, based on the definition of an unemployed person according to the conditions given by the International Labour Organisation – ILO. Our data concerning unemployment in the Czech Republic come from the Labour Force Sample Survey arranged by the Czech Statistical Office.

The economic evolution within stages of the economic cycle is documented by the GDP quarterly growth rate, which is a relative increase in the GDP value from the preceding to the actual quarter; the values are seasonally adjusted. The corresponding GDP values are expressed in the chain-linked prices of 2010.

When selecting the length of the quarterly time series, we have encountered several formal issues: in the Czech statistics, we do not have at our disposal time series of aggregate indices that would be as long as those available in most western countries; moreover, the Czech economy underwent an extensive transformation of ownership relationships and tools for economy control in the early 1990s. We have finally selected the period from 1996 to 2018 (with quarterly observations, the length of the series is nearly 100).

This length is not only suitable for the tools we have used for stochastic modelling of the time series, but also sufficient for manifestations of the economic cycle stages occurring in the Czech economy in that period of time. They, for example, include the slowdown of the Czech Republic's economic growth in the mid-1990s due to the post-transformation shock; the accelerated dynamics of the Czech economy starting at the turn of the millennia (and culminating between 2005 and 2007); serious consequences of the worldwide crises in 2008-2009 and again in 2011-2013; the recovery lasting until 2017; and the subsequent slowdown in the Czech economy's performance which we could see starting at the beginning of 2018.

The described stages implicitly reflect the development stages of the world economy (the fall of East-Asian economies in the late 1990s, overheated prices of American technological securities at the beginning of the millennium as the first omen and, at the same time, the hidden cause for the worldwide economic crisis which actually came in 2008), the fiscal irresponsibility seen from 2001 to 2013, etc. Even though many of those symptoms did not stem from the Czech economy (as already stated above), they had serious consequences on it, and we must allow for their effects in the subsequent analysis of the relationship between the signal gap values and the GDP growth.

Our analysis has been carried out on the data of the Czech Republic. Once again: the Czech Republic is not a country that would, in general, stand at the root of economic crises and it is unlikely to be a source from which the causes for global crises would be coming. It is rather an "importer of crises"; and as a small, open economy it often feels their consequences more deeply and, as a rule, for a longer time than the countries, or group of countries in which the crises were born. Let us just recall the most recent worldwide crises of 2008–2009 and 2011-2013. Despite the mentioned facts, even this small economy may encounter isolated occurrences of economic slowdown, whether for internal causes (such as in 1997–1998 and, most likely, nowadays) or causes of a deeper nature imported from outside of the Czech Republic territory (the crisis of 2008–2009).

We have used the cross correlation function (CCF) to verify the hypothesis that there is a certain time lag by which the signal gap value (as the lead-time index) precedes a change in the GDP growth rate; this time lag must be identified and confirmed by the relevant tests. The CCF is defined for stationary time series and its advantage is that it measures not only the intensity, but also the direction of the mutual linear dependency between two time series. From this function's values we can derive the time lags in the time series to be analysed.

Let us denote the time series to be analysed by X_t and Y_t ; the CCF is then defined at k as the covariance of X_t and Y_{t+k} for $k=0, \pm 1, \pm 2, \dots$, divided by a product of the standard deviation values of both series:

$$\rho_{XY}(k) = \frac{\gamma_{XY}(k)}{\sigma_X \sigma_Y}, \quad (1)$$

where σ_X and σ_Y are the standard deviation values for the series X_t and Y_t (respectively). It is clear that $\rho_{XY}(k) = \rho_{YX}(-k)$ holds. In other words, in addition to the intensity of the dependency, the CCF also identifies its direction. That is why we have to calculate the CCF values for both positive and negative values of k . Of course, we do not know the covariance and standard deviation values in practice. We must therefore replace them with their sample counterparts in the cited formula – cf. Wei (2006) in more detail.

If we identify the time lag in the linear dependency of both series, we can express this dependency and the time lag within the framework of a dynamic regression model. This type of model is capable of describing relationships between time series at different moments of time (that is, inclusive of the time lag); due to this feature they are similar to regression models; at the same time their assumption is that the dependent time series is governed by an ARIMA stochastic model. The model is formulated as follows:

$$Y_t = c + v_0 X_t + v_1 X_{t-1} + v_2 X_{t-2} + \dots + v_K X_{t-K} + \frac{1}{(1 - \phi_1(B))(1 - \Phi_1(B^L))} \varepsilon_t, \quad (2)$$

where the meanings of the symbols are described in detail in Box, Jenkins and Reinsel (1994) or Wei (2006).

RESULTS OF OUR ANALYSIS

Our analysis for the signal gap as an indicator of a coming recession (or crisis) is based on graphically depicting the time evolutions of the quarterly values of the selected indices, i.e., the general unemployment rate, inflation rate and GDP growth rate – cf. the chart in Figure 1. This chart helps us identify the time segments in which the curves of the unemployment and inflation rates touch on each other. Namely, the following time periods are concerned:

- the beginning of 1996; there was a record value of economic growth in the Czech Republic in 1995 (with a year-to-year GDP growth rate of 6.1%), which was clearly above the capacity of the Czech economy because the economic transformation processes had not been completed yet. The signal gap value of 0.1 percentage point is a good indicator of an overheated economy and the coming crisis. In 1997 and 1998 the GDP in the Czech Republic went down by 0.6% and 0.3% (respectively);
- the break of the years 1997 and 1998, when the inflation rate, due to the extraordinary restrictive measures applied in the fiscal and currency policies, jumped up to 5% in the 3rd quarter of 1997 and the 1st quarter of 1998 from the last year's 1.2% or 1.6% (respectively). It went down to 1.6% in the 4th quarter of 1997, and to 0.7% in the 2nd quarter of 1998. In this instance, the low signal gap values (0.0 percentage points and 0.9 percentage points) were non-recurring – they were caused by the state interventions in the economy, aimed at mitigating the growing deficit of the state budget and foreign trade, and averting the fall of the economy. These interventions were reflected by price jumps in the said quarters. It means that these isolated small values of the signal gap cannot be viewed as a trend indicating a coming recession;

Figure 1. *Time evolution of selected national economy indices in the Czech Republic*

- the beginning of 2008, when the signal gap values were, during 2007, decreasing to 0.9 percentage points in the first quarter of 2008. This trend in the signal gap values (a decrease in five consecutive quarters) can, in this instance, be viewed as an indicator of a coming recession. In other words, the period from the end of 1998 to the end of 2006 is a period of economic growth in the Czech Republic, which is also illustrated by the large signal gap values, namely, between 5 and 8.6 percentage points; a similar trend can be seen in the period of 2010–2016 (cf. Figure 2);

Figure 2. Relationship between signal gap and GDP growth rate (an example of the Czech Republic)

- the year 2018 – from the 3rd quarter of 2017, the Czech economy shows a slowdown of its growth with an average quarter-to-quarter rate of 0.6%); the signal gap values again tend to a decrease in five consecutive quarters. The Czech economy is getting to the limit of its growth capacity (the unemployment rate has been below 3% and the inflation rate below 1%); hence we can expect that a recession will come. In what time (measured by a number of calendar quarters) can the beginning of that recession (or crisis) be expected? The model described below provides an answer to this question.

We have used the above-mentioned CCF to verify the time lag. Both of these series have to be stationarised to enable us to use the CCF. Taking the usual seasonal differences has achieved this goal. The CCF values for the stationarised series are shown in the following Figure. The values of the series are significantly linearly dependent at points X_{t-4} and Y_t , where X_t is the signal gap series and Y_t is the series of the GDP quarterly growth rate. Since we are working with quarterly data series, this time lag represents four quarters. In other words, the series of signal gap values predicts a change in the GDP growth rate series with a lead time of four quarters, that is, one calendar year. We can thus estimate the change in the GDP growth rate one year ahead on the basis of the behaviour of the signal gap series.

Figure 3. CCF Values

We can describe this relationship by a linear regression model

$$Y_t = 0.1973 X_{t-4} + (1 - 0.4174B)(1 - 0.7191^4)\varepsilon_t, \tag{3}$$

where Y_t is the series of the GDP quarterly growth rate after the current and seasonal differentiating, X_t the series of the signal gap quarterly values after the current and seasonal differentiating, and ε_t is the standard white noise. Both the CCF values and the model itself show an apparent time lag of four units (in our case, this means four quarters, i.e., one calendar year). This fully confirms our hypothesis that the signal gap values at time t significantly influence the values of the GDP growth rate series at time $t+4$. The random component ε_t is governed by a seasonal process of moving averages (SARIMA (0,1,1) x (0,1,1)). Our calculations unambiguously imply that, with the aid of the CCE and the said model, we are able to predict the values of the GDP growth rate series by four quarters ahead. The four-quarter time lag enables us to directly substitute the signal gap values into the model, thus obtaining the estimates for the future values of the GDP growth rate series. One advantage of this model is the fact that the X_t input values have been calculated from actual data, i.e., they are not just estimates, as is usual within standard utilisation of dynamic regression models. As a matter of course, the resulting prediction error is then far smaller. This model has successfully passed all stages of verification, whether by residual analysis or other adequate tests (the unit root, homoscedasticity, and Dickey-Fuller tests).

The results of the analysis are unquestionably important as one of the possible ways of knowing the phases of the business cycle. Effort to anticipate a slowing growth in the economy ahead is one of the permanent goals of research. The initial hypothesis that the decreasing value of the signal gap may be an indicator of the incoming recession was on the data of the Czech Republic, ie the country that has experienced significant turbulence over the last thirty years. The time series model used shows that the upcoming reversal in economic development is predictable in advance of four quarters, following the

monitoring of the signal gap. We will continue to research that the signal gap is capable of indicating changes in the business cycle.

CONCLUSIONS

Economic evolution is, in each country, a result of many significant economic factors. Statistical indices are used to express such factors in a formal, quantitative format. The unemployment and inflation rates are, undoubtedly, among indices considered the most important when monitoring the conjunctural development. The difference between the values of these indices, called the signal gap in this paper, tends to zero at the apex of the economic cycle, when the economy has exhausted the resources for its continuing growth, followed by a slowdown in the economic growth and occurrence of a recession (possibly even a crisis).. Using the quarterly data of the Czech Republic in the years 1996 through 2018, this paper shows that, in a period in which the Czech economy has undergone substantial turbulences, the hypothesis is valid. At the same time, we can see a model explaining the time lag of recessions after the signal gap value's approaching zero. At the same time, we can see in the Czech Republic's data that the zero (or close to zero) signal gap values isolated in time may have been caused by non-recurrent (e.g. fiscal or taxation) measures introduced by the government and influencing the price jumps in the respective quarters. Such non-recurrent values (not representing a trend prevailing in several consecutive quarters) cannot be viewed as indicators of coming recessions. Our analyses based on the CCF values and the dynamic regression models have shown that a recession occurs four quarters after occurrence of a minimum in the signal gap values. In our future research, we would like to verify the validity of our conclusions for the economies in other developed countries.

PROFITABILITY AND WINE PRODUCTION COMPANIES DURING TEN YEARS: WHAT'S THE ISSUE?

Iovino, Felicetta

University of Sannio, Benevento, Italy

ABSTRACT

This paper focuses on the situation in Italy with specific reference to wine producer during the period of global economic crisis. It aims to analyze their profitability structure, in a ten year period (2008-2017), in relation to the different geographical areas. At this end, the study focuses on three research questions: what is the actual situation and what the trend has been in the last ten years in the various Italian geographic areas; if there are differences between geographic area and if these differences are statistically significant. The trend analysis and analysis of variance (ANOVA) have been used starting from secondary data on AIDA database (at the end 289 wine production companies). The profitability structure is assessed using two ratios: ROA and ROE. The findings show that the profitability structure of energy suppliers have not been substantially affected by the crisis in any geographic area. Moreover this factor produces statistically significant differences in the profitability structure of wine companies.

Keywords: Italian wine production Companies; Global Crisis; Finance; ROA; ROE.

INTRODUCTION

This paper is aimed at analyzing wine companies in Italy. In particular, the objective is to analyze the profitability situation during and after the global financial crisis of 2008. This analysis was conducted with reference to the different geographic areas in which Italy is divided. Furthermore, a comparison was also made with the entire sector that produces beverages, including the production of wine. To this end, three questions of re-search have been asked:

- 1) What was the profitability trend of wine producing companies in the different geographical areas of the Italian territory?
- 2) Are there differences between the different geographic areas?
- 3) Are these differences statistically significant if present?

With regard to these research questions, as many hypotheses have been asked. The first hypothesis (H1) is that the crisis triggered by the financial system has not affected the profitability of wine producing companies by virtue of the strong brand of these companies and a very loyal clientele

(Sellers-Rubio, Mas-Ruiz and Sancho-Esper, 2018; Castro, Giraldi, 2018; Pereira, 2016; Drennan, Bianchi, Cacho-Elizondo, Lourier and Guibert, Proud, 2016; Iovino, 2012; Iovino, 2014; Iovino, 2015; Iovino and Migliaccio, 2016; Iovino and Migliaccio, in press b). The second hypothesis (H2) is that there are differences between the different geographical areas in which the Italian territory is divided and the last hypothesis (H3) is that these differences are significant from the statistical point of view.

At this end, the profitability dynamics is assessed using two ratios: ROA (operating profit / total assets) and ROE (net income/equity); the period considered is the decade from 2008 to 2017; trend analysis and analysis of variance (ANOVA) have been used.

In the following sections a review of literature on energy companies is presented. Thereafter the methodology, results and implications are discussed.

LITERATURE REVIEW NOTES

Following is a brief literature review of the main studies on crisis and wine companies.

Yu and Lindsay (2016), analyze the effects of the global financial crisis on the export performance of wine companies. The results show that there is a negative effect of the crisis on exports and they are also influenced by the previous export performances of these companies.

Simon-Elorz, Castillo-Valero and Garcia-Cortijo (2015), verify the possible competitive strategies that the wine companies of the Castilla-La-Mancha area can adopt for the period 2004-2010. They use a model to verify financial performance in relation to some variables such as age and size. Furthermore, they monitor the effects of the economic crisis on the results of these companies.

Giuliani, Lorenzoni and Visentin (2015), use a case study of the Italian wine industry in order to verify the relative responses to crisis situations. The results demonstrate the decisive role of knowledge and practices in what can be defined as a true renaissance of the wine industry. Added to this is the role of preconditions.

Fabbrizzim, Sacchelli, Menghini and Bernetti (2015) use a case study to investigate policies and strategies to alleviate the effects of the economic crisis. The case study is related to Tuscany, a region of central Italy. The results highlight various policies and managerial activities that can improve the performance of local wine companies. Among them are cooperation, long-term associations and the ability to obtain funds.

Idsardi and Cloete (2013) analyse the effects of financial crises on a global level. To this end they use the case study of wine and fruit imports in South Africa. The analysis was conducted with reference to a period of 28 years. The results show that economic crisis also have positive effects on the results of wine and fruit companies.

Masset and Weisskopf (2010) analyse the effects of the diversification of wine companies through the fine wine during times of crisis. The analysis covers the period 1996-2009. The results show that a balanced portfolio through the presence of fine wine determines a reduction in volatility and an increase in added value.

Duquesnois, Gurău and Le Roy (2010) analyse the responses of wine producers during times of crisis. The research is conducted on a sample of companies from the Languedoc-Roussillon region, south of France. The results show that the strategies chosen to deal with the crisis are a combination of niche and differentiation. These strategies do not lead to revenue reduction.

RESEARCH METHODOLOGY

Data collection and sample characteristics

To our aims, secondary data on AIDA database has been used. To analyse the profitability situation, two ratios, ROA (operating profit / total assets) and ROE (net income/equity), have been chosen. The last ten years after liberalization, i.e. 2008-2017 had been considered. The sample was made up of the Italian wine production companies, that is 696 wine production firms. Then we have chosen only the companies that had all the values for both ratios analysed for all the years considered. At the end the sample was made up of 289 companies. Successively, different groups have been identified using as discriminating factor, the geographic area. About this three clusters were identified: north, centre and south according to conventional classification of Italian regions. The geographic distribution of the sample was the next: 57% in the North group, 19% in the Centre and 24% in the South ones. To identify the wine production companies we have used the statistical classification of economic activities (*NACE rev. 2*).

Figure 1 – Source: our elaboration - geographic distribution of Italian wine production companies

Figure 2 – Source: our elaboration - market distribution of Italian beverage producer companies

Method

First of all we analysed data's trend in the period 2008/2017 for each ratio and group. Then using the analysis of variance (ANOVA) we assessed the differences of means between groups the response variable means at the different factor levels.

The null hypothesis states that all population means (factor level means) are equal while the alternative hypothesis states that at least one is different. In our case, the independent variables were the geographic localization while the dependent variables were the ratios. We chose ANOVA one-way type, because two variables were analysed separately (Iovino and Migliaccio 2019).

RESULTS AND DISCUSSION

Trend analysis

ROA (operating profit / total assets) is an index of profitability. It expresses the return in terms of operating profitability of the total assets invested. This means checking the capacity of the characteristic management, that is the typical activity of the company, to remunerate the total investments made in the company. Therefore, it is certainly positive that this index fulfils values as high as possible. During the ten years analysed the value of this index is between 2.48% and 4.89% if the geographical distribution is taken into consideration. If instead, we consider the belonging to the sector this value is between 3.70% and 5.17%. Figures n. 3 and 4 show that the ROA value is quite high in all the years analysed. This happens both for all geographical areas and for the wine market compared to the general beverage production market. The highest value recorded in the north in 2015, while the lowest value is recorded in the centre in 2009. The values of the northern companies are higher in all ten years analysed compared to those of the southern firms and of the centre that keep lower and lower.

Figure 3 – Source: our elaboration - Trend of ROA according to belonging market

Figure 4 – Source: our elaboration - Trend of ROA according to geographic localization

ROE is the index of the overall profitability of the company. It is given by Net income / Equity. It expresses the ability of net income to remunerate the total invested equity. This also takes into account the incidence of profits or losses deriving from operations other than the typical management of the company, ie financial, extraordinary and non-specific management. Like the other profitability ratios, even a positive ROE with the highest possible value is desirable on the part of the company. In the years analyzed, the ROE always assumes positive values. This expresses a constant positive profitability despite the period of crisis. The values fluctuate between 0.20% and 8.7% if we consider the different geographical location. If, on the other hand, the wine market alone is compared with the overall beverage production sector, the values range from 3.96% to 8.41%. The corporate values of the center are constantly except in the last three years analyzed below those of companies in the center

and north. The latter, as in the case of ROA, record the values that are constantly higher in all the ten years analyzed. In fact, the lowest value is recorded by the enterprises of the center in 2013 equal to 0.20% the highest one from the northern enterprises in 2010 (fig. 5-6).

Figure 5 – Source: our elaboration - Trend of ROE according to belonging market

Figure 5 – Source: our elaboration - Trend of ROE according to geographic localization

Therefore from what emerges from the trend analysis The values of both indices are always positive in all the ten years analysed. This analysis also shows that these values for both indices did not undergo substantial reductions during the years of the crisis. The wine-producing companies have not seen their profitability reduced during one of the most difficult periods globally from a financial point of view. The trend is substantially stable in the case of ROA. This is by referring to the different geographical areas and by comparing the entire sector with the wine production business. It is also possible to note that in recent years there has also been a certain increase in values. The stability of the

ROA over time implies the ability of these companies to maintain the profitability of the characteristic management and therefore of the typical business activity unchanged over time. The core business of wine producers therefore did not suffer the effects of the crisis. The ROE trend is on the contrary, very variable over the ten years analysed. It presents substantial reductions, but also strong growth during the analysed period. Such an extremely variable trend also characterized by strong growth even during the most acute years of the crisis does not therefore appear to be due to the repercussions of the global financial crisis. These changes are certainly attributable to the changes in income and charges from operations other than the typical, primarily the financial one (Iovino, F., in press a, b). The latter was intuitively affected by the financial crisis. However, the ROE is always positive over the ten years with very satisfactory values. Therefore, the profitability, both in relation to the total of the investments made and in relation to the only capital invested, remains constantly over the years of the crisis, always at adequate levels. In this way, companies are also able to borrow money from third parties and remunerate them. This therefore makes it possible to exploit the financial leverage of third-party capital and push the return on capital out of that of the invested capital. We can therefore state that the crisis has not substantially affected the profitability of wine-producing companies. Therefore the hypothesis H1 is substantially verified. Even the H2 hypothesis is verified as there are substantial differences in the performance of both indices in the three different geographical areas in which Italy is divided. The wine market follows the same trend as the entire beverage production sector. This is probably due to the fact that it alone represents 61% of it. *Analysis of variance*

About ROA, Table 1 shows the results of the analysis, assuming the geographic area as independent variable. There is a statistically significant difference between groups ($F(2,27) = 73.31808$, $p = 1.22537E-11$), in fact $F < F_{crit}$ (p value < 0.05).

Source of variation	SS	df	MS	F	P-value	F crit
Between groups	14.68138	2	7.340692	73.31808	1.22537E-11	3.354131
Within groups	2.703271	27	0.100121			
Total	17.38465	29				

Significant level at 0,05

Table 1. ROA - Analysis of variance with geographical localization as independent variable

The null hypothesis must be reject and the alternative ones must be accept. There is therefore a statistically significant difference between the ROA values recorded in the three different geographical areas.

Source of variation	SS	df	MS	F	P-value	F crit
Between groups	70.91631	2	35.45816	19.93116	4.82461E-06	3.354131
Within groups	48.03385	27	1.779032			
Total	118.9502	29				

Significant level at 0,05

Table 2. ROE - Analysis of variance with geographic localization as independent variable

The results of ANOVA applied to ROE are shown in table 2. It indicates a statistically significant difference between groups ($F(2,27) = 19.93116$, $p = 4.82461E-06$), in fact $F > F_{crit}$ ($p \text{ value} < 0.05$).

We have to reject the null hypothesis. Thus, there is a statically significant difference between groups (see tables 2), as trend analysis has shown.

The results of statistic analysis show that the hypothesis H3 of this research, previously described, is tested with regard to ROA and ROE if we consider the geographic localization. There is therefore a substantial difference between the profitability of the three geographical areas.

CONCLUSIONS

It is possible to affirm that the hypotheses posed are substantially verified. In fact, the profitability of wine-producing companies is not affected by the crisis that has occurred since 2008. In addition, there are differences between the different geographical areas and these differences are statistically significant. In fact, ROA appears to have a substantially constant trend over the ten years analysed. In fact, over time there has also been a slight increase, especially in the last three years. This trend characterizes this index in all geographical areas, but also if we only compare the wine production market with respect to the overall beverage production sector. Both the trend analysis and the ANOVA confirm the existence of differences between the different geographical areas (Iovino, in press b). The best performances are from companies in the north of the country. Wine producers are therefore able to maintain the profitability of their operations unaltered despite the difficult financial conditions. ROE shows a more variable trend over the years. However, its values are always positive and high except for a few years and in particular for the companies of the centre. Also in this case there are differences between the different geographical areas. This is evidenced both by the trend analysis and by the ANOVA. Wine companies are therefore able to contain the effects of changes in income and expenses of other operations (Iovino, in press c).

The paper has several limitations which also constitute the prospects for future research. In fact, only two profitability ratios were considered. Furthermore, only those companies of which the values of the two indices were available for all the years considered were taken into consideration. It is evident that these are the companies that manage to survive over time, also having the best results (Iovino and

Migliaccio, 2018a, 2018b, in press a). The future research guidelines will be aimed at considering a multiplicity of indices, not only ritualistic, but also financial. Moreover, companies belonging to different countries may also be compared, also seeking to explore the role exercised by different types of variables in determining the financial performance of these companies.

GENERATION ENERGY COMPANIES AND ITS FINANCIAL DYNAMICS DURING TEN YEARS

Iovino, Felicetta

University of Sannio, Benevento, Italy

ABSTRACT

The financial crisis was a global crisis, which affected the whole world. This paper focuses on the situation in Italy with specific reference to generation energy companies. It aims to analyse their financial structure, in the period during the crisis and after liberalization processes (2008-2017), in relation to the business market as a discriminating factors. At this end, the study focuses on three research questions: what is the actual situation and what the trend has been in the last 10 years in the various business markets; if there are differences between business markets and if these differences are statistically significant. The trend analysis and analysis of variance (ANOVA) have been used starting from secondary data on AIDA database (at the end 287 generation energy companies). The financial structure is assessed using two ratios: the Debt/Equity Ratio and Quick Ratio. The findings show that the financial structure of generation energy companies has been affected by the crisis in the different business market in different way, due to other processes. Moreover these two factors produce statistically significant differences in the financial structure of generation energy companies.

Keywords: Energy Companies; Finance; Debt/Equity Ratio; Quick Ratio; Generation.

INTRODUCTION

The paper analyses the financial dynamics of energy production companies in Italy. In particular, data relating to the 2008-2017 period will be taken into account. This period refers to the analysis of the period during and after the global financial crisis coinciding with the complete liberalization of the energy market in Italy, but also in Europe. The analysis will be conducted in relation to the aforementioned period by referring to the different geographical areas in which the country is disinclined.

To this end, three fundamental research questions will be asked:

- 1) What are the characteristics of the trends of the financial indices published in the period considered?
- 2) Are identifiable differences between the two different businesses?
- 3) Are the identified differences statistically significant?

The H1 hypothesis is that the global financial crisis has not affected the financial performance of energy production companies due to the processes of opening up the energy market (Iovino, 2012; Iovino, 2014; Iovino, 2015). The hypothesis H2 is that there are differences between the two businesses; H3 hypothesis is that these differences are statistically significant. In this sense, the financial structure is evaluated using two financial indices: debt / equity ratio (debt / equity) and the quick ratio (liquidity assets / current debt). The analysis of these indices was carried out for the 2008-2017 period, 10 years; a trend analysis and ANOVA (one-way) was then used.

LITERATURE REVIEW NOTES

Below are some studies on the analysis of the performance of energy companies by international literature.

Marti-Ballester (2017) checks how the financial performance of energy companies is conditioned by the use of sustainable energy systems. The conclusions of the research suggest a positive impact in the short term. Furthermore, the paper indicates useful suggestions for an increase in performance even in a long-term time horizon.

Guo et al.'s study (2016) highlights the role of the characteristics of top managers on the performance of Chinese energy companies. The study shows positive impacts the higher the level of education.

Qin's study (2014) is related to the financial decisions of Chinese listed energy companies. The paper highlights the existence of a link between financial indices and indices relating to the capital structure of companies.

Patari and Sinkkonen (2017) try to understand the most critical aspect for the financial performances of energy companies. The results show that their activity is little known. Therefore, the priority element is to give more ample space to the key elements both tangible and intangible.

Eyüboğlu and Çelik conduct research on the financial and profitability ratios of 13 Turkish energy companies. The analysis is conducted for the period 2008-2013. The study proposes a ranking of the analyzed companies.

Schisani and Caiazzo's study (2016) investigate the effects of Italian political unification and the related effects on energy companies. The research focuses on the companies of Naples and indicates the characteristics of stronger companies. This is the result according to this study of improvements in the financial markets and in the progress of technology.

Khurana and Banerjee (2015) analyse Indian energy companies following the adoption of the Electricity Act. The objective of the study is to verify the financial and operational performance of these companies in the period 2003-2011. The report provides a useful overview of the crisis period, but also with possible future scenarios.

Li et al.'s study (2016) examines how the internationalization and diversification strategies affect the performance of Chinese energy companies. The research underlines that the best choice is to expand the products offered to its customers and at the same time move towards a strategy of refocusing on the core business.

Anderloni and Tanda's study (2017) analyses the stock performance of green energy companies. The study verifies that there is no substantial difference in the share values of renewable energy companies compared to fossil fuels.

Ren and Li provide useful suggestions so that the financial strategy will allow the Chinese energy system to pursue adequate results in terms of profitability as well as sustainability.

METHODOLOGY

Data collection and sample

In order to answer our research questions and verify the hypotheses posed, secondary data of the AIDA database have been used. The financial dynamics of Italian energy production companies was analysed using two indices, debt / equity ratio (debt / equity) and quick ratio (liquid assets / current liabilities). The ten years after liberalization and during the period of the global financial crisis, i.e. 2008-2017 had been considered. The sample was made up of energy suppliers, that is 287 generation energy firms. Thus, two different groups were identified, since the business market was used as a discriminating variable. The geographic distribution of the sample was the next: 65% in the North group, 21% in the Centre and 14% in the South ones. To identify the belonging market a specific section was assigned to each energy generators according to statistical classification of economic activities (*NACE rev. 2*), and they were grouped in two groups: electricity market and gas market.

According to the business discriminating factor, the sample consisted of 98% energy generators of electricity market and 2% energy suppliers belonging gas market.

Figure 1 – Source: our elaboration - geographic distribution of Italian generation energy companies

Figure 2 – Source: our elaboration - market distribution of Italian generation energy companies

Method

First of all a trend analysis was performed for the 2008/2017 period for each index and group. In order to assess any significant differences or not between the different ANOVA groups (one-way) it was used.

ANOVA (one-way) is useful when there are at least two variables to be analysed and these are verified separately. In our case the independent variable consists of the various indices, while the dependent variable is the market to which it belongs. The null hypothesis states that all values are equal to each other. The alternative hypotheses state that at least one value is different from the others (Iovino, in press).

RESULTS AND DISCUSSION

Trend analysis

The debt / equity ratio is a type of debt ratio and indicates the portion of third-party capital relative to own capital. It is obvious that to adequately assess the financial structure of a company it is necessary to consider a plurality of financial indices. An optimal value of this index is equal to 2. This means that the total of the third-party means is equal to twice the own capital. It is obvious that if the cost of third-party capital is lower than the issue of new shares, the company will have the advantage of increasing the use of credit, rather than acquiring other means from the shareholders of the company. The value of this index varies between 0.442857142857143 and 12.4162096774194 considering as belonging to the different market, electricity and gas respectively. Figures 3 shows that over the ten years analysed there is a clear difference in the values assumed by this index between the two markets, electricity and gas. In fact, except for 2008, the values of the two markets clearly diverge. In fact, while in the case of gas there is a substantially stable trend over the years, and around substantially the equilibrium value, the trend in the case of electricity is different. In fact, except for

2011, in which the debt / equity assumes a value exactly equal to that of equilibrium, 2, in all the other years of the decade analysed it assumes very high values. In fact, the maximum value of 12.4162096774194 is registered in 2010. However, also the other years are characterized by very high values to then assume a decreasing trend starting from 2015. In fact, in 2017 the value of the debt / equity in the electricity sector is around 4.

Figure 3. Trend of debt/equity ratio according to market; Source: our elaboration

The quick ratio or acid test ratio expresses the capacity of the companies to meet short-term commitments to third parties using only the liquid assets, i.e. the short-term cash and credits excluding the stock. It is obvious that a high value of this index is a positive signal. However it should remain around a maximum value of 1. The trend analysis (fig. 4) shows a situation of excellent liquidity. The values range from a minimum of 0.858571428571429 to a maximum of 1.80539285714286 during the ten years analysed. The maximum value is recorded for electricity in 2017, while the minimum value is brought back by gas in 2008. The electricity trend is substantially increasing over time. The gas market appears to be more stable during the analysed period, but then it recorded a substantial growth starting from 2014. The electricity business values are starting from 2010 ever higher than those of the gas business. Therefore, the best liquidity is that of the electricity business, even though it brings the gas business values substantially always close to those of equilibrium.

Figure 4. Trend of quick ratio according to market; source: our elaboration

Considering the results of the trend analysis, it is possible to state that the H1 hypothesis is partially verified. In fact, the trend of the debt / equity ratio has risen since 2008 with regard to electricity. While the trend for gas is substantially stable for the entire period analysed. The same considerations can be made with regard to the quick ratio. However, while the growing debt / equity trend for electricity indicates a serious risk situation, the case for the quick ratio is different. In fact, in this last case the quick ratio for electricity is substantially higher with the passing of years until 2017. The case of gas is different, so the trend appears stable, with an increase only starting from 2014. Therefore, hypothesis H2 is substantially verified, i.e. there are differences between the two businesses, electricity and gas. These differences are evidenced by the different index trends analysed over the 10 years (2008-2017). The gas business for infrastructural reasons appears to be more stable than that of electricity, which tends to suffer the most positive effects, but also negative ones deriving from environmental conditions (Iovino and Migliaccio, 2019, b; Iovino and Migliaccio, 2019, a; Iovino and Migliaccio, in press a). Liberalization has positive effects, see the trend of the quick ratio, but also the negative ones linked to the financial crisis that characterized that period.

Analysis of variance

Anova (one-way) for the debt / equity ratio shows in table 1 the relative results of the partnership as an independent variable. The table shows the presence of statistically significant differences between the two businesses. Indeed, $(F(1,18) = 24.196931,45, p = 0.000111)$, in fact $F > F_{crit}$ (p value < 0.05).

SUMMARY

Groups	Count	Sum	Average	Variance
Row 1	10	16.42714	1.642714	1.480472
Row 2	10	77.5019	7.75019	13.93523

Total	325.2476	19				

Significant level at 0,05

Table 1. Debt/equity ratio - Analysis of variance with belonging as independent variable

The null hypothesis must therefore be rejected and the alternative hypotheses accepted.

The same result is achieved in the case of the quick ratio, as shown in table 2. It shows the results of the ANOVA considering once again the belonging business as an independent variable.

SUMMARY

Groups	Count	Sum	Average	Variance
Row 1	10	10.44857143	1.044857143	0.04844
Row 2	10	14.14957143	1.414957143	0.042375

ANOVA

Source of Variation	SS	df	MS	F	P-value	F crit
Between Groups	0.68487005	1	0.68487005	15.08281	0.001088	4.413873
Within Groups	0.817331801	18	0.045407322			
Total	1.502201851	19				

Significant level at 0,05

Table 2. Quick ratio - Analysis of variance with belonging sector as independent variable

In fact, if the business market is considered as independent variable the results, set out in Table 2, indicate a statistically significant difference between groups ($F(1,18) = 15.08281$, $p = 0.001088$), in fact $F > F$ crit (p value < 0.05).

Thus, ANOVA confirms what results from the trend analysis and therefore the hypothesis H3 is fully verified. There are therefore statistically significant differences between the two businesses, electricity

and gas. For structural and technological reasons, these businesses are significantly different also in the results concerning the financial structure and its relative dynamics (Iovino, 2019).

CONCLUSIONS

In conclusion we can say that the hypotheses put forward are substantially verified, albeit differently between the two businesses and indices. In fact, the debt / equity ratio of electricity undergoes a sharp increase during the period of the crisis coinciding with the start of complete liberalization of the electricity market. Otherwise, the gas market does not see significant changes in this index during the period analysed. The case of the quick ratio is different, for which values tend to be positive and with a growing trend in both businesses. So in this last case, both in the case of electricity and gas, the global financial crisis did not have a significant impact on the value of this index. In fact, companies still manage to achieve positive results by virtue of the processes of opening up the energy market. However, it is evident from both the trend analysis and the ANOVA that there is a difference between the two businesses for both indices. Moreover, this difference is statistically significant. All this then confirms that the financial dynamics reflect the various infra-structural characteristics of the two businesses.

The paper is not without limitations. In fact, only two indexes of the possible financial type have been used. Furthermore, only the companies whose values are available for the period considered were considered. So we are talking about the companies that manage to obtain the best results in the period considered (Iovino and Migliaccio, 2018a, 2018b, in press a). Quin-di, future research lines, are constituted by considering a multiplicity of indices, also of a different nature from the financial one, as well as more Countries starting from the European ones in which the liberalization processes took place in a unitary way due of the various European directives. Further extensions of the research also relate to considerations relating to countries in the U.S. area, Latin America and Asia.

PROFITABILITY STRUCTURE OF TRAVEL AGENCIES AND TOUR OPERATORS DURING TEN YEARS

Iovino, Felicetta

University of Sannio, Benevento, Italy

ABSTRACT

The global economic crisis affected on several geographic areas in several countries. This paper tries to understand the effects of the crisis on Italian tourism firms. In particular, it aims to verify the profitability structure, in the period during and after the crisis (2008-2017), in relation to two discriminating factors. In fact, three research questions have been posed: what was the trend in the last ten years in the different Italian geographic areas and business markets; if there are differences between business markets and geographic area and if these differences are statistically significant. The trend analysis and analysis of variance (ANOVA) have been used starting from secondary data on AIDA database (at the end 91 firms). The profitability structure is evaluated using two ratios: ROS and ROI. The findings suggest that the profitability structure of travel agencies and tour operators have been affected by the crisis in any geographic area and business market. Furthermore, these two factors show significant differences in the profitability structure of tourism companies.

Keywords: Italian Tourism Companies; Global Crisis; Finance; ROI; ROS.

INTRODUCTION AND MOTIVATION: AIMS AND STRUCTURE OF THE PAPER

The paper aims to investigate the situation of Italian tourism companies during and after the global financial crisis of 2008. The analysis will be conducted in particular with reference to travel agencies and tour operators and in relation to different geographical areas.

In this sense, three key questions are asked:

- 1) What have been the trends in the different geographical areas and in the different business markets over the last ten years?
- 2) Are there differences between the results of the different geographical areas and the different businesses?
- 3) Are any differences statistically significant?

As for the research questions, as many hypotheses are posed. The first hypothesis (H1) is that the income structure of tourism businesses has not been conditioned by the financial crisis due to their

resilience (Iovino, 2018; Biggs et al., 2012; Cochrane, 2010; Iovino, and Migliaccio, 2018a; Iovino and Migliaccio, 2018, b; Luthe and Wyss, 2014). The second hypothesis post (H2) is that there are differences between the results of the different geo-geographical areas and the different markets analysed; the last hypothesis (H3) is that these differences are statistically significant. To this end, the income structure is evaluated using two different indexes: ROI (operating profit / operating assets) and ROS (operating profit / net sales). This analysis was conducted in relation to the 2008-2017 period and in this sense trend analysis and ANOVA were used.

THEORETICAL BACKGROUND

Different authors have been interested in the issue of tourism companies and the effects of the crisis on their general trend.

Ersan et al. (2019) analyse the effects of European political uncertainty on the stock returns of tourist companies listed on the STOXX Europe 600 Travel & Leisure Price Index. The analysis is performed by analysing the data for a period of 20 years. The results of the survey show a negative effect on the stock returns of tourism businesses due to the uncertainty of European as well as global policy. Furthermore, the assessment of political uncertainty has a greater predictive power than that deriving from the use of other macroeconomic variables.

Kubickova et al. (2019) analyse the effects of the 9/11 terrorist attack and the 2008 global financial crisis on hotel room demand. Their focus is on Costa Rica and Honduras. The analysis shows that the two crises have a different impact in each country is more negative in Costa Rica. The 2008 crisis has indeed a greater impact on the hotel industry in both countries. Furthermore, many other factors have an effect on this market. Among them, the transport system, the level of development of the segment, the institutional development shows that they have an effect on how the hotel market is able to respond to a crisis.

Brown et al. (2019) perform a quantitative analysis of hotel resilience in the face of natural crises. Data are obtained through interviews with managers from two tourist destinations in New Zealand. These authors take into consideration several factors with respect to which the resilience of hotels is implemented with respect to natural disasters. Attention is focused on Wellington and Hawke Bay. The factors evaluated are not only economic, but also cultural, social, human, psychological and natural. Particular attention is paid to the role of workers. The analysis shows how hotels have a good resilience of hotels and highlights areas of future research including research on budgeting activities.

Moradi and Paulet (2019) analyse the effects of the euro crisis on a sample of companies belonging to 6 different European countries and 4 different sectors including tourism. The authors show that some factors including growth, profitability, taxation and the euro crisis are negatively correlated. Instead,

other factors including size (Iovino and Migliaccio, 2019), tangibility of assets and volatility of earnings are positively correlated. In particular, the tourism sector has a greater impact from the euro crisis than other sectors under investigation.

Podhorodecka (2018) checks the effects of the global financial crisis on tourism in 17 islands whose economy is based on tourism. The study verifies that the territories react differently, in particular with regard to tourism spending, employment in tourism and the overall flow of tourists.

Mecca et al. (2018) verify the effects of the Brazilian economic crisis on tourism considering a particular tourist destination. The analysed destination is a consolidated destination, i.e. Gramado. The analysis is aimed at checking whether there has been a reduction in tourism in the period 2014-2017. There are various data collected in reference to this location, among them the flow of tourists, the occupation declared in tourism, the average number of visitors, revenues from the sale of local events. The survey shows that the locality does not suffer the general negative effects of the economic crisis. On the other hand, an increase in tourism is recorded, proving that a consolidated destination has not been affected by the serious economic crisis in the country.

Ivanov et al. (2018) investigate the effects of the 2015 refugee crisis on the tourism of 4 Greek islands. The study finds that the refugee crisis has had a very negative impact on the tourism of these islands. In fact, the image of the hotels on the islands has deteriorated considerably. The reaction of the entrepreneurs in the sector is to focus on cutting prices and costs and on numerous marketing activities rather than reducing the number of people employed.

As is evident, therefore, it has not sufficiently developed an analysis of the effects of the financial crisis in the tourism sector, using a perspective that mainly takes into account the financial performance of these companies.

For this reason, it was decided to investigate the performance of some financial indicators to verify if there were significant effects on the financial situation of the companies, or if the firm management was able to face the detrition in the economic situation maintaining the profitability balance of tourism companies also using the new tools including those offered by digital transformation (Iovino, 2012; Iovino, 2014; Iovino, 2015; Iovino and Migliaccio, 2016; Iovino and Migliaccio, in press, b).

RESEARCH METHODOLOGY

Data collection and sample characteristics

In order to answer the search questions secondary data from the AIDA database have been used. In order to analyze the profitability of the companies, two indices, ROI (operating profit / operating assets) and ROS (operating profit / net sales) were chosen. Ten years during and after the Ipa crisis

were considered, i.e. 2008-2017. Only companies whose data was available for both indices in all 10 years analyzed were considered. The sample consisted of 91 companies, travel agencies, tour operators and agencies and tour operators at the same time. Subsequently, different groups were identified by means of two discriminating factors, the market to which they belong and the geographical area. With regard to the second factor, three clusters have been identified: north, center and south. The geographical distribution of the companies belonging to the sample is the following: 54.95% in the north, 31.87% in the center and 13.18% in the south. With regard to the relevant market, three clusters have been identified using the ATECO classification: 791 - Activities of travel agencies and tour operators. The groups identified are: travel agencies, tour operators and travel agencies and tour operators at the same time.

The second discriminating factor identifies 59, 34% of companies that are agencies and tour operators at the same time, 36.26% of agencies and 4.39% of tour operators.

Figure 1 – Source: our elaboration - geographic distribution of Italian tourism energy companies

Figure 2 – Source: our elaboration - market distribution of Italian tourism companies

Method

First of all, an analysis of the trends relating to the 2008-2017 period for each group and ratio was conducted. Subsequently, the ANOVA (one-way) variance analysis made it possible to verify any differences between the values belonging to the different groups. The null hypothesis is that all the population values are equal. The alternative hypothesis is that there is at least one different value belonging to the analysed groups. In our analysis, the dependent variable is constituted by the geographical location, but also by the market to which it belongs. ANOVA (one-way) was chosen, because the two factors were analysed separately and because there are at least two variables (Iovino, in press, b).

RESULTS AND DISCUSSION

Trend analysis

ROS is an index of profitability equal to operating profit / net sales. It expresses the percentage of operating income, that is, deriving from the characteristic management that remains from the net sales made. To evaluate the profitability, it must be considered together with other profitability ratios. This value is naturally positive as high as possible. According to the geographic location it assumes values between 0.62 and 4.62. If instead we consider the market to which they belong, the values fluctuate between 0.45 and 3.19. Figures 3 and 4 show very variable values in all geographic areas and in all markets. Positive peaks were recorded in 2016 if we consider the geographical location and in 2014 and 2016 if we consider the market to which they belong.

Figure 3. Trend of ROS according to geographic localization, Source: our elaboration

Figure 4. Trend of ROS according to market, Source: our elaboration

ROI is given by the relationship between operating profit and invested operating capital (Iovino, in press, a). It sets the percentage that returns in the form of operating income of the capital invested in operational operations, that is, typical of the company. Its positive value is certainly a value as high as possible. Figures 5 and 6 show how in the case of ROS this index assumes quite variable values during the analysed decade. If we consider the geographical location values are between 1.87 and 9.9. If we consider the market to which we belong, these values are between 1.36 and 10.12. ROI peaked in 2010 with a succession of very variable values if we consider the geo-geographical localization. Instead, if we consider the market of belonging, the peak was registered in 2008 in co-incidence with the beginning of the crisis. Even in the case of the market of belonging, the values are quite variable (Iovino, 2019).

Figure 5. Trend of ROI according to geographic localization, Source: our elaboration

Figure 6. Trend of ROI according to market, Source: our elaboration

The values of the two indices testify to a good profitability. The ROI values are higher than those of the ROS. This testifies to the ability of the investment to be renumbered more than sales. However, in the case of both indices the values are extremely positive. Therefore, although there are negative peaks, profitability remains positive and good in all 10 years analysed. However, the values are very variable and even decreasing. This means that the crisis has affected the income structure of these businesses. This has occurred most with regards to ROS. This variability appears to affect all the markets analysed, but also all the geo-geographic areas. Therefore, H1 is therefore not verified. The crisis has affected all geographical areas and different markets. H2 appears to be verified, because the trend appears to be different in the different geographical areas and in the analysed markets.

Analysis of variance

With regard to ROS, Table 1 shows the results of ANOVA using geographical location. There is a statistically significant difference between the groups. Indeed, $F(2,27) = 4.365645$, $p = 0.022764$, and therefore $F > F_{crit}$ with $p \text{ value} < 0.05$.

Source of Variation	SS	df	MS	F	P-value	F crit
Between Groups	5.680436	2	2.840218	4.365645	0.022764	3.354131
Within Groups	17.56576	27	0.650584			
Total	23.2462	29				

Significant level at 0,05

Table 1. ROS - Analysis of variance with geographical localization as independent variable

Therefore, based on the results of table 1 the alternative hypothesis must be considered, while the null hypothesis must be rejected. This also happens in the case where the membership market is considered an independent variable. In fact, from table 2 it results that there is a statistically significant

difference between the groups considered. Indeed, $F(2,27) = 7.244525$, $p = 0.003029$ and therefore $F > F_{crit}$ with p value < 0.05

Source of Variation	SS	df	MS	F	P-value	F crit
Between Groups	5.848225	2	2.924113	7.244525	0.003029	3.354131
Within Groups	10.89803	27	0.403631			
Total	16.74625	29				

Significant level at 0,05

Table 2. ROS - Analysis of variance with belonging sector as independent variable

Instead, in the case of ROI when we consider the geographical location as an independent variable, there is no statistically significant difference as shown in Table 3. Indeed, $F(2,27) = 1.749455$, $p = 0.193007$, and therefore $F < F_{crit}$ with p value > 0.05 . Table 4 shows the results relating to the ROI when considering the relevant market as an independent variable. In this case, unlike the previous one, there is a statistically significant difference. Indeed, $F(2,27) = 13.34057$, $p = 9.35E-05$ and therefore $F > F_{crit}$ and $p < 0.05$.

Source of Variation	SS	df	MS	F	P-value	F crit
Between Groups	12.86146	2	6.430729	1.749455	0.193007	3.354131

Total	120.176	29				

Significant level at 0,05

Table 4. ROI - Analysis of variance with belonging market as independent variable

So the results of ANOVA tell us that the H3 hypothesis is fully tested as far as ROS is concerned. There are statistically significant differences both in the different geographic areas and in the different business areas. Instead, the H3 hypothesis is partially verified regarding the ROI. In fact, there is a statistically significant difference between the different markets analysed. Instead, this difference does not appear to be present when the various geographical areas are considered. Thus, belonging to different markets appears to be the pre-dominant factor in determining differences in the income results of the companies analysed. Instead, the geographical factor appears to have a more contained effect in determining the profitability of these companies (Iovino and Migliaccio, 2019).

CONCLUSIONS

It is possible to state that the hypotheses are partially verified. In fact, the tourism companies analysed are affected by the crisis in their profitability. Furthermore, there are differences and such differences are also statistically significant. In fact, the ROS appears to have a decreasing trend starting from 2008. Moreover, it is quite variable over time. Differences appear between the different geographical areas, but also between different businesses. This is confirmed by the ANOVA which highlights the presence of statistically significant differences. Also in the case of ROI the trend of profitability according to the trend analysis is quite variable with a reduction starting from 2008. However, subsequently there are peaks in increase and decrease. Furthermore, there is a certain difference between the different geographical areas and the angled businesses. The ANOVA confirms a statistically significant difference between the different businesses, while there is no difference between the different geographical areas of the country. Tour operators appear to be the type of company that best understands the company in terms of sales. Instead, when considering the overall profitability of the operational management, the companies that simultaneously carry out the two activities are analysed to obtain the best performances. This means that in the case of tour operators the income from sales is absorbed by the costs of operational management. Relatively to the geographic areas the southern enterprises have the best results as far as ROS is concerned. Instead, businesses in the centre regions get the best results with regards to ROI. Thus, the companies that carry out activities in an integrated manner are able to obtain a superior profitability compared to the companies that carry out the two activities separately. The paper has several limitations which also constitute the prospects for future research. In fact, only two profitability ratios were considered. Furthermore, only those companies of which the values of the two indices were available for all the years considered were taken into consideration. It is evident that these are the companies that manage to survive over time, also having the best results (Iovino and Migliaccio, 2018a, 2018b, in press a). The future research guidelines will be aimed at considering a multiplicity of indices, not only ritualistic, but also financial. Moreover, companies belonging to different countries may also be compared, also seeking to explore the role exercised by different types of variables in determining the financial performance of these companies.

ABSTRACT

There is a general consensus that the most important factor for start-up success is a well-organized network. Recent works have highlighted the role played by incubators in embedding a company within networks. In this work we aim at contributing to the literature on business incubators by focusing on network-based incubators. We introduce the case of Invention 2 Innovation Center (I2C), a new university-based incubator of Huntsville (AL), which is a key player of the entrepreneurship ecosystem of the region. I2C's success factors are based on the implementation of a robust selection process to support and nurture start-ups, the delivering of support services and resources for entrepreneurs and start-ups and the building of strategic and symbiotic relationships with entrepreneurship focused communities, venture accelerators, public-private organizations, investors, mentors, service providers and strategic partners. We highlight how I2C's entrepreneurial networks serve as catalysts, thus accelerating new venture creation which ultimately drives innovation and economic development within the community region. Finally, we provide an agenda for future research based on a systematic literature review of managerial studies dealing with the issue of incubators by means of bibliometrix, a unique tool in the R language for comprehensive bibliometric analyses, followed by a content analysis focusing on network-based incubators.

Keywords: Networked-based Incubators; I2C; Performance Measures

INTRODUCTION

In an environment where uncertainty is the main feature, entrepreneurship is an important research field as it involves the detection and exploitation of new opportunities, this way sustaining social and economic development (Iscaro et al., 2017). In this environment, Business incubators (BIs) play a key role as they help starting ventures by providing access to several services and resources.

Business incubators are popular entities established around the world to stimulate and support new business creation. "Business incubators nurture young firms, helping them to survive and grow during

the start-up period when they are most vulnerable" (Aernoudt, 2004, 127). The American National Business Incubation Association defines business incubation as a dynamic process of firm development (Aernoudt, 2004). Since the opening of the first Incubator in 1959, The Batavia Industrial Center, commonly known as the first U.S. business incubator, established in Batavia, N.Y., the concept, the offer and the defining structure of BIs have faced severe transformations.

It must be observed that BIs have experienced two important changes, which have led them from the first to the third generation (Bruneel et al., 2012), as shown in Figure 1 (Iscaro et al. 2017). First generation of incubators (1970s/1980s) provided infrastructures. The advantage for incubatees was the possibility of saving money for those costs difficult to sustain in the start-up phase. Hence the value offered by the first type of incubators was related to their ability to control scarce tangible resources (Boschetti et al., 2003). At the end of the 1980s the second generation of incubators emerged. As the main obstacle for successful start-ups was the lack of business competencies, incubators started offering intangible 'knowledge-based' resources in addition to tangible ones. With the hectic diffusion of entrepreneurship, the third-generation incubators (mid 1990s) understood the importance of networking for incubatees (Bruneel et al., 2012). If in the second generation resources were owned by the incubators, which provided something within their value chain, in the third generation, incubators offer resources and competencies not necessarily owned, often outside their value chain (Boschetti et al., 2003). Indeed today the value lies in the network, in the relational capital an incubator can rely on (Iscaro et al., 2017).

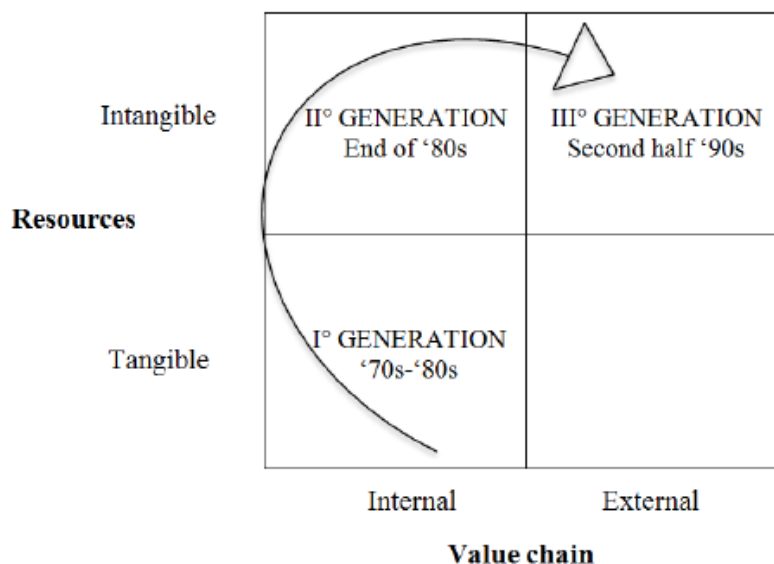

Figure 1. The evolution of Incubators (Iscaro et al., 2017. Adapted from Boschetti et al., 2003)

As a result of this evolution, the most common definitions of incubators usually describe as their core offering either intangible or tangible assets. We generally find shared office space rented at favorable rates and shared support services that reduce overhead costs as tangible assets and professional business support, advice and mentoring, and professional and trade networking as intangible assets. The literature has analyzed each of these aspects but there is currently a general consensus that the most important factor for start-up success is a well-organized network (Bennett et al., 2017, Haapasalo and Ekholm, 2004). Hence, recent work has shifted the focus of research “on the role played by incubators as a mechanism for embedding a company within networks” (Bennett et al., 2017) recognizing that the entrepreneurial literature emphasizes that access to networks is essential for start-ups and small companies.

In this work we aim at contributing to the literature dealing with the issue of business incubators with a focus on network-based incubators.

The paper is structured as follows. In section 1 we conduct a brief literature review on the issue of networked-based incubators, focusing on the identification of suitable performance measures. Section 2 illustrates the entrepreneurial ecosystem of Huntsville (AL). Section 3 focuses on the role of the Invention 2 Innovation Center (I2C) in the Huntsville ecosystem and Section 4 presents the experience and specific characteristics of the I2C as a network-based incubator. It is the new university-based incubator of Huntsville, which - though young - is already a key player of the entrepreneurship ecosystem of the region. The choice of the case study was due both to the characteristics of the incubator and to its geographical location as a prerequisite for the development of useful inter-organizational relationships and networks. Indeed Huntsville is not only the center for rocket-propulsion research in the US but also a vibrant and active economic ecosystem, named by Forbes 2018 as 107th best place in USA for business and careers and awarded by Moody’s Investors Service and Standard & Poor’s Rating Services for the robust economy, solid budgetary performance and strong institutional framework. Huntsville hosts four main Universities and one of the world’s leading science and technology business parks (the Cummings Research Park), with a combination of Fortune 500 companies, local and international high-tech enterprises, US space and defense agencies.

Extensions for future research follows in Section 5.

THE NETWORKED-BASED INCUBATORS

Recent years have seen the emergence of a new incubator model, the “networked incubator” (Bollingtoft and Ulhoi, 2004). It helps start-ups to develop their network meant as a set of nodes (actors, which can be of a different type – e.g., large firms, small firms, universities, government – or

organizational levels – e.g., firms, divisions, projects, individuals) connected by ties (relationships – e.g., friendship, cooperation, power, exchanges) (Eveleens et. al, 2017).

It has been observed that the network of relationships of a firm profoundly influences its conduct and performances (Gulati et al., 2000).

In a knowledge-based economy authors emphasize the cognitive relevance of networks, due to interorganizational knowledge sharing and division of cognitive labour (Appleyard, 1996; Rullani, 2004). To be a source of competitive advantage, the dynamic processes of organizational learning must go beyond the boundaries of individual firms (Dyer and Nobeoka, 2000): if properly managed - through the creation of a strong group identity and the adoption of effective coordination rules - a network is an organizational unit able to recombine and generate knowledge better than the single firm. In contexts characterized by complex and continuously and rapidly evolving cognitive structures, the locus of innovation resides outside the firm and within inter-organizational networks (Powell, Koput and Smith-Doerr, 1996).

Authors suggest that firm effects of network participation also depend on the occupied network position and the characteristics (strength and embeddedness) of the relationships¹ (Eveleens et. al, 2017; Granovetter, 1973; Uzzi, 1997). On the one hand, a central position and strong relationships can enhance performance because of information, power, learning and resource advantages, on the other hand, they could limit performance, as they are costly to maintain and can blind the business to new ideas and developments (Eveleens et. al, 2017). Uzzi (1997) and Duyster and Lemmens (2003) warn about the dangers inherent in too strongly cohesive ties, mainly concerning the risk of 'overembeddedness', limiting firm innovative capacity by fueling non-productive redundancy. These risks find empirical evidence, for example, in the study by Hoang and Rothaermel (2005), showing that a partner-specific experience does not contribute to managerial learning being negatively associated with future alliance success.

Network-Based Incubators: Assessment Measures

Considering the key role and the large amounts of money invested in incubators by governments, universities, research institutions, municipal agencies and other interested stakeholders, the question of the return of investments has been raised. Thus the evaluation of incubator performance has attracted great attention (Bergek and Norrman, 2008).

The traditional model of measuring success in any type of business organization is often as direct as reading a profit and loss statement (Aerts et al., 2007), but the development of common performance measures (PMs) and measurement systems (PMSs) has been a debated topic for many decades (Vanderstraeten and Matthyssens, 2010) and it still is. Researchers in the BIs literature stress the

¹ Social network analysis allows the analytical study of the structure and characteristics of a network.

importance of performance evaluation. As Vanderstraeten and Matthyssens (2010) highlight, not only incubator managers, but also companies managers can benefit from robust and shared incubator PMs and PMSs for resources allocation and physical location decision. Moreover, also government-related organizations such as the European Commission has been using incubator PMs and PMSs for resource allocation and benchmark. However, today there is no yet a common standard to measure incubator performance (Phan et al., 2005). Indeed, the incubators literature for many decades has proposed and used different measures. Existing studies are heterogeneous, with different methodological approaches and focused on different measures. Some studies explore the impact of incubators at the individual firm level while others assess the impact at a macroeconomic level. Additionally, some frameworks rely on several dimensions to provide a more comprehensive picture of incubators' performance (Hausberg and Korreck, 2018). As a result of such a rich and not standardized literature, we have several measures used to evaluate the success of BIs.

Mian (1994) proposes one of the first frameworks for assessing the performance of incubators, identifying 13 key characteristics: the origin of facilities, the incubator objective, organizational design, governance, tenant performance reviews, institutional support, staffing, funding resources, technologies targeted, personal traits of tenant entrepreneurs, strategic operational policies, services and their value added, as well as the survival and growth of tenant firms. Tenant employment, incubation period, tenant success rate, local retention of graduates, added value of incubator services, incubator size and occupancy rate, jobs created and firms graduated were measures proposed by Allen and McCluskey (1990). The European Commission (2002) stressed the importance of firm survival rates as indicator of the performance of incubators. Smilor (1987) identifies ten factors for the success of the incubator system: on-site business expertise, access to financing and capitalization, in-kind financial support, community support, entrepreneurial network, entrepreneurial education, perception of success, selection process for tenants, tie to a university, and concise program milestones with clear policies and procedures. Most studies assess incubators' performance in terms of new venture creation, growth and survival rate of new businesses relying on quantitative data from questionnaires (Eveleens et al., 2017). Many researchers have also focused the attention on the importance of the tenants screening process to determine the success of the incubators, as it is an important component in the incubation process (Hausberg and Korreck, 2018).

It is also important to notice that researchers, who want to assess the performance of incubators, face several challenges. One difficulty is related to the problem of getting good and reliable data, as entrepreneurs are often hesitant in sharing information, do not keep good records, or tend to be too self-referential when providing information. In addition start-ups are not required to report their performance to public shareholders, making it difficult to obtain data. Moreover, start-up experience

changes in time, making essential for data quality the moment at which the performance is measured (Eveleens et al., 2017).

The networked-based incubation literature is in line with the most general ones as it considers start-up performances, incubators management characteristics and impact on the external macro environment as key PMs.

Eveleens et al. (2017) propose two main elements that need to be measured in order to assess the networked-based incubators success: the start-up performance (which is one of the most used dependent variable in the literature) and the network itself. They classify the key measures of the start-up performances in 4 main categories: general objective measures, incubation-specific objective measures, general subjective measures and incubation-specific subjective measures (Tab. 1). In addition, considering the crucial role of the network for the success of the start-ups and, in turn, of the incubators, the authors focus on the two basic elements that compose its structure and need to be measured: nodes and ties. As mentioned above, nodes are actors involved (firms, divisions, universities, governments, or individuals). Ties represent the type of relationship among actors (Tab. 2).

Incubatees Performance	GENERAL OBJECTIVE MEASURES	Success, survival, firm size, firm growth in terms of sales, profit and employment, and total of funds obtained
	INCUBATION-SPECIFIC OBJECTIVE MEASURES	Firm graduation from the incubator and number of lifted obstacles
	GENERAL SUBJECTIVE MEASURES	Anticipated survival, success, market or business performance, achievement of entrepreneurial goals, estimation of growth, competitive performance, estimated sales, performance compared to competitors, estimation of profit, and satisfaction with the return on assets
	INCUBATION-SPECIFIC SUBJECTIVE MEASURES	Advancement in the incubation process from initiation to Commercialization

Tab 1. Performance Measures (Adapted from Eveleens et al., 2017)

Network	ACTORS INVOLVED	Incubation manager, mentors, researchers, universities, informal investors, venture capitalists, consultants, and service providers
	TYPE OF RELATIONSHIP	The content, the formality, the strength of the relationships, the form of relationship communication, and whether it is an incubator-internal or incubator-external relationship

Tab 2. Incubators Network (Adapted from Eveleens et al., 2017)

THE ENTREPRENEURIAL ECOSYSTEM OF HUNTSVILLE (AL)

Huntsville (AL) is also known as the Rocket City, as its main economic influence is derived from aerospace and military technology. Redstone Arsenal, Cummings Research Park (CRP), and NASA's Marshall Space Flight Center represent the main hubs for the area's technology-driven economy. Huntsville is the center for rocket-propulsion research in the US. Beyond aerospace, Huntsville has a vibrant and active economic ecosystem. Forbes 2018 named Huntsville as 107th best place in USA for business and careers¹. Two of the nation's top credit rating agencies assigned the City of Huntsville their highest scores in May 2019. Moody's Investors Service and Standard & Poor's Rating Services awarded the robust economy, solid budgetary performance and a strong institutional framework. Huntsville is also a hub for education and research with 4 main Universities (Alabama A&M University, University of Alabama in Huntsville, Calhoun Community College and Oakwood University) and the Cummings Research Park (CRP), the second largest research park in the country and the fourth largest in the world. CRP is one of the world's leading science and technology business parks, with a combination of Fortune 500 companies, local and international high-tech enterprises, US space and defense agencies. CRP is the home of nearly 300 companies, almost 27,000 employees and 11,500 students. In such a dynamic ecosystem, entrepreneurship thrives. Indeed, entrepreneurship and innovation play a critical role in the City of Huntsville's economic diversification strategy. The **Business Relations Office** has developed a report² on **Huntsville's Entrepreneurship Ecosystem** that highlights the many organizations that support innovation and entrepreneurship. More in detail, the Advisory Council on Innovation and Entrepreneurship of the City of Huntsville has built a "guide" of the entrepreneurship actors in the community, with the purpose of identifying the many assets available for entrepreneurs. The guide classifies the actors of the ecosystem based on their main offer and it presents six sections: education (e.g. schools and universities), meet-ups (e.g.

¹ <https://www.forbes.com/places/al/huntsville/>

² For the complete report see <https://3jzi0q2zthm01oqpx2h96lz1-wpengine.netdna-ssl.com/wp-content/uploads/2018/10/Entrepreneur-ecosystem-prototype-v-8-103018.pdf>

networking events), incubators/accelerators, mentoring assistance, investors (e.g. angels, VC), and R&D Centers.

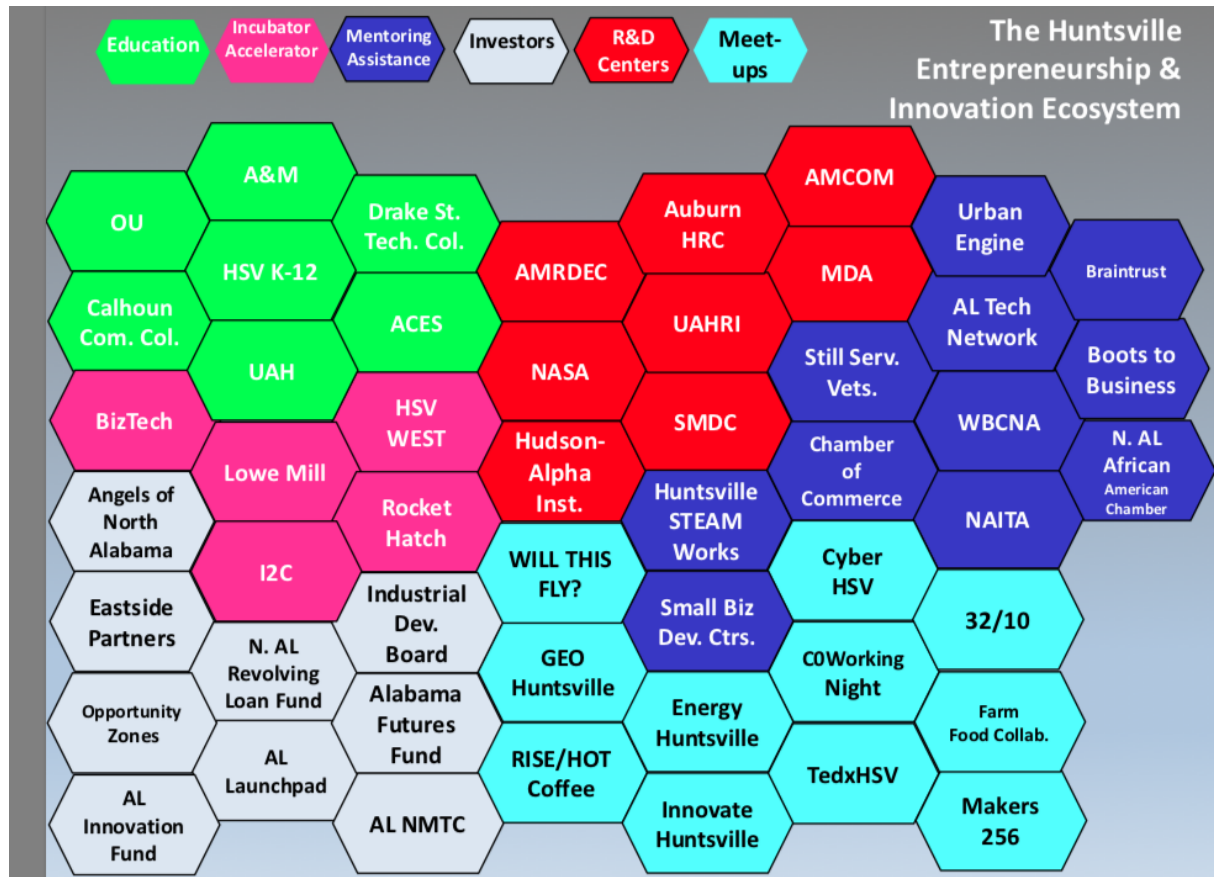

Figure 2. The Huntsville Entrepreneurship & Innovation Ecosystem. Business Relations Office, City Of Huntsville.

In Huntsville there are 5 organizations classified as Incubators/Accelerators:

1. BizTech¹: high tech incubator located in Cummings Research Park. It offers office space, conference rooms, and labs for growing companies. In addition to space to work, it offers mentoring opportunities as well as opportunities to network with likeminded companies.
2. Huntsville West²: Huntsville West is a small business incubator that offers co-working space with a low barrier to entry.

¹ <http://biztech.org>

² <https://www.huntsvillewest.com>

3. Lowe Mill¹: Lowe Mill ARTS & Entertainment is America's largest independent center for the arts. With over 120 working artists, small businesses, restaurants, and live performance venues, this space is home for music, art, and culture businesses.
4. Rocket Hatch²: through networking events, their CO.STARTERS program, their Will This Fly competition, and more, Rocket Hatch encourages collaboration and sustains ideas and businesses from the ground up.
5. Invention to Innovation Center (I2C)³: a regional initiative that fosters, promotes, and accelerates commercialization of technology-based ventures through incubation, co-working, mentorship, funding, strategic support and more.

Thus in Huntsville there is a multitude of factors that can promote entrepreneurship (Wilton and Toh, 2012) and the presence of innovation centers that create the necessary link among all the involved actors, which is crucial to stimulate the creation of an effective innovation ecosystem (Ferraris and Grieco, 2015).

In this context we focus our attention on the I2C, as it is the only University-Based incubator of the ecosystem. With key nodes and strong ties in its network, it is able to converge in one place all the 6 elements of the entrepreneurship ecosystem.

THE ROLE OF I2C IN THE ECOSYSTEM

The I2C serves as regional resource for emerging tech companies through leadership and support of entrepreneurial initiatives throughout north Alabama and south-central Tennessee 15 county region where entrepreneurs can ideate, collaborate and build companies that are scalable and investable – in a vibrant and dynamic environment that supports and stimulates co-creation and open innovation. I2C focuses on venture acceleration, mentorship, programming and incubation – with an emphasis on establishing pathways and facilitating collaborations with other entrepreneurial ecosystems.

Any incubation initiative needs an anchor to sustain operational stability, deliver programming, provide strategic support and develop entrepreneurial competencies for its incubatees and the larger ecosystem. The odds of success rise dramatically with a university playing that role - both strategically and financially - through creation of physical infrastructure and support systems necessary for new venture creation.

¹ <http://www.lowemill.net>

² <http://www.rockethatch.org>

³ <https://www.uah.edu/i2c>

The need for rapid and disruptive innovation has prompted an urgent push by universities to focus on applied research - a large majority actively seeking commercialization pathways through their respective tech-transfer offices. Presence of an innovation focused incubator on campus performs a dual role - serving as platform to actively pursue spin off opportunities fueled by university Intellectual Property and led by students, faculty etc. and 2) acting as catalyst for entrepreneurs and start-ups to leverage university centric resources as a result of participating in the incubation program. Thus university anchors tied to an incubation initiative lead to opportunities that enable public-private partnerships, deal flow, educational and research collaborations, mentorship, talent sourcing and funding access, all of which contribute towards the creation of a robust entrepreneurial ecosystem.

The establishment of the I2C as the only “regional and university based” innovation initiative in North Alabama is a win-win for the community and the 15-county entrepreneurial ecosystem that it supports. The strategic advantages for aspiring entrepreneurs and start-ups to leverage UAH (University of Alabama in Huntsville) resources through the I2C opens avenues to explore synergies and collaborations spanning several key areas including opportunities to partner with faculty and students on spin offs, collaborative/sponsored research, grant funding, talent acquisition through internships and consulting projects, commercialization and IP support and use of university’s physical resources including special purpose facilities, labs, equipment and related capabilities which can accelerate innovation and technology development.

I2C’s success factors depend on the following:

- Implementing a robust selection process to support and nurture start-ups that will help attract quality deal flow, assess resource allocation and identify early wins within its portfolio.
- Delivering support services and resources for entrepreneurs and start-ups, including space, mentoring, programming, education, access to capital etc., which will help accelerate new venture creation.
- Establishing collaborations and connectivity locally, regionally, nationally and globally. This includes a concentrated effort on building strategic and symbiotic relationships with entrepreneurship focused communities, venture accelerators, public-private organizations, investors, mentors, service providers and strategic partners who will help companies flourish.

THE I2C AS A NETWORK-BASED INCUBATOR

The evolution of successful entrepreneurial ecosystems (Bay Area, Boston, NYC, Austin and others) is a result of two main drivers: university serving as anchors and industry serving as partners. These form the core/hub of a dynamic ecosystem wheel. The spokes are resources - programmatic, funding, business/strategic services and others. Successful alignment is a result of connectivity and

collaboration between the “hubs and spokes” and ultimately, establishing “networks/pathways” with other ecosystems to create a broader impact. Through the establishment of I2C, the region stands poised to expand its entrepreneurial footprint by establishing collaborations strategic to its mission to include a robust experience for its ecosystem in the areas of programming, mentorship, services and access to capital. The data below in Tab 3 combines metrics of I2C and its 17 virtual and on-site companies since inception of the program in Q1, 2018.

Metrics	As of 1st Sept, 2018
Total amount of investment capital raised	\$275,000
Past fiscal year business sales	\$250,000
Total business sales	\$425,000
Total # of jobs created or retained	12
Total # of technical assistance meetings	53
Total # of mentoring & coaching sessions	34
Total # of meetings with potential investors	9
# of new product launched / under development	16

Tab 3. I2C performance data

I2C’s entrepreneurial networks serve as catalysts, which help accelerate new venture creation which ultimately drives innovation and economic development within the community/region. I2C’s resources (both infrastructure and programmatic) are unique to this region thus presenting an opportunity to nurture, develop and expand a tech-based ecosystem by leveraging the collective strength of ecosystem as a whole.

I2C is leader in the formation of Innovate Huntsville, a collaboration and celebration of the entrepreneurial ecosystem in North Alabama. Innovate Huntsville is represented by 11 organizations (including I2C) who are dedicated to bringing entrepreneurs, and innovators together with local resources to build momentum and opportunity around Huntsville’s vibrant entrepreneurial ecosystem.

Through this collaboration, the partnering organizations work together to collectively provide the following services and support to this regional entrepreneurial ecosystem: Co-working, community and collaboration.

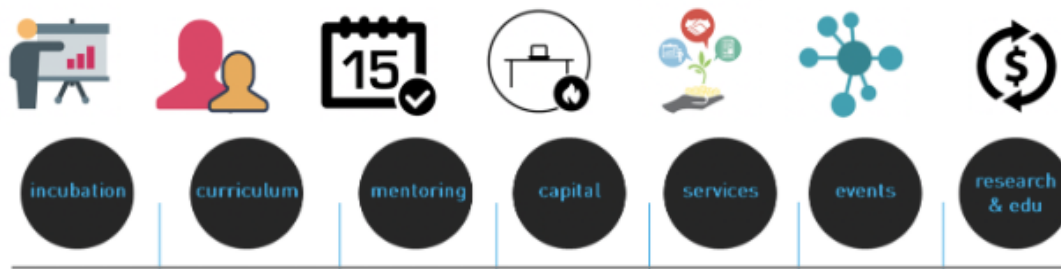

Figure 3. Innovate Huntsville Services

This organized network represents a powerful framework that leverages best practices, resources, expertise and strategic support from participating organizations, which share the common mission of championing entrepreneurship and venture acceleration in the region.

Other relevant I2C partnerships encompass program development with Hacking for Defense (H4Di) to introduce the Lean Startup curriculum for Spring 2020 semester, Trellis an immersive workshop series focusing on Corporate Innovation, The Civil-Military Innovation Institute (CMI2) to build an innovative workforce optimized to advance national security technologies in support of the National Security Innovation Network (NSIN), Soft Landing Program in partnership with InBIA (a global non-profit with over 2,200 members that lead entrepreneurship support organizations in 62 countries), European Space Agency through the Huntsville Chamber of Commerce for Aerospace startups under the Space Exploration Masters Program and North Alabama International Trade Association (NAITA), a business-driven organization committed to increasing knowledge, interest, and activity in international trade in North Alabama, to establish similar programs to incubate foreign technology startups, European Innovation Academy's Innovation Accelerator program and the NSF I-Corps SBIR Phase Zero program with Georgia Tech.

FUTURE RESEARCH

The work is still in its initial phase. As a second step we will conduct a systematic literature review (SLR).

Indeed the ample number of scientific managerial publications dealing with the issue of incubators makes it useful to adopt a SLR to keep up with the state of art of literature.

When the large amount of contributions results in voluminous and fragmented research streams, hampering the ability to accumulate knowledge and actively collect evidence through a set of previous research papers, a suitable activity of literature review assumes a crucial role in synthesizing past research findings and advance a line of research. Scholars use different qualitative and quantitative techniques to understand and organize earlier research findings. Among these, bibliometrics introduces a systematic, transparent and reproducible review process based on the statistical measurement of scientific activity, thus generating a comprehensive overview of extant research (Aria and Cuccurullo, 2017).

For our research aim, we will conduct a systematic literature review of managerial studies dealing with the issue of incubators by means of bibliometrix, a unique tool developed by Aria and Cuccurullo (2017) in the R language for comprehensive bibliometric analyses, providing a wide variety of statistical and graphical techniques supporting the following activities:

1. Data collection: bibliometrix supports the sub-stage of data loading and conversion to R data frame;

2. Data Analysis, articulated in three sub-stages: a Descriptive analysis of a bibliographic data frame; b Network creation for bibliographic coupling, co-citation, collaboration, and co-occurrence analyses; c Normalization;

3. Data visualization: a Conceptual structure mapping; b Network mapping.

The SLR by means of bibliometrix will be followed by a content analysis focusing on network-based incubators, leading to the generation of research propositions.

Finally we will test theory in encounter with practice conducting and in-depth analysis of the I2C characteristics and network.

DEVELOPING ATTRACTING DESTINATIONS FOR GENERATION Z BASED ON DESIRED DESTINATION COMPONENTS

Kamenidou, Irene; Mamalis, Spyridon; Pavlidis, Stavros; Bara, Evangelia-Zoi

Department of Management Science & Technology, Kavala Campus, International Hellenic University

ABSTRACT

Generation Z is the youngest adult consumer tourist, and knowledge of its perceptions of desired destination components is of extreme value for destination marketing managers. Therefore, this paper presents the product of field research concerning what tourists (potential or actual) of Generation Z perceive as desirable or essential components of a destination that generates a favorable image. A literature review combined with qualitative research produced 42 destination image components, that were rated by individuals belonging in the Generation Z cohort. Social media and specifically Facebook have been adopted to collect data, obtaining in this matter 258 questionnaires. Data analysis incorporated descriptive statistics, factor analysis in order to produce a smaller set of variables, and in later proceed to segmentation analysis. In this way, twelve factors were produced which were treated as new variables and cluster analyzed. K-Means cluster analysis yielded three groups of Generation Z's perception of destination image components which are desired or not by them.

Keywords: Generation Z cohort; Destination image; Destination components; Tourism; Marketing; Segmentation; Tourism marketing management

INTRODUCTION

Prior research identifies the significance of destination image in influencing destination choice (Prebensen 2007; Chen and Hsu, 2000; Baloglu and McCleary, 1999). It also recognizes that it is essential for tourist satisfaction (Lee et al., 2014; Prayag and Ryan, 2012) and loyalty (Prayag and Ryan, 2012). Milman and Pizam (1995) assert that if the image of a destination is not favorable by tourists, they will not visit it, except in the case that this visit to the specific destination is unavoidable.

Gallarza et al. (2002) postulate that destination image is subjective and due to its subjectivity, it is imperative for marketing managers to be knowledgeable of the variables that consist the desired destination image of actual and potential tourists (Buhalis, 2000). Furthermore, researchers acknowledge that travel behavior is influenced by the generational cohort that the individual belongs in (Chung et al. 2016; Alegre and Pou, 2004).

Generational cohorts are people that are born in the same time zone, at similar places (Kupperschmidt, 2000; Mannheim, 1972), and have lived the same catalytic events (Lester et al., 2012) that shaped their behavior (Parry and Urwin, 2011). Generational cohorts differ from generations since the latter refers only to people born in the same year range of approximately 20-25 years (Tung and Comeau, 2014).

Under this concept, this paper has as its purpose to segment the Greek Generation Z cohort based on what cognitive and affective components synthesize the desired destination image as perceived by them.

This study contributes to the academic tourism literature on destination image in the following manners. 1) previous studies on destination image are mostly focused on a specific destination and the perception towards it. This study investigates the destination variables that tourists consider as necessary for synthesizing a (favorable) destination image in order to include it in their set of choices. 2) there is a lack of studies on the Generation Z cohort tourists (born 1995 and after), a cohort that has entered the workplace and are the future consumers. 3) while there is an abundant number of studies regarding perception, formation, and evaluation of a destination image, there are very few studies that concern generational cohorts and destination image (Huang and Lu, 2017; Zhang et al., 2017; Chung et al., 2016). 4) lastly, to our knowledge a handful of studies exist on destination image and the Generation Z tourist cohort.

LITERATURE REVIEW

In order for a travel for tourism to happen, at first the potential tourist has to answer to the “if” there will be a vacation at all question, and in following the “where” it will occur question (Crompton, 1977 in Um and Crompton, 1990) i.e., which destination will be chosen. In the “where it will take place” phase, the different destinations compete to be included in the potential tourists' choice set (Gartner, 1994), with the perceived destination image being one of the determining choice factors (Buhalis, 2000). Consequently, destinations with a strong, favorable image have a greater chance to be chosen (Hunt, 1975; Milman and Pizam, 1995).

A destination image refers to perceptions or/and impressions, or/ and beliefs that one holds towards a destination (Fakeye and Crompton, 1991; Crompton, 1979; Hunt, 1975). There are mainly two different approaches regarding the destination image. Traditionally, authors consider that it is composed of two components: the cognitive and affective component (e.g., Baloglu and McCleary, 1999; Moutinho, 1987) or three components: the cognitive, affective, and conative (e.g., Chen and Phou, 2013; Gartner, 1994). Additionally, authors consider that the holistic (overall) impression should be taken into

account when measuring destination image (Tasci and Gartner, 2007). The cognitive component has to do with the (evaluation of/feelings towards) physical, actual properties of the destination and the affective component involves subjective evaluations and feelings towards the destination (Baloglu and McCleary, 1999). Lastly, the conative component refers to the behavioral aspect -intention deriving from the cognitive and affective image of the destination (Prayag, 2007; Gartner, 1994).

There is an abundance of prior research confirming that image research is vital for destinations with plethora focusing solely on the cognitive variables (e.g., Peña et al., 2012), while others use both, the cognitive and affective dimension (e.g., Kim et al., 2019). Moreover, some use the cognitive, affective, and conative components of destination image (e.g., Stylos et al., 2017), while others use the holistic image (Stylos et al., 2016; Michaelidou et al., 2013). Furthermore, there is a generous number of studies referring to segmentation analysis (e.g., Kamenidou et al., 2015; Leisen, 2001) and tourists' characteristics and effects on destination image (Beerli and Martín, 2004).

In addition to the above, vast bulk of research regards destination branding (Ekinci, 2003); motivation (Phillips and Jang, 2007); information sources (Kavoura and Stavrianeas, 2015), choice criteria (Kamenidou et al., 2009); and expectation (Vitouladiti, 2013). Also, there is a great volume of studies on tourist's behavioral intentions (e.g., Chen and Tsai, 2007); satisfaction (Joppe et al., 2001); and loyalty (Chen and Phou, 2013; Zhang et al., 2014). Another aspect well researched is tourist's recommendation of a destination (Inan et al., 2011); as well as the beforementioned relationships (e.g., Chi and Qu, 2008).

Whereas there are countless publications on tourism studies, relatively few exist as regards generational cohorts and tourism, which though is an emerging topic in the tourism marketing domain (e.g., Swanson and Cavender, 2019; Confente and Vigolo, 2018; Chung et al., 2016; Desivilya et al., 2015;), while even fewer exist regarding tourism and the Generation Z cohort (e.g. Self et al., 2019; Haddouche and Salomone, 2018) pointing out that in tourism destination studies, generational cohorts are an understudied issue. Additionally, studies that deal with destination behavior and Generation Z (which is the focus of this paper) are rare (Skinner et al., 2018; Qi and Leung, 2018; Sá, 2017). Rare are likewise, studies dealing with perceived destination image, which is also the issue of this research (Zhang et al., 2017; Chung et al., 2016; Fabšík, 2013). Lastly, to the author's knowledge, a handful of studies deal with the perception of a destination image and the Generation Z cohort.

Zhang et al., (2017) compared the tourist destination image (TDI) of different generations (generation decades of the 1950s, 1960s, 1970s, 1980s, and 1990s). Their results revealed significant differences and some regularity, that is, the earlier the generation is, the higher the TDI evaluation is. Huang and Lu (2017) studied amongst other issues, China's potential outbound tourist destination evaluation criteria from a five-generational point of view (n=4047). The five generations were: The Firm Communist

Generation (FCG), the Lost Generation (LG), the Reform and Opening-up Generation (ROG), the Only-child Generation (OG). Chung et al. (2016) investigated the destination image of 350 Mainland Chinese tourists visiting Taiwan (i.e., cross-strait tourism) across four generations (Republican, 1930-1950; Consolidation, 1951-1960; Cultural Revolution, 1961-1970; and Social Reform, 1971+). Fabšík (2013) investigated if there is a gap between the communicated and perceived image regarding Slovakia and Czech tourists, targeting generation Y tourists (n=140).

Specifically, as regards to destination image and the generation Z cohort tourist, two studies were found in the context of destination tourism and Generation Z cohort. Qi & Leung (2018) studied the Chinese generation Z cohort traveling behavior towards Kenya as they measured the "perceived importance of nine dimensions of destination related information", i.e., natural resources, general infrastructure, tourist infrastructure, tourist leisure and recreation, culture, history and art, political and economic factors, natural environment, social environment, and atmosphere of Kenya (based on Beerli and Martin, 2004 dimensions). They found that the Generation Z cohort rated as most important the "natural resources" and "natural environment" dimensions, while they rated as the least important the "Leisure and recreation information" dimension. They state that their results show, that the perceived destination image has an impact on the perceived importance of the destination information. Lin and Huang (2017) incorporated the construct of perceived value (functional, social, and emotional value) to examine the factors that influence the tourism decisions of Chinese students as tourists belonging in the generation Z cohort (n=405).

METHODOLOGY

Literature review combined with qualitative research (n=8 depth interviews) generated forty-two destination image components which were included in the final questionnaire. As regards the field research questionnaire, the question referring to destination components was stated as "which of the following components do you consider as important for the formation of a desirable destination image in order for the destination to be chosen" (5-point Likert-type scale: 1= completely unimportant, to completely important). A non-probability sampling method was used to obtain data. This research targeted population in the Greek Generation Z cohort. The Greek Generation Z cohort consists of individuals born 1995-2009 (McCrindle and Wolfinger, 2010) in Greece, and the year of the research (2017) these people were 18-22 years of age.

The research tool was developed in google docx form, to be forwarded via the internet and specifically via Facebook and e-mail; employing convenience and snowball sampling. By this procedure, 258 valid answered questionnaires were gathered that were used in the analysis. The SPSS ver.24 was

employed, and the statistical analysis encompassed percentages and mean scores (MS), factor and cluster analysis, as well as chi-square and crosstabulation tests.

RESULTS

Sample profile

44.2% of the sample were males and 55.8% females, with participants' age as follows: 9.3% were 18 years old; 26.4% were 19 years old; 32.6% were 20 years old and 17.8% and 14.0% were 21 and 22 years old respectively (percentages regard the year 2017, when the research has taken place). Respondents were single (99.2%) with secondary education (81.0%) being university students in the majority (79.1%) and with a net monthly family income up to 1500.00 euros (86.7%). Additionally, 29.3% had at least one family member fired from May 2010, when the memorandum of understanding was signed, and 4.0% had no family member currently working, due to the economic recession that the country is experiencing.

Perceived important components of a destination image

From the 42 components evaluated as important or not by the Generation Z cohort to produce a desirable destination image, none had as a Mean Score (MS) >4.51 . The statements with the highest evaluation were that it must be an "exciting destination" and is/has "beautiful place/landscape" with $MS=4.35$ and $MS=4.33$ respectively. Moreover, the element with the lowest evaluation was "Free camping (camping in a non-campsite environment)" with an $MS < 2.00$.

K-means cluster analysis- profile of clusters

Exploratory Factor (Principle Component Analysis) with varimax rotation was performed on the 42 destination image items. The analysis produced 12 factors ($KMO=0.656$; $BTS=2531.862$; $df=861$; $p=0.000$), explaining 69.42% of Total Variance (TV). The number of factors was defined with the >1.0 eigenvalue criteria (Kaiser, 1958) and all factor loadings exceeded the 0.4 loading criteria (Ford et al., 1986).

Table 1 presents the produced factors, their eigenvalues, total variance explained (TVE); Cronbach α of the factor, and Mean Factor Score (MFS). Total Cronbach α of the scale was $\alpha=0.828$, and as one may observe, three factors resulted in low reliability (<0.50).

a/a factor	Factor name	N of items	TVE (%)	Eigenvalue	Cronbach a	MFS
1st	Infrastructure	8	11.34	6.95	0.861	4.10 (0.66)
2nd	Sightseeing	6	8.30	4.46	0.838	3.28 (0.76)
3rd	Exciting destination	3	6.52	3.28	0.827	4.23 (0.65)
4th	Famous and "in" place	3	6.36	2.19	0.774	2.74 (0.95)
5th	Nightlife and safety at night	4	5.83	2.14	0.638	3.59 (0.79)
6th	Food and Restaurants	2	5.20	1.97	0.821	3.96 (0.83)
7th	3s: Sea, Sun, and Sand	4	5.18	1.71	0.661	3.96 (0.63)
8th	Value for money	2	5.18	1.47	0.857	3.98 (0.91)
9th	Activities	3	4.11	1.44	0.468	3.54 (0.71)
10th	Family destination	2	4.02	1.32	0.545	2.78 (0.97)
11th	Locals, festivals, and free camping	3	3.98	1.17	0.395	2.89 (0.75)
12th	Exotic place	2	3.41	1.06	0.308	3.47 (0.80)

Table 1. *Derived factors of perceived important destination image components*

The 12 dimensions extracted through factor analysis were handled as new variables. K-means cluster analysis was performed to group the cohort of Gen Z-ers with similar perceptions of the destination image components. Table 2 presents the derived clusters, the number of subjects in each group, and the Final Cluster Centers (FCC). Additionally, ANOVA tests revealed that all clusters are statistically different in all cases (F-value and significance in Table 2).

a/a factor	Factor name	Cl.1 N=52	Cl.2 N=146	Cl.3 N=60	F	Sig.
1st	Infrastructure	4.47	4.24	3.45	57.542	0.000
2nd	Sightseeing	3.35	3.42	2.86	13.050	0.000
3rd	Exciting destination	4.53	4.27	3.88	16.052	0.000
4th	Famous and "in" place	3.29	2.43	3.03	23.092	0.000
5th	Nightlife and safety at night	4.38	3.22	3.82	66.324	0.000
6th	Food and Restaurants	4.60	4.01	3.28	48.490	0.000
7th	3S: Sea, Sun and Sand	4.54	3.86	3.69	38.167	0.000
8th	Value for money	4.56	4.21	2.93	93.544	0.000
9th	Activities	4.10	3.46	3.26	25.911	0.000
10th	Family destination	2.13	3.25	2.20	55.454	0.000
11th	Locals, festivals, and free camping	3.21	2.81	2.82	5.923	0.003
12th	Quiet/calm place	3.38	3.63	3.17	7.897	0.000

Table 2. *Gen Z-ers segmentation based on perceived importance of destination image components*

Chi-square and crosstabulation tests were used to observe if the three clusters and the Generation Z cohorts' socioeconomic and demographic characteristics (gender, age, income, profession, number of family members working and fired) have a statistically significant difference. Results revealed that five socioeconomic and demographic characteristics of participants produced statistically significant differences. These are 1) gender ($\chi^2=13.380$; $p=0.001$); 2) profession ($\chi^2=23.879$; $p=0.002$); 3) number of family members producing an income ($\chi^2_{10}=27.323$; $p=0.002$); 4) number of family members fired after the memorandum of understanding ($\chi^2_6=19.391$; $p=0.004$); and 5) income ($\chi^2_{10}=22.743$; $p=0.012$). On the other hand, three as expected did not 1) age ($\chi^2_8=10.502$; $p=0.232$); marital status ($\chi^2_2=6.652$; $p=0.088$); and education ($\chi^2_6=8.765$; $p=0.187$).

Cluster N.1 "Adventurous and economic rational Gen Z-ers". The 1st group is the most demanding since 7 out of 12 factors have MFS>4.00. This segment considers that a favorable destination image consists of the following dimensions: Infrastructure; Exciting destination; Nightlife and safety at night; Food and Restaurants; 3S: Sea, Sun and Sand; Value for money; and Activities. For a favorable destination image four dimensions are indifferent to them, i.e., sightseeing; famous or "in" place; "quiet/calm place"; and "Locals, festivals, and free camping". Lastly, one dimension is not at all important for them for a destination to be evaluated as favorable, i.e., "Family destination". This segment consists of women (69.2%); 20 years old (34.6%), all single (100.0%); secondary education (80.8%), university students (88.5%), with a family net monthly income up to 1000.00 euros (46.1%). This segment has the least number of family members producing income as compared to the other segments, with one family member producing an income (42.3%), while it has the biggest number of fired persons (50.0%).

Cluster N.2 "Excitement - seekers and economic rational Gen Z-ers". The 2nd group considers that a favorable destination image consists of the following four dimensions (FCC>4.00), i.e. infrastructure, visiting an exciting destination, good food, and restaurants, all with a good cost-benefit ratio. This group is also indifferent to sightseeing; if the destination is considered as famous or "in"; if it is a "quiet/calm destination"; about the locals' behavior, festivals, and free camping. They too consider unimportant a destination that is intended for families. This segment has almost equally men and women; 19 (28.8%) and 20 years old (34.2%), all single (100.0%); secondary education (81.5%), being university students (75.3%) and having the largest percentage of unemployed (17.8%). The Gen Z-ers in this group have family net monthly income being in two groups: ranging from 1000.01-1500.00 euros (25.0%) and 1500.01-2000.00 euros (31.9%). Additionally, 63.4% of the cluster has 2 or three family members producing an income and 22.5% that have at least one family member losing his/her job after May 2010 (when the memorandum of understanding was signed).

Cluster N.3 "Excitement seekers and 3S Gen Z-ers". This segment has all FCC<4.00 and >2.00. It considers that a favorable destination image consists of the following two dimensions (FCC>3.51): an exciting

destination with satisfactory and safe nightlife. The other destination image components are of indifferent importance ($MS < 3.00$ and $MS > 2.51$). One dimension is not critical at all ($MS < 2.50$): family destination.

This segment has mostly men (63.3%) and with the age groups almost equally divided (ranging from 17% to a maximum of 26%). This segment is the one that has divorced participants (3.3%). Participants have a secondary education (80.0%) and are in majority university students (80.0%), while this cluster has the largest percentage of public employees (10.0%). The Gen Z-ers in this group have family net monthly income being in two groups: ranging between 600.01-1000.00 euros (30.0%) and 1000.01-1500.00 euros (26.7%), with 60.0% and 3.3% having one member and five family members respectively producing an income.

DISCUSSION-CONCLUSION

This paper had as its aim to segment Gen Zers ($N=258$) based on destination image components. In order this to be achieved a 42-item question referring to the components producing a favorable destination image was rated. The elements with the highest rating were "exciting destination" and is/has "beautiful place/landscape". Regarding segmentation based on these ratings, K-means cluster analysis with preceding factor analysis (PCA with varimax rotation) produced three groups of the Greek Generation Z cohort. ANOVA tests (from cluster analysis) revealed that in all cases the three groups are statistically different as regards the 12 dimensions cluster analyzed and examined. Lastly, chi-square and crosstabulation test, revealed the socioeconomic and demographic synthesis of each group.

The above findings are partially consistent with previous findings regarding destination image and the Generation Z cohort. Qi and Leung (2018) found that for the Chinese generation Z cohort important components of a destination was the "natural resources" and "natural environment" dimensions, while they rated as the least important the "Leisure and recreation information" dimension.

It is crucial for destination marketing managers to be knowledgeable of the variables that consist of a favorable image for future tourists and to adjust their image accordingly. These findings are very valuable for destination marketers since if they want to target this market, they have to focus on the desired by them elements of the destination and emphasize upon them during their communication campaign. Thus, the findings of this research can help destination marketing managers as well as the local tourist authorities in designing and implementing suitable communication strategies for targeting potential tourists of the Generation Z cohort.

LIMITATIONS - DIRECTIONS FOR FURTHER RESEARCH

This research has some inevitable limitations which could generate guidelines for future research. 1) Forty-two items of destination image components were rated, which arose from the literature review and the qualitative study. Though, other variables could be of importance that are not included in the questionnaire. 2) It focused on one Greek generational cohort, i.e., the Generation Z. 3) A non-probability sampling method was employed for data collection, being restrictive of generalizability of findings. 4) The sample obtained was quite small, though adequate for the study as well as for the statistical analysis implemented.

Even if this research has the limitations mentioned, it is substantial because it provides with an understanding of tourist behavior and destination image perception of a generational cohort that is understudied.

ABSTRACT

The aim of this study is to present a Quality Function Deployment (QFD) decision framework that recognizes the interrelationship between sustainable service design decisions and supplier evaluation and selection decisions and lines up the efforts of all members of a tourism supply chain to create common value, setting the foundation for sustainable development. By taking into consideration service quality and sustainability criteria, the proposed framework facilitates decision-making within the context of Sustainable Supply Chain Management. Towards this end, the proposed QFD framework is deployed in 4 phases (Houses of Quality – HOQ) and works on two levels. At first level it facilitates the sustainable design of tourism services, by incorporating social and environmental sustainability considerations as well as quality parameters, accrued from the “Voice of the Customer”, while at a second level it provides guidance on supplier evaluation and selection procedures. Moreover, an extension of QFD method based on Decision Analysis and Multicriteria methods, the QFD-LP-GW-Fuzzy AHP methodological approach, is employed within the proposed decision framework to enhance the effectiveness of the traditional QFD method in capturing and prioritizing uncertain and subjective judgments. Results from the implementation of the QFD framework, concerning the realization of the first phase (first HOQ), are presented.

Keywords: QFD, Sustainability, Tourism Supply Chains, QFD-LP-GW-Fuzzy AHP

INTRODUCTION

The key to create value for customers and other stakeholders in tourism supply chains lies in the adoption of the principles and practices of sustainability in all supply chain activities i.e. service design, procurement management, service production management, delivery-distribution management and reverse logistics management (Edgell, 2016; Sigala, 2008). The present study focuses

on sustainable service design, which encompasses the establishment of tourism experience standards and procedures that meet environmental, social and economic criteria, as well as the evaluation and selection of suppliers according to sustainability principles.

In particular, the production of sustainable services requires sustainable approaches in the design and development of services throughout their entire lifecycle, from their conception to withdrawal (Maxwell and Van der Vorst, 2003). Usually, the Triple Bottom Line context is incorporated into the design process; hence the design is constrained by environmental, social and economic considerations (Elkington, 1998). In this fashion, a balance is accomplished between environmental protection, social equity and economic prosperity of organizations. Still, traditional service requirements, like customer requirements, translated into quality parameters and technical specifications, should also be taken into account. Therefore, the aim of a sustainable service design should be the production and provision of services that satisfy both traditional service specifications and sustainability criteria.

Moreover, since, the tourism industry is a mosaic of services, provided by various tourism actors coming from lodging, dining, transportation, event management sector etc., cooperative schemes should be developed to achieve alignment of actors into common sustainability policies throughout the value chain (Budeanu, 2009). In this respect, tourism service organizations have to incorporate environmental and social values into their supplier selection policies in order to move toward sustainable development (Azadnia, Saman and Wong, 2015).

Thus, this paper proposes the incorporation of sustainability parameters into service design and supplier evaluation and selection processes, along with the alignment of sustainable service design decisions with supplier evaluation and selection decisions. More specifically, the purpose of this paper is to present a decision framework for designing tourism services and for evaluating and selecting suppliers within the context of sustainable Supply Chain Management. Toward this direction a Total Quality Management and Marketing Management tool -the Quality Function Deployment method (QFD)- combined with quantitative methods from Operational Research (such as Multicriteria Decision Analysis methods, Fuzzy Logic theory and Linear Programming) is employed (QFD-LP-GW-Fuzzy AHP). The proposed decision framework incorporates simultaneously the "Voice of the Customer" and sustainability criteria, while recognizes the interdependence between sustainable service design decisions and supplier evaluation and selection decisions and aligns them, ensuring consistency in the service design process.

THE QFD DECISION FRAMEWORK

QFD is a well-established method that offers a structured framework to design and develop high quality products/ services, by providing a mechanism for translating the "Voice of the Customer"

(WHATs) into product/ service specifications (HOWs), from conceptual design to production and provision (Akao, 1990; Dror and Sukenik, 2011; Zare Mehrjerdi, 2010). In this fashion, it focuses on what customers deem important and ensures that the final product/ service conforms to the technical specifications set by the cross-functional team (Ahmed and Amagoh, 2010). QFD is accomplished through a series of visual planning matrices, the “Houses of Quality (HOQ)”, which provide detailed guidance throughout the product/ service development process (Cohen, 1995). Like a chain, each HOQ is closely related to its preceding and following HOQ. This implies an interrelated set of steps, since the outcome of each HOQ serves as input for its succeeding HOQ in determining priorities in the subsequent design and planning efforts, embracing different aspects of design and development.

This study proposes a QFD decision framework that lines up the efforts of all members of a tourism supply chain to create common sustainable value. The particular framework is designed to provide pragmatic guidance to tourism organizations for deploying sustainable services of high quality. The required phases for the implementation of the proposed methodological framework as a supply chain management tool, aiming at improving the quality and sustainability of services provided by hotels is illustrated in Figure 1. Specifically, a QFD planning process, comprising four interrelated phases -HOQs- to accommodate service design and supplier evaluation and selection decisions, is developed. In this respect, the proposed QFD framework begins with obtaining the “Voice of the Customer” regarding hotel selection criteria that influence customer satisfaction. Thus, the first phase (HOQ 1) concerns the specification and ranking of customer’s criteria for selecting hotels, their translation into hotel management aspects and the prioritization of hotel management aspects in line with hotel selection criteria. It should be mentioned that selection criteria includes both traditional and sustainability criteria. In the second HOQ the ranked hotel management aspects are utilized as input data in order to identify sustainable hotel practices and estimate their priorities. In the third HOQ the specified sustainable hotel practices and their weights determine the proper supplier selection criteria. Then, the prioritized supplier selection criteria are employed to identify in the fourth HOQ the supplier that share with the hotel, common sustainability values. Essentially, the fourth HOQ serves as a supplier evaluation and selection tool. The results of completing the first HOQ are presented in the next section.

Finally, in this paper the extended QFD methodological approach developed by Kamvysi *et al.* (2014) is employed within the proposed QFD framework, integrating QFD with LP-GW-Fuzzy AHP. QFD-LP-GW-Fuzzy AHP provides a systematic procedure to capture the actual “Voice of the Customer” (WHATs) and to accurately translate it into design decisions (HOWs) (Kamvysi *et al.*, 2014). It exploits Fuzzy AHP’s strengths to handle vagueness and

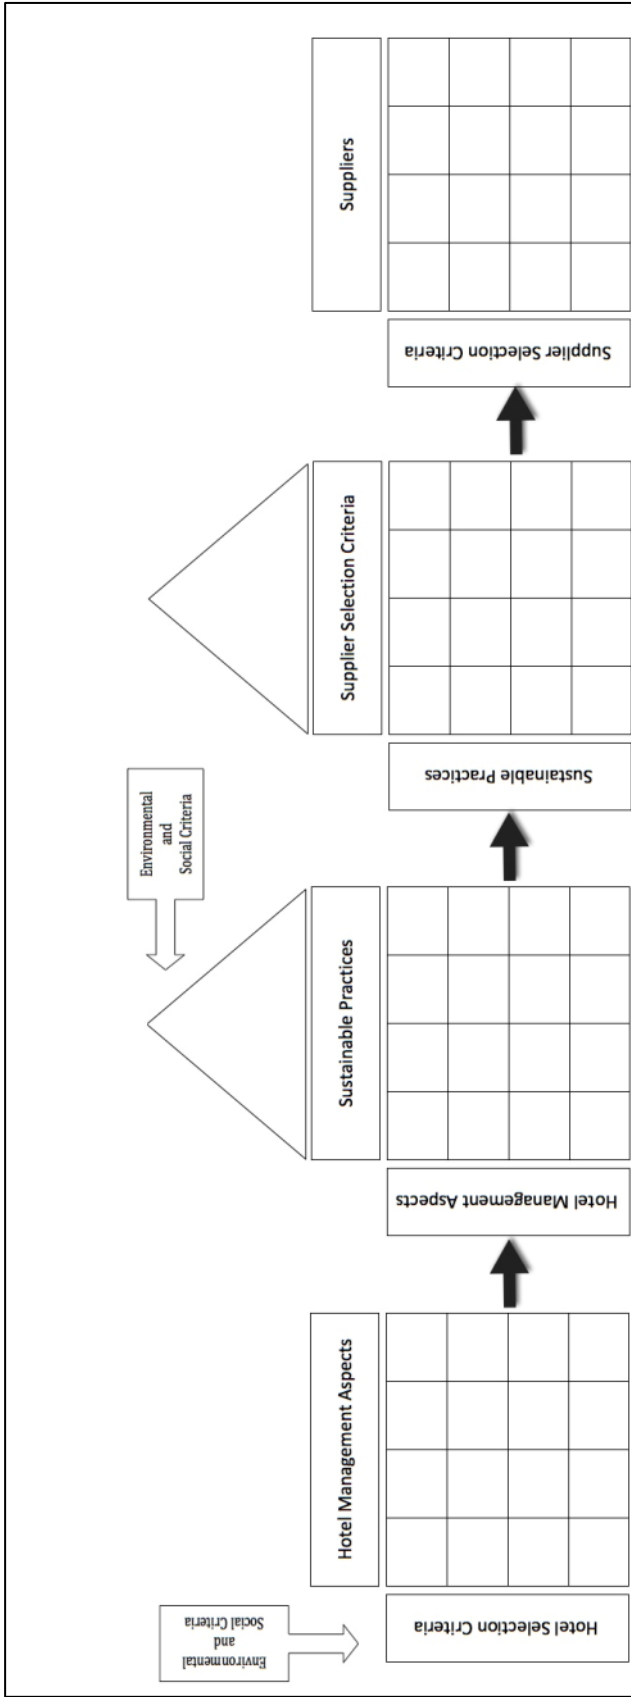

Figure 1. The proposed QFD decision framework

subjectivity of human judgments, improving the value of QFD's incoming information and subsequently capturing the true customer requirements. AHP, a versatile and widely used decision-making method (Ho, 2008), effectively supports decision-making by offering a comprehensive, systematic and rational framework to rank a set of alternatives in the presence of multiple and conflicting criteria (Saaty, 1990), while fuzzy logic fosters the integration of incomplete information, qualitative data, non-obtainable information, and partially ignorant facts into the decision-making process (Bozdag, Kahraman and Ruan, 2003). Then, the LP- GW-Fuzzy AHP utilizes the principles of linear programming to generate weights of alternatives using the values from AHP comparison matrices, replacing the eigenvalue method (EV) in the computation of the priority vector of "HOWs" and improving the hitherto inaccurate prioritization of "HOWs". A key feature of the LP-GW-Fuzzy AHP methodology is that it solves only one LP model for deriving priority vectors from comparison matrices and does not require normalization of the derived weights thus avoiding rank reversal. Finally, due to the assurance regions constraints of the LP model, LP-GW-Fuzzy AHP takes advantage of all available information from comparison matrices and estimates final weights that are consistent with decision makers' subjective judgments (Wang, Chin and Poon, 2008).

THE PROCESS FOR COMPLETING THE FIRST HOQ

Following the proposed QFD decision framework, the first HOQ links the "Voice of the Customer" with hotel management decisions, taking both customers' preferences and hotel managers' knowledge and judgments into account. Particularly, it involves the identification and ranking of hotel selection criteria (WHATs) and subsequently the prioritization of hotel management aspects (HOWs) in accordance with the specified hotel selection criteria. This first phase can be perceived as the primary driver of the entire QFD framework, since capturing what customers want is the most important step in designing sustainable services of high quality.

The hotel selection criteria, including environmental and social responsibility, that influence customer satisfaction, are obtained from an extensive review of the relevant literature and from hotel booking and review websites (Li, Ye and Law, 2013; Millar, Mayer and Baloglu, 2012; Qu, Ryan and Chu, 2000; Ramanathan, 2012; Ramanathan and Ramanathan, 2011; Zhou *et al.*, 2014). Affinity diagrams were utilized to group selection criteria and as a result seven categories were obtained: Room/ Hotel amenities, Location, Conformance-Encounter Quality, Quality and Variety of Food & Beverages, Price and Perceived Value, Environmental Responsibility and Social Responsibility. Whereas a focus group consisted of experts helped to classify hotel management aspects into five main categories, namely, Physical-Property Management, Food and Beverages Management, People Management, Process Management and Communication Management.

In order to estimate the priorities of the hotel selection criteria a survey was conducted. The survey instrument was a self-administered questionnaire utilizing short, clear and easy to understand questions. Data was collected from a total of 169 respondents, who had selected a 3, 4, and 5 star hotel during the time of their travel. The surveyed travelers had spent at least two nights in a hotel the previous twelve months. The first section of the questionnaire contained the demographic questions, while the second section asked the respondents to compare each pair of hotel selection criteria and to express their preferences by utilizing the usual 9-point AHP scale, being aware of its matching linguistic variables (Table 1). Then the LP-GW-Fuzzy AHP methodology was employed to obtain the priorities of the selection criteria. The analytic description of how to integrate LP-GW-Fuzzy AHP with QFD is beyond the scope of this paper.

After ranking selection criteria, a survey was carried out to fill the relationship matrix of the HOQ, which display the degree of relationship between each selection criterion and the corresponding hotel management aspect. Data were collected by conducting structured interviews with a cross-functional team of senior hotel managers. Senior managers were asked to evaluate the importance of hotel management aspects regarding selection criteria by utilizing the usual 9-point AHP scale. Finally, the LP-GW-Fuzzy AHP methodology was used to produce the relative and final weights of hotel management aspects.

Linguistic variables	AHP Scale
Equally important	1
Intermediate	2
Moderately more important	3
Intermediate	4
Strongly more important	5

Extremely more important	9

Table 1. AHP scale

RESULTS

LP-GW-Fuzzy AHP produced a priority score for each of the hotel selection criteria, making it possible to rank them in order of importance. The results show that the most important criterion is "Price and Perceived Value", with a percentage priority of 24.40%, followed by "Room/ Hotel Amenities", with a priority of 19.58% (Table 2). The third selection criterion in ranking is "Location", with a percentage priority of 18.87%. "Conformance-Encounter Quality" follows with a priority of

17.20%. The Environmental and Social Responsibility criteria were assigned relative low importances among the respondents, whereas the “Quality and Variety of Food & Beverages” was found to be the criterion with the lowest preference value, at 6.38%.

Hotel Selection Criteria (WHATs)	QFD-LP-GW- Fuzzy AHP Priorities	Ranking
Price and Perceived Value	24.40%	1
Room/ Hotel Amenities	19.58%	2
Location	18.87%	3
Conformance-Encounter Quality	17.20%	4
Social Responsibility	6.93%	5
Environmental Responsibility	6.64%	6
Quality and Variety of Food & Beverages	6.38%	7

Table 2. *Priorities of hotel selection criteria and their ranking*

Hotel Management Aspects (HOWs)	QFD-LP-GW-Fuzzy AHP Final Weights	Ranking
Physical Property Management	37.67%	1
Process Management	23.12%	2
Food & Beverages Management	15.99%	3
People Management	14.41%	4
Communication Management	8.82%	5

Table 3. *Final weights of hotel management aspects and their ranking*

Relevant literature offers support to the findings. In particular, in the work of Lockyer (2005) and Caber and Albayrak (2014) “Price and Perceived Value” was also assessed as the most important criterion when choosing a hotel. Moreover, the low-preference for the criterion “Environmental Responsibility” is justified, because, according to Kasim (2004) and Yeh *et al.* (2003), customers do not take into consideration environmental criteria when deciding between hotels, even though they are more informed and aware of environmental issues. In general, a discrepancy is noticed between what customers want and what they actually decide. For example, Chia-Jung and Pei-Chun (2014) found that while tourists express their preference for luxury rooms and personal toiletries, at the same time they are willing to accept reduced service quality for the sake of environmental practices. In addition, Tilikidou and Delistavrou (2015) concluded that although tourists express their intention to stay at a green hotel, they scarcely book a room at a green hotel.

Furthermore, the completion of the relationship matrix with the relative weights of management aspects indicates that for each selection criterion there are many management aspects that could be fulfilled (Figure 2). The final weights of hotel management aspects are calculated by multiplying the priorities of hotel selection criteria with relative weights of management aspects. The derived final weights of management aspects are provided in the last row of the HOQ (Figure 2). The ranking of management aspects is displayed in Table 3.–“Physical Property Management” is found to be the aspect with the highest weight, 36.67%, indicating where to concentrate efforts first. The next two aspects in ranking are “Process Management” and “Food & Beverages Management” with priorities of 23.12% and 15.99% respectively. The remaining management aspects are classified in the following order: “People Management” (14.41%) and “Communication Management” (8.82%).

Hotel Selection Criteria	Hotel Selection Criteria Priorities %	Hotel Management Aspects				
		Physical Property Management	Food & Beverages Management	People Management	Process Management	Communication Management
Conformance-Encounter Quality	17.20	0.0668	0.0918	0.4045	0.3981	0.0388
Price & Perceived Value	24.40	0.4469	0.0835	0.0417	0.3436	0.0843
Room/ Hotel Amenities	19.58	0.6643	0.1016	0.0650	0.1153	0.0539
Quality & Variety of Food & Beverages	6.38	0.0403	0.6368	0.0990	0.1832	0.0408
Location	18.87	0.2779	0.2202	0.1729	0.1643	0.1647
Environmental Responsibility	6.64	0.5539	0.1954	0.0399	0.0833	0.1275
Social Responsibility	6.93	0.4946	0.1259	0.1441	0.1167	0.1186
Final weights %		37.67	15.99	14.41	23.12	8.82

CONCLUSIONS AND FURTHER RESEARCH

This paper presents work in progress on lining up tourism service design decisions with supplier evaluation and selection decisions under the umbrella of Sustainable Supply Chain Management. The novelty of this paper lies in the idea to propose a decision framework that aligns the efforts of all members of a tourism supply chain to create common value, setting the foundation for sustainable development. Having as a starting point the actual “Voice of the customer” and as ultimate goal service quality, satisfaction of both intermediate and final customers (consumer) and sustainability along the tourism supply chain, a review of the traditional sustainable service design process is achieved. In this respect, the contribution of this work is the development of a QFD decision

framework that facilitates the sustainable management of tourism supply chains by providing guidance on service design and suppliers' assessment and selection decisions through a systematic procedure that incorporates as restrictions the "Voice of the Customer" and environmental and social responsibility criteria.

Although there are numerous applications of QFD in the service sector, it has not been previously utilized for assessing and selecting suppliers in the service industry in general and in tourism in particular. In addition, a QFD methodology framework that links service design decisions with supplier rating and selection decisions is introduced for the first time. Moreover, the incorporation of sustainability criteria, like environmental and social responsibility criteria, in the process of evaluating and selecting suppliers, is not often found in the literature. Finally, the role of sustainability and sustainable supply chain management in tourism sector has not yet been studied extensively.

The future research project concerns the implementation of the proposed QFD decision framework as supply chain management tool to improve the quality and sustainability of services provided by a chosen tourism organization, strengthening its competitive position. The hotel, on which the proposed methodological framework will be applied, will be selected according to its attitude towards sustainability and sustainable Supply Chain Management.

LEARNING AS AN OUTCOME OF DYNAMIC CAPABILITIES IN CASE OF STRATEGIC RENEWAL

Karagouni, Glykeria¹; Karagiannis, Antonis²

¹University of Thessaly, Larissa, Greece

²XL furniture S.A., Larissa, Greece

ABSTRACT

According to existing literature, learning occupies several roles within the dynamic capability (DC) perspective which are far from clear, while many gaps and contradictions appear to exist between the organizational learning (OL) and the resource-based views in the case of significant changes of the organization such as the strategic renewal. The purpose of this study is to shed some more light on learning as a portion of DCs' framework and to add to the relatively little cross-fertilization of the two perspectives regarding the drivers of strategic renewal. The empirical context was provided by XLfurniture, formerly one of the leading chair manufacturers in Greece. A study of the last four decades of the life of the company and of its three efforts of strategic renewal, shows *how* utilization of XLfurniture's DCs resulted in significant learning outcomes leveraging exploration and exploitation, which are the basic learning elements according to the OL theory, and provides insights into *why* learning can be treated as an outcome of exercising DCs, explicating the importance of the learning consequence and how this may contribute to the further refinement of the existing and the creation of new capabilities. Using the extended case method, the study advances DC theory by exploring learning, a poorly -so far- addressed consequence in DC theory, confronting it with an empirical case. Besides its theoretical and empirical contribution to DC literature, the study is among the few ones to attempt some integration across the DC and OL perspectives in strategic renewal research.

A study of the last four decades of the life of the company provides rich insights of learning as a DC outcome, showing

Keywords: learning, dynamic capabilities, strategic renewal, organizational learning theory, exploration, exploitation, outcome, resource-based view, case study

INTRODUCTION

Dynamic capabilities (DCs) arguably have captured attention among scholars and managers since they are supposed to offer a route to competitive advantage under conditions of change, a vexing goal that

according to Helfat & Peteraf (2009) constitutes the virtual Holy Grail of strategic management. For more than 20 years now, DC research is evolving to a degree to be today treated as an institutionalized field of its own, although it frequently draws on related literatures such as organizational learning or evolutionary economics. Dynamic capability refers to the ability of a firm to renew itself in the face of a changing environment (Teece, et al., 1997) by changing its set of resources (Eisenhardt and Martin, 2000). Helfat et al. (2007) defined dynamic capabilities (DCs) as “the capacity of an organization to purposefully create, extend, or modify its resource base” (p. 1) in a practiced and patterned manner. Dynamic capabilities literature underscores that DCs are fundamentally concerned with change and learning (Winter, 2003). Firms revitalize, redeploy or even replace their current organizational attributes (Agarwal and Helfat, 2009), explore and learn new ways of using their core competences and even alter their competitive approaches. A distinguishing feature of the DC approach is the emphasis of DCs on strategic change which in turn necessitates insight on how organizations develop and integrate new resources and capabilities; this is where organizational learning (OL) theory comes in (Zollo and Winter, 2002).

Learning is considered a highly multifaceted phenomenon (Argote, 1999). Within the organizational learning literature, it is the capability of an organization to process knowledge, i.e., the ability to create, acquire, transfer and integrate knowledge and, also, to modify the behavior to reflect the new cognitive situation (Jerez-Gomez, et al., 2005). As identified by March (1991), the higher-level learning is typically conceptualized as involving a tension between the exploration of new learning and the exploitation of what has already been learned. OL literature refers to exploration and exploitation as significant outcomes; exploration enables the organization moving outside the current boundaries with new knowledge and practices, while exploitation facilitates the creation of mechanisms to support firms develop what has been learned through feedback (Easterby-Smith and Prieto, 2008; Zollo and Winter, 2002). Scholars have approached learning mainly as an operational process of obtaining information and converting it into knowledge (Franco & Haase, 2009) or of detecting and correcting errors (van Grinsven & Visser, 2011) while Eisenhardt & Martin (2000) suggest that learning processes enable dynamic capabilities to become more salient.

In the broader resource-based literature, learning has been considered mainly as a dimension as proposed by Teece et al., (1997) or it has been explored as a contributor to the emergence of dynamic capabilities (Zollo and Winter 2002; Birkinshaw et al. 2016). According to Schilke’s et al. (2018) systematic review of the current state of the DCs, there are two small but quite interesting streams of research; one explores learning as an antecedent of dynamic capabilities and another as a consequence of dynamic capabilities next to resource-base change. In the last case, learning includes learning outcomes, such as new knowledge-based resources, improved operational routines, a variety of new of

significantly improved activities and acquisition of new knowledge or skills (Easterby-Smith & Prieto, 2008). Within the DC perspective, such knowledge is mainly strategic, institutionalized on the non-human facets of organizations, such as organizational systems, structures, procedures, and routines (Alegre et al., 2013) while groups and teams of the organization test their applicability and incorporate the most viable in the generation of new products and processes (Nonaka and Takeuchi, 1995).

When firms transform their competitive advantages and their core capabilities to suit them, then we refer to strategic renewal (Flier et al., 2003). The resource and DC perspective describe strategic renewal as resulting from firms' efforts to reconfigure their resource bases. DCs, such as new product development (e.g. Danneels 2002), firm collaborations (Smart et al. 2007) and market sensing are then associated with strategic renewal. According to the learning perspective based on the organizational learning theory (March, 1991), strategic renewal requires organizations to explore new ways while simultaneously exploiting what they have already learned (Crossan and Berdrow, 2003). Combining the above-mentioned perspectives, the emphasis of dynamic change necessitates insight into how capabilities enable the development and integration of new resources and capabilities and it is the *very actual issue of organizational learning* (Zollo and Winter, 2002).

Strategic renewal involves changes to the 'resource patterns of business' (Stopford and Baden-Fuller 1994, p. 522), or according to Floyd and Lane (2000), the firm's core capabilities which are associated with a considerable level of turbulence. According to the behaviourist approach, learning takes place in response to changes in the environment (Crossan, Lane and White, 1999) while according to the DC stream (Teece et al. 1997), strategic or otherwise, organizational renewal is associated with environmental dynamism (Teece et al., 1997), no matter its type and density, including the context of business alteration due to various reasons and occasions (Helfat and Winter, 2011).

It is quite evident that learning occupies several roles within the DC perspective which are far from clear while many contradictions appear to exist between the learning (Crossan et al. 1999) and the resource perspective (Augier and Teece, 2009) in the case of significant changes of the organization such as the strategic renewal. The purpose of this study is therefore to shed some more light on the relationship between learning specifically as an outcome of the utilization of dynamic capabilities and to add to the relatively little cross-fertilization of the two perspectives (DC and OL) regarding the drivers of strategic renewal.

Overall, this study contributes to research on dynamic capabilities, strategic renewal and organizational learning. It is among the very first efforts to study learning as an outcome (consequence) of DCs and among the few ones to attempt some integration across the DC and OL perspectives in strategic renewal research indicating the relevant gaps in existing literature. According to Schmitt et al. (2018), so far, past strategic renewal studies have used an "either/or" (learning or resource) perspective.

For the purposes of the research, the extended case method (Yin, 1989), was used which draws on a detailed study of a case to extend current theory. The empirical context was provided by XLfurniture, formerly one of the leading chair manufacturers in Greece. The research focused on learning as an outcome of the company's DC utilization in several efforts of strategic renewal of the company.

Thus, the major contribution of the present study is its empirical support of its suggestion that under the lens of both the DC and the organizational learning perspective, the changes of the organizational structure, infrastructure, the systems and technology that underpin the organization's activities and the creation of a subsequently new learning culture (Pemberton et al., 2001) can be considered significant learning outcomes of the utilization of dynamic capabilities especially in cases of strategic renewal.

METHOD

The study relies on the extended case method which uses an in-depth historical analysis of a single firm to reconceptualize, build, and extend theory (Danneels, 2011). The extended case method thus involves constant cycling between theory and data to help provide novel accounts on DCs and strategic renewal as a response of the firm to market and technological changes over a protracted period. In our study, we focus on the market and technology sensing (Protogerou et al., 2012), alliancing (Schilke, 2014) and New Product Development (NPD) (Danneels, 2008) dynamic capabilities within XLfurniture over multiple years. The time span extends to almost four decades using both interviews and secondary data. Time is a very important consideration in DC research, given that change is the essence of the phenomenon. The focal period of interest is 1980 to 2018. The study period starts in 1980 when the company changed from a plain regional woodworking company to a chair and table production organization addressing the national market. It continues with a strategic renewal in 2003 when the company turns from craft to mass production and internationalization (times of prosperity), another one in 2012 to face the severe socioeconomic crisis in Greece (turbulent times) as an effort to survive.

The case study was developed together with the current CEO of the company Mr Karagiannis who is the second-generation entrepreneur of XLfurniture. With the help of the former generation (two partners) and based on corporate and public archives (e.g. administrative documents, reports, internet and press news), an event timeline was constructed. Extensive archival data on the wood and furniture industry in general, market and technology trends and the socio-economic environment in Greece and Europe was also collected. In addition, information was triangulated with information from other interviews where possible (such as customers, collaborators and member of the industry chamber). The study started with the dynamic capabilities' literature, which after confrontation with the case, led into literatures about distinct areas such as strategic renewal, and organizational learning.

A BRIEF HISTORY OF XLFURNITURE

The company was established in 1964 in the city of Larissa (Greece) as a small woodworking business by three friends. It occupied a space of only 100m² and produced custom-made furniture under the name of “Xyloviotechniki” for the local market as one of the many wood-workshop that manufacture custom-made furniture. In 1968 it is relocated in a new space of 500m² and starts manufacturing woodworks for outfitting buildings within the region of Thessaly. In 1980 the management sees a strategic direction that had the potential to determine their long-term competitiveness and performs a strategic renewal: it turns to the systemized production of wooden seats and tables instead of custom-made furniture removing and replacing key functions in the firm. One of the three partners left the company due to the risk of the new investments in chair making machinery, production systemization, as well as of management methods to achieve the volumes needed to cover the national market. The company is relocated in new privately-owned installations of 1500m² under a new name “XYLOVIOTECHNIKI KARAGIANNIS-KERMELIOTIS O.E.” which reflected the local business culture of the 80s; the names of the two partners and the area of expertise. The decade of the 90s signals the rapid growth of Xyloviotechniki. The philosophy of continuous technological renewal and market sensing supports incremental changes such as new equipment in a space of 6500m² and development of processes and company departments such as the sales and the economic department that make the company the leader at national level.

That was the time for the next strategic renewal of the firm; in 2003, one year before the Olympic games in Athens, Greece enjoys prosperity and markets are promising. The two partners invest in mass production, brand strategy and internationalization starting with the commercial aspects (the first sales were in Cyprus and Germany). They transform the plant into a modern fully equipped one of 10.000m² with cutting edge technology and adapt “European successful business models” as father Mr Karagiannis narrates. To address the global markets, they participate at international trade shows and start working on network and channel creation. They also change the company’s name since the eponymous company name “gave the perception that the business was a two-persons show! Times changed! First, we wanted locals to trust us! It was not the same for going international. The name should be easy to spell no matter if the client was an Arab or a German!” Mr Karagiannis Senior mentioned. Furthermore, the new name should be more general than just chairs and tables, exercising some foresight about how the business might expand. It took almost four years and a significant amount of money to change the name to XLFurniture.

However, in 2008 the financial crisis hits Greece as well as the rest of the world. It was the beginning of the long-lasting Greek government-debt crisis, also known as the Greek Depression. Widely known in the country as The Crisis, it reached the populace as a series of sudden reforms and austerity measures

that led to impoverishment and loss of income and property. Even today, the Greek economy suffers the longest recession of any advanced capitalist economy, overtaking the US Great Depression. Between 2008 and 2016 more than 50% of the Greek furniture producers bankrupt (IOBE, 2017) while the survivors downsize and face severe economic problems. In 2010, XLfurniture started to lose money; the beginning of three difficult years. Within the crisis, and with the company running deeply in the red, a new strategic renewal takes place in 2012. The company approaches IKEA and discusses the option to become a major supplier in Greece. "We faced liquidity problems mostly due to the instability of the Greek markets. IKEA was an attractive customer. On the other hand, we were aware of the risk; IKEA would exclude all our small customers. The decision was not easy." remembers Mr Karagiannis. The company fulfilled IKEA's requirements and becomes the major customer of XLfurniture. "The partnership was fruitful for both parts."

In the beginning of 2017 the company enters the market of contract woodworking projects and bespoke furniture building a new competitive advantage on affordable flexibility to cater for any commercial project of any size. The strategy is to build on the strength of the design and technological capabilities of the XLfurniture and its channels while sourcing products from third-party manufacturers. "Market signals indicate emerging markets of contract woodworking in our islands, and abroad; for example, in Cyprus, UAE and Germany. We have significant equipment to produce parts in massive ways – pay attention please! I said parts, wooden parts! Not chairs or tables. We can use the valuable knowledge, skills and capabilities that IKEA taught us. It is a promising area which can further enable profitable leverages of all our resources." In the beginning of 2019, the company survives and opens new market segments in several countries. "Excelling in the production of wooden parts as well as our capabilities such as networking, subcontracting and new product development supports our vision to turn to a variety of wooden products besides furniture. We have already produced parts of wooden bicycles and toys. Smart products are already in our NPD department."

FINDINGS

The above story shows that XLfurniture attempted strategic renewal of different types and for different reasons. In sum, the company can be viewed as having four basic historical periods which link to its strategic renewals and the subsequent transformations and reconfigurations of its capabilities: in 1980, the firm turned from a small handicraft woodworking workshop to an SME with a fully equipped plant factory which was gradually improving through a series of regular adaptations to changes (*the industrialization years* - 23 years); in 2003 the company went international with subsequent changes in strategy, resources and capabilities (*the internationalization years* – 10 years); and the *IKEA - alliance years* (5 years). It is quite interesting to observe that the periods between strategic renewals are getting

gradually shorter and almost following a geometric progress ($l=0.5$). This indicates the role and significance of the environmental dynamism; the first 23 years are characterized by stability and slow paces of technology changes while the years especially after 2007 are the crisis and recession years; the environment became very hostile and turbulent while market and technology change rates accelerated. The company did not attempt a major transition into other categories or industries (cf. Danneels, 2002) to secure survival and growth within the vulnerable Greek entrepreneurial landscape. Findings regard the forms and types of strategic renewal, the DCs at the distinct periods of the company's life, and the types of learning as an outcome of the DCs' utilization. The data indicate a gradual development of the dynamic capabilities as well as their further refinement between strategic renewals. Furthermore, they support the suggestion that DCs are fundamentally concerned with change and learning (Winter, 2003).

First Strategic Renewal (the industrialization years)

For several decades (almost until 2000), slow growth and relative stability characterized the wood and furniture industry, with a small percentage of imported furniture (mainly Italian), new products introduced on a regular basis, and with only gradual changes in consumer demands. On the other hand, the decade of 90s and early 00s enjoys prosperity, with high levels of profitability, thanks to the protected domestic market and relatively benign market conditions. The strategic transformation of 1980 was brought about through the removal of key functions of the former woodworking business at operational level (technology towards chair and table making is completely different than general furniture manufacturing), and markets (individuals become secondary target groups with corporate customers to become the primary one). Additionally, incremental renewal occurred through a series of regular adaptations to changes such as the acquisition of new equipment, the implementation of routines and the advanced administrative management that made the company a leader at national level.

During these years of stability and prosperity, the company uses the linear model of production replicating existing designs of products to significant volumes. "We had a small number of codes. People and especially companies were not interested in variety then." Consequently, there was no NPD capability while no types of alliances were mentioned. However, the two partners recall their visits at national shows to gather market information as well as their informal ways of watching national competitors. Furthermore, they would keep long-lasting relationships with the big customers who would further inform them on offers of their rivals. Best information would be retrieved during a dinner with the client. The two partners had further a very good sense of technology. In order to build the industrial building and the chair / table plant, they are almost obliged to learn a lot about the relating technology. The philosophy of continuous technological renewal, as mentioned above advanced technology sensing further.

This first strategic renewal followed by incremental renewals for more than 20 years establishes XLfurniture as a chair making leader at national level. During this period, technology and market sensing are gradually developed: investments in the systemized industrialized production of wooden seats and tables are essentially investments in exploitation. The company had developed significant technical capabilities that leveraged its knowledge of woodworking. It is a classic example of Levinthal and March's (1993) definition of exploitation as 'the use and development of things already known'. Learning as an outcome of technology and market sensing can be also viewed as knowledge exploration in Levinthal and March's (1993) definition of exploration as 'the pursuit of new knowledge of things that might come to be known'. Moving from craft to industrial production requires knowledge combinations from multiple technical disciplines such as production systemization and introduction of management methods.

For the company in the 90s, the temptation to focus resources and efforts on exploitation was dominant. Market and -mainly - technology DCs target learning outcomes, such as new knowledge-based resources, new information and communication systems, improved operational routines, a variety of new or significantly improved activities and acquisition of new knowledge or skills (Table 1). The creation of the sales and economic departments are results of this learning outcome including the set of elementary management principles which was an innovation for the furniture sector for the domestic market. By 2000, the company has adopted and developed principles of assembly-line manufacturing orientation, and big-series production, principles of management and leadership investing in technology, standardization of production and skilled labour and, thus, turning from a craft-based firm to volume producer.

Second Strategic Renewal (the internationalization years)

At the start of the second period, in 2003, one year before the Olympic games in Athens, Greece enjoys prosperity and markets are promising. However, the invasion of Chinese products in 2004 and the increasing globalization of the furniture industry resulted in entirely new challenges for the national market, with consumers increasingly evaluating products in terms of cost and early delivery rather than quality and credibility alone. Having received the signs of pressure in domestic market, XLfurniture attempts a proactive punctuated change, a new transformation of its core capabilities, breaking its path dependence to ensure its long-term survival. The final market requires chairs to produce new models faster and with a better quality/price ratio against the high labour cost (e.g. compared to China or Slovakia). XLfurniture develops its own sophisticated balance of exploration and exploitation dimensions within the firm: transformation of both technology- and market-related resources and capabilities, automation, New Product Development (NPD) capability, brand building, development of a capability in collaboration with other firms, and internationalization.

Investing in automation, the firm improves further the technological sensing capability which can be considered a significant aspect of exploitation of both resources and capabilities. Standardization of production was related to minimization of costs, advances in production and logistics management, an introduction to waste reduction and safety issues. Indicatively, the successful introduction and further development of Computer Integrated Manufacturing (CIM, which combines Computer Assisted Manufacturing (CAM) and Computerised Numerical Control (CNC) machines) can be considered a significant both exploration and exploitation learning outcome of technology sensing dynamic capability.

In parallel, the company starts thinking on the development of new products. The entrepreneurs make their first contacts with the Wood and Furniture Design and Technology Department (WFDT); they hire two furniture designers and develop NPD processes including market research, market segmentation, pilot design and consumer tests. Much new knowledge is generated at this stage. XLfurniture learns how to sense changing tastes, emerging needs, competitors' innovative products and their novel approaches at global level. They further become sensitive in the emerging trends such as globalization, ergonomics, functionality, eco-issues and mass customization. Competing with the prices of Asian (mainly Chinese) imports, the company advanced design and use of novel materials as the core means of differentiating their products, changing their competitive approach to counterbalance the price advantage of the Asian or IKEA-type products. This means new knowledge too: from function to form, from material to color and finishing, from aesthetics to functionality.

In order to cope with the difficulties, XLfurniture develops constant collaboration with the WFDT Department on several issues such as new designs and quality controls in the certified laboratory as well as periodical ones with external designers. Its new designs lead to bigger market acceptance and a rise in profits. NPD DC development leads to other types of collaboration, too; the firm works closely with suppliers of new materials and technology and soon they turn to foreign suppliers for more advanced options. Utilization of NPD dynamic capability has significant learning exploration consequences; XLfurniture starts moving outside its current boundaries with new knowledge and practices and feels confident to get out of the national borders. NPD becomes one of the core mechanisms by which the firm creates, integrates, recombines and sheds its resources. Additionally, the firm developed a capability in managing collaborations and starts creating the alliancing dynamic capability which can be considered a significant exploration outcome (McNamara and Baden-Fuller, 1999).

Learning how to develop a collaboration with a foreign company, XLfurniture moved on from simple international sourcing to exporting and distribution. To address the global markets, they participate at international trade shows and start working on network and channel creation. This further leads to the

development of advanced ICT solutions and the search for, and adoption of more mature purchasing and distribution methods. XL furniture develops the vision to become a leading export power. In this context, the company develops a transnational network and enters the markets of both developing and industrialized nations such as Cyprus, Balkans, Sweden, Germany, Holland, England, Belgium, Dubai, Japan, USA and Australia. The combination of NPD and internationalization created further exploration outcomes related to the facilitation of the organization to move outside the current boundaries by brand development, while the relevant exploitation outcomes are related to the creation of the necessary mechanisms to add value to the products (Daneels, 2011). Brand building took almost four years and it was related to development of a shared culture across the firm.

In this period, exploitation learning can be considered mainly as an outcome of the market and technology sensing DCs utilization and experience. In the same vein, exploration learning appears to be the consequence of the newly developed NPD and alliancing DCs' utilization. It appears that learning orientation becomes a core outcome of all DCs utilization at this phase of the company: the chance to learn becomes an important criterion in the company's effort to enter new markets. The company - almost unintentionally- develops informal routines of learning and mastering new knowledge and skills by both exploitation of existing resources and capabilities as well as by exploration advancing its knowledge sources. Collaborative ties had been formed with academia and several suppliers and these ties were viewed as central to the future of the firm. The firm develops a learning culture, based upon a clear and shared vision, questioning existing practice on a permanent basis. Furthermore, the employees are empowered to participate actively in proposing changes and ideas.

Third Strategic Renewal (the IKEA years)

The long-lasting severe Greek recession places further pressure on XL-furniture to address its poor financial performance. According to Huff, Huff and Thomas (1992) shocks are needed to engineer change; with significant losses and liquidity problems, the management decides a reactive strategic renewal. Discussions with IKEA took two years including the selection period which lasted almost a year. "We were the only furniture company in Greece mapped by IKEA. It was actually IKEA's mapping report that made us think of this alternative". IKEA's policy consists of a broad spectrum of criteria, including: price, capacity, access to raw material, performance, reliability, financial situation, attitudes, management style, and the potential to work with IKEA on a long-term basis, in addition to the criteria within IWAY and CoC. XLfurniture fulfilled the whole spectrum and delivered the first order in late 2013.

Collaboration with IKEA appears indeed to be a turning point in XLfurniture's history. The firm improves and advances its dynamic capabilities, enabling the development and integration of new resources and capabilities and indicating the very actual issue of organizational learning (Zollo and

Winter, 2002). DCs support organizational change and result to a combination of exploration and exploitation; market and technology sensing and NPD capabilities facilitate the development and further refinement of mechanisms to support what had been learned through feedback during the former strategic renewal: "IKEA's strategy gradually upgraded us in terms of production and technological capabilities, such as formal control processes over product quality, cost development and performance standards" (IWAY). A major issue is the fact that due to IKEA, the company introduced the learning routines. "It was only then that we realized the importance of formal processes and learning. And it was the very first time that we came across auditing and auditing reports".

A significant issue was the upgrade of the company's technological capabilities through establishing business relations and several kinds of technological support in regard of new product and process technologies. Upgrade regarded the operational capabilities, including the basic manufacturing skills, establishment of quality control procedures, inclusion of employees on sharing common experiences, as well as maintenance and procurement capacities. Additionally, technology sensing became more advanced in regard of more organized expansion of capacity, acquisition and integration of external technologies and relevant skills and innovative capabilities. The major outcome of the utilization of technology sensing was according to Mr Karagiannis "technology learning".

NPD and design activity became a well-defined and disciplined process. "We are proud to say that we can design for IKEA's free range - the limited edition (not a part of regular collection) products which IKEA introduces in its collection for exclusivity in the ongoing collection. We contact initial research, public survey and analyses. We also learned that it is better to devote time in specifying manufacturing detail planning than trying to fix things when producing!" XLfurniture appears to revitalize and even replace their current organizational attributes, exploring and learning new ways of using their core competences. The firm developed routines to observe and adopt the best practices in its sector and change practices based on customer (IKEA) feedback. Exploitation of former learning from exercising NPD and sensing DCs provides an excellent framework for the exploration of new knowledge. The ability to design for IKEA led to a regular mapping of the consequences of changing market demand in terms of new products and services and of the changing shifts in the market.

However, the major changes appear in the learning outcomes from the utilization of the alliancing dynamic capability (ADC) which are of both exploitative and explorative nature. Collaboration with IKEA initiated a process of information and knowledge interaction creating a basis for learning. Indicatively, XLfurniture had to unlearn and learn several patterns and make various changes such as its decision-making for the IKEA projects; the project team sometimes needed to be ratified by several layers of management. This initially created some nagging and slowed the project, however it offered excellent opportunities to learn the management of alliances with large firms. "It was only then that we

realized the importance of learning and communication”, says Mr Karagiannis. Supported by IKEA, the firm develops courses, training programs and other forms of communication; for example, information about the IKEA standards or courses for employees in connection with IWAY updates. It is interesting to highlight the significance of learning as an outcome as it is considered a way to improve the quality of knowledge and skills. Indicatively, a collaboration with the WFDT Department in the development of smart furniture for disabled people commercially failed; however, it was treated as a source of knowledge which could pay off later.

The company does not rest in IKEA’s initiatives. It develops its own platforms and training system: “We realized that our own employees did not have a common language, they did not share our vision and our values, there was no common frame of reference.” It can be therefore assumed that XLfurniture learned the need of establishing its own organizational culture favorable for learning and communication, besides the establishment of routines and processes. The developing culture is based upon a clear and shared vision, within which both individual and organizational learning and knowledge are valued highly. Furthermore, existing practice is always questioned, and this results mainly from the audits established by IKEA. Experimentation with new approaches is encouraged, since the company designs “free range” products for the markets of Germany, Russia, Australia and Japan. Towards this direction and after discussions with IKEA, the company decided last year to integrate sustainability values including information and training as well as building knowledge on sustainability issues.

Learning the management of alliances supported the firm to recognize and learn the gaps in its own knowledge bases, stimulating the managerial processes of both exploration and exploitation. In this vein, the alliancing DC introduced a procedure for mapping supply chains’ strategies and tools. Furthermore, the learning of developing collaboration and dialogue with external actors became fundamental for the learning process since these actors were considered significant sources of knowledge in their own areas, strengthening the networking capability, subcontracting and participation in several types of collaborations. “We adopted several forms of communication, such as technical descriptions and instructions and we produced our own specifications of demands, as well as other code and control documents”.

The management initiated a learning process to obtain closer integration with downstream activities and better control its distribution channels. The process includes ways to map, work with and control subcontractors and other partners, and this facilitates the company’s decision to enter another segment of the market. The objective is to enlarge their market share and provide their customers with supplementary services based on learning experience, an improved image and the reputational benefits of working with IKEA. New strategic alliances such as subcontracting (outsourcing), research and

development consortiums, innovation or project-based networks, clusters, memorandums of understanding, and similar are now reachable and achievable including new and current partners. However, this ability to form new or additional alliances is a form of exploitation Lavie and Rosenkopf (2006), since these relationships enable the extension of a firm's current knowledge base.

Learning outcomes		
1st strategic renewal	2nd strategic renewal	3rd strategic renewal
Elementary Management & leadership principles Information and communicational systems Technological capabilities Brand culture establishment Acquisition of new skills and new knowledge Principles of assembly-line manufacturing orientation, and big-series production, Technology, standardization of production and skilled labour	Management and leadership principles Learning Culture (informal routines) Knowledge, information and communicational systems (ICT) Technological capabilities Quality processes (informal) Brand culture establishment First steps in the creation of an organizational learning culture (Creation of a vision, Employee involvement, Quality vision) Acquisition of new skills and new knowledge Standardization Automation – CIM (CAD-CAM) New Product Development processes Design capability Emerging capability in collaboration Internationalization	“Technology learning” Alliancing dynamic capability Training & education: On-going training in QWAY, IWAY electronic communication systems management Improved operational capabilities: Quality systems (QWAY), CSR-programs (IWAY), Production planning, maintenance, Labour standards, Environmental policies Improved adaptive capability: Radically new product technologies to IKEA, Adapted and new products to existing customers, Adapted and new products to new customers Improved innovative capabilities: Generation of innovative product concepts, New own-designed products for local customers, New own-designed products for the export market Technological and managerial capabilities Advanced Management systems and leadership principles Learning Culture (on-going training) Knowledge, information and communicational systems, Organizational learning culture: clear and shared vision, employee involvement, Quality principles and procedures Acquisition of new skills and new knowledge Formal communication forms (e.g. technical descriptions and instructions, code and control documents) Performance measurement & reporting

Table 1. *Learning outcomes*

For almost five years, IKEA is the major customer of XLfurniture absorbing 70% of its production. Working with IKEA meant adapting to a number of new management systems and new routines, experiment with new business models while also continuing to work with the old models, and this has created organizational and managerial challenges while DCs development and utilization has resulted in several learning outcomes. In 2017, the company reconfigured its core capabilities, with a strong emphasis on enhancing productivity, flexibility and administrative efficiency. The firm turned also to the market of contract woodworking projects and bespoke furniture for residential, business and commercial buildings and interior-exterior spaces taking advantage of the emerging needs of such products in Cyprus, its strong alliancing capability, its core competencies as well as its former visibility in Cyprus. The strategy is to build on the strength of the design and technological capabilities of the

XLfurniture and its channels while sourcing products from third-party manufacturers (an ADC learning outcome). “Market signals indicate emerging markets of contract woodworking in our islands, and abroad; for example, in Cyprus, UAE and Germany. We have significant equipment to produce parts in massive ways – pay attention! I said parts, wooden parts! Not chairs or tables. We can use the valuable knowledge, skills and capabilities that IKEA taught us. It is a promising area which can further enable profitable leverages of all our resources.”

In the beginning of 2019, the company survives and opens new market segments in several countries. “Excelling in the production of wooden parts as well as our capabilities such as networking, subcontracting and new product development supports our vision to turn to wood-based novelty. We have already produced parts of wooden bicycles and toys.” Furthermore, Mr Karagiannis today refocuses the organization once more on “shaping the future,” resulting in a wave of innovations such as smart furniture and circular-economy based solutions.

DISCUSSION

During almost half century, strategic renewal for XLfurniture regarded gradual transformation of its core capabilities associated with competitive advantage with several implications across its organizational levels and certain changes in its path dependence to ensure the firm’s long-term survival. The strategic renewals in 1980, 2003 and 2012 provoked the company to modify its products and its markets, remove and replace key functions and alter several other aspects of its strategy and organization, as seen above. Incremental proactive strategic renewals advanced further technological strategies, routines and market approaches comprising incremental adjustments to the core business of the company.

This study examined the learning outcomes of DCs utilization by XLfurniture as created and developed between successive strategic renewals purporting to advance DC theory and to support it by an empirical case. The purpose was accomplished in several ways: First, by exploring a consequence dimension of DCs besides the much-discussed performance and resource changes issues (Schlike et al., 2018), the study has provided a rich understanding of learning as a DC outcome, in other words, *how* dynamic capabilities result in learning. It has also provided insights into *why* learning can be treated as an outcome of exercising DCs explicating the importance of the learning consequence and how this may contribute to the further refinement and institutionalization of capabilities (Agarwal and Helfat, 2009).

Second, this study related the DC theory to other areas of conceptual and substantive inquiry and more precisely purported an integration across the Dynamic Capabilities and Organizational Learning perspectives in Strategic Renewal research against the “either/or” (learning or resource) perspective. It

further shows and clarifies relationships among concepts that are relevant to understanding dynamic capability but that have remained partially connected in disparate literatures, such as exploration and exploitation of the OL literature and the antecedents of strategic renewal. Therefore, the study adds in the existing efforts to build theoretical bridges across the learning and resource perspectives on strategic renewal. Although the OL literature has been identified as a candidate for further enriching the DC perspective (Zollo and Winter, 2002), there is scant empirical evidence on the relationships among the elements of organizational learning in within the dynamic capabilities' framework.

Third, it empirically grounds the still rather elusive dynamic capability theory through examining in great detail how a firm committed successful strategic renewals exploring new ways while simultaneously exploiting what already learned as consequences of its dynamic capabilities. Forth, this study advances the exploration of the temporal dynamics of strategic renewal under a DC perspective adopting a processual perspective while, according to Schmitt et al. (2018), prior empirical studies frequently took a rather static approach. The study indicates that environmental dynamism impacts the timing of strategic renewal while its DCs and the learning outcomes have a role in its performance. It appears that strong learning outcomes enable existing DCs' upgrade or new DCs creation, facilitate the questioning and breaking of old routines as well as the challenge of emerging ones, and therefore prepare the organization for a new strategic renewal which appears to be necessary even within stable environments.

Firms develop and use their dynamic capabilities to undertake specific forms of strategic renewal (Agarwal and Helfat 2009). XLfurniture started with mediocre technology sensing and rudimentary market sensing. However, these just emerging DCs resulted in significant learning outcomes leveraging exploration and exploitation. In Nonaka's view, the development of capabilities involves a process of the conversion of tacit knowledge into explicit in an effort to create new knowledge and integrate efficiently the existing one. This is evident in the XLfurniture case; there is a gradual creation of new knowledge which is then embedded and dynamically exploited. The second strategic renewal is characterized by a rapid improvement of the sensing DC and the gradual development of NPD while the alliance DC is at its very prime. However, learning outcomes of the DC utilization are significant in both exploitation and exploration terms. The firm develops a learning culture, based upon a clear and shared vision, questioning existing structures, knowledge and practice on a permanent basis. The emergence of the alliancing dynamic capability can be considered a significant exploration outcome (McNamara and Baden-Fuller, 1999) posing the question of the role of learning as DC antecedent. The third strategic renewal adds further to DC development as well as the learning outcomes. The new learning-oriented infrastructure of XLfurniture consists of systems and technology that underpin its activities, learning culture and structure. Indicatively, the investments in information and

communications technology, and networking facilitate the ability of both individuals and the organisation to augment their intelligence by accelerated learning. In this sense, the alliancing dynamic capability results in exploration engaging in upstream activities of the value chain, with the creation and learning of new knowledge and capabilities.

The evolution of the firm's strategic renewal activities supports the existence of path dependency (Kwee et al., 2011). Previous strategic renewal activities and their performance outcomes influence the firm's subsequent renewal activities (Volberda and Lewin 2003). Therefore, this study contributes also towards a better understanding of strategic renewal's complex nature, adding significant empirical evidence by offering a longer time horizon which allowed for a more fine-grained understanding of 'when', and 'why' companies perform strategic renewals and 'how' these evolve. It further adds to the conceptual work done so far to fruitfully integrate different theoretical perspectives and research contexts and namely DC, OL and strategic renewal areas.

According to population ecology, major changes to an organization's core competences are similar 'to creating a new organization' (Hannan and Freeman, 1984, p. 159). Crisis led to the collaboration with IKEA and this becomes a turning point in XLfurniture's history. The relationship between crisis and capability in organizations has not been sufficiently studied. In this study, it appears that a crisis can be a critical point in capability creation when in a nurturing environment and thus further research on the crisis issue is suggested. The study contributes also to SMEs' literature; it empirically supports suggestions on the existence of DCs in small and medium firms and especially those of a mature sector strengthening the emerging stream that argues that the DC perspective is equally appropriate for traditional, mature market contexts where established organizations need to challenge routines, question resources and reconstruct capabilities.

Despite its limitations as a single case study, some managerial implications can reasonably be drawn. First, virtually every organization faces the dilemma of engaging in strategic renewal or continue as it is no matter the consequences. According to the findings, firms that have developed and nourish DCs can easier perform successful strategic renewals. Firm executives need to identify their current DCs and assess their learning outcomes. A focal question should be addressed regarding the potential of the different exploration–exploitation combinations, since both explorative and exploitative learning processes are needed to drive strategic renewal. Further research can help researchers and practitioners clarify the DC-based learning processes that drive strategic renewal underlying firms' long-term survival and prosperity.

Summarizing, the study aimed at contributing to dynamic capability research by shedding light on how dynamic capabilities result in learning as a significant outcome within the context of strategic renewal. Under the lens of both the DC and the OL perspective, the changes of the organizational

structure, infrastructure, technology and DCs that underpin the organization's activities and the creation of a subsequently new learning culture (Pemberton et al., 2001) can be considered significant learning outcomes of the DC utilization especially in cases of strategic renewal. Researchers and practitioners alike are strongly encouraged to think more carefully about different learning outcomes since different DCs are needed in different settings, whereabouts in the organization these capabilities should be held, and how they affect organizational learning over time and not necessarily within a strategic change context. These insights on the nature of learning outcomes of dynamic capabilities may help established SMEs to improve their track record of successfully adapting to the fragile and vulnerable environment. Furthermore, these learning processes may contribute to the further refinement and institutionalization of the dynamic capabilities (Agarwal and Helfat 2009), since learning appears to hold three roles in the DC framework which are not well distinguished (Schilke et al., 2018). In this vein, the present study encourages mainly the exploration of learning as a DC antecedent as it is empirically indicated by the findings that learning outcomes support the creation of DCs; this coincides with relevant theoretical considerations such as Helfat et al.'s (2007, p. 3) suggestion that DCs 'arise from prior learning'.

The study challenges researchers of multiple areas such as the resource-based, dynamic capabilities, organizational learning theory and strategic renewal perspectives. However, further multiple case and filed research could reveal whether the XLfurniture case is unique (Yin, 1989) or one of many cases which support this study's arguments.

IS THE FUTURE GENERATION OF GREEK CONSUMERS WILLING TO INVEST IN RENEWABLE ENERGY?

Karasmanaki, Evangelia; Tsantopoulou, Georgios

Department of Forestry and Management of the Environment and Natural Resources, School of Agricultural and Forestry Sciences, Democritus University of Thrace, Orestiada, Greece

ABSTRACT

Nowadays it is widely recognized that renewable energy (RE) deployment can make a substantial contribution to sustainable environmental management and climate change mitigation. In this regard, a lot depends on the decisions of the future generation on energy investments, since environmentally conscious decisions could contribute to the solution of environmental issues. Thus, the present study aims to examine via questionnaire whether current university students who are the future consumers and potential investors in energy systems are willing to make investments in renewable energy sources (RES). The sample consisted of 214 undergraduate students majoring in the Department of Forestry and Management of the Environment and Natural Resources at the Democritus University of Thrace in Greece. Results show that most respondents were willing to invest in RES in the future and would do so motivated by environmental reasons. At the same time, participants who exhibited more positive environmental attitudes were more willing to invest in RES compared to their peers with lower environmental attitudes. Finally, the understanding of the views of young individuals can enable developers and policymakers to design regulatory frameworks which will create a favorable climate for investments attracting the interest of young householders.

Keywords: Citizen investment; renewable energy investments; willingness to invest; potential investors' views; young citizens.

INTRODUCTION

Nowadays even the simplest daily activities require the consumption of energy, making energy an integral part of modern living. However, since the world population has reached 7.5 billion, the energy demand and production have skyrocketed burdening the atmosphere with greenhouse gas emissions, which have led to the most dangerous environmental issue humanity has ever faced, climate change (IRENA, 2019). In an effort to address the risk, renewable energy sources were developed, which compared to fossil fuels are not only less harmful in terms of emissions, but also involve inexhaustible

generated energy. In addition, renewable energy deployment can bring notable benefits including energy security and new jobs. Indicatively, in the year 2017 about 10.3 million of new jobs were created in this relatively new sector (IRENA, 2018).

At the same time, renewable energy sources -especially of solar and wind- are attracting major citizen investment interest across the globe and those possessing a plot of land or even a roof can invest, for instance, in a photovoltaic system and enjoy the economic benefits of their investment (Tsantopoulos et al., 2014). The rise in public investment has been aided by policy schemes with the most important being the feed-in-tariff and net-metering. In Greece, the first incentives for citizen photovoltaic system investment were enacted through Law No 3468/2006. The success of the incentives was such that the licensing procedures for some photovoltaic categories had to be suspended (JMD B 2317/2012), while the national 2020 goals for photovoltaic capacity were met much earlier (Karteris and Papadopoulos, 2013).

The Greek case can serve as an example to demonstrate that citizen participation in RES investment can accelerate the achievement of set targets and substantially contribute to the solution of environmental issues. Moreover, the case of Sweden has shown that to establish successfully legislative frameworks which correspond to the demands and concerns of citizens, public attitudes must be taken into account (Viklund, 2004). Acknowledging the important role of public opinion on the matter, a growing body of literature has examined citizen willingness to invest in renewables (Curtin *et al.*, 2019; Ebers Broughel and Hampl, 2018; Strazzeria and Statzu, 2017; Baharoon *et al.*, 2016; Tsantopoulos *et al.*, 2014). As observed, the opinion of the younger generation of potential investors has not been discovered yet. Nevertheless, such insights could make a considerable contribution to developing effective policies which will meet the expectations and demands of the coming consumers. To address this neglected research area, the objective of the present paper is to examine the willingness to invest in renewable energy among young citizens. Specifically, the study 1) investigates participants' willingness to invest in renewable energy systems, 2) examines respondents' views on reasons for installing renewable energy, 3) explores citizens' opinion on Greece's investment activity, 4) investigates whether there are statistically significant differences among participants in terms of their environmental attitudes and willingness to invest in RES and 5) identifies participants' most preferred information sources. It should be noted that the chosen sample consists of 214 students majoring in the Department of Forestry and Management of the Environment and Natural Resources at the Democritus University of Thrace in Greece. The specific university students were considered the most suitable respondents for our study for two reasons: first, they are not financially independent yet (as they are not engaged in full-time paid work yet) and second due to their studies they are familiar with topics on renewable energy and energy investments.

LITERATURE REVIEW

Acknowledging that citizens are key-players in the diffusion of renewable energy, research has exerted efforts to explore citizen investment in RES. The most notable research topics in this relatively new literature strand involve citizen willingness to invest, financial characteristics of RES investments, variables affecting investment intention, drivers and barriers to invest, as well as information sources citizens prefer for obtaining information on RES investments.

In terms of citizen willingness to invest, increased levels of investment willingness have been reported in Switzerland, Austria, Yemen, USA, Ireland, Italy and Greece (Curtin *et al.*, 2019; Ebers Broughel and Hampl, 2018; Strazzeria and Statzu, 2017; Baharoon *et al.*, 2016; Tsantopoulos *et al.*, 2014). In monetary units, the Swiss and Austrian potential investors would invest from 100 to 1000 CHF or EUR, while a remarkably high share (35%) of Swiss respondents would dedicate even 1000 to 10,000 CHF (Ebers Broughel and Hampl, 2018). Although most Irish citizens also expressed some level of willingness to invest in renewables, they preferred investments of smaller amounts with 31% of them favoring investments up to 500 EUR and only 7% demonstrating preference for investment amounts up to or more than 50,000 EUR (Curtin *et al.*, 2019). High willingness to invest was also found among Greek citizens (Tsantopoulos *et al.*, 2014).

Undeniably, the financial characteristics of RES investment can either encourage or prevent citizens from investing. Recognizing the importance of preferences, research has explored citizen views on the financial characteristics of the investment, such as feed-in-tariffs. Although this scheme attracted investors during the first years of its application, it seems that it has now become less appealing to potential investors. Indicatively, Italian citizens showed limited preference for feed-in-tariffs, but they favored other forms of subsidies and tax allowances (Strazzeria and Statzu, 2017). In addition, it was estimated that the Flemish citizen investment in RES would increase if the Flemish government continued to decrease subsidies (Beliën *et al.*, 2013). Conversely, positive attitudes to the feed-in-tariff scheme were recorded in Yemen, where the majority of participants stated that they would invest in photovoltaic panels on the roofs of their houses and shops, if this policy was enacted by the government (Baharoon *et al.*, 2016). At the same time, strong concerns about the riskiness and payback periods were observed among Irish interested investors who favored shorter holding periods, low investment risk and high annual return on investments (Curtin *et al.*, 2019).

Beside investment preferences, the profile of potential investors and variables affecting willingness to invest have been examined. In terms of age, findings are somewhat conflicting. On the one hand, it has been indicated that older citizens are less likely to consider investing (Ebers Broughel and Hampl, 2018; Strazzeria and Statzu, 2017) possibly because they are prevented from the long payback periods (Strazzeria and Statzu, 2017). Meanwhile, in the study of Curtin *et al.* (2019) older participants were

slightly more likely to invest, whereas in the study of Ribeiro *et al.* (2014) younger investors expressed more positive attitudes to RES investment compared to their older counterparts. Apart from age, high income and home ownership are positively related to RES investment (Curtin *et al.*, 2019; Ebers Broughel and Hampl, 2018) and often consist the factors determining whether citizens will invest. Additionally, the educational level seems to have a notable effect on investors since most findings have indicated that educated citizens recognized to a greater extent the benefits of the investment and presented increased levels of willingness to invest compared to the less educated participants (Ebers Broughel and Hampl, 2018; Tsantopoulos *et al.*, 2014; Ribeiro *et al.*, 2014). What is more, the place of residence (Baharoon *et al.*, 2016) and prior investment experience (Curtin *et al.*, 2019) are often positively influential to RES investment. Finally, it is significant to note that most investors were citizens with positive environmental attitudes (Baharoon *et al.*, 2016; Tsantopoulos *et al.*, 2014) and that many valued environmental reasons for adopting RES such as pollution reduction, energy conservation and climate change mitigation (Pelizzone *et al.*, 2017), but also natural resources protection (Ebers Broughel and Hampl, 2018). It can be inferred that for these environmentally conscious investors the environmental benefits override the economic prospects of investing in renewables and in this regard the importance of environmental awareness is highlighted.

Perceived barriers to RES investment consist another noteworthy area in this literature strand. As expected, the lack of financial means, such as insufficient savings and limited access to loan finance, has emerged as the most prominent obstacle (Ebers Broughel and Hampl, 2018; Curtin *et al.*, 2019). Other significant obstacles involve those of a more practical nature such as space constraints and living in condominiums where it is generally difficult to obtain permission to install panels (Strazzera and Statzu, 2017).

Another issue that should be addressed is that citizens are often inadequately informed or misinformed about the actual costs and economic features of investments in renewable energy (Ebers Broughel and Hampl, 2018; Tsantopoulos *et al.*, 2014; Ribeiro *et al.*, 2014). To alleviate this issue, policymakers and developers should employ citizens' most preferred information sources to disseminate accurate and reliable information. In this context, research findings could shed some light, since it has been found that potential investors use mainly the Internet as a source to learn more about these investments and at the same time they would prefer to receive information from "neutral" sources rather than professionals or organizations holding private interest in the investment (Strazzera and Statzu, 2017). Although the Internet is citizens' prevalent information source on investments, they also draw information from TV, radio, newspapers, information leaflets and family and friends, whereas they acquire very little information from educational establishments, banks and NGOs (Tsantopoulos *et al.*, 2014).

To conclude, although there is an unquestionable increase in the numbers of adopters and investors worldwide, more efforts are required to achieve the desired transition to a low-carbon energy system. To that end, tax incentives, regulatory stability and policy certainty (Curtin *et al.*, 2017) as well as provision of public information through the most preferred media could facilitate renewable energy deployment. Moreover, despite the substantial citizen share in RE investment, more citizens and especially those with lower income should be offered the opportunity to adopt or invest in renewables.

METHODOLOGY

The data presented in this paper consist part of a broader research which was carried out in Greece in May 2018 and aimed at discovering the awareness levels about renewable energy among undergraduate students majoring in the Department of Forestry and Management of the Environment and Natural Resources at the Democritus University of Thrace. To achieve the research objectives, a questionnaire consisting of 21 closed-ended questions was developed. To design the questionnaire, the existing literature on university students' awareness about and views on energy- and environmentally-related topics was taken into account (Çakırlar Altuntaş and Turan, 2018; Cotton *et al.*, 2016; Keramitsoglou, 2016; Karatepe *et al.*, 2012; Çoker *et al.*, 2010; Ozil *et al.*, 2008). Then, to ensure that the questionnaire would give accurate and coherent results, a pilot study was conducted on a limited scale leading to some minor changes in the formulation of certain items. Once these alterations were made, the final form of the questionnaire was ready. According to the existing regulation, every research carried out within the department must first be approved. Thus, the research received permission from the Department of Forestry and Management of the Environment and Natural Resources (File number: DUTH/DFENR/41576/1364). The followed sampling method was the multistage sampling and in line with this method the month was the first and the week was the second stage of the study. To select the month and the week, a draw was used and hence the second week of May was selected. In that week, an inventory of all courses was taken and in the following week the professors were contacted and asked to allow classroom time for the completion of the questionnaire. The participating students filled in the questionnaire at the beginning of each class period and in total 214 questionnaires were gathered. This number accounts for about 30% of all enrolled students and for about 50% of students enrolled in the five years of study, whereas it corresponds to about 70% of the students who attend exams at the end of the semester. The collected data were analyzed with the Statistical Package for the Social Sciences (SPSS) and descriptive statistics was applied to all survey variables and based on the nature of each variable further statistical tests were performed including the non-parametric Friedman test and principal component analysis. Specifically, to gain a better understanding of participants' views, the non-parametric Friedman test was performed for the multivariate "Reasons for installing RE systems"

and “Information sources”. Since the multivariate “Reasons for installing RE systems” included many variables more analysis was required and to identify factors affecting views on reasons for installing RE, factor analysis was considered appropriate. Finally, the Independent Samples t-test was performed to examine whether there were statistically important differences between participants' environmental attitudes and their willingness to invest in renewables.

RESULTS

This section proceeds as follows: first, participants' demographic characteristics are described. Then, their willingness to invest and their views on reasons for installing RES systems are presented. Afterwards, findings regarding students' opinion on Greece's investment and preferences for information sources are presented.

Sociodemographic characteristics

The questionnaire included a special section collecting information about the students' gender, year of study and parental occupational and educational level. The sample consisted of 214 students (115 male and 99 female participants). As to the year of study, second- (12.6%) and third-year (14.5%) students presented smaller participation, while the first (20.6%), fourth (24.3%) and fifth (28%) years of study were higher represented in the sample. Regarding parents' occupation, the shares of fathers (48.6%) and mothers (46.3%) working in the private and public sector were greater compared to those who were currently unemployed, freelancers and pensioners. In terms of education, students' parents were overall highly educated since a considerable proportion of fathers (36.9%) and mothers (45.3%) were degree qualified, whereas the percentage of parents having completed merely the compulsory education level was notably lower.

Respondents' views on renewable energy investment and reasons for installing RES systems.

To measure participants' willingness to invest, they were first asked whether they would themselves invest in a renewable energy system in the future (for example as homeowners). Results depicted in Table 1 show that the clear majority of students, by 85%, was willing to invest in RES in their later life.

	Frequency	Percentage (%)
Yes	182	85.0
No	32	15.0
Total	214	100.0

Table 1. *Frequency and percentages of students' willingness to invest in RES*

Afterwards, students' opinion on reasons for adopting renewable energy systems was examined. Specifically, the students evaluated various reasons for installing an RE system, such as wind energy or photovoltaics. According to the findings of the non-parametric Friedman test (Table 2), the

increased energy independence of Greece was ranked first (mean rank 8.81), followed by the reduction in pollution (mean rank 8.71) and improved air quality (mean rank 8.63).

Variables	Mean ranks
Subsidies for the purchase of RE system	6.60
Subsidies for RE system maintenance	6.88
Fixed and guaranteed income	6.86
Minimum amount of required work	4.58
Lower-risk investment for savings	6.55
Higher profitability compared to other investments	6.54
Tax exemptions due to installation cost of RE	6.47
Tax exemptions due to maintenance cost of RE	6.25
New job positions-unemployment reduction	8.03
Enhanced social prestige-entrepreneurial activity	6.07
Reduction in pollution	8.71
Improved air quality	8.63
Increased energy independence of our country	8.81
N= 214 Chi-Square= 348.169 df =12 p <0.001	

Table 2. The application of the Friedman test for ranking respondents' views on reasons for installing RE

To gain further insights into students' perceptions of reasons for installing RES systems, the performance of factor analysis was deemed appropriate. Prior to performing the analysis, the Cronbach alpha test, the Keiser-Meyer-Olkin index and Bartlett's test of sphericity verified the data adequacy. Hence, the Cronbach's alpha value was found to be 0.778, KMO value was 0.717 and Bartlett's sphericity result was found statistically significant ($\chi^2=695.757$, $df=78$, $p=0.000$). After conducting Varimax rotation for the multivariable "Reasons for installing RE systems" five factors emerged (Table 3). The first factor (PC1) included the variables "Improved air quality", "Increased energy independence of our country" and "Reduction in pollution", while the second factor (PC2) comprised "Subsidies for the purchase of RE system", "Subsidies for Re system maintenance", "Fixed and guaranteed income" and "Minimum amount of required work". The third factor (PC3) involved the variables "Lower-risk investment for savings" and "Higher profitability compared to other investments". Then, on the fourth factor (PC4) the variables "Tax exemptions due to installation cost of RE", "Tax exemptions due to maintenance cost of RE" were loaded and finally on the fifth factor (PC5) the variables "Enhanced social prestige-entrepreneurial activity" and "New job positions-unemployment reduction" were loaded.

Variables	Component				
	1	2	3	4	5
Improved air quality	0.823	-0.001	0.217	0.025	0.150
Increased energy independence of our country	0.787	0.110	0.009	0.122	0.083
Reduction in pollution	0.777	0.235	0.150	0.107	0.033
Subsidies for the purchase of RE system	0.109	0.833	-0.023	0.120	0.098
Subsidies for the maintenance of the system	0.201	0.747	0.068	0.164	0.157
Fixed and guaranteed income	0.110	0.587	0.375	-0.021	0.319
Minimum amount of work	-0.016	0.565	0.243	0.036	-0.348
Lower-risk investment for savings	0.162	0.163	0.814	0.008	-0.009
Higher profitability compared to other investments	0.126	0.017	0.808	0.096	0.153

Tax exemptions due to installation cost of RE	0.110	0.062	0.156	0.876	0.041
Tax exemptions due to maintenance cost of RE	0.108	0.183	-0.056	0.862	0.079
Enhanced social prestige-entrepreneurial activity	-0.008	0.103	0.125	0.059	0.823
New job positions-unemployment reduction	0.361	0.131	0.078	0.098	0.696

Table 3. Factor loadings after Varimax rotation for students' views on reasons for installing RE systems

Participants' opinion on Greece's investment in renewable energy

Thereafter, the survey intended to discover students' opinion on Greece's investment in renewable energy sources. As it can be seen in Table 4, almost six out of ten respondents considered that the Greek state has not invested sufficiently in RE.

	Frequency	Percentage (%)
Do not know	12	5.6
Strongly disagree	21	9.8
Disagree	107	50.0
Neither agree or disagree	56	26.2
Agree	16	7.5
Strongly agree	2	0.9
Total	214	100.0

Table 4. Frequency and percentages regarding students' degree of agreement on how much Greece has invested in RES

Differences among respondents in terms of their environmental attitudes and their willingness to invest

The t-test was next performed to examine whether there were statistically significant differences between participants' environmental attitudes and their willingness to invest in renewable energy sources. Results tabulated in Table 5 report that the students who were willing to invest in RES also exhibited friendlier environmental attitudes compared to those who were not interested in investing.

Variables	Investing in RES	n	m. v.	s. d.	T	Df	P
Total environmental attitudes	Yes	182	45.6703	6.44322	3.788	212	0.000

Table 5. *T-test results comparing students' environmental attitudes and their willingness to invest in RES in the future (m. v: mean value, s. d.: standard deviation, t: t-test, df: degrees of freedom)*

Respondents' preferred information sources

Next, participants' preferences for information sources were scrutinized. To that end, students assessed on a ten-point scale different media of information based on how much they used each medium daily. In view of the results (Table 6), social media, news websites and websites of particular interest were the most preferred information sources. Conversely, printed media like national and local newspapers were the least favored choices.

	Not at all									Very much
Medium of information	1	2	3	4	5	6	7	8	9	10
Family and friends	1.9	3.7	4.7	7.5	15.0	15.4	9.8	16.8	8.9	16.4
National television and radio networks	7.9	4.2	5.6	10.3	11.7	15.0	14.5	12.1	8.9	9.8
Local television and radio networks	3.6	4.7	7.9	10.3	16.8	14.0	9.8	9.8	5.6	7.5
National newspapers	22.9	9.3	12.1	10.7	13.6	12.6	7.5	5.6	4.2	1.4
Local newspapers	24.8	17.8	10.3	8.9	12.6	8.4	7.9	4.7	3.3	1.4
News websites	6.1	6.1	2.8	8.4	10.3	12.6	15.4	12.1	14.0	12.1
Websites of particular interest	2.3	3.3	3.7	5.6	9.8	11.2	14.5	14.0	19.2	16.4
Social media	1.4	0.9	0.5	2.3	12.6	11.7	13.1	17.8	19.2	20.6
Scientific publications	13.6	4.7	9.3	11.2	10.7	9.8	9.8	13.1	10.3	7.5

Table 6. *Percentages regarding students' assessment of information sources*

At this point, it was deemed necessary to further analyze students' ratings of information sources and hence the non-parametric Friedman test was carried out (Table 7).

Variables	Mean rank
-----------	-----------

Social media	6.88
Websites of particular interest	6.32
Family and friends	5.67
News websites	5.55
National television and radio networks	5.05
Scientific publications	4.88
Local television and radio networks	4.40
National newspapers	3.31
Local newspapers	2.95
N= 214 Chi-square= 444.363 df =8 p <0.001	

Table 7. *Hierarchy of the information sources that students use on daily basis*

According to the Friedman test results, social media were in the lead of the ranking (mean rank 6.88), followed by websites of particular interest (mean rank 6.32). It is also interesting to note that national and local newspapers received the lowest rankings (mean ranks 3.31 and 2.95, respectively).

DISCUSSION

The present study has pointed to various points that call for special attention. In this section, it is aimed to interpret and contextualize the results and draw inferences, highlight inconsistencies, compare the present findings with other research findings and detect areas for future research.

As mentioned earlier, citizen investment in RES is crucial to achieve a low-carbon society and, in this regard, it is rather encouraging that most young citizens in our sample were willing to invest in an RE system. Similarly, Tsantopoulos *et al.* (2014) indicated high levels of willingness to invest among Greek citizens while increased investment willingness was also recorded in other European countries (Curtin *et al.*, 2019; Broughel and Hampl, 2018; Strazzera and Statzu, 2017; Tsantopoulos *et al.*, 2014), suggesting that European policies and subsidies have created a favorable climate for citizen investments in the market of renewable energy.

Another point worth discussing involves participants' evaluation of reasons for installing RES. Exceeding our expectation, higher improved air quality and national energy independence, namely environmental reasons, were ranked higher than economic incentives. Hence, the young citizens appeared to be conscious about environmental issues, while their concern about air quality was highlighted. To contextualize the latter, we should note that currently in Greece heating and transportation rely mainly on fossil fuels. However, the wide use of fossils has led to high ground-level ozone concentrations and smog in big cities of Greece (European Environment Agency, 2018) causing health issues to many citizens. From this perspective, students were possibly aware that the burning of fossil fuels is harmful to public health and acknowledged that RE deployment in Greece could address this issue. Greek students' awareness about air quality was paramount to that of Malaysian university students who were found similarly conscious about the quality of the local

environment (Ahamad and Ariffin, 2018). Likewise, citizens in different countries were driven by environmental reasons to install renewables (Curtin *et al.*, 2019; Ebers Broughel and Hampl, 2018; Pelizzone *et al.*, 2017). Hence, it could be stated that pronounced environmental awareness is often what induces environmentally conscious citizens to invest in renewable energy. In this regard, the importance of developing programs aiming at raising environmental awareness among social groups as a means to address environmental issues cannot be stressed enough (Karasmanaki and Tsantopoulos, 2019).

To assist a better understanding of students' mindset regarding reasons for installing RES, the results of factor analysis should be discussed. To remind our readers, factor analysis loaded five factors affecting students' opinion on why to adopt RES. The first factor involved mainly environmentally related variables, "Improved air quality" and "Reduction in pollution", whereas on the second factor financial variables loaded, that is "Subsidies for the purchase of RE system", "Subsidies for RE system maintenance", "Fixed and guaranteed income" and "Minimum amount of required work". The third factor included the variables relative to investment: "Lower risk investment for savings" and "Higher profitability compared to other investments". The fourth factor involved explicitly the taxation related variables of "Tax exemptions due to maintenance cost of RE" and "Tax exemptions due to installation cost of RE", whereas on the fifth factor somewhat mixed variables ("Enhanced social prestige-entrepreneurial activity" and "New job positions-unemployment reduction") were loaded. The loadings of these five factors imply that the reasons motivating participants to install renewables are multifaceted and varied. Yet, it appears that young citizens had a clear and complete view of the different reasons affecting the decision-making in terms of RES installation.

Quite unexpectedly, students perceived that the Greek state has not invested sufficiently in renewable energy. This finding was surprising because Greece has met the set targets and managed to double the share of energy from renewable sources between the years 2004 and 2017 (Eurostat, 2019). Hence, more analysis is needed to understand why students kept this wrong view.

A rather meaningful comparison occurred between environmental attitudes and student willingness to invest in RES. Confirming the expectations, students presenting higher environmental attitudes were those mostly interested in investing in RE themselves in the future. This suggests that the forestry students had a good grasp not only of the ability of renewables to address environmental issues by producing lower emissions, but also of the profitability prospects of RE investments. Of course, the increased familiarity with renewables could be attributed to the knowledge on RES students have gained throughout their studies in an environmental department.

Finally, respondents' preference for information sources is also worthwhile discussing. Predominantly, students expressed a clear preference for social media and websites of particular interest. The same positive disposition toward digital media was also reported in the case of Malaysian students (Ahamad and Ariffin, 2018), but also in other case studies (Strazzera and Statzu, 2017; Tsantopoulos *et al.*, 2014), suggesting that citizens worldwide favor the digital media over their printed counterparts. This may be associated with the overall preference for digital information media which consist more convenient and accessible options. To enhance the provision of information to potential investors, policymakers and developers could use these media to disseminate information ensuring that the younger investors have easy access to information on the existing incentives and policies on renewable energy investment.

CONCLUSIONS AND IMPLICATIONS

The present survey examined a representative sample of 214 forestry students and collected via questionnaire a variety of data regarding Greek young citizens' views on RES investment. The aim was to identify whether students were willing to make investments in renewables as they are not only future consumers but also possible experts in the environmental field. In the light of our study findings, it can be inferred that the surveyed citizens expressed increased interest in RES investment and consequently were not only likely to invest in renewables later, but also to support them as future foresters. In addition, the main contribution of this study is the research gap it addresses; that is, no other study had explored the younger citizens investment intention towards renewable energy investment. Nevertheless, greater importance should be placed on their intentions since they are the future consumers and if these allocate part of their income or savings to investing in RE then significant diffusion of renewables can be expected in the following years.

In terms of policy implications, the findings of this study can be utilized by policymakers, educators and other relevant stakeholders to design effective measures aiming at increasing renewable energy investments. Since this study revealed a higher acknowledgement of the environmental rather than the financial aspects of sustainable investments, it is possible that participants were unaware of the financial gains of investing in renewables. However, it cannot be certain that investment willingness driven by environmental awareness alone will be translated into actual investment. In other words, students' positive evaluation of the reasons to invest seems to be limited only to the environmental aspect of green investments thereby neglecting the financial potential. To enhance, however, the possibility of actual investment, efforts should be made to inform students about the financial benefits of renewable investments and this could be achieved by adding more informative material in the courses included in the curricula of departments.

Another finding that certainly involves some degree of implication for policymakers and project developers is participants' clear preference for social media and websites to obtain information. Both media could be used to approach young potential investors and inform them about 'green' investments using tailored messages that resonate with younger audiences. Moreover, it is crucial to emphasize that our study focused explicitly on young individuals who are not financially independent yet and recorded an increased investment willingness. To ensure that this willingness can be realized, the policy framework should consider the profile of these young investors and provide incentives which will be especially designed for young citizens who are just setting up their household. Indicatively, "green" loans at nil or low interest rates to install a domestic renewable system or to invest in renewable energy projects could be offered. Additionally, this study has indicated that concern about the environment and its problems can affect positively the intention to invest in clean energy. Hence, it is critically important to cultivate environmental awareness among large groups of young individuals so that they will adopt an environmentally conscious behavior as future consumers. To that end, information days and other activities should be held at all educational institutions frequently and systematically enabling students to learn more on how they can contribute to the protection of the environment.

CAN GRATITUDE INCREASE LOYALTY?

Kirse, Sigita; Dikcius, Vytautas; Adomaviciute, Karina

VU Faculty of Economics and Business Administration, Vilnius university, VU, Vilnius, Lithuania

ABSTRACT

Customer loyalty and its driving factors are relevant to both business enterprises and science. However, most the previous studies focused on the analysis of rational factors, such as product quality, switching costs, trust or satisfaction and their impact on consumer loyalty. However, only some of the studies explained the importance of emotional factors on the increase of consumer loyalty. The lack of knowledge of the gratitude effect on the consumer loyalty presents a research gap, and this study attempts to address it.

The study is based on the systematic analysis of the 29 selected articles from the area of psychology and sociology. The performed systematic analysis enriches the knowledge of the concept of gratitude, its causes and effect on consumer behavior. Furthermore, it helps to better understand the antecedents of the consumer loyalty.

Keywords: gratitude, customer behaviour, loyalty, marketing, personality psychology

INTRODUCTION

Customer loyalty and its driving factors are relevant to both business enterprises and science. It is no surprise that loyalty driving factors have been analysed in hundreds of scientific articles. Customer satisfaction is often identified as an inherent loyalty driving factor (Tanford, 2016; Wang et al., 2018). The link between customer satisfaction and loyalty was analysed in different business areas: retail (Schirmer et al., 2018), sporting events (Ahrholdt et al., 2017), hotels (Jani and Han, 2014), insurance sector (Picon, 2014), banking sector (Chiguvi and Guruwo, 2017), hospitality industry (Kandampully et al., 2015), etc. However, the performed meta-analysis showed that satisfaction explains from 30-40% of variation in loyalty measurement (Kumar et al., 2013) till 50-60% (Wang et al., 2018). These results show that customer satisfaction is a critical but not sufficient antecedent of customer loyalty (Dolnicar et al., 2015; Kumar, Pozza, and Ganesh 2013; Taplin, 2013).

Since satisfaction only partially explains customer loyalty, the authors also measured other variables which could have impact on customer loyalty. Such variables included trust (Hsu et al., 2012; T.T. Kim, Kim, & Kim, 2009, Schirmer et al., 2018), commitment (Lai, 2015; Baloglu et al., 2014; Schirmer et al.,

2018), switching costs (Kwortnick & Han, 2011; Picon et al., 2014), as well as perceived value, product quality, brand reputation (Pan et al., 2012; Kandampully et al., 2015). However, the causes of loyalty could not be fully explained by the said factors.

The authors have observed that long-term business-to-consumer relations may result not only from rational factors, such as product quality, switching costs or satisfaction but also from emotional factors. Gratitude is one of such emotional factors. Gratitude may work as short-term emotion or long-term feelings (Algoe, 2012, Bartlett, DeSteno, 2006; Fazal el Hasan et al., 2014; McCullough et al. 2008; Palmatier et al. 2009; Raggio et al., 2014, Tsang 2007; DeSteno and Bartlett, 2010). It has a strong effect on individuals' behaviour, their mutual relations (Palmatier et al. 2009, Huang, 2105; Raggio et al. 2014; Bartlett, DeSteno, 2006; Kolyesnykova et al. 2011; Kolyesnykova and Dodd, 2008; Watkins, 2006). Earlier studies show that gratitude can create strong relations (McCullough et al., 2008; Bartlett, DeSteno, 2006; Kashdan et al., 2009) and give financial benefit (Raggio et al. 2014, Tsang 2006a, Kolyesnykova and Dodd, 2008). Finally, some authors indicate that gratitude may also cause loyalty (Raggio et al. 2014; Socia, 2007; Fazal el Hasan et al., 2014; Palmatier et al. 2009; Morales, 2005). Meanwhile, Kim and Lee (2013) identified that it is gratitude rather than satisfaction that causes customer satisfaction in higher-level restaurants.

Earlier studies of gratitude indicate that gratitude can be manipulated in view of the individual features of each person (Watkins, 2003; McCullough et al. 2004; Kashdan et al., 2009; Tsang 2007; Kolyesnykova et al. 2011; Wood, 2009), however Huang (2015) claims that it is not clear how different factors can cause consumers' gratitude. Finally, Bock et al. (2016) claims that although customer gratitude is a growing topic of interest among scholars, the current state of the literature is problematic because there lacks a clearly accepted definition.

Therefore, the current study seeks to address some of these gaps and offers further theoretical insight and contribution into the contention that customer gratitude is an antecedent of customer loyalty. To accomplish the aforementioned objectives, we attempt to probe the effect of customer gratitude in the marketing environment via a systematic analysis of the prior literature. The systematic analysis let us collect empirical findings from individual studies for integrating, synthesizing and making sense of them. This systematic analysis will enable us to evaluate the concepts of gratitude defined by different authors and to define gratitude in the customer-seller context. Also, the analysis of earlier studies will be helpful in distinguishing the main factors which cause customers' gratitude. Finally, while individual studies typically examine the consequences of customer gratitude, the study will help evaluate a possible effect of gratitude on different types of loyalty.

METHODOLOGY OF SYSTEMATIC ANALYSIS

The systematic analysis was performed in four stages: planning; data collection, data organization and data analysis. The main question of this study was raised in the planning stage – what effect the emotion of gratitude has on the consumer's loyalty through willingness to offer gratuity in trading situations. A theoretic conceptual framework of gratitude should be obtained during the study as well as the instruments used to measure the emotion of gratitude. To this end, the study protocol was prepared, and 5 analysed positions were recorded: 1. Measurement instruments; 2. Conceptual meaning of gratitude; 3. Causes of gratitude 4. Gratuity reactions.

During the data collection stage, automatic databases are used for search of publications: Google Scholar, Scopus. The criterion of time was not applied for the selection of articles to not be distanced from the fundamental scientific sources, if any. The initial stage of scanning sources included all scientific texts (except for books and conference texts) where gratitude is analysed as a phenomenon or the impact of that phenomenon on personal behaviour is discussed. It was observed that gratitude was analysed in scientific literature from a very broad perspective, e.g. evolution, religion, medicine; therefore, for the emotion of gratitude to maximally reflect the aspects of consumer behaviour, it was decided to record the keywords *customer behaviour, marketing, personality psychology* and to use them in the search together with the meanings of gratitude.

The English language suggests a few semantic meanings of gratitude: gratitude, appreciation, thankfulness; therefore, all of the said keywords were used in the initial literature scanning stage. However, the keywords "appreciation" and "thankfulness" were given up since in symbiosis with the customer behaviour keywords they generated an excessive number of articles and led to the content that was not related to the goals of the study in any way.

After the scientific sources were decoded, the systematic review included 29 articles. Each of the selected 29 scientific articles had to meet the following qualitative criteria:

1. The goals and objectives of the study are explicitly specified and described;
2. A clear respondents' selection procedure;
3. Justified and clearly described criteria for the selection of measurement instruments;
4. The methods of analysis are properly selected and described;
5. The conclusions of the study are clear and justified.

Following the said qualitative criteria, 5 articles were removed from the selected 29 articles (see Table No 1), thus 24 articles were used for the final analysis.

Article	Reason for rejection of the article
Algoe, S. B., Haidt, J., and Gable, S. L., (2008) "Beyond reciprocity: Gratitude and relationships in everyday life". <i>Emotion</i> , Vol. 8, pp. 425–429.	The article was not indexed by Scopus database. The style of the article was publicist rather than scientific.
Rusk R.D., Vella- Brodrick D.A., Waters L., (2015) "Gratitude or Gratefulness? A Conceptual Review and Proposal of the System of Appreciative Functioning", <i>Journal of Happiness Studies</i> , Vol. 17 No.5, pp 2191-2212	In this article, a semantic analysis of the concepts of gratitude and gratefulness was conducted on the basis of systematic analysis, however the context was not related to business or its environment
McCullough, M. E., Kimeldorf, M. B., and Cohen, A. D. (2008). „An adaptation for altruism? The social causes, social effects, and social evolution of gratitude“. <i>Current Directions in Psychological Science</i> , Vol. 17, pp. 281- 284	The overview of gratitude theories which wasn't rely on qualitative or quantitative research.
McCullough, M. E., Kilpatrick, S. D., Emmons, R. A., and Larson, D. B. (2001). "Is gratitude a moral affect?" <i>Psychological Bulletin</i> , vol. 127, 249-266.	The literature analysis was not grounded by the research results.

METHODS OF THE RESEARCH

The systematic analysis showed that the field of research in the context of the factor of gratitude is particularly wide. The reasons of the occurrence of gratitude and the resulting behavioural outcomes may depend on many factors, such as personal traits of character, environmental factors or even diseases that an individual is suffering from. In order to answer the main question of the study, i.e. what effect the emotion of gratitude has on the consumer's loyalty through willingness to offer gratuity in trading situations, the analysis of various aspects of the research methods is of great importance since the characteristic features of consumers are the same as those of individuals in the general sense; therefore, it is important to understand not only the methods of the research but also the motives for selection for the specific instruments of the research.

The authors of the reviewed scientific sources in most of the cases used a survey, meanwhile the methodology of an experiment in the studies was very much similar in number to mixed choices of methods.

Method	Uses
Survey	10
Experiment	7
In-depth interview	1
Mixed methods	6

Table 3. Methods used in previous studies.

THE CONCEPT OF GRATITUDE

The definition of gratitude. Gratitude is not easy to define: it is measured as an emotion, attitude, moral virtue, habit, personal feature or response (Emmons, McCullough, 2003). The word “gratitude” originates from the Latin word “gratios” which means *grace, graciousness, or gratefulness* (Emmons, McCullough, 2003). The analysis of sources of literature revealed that authors who analysed different aspects of gratitude differently interpreted its concept (see Table No 1).

Algoe (2012)	Gratitude is response to the received benefit; Gratitude may be perceived as an emotion that promotes social relations.
DeSteno et al., (2010)	Gratitude is an emotional state that decreases the probability of selfish economic action, fosters trust and stable exchange, which together constitute a necessary element for social flourishing; Gratitude is an element that belongs to the social class of emotions aiming at creating a social and emotional capital and involving individuals into creation of long-term wellbeing; Gratitude is the compensator of positiveness and happiness aiming for long-term benefit rather than short-term pleasures.
Emmons et MCCullough, (2003)	Gratitude is recognizing and valuing an altruistic gift.
Fazal el Hasan (2014)	Gratitude is an emotional response to a recognised benefit received from the benefactor.
Huang (2015)	Customers’ gratitude is the purchasing behaviour triggered by a sensitive duty to repeatedly use the services offered by the seller.
Kashdan et al (2009)	Gratitude is experienced when people receive something useful or pleasant.
McCullough et al. (2008)	Gratitude is a positive emotion which usually arises from the understanding that an individual received a benefit which costed

	another person's deliberate and voluntary actions; Gratitude is a pleasant emotion, but it differs from happiness as gratitude requires an assumption that an individual received benefit from another person's generosity.
McCullough et al. (2001)	Gratitude is a moral effect similar to other moral emotions, such as empathy and guilt; Gratitude is the response to moral behaviour and the motive of moral behaviour; Gratitude is understanding that the receiver accepts the benefit offered.
Palmatier et al. (2009)	Gratitude is the basic social component of human interaction which gives an emotional basis to the required behaviour; Emotional gratitude is gratitude for benefit received; Behavioural gratitude is giving response (reciprocal connection) for the feeling of gratitude.
Raggio et al. (2014)	Gratitude is a feeling arising from an individual's (recipient) understanding that the partner (benefactor) (e.g. an individual or an organisation) acted intentionally to do good to the recipient (c.f., Fredrickson, 2004, p. 150). "The feeling of gratitude" means an emotional response to this understanding.
Tsang (2006a)	Gratitude is a positive emotional reaction to the receipt of a benefit that is perceived to have resulted from the good intentions of another; Gratitude is a positively valued emotion which means that an individual appreciates the benefactor or the benefit
Tsang (2007)	Gratitude is a positive emotion experienced when an individual realises the benefit intentionally caused by another

Table 4. The definition of gratitude used in previous studies.

Gratitude is an obvious phenomenon with its own rules, expectations, and benefit (Raggio et al., 2014), and is clearly distinguished from the overall state (Bartlett et DeSteno, 2006) and from conventional constructs of behaviour, such as obligation or trust, and may independently promote expression and behaviour (Raggio et al., 2014). The researchers identified two basic aspects of gratitude: 1) emotional – occurring when an individual perceives himself/herself as a recipient for another person's efforts towards him/her; 2) behavioural – related to actions resulting from the feelings of gratitude (Palmatier et al., 2009)- It is worth discussing gratitude from these two perspectives.

Gratitude as an emotion. The definition of gratitude as an emotion is supported by many authors who analysed this phenomenon (e.g. Algoe, 2012, Bartlett, DeSteno (2006), Fazal el Hasan et al., 2014; McCullough et al. 2008; Palmatier et al. 2009; Raggio et al., 2014, Tsang 2007). DeSteno et Bartlett (2010) define gratitude as the element of emotions intended to create a social and emotional capital, involving individuals in the creation of lasting well-being. Meanwhile, an emotion can be defined as an active response of limited duration to significant changes in the environment (McCullough, Kimeldorf, Cohen, 2008) arising from the way individuals measure objects, events, and opportunities (Kashadan et al., 2009). Not all emotions can be predicted and forecasted, however the research shows that unlike many other emotions, gratitude can be predicted (McCullough, Tsahg, Emmons, 2004; DeSteno et al., 2010). In terms of business, the possibility to predict and forecast gratitude is a very important feature of this emotion suggesting that gratitude can be used as a marketing tool to achieve various business goals. Emotions have a mediating role for behaviour (Morales, 2005) and gratitude is not an exception, which like any other emotion can influence decisions (DeSteno et al., 2010). The analysis of literature sources suggests that emotions that arise in certain environment may move into another environment and further influence decisions as long as it lasts, even if such outcomes are not related to the source of emotions (Bartlett et Desteno, 2006).

Gratitude as behaviour. Palmatier et al., (2009) observed that few marketing studies were carried out to analyse gratitude in the context of customers' behaviour. In business environment, behaviour gratitude is often related to another person's efforts, i.e. people feel angry and tend to punish those who have a negligent attitude towards their work and feel grateful and tend to award those who do their best for them (Morales, 2005). Huang, (2015) defined customer gratitude as the emotional basis of reciprocity and the main factor maintaining successful relations between buyers and sellers. Reciprocity means that what is given needs to be returned and thereby a cycle is created, (Palmatier et al., 2009); whenever gratitude comes back, the circle is considered to close and the reciprocity requirement is satisfied as the perceived possibility of ungratefulness is eliminated, (Raggio et al., 2014). Gratitude is social relations standard or credible behaviour; therefore, ungratefulness can cause considerable damage (Raggio et al., 2014). Thus, gratitude motivates people to behave proportionately after benefit is gained, which promotes prosocial behaviour and influences psychological states that support gratitude and cooperation, (McCullough et al., 2008). Consumers subconsciously realise that the seller will gain benefit if they buy in gratitude; therefore, on the one hand, buyers can perceive buying as means of gratitude and on the other hand, buying may result from the need to follow the reciprocity norms, Kolyesnykova et al. (2009).

Palmatier et al. (2009) and Bartlett et DeSteno (2006) observe that gratitude is often ignored in researches and all features of the gratitude emotion are ascribed to reciprocity. The analysis of

literature reveals that authors are not united about the moderating influence of gratitude and reciprocity on behaviour. Kolyesnykova et al., (2011) claim that gratitude may be triggered by reciprocity, meanwhile Algoe (2012), Fazal el Hasan et al. (2014) claim that gratitude is what can encourage reciprocal behaviour between the receiver and the giver. Bartlett et DeSteno, (2006) carried out a research and identified that the emotional state of gratitude encourages prosocial behaviour, while reciprocity cannot be the cause of behaviour. The content of the analysed research sources reveals that some authors (e.g. Raggio et al. (2014), Socia (2007), Tsang, (2006b), (Tsang 2007), (Watkins, 2006), Kolyesnykova et al. 2011) chose to study emotions from the opposite poles, e.g. gratitude *vs* indebtedness, obligation, guilt, anger – the results of the study in the general sense reveal that reciprocity may be both positive and negative. Thus, to this end, gratitude cannot in principle be equated to reciprocity as the situation of gratitude leads to the expectation for exceptionally positive reciprocity: the study by Watkins (2006) showed that gratitude is assessed as a positive effect, while indebtedness has mixed associations, also, gratitude is more related to altruism than to obligation; the respondents of this study said that they enjoyed the feeling of gratitude, the study by Kolyesnykova et al. (2011) revealed that the words that were usually associated with gratitude were: grateful, recognized, thankful, valued, acknowledged, positive, pleased, and honoured, meanwhile the words associated with obligation were as follows: uncomfortable, obligated, indebted, reluctant, guilty, pressured, irritated, and owing. In conclusion, like in any other situation of life, and in business terms, gratitude maintains its positive concept and can positively impact mutual relations and influence consumers' behaviour. This emotion may fill in the gap between regular (impersonal) transactions and developing, relationship-based exchange since understanding (cognitive component), experience (emotional component), and expression (behavioural component) may become stronger with gratitude (Raggio, 2014)

Gratuity reactions. The above-mentioned studies suggest that unlike in case of obligation or indebtedness, gratitude allows an individual to feel good psychologically in reciprocity situations but at the same time with the emotional duty to return the benefit received. Thus, although an individual may feel obligated affected by gratitude, this does not cause any discomfort and does not raise negative emotions or negative associations, therefore the individual's actions towards the benefactors are genuine and socially just. The results show that gratitude works through community (Grant et Gino, 2010) and causes a psychological pressure to return the pardon. (Palmatier et al. 2009), increases confidence in strangers (McCullough et al., 2008), encourages to reward the benefactor, even if it is costly (Bartlett et De Steno, 2006). The studies show that gratitude may successfully impact various business processes: an expressed (not just felt) gratitude triggers secondary (non-financial) exchange that can increase the probability of financial exchange (Raggio et al., 2014). The study carried out by

Tsang (2006a) revealed that grateful individuals tend to spend more money as gratitude to the benefactor. Kolyesnykova et Dodd (2008) related the intensity of this emotion with the amount of financial expenses claiming that greater gratitude encourages buyers to spend more money. According to Socia (2007), gratitude encourages positive response and repeated purchases. Morales (2005) observed that the feelings of gratitude motivate consumers to award the company by choosing that company instead of its competitors. Gratitude strengthens social relations and friendship, and develops the human ability to take care, encourages altruism, and, like other positive emotions, contribute to strengthening the relationship with time (Kashdan et al. 2009). Gratitude is related to building relations and can initiate a cycle to build relationship between the receiver and the benefactor (Algoe, 2012). Buyers have a better appreciation of the relations with the seller which promotes their loyalty (Fazal el Hasan, 2014). Affected by this emotion, people agree to short-term losses to receive a long-term benefit (Bartlett et DeSteno, 2006). Gratitude felt as an emotional component has an individual effect (Raggio, 2014), therefore the reactions to be triggered by gratitude in the trading environment may depend not only on the buyer but also on the qualities of each individual as different customers may feel a different level of gratitude for the same services (Fazal el Hasan et al., 2014).

Causes of gratitude. Sources of literature emphasise different causes triggering gratitude. Kashdan et al. (2009) claims that gratitude appears when people receive something useful or when they feel that somebody is doing them a favour or offering help. The study by Palmatier et al. (2009) revealed that the customers' understanding of about the sellers' goodwill, free will, and the intensity of the need felt by the customer towards the seller's certain behaviour very much promotes the feelings of gratitude. This means that gratitude may be triggered by a situation where the customer's problem is urgently resolved, e.g. the customer is planning a party and suddenly realises to have bought clothes in a wrong size – the buyer who delivers the right size of clothes or opens the shop for a short while will receive greater gratitude than the seller who offers to change the clothes on the following day using the policy of the shop as an excuse, (Fazan el Hasan et al., 2014). Efforts efficiently cause gratitude, (Morales, 2005), even simple common efforts such as consistency, honesty, reliability, openness, willingness to share and communicate, empathy can cause gratitude, however in business conditions, e.g. in B2B context, the partners' actions like "they gave us a second opportunity", "they opened a third shift to adapt to our needs" or meeting the terms even after changing the company's policy always raise the emotions of gratitude (Raggio, 2014). Algoe et Haidt (2009) also agree that gratitude is promoted by understanding that the benefactor reacts in view of the receiver's needs and preferences. In his later study, Algoe (2012) concluded that gratitude is related to both the benefit received and to the benefactor's evaluation, i.e. the higher price (in money) is paid by the benefactor, the greater gratitude is felt by the receiver; the higher the benefactor's efforts are perceived by the receiver, the more value is

attached to the benefit. Manipulation in goodwill successfully triggers gratitude (Tsang, 2007). McCullough et al. (2008) distinguished four types of information that cause gratitude: 1) the benefit offered is related to costs for the benefactor, 2) the benefit is valuable to the receiver, 3) intentions behind the benefit offered; 4) the extent to which the offered benefit is free of relative obligations. The study by Huang (2015) showed that exceptional behaviour and interpersonal communication positively impact the customer's gratitude. Gratitude is also affected by the public conditions, i.e. the more people see the benefit given, the more likely it is that gratitude will be rewarded (Kolyesnykova et al. 2009).

Socia (2007) observed that gratitude is triggered when the seller seeks it, however some authors emphasise that the situations of gratitude must be created with subtlety. Benefits that everyone can receive or benefits that can be received as the competitors' offer do not cause much gratitude and do not require reciprocity: formal written rules or programs where customers receive a reward (e.g. airline loyalty points) will most probably not create reciprocity as the lack free will (Palmatier et al., 2009). If the act is based on the company's policy but not on the personal intention to offer benefit, this can be interpreted as the benefactor's mere concern of its business (Raggio et al. 2014). The results of the study carried out by Tsang (2006b) show that individuals feel much more gratitude if the benefactors demonstrated goodwill rather than an open (selfish) motive. If the customer knows that the seller works for commissions, the factor of goodwill suffers (Palmatier et al. 2009), also, if benefit is offered to the receiver as a repaid grace, this feeling is less likely to cause gratitude (Watkins et al. 2006). Something that is perceived as persuasion will not encourage the gratuity reaction, even in case the company's efforts are sincere (Morales, 2005).

Individuals may feel grateful not only for the benefit received but also for the intentions or perceived benefit (Raggio et al. 2014). It is important to note that the company's true motives are not relevant as the response is triggered not by the company's intentions but by the motives that are perceived by the consumers (Morales, 2005). Giving real benefit is not necessary: even in case the company gains benefit from the relationship, what is the most important is that the customer perceives it as something personally valuable (Raggio et al. 2014). In order to trigger gratitude, it is recommended that the Relationship Marketing Programs should include random or hidden elements as reference that the customers' interests are more important to the seller than the financial benefit received, i.e. the buyer should interpret that as well-intended actions (Fazal el Hassan, 2014). The study showed that sellers can enhance the customer's gratitude and loyalty by servicing their regular customers better compared to irregular customers, which can be done through warm and personal communication and by offering tangible benefits, e.g. free gifts and exceptional discount coupons to their customers (Huang, 2015). Businesses could increase the level of gratitude by giving more authorities to the employees, for example, by offering them a possibility to adapt the company's policy to the situation or event to

change the rules when the customer's problem needs to be resolved, to offer although small but exceptional services to the customers; in the ideal case, several random or selected elements should be left as very structured *quid pro quo* programs, usually integrated into total offers, lead to losing the opportunity to promote relationships (Palmatier, 2009).

CONCLUSION

The consistent methodological framework of the research fixed in the protocol helped to identify main research objectives, justifying the relationship between gratitude and loyalty. The study was divided into 5 major stages: 1) identify the instruments used for the study to measure the emotion of gratitude; 2) define the general concept of gratitude; 3) analyse actions that cause the emotion of gratitude; 4) identify gratuity reactions; 5) identify whether the emotion of gratitude may have impact on a consumer's loyalty through willingness to repay. The analysis and summary of the articles used in the systematic research analysis showed that quality of the 24 analyzed studies could be evaluated as high justifying that the research met all the evaluation criteria. The analyzed studies were from different research areas: psychology, sociology, politics, business and marketing. Furthermore, these multidisciplinary studies used different methodologies which confirmed the statistically significant direct and indirect relationship between the gratitude and willingness to pay back.

The systematic analysis revealed that the studies of the emotion of gratitude used questionnaires in most cases. The frequent use of this method can be explained by the fact that surveys require the least time resources from both researchers and respondents, also the obtained results are easier to process and interpret. Meanwhile, an experimental methodology is more complex and requires more preparation from researchers, greater involvement of respondents, and in some cases a more careful selection of respondents, also the data collected during an experiment is often more difficult to process and interpret. The analysis has revealed that to obtain more precise results of the study, some authors (e.g. Watkins et al. 2006; Tsang 2007; Kolyesnykova et al. 2011) used a mixed technique of study instruments: where e.g. questionnaires and an experiment are both used at the same time. Thereby, a direct manipulation of the respondent's emotion of gratitude allows to efficiently use various standard scales of studies, i.e. with boosted emotion of gratitude, participants answer the researcher's questions with more precision. Thus, it can be presumed that various methods can be used to study the situations of gratitude but the synergy of two or more techniques of studies produces more precise results.

The topic of gratitude is not popular in the context of marketing research studies. This can be explained by the fact that in cases where the concept of gratitude is not consistently analysed, this emotion can be assimilated with other factors that are more frequently analysed, e.g. satisfaction, reciprocity, and commitment by attributing the features of gratitude to the latter. But this analysis showed that

gratitude is a phenomenal element of emotions with unique characteristic features. Gratitude may be classified as both an emotion and behaviour but in both of these cases retains its positive concept. The analysis showed that, with few exceptions, (related to an individual's personal features or suffered diseases), gratitude always triggers positive behaviour towards the benefactor.

The scientific sources analysed in this study indicated different reasons that trigger gratitude. The stimuli of gratitude were identified as goodwill, economic value of the obtained benefit, value of the obtained benefit to the receiver in the general sense (e.g. the service was rendered at the time when the receiver needed it the most), perceived level of efforts, exceptional communication, free will, public conditions, etc. It is interesting to note that the benefactor's true intentions do not matter but his actions must be interpreted as sincere and targeted at the beneficiary's problem.

Standard marketing solutions often do not bring the expected result once the buyers realise that they appear on the loyalty programs for the seller's selfish goals. Meanwhile, manipulating the emotion of gratitude may be an effective marketing tool to enhance consumers' loyalty. The studies show that gratitude certainly promotes prosocial behavior, strengthens relations; grateful individuals tend to commit, return the obtained benefit, and demonstrate positive behavior towards the benefactor. The systematic analysis of literature showed that the emotion of gratitude may effect the consumer's loyalty through willingness to repay. However, the possibilities of using gratitude to enhance loyalty should be better analyzed since the analysis of literature shows that manipulation of gratitude requires subtlety; therefore, applying this emotion in marketing requires a well-considered approach.

LIMITATIONS AND SUGGESTIONS FOR FUTURE RESEARCH.

This conceptual analysis of the gratitude may be used as a theoretical basis for future studies analyzing gratitude in the commercial environment. The performed systematic analysis showed that wrong use of research methods or tools may cause negative emotions like feeling of debt, guilt, shame and commitment generating negative consumer reactions, instead of gratitude. Therefore, wider analysis of the gratitude would be help to better understand how this emotion can be used in order to generate positive consumer reactions towards the specific company. Furthermore, performed analysis revealed that each person has an individual level of gratitude. For this reason, future studies could provide insights into whether the persons with different levels of gratitude accept the coded marketing message in the same way.

²Department of Marketing, University of Nicosia, Nicosia, Cyprus

ABSTRACT

Cash management and cash holdings have been examined in the literature as a crucial issue for corporate sustainability. Several theories have been developed trying to explain the corporate decisions on cash holdings. The scope of this study is to shed further light on this issue by examining the impact of cash holdings on the financial performance and viability of Greek corporations before and after the Greek sovereign debt crisis. We collected a large sample from Small-Medium Enterprises (SMEs) and a comparable sample from large firms operating in Greece during the period 2003-2016. Panel regression results indicated that cash holdings contribute positively to the profitability and viability of firms validating the precautionary theory of cash holdings in Greece. Before the crisis, SMEs and large firms both benefited significantly by cash holdings but after the crisis that positive impact of cash is more evident and significant for SMEs. These findings corroborate our hypotheses that during a period of limited lending (and hence financial turmoil), cash holdings (and effective cash management) could be a vital tool for sustaining SMEs viability and financial performance. The study offers useful managerial implications and contributes to the ongoing debate about the impact of cash holdings on corporate performance.

Keywords: SMEs, Cash holdings, Profitability, Viability, Greece, Crisis.

INTRODUCTION

Cash holding decisions have been considered extensively by previous studies on the field of working capital management as a mean to alleviate day-to-day operations, take advantage of investment opportunities and even overcome harsh financial conditions (Opler et al., 1999; Ozkan and Ozkan, 2004; La Rocca et al., 2018; Martínez-Sola et al., 2018). The literature on liquidity management documents that there are mainly two reasons that firms hold cash. The first reason is the transactional motive which dictates that cash holding aims at reducing transactional costs via cash payments without having to resort to external financing or liquidation of assets, both of these yield significant costs to the firm (Han and Qiu, 2007; Martínez-Sola et al., 2018). The other reason is the

precautionary motive which suggests that firms collect cash in order to cover unexpected contingencies and events. This stockpile may assist firms to overcome financing difficulties, avoid overdue payables and finance investment opportunities when they arise (Han and Qiu, 2007) even during periods of financial troubles.

In the case of smaller firms (Small-Medium Enterprises - SMEs for example), the precautionary motive for cash holding decisions is more prevalent, since SMEs face more financial frictions, have less assets, are more vulnerable to financial turmoil and face higher restrictions in financing either from money and capital markets (Almeida et al., 2004; Dewally et al., 2013; Gao et al., 2013). Also, La Rocca et al. (2018) documented that European firms that piled more cash before the crisis period were able to sustain and even improve their profitability during the European financial crisis.

The scope of this study is to shed further light on the impact of cash holding decisions on the financial performance and viability of SMEs versus large firms in Greece by considering that relation before and after the Greek sovereign debt crisis. According to a recent report by the Association of Enterprises and Industries - AEI (2017), SMEs employ the majority of the working force in the country (more than 80 per cent) and contribute significantly to the GDP (19.3 per cent net added value to the GDP in 2014). The reports by the AEI (2017) and the Economic Chamber of Greece (2018), point that access to financing was the top issue facing by SMEs during the period 2014-2017, 76 per cent of them did not raise new financing since the 65 per cent of the SMEs experienced a deteriorating or at best a stable profitability. To our knowledge, this is the first study considering the relation between cash holding and corporate performance within an economy with a majority of SMEs and facing a long-term financial crisis.

LITERATURE REVIEW AND HYPOTHESES DEVELOPMENT

The precautionary motive of holding cash originates in the trade-off theory and suggests that cash in hand allows greater flexibility to managers and makes them able to finance potential value-enhancing investment projects when they arise or they can compete effectively with their competitors in the market. Recent empirical evidence suggests that the cash holdings impact positively on firm performance especially during periods of market imperfections. La Rocca et al. (2018) examined a sample of European firms over the period 2007-2015 and documented a positive impact of cash holdings on financial performance. Thus, firms were CFOs were able to stockpile cash were able to adhere to hearse financial conditions, take advantage of investment opportunities and further improve corporate value and profitability. Similar evidence have been provided by Dewally et al.

(2013) and Martínez-Sola et al. (2018). Thus, based on the previous discussion we can form the first hypothesis as follows:

H1: Cash holdings will have a positive impact of corporate financial performance.

The impact of cash on financial performance can be distinct based on the size of the firm. Typically, SMEs are facing higher information asymmetries and more difficulties on raising external funds and even if they can raise external funds those are associated with higher interest costs, thus they are inclined to use and hold more cash as a tool to sustain their financial viability (La Rocca et al., 2018; Pinkowitz et al., 2006). Empirical evidence from Ozkan and Ozkan (2004), Faulkender (2002) and Martínez-Sola et al. (2018) document that small firm's hold more cash since they are likely to be less diversified and more probable to experience financial distress. These characteristics lead smaller firms to hold more cash since they are not able to obtain credit in the market due to higher probability of bankruptcy and higher risk. Therefore, based on the abovementioned discussion we formulate the second research hypothesis as follows:

H2: The positive impact of cash holding on corporate financial performance will be more significant for SMEs relative to large firms.

The recent global financial crisis of 2007-2008 and the subsequent Greek sovereign debt crisis may also have affected the firm's cash levels and their decisions on cash holdings. The recession in the Greek economy resulted in a significant reduction of bank lending, leading to firms' inability to repay obligations, debt and even sustain their short-term viability. Especially, SMEs were even more vulnerable on the shock of the recent crisis. Since the majority of SMEs in Greece were financed by banking institutions, the reduction of bank lending had an immediate impact on their cash holding decisions. La Rocca et al. (2018) documented that during the financial crisis SMEs in Europe reduced their cash holdings (mainly because of their inability to lend) in order to address transactions, adhere to opportunities, a decision which had a further positive impact on their profitability. Thus, the precautionary motive of cash holding proved crucial during the crisis since it allowed cash-rich SMEs to survive the financial turmoil. Consequently, we state the third research hypothesis as follows:

H3: The positive impact of cash holding on corporate financial performance will be more significant for SMEs during the debt crisis period, relative to large firms.

DATA SELECTION PROCEDURE AND RESEARCH DESIGN

Data used in this study include non-financial firms which according to the Greek Law are obliged to prepare individual financial statements under Greek GAAP or IFRS. The sample period is divided into two sub-periods before the Greek sovereign debt crisis (from 2003 to 2010) and during the crisis period (2011 to 2016). All financial data were collected from the ICAP database. The final

unbalanced sample that was utilized in the analysis consists of 16,076 firm-year observations. In order to test the three research hypotheses and examine the impact of cash holding on corporate performance and viability, we will estimate the following panel fixed effect regression model where i denotes the firm and t the year and e is the error term:

$$FP_{it} = a_0 + a_1CRISIS_{it} + a_2CASH_{it} + a_3CRISIS_{it}*CASH_{it} + a_4SIZE_{it} + a_5LEV_{it} + a_6GROWTH_{it} + a_7NWC_{it} + a_8TANG_{it} + a_9CFO_{it} + a_{10}FIR_DIV_{it} + Year\ F.E + Industry\ F.E. + e_{it} \quad (1)$$

The dependent variable FP denotes the corporate financial performance. Following previous studies by La Rocca et al. (2018) and Martínez-Sola et al. (2018), we use two measures of financial performance, the return on assets (ROA) estimated as the ratio of earnings before interest and taxes (EBIT) to total assets which captures firms' profitability and the second measure is the Altman Z-score for private firms (Altman, 2000) capturing the likelihood of financial distress. This variable is estimated as: $Z\text{-Score} = 0.717*X_1 + 0.847*X_2 + 3.107*X_3 + 0.420*X_4 + 0.998*X_5$, where X_1 = working capital/total assets, X_2 = retained earnings/total assets, X_3 = net operating profits/total assets, X_4 = book value of equity/book value of debt and X_5 = sales/total assets. A Z-score above 2.9 indicates that the company is deemed safe, while a value below 1.23 indicates that the firm faces a high likelihood of financial distress. In other words, the higher the Z-score the more viable the firm. The CASH variable is the ratio of cash items and cash equivalents to total assets and CRISIS is a dummy variable receiving unity (1) for the Greek sovereign debt crisis period (2011-2016) and zero (0) for the pre-crisis period. Model (1) includes other control variables along with firm and year fixed effects in order to capture any impact on the regression model attributed to specific industry and annual characteristics. Model (1) will be estimated using the panel fixed effect estimation method.

EMPIRICAL RESULTS

Table 1, Panels A and B present the descriptive statistics of the sample variables for the full period as well as for the pre and post crisis periods and also after separating the sample firms between SMEs and large firms. On average the viability and profitability of sample firms improved after the crisis period since both the Z-score and ROA present a relative increase. SMEs on average present higher profitability (positive average ROA of 0.08) relative to large firms where the respective figure is negative. Moreover, CASH comprises almost the 15 per cent of total assets and this figure seem to be rather stable before and after the crisis and between SMEs and large firms. Also, LEV has increased slightly after the crisis period which is expected by the hearse financial conditions, but both SMEs and large firms finance their assets by 22 per cent from long term liabilities. In addition, GROWTH and NWC have been reduced after the crisis indicating a reduction of sale revenues and liquid assets. The same stands for dividends and tangible assets since both those variables were lower in average in the

post crisis period. Finally, SMEs seem to have on average more positive operating cash flows relative to larger firms and this is the reason why SMEs have more liquid assets since they are able to finance daily operation easily even in periods of reduced bank lending.

Table 2 presents the panel regression results from the estimation of model (1) using ROA as the dependent variable. Regarding the full sample estimation, CASH produced a positive and significant coefficient (0.043) corroborating our first hypothesis and verifies the precautionary motive of cash holdings evidenced also by previous studies (Denis and Sibilkov, 2010; La Rocca et al., 2012; 2018). Also the interaction term CRISIS*CASH produced a positive and significant coefficient (though of smaller size compared to the CASH coefficient) suggesting that even after the crisis cash holding can assist firms to survive the financial turmoil by increasing their spending on investments, a fact that is even more important during periods of financial crisis. This result is in line with evidence by La Rocca et al. (2018) and verifies our third research hypothesis (H3).

The second and third columns of Table 2 present the re-estimation of model (1) separating sample firms between SMEs and Large enterprises. The variables under interest CASH and CRISIS*CASH both produced positive and statistically significant coefficients for SMEs while on the contrary they were insignificant for the comparable sub-sample of large firms. These evidence verify H2 and H3 and are in line with previous studies from Ozkan and Ozkan (2004), Faulkender (2002) and Martínez-Sola et al. (2018) and suggest that SMEs hold more cash because they are not able to obtain credit in the market due to higher probability of bankruptcy and higher risk thus cash holdings are more valuable for SMEs relative to large firms.

Table 1, Panel B: Descriptive statistics of sample variables, between SMEs and Large firms.

The last Table 3 presents the panel regression results from the estimation of model (1) using Altman Z-Score as the dependent variable. Regarding the full sample estimation, the CASH coefficient remains positive and highly significant verifying again the first hypothesis and suggests that firms holding more cash can improve their financial viability and reduce their distress risk. The same stands for the coefficients between SMEs and Large firms. However, the interaction coefficient CRISIS*CASH was insignificant for the full sample estimation and for the large firms sub-sample, but is positive and significant for SMEs. These findings again provide support for hypotheses H2 and H3 and document that SMEs which hold more cash on their assets could reduce their distress risk even during the crisis since they are able to finance daily operations and take advantage of investment opportunities.

CONCLUSIONS

In this study we aimed to analyse the way cash holdings impact on the profitability and distress risk of SMEs operating within a severe financial crisis environment characterized by reduced lending and investment opportunities. Empirical evidence verified all of the research hypotheses and indicated that cash holding impact positively on profitability and viability of SMEs, corroborating the precautionary motive of cash holdings (Martínez-Sola et al., 2018; La Rocca et al., 2018). Also, evidence suggest that the positive impact of cash holding on corporate financial performance is more significant for SMEs relative to large firms, especially during the sovereign debt crisis period. The findings of this study could be proved useful to managers and owners of SMEs. Holding a stock of cash and their equivalents is a valuable strategy for sustaining the ability of SMEs to finance daily operations and repay overdue obligations. Cash holdings are valuable for SMEs because they are financially constrained firms facing difficulties to raise credit and thus cash reserves provides them with the desired liquidity without having to liquidate assets or being forced to raise capital with higher costs.

A CONTEMPORARY SPORT SPONSORSHIP EFFECTIVENESS MODEL: SCALE DEVELOPMENT AND VALIDATION

Koronios, Konstantinos¹; Dimitropoulos, Panagiotis¹; Kriemadis, Athanasios¹;

Papadopoulos, Andreas¹; Thrassou, Alkis²

¹Department of Sport Management, University of Peloponnese, Sparti, Greece

²Department of Marketing, University of Nicosia, Nicosia, Cyprus

ABSTRACT

Sport sponsorship is one of the most rapidly developing means of marketing communication, and its development rate has surpassed conventional media advertising as well as promotion of sales. Corporations, on a global scale, are likely to pay out \$65.8 billion on sponsorship contracts in the year 2018 of which the largest share of funds will be spent on sports, in accordance with data provided by the world advertising research center (Handley, 2018).

Nevertheless, in spite of the substantial increase in sport sponsorship and its marketing ramifications, not much is known with regard to its effectiveness as a vehicle for marketing. The present research attempts to reveal which determinants impact sport sponsorship efficacy by proposing a theoretical model as well as to create a reliable and valid measurement scale for application in this field.

For the scope of the present research, a quantitative method was employed for scale development & validation, and a total of 3,434 questionnaires were gathered and examined by means of SPSS and AMOS. The reliability and validity of the developed dimensions of sponsorship efficacy were substantiated by the empirical examination of the theoretical model identifying the structural correlation between the proposed determinants.

Keywords: sponsorship, awareness, attitude, purchasing intentions, word-of-mouth, scale development, sport marketing.

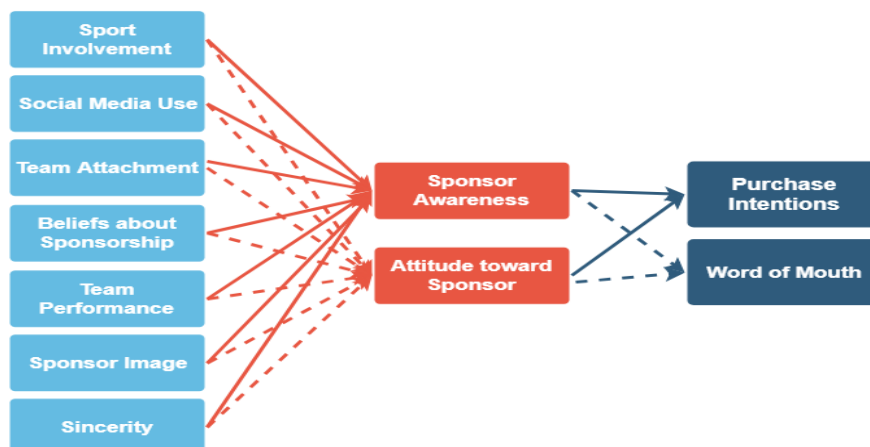

INTRODUCTION

Sport sponsorship is one of the most rapidly developing means of marketing communication, and its development rate has surpassed conventional media advertising as well as promotion of sales. Even though past research has concentrated independently of the antecedents impacting sponsorship awareness or the correlation between sponsorship and buying aims (Biscaia et al., 2017), so far neither has an all-inclusive model nor a reliable and valid measurement scale been created which combines these aspects in order to offer a detailed comprehension of the determinants which affect the efficacy of

sponsorship. This research attempts to reveal which determinants impact sports sponsorship efficacy as well as to create a reliable and valid measurement scale for implementation in this field.

THEORETICAL BACKGROUND

Sponsorship assessment is the subject of controversy in the literature, with the implication that present methods do not deal with or comprehend the full impact of activities related to sponsorship. The primary aspects of this research's model are the supporters' awareness of and attitudes toward official sponsoring companies, which includes their impact on fans' buying and word-of-mouth aims. In addition, the current research tried to explore the role of important predecessors, for instance, fans' involvement with sport (Gwinner & Swanson, 2003), fans utilization of social media (Eagleman and Krohn, 2012), sponsoring companies' anticipated sincerity (Olson, 2010), fans' degree of attachment with their sports club (Madrigal, 2001) in addition to their beliefs regarding sponsorship in general, the influence of team's performance as well as the sponsors' image (Walraven, 2013).. The above antecedents play significant part in increasing sponsorship effectiveness, which is displayed through a series of responses which, more often than not, starts with sponsorship identification and ultimately leads to increases in the purchasing of sponsoring companies' commodities, together with favorable word-of-mouth aims about them. Based on the previous discussion, the present study proposes a newly developed model in addition to reliable, valid as well as generalizable scale for sponsorship research that is based on a composite of the literature. Thus, the following model is proposed:

METHODOLOGY & RESULTS

The process of the present study is in accordance with Churchill's (1979) method for creating scales of multiple item marketing frameworks. A questionnaire was employed so as to gather data and was founded upon past studies which included specific sponsorship assessment determinants. Various

existing scales were employed so as to assist in defining the items of measurement in each determinant, but were changed and/or adjusted appropriately.

In order to create a sufficient pool of items which reflect the determinants impacting the efficiency of sport sponsorship, a comprehensive literature review as well as interviews of a semi-formal nature with knowledgeable individuals were carried out as a field test. The instrument was edited on the basis of feedback received from these experts. If items were recognized as being valid by the expert panel at the percentage of 75%, they were retained. This led to a first sample (6-10 items for each determinant), comprising items that were worded in both a positive and negative way. Then, eight experts (PhD students, researchers, professors) in the fields of sport services, sport marketing and buying behavior were identified and whom half (4) were requested to employ their expertise to offer further items for each determinant. A bank of 50 items (2 each factor contain from 1 to 9 items) was provided via this exercise.

The rest of the experts (4) were requested to go over the list of items which had been created and assess how pertinent they believed each of these items to be in regard to what it was meant to measure. This procedure led to a reduction in the number of items to 43. These 43 items were, in turn, incorporated in a questionnaire which was to be distributed at the purification stage.

Each of the items was arranged in a 5 point (completely agreed to completely disagree) Likert type scale. Items which reflected the 10 determinants were incorporated randomly. The questionnaire was administered to 100 students taking courses in sports management at an undergraduate level (Study 1). The final development sample size comprised 82 respondents (rate of response 82%). Exploratory factor analysis (EFA) and reliability analysis were performed in order to investigate the factorial structure of the questionnaire (Thompson, 2004). Investigation of whether the data is suitable for factor analysis include the measure of Kaiser-Meyer-Olkin's (KMO) and the Bartlett Sphericity Test. Moreover, rotation of axes was performed using Varimax method. Also, the reliability of exported factors evaluated by Cronbach α coefficient. These analyses revealed a ten-factor solution and resulted in a reduced scale of 38 items (1 to 9 items per factor). The final factor analysis explained 67.52% of the total variance.

Sport Involvement (Attraction)
Football is very important to me
Most of my friends are in some way connected with football
To me, there is no other sport like football
I think about football all of the time
Sport Involvement (Centrality)
Watching football games is one of the most enjoyable activities
I watch football whenever I can attending sporting events
I like viewing sport on TV

Team attachment
I feel like I am a member of the football team
The team is important part of my life
I want others to know I am a fan of the team
I believe that I work for the good of the team
I feel connected to my team
I feel I am part of my team
I feel like I am a 'real' fan of the team
It is important for me to be a fan of my team
I would experience a loss if I had to stop being a fan of my team
Awareness
Participants were asked to name, without any cues, the official sponsors <team name>
A list of brand names was used to assess recognition.
Beliefs of Sponsor
Sponsorship offers valuable financial support to football teams
Sponsorship helps teams to be successful.
Attitude Toward Sponsor
Due the particular sponsorship, I like more the products of the sponsor
I have a positive attitude toward the sponsors and their products, due to their sponsorship to my team.
The sponsorship improves my perceptions about the team sponsors and their products
Purchase Intention
"Will certainly buy products from the sponsor".
How likely it was that they would "Consider buying products from the sponsor,
Sponsor Image
Sponsors are involved in the community
Sponsors have good products/services
Sponsors only want to make money
Sponsors respond to consumer needs
I have a positive attitude toward the sponsor and its products due to the team sponsorship
The sponsorship improves my perceptions about the team sponsor and its products
Sincerity
This sponsor would be likely to have the best interests of the sport at heart.
The main reason the sponsor would be involved in the event is because the sponsor believes the event deserves support.
The sport would benefit from this sponsorship at the grassroots level.
Team Performance
I am delighted with the performance of my favorite team in the last competitions
I'm happy with the current performance of my favorite team
I appreciate that my favorite team will do well in the World Cup of Russia
Word of Mouth
How likely it was that they would "Recommend sponsor's products to others."

Table1: Sponsorship Effectiveness Factors & Items

Confirmatory analysis-assessment of the Latent structure

The question employed in this research consisted of the 38 item sponsorship efficiency scale as well as measures of a number of determinants, which were integrated in order to assess the validity of the scale. Questionnaires were collected from individuals of Greek descent who spectated the FIFA World Cup Russia 2018. These individuals were requested to complete a web-based survey, with the aid of a well-known sports website that encouraged visitors that watched the world cup to take part in the specific survey (Study 2). 3,434 questionnaires, in total, were completed with success and were then analyzed by means of SPSS and AMOS.

Dimensionality analysis was performed using confirmatory factor analysis (CFA) and explanatory factor analysis (EFA). Confirmatory factor analysis is a special statistical method of structural data processing that is used to determine the Goodness of Fit Index - GFI between an already fully formed and factorially structured model.

The general indicators of good adaptation studied were: the index χ^2 , Root Mean Square Error (RMSE) and Comparative Fit Index (CFI). If it emerges that χ^2 (χ^2/df) degrees of freedom with ratio <2.0 , RMSEA <0.1 and CFI >0.90 (Lomax and Schumacker, 2013) an acceptable adaptation is shown. Finally, in order to investigate the hypothesis presented in previous section, a Structural Equation Modeling (SEM) was used. In order to evaluate the proposed model a specific process was followed and the appropriate indicators were examined: Normed $\chi^2 < 1$, RMSEA < 0.1 and CFI > 0.9 (Schumacker and Lomax, 2010). CFA and SEM was performed using the AMOS software while EFA was performed using the SPSS software. The CFA showed that the proposed model for the structure of the tool was satisfactory (Normed $\chi^2 < 1$, RMSEA < 0.1 and CFI > 0.9). The results indicate that the proposed scales had a satisfactory validity and reliability indexes.

DISCUSSION

Sport sponsorship is one of the most rapidly developing means of marketing communication and corporations spend large amounts of money on sponsorship agreements. The present research attempts to explore the main factors influencing sponsorships' effectiveness, identifying 11 related factors and 37 items incorporated in the developed sponsorship questionnaire. The present conceptualization adds to previous efforts at measuring sponsorship's effectiveness, particularly via the development of a comprehensive scale which was submitted to a rigorous validation process and proved to be a generally valid and reliable tool for sports marketers and practitioners. Further researches should explore the validity of the developed tool in different contexts and population to further enhance the generalization of the results.

**UNDERSTANDING THE IMPACT OF SOCIAL COMMERCE
COMPONENTS ON CONSUMERS' PURCHASE DECISION-MAKING
PROCESS: A RESEARCH MODEL**

Kutabish, Saleh; Soares, Ana

School of Economics and Management, University of Minho, Braga, Portugal

ABSTRACT

In an era of fast-changing technology, businesses and consumers are increasingly shifting from e-commerce to social commerce. Consequently, the importance of social commerce is growing rapidly. Social commerce is identified as a subset of electronic commerce which includes two main types: a social network website that integrates commercial features enabling transactions and advertisement, or a traditional e-commerce website that includes social tools to enable social interactions. Businesses are moving toward social commerce due to the increase of social media popularity. Consumers tend to enrich their information and develop their knowledge by exploring and gathering information online and learning from other consumers who share their experience and purchase information publicly online. The use of social commerce components (SCCs) in social commerce websites was found to trigger consumers buying intention online. These components include social media, social shopping, rating and review, recommendations and referrals, and forums and communities. In this research, we focus on rating and reviews, recommendations and referrals, and forums and communities as learning tools in social commerce, which constitute tools for consumer interaction and information source. Drawing from the social learning theory and the online purchase decision-making process model, we propose a research model to study the impact of SCCs on consumer purchase decision-making process mediated by a consumer typology based on decision-making style and prior knowledge of product. Expected implications for practitioners and scholars are discussed.

Keywords: Social Commerce; Social Commerce Components; Online Purchase Decision-making Process; Online Buying Behaviour; Social learning

INTRODUCTION

All jobs require people to manage their emotions to an extent. This management of emotions also leads to specificity in the display of emotions, which could either accord to how staff feel or be different from it (Liu, Chi & Gremler, 2019). Emotional labour, as this process is termed, is defined by

Hochschild (1983) as “the management of feeling to create a publicly observable facial and bodily display” (1983, p.7). Many jobs contain an emotional component that goes beyond the normal burden on feelings caused by work and thus require “emotional labour” (Liu et al., 2019). Such work has three things in common: (a) requires face-to-face or voice-to-voice contact with public, (b) requires the employee to produce an emotional state in the customer, and (c) allows the employer, through training and supervision, to exercise some control over the emotional life of employees (Hochschild, 1983).

Hochschild (1983) distinguishes between two approaches available to the emotional labourer - *surface* and *deep acting*. These terms have been derived from world of theatre and are techniques used by actors. In surface acting (SA) actors deceive others about what they actually feel, and the aim is primarily to get the ‘right emotion’ (here, this can be taken to be the emotion desired by the employer) across to the audience, although the emotion is not felt by the actor as such. In deep acting (DA), actors deceive themselves to produce the feeling that is required for them to have the outward appearance that induces the desired emotion in the audience. Deep acting is of two types, one works by directly exhorting the feeling and the other is through trained imagination, which is also known as *method acting* (Stanislavski, 1965). In the method acting technique, the actor primarily exhibits an emotion by digging into their past pool of incidents, which act as an emotion ‘bank’, and recall situations relevant to the emotion that they need to deliver at that moment. For example, if a scene has to be performed where the actor is required to show condolence towards an ailing confused co-character, they may wish to draw the emotion out of a similar situation from their life, say when they may have looked after an aged and unwell parent, or when they perhaps attended to someone at a care home. Another example - say a flight attendant delivers their statements in a particular manner denoting politeness, synchrony of tone and respectful usage of words with the aim that the customer feels cared for - “*Sir, kindly fasten your seat belts since we are encountering bad weather.*” This can be an example of deep acting by the employee where genuine concern is being projected to passengers on board through a conditioned mode of message delivery. However, a flight attendant may also exhibit surface acting by not feeling any genuine concern while they greet passengers with a smile when getting aboard on the flight - “*Good morning! Welcome aboard!*”

Aim: This conceptual paper explores the dimensions of emotional labour and its interconnections to interaction quality and service continuity in both service encounters and service relationships. This provides the basis from which to develop new avenues for research to take account of the plausible layers of EL treatment and their interconnections to interaction quality and service continuity as outcomes.

As such, the various definitions of EL are examined, as is how the term has evolved and been explored from organizational, employee and customer perspectives. An attempt is then made to forge possible interconnections between EL, interaction quality and service continuity with logic derived from developments within research on EL thus far. Furthermore, the paper considers the differences that may exist in the nature of EL in contextual settings that can be seen as service encounters or as service relationships (Albrecht et al., 2015; Chi & Chen, 2019; Liu et al., 2019). The conceptual interconnection of EL with other service marketing dimensions is an attempt to pave way for further empirical research that would enrich existing literature and offer benefits to industry practitioners for planning and integrating EL in the design, plan and execution of their service strategy.

The next section presents the different approaches that have been taken to define EL and presents the definition of EL that forms the basis of this paper.

Definitions of EL

The management of feelings and its display are interrelated in Hochschild's (1983) definition. Her approach focuses on how employees need to manage their emotions to suit the display expected by the organization to serve their customers well. The expression and display aspects of EL are connected to the internal management of feelings and expressed emotions are considered as a part of 'management' in Hochschild's (1983) definition. Wharton and Erickson (1993) however segregate the aspects of *managing* emotions and its *display* in their EL definition. While Morris and Feldman (1996) focus on employees' *expressed* behaviour; and Ashforth and Humphrey (1993) deal with their *observable* behaviour conforming to the organization's rules and expected display (see Diefendorff & Gosserand, 2003 for further discussion).

Irrespective of the singular or separated treatment of the management of feelings and its display in EL definitions, there is a clear view that the emotions staff display need to be aligned to the rules and expectations of their employer. Conformance to an organization's display rules (Ashforth & Humphrey, 1993; Diefendorff & Gosserand, 2003) is an external influence on the employee's emotional expression. Many other external triggers such as supervisor and customer influence (Totterdell & Holman, 2003) and internal triggers, such as personality traits, could also initiate employees' efforts to manage their emotions (Grandey, 2000). Given this, Hochschild's (1983) definition is more inclusive in defining all aspects of EL, since employees actually manage multiple triggers and influences to perform EL, using it as a tool to render their interactions towards multiple stakeholders, customers being chief amongst these (Totterdell & Holman, 2003).

The sub-constructs of SA and DA (Hochschild, 1983) are used to define the attributes of EL. SA (Grandey, 2000; Smith et al., 2009) is defined largely by most researchers as it is by Hochschild (1983). DA has been defined by some as having as two parts - active DA, where an employee invokes the

feelings and passive DA, when employees genuinely feel the emotions. However, Hochschild's (1983) definition captures DA as one component of EL. The argument against the other definitions is that it might be very difficult for an individual to segregate between invoked and genuinely felt emotions since they may appear to be the same to some (particularly as unlike actors – they are unlikely to have received formal training in this respect). Also, when someone tries to invoke feelings, this could overlap with the attribute of 'pretending to have emotions that one doesn't have' which is a part of SA (Hochschild, 1983). Thus, the constructs of SA and DA are best dealt as two sub-constructs of EL, with no further segregation in DA.

Table 2.1 gives a summary of EL definitions, sub-constructs, and major differences from Hochschild's (1983) definition.

Table 2.1: Summary of EL definitions

Author & Year	Definition	Salient focus areas
Hochschild (1983)	The management of feeling to create a publicly observable facial and bodily display	<ul style="list-style-type: none"> - Sub-constructs- DA and SA - Concentrates on management of feelings
Wharton and Erickson (1993)	Emotion management as the extent to which work or family role calls for an intentional display of emotions, and type of emotional display refers to the particular emotions that are expressed in the role	<ul style="list-style-type: none"> - Segregate the aspects of managing emotions and the display of those emotions as two separate dimensions of EL
Morris and Feldman (1996)	The effort, planning and control needed to express organizationally desired emotions during interpersonal transactions	<ul style="list-style-type: none"> - More concerned with expressed behaviour than felt feelings
Ashforth and Humphrey (1993)	The act of displaying the appropriate emotion (i.e. conforming to a display rule)	<ul style="list-style-type: none"> - Concentrates on observable behaviour - Believes that DA and SA become more a routine act over time for employees
Grandey (2000)	Emotion regulation defined as modifying feelings by thinking good thoughts or reappraising the event (deep acting), or modifying expression by faking or enhancing facial and bodily signs of emotion (surface acting)	<ul style="list-style-type: none"> - Deals with emotion regulation - DA and SA constructs are similar to those of Hochschild (1983)
Diefendorff and Gosserand (2003)	The process of regulating one's emotional displays in response to display rules so that	<ul style="list-style-type: none"> - Concentrates on employing EL strategies based to match organization's

	work goals can be achieved	display expectations (a control theory method)
Smith, Dorsey & Mosley (2009)	EL is defined as two components - "emotive effort" that captures active deep acting and "emotive dissonance" that captures surface and passive deep acting	<ul style="list-style-type: none"> - Sub-constructs - emotive effort (active deep acting) and emotive dissonance (passive deep acting and surface acting) - Focuses on the aspect of actually feeling as a separate component of DA

It is interesting to note from considering these definitions that Hochschild's encapsulates the interaction component, the felt emotions and the observed emotions of the EL bearer in a single frame, while others focus on one or the other elements of EL. Also, previous research primarily concentrates on EL as rendered from the employees' perspective, thus denoting the *flow* of EL from employees to the other entities - such as customers, co-workers, and supervisors. An opposite flow such that customers influence the EL rendered by employees is possible too (Liu et al., 2019).

The following section examines the evolution of EL literature and the various perspectives it has been researched through.

EVOLUTION OF EMOTIONAL LABOUR RESEARCH

EL, as a concept, evolved from an organizational perspective and is widely understood from an employee perspective. Aspects of the concept were also examined from a customer standpoint and the following sections delineate the evolution of EL from these varied viewpoints and set out the key concerns of EL that help conceptualize the interconnections between EL, interaction quality and service continuity.

Organizational Perspective on EL

The organizational culture, the nature of jobs, the intensity of interaction component in the jobs, and EL display expectations could greatly influence EL and the interaction perceptions ensuing from the EL generated.

Influence of organizational culture on EL

Organizations might create a culture, setting demands of EL from their employees (Albrecht et al., 2015; Karabanow, 1999, Liu et al., 2019) to achieve their organizational objectives of positive customer engagement (Grandey, Fisk & Steiner, 2005; Sutton, 1991). Organizational control of employee EL (ability to direct, demand and influence the amount of EL) could also result in employees employing coping strategies that allow them to share and alleviate their pain (if any) (Grandey, Foo, Groth &

Goodwin, 2012; Korczynski, 2003). Positive organizational culture could influence employees to have a positive disposition towards EL (more DA and less SA) (Ashforth & Humphrey, 1993; Grandey 2000; Grandey, 2003 Morris & Feldman, 1996). This adds credence to studying employee-customer relationships with respect to the how EL may influence interaction quality between employees and customers.

Organizational influences and expectations from employees may, or may not, influence their use and the intensity of EL during employee-customer interactions. Positive organizational support could motivate the employees to indulge more in DA than SA, reducing their strain and emotional exhaustion (Ashforth & Humphrey, 1993; Grandey 2000; Morris & Feldman, 1996). Customers, being one of the prime recipients of employee EL (Grandey, 2000; Grandey, 2003; Totterdell & Holman, 2003), could thus formulate different perceptions of interaction quality rendered by employees. EL could also impact other interactions within employees such as co-workers and supervisors (Totterdell & Holman, 2003).

EL in interaction jobs

The prevalence of EL in a job may vary depending on the type of job and the level of employee involvement with regards to interactions (Grandey, 2000; Wu & Hu, 2013). These interactions could vary in terms of the frequency, duration and the variety of EL employed (Guy & Newman, 2004). High versus low interaction jobs would entail variations in EL. Also, different service types and environments would have an impact on the EL generated in the service interactions this would offer several opportunities to test EL in different contextual situations (Albrecht et al., 2015, Liu et al., 2019; Razzaq, Razzaq, Yousaf, Akram & Hong, 2017). Variations in EL could also impact the perceptions of EL in interactions and impact service continuity outcomes (Liu et al., 2019).

Impact on EL interconnections

Organizational influences could impact the EL that employees may engage in towards their co-workers and customers (Wu & Hu, 2013; Bhave & Glomb, 2016). This could be an interesting area of study to test the influence of EL in different service contexts and how different organizational factors such as organizational culture, EL expectations and co-worker support influence (or not) the employee engagement in EL, customer perceptions of interactions and the ensuing service continuity (Liu et al., 2019).

Here how organizational influences could impact the EL rendered by employees has been outlined. The next section captures other intrinsic (from within self) and extrinsic (external environment) factors that may influence employees to engage in EL, how this impacts the employees and their interactions (Albrecht et al., 2015).

Evolution of EL: Employee Perspective

There are different factors, both *intrinsic* and *extrinsic* that may influence an employee's ability to engage in EL (Bhave & Glomb, 2016) and impact their relationships with the customers (Grandey, 2000; Grandey, 2003) as highlighted in the sub-sections that follow.

Intrinsic: Employee personality traits

Individual traits and personalities could give rise to variations in EL behaviour amongst employees, and some could therefore engage more in SA, while others could exhibit more DA, with DA postulated to have a more positive impact on the employee-customer relationships and SA more negative (Groth, Hennig-Thurau & Walsh, 2009; Liu et al., 2019; Liu, Prati, Perrewé & Ferris, 2008; Trougakos & Jackson, 2011).

Personality traits of employees could also influence other entities such as their colleagues, supervisors and the customers they interact with (Liu, Perrewé, Hochwarter & Kacmar, 2004) and traits, such as emotional intelligence, could influence the employment of DA more than SA by employees (Liu et al., 2008). Extraverts tend to perform more DA than introverts (Judge, Woolf & Hurst, 2009), just as highly customer-oriented employees (Allen, Pugh, Grandey & Groth, 2010) and proactive personalities do (Randolph & Dahling, 2013). Most importantly, if individual identity traits are congruent with organizational display rules, it results in more DA than SA (Ashforth & Humphrey, 1991; Gosserand & Diefendorff, 2005; Morris & Feldman, 1996).

Thus, different intrinsic factors, such as personality traits, could influence employee EL and affect the customer relationships they hold. Factors inherent to the employees could lead to variations in the intensity and process of engagement in EL. Not only does engagement impact the employee's well-being in different ways, the flow of EL to other entities, such as colleagues and customers, impacts the interactions of the employees with these entities (Liu et al., 2019). These findings strongly support examining the flow of EL and its interconnections to interaction perceptions by involved parties (Albrecht et al., 2015).

Extrinsic: Employee environment

Just as with intrinsic factors, extrinsic factors could also impact employee EL variations. A high interaction job component can cause EL amongst employees (Albrecht et al., 2015; Brotheridge & Grandey, 2002; Grandey, 2000; Grandey, 2003). Intensity, frequency, variety and display rules can also greatly impact the amount of EL performed by employees (Totterdell & Holman, 2003). Supervisor's display perceptions and co-worker's expectations of display could additionally impact the EL behaviour of employees (Diefendorff & Richard, 2003; Wu & Hu, 2013). Employee EL could be impacted by other social factors such as working in a team or alone (Drach-Zahavy, Yagil & Cohen, 2016) with a tendency for DA when in a team. Most importantly, customers may exert a greater power on EL than colleagues and supervisors (Drach-Zahavy et al., 2016; Liu et al., 2019; Totterdell &

Holman, 2003). Hur, Moon and Jung (2013) also found that employee EL impacted job satisfaction, which then further mediated customer satisfaction. Emoting to someone who has the power to decide on the delivery of service, interaction quality and thus make decisions that could influence gains to the organization, and the individual employee, is highly likely to influence the EL performed by employees. Hence, customers could influence employee EL engagement and approach (Diefendorff, Morehart & Gabriel, 2010; Li et al., 2019). Customer's emotional experience could mediate the impact of employee EL on the customer outcomes (Tang et al., 2013).

The above findings indicate that customers could be a major reason for employees to engage in EL. Customer influence could be stronger than that of internal entities such as colleagues or supervisors as the organizational and employees' individual goals, motives and gains are heavily influenced by customers. Thus, the flow of EL from employees to customers and the other way round, appears to be of paramount importance and may have a possible influence on service continuity between the entities involved (Razzaq et al., 2017).

Evolution of Emotional Labour: Customer Perspective

The evolution of EL has been widely studied from an organizational and employee perspective. However, customer *expectations* of EL have not been explicitly recorded in any prior research.

Customers' expectation of EL from employees could be very high when interpersonal interactions are involved between them (Razzaq et al., 2017; Wharton & Erickson, 1993). Authenticity anticipation could, for instance, be extremely high in personalized service contexts (Salman & Uygur, 2010; Wang & Groth, 2014). DA appears to have a positive impact, while SA has a negative impact on customer perceived service quality (Tang, Seal & Naumann, 2013; Trougakos & Jackson, 2011). However, employee SA does not always impact customer service quality negatively, as long as customers are not able to detect the SA (Albrecht et al., 2015; Drach-Zahavy et al., 2016; Groth et al., 2009; Hur et al., 2013). These findings were applicable in the context of service encounters (Gutek, Groth & Cherry, 2002; Liu et al., 2015; Pugh, 2001). DA's positive impact was reinstated however SA's negative impact on customer satisfaction was not established when the relationship strength and intensity was high possibly because the customers didn't want to be judgmental of the authenticity of EL by the employees (Gabriel, Acosta & Grandey, 2015; Wang & Groth, 2014). The context of the study was set in service encounters and this could possibly change in service relationships (Chi & Chen, 2019).

Longer duration and intensity in interactions could accentuate the prominence of EL (Grandey, 2000). A study done on dyads of insurance agents and customer dyads found that DA has a positive impact and SA a negative one on customer satisfaction and. Also, relationship strength was found to moderate the positive impact of DA and negative impact of SA on customer outcomes such as purchase amount, willingness to recommend and willingness to remain in a long-term relationship

(Chi & Chen, 2019). Kiely's (2005) qualitative study tries to understand the customer and employee perspectives in business-to-business interpersonal relationships. Customers' expectations of EL in the service relationships could impact an employees' EL, as well as a customers' perspectives on service quality (Kiely, 2005). Hence it can be suggested that the organizational, employee and customer perspectives on EL all focus on the interplay of EL and the interactions between entities – be they the employee and their colleagues or the customer, where its impact on quality perception might be thought a chief concern (Albrecht et al., 2015).

EMOTIONAL LABOUR AND INTERACTION QUALITY CONNECTION

However, interaction quality has not been studied in conjunction to EL despite the high prominence of EL in interactions. Interaction quality has been defined as a sub-dimension of service quality by Brady and Cronin (2001).

Perceived service quality has been defined as “customers' judgment about an entity's overall excellence or superiority” (Parasuraman, Zeithaml, & Berry, 1988, p.15). Service quality has been defined by a single layer of dimensions (Parasuraman, Zeithaml & Berry, 1985; Parasuraman et al., 1988; Parasuraman, Zeithaml & Berry, 1994); or through hierarchical models (Cronin & Taylor, 1992; Cronin & Taylor, 1994; Dabholkar, Thorpe & Rentz's, 1996; Gronroos, 1984; Haywood-Farmer, 1988; Rust & Oliver, 1994, Brady & Cronin, 2001).

Service encounter 'rich' contexts, such as retail interactions, could provide opportunities for observing multiple EL encounters between employees and customers (Dabholkar et al., 1996; Groth et al., 2009). Interaction intensive and high-contact service contexts (Karatepe, Avci & Tekinkus; 2005; Lassar, Manolis & Winsor, 2000), also provide an apt environment for employees to indulge in EL towards their customers.

Such an interactive process fosters long-term service relationships (Svensson, 2003; Svensson, 2004).

EL is prevalent in interactive environments and is a medium for employees to render service to the customers, yet the impact of EL on interaction quality has not been examined explicitly (Diefendorff & Richard, 2003; Grandey, 2000; Liu et al., 2019; Totterdell & Holman, 2003), particularly in long-term service relationship service contexts (Chi & Chen, 2019; Kiely, 2005). Employee EL has additionally not been much investigated with regards to its flow to (or influence on) the customer, particularly their perceived interaction quality. Matching customer EL expectations to employee EL has also not received attention, although both employees and customers are involved in performing and receiving EL simultaneously. Chi and Chen (2019) also propose the importance of studying customer expectations of EL. Recording the joint responses of both entities has been limited to a few studies (Chi & Chen, 2019; Groth et al., 2009; Liu et al., 2019; Trougakos & Jackson, 2011). Such studies provide

ideal opportunities for testing the impact of EL on employee and customer interaction perceptions. EL perceptions and interaction perceptions could well impact relationship outcomes, such as service continuity intentions (Razzaq et al., 2017).

EMOTIONAL LABOUR'S IMPACT ON SERVICE CONTINUITY

Relationship continuity is an essential prelude to customer loyalty in long-term relationships so that customers consider further engagement with the organization through repeat purchase, and referral (Zeithaml, Berry & Parasuraman, 1996). For example, EL could impact the interactions positively in the case of service encounters and have an impact on customer loyalty in turn (Chi & Chen, 2019; Groth et al., 2009; Hennig-Thurau et al., 2006; Razzaq et al., 2017). The interactions, for example, in private banking can influence customers' investment decisions and thus subsequently affect the organization's tangible (financial) and intangible (e.g. perceptions of service) gains (Horn & Rudolf, 2011; Mittal & Lassar, 1998). The interpersonal interactions with employees strongly impact customers' loyalty intentions, particularly in high-context services (Chi & Chen, 2019; Kiely, 2005; Razzaq et al., 2017; Yavas, Benkenstein & Stuhdreier, 2004). However, before a customer forms any perceptions about the organization, they possibly consider the bond shared with their service provider. This person-to-person bond could be so strong that it influences the customer to even move their association with this employee to another organization when the employee switches employment (Parkington & Shneider, 1979). As the person-to-person bond is likely to impact the customers' bond with the organization, and their loyalty intentions, the intention to continue the service relationship with the employee (Chi & Chen, 2019; Razzaq et al., 2017; Svensson, 2003; Svensson, 2004) could be a function of the perceived customer interaction quality.

The key prelude to customer loyalty intentions would be the continuity of the service relationship itself (Chi & Chen, 2019; Kandampully, 1998). Interactive process can have a continuous influence on the expectations of the service receiver and their perceptions of the interactions. The evaluation of the interactive process could last through a single interaction, as seen in a service encounter, or through multiple interactions in a service relationship. This would lead the service receiver (customer) to evaluate the continuity of the service relationship (Gutek, Groth & Cherry, 2002) on a continual basis through the interactions (Chi & Chen, 2019; Svensson, 2003; Svensson, 2004). This is especially true for high-contact service contexts where the bond between the entities involved in a relationship could be stronger (Chi & Chen, 2019). On certain occasions, service continuity could depend on this interpersonal relationship, rather than the loyalty association of a customer with the organization (Chase, 1978; Chase, 1981).

This connects further to 'intention to continue the service relationship' (Bloemer, Ruyter & Wetzels, 1999; Boulding, Kalra, Staelin & Zeithaml, 1993; Chi & Chen, 2019; Kandampully, 1998; Pollack, 2006; Zeithaml et al., 1996); building a bridge between EL-interaction quality and service continuity.

The context of the service is covered next. Service context may add variations to the extent of EL elapsed, perception and expectation of EL by the involved participants, and its impact on perception of interactions and finally service continuity.

CONTEXT SELECTION: SERVICE ENCOUNTER VS. SERVICE RELATIONSHIP

Morris and Feldman (1996) postulated that frequency, intensity, duration and variety of EL would have different positive negative, or no relationship, with each other. Brotheridge and Lee (2003) also reiterate that EL is the behavioural response to variations in the frequency, variety, intensity and duration of service interactions" (p.367). It can be inferred therefore that service relationships would vary significantly across frequency, duration and variety of EL from service encounters, particularly given that customers and relationship managers meet regularly, and the duration of the meetings are significant (Chi & Chen, 2019). The intensity of each encounter may vary depending on its subject and all four elements (frequency, intensity, duration and variety) would invoke different varieties of EL between the employees and the customers, hence impacting their interaction quality. Investigating EL in the contexts of service encounters vs. service relationships could offer varied outcomes with respect to the perceptions of interactions, EL and service continuity (Chi & Chen, 2019).

This paper considers the nuances of a service encounter vis-à-vis a service relationship context to examine EL and its interconnections. Service relationships differ from service encounters with respect to the frequency of interactions, intensity of the interactions and the tendency that the service is rendered by the same service provider over time. "A single interaction between customer and provider is referred to as a 'service encounter'. A service relationship is when the two individuals - employee and customer - have repeated contact with each other over time and get to know each other as role occupants and sometimes even become friends" (Guttek, Bhappu, Lia-Troth & Cherry, 1999, p.133).

Previous EL studies have predominantly chosen service encounters spanning contexts such as retail, convenience store, healthcare and call centres. The prevalence of EL has been found to be high in interaction-intensive contexts. This may also indicate a high prevalence of EL in the service relationships, where many interactions may span a period of time between the two entities (Chi & Chen, 2019; Kiely, 2005). The interactions in a service relationship can lead to participants knowing each other well on a person-to-person level. The intensity of interaction would additionally be higher

in a service relationship, since the propensity for future interactions and transactions exist between the two entities (Chi & Chen, 2019; Gutek et al., 2002; Kiely, 2005).

Customers are less affected by service employees' emotional labour, or the lack of it, when the service encounters are low-affect, low-intimacy types such as in a convenience store (Gabriel et al., 2015; Grandey, 2000; Price, Arnould & Deibler, 1995; Wang & Groth, 2014). This is probably because the customers also realize that service providers do not always express 'real' emotions, and the customers do not expect, or care, when they perceive that such an effort is being made. In an extended service relationship context, the employee EL is valued more since it is a way of communicating trustworthiness (Chi & Chen, 2019; Grayson, 1998). Both service encounters and service relationships, would provide different kinds of opportunities for exploring the impact of EL on interactions and service continuity.

Service encounters are anonymous in nature and avoidance of another contact with the same employee is possible (Wang & Groth, 2014; Gabriel et al., 2015). This anonymity could lead to verbally abusive relationships. However, this could drastically contrast to the situation in service relationships, where the tendency for multiple contacts and the longevity of the relationship exists over time (Chi & Chen, 2019; Grandey, Kern & Frone, 2007). The possible negative impacts of EL on the interactions between the two entities is an area for further exploration.

Lin and Lin (2011) conducted a study across several service encounters, and different types of service contexts. Independent viewers marked their observations of the encounters and also took feedback from the customers to find that the service environment, the group mood amongst peers and self-emotion influenced employee affective delivery, which in turn had a positive effect on the customers' service encounter satisfaction and loyalty intention. This is an important study as it emphasizes the impact of different contexts on EL strategies followed by employees (Albrecht et al., 2015; Liu et al., 2019). Lin and Lin's (2011) study also underscores the variations in the interconnections of EL-interactions-service continuity intentions, owing to different contexts. Different contexts could generate service encounters and service relationships of varying intensity and with a frequency of interactions and the focus of this paper is to bring to attention to those overlooked opportunities for further exploration (Chi & Chen, 2019; Liu et al., 2019).

A strong association and difference exist in the demands of EL in response to the interactional nature of services. A longer service duration could demand heavier emotion regulation, than a shorter one, as postulated by Grandey (2000). Greater familiarity between a service provider and their customer could actually enable them to map each other's emotions far better, since they meet over several encounters and probably even generate a rapport or friendship over time. The employee's EL and a customer's perception could also be much more pronounced and an expectation set by the customer in

such a context (Chi & Chen, 2019). An employee's EL could be smooth, or difficult, depending on the kind of service relationship that they share with the customer. A customer's perception could also vary from being extremely demanding to being predominantly tolerant in terms of the extent of EL adopted by the employee. Differences may also exist due to diverse service types (Silvestro, Fitzgerald, Johnson & Voss, 1992). For instance, the intensity of the interactions could be much more pronounced in service relationships than in service encounters, and thus, the consideration of the EL intensity (Grandey, 2000) generated could provide interesting insights on the study of EL in different service types, service encounters and/or service relationships.

Kiely (2005) studied emotions in the context of business-to-business service relationships in the shipping industry. Adopting an interpretive style, it is one of the first steps towards understanding emotional labour in complex service relationships. Kiely's (2005) findings depicted that most employees engaged in DA, although there were occasions where they subjugated their real emotions to emote otherwise. The interesting aspect was that most of the employees felt an anguish at not being able to deliver as per the customer expectations, and this was an innate feeling rather than a monitored, centralized or trained emotion (Kiely, 2005). It is one of the first studies to consider a service relationship in the business-to-business context where both the employees and customers were associated with firms involved in business transactions with each other. Kiely's (2005) work further enforced the impact of EL in service relationships and its impact on service continuity supporting avenues for further research as outlined in this paper. Chi and Chen (2019) also found EL to impact the customer outcomes in a service relationship context.

Many research gaps can still be explored to study EL from both the categories of services- encounters and relationships, and more so from service relationships given the limited research conducted so far, and the higher prevalence of EL plausible in service relationships.

The next sections analyze the possible research gaps based on the perusal of literature in EL thus far. Further research could enrich the literature in EL and its connectivity to services, interactions and service outcomes.

DISCUSSION: RESEARCH GAPS FOR EXPLORATION

The following outlines the key observations arising from the evolution of EL, and its connections with interaction quality and service continuity:

- EL has been explored from one of entities' perspective (customer or employee). The perspectives of both entities at a given point have not been captured in any previous research, except for the work by Groth et al. (2009).

- Paired research that involves the dyadic responses of employee-employee (between colleagues) pairs could be conducted to test the flow of EL between employee interactions within an organization. The exploration could be emulated between supervisor-employee pairs within an organization, here perhaps a focus on employee well-being and employee retention might be of particular interest.
- Customer-employee dyads could be explored to test the impact of EL on the interactions between customers and employees and examine the ensuing interaction outcomes. Customer perspectives alone have been captured previously, however joint responses have not been considered much. This could throw further light on the nature of EL flow and its impact on customers and employees.
- Customer expectations of EL could also be studied and matched to actual employee acting strategies to consider whether the EL threshold is exceeded, or not met at all, as per a customer's needs.
- EL has been predominantly studied in the context of service encounters, while this paper extends to consider the realm of service relationships as well.
 - EL could be explored more in service relationship contexts than service encounters to expand on Kiely's (2005) work, which is the one so far to capture EL in the context of service relationships.
 - Comparative studies could be conducted between the contexts of service encounters and relationships - examining the relative EL flow between different entities (employees and customers) in each of the contexts.
 - EL interconnections, as shown in this paper, could be particularly explored in service relationships expanding the work of Groth et al. (2009) and Wang and Groth (2014) that was conducted in service encounters.
- Previous studies have not captured the outcomes of EL with respect to service continuity (Chi & Chen, 2019). Most employee perspective studies have considered the impact on employee well-being and customer perspective studies have considered impact on customer loyalty intentions. However, future works could consider the nuances of service continuity from either entities or as dual perspectives.

Exploration of emotional labour along the said lines could help contribute to theory and practice in a considerable manner.

CONCLUSION

Plausible Contribution to Theory

Despite the ubiquitous nature of EL in service contexts involving high-contact and high-frequency interactions; interaction quality (Brady & Cronin, 2001) has never been explored with regards to how employee EL could impact customers' interaction perceptions and in turn this may affect the customers' service continuity intentions (Boulding, Kalra, Staelin & Zeithaml, 1993; Kandampully, 1998; Zeithaml, Berry & Parasuraman, 1996). The interaction process involves the expectations of service receiver, as well as perceptions of interactions (Svensson, 2003; Svensson, 2004). This paper highlights customers' perceptions of interaction quality that result from to employee EL in service encounters and relationships (Gutek et al., 2002; Svensson, 2003; Svensson, 2004).

Customers, in comparison to colleagues or supervisors, could exert a higher relative power in influencing employee EL (Diefendorff, Morehart & Gabriel, 2010; Liu et al., 2019; Totterdell & Holman, 2003), yet linkages between employee-customer have not been explored in EL literature (nor indeed have those between employee-employee).

High-contact, interaction-intensive service relationship contexts may involve higher stakes than service encounters, for both the customer and employee. These personalized service relationships could impact revenues, customer service perceptions and even their loyalty intentions (Mittal & Lassar, 1998; Parkington & Schneider, 1979; Seiler et al., 2013; Yavas et al., 2004), with bonds so strong that they continue even when an employee changes firm (Mittal & Lassar, 1998; Parkington & Schneider, 1979). An opportunity to test the impact of EL in service relationships and/or compare these with those found in service encounters has thus remained unexplored, providing rich area of future research (Chi & Chen, 2019).

Customers' expectations of EL have also not previously been matched to employees' actual EL behaviour. The employee puts effort towards into delivering EL to the customer through interactions, while the customer could be expecting the same, less - or more - EL from the employee (Chi & Chen, 2019; Diefendorff, Morehart & Gabriel, 2010; Totterdell & Holman, 2003). This match (or mismatch) between customers' EL expectations and employees' delivery of EL could help understand the flow of EL in the interactions between both entities.

The transpiring flow of employee EL enactment and perception by customers' has not been entirely captured in previous research. This conceptualization thus explores the possibilities of exploring EL:

- From the perspective of the involved entities;
- In the context of service encounters and/or service relationships;
- In conjunction with other dimensions such as interaction quality and service continuity.

Contribution to Practice - Potential Gains

Customer feedback could be captured on an ongoing basis to be able to map their EL expectation to actual employee EL, which could identify the expectations gap that may otherwise go unnoticed by employees performing EL in isolation. This could impact employees by helping them to engage in appropriate EL and thus positively impact interaction quality and, finally, yield positive encounters and sustained relationships with their customers over time.

Organizations could hire, train and hone the skills of their employees so that they could manage their emotions and naturally align them to the EL expectations of their customers; while also being able to replenish their own emotions due to any drain from engaging in EL. The expected outcomes would heighten interaction quality and high-gaining service encounters and relationships.

Management of emotions and a congenial culture of building and strengthening relationships over time can prove more beneficial than chasing short-term financial gains alone. Strong interactions could harbour lasting and sustainable relationships for customers, employees and the organizations involved.

Final Reflections

Diagram 1.0 provides a diagrammatic representation of the concepts that have been analysed and proposed as having interconnections with EL.

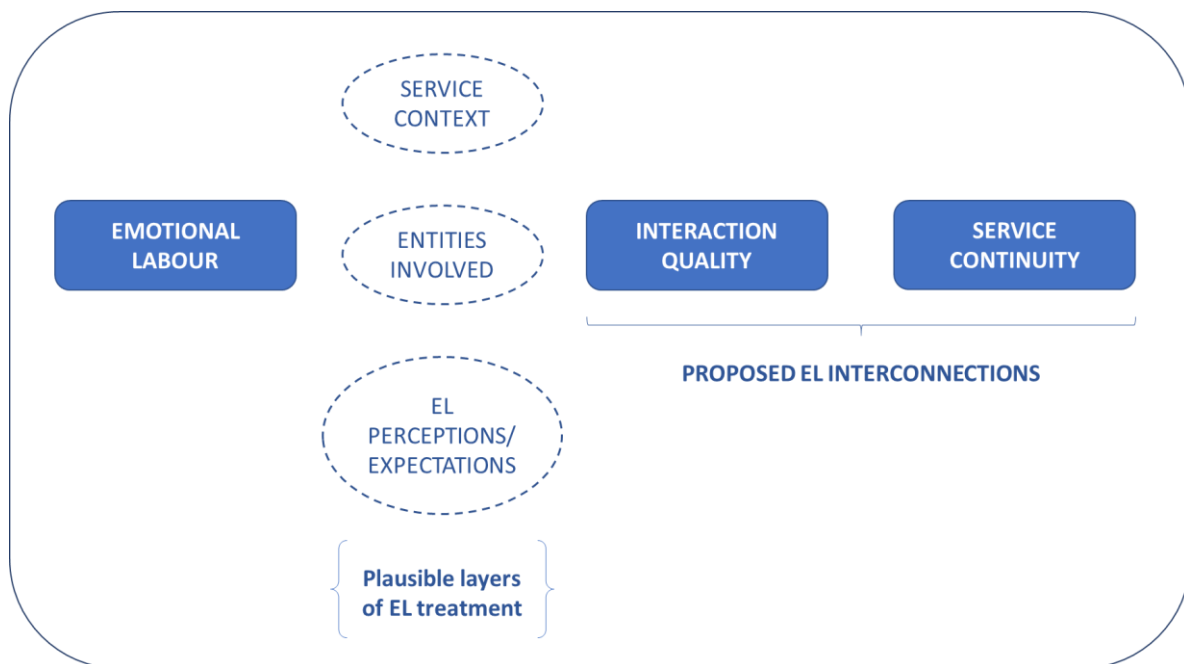

Diagram 1.0: EL interconnections

This paper established the conceptualization of EL and its connections to interaction quality and service continuity. EL could be treated through different filters to examine the variations in the outcomes of other interconnecting dimensions. EL has been researched from - organizational, employee, and customer perspectives. This paper indicates the nuances of service encounter and service relationship contexts that may prime different EL strategies from the service provider *and*

different expectations and outcomes from the service receivers. These could variously impact the dimensions of interaction quality and service continuity due to the service contexts, entities involved and/or the perceptions and expectations of EL and interaction quality.

The discussion helps explore the dimension of EL and advance its consideration with other dimensions of marketing for as the basis of further empirical exploration. Such examination has significant potential for the understanding of EL in its varied forms and with its numerous impacts – both in the encounter and in longer-term service relationships.

²St James hospital Leeds and University of Leeds, UK

³University of West Attica, Greece

ABSTRACT

As complexity in health care increases, European Health Management Systems require innovative leaders who can identify needs and current challenges in their practice, shift and adapt quickly, are resourceful and effective, thrive on organizational change, inspire others and make sense out of uncertainty and resistance to change for those they lead. Strong leadership is the key driver of overall organizational performance, and well-constructed talent management systems remain critical to developing and retaining a successful pool of strong healthcare leaders, capable to meet growing demands for high quality, cost-effective care.

Additionally, innovative Human Resource practices may result in a great cultural shift within main stakeholders involved in managing health conditions, allowing and promoting new service development and assist in shaping learning and development from clinicians, managers and commissioners. Hence, clinical leaders can exercise leadership and Emotional Intelligence qualities, manage talent within the hospital and make informed decisions since they have expert knowledge at the core of the health organization they are operating (Kyriakidou and Papagiannopoulos cited in Turner, 2018).

A recently developed program on clinical leadership for Thoracic surgeons, funded by the European Society of Thoracic surgeons, demonstrated a clear impact which doctors have in shaping their medical practice when they exercise their qualities in leading their staff and promote change within their health organizations. The European cases we developed demonstrated that that the greater the involvement of clinicians in the roles of management and governance the more efficient and productive their health care organizations become (Kyriakidou et al cited in Turner, 2017).

Keywords: Clinical Leadership, European Leadership Programmes, EI

1. INTRODUCTION

The European Health Sector is undergoing significant transformation (Turner, 2017 and 2018; Enock and Markwell 2010; Veronesi 2018, Veronesi et al, 2013) and the resulting complexity has led to an increased focus on Leadership at all levels. As such, the need for a modern health leader is more than obvious in all Health Care systems. Engaging more doctors in leadership positions improves effectiveness and productivity of hospitals along some key performance indicators (Veronesi et al., 2018; Veronesi et al., 2013; The King's Fund, 2011; Hamilton et al., 2008). The majority of hospitals globally have taken into consideration the role of Clinical Director; clinicians need to be offered managerial responsibilities, relating to financial and human resources, who become also accountable for the overall performance of their respective Division (Veronesi et al, 2018; Kirkpatrick et al., 2016). Previous research conducted in this area, reveals that clinical leaders can have a positive effect on a range of outcomes relating to communities as a whole, patients and employees (Kickpatrick et al. 2016; Mountford and Wagg et. al, 2014).

The overall scope of the project is to explore the opportunity and create the basis for the development of European Programmes for health leadership and development. Its key objectives (KO) are:

KO1: To develop a competency framework which helps health leaders across Europe to identify their development needs, develop their professional plan and supports them in their roles.

KO2: To identify varied methods of delivery from in-house (leadership center) and external leadership and management programs to coaching, mentoring, shadowing, e-learning and develop a database with a range of academic and professional resources.

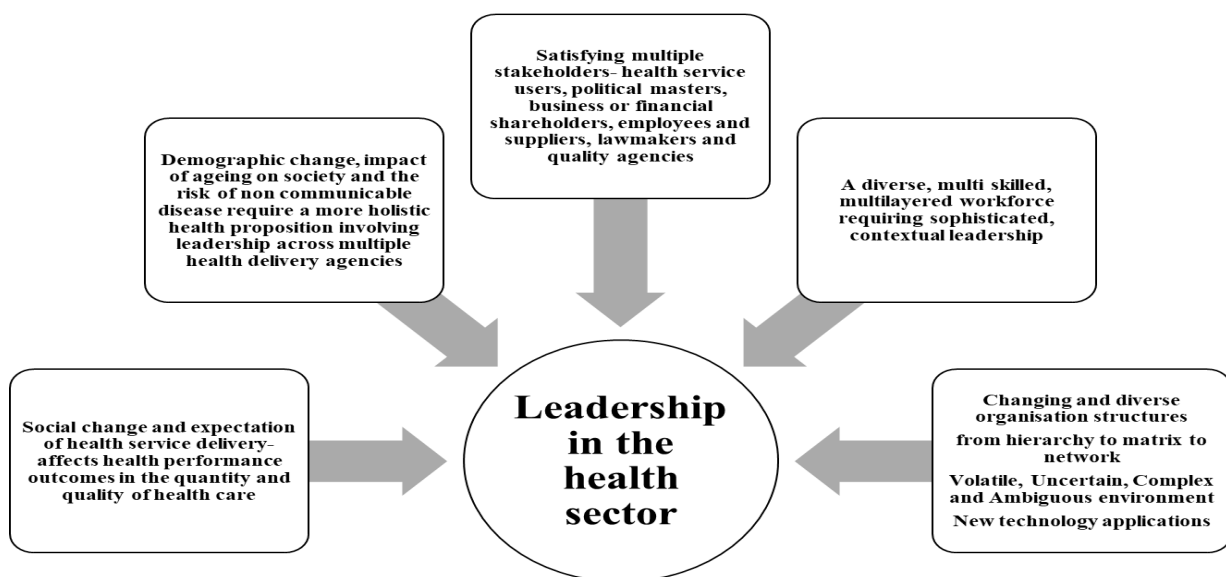

2. THE NEED FOR CLINICAL LEADERS

Health sector leaders can have a positive effect on a range of outcomes relating to communities as a whole, patients and employees (Kickpatrick et al. 2016; Mountford and Webb, 2009). But the definition of health sector leadership has many interpretations. There are those in business, operational or managerial roles; and they are those who lead health professionals in the delivery of care. The latter area is one of Clinical Leadership and it is important to have both role clarity and the right set of competences if those in such leadership positions are going to deliver to their objectives. However, empirical evidence shows that the engagement of clinicians in hospital management and leadership in terms of hospital performance varies across countries; 26.03% of board members in the United Kingdom have clinical backgrounds and 22% of the Chief Executive Officers in hospitals have clinical backgrounds (Veronesi et al., 2013). A comparative European research conducted in 2010 in regards to the role of doctors in senior management, demonstrates that doctors represent a majority of the senior

managers in the European health system with 50% in Italy, 63% in France, and 71% in Germany (Dorgan et al. 2010). Engaging more doctors in leadership positions have been found to improve effectiveness and efficiency of hospitals along some performance indicators (Veronesi et al., 2018; Veronesi et al., 2013; The King's Fund, 2011; Hamilton et al., 2008).

Following a growing interest of practitioners and policy makers in involving clinicians in management and governance of health care organisations (the King's Fund, 2012; Ham and Dickinson, 2008), research done on this suggests that having a higher participation of clinician at strategic decision making levels potentially has benefits for hospitals (Veronesi et al. 2018). Reflecting on that, Clay-Williams and et al. (2014) argued, that some of the advantages of having doctors in management are their strengths in dealing with the structure and the process of the organisation, the outcomes of patients, issues of safety and quality and their ability to make informed and intelligent decisions on patients and organisational processes.

Figure 1: Five Forces that Impact Health Sector Leadership

3. EXPLORATION OF LEADERSHIP DEVELOPMENT PROGRAMMES FOR HEALTH PROFESSIONALS

Great leadership requires the ability to innovate, motivate and communicate a common goal to other members of the team or organisation. The healthcare sector provides a challenging environment in which effective leadership is depended significantly on both organisational and team dynamics. It is also a dynamic field influenced by economics, politics, environmental and social factors (Turner, 2018). However, due to current financial and human resource constraints (Veronesi 2018), healthcare

must have strong leadership to ensure these limited resources are spent appropriately and efficiently. Part of this complexity is due to difference in aims.

It is the key priority of the health leaders to deliver healthcare in keeping with the government's aims and agendas. This is influenced by the economic and political climate along with the individual needs of the *patient-user*. Furthermore, key services that patients would like to receive such as affordable treatment with minimal waiting times, which may not be feasible and a flexible approach is needed alongside with effective leadership of healthcare organisations by healthcare professionals. Evaluation of the volatility, uncertainty, complexity and ambiguity (VUCA) can help identify areas for a leader to address (Bennis & Nanus, 2007).

Reflecting on the above, developing leadership qualities at work involves a process which can be learned and developed not only by work experience but also through training and development courses available to health professionals (Cherniss & Goleman, 1998; Mattingly and Kraiger, 2018). Effective leadership and development can make a difference as to how organisations in the sector are operated and how they deliver healthcare services. Key contributions of effective leadership development include but not limited to:

- Enhancement of organisational culture and performance. (Reichenpfader et al 2015:299 Gauld 2017).
- Positive outcomes across a range of patient-oriented, staff-oriented or organisational measures including patient care quality and patient satisfaction; employee satisfaction and organisational commitment; on organisational productivity and team working and on inter-professional collaboration (Jeyaraman et al 2018:84).
- Positive reinforce the setting of clear team objectives, high levels of participation, commitment to excellence, and support for innovation; leading to effective, compassionate and quality health care (Veronesi et al. 2018; Turner, 2018).

One of the key challenges of the health systems and other educational providers (for example universities) is to reflect on macro and micro level changes and how they impact on the development of health leadership programmes that are based on the needs of clinical leaders and focus on the development plan that they need to fulfil in a specific timeframe set by the organisation (i.e. for consultancy level roles). In other words their effectiveness is based on the development of leadership qualities and styles of managing the staff within the health organisations with emphasis on the leadership qualities of the clinical leaders, especially the development of their emotional intelligence (EI). Regarding EI, theorists such as Cherniss & Goleman (1998) suggest that different interpersonal skills and competences could be improved if differences between emotional and cognitive learning would be taken into consideration during their design and implementation of such programmes.

Cognitive learning refers to the process where new knowledge is added to neural circuitry, whereas “developing emotional intelligence requires unlearn old habits of thought, feeling, and action that are deeply ingrained, and grow new ones” (Cherniss & Goleman 1998 p. 28). According to Cherniss et al. (1998), effective leadership requires the ability to use both emotional and cognitive competences together to enhance managerial performance and personal development (Warren, 2013).

Even when existing studies have shown evidence of the effectiveness of different approaches to increase emotional and cognitive competencies for leaders at different sectors (Nelis et al., 2009; Groves, et al., 2008; Hodzic, et al., 2018), there is a lack of a conceptual framework/model of competencies integrated to those programs which can apply to the needs of each sector for example health sector. There is a limited research conducted in this area which effectively evaluates the validity of those training programs, their effectiveness towards the learning objectives and process they follow during their development, delivery and follow up stages. (Groves et.al, 2008). Hodzic et.al (2018) in their meta-analysis investigation conclude that leadership development programs based on ability models (Mayer et.al, 2002, 2003) are easier to develop and possess higher outcomes to improve emotion traits than miscellaneous models. Yet, the acknowledged power of the development depends on the circumstances of those interventions. Goleman and Cherniss (1998) developed the optimal process in which emotional intelligence can be successfully trained in organisations. Although it could seem challenging to implement such a training, it is the aim of this project to enhance leadership qualities of the clinical leaders by exploring empirically the development of a framework of skills for healthcare leaders based on the Goleman’s following set of competencies:

- *Personal competences*. Encompasses the ability of self-awareness to monitor own emotions and identify their impact, as well as being able to self- manage them; stay committed, positive and self-motivated.
- *Social competences*. It is characterized by the ability of manage effectively interpersonal relationships, be socially aware, collaborate and communicate effectively, working and influence others; dealing with conflict and change management.

This project will analyse the effectiveness of a training programme designed to develop international leaders in the health field. An exploration of how the course activities – pre and post-programme - had an impact on enhancing their performance and competencies development is demonstrated empirically later on in this paper.

4. PURPOSE OF THE WORKING PAPER

The purpose of this paper is to identify key qualities of the clinical leaders in the European Health Sector and how those qualities may contribute successfully towards the organisational effectiveness.

The recently developed program on clinical leadership for Thoracic surgeons, funded by the European Society of Thoracic surgeons, demonstrated a clear impact which doctors have in shaping their medical practice when they exercise their qualities in leading their staff and promote change within their health organizations. Reflecting on the program, the learning objectives were based on the following units:

- Leadership development and change management
- Talent management in health leadership development
- The relation between Emotional Intelligence and its contribution to health professional development and leadership.

The project follows Goleman and Cherniss (1998) 's research process. It consists in a course which was delivered by professional and academic experts from Leeds Beckett University, UK and the University of West Attica, Greece, who taught Thoracic Surgeons across Europe in a pre and post-programme. The aim of this course was to build knowledge of leadership and management in hospitals. To do so, an understanding of principles and practicalities to manage different contextual situations was provided. The designed sessions supplied a framework of skills development by equipping Thoracic Surgeons with the essential tools, competences and knowledge in order to be able to manage others on an emotional intelligent way.

The learning objectives have been designed to provide all participants the opportunity to gain a better understanding of their own leadership and management style when interact with their team members but also during their decision-making processes (based on the key pillars of competencies development as per Goleman, 2000). Also, the programme aim is to reflect on previous competencies and work experience of the participants (through the use of action learning, and psychometric assessment) and to develop an personal action plan to analyse and know better themselves. Another key point to success was specified to an understanding of business innovation and change, what enable the individuals to influence and persuade their stakeholders (patients, staff members).

The first session was an introduction to the programme content and structure, where an opportunity to discuss main issues that clinical leaders need to address was provided. These issues are related to examine the principles of leadership, business innovation, decision making and self-awareness using emotional intelligence by explaining the concept and its importance in the leadership role/identity and evaluate their own attributes regarding to EI.

The second session was divided in two components. Primarily it was based on business processes where participants acknowledge leading innovation and changing in the business. The key points were to understand the needs within the hospitals individuals work for, produce innovative solutions

to improve their performance and apply the appropriate methods to influence people. Secondly, being able to make decisions through an understanding and using an appropriated range of decision strategies on their practical operations for Thoracic Surgeons.

The evaluation of the programme was supported by the EQ-I tool which enable participant to reflect and develop their emotional intelligence and 1:1 feedback, according to each individual needs. Future support was delivered to analyse and evaluate programme outcomes. After 1 month participants attended to a reflective learning experience and individualized coaching to explore their EI results with their personal leadership and management style (related to *personal competencies* development as per Goleman and Cherniss model of skills development). 6 months after, another coaching and support was carried out where self-assessments took place and a review of a further action plan was made (related to the *social competencies* as per Goleman and Cherniss model).

5. METHODOLOGY

This study focuses on an interpretivism philosophy, inductive approach, and qualitative methods and due to the short period given to this research, a cross-sectional time horizon design. The focus of this paper is to understand and analyse the impacts of the International Leadership Development Programme (ILDLP) has on their personal and professional development. The participants for the data collection in this research are based on international leaders and health professionals participated in the course within the last 3 years. The subjective and socially constructive results obtained in the analysis could bring multiple interpretations depending on the sense applied (Saunders et.al, 2012). The qualitative approach adopted is focussed on people's experiences, a holistic perception of subject's point of view (Skinner, et.al 2000). This method concerns processes, reflections and meanings clinical leaders put in place to make sense of their experiences at work. The instrument used to collect data in given by the human capacity to connect with individual in the project research with the objective of observes and record behaviours and gaining a good understanding of individual's point of view through words or non-verbal expressions.

The methodology to be used for this project will be developed in order to meet the key objectives based on the following Work Packages (WP).

WP1: Desk research. Systematic literature review of most recent research and health reports in order to develop the conceptual clinical leadership competency framework (**KO1 and KO2**). Some preliminary work has been done leading to recent publications in European Health Leadership and the development of impact case studies.

WP2: Mixed methods approach (distribution of a questionnaire and skype semi structured interviews with consultants and clinical directors) in order to assess current needs and development plans and

develop a European Clinical Leadership Competency Framework (**KO1 and KO2**). Sample data will be collected from the participants of the business courses delivered to members of the European Society of Thoracic Surgeons during the last 3 years (17 participants).

WP3: Focus groups with senior academics, program directors and senior consultants during Exchange university visits, symposiums, conferences (KO2 and KO3) to identify needs, and methods of delivery (**KO2 and KO3**).

This is work in progress and it is based on the development of two key case studies as produced with senior consultants and clinical leaders from their cross-national experience in different health settings.

6. CASES IN EUROPEAN CLINICAL LEADERSHIP

The European cases we developed demonstrated that that the greater the involvement of clinicians in the roles of management and governance the more efficient and productive their health care organizations become (Kyriakidou et al cited in Turner, 2017). The European clinical leadership case shows the impact of doctors may have in their medical practice when they exercise their qualities in leading their staff as part of their practice and promoting change within their health organisations. A clinical leader may become a potent force and holds wide appeal to reforming policy-makers. The majority of hospitals globally have taken into consideration the role of clinical director in where managerial responsibilities relating to financial and human resources is given to a clinician, who is also accountable for the performance of directorate (Kirkpatrick et al., 2016). A common assumption across the healthcare systems is that greater involvement clinicians in the roles of management and governance would have extensive benefits for effectiveness and efficiency of health care organisations (Veronesi et al, 2018).

Talent management: Developing leadership not just leaders

Talented leaders/managers are a sine qua non of every Health Care System.

Several years ago I had the opportunity to witness the **Belgian Health Care System** employed as a starting Consultant. Soon after commencement of employment I realized that the Department had all skills and expertise required to provide an excellent care to patients but was not able to identify well established, standardized and recorded standard operating procedures (SOP) for the postoperative management of patients. A common language amongst nursing, junior medical and senior medical staff members.

Obstacles to overcome:

1. Persuade team members of the need of such SOP in an established practice
2. Engage senior team members with established ideas and habits
3. Engage all 3 core teams of the Department (nursing staff, junior doctors, senior medical staff)

The need was obvious but the message was challenging. Being a fresh member and not the most senior I spent a period of time preparing an appropriate business case tailored to the needs of the individual system based on evidence (**preparation and tailor made presentation**).

I therefore identified and approached individual talents within all 3 teams who were respected amongst peers, were influential but also had the skills and the vision to identify innovation (**identify talents**).

I offered a period of consultation, allowing the case to become embedded, listening and not just hearing comments and suggestions (**team work, sense of ownership, opportunity to be heard**).

The most critical step was assignment of segments of the business case to individuals from all different teams with short cycles of auditing and insisting on deadlines (**team work, healthy competition amongst team members, global engagement and ownership, team building, delegate responsibilities while coaching and keeping control, identify and employ different styles of leadership**).

At the conclusion of the business case and the successful implementation of SOP an official presentation was arranged in Hospital. It allowed other teams to witness a good piece of work, offered a well-perceived recognition to all who worked hard for the completion, teased out the talents within the team and awarded the enthusiasts and innovators of the team. The end result was rewarding as the business case was completed in time, was accepted by all team members as it had several individual flavors, and left a sense of satisfaction and pride to all those who had worked with passion and enthusiasm (**sense of ownership, address and reward the talents, share good ideas and market them to a wider audience, keep talents engaged**).

Most recruiters when they try to identify talented managers to lead, traditionally focus on competencies, knowledge, skills and qualifications as these are generally easier to articulate, identify and measure. Some qualitative studies have pointed out that the major factors that are related to the improvement of hospital performance are physician engagement, leadership, culture, strategy, structure, good communication, training and skills and information (Brand et al., 2012). However, values, personality traits, organisational behaviours and motivational drivers are equally of value to identify talents.

As complexity in health care increases, European Health Management Systems require leaders (at every level) who can identify needs and current challenges in their practice, shift and adapt quickly, are resourceful and effective, who thrive on organisational change, inspire others and can make sense out of uncertainty and resistance to change for those they lead. Strong leadership is the key driver of overall organizational performance, and well-constructed talent management systems remain critical

to developing and retaining a successful pool of strong healthcare leaders, capable to meet growing demands for high quality, cost-effective care.

Clinical leaders should lead with purpose and clear outcomes. They are Emotionally intelligent individuals who are guided by ethos and values and capable in developing strong relationships with the people around them, empowering teamworking and participating leadership and as such, inspire whom they lead to make a difference.

An example of participative clinical leadership was the start **a single port minimally invasive thoracic surgery program** in the Department of Thoracic Surgery in Ancona, Italy, in which I have been working for more than 20 years. In the early 2000s, the advent of minimally invasive thoracic surgery, keyhole surgery revolutionized our specialty. Our centre was experiencing a difficult period of reduced productivity.

There was a need of an effective change that could boost the image of the unit and attract referrals.

In that period I had the chance to observe this new technique from a famous surgeon. **I immediately perceived this technique as a valuable change to introduce in our unit.** A change that could: 1. Revitalize the morale and enthusiasm of the team and 2. Increase surgical referrals and productivity.

The most important leadership skill to successfully implement this technique in our unit was my **ability to set direction and communicate** this to my colleagues. In that situation, it was critical to convince the team about the strategic importance of implementing the new technique.

Communication was the key to the success of the program. In fact, the first step was to communicate my vision to the other team members and buy them in. I presented and discussed my vision and objectives with my colleagues in the context of the emerging needs of the unit. Using a **participative leadership style** I encouraged my colleagues to share their ideas and opinions engaging them in the process. This was important as they all felt part of the project even if they initially were not directly involved in the surgery. The stepwise approach was well defined since the start in order to avoid misunderstanding and win resistance. Taking into consideration the opinions of my team members, I was able to set direction by building a **guiding team** consisting of two surgeons, who started to learn and apply this technique and subsequently were able to tutor the rest of the team. This led to increased surgical activity and productivity of the unit again.

Cases from the European countries also point out the importance of the leaders' ability to set direction and communication this to their team members. In the light of the above, clinical leadership is seen to be a critical factor in maintaining patient safety and quality in the healthcare (Montoute, 2013, Veronesi et al., 2013 and Dorgan et al., 2010)

Additionally, innovative Human Resource practices may result in a great cultural shift within main stakeholders involved in managing health conditions, allowing and promoting new service development and assist in shaping learning and development from clinicians, managers and commissioners. Hence, clinical leaders can exercise leadership and Emotional Intelligence qualities, manage talent within the hospital and make informed decisions since they have expert knowledge at the core of the health organization they are operating (Kyriakidou and Papagiannopoulos cited in Turner, 2018).

While the competencies and professional expertise/experience provide valuable information and insight about an individual's creditability for a particular role/position/responsibilities, personality traits and personal drivers help to evaluate a person's potential for developing leadership qualities, hence promotional opportunities into senior leadership positions.

PREPARATION FOR EXPATRIATION: DO MILLENNIALS NEED OTHER CULTURAL TRAINING AND DEVELOPMENTS?

Ladwig, Desiree H.¹; Domsch, Michel E.²; Wolf, Alexandra¹

¹University of Applied Sciences Lubeck

²Helmut Schmidt University, Hamburg, Germany

ABSTRACT

Due to globalization and an increasing diverse and international workforce the preparation of Millennials/Generation Y for their future jobs raises new questions and challenges. The digital natives have special digital competencies and much more international experiences at a very early stage of their lives compared with earlier generations. Therefore, we presume that they no longer suffer from a cultural shock. Hence, this paper examines whether Jordanian, American and German millennial students still experience a culture and reverse culture shock. The overall research question is: "Is the concept of culture and reverse culture shock still applicable to Generation Y?" Primary data were conducted by guide-line supported face-to-face interviews. The empirical results show that the majority of Jordanian students have experienced a culture shock and also a reverse culture shock. The majority of German and American students did not have a negative perception due to culture difference during their sojourns abroad. Consequently, the traditional discussion about how to deal with cultural shock has to be modified.

Keywords: cultural shock, generation Y/Millennials, Human Resource Management, expatriation, students sojourns abroad

1. INTRODUCTION

Due to the increase in global business, human resources managers nowadays face the challenge to build a workforce that is able to deal with an intercultural environment and that is able to think cross-culturally (Luthans, 2011, p.35). Digitalization supports the communication beyond countries' borders. Intercultural expertise is particularly necessary for employees being deployed abroad (Luthans, 2011, p.32). For the sake of a successful deployment and later reintegration, it is necessary to explore the existence of a culture shock and a reverse culture shock in order to implement effective preparation measures for sojourners. Most graduates currently entering the labor market belong to Generation Y. Therefore the case study investigates Millennials' experiences.

The present paper explores whether a culture shock and a reverse culture shock for Generation Y still exists. The research question is: "Is the concept of culture and reverse culture shock still applicable to Generation Y?"

Three cases of intercultural experiences have been examined: American and Jordanian students' sojourns in Germany and German students' sojourns in the United States. Data have been conducted by guide-line supported face-to-face interviews and by the comparison of individual's culture shock and reverse culture shock curves tendencies. Finally, these data have been interpreted with reference to the research question. Based on the findings improved preparation measures are suggested.

2. LITERATURE REVIEW

2.1 Culture

A wide range of researches about culture in terms of human societies has been conducted, but yet no overall definition has been agreed on. In 1952 Kroeber and Kluckhohn conducted a critical review of concepts and definitions about culture analyzing 164 definitions published between 1871 and 1950 (Kroeber, Kluckhohn, 1952, p.149) concluding the following definition (Kroeber, Kluckhohn, 1952, p. 181):

"Culture consists of patterns, explicit and implicit, of and for behavior acquired and transmitted by symbols, constituting the distinctive achievement of human groups, including their embodiments in artifacts; the essential core of culture consists of traditional (i.e. historically derived and selected) ideas and especially their attached values; culture systems may, on the one hand, be considered as products of action, on the other as conditioning elements of further action."

Kroeber and Kluckhohn further state that their definition is not an overall theory, but rather a concept (Kroeber, Kluckhohn, 1952, p. 181). This concept needs to be revised continuously, because culture is adjusted over time. During the decades from 1950 and 2001 the anthropologist Edward T. Hall, the management consultant Alfons Trompenaars and the social psychologist Geert Hofstede have conducted well-known cross-cultural studies. In the course of their researches they have described culture as follows:

"[...] culture presents itself to us in layers. The outer layers are the products and artifacts that symbolize the deeper, more basic values and assumptions about life. The different layers are not independent from one another, but are complementary." (Trompenaars, Hampden-Turner, 1997 p. 27)

"Culture is a man's medium: there is not one aspect of human life that is not touched and altered by culture." (Hall, 1976, p.16)

"Culture is the collective programming of the mind that distinguished the members of one group or category of people from others." (Hofstede, 2001, p.1)

Another literature review has been conducted by Gomos. She describes six characteristics of culture (Gomos, n. d., p.4):

- o *Culture is dynamic and not static.*
- o *Culture is shared amongst members of a particular social group or society.*
- o *Culture is learned by members of the social group or society and not biologically inherited.*
- o *Culture is transmitted from one generation to the other.*
- o *Culture enables people to get properly adapted to their physical, social and political environments without much stress or challenges.*
- o *Culture differs from one society to the other.*

Moreover, she states that culture consists of materialist elements such as artifacts, customs and clothes and of non-materialist elements such as laws, norms, values, philosophies, folklores, folkways and art (Gomos, n. d., p.6).

In sum, deriving from the present definitions and characteristics the focus of this paper is on culture as »a complex concept of several traditional tangible elements as well as a collective state of mind and behavior that differentiates groups from one another. This concept has been and will be dynamically modified and transmitted over generations embossing everything in human's life.«

Certainly, all cultural definitions refer to an interpretation of a collective group. However, one collective is consisting of a big variety of individuals that think and behave differently even though they have the same culture (Hofstede, 2001, p.1). The continuous changes in culture and the variety of individuals are the reasons why there is no universal definition for the term culture. Furthermore, culture dynamics and individual values demonstrate the complexity of each culture and therefore the necessity to continuously conduct culture and cross-cultural researches.

2.2 The culture shock and reverse culture shock curve models

The terms "culture shock" and "reverse culture shock" as well as their developments are further explained consulting two models: In 1954 the anthropologist Kalervo Oberg has first spoken about four different stages of the culture shock (Oberg, 1954). Sverre Lysgaard has graphed those stages in an U-shaped curve (Lysgaard, 1955, p. 51). A further research has been conducted by Gullahorn and Gullahorn resulting in an extension of the original U-shaped model to a W-shaped culture shock and reverse culture shock (Weaver, 1960, p. 221) model (Gullahorn, Gullahorn, 1962).

The culture and reverse culture shock curve are graphically presented in figure 1. The curve is drawn based on the literature review and based on previously drawn models (e.g. Woesler, 2009). However, one major change has been made in comparison to other models. Prior researchers have illustrated a smooth transition from the low point of the culture shock in the entry phase to a maximum when

entering the home culture. This is a vague illustration, because literature review indicates that there is a phase of stable adjustment after the recovery of a culture shock as shown in figure 1.

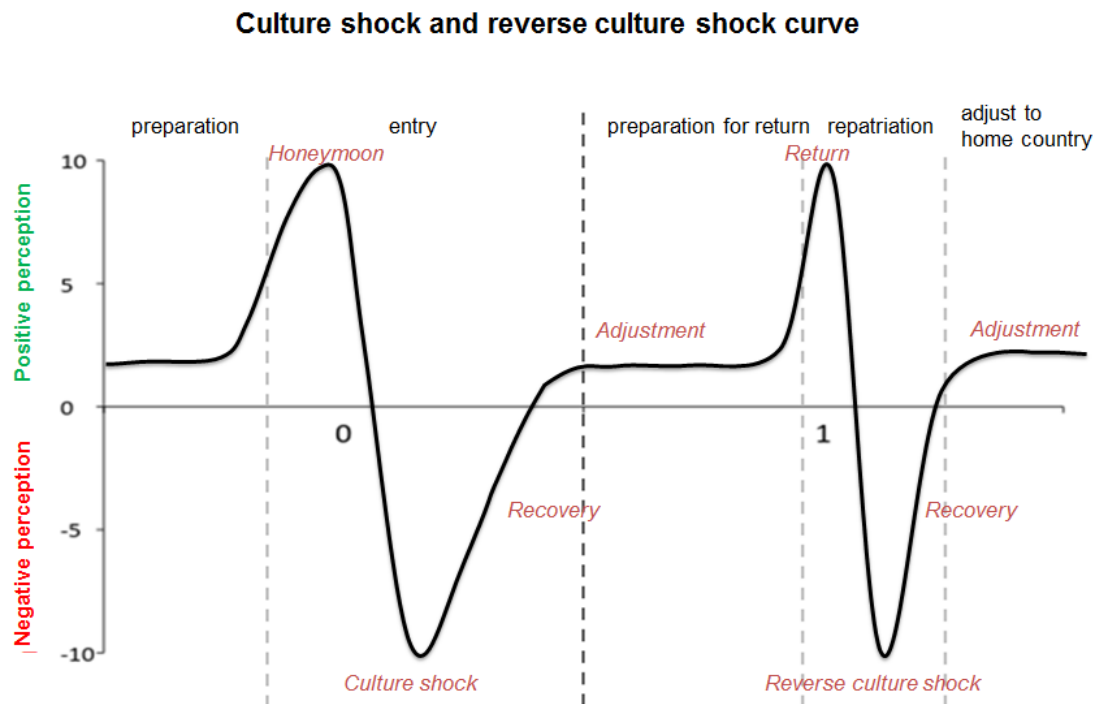

Fig. 1: Culture shock and reverse culture shock curve (own research based on Oberg, 1960 and Gullahorn and Gullahorn, 1963)

2.2.1 The culture shock

As soon as sojourners go abroad, they enter the first stage, i.e. the honeymoon stage (Oberg, 1960, p.178), also called the tourist phase (Winkelmann,1994, p.2). This phase is characterized by fascination, excitement about and interest in the new country and its culture (Oberg, 1960, p. 178). The honeymoon phase lasts from a couple of days up to half a year depending on the sojourner's character, the reason for the stay and the environment (Oberg, 1960, p. 178). During the honeymoon stage, people are generally spoken not getting completely involved with the foreign culture (Weaver, 1960, p.220). They are still discovering the surroundings, are often involved with country mates or institutions and are thereby isolated from the host culture (Winkelmann, 1994,p.2).

If a sojourner wants to spend a certain period of daily life in the foreign country, he/she faces the "real conditions of life" (Oberg, 1960, p. 178) and daily life-struggles increase (Oberg, 1960, p2). Difficulties might arise from e.g. a climate change leading to physical problems or increased uncertainties through broken routines and communication barriers (Weaver, 1960, p.220). The sojourner starts to feel frustrated, frightened or depressed (Oberg, 1960, p. 178). If daily situations seem uncontrollable, they result in stress and the stage of culture shock, the crisis, emerges (Oberg, 1960, p.179; Weaver, 1960, p.220). Oberg defines culture shock as "the anxiety that results from losing all our familiar signs and

symbols of social intercourse" (Oberg, 1960, p.177). It is psychologically proven that an overstraining situation that gets uncontrollable leads to stress (Struhs-Wehr, 2017, p.33). Therefore, it is assumed that a culture shock can be described as a form of stress. Stress is perceived subjectively (Struhs-Wehr, 2017, p. 39) and its heaviness and duration depends on an individual's evaluation of the situation and his/her behavior (Struhs-Wehr, 2017, p. 39). Psychologists call it the resilience ability, i.e. the ability to recover from stress (Aronson et al., 2014, S. 545). Transferred to the term culture shock, it means that a culture shock is perceived subjectively as well and its heaviness and durations depend on each sojourner's ability to recover from the shock.

The third stage is the recovery from a culture shock (Oberg, 1960, p.179). It is also called reorientation (Winkelman, 1994,p.2). In this phase sojourners try to find solutions to cope with the new environment (Oberg, 1960, p.179). There are two different generalized ways sojourners take. Some sojourners start to acculturate, i.e. they adapt to the new culture. They deal with cultural differences, study the language and involve with inhabitants (Winkelman, 1994, p.2). However, one should take into consideration that not everyone is acculturating. Some sojourners also find a solution in isolating themselves from the culture (Winkelman, 1994, p.2). Both ways are methods for reorientation having one important aspect in common: Sojourners have changed their attitudes in order to deal with the new circumstances and recover from the culture shock (Oberg, 1960, p.179).

After a while of reorientation a sojourner reaches the fourth stage, the complete adjustment (Oberg, 1960, p.179). Sojourners accept the foreign culture and have found a stable way of living in the new country without feeling frightened or overstrained (Oberg, 1960, p.179).

2.2.2 The reverse culture shock

During their research, Gullahorn and Gullahorn have come to the result that after successfully adapting to a new culture the same shock-like state, the so-called reverse culture shock, can occur when people return to their own country and have to adapt again from their host culture to their home culture (Gullahorn, Gullahorn,1963, p. 7). The reentering can stress people even more than entering a new culture depending on the degree of involvement in the foreign culture and on the expectation of a reverse culture shock (Weaver, 1960, p.221). After being integrated to another culture, sojourners might identify themselves with their host country's culture (Gullahorn, Gullahorn, 1963, p7). In addition, impacts on personal growth and changes in characteristics and values are often outcomes of a long-term sojourn and are increasing the necessity of a reacclimation (Gullahorn, Gullahorn, 1963, p.7).

2.3 Generation Y

Since the majority of current labor market entrants are affiliated to Generation Y, this paper investigates the culture shock and reverse culture shock experiences among Millennials. Therefore, it is necessary to define Generation Y and describe general characteristic.

There is no overall consensus on the birth years of Generation Y. However, reviewing different literature, the so-called Millennials are born between 1980 and 2001 (e. g. Black, 2010; Ng, McGinnis Johnson, 2015; Vuokko, 2016). The developments of those years have a huge impact on Generation Y's behavior and way of thinking (Ng, McGinnis Johnson, 2015, p. 121). Especially the technological development is affecting Generation Y (Vuokko, 2016, S.5). Due to their dependency on technology, Millennials are considered as digital natives (Black, 2010, p.94). This term has first been introduced by Prensky claiming that young people nowadays speak "digital language" fluently (Prensky, 2001). Furthermore, the Generation Y is highly educated and trained to think critically (Ng, McGinnis Johnson, 2015, p. 123). Millennials are characterized by strong desires of self-fulfillment, growth and independency (Pope et al, 2014 p. 98, 99). Those desires are motivators for millennial students to integrate a sojourn abroad during their studies (Pope et al, 2014 p. 105). Moreover, Millennials seek to achieve a good work-life-balance (Vuokko, 2016, S.4).

However, in chapter 2.1 it has already been defined that every cultural collective consist of individuals thinking and behaving differently. It is also necessary to take this into consideration when describing Generation Y. Even though a consensus of certain characteristic within Generation Y exists, recent generational researches have questioned the existence of a global Generation Y (Ng, Parry, 2016). Due to significant differences in politics, economy, society and culture between countries (Ward, Bochner, Furnham, 2001 p. 44; Zhou, Jindal-Snape, Topping, Todman, 2008, p. 69), it is necessary to limit generational studies in a local context (Ng, Parry, 2016). Consequently, the outcomes of generational studies can only be related to characteristics and behaviors of Generation Y in those countries that have been examined. Due to cultural differences between countries it is very vague to transfer findings of certain generational studies to other cultures and deriving a definition of a global Generation Y. Therefore, we agree with present literature stating that a global Generation Y does not exist (Ng, Parry, 2016). This emphasizes the necessity to conduct researches about Generation Y in a variety of countries.

3. HYPOTHESES DEVELOPMENT

As the culture shock and reverse culture shock models have been developed before Generation Y was born, it is questionable whether Oberg's culture shock curve model and Gullahorn and Gullahorn's reverse culture shock curve model are still applicable to Generation Y.

Millennials are grown up with a huge diversity within a nation (Ng, McGinnis Johnson, 2015, p. 123). Due to interacting with different races and cultures in their daily life, Generation Y has developed an ability of inclusion (Ng, McGinnis Johnson, 2015, p. 123). The trends of multi-cultural nations, diversity and the advanced technology resulting in an ease of communication and travelling around the world create the possibility for Millennials to highly perceive globalization and create an increase in culture exchange (Pope et al, 2014 p. 97; Black, 2010 p. 96). Millennials “[...] *serve as ambassadors who are bringing cultures, countries, and religions closer with online communication*”. (Black, 2010, p.96) Those characteristics may lead to the assumption that Generation Y does not perceive any culture shock.

However, the contact between different ethnics and cultures in one’s own country has been described as “within-society contact” (Bochner, 2003, p. 1). In contrast, a long-term sojourn is referred to a “between society culture-contact”, meaning a culture exchange beyond the home countries boundaries (Bochner, 2003, p. 1). The difference between those experiences is that the long-term sojourner actually leaves his/her home country and exposes him/her to a strange environment. Additionally, it should be considered that people from other ethnics and cultures within one society might have adjusted or even acculturated well to the society’s original culture. Hence, a complete exposure to a foreign culture can only happen by doing a long-term sojourn abroad. In consequence, that means, even if Generation Y has made some cultural experiences within its society, it is not comparable to a long-term sojourn abroad. Also the fact that travelling is easier nowadays cannot be stated as an argument for the reduction of a possible culture shock, because a short-term travel does not lead to anything beyond the honeymoon stage (Oberg, 1960).

Moreover, in chapter 2.3 it has been shown that there is no such phenomenon like a global Generation, but that individuals within a local Generation Y and Millennials of different origins can be very different from each other. The acculturation in a foreign country and hence the reaccluturation in the home country is not influenced by the time people are born, but rather by the differences of the home and host countries in social, political, economic and cultural factors and by individuals’ personality and sojourn situation as shown in figure 2 (Ward, Bochner, Furnham, 2001, p. 44; Zhou, Jindal-Snape, Topping, Todman, 2008, p. 69).

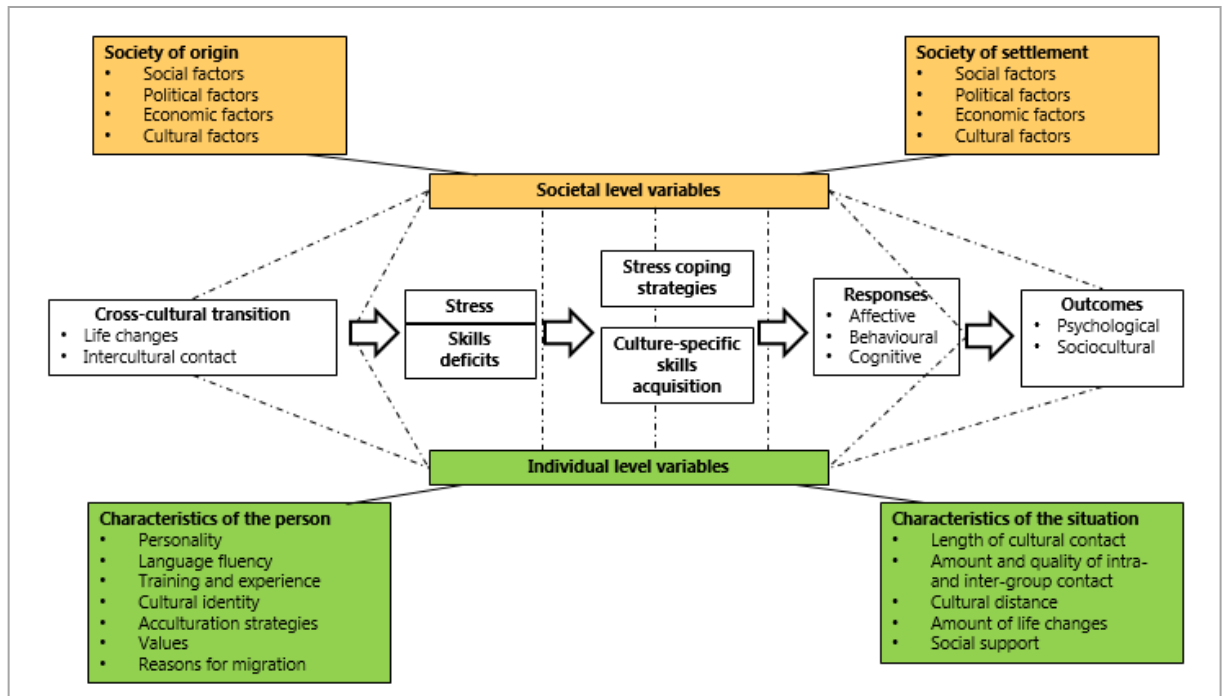

Fig. 2: Societal and Individual level variables (own visualization based on Ward, Bochner, Furnham, 2001; Zhou, Jindal-Snape, Topping, Todman, 2008)

Based on those arguments it is assumed that Millennials can still experience a culture shock as well as a reverse culture shock when returning home. Hence, it is hypothesized:

H1: "The majority of millennial students experiences a culture shock during a long-term sojourn abroad."

H2: "The majority of millennial students experiences a reverse culture shock after returning home from a long-term sojourn abroad."

In the following chapters the hypotheses are analyzed qualitatively with the interview data.

4. METHODOLOGY

4.1 "Societal level variables" influencing the acculturation

The acculturation in a foreign country and assumingly the reacclturation in the home country are influenced by so-called "societal level variables", i.e. the social, political, economic and cultural differences of the home and host societies (Ward, Bochner, Furnham, 2001 p. 44; Zhou, Jindal-Snape, Topping, Todman, 2008, p. 69). Consequently, it is necessary to compare firstly the case of Millennials sojourning in a country with similarities to their home country's societal level variables and secondly the case of Millennials sojourning in a country with significant differences to their home country's societal level variables.

Therefore, this research is examining the cultural experiences of sojourners from two Western countries with similarities on all societal level variables: the United States and Germany. Moreover, an Eastern country with significant differences on the societal level is chosen: Jordan. To examine the similarities between the US and Germany in contrast to Jordan, the GDP per capita is compared as well as certain cultural dimensions.

For a short comparison of the economical situations and as an indicator of living standard the GDP per capita is compared. The US has a GDP per capita of \$65,058 and Germany has a GDP per capita of \$53,577. In contrast, Jordan's GDP per capita is quite low with \$4,448 (World Population Review, 2019) indicating a lower living standard in comparison to the US and Germany.

For further societal and cultural comparisons Hofstede's six dimension model is consulted revealing that the US and Germany have strong similarities in the dimensions "power distance", "individualism" and "masculinity" as visualized in figure 3 (Hofstede, 2010). In those dimensions Jordan is significantly different.

Fig. 3: Comparison of the six culture dimension model's outcomes for Germany, Jordan and the US by Geert Hofstede (own visualization based on Hofstede, 2010)

As illustrated, Jordan is a high power-distant country (70). The government of the Hashemite Kingdom of Jordan is shaped by a unitary parliamentary constitutional monarchy. Also within organizations and families strict hierarchies, centralization and autocrat leaderships exist. In contrast, Germany (35) and the USA (40) are considered to be low power distant countries. Both countries are republics and have a wide middle class. In organizations, equality and participation are important shown by managers and employees consulting and relying on each other (Hofstede, 2010).

Germans (67) and Americans (91) are individualistic. They mostly care about their “inner circle” and highly value independency, autonomous work, high sense of responsibility, an honest and direct communication and constructive criticism. In contrast, Jordanians are highly collectivistic (30) expecting a high sense of importance, loyalty and responsibility among their wide circles. For the sake of harmony indirect communication is preferred and offence rather avoided (Hofstede, 2010).

Jordan is considered to be a feminine society (45) whereas Germany (66) and America (62) are considered to be masculine. Generally spoken, Jordanians work for the necessity to earn money, are motivated by liking their work and focus on their spare time. In contrast, Germans and Americans put a high value on work. Work is seen as a way of self-fulfillment and a source of self-consciousness. Motivation is derived from competitiveness, monetary rewards and status symbols (Hofstede, 2010).

To summarize, it is obvious that in contrast to Jordan, the US and Germany share a lot of similarities in politics, economy, society and culture. Table 1 provides an overview of the societal level similarities between the US and Germany in contrast to Jordan.

Societal level variables	US & Germany	Jordan
Politics	Republic	Monarchy
Economics	High living standard, wealthy	Low living standard
Culture	Low power-distance Individualism Masculine	High power-distance Collectivism Feminine
Society	Wide middle class, equality Close inner circle Direct communication Values: Independency, autonomy, work	Inequality Wide circles Indirect communication Values: Loyalty, harmony, spare time

Tab. 1: Societal level similarities between the US and Germany in contrast to Jordan (own visualization based on Hofstede, 2010 and World Population Review, 2019)

Hence, exploring the culture shock behavior of Germans sojourning in America and Americans and Jordanians sojourning in Germany might show different results and reasons for the existence of a

culture shock due to similarities and differences on the societal level. Therefore, it is necessary to investigate those different cases.

4.2 “Individual level variables” influencing the acculturation

The acculturation in a foreign country is furthermore influenced by “individual level variables”, that means the characteristics of the personality and characteristics of the situation abroad (Ward, Bochner, Furnham, 2001 p. 44; Zhou, Jindal-Snape, Topping, Todman, 2008, p. 69).

In order to investigate the acculturation process of the interviewees a guideline-supported interview and a template for drawing the culture shock and reverse culture shock curve were used. The interview is designed with open questions to keep the horizon of the responses wide. The interview starts with an introduction explaining the research topic and the purpose of the interview beforehand. The first part of the interview contains ten general questions regarding the characteristics of the situation (Ward, Bochner, Furnham, 2001 p. 44; Zhou, Jindal-Snape, Topping, Todman, 2008, p. 69) of staying abroad. The questions examine the purpose and duration of the stay, whether the interviewee went abroad alone or in company, the frequency, purpose and methods of contacting family and friends at home, significant events abroad, life changes, in particular developed competencies and abilities, the perceived culture distance, the support during the preparation and beginning phase and the adaptation methods to new situation and their impacts (Ward, Bochner, Furnham, 2001 p. 44; Zhou, Jindal-Snape, Topping, Todman, 2008, p. 69).

In the second part five questions conduct information about the personality (Ward, Bochner, Furnham, 2001 p. 44; Zhou, Jindal-Snape, Topping, Todman, 2008, p. 69) of the interviewee. They address the knowledge of foreign languages, long-term experiences in foreign countries prior to the stay abroad, the fulfillment of stereotypical characteristics, the methods to increase the comfort factor abroad and the interviewees’ values as well as changes in values due to the stay abroad (Ward, Bochner, Furnham, 2001 p. 44; Zhou, Jindal-Snape, Topping, Todman, 2008, p. 69).

The third part is particularly concentrating on the interviewee’s own reflection on a possible culture shock and reverse culture shock. Therefore, the interviewee gets an empty template consisting of five different phases: The beginning, the entry, the preparation for return, the repatriation and the adjustment to home. The interviewee is asked to describe his/her emotional state within each phase on a scale from +10 indicating very happy and -10 indicating very unhappy and to draw his/her curve respectively. Additionally, he/she is asked to explain the reasons for positive or negative slopes of the curve. Afterwards, the interviewee is asked to explain possible reasons that could have changed the curve progression.

The interview ends with examining the interviewee’s desires for another long-term sojourn and his/her favored and unfavored countries.

4.3 Data collection

The interviews include students from the Lübeck University of Science and Technology (THL)/Germany who have done a sojourn at Milwaukee School of Engineering (MSOE)/US, students from the MSOE and from the German Jordanian University (GJU)/Jordan who have done a sojourn in Germany at THL. The preconditions are having spent at least two terms abroad and the affiliation to Generation Y.

The interview was conducted face-to-face. By the interviewer getting in direct contact with interviewees, the interviewer seems more serious about the research and more thankful for the interviewees' participation (Hague, Cupman, Harrison, Truman, 2016, p. 156). The direct contact encourages a more detailed response (Hague, Cupman, Harrison, Truman, 2016, p.156). Additionally, drawing the personal culture shock and reverse culture shock curve is easier by using analog methods. The interviews have been conducted in the premises of MSOE, GJU and THL.

5. ANALYSIS AND RESULTS

5.1 Interviewees' characteristics

The Jordanian sample consists of nine students/graduates. 67% of the interviewees are female. 67% were born in 1995 and 33% in 1996 with the average age of 22.1 years. Four interviewees have spent one and a half years in Germany. Five interviewees have spent one year in Germany. The German sample consists of nine students. 33.33% are female. They have stayed two terms in the United States. The American sample consists of eight students. 37% of the interviewees are female. The average age is 20.75 years. Seven of the interviewees stayed for two terms in Germany, one of the Americans did a sojourn for one term.

5.2 Hypotheses analysis

5.2.1 Jordanian individuals' curve comparison

The Jordanian interviewees' individually drawn curves reveal graphically the existence of a **culture shock** for the majority (see table 2 and figure 4). All interviewees have drawn a minimum in the entry phase. Seven of the minimums are drawn in the area of negative perception, indicating that 77.78% of the interviewees have experienced a culture shock.

The Jordanian interviewees' individual curves also illustrate the existence of a **reverse culture shock** for the majority of the students (see table 2 and figure 4). In the phase of repatriation seven of nine interviewees have drawn their curves in the area of negative perception. Two aspects become obvious:

Firstly, four of the curves have already had a negative slope in the preparation for return. Secondly, six of the decreasing curves do not really have a constant minimum for a certain time. Since seven of the curves are in the area of negative perception and five of them went down within or shortly before the phase of repatriation, it indicates that 77.78% of the interviewees have experienced a reverse culture shock.

Jordanian interviewees	Culture and reverse culture shock phases positive perception: + ; negative perception: -				
	Preparation	Entry	Preparation for return	Repatriation	Adjust to home country
1	+ / -	+ / - / + culture shock	+	+	+
2	+	+	+	- reverse culture shock	- / +
3	+	+ / - / + culture shock	+	+ / - / + reverse culture shock	+
4	- / +	+	+ / - / +	+	+
5	+	+ / - / + / - / + culture shock	+ / -	- reverse culture shock	- reverse culture shock
6	+ / -	- / + culture shock	+ / -	- reverse culture shock	- / +
7	+	+ / - / + culture shock	+ / -	- reverse culture shock	x
8	+	+ / - / + culture shock	+ / -	- reverse culture shock	-
9	+	+ / - / + culture shock	+ / -	- reverse culture shock	- reverse culture shock

Tab. 2: Individuals' culture shock and reverse culture shock curves from Jordanian students during/after their sojourn in Germany (own research)

Fig. 4: Individuals' culture shock and reverse culture shock curves from Jordanian students during/after their sojourn in Germany (own research)

Jordanian students that have experienced a culture shock have described problems in daily life, e.g. language barriers, difficulties with going alone to the university, problems with the accommodation, living alone and not being able to contact the family at home. Moreover, six of nine students perceived a culture distance in German's individualistic behavior and Jordanian's collectivistic behavior. The sojourners perceived that Germans are e.g. less social, less communicative and less reaching out than Jordanians whereas Jordanians described themselves with being hospitable, sociable and family-oriented.

Those students who have already drawn a negative slope in the preparation for return explained that they have been sad about leaving Germany, the new environment and people they have met. Only one student has drawn a minimum as suggested by Gullahorn and Gullahorn. Six students have drawn a continuous negative perception. Their negative perceptions in the repatriation phase results mainly from leaving Germany where they have experienced independency, freedom and growth in being self-reliant and from going back to Jordan to old routines and family rules. Moreover, one student explained the term reverse culture shock as a result of being well adjusted to Germany.

5.2.2 German individuals' curve comparison

A **culture shock** among German students sojourning in the United States did not exist like the typical cultural shock model suggests (see table 3 and figure 5).

German interviewees	Culture and reverse culture shock phases positive perception: + ; negative perception: -		
	Preparation	Entry	Preparation for return
1	- / +	+ / - / + / - / + / - / + minimum	+
2	+	+	+
3	- / +	+ / - / + minimum	+ / -
4	+	+	+
5	-	+ / - / + minimum	+
6	+ / -	- / + / - / + minimum	+
7	+	+	+ / -
8	- / +	+ / - / + minimum	+
9	+	+	+

Tab. 3: Individuals' culture shock curves from German students during their sojourn in the United States (own research)

Fig. 5: Individuals' culture shock curves from German students during their sojourn in the United States (own research)

German students have explained the minimums of their curves with the partners leaving after a visit, with uncertainties about life progress and future work and with the stress of the bachelor thesis phase. However, those reasons are rather future uncertainties that supposedly would have emerged in Germany as well.

5.2.3 American individuals' curve comparison

The American individuals' curves illustrate for only half of the students the existence of a **culture shock** (see table 4 and figure 6).

American interviewees	Culture and reverse culture shock phases positive perception: + ; negative perception: -		
	Preparation	Entry	Preparation for return
1	+	+ / - / + / - culture shock	-
2	+	+ / - / + / - / + minimum	+
3	+	+ / - / + culture shock	+
4	+	+	+
5	+	+	+
6	+	+ / - / + / - / + minimum	+
7	+	+	+
8	-	- / +	+

Tab. 4: Individuals' culture shock curves from American students during their sojourn in Germany (own research)

Fig. 6: Individuals' culture shock curves from American students during their sojourn in Germany (own research)

The **American** interviewees who have experienced a culture shock in Germany explained their decreasing slope with e.g. different living circumstances, frustration about the adjustment, the high workload at THL, financial distress and the stressful exam preparation phase that was different from American universities. However, only the first two reasons have occurred due to culture differences indicating a culture shock only for two interviewees.

6. DISCUSSION

The majority of Jordanian students have experienced a culture shock, because of a new environment, daily life difficulties, communication barriers and the alien individualistic behavior of Germans. Furthermore, the majority of Jordanian students have experienced a reverse culture shock, because of the necessity of reacculturation due to successful adjustment to German culture and because of personal growth, particularly being independent. The reasons mentioned by Jordanian students for their strong negative perception leading to a decreasing slope of their culture shock curves go along with Oberg's research about how and why a culture shock evolves (Oberg, 1960, p. 178). However, considering the reasons for the decreasing slopes of American and German students' curves in the entry phase, it becomes obvious that the majority of the American and German students who have drawn a minimum in the area of negative perception have rather had problems with the workload or

study plan than having issues due to cultural differences. Hence, H1 "The majority of millennial students experiences a culture shock during a long-term sojourn abroad" can be corroborated for Jordanian students sojourning in Germany, but falsified for the German and American cases.

The examination of the Jordanians' reverse culture shock curves has revealed that the majority of the Jordanian students has experiences a reverse culture shock. The necessity to reacculturate to the home culture after adjusting to the German culture and after personal growth agree with Gullahorn and Gullahorn's research about how and why a reverse culture shock evolves (Gullahorn, Gullahorn,1963, p.7). Hence, H2 "The majority of millennial students experiences a reverse culture shock after returning home from a long-term sojourn abroad" is corroborated for this case.

The research question: "Is the concept of culture and reverse culture shock still applicable to Generation Y?" can be answered with a yes. However, the existence of a culture shock and reverse culture shock is obviously related to how strong the differences in societal level variables are.

Therefore, the outcomes validate the researches about the significance of political, economic, societal and cultural differences between countries (Ward, Bochner, Furnham, 2001 p. 44; Zhou, Jindal-Snape, Topping, Todman, 2008, p. 69) and the necessity to limit generational studies in a local context (Ng, Parry, 2016). The findings also emphasize the non-existence of a global Generation Y.

7. RECOMMENDATIONS FOR IMPROVEMENTS

For all samples a good measure is to have an interactive workshop for training cross-cultural awareness, especially for sojourners that will go to a country with a very different culture. For Jordanians from GJU, a special focus should be put on increasing students' expertise in German culture and on the awareness of the differences between individualism and collectivism. The workshop should be an obligatory requirement in order to increase the attendance. Furthermore, alumni students should present a realistic overview of their experiences, including expenses, difficulties as well as their problem solving methods.

Those universities that do not provide a study buddy program should implement it. The host university should train their buddies by increasing the awareness for cultural differences and for the importance of their help. In order to avoid that study buddies only participate in the program to get a certificate for social engagement, the international office should implement control measures to evaluate if the buddies fulfilled their task, e.g. by a questionnaire for sojourning students and by requiring a report from the buddies after the program. Furthermore, study buddies should be assigned latest one month before the arrival and get the duty to help finding an apartment if it is still necessary.

Before returning home, the host university could provide another preparation workshop providing discussions and exercises for sojourners with the objectives of making them aware of returning home, of their personal changes, of possible changes in their home country and of a possible reverse culture shock.

8. LIMITATIONS AND OUTLOOK

This research is limited to the examination of a culture shock among American, Jordanian and Germans millennial students doing a sojourn in America and Germany and additionally a reverse culture shock for the Jordanian students. It is not possible to draw a conclusion for Generation Y worldwide. In order to get a result for Generation Y's culture shock and reverse culture shock across the world more researches with Millennials from different origins doing a sojourn in diverse countries should be conducted and compared.

As the research reveals that Jordanian students experience a reverse culture shock when returning from Germany, future researches should examine if there is a significant correlation between the strength of a reverse culture shock and returning to a country that is less developed and less wealthy than the country of sojourn. Furthermore, future research can be conducted about the relationship between the strength of a culture shock and entering a country that is less developed and less wealthy than the home country.

In the course of future researches it can be furthermore useful to develop an additional standardized questionnaire conducting quantitative, metric data considering the strength of sojourners' culture shock and reverse culture shock and diverse influencing factors in order to analyze statistically causes and effects. For the standardized questionnaire a larger sample should be chosen in order to increase the reliability of the outcomes.

INNOVATIVE TEACHING CONCEPT FOR FUTURE MANAGERS IN AGILE COMPANY STRUCTURES - SUPPORTING STUDENTS' SELF- ORGANIZATION AND COLLABORATIVE LEARNING SKILLS

Ladwig, Désirée¹; Beer¹; Domsch, Michel E²

¹University of Applied Sciences Lübeck

²Helmut Schmidt University, Hamburg, Germany

ABSTRACT

The requirements for future managers and high skilled professionals in an agile and digital working environment are changing dramatically. This has to be taken into account within the developments of academic education. The students have to be prepared and trained from the beginning of their studies to work in collaborative, diverse teams and cope with new leadership concepts like remote leadership. The project "module maps" worked as an innovative approach to develop the needed skills among the students. The student body in Germany has become more diverse over the past 10 years. There are more students with special biographies and different backgrounds entering universities, like being parents, disabled, employees, transgender, migrated, first generation academics, different religions etc. Collaborative learning, also supported by virtual learning environments, offers them the opportunity to participate in the academic world and seize equal opportunities. But these student groups sometimes require special integration, networking support and supervision in order to feel welcome, so that they do not give up early. The dropout rate just in the STEM (science, technology, engineering and mathematics) subjects is alarming. With the project "module maps" we designed and practically tested an innovative approach that takes into account both aspects: the increasing diversity of the student body and the importance of collaborative learning for the future managers in agile company structures.

Keywords: academic success, self-organization, collaborative learning skills, Human Resource Management, reduce drop out rate

1. CONFLICT FACTORS FOR EARLY STUDENT DROPOUT

The reduction of early student dropout is one of the strategic objectives of our university as well as to make STEM subjects an attractive choice, especially for women. Derboven/Winker assume that four out of six identified dropout types of STEM students would be fundamentally capable of completing

their studies. These types can account for 80 percent of the interviewed dropouts (Derboven, Winker 2010, p. 65–68):

- Technology-focused students, who are overstrained with the quantity of study matter (Type 1)
“I don’t know how to cope with the vast amount of abstract knowledge.”
- Technology-committed students, who are capable of studying (Type 2)
“I want to get an idea about the topic, beyond formulas.”
- Inexperienced students, who are disoriented (Type 3)
“I don’t know how to work on my own.”
- Outsiders, who are interested in technique (Type 5)
“I am different from the others.”

Derboven/Winker name two of the types explicitly as prone to suffering from social conflicts: for the „inexperienced students, who are disoriented“ (Type 3) and the „outsiders, who are interested in technique“ (Type 5), who make up 24 percent of the respondents, a missing *social support* was one of the main conflicts during their studies and probably contributed to their dropout. Apart from that, both groups were basically capable of studying with regard to their technical and social competencies (Derboven, Winker 2010, p. 67f.).

Missing social support seemed to have a negative effect on students’ *self-organization*, especially on self-regulated learning apart from the lectures. Similarly, a lack of *social integration* diminished *the identification with the subject*. Thus, institutional interventions to reduce dropout in STEM subjects should consist preferably of consulting, supporting and networking offers (Winker et.al. 2009, p. 60).

The ability of academic self-regulation has a major effect on the study success. “Academic self-regulation” is defined as „self-generated thoughts, feelings, strategies, and behaviors designed to attain academic goals“ (Zimmerman, Kitsantas 2005, p. 398). As an element of this competency, numerous psychological studies analyzed amongst others „independence, study skills, and positive academic attitudes“ (Zimmerman, Kitsantas 2005, p. 398). Self-regulated work beyond classes (homework) promotes these elements, i.e. the self-organization of the student in total.

The positive connection between social integration and collaborative learning on the one hand, and between self-organization, motivation and academic performance on the other hand, has been described in various studies. These aspects are also to be found in the upper 20% to 40% of 138 appropriate conducive factors for learning performance in the meta-analysis *Visible Learning* of John Hattie (first edition 2013). Considering the aspect of social integration, especially peer-tutoring (rank 36) and cooperative versus individual learning (rank 24) can play an outstanding role in counteracting student dropout of specific student groups.

2. OUR PROJECT “MODULE MAPS”: AN EFFECTIVE INSTRUMENT FOR ACADEMIC SELF-REGULATION

We implemented a concept, currently unique in Germany, called “module maps”, which starts during the sensitive introductory phase, usually at the first day of study. Divided into small groups of 8 to 10 persons, the new students create all together the so called “module map” of their degree program during their first meeting. This takes about two hours. They use the module handbook and try to get an overview about all modules of their degree program, along with the content-related connections and sequence relationships for each semester (see Figure 1).

Figure 1: “Module map” created by first-semester students

For this purpose, the students work their way through the official module handbooks as well as the curriculum (module table) of their degree program. Electives and possibilities for in-depth studies are depicted, too. The students are moderated by peer tutors – students from higher semesters, who are experienced with cooperative learning and have special diverse backgrounds, like first generation academics, disabled, migrants etc. Professors of the respective departments join this meeting and assist them if questions arise.

Figure 2: A professor in discussion with a first-semester student

The self-gained overview of the module map informs the students about how their course of studies is designed in regards to its contents and that topics from previous semesters are required in following modules as an actively available knowledge base. This should make them sensitive to the futility of short-term “bulimia learning” as well as of the disinterested and passive attitude “just getting through somehow”.

During the map creation, peer tutors and professors stimulate discussions about possible variants of the schedule: the curriculum is not a „one-way street for everybody“; there are special topics to be chosen from, electives from neighboring disciplines can be taken and focuses for an individual career design may be set.

Starting from a course progression map “for everybody”, the students finally end up with an individual map for their study. This support for an individual management of study courses, giving space for experiences abroad for example, takes into account the students’ different background experiences, different aims and preferences and / or the need of a work life balance.

But the base for an individual study strategy should still be a realistic self-assessment, an effective learning plan and a successful strategy, to cope with the burdens and possible failures.

During the described scrutiny of the “standard” course progression map, peer tutors and professors ask the new students about their different perspectives on studying, different work experiences and self-images and classify them as important facets. Opposite views, e.g. of students with special

working experiences instead of a university entrance diploma, can help to perceive one's starting position in a more differentiated way. On the other side, commonalities may be discovered even with students who have been judged at first glance as "different to my kind of people" (e.g. due to sex, age, social milieu or self-portrayal). Since every first-year students may feel strong in at least one field of topics, e.g. mathematics or a specialized technical subject, this exchange can lead to feelings of both pride and solidarity: The students will face similar challenges during studies together and could complement each other.

To promote this self-reflexivity, in the next two hours after creating their "module map" the new students systematically exchange opinions. They are asked for which module -courses they

- fear performance issues,
- expect increased learning needs, because they have no idea about some special module courses,
- believe they will be able to rely on previous knowledge,
- have a particularly high motivation arising from a strong personal interest in some special module courses.

These self-assessments are not only expressed openly, but visualized by putting self-adhesive labels on name cards / icons (see Figure 3).

Figure 3: Icons "fear", "no idea", "previous knowledge" and "strong interest", from left to right

They are assigned to every single module course and are then discussed collectively (see Figure 4).

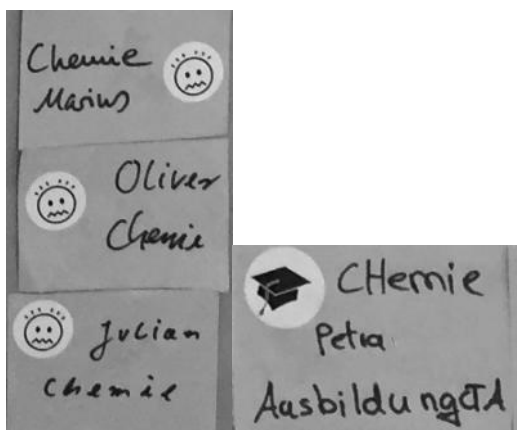

Figure 4: Name tags with self-adhesive labels „fear“ and „previous knowledge“

During this process, the peer tutors act as role models who eagerly tell about their own worries, motives and learning strategies. They explicitly appeal to solidarity among students and urge them to

form learning groups. Instead of just asking for measurable results and comparing (and competing with) each other in terms of grades, questions about learning contents and solution strategies should take center stage of the students' exchange.

This discourse on learning strategies and mutual assistance shall be maintained beyond the start of studies. In its second stage, the "module maps"-project supports students to build up learning groups.

3. INSTITUTIONALIZED LEARNING GROUPS WITH PEER SUPPORT

Both dropout-relevant factors, academic self-regulation and social integration, influence students' learning strategies. Both can be promoted by social and professional support provided by cooperative learning.

As second part of the project, the new students get "matched" in terms of supply and demand (see Figure 5), usually the following day. Looking at the labelled name tags every student can recognize: "Who could help me with her or his previous knowledge? Who could benefit from my own previous knowledge?" These matching results are documented in a digital learning space (Moodle), staying accessible during their entire studies.

Figure 5: Matching of supply and demand

The matching approach deliberately puts great emphasis on reciprocity – depending on the module courses, everyone will sometimes be on the side of the students giving support, sometimes on the side

of the students seeking for support. This early networking in the first week of their studies emphasizes that this form of student cooperation and self-guidance at our university is considered to be a functional and natural component of studying.

The building of learning groups is not only institutionally encouraged, but institutionally sustained, too: for each learning group, one of the group is defined as contact person, who is responsible for the contact between the matched students. He or she also invites the learning group to meetings and constitutes an interface to peer tutors and professors. In this way, a multitude of students can be supervised in their learning management with comparatively low personnel expenses.

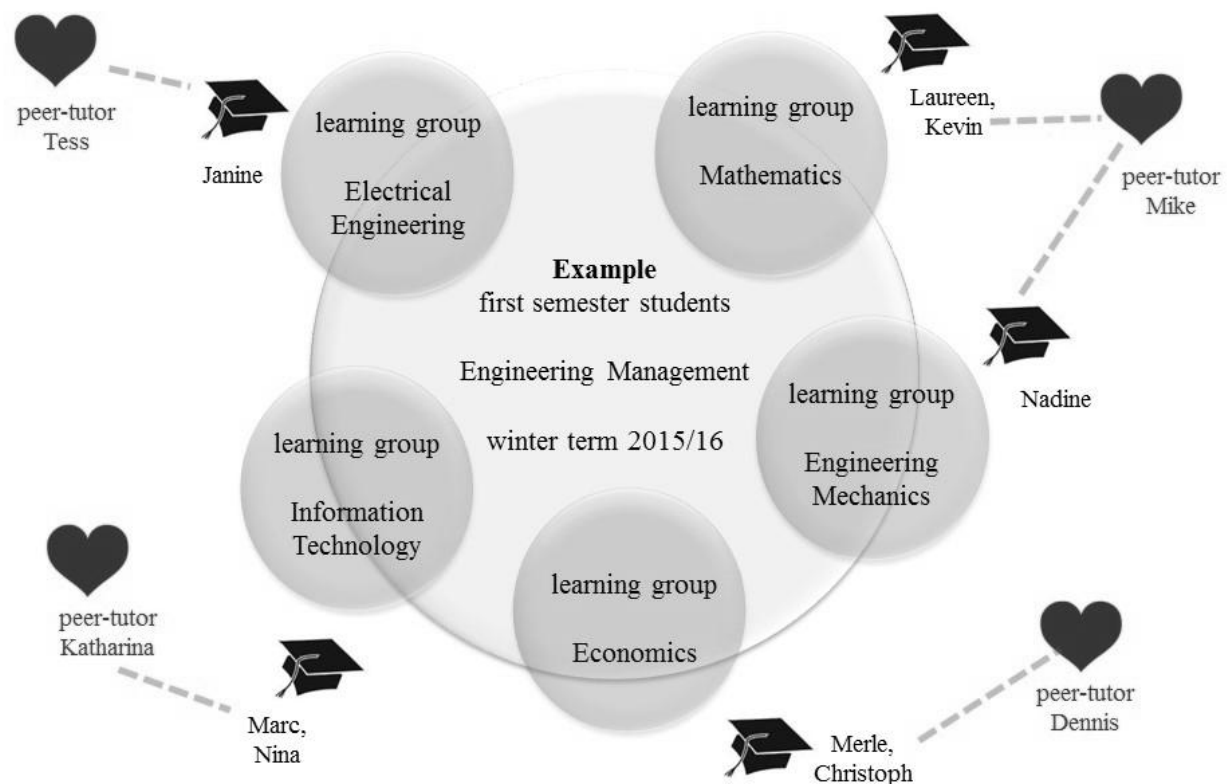

Figure 6: Organigram of an institutionalized supervision of five learning groups

Figure 6 shows how learning groups for respective examination subjects are organized by group organizers from the first semester (symbol mortarboard: students with high self-efficacy expectation for the respective subject). They again form the interface to a peer tutor each (symbol heart: special engagement for cooperative learning and networking in their department).

An early methodological guidance for cooperative working in small groups is decisive for team success (Hattie 2015, p. 113). Thus, the peer tutors keep an eye on the activities of the learning groups throughout the first semester, assisting them when required. Particularly their own practical

knowledge is valuable for new students, for instance how to make working sessions attractive and effective, how to share tasks and how to encourage commitment in their groups. Especially those peer tutors who started their studies with little previous knowledge in a specific subject can give valuable tips for a successful learning management – for example how learning groups can collectively prepare subject matters ahead, so they can use the in-class lectures primarily for specific comprehension questions.

The peer tutors also remind the first-semester students to prepare for their first exams and term papers and for further knowledge transfer in time. They also motivate them to make use of the institutional offers beyond the instructions: example tutorials, professors' consultation hours, additional courses and additional instructional media.

The whole process is digitally supported by a virtual learning environment (Moodle, intra-wiki) to facilitate the exchange and organization of the learning groups. Here they can upload and share content and create an own wiki during their entire studies, building their own knowledge database and reference book.

4. CONCLUSION

A few months after the end of the project, lecturers and tutors were asked for their evaluation. They described the following positive developments of the supervised first-year students compared to former cohorts:

- Students improved awareness and knowledge of their degree program.
- Improved networking and integration of the students, in particular of those students, who have problems to get in contact with others.
- More intensive contact between the cohorts as well as to the students' committees, likewise an enhanced participation in students' committees.
- Better grades for members of learning groups.

In addition to these results, some directors of study courses and program coordinators intensified their communication about the structure of the courses, content-related references and students' individual room for maneuver in terms of study strategies. In the end, a redesign and reformulation of the module handbooks was started, to enable new students a better orientation. Similarly, some professors expressed increased interest in designing courses that are harmonized with one another and to create interdisciplinary references.

The current state of the teaching and learning research assumes that student-centered teaching with collaborative forms of learning are the best choice to allow students with different origins and different conditions to finish their studies successfully (Haggis, 2006). By supporting the formation

and organization of learning groups, the “*module-maps*” project supports the diversity strategy of our university and its fundamental objective to reduce the dropout rate for STEM students.

ABSTRACT

The purpose of this study is to examine whether gender differences are encountered in the use of humorous discourse by managers in a business environment. It also aims at identifying the style of humour male and female executives opt for, as well as the age group that uses humour mostly. For this purpose, a pilot study has been conducted with the participation of 46 female and male managers in Greece of different age groups, coming from various sectors. A quantitative analysis has been performed, with participants completing a questionnaire with three sections, aimed to determine the frequency of usage of humorous discourse, and the second—the *Humor Styles Questionnaire* (Martin *et al*, 2003)—to reveal the style of humour subjects prefer most. The findings demonstrate that both genders use humour to an equal extent in their discourse when found at their worksite. Moreover, results indicate that the humour type mostly preferred by both males and females in their business milieu is the 'Affiliative' one, while the age group that displayed the highest frequency of humorous discourse was the 56-67 years old for the male executives, as opposed to the 36-45 for the female managers. The significance of these findings lies in that they constitute some preliminary evidence towards invalidating disbeliefs that stereotypically question women's ability to produce humorous discourse at work. Results also demonstrate that there are both affinities and dissimilarities in the use of humour in a business communication framework by male and female interlocutors, which are worth focusing on in future studies.

Keywords: Humour; Organizational Communication; Gender Studies; Age; Business Discourse.

INTRODUCTION

Humour as a phenomenon has preoccupied sociologists and linguists alike. During the last decades, many Fortune 500 companies have demonstrated a growing interest in researching humour and its relationship with creativity, as based on previous findings creative individuals tend to display a good sense of humour (Lang and Lee, 2010). Humour can be expressed in the form of teasing, joking or puns, irony and sarcasm, while its purpose is to evoke levity. Humour is considered to be an element

common in all human societal interactions and, therefore, its impact extends to the workplace which constitutes a distinctive society.

Workplace culture has become a prominent topic of research as it continually manifests itself in action, interaction and continuous talk (Avolio *et al.*, 1999; Holmes and Schnurr, 2005; Schnurr, 2009, Romero and Cruthirds, 2006). Schnurr (2009) claims that this particular culture is developing and is modified by various acts; these acts happen in social interactions with constant exchanges among 'co-workers.' One of the main characteristics of such on-going interactions is humour, which constitutes a communicational trait that contributes largely to the character and the development of a workplace culture, as its presence reflects the beliefs and values that employees share within that specific culture (Holmes and Mara, 2002). For example, previous literature on leadership has proven that leaders can use humour not only to enhance their leadership by improving group cohesion and communication, but also in order to foster a productive workplace culture (Ho *et al.*, 2011; Romero and Cruthirds, 2006).

Lang and Lee (2010) also posit that humour among employees can aid in addressing sensitive issues and relieve stress, because it serves as a medium for discreet communication. Along these lines, Craig (2009) asserts that humour is a very important component when it comes to manager-client communication, particularly in the health-care industry; "by improving the mood, case managers have concrete opportunities to contribute to the positive outcomes of authentic communication and improve the quality of health care experiences of their clients" (p. 20). Similarly, Romero and Arendt (2011) maintain that the judicious use of humour in a workplace environment, can contribute to a higher level of customer retention along with a higher employee productivity.

Although humour as "a mode of discourse and a strategy for social interaction" (Crawford, 2003: p. 1413) has been explored in a number of studies linked to leadership skills and levels of creativity (see Avolio *et al.*, 1999; Berdahl, 1996; Holmes, 2007; McIlheran, 2006; Vecchio, 2002), a limited number of scholarly works have investigated humour in relation to gender (e.g. Crawford, 2003; Holmes and Schnurr, 2005), and only a handful of them have approached humour from a gender perspective in the realm of organizational communication, focusing on whether gender differences exist in discursive patterns as in expressing humour (Crawford, 2003; Hemmasi *et al.*, 1994; Martin, 2004).

As a result, the originality of the present study lies in that it aims to provide additional insights on both genders' humorous behaviour inside various workplaces, on the grounds that gender constitutes itself "a system of meanings that influences access to power, status and material resources" (Crawford, 2003, p. 1413). In addition, this study investigates whether humour is a gender- and age-specific pragmatic phenomenon, by examining the frequencies of humorous discourse employed by

female and male managers at the workplace. It also attempts to unravel the type of humor female and male managers employ the most in their daily interactions at their workplace.

Thus, the following research questions are addressed:

1. Do women and men in managerial positions use humorous discourse equally in their business milieu?
2. Which type of humor do female and male executives use most?
3. Which age group of female and male participants exhibits the highest frequency of humorous discourse?

In order to achieve these aims, the relevant literature on humour will be presented, followed by the research design of the current study. Then, the findings retrieved will be discussed, together with the limitations and implications that our preliminary findings pose for future gender and sociolinguistic studies on organizational communication. It should be noted that in this paper the terms 'manager' and 'executive' are used interchangeably without any underlying theoretical or practical implications.

THEORETICAL FRAMEWORK OF HUMOUR

Types of Humour

In the relevant scholarly work, various approaches to analyzing humour and its functions have been put forward depending mainly on the framework adopted. For example, from a sociological perspective, humour can express superiority or enforce norms (Holmes, 2000), whereas from a psychological angle humour can aid in the expression of frustration or the release of tension (Craig, 2009; McIlheran, 2006).

Focusing on the workplace, humour is claimed to have multifaceted functions, with evidence suggesting that one of its main roles is to construct and enforce collegiality bonds among colleagues (Holmes, 2006). In general, the functions of organizational humour can be encompassed under three theories (based on Lyttle, 2007; Martin, 2004; Romero and Arendt, 2011):

- i. The 'Relief Humor Theory,' which posits that humour aids in releasing stress and tension; organizational managers use it to encourage teamwork and to facilitate the construction and development of group identity and work culture;
- ii. The 'Superiority Humor Theory,' according to which humour derives from the desire to feel superior; it is exercised by individuals that hold power in a group, or wish to enforce their leadership initiate Superiority humor; and
- iii. The 'Incongruity Humor Theory,' which postulates that humor initiated deliberately violates rational linguistic patterns; in other words, something is funny because it is unreal, or sudden or because it completely surprises the audience.

On the other hand, humour can be also approached through a pragmatic perspective, and more specifically, from a Politeness Theory angle. In the realms of pragmatics, politeness is defined as the total amount of communicative strategies people employ in order to promote or maintain harmonious social interactions (Brown and Levinson, 1987), where the concept of 'face' constitutes a public self-image that each person wants to adopt for themselves in order to be socially accepted (Brown and Levinson, 1987). According to Holmes (2000), Politeness Theory attempts to explain humour on the basis of the positive face needs of both the speaker and the hearer/addressee. In other words, humour that expresses solidarity caters to the hearer's positive face needs, whereas self-depreciative humour caters to the speaker's positive face needs. However, when individuals communicate, but bear asymmetrical roles (as in the case of managers and their subordinates), often interlocutors base their communicative power on their position. This power is usually coercive and can, thus, be performed through discourse that is undisguised and explicit, or oppressive. In an era, though, where professional relations value informality, there is a general trend towards reducing power differences. Holmes (2000) postulates that when the actual intend is indeed coercive, the language use can be labelled as "repressive discourse" (p. 165), where humour constitutes a common vehicle for accomplishing such discourse at the workplace.

In an effort to assess the type of humor interlocutors tend to use, Martin *et al.* (2003) designed the Humor Styles Questionnaire, employed in numerous studies thereafter (see, for example Evans and Steptoe-Warren, 2018; Ho *et al.*, 2011; Kim *et al.*, 2016; Kuiper *et al.*, 2004; McCosker and Moran, 2012; Robert *et al.*, 2016; Romero and Cruthirds, 2006, Rose, 2010; Ünal, 2014). Martin *et al.* (2003) proposed four 'types', or 'styles of humour', divergent in two measurements or dimensions: the first dimension focuses on whether the humour is addressed to others or on one's self, while the second dimension emphasizes whether humour is potentially agreeable and benign, or injurious and hurtful. Consequently, these two dimensions produce a total of four styles of humour:

1. The self-enhancing humour: This type of humour is characterized by benevolence and it is addressed towards one's self. Optimism, overt humour, and the ability to cheer oneself up by recognizing a funny side in every stressful situation is what characterizes people who express this style of humour. In this case, people who express humour can effectively deal with adversities by curtailing negative emotions (Kim *et al.*, 2016).
2. The affiliative humour: This type of humour is addressed to others, and is highly beneficial as it enhances relationships (Kim *et al.*, 2016; Thelen, 2019). It creates a positive and pleasant environment at the workplace and it is characterized by jokes, funny stories and witty banters. As a result, it reduces tension, contributes to the strengthening of bonds and, as a consequence, it can ameliorate working conditions.

3. The aggressive humour: This type is addressed to others, and it is considered injurious and potentially hurtful (Martin *et al.*, 2003). It is destructive as it includes ridicule, teasing and sarcasm, while it results in alienating people. Inevitably, this humour style leads to impairment of workplace relationships.
4. The self-defeating humour: According to Martin *et al.* (2003), this is humour addressed to one's self, and is hurtful as it usually involves self-defeating jokes, or ridicule about one's self only with the purpose to earn approval by others (Kuiper *et al.*, 2004; Kim *et al.*, 2016). Martin *et al.* (2003) posit that this self-defeating behaviour can function as a double-edged sword, because whereas in some instances it could benefit relationships by mediating tensions, in some others this behaviour could be detrimental as it injures the image of the person in focus. As a result, interpersonal relationships may also suffer.

Humour at the workplace

The contribution of humour at work is multifaceted. A great number of scholars (see Barsoux, 1996; Chen and Ayoun, 2019; Evans *et al.*, 2019; Holmes, 2007; Lyttle, 2007; Murata, 2014; Rose 2010, Robert and Wilbanks, 2012, Thelen, 2019; Wang *et al.*, 2018; as well as Wijewardena *et al.*, 2019) postulate that the use of humour at the workplace may improve human relations, boost morale, enhance solidarity, reduce stress, improve motivation and productivity among colleagues, as well as employee commitment. Humour also shields against criticisms, insults and directives—acts that are generally considered to be face-threatening.

Studies exploring humour as a management tool, or a leadership feature, point to humour being valuable in problem solving and conflict mediation (Collinson, 2002). Subordinates, too, resort to humour when they attempt to express disapproval, as humour provides an acceptable setting to express aggression and resistance, regardless of work-related hierarchy (Murata, 2014). This is also enhanced by Plester's findings (2009) that using profanities at work interrupts the routine by instigating laughter and facetious responses among colleagues, while it also functions as an effective mitigating strategy. Plester (2009) also posits that the use of humour may serve as a coping strategy in stressful situations, and as such it can assist co-workers in saving face.

Humour is claimed to constitute a very important component in the success of human relationships, on the grounds that it enhances cohesion and interaction within a social group (Evans *et al.*, 2019; Romero and Cruthirds, 2006; Ünal, 2014). When used appropriately, it creates a positive atmosphere, mediates conflict and embarrassment, while it boosts the productive energy and bonds among the members of a working group (Martin, 2001). For example, according to a study conducted by Avolio *et al.* (1999), many organizations have adopted humour as one of their strategies in order to boost organizational productivity. Based on the results retrieved, the well-being of subordinates is

greatly enhanced under a leadership which uses humorous discourse, since humour buffers the effect of employee stress at the workplace (Cooper *et al.*, 2018; Thelen, 2019). For Decker and Rotondo (2001), humour can be a great management tool for effective managers; leaders are responsible for not only directing, but also for ameliorating their subordinates' efforts for effective goal achievement, and hence, successful leadership involves many behavioral strategies, such as being eloquent, persuasive, socially adept, and use humour. In alignment with the above, Schnurr (2009) claims that leaders of communities of practice construct their own identity at work by using many discursive strategies; one of those strategies is humour, and more specifically different styles of teasing.

Rizzo *et al.*'s (1999) findings had already confirmed these claims as to how subordinates perceive their leaders' sense of humour, demonstrating that leaders who expressed humorous discourse more frequently were considered to be more effective and appealing by their employees. Priest and Swain (2002) showed that subordinates rated leaders who used humour as 'good,' contrary to the ones that did not exhibit a particularly warm style of jocularity. Similarly, Robert *et al.* (2016) analysed the effects of leaders' humour styles on employee satisfaction and their findings suggested that both affiliative and aggressive humour had a positive impact on job satisfaction. Avolio *et al.* (1999), Holmes (2007), as well as Romero and Ardent (2011) indicated that strong leadership skills are closely interwoven with the humour usage, and stated that a good leader can create a milieu in which flexibility and freedom are cultivated, while humour may operate as a means for authority assertion.

However, one needs to consider what a judicious use of humour within a workplace community is; Davidhizar and Bowen (1992) claim that for humour to be appreciated and well-accepted, people have to evaluate certain factors, such as how flexible the audience may be, the context of humour, as well as its proper timing. Positive humor brings positive outcomes on business operations and relationships; however, insulting and derogatory humor leads to harmful outcomes (Bompar *et al.*, 2018; Chen and Ayoun, 2019; Evans and Steptoe-Warren, 2018). In other words, it is highly likely that humour at the workplace may be interpreted as harassment (Duncan *et al.*, 1990); Westwood and Johnson (2011) warn that symptoms of discrimination and harassment may prove to be detrimental not only to the recipients, but also to the organization itself.

In the same context, Quinn (2000) asserts that—when humour at work becomes sexist, it is possible that the targeted members of the particular worksite define it as sexual harassment, rendering the working environment hostile. Moreover, Hemmasi *et al.* (1994) postulate that sexual or sexist-related jokes narrated by superiors are more probable to be taken as sexual harassment than if the same joke was told by a co-worker. Lyttle (2007) does not only caution leaders to carefully use humour when addressing their subordinates, but also warns of the detrimental repercussions offensive humour might have when addressed from subordinates to managers, or to customers. As a

result, humour at the workplace should be used sensibly so that it benefits relationships, rather than hurt them.

From the existing literature it becomes evident that the use of humour in the workplace has attracted the attention of linguists, sociologists, psychologists and management researchers. In light of the above literature, the present study is the initial phase in attempting to address the existing gap on the frequency female and male executives employ humorous discourse in their daily interactions at the workplace. It also addresses the question of whether there is any similarity in the humorous style both genders prefer using at work, and identify the age group among female and male managers that mostly employ humorous linguistic behavior.

RESEARCH DESIGN

The current study, which constitutes the pilot phase of a wider project, has invited the participation of English-speaking, active female and male managers from Greece, with the use of a purposive sampling (Cohen *et al.*, 2018). All respondents have participated on a volunteer basis. In terms of selection criteria, firstly, participants recruited needed to possess a minimum of intermediate English language knowledge. Secondly, all respondents should be active managers for a minimum of two years by the time they completed the research questionnaire; a random selection of 74 job listings in the website LinkedIn (www.linkedin.com/jobs/junior-manager-jobs) that we conducted indicates that the average minimum experience requested for managers' positions is 2 years.

The initial number of participants was fifty-two ($n=52$), while the actual number of participants was fourth-six (46), as six of them had to be excluded from the study, because of not meeting the professional experience criterion. Regarding subjects' gender, although a balanced representation of both groups was pursued given the topic of the study, the number of male participants' was higher (i.e. 58%). In terms of age, there was no strict age criterion pre-identified, and thus participants' age ranged from 26-75 years old.

Participants were recruited through the internet via a random selection over a period of three months. Initially, subjects were presented with an information sheet explaining the purpose of the study; they were also reassured that all data collected would remain anonymous and strictly confidential, aiming at responses with reduced risk of bias (Rose, 2010). Moreover, participants were informed that, should they feel uncomfortably, they could withdraw from the study at any stage without any repercussions—personal or professional. Once respondents signed the consent form, then they were allowed to proceed with the survey, and complete the questionnaire uploaded in the format of Google form.

With respect to the research process applied, participants were required to complete a structured questionnaire with three sections. In the first section, subjects were called to provide the requested personal information, such as age, gender, level of formal education received, professional field and the maximum number of subordinates they have ever line-managed. In the second section, participants were presented with general questions, such as in which instances they most frequently used humour, for example while interacting with subordinates, customers or higher administration.

For the third section we employed the *Humour Styles Questionnaire* designed in 2003 by Martin and colleagues (Martin *et al.*, 2003). This comprises of 32 items, and it has been extensively used in research studies as a reliable tool for the self-assessment of humour styles in educational or other settings, like the workplace (see indicatively, Romero and Cruthirds, 2006; Saroglou and Scariot, 2002; Ünal, 2014). More precisely, participants were invited to employ a 7-point Likert scale (from 1=Totally agree, to 7=Totally disagree) while assessing below affirmative statements whether—or how often—they use various humour styles, namely the affiliative, self-enhancing, aggressive and self-defeating humour style.

Examples of such statements are cited below (Martin *et al.*, 2003):

- (1) *I don't have to work very hard at making other people laugh. I seem to be a naturally humorous person.* (Affiliative humour, positive)
- (2) *Even if I am by myself, I am often amused by the absurdities of life.* (Self-enhancing humour, positive)
- (3) *When telling jokes, or say funny things, I am usually not very concerned about how other people are taking it.* (Aggressive humour, negative)
- (4) *I often try to make people like or accept me more by saying something funny about my own weaknesses, blunders, or faults.* (Self-defeating-humour, negative)

In terms of scoring, based on Martin *et al.* (2003), each statement marked with an asterisk on the 'key' is reverse scored; for example, for the *Question/Statement number 9**, if the answer is 1 (=totally disagree), it is scored with a 7; if the answer is 2 (=moderately agree), it is scored with a 6, and so on. On the contrary, for the statements without the asterisk, the opposite occurs. And this how the sum across all items is generated, revealing the humor profile of each user based on Martin's *et al.* (2003) questionnaire guidelines.

The data of all questionnaires collected during the pilot-study have been exploited using the SPSS programme (version 20). Descriptive statistics has been used to illustrate participants' responses—by measuring and describing values such as frequencies, percentages and standard deviations (Cohen *et al.*, 2018), with the results being presented in tables and graphs. Then, inferential statistics and different tests have been implemented: more specifically, Independent Samples T-test

(which unveils differences between two groups), as well as the Two-Way ANOVA test have been used to identify any statistically significant differences between the different gender and age groups.

FINDINGS AND DISCUSSION

Demographic profile of the participants

Out of the 46 participants, 58% were male and 42% were females. Regarding their age, 28.3% of the participants occupied the 26-35 age group, 26.1% the 36-45 group and 26.1% the 46-55 age group. Concerning the educational level, 41% of the participants held a Master's degree, 39% possessed a Bachelor's degree, and 15% of the sample population were PhD holders. In relation to their field of work, 41.3% worked in the educational sector, 30.4% in the business domain, while 6.5% were occupied in the communications sector and an equal number of subjects in computer science domain of expertise.

RQ1: Do women and men in managerial positions use humorous discourse equally?

The authors' first hypothesis was that female managers use less humour at work compared to their male colleagues. This hypothesis was based on the fact that there is ample literature showing that female and male leaders use different leadership styles, which might also differ in the amount of humour they employ. Since, based on our knowledge, there is no prior literature published on leadership patterns and humour usage in the Greek professional context we decided to examine—on a small scale—the frequency of humorous discourse displayed by males and females who occupy managerial positions. The equality of variances for these two specific groups was examined by using T-test. The variance for the male and female managers was calculated and it was found to be greater than 0.270 ($p\text{-value} > 0.270$, $t(44) = 1.117$). This indicates that there are no significant differences between female and male managers, regarding the frequency of humour usage at the workplace. Hence, the first hypothesis was rejected. Our results are in alignment with the Holmes *et al.*'s (2003) survey, which was conducted in New Zealand and was based on recordings from various business environments. Although the survey was not targeted to managers specifically, but women at their worksite in general, the findings indicate that women's contribution of humorous discourse at work is equal in extent to that of men.

RQ2: Which type of humor do female and male executives use most?

Our second research hypothesis was that female managers use more affiliative humour, whereas males tend to employ more aggressive humour. The results of the pilot study reveal that both female and male managers in the present sample population, display equal use of the affiliative humour; the Independent Samples T-test conducted shows a value of 0.466 ($p = 0.466$, $t(44) = 0.735$), which is greater than 0.05, and thus the difference displayed is not significant. Therefore our second hypothesis was

also rejected. These results seem to contradict the results reported in Martin *et al.* (2003) sample population, where the male participants exhibited a greater tendency to expressing aggressive humour than the female population.

Additionally, regarding the other humour styles, both genders in their professional discourse use to an equal degree the self-enhancing humour ($p=0.955$, $t(44)=.057$), the aggressive humour ($p=0.390$, $t(44)=.868$), and the self-defeating humour ($p\text{-value}=0.958$, $t(44)=-.053$). For the latter style of humor, our results agree with Holmes and Marra (2004) study, who postulate that in the workplace women managers use, at times, self-depreciating humour in order to mitigate directives. However, these results contradict Martin *et al.* (2003) study results, in which the male population exhibited higher results in expressing Self-defeating humour than the female population.

In terms of the humour styles preferred within each gender group, females use the various styles in the following order of preference: they employ mostly the affiliative style, then the self-enhancing, while they resort to the self-defeating and aggressive humour on a smaller scale. On the other hand, men also use mainly the affiliative style, slightly less the self-enhancing humour, and they tend to employ the aggressive and self-defeating humour styles almost equally, yet to lesser extent than the first two types.

RQ3: Which age group of female and male participants exhibits the highest frequency of humorous discourse?

To our knowledge, there is no previous literature associating humorous discourse and age among male and female leaders in professional environment in Greece. Yet, our third hypothesis of the present study was that both genders would exhibit the highest frequency of humorous discourse within the age group of 46-55 years old. Findings unveil that among the male managers, the age group 56-65 is the one that presents the highest frequency of humorous discourse with a mean value of 4.00 ($M=4.00$), whereas between the female age groups the one with the highest frequency of humorous discourse is the 36-45 age group scoring a mean value of 3.66 ($M=3.66$). Furthermore, a two-way analysis of variance (ANOVA) was conducted that examined the effect of gender and age on the frequency of humor usage. Based on the results retrieved, there is no statistical significant between the effects of gender and age levels on the frequency of humor usage, given that $p\text{-value}$ is 0.804 and higher than a (0.05). These results reject the hypothesis that both genders exhibit the same frequency of humorous discourse at the age group of 46-55.

CONCLUSIONS

This study has shed some light in examining whether women managers use as much humour as men leaders do at work. The results contradict the misbelief that targets at women's linguistic ineptitude to

produce humour at work, as it showed that, in this particular population sample, women's contribution to humorous discourse at the workplace was equal to that of men.

With respect to the type of humour male and female managers use, our findings reveal that both genders opt for using affiliative humour, which is a positive, bond-forming type of humour (Kim *et al.*, 2015; Martin *et al.*, 2003). This humour is meant to contribute to the strengthening of bonds, and relieves tension while ameliorating working conditions. This type of humour constitutes part of the modern leadership style, however, further research studies at a larger scale and across different cultures are deemed necessary. These results are also in support of gender similarity as far as the use of humorous discourse at the workplace is concerned.

Another parameter examined, apart from gender differences and affinities, was the age factor; part of the originality of the current study lies in that there is very limited research, to the best of our knowledge, pertaining the use of humorous discourse at work by managers in connection with their age group.

At the worksite, although the number of managerial positions occupied by women has been increasing, there still exist not so flattering stereotypical misconceptions as to their ability to incorporate humor in their management and leadership discourse (Holmes *et al.*, 2003). As a result, this research paper contributes to the dissolution of such stereotypes, since it has managed to demonstrate—in a small-scale sample—that women leaders, just as their male counterparts, are sociolinguistically adept conversationalists in their workplaces, more than able to create humour.

Limitations and suggestions for future research

As with any other study, the current work exhibits certain limitations. Although the pilot sample was adequate for the purposes of the initial phase of the study, next steps should encompass larger samples. Furthermore, despite the appropriateness of using the measurement tool provided by Martin *et al.* (2003), forthcoming studies could cross validate the findings by implementing other measurement instruments as well that help explore the use of humour. Finally, these results were collected in Greece and may reflect specific cultural characteristics, as in different cultures results might vary. As Murata (2014) rightfully highlights, since humour is a characteristic of a workplace culture, it is highly possible that its manifestations may vary from one work culture to another. After all, we should take into consideration that every workplace culture establishes its own unique norms and distinct characteristics (Holmes and Marra, 2004), and the expression of humorous discourse is one of these whose patterns need to be thoroughly and cross-culturally examined.

ABSTRACT

Entrepreneurs' personality traits determine how external information, condition, and stimuli are filtered, interpreted, and incorporated into a decision. This paper investigates the role of entrepreneurs' narcissism showing that this personality trait moderates the relationship between market concentration or market dynamism and start-ups' patenting. Empirically, we analyse a cross-industry sample of 195 start-ups' entrepreneur. Our proposed model is based on survey and archival data. We show that market concentration and market dynamism affect start-up patenting. In particular, we find that market concentration has a positive impact on start-up's patenting propensity, and that entrepreneur narcissism moderates the hypothesised relationship by amplifying, in case of market concentration, and by weakening, in case of market dynamism, the effects on start-up's patenting of the two market scenarios.

Keywords: Market concentration, market dynamism, start-up patenting, entrepreneur narcissism, entrepreneurship, personality traits.

INTRODUCTION

Patenting is of pivotal role to innovation and gives various benefits for start-ups (Helmets and Rogers, 2011, Holgersson, 2013). Start-ups are firms that offer new products or services by applying modern technologies, or rethinking old products and services to produce different and more effective solutions (Talaular *et al.*, 2005, Tzabbar and Margolis, 2017). Generally, start-ups use patents to protect their ideas from competitors and to secure freedom to operate in the various market (Blind *et al.*, 2006). Moreover, patenting enables start-ups to profit from their inventions and protects their competitive advantage (Helmets and Rogers, 2011). Finally, patent ownership positively affects investors' evaluation of the start-up by providing a strong signal of its potential (Hsu and Ziedonis, 2008). The market type and degree of competition have a significant impact on the start-ups' propensity to patent (Blazsek and Escibano, 2016, De Vries *et al.*, 2017). For instance, in growing or emerging markets, resources are plentiful and mistakes are not as costly as in less productive environments where disparities in market access can hinder small firms from competing against larger companies (Im *et al.*,

2015). We focus on two types of market characteristics, i.e., market concentration and market dynamism because they are responsible for the competitiveness inside the industries (De Vries *et al.*, 2017, Castelo Branco *et al.*, 2010) and impact on the patenting choice.

Market concentration refers to the degree to which a relatively small number of firms account for a relatively large percentage of the market (Jansen *et al.*, 2006, Miller, 1987). Generally, highly concentrated markets are characterised by fewer price wars, less competition, and greater market power. Therefore, firms have higher remunerative margins than firms in fragmented markets and usually enjoy higher barriers to market entry, and higher prices (Luo and Homburg, 2007, Jansen *et al.*, 2006). Market dynamism refers to unpredictable and rapid changes in environments in which firms operate (Dess and Beard, 1984, Duncan, 1972); changes can be linked to customer preferences, technologies, instability, and increasing uncertainty (Jansen *et al.*, 2006, Wallace and Baumeister, 2002). Previous researches show that patenting propensity differs considerably among industries (Mann and Sager, 2007, Cohen *et al.*, 2002) and we hypothesise that this is due to the different levels of market concentration or dynamism that characterise each industry.

According to the upper echelon theory (Hambrick and Mason, 1984), entrepreneur experience and personality traits influence organisational outcomes, such as strategic choice and performance levels. We investigate the influence of entrepreneurs' narcissism showing that this personality trait moderates the relationship between market concentration or market dynamism and start-ups' patenting. Start-ups or small and medium enterprises should have entrepreneurs with high levels of innovativeness, proactiveness and risk-taking propensity to be valid and winning ventures (Wales *et al.*, 2011, Leonelli *et al.*, 2016). Entrepreneurs' personality determines how external information, condition, and stimuli are filtered, interpreted, and incorporated into a decision (Hambrick and Mason, 1984, Engelen *et al.*, 2016). We decided to consider entrepreneurs' narcissism because it is a common trait of the majority of the leader, both CEOs and politicians and has attracted a great deal of attention from the general public and researchers alike (Campbell *et al.*, 2011, Chatterjee and Hambrick, 2007). Narcissism represents someone who is arrogant, proud, and grandiose, he/she thinks he/she is superior and deserving of special treatment, and he/she requires excessive admiration (Campbell *et al.*, 2004, Wales *et al.*, 2013, Rosenthal and Pittinsky, 2006). Start-ups' entrepreneurs, in markets with different levels of concentration and dynamism, have greater managerial discretion, i.e. absence of constraint or presence of multiple plausible alternatives. Thus their personality characteristics have a significant and impactful effect on firms' strategic choices (Hambrick and Finkelstein, 1987, Engelen *et al.*, 2014).

Empirically, we analyse a cross-industry sample of 195 start-ups' entrepreneur. Our proposed model is based on survey and archival data and provides some interesting and significant results which

show that market concentration and market dynamism affect start-up patenting. In particular, we find that market concentration has a positive impact on start-up's patenting propensity, and that entrepreneur narcissism moderates the hypothesised relationship amplifies, in case of market concentration, and weakening, in case of market dynamism, the effects on start-up's patenting of the two market scenarios.

This work has both theoretical and practical contributions; it contributes to the strategic literature by showing that personality traits can influence firms' performance, and this is amplified in particular market scenarios and to the entrepreneurship literature by extending personality research beyond personality traits.

The remainder of the paper is organized as follows. First, we review existing work on start-up's patenting, and we develop a research model formulating some hypotheses. Second, we discuss our methodology and findings before concluding the paper by suggesting some implications of our results and recommendations for future research.

THEORETICAL BACKGROUND AND HYPOTHESES

Market concentration

Market concentration refers to the degree of competition in a market (Miller, 1987). In particular, it describes the sum of the market share of the largest firms that are active within a particular market (Harris, 1998). We argue that market concentration influences a start-up's patenting propensity for two main reasons. First, market concentration leads entry barriers (Bamiatzi et al., 2016), i.e. markets with a high concentration have high entry barriers, while lowly concentrated markets have low entry barriers. In markets with high concentration, thus with high entry barriers, incumbents have a strong and influential position (Besanko et al., 2009). Radical or disruptive innovations are fundamental for start-ups to enter in such markets; hence patents play an essential role in the start-up's market entry strategy, given that they support the start-up in appropriating returns on innovations (Thomä and Bizer, 2013). Patents act as an offensive blockade to prevent other firms from using the innovation and thus helps capture some initial market share, or as a defensive blockade to avoid the innovation being patented by a competitor (Blind *et al.*, 2006). Without the protection of the start-ups' innovations, it becomes more difficult to pose a credible threat to the powerful incumbent firms that are established within an industry (De Vries *et al.*, 2017). Instead, in low concentrated markets, with low entry barriers, it is relatively easy for start-ups to become operative. Start-ups do not need radical or disruptive innovation, and hence they can decide not to carry out a patenting activity (Srinivasan et al., 2008). In this case, investing in intellectual property protection is a waste of resources that could be exploited for

marketing or manufacturing, to benefit a technological opportunity and increase firm survival (Siegel et al., 2007). Accordingly, we formulate the following hypothesis:

Hypothesis 1 (H1): Market concentration is related positively to start-up's patenting.

Market dynamism

Market dynamism refers to unpredictable and rapid changes to the environment in which the new venture operates (Dess and Beard, 1984). Stable environments are characterised by minimal changes in customer preferences, technologies, and competitive dynamics. Instead, highly dynamic industries are characterised by high rates of change in customer preferences or customers' inability to articulate their needs, instability and increasing uncertainty (Jansen *et al.*, 2006, Rodrigo-Alarcón *et al.*, 2017). In addition, markets characterized by rapid and unpredictable changes do not enable entrepreneurs and management team to accurately assess both the present and future states of the market; such conditions engender high levels of stress, which in turn can undermine the harmonious and collaborative relationships among team members (Zhu *et al.*, 2017).

Therefore, considering that firms are often forced to make key decisions based on incomplete and outdated information, thus increasing the level of uncertainty and risk (Baron and Tang, 2011), entrepreneurs should develop innovative capabilities and creative strategies to deal effectively with this challenge (Li and Simerly, 2002). Start-ups should invest in firm-specific assets, i.e. broaden their technological knowledge base and keep abreast of cutting-edge technologies, that help build temporary competitive advantages (Zhu *et al.*, 2017). Moreover, the rapid changes of market components (e.g., customer demand, advances in scientific technology, competitor structure) often lead to an information lag, technology obsolescence, and outdated prior scanning and research work. To quickly adapt to changing environments and seize potential market opportunities, firms should expand their knowledge base by engaging in broader external searches and gaining access to sources of novel information.

However, start-ups are new and small ventures, and generally do not have the necessary funds to innovate continually (Hyytinen *et al.*, 2015). At the same time, they can likely decide to not patent their idea because the turbulence and the rapid changing in the market, preferring to invest in incremental innovation of the product/service they offer. In contrast, in less dynamic environments, in which markets are relatively stable with little technological progress or customer preference changes, start-ups can likely decide to patent their ideas because this investment will pay out in the future. Therefore, we propose the following:

Hypothesis 2 (H2): Market dynamism is related negatively to start-up's patenting.

Entrepreneurs' narcissism

In this paper, we focus on the nonpathological narcissism that includes many of the basic qualities of the narcissistic personality such as self-admiration, arrogance, perceptions of entitlement, and hostility toward external criticism (Wales, Patel, & Lumpkin, 2013). However, as each personality trait, narcissist individuals can also have a bright side, i.e. a productive side. They can be people with great passion and perseverance, high risk-taking propensity, and great independence (Maccoby, 2003). Accordingly, the organisational behaviours and strategic decisions of start-ups vary according to entrepreneurs' values, experiences, and personalities. These personal dispositions shape how entrepreneurs perceive the stimuli and interpret the situations and context around them. Following this line of research, our study examines how entrepreneurs' narcissism interacts with a contextual or environmental factor and how this interaction ultimately affects start-ups patenting propensity. Considering the high level of managerial discretion that is typical of particular market scenario, an enhanced understanding of how a entrepreneurs' narcissism can affect start-ups' patenting propensity by interacting with other contextual factors is critical; this has, however, not yet been studied in detail in the existing literature. To the best of our knowledge, the present study is the first to examine the moderating effect of entrepreneurs' narcissism on the relationship between market scenarios and start-ups' patenting.

The impact of entrepreneurs' characteristics is greatest under boundary conditions because they offer high degrees of discretion (Finkelstein and Boyd, 1998, Engelen *et al.*, 2014). The positive relationship between start-ups' patenting and market concentration might be amplified by entrepreneur narcissism. Narcissists seek sensation and attention, being prone to boredom, and are not fond of maintaining the status quo or making incremental changes or developments (Chatterjee and Hambrick, 2007). Narcissists are instead interested in making actions that are bold and highly visible to the public and they are constantly seeking sources of narcissistic supply, such as attention, adoration, recognition, awards, and praise (Dess and Lumpkin, 2005, Yuille, 2013). In this sense, patenting might be a way for narcissistic entrepreneurs to be the centre of attention and admiration, in fact narcissists' need for praise and respect results in them being motivated by self-enhancement (Wallace and Baumeister, 2002). Reinforcing their positive self-view is extremely important to narcissists when making decisions and setting goals (Campbell *et al.*, 2004).

Instead, the negative relationship between start-ups' patenting and market dynamism might be reduced by entrepreneur narcissism. A highly dynamic environment offers greater opportunities for self-enhancement and thus motivate narcissists to put extra efforts into their jobs (Wallace and Baumeister, 2002). Instability and increasing uncertainty are the preferred features of narcissistic entrepreneurs because they are risk-takers and are able to capture information even if there is a lack. These capabilities enable them to be fundamental for the choices of the strategies of the start-up and to

reach their intrinsic goal, i.e. to be the centre of attention. Accordingly, we formulate the following hypotheses:

Hypothesis 3 (H₃): Entrepreneurs' narcissism has a positive moderating effect on the relationship between market concentration and start-up's patenting.

Hypothesis 4 (H₄): Entrepreneurs' narcissism has a positive moderating effect on the relationship between market dynamism and start-up's patenting.

Figure 1 illustrates the research model.

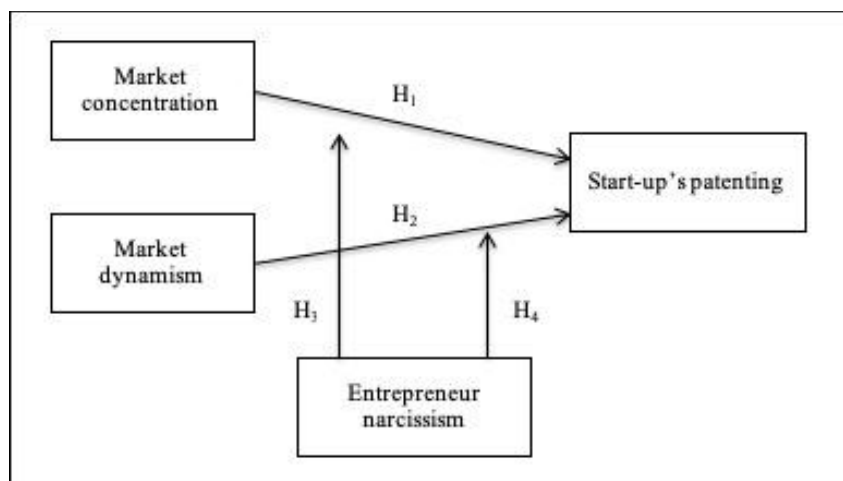

Figure 3: Research model.

METHOD

Sample and data collection

The analysis is based on survey data and secondary information from a public database which increases external validity and avoids common method bias problems. Our sample is composed of Italian and French start-ups. Survey data were collected via an online questionnaire. The first section included 16 questions to measure entrepreneurs' narcissism (Ames et al. 2006). The original NPI-16 version is in English and we employed a rigorous back-translation technique to ensure accurate translation into Italian and French (Brislin, 1980). The second section asked respondents for personal details such as name, age, sex and number of firms owned.

For the Italian sample, we selected start-ups listed in the Italian Chambers of Commerce register and founded between 2012 and 2015. For the French sample, we selected start-ups listed on the myFrenchStartup website, founded between 2009 and 2015 and located in the Région PACA (Provence-Alpes-Côte d'Azur).

We contacted start-up entrepreneurs mainly via LinkedIn: entrepreneurs with no LinkedIn profile were contacted via Facebook or personal e-mail addresses. We used our personal profiles to introduce

ourselves and the study. Those who agreed to participate in the study were sent a link to the online survey which was administered in 2016 in Italian and French as relevant. In total, 1055 start-ups' entrepreneurs agreed to participate, and we obtained 195 responses, a response rate of 18.48%.

Economic and financial information were collected from the Aida database for the Italian sample, and from Orbis database for the French sample. Aida and Orbis are Bureau Van Dijk databases that provide comprehensive information on firms around the world.

Measures

Our dependent variable, start-up patenting, was derived from the Italian and French patent registers. We constructed a dummy variable that takes the value 1 if the start-up owns at least one patents and zero otherwise. We decided to use a dummy variable because start-ups generally have small numbers of patents. We constructed the three independent variables, market dynamism, market concentration and entrepreneurs' narcissism, as follows.

We measured *market concentration* using the Herfindahl index. The formula is $H = \sum_{i=1}^S s_i^2$, where S represents the revenue market share and *i* is the index for the individual firm. Instead, we measured *market dynamism* considering the standard deviation of the annual industry (2-digit ATECO code) sales growth rate (Barelds and Dijkstra, 2010). For both the indexes, data were gathered from Aida and Orbis and even if we collected them for the previous five years, we used 2012 values. This because when we analysed the values for different years, we found they were constant over time.

Entrepreneurs' narcissism is measured using the 16-item NPI-16 developed by Ames *et al.* (2006) in the five-point Likert scale version (see Gentile, 2013). We conducted an exploratory factor analysis on the NPI-16 to create the measure for narcissism.

As control variables, we controlled for variables at individual, firm, and environmental level. The former includes *entrepreneur age* measured as a five-point ordinal scale (i.e. 1 = less than 29 years old, 2 = 30-39 years old, 3 = 40-49 years old, 4 = 50-59 years old and 5 = more than 60 years old), *entrepreneur gender* measured as dummy variable (reference value man) (1= yes, 0= no), and *entrepreneur education* measured as a four-point ordinal scale (i.e. 1 = high school, 2 = bachelor's degree, 3 = master's degree and 4 = doctoral degree).

The control variables at firm level include *start-up initial capital* measured as a five-point ordinal scale (i.e., 1 = less than 5,000 €, 2 = 5,001-10,000 €, 3 = 10,001- 50,000 €, 4 = 50,001- 100,000 €, and 5 = more than 100,001€), *start-up age* measured as a three-point ordinal scale (i.e., 1 = less than 2 years "Seed phase", 2 = 3-5 years "Creation phase", and 3 = more than 6 years "Maturity phase"; reference year 2019), and *start-up size* measured as a three-point ordinal scale of the number of employees (i.e., 1 = less than 5 employees, 2 = 5-9 employees, and 3 = more than 10 employees). Finally, the control variables at environmental level include *industry sector* which refers to the start-ups principal activity

and is captured by the industry dummies at the two-digit ATECO (classification of economic activities adopted by the Italian Institute of Statistics) code, and *start-up location* captured by regional dummies (corresponding to the Nomenclature of Territorial Units for Statistics level 2, NUTS 2).

Model specifications

We conducted exploratory factor analysis (EFA) to extract the appropriate number of factors from the narcissism scale. According to Osborne and Costello (2009), a screen test is optimal to decide how many factors to consider. This involves examining the eigenvalue graph to identify natural curves or breakpoints in the data when the curve flattens. For the NPI-16 scale, only one factor had an eigenvalue superior to 1 (2.810), thus, we decided to opt for a one-factor solution; Cronbach's alpha is 0.81. Appendix A reports the factor loadings of all the variables.

On the above bases, we were able to build a general linear model which is the conventional linear regression model for continuous response variables and continuous and/or categorical predictors (McCullagh and Nelder, 1989).

RESULTS

Table 1 summarizes the observations, mean, standard deviations, and degree of correlation among the variables. We checked for multicollinearity and found that none of the variables was related.

Variable	Mean	Std. Dev.	N	1	2	3	4	5	6	7
1 Market concentration	0.753	2.669	195	1						
2 Market dynamism	0.040	0.079	195	-0.308***	1

Table 1: Descriptive statistics and correlation

Table 2 presents the results of the general linear model. Model 1 includes the control variables; model 2 adds the market concentration and entrepreneur narcissism variables; model 3 includes the moderation variable; model 4 adds to model 1 the market dynamism and entrepreneur narcissism variables; finally model 5 includes the moderation variable.

Model 2 shows that the market concentration has a significant positive impact on start-up patenting ($\beta = 0.043$, $p < 0.05$). This supports hypothesis 1 that market concentration is related positively to start-up patenting; start-up patenting propensity increases with the level of market concentration. However,

entrepreneur narcissism has a non-significant negative impact on start-up patenting ($\beta = -0.041$, $p > 0.1$). When we consider the moderation term, in model 3, we show that market concentration has a significant positive impact on to start-up patenting ($\beta = 0.042$, $p < 0.1$) and also entrepreneur narcissism became significant and is related negatively to start-up patenting ($\beta = -0.069$, $p < 0.1$). However, the interaction between market concentration and entrepreneur narcissism has a positive effect on start-up patenting ($\beta = 0.030$, $p < 0.05$). In other words, entrepreneur narcissism increases the effect of market concentration on start-up patenting and confirms the presence of a complementarity effect corroborating hypothesis 3 that entrepreneur narcissism has a positive moderating effect on the relationships between market concentration and start-up patenting propensity.

Model 4 shows that market dynamism has a significant negative impact on start-up patenting ($\beta = -1.339$, $p < 0.01$). This supports our hypothesis 2 that affirms that market dynamism is related negatively to start-up patenting. At the same time, entrepreneur narcissism also has a non-significant negative impact on start-up patenting ($\beta = -0.045$, $p > 0.1$). When we consider the moderation term, in model 5, we show that market dynamism is always negatively related to start-up patenting ($\beta = -1.322$, $p < 0.01$) and entrepreneur narcissism became significant and related negatively to start-up patenting ($\beta = -0.234$, $p < 0.1$). However, the interaction between market dynamism and entrepreneur narcissism has a not-significant negative effect on start-up's patenting ($\beta = -0.049$, $p > 0.1$). In other words, entrepreneur narcissism has not a moderating effect on the relationships between market dynamism and start-up's patenting propensity and we should reject our hypothesis 4.

DISCUSSION AND CONCLUSION

We investigated the effect on start-up's patenting of market concentration and market dynamism. Patenting enables start-ups to profit from their inventions and protects their competitive advantage (Helmets and Rogers, 2011). We found that market concentration has a positive effect on start-up's patenting: high market concentration corresponds to high propensity of start-ups to patent. We found also that market dynamism has a negative effect on start-up's patenting: high market dynamism corresponds to low propensity of start-ups to patent. Finally, we found that entrepreneur narcissism moderates only the relationship between market concentration and start-up's patenting: entrepreneur narcissism amplifies the positive effects on start-up's patenting of market concentration.

Our findings have both theoretical and practical implications. The paper contributes to the entrepreneurship literature by extending personality research beyond personality traits and it also

contributes to the strategic literature by showing that personality traits can influence firms' performance, and this is amplified in particular market scenarios.

The paper has some practical implication for firm owners and investors. Firm owners need to recognize the importance of entrepreneur personality traits and attitudes since these are likely to mediate the influence of market scenarios on start-ups' patenting. Investors - venture capitalists, bankers, public agencies and other investors - could incorporate measures to assess personality traits such as narcissism, when screening candidates and entrepreneurial projects. This would help to identify entrepreneurs with the potential to create high-innovative firms.

The present study has some limitations which could constitute the starting points for further research. The sample includes only Italian and French start-ups; therefore, we cannot determine whether very different national culture can intervene in the different entrepreneurs' styles and actions. It would be interesting to replicate our study in different country contexts. An ideal setting would be China, which has a more collectivist culture than western economies. High levels of collectivism might influence entrepreneur personality. Second, our sample is composed of start-ups; future work could focus on a sample of established companies to show whether firm age plays a role in defining the above relationships. Finally, we use cross sectional data; the study could be replicated after three or five years to investigate whether age or life events mitigate or amplify the effects of narcissism.

THE EFFECTS OF GLOBALIZATION ON FINANCIAL REPORTING

Liviu-Alexandru Tudor

Academy of Economic Studies, Bucharest, Romania

ABSTRACT

The process of globalization has gained great significance over the last decades due to the changes in international trade and business between countries, leading to the spread of multinational companies and foreign cross-border investments. These global changes have been the premises for introducing new information flows that allow foreign investors to find new ways to understand better the business. Regarding the financial reporting, the world experienced a major change, the most obvious feature being the adoption of IFRS. The process of globalization has led the companies to comply with financial reporting standards in a uniform way due to the positive effects that follow the implementation. The purpose of this paper is to present the evolution of economic globalization by capturing the impact it has on financial reporting.

Keywords: Globalization, Evolution, Factors, Challenges, Benefits, IFRS

INTRODUCTION

One of the most controversial events that marked the world at the end of the 20th century is globalization. With a broad scope, this phenomenon has been found in a multitude of areas such as: cultural, social, economic, political and has led to a multitude of opinions. Globalization is the process of increasing the economic correlation between countries around the world based on the development in goods and services transactions, the expansion of foreign capital flows, and the evolution of technology.

The globalization process has led to the outlining of several definitions; for example: Gorgan C, (2013) makes a presentation of globalization from three perspectives: 1) as a group of processes which contributes to the creation of a unitary state; 2) as a process which eliminates the geographical distance due to the intensification of the economic and political relations based on new technologies; 3) as a phenomenon that can be associate with internationalization, universalization, liberalization. The economic globalization captures the important progress from various industries, services, commerce and foreign investment from multinational companies.

By focusing our attention on economic globalization, this paper tries to capture important moments of globalization in order to present the factors and the consequences that influenced the accounting field.

EVOLUTION AND FACTORS OF GLOBALIZATION

Regarding the economic globalization we can define as being an evolutionary process based on technological, political, economic causes and not as a recent process without a solid foundation in history. Worldwide we can talk about a division of globalization in two periods: the first one between 1870-1914 and the second one starting after 1945 and which extends until present (Baldwin and Martin, 1999; Federico and Tena-Junguito, 2010). The first stage was characterized by an increase in the exchange of goods and services, increase in the production factors and technology transfer from developed countries to developing countries. Globalization in the first period is emerging under British domination in which the industrial revolution playing a major role for this phenomenon. Neither should we forget other key elements that have made globalization possible: reduction of transport costs and communication, removing national barriers and expanding capitalism.

The period after the Second World War may be characterized as one under the domination of the United States. This stage has a significant difference compared to the previous period because the international regulators have made their appearance (the International Monetary Fund established in 1945, the General Agreement on Tariffs and Commerce set up in 1947, the World Trade Organization set up in 1995).

Some authors considered the recent progresses in technology being the key element of globalization that have led to the free movement of information and encouraged the marketing of products and services worldwide (Bari.I, 2005). The development of technology has determined a reduction in geographical distance and the strengthening of cross-border links.

The liberalization of foreign investment is a main factor in the process of economic globalization through the elimination of foreign companies' restrictions on operations in national capital markets. This was possible due to the decreasing of the state's control over the capital inflows and outflows and because of the existence of international regulatory standards which have been imposed by national regulators. Multinational companies have contributed decisively to the globalization of capital through the investments they have made.

THE IMPACT OF GLOBALIZATION ON THE ACCOUNTING FIELD

Globally, accounting becomes an element of interest for business environment both at national and international level, mainly due to the entry of multinational companies on international markets. In order to understand the accounting process in the last decades, we should answer to a simple question: why is it important that everyone from each state to speak the same accounting language? A fundamental factor is the decisions of the various investors regarding the future investment policies and their need to have qualitative and, above all, comparable financial information. Based on these needs, the accounting process can be presented through three phenomena: normalization, harmonization and convergence.

The normalization process originally appeared locally but expanded its applicability with the evolution of international goods and services markets. According to Ionascu (2013), accounting normalization requires the application of the same accounting rules in the same geopolitical space aiming the uniformity of accounting practices.

Feleaga L and Feleaga N, (2007) presents the process of accounting harmonization as being the process of convergence of national rules or norms from one country to another, so that comparability can be achieved. At international level, organizations with the most significant impact on harmonization are represented by the International Accounting Standards Board (IASB) and the Financial Accounting Standards Board (FASB). The harmonization process at European level has started since the 1970s when among the most important accounting directives were: the Fourth Directive on financial statements of the companies, the Seventh Directive on Consolidated Financial Statements, and last but not least the Directive VIII on the Legal Audit of Financial Statements.

In the accounting field the consequence of globalization is represented by the implementation of international financial reporting standards (IFRS). The tendency to achieve a common economic language was manifested by signing a convergence agreement between IAS-IFRS and US GAAP in 2002 between the IASB and the FASB. The implementation of IFRS has become a defining element for assuring the quality of accounting information. The promotion of a single set of accounting standards is a passing method from international harmonization to global convergence (Qu and Zhang, 2010).

At European level, Regulation (EC) No 1606/2002 on the application of IFRS is one of the most important stages of accounting convergence. Under this regulation, listed companies of member states, banks and insurance companies must prepare their consolidated financial statements in accordance with IFRS. According to Feleaga L and Feleaga N (2006), the EU's decision to adopt IFRS is a response to the dominance of American accounting rules in the global financial markets. Table 1 below shows the current situation regarding the adoption of IFRS within the European Union.

Countries	IFRS Standards are required for domestic public companies	IFRS Standards are permitted but not required for domestic public companies	IFRS Standards are required or permitted for listings by foreign companies	The IFRS for SMEs Standard is required or permitted	The IFRS for SMEs Standard is under consideration

CHALLENGES AND EFFECTS OF IFRS ADOPTION

Over time, researchers have focused on convergence and blocking factors that have delayed or even stopped the process of adopting IFRS. Existing work presents evidence of the challenges that have influenced the quality of accounting. We can highlight among them:

- o Heavy content of IFRS, lack of specialists for implementation and frequent changes in the content of international standards (Jermakowicz and Gornik-Tomaszewski, 2006),
- o The presence of emerging capital markets. (Ding et al., 2007).
- o Different accounting cultures that often result in understanding issues. (Jermakowicz and Gornik-Tomaszewski, 2006), (Soderstrom and Sun, 2007) (Albu et al., 2010).
- o Problems between taxation and accounting that put some barriers in IFRS practices. (Jermakowicz and Gornik-Tomaszewski, 2006).
- o Very high costs related to the way IFRS is implemented. (Jermakowicz and Gornik-Tomaszewski, 2006), (Ionascu et al., 2014).

Figure 1 Provides a schematic framework for a better visualization the determinants of accounting quality.

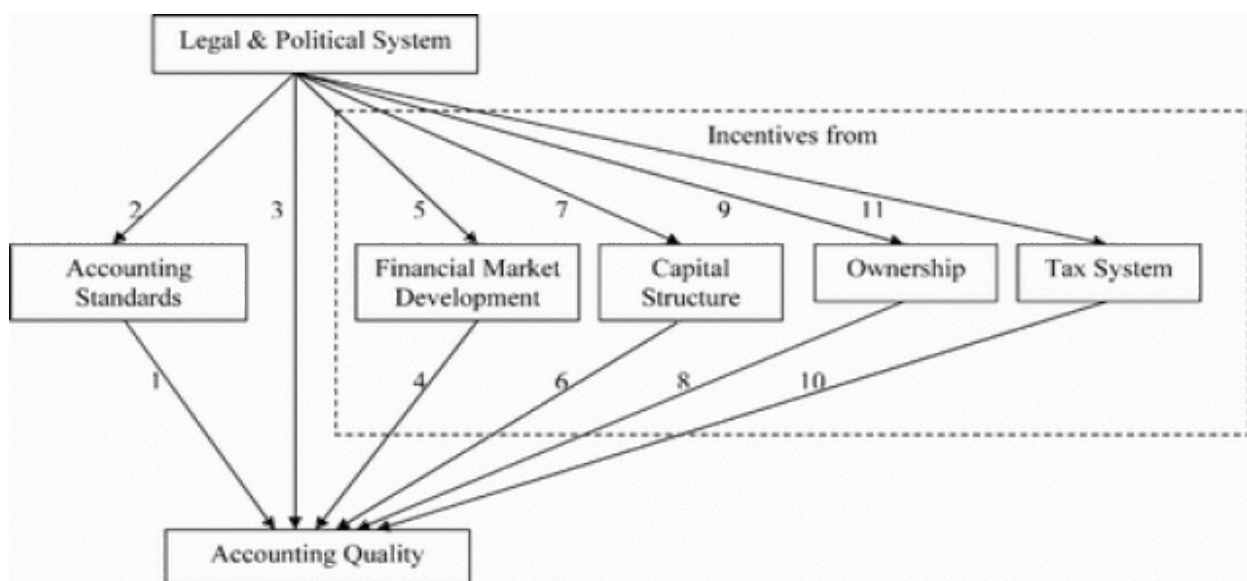

Figure 1. *Factors influencing accounting quality.* Source: (Soderstrom si Sun, 2007)

Although obstacles for the application of IFRS were obvious in countries where accounting culture differs from IFRS culture, the implementation process generated various consequences for both mandatory adoption and voluntary adoption. Among the first papers who have investigated the voluntary adoption of IFRS, we can mention: (Soderstrom and Sun, 2007), (Daske et al., 2008), (Horton et al., 2013). The results of these studies indicate a positive impact on the quality of financial information regarding the voluntary adoption of IFRS, but these results cannot be generalized in case of mandatory adoption. In most cases, voluntary adoption refers to the policies that entities have set in

order to increase transparency. (Daske et al., 2008). Other authors have shown that there is an increase in cross-border investments based on the voluntary adoption of IFRS (Horton et al, 2010).

In the case of studies focusing on the effects of mandatory IFRS adoption, we can note higher quality of financial reporting, comparability and transparency of financial statements. (Albu et al, 2010), (Chen et al, 2010). The question of comparability has long been discussed worldwide and overall, the impact being positive. Contrary to this opinion (Zeff, 2007) launches an alarm signal that we need to be careful to the future progress regarding the consolidation of financial statements.

Other studies focused on the economic consequences of adopting IFRS illustrate the increase volatility of the result and the increase of equity (Soderstrom and Sun, 2007), (Daske et al., 2008), (Albu et al, 2010). Another effect presented by the researchers was the decrease of cost of capital. Opinions have been divided between studies that have shown there has indeed been a decrease of capital costs ((Jermakowicz and Gornik-Tomaszewski, 2006), (Daskte et al, 2008) and other studies indicated that there has been no modification of capital cost with the adoption of IFRS (Ionascu et al, 2010).

CONCLUSIONS

The process of globalization involves all of us being the phenomenon of the contemporary world that affects all of us. Globalization and its effects on accounting are related to normalization, harmonization and convergence. The implementation of international accounting standards has become a necessity and at European level Regulation (EC) No 1606/2002 on IFRS application is one of the most important stages of accounting convergence.

Applying IFRS to a larger scale, implies several limits but also benefits. Studies have shown many advantages such as increasing the comparability of the financial statements which give to investors the opportunity to access capital at a lower cost and also with a lower risk. The limits have mainly focused on the costs and the level of compliance that must be achieved between local and international standards. However, as a general consequence, we can affirm that the benefits of implementing IFRS were clearly superior to the challenges.

IMPLEMENTATION OF SOCIAL AREA OF CSR WITHIN THE COMPANIES AND ITS EFFECT ON HUMAN RESOURCE MANAGEMENT

Lušňáková, Zuzana; Šajbidorová, Mária; Lencéšová, Silvia; Sokil, Oksana

Department of Management, FEM SUA Nitra, Slovakia

ABSTRACT

The development of conceptual foundations for implementation of CSR in the area of employees' development and creating conditions for the harmonious development of the person is one of the most actual scientific tasks. The aim of the paper is to find out the implementation of CSR within chosen companies and its effect on human resource management. We analysed the relationship of social area of CSR and human resources in 331 food companies in Slovakia. The tool for analyse was the questionnaire based on the 5-degree Likert scale and controlled interviews. Data processing was performed using statistical program SAS Enterprise Guide 7.1. The statistical relations and correlations between variables were performed using Cronbach alpha, Spearman's test, Kruskal-Wallis' test. The characteristic features of a socially responsible food company with regard to human resources, as its most important source, are to promote the balance of work and personal life of employees, care for their health and welfare, respect for their rights and freedoms, support employees' participation in the decision-making process of the company, development of skills and knowledge of the employees, prevent bureaucracy. Food companies in Slovak republic have to work hard to implement rules of diversity management and support corporate philanthropy.

Keywords: corporate social responsibility, employee, food company, human resource management

INTRODUCTION

Nowadays enterprises operate in conditions of dynamism, uncertainty, the spread of risks in all spheres of management, aggravation of competitive struggle, etc. (Salehi et al., 2018). Under these circumstances, employees should be considered as a strategic resource, which, in the case of effective management, can positively influence the productive and stable activity of the enterprise (OECD, 2000). Human resources have to be prepared for this revolutionary development, at all managerial levels (Juričková et al., 2019). Enterprises need to develop new approaches in the system of human resource management. The core of such innovations should be the concept of Corporate Social Responsibility (Voegtlin and Greenwood, 2013; Boxall, Purcell and Wright, 2009). Corporate Social Responsibility

begins with its transformation into an institution that actively assumes responsibility for the impact of its activities on employees and their families, what greatly contributes to their job satisfaction. Satisfaction further leads to strengthening personal responsibility at the workplace, towards customers, suppliers, the environment, and the community where the company is developing its activities (Cohen, 2010). The aim of our paper is to find out the implementation of CSR within chosen companies and its effect on human resource management.

Chatzoglou et al. (2015) wrote that CSR implementation seems to have a positive effect on “employee commitment”, “customer satisfaction” and “company reputation. However, a socially responsible organization should not only comply with the obligations that derive from the law, but also invest more in human capital, in the environment and in the relations with its social partners. As Jamali et al. (2014) wrote, CSR does not act as a traditional function of HRM, since HRM is concentrated on the organization's employees, and CSR can often be focused on other stakeholders. But Porter and Miles (2013) believe that the connection between CSR and HRM are extremely promising, but the process of measuring the impact of CSR actions in relation to the company's efficiency and reputation is long-term and often difficult to fix. Voegtlin and Greenwood (2013) also argue that there is practically impossible to inquire the impact of links between CSR and HRM. The authors explain that there is a reciprocal link between these two concepts, that is, CSR can affect the practice of personnel management as well as the practice of human management can affect the company's actions in the context of CSR.

THEORETICAL BACKGROUND

Employees have been identified as an important stakeholder group with respect to CSR, who could become highly engaged advocates and ambassadors of a responsible organization (Dhanesh, 2014; Gill, 2015). Enterprises of economically developed countries use CSR as a reliable tool aimed at increasing the efficiency of HRM, motivation and loyalty of employees, forming a positive image of the company and the brand on the market (Aksak et al., 2016; Asemah et al., 2013). Most of the works created in the field of CSR are focused on meeting the needs of external stakeholders. Companies should be aware that employees are also an important stake, which has a vast influence on the enterprise (Jiang and Men, 2017). Therefore, senior management of an enterprise has to develop and implement a socially responsible policy, which helps to satisfy all desires of each entity (Oliylyk, 2015). This approach involves studying the behaviour of the employee at the enterprise, identifying the laws in the field of labour and personality development, evolving and implementing socially responsible actions that can be the best way to cater the needs of each employee. The results of the international research prove that the company receives a lot of benefits (including financial) from the implementation of the CSR activities which are connected with the workers (Oliylyk, 2015).

One of the most important elements of the conceptual framework is the choice of the forms of CSR implementation in the field of HRM. The development, approval and implementation of the internal socially responsible system should become part of the general management programs.

The essence of CSR principles in labour relations is the following (Hrishnova et al., 2014): observance of the legislation of country and international norms; avoidance of reduction of existing social rights and guarantees; workers' participation in decision-making concerning their interests; permanence - socially responsible behaviour is a constant feature of the social partners' activities; transparency - openness in relation to own activity, provision of reliable information in an accessible and full extent; accountability - the willingness to report on the impact of its activities; efficiency - achievement of the maximum result at minimum expenses; the principle of feedback - the current result should be compared with the goal set at the beginning, the discrepancy should be promptly detected and correct by managerial decisions; scientific feasibility - methods and tools of management should be scientifically substantiated and tested in practice.

In recent years, both public and private sector organizations have adopted a variety of work-life balance programs (WLBPs), as an important part of CSR social program, which can include flexible scheduling (compressed workweeks, voluntary work reduction, telecommuting, and job sharing), alternative work sites (smart centers) and leave arrangements (Lee and Kim, 2010).

In relation with sustainable development, the HRM is seen as the key driving force in the development of sustainability of modern organizations. Human resource management should incorporate organizational culture within sustainable business strategy, but also they need to shape organizational system in a way to enable the impact on employees, society and other stakeholders, in line with the vision of sustainable society (Garg, 2014). Sustainable human resource management (SHRM) means using the tools of HR to create a workforce that has the trust, values, skills and motivation to achieve a profitable triple bottom line. The idea of employee engagement as a part of SHRM, visualizes an employee who is cognitively, affectively and behaviorally 'present', absorbed and dedicated while performing an organizational role (Duthler and Dhanesh, 2018). Employee loyalty, which is very closely connected with employee's engagement, is a term for a set of emotions that make employees feel attached to their current employer and less likely to see greener grass elsewhere. The employee loyalty meant the ability to stay with the organization. To increase employee loyalty, man must increase the positive emotions and decrease the negative emotions that employees feel as they make a decision to stay or go. It based on the premise that staffs loyalty to organization could be measure by the amount of time one work for the company or organization (Portney, 2008).

MATERIAL AND METHODS

Employees should be involved in the solving of important decisions for the organization, for example, the formulation of values, business development strategies, etc. Indeed, an effective system of the human resource management involves not only the engagement of employees in the adoption of strategic decisions but also the use of their creative and intellectual potential for the accumulation of innovative ideas. While the existence of employees depends on their employers, responsible owners and managers know that a skilled and motivated workforce and an elderly employer are key assets of a knowledge-based economy.

The aim of the scientific paper is to find out the implementation of CSR within chosen companies and its effect on human resource management. Our task was to analyse the relationship of social area of CSR and human resources in food companies in Slovakia. The tool for analyse was the questionnaire based on the 5-degree Likert scale, where the respondents expressed the degree of their agreement or disagreement with the particular statement. The questionnaire was filled by sample of 331 respondents (1 questionnaire for 1 company), which holds a different position in the chosen companies (such as owner, manager, the employee of the economic, logistics, production or sales department and so on). To complete information we also realized 34 controlled interviews by face to face meetings in these companies. Our research was realized from May to September 2018.

Data processing was performed using statistical program SAS Enterprise Guide 7.1. The statistical relations and correlations between variables were performed using Cronbach alpha, Spearman test, Kruskal-Wallis' test. In general like in each research, the reliability and accuracy of measurement are important. In conducted survey, we used the Cronbach coefficient alpha as part of the statistical evaluation, where: the higher the homogeneity of the elements, the higher the reliability. We applied mathematical and statistical methods such as non-parametric Kruskal-Wallis test and correlation analysis using Spearman test for statistical hypothesis testing. The Spearman correlation coefficient is a non-parametric measure of association. The values of this coefficient are from 1 to -1. Values approaching 1 represent strong positive correlation. Values approaching 0 represent none correlation and values approaching -1 represent strong negative correlation. The Spearman correlation coefficient provides better estimate than the Pearson correlation coefficient. (Benda-Prokeinová, 2014)

The most widely used method for assessing the reliability of scales is Cronbach Coefficient Alpha. It represents the degree of internal consistency of the scale. The values of Cronbach Coefficient Alpha 0.7 and higher means sufficient internal consistency of the scale. (Benda-Prokeinová, 2014)

We have tested first three research presumptions using nonparametric one-way ANOVA by Kruskal-Wallis test. The last three research presumptions where tested for relationship using Spearman correlation coefficient.

Interpretation of Spearman and Cronbach correlation coefficient values was based on the following table. (De Vaus, 2002)

Correlation value	Dependence interpretation
- 0.09	Trivial or none
0.10 – 0.29	Low to medium
0.30 – 0.49	Medium to essential
0.50 – 0.69	Essential to very strong
0.70 – 0.89	Very strong
0.90 – 0.99	Almost perfect

Table 1. *Interpretation of correlation coefficient values*

Source: (De Vaus, 2002)

In our research we determined and verified 3 research presumptions (hypotheses):

H1: We assume that there is statistically significant difference between the respondent's position in the firm and his/her work-life balance.

H2: We expect that there is statistically significant difference between awareness of employees about important matters relating to the company and their knowledge of firm's concept of CSR.

H3: We expect positive correlation between the statement "our company is socially responsible" and employee's loyalty to the company.

RESULTS

During the last decades, the Slovak republic has faced significant changes in the social, political and environmental spheres. The concept of CSR for this region is comparatively new. However, it should be noted that the practice of using CSR develops rather rapidly within the framework of integration of this region with the European Union, as well as under the effect of the increase of foreign investors and the development of international companies. Therefore, the assessment of CSR state in this region is becoming more interesting not only for the scientists but also for the companies themselves. In our opinion, an important part of the analysis conducted in the study was the assessment of the level of CSR in human resource management, as human labour is considered as one of the most valuable resources of each enterprise.

As noted above, research on issues related to HRM and CSR we focused on companies in Slovak republic. Moreover, the socio-political changes, as well as the transformation of the economy from centrally planned to market form, could have caused entrepreneurs' lack of interest in the requirements of workers, as companies could think that needs of other stakeholders are more important to satisfy. Thus, the purpose of this study is to determine the level of CSR quality measures in the relationship between the firm and employees.

Based on the first research presumption formulated in the part “Methods” we set zero and alternative hypothesis:

H₀: There is no statistically significant difference between the respondent’s position in the firm and his/her work-life balance.

H₁: There is statistically significant difference between the respondent’s position in the firm and his/her work-life balance.

These hypotheses were tested using nonparametric one-way ANOVA by Kruskal-Wallis test. The results of this test are shown in the table 2 below.

We have found out that obtained p-value is lower than 0.0001. It is lower than determined value Alpha=0.05. It means that reject zero hypothesis and accept the alternative hypothesis. The obtained p-value is also lower than Alpha=0.01 and it means that there is not just statistically significant difference, but also highly statistically significant difference.

Wilcoxon Scores (Rank Sums) for Variable work-life balance of employees Classified by Variable Your position in the firm						
Your position in the firm	N	Sum of Scores	Expected Under H0	Std Dev Under H0	Mean Score	
Owner	18	4599.00	2988.0	352.686460	255.500000	
Manager	36	9198.00	5976.0	484.219889	255.500000	
the employee of the economic department	27	7542.00	4482.0	425.695480	279.333333	
the employee of the logistics department	27	2794.50	4482.0	425.695480	103.500000	
the employee of the production department	198	25641.00	32868.0	762.498126	129.500000	
the employee of the sales department	25	5171.50	4150.0	410.970911	206.860000	
Average scores were used for ties.						

Kruskal-Wallis Test	
Chi-Square	162.8863
DF	5
Pr > Chi-Square	<.0001

Table 2. *Kruskal-Wallis test for the first research presumption.*

Source: own research

According to this realized Kruskal-Wallis test, we can summarize that there is highly statistically significant difference between the respondent’s position in the firm and his/her work-life balance at the level of significance of 99%.

More authors agree that balanced employees tend to feel more motivated and less stressed out at work, which thereby increase company’s productivity and reduces the number of conflicts among co-workers and management (Bastin and Allegra, 2018). And managers are also very important to employees seeking work-life balance. Managers who pursue work-life balance in their own lives model appropriate behaviour and support employees in their pursuit of work-life balance (Heathfield, 2018). The purpose of implementing the idea of work-life balance is to enable people to achieve self-fulfillment in all the fields of human activity. This requires a perfect harmony of all the aspects of life.

There are specific actions undertaken to address the problem of work–life imbalance. According to researchers from Worklifebalance.com Inc., companies usually introduce: flexi-time working systems, teleworking, job-sharing, child care and elderly care schemes, access to leaves, aid programs and fitness schemes (Golaszewska-Kaczan, 2015).

The second research presumption was: There is statistically significant difference between awareness of employees about important matters relating to the company and their knowledge of firm's concept of CSR. Subsequently we set following zero and alternative hypothesis:

H0: There is no statistically significant difference between awareness of employees about important matters relating to the company and their knowledge of firm's concept of CSR.

H1: There is statistically significant difference between awareness of employees about important matters relating to the company and their knowledge of firm's concept of CSR.

The hypotheses were also tested using nonparametric one-way ANOVA by Kruskal-Wallis test. The test results are shown in the following table 4.

Obtained p-value was lower than 0.0001, which is lower than determined value Alpha=0.05. So it means that we reject the zero hypothesis and accept the alternative hypothesis. As in the previous research presumption, also this obtained p-value is lower than Alpha=0.01. We can evaluate this second Kruskal-Wallis test as follows.

Wilcoxon Scores (Rank Sums) for Variable awareness of employees about imp Classified by Variable Do you know the concept of CSR?					
Do you know the concept of CSR?	N	Sum of Scores	Expected Under H0	Std Dev Under H0	Mean Score
Yes	133	29584.0	22078.0	751.419355	222.436090
No	198	25362.0	32868.0	751.419355	128.090909
Average scores were used for ties.

Chi-Square	99.7820
DF	1
Pr > Chi-Square	<.0001

Table 3. *Kruskal-Wallis test for the second research presumption*

Source: own research

There is highly statistically significant difference between awareness of employees about important matters relating to the company and their knowledge of firm's concept of CSR at the level of significance of 99%.

Because of the great significance of human resources for the development of a company, the efforts at shaping the relationship with this group are crucial. In fact, socially responsible policies towards employees should be a point of departure of all CSR activities. Involvement in other issues but ignoring those directly concerning the staff makes pro-social activity of a company inauthentic, or even provokes the resistance of both employees and business environment. The significance of correct relationships

with workers is confirmed by research conducted by Polish Agency for Enterprise Development. As many as 72% of the surveyed firms indicated these relationships as important for their development (Golaszewska-Kaczan, 2015). Nielsen reports that during a recent survey asking employees if corporate social responsibility was important to them, 67 percent of the respondents replied that it was either essential or a strong preference when it comes to choosing the right employer. The Nielsen group has compiled plenty of data on this issue over the last few years. Learn more about what they discovered when they surveyed your customers about their buying preferences with regards to CSR (Widjaya, 2016).

According to CBRE's Research report on Wellness in the Workplace, one of the largest organizational trends of 2016 was the growing awareness of stress and mindfulness in employees. Moreover, 80 percent of employees stated that (mental) wellness programs would be crucial to attracting and keeping them at their jobs for the next 10 years (Fabiano, 2016). One of the best ways to boost employee morale and help workers get to know each other in a non-stressful capacity is by offering an occasional company outing. This type of outing can be as low-key or as extravagant as you like, depending on your company's culture and budget for such things. Taking relaxing breaks will make employees more productive, it can also boost creativity, one's ability to deal with stressors and one's overall health. Nevertheless, taking breaks is not only an effective way to combat stress. Research suggests taking breaks can boost productivity, creativity and happiness as well (Schwartz, 2013).

The workplace that enables employees to achieve work-life balance is particularly motivating and gratifying to employees. When employees feel a greater sense of control and ownership over their own lives, they tend to have better relationships with management and are able to leave work issues at work and home issues at home (Bastin and Allegra, 2018).

The last research presumption deal with correlations. As the first we have determined Cronbach coefficient alpha to evaluate reliability of the realized research. As we can see in the table 4, the value of this Cronbach Coefficient Alpha is 0.892629. It represents very high file reliability based on interpretations of correlation according to De Vaus (2002).

Cronbach Coefficient Alpha	
Variables	Alpha
Raw	0.881915
Standardized	0.892629

Table 4. *Cronbach Coefficient Alpha*

Source: own research

In the following table 5, there are shown values of Spearman correlation coefficient for relationship of first nine questions between each other. Values marked with "*" mean, that they are statistically significant at the level of significance of 95% (Alpha= 0.05). Values marked with "**" mean, that they are highly statistically significant at the level of significance 99% (Alpha=0.01). Values marked with

“pale grey” mean, that they represent essential to very strong correlation between two variables based on interpretations of correlation according to De Vaus.

Based on the third research presumption formulated in the part “Methods”, we set a zero and alternative hypothesis, which are following:

H0: There is no positive correlation between the statement “our company is a socially responsible company” and employee’s loyalty to the company (files are not dependent).

H1: There is positive correlation between the statement “our company is a socially responsible company.” and employee’s loyalty to the company (files are dependent).

To evaluate the correlation, we used the Spearman correlation coefficient. Table 7 shows, that Spearman correlation coefficient for this relationship acquires value 0.61330. This value represents essential to very strong correlation between the statement “our company is a socially responsible company” and employee’s loyalty to the company at the level of significance of 99% (Alpha=0.01).

The obtained p-value for this correlation is lower than 0.0001 and at the same time it is lower than the determined value Alpha=0.05. So that means, that we reject the zero hypothesis and we accept the alternative hypothesis. Simultaneously the obtained p-value is also lower than Alpha=0.01. Therefore, we have confirmed that there is essential to very strong positive correlation between the statement “our company is a socially responsible company” and employee’s loyalty to the company at the level of significance of 99%, so we can say that files are dependent. In other words, we can say, that if the employee consider company (for which he/she works) socially responsible this employee is more loyal.

Table 5. Spearman Correlation Coefficients for correlation of questions 1-9 with each other

Source: own research

Q1 – our company is a socially responsible company

Q2 – awareness of employees about important matters relating to the company

Q3 – communication with the employees

Q4 – compliance with labour standards

Q5 – corporate philanthropy

Q6 – development of qualification, skills, and long-lasting career of its employees

Q7 – early preparation of the staff to changes

Q8 – employee loyalty to the company

Q9 – fighting against corruption and bribery

An employee is loyal to a company for many reasons, including confidence in the company's future, enjoyment of the workplace atmosphere and satisfaction at his pay structure. When those elements are working together to create employee loyalty, it is difficult for your competitors to lure your staff away. A good example of employee loyalty is when your employees volunteer for tasks that improve the company's image. For example, having your employees get involved in building a home for a low-income family shows that the staff is interested in doing something good for the community and improving the public image of the company (Root, 2018).

The CSR concept is relatively new in Slovakia. Therefore, Ubrežiová – Moravčíková (2017) were curious about the formal side and the length of its involvement in management structures. Customer loyalty was considered as strong factor for motivation for almost 40% of companies in our research. When taking into account surveys in Slovakia, the biggest motivational factor according to FOCUS (2010) was keeping up with the competition, followed by attracting and retaining quality employees.

Despite the fact, that we didn't set the research presumption for correlation between "fighting against corruption a bribery" and "gender mainstreaming and the minimization of discrimination", we decided to describe also this relation. It is the highest value of correlation from results of Spearman tests. This value was 0.78238, what represents very strong correlation (based on interpretations of correlation according to De Vaus). At the same time, it was marked with "***", which means this correlation is highly statistically significant at the level of significance 99% (Alpha=0.01). So we can interpret this correlation as following: the companies fighting against corruption and bribery simultaneously minimize gender or other discrimination.

The characteristic features of a socially responsible company with regard to human resources, as its most important source, are to promote the balance of work and personal life of employees, care for their health and welfare, respect for their rights and freedoms, support employees' participation in the decision-making process of the company, development of skills and knowledge of the employees, prevent bureaucracy. Companies in Slovakia have to work hard to implement rules of diversity management and support corporate philanthropy.

DISCUSSION

Research made by Szlávicz and Berber (2015) proved the acceptance of CSR in organizations and defining that concept in form of statement in written form has a positive correlation with HRM

activities. Working with human resources is very responsible and demanding also in the social field of CSR. It is the responsibility of the company management to ensure sufficient communication as well as building mutual trust. Internal communication can affect employees' perception of their organization's CSR. It can also moderate the relationship between employee perceptions of CSR and outcomes such as organizational commitment and esprit de corps (Duthler, Dhanesh, 2018). The findings of Komodromos et al. (2019) also highlight the need for organizational leadership to establish mutual trust and effective communication with managerial employees for successful cooperation during times of strategic change and enhanced overall employee performance. The research made by Salehi et al (2018) in the field of CSR suggests that the investment in CSR initiatives is significantly and positively associated with firm financial performance, what can affect also employees in the positive way.

On the base of our survey, there is highly statistically significant difference between awareness of employees about important matters relating to the company and their knowledge of firm's concept of CSR. Research findings of Chatzoglou et al. (2017) pointed out, that three factors ("CSR awareness", "relevant cost of CSR", "appropriateness of CSR strategies") have a direct effect on CSR implementation, while one factor ("knowledge of CSR") has an indirect effect, through "CSR awareness". On the other hand, CSR implementation seems to have a positive effect on "employee commitment", "customer satisfaction" and "company reputation".

The CSR activities which not only affect employee commitment but also company reputation and customer satisfaction, are confirmed, while the reliability of the employee perception theory, the signalling theory and the equity theory (Galbreath, 2010) are also proved. Although employees are not directly connected with companies' socially responsible behaviour, they seem to prefer working in a responsible company because CSR principles demand better working conditions, fair treatment, improved salaries and so on, and as a result their productivity is enhanced too (Hansen et al., 2011).

Although some research regarding the organizational benefits of implementing work-life balance programs (WLBP) has produced mixed results, research made by Lee and Kim (2010) has consistently found that WLBP produce positive individual benefits that would likely translate into organizational benefits. While much literature focuses on the potential positive impact of WLBP use on women's work-nonwork balance, Brown, Kim and Faerman (2019) found that many women did not believe that work-nonwork balance would be achievable through WLBP use and so did not use these programs. Study findings suggest additional research that examines societal and organizational culture simultaneously is needed. Findings of research made by Ford and Collinson (2011) suggest that in practice work-life balance initiatives may only serve to increase managerial anxieties and pressures,

the very opposite outcome to that intended. These themes do not feature in many work-life balance debates, which tend to assume the perfect manager who is able and willing to create a symmetrical balance between different spheres of life.

A wide variety of CSR activities can be seen as influences on a firms' loyalty of employees. Examples of these activities are; flexible work schedules, eldercare, education and empowerment of women (Portney, 2008). These kinds of activities increase employee satisfaction and loyalty, which was also confirmed in our survey.. Tahir et al. (2013) also investigated the impact of Corporate Social Responsibility on Customer Loyalty. The study found significantly positive relationship between CSR and Customer Loyalty. CSR policy of organizations and its activities can do much for the degree of the employee loyalty of the firm

CONCLUSIONS

It should be noted that a sustainable effect (economic, organizational, social) on the use of Corporate Social Responsibility in the field of HRM is possible if the implementation of CSR principles is related to the daily economic activities of the organization and the constant interaction of social partners. Present-day shows that modern companies are concentrated on informing employees about the company's actions in CSR. The growing role of HRM in CSR pushes enterprises to create events that can promote the value of Corporate Social Responsibility among workers. There is a practice of implementation CSR training as a promotion of skills for employees.

The company's success is based on employees who can increase productivity, care for customers and bring innovative ideas. The claim that people are our most important capital can not only be taken as an exhausted phrase but as an effective tool for achieving competitiveness.

Based on the results of our research and the verification of three established research presumptions, our conclusions are:

- there is highly statistically significant difference between the respondent's position in the firm and his/her work-life balance; the employee of the economic department were the more satisfied ones with work-life balance and opposite the employee of logistics department were the less satisfied ones;
- there are not highly statistically significant differences between awareness of employees about important matters relating to the company and their knowledge of firm's concept of CSR;
- there is essential to very strong correlation between the statement "our company is a socially responsible company" and employee's loyalty to the company; if the employee consider company (for which he/she works) socially responsible this employee should be more loyal;

- we didn't set the research presumption for correlation between "fighting against corruption a bribery" and "gender mainstreaming and the minimization of discrimination", we found out very strong correlation; the companies fighting against corruption and bribery simultaneously minimize gender or other discrimination.

Based on our research and its results, our recommendations for practice of companies in Slovakia are as follows:

- it is essential to promote and develop effective communication within the company in order to ensure that all employees are informed (or enable them to participate in decision-making process);
- to ensure (by the available means) the balance between the working and private lives of all employees, not only managers, as well as provide the suitable space for their mental hygiene;
- on the basis of the established strong dependence between the statement "our company is a socially responsible company" and employee's loyalty to the company, we recommend to pay increased attention to socially responsible business activities in all three areas because of its major impact on employee's "stay on the job" decision-making;

Compliance and strengthening the above, companies can significantly contribute to the development of socially responsible business activities, ensure a sufficient quality and loyal employees and targeted towards sustainable development.

ABSTRACT

The aim of this paper which came out of a secondary research is to show how important it is for companies to be concerned to a considerable extent with ethical issues when they are applying different marketing communications, either from the corporate or the consumer's perspective.

Keywords: Marketing communication, Social responsibility, Advertising, Ethical Brands

INTRODUCTION

The essence of communication

First of all, communication is a transaction process between two or more parties where either the message or the core meaning of that transaction is exchanged via an international use of symbols, (Branding and Communications, 2011). Moreover, (Branding and Communication, 2013) according to the linear model of communication, the sender can be an individual or a firm that is aiming to communicate a need or a market opportunity to either a specific target audience or to the audience in general. Different elements like language, colours, pictures, signs and symbols are part of the **Encoding** which are about to convey to the audience the intended meaning.

Marketing communications in different ways

It's very important to define the different types of communication. Actually there are two types of marketing communications. Non-personal (NPCs) and personal (PCs). NPCs are targeted at the public to different market segments. The message can be transmitted either via advertising by television, or when an event is sponsored either by a firm or a product of the firm. In addition the pack for sales promotion organised by a firm is another type of NPCs. Those tactics of the NPCs intend to promote the image of the company or lines of products, even a particular product, and to build up the company's brand, (Hartley and Pickton, 1999). Some tools which can be used under the

NPCs are: advertising: a paid adverb to communicate a message in a medium. Press advertising: any message that is communicated in a newspaper, magazine or directory. TV advertising: any commercial messages that are communicated in the breaks or during television programmes. Radio advertising; any messages that are communicated by broadcast on radio. Outdoor advertising: messages are communicated on billboards, bus shelters or fly posters.

On the other hand personal communication (PCs) are those that are using a direct two-way communication, such as direct communication with the individual. It could be in person with the consumer or the business-firm, by using different methods like an email, or telephone, fax or an international Web (WWW). PCs intend to increase sales, provide essential service and above all to manage customer contact. Some tools are: personal selling, that is face-to-face communications between buyers and sellers. Database marketing: consumers are profiled in advance and are sent personalized mailings. Finally, exhibitions and trade fairs where companies take individual or group stands at trade fairs which they manage to have a direct contact with either consumers of firms in order to promote and sell their products of services.

Concluding objectives in the field of marketing communications

Three main objectives are to be found: Cognitive: the main goal is to bring awareness about the brand, and to create attention and interest about it. Affective: the main goal is to change consumer's opinion about the brand, and to change the way people face and feel about it by sharing common associations on behalf of consumers. At last, behavioural: the main goal is to invite actions on behalf of consumers. Such a goal can be achieved through on line votes about the brand (Branding and Communication, 2013).

The issue of ethics in marketing communications

Nowadays, the most visible part of marketing are marketing communications and brands. Not only advertising but other forms of communications like corporate images, product images, and image of identity bring up to the surface cultural values and any form of ideological position. A new communications climate is already established in the Global context, like the rise of individualised marketing via direct marketing, or customer relationship management (CRM), (Branding and Communication, 2013).

HOW DIFFERENT DEMOGRAPHIC, CULTURAL, RELIGIOUS AND ETHNIC GROUPS ARE TARGETED DIFFERENTLY BY MARKETERS AND IMPLICATIONS OF THEIR ACTIONS

According to Hackley's historical review (Branding and Communication, 2013), advertising has been central to the general concept of consumer marketing and its growth. Otherwise, advertising by itself promotes the idea of consumption. Furthermore, as Savan mentioned (Branding and Communication, 2013), 'it has been said by television's critics that TV doesn't deliver products to viewers but the viewers are the real product, one that is delivered to its advertisers'. Consumers are abused by the advertisers via television. As consumers we are pushed to different commodities through advertising. An example of this is when a company is promoting a cigarette brand. First of all, the company is promoting its brand. Secondly, by promoting a cigarette brand we are promoting the habit of smoking. The promotion of a cigarette brand itself promotes the action of consumption; in other words such an advertisement encourages consumers to consume.

As Klein (Branding and Communication, 2013) states under her bestseller *No Logo*, 'By the time you're twenty-one, you'll have seen or heard a million advertisements. But you won't be happier for it'. Consumers are exposed to too many and different advertisements. Consumers nowadays are under pressure to buy and use products and services that are not necessary for them. In addition, Klein describes the working conditions in factories that produce branded goods. Cases like child labour, abuse of workers in inappropriate working environments that they have also to work long hours, are called 'sweatshops'.

Brands are sometimes abused by Marketers

Brands are used by Marketers as an important and essential way to communicate and promote their products and services. Nowadays such brands can be the cause of social division amongst children. This results in the creation of two groups the 'in' and 'out'. The first group 'out' is those ones that they do not own the proper brands, which is discriminated and characterised as having a low self esteem. As a result they have their parents feeling guilty for not being able to provide their children with the latest brands. Unfortunately, no attention was given to the effects of marketing young children that are not able to afford expensive or similar brands compared to those from middle or higher income groups. Nowadays such discrimination is happening in schools, those who can afford the latest brand names are called 'in', and those who can't are called 'out'.

Materialism and children

In addition Piacentini and Mailer (Roper and Shah, 2007), found out that students coming from comprehensive schools were more brand name obsessed than those from private schools. We therefore draw the conclusion that popular brand names were more desirable to the lower social

economic groups. As children from higher economic groups do not need to show their financial status, compare to those from lower economic classes, which tend to show their financial competence or hide the lack of it, by owning the latest brands. A further development has show that such children of the lower class, are concerned with materialism. As Ward and Wackman (Roper and Shah, 2007), stated that materialism, is an orientation which views material goods and money as important for personal happiness and social progress. Nowadays children are becoming increasingly materialistic.

STAKEHOLDERS' CONCERN ABOUT THE ETHICAL DIMENSIONS OF MARKETING; DIFFERENT VIEWS AND SOCIAL RESPONSIBILITY IN ADVERTISING

Nowadays advertising's role as the most visible and powerful tool of the marketing mix and marketing communications, introduced Corporate Social Responsibility (CSR). Thus, helped marketers to promote the benefits of CSR. Recently, a survey which has taken place among marketing professionals and consumers, just 35% of respondents considered marketing and advertising a valuable profession. Moreover, marketers and advertisers were rated below politicians and lowers in terms of value to society, (Kendrick, Fullerton and Kim, 2013). Consumers and employees are the most important stakeholder groups where CRS is applied. There are, however, two views; that the corporation's one and only role is to make profit and on the other hand as Freeman's argument that its role is not only to serve shareholders but the other stakeholders, such as employees, suppliers, customers. CSR is playing a considerable role as far as business reputation and identity is concerned. The promotion of commercialism, intrusion and irrationality, visualising social stereotypes and creating negative feelings to certain parts of the society are criticized (Kendrick, Fullerton and Kim, 2013).

On line nationwide student's survey

A nationwide online survey of advertising students via an email invitation to an estimated 6,000 students from 228 universities took place with the following findings. A total of 1,045 students from 176 universities responded with an overall response rate of (77.2%), (Kendrick, Fullerton and Kim, 2013). In the meantime two research questions were set: the first one: 'How do marketing communication students define social responsibility?' and the second one; 'To what extent do student definitions of local responsibility emphasize message or non message aspects of advertising?'. A total of 66% of students answered those questions. Among those 690 respondents, just the (0.02%) believed there was no social responsibility in advertising and another small percentage of (8.8%) commended without being precise. Furthermore, under the first question, and having the students looking at the major categories of responsibilities, ethical responsibility was mostly mentioned by a response of

(56.9%), legal by (50.6%), economic by (27.9%), and finally discretionary by (16.2%). In addition under the second question, more than (64.3%) of respondents included message related content, where just (21.9%) of respondents included non message issues.

Concluding that survey and taking that sample of students as a stakeholder approach about CSR in advertising we come up to an important finding: how do the next generation of advertisers face up the relationship of business versus society. In addition, another issue from that students survey is that today's advertising and marketing education sets CSR mainly as a matter of ethics, law and advertising messaging.

SHOULD COMPANIES BE CONCERNED ABOUT CONSUMER PERCEPTIONS OF THEIR ETHICAL BEHAVIOUR (OR LACK OF IT)?

According to Dean Sanders, and its firm's research called 'Good brand and Company', has shown that 'innovation, ethical standpoint, and social behaviour is nowadays guiding the consumer choice, and not quality and price. A European study of consumer behaviour on Corporate Social Responsibility-CSR, 70% of them mentioned that CSR was essential when choosing a product or a service. Moreover, 37% also mentioned that they had bought a product labelled as ethical in the past 3 years, (Singh, Iglesias and Batista-Foguet, 2012).

Corporations nowadays because of the increasing concern of ethical issues on consumer behaviour, are about to promote CSR hoping to impact their profitability. A recent publication by Ethisphere institute has shown that most of ethical oriented companies achieved to bring better financial results, even in times of economic crisis, due to the fact that they have invested in ethical practises, (Singh, Iglesias and Batista-Foguet, 2012). Despite the importance of CSR, the ethical corporate brand identity versus consumer/stakeholder perceptions and reaction is under a recent academic research. It still remains inconclusive how those ethical issues affect the consumer's purchasing decisions, and the connection between consumer perceived ethicality (CPE), and consumer behaviour needs to be further investigated.

LITERATURE REVIEW

According to a recent literature on consumer's ethical perceptions, we come to the point that consumer perceived ethicality (CPE) at the corporate brand level, as a brand which is honest, responsible, and accountable to its various stakeholders. Furthermore, it is expected that a corporate brand that is perceived by the consumer as ethical, is likely to produce and provide to the market products and services that are fair, honest and trustworthy. In other words an ethical brand transfers its trust to its products and services. Moreover, to a certain extend that relationship between the

consumer and the brand itself is a perception of mutual trust which the consumer communicates with other consumers and other members of the stakeholder group such as the brand's employees. A 'brand affect' is the brand's ability to positively influence the average consumer to use it, (Singh, Iglesias and Batista-Foguet, 2012), and extending this to brand management, it's probable to assume that an ethical brand (following good practices), might be also high in brand affect.

A recent research on fast moving consumer goods (FMCG) which had taken place in Spain among 4,027 consumers for buying groceries for their home, and with an average years of 36.3 which 85% of the respondents were women, a representative of the Spanish market as that percentage of 85 represents the women as the decision makers when about to buy grocery for home, has come up with considerable findings. The research applied to the fields of business ethics, marketing and brand management and it is the first paper that has demonstrated the relationship between the CPE of a corporate brand and its product brand trust and brand affect. The results have shown that one of the main concerns of marketing managers about investing in CSR and ethics at the corporate level is that they should behave ethically. Especially nowadays in such a connected world where brands became more transparent, a real ethical behaviour is necessary to succeed in any market place, (Singh, Iglesias and Batista-Foguet, 2012).

Marketing and advertising ethically, in the era of globalization

When we say 'marketing ethics' or 'advertising ethics' we are invoking the definition provided by Peggy Cunningham as 'what is right or good in the conduct of the advertising function. It is concerned with what to be done, not just with what legally ought must be done', (Branding and Communication, 2013). Her major concern is what should be done, not just with what legally is supposed to be done. Marketers nowadays are sometimes accused for promoting and selling not appropriate products to children and adults like foods that are high in sugar and fat. They also promote alcoholic beverages to young females, (Branding and Communication, 2013). Globalization offers lots of potential benefits to firms and consumers. As marketing attempts to change the lives of many of us, marketers need to consider the ethical consequences of their actions in order to remain credible and legitimate.

Greenwald (Globalization and Ethics, 2011), asks how do companies manage to price their goods in such a way that they can claim to have 'every day low prices'. One way is by paying workers poor wages in developed countries, or by employing illegal aliens is another way. In other words, these products are so cheap because they are produced by workers labouring for long hours in hot, and poorly ventilated factories, (Globalization and Ethics, 2011).

The case of Muslims Ramadan

During such periods, at night everyone is at home with their friends and families, eating and watching television. During those periods, companies spend most of their advertising budgets which sometimes doubles the advertising cost. Advertising messages tend to be culturally sensitive in order to show to their audiences a feeling of goodwill. They also communicate their corporate social responsibility. Surprisingly food products are advertised ahead Ramadan. By the end of the holly period, other products such home furnitures, bed and bath products and so on are advertised (Globalization and Ethics, 2011).

The cost and reward for so-called 'Ethical brands'

As Fan (Fan, 2005) states, an ethical brand is one that does not harm the public good but instead promotes it, and an ethical brand has certain attributes such as honesty, integrity, diversity, responsibility, quality, respect and accountability. Thus ethical brands nowadays with a focus on consumption, present themselves as clean, green and socially responsible. In addition, according to the survey mentioned above, ethical brands can't just depend on their corporate communication, but instead they really have to promote an ethical behaviour that is transferred not only to the customers but to all other external stakeholders, in every interaction with the corporate brand/brands and their products. Moreover, the brand itself becomes an experience, and thus becomes an ethical experience as marketing managers need to invest in a better employee training and even recruitment. In addition, they also need to establish an internal communication within the organisation at all levels in order to maintain the ethical values of the brand.

DISCUSSION AND IMPLICATIONS

Without any doubt, companies nowadays have no option, but to relatively, even essentially, behave ethically when using different ways of communication. Corporations need to seriously pay attention to their customers' perceptions of their ethical and unethical behaviour, via their actions.

A responsible adverb should not harm or avoid any harm to any stakeholder while benefiting at least one, enhances and supports behaviours of trust, and respects viewer's dignity as well as self esteem. Although the freedom of commercial speech is under protection, several issues like misleading and unfair advertising is subject to regulation.

As ethics starts after the law and requires advertising to be truthful, is often left to the consumer's judgment. Thus, such truthfulness needs to be seen as an ethical responsibility. Though the use of stereotypes, the presentation of an unachievable beauty ideal, sex appeal, or targeting children or any other vulnerable consumer segments are permitted by the law, any advertising actions away from such tactics would be ethical responsibility in advertising.

Obviously, behind a brand there is a legal entity, which is a company, a retail store, a city, a corporation or even a country. Its behaviour, affects the way the brand is perceived by consumers, either positive or negative. Unethical practices implemented by marketing managers, sooner or later will be recognised by consumers. This damages the brand with its negative consequences. That's why nowadays, companies realise how important it is to behave ethically, and pricesly to do business in such a way that their brand/brands, do not harm the physical or social environment of the society.

There is no doubt that nowadays consumers, employees and suppliers are among the most important stakeholders in terms of corporate social responsibility. Corporations tend to promote CSR in different ways in order to manage better profitability.

ENVIRONMENTAL CONCERN, GREEN PRODUCT BELIEFS AND WILLINGNESS TO PAY MORE TOWARD GREEN FASHION PRODUCTS. A COMPARISON BETWEEN CHINA AND TAIWAN

Mainolfi, Giada

Faculty of Economics, University of International Studies of Rome, UNINT, Rome, Italy

ABSTRACT

Increased community awareness on environmental degradation and its consequences on health and ecosystem has changed consumers' consumption culture. Despite a growing environmental concern, consumers still fail to buy eco-friendly products, above all in fashion industry. The study aims at understanding consumers' attitudes toward green products by analysing the effect of perceived environmental knowledge and green product beliefs on willingness to pay a price premium. Data collected from 520 respondents in China and 384 in Taiwan are tested against the research model by using structural equation modelling. Results reveal that environmental concern has a significant impact on perceived environmental knowledge, which in turn can influence both green product beliefs and willingness to pay a price premium. Green product beliefs report a positive influence on intentions to pay more only for the Taiwanese sample. The findings of this study present important theoretical and practical implications for consumer green product purchase behaviours.

Keywords: environmental concern, perceived environmental knowledge, green product beliefs, willingness to pay.

INTRODUCTION

Consumption culture of the twentieth century has caused an environmental degradation manifested in the forms of global warming, depletion of natural resources, air, water and land pollution (Chen & Chai, 2010). As a consequence, consumers are becoming more concerned about the protection of the environment and have also showed their growing apprehension through the demand for environmentally friendly products (Suki, 2016). These changes have challenged companies with decisive choices in terms of green marketing strategies by introducing alternative products categorised as green products. These challenges undoubtedly appear to be most critical for the apparel sector, which remains as one of the greatest polluters and the second largest consumer of water usage in the world (Nam et al., 2017; Sahni, 2016).

Firms need to address stakeholders' interests by investing in green supply chain management.

Recently, more apparel companies have joined the Sustainable Apparel Coalition (SAC), a nonprofit trade organisation founded by a group of leading apparel retailers and brands (i.e., Patagonia, Walmart, GAP, Levi's, Nike), to demonstrate their commitment to reduce the environmental impact in favour of an improvement of life quality and safeguard of the planet (Sustainable Apparel Coalition, 2016).

However, despite growing concerns about the environmental impact of consumption, consumers still fail to purchase green products (Gupta & Ogden, 2009). Extant literature remarks knowledge as one of the most influential factors that affects green purchase intention and behaviour. Thus, consumers' incapacity to make informed choices due to inadequately described benefits can become a real barrier to the adoption of green products (Vermeir & Verbeke, 2006). Another relevant barrier to the purchase of green fashion products can be found in the perception of poor product quality. If taste, quality and healthiness have been reported as important attributes for consumers who purchase green food products (Owusu & Anifori, 2013; Cerjak et al. 2010), the same cannot be said for green fashion products. A study by Newman et al. (2014) found that consumers are less likely to purchase something if they think it has been changed with the specific aim of helping the environment. If a company intentionally made a fashion product better for the environment (for example, using organic or recycled fabrics), consumers believe that quality must have suffered because resources have been diverted away from product quality. Therefore, from a broader point of view, the analysis of the judgments nurtured toward green products in terms of functional value, image concern, social value and country-of-origin can guide a deeper understanding of the links existing between subjective norms, perceived behavioural control and purchase intention of green fashion products.

Following this perspective, the purpose of the study is to widen the knowledge on green consumption through the proposal and empirical investigation of a research model aimed at evaluating the influences exerted by environmental concern and perceived environmental knowledge on the use of green product beliefs and on intention to buy green fashion products. In this study, green fashion products were defined as a specific product category made of natural and (or) recycling materials that use alternative fabrics or fibers with less pollution to preserve nature. Notwithstanding the relevant contributions of past studies, some gaps emerge from the literature review, thus guiding the goals of the study. First, in spite of dynamic emphases on environmental issues, little research has investigated the role of country-of-origin in shaping green products judgments. Second, most of the studies have so far focused their attention on Western countries, underestimating developing countries (Ojiaku et al., 2018; Paul et al., 2016; Biwas & Roy, 2015) such as Asian countries, which are becoming the most relevant fashion markets. Therefore, the study aims to fill these gaps by explicitly examining the interactions between environmental concern, perceived self-identity as "green consumer" and green

product beliefs, and how these interactions can impact on behavioural patterns toward green fashion products. Understanding consumers' judgments together with the willingness to pay a price premium for green products is of importance to fashion companies interest in investing in eco-friendly productions without compromising brand equity. Moreover, the results will not only shed light on the relationships between the relevant constructs in the context of green consumption, but may also verify whether these relationships are consistent across two countries, such as China and Taiwan, which are categorised as relevant target markets for fashion industry (IAF, 2018).

THEORY AND HYPOTHESES

The conceptual foundations of the proposed model and related hypotheses are drawn from three different research streams: *environmental concern* (Moustafa, 2007; Bamberg, 2003; Dunlap, 2000); *product-country images* (Knight & Calantone, 2000; Laroche et al., 2005; Papadopoulos et al., 2013); *purchase intentions* (Moon et al., 2008; Yoo & Donthu, 2001). Thanks to a review of relevant literature, the most robust constructs were assessed, and the selection was made according to their relevance and expected validity for the purpose of the study. From a structural point of view, the research model is composed by six main constructs, derived from the literature review: a) *environmental concern* refers to attitudes about environmental issues based on the relative importance that a person places on themselves, other people, or plants and animals (Dunlap et al., 2000; Stern & Dietz, 1994); b) *perceived environmental knowledge*, defined as "the general knowledge of facts, concepts and relationships concerning the natural environment and its major ecosystems" (Fryxell & Lo, 2003: p. 45) c) *green product beliefs*, which refer to consumers' evaluative judgments specific to sustainable products (Ojiaku et al., 2018); d) *willingness to pay a price premium* can be interpreted as the readiness to pay more in order to obtain a particular product (Netemeyer et al., 2004); e) *word-of-mouth*, defined as consumer intentions to spread positive or negative judgments to a multitude of people (Babin et al., 2005).

As shown in Fig. 1, the main underlying hypothesis of the proposed model is that environmental concern and perceived environmental knowledge are judged capable of positively influencing green product beliefs. Moreover, it is hypothesised that green product beliefs may positively impact on both willingness to pay a price premium and WOM. Likewise, environmental concern is expected to positively influence perceived environmental knowledge. At the same time, this latter is assumed to positively affect willingness to pay more.

Influence of environmental concern on perceived environmental knowledge and green product beliefs

Many consumers are making consumption decisions that reflect their desire to protect the environment. Environmental concern may be defined as the degree of concern a person holds toward the environment. Dunlap et al. (2000) identified four main dimensions of environmental concern:

ecological limits, balance of nature, human domination, ecological catastrophe. Past studies found that a positive relationship exists between ecological concern and environmental disposition (Chan, 2001; Gill et al., 1986). The study tests the hypothesis that environmental concern influences specific behaviour via its impact on perceived environmental knowledge and green product beliefs in the context of the decision to buy green fashion products. Thus, it is hypothesised that:

H_{1a}: *Environmental concern positively influences perceived environmental knowledge*

H_{1b}: *Environmental concern positively influences green product beliefs*

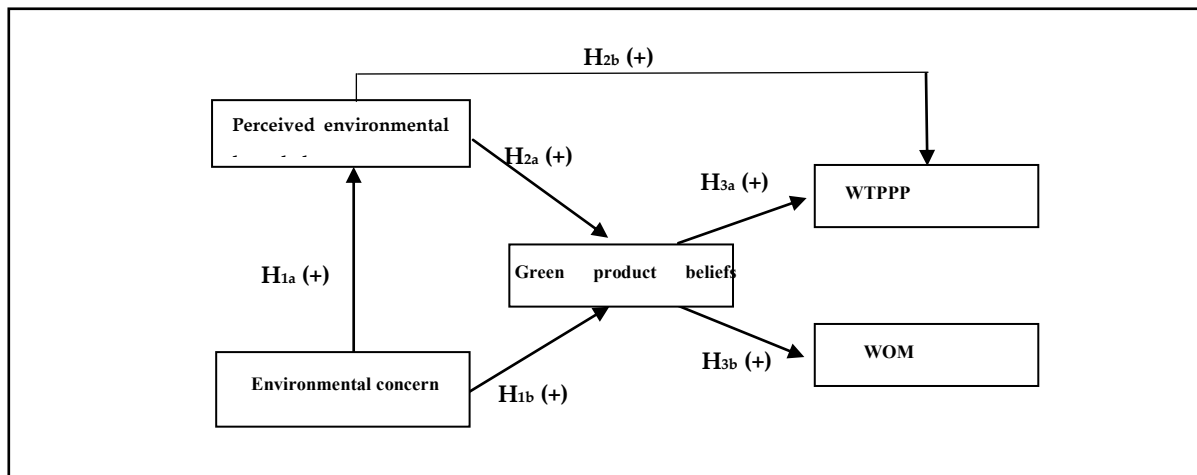

Figure 1. Research model and hypotheses

Influence of perceived environmental knowledge on green product beliefs and willingness to pay a price premium

Knowledge has a powerful impact on almost every aspect of consumer behaviour (Brosdahl & Carpenter, 2010). Environmental knowledge has been defined as the general knowledge about facts, concepts, actions regarding the natural environment and its major ecosystems (Fryxell & Lo, 2003). Several authors (D'Souza et al., 2006) maintain that a higher level of environmental knowledge could be associated to a more favourable attitude toward green products. Consumers who are inclined to adopt eco-friendly behaviour are more motivated to embrace green apparel consumption behaviour (Chan, 1999; Kim & Damhorst, 1998). Moreover, some studies indicated that consumers' willingness to pay more for environmentally friendly products is higher compared to conventional products (Barnard & Mitra, 2010; Bang et al., 2000). However, other studies reported different results. Consumers were either not willing to pay more for green products or were willing to do so only if the product has the same quality to the non-green version. For example, a study by Barber et al. (2009) demonstrated that wine consumers are willing to pay a premium for green products only if marketing's communication approach and methods aid in informing and educating. In the context of apparel, a recent study by Momberg et al. (2012) on South African millennials revealed that price sensitivity is still a barrier preventing "green" consumers to buy eco-friendly products. Starting from

the above considerations, we believe that in order to gain better knowledge about potential influences exerted by perceived environmental knowledge on behavioural patterns it is necessary to integrate the analysis with green product beliefs. Such an integration could shed light on some mixed results related to the interaction between environmental awareness and buying decisions.

Thus, it is hypothesised that:

H_{2a}: *Perceived Environmental Knowledge (PEK) positively influences green product beliefs*

H_{2b}: *Perceived Environmental Knowledge (PEK) positively influences willingness to pay a price premium*

Influence of green product beliefs on willingness to pay more and WOM

Despite the emergence of a green movement, consumers are still sceptical about green brands and products. Consumers still appear to be unsure about making eco-sustainable choices and purchases. Unlike the agri-food sector, where there is a growing awareness of the benefits that can be achieved, fashion consumers are not confident about the characteristics and performances of eco-friendly products which are often judged to be far from the “non-green” version. The assessment of such beliefs is decisive as this will result in the willingness, or otherwise, to buy eco-friendly products (Leonidou & Skarmeas, 2017). Green product beliefs can be interpreted as the set of cognitive judgements toward sustainable products, i.e., in terms of quality, innovation, style, etc. Thus, consumers who hold positive and strong beliefs about environmentally friendly products will be more willing to buy and use green products. For example, Kang et al. (2013) found consumers’ belief about buying and wearing organic cotton apparel to positively affect purchase intention. However, the relationship between green product beliefs and willingness to pay a price premium did not receive the same attention from fashion marketing research. Moreover, consumer’s judgements may influence word-of-mouth. If positive and strong, green product beliefs affect consumers in recommending to friends and relatives their beloved products and brands.

Therefore, it is hypothesised that:

H_{3a}: *Green product beliefs positively influence willingness to pay a price premium*

H_{3b}: *Green product beliefs positively influence word-of-mouth*

METHOD

Data collection and procedure

To test the proposed model, an online survey was conducted on a sample of Chinese and Taiwanese residents during the period October-November 2018. Face validity was addressed by a panel of experts (an Italian academic, expert in Asian culture, an Italian marketing academic and a Chinese academic) to assess the clarity and, above all, the appropriateness of the questions. The two Italian academics first evaluated the English version. The Italian expert in Asian culture and the Chinese

scholar evaluated the Chinese and Taiwanese version. Based on this feedback, the questionnaire was modified, with some items deleted and others modified to improve the correct translation of meanings. The procedure was completed by back-translations from the Taiwanese/Chinese version to the English one. Respondents were recruited online through a Qualtrics panel provided by Qualtrics Panels, LLC. Qualtrics panel management is a service in which the company recruits the target population and compensates them for participating in research. Online panels have been found to be comparable to other methods of recruiting survey participants (Mody et al., 2017; McKeever et al., 2016). During the online survey, more than 1,000 consumers were contacted. The respondents were selected based on screening questions that qualified them as fashion consumers (i.e., they had bought recently or regularly bought fashion items). At the end of the fieldwork, 902 questionnaires were judged valid (520 for the Chinese sample and 382 for the Taiwanese one) and coded for the data analysis. A descriptive analysis of the samples is reported in Table 1.

Measure	Items	Percentage	
		Taiwan	China
Gender	Female	54.6	59.7
	Male	45.6	40.3
Age	17-24	20.5	22.5
	25-34	35.0	33.2
	35-44	21.8	24.5
	45-64	18.5	16.8
	>64	4.2	3.0
Education	High school	10.1	8.7
	Diploma	19.6	18.2
	Bachelor's	38.6	42.6
	Master's	27.7	24.9
Employment status	PhD	4.2	5.6
	Student/ Unemployed	12.2	13.2
	Housewife/husband	8.6	7.4
	Professional	34.8	31.5
	Full-time job	32.7	34.6
	Part-time job	11.7	13.3

Table 1. Profile of respondents

Measures

Model constructs were measured based on 7-point Likert scales adapted from similar studies. Environmental concern was assessed through a reduced version of the Dunlap et al. scale (2000). Perceived environmental knowledge was assessed using five items developed by Mostafa (2007).

Green product beliefs were assessed through 5 items proposed by Elliot et al. (2010), adapted for green products. Willingness to pay a premium price was measured using three items proposed by Lee et al. (2010). Finally, the 3-item scale proposed by Babin et al. (2005) was used to assess word-of-mouth, with some adjustments for the purpose of the research. All statements were on a seven-point anchored scale (from “completely disagree” to “completely agree”). The items of the scales are shown in Table 2.

Analytical procedure

Data underwent two phases of analysis. Firstly, a confirmatory factor analysis (CFA) with the latent variables considered was performed to assess convergent and discriminant validity of the measurement scales. Secondly, the paths of the hypothesized relationships were explored simultaneously for the Italian and Taiwanese groups of respondents. Structural equation modelling (SEM) with maximum likelihood method was employed for the CFA and for the analysis of the conceptual models. Data were analysed using Lisrel 8.80. The fit of the models was interpreted based on a range of indices: the Chi-square (χ^2) value, the degree of freedom (df), the comparative fit index (CFI), the non-normed fit index (NNFI), the root mean square error of approximation (RMSEA) and the standardized root mean square residual (SRMR). A good fit of the data was indicated by a chi-square/degrees of freedom value less than 4 (Field, 2000). Values in the 0.90 range and above have been deemed acceptable for CFI and NNFI (Hooper et al. 2008; Hu & Bentler 1995). Values lower than 0.08 have been deemed acceptable for the RMSEA and SRMR (Bollen, 1989; Browne & Cudeck, 1993).

RESULTS

To assess convergent and discriminant validity of the measurement scales a confirmatory factor analysis was estimated using the total sample as well as the Chinese and the Taiwanese data separately. As the skew and kurtosis statistics showed that the normality assumption was violated, the models were estimated using the Satorra-Bentler method (Satorra & Bentler, 1994). The fit statistics indicated that the measurement models fit the data well (total sample: $\chi^2 = 542.156$, $df = 160$, $p = 0.000$, $CFI = 0.99$, $RMSEA = 0.06$, $NNFI = 0.99$, $SRMR = 0.06$; Taiwanese sample: $\chi^2 = 353.612$, $df = 160$, $p = 0.000$, $CFI = 0.97$, $RMSEA = 0.05$, $NNFI = 0.97$, $SRMR = 0.05$; Chinese sample: $\chi^2 = 504.209$, $df = 160$, $p = 0.000$, $CFI = 0.98$, $RMSEA = 0.06$, $NNFI = 0.98$, $SRMR = 0.06$). Convergent validity was tested by checking that all items substantially and significantly loaded onto the expected latent construct (Anderson & Gerbing, 1988). All constructs also showed satisfactory levels of Composite Reliability (CR) and Average Variance Extracted (AVE), exceeding the recommended cut-off points for the adequacy of 0.70 and 0.50 respectively (Fornell & Larcker, 1981; Steenkamp & Van Trijp, 1991). Next, discriminant validity was assessed by the Fornell and Larcker's (1981) criterion. The average variance explained by each latent variable was greater than any of the squared correlations involving the variable, suggesting that discriminant validity was achieved. Cronbach's alphas were also used to confirm the scales' reliability. All constructs were

greater than the threshold value of 0.70 (Nunnally, 1978). Table 2 reports the reliability and validity indexes for each construct.

		Overall	Taiwan	China
Sample size		902	382	520
Environmental concern (EC)				
When humans interfere with nature, it often produces disastrous consequences	CR	0.80	0.90	0.88
	AVE	0.65	0.71	0.65

I will encourage friends and family to buy eco-sustainable products				
Fit statistics				
Taiwan: $\chi^2 = 353.612$ (d.f. 160; $p < 0.001$); RMSEA=0.05; NNFI=0.97; CFI=0.97; GFI=0.90; SRMR=0.05				
China: $\chi^2 = 504.209$ (d.f. 160; $p < 0.001$); RMSEA=0.06; NNFI=0.98; CFI=0.98; GFI=0.91; SRMR=0.06				
Overall: $\chi^2 = 542.156$ (d.f. 160; $p < 0.001$); RMSEA=0.06; NNFI=0.99; CFI=0.99; GFI=0.93; SRMR=0.06				

Table 2. Measurement scales reliability and validity

TESTS OF THE STRUCTURAL MODEL

Results showed that the model fits the data well for both groups (Taiwanese sample: $\chi^2 = 397.279$ (d.f. 163; $p < 0.001$); RMSEA=0.06; NNFI=0.96; CFI=0.96; GFI=0.90; SRMR=0.05; Chinese sample: $\chi^2 = 527.152$ (d.f. 163; $p < 0.001$); RMSEA=0.06; NNFI=0.99; CFI=0.99; GFI=0.90; SRMR=0.06). Results indicated that the first group of hypotheses is partially supported in both groups. While the influence of environmental concern on perceived environmental knowledge is confirmed for both samples ($\gamma_{\text{Taiwan}} = 0.622$, $p < 0.01$; $\gamma_{\text{China}} = 0.728$, $p < 0.01$), its

positive impact on green product beliefs is confirmed only with respect to the Taiwanese group ($\gamma_{\text{Taiwan}} = 0.466$, $p < 0.01$). Conversely, H2 (*a* and *b*) was fully supported by empirical data. The perceived environmental knowledge increased the positive perception of green products ($\gamma_{\text{Taiwan}} = 0.162$, $p < 0.01$; $\gamma_{\text{China}} = 0.964$, $p < 0.01$) and exerted a significant and positive effect on willingness to pay a price premium in order to own fashion green products ($\gamma_{\text{Taiwan}} = 0.352$, $p < 0.01$; $\gamma_{\text{China}} = 0.829$, $p < 0.01$). Turning to the third set of hypotheses, the empirical findings on the effect of green product beliefs reported partially different patterns between the Taiwanese and the Chinese sample. Results from the Taiwanese sample showed that green product beliefs have a positive influence on willingness to pay a price premium ($\gamma_{\text{Taiwan}} = 0.308$, $p < 0.05$), but they are not related to word-of-mouth. The Chinese sample, instead, reported a positive influence of green product beliefs on word-of-mouth ($\gamma_{\text{China}} = 0.868$, $p < 0.01$), but not on willingness to pay a price premium.

CONCLUSION

The study has examined consumers' attitudes toward eco-friendly fashion products. Two main contributions from this study. First, the research contributes to the theory of reasoned action (Ajzen & Fishbein, 1980) by introducing a conceptual framework which reveals environmental concern, perceived environmental knowledge and green product beliefs as antecedents of behavioural intentions. Second, the binational survey contributes to the green marketing literature by revealing similarities and differences of two relevant emerging markets, namely China and Taiwan.

Results show that the perceived environmental knowledge is a significant predictor of green purchase intentions. Consumers will buy eco-friendly products if they are aware and concerned of environmental issues to the point of perceiving themselves as "real" green consumers. However, mere concern for the environment does not necessarily translate into positive ecological behaviour, consumer may be sceptical of green product features. In fact, from the findings, the set of beliefs held with respect to green fashion products seem to be able to reinforce the willingness to pay more only for the Taiwanese sample. Considering the Chinese sample, instead, green product beliefs are capable of positively influencing the willingness to share positive judgments about eco-friendly products with friends and relatives, but not the willingness to pay more. Such mixed results may confirm the

presence of a possible consumer mistrust toward fashion green products whose features are judged inferior compared to “traditional” fashion products.

MANAGERIAL IMPLICATIONS

Understanding the antecedents of green purchasing behaviour is essential to promote sustainable consumption strategies in emerging countries. The current study clarifies the contribution of the theory of consumption values to green purchasing intentions among young adults in China and Taiwan. Findings show that the knowledge concerning environmental issues plays a significant role in affecting both green product evaluation and willingness to pay more. However, the evaluation of eco-sustainable products seems to be still penalised compared to conventional products. Following this perspective, results of this study have meaningful implications for fashion companies that are investing in eco-friendly productions. Due to the fact that some consumers may be sceptical and evaluate green fashion products of less quality among non-green ones, companies should communicate green marketing arguments providing details and specifications of quality standards characterising the eco-friendly products. Marketers should invest more efforts in communicating and describing the performance of green products. Companies improving a basic product feature such as making something more environmentally friendly or better tasting should either position the improvement as unintended or emphasise that the primary goal is improving the quality of the product. Consequently, company claims about green products should be communicated to customers in a coherent and truthful way capable of reflecting the corporate identity. Only in this way the green efforts of the brand may obtain an effective awareness by customers and stakeholders.

ABSTRACT

Agriculture has been steadily attracting severe criticism due to the negative impact farming practices have on the natural environment. To overcome challenges, it is necessary to gain insights into farmers' attitudes towards practices and especially of those active in protected areas. Hence, the present study aims to investigate crop and livestock farmers' attitudes towards sustainable agriculture in the protected area of Lake Pamvotis in Greece. Results based on data collected via questionnaire show that over half crop farmers held a certificate for proper pesticide use, while most of them followed the instructions written on the pesticide label and wore mask and gloves during application. In addition, they kept the correct time intervals between pesticide application and harvesting, while they avoided spilling the remaining product and disposing the container in irrigation rivers and channels. Regarding livestock farmers, they obtained information mostly from the veterinarian who supplied them with veterinary medicines and from their parents, while almost all administered antibiotics to their livestock only according to the veterinarian's prescription. However, about half did not perform tests to examine the quality of the non-branded feed and water their livestock consumed. Since the findings revealed weaknesses and issues, local authorities could use them to organize Environmental Education and Communication programs aiming at raising environmental awareness in farmers so that they become more conscious about the impact of farming practices and in turn contribute to the sustainable development of the protected area.

Keywords: Protected areas, sustainable farming, crop and livestock farmers' attitudes, Ioannina basin.

INTRODUCTION

Across the world, agriculture has been attracting severe criticism due to the negative impacts it has on the natural environment and the world ecology at large. Soil degradation, erosion, water pollution, excessive use of chemicals, waste of water, decreasing ground water tables, destruction of natural habitats for wildlife, and limited animal welfare are just few of the concerns raised by environmentalists, ecologists, nature conservationists and the public. This has led to a persistent call for agriculture to become less exploitative and more 'sustainable', meaning that agriculture should make the best use of available natural resources and inputs, and regenerate conditions for future production (for example, soil fertility, resilience of the ecosystem, water availability).

On the other side, protected areas were established with a view to enhance local biodiversity and manage sustainably local natural resources. Meanwhile, the perceptions and attitudes of the local population towards protected areas consist major determinants of the sustainable development of the entire area (Booth *et al.*, 2009). In essence, this means that the attitudes of the local public and particularly of crop and livestock farmers who are close to protected areas have a direct effect on the sustainability of protected areas which are often subjected to the detrimental effects of conventional farming activity.

In protected areas, such as Lake Pamvotis in the basin of Ioannina, agricultural activity should not only respect the environment but also produce quality products with high additive value. Hence, the present study aims to examine the attitudes and views of crop and livestock farmers of the Ioannina basin on the practices they use for their crop and livestock production. The identification of their views and attitudes will enable the detection of weaknesses and problems. Indicatively, the relevant stakeholders could use the present study findings to design effective Environmental Communication Programs to protect the vulnerable ecosystem of Lake Pamvotis. That is because studies on individuals' attitudes and views can be used as a useful tool by policymakers (Tsantopoulos *et al.*, 2013).

LITERATURE REVIEW

It is often argued by authors (Berkes & Folke, 1998; Roling & Wagemakers, 1998) that 'sustainability' cannot be regarded exclusively in biophysical or ecological terms, because the state of 'hard systems' depends crucially on interactions between multiple human beings (i.e. on the 'soft system'). The hydrological state in a water catchment area, for example, cannot be understood properly only in hydrological terms. That is because hydrological processes and their outcomes are shaped and influenced by the way farmers irrigate their land, use stream banks, make wells, plough their land, manage contours and choose crops. In turn, the choice of practices depends partly on wider social-organizational circumstances, such as water laws and regulations, the way markets for different

agricultural products are organized, population pressure, the functioning of agricultural service institutions and so on. Thus, from a sustainability perspective, when the aim is to improve the management of water in a catchment area one will essentially have to foster new agreements, modes of co-ordination and/or forms of organization among farmers themselves, and between farmers and other societal stakeholders, including other water users (for example, industries, urban communities).

The example of water catchment management indicates that the management of natural resources often exceeds community and regional boundaries. Hence, it is reasonable that some of the environmental issues the planet faces (such as climate change, water shortage) can be effectively addressed only if significant cooperation is achieved on a transnational or even global level. In this context, understanding farmers' attitudes towards crop and stock-farming practices becomes key to solving issues such as the above, but also protecting vulnerable ecosystems. Attitudes are defined as a disposition to respond favorably or unfavorably to an object, person, institution or event. An attitude is (a) directed towards an object, person, institution, or event; (b) has evaluative, positive or negative, elements; (c) is based on cognitive beliefs towards the attitude-object (i.e., the balancing between positive and negative attributes of an object leads to an attitude); and (d) has consequences for behavior when confronted with the attitude object (Bergevoet *et al.*, 2004).

Attitudes are determined by the beliefs that are salient or important to a person and they are formed by what an individual perceives to be true about the attitude-object. This perception may or may not be based upon information and knowledge and/or an emotional reaction towards the object. In addition, many beliefs and values may underpin an attitude (Willock *et al.*, 2008). Attitude simply refers to 'a person's evaluation of any psychological object'. These evaluation judgments are represented as items of knowledge, which are based on three general classes of information: cognitive information, emotional information, and information about past behaviors (Allen *et al.*, 2005). Dimara and Skuras (1999) also concluded from their research that there is a significant relationship between attitudes and behaviors: attitudes cause behaviors and behaviors cause attitudes, while both have mutual causal impact; and attitudes and behaviors are slightly, if at all related (Bentler and Speckart, 1981).

Studies in the literature strand on farmers' attitudes have explored specific topics such as knowledge, information sources, attitudes to issues such as water use and antibiotics as well as factors affecting attitudes. Regarding knowledge, the reviewing of case studies showed that there was diversity in knowledge sources, while most valued the local experiential knowledge since they regarded it as practically, personally and locally relevant (Šūmane *et al.*, 2018). However, it is concerning that a lack of knowledge on practices was observed in many Natura 2000 areas (Šorgo *et al.*, 2016). To enhance farmer knowledge and contribute to sustainable farming, Šūmane *et al.*, 2018 recommend that the role of all

stakeholders, including farmers, must be acknowledged, while both formal and informal types of knowledge must be brought together.

Another focal point in the relevant literature is farmers' attitudes towards the use of water and antibiotics because many of these practices often entail severe impacts. In other words, the quality of water for irrigation and the antibiotics livestock farmers administer to their livestock are often criticized as harmful not only to the environment but also to public health. So far, it has been discovered that farmers in Iran were aware that the use of untreated wastewater for irrigation purposes is associated with health risks. However, reasons such as water scarcity, production costs and limited freshwater accessibility drove them to use it for irrigation (Maleksaeidi *et al.*, 2018). Meanwhile, an alarming tendency to use nontraditional water was noticed in the United States where a large share of farmers stated they would use it despite being concerned about issues such as water quality and food safety (Suri *et al.*, 2019).

Apart from water use, practices regarding antibiotics consist a major issue as the irrational antibiotics administration to livestock can pose great risks. In this regard, it is worrying that Malaysian farmers had insufficient knowledge about conditions requiring antibiotic treatment and that most farmers considered that all sick animals had to be given medicine. At the same time, half respondents perceived that antibiotics have no side effects, whereas most of them were indifferent to administering antimicrobials only when prescribed by veterinarians (Sadiq *et al.*, 2018). To overcome issues arising from the wrong use of antibiotics, Suri *et al.* (2019) advised that farmer knowledge on antimicrobial resistance and use must be targeted through educational campaigns for farmers and that they should be more actively involved in the design and evaluation of antimicrobial regulations.

Finally, to gain insights into farmers' mindset, more research on factors affecting attitudes to practices is needed. Indicatively, it has been indicated that knowledge, moral norm and social cohesion (Maleksaeidi *et al.*, 2018), as well as personal efficacy, training and perceived usefulness (Zeweldi *et al.*, 2017) affect farmers' preference for sustainable or unsustainable practices.

METHODOLOGY

The study was conducted in 2016 within the limits of the water catchment area of the lake Pamvotis while the local livestock and crop farmers consisted the "population" under study. To collect the data, the questionnaire was chosen as the most appropriate instrument since it consists a standardized design for collecting and registering specialized information related to a topic with accuracy and completeness. The specific questionnaire included questions on the livestock and crop farmers' attitudes, knowledge and everyday practices. The chosen sampling method was the simple random sampling and it was revealed that 185 holdings were necessary. The holdings of the sample were

found with the help of random numbers by using tables of random numbers. This indicated 155 livestock holdings, 20 crop and livestock holdings as well as 11 crop holdings. In these selected holdings, personal interviews with the head of the holdings were conducted.

In addition, to analyze the obtained data, descriptive statistics, the non-parametric Friedman test and categorical regression were used. The Friedman test is used to compare the values of three or more correlated groups of variables. The distribution of the Friedman test is χ^2 distribution with degrees of freedom (df) $df = k-1$, where k is the number of teams or samples. This test classifies the values of variables for every subject separately and calculates the mean rank of classification values for each variable. Categorical regression is an extension of the principles of classical linear regression and logarithmic analysis. Through scaling, it assigns values to each category of variables in such a way that they are optimum concerning the regression and reflect the characteristics of the original variables. The interpretations are related to the transformed variables, but they are also related to the original variables, due to the relationship that exists between the original variables and the transformed ones.

RESULTS

Study results provide information on the sociodemographic characteristics of participants and focus on a variety of topics. Specifically, farmers' views on obtaining information from various sources on crop and livestock production as well as the practices they use in the context of crop and livestock production are described.

Crop farmers' views and attitudes

In socioeconomic terms, most farmers involved in crop production were male (74.2%) and more than half (51.6%) of respondents were aged between 41 and 60 years, while a considerable share (29%) were aged between 51 and 60 years. At the same time, the vast majority (90.3%) was married.

To investigate whether there were statistically important differences among crop farmers' views on the information sources from which they obtained information on crops, the non-parametric Friedman test was performed (Table 1). The Friedman criterion is a non-parametric test which ranks the items of a multivariate. According to the test results, the agronomist who supplies pesticides to the farmers was in the lead of the ranking indicating that the agronomist-supplier consisted crop farmers' main information source (mean rank 5.39). Moreover, the knowledge the crop farmers have received from their parents was the second ranked information source with a mean rank of 4.98. Conversely, to a lesser degree the respondents stated they drew information from books or magazines, the Internet and agronomists employed by public services.

Information sources	Mean rank
Knowledge received from parents	4.98
Agronomists employed by public services	3.15
Agronomist supplying pesticides	5.39
Books-magazines	3.55
Internet	3.69
N= 31 Chi-Square= 43.788 df = 4 p<0.001	

Table 1. *The application of the non-parametric Friedman test regarding crop farmers' assessment of information sources*

Crop farmers' practices prior to and during pesticide application

Regarding crops, most farmers were involved in large-scale crops (corn, alfalfa, wheat), while some cultivated small areas of land with horticultural products which were mainly vines and vegetables. Interestingly, more than half farmers (54.8%) had acquired certificate for proper pesticide use. Then, to detect the priority the respondents assigned to each item of the multivariate "Crop farmers' practices prior to and during pesticide application", the non-parametric Friedman test was carried out (Table 2).

Statement	Mean rank
Reading the instructions on the pesticide's label before using it	5,70
Having acquired a first-aid kit	2.15
Being properly dressed during application	5.27
Wearing gloves during application	5.68
Wearing a mask during application	5.37
Noting down the exact dates of pesticide application	3.65
Spraying in conditions of still air	4.43
Using the same spraying system for both pesticides and other products	3.75
N= 30 Chi-Square= 80.657 df = 7 p<0.001	

Table 2. *The application of the non-parametric Friedman test ranking farmers' practices prior to and after pesticide application*

The test results showed that reading the instructions on the pesticide's label before use was ranked first (mean rank 5.70), while wearing gloves during application was also ranked very high (mean rank 5.68). In percentage units, 74.2% of respondents stated they always read the directions on the pesticide label, whereas 71% did not often keep a first-aid kit at hand. At the same time, more than 80% reported to take measures necessary for their safety and health protection, such as wearing appropriate clothes, gloves and mask. In addition, about half farmers stated they kept an application journal for each crop, while 63% sprayed their fields in conditions of still air. Finally, six in ten respondents used the same spraying equipment for herbicides and other pesticides.

Crop farmers' practices after pesticide application

After performing the non-parametric Friedman test for the multivariate “crop farmers’ practices after pesticide application”, it was indicated that the most preferred practice was keeping the correct time intervals between application and harvesting with a mean rank of 5.03 (Table 3). In particular, about half respondents did not store the remaining spraying solution for future uses, whereas 74.2% did not dispose the remaining product in non-arable land. Remarkably, almost all farmers claimed they never spill any remainder of product in irrigation channels and rivers and most of them (87.1%) were keeping the proper time interval between application and harvesting. Finally, the majority (83.9%) washed the spraying equipment with abundant water and detergent.

Statement	Mean rank
Storing the remaining product for the next application	3.10
Placing the remaining product in an area that is not farmed	2.27
Spilling the remaining product into irrigation channels and rivers	1.85
Using the remaining product until the container is empty	3.90
Keeping the proper time interval between application and harvesting according to instructions	5.03
Washing the spraying equipment with abundant water and detergent	4.84
N= 31 Chi-Square= 100.072 df = 5 p<0.001	

Table 3. *The application of the Friedman test regarding farmers’ activities after pesticide application*

Next, the non-parametric Friedman test was applied again to detect the priorities the surveyed farmers assigned to the items of the multivariate “disposal of empty pesticide container after use” (Table 4). According to the test results, most respondents favored the practice of gathering the empty pesticide container for burning with a mean rank of 5.03. In percentage units, 83.9% of farmers did not bury the containers in fields, while 96.8% did not keep them for other uses. Meanwhile, 67.7% gathered them for recycling and 54.9% burnt them. Moreover, the majority did not dispose empty packages in landfills and no participants disposed them in irrigation channels and rivers.

Items	Mean rank
Burying the empty container in the field	3.02
Keeping it for other uses	2.69
Gathering it for recycling	3.44
Gathering it for burning	5.03
Disposing it in waste sites or landfills	4.24
Disposing it in irrigation channels or rivers	2.58
N= 31 Chi-Square= 65.851 df = 5, p<0.001	

Table 4. *The application of the Friedman test regarding the disposal of empty pesticide containers after use*

Factors affecting crop farmers’ practices on pesticide application

Categorical regression was conducted to examine the factors influencing crop farmers’ practices i) prior to and during pesticide application and ii) the disposal of empty pesticide containers after application.

Regarding factors affecting participants' practices, as Table 5 shows, the aggregate scoring of sub-topics of the multivariate QA and independent variables gave dependent variable. The categorical regression gave coefficient value of multiple determination $R^2=0.869$, indicating that 86.9% of the dependent variable's variance was accounted for by the modified values of the independent variables participating in the regression equation. In addition, the analysis of the variance (ANOVA) gave value $F=4.3$, which corresponds to a zero level of statistical importance, suggesting that the subsample of the categorical regression adapted well to the modified data. Meanwhile, there was no multicollinearity due to the low values of the correlation coefficients. The above can also be confirmed by the very high acceptance values of the independent variables which express the variance participation of each independent variable, which is not explained by the remaining ones.

The standardized (regression) coefficients of the independent variables and the diagrams of dependent and independent variable modification indicate that the variables age, information from the agronomist-supplier, information from the Internet and certificate for proper pesticide use affect significantly crop farmers' practices. Additionally, based on the F values of each independent variable it was found that the deletion of variables with high F values, such as age and certificate for proper pesticide use, made the subsample weak. Moreover, the measures of relevant importance of the independent variables suggest that the variables information from the agronomist-supplier (35.1%) and certificate for proper pesticide use (24.2%) made the greatest contribution to the dependent variable.

	Beta	F	Sig.	Importance (Pratt)
Gender	0.345	2.,234	0.166	0.032

Children number	0.733	2.149	0.173	0.528
Information from the agronomist-supplier	0.521	2.954	0.045	0.351
Information from the Internet	0.392	3.318	0.046	-0.009
Certificate for proper pesticide use	0.361	4.060	0.022	0.242

Table 5. *Categorical regression results regarding the factors affecting crop farmers' practices prior to and during pesticide application*

Next, as it appears in Table 6, a dependent variable emerged from the aggregate score of the subtopics of the multivariate QB and independent variables. Categorical regression gave coefficient value of multiple determination $R^2=0.795$, indicating that 79.5% of the variance of the dependent variable was explained by the modified values of the independent variables participating in the regression equation. Moreover, the relevant analysis of variance (ANOVA) gave value $F=3.587$ which corresponds to zero level of statistical importance, showing that the subsample of categorical regression adapted well to the modified data.

	Beta	F	Sig.	Importance (Pratt)
Gender	0.197	0.915	0.358	-0.052
Age	1.176	7.815	0.004	0.514
Family status	0.051	0.037	0.850	-0.017
Children number	-0.221	0.326	0.579	0.069
Information from the agronomist-supplier	-1.227	6.338	0.013	0.355
Information from the Internet	0.516	3.571	0.039	0.128
Certificate for proper pesticide use	0.065	0.138	0.717	0.001

Table 6. *Categorical regression results of factors influencing the disposal of empty pesticide containers*

There was no multicollinearity due to the low values of the correlation coefficients which can be further affirmed by the high acceptance values of the independent variables. The standardized (regression) coefficients of the independent variables and the diagrams of dependent and independent variable modification show that the disposal of empty pesticide containers after application was mostly affected by the variables information from the agronomist-supplier, age and information from the Internet. Moreover, in view of the F values of each independent variable it was indicated that the deletion of variables with high F values, that is the variables age and information from the agronomist-supplier, rendered the subsample weak, while the deletion of the variable information from the Internet had a slight effect on the predictability of the subsample. In addition, the measures of relevant importance of the independent variables suggested that the variables age (51.4%), information from the agronomist-supplier (35.5%) and information from the Internet (12.8%) contributed mostly to the independent variable.

Livestock farmers' views and attitudes

Regarding the socio-demographic characteristics of the surveyed livestock farmers, male participants (64.0%) outnumbered their female counterparts. In terms of age, 60.6% were aged between 31 and 50 years and 22.9% between 51 and 60 years. Moreover, most respondents (78.3%) were married.

The majority (52.5%) of livestock farmers in the study area were involved in poultry breeding, followed by sheep/goat farming (42.0%) and cow farming (5.5%). Notably, the biggest share of livestock farmers (64.0%) were authorized to operate their units. Meanwhile, 60.0% of the livestock holdings were housed, 35% were semi-housed and 5% were free-range livestock. In addition, all livestock farmers had registered their livestock in the Veterinary Service. It is also important to note that 94.3% did not process their products, but directly marketed them with companies and traders they cooperated with. All livestock farmers complied with the national vaccination program of the Veterinary Service.

First, participants reported the information sources from which they received information on farm-related topics. As it can be seen in Table 7, the veterinarian who supplied veterinary medicinal products to them consisted the primary information source.

Information sources	Mean rank
Knowledge received from parents	4.50
Agronomist employed in public service	3.59
Veterinarian employed in public service	4.38
Agronomist-pesticide supplier	4.02
Veterinarian-veterinary medicines supplier	5.08
Books-magazines	3.18
Internet	3.25
N= 175 Chi-Square= 173,612 df = 6, p<0.001	

Table 7. *The rankings of the non-parametric Friedman test concerning the livestock farmers' preferred information sources*

More specifically, seven in ten livestock farmers had acquired information from the veterinarian who supplied them with veterinary medicinal products. Simultaneously, five in ten respondents obtained information from the veterinarians employed in regional public services and about the same proportion relied on the knowledge they received from their parents. Much like crop farmers, books, magazines and the Internet consisted the least reported information sources for the livestock farmers. The respondents were then asked whether they agreed with the imposition of an environmental protection tax. As shown in Table 8, half respondents were in disagreement with the measure.

Percentage (%)				
Not at all	Slightly	Moderately	Very	Extremely
18.9	32.6	31.4	9.7	7.4

Table 8. *Participants' level of agreement with the imposition of environmental tax*

Next, livestock farmers' practices regarding the management of farm waste were examined. Results tabulated in Table 9 show that most respondents (73.7%) spread the waste on land, whereas 24% possessed segregated tanks and only 8% owned a biological treatment plant in their holding.

Practices	Percentages (%)
Biological treatment plant	8.0
Segregated tanks	24.0
Spreading waste on land	73.7

Table 9. *Respondents' practices relating to livestock waste management*

Finally, the biggest share of livestock farmers (64%) were authorized to operate their units. At the same time, almost all respondents (99.4%) administered medication to their livestock only according to the veterinarian's prescription.

However, 54.3% did not perform laboratory tests to examine the quality of animal feed which is not branded or standardized, whereas about half respondents conducted chemical analysis on the water consumed by their livestock (Table 10).

Animal health characteristics and practices				
	Holding an operation authorization	Medication administration only according to the veterinarian's prescription	Performance of laboratory tests examining the quality of animal feed which is not branded or standardized	Chemical analysis conduct on the water consumed by their livestock
	Percentage (%)			
Yes	64.0	99.4	45.7	50.3
No	36.0	0.6	54.3	49.7
Total	100.0	100.0	100.0	100.0

Table 10. Percentages of livestock farmers' practices regarding animal health

DISCUSSION

It is rather encouraging that more than half of the surveyed farmers possessed a certificate of proper pesticide use. It should be noted that this certificate indicates adequate knowledge of a variety of topics involving the legislation on pesticides and their use, measures minimizing biodiversity and environmental risks, safe working practices regarding pesticide handling and storage, disposal of empty pesticide containers and personal protection measures. Moreover, codes of good agricultural practice aim at tackling issues arising from agricultural activity and securing the continuation of proper operations. These practices are intended to contribute to the sustainable development of farm lands and natural resources, rural landscape protection and conservation but also to protect farmers' and consumers' health. The adoption of safe practices is particularly important because studies have indicated high pesticide concentrations mainly in farm holdings (Vryzas *et al.*, 2007; Vryzas *et al.*, 2009) but also in protected areas such as the basin of Lake Vistonis where studies have reported not only residues of frequently detected pesticides at high concentrations but also residues of pesticides which are not registered in Greece and possibly were obtained from illegal imports (Papadakis *et al.*, 2015). Hence, farmers' increased level of familiarization with the code could to some degree ensure that the farming activity respects the natural environment and contributes to the sustainable development of protected areas.

A positive result was that most crop producers took personal safety measures and read the instructions on the pesticide label before pesticide application. Hence, it appears that the vast majority respected consumers since they kept the required intervals between the last application and harvest. In addition, respondents were aware of the proper way to clean the container after pesticide application and were willing to participate in an organized program of empty pesticide containers collection. However, in the year 2017 a systematic procedure for empty pesticide container collection began in the area where the survey was performed. This was coordinated by the Association of owners of farm supplies establishments, the Hellenic Crop Protection Association, the municipalities of Ioannina and Zitsa and the Regional Crop Protection, Quality and Phytosanitary Inspection Centre

of Ioannina. It can be thus expected that this action will reduce the dangerous pollution load threatening the vulnerable ecosystem of Lake Pamvotis and prevent farmers from managing plastic waste in environmentally unfriendly ways.

Most livestock farms were authorized to operate, however, to adapt livestock farming to the current business requirements this percentage ought to be increased. To that end, according to Law No 4056/2012 all livestock holdings were required to receive authorization by December 2018. What is more, Law 4178/2013 enabled livestock farmers to legalize any arbitrary holdings, so they could update their authorization. Hence, it can be anticipated that great percentages of farms will be authorized making them more likely to conform to sustainable farm management measures.

Undeniably, our finding that most livestock farmers spread livestock waste onto the fields, while only few possessed segregated tanks or biological treatment plants, consists a major point of interest. To assist a better understanding of this, it should be noted that according to the existing legislation the generated manure is not characterized as waste, but as animal by-product on the condition that it is not intended for incineration, landfilling, composting or use in biogas plant. In case of composting, manure management is conducted on a case by case basis (collection, transportation, storage) as defined in Regulation (EC) No 1069/2009 of the European Parliament and of the Council of 21 October 2009 which laid down health rules about animal byproducts and derived products which were not intended for human consumption (European Commission, 2011). Exceeding our expectation, almost all surveyed livestock farmers administered antibiotics to their livestock following the exact prescription of the veterinarian. Greek livestock farmers' pronounced awareness about the proper use of antibiotics is in sharp contrast with the attitude of the Malaysian farmers who were quite indifferent to using antimicrobials only when prescribed by the veterinarian (Sadiq *et al.*, 2018). In terms of water use, about half respondents were somewhat uninterested as they did not perform chemical analysis on the water consumed by their livestock. Low levels of awareness about water quality were also indicated in Iran where farmers used untreated water despite knowing its negative effects (Malaksaeidi *et al.*, 2018) and the US where respondents would use nontraditional water (Suri *et al.*, 2019).

CONCLUSIONS AND IMPLICATIONS

The objective of the present study was to identify crop and livestock farmers' attitudes towards farming practices in the protected area of Lake Pamvotis. In view of the findings, it may be inferred that overall both crop and livestock farmers were found to have positive attitudes towards sustainable practices and their role in the sustainable development of the area could be further enhanced.

Regarding crop farmers, most had already acquired a certificate for proper pesticide use and were familiar with personal safety measures such as wearing gloves and mask before pesticide application. In terms of information, most respondents obtained knowledge about farming practices from their families and the agronomist who supplied pesticides to them. Moreover, categorical regression analysis indicated that farmers' disposal of empty pesticide containers, which consist a concerning source of pollution, is affected mostly by certain variables and mainly by their age, the information they receive from the agronomist-pesticide supplier and Internet-based information. To enhance crop farmers' awareness about sustainable practices regarding pesticide use and management of waste, it is recommended to use the aforementioned influential information sources. For example, authorities could disseminate information on organized actions regarding pesticide container collection for recycling through the most preferred sources and ensure that all farmers are well informed about the possibility of safe disposal.

As for livestock farmers, results showed that almost all of them followed the prescription of the veterinarian to administer antibiotics to sick animals and at the same time most respondents were authorized to operate their farm. Nevertheless, it was indicated that only half of them conducted analyses to examine the quality of water and feed consumed by their livestock. In terms of livestock waste management, participants stated they mostly spread it onto their field, whereas only few possessed segregated tanks and biological treatment plants. Much like crop farmers, the surveyed livestock farmers obtained knowledge on practices from the veterinarian who supplied antibiotics and their family.

Although an adequate level of sustainable practices was identified among both crop and livestock farmers, it is crucial to further enhance their information and awareness levels because the chosen practices of farmers have a direct impact on the natural environment and public health. To that end, the relevant authorities should plan Environmental Communication programs on a frequent basis and in a manner that suits the expectations and needs of farmers. At the same time, importance should be placed on the solution of longstanding issues of the primary sector such as production cost reduction, separation of forest and agricultural land, disposal of empty pesticide packaging, waste and dead animal management as well as product identity. Beside these issues, the degradation of the ecosystem in Lake Pamvotis must be avoided at all costs. Specifically, steps should be taken to secure the total water volume of the lake and activities taking place in the lake area should be monitored. Finally, the Managing Body of Lake Pamvotis should design Environmental Education and Communication programs targeted at farmers to raise their environmental awareness, so that they are more conscious about environmental protection during their farming activities. The above findings were based upon the views of the surveyed crop and livestock farmers. To indicate the pollution level in the wider area

of Lake Pamvotis, it is recommended to take and analyze not only soil samples but also samples from plants and animals. Finally, following the application of Environmental Education and Communication programs it is recommended to perform new studies in order to investigate whether the wider area is still burdened by pesticide use and to examine the awareness levels of crop and livestock farmers.

THE SVALBARD ARCHIPELAGO UPON THE LAW OF THE SEA

Maniatis, Antonios

Law School, University of Nicosia (UNIC), Nicosia, Cyprus

ABSTRACT

The Svalbard region (territories and territorial waters) constitutes a separate case of International Law, subject to the stipulations of the 1920 Spitsbergen treaty. Upon its legal regime, it belongs to the State of Norway, but all the nationals of the contracting parties have equal liberty of access and 'entry' ('relaxation' according to the French version) for any reason or object whatever to the waters, fjords and ports of the territories and may carry on there without impediment all maritime, industrial, mining and commercial operations on a footing of absolute equality. In 1977, Norway established a 200 nautical mile Fisheries Protection Zone (FPZ) off Svalbard, which is considered as a new zone of the Law of the Sea. To date, the Spitsbergen treaty has offered a privilege of equal treatment against Norway to contracting states, particularly the (mainstreaming) coastal ones, as almost no landlocked country is a contracting state. The Svalbard Archipelago constitutes a challenge for contracting parties, such as Greece, which should put the stress on both mercantile navy and fishery. Besides, the Spitsbergen treaty consecrates the fundamental right of both ships, put into Svalbard ports, and of private individuals, exemplified by seafarers, to relax and therefore could be slightly seen as a precursor of Maritime Labour Convention (MLC). In general, it is indicative of anthropomorphism of ships in Maritime Law. So, it results a 'Maritime Law paradox', consisting in the pioneer content of this treaty, which is a Law of the Sea agreement endowed with Maritime Law innovations.

Keywords: Exclusive Fisheries Zone (EFZ), Fisheries Protection Zone (FPZ), Greece, landlocked states, Law of the Sea, Maritime Law, Norway, Right to relaxation, Spitsbergen treaty, Svalbard

INTRODUCTION: THE LAW OF THE SEA, A TRADITIONALLY CUSTOMARY BRANCH

The Law of the Sea constitutes a traditional branch of International Law, which regulates the various zones of the Sea, not of waters of other entities, such as rivers and lakes (Alexopoulos and Fournaraki, (2015). It is a genuine body of Public Law rules, having to do mainly with sovereignty and other forms of political power of States, particularly of the coastal ones.

The newer period of the Law of the Sea begins in the 17th century, due to the fact that maritime countries expressed their interest to govern in the sea place (Roukounas, 2006). One of them was

Venice, which had already managed to become the biggest place of commerce of the Christian West (Vergé – Franceschi). The normativity on the matter had been an intrinsically customary branch, having little relationship with written rules, till 1958, when United Nations achieved the adoption of four (complementary) Conventions, known as the Geneva Conventions. Although that development was of unique importance, it was not exempted from weak points and therefore led to a new legislative initiative. The second codification attempt resulted in the United Nations Convention on the Law of the Sea (UNCLOS), concluded in 1982 in Montego Bay. This single code is comparable to the formal Constitution of sovereign States, that is why the doctrine has called it 'Constitution for the Oceans' (De Pooter). This text, as modified in 1994, includes almost all institutions of this branch, with the exception of a relatively new zone. It is about the Exclusive Fisheries Zone or Exclusive Fishery Zone (EFZ), having a customary origin. This zone secured increasingly wider support after the 1945 Truman Coastal Fisheries Proclamation (Molenaar, 2015). It is to point out that before the entry into force of the UNCLOS – probably by the early 1970s – a coastal State's entitlement to sovereign rights and jurisdiction for fisheries purposes within a 200 nautical mile EFZ had crystallized into customary international law. Anyway, we consider it as the 'big anarchist' of the Law of the Sea, because it escapes from international (non-customary) regulating power. Moreover, the last years the countries having made use of it, such as Iceland, have got the tendency to consider that they are endowed with an Exclusive Economic Zone (EEZ) instead of an EFZ.

Similar remarks are valid for the International Seabed, which was legally consecrated, (initially in a customary way, in 1973) as the 'Area', being a common heritage of mankind. It is also notable that the person promoting this consecration, the ambassador of Malta Pardo, is considered as the Father of the Law of the Sea in its current form. That diplomat served as Malta's representative at the Preparatory Commission of the Law of the Sea conference in 1972 and led the Maltese delegation to the UN Seabed Committee from 1971 to 1973. The Area has gained an interest of major importance the last decades whilst it is relevant inter alia to the abyss, which constitutes a key to the future mainly thanks to its metal deposits (Duperron and Gail).

The current paper aims at introducing to the question of legal nature and economic opportunities in the region of Svalbard.

We suppose that contracting parties to the 1920 Spitsbergen treaty should get benefit from this region.

THE 1920 SVALBARD TREATY, OFFERING A PRIVILEGE TO STATES AGAINST NORWAY

The Arctic Archipelago of Svalbard constitutes a rather 'unknown' region reminding of the archaeological zone, which has been introduced through the UNCLOS but in an unclear way, let alone

with no name. We consider it as an 'invisible zone' due to the fact that there is the tendency not to include it, at least explicitly, in the maps of the Law of the Sea, apparently implying that it is about a specific version of the contiguous zone. However, it has been signaled that this zone, being comparable to the contiguous one, should be promoted to a clearly consecrated autonomous zone of the Law of the Sea, namely independent to the contiguous one (Maniatis, 2018b).

As far as the Svalbard region is concerned, the proto-condominium arrangements discussed in the 1870s and immediately preceding World War I attempted to conform the concept of condominium to parochial interests – and not the other way around – principally because no individual State was capable enough to secure or perfect its own economic security interest (Rossi, 2015). Indeed, the Russo/Swedish-Norwegian Agreement of 1872 was inspired by the concept of *terra nullius* (commonly called a 'no man's land'), given that the archipelago was regarded as a territory which could not be the object of exclusive possession by any State.

Unlike other unclaimed territories, which historically have been acquired by discovery, effective or symbolic occupation, or by force, Norway's sovereignty over Svalbard was conferred on it by a legal text. It is about the 'Treaty between Norway, the United States of America, Denmark, France, Italy, Japan, the Netherlands, Great Britain and Ireland and the British Overseas Dominions and Sweden Concerning Spitsbergen Signed in Paris 9th February 1920'. Article 1 of this text recognizes the full and absolute sovereignty of Norway over the Archipelago of Spitsbergen, as the Svalbard archipelago was commonly referred to, whilst the King of Norway proclaimed the islands as Svalbard in 1925. The Archipelago comprises, with Bear Island or Beeren-Eiland, all the islands situated between 10° and 35° longitude East of Greenwich and between 74° and 81° latitude North, especially West Spitsbergen, North-East Land, Barents Island, Edge Island, Wiche Islands, Hope Island or Hopen-Eiland, and Prince Charles Foreland, together with all islands great or small and rocks appertaining thereto.

Last but not least, article 9 establishes the demilitarization of the archipelago as Norway undertakes not to create nor to allow the establishment of any naval base in the territories specified in Article 1 and not to construct any fortification in the said territories, which may never be used for warlike purposes.

THE ANTHROPOMORPHISM OF SHIPS AND THE FUNDAMENTAL RIGHT TO RELAXATION

Article 2 previews that ships and nationals of all the contracting parties enjoy equally the rights of fishing and hunting in the territories (specified in Article 1) and in their territorial waters. It is to point out that the formulation on the matter is quite impressive, confirming the anthropomorphism of ships

as long as ships are endowed with rights, let alone the fact that they are equalized to human beings and in English are parallelized to women (Maniatis, 2018a).

Article 3 mentions that the nationals of all contracting parties have equal liberty of access and 'entry' for any reason or object whatever to the waters, fjords and ports of the territories specified in Article 1. Subject to the observance of local laws and regulations, they may carry on there without impediment all maritime, industrial, mining and commercial operations on a footing of absolute equality. It is to clarify that the French official version of the treaty does not make use of the aforementioned term 'entry' but of the term 'relaxation', which is personalized and more friendly to human rights of private individuals. In a similar way, the same article previews that notwithstanding any rules relating to coasting trade (in French 'cabotage') which may be in force in Norway, ships of the High Contracting Parties going to or coming from the territories specified in Article 1 shall have the right 'to put' into Norwegian ports on their outward or homeward voyage for the purpose of taking on board or disembarking passengers or cargo going to or coming from the said territories, or for any other purpose. However, for one more time the French text makes an explicit reference to the right to relaxation, let alone of the ships themselves (implying the relaxation of their crews, as well). More concretely, the text (as it is also the case of other linguistic versions, such as the Greek one) makes use of the term 'to relax' instead of the aforementioned term 'to put'. So, the French text has an anthropocentric approach and a more intensive anthropomorphism than the English version. This formulation reminds of the International Labour Organization (ILO), established one year earlier, to promote the rights of the working population. It is to signalize that one of the most important legal texts of Maritime Law consists in Maritime Labour Convention (MLC), which constitutes the ILO convention number 186, established in 2006. The fourth pillar of International Maritime Law (after SOLAS, STCW and MARPOL) embodies all up-to-date standards of existing international maritime labour Conventions and Recommendations, as well as the fundamental principles to be found in other international labour Conventions. It applies to all ships entering the harbors of parties to the treaties and to all ships flying the flag of state party and consecrates the seafarers' right to rest and leisure.

SVALBARD, AN ARCHIPELAGO OF (MAINSTREAMING) COASTAL STATES

Fourteen States were original signatories of the Spitsbergen treaty whilst the Soviet Union and Germany signed the agreement in 1924 and 1925, respectively. The Treaty came into force on 14 August 1925 whilst in 2018 there were 46 parties to the treaty. For instance, Greece ratified the text in 1925 without enacting a particular role on the matter. It is to put the stress on the fact that the Law of the Sea has a 'democratic' orientation, not ignoring the legitimate interests of landlocked countries. Some States of this very common category are endowed with military navy, such as Bolivia, for their

national waters, such as lake and river ones. This remark is also valid for private ships, as it has been traditionally the case of the Grand Duchy of Luxembourg. This country has its fleet of ships flying the Luxembourg flag whilst about 335 shipping companies are registered in Luxembourg. So, it is obvious that dealing with military navy or shipping is not merely a geographical matter and the Law of the Sea has an important autonomy against conventional institutions and approaches to the source of wealth. It goes without saying that the 'big State of the sea' is available for the enhancement of national prestige, if not for the completion of sovereignty of States, particularly the ones marked by important geographical or historical limitations in their identity.

To date, the doctrine has omitted to remark that landlocked countries, with only three (essentially two) exceptions, have abstained from acquiring rights resulting from the Svalbard treaty. More concretely, Hungary ratified the treaty on 29 October 1927 and Czechoslovakia acceded to this text on 9 July 1930. As a result, the Czech Republic in 2006 and Slovakia in 2017 informed that they considered themselves bound to the treaty since their independence on 1 January 1993, as successor States of the dissolved State of Czechoslovakia. It is obvious that landlocked States have not been literally indifferent on the matter but have been traditionally discouraged from getting involved in an area far away from their territory, not to speak about other parameters like transport controversies of old times. So, Svalbard archipelago has proved to be a *de facto* opportunity for differentiation between coastal countries, particularly the mainstreaming ones, and the rest ones. However, in the current era of globalization and climate change implicating Arctic ice melting, even landlocked countries are motivated to get benefit from the Svalbard Archipelago, as the last years some coastal countries, such as Spain, have begun to do in the Fisheries Protection Zone (FPZ) off Svalbard. A journey from metropolitan Spain to Svalbard lasts from 5 to 6 days but it is obviously value for money.

In a similar way, the Greek nation is the world leader in terms of mercantile navy and so is motivated to get benefit from the Svalbard archipelago in terms of shipping. However, severe criticism has been raised against Hellenic Republic for its traditional minimalism relevant to the economic and geopolitical opportunities offered by the International Law and particularly the Law of the Sea. We recommend Greece acquire a specialized, single Shipping and Fishery Ministry, essentially a 'Svalbard Archipelago Ministry', being competent for Hellenic Coastguard, shipping and fishery, and oriented *inter alia* to internationalize the Greek fishery activities. Greek fishermen, the last years, have been led to destruct about 13.000 private fishery vessels due to the official EU policy against overfishing. The Greek State has not adopted a counterbalancing policy to safeguard these ships, representing a traditional, national shipbuilding art, not to speak about the promotion of fishery activities in the Svalbard archipelago.

CURRENT QUESTIONS RELEVANT TO THE SVALBARD ARCHIPELAGO

Despite the fact that the important military restrictions have been imposed, as already signalized, the archipelago is not entirely demilitarized.

Furthermore, Norway argues that the text offers to other countries equal economic access but only to the territories of Article 1 and their territorial waters, whose breadth was 4 nautical miles then (and 12 nautical miles currently). It adds that the continental shelf is a part of mainland Norway's continental shelf and should be governed by the aforementioned Geneva Convention on the Continental Shelf, adopted in 1958. However, it has to cope with the permanent reaction of its powerful neighbor country, namely initially Soviet Union and currently the Russian Federation, which supports the position that the Spitsbergen Treaty is applicable to the entire zone.

More precisely, on 1 January 1977, Norway's 200 nm Economic Zone off its mainland came into effect, followed by a 200 nm FPZ off Svalbard later in 1977 and a 200 nm Fishery Zone (a de facto EFZ) off Jan Mayen in 1980 (Molenaar, 2015). According to this country, the usual Law of the Sea regime applies seaward of the outer limit of the territorial sea and entitles it to a continental shelf and EEZ and their associated sovereign rights and jurisdiction. However, no other parties to the Treaty support this position and an important number of them take the view that Svalbard generates – or can generate – all the usual coastal State maritime zones but that the Treaty applies to all of these. In view of these different positions, Norway established a FPZ off Svalbard, while insisting on its right to establish an EEZ or on its customary right to acquire an EFZ – and has granted certain allocations of fishing opportunities to a limited number of parties, largely based on historic track records. A scholar has supported the opinion that this FPZ is a new maritime zone of the Law of the Sea (Molenaar, 2015). In view of the uniqueness of the situation – in particular the fact that sovereignty over Svalbard was granted by, and subject to, the 1920 Svalbard Treaty – no other coastal States will feel compelled or have an incentive to establish a similar maritime zone off part or all of their territory. While several other coastal States have also established FPZs, for instance Spain in 1997 relating to most of its coast in the Mediterranean Sea, and Libya in 2005, their enactments show that they are really de facto EFZs. However, we consider that the position that the FPZ of Norway is the unique authentic zone of this category has not been proved (as for its unique character) whilst it is also to add that the regime of various zones relevant to fishery is not quite clear. For instance, Spain has established its own EEZ in the aforementioned region of FPZ, without considering that the FPZ has been abolished through the creation of the new zone on the matter.

Anyway, scholars have taken the position that rapid ice melting and conditions of global warming, together with technological advances and increasingly accessible resources, have awakened competing interests over the legal regime that both confers on Norway full and absolute sovereignty

and limits that sovereignty by establishing equal access and non-discrimination rights for all states parties to the Svalbard treaty (Rossi, 2015).

Besides, the doctrine has argued that the Svalbard Treaty is outdated, a victim of the passage of time and unanticipated developments now producing ambiguities in its application.

Furthermore, the Svalbard case can offer invaluable food for thought for anyone who cares about the Arctic and is ready to grapple with its full legal, political and psychological complications (Bayles, 2011). The existing Treaty regime aims at two of the same things that all serious players say they want for the whole Arctic region: peace and stability in 'hard' military terms, and responsible resource management with fair shares for all.

CONCLUSION: A TREATY GENERATING INNOVATIONS LIKE THE RIGHT TO RELAXATION

We conclude that the first thing to highlight as for the Spitsbergen treaty is the fundamental right of both ships, put into Svalbard ports, and of private individuals, exemplified by seafarers working in the ships on the matter, to relax. Relaxation is omitted by the English version of the treaty, which is a quite paradoxical matter but goes in with the spirit of the very recent creation of the ILO. So, the treaty could be slightly seen as a precursor of the fourth pillar of International Maritime Law, consisting in the ILO text 'MLC'. In general, the Spitsbergen treaty is also indicative of the wider phenomenon of the anthropomorphism of ships in Maritime Law. So, it results a paradox coming from the content of this classical treaty of the Law of the Sea, which is not uniquely a pioneer convention of this branch of law, being still customary, but also emblematic and modern as far as Maritime Law is concerned. This phenomenon could be called the 'Maritime Law paradox'. It is to add that this syllogistic could be concluded with a reference to the (future) fundamental rights to tourism and hospitality as long as tourism is conducted through maritime journeys. Anyway, tourism and hospitality constitute 2G fundamental rights in the world history, namely belonging to the same era to the Spitsbergen treaty, which had recently begun (in 1918).

Besides, the Svalbard treaty has generated a very uncommon status quo, which has to do with a restricted national sovereignty of Norway and with exploitation rights of nationals of many other countries whilst Soviet Union made use of its mining rights on land, in contradiction to other countries. If the ideas of conferring and restricting sovereignty (of the coastal State of Norway) have been the Treaty's most unusual features, they have also indirectly led Norway to innovate, by creating an authentic FPZ off Svalbard, instead of an EFZ, so an original new maritime zone of the Law of the Sea. Anyway, not only Norway but also its great competitor, Russia, are hardcore players in the Arctic region, whose legal status could be regulated eventually through a region-specific international treaty.

Last but not least, the paper hypothesis has been confirmed, given that coastal countries besides Norway, such as Greece, are motivated to proceed to economic activities and confirm their interest in this region, marked by peaceful international economic coexistence. The Arctic Ocean and particularly the Svalbard Archipelago should become the field of an original, anthropocentric, peaceful approach of a wider set of countries, the landlocked included...

BLOCKCHAIN WITH EMPHASIS ON TAX LAW

Maniatis, Antonios

Law School, University of Nicosia (UNIC), Nicosia, Cyprus

ABSTRACT

Blockchain constitutes a relatively new technology, on the basis of decentralization, proof-of-work consensus and practical immutability. Its mainstreaming application, since 2009, consists in virtual cryptocurrencies, mainly exemplified by Bitcoin (BTC), which has been officially admitted as a form of currency, initially by the USA jurisprudence. In October 2015 the Court of Justice of the European Union, interpreting Directive 2006/112/EC on the common system of value added tax, did not consider bitcoin as a material good and judged that the exchange of traditional currencies (such as krona, euro...) against bitcoins is exempted from value added tax. If virtual cryptocurrencies have been recognized as means of payment, being similar to the rest currencies, many investors have preferred them as an alternative means of investment. Blockchain, having got rid of traditional figures of trade, such as banks, is comparable with another application of Internet, sharing economy, in the field of tourism. This application has recently overridden traditional figures, such as the hotelier, through digital platforms, like Airbnb.

Keywords : Bitcoin (BTC), blockchain, cryptocurrency, taxation, tax law

INTRODUCTION: BLOCKCHAIN AND CAPITALISM

Blockchain or Distributed Ledger Technology (DLT) constitutes a kind of technology, which is not absolutely new, as its first application started in 2009. This technology was associated to new means of payment, but its consequences are not limited to this domain. As it was the case of other previous new technologies, blockchain, let alone cryptocurrency, is linked with a political ideology supporting capitalism although it is marked by skepticism against States.

It is to underline that capitalism tends to favorize competition and mobility of the market, for instance in the sector of fashion. The doctrine remarks that this sector has an ambiguous character, namely utilitarian – practical (reminding of the French etymological origin “façon” of the English word “fashion”) or artistic – not functional (Donaud, 2017). It is to pay special attention to the fact that the USA have promoted the development of the very prosperous domain of clothing products upon the utilitarian approach, through legalizing the copying of original works against conventional institutions, such as the author’s copyright. Of course, this is not the case of other countries, such as

France, which is a pioneer worldwide as far as the intellectual and industrial property rights of fashion designers are concerned. So private initiative, particularly in the domain of trade, is encouraged, in the framework of capitalism whilst taxation continues to be a constant competence of States.

The enthusiasm which has resulted from blockchain have led some scholars to make speech of a new revolution, which could be compared with the (much wider) Internet revolution. It is to signalize that applications of this technology have been localized in almost all branches of economy. Financial markets, simple contracts, probate, property transfers, taxes, corporate governance, and insurance agreements are areas already penetrated by blockchain, mainly for monetary transactions and tracking data changes (Fulmer, 2019). In February 2018 European Commission announced the foundation of an observatory and a forum on blockchain, to monitor the developments on the matter.

We suppose that regulations relevant to cryptocurrency are suitable to promote trade.

Exploring every application of blockchain is beyond the scope of this paper, which includes a description of the operation of blockchain. Afterwards, the paper introduces to blockchain regulation issues and then analyzes cryptocurrency, particularly bitcoin, upon Tax Law.

DESCRIPTION OF BLOCKCHAIN

Blockchain technology emerged on the basis of the following three elements: decentralization, proof-of-work consensus, and practical immutability (Fulmer, 2019). Combined, these core components provide a unique solution to any digital transaction that eliminates the need for an intermediary to legitimize the transaction. It results a network of users to maintain and monitor the distributed record, which is called "ledger". The ledger is broadcast through a network of computers and, as already signalized, eliminates the need for a central intermediary. To ensure an accurate record of transactions, blockchain incentivizes a group of users on the network to verify valid transactions. Once verified, the transaction is incorporated into a block and cryptographically linked to the previous transaction. That transaction is itself linked to the preceding transactions, infinitely. Thanks to the technique of cryptographic linking, it is proved to be nearly impossible (or at least highly impractical) to falsify a transaction. The reason is that if this kind of criminality is committed, all the previous transactions would also have to be altered, following the concept of an authentic chain of interdependent components. As far as the aforementioned feature of immutability is concerned, this element, alternatively called "extreme resistance to tampering", offers cryptocurrencies and other blockchain applications their intrinsic value, given that most business and industries rely on accurate untampered records. To clarify the function of blockchain through its most frequent application to date, bitcoin, when Anna wants to send a Bitcoin to Bill, Anna enters Bill's public key, the amount of

bitcoin, and signs the transaction with his private key. The transaction is then broadcast to all nodes on the network and a subset of those nodes, miners, compete to verify the transaction. The miner solves the cryptographic hash function that certifies that the information contained in the transaction is correct and valid. At last, the group of verified transactions enhances blockchain, in the sense that these transactions are contained in a block and added in the blockchain.

As the nodes of a decentralized ledger can span multiple locations around the world, it is often difficult to establish which jurisdictions' laws and regulations apply to a given application (Salmon & Myers, 2019).

CRYPTOCURRENCY REGULATION

Regulatory and legislative bodies do not find it easy to keep up with variations on cryptocurrency transactions given its rapid growth and innovations (Fulmer, 2019). In addition to using cryptocurrencies as currencies to buy goods, many entrepreneurs are also issuing their own cryptocurrencies to raise money to fund their products.

The need for legal definition of cryptocurrency implicates its classification in the legal system (Logaras, 2018). Although this term reminds of currencies, the answer does not prove to be so obvious, given that almost no cryptocurrency functions as a currency. To take advantage of the blockchain technology, there are the tokens (such as "ether" for the platform of Ethereum), which are indispensable for the participation in the platform. It results that the nature and the operation of cryptocurrency fit in mainly with digital elements of fortune, whose value exists only in the framework of the "ecosystem" of operation of a concrete blockchain protocol. The notion of tokens is more understandable through the architecture and the structure of companies that issue and offer them, usually through the procedure called "Initial Coin Offering or ICO". This term reminds of the "Initial Public Offering – IPO" but has nothing to do with public registration.

As for bitcoin, the mainstreaming question consists in the question whether bitcoin constitutes a means of payment or a means of hoard. It is to signalize that bitcoin was for the first time admitted as a form of currency in the sentence of the Texas District Court, in the case "Securities and Exchange Commission v. Trendon T. Shavers and Bitcoin Savings and Trust", which was emitted in 2013. Upon this tribunal, *"Bitcoin ("BTC") is a virtual currency that may be traded on online exchanges for conventional currencies, including the U.S. dollar, or used to purchase goods and services online. BTC has no single administrator, or central authority or repository"*.

CRYPTOCURRENCY UPON TAX LAW

In October 2015, the Court of Justice of the European Union, interpreting Directive 2006/112/EC of 28 November 2006 "on the common system of value added tax", adopted a jurisprudence on bitcoins (C-262/14). Upon this sentence, bitcoin cannot be characterized as a material good in the sense of article 14 of this directive because its exclusive target is to constitute a means of payment. The exchange of traditional currencies against bitcoins is exempted from value added tax, in other words article 135 par. 1e is applicable, which refers to all forms of currency as means of payment. The disposition on the matter is the following: "*The Member States shall exempt the following transactions:... e. transactions, including negotiation, concerning currency, bank notes and coins used as legal tender, with the exception of collectors' items, that is to say gold, silver or other metal coins or bank notes which are not normally used as legal tender or coins of numismatic interest;*".

According to the same sentence, bitcoin is classified among the so-called virtual currencies on the basis of exchange rates. These virtual currencies, on the one hand, are similar to the rest currencies being exchanged (such as krona, euro...), as for their use in the physical world and, on the other hand, are different from electronic money as long as the sums of money are expressed not in conventional units, such as euro, but in virtual ones, like bitcoin. Therefore, the European Central Bank turns down any submission of bitcoin to the dispositions of directive 2009/110/EC on the taking up, pursuit and prudential supervision of the business of electronic money institutions (Theodosaki, 2018).

In spite of the recognition of bitcoin as a means of payment according to the aforementioned sentences in the framework of comparative law, many investors since years have preferred it as an alternative means of investment, taking an approach to bitcoin as a means of store of value. The value of bitcoin, whose emission is going to be stopped (probably in 2140), is nowadays enhanced against its initial value (Kehagia, 2018). However, this value is marked by strong fluctuations (20% - 30%) whilst in January 2017 it cost just 998,12 dollars. Due to these economic data, many investors are motivated to buy bitcoins to get benefit from its goodwill which is likely to result from an eventual resale.

Besides, it is notable that the Internal Revenue Service (IRS), which constitutes the revenue central service (of the USA federal government) has tried to classify cryptocurrencies as "virtual currency". On 25.03.2014 IRS emitted some notices, according to which virtual currency will be treated as means of fortune, as far as taxation policy is concerned. It is obvious that a regulation like this adequately resolves the issue relevant to the revenue resulting from the use of bitcoin as a means of investment. Despite the name "virtual currency", currencies of this category are not taxed as currencies, which presents challenges for users who use cryptocurrencies in different ways (Fulmer, 2019). That public finance service defined the term "virtual currency" as a "*digital representation of value that functions as a medium of exchange, a unit of account, and/or a store of value*". Most, if not all, blockchain currency would

fall under this category, but there is still uncertainty revolving around the classifications and taxation of digital assets. Bitcoin is further classified, by the doctrine, as a “*convertible virtual currency*”, which means that it “*can be easily valued and exchanged for real currency or that acts as a substitute for real currency*” (Fulmer, 2019).

The aforementioned approach of IRS has raised criticism as long as it underestimates the fundamental function of bitcoin, which is compatible with the initial scope of cryptocurrency, consisting in means of payment (Kehagia, 2018). For this reason, in September 2017, a bill was tabled in the US House of Representatives, which aimed at introducing an exception to the rule of virtual currency as means of fortune, in case of purchases through virtual currency inferior to 600 dollars. It is also notable that in the same legal order bitcoin is defined as money in criminal law cases whilst in October 2017 the independent authority “Commodity Futures Trading Commission (CFTC)” classified it among commodities.

As far as Greece is concerned, the eventuality of use of cryptocurrency is not subject to any particular tax regulation (Kehagia, 2018). Taking into account the aforementioned European jurisprudence, it is not easy to link bitcoin to the cases of tax income coming from of transmission of titles (article 42 of Income Taxation Code). Anyway, it is difficult for the tax authorities to identify the possessor of bitcoin, with the exception of deals which are endowed with transparency by law, such as transactions taking place in a shop compatible with bitcoin as a means of payment. Even in case that the possessor of this cryptocurrency makes a voluntary statement, it is to examine the purpose of the use of cryptocurrency (payment or investment).

CONCLUSION: BLOCKCHAIN, A TAXABLE BARGAIN LIKE AIRBNB

The hypothesis of the current paper has been partly confirmed, essentially there are no regulations, at least specific legislative ones, for blockchain cryptocurrency. European Union has reserved the privilege of tax exemption to virtual cryptocurrencies, such as bitcoin, as far as value added tax is concerned. The lack in this form of tax (as it was for instance the case for lawyer’s profession in the Greek legal order) obviously facilitates the market and so enhances competition.

However, the doctrine finds it important to introduce norms for the clear differentiation of bitcoin as means of payment against its investment use (Kehagia, 2018). If this virtual currency is not linked to any central power, it is subject to power of national legislators in various terms, such as taxation. The adoption of tax law rules on the matter is recommended, particularly due to the intensive fluctuation of the value of bitcoin and to the speculative trends that this fluctuation implicates. Besides, as bitcoin is used mainly in international transactions, the inexistence of a single normative approach to it causes

further problems. It goes without saying that the advent of new technologies and the use of Internet as a means of transactions have led to rapid developments in the field of trade and economy. It results that the legislative power should be constantly alert, coping with new challenges. On 11 July 2017, about 900 cryptocurrencies in use were localized, so the need for regulation and control is self-evident. Nevertheless, it is also to highlight the wind of change, thanks to the use of Internet applications. If blockchain has got rid of traditional figures of trade, such as banks, and has facilitated commercial relations and competition, another application of Internet, sharing economy in the field of tourism, has changed the landscape in tourism market, in a quite similar way. Indeed, the role of another traditional figure of merchant, the hotelier, is overridden through platforms such as Airbnb, let alone about at the same time that bitcoin was introduced in the market. It is to add that current tourists making use of cyberspace have gained in general their autonomy, against travel agencies and tour operators. Last but not least, States should cope with tax evasion (Maniatis, 2018) and not let modern transactions become uncontrollable, particularly exempted from their classical competence of taxation promoting public interest...

Blockchain is a subversive bargain towards privatization whilst conventional currency, such as Euro, has to do with a very important economic crisis, particularly exemplified by the case of Greece, which coincides with the brief history of virtual cryptocurrencies, such as Bitcoin...

IS THERE A FASHION LAW?

Maniatis, Antonios

Law School, University of Nicosia (UNIC), Nicosia, Cyprus

ABSTRACT

Fashion designers in the French legal order, although with a very protracted delay against authors of “major arts”, are subject to the Industrial Property Law regime of protection for designs and models. In virtue of the principle of unity of art, almost simultaneously they acquired the Literature and Artistic Property Law authors’ rights. Besides, the principle of public presentation of cultural goods seems to implicate or at least to justify restrictions on rights of involved factors (museums, mannequins). One of the conditions for the operation of a private French museum consists in the existence, in the statutes of the institution concerned, of a clause providing for the irrevocable dedication of acquired goods, through donations or bequests or the assistance of the State or a self-government local authority, to the presentation to the public. This condition is obviously set in order to avoid the expropriation of the goods of each collection. In a similar way, mannequins have evolved from dolls to women in the nineteenth century and are defined as persons intended for public presentation of a product, a service or an advertisement spot or to pose. They are deprived of neighboring rights, let alone the fact that French jurisprudence made use of this legislative definition, which is based on the presentation concept, to ensure the delimitation of neighboring rights of performing artists, who proceed to interpretation instead of presentation. It results that Fashion Law is being emerged as a specific, not autonomous (independent) branch of law.

Keywords : Fashion Law, mannequins, museums, presentation of cultural goods, fashion designers, neighboring rights

INTRODUCTION: FASHION AND LAW

Fashion constitutes a word coming from Middle English (in the sense “make, shape, appearance”, also “a particular make or style”) and furthermore from Old French “*façon*”. This French word resulted from a Latin one coming from the infinitive “*facere*”, meaning “to do” or “to make”. So, this etymological approach proves to be useful for the following two reasons; it highlights the “constructive” character of this art, aiming at covering concrete practical needs of individuals in everyday life. Besides, it is quite indicative of the fact that the French nation is obsessed with fashion and has managed to transform this practice gradually to an authentic branch of economy, being a

separate kind of industry. So, it is without saying that France deserves the academic interest of this paper, which focuses on the question of existence of Fashion Law.

We suppose that the legal regime of fashion constitutes a branch of law.

INTELLECTUAL PROPERTY RIGHTS IN THE FASHION SECTOR

The fashion sector is a sui generis domain as it is submitted to extremely short circles. Its creations for a very big period were endowed with no legal protection and finally began to be protected on the basis of the already adopted design and model law, in the French legal order. This protection has merely resulted from the jurisdictional mission of judges, who decided, from 1913 and on, to place all creations on the matter in the field of law of 18th March 1806 (which was the legislative text on designs and models), as modified afterwards by law of 14th July 1909. By the way, it is to signalize that the first regulation on industrial designs or models was adopted in France, in the era of Louis XI, in 1466 (Panagiotara, 1999).

As time passed, French tribunals kept distance from their jurisprudence, which had the tendency to reject any protection of those creators, because of the ephemeral character of their products. It is to pay special attention to the fact that on the basis of this ephemeral feature, Justice had the pleasure to localize a point of phantasy.

However, this jurisprudential development was not the same as far as the law on the author's rights is concerned. That regime denied any legal interest relevant to creations of the fashion sector, alleging the fact that it was impossible to assimilate these creations to the major arts, which were situated in the classical field of the artistic property, submitted to laws of 19th and 24th July 1793, relevant to the extension of the monopoly on the author's right (Donaud, 2017). The unique exceptions available consisted of the clothes of theatre or of the clothes of court (namely of the King's social environment), which were protected as they constituted pieces of art "by destination". We consider that this singularity of history, favorizing theatre, could be interpreted as an artistic forum, which would be associated, much later, to neighboring rights of actors, endowed with the particular status of performing artists. Besides, according to the opinion of Professor of the University of Vlora Ergysa Ikonomi, stage clothes are considered pieces of art because these help the actors shape or create a character with individuality. Sometimes they are so important when they hit public more than words.

Just in 1920 jurisprudence unanimously admitted the protection of fashion creations through 1793 law, by considering that the criterion of originality itself was enough for the application of the regime of protection. One more time, it was the judicial power which decided to make a step forward, whilst the rest State powers were reluctant. Judges adopted a pioneer jurisprudential line consisting in the principle of unity of art and so they assimilated designers to other categories of authors, whilst in

other legal orders, such as the Greek one, the same year the author's rights were explicitly recognized, although with some odd restrictions, by the first intellectual property law.

The principle of unity of art was later consecrated in the French positive law, namely in the law of 11th March 1957. The author's right is available, in the sense of article L. 112-1 of Intellectual Property Law, for all works, independently of their kind, the form of expression, the value and the destination.

According to article L. 112-2 14th of Intellectual Property Code, the creations of the seasonal industries, of clothing and adornment, may be characterized as works of the spirit and protected as such, as long as they comply with the condition of originality.

The doctrine comments that the concept of originality is deprived of any legislative definition and corresponds to the imprint of the author's personality, to his creation and intellectual contribution (Donaud, 2017). It is to clarify that the form and the originality are the two components of the notion of spirit work, which is protected by intellectual property law. In other words, creativity ensures originality of the author's intellectual activity.

The criterion of originality is based on the combination or on the concentration of some preexistent elements, given that the sector of fashion is – as already signalized – cyclical. In view of this important, intrinsic feature, the components that form the models may individually belong to a common tank, but it is about their particular (renewable) combination which generates the required originality. As a matter of fact, originality is not assessed in each component of the fashion product because these elements would be already known, let alone banal. The global manner prevails “ *with the function of the appearance of the total, which is produced by the disposition of the elements* “. Given that the fashion sector is situated at the crossroads between creation and imitation, it is logical to think that the principle of analogy, commonly called proportionality, which includes a notion of balance and is linked with the grade of creativity, can have its own place in the matter of this sector.

THE QUESTION OF THE JURIDICAL RELATION BETWEEN FASHION AND INNOVATION

Literature has been recently endowed with a monograph made by a couple of jurists, which focuses inter alia on fashion (Dumez, 2012). This research supports the opinion that innovation can coexist in some domains with copying and that mass copying is likely to promote sometimes, if not frequently, innovation (Raustiala & Springman, 2012). This result, already much earlier, had been called by these authors “the piracy paradox”. (Raustiala & Springman, 2006).

The lesson that results is that society should be prudent in the matter of regulation aiming at restricting copying, given that regulation may sometimes have a reverse result and block innovation while attempting to promote it. The logical concept would consist in elevated speeds of development

in the domains of creativity that are protected by patents and a very limited creativity in the rest domains, in which innovation is not consecrated by law. The aforementioned authors conducted an empirical research, in various sectors, such as fashion and music, and proved that there are domains extremely creative, in which innovation is unprotectable whilst sometimes the lack in legal protection sparks creativity of the interested factors. According to the opinion of Professor of the University of Vlora Ergysa Ikonomi, this

has to do with the priority already given to subjective innovation in industrial design over objective innovation, which demands that the design must be entirely new compared to any known design in the world. As in fashion design this is impossible, it is widely accepted the subjective innovation that demands the design to be new and different from all designs already known from the fashion designer involved.

As far as fashion is concerned, this research highlights it as the branch of economy which represents an annual sales turnover of about 1.300.000.000 dollars (Dumez, 2012). We think that it is about quite impressive data, given that fashion is endowed with a huge turnover, being superior to the turnover of the sectors of cinema, book, software and registered music. In the legal order of the USA, there is no legal protection of innovation of the fashion industry, at least as for the level of creativity, namely of the conception of design. The reason consists in the fact that the Supreme Court has been always reluctant to make use of the Intellectual Property Law for sectors producing necessities (clothing, nutrition, furniture). Author's copyright is applicable for artistic products, which are not operational, such as music. It results that copying is a particular feature of the fashion sector.

It is quite indicative of this legal regime that the aforementioned monograph begins with the following example: In 2007, Paris Hilton showed up on a TV show, wearing a dress with designs of flowers. This cloth was designed by the fashion company «Foley + Corinna», founded by Dana Foley and Anna Corinna. Shortly afterwards, a retail clothing company, "Forever 21", placed in the market a copy of this dress. According to the established theory, this practice should kill any creativity relevant to fashion design. However, empirical data do not confirm this assumption. Even Coco Chanel thought that the fact that she was copied was the price of her talent and success. However, an in-depth analysis of this legal regime highlights the fact that the function itself of the sector of fashion is under doubt: as creations are copied, they gradually lose a part of their power of attraction and that is why authors are motivated to create more and more, in a permanent way. Furthermore, the absence of copyright in a design and its derivatives allows creative variations or copies. Finally, the copy creates the tendency: among all creations, some are enhanced because they are imitated, therefore the season is structured. The key factor is the consumer on the lookout, called "early adopter": the fact that copies appear quickly, pushes him to look for differentiation in permanent terms, so to create new

markets. In other words, fashion offers an example confirming the remark that the absence of juridical protection does not kill innovation but it favors it.

LITERATURE DISCUSSION

From law science literature it results that Cultural Law (in a wide sense, including Intellectual Property Law) comprises two fields almost diametrically opposite, as far as the question of legal protection is concerned. On the one hand, antiquities and the rest monuments of cultural heritage belong, as a general rule, to the State and are submitted to traditional principles of Administrative Law, such as inalienability and the exemption of State claims from prescription. Monuments are strictly related with museums, as places for the public exhibition of collections. The “Museum of France” label constitutes an institution for the exclusive certification of museums in the French legal order, from 2002 and on. One of the conditions for the operation of a private museum consists in the existence, in the statutes of the institution concerned, of a clause providing for the irrevocable dedication of the acquired goods, through donations or bequests or the assistance of the State or a self-government local authority, to the presentation to the public. This condition is obviously set in order to avoid the expropriation of the goods of each collection.

In contraposition to this intense privilege of the State, prevailing over individuals, there is a mobility in the sector of fashion whilst the doctrine remarks that this sector has an ambiguous character, namely utilitarian – practical (reminding of the aforementioned etymology of the word “fashion”) or artistic – not functional (Donaud, 2017). As already analyzed, the USA have promoted the development of the sector of clothing products upon the utilitarian approach, through legalizing the copying of original works. It is also to add that not only have they denied intellectual property rights to fashion designers but they have also begun to recognize a branch of law on the matter. Indeed, if American literature has produced the term “paradox of piracy”, perhaps it seems also paradoxical that since some years the USA have made speech of “Fashion Law”, implying the existence of a new field of law. Just the opposite, the recognition of this branch remains marginal, if not thoroughly inexistent, in Europe (Blaise-Engel, 2018).

However, the legal regime on professionals of the fashion community has in common the marginalization of mannequins. Mannequins have evolved from dolls to women in the nineteenth century and are defined, by the French Labor Code, as persons intended for public presentation of a product, a service or an advertisement spot or to pose. They are deprived of neighboring rights, let alone the fact that jurisprudence, of the Paris Court of Appeal, of 27th January 1995 (in the case *Chaudat vs Soc. Coccinelle et autres*), made use of this legislative definition, which is based on the presentation concept, to ensure the delimitation of neighboring rights of performing artists, who proceed to an

authentic “interpretation” instead of a (legally unprotectable) “presentation” (Tafforeau, 2015). Anyway, we consider that the exclusion of mannequins from the field of Literature and Artistic Property Law is particularly useful for the academic approach to fashion. For instance, the following conclusions may be drawn:

a. Fashion Law not being limited to Intellectual Property Law

It results that the normativity on fashion has a particular nature, given that fashion is not submitted uniquely to the rules of Intellectual Property Law, in its double version (a. Literature and Artistic Property Law or Intellectual Property Law in a narrow sense, upon which fashion designers have acquired the authors’ rights, and b. Industrial Property Law, mainly the subcategory of law on designs and models). The normativity on the matter has to do with various norms, such as Labor Law on mannequins, being endowed with labor rights.

b. The principle of public presentation of cultural goods

We have localized a fundamental principle in Cultural Law, consisting in public presentation of cultural goods (for instance through museums and mannequins), which seems to implicate, or at least to justify, due to reasons of public interest, restrictions on rights of involved factors (museums, mannequins).

CONCLUSION: A NEW BRANCH OF LAW FOR A TWO-CENTURY-OLD SECTOR

It seems rather paradoxical to make speech of “Fashion Law” as even the current new generation of law scientists has made no studies and has got no acquaintance on such a branch of law. However, from the current analysis we draw the conclusion that the paper hypothesis has been confirmed. Indeed, a new branch of law is being emerged, Fashion Law, whilst its scope has about a two-century history. It is no more about “legislation”, namely a mere normativity on heterogeneous matters. It is about a separate field of law, having to do with the fashion market and the status of each category of professionals involved, such as designers, mannequins and photographers. Anyway, Intellectual Property Law itself has recently been transformed to a single, synthetic branch, including the Literature and Artistic Property Law, traditionally associated to the autonomous branch of Civil Law, and Industrial Property Law, classified in the autonomous field of Commercial Law. Mannequins have no neighboring rights yet, they are regarded as “presenters” in contradiction to actors who are regarded as “performing artists” and so have been endowed with neighboring rights. However, these emblematic figures of the fashion community have gained territory, at least in the field of Labor Law. In a similar way, a legal approach to photographers is not merely based on Intellectual Property Law but is also enhanced through a new branch of law, the Personal Data Protection Law.

Fashion is an important sector of economy which nowadays does deserve its own branch of law. This specific field of private law is not autonomous branch, in the sense of independent, against other traditional branches, such as Civil Law and Commercial Law. Anyway, it is comparable with Cultural Law, particularly the subcategory of rules on cultural heritage, although these two sets of normativity belong to different sectors of economy (heritage owned by State against the private market of fashion).

Fashion law exists but it is doubtful whether, in the closed community of fashion, law (against social norms) is the main device regulating the relevant relationships or not (La Diega, 2018).

LABOR COST AND PROFITABILITY: AN ANALYSIS OF NORTH WEST ITALY

Marro, Davide; Giovando, Guido; Venturini, Stefano

Dept. of Management, University of Turin, Italy

ABSTRACT

The paper deals with Labor Cost in SMEs (Small and Medium size enterprises) and investigates its role of key success factor in enterprise performances. A better understanding of the labor cost variable is crucial in these companies, as SMEs account for more of 90% of the economic fabric both in Italy and in the rest of the European Union.

Moreover, Labor and occupation have a major social impact in our society that triggers the close attention of politics: work is one of the primary means people have to reach self-fulfillment and to guarantee to the families a respectable lifestyle.

Starting from these assumptions, this paper has three main purposes. First, we describe northwest of Italy (Piedmont, Lombardy, Ligure and Aosta Valley) in terms of SMEs and we set the database for our analyses including variables such as economic dimensions and main financial indicators (revenue, R.O.E. total labor cost, labor cost per employee, economic result). We made this choice since we wanted to investigate this very important area of Italy which is part of the “economic engine” of the Country.

Second, we want to analyze and compare small versus medium sized enterprise in order to draw some conclusion and highlight similar trend.

Lastly, the final part of the paper focuses on the correlation between labor costs and profits: we verify if (and to what extent) a rise in labor cost leads to an increase in the economic performance of the SMEs.

Keywords: Labor Cost, investments, resources, Corporate Welfare, profitability, growth.

INTRODUCTION

Scholars have been wondering about what the main purpose of an enterprise is. The most obvious answer may appear to be “profit”. Even if positive economic results are vital for an Enterprise, we cannot assume profit as the only driver for the Company success in the actual Society.

For example, one of the most widespread business theories, argues that the creation of value represents the main long-term goal for a company. Value creation itself is not easily decomposable, due to the complexity and number of variables interacting with each other.

Stakeholders for example are often involved in value creation: more specifically, they are all those individuals who bear interests in the organization. They can be internal or external to the company (e.g. members of the management, shareholders, employees, suppliers, customers, Treasury etc.). Some then, argue that the creation of value towards stakeholders is a necessary condition for the success of a company.

To the extent of this paper, it is very important the relationship between the company and its employees: in fact they are those who make possible the production of the goods/services object of sale and, from their productivity, also depends the trend of the corporation. It is necessary a serene and stimulating working environment to be able to have an active production cycle.

From this point of view, an adequate and fair treatment of the personnel, granting the appropriated benefits to the employees, creating a stimulating working environments with possibility of growth, are some elements which certainly lead to an higher yield and, as a consequence a productivity growth, which then lead to the fulfilment of the market and to the improvement of the results.

This paper investigates the role of work cost in small-medium sized enterprises which represent the vast majority of the Italian enterprises: for these indeed, labor cost can be considered a critical success factor as they usually have less resources compared to Larger companies.

For the aim of this paper we consider labor cost as an investment (or Asset) which should lead to high economic benefits and guarantee the prosecution of the company's activities.

In these terms it can be argued that labor cost represents an asset for the company: it requires a constant expense that results into a favorable context, which guarantees a performance improvement.

Everything we have seen and defined so far is part of a general concept called "*corporate Welfare*".

This theme of Welfare and the various benefits granted to employees has changed over time, in relation with changes in the lifestyle of people and in their needs. Some examples are Company Canteens, Cars, Mobile Phones, Nursery for children of Employees, assistance the abroad workers and additional insurance protection.

All these elements demonstrate the increasing attention on the part of the companies to the conditions of their workers also aimed at motivating the employees.

Surely, the global economic crisis has hindered the concept of corporate Welfare and has put the strain on companies. The work has been strongly affected: In Italy, for example, youth unemployment rate has soared over 30%.

Despite this the corporate Welfare and social balance will surely have a role to play in the years to come, along with the economic recovery, with an increasing number of companies (small or large) that in different ways will follow this road.

This paper then will reinforce the concept that labor cost is not a simple cost, but rather a resource, and like all resources must be protected and facilitated, in order to draw more advantages and to be able to pursue the objectives set.

The paper is organized as follows: Section 1 presents a literature review on the topic, Section 2 introduces the research design and methodology illustrating the sample for the analysis. Section 3 includes findings while section

LITERATURE REVIEW

The importance of labor costs in the business context is demonstrated by the numerous studies that have analysed this subject under different circumstances for companies, including those who have tried to provide labor cost has a strategic relevance for the enterprises.

Bowers, Martin and Luker (1990) – stressing the importance of workforce for the Companies – suggested strategies to improve the relationship with employees in order to obtain strategic advantages. One of the ways they illustrated, for example, was to treat them as customers (and vice-versa) in order to improve the quality of services offered by decreasing costs and increasing customer satisfaction. This statement was born from the fact that employees are usually more in contact with the customers.

Also recent Scholars and Consultancy firms such as John Wiley & Sons LTD (2014) or Punjaisri, Balmer (2016) reflect on the relevance of the workers, in order to increase the overall business value.

Another element related to the matter of this paper, is the U.C.L (Unit Labor Cost) or the cost of work per unit produced (referred to a single employee). Indeed, it represents an important indicator of productivity and it has been crucial also in several studies. For example, Van Bart, Stuivenwold, YPMA, (2005) used the U.C.L. to study of competitiveness, while on the contrary Myant (2016), argued that UCL may not be the best indicator in measuring it.

Another element taken into account is the economic crisis that has affected Europe since 2007. Cuestas, Ordóñez, Staehr (2018), analyzed the effects of production cost reduction measures to "exit" the recession in the four *GIPS Countries* (Greece, Italy, Portugal and Spain) and comparing them to German and Dutch benchmarks with the effects on production and employment.

From a social point of view, a recent issue that is at the heart of debates in European countries is the policies geared towards guaranteeing the legal minimum wage; Herzog-Stein, Alexander; Logeay, Camille; Stein, Ulrike; Zwiener, Rudolf (2016) take into account the case of Germany and the effects that this law produced. Moreover they compare Germany to other European countries, concluding that legal minimum wage-oriented policies lead to advantages in relation to the macroeconomic context. More specifically, all the positive aspects that these policies generate and which are not limited only to

income earners, but to the economy as a whole. On this issue also Fabo, Belli (2017) gave their contribution by analysing the differences between the minimum wage and the minimum wage for living, highlighting strong deviations of values especially in the peripheral EU countries.

Finally, directly linked to the subject of this paper, Lavoie, Stockhammer (2013) argue how workers' wages influence domestic demand and therefore, a policy geared towards them would lead to an increase in productivity and economic growth. This process, opinion of the authors, has a greater impact rather than profits.

This paper supports the thesis that labor cost is one of the main variables that lead to positive results for business and consequently to general economic growth.

This work aims to be a starting point for a broader investigation focused on the labor cost and the effects it brings in European Economies, as well as the analysis of its structure in the different European countries.

METHODOLOGY

Research Design

This paper involves a quantitative methodology: a sample of enterprises was selected in order to observe some data and indicators and to draw objective conclusions. Descriptive statistics methodologies were adopted to outline the labor cost trend under analysis.

The sample included companies from the North-West Italy and investigated some balance sheet items and financial ratios. These in fact represent a primary source of information and are strictly regulated by the Italian Legislation; the main normative source is the Italian Civil Code, on the fifth Book (Labor), V Title (Companies).

	Small Companies	Medium-Sized Companies
Legal Status	Actives	Actives
Registered office	Piemonte, Lombardia, Liguria, V. Aosta	Piemonte, Lombardia, Liguria, V. Aosta
Legal Form	Limited Liability Companies	Limited Liability Companies
Number of employees	Between 10 and 50	Between 50 and 250
Revenues	Between 2 Mln € and 10 Mln €	Between 10 Mln € and 50 Mln €

Table 1. *Research Strategy for Aida.*

In addition to the data exposed in the "Table 1", we considered only companies that have a known value of: Cost of Labor per Employees, R.O.E. (Net Result on Equity), total amount of cost of labor and net profit. We considered the data for the three years 2015-2017. The sample included more than 14,000 companies and this allows to draw some relevant and reliable trends. However, this paper presents some limitations: first of all it focuses on a single area which, although vast, does not represent a macro-

region at European level but only at national level. Anyway, the research may be considered as a starting point to underline differences between North-West of Italy and other European regions. Secondly, by inserting the research strategy shown in the next paragraph, certain companies that do not have the necessary requirements are excluded. Therefore, it should be recalled that the research conducted has conclusions that do not reflect the whole area taken into account but a part of it.

The study has been conducted on the small and medium-sized enterprises, established in the north-west part of Italy. It represents the initial step of a broader research, which will compare the data of the entire Northern Italy with those of the Center/South Italy to verify the accuracy of the definition of Italy as a "two-speed" Country. A further step of the research will be represented by the enlargement of the sample taking into account enterprises from European countries to verify the homogeneity of labor cost trend between the various EU States.

Data Collection and Procedures

The research was conducted using the Aida database provided by Bureau Van Dijk, which contains the data of a multitude of Italian companies. As already mentioned in the introduction, it was decided to focus on small and medium-sized enterprises: for the definition of SME's (small and Medium-Sized Companies), we followed the "User guide to the SME Definition" (by the European Commission, Ref. Ares 956541 - 24/02/2016) which includes in small businesses those with less than 50 employees (but at least 10) and with a turnover of between 2 Million € and 10 Million €. An enterprise is considered medium-sized if it employs between 50 and 250 workers and it has a revenue between 10 and 50 million Euros.

As anticipated in the previous paragraph, legally active limited companies have been selected in the research strategy (located in Piedmont, Liguria, Lombardy and Aosta Valley), which had among the available data the Return On Equity, revenue (between 2 million and 10 million for the Small and between 10 million and 50 million for averages), the number of employees (between 10 and 50 for small and between 50 and 250 for averages), the total cost of labor, the index of labor cost per employee and the net profit/loss.

These research criteria led to a sample of 12,354 "Small" companies and 2,616 "Medium" companies; For a total of 14,970 enterprises.

In order to investigate the different aspects of the labor cost the following research questions were formulated:

- 1) How are the Small-Medium Sized Enterprises subdivided in the North West Italy and what are the main differences of the SMEs among the different regions?
- 2) What are the main differences and similarities between small and medium-sized enterprises?
- 3) Does a higher cost per employee also correspond better results for companies?

In order to answer the three research questions, the results were synthesized in tables to highlight the data and divide them into the various categories (analyzed by region or by size).

With reference to the first RQ, a comparative analysis of the results was carried out displaying on a table the composition in the various regions and the economic data available and the same was done for the second question.

In order to answer the third question, the labor cost per employee was analysed. The enterprises in the sample were ordered in ascending order, then divided into quartiles. Lastly, the economic data was analysed with reference to the quartile range in order to draw conclusions about the possible correlation between labour costs and economic indices of profitability in the various sub-categories. Differently from the first two points, in order to focus the attention on the cost of the worker, it was necessary to remove the outliers from the sample. This, in order to avoid including in the research data that could have a distorting effect on the result; in these terms, the choice of excluding the companies that had a labor cost per employee less than €30,000 (annually). As a result of this modification, the sample went from 14,070 companies to 13,531 companies, i.e. eliminating about 3.8%.

FINDINGS

As already mentioned in section 2 “*Methodology*”, data was extracted from the “Aida” database which included results for more than 14,000 companies. The extracted data refer to the three-year period 2015-2017 and for these the average of the three-year period was calculated to obtain a single datum to be able to compare. The results obtained have been summarised in tables.

As a starting point, as already mentioned, the 14,070-company sample is decomposed into 12,354 small and 2,616 Medium-size enterprises. Since the sample is limited to SMEs incorporated in the form of limited companies, as can be easily predicted, S.R.L (Ltds) constitute over 90% of the sample while S.p.A. represent only 10% of the sample.

With reference to the medium enterprises instead, the S.P.A constitute 58% of the sample while the S.R.L. represent 42%. Thus, it is observed an increase of the companies by shares and of the limited liability companies which constitute however a good number.

After having obtained an indication on the structure of the sample, we proceed with the presentation of the data obtained in reference to the three questions of the paper:

1) How are the Small-Medium Sized Enterprises subdivided in the North West Italy and what are the main differences of the SMEs among the different regions?

It is a widely known that Lombardy, and the area nearby Milan in particular, is the “economic engine of Italy. The results observed within the research seem to confirm this hypothesis, at least with reference to the sample: about 74% of the small and medium-sized enterprises, have the registered

office in Lombardy; followed by the Piedmont (around 20.5% of SMEs); while about 5% of the SMEs have the registered office in Liguria (for both categories) and lastly, only 0.5% in the Aosta Valley. As can be seen from data, Enterprises are not distributed evenly on the territory: Lombardy region, although smaller than Piedmont, has about 3.5 times the number of companies included in the sample. After this first glance of the enterprises distribution among the regions, other different trends may emerge in terms of economic results. Starting from the occupation point of view, the average number of employees is almost homogeneous among all of the regions, which count more than 20 employees in small enterprises and around 100 employees in the Medium-sized ones. Also, in relation to employment, it is relevant to underline the results on the of labor cost per worker index. With reference to this index similar results among the regions are observed: Lombardy ranks first in terms of Labor cost per worker (46,803 Euro per worker), followed by Liguria (45,927 Euro per worker), Piedmont (44,283 Euro per worker) and eventually by Aosta Valley (42,345 Euro per worker).

It is also relevant to observe the average revenues (for the three-year period 2015-2017) in the different regions. In this case, however, it is necessary to split the analysis between small and medium-sized enterprises, as revenue is one of the parameters adopted by for the definition of the categories. Even in this situation, the trend already seen stands in line with each other the ones observed above: small companies perform an average amount of 4.5 million € in all of the four regions, while Medium-sized perform:

- about 23 million Euro in Lombardy, Piedmont and Liguria;
- around 18 million in the Aosta Valley.

This can be explained by the nature of the territory and of the economic pattern of the Aosta Valley which may foster smaller entrepreneurship.

Having completed a general analysis on the dimensions, it is worth to analyze the profitability of the companies. This analysis relies on the net profit (or loss) for each observation and on the R.O.E. (one of the most important profitability index, which is often taken into account by shareholders and stakeholders).

First, the net result reflects the economic management of the company. As said in the introduction, profit is a necessary (even if not sufficient) condition for Enterprises willing to survive on the market. In this sense it is still a fundamental indicator of status of the health of enterprises, so it is worth noting the excellent trend showed by Lombardy. Indeed it presents an average net profit of the three-year period of about € 170,000 for small companies and about € 938,000 for the Medium-sized. However, there is also an excellent result for the Piedmont, with € 166,000 of small and almost € 970,000 of Medium-sized; a bit "lower" the Liguria companies, with € 108,000 (Small) and € 780,000 (Medium). At last, the Valle

d'Aosta, which is the one with the lowest number of companies, presents €76,500 (the lowest) of net profit in smalls and €1,460,000 in Medium-sized (the highest).

The Return on Equity (R.O.E.) is one of the best-known profitability index: it measures the remuneration of the equity, namely, of the resources provided by shareholders to the Company. R.O.E. is a key index for the investors as it measures the (potential) profitability of the investment.

From this point of view, as for the other indicators, the ROE analysis show convergent results amonge the diferrent regions. The small enterprises in Lombardy, Piedmont and Liguria regions show a ROW around 13% while the Aosta Valley alone stops at 6.53% (this in line with its lower net profit). Differently from small sized enterprises, medium-sized ones show an average R.O.E. aligned among all four regions. In this case the index exceeds 10% and Liguria has the highest one at 12.04%.

Based on the above, we can anticipate some conclusion and observe that small-medium sized enterprises based in the North-West of Italy usually have excellent economic results and, generally speaking, aligned among them. Nonetheless, Lombardy emerges among the others.

2. What are the main differences and similarities between small and medium-sized enterprises?

The second research question focuses on the difference that may emerge between the two categories of enterprises rather than on their geographical location.

This second part of the analysis then highlights the interesting differences that emerge comparing enterprises on the base of their size.

This analysis adopts, of course, a different approach from the previous part and it is based on the parameters adopted to define the categories that are:

- Revenue, a company is considered a small enterprise if its revenue is below 10 million euro, while it is considered to be a medium sized enterprise if its revenue between is between 10 and 50 million Euro;
- Number of employees, a company is considered a small enterprise when it does not employ more than 50 workers, while it is considered a medium sized enterprise if it employs 50 to 250 workers.

Starting from the latter, it is observed that small enterprises employ on average of 22 workers while medium sized enterprises employ 100 workers on average.

As far as revenue is concerned, the value of small enterprises amounts to 4.5 million euros while for Medium-sized it is 23.2 Million euros. In order to make objective comparisons between the two categories, the average incidence of labor cost on revenue has been computed.

Both the two categories present an average incidence of labor cost over revenue above 20%. More specifically, small sized enterprises present 21.97% while medium sized present 22.94%.

This indicates that, regardless to the dimension of the company, the labor cost absorbs a relevant portion of the revenue.

Moreover, the labor cost per worker is higher in medium sized enterprises (49.8 k euro compared to 42.5%).

From another point of view, a significant difference emerges however comparing the average operating results; Even in this case the same is inevitable given the values that make up the balance sheets of the two types of companies. With regard to Medium-sized we have an average of about € 943,000 while for the small the value is around to €166,000.

Focusing on the R.O.E. index, which allows to make comparisons, we observed that small companies have a higher ROW compared to Medium-sized (13.27% versus 10.31%).

We may ask where does this difference come from?

In this case we observe that smaller companies usually have a lower equity, so we can argue that the answer lies in the denominator of the ROE formula.

In conclusion, we can affirm that, albeit composed of quantitatively different data, we have the similarities between small and medium-sized enterprises in the values related to the incidence of labor costs on revenue, of the cost per worker (albeit slightly different) and ROE. These elements help to understand the Italian realities of the northwest that can be defined on average with good performances.

3) Is it true that at a higher cost per worker also corresponds better results for companies?

The third question of the paper is perhaps the most interesting one as it is closely linked with what has been said so far about the cost of work and the role that it has within a company.

As anticipated in the *methodology* section, we eliminated the outliers of the sample to avoid taking into account unrealistic data (the Aida software provides data and, in some cases, there may be errors) and thus obtaining a final sample of 13,531 companies.

The evaluation was done separately for small and medium-sized enterprises (as for the previous ones). The companies were ordered in ascending order according to the labor cost index per employee excluding values below euros 30,000. The order obtained was thus subdivided into homogeneous quartiles so as to have in the first the set of companies with the lower value of labor cost per worker, to arrive at the last quartile, the one with the highest value.

With regard to small companies, the following table summarizes the results.

Quartiles	Cost per employee average	Average turnover	Average personal cost Tot.	Incidence% labor cost on turnover	Average result of Es.	ROE Medium
Q1	34,090	4,181,502	715,571	18.91%	132,799	13.22%
Q2	39,874	4,439,254	884,893	21.78%	164,406	12.77%
Q3	45,722	4,675,815	1,033,218	24.00%	166,385	12.20%
Q4	58,740	5,089,258	1,230,996	26.42%	229,836	13.76%

Table 2. *Small companies divided by quartiles in relation to the labor cost per worker*

The first column displays the quartiles, while the second displays the average cost per employee.

The table shows that an increase of labor cost is followed by an increase of the average result of the company, while ROE does not seem to be influenced by the cost per employee. This evidence is also followed by the average percentage incidence of labor costs on revenues, since between the first and the last quartile the distance is about 8%. As for the two final values, the average of the net profit increases by moving from one quartile to another while the ROE of the last quartile is higher than that of the first, although the latter is greater than the two intermediates.

With reference to medium-sized enterprises are concerned, Table 2 summarizes the results.

Quartiles	Cost per average attendant	Average turnover	Average personal cost Tot.	Incidence% labor cost on turnover	Average result of Es.	ROE Medium
Q1	38,003	20,695,399	3,939,950	21.02%	640,803	9.85%
Q2	45,707	21,911,973	4,504,177	22.63%	823,694	9.22%
Q3	52,363	24,720,641	5,203,387	22.81%	931,069	10.52%
Q4	66,521	26,059,730	6,214,999	26.10%	1,440,834	11.07%

Table 3. *Medium-sized companies divided by quartiles in relation to the labor cost per worker*

Leaving aside obviously the trend of the cost of labor per worker (which follows the quartiles in ascending order), it is worth noting how the average revenue increases much more than in the small companies. The average cost of total work also almost doubles the value in the last quartile with respect to the first.

The average percentage incidence of labor costs on revenue increases but less than small ones (the last quartile is greater than the first of about 5 percentage points). As regards the average operating result and ROE, we observe a greater increase than in small companies. With the average of Q4 profit more double than Q1 and with ROE rising by nearly 2 percentage points (while in the case of small about 0.5%).

CONCLUSIONS

As anticipated, this study represents the beginning of an analysis that is going to be extended to a broader sample, in order to be able to draw a trend at national level and to make a comparison with other European countries.

Despite the geographically limited sample, this research has provided interesting data in order to draw a general picture of the Italian northwest.

Firstly, Lombardy has confirmed to be the region, among those analyzed, with the strongest presence of enterprises, both small and medium-sized, counting over 70% of the sample, with about 11,000 companies on 14,970 totals. The economic data confirm this trend, albeit less evident. Lombardy is the leading region for average sales and for labor costs per worker. With regard to the average R.O.E., the Piedmont region has the highest value in relation to small businesses, while Liguria is the one for the medium-sized. Lastly, the average operating result presents the highest values in Lombardy for the only small companies, as for the averages the Valle d'aosta, which is certainly complicit in the privileged fiscal aspect and the lower number of the sample.

It can therefore be concluded that, overall, the average economic data of the sample analyzed are homogeneous and positive; which means that the area of the Northwest, at the entrepreneurial level, is generally full of resources.

Moving on to the second point dealt with in this paper, that is the comparison between small and medium-sized companies apart from the region of belonging, an interesting general picture emerges. For example, the average incidence of staff costs on revenue can be seen that in both cases this item of income statement exceeds 20% (albeit with different nominal values); This shows that regardless of the size, the cost of labor is a component that "weighs" in a business balance sheet. Another comparable data is ROE, which is around 13% in small and 10% in averages; They are both positive results but which show that in this case the equity is important, because at the numerical level, the average profit of medium-sized enterprises is inevitably higher than that of small ones, this makes the denominator in ratio for the calculation of ROE (the equity) is decisive to make it invert the tendency on the index (a lower asset leads to a greater result being the denominator in the ratio). From this evidence you can see how small businesses in the northwest are a pulsating engine of the economy albeit with smaller numbers.

In The final analysis we see the importance of labor costs demonstrated by the numbers; Taking in fact as a reference the labor cost index per employee we have seen how it is shown that the increase in the index on average increases the incidence percentage of labor cost on revenue, increases the average of the operating result (net profit) and finally, the ROE also increases; What does all this mean? That the cost of labor is a variable that is not limited to the cost function but which, together with a whole range of other components, can allow companies to improve their results. This type of analysis can obviously not be limited to the numbers, but it cannot be separated from them as they are the only tool to be able to do it.

The importance of labor costs, as anticipated in the introduction, is also demonstrated by other factors such as corporate Welfare or political attention, etc.; But it must find (and it found) inevitably reflected in the numbers.

SYSTEMS OF INNOVATION AND QUINTUPLE HELIX: PRELIMINARY RESULTS OF A SYSTEM DYNAMIC APPROACH

Maruccia, Ylenia; Solazzo, Gianluca; Passiante, Giuseppina; Del Vecchio, Pasquale

Department of Engineering for Innovation, University of Salento, Lecce, Italy.

ABSTRACT

Recent developed innovation model such as the Quintuple Helix framework, in which the natural environments of society and the economy also are seen as drivers for knowledge production and innovation, calls for an effort for better understanding and forecasting the relationships between ecology, knowledge and innovation, deeply analyzing synergies between economy, society, and democracy. Moreover, current developments within the innovation systems field are calling for less static and descriptive approaches and more dynamic and forward looking ones, such as the system dynamics modeling, a widely used methodology for modelling complex socio-economic systems. However, little is known about its use in the innovation studies domain in general and in the innovation systems field in particular. This paper focuses on the relationships between the Quintuple Helix model and system dynamics modelling from a quantitative perspective. Using Global Innovation Index indicators and modelling their interactions, we have designed a Casual Loop Diagram that represent the process of knowledge generation and innovation diffusion within the Quintuple Helix model. Results show that, even if there is the need and the awareness of enlarging the Triple Helix to the Quadruple and Quintuple Helix from a theoretical perspective, from a quantitative one it comes to light that “government-industry-university” behaves as the real actuator in the generation of knowledge and innovation, while society and environment experience the changes. This approach could possibly be a powerful decision-making tool, allowing to make simulations and understand what could be the impacts of some particular planned actions.

Keywords: quintuple helix, innovation systems, system dynamics, global innovation index,

INTRODUCTION

The issue of innovation ecosystems has been a topic largely debated with different contributions shaping from the regional development to the open innovation. The premises at the basis of the systemic view on innovation ecosystem is that innovation is not more a linear but a systemic process that grows within a network of inter-organizational relationships (Zajac and Olsen, 1993; Powell et al.,

1996) able to promote the interrelation and integration of different knowledge sources and providers (Romano, et al., 2014). Designing and managing of these complex network of actors, also defined as innovation ecosystems, become mandatory to assure the achievement of innovation goals by assuring participation and user-centrality for the sustainable, inclusive and intelligent growth of individuals, companies and territories (Passiante and Romano, 2016). Innovation ecosystems are institutional infrastructures supporting networking and collaboration among a plurality of stakeholders by activating virtuous and knowledge-intensive flows of knowledge (Asheim and Gertler, 2005; Romano et al., 2014). The debate on innovation ecosystems identifies the attribute of sustainability within its main characteristics (Passiante and Romano, 2016). The inbound and outbound flows of knowledge activated by the interaction of the stakeholders within the ecosystems, make these environments as sustainable contexts to booster the process of value creation, in its larger definition. A useful framework for mapping and managing the dynamics undertaken in such contexts is identifiable into the Quintuple Helix model (Carayannis and Campbell, 2011). Inspired at the logic at the most well-known framework of the Triple Helix model (Garner and Ternouth, 2011; Etzkowitz, and Zhou, 2006), representative of the fruitful and knowledge relevant interactions between governments, academia, industries and institutions, the Quintuple Helix model embeds the Quadruple Helix (Carayannis and Campbell, 2009), that included the media based and culture based public, with the context of the natural environment, by demonstrating a more visible attention at the sustainability dimension. Despite the topic of systems of innovation results to be intrinsically linked to a dynamic and evolutionary perspective, very few studies have explored its meaning and the research on approaches useful for its dynamic management needs of more investigations. Framed in the above premises, this paper aims to demonstrate as system dynamic approach can be opportunely adopted for managing and forecasting the performances of an innovation systems configured according to a Quintuple Helix model.

This paper is structured as follows: in the next section the literature background is presented, then the design process that lead us to build the Casual Loop Diagram has been described. Last sections of this paper discuss the results achieved and highlights some limitations of the study, which can open new paths for further research.

BACKGROUND

The concept of the “national system of innovation” (or national innovation system), developed by Lundvall (1992) and Nelson (1993), contextualizes innovation in the perspective of societies at the level of nation states. According to Lundvall (1992), in a modern economy knowledge is the most important resource, while learning is the most important process and in a system of innovation elements and relationships interact with each other in the production, diffusion, and use of new, and economically

useful, knowledge. Besides, a national system includes such elements and relationships, either located within or rooted inside the borders of a nation state. As pointed out by Carayannis and Campbell (2019), it can be argued that innovation is an engine that exploits or translates knowledge into application and use. Moreover, knowledge may be potentially used in order to generate financial revenues and profits, therefore innovation is able to convert the creation and production of knowledge into economic activities. In this sense, innovation is seen as a driving force that exploits and nourishes knowledge in both society and economy of a knowledge society and a knowledge economy (Carayannis and Campbell, 2019). Thus, the concept of Triple Helix innovation systems has been introduced by Etzkowitz and Leydesdorff (2000) and focuses on knowledge production and use in context of “government-industry-university” relations. The Triple Helix thesis is that the potential for innovation and economic development in a Knowledge Society lies in a more prominent role for the university and in the hybridization of elements from university, industry and government to generate new institutional and social formats for the production, transfer and application of knowledge. This vision encompasses not only the creative destruction that appears as a natural innovation dynamic (Schumpeter, 1942), but also the creative renewal that arises within each of the three institutional spheres of university, industry and government, as well as at their intersections. Through subsequent development, a significant body of Triple Helix theoretical and empirical research has grown over the last two decades that provides a general framework for exploring complex innovation dynamics and for informing national, regional and international innovation and development policy-making.

Afterwards, the Triple Helix has been extended in the Quadruple Helix by adding the helix of a “media-based and culture-based public” (Carayannis and Campbell, 2009), that integrates and combines two forms of “capital”: on the one hand a “social capital”, through its values, experience, traditions, and visions (the culture-based public); on the other hand, a “capital of information” (i.e. news, communication, social networks) thanks to television, internet, newspapers, etc. (the media-based public). Later, the Quadruple Helix has been enlarged in the Quintuple Helix, by further adding on the helix of the “environment” (“natural environments”, Carayannis and Campbell, 2009). In this sense, it can be argued that the Quintuple Helix's innovation system is ecologically trustworthy and it can be seen as a framework for interdisciplinary analysis and transdisciplinary problem-solving in relation to sustainable development, as it is built on the understanding of the production of knowledge (research) and application of knowledge (innovation), both to be contextualized by the natural environment of society (Carayannis and Campbell, 2019; Carayannis et al., 2016). In other words, Quintuple Helix is a five-helix model that embeds the Triple Helix and the Quadruple Helix and it visualizes the collective interaction and exchange of knowledge in a nation-state through five helices or subsystems: (1) education system, defined as academia, universities, higher education systems and

schools, in which the necessary “human capital” is being formed by diffusion and research of knowledge; (2) economic system, defined as industry, firms and banks, that focuses on the “economic capital” of a state; (3) the political system, that has to define, to plan, organize and administer the general condition of the nation-state in order to follow a strategic plan, and hold the “political and legal capital”; (4) media-based and culture-based public, that holds both the “social capital” and the “capital of information”; (5) the natural environment, that is decisive for a sustainable development and that provides people with a “natural capital” (Carayannis et al., 2012). Therefore, in an innovation system outlined by the Quintuple Helix model, the exchange of knowledge in a nation-state means that all the subsystems have to be in conjunction in order to promote knowledge-production-based sustainable development (Carayannis et al., 2012).

In the last years, many authors have pointed out the complexity and dynamicity associated with the innovation systems from a theoretic perspective, due to the continuous exchange and evolutions of agents, organizations and institutions (Uriona and Grobbelaar, 2017; Niosi, 2011; Hekkert et al., 2007). Instead, researchers have recently been invited to propose less static and descriptive advancements within the innovation systems field. In fact, there is the need to suggest more dynamic and forward looking approaches, such as the system dynamics modeling, a widely used methodology for modelling complex socio-economic systems.

System Dynamics (SD) originated in the late 1950s as a method to manage the complexity characterizing systems where several elements interact with each other as well as to analyze from a qualitative and quantitative point of view their evolutionary dynamics (Gallo, 2008). This methodology studies the dynamic interactions and feedback effects among a set of variables that compose a system (Forrester 1961; Sterman, 2002), where variables are conceptualized as stocks whose values, at a given time, are defined by inflows and outflows, while information flows link the various stock variables together. In particular, a SD model is driven by different feedback mechanisms (the so called causal loop) that connects two or more variables and could lead either to a reinforcing loop (when the variables support each other) or to a balancing loop (where one variable attenuates the growth of the other).

The dynamics of a system over time is therefore determined by the whole set of causal loops and the better way to represent them is constituted by a causal loop diagram (CLD). A CLD concisely capture and communicate cause and effect relationships that can explain dynamic issues in a concise manner, by using a graphical representation that provides a clear visualization of the model. It is composed by a set of nodes, that represent the variables of a system, and edges, that are arrows links those variables which have a causal connections between them (Barlas, 1996; Sterman, 2002). Two basic feedback loops are at the root of all systems behavior – balancing and reinforcing loops. Balancing loops tend to keep

the system in its current stage and reinforcing loops tend to compound change in one direction. These two loops are the building blocks for describing all complex social and economic systems. CLDs limitation is not to provide a detailed representation of the structure producing the dynamics. That purpose is served by stocks and flows diagrams.

Due to the appeal of the systems thinking perspective, the notion of complex systems and a growing computational processing power (Uriona and Grobbelaar, 2017), SD has been adopted in different industrial fields. It is in this direction that some contributions have focused on their general application for the improvement of company performances (Bianchi, 2009); for managing risks (Santillo et al., 2014; Dubois and Holmberg, 2000); for evaluating patterns of diffusion in the innovation (Milling, 2002; Maier, 1998); for the decision making in strategic management and policy agenda (Fong et al., 2009); for the project management (Sterman, 1992; Rodrigues, 1994); for the analysis and definition of political agendas (Fiorani, 2010); for environmental policy and management (Fiddaman, 2002; Meadows et al., 1972); for urban planning (Forrester, 1969) and economic policy (Radzicki and Sterman, 1994; Forrester et al., 1976), etc.

Framed in the above premises, in the next section it has been described the design process that allows us to outline the CLD through the adoption of the Global Innovation Index as variables of the system.

DESIGN PROCESS

As previously discussed, several works in literature have used SD as to model the dynamics within the innovation systems. Nevertheless, more studies are of conceptual nature (about 65% of them) and have employed SD only as explorative models and for conceptual use. This approach meant that either no data or dummy data have been used for the simulations (Uriona and Grobbelaar, 2017). Besides, some works have exploited “real data”, gathering them from innovation surveys, expert interviews/surveys, regional/national government, firm-level, and so on.

In our research, we have used indicators provided by Cornell University, INSEAD, and the World Intellectual Property Organization (WIPO) and which the Global Innovation Index (GII) is built on. Within the Global Innovation Index report, innovation indicators have been measured since 2013 on more than 100 countries worldwide. In the 2018 release of the GII report, 80 indicators have been identified.

The GII is an annual classification of countries, ranked by their capacity for making innovation and it is based on both subjective and objective data derived from several sources, including the International Telecommunication Union, the World Bank and the World Economic Forum (Global Innovation Index 2018). The GII is built on seven pillars: the first five called Input pillars which enable innovative activities (Institution, Human Capital & Research, Infrastructure, Market Sophistication and Business

Sophistication), the last two called Output pillars which capture actual evidence of innovation (Knowledge and Technology Outputs and Creative Outputs). Each pillar is divided into three sub-pillars. Additionally, each sub-pillar is composed of two to five individual indicators. So, each sub-pillar score is done by the weighted average of its individual indicators, and, contextually, each pillar score is calculated as the weighted average of its sub-pillar scores. The weights have been decided *a priori* by GII analyst, in order to ensure a greater statistical coherence of the model. The GII distinguishes between Innovation Input Sub-Index, that is the arithmetic average of the first five pillar scores, and Innovation Output Sub-Index, which is the arithmetic average of the last two pillar scores. The GII is the arithmetic average of the Input and Output Sub-Indices. The GII model includes 80 indicators: 57 belong to the quantitative / objective / hard data category, drawn from a variety of public and private sources and often correlated with population, gross domestic product (GDP), or some other size-related factor; 18 belong to the composite indicators / index data, coming from a series of specialized agencies and academic institutions such as the World Bank, the International Telecommunication Union (ITU), the UN Public Administration Network (UNPAN), and Yale and Columbia Universities; 5 belong to the survey / qualitative / subjective / soft data category, drawn from the World Economic Forum's Executive Opinion Survey (EOS) and aimed to capture subjective perceptions on specific topics.

In 0 the design process is shown. The first step of our analysis has consisted in identifying those indicators relevant for our aims and making a first associations with the five helices of the Quintuple Helix model. In particular, each indicator has been mapped on one or more helix, investigating on its contribution in terms of interaction and exchange of knowledge respect to the five subsystems in the Quintuple Helix model. From each indicator, one or more variables have been identified for casual loop diagram design.

Figure 1. *Design process.*

Then, causal relationships between indicators have been identified by considering:

- qualitative description provided in the GII report for each indicator;
- indicator definition and composition (sub-indicators, pillars, issues, etc.);
- diagram characterization.

As for the latter point, i.e. the diagram characterization, links have been marked with (+) when they indicate a positive relation (the two nodes change in the same direction) and with (-) when links indicate a negative relation (the two nodes change in opposite directions). Furthermore, closed cycles in the diagram have been identified as a reinforcing or balancing feedback loop. A reinforcing loop is a cycle in which the effect of a variation in any variable propagates through the loop and returns to the variable reinforcing the initial deviation (i.e. if a variable increases in a reinforcing loop the effect through the cycle will return an increase to the same variable and vice versa). A balancing loop is the cycle in which the effect of a variation in any variable propagates through the loop and returns to the variable a deviation opposite to the initial one (i.e. if a variable increases in a balancing loop the effect through the cycle will return a decrease to the same variable and vice versa). With this deeper analysis, after several iterations, a CLD, representing the knowledge flow measured by GII within the subsystems of the Quintuple Helix model, has been designed.

RESULTS

As described in the previous paragraph, the GII indicators have been explored in order to find mutual causal relationships and build a CLD, aiming at representing the process of knowledge generation and innovation diffusion in a Quintuple Helix model.

In 0 the CLD is shown. As it can be seen, through the exploitation of the GII indicators, different reinforcement loops has been identified. In particular, three reinforcement loops correspond to the three helices that represent the educational system, the economic system and the political system. Starting, for example, from the educational system (in 0 it is in red), all the indicators encourage the formation and the nourishment of the human capital, in line with the Quintuple Helix model, and it is the reason why the reinforcement loop has been named in this way. In fact, the expenditure on education and the government fundings generally allow to form students and a part of them will graduate in scientific and technological subjects and increase the number of researchers, who, in turn, will contribute to the knowledge creation, impact and diffusion.

Besides, in the economic system (in 0 in blue) the Gross Expenditure in Research and Development (GERD) helps to invest in the employment of qualified employees in knowledge intensive services, impacting on the knowledge creation, impact and diffusion in the whole system and increasing the economic capital.

It is clear that these two subsystems, the education one and economic one, are in collaboration between them (in 0 in purple). In fact, students who graduated in scientific and technological subjects have a positive impact on both the number of researchers and in the number of employment in knowledge intensive services inside the companies. Moreover, through the collaboration between industries and

universities and the research talent in business enterprises, the educational system gives support to the growth of the economical capital and vice versa.

Together with these two subsystems there is the political system (in 0 in orange). The aim of the political system is to design a strategic plan in order to organize and well administer the general condition of the nation-state. Therefore, if good rules are taken and the perception of a strong political system by citizens is high, then there is a reinforcement in the political and legal capital.

This helix has an important role in the production of knowledge and the diffusion of innovations, together with the education system and the economic one. In particular, the political system interacts with them by enabling business facilities (in 0 in teal), that allow new formation of companies or help the existing ones to improve their business. Moreover, a good perception of government implies a growth in the attractiveness from abroad and an increase of GERD financed by abroad, in support of both the education and economic subsystems. On the other hand, a good political system incentives and makes accessible the ICT infrastructures to all the citizens (in 0 in turquoise), in line also with the actual global regulations that aims at simplifying bureaucracy. In doing so, it gives support to the creative goods and services (in 0 in magenta), that is at the basis of the capital of information (in 0 in rose) held by media- and culture- based public, and to the *ICTs and business model creation* and *ICTs and organizational model creation*, all contributing in the creation and diffusion of knowledge.

Finally, the political system has to establish some rules that everybody must observe in order to preserve the natural capital. This measure is given by a set of indices that are all represented by *Environmental performance*, regarding the quality of water, the air pollution, the CO₂ level, and so on. It is clear that the knowledge creation and impact should be done in observation of such regulations (in 0 in green).

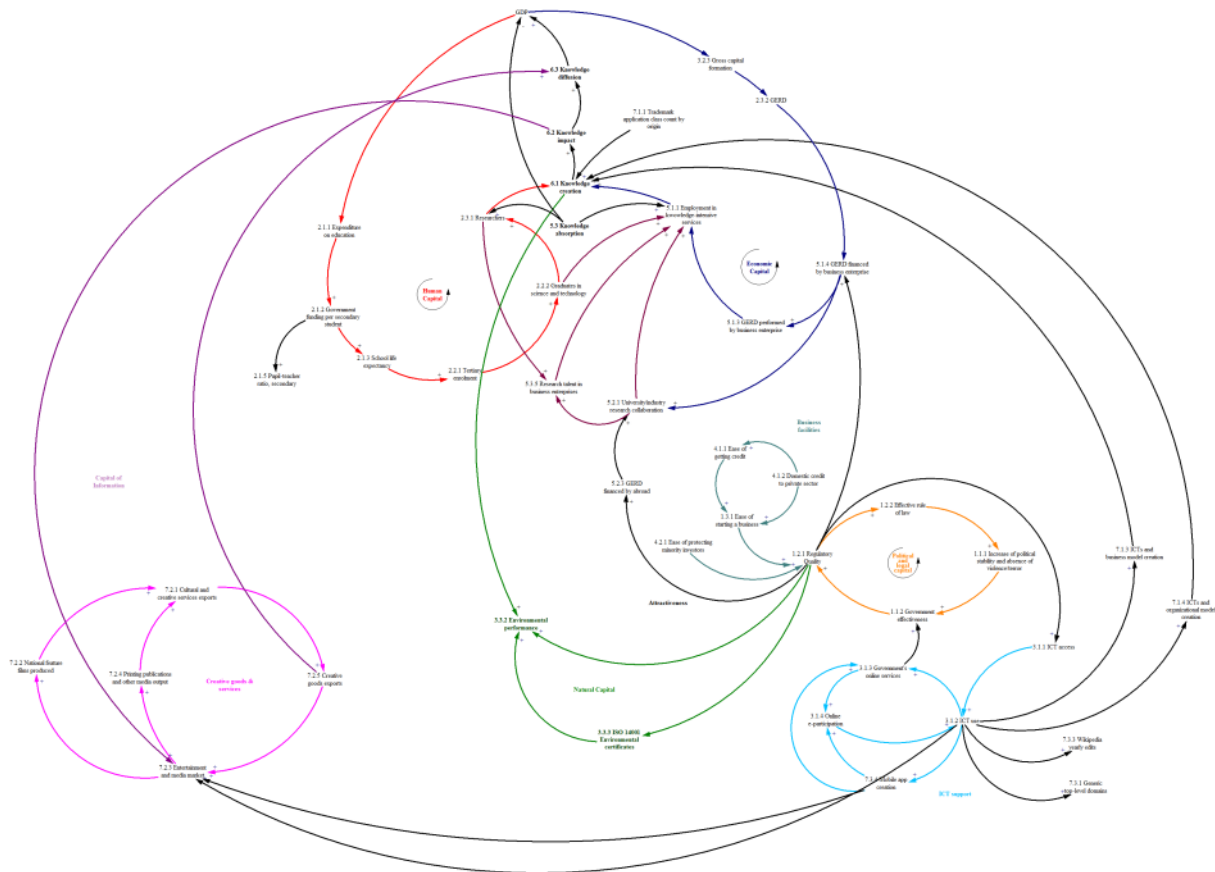

Figure 2. Causal LoopDiagram (CLD).

The CLD illustrated above shows that, even if from a theoretical point of view there is the need and the awareness of enlarging the model to the Quadruple and Quintuple Helix, by including society and environment, from a measurement (and therefore quantitative) point of view the available tools do not cover all the forms of capital envisaged in the Quintuple Helix model, even using the GII which currently is the most complete tool available. In fact, regarding the media- and culture- based public, it is measured only the capital of information, while measurements about the social capital are not available. Furthermore, regarding the natural environment, the measurement of the natural capital is limited to the part of environment performance, as described above.

Moreover, it comes to light that the real “core” of innovation is founded on the Triple Helix “government-industry-university”, that acts as an actuator in the generation of knowledge and in the processes of innovation that, on the contrary, society and environment experience.

This is a confirmation of the importance of simulation in order to evaluate the effects “suffered” by the media- and culture- based public and environment subsystems in a period of time greater than that to which the government-industry-university is subjected.

DISCUSSIONS AND CONCLUSIONS

This paper aimed to provide a contribution at the comprehension of performances of systems of innovation in a Quintuple Helix perspective through the adoption of a SD approach. Despite its novelty and original contribution, the current version with its preliminary exploration presents several limitations: as mentioned before, the first step in building a SD model has been presented, and furthermore only one set of indicators, i.e. indicators from GII, has been used. Besides, the novelty of our approach need to be considered. In fact, in the past years, SD has been adopted in order to conceptualize complex behaviours and developing causal assumptions, especially regarding innovation systems. Nevertheless, these SD models have often been focused only on some specific parts of the innovation system, usually losing sight of its big picture. Thus, in this paper, System Dynamics modelling for the Quintuple Helix framework has been proposed in order to measure quantitatively the knowledge created in each helix subsystem through the exploitation of Global Innovation Index indicators. A Causal Loop Diagram including variables, links and loops has been designed. A CLD is the first step in the SD modelling that puts the basis for Stock and Flow Diagrams and simulations. Actually, using GII indicators for modelling all of the Quintuple Helix subsystems do not cover all the forms of intellectual capital. In particular, the social capital, belonging to the culture-based public, and the natural capital of a nation-state, remain still uncovered.

This research opens new perspectives for researchers, in the study of system dynamics applied to the innovation systems. In fact, this work lays on a quantitative approach, bringing out the relationships between the Quintuple Helix model and the GII indicators. For practitioners, this approach is potentially a powerful decision-making tool, as it allows to make simulations and understand what could be the impacts of some particular actions that are going to be planned. In particular, it could be very useful in order to understand policy impacts on environment and society, that usually are visible in a time scale of the order of ten years.

In future research, the proposed CLD could be the basis for the development of a Stock and Flow Diagram, useful for simulations of the real data and to deeply understand the behavior of the five helices of the model. Moreover, the GII dataset could be expanded and enriched by other available indicators, in order to obtain a better coverage of all the intellectual capitals forms and enhance the complex structure of the whole innovation system.

DIGITAL TRANSFORMATION IN THE LUXURY INDUSTRY- A SYSTEMATIC MAPPING STUDY

Mastropetrou, Margaret; Bithas, George; Kutsikos, Konstadinos

Growth Transformation & Value Engineering (W.A.V.E.) Lab, Business School, University of the Aegean, Chios Island Campus, Greece

ABSTRACT

Digital transformation is increasingly becoming top agenda item for businesses across sectors and geographies. The question is no longer when they need to make it a strategic priority. It is all about how to embrace it for achieving new types of competitive advantage. In the luxury goods sector in particular, practitioners like the consulting firm McKinsey, indicate that by year 2025, one out of five luxury purchases will happen online, causing significant changes in how luxury firms will need to operate. This article's main aim and contribution is to provide an initial mapping of current research/practitioner efforts in order to depict the current state of digital transformation in the luxury goods sector. A preliminary search pointed to an under-researched field, so a Systematic Mapping Study (SMS) methodology was chosen and deployed, as the most appropriate one for achieving the goal of this research. The results were clear: a) luxury goods firms have not yet embraced digital transformation; b) both the sector and the related fields of scientific research seem to stand at a point of passive recognition for the digital need. The lack of strategic frameworks (academic or otherwise) for digital transformation in this sector indicate an opportunity for further scientific research in areas such as: a) the emerging Luxury 4.0 operating model, with which luxury goods firms can use big data to build customer intimacy, capture luxury customer preferences and streamline the process of turning ideas into new products; b) luxury business ecosystems, where luxury good firms, along with players from other industries, will co-design innovation and co-develop new types of joint competitive advantage.

Keywords: transformation, digital, luxury, systematic mapping study, innovation, management, business, organizational development, change, change management

INTRODUCTION

The luxury market includes a wide range of categories from fashion, accessories and cars to art and luxury experiences, comprising a global market valued at \$260 billion (D'Arpizio and Levato, 2018). (Achille *et al.*, 2018) identify an increasingly significant trend in this market, accounting for about 8%

(i.e. about \$20 billion) of its size: the use of digital channels for purchases of personal luxury goods – apparel, footwear, accessories, jewelry and watches, leather goods, and beauty. Digital is having an even greater impact on how luxury shoppers select and relate to brands: nearly 80% of luxury goods sales are “digitally influenced” meaning that, in their luxury shopping journeys, consumers hit one or more digital touch points (Achille *et al.*, 2018).

From a luxury firm’s viewpoint, digital can thus be considered a positive lever: it creates new opportunities for providing bespoke services to many more customers. So, should the industry jump on the digital bandwagon? The answer is not straightforward. Besides obvious strategic considerations, the experience from other industries indicates that success in exploiting digital channels is pre-conditioned upon potentially vast internal changes – what is known as digital transformation: digital technologies need to become central to how a business operates, effectively re-thinking and possibly re-inventing its business model to quickly and timely anticipate competitors’ next moves, monitor market tastes and adapt its products and structure (Carcary *et al.*, 2016; Bresciani *et al.*, 2013).

To explore this challenge, the authors of this article focused on cataloguing research efforts of digital transformation in the luxury goods industry. This led to the development of a systematic mapping study (SMS), aiming at identifying research gaps and relevant clusters of evidence (Engstrom and Runeson, 2011).

Presenting the development of the study and the mining of key insights are the goals of this article. First, the context of the study is highlighted, by discussing key concepts relevant to the two fields of interest: digital transformation, and the luxury goods sector. The SMS methodology steps that were implemented are then described, with particular emphasis on the definition of the study’s research questions, inclusion and exclusion criteria, the classification scheme, and the final mapping. A number of key findings/insights are then analyzed, followed by certain lessons learnt and future research directions.

BACKGROUND

The luxury industry

The concept of luxury exists since ancient times (Berry, 1994). The term “luxury” itself comes from the Latin “luxus”, which means “soft or extravagant living, sumptuousness, opulence” (from the Oxford Latin Dictionary in Dubois *et al.* 2005). Luxury goods have been associated with wealth, exclusivity and power, as well as somewhat superfluous needs. Sombart (1913) emphasizes that a luxury good is

characterized by a unique aura and its possession is something exceptional, which breaks the serial production of the mass market.

Under the Standard Industrial Classification system, luxury firms cannot be collectively recognized as an independent industry, as goods and services produced by such firms vary from wristwatches to valet driving. Even though luxury firms might serve different needs, they provide consumers with symbolic and experiential benefits (such as prestige and social status) that mostly come from the intangible attributes of their brands (Kapferer and Bastien, 2009). Therefore, the luxury industry refers to an exclusive group of firms across different product segments that are distinguished by their ability to offer exclusivity and consumer-perceived luxuriousness (Vigneron and Johnson, 2004). This research effort focuses on a sector of this industry, namely the personal luxury goods sector, which includes apparel, footwear, accessories, jewelry and watches, leather goods, and beauty.

From the consumers' perspective, the word "luxury" reflects the lifestyle of High Net Worth Individuals (HNWI; with at least \$1million in cash) and ultra-High Net Worth Individuals (with at least \$30million). In reality, the luxury goods sector creates goods that are also accessible to various market segments. For example, when Chinese consumers refer to 'luxury goods', they refer to products available in premium department stores (Kapferer, 2016).

This further explains how luxury creates value. It is true that millionaires and billionaires in the world are a significant source of luxury goods' demand. However, the ultra-rich customer segment alone cannot explain the increase in the luxury industry from \$90billion to \$217 billion in 24 years. The luxury marketplace has grown so much because "this sector aims at everyone, without seeming to aim at everyone" (Kapferer, 2016). Nevertheless, varying economic trends, and evolving consumer preferences and tastes are creating a new competitive landscape where luxury goods firms will need to rethink their strategies.

Digital transformation

The market-changing impact of digital disruptions is often wider than products, operating processes, or supply chains—entire business models are being reshaped and new ones emerge, oftentimes from left-field competitors (Hess *et al.*, 2016).

As a result, digital transformation is increasingly becoming top agenda item for businesses across sectors and geographies. The question is no longer when they need to make it a strategic priority. It is all about how to embrace it for achieving new types of competitive advantage (Hess *et al.*, 2016).

At its core, digital transformation is about “a fundamental change, a metamorphosis, in how companies generate value for their owners and other stakeholders, achieved by applying digital technologies and ways of working to all aspects of the business” (Reichert and Hutchinson, 2019). The combination of such technological advances means that an enormous number of business processes and structures will be redesigned and automated in the coming years, potentially creating (or destroying) huge amounts of business value. The overall goal is to identify and exploit growth opportunities and deploy new business models (Reichert and Hutchinson, 2019).

In the academic world, the above challenge is mostly addressed in a piecemeal way and there is limited effort in developing a holistic approach to the development of a company-wide digital transformation strategy (Hansen and Sia, 2015). For example, (Matt *et al.*, 2015) developed a Digital Transformation Framework (DTF) for formulating a digital transformation strategy along four axes: a) developing capabilities to deploy disruptive information technologies; b) defining value drivers; c) reshape organizational structures, processes and skill sets; and d) securing financial resources for achieving change. However, this is a rather generic and theoretical framework and its practical use remains to be seen.

In this context, managers across sectors and geographies are struggling to approach digital transformation as a strategic move, and their actions are oftentimes ad hoc. The result points to a “winner takes all” situation, for now: ‘born digital’ pioneers (e.g., Amazon, Facebook and Google) have grown into titans, while companies that long dominated their industries face a threat in their traditional value propositions as they struggle to define digital transformation paths (Sebastian *et al.*, 2017; Zinder and Yunatova, 2016).

Appreciating these realities is particularly important for managers from traditional industries (such as the luxury industry), as the underlying logic of digital business models is often fundamentally different from their experience. There are many examples of companies that have not been able to keep pace with the new digital marketplaces, such as the movie-rental titan Blockbuster, largely resulting from the firm’s inability to quickly develop and implement a new digital transformation strategy (Hess *et al.*, 2016). Researchers suggest that the development of such strategies requires strong capabilities: high levels of organizational flexibility, learning and knowledge transfer skills, and flexible corporate culture (Eisenhardt and Martin, 2000). Ultimately, in a constantly shape-shifting business environment, true competitive benefit comes from companies’ capability to innovatively transform when their competitors cannot (Vrontis *et al.*, 2012; Vrontis *et al.*, 2016).

Independent of the industry or firm, practical digital transformation strategies seem to share certain elements. These elements can be ascribed to four dimensions: harnessing data and advanced

technology, digitizing customer relationships, building digital talent and organization, digitizing operations and automating processes (Reichert and Hutchinson, 2019). This means, that a company has to make a variety of major changes across its structure and culture, and incorporate “digital” into everyone’s job. Such changes are never easy, especially on the culture of businesses that have deep legacy roots (Bilefield, 2016). This may explain why academic research has not yet come up with a set of accepted guidelines on how to formulate, adopt and evaluate digital transformation practices (Matt *et al.*, 2015).

Trends in the luxury industry and the need for digital transformation

The consumption of luxury goods is influenced by a number of trends. These trends are: a) cultural, such as globalization; b) social, such as the emergence of new market segments; c) external to the industry, such as the growing popularity of internet shopping (Seo and Buchanan-Oliver, 2015).

In recent years, the luxury goods industry has been strongly affected by the rapid evolution of technology, including social media, e-commerce and mobile shopping. The growing role of digital channels leads luxury goods firms to enter an omni-channel world that they are hardly prepared for. Moreover, they are faced with new technologies such as 3D-printing and high-tech materials, which may allow producing unique luxury goods for low costs (Gutsatz and Heine, 2018).

Although this evolution has been a blessing for other businesses, in the luxury goods sector it has been encountered with great concern (Escobar, 2016; Ribeiro and Nobre, 2016). This was further fueled by the fact that some luxury goods firms have spent billions trying to approach the concept of “digital”, but the results have yet to translate into economic value (Ventura, 2017; Kansara, 2017).

Many researchers and practitioners have pointed out the urgent need for digital transformation in the luxury goods sector and proposed a series of steps towards it. (Beauloye, 2018) has focused on digital storytelling and search engine optimization, while (Jain *et al.*, 2018) suggest that big data may drive luxury goods firms’ growth beyond digital. (Ventura, 2017) points that successful digitally-minded luxury firms that position themselves as “technological” leaders are systematically searching for and exploiting digital opportunities, understand the importance of human resources, and respond quickly to luxury customers’ needs. However, most firms in the sector seem to address the issue of digital transformation by using marketing techniques that simply make their brand more appealing.

In reality, digital is penetrating the value chain and creating opportunities to be more effective and responsive (Jankowska and Polowczyk, 2016). While luxury goods firms and retailers recognize that it is essential to experiment on this front, there is a wide variation in what companies are doing to transform for exploiting these opportunities. The most forward-looking firms are focusing on

digitizing their businesses and building an operating model that increases their speed and agility. They are using data to take customer knowledge and relationships to a new level, and form partnerships within and outside the luxury goods sector to accomplish what they cannot do on their own (Achille *et al.*, 2018).

A case in point is Burberry. By 2006, the firm had lost much of its sparkle; its British heritage and luxury outerwear products, pricing and store design were inconsistent and outdated. To regain control, Burberry made the strategic choice to digitally transform. Internally, a new digital collaboration platform, Burberry Chat, allowed employees, suppliers, partners and investors to link up and its use was encouraged and incentivized. Customer-facing activities were also revamped, in sync with internal transformation: the firm started spending more than 60% of its marketing budget on digital media (triple the industry average), attracting millions of viewers to its Twitter, Facebook and YouTube sites (Wade, 2016). The above initiatives were complemented by major investments across Burberry's technology landscape, thus creating a digital ecosystem of mobile apps, websites and data analytics.

In conclusion, digital transformation has not yet been widely accepted and adopted by the luxury goods sector, although this sector has gone under big strategic changes during recent years. However, major players have started embracing it and it is expected to drive, on average, 40% of projected sales growth till 2020, as opportunities to open physical retail space diminish and consumers increasingly look for digital-rich shopping experiences (Kansara, 2014).

METHODOLOGY

A systematic mapping study (SMS) provides a broad review of a research area that aims to identify the quantity and type of research and results available within it (Kitchenham and Charters, 2007). It also provides a structure of the type of research reports and results that have been published, by categorizing them. The research questions in mapping studies are rather broad, as they aim to discover research trends (Petersen *et al.*, 2015), which can be also detected by mapping the frequencies of publications over time (Petersen *et al.*, 2008). Overall, five main steps are usually conducted: definition of research questions, searching for relevant papers, screening papers, key wording of abstracts, and data extraction and mapping (Fauzi *et al.*, 2010).

The main goal of an SMS study is the classification and thematic analysis of literature on a topic. The research questions are related to research trends, the search process is defined by the topic area and the scope of systematic mapping is broad- all papers related to a topic area are included, but only classification data about them are collected. The result is a set of papers related to a topic area

categorized in a variety of dimensions, along with the number of papers in each category (Petersen *et al.*, 2015, James *et al.*, 2016). What is more, systematic mapping follows the same rigorous, objective and transparent processes as do systematic reviews to capture evidence that is relevant to a particular topic, thus avoiding the potential pitfalls of traditional literature reviews (e.g. reviewer and publication bias).

The method of systematic mapping was selected for two reasons. First, because of its adequacy for the exploration of a research area in a systematic way. Systematic mapping is used frequently in the field of software engineering, but it was developed in social sciences due to the small amount of empirical data and to the need for a method to describe the literature across a broad subject of interest (James *et al.*, 2016).

Second, because of its novelty. To the best of the authors' knowledge, there is only one mapping study concerning the luxury goods sector, which focuses on a multidisciplinary, bibliometric overview of the state of the luxury research field up to 2016 and its intellectual foundations (Gurzki and Woisetschläger, 2017).

Definition of the research questions

The driving research questions for this mapping study are:

- RQ1: Are there any existing approaches that may drive digital transformation in the luxury goods industry?
- RQ2: What are the most investigated topics related to the combination 'luxury goods sector' and 'digital transformation' and how have these changed over time?

Conduct search

Initial search was conducted by using search strings in scientific databases or browsing manually through journal publications - a preliminary search was conducted in Google Scholar and Science Direct, using the keywords "luxury industry" and "digital transformation". From these identified keywords, sets of keywords were formulated which are listed in Table 1.

"luxury industry" (set 1)	"digital transformation" (set 2)	"digital transformation of the luxury industry"
"luxury brand"	"big data analytics" and "digital transformation"	"digital transformation" and
"luxury brand management"	"disruption" and "digital	"luxury industry"

"digitalization" and "luxury industry"	transformation"	
"digitization" and "luxury industry"		
"consumers perceptions" and "luxury industry"		

Table 1: Searched keywords

Each keyword and set of keywords have a significant part in this study. For example:

"Consumers' perceptions": As emphasized by (Dubois and Duquesne 1993a), "we believe that an analysis of the direct relationship between consumers and brands is the key to an improved understanding of such a market." This could be used not only in the creation of a luxury brand but also in the constant investigation of existing luxury brands and in basic research in consumers' attitudes (Vigneron and Johnson, 2004).

"Big data analytics": Big data analytics is typically characterized by a "focus on very large, unstructured and fast-moving data" (Davenport, 2014). Their analysis in different ways may help pave the way to digital transformation and the creation of sustainable competitive advantage, by driving internal realignments to capture opportunities identified through data mining.

Study selection (inclusion and exclusion criteria)

The outcome of the previous step was a large number of articles, which were then filtered based on titles and abstracts, as well as on full text reading, as suggested by (Petersen *et al.*, 2015). The relevant inclusion and exclusion criteria are shown in Table 2.

Inclusion criteria	Exclusion criteria
<ul style="list-style-type: none"> ● Books or book chapters that provide information on the topic of digital transformation, luxury brand management or trends in the luxury goods sector. ● Reports describing empirical studies on the topic of digital transformation and the luxury goods sector. Empirical studies with results based on observed and measured phenomena and derived knowledge from actual experience rather than from theory or belief. ● Papers that provide scientific research findings or reviews of research on the topic of digital transformation or the luxury goods sector (opinion papers, validation papers, evaluation papers, case studies) ● Time frame: 2009- 2019. Before 2009, business and 	<ul style="list-style-type: none"> ● Studies without empirical findings. ● Studies that cover the topic of luxury as a concept, but do not focus on its digital aspects. ● Duplicates. ● Studies not available in full text. ● Studies written in languages other than English. ● MSc and PhD theses on digital transformation or the luxury industry.

creative opportunities of the Internet were not really on the radarscope of by luxury firms (Okonkwo, 2010).	
--	--

Table 2: Inclusion and exclusion criteria

Classification of selected studies

The result from the previous step was a pool of 60 papers. The authors then proceeded with the classification step, based on a topic-related classification scheme, as proposed by (Petersen *et al*, 2015).

First, abstracts were studied and searched for keywords and concepts reflecting the contribution of a paper and its context. Then, the set of keywords from different papers were combined to develop a high-level understanding of the various concepts involved. In cases that abstracts could not offer the necessary information, the authors chose to further study the introduction and/or conclusion sections of the corresponding paper, as suggested by (Petersen *et al*, 2008).

Data extraction and mapping of studies

During this SMS step, articles were sorted into the scheme derived in the previous step, and a table was used to document the data extraction process. The table contained each category of the classification scheme. When the data of a paper were included in the scheme, a short justification was provided about why the paper should be in a certain category. At completion of the table, the frequencies of publications in each category were calculated. This made it possible to see which categories have been emphasized in past research and thus to identify gaps and possibilities for future research.

RESULTS OF THE MAPPING

As a result of the SMS implementation process, a number of insights emerged, linked to the study's research questions:

RQ1: Are there any existing approaches that may drive digital transformation in the luxury goods industry?

Digital is a reality that can make a transformative difference in the luxury goods sector (Abtan *et al.*, 2016). It opens up new opportunities to create personalized offerings (Ataíde *et al.*, 2018), it can help design and deliver bespoke experiences to many more customers, it widens the distribution channels and it provides new ways to engage with customers online in markets where a luxury goods firm has no stores. Top consulting firms (McKinsey, BCG, Deloitte) set digital transformation as the number

one priority for competitive advantage in the luxury industry, acknowledging the need for the luxury sector to fully embrace digital (Reichert and Hutchinson, 2019; Deloitte, 2018).

Despite the above realization, adoption of digital technologies by luxury goods firms is still in its infancy, due to their willingness to maintain exclusivity and prestige, as well as due to the lack of relevant technical and strategic skills. This has led to the inability of those firms to reposition themselves, to react to shifts in their operational context and to be competitive in emerging markets. In fact, one of the reasons they react passively towards digital is because it implies an idea of modernity that may contrast with a luxury brand's image (Tauriello *et al.*, 2017). This is particularly evident in the luxury fashion sub-sector, where managers struggle to understand innovation logic that may deviate fundamentally from their *modus operandi* (Remane *et al.*, 2017).

As a result, digital transformation approaches in the luxury goods sector mostly concern digital marketing strategies, the engagement to social media, and deployment of new information technologies (Pappas *et al.*, 2018; Mikalsen *et al.*, 2018; Remane *et al.*, 2017; Romao *et al.*, 2019; Choi *et al.*, 2014). However, no study (academic or otherwise) within the scope of this research effort recognized an urgent need for further actions.

In addition, these approaches emphasize the viewpoints of digital-first firms, rather than the concerns of traditional luxury goods firms that are facing a tsunami of digital and strategic disruptions (Remane *et al.*, 2017).

RQ2: What are the most investigated topics related to the combination 'luxury goods sector' and 'digital transformation' and how have these changed over time?

Most of the articles were published in scientific journals, such as the Journal of Global Fashion Marketing; the Journal of Business Research; the Journal of Retail & Distribution Management; the Journal of Fashion Marketing & Management.

Overall, they provide an examination of the landscape of the luxury goods sector either from the consumers' or the firms' perspective (e.g. Kapferer and Valette-Florence, 2016; Miller and Mills, 2012). Some studies describe generic frameworks for luxury brand management and propositions for digital brand enforcement (e.g. Cavender and Kincade, 2015; Hung *et al.*, 2011). Others examine the steps to digital transformation as applied in other industries (e.g. Remane *et al.*, 2017; Berman, 2012). Finally, some studies focus on examining some less trending but equally important aspects of the luxury industry, such as synergies and brand extension (e.g. Som and Pape, 2015; Kim and Kim, 2017).

Topics were classified according to the keywords of each study (see tables 3 and 4). The term “digital” is classified into 3 main typologies: (i) digital technologies, which include social media and the online channels for e-commerce (Gao *et al.*, 2013; Pantano and Verteramo, 2017), (ii) mobile technologies, which include mobile apps (Pantano *et al.*, 2017; Varnali and Toker, 2010), and (iii) immersive/pervasive in-store technologies (Pantano and Verteramo, 2017; Papagiannidis *et al.*, 2017). However, most of the studies included the topics of social media and e-commerce, without considering the other forms/types of digital. For example, they are concerned with the online shopping experience (Liu *et al.*, 2013), luxury branding on the internet (Seo and Buchanan- Oliver, 2014), and social media marketing (Phan *et al.*, 2011).

TOPICS	FREQUENCY (# of papers)

Table 4: Timeline of publications

It is important to note that the selected studies which included the term “digital” were published after 2015. Based on this observation, this is a rather recent trend in the luxury goods industry. Other trends were also identified, which link digital transformation in the luxury goods sector with new strategic directions. For example, (Bellaiche *et al*, 2013) highlighted the topic of digital-driven luxury ecosystems, as a way to help luxury goods firms reduce the risk and costs of innovation, while becoming more agile and competitive. (Achille *et al*, 2018) proposed Luxury 4.0, inspired by Industry 4.0 – the fully digitized model for manufacturing. Luxury 4.0 will be about creating a new seamless system that ties together smart logistics, customer data, and design. This will enable rapid response to shifts in demand and luxury customer needs, and will allow luxury goods firms to turn customer data into new products and business models that drive growth.

Last but not least, (Jain *et al*, 2018) highlighted the topic of “big data” in the luxury goods sector, based on the fact that 85% of luxury goods sales come from customers already registered in luxury firms’ databases. Big data analytics should further enable luxury goods firms to better identify and connect with their affluent consumers, fully understand their lifestyle and purchase behaviors, and build long-term engagement. Luxury goods firms can then deliver personalized content and connect with their consumers as a result of insights generation, which may further lead to the identification and commercial exploitation of new markets (Neubert, 2018).

CONCLUSIONS

Based on the above findings, it seems that the link between the luxury goods sector and digital transformation is either ignored or misconceived. In fact, most studies do not consider the impact that digital transformation can have for the future of the luxury goods sector.

Practitioners, like (Achille *et al.*, 2018) of the consulting firm McKinsey, indicate that by year 2025, one out of five luxury purchases will happen online, causing significant changes in luxury marketplaces. However, there are no definitive approaches for aligning the luxury goods sector with the practical aspects of digital transformation.

At the same time, academic studies only partially discuss the issue of digital transformation and resulting business strategies. Instead, they focus on the effect of social media and online or omni-channel shopping on luxury consumers’ purchase intentions. To make things worse, such partial digital activities have cost luxury goods firms significant amounts of money with questionable returns on their investments (Annie-Jin, 2012).

Hence, it can be safely stated that: a) luxury goods firms have not yet embraced digital transformation; b) both the sector and the related fields of scientific research seem to stand at a point of passive recognition for the digital need. In addition, luxury goods firms seem to fear the shift to digitalization and have been slow to the transformation process, due to their concern for losing their exclusivity and sense of uniqueness (Tauriello *et al.*, 2017). In order to move one step towards digital transformation, it is imperative that luxury goods firms overcome these fears which leave them unprepared for the disruptions ahead: digital has driven consumers to expect continuous excitement from their digital shopping experiences and luxury goods firms must find a balance between their traditional strategies and disruption-driven innovation.

Moda Operandi is a case in point. This digital-first luxury goods firm with physical stores in New York and London, was founded in 2010 with a unique value proposition: let luxury shoppers preorder clothes and accessories straight off the catwalk. By creating a unique business ecosystem with over 1,300 designers (from newly-minted ones to Prada and Givenchy), Moda connects directly luxury goods brands with luxury shoppers. Behind the scenes, though, Moda is becoming the data analytics disruptor in the luxury goods industry, through its “runway reports” – detailed ‘maps’ of luxury buyers’ shopping habits, including forecasts for new fashion trends. These reports capture key customer interests (styles, colors, sizes) along with preferred store locations, days and times they like to shop. More importantly, runway reports are shared with collaborating fashion houses and designers, thus co-creating rich business value: by using the reports, Moda’s ecosystem knows which luxury products appealed more to customers and they can design their next collections of luxury products according to clearly defined needs and preferences.

The need for a digital shift in the luxury goods sector is thus imperative. For a traditional firm in this sector, redesigning the business strategy with digital in mind, means moving from a mindset of control to one of agility. Executives must realize that a complete embrace of digital requires nothing less than a companywide transformation effort encompassing all business areas and all employees. This should further push scientific research in relevant but groundbreaking directions, such as:

- the emerging Luxury 4.0 operating model, with which luxury goods firms can use big data to build customer intimacy, capture luxury customer preferences and streamline the process of turning ideas into new products;
- luxury business ecosystems, where luxury good firms, along with players from other industries, will co-design innovation and co-develop new types of joint competitive advantage.

FISCAL INCENTIVES FOR TENANTS OF SPECIAL ECONOMIC ZONES IN RUSSIA'S FAR EAST

Mayburov, Igor¹; Sinenko, Olga²

¹dept.Graduated School of Economics and Management, Ural Federal University, UrFU, Ekaterinburg, Russian Federation

² dept. School of Economics and Management, Far Eastern Federal University, FEFU, Vladivostok, Russian Federation

ABSTRACT

The article analyzes the findings of a survey regarding the influence that various types of fiscal instruments have on the behavior of economic entities in the special economic zones of Russia's Primorsky Region. The article also looks at the current business climate in the region with regard to fiscal support measures provided to the areas of the Far East. The basic research methods were statistical methods, as well as tools for correlation and regression analysis. The authors argue that fiscal instruments are an indispensable part of a package of measures for attracting investors and that they have a significant influence on investment decisions. The authors prove that tax incentives for corporations and lower social security contribution rates find the highest demand among investors. At the same time, all respondents note the significance of individual preferences, for example, lower tariffs for insurance premiums over 10 years at a rate of 7.6% instead of 30% for non-residents. Accelerated procedure for VAT refunds and shortened inspection periods are not topical preferences for residents due to an effective automated VAT tax administration system in the Russian Federation. The study did not confirm the presence of closer attention to residents by the inspection structures. The purpose of the article is to evaluate the attractiveness of fiscal instruments facilitating business development by using the results of a survey of special economic zone tenants in Russia's Far East.

Keywords: tax incentives, Russia's Far East, Free Port of Vladivostok.

1 RELEVANCE OF RESEARCH

The Far East is Russia's window into the Asia-Pacific and is regarded as one of the most promising regions of Russia with huge economic and geopolitical significance for the country's development. The Asia-Pacific is the most fast-developing area of the world where special economic zones (SEZs) have been sprouting up. Such zones actively use tax instruments to facilitate business development and attract foreign investors. Russia's Far East is no exception as it has been home to free economic

zones (Free Port of Vladivostok²⁰ and territories of advanced social and economic development.) offering preferential treatment to businesses since 2015. The policy of creating a friendly investment environment for SEZ tenants envisages the provision of preferential treatment to businesses. Tenants enjoy various incentives, such as tax concessions, trade preferences, and administrative incentives. Tax incentives are particularly relevant as they are having a much stronger influence on investment decisions than in previous years. The distribution of tenants across the special economic zones of the Far East is uneven. The free port of Vladivostok and Primorsky Region have the largest number of tenants (70% of them are registered in Vladivostok); the territories of advanced social and economic development (ASEZ) in Primorsky Region account for 25% of tenants²¹. In 2018, the number of tenants in the territories of advanced social and economic development and the free port of Vladivostok nearly tripled (from 454 to 1,200). This is a sign of the growing interest of the entrepreneurial community in developing business in the Far East. SEZ tenants are entitled to customs preferences (customs clearance procedures of the free customs zone) and administrative incentives (shorter audits, one-stop shops for investors, legal representation of tenants in court) as well as tax incentives.

ASEZ	Tax exemption terms		
	Corporate income tax	Corporate property tax	Land tax
Territories of advanced social and economic development			
«Amur-Khingan»		0% for the first 5 years	0% for 3 years
«Komsomolsk», «Khabarovsk», «Nikolayevsk»; «Beringovsky»	Federal tax (FT): 0% for the first 5 years since the first profit-making year; 2% for the subsequent 5 years.	0% for the first 5 years; 1,1% for the subsequent 5 years	0% for 3 years
«Nadezhdinskaya», «Mikhaylovsky», «Bolshoy Kamen», «Neftekhimichesky»	Regional tax (RT): 0% for the first 5 years since the first profit-making year, 10% for the subsequent 5 years	0% for the first 5 years; 0.5% for the subsequent 5 years	0% for 3-5 years
«Yuzhnaya», «Gorny Vozdukh», «Kurils»	0% for 5 years	0% for 5 years	0% for 5 years
«Priamurskaya», «Belogorsk», «Svobodny»	0% for 5 years, at least 10% for the subsequent 5 years	0% for 5 years; 1% for the subsequent 5 years	0% for 3 years
«Kangalassy», «Yuzhnaya Yakutia»		0% for 5 years	0% for 5 years
«Kamchatka»	FT: 0% for 5 years; RT: 5% for 5 years	0% for the project payback period, but not more than 5 years	0% for 5 years
Free Port of Vladivostok (FRV)			
Free port of Vladivostok	0% - for 5 years; 12% - for the subsequent 5 years	0% for 5 years; Up to 2,2% for the subsequent 5 years	0% for 5 years

Compiled by the authors (Sinenko, O., *et al.*, 2018)

Table 1. Tax incentives for tenants in advanced special economic zones (ASEZ) of Russia's Far East

²⁰ Federal Law No 212 "On Free Port of Vladivostok" adopted 13 Jul 2015 (as last amended on 3 Jul 2018)

²¹ Far East Development Corporation (2018). Available at: <http://www.erd.ru>.

The specifics of exemptions from the corporate income tax, property, and land tax available to the tenants of the advanced development territories in Russia's Far East and the free port of Vladivostok are summarized in Table 1.

An additional advantage available to tenants of advanced development territories is a reduction on social security contribution rates from the standard 30% to 7.6% for 10 years. Additionally, tenants are entitled to an accelerated VAT refund procedure (15 days) and a tax reduction factor for mineral extraction tax (from 0 to 1 for 10 years).

2 LITERATURE REVIEW

The key issue for countries setting up special economic zones today is the provision of proper tax benefits (Sinenko, 2016). Another point worth mentioning is competition for investors and taxpayers that generates new approaches to taxation of investments (Ślusarczyk, 2018), which in turn increases tax migration (Wiedemann & Finke, 2015; Moberg, 2018). The impact of special economic zones in Poland on the sustainable development of municipalities, taking into account measurable economic, social and environmental criteria, has been investigated by Slusarczyk (2018).

The work of Lamantia and Pezzino (2018) is devoted to the study of tax migration of taxpayers in the EU. In order to prevent business from migrating to special economic zones, some cities close to Shanghai announced an 'X+1' plan for policy support in 2000, meaning these cities offered one additional form of policy support in addition to the policy support offered by Shanghai (X). In response, Shanghai expanded the planning area of the Economic and Technological Development Zones from 67 square kilometers to 173 square kilometers.

Kaneko (2018) revealed the positive impact of special economic zones in creating an investment climate in Poland, where 35% of foreign direct investment in the manufacturing sector was attracted. In a study by Quaicoe (2017), opposite conclusions were made that the free zones of Ghana have a negative impact and retard economic growth in the country. The author proposes to abandon the free zones and at the same time create the infrastructure and provide tax incentives throughout the country to ensure a balanced and sustainable development of the economy of Ghana. The impact of tax structures on economic growth in Jordan over the period 1980-2015 was investigated by Metri Fayeze Mdanat et al. (2018). The analysis shows that consumption and tariffs have a positive effect on per capita gross domestic product growth, whereas income taxes negatively influenced this growth measure.

The impact of tax benefits on investing activities of Chinese businesses was investigated by Zhang et al. (2018). Researchers are curious about the experience of Asia-Pacific countries in creating

mechanisms of tax incentives in special economic zones and the outcomes of investment attraction programs in such zones (Zeng, 2015, 2017). There is a number of studies dedicated to fiscal policies in free ports of the Asia-Pacific region (Chen, 2018; Tian, 2018).

3 MATERIALS AND METHODS

The authors use both quantitative and qualitative research methods. The qualitative method used is a survey conducted in a focus group consisting of tenants of the free port of Vladivostok and the advanced special economic zones of the Far East. The list of the quantitative methods employed includes systematization, the processing of the survey results by means of correlation and regression analysis tools. The survey of the economic entities operating as tenants of the special economic zones of Russia's Far East was conducted by master's degree students at the School of Economics and Management of the Far Eastern Federal University in 2018 as part of the project "Effects of special institutional regimes on the behavior and performance of companies (the case of Russia's Far East (Sinenko, 2018)). At the time of the survey, the free port of Vladivostok had 556 tenants; the advanced special economic zones – 248 tenants. The survey sample contained 126 respondents, 99 of them being tenants of the free port of Vladivostok and 27 - tenants of the special economic zones. The majority of the respondents operated in the free port of Vladivostok, Primorsky Region, which is due to the survey site. The survey questionnaire contained the full spectrum of questions about the company's operations. It was divided into the following sections: company information; the company's strategic goals; the company's internal characteristics; external environment etc. The response options for the questions included a 0-7 rating scale (ranging from 7 -"very important" to 0 "have difficulty answering the question").

The purpose of the study was to evaluate the attractiveness of fiscal instruments facilitating business development in the special economic zones by using the results of the survey. The following hypotheses were verified as part of the survey:

1. Various tax incentives and preferences help boost business development;
2. By offering tax incentives to SEZ tenants it is possible to have an impact on their activities and the business climate;
3. The need to file tax returns (the absence of simplified tax accounting and reporting forms) negatively impacts the activities of tenants.

Construction was the most represented sector in the survey (23% of respondents), followed by services (21%), including logistics, transportation and warehouse services, and processing industries

(15%). The location of the free port of Vladivostok is the reason why many of its tenants are involved in fishing and fish farming.

4 ANALYSIS OF THE RESULTS

One of the core business performance questions for SEZ tenants has to do with the investment climate, including the available incentives. Figure 1 presents an analysis of the distribution of the respondents' answers as to why they became a SEZ tenant in Russia's Far East.

Compiled by the authors

Fig. 1 – Distribution of respondents' answers as to their motivation for becoming a SEZ tenant in the Far East

The analysis confirms the importance of fiscal incentives for businesses. As part of the survey, SEZ tenants were asked to indicate the degree to which the suggestions below accurately described their behavior in case there were no tax incentives available to them. The results are presented in Table 2. The analysis of the answers given by 76% of the surveyed companies that said they would carry on with their business without any tax incentives confirms one of the hypotheses of the study.

Taxpayer's actions in case of lack of preferences	Mean score	Construction	Other services
The company is ready to develop its business because it has been in the industry for a long time	3.63	3.50	3.44
The company is ready to develop its business because it is profitable and interesting	4.28	4.83	4.19
The company would not start a business in this region	3.00	2.50	2.63

Table 2. Taxpayers' assessment of accuracy of behavior descriptions in case of absence of tax incentives

Table 3 presents an analysis of the significance of tax preferences for SEZ tenants. Due to their application peculiarities, the reduction factor for mineral extraction tax and customs incentives were not valued highly by the surveyed group. Moreover, an accelerated VAT refund procedure and shorter time limits for tax audits are not of prime importance thanks to an efficient automated system of VAT administration in Russia. Thanks to electronic invoicing, the automated system quickly traces each product as it passes from the manufacturer to the end-buyer through a chain of intermediaries.

Available preferences	Mean score	Construction	Services
Exemption from corporate income tax	5.21	4.77	5.59
Exemption from property tax	5.16	5.03	4.85
Accelerated VAT refund procedure	4.05	2.93	4.33
Exemption from land tax	4.40	3.93	4.78
Reduction factor for mineral extraction tax	1.46	1.00	1.56
Lower social insurance contribution rates	5.46	5.20	5.15
Customs incentives	3.55	2.43	4.04
Shorter audits by oversight agencies	4.32	4.33	4.22

Table 3. Analysis of the significance of tax preferences for tenants of special economic zones in the Far East

Figure 2 depicts the distribution of the respondents' answers about the importance of the key tax incentives to them.

Compiled by the authors

Fig. 2 – Distribution of the respondents' answers about the importance of the key tax incentives to them

All respondents view lower social insurance contribution rates as significant: for the first 10 years, SEZ tenants pay a reduced social contribution rate of 7.6%, compared to the standard rate of 30% outside the SEZs. This supports the hypothesis that the provision of tax incentives to SEZ tenants influences their business and the business climate.

When assessing the significance of possible new incentives for their company, all respondents pointed to the need of extending the duration of tax concessions. Table 4 presents an analysis of the relevance of currently available fiscal preferences to SEZ tenants. The analysis of the data indicates that SEZ tenants assign the biggest importance to modifications to the incentives on property tax and reduced social insurance contribution rates. The respondents also noted that the tax incentives did not help them recoup the funds invested in fixed assets.

Improvement proposals for available preferences	Mean score
Land tax exemption should be extended beyond the 5-year time limit	5.62
Reduced social security contribution rates should be extended beyond the 10-year time limit	6.01
Corporate property tax should be extended beyond the 5-year time limit	6.01
Nil rate of corporate property tax encourages purchase of fixed assets (as opposed to leasing them)	5.75
Property tax exemption for new buildings should be extended beyond 5-year time limit	6.02
Tax preferences enabled the company to fully recoup its investments in fixed assets	2.28
Corporate income tax exemption should be extended beyond 5-year time limit	5.98
Nil rate of land tax encourages purchase of land plots (as opposed to leasing)	5.44

Compiled by the authors

Table 4. Evaluation of the relevance of currently available fiscal preferences

In order to analyze correlations between responses within business sectors, a correlation matrix was built (using the Pearson correlation coefficient) on the basis of the responses obtained from the respondents involved in the construction business and provision of services (primarily logistics). For testing the statistical significance of the obtained correlation coefficients, Student's t-test was used (Table 5).

Corporate income tax exemption	Sales growth	Number of employees	Market share	Higher profitability
Correlation coefficient	0.631	0.680	0.602	0.621
Student t-test	10.22	11.65	9.48	9.96
